THE ELIXIR OF LIFE — *Leoline L. Wright*

That which in the beginning is as poison and in the end as the water of life. . . . — *The Bhagavad-Gita*, ch. xviii

This is an age when personality is the supreme fetish. Everywhere, in salons and offices, in marriage and in the pulpit and in almost every human relationship, we are all trying to "get by on our charm." Schools of pseudo-psychology for the cultivation of an irresistible personality flourish by the score. It reminds one of a phrase used by Katherine Tingley as a title for one of her Temple lectures: 'The World Upside Down.' For that is what it amounts to. It is an inverted psychology. It represents our failure to sense the real meaning of things, the basic elements of life and human nature which we must understand and master before we can solve the appalling problems which beset the individual and the world.

The solution of this difficulty is to turn things right side up again. Theosophy has given us the method in the teachings about impersonal love. Perhaps there is no expression in Theosophical literature which is so little understood by the inquirer as 'impersonality.' Yet impersonality is the true Elixir of Life — at first almost always a bitter draught, but cleansing, refreshing, life-renewing if often and deeply quaffed.

Impersonality means just one thing — NOT living in the personality. But here many will exclaim: "Where then shall I live? My personal consciousness is the only part of me I know and understand!" The answer is very simple: By *not* living in the personality. By setting aside even for one day the desire to shine, to dominate, even at the expense of others, or to 'put across' one's own methods or opinions, something rare and unsuspected will

open up in the nature — a spiritual center of peace and well-being. It is there. We do not need to search for it. All we need is to think and feel and act so that it is possible for it to function. One can make a beginning in any moment. Just setting aside the sense of superiority which leads us to ridicule or resent or disparage, even in thought; one effort to further the welfare of a friend before our own; a quiet sacrifice that a brother or sister may have a larger share — anything that one can find to do which will set aside the insistence of ME and MINE — these things will accumulate into the first push against the once closed door where waits the companionship of the Inner God.

The personality is designed by evolutionary law as a marvelous psychological instrument, but, like the body, it has its un-self-governed insatiable lusts. It is complex and invisible and harder than the body to understand and control. But until we master it and dedicate it to impersonal service we shall continue to be led astray from the true goals of evolution.

Then we often see a corresponding personal dominance in the family, where one or the other parent imposes personal prejudices to the detriment of the children; or in the neighborhood where the rights of 'My family' or 'My children' cause trouble for everyone in the vicinity. Perhaps nowhere else are the qualities of impersonal love more urgently needed than in the duties and problems of the home. Yet if one were to suggest this fact to the average parent, what a stare of outraged incomprehension he would meet! Among nations it is the same — we have only to read the daily news columns to find a satiety of examples.

Some may imagine that self-forgetfulness might result in loss of individuality; but the grandest characters in history, men like the Buddha, Jesus, and Confucius have swayed enormous sections of

the world's population for millenniums, just because they were the grandest exemplars of self-forgetful love.

We must of course beware of neglecting our material duties to those dependent upon us or of the tendency to feel in self-sacrifice a sense of power or complacency, for then we are robbed of the perfect result. The spiritual circulations of the individual cosmos are in this way diluted with the old familiar virus and do not pass on to us the pure essence of the Inner God.

Daily practice in impersonal love dissolves the densities that shut us into our self-wrought prison from communion with the Gods. We are permeated and surrounded in our higher natures by the divine Akasa where flow the Circulations of the Cosmos. We might, if we would, know in our own being the dazzling currents of spiritual vitality and joy which are the life-streams of those Gods, the great Nirmanakayas and Dhyani-Buddhas from whom we derive our spiritual heredity, and to whose Hierarchy of Compassion our own Inner God belongs. To find these great beings, to live where they do, to let their spiritual energies flow out through us in love and blessing, we have only to set aside persistently the self-demanding personality. As we "nourish the gods by sacrifice," the gods will nourish us.

The Theosophical Forum

WHY STUDY THEOSOPHY? — *A. Trevor Barker*

Before we can answer this question at all satisfactorily and present reasons as to why we should study Theosophy, we naturally ask ourselves, 'What is Theosophy?'

Theosophy is not something new; it is not the invention of one or two men or women, either modern or ancient; it is not a progressive system which is subject to change from day to day, following upon experiments in the realm of science, where any morning we may wake up to find that that which we had thought to be Truth has actually had to be changed, modified, or altered. This is the difference between the Ancient Wisdom and scientific methods.

A passage from our teachings will show you in language much better than I could employ, just where Theosophy comes from:

Theosophy is the Primeval One Truth taught Humanity in the infancy of its Races by every First Messenger — the Planetary Spirit whose remembrance lingers in the memory of man as Elu of the Chaldees, Osiris the Egyptian, Vishnu and the first Buddhas — for there was a primeval revelation and it still exists; nor will it ever be lost to the world but will reappear. The Wisdom religion has been Esoteric in all ages: it was ever One and the same and being the last word of possible human knowledge was therefore carefully preserved. It is the substratum and basis of all the world-religions and philosophies — but its doctrines are the exclusive possession of none of them. They are the birthright of every human soul and pertain exclusively to man's knowledge of his own nature and the higher life of the soul. It was the universally diffused religion of the

Ancient and prehistoric world. Proof of its diffusion, authentic records of its history, a complete chain of documents, showing its character and presence in every land, together with the teaching of its great Adepts, exist to this day in the secret crypts and libraries belonging to the Occult Fraternity.

This Ancient Wisdom which was preserved by the elect of mankind literally from the birth of humanity on this planet, has been restated for us by one of that Brotherhood who was sent to the Western world, and whom we know as H. P. Blavatsky. It was she who founded the Theosophical Society and gave Theosophy to us. Now this does not mean that Theosophy is limited to the writings of Blavatsky. That is not true. You will find the literary records of Theosophy spread everywhere. For example, you will find traces of Theosophy amongst the writings of the early Christian Fathers; you will find it in the teachings of Jesus in the New Testament; you will find it in the Egyptian 'Book of the Dead,' and in the teachings, literally, of all the great Sages and Seers that the world has ever known. Take the teachings of Gautama-Buddha, for example. From our point of view as Theosophists, there is no difference between the teachings of the Buddha and the teachings of Theosophy, though I must enter one little word of warning in case the record of what the Buddha taught may not be exactly as he gave it in all respects, any more than the record of the teachings of Christ is exactly as he gave them. Nevertheless, whatever we have of the real teachings of these great Masters of Life and Wisdom is Theosophy.

You will find Theosophy in the *Upanishads* of ancient India; you will find it in the *Bhagavad-Gita*; and in the writings of Confucius and Lao-tse. So it is no narrow, sectarian idea of some kind of religious philosophy, but it is literally the essence, both ethical and philosophical, of all the world-religions.

And yet, strange as they may appear, the writings of Blavatsky were not the mere synthesis, if you understand me, of what those different religions contained — and this is a very important point. If that were so, then you or I, if we had had the brains, could have merely gone through these different records and books, and put them together in some kind of fashion, and said: "There, that is your Theosophy!" It would have contained possibly a great deal of Theosophy, but it nevertheless would not be the real thing; and that is why I say that Theosophy is the mother-root, the essence, of all these great religions. It is the mother-root from which these great teachings originally came. I want to emphasize this because Theosophy is the Esoteric Doctrine, the real truth about man and the universe; the real truth about the human soul and its pilgrimage, and what we are here for, and what the whole universe is about. These Truths are preserved by a living Brotherhood of Holy Men, and it was that Brotherhood from whom came the Great Teachers. It is that Brotherhood which is the root from which all the great religions sprang — a root imbedded in the consciousness of living man.

What is the great need of man today? It is not, mind you, something that is exclusively a need of our own times, but it is particularly emphasized in this moment of the world's history. Every man sooner or later asks himself the question as to the nature of the universe. He comes in conflict with his environment, and he seeks an explanation — as a rule outside of himself first of all, because we seem to be built that way. If we suffer, we tend to think that it must be the world around us which is wrong, and therefore when faced with problems which to us are unfair, or which seem at a given moment insoluble, we start to ask ourselves about the universe!

Therefore the first great reason why we study Theosophy is

because it gives us an explanation of the universe around us — an explanation that you will find nowhere else in modern literature. It gives us an explanation of the origin not only of our planet, but of the solar system of which the planet is a part — aye, and the universe, which is full of solar systems. And by extending, as it does inevitably, our vision of the universe in which we live and move and have our being, we come as it were out of the little tight box in which — we recognise after the event — we were confined, all our life, up to that moment. That is why honestly I can sincerely envy the man or woman to whom at any moment — perhaps the present — Theosophy comes for the first time; because I remember what it meant to me when as a very sick man during the Great War I was in the situation where, suffering very much in all sorts of ways, I sought an answer to the problems of my own life. Sooner or later I believe we all get into this position. Life drives us until we come up against some great enigma; then, if our longing is sincere and true enough, we find Theosophy. It comes as a revelation to the mind, as if one's whole soul were opened to the sunlight for the first time. The effect of this upon me was to get me in touch with the nearest Theosophical library, and no power on earth could have stopped me from taking an armful of books away, and then reading till I had dragged the inside out of them, and absorbed them. That is a wonderful experience, and any one of us can have it. It is part of the work of the Theosophical Society — in fact, the main part of our work — to bring to others these truths which have meant so much to us, and to ask them to take them in their turn to still others.

It is quite obvious that we cannot pass on these truths unless we know something about them ourselves. But one of the beautiful things about Theosophy is that one who hears its teachings for the first time reflects upon what he has heard; and then he starts to

read for himself a few relatively simple manuals or books, and immediately the mind becomes quickened; the hunger for truth is aroused. The next step is that the longing which is bound to be present in a man or woman who is ready for these teachings must be satisfied: the longing to help all those around him who also are perplexed with the enigma of life, who suffer.

This is the background of experience, therefore, which every server in the Theosophic Cause goes through; because the way for the individual and the race to acquire this knowledge opens only when the human soul has been brought by suffering to the point where the teaching is received as a trust, as something more precious than earthly gold or jewels, something which is to him literally the breath of life. Every one of us has received these teachings from the work and efforts of others, and as we receive them we make of ourselves a chalice into which gradually the out-pouring of the Life of the Spirit flows. But our life obviously has to be cleansed of its material propensities; we have to empty ourselves; the vessel in which we would hold the waters of life and give them to others must be made a clean vessel — otherwise, we cannot give clean water to those who seek it.

One of the great reasons for the study of Theosophy is that in process of discovering ourselves we necessarily discover that at the root of our being is a Divinity, a God. The source from which flow those things in our lives which are sweet and beautiful, those thoughts and dreams of a higher life, the love which we bear to our fellows, all aspirations that encourage one to lead a different kind of life, all deeds that are helpful in character and of a truly spiritual and divine nature: all that is eternal in our being — these qualities flow from this Divine part of us. But, having discovered the existence of this spiritual pole of our being, we want to know how we are going to strengthen the Divine and vanquish the lower. That gives us another reason for the study of

Theosophy: to find the way of life — the ethics of conduct in our daily lives. We know in a vague sort of way what we ought to do. We have heard from our childhood the golden rule of not doing to others what we would not have them do to us — a summing-up of the ethics of all the great Teachers; but still we need something further.

Let me put it to you from another angle: what are you going to study if you do not study Theosophy? For example, you have the Christian Churches. There are some 320 varieties of Christian sects and what not. Why do so many people find that they still have an unsatisfied need and hunger? One of the reasons is that although the New Testament has sublime ethics — you cannot find a better ethical standard anywhere than in the 'Sermon on the Mount' — what it lacks is philosophy. Men and women in these days want a reason why they should be better and do better. They are no longer satisfied with being told "Be good and you will be happy," even if you have a dull time of it! No, they want to know why they are here, where they came from, where they are going, and what it feels like to be in that state that all men must come to when their earthly life is finished. Have we not all asked ourselves these questions? And was there any orthodox religion in the world, with the noble exception of Buddhism, and to some extent Hinduism, that could answer you? I do not believe so.

You will find in the teachings of Theosophy, once you understand them correctly, food of a religious nature for the spiritual part of your being; philosophy for your aspiring intellect; and a code of ethics for living your daily life.

"No philosophy in the world can meet the great human 'question and answer' as does Theosophy. This I know, for it includes the best in all others. . . . What but Theosophy

can meet the great need of the hour?" — Katherine Tingley

The Theosophical Forum

TIBETAN YOGA: I — *C. J. Ryan*

In this Transition Age, we, who have the good fortune of being here to watch the new developments and to do our share in their unfoldment, are naturally interested in the progress of scientific discovery and the steady advance of the new science — a philosophic science — toward the Ancient Wisdom. But there is a still more important change taking place in the high intellectual regions of Western thought which likewise is directly traceable to the untiring work of the Theosophical Movement, outwardly started by H. P. Blavatsky in 1875, but originated and constantly energized by the Masters of Wisdom. This change is shown by the new attitude of Western scholarship to the philosophy and Yoga teachings of Tibet. Not many years ago the stories of mysteries and magic in Tibet were utterly ridiculed by serious scholars; it was not respectable to listen to them in academic good society, or perhaps anywhere. The deadly, stodgy opposition from which H. P. Blavatsky suffered so terribly, largely arose from the complete ignorance of such possibilities on the part of the Western cultivated classes, elated and enthusiastic over the triumphs of materialistic science. "There ain't no sich animal," as the farmer said, and when H. P. Blavatsky said there was and that she could prove it — well, the natural consequences followed.

When Col. Olcott, the then President of the Theosophical Society, interviewed the great Sanskrit authority, Max Müller, about fifty years ago, the latter pleaded with him to advise the scholars in the Theosophical Society to abandon their belief that there was anything more in the Hindu Scriptures than what appeared on the surface, or that there could be any basis for esoteric or occult interpretations of them, as claimed by the 'superstitious' Hindus.

Today, however, we find great Orientalists not only accepting as a matter of course the existence of *yogis* possessing some occult powers, but whole-heartedly speaking of esoteric interpretations of the Hindu Scriptures, and some, like Mme Alexandra David-Néel, even claiming personal, though limited, knowledge of the *rationale* of certain psycho-magical processes. Dr. Richard Wilhelm the great German Sinologist, Dr. Carl Jung the psychologist, Sir Wallis Budge, late Egyptologist to the British Museum, and others, have given open support to the fact of that Eastern occult knowledge which was regarded as the purest superstition before H. P. Blavatsky began "to break the molds of mind" in the West. Today we see an audience of eminent scientists in England seriously studying the 'impossible' Fire-Walk and finding it a fact, but also finding no physical explanation!

The latest revelation of Oriental psychology is Dr. Evans-Wentz's *Tibetan Yoga and Secret Doctrines* (1) This is the third volume of a trilogy, the others being *The Tibetan Book of the Dead*, and *Tibet's Great Yogi, Milarepa*, also published by the Oxford University Press. Thus, as Dr. Marett says in the Foreword, in regard to the collaboration between the author, or 'editor' as he modestly calls himself, and his Tibetan teacher, the late Lama Kazi Dawa-Samdup, the translator:

Its fruit is the trilogy of substantial works, based on translations from the Tibetan, and accompanied by an interpretation from within such as demands something even rarer with Western scholars than the ordinary scholarly equipment, namely, a sympathetic insight transcending the prejudices which render the average man antipathetic to any type of unfamiliar experience.

This is hardly surprising in view of the fact that Dr. Evans-Wentz has been closely associated for many years with the teachings of

Theosophy and the International Headquarters at Point Loma, and that he has also spent much time in India in the intensive study of the *Yoga* philosophy at first hand.

Tibetan Yoga and Secret Doctrines consists of seven treatises translated from the Tibetan and "representing a more or less comprehensive and unified expression of the most important tenets of Mahayanic Buddhism," elucidated by a masterly Commentary and exhaustive explanatory footnotes by Dr. Evans-Wentz. The translation was made by the Lama Dawa-Samdup, assisted by the editor, and the difficulty of rendering subtil philosophical and technical Tibetan expressions into good English has been brilliantly overcome. The Lama was an initiate of the *Kargyutpa* School of *Mahayana* or Northern Buddhism and had profound practical knowledge of the *Yoga* philosophy and methods. He was, therefore, unusually qualified to help in the interpretation of Tibetan esoteric doctrines and secret lore hitherto hardly known, if at all, outside the precincts of Lamaism. They are not easy of comprehension by the Westerner, with the exception of a few students of Theosophy, or the like.

Dr. Evans-Wentz speaks very highly of his Tibetan *guru's* learning and marvelous interpretive ability, and of his splendid spirit of helpfulness and desire to serve by bequeathing these translations of the abstruse doctrines of "the master minds," so-called, of Tibetan Lamaism. Mme David-Néel was also associated with the Lama Dawa-Samdup, of whom she gives an account that shows he was a quaint and unique character. He ended his days as Professor of Tibetan at the University of Calcutta.

The Lama is a valuable witness in defense of H. P. Blavatsky against the absurd charges made in her lifetime that she invented the teachings of Theosophy. In his *Tibetan Book of the Dead*, Dr. Evans-Wentz says:

The late Lama Kazi Dawa-Samdub was of opinion that, despite the adverse criticisms directed against H. P. Blavatsky's works, there is adequate internal evidence in them of their author's intimate acquaintance with the higher lamaistic teachings into which she claimed to have been initiated.

We venture to suggest that, while the Lama was right so far as he goes, H. P. Blavatsky belonged to a far *higher Order*, and a far nobler, than the term 'lamaistic' suggests.

The seven treatises are arranged in a definite order, though each can be profitably studied by itself, but they are not all of similar origin. The first four are from the *Kargyutpa* School of the *Mahayana* or 'Great Path,' and are decidedly interesting to students of Theosophy. Dr. Evans-Wentz says that the entire Seven, however, "represent a more or less comprehensive and unified expression of the most important tenets of Mahayanic Buddhism, some of which in the form herein presented are as yet unknown to the Occident save for a few fragmentary extracts."

Much, if not all, of the *Kargyutpa* Treatises are fairly in harmony with the Theosophical teachings on inner development, but parts of the others deal with extremely perilous psychological exercises which cannot be attempted safely, if at all, without an adept teacher and without the previous attainment, after almost incredible labor, of a power of self-control hardly conceivable in the West. These parts treat of occult forces, and of powers that are said, perhaps with truth, to arise as by-products of deep insight into occult laws or of spiritual development, but we are compelled to state that high spiritual Teachers would never give the real facts outside the privacy of the *asrama*. Most of the Treatises which touch on these matters are derived from the primitive unreformed Bonpa sources. The Bon religion, as H. P.

Blavatsky mentions it, is:

itself a degenerated remnant of the Chaldean mysteries of old, now a religion entirely based upon necromancy, sorcery and soothsaying. The introduction of Buddha's name into it means nothing. — *The Complete Works of H. P. Blavatsky*, III, 271

The Ritualistic Texts contain instructions for the development of occult knowledge little or not at all known in the West, such as immunity from fire, levitation, materializing of thought-forms, "transfer of consciousness," and the Tummo, or the control of bodily temperature. In the last case the *yogi* keeps warm and comfortable while sitting on the snow in a furious blizzard with the temperature far below zero! Mme David-Neel describes her observations of this feat, and even mentions her own application of the Tummo to a limited degree when caught without fuel in a Tibetan wilderness!

The Fifth Treatise, which largely comes down from the pre-Buddhistic Bon faith, presents the *Chod* Rite of the 'short path' method, a desperate method of rapidly breaking the fetters of Maya and separateness by the mystical sacrifice of the body to the elementals, which sometimes brings insanity or death to the impatient venturer. Mme David-Neel gives a rather horrifying account of personal experiences in connexion with Chod in *Magic and Mystery in Tibet*. The ostensible aim of this grim Rite is to deliver the candidate from the necessity of rebirth, but it seems only too probable that it would be more often used to gain control of the elementals for personal power. Mme David-Neel frankly states that many so-called *yogis* enter the psychic training for selfish reasons such as revenge and vanity.

It is interesting, and should be of great significance to Western ill-informed and skeptical psychologists and other students for

whom this work is written, to see in what a matter-of-fact way these occult and psychic matters are regarded by the *yogi-authors* of the Treatises. All such things are known to be strictly governed by natural laws, however obscure and 'miraculous' to the profane. Also, as we are told, they are treated by the most respected lamaistic teachers as being insignificant in comparison with the attainment of the Cosmic consciousness, the transcending of Maya, the Great Illusion in this and higher worlds.

It would be an error to condemn these Treatises as a whole, though some of the instructions, derived from Bonpa practices entirely at variance with the pure, impersonal, and beneficent *Yoga* of the Lord Buddha, are not at all consonant with the wholesome self-disciplinary methods advised by H. P. Blavatsky for her pupils. It seems a pity that the excellent precepts of the first Treatise on 'The Supreme Path of Discipleship' should have to be associated in the same series with certain phenomenalistic instructions, useless though the latter may be without the guiding and warning hand of a real teacher. Are not such texts, while perhaps informative for scholars as exhibiting the weaker side of lamaistic Buddhism, doubtfully suitable for wide publication to the Western world which is turning more and more toward the development of psychic powers for purely selfish purposes, or, at best, for the gratification of curiosity disguised under high-sounding names?

The *Kargyutpa* School, to which the Lama Kazi Dawa-Samdub belonged, originated in a purifying reform under the famous *Gurus* Marpa and Milarepa in the 12th century when it separated from the Singmapa School, the "Red Caps" founded in 747 a.d. by the Hindu University Professor Padma Sambhava, who introduced the Tantrik element into Buddhism. The improvement brought about by the *Kargyutpa* reform was important, and its

Tibetan *Gurus* followed *Marpa* (11th-12th cent.) in regular 'apostolic succession,' as Dr. Evans-Wentz mentions with approval. The word *Kargyutpa* means 'Followers of the Apostolic Succession,' and the line from which the Order was derived traditionally goes back for unknown centuries before the Christian Era. In this esoteric method each successor was obligated to hand on the teachings as received, and even Gautama-Buddha "is but One who handed on teachings which had existed since beginningless time." The author praises the followers of the reforming *Gurus*, Marpa and Milarepa, for "their insistence upon the Bodhisattvic ideal of world-renunciation and selfless aeon-long labor looking to the ultimate enlightenment of every sentient being."

Dr. Evans-Wentz states that Tsongkhapa, the greatest and wisest Reformer of Tibetan Buddhism, was "an eminent apostle" of the *Kargyutpa* School, but he refers to him only very briefly. Tsongkhapa did not, however, utilize that School as the nucleus of his sweeping reform in the fourteenth century, but associated himself with the *Khadampas*, "Those bound by the Ordinances." This was the School which Atisha, another great Reformer, joined in the eleventh century. A good deal was written by H. P. Blavatsky about Tsongkhapa, but significantly she does not mention the names of the *Kargyutpa Gurus*. It was Tsongkhapa as Avatara of Buddha, she says, who established the *Gelugpa*, 'Yellow Caps,' the now Established Church, and also "the mystic Brotherhood connected with its chiefs." Tsongkhapa must have had good reasons for choosing the *Khadampas* rather than the *Kargyutpas* as the foundation of his new and completely reformed institution. Is it not possible that there was too much old Bonpa sorcery, or at least phenomenalism, in the *Kargyutpa* Order?

(To be concluded)

"The Esoteric Philosophy is alone calculated to withstand, in this age of crass and illogical materialism, the repeated attacks on all and everything man holds most dear and sacred, in his inner spiritual life." — H. P. Blavatsky
(quoted in *The Esoteric Tradition*)

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: I — *H. T. Edge*

INTRODUCTORY

This series of articles deals with the interpretation of symbolism and mythology, and in introducing this subject it will be advisable to give a brief summary of those Theosophical teachings most concerned therewith. And while it is not possible to expound and demonstrate these teachings within the necessary limits, the inquirer will find what he needs in this respect in the Theosophical literature which is so readily available.

Theosophy is the recent presentation of a body of doctrine known as the Secret Doctrine, the Wisdom-Religion, the Esoteric Tradition, etc., which has existed in all ages, and which constitutes the basis of all religious and philosophical systems. This knowledge concerns the deeper mysteries of man and the universe, and was communicated to the early races of mankind by man's divine ancestors. It has been handed down throughout succeeding ages by those qualified to be its guardians, by whom it is still preserved at the present day.

There have been times in past history when this knowledge was commonly known; and other times, including the present, when it has been esoteric or hidden from public view. But in this latter case, the Wisdom-Religion is communicated to mankind by Messengers, who are the founders of great religions or the teachers of great philosophies. Theosophy accords to the human race, and even to civilization, a far greater antiquity than is allowed by our timid scholars, not yet emancipated from the narrow purview to which theology has accustomed us. But when this prejudice has been overcome, it will be possible to give due

value to the evidence of archaeology, which conflicts with the foregone theories of science, but supports the teachings of Theosophy.

Humanity has been on earth for many millions of years, during which the earth has witnessed the rise and fall of countless races and cultures, succeeding each other like waves. It follows from this general plan of cyclic evolution that some of the races of antiquity have been further advanced in knowledge and culture than we as yet are; we stand, towards such ancient races, in the same relation as a child stands to its parent; the child belongs to a more advanced stage of evolution, but the parent has attained greater maturity. Hence we, though at a more advanced stage in evolution, can learn from our ancestry because they had reached greater maturity in their cycle than we have in ours.

The course of evolution is, broadly speaking, double: there is an evolution upward from below, and an evolution downward from above. (1) The result of this twofold action is that humanity first descends from spirit into matter, and then reascends from matter into spirit. The earliest races of mankind (represented by Adam in Eden) lived in the presence of God (so to speak); they were in a Golden Age of innocence. In subsequent races, the natural course of evolution led man to become less spiritual and more material (represented by the expulsion from Eden and the acquisition of 'coats of skin'). The spiritual faculties became latent as the physical faculties developed. Man had no longer direct communication with the Gods, and this communication was kept up indirectly by the means of divine instructors. The traditions of these divine instructors are preserved in allegorical form in the ancient mythologies, which tell of Gods, God-men, Heroes, the founders of cities and civilizations, the teachers of arts agricultural or technical. In still later stages, the progress of materialization had so far supervened that even this means of

communication was no longer open. In these ages knowledge was kept alive by the sending out periodically of Messengers, from the Lodge of Initiated Adepts who preserve the sacred knowledge, to reawaken the light among men by founding schools of the Mysteries, which schools afterwards became the great religious systems which we find today, or great philosophical schools like those of Pythagoras and Plato.

Thus man is essentially a God, having latent within him the germs of divine faculties, which are ready at some time to germinate and fructify. And this germinating is effected by the action of other men, of more advanced evolution, who act as teachers and pass on the light which they themselves have received, kindling in their pupils and successors the latent spark of knowledge that is within all men. This is the esoteric tradition in one sense of the term; light is handed down from man to man and from race to race; and history shows us that progress of all kinds is due to the inspiration imparted by individuals and by the movements which they start.

But for our present purpose there is one particular mode of preserving the esoteric tradition which most concerns us; and that is the method of symbolism and sacred allegory. Before H. P. Blavatsky wrote her great work *The Secret Doctrine* in 1888, various scholars had studied this subject and become convinced that there is a system of symbols common to all religions, diffused over the globe, identical in essence among the most widely scattered and diverse peoples; and that the mythologies of Greece, India, Egypt, Scandinavia, etc., have a common basis. But the works written by these scholars were few and sporadic, not generally known, and merely contributing to the rare exotics of literature. It was H. P. Blavatsky who put together these scattered fragments, wove them into a consistent whole, and gave them their real significance; for they are not mere items of curious lore,

but facts of the most important character; and in our endeavor to interpret some of these myths and symbols we shall show their bearing upon an understanding of the mysteries of the life we all have to lead.

There are certain broad general truths which transcend the power of expression in ordinary verbal language; and this must necessarily be the case. For verbal language is the instrument of a certain portion of the mind which has limits; the knowledge of which we are speaking relates to powers of the mind which transcend those limits; and therefore they are beyond the power of words. Such profound ideas are expressed by symbols; the full meaning of these symbols has to be grasped intuitively by the exercise of higher faculties of the mind; but we can approximate to such a comprehension by studying the various meanings which the symbol conveys, and holding all these meanings in the mind, until finally we gain some sense of the real underlying meaning.

It is these symbols which constitute the mystery-language; which thus becomes at once a means of preserving and conveying the knowledge, and a means of concealing it. For mysteries are revealed to those who have eyes to see, and doors are opened to those having the keys. The classical mythology is a much altered form of ancient mystery-teachings which were conveyed to the public in the guise of dramatic presentations. For the Mystery-Schools had outer and inner mysteries, the inner for candidates for initiation, the latter for the public; just as Jesus had private instructions for his disciples, but spoke to the multitude in parables. In the course of our interpretation of symbols, we shall give illustrations of the real meaning of these classical myths and of similar myths in other lands.

and involution, in order not to confuse the beginner with too many details. ([return to text](#))

The Theosophical Forum

TRANSACTIONS OF THE POINT LOMA LODGE: LIGHT AND COLOR

— *G. de Purucker*

G. de P. — Brother Clark I believe spoke of light and color. Now the sevenfold solar beam we perceive as what we call white light or yellow light. We call it white light. Let this ray pass through a prism — and you have a beautiful series of colors. Now each one of these different colors is an individual color. Nature produces it every time under the right circumstances. We have here seven different forces of Father-Sun occupying space. *Question:* These seven different forces of the solar beam when joined form what we call white light. It needs all to form our common or ordinary light. Is white light then the most spiritual or the most material? To form the complete man we need all his seven principles.

B. de Zirkoff — It is neither the most spiritual nor is it the most material, as it combines all in one unity. I think that the white light referred to can be symbolically, or rather by analogy, spoken of as Space, and white light has within it the polarity of the most spiritual and the most material and all the rays in between. So is space that polarity which manifests as consciousness and substances — as the consciousness-side of the universe and the substance-side of the universe. If neither is unitary throughout in its methods of manifestation and functioning there should be and there is a perfect analogy from one realm to the other. Therefore we can see in white light the sum-total of all colors as the sun is the sum-total of all the energies of its own universe. And so is space by analogy that which doesn't merely contain all there is but is all that can have existence.

O. Tyberg — I quite agree with Mr. de Zirkoff. If you regard for instance the physical body as a representation of the spiritual as

well as the material cause, white light stands in relation to all the colors as does the physical body to the organic body which manifests itself by six distinct forces or, as we say in Theosophy, by six principles. Those came out of the one, but that one we do not see, and that one is Darkness. It seems to me really that the most divine is darkness and the least divine, the most material, is the white light, that which we see in space.

L. Plummer — A reflexion has been going through my mind in this way: that as you may pass a beam of white light through a prism, causing it to split up into the seven prismatic colors, so this spectrum may be passed through a second prism, thus bringing the colors together, and making white light once more.

Symbolically the prisms are like laya-centers. The light, which in itself is perfectly invisible until it strikes the eye, represents consciousness on its way to manifestation as a seven-principled entity, which latter is represented by the multicolored spectrum. The return of the consciousness-center into unmanifested life is here symbolized by the passing of the seven colors through the second prism. It does not seem, therefore, that white light in itself is more spiritual than colored light in general. Which of the *colors* is the more spiritual and which the more material, is determined by the law of correspondences, wherein it is found that each color is directly associated with one of the human principles. That white light is the sum-total of all the colors shows that it contains within itself, though undifferentiated, the spiritual as well as the material.

[Several more responses followed, here omitted for lack of space.]

G. de P. — The answers have been splendid. I think these thoughts are very suggestive if we do not wander off into too distant spaces of abstraction. Now for instance, this thought occurred to me, Mme. Chairman. All the different colors of the solar spectrum

originate in the sun and are represented on our earth in the form of light, of forces — forces in the sun, every color of which is the outflow or efflux of a distinct force or principle. *Question:*

Although all these forces and substances are in essence divine to us human beings with our scale of relativities, which one of the seven colors is the most spiritual, or the more spiritual color than some other color? That is a very interesting thought to me. It is suggestive.

[The meeting of April 14th was given over to a lively discussion of the Leader's question last quoted. Space does not permit the inclusion of the many interesting remarks, but the gist of them may perhaps in degree be gathered from G. de P.'s own comments which follow, from which also the Theosophical teaching will be made clear.]

G. de P. — May I ask the indulgence of the Chair to say a few words. Companions, I had it in my mind to ask you to think over this very interesting theme of thought not so much from the standpoint of color as a pigment, as one of the speakers has pointed out; but from the standpoint of recollecting that as the Sun is the vehicle of a Divinity, whatever flows forth from it is rooted in the Divine. There are seven — or ten — solar forces or elements. From these seven solar individualities, powers, forces, flow streams of substance or force, combined in the light which we receive and recognise by our eyes as daylight, white light. Pass this solar beam through a prism, and you have it broken up into its component parts, which we call colors. *Question:* Which one of these colors, forces, energies, rivers of life, is the most or the least spiritual? Is the question clearer now?

[Discussion]

G. de P. — I am very anxious to clear our thoughts with regard to the substantial meaning of this question. Now, the mere matter of

color as a pigment or a light can be found in the science-books. We do not need to bother about that. But the seven colored rays of the solar spectrum are seven effluvia, seven auric flows of vitality, from the solar heart. That is what I am after — not so much the difference of the colors, and which one is to be preferred. That thought may be valuable to us as a side-thought; but the heart of my question, the essential idea, is: which one of these effluvia combining to make light as we understand it, which one is the most spiritual? Which one of these effluvia flowing forth from the Sun, its aura, the seven effluvia of its vital aura, of its life — which one, so to speak, comes from the Sun's highest part? Is the question plainer now?

G. de P. — Madame Chairman: Just like Brother Tyberg, I feel that all that has been said has been beautifully said, informative, instructive; and personally, putting myself in the mind of each speaker, I think I can truthfully state that I agree with everyone, which means, *however*, coming to the answer that I was hunting for, I agree with none! A strange paradox! Everything that has been said has been true; but yet it was not that one answer to the question that I was seeking for. In all humbleness of spirit, with all the reserve which I feel that I should make, subject to correction by a greater mind than anyone here, than my own certainly, I would say this: that not one of the colors in essence is superior to any of the others. They are all divine in origin. That statement was made. But by comparison on the plane of material existence, and having in view the work which each of the effluvia from the Sun does on this scale of matter, of differentiated life, we are bound to make distinctions (and this was not what I had in mind), and say that Atman is colorless, Buddhi is yellow, and so on. Kama is red.

But now listen carefully. As Brother Fussell pointed out — and I speak of it in especial because the same thought was running in

my mind — do not get it in your heads that red is an evil color. It is no more evil than gold or than green or than yellow or than any other color. It is misuse of force which is evil, not the force itself. "Desire [Kama is the Sanskrit term] first arose in the bosom of It" — the Boundless — the spiritual yearning, the desire to manifest its transcendent glory. Every time you have an aspiration in your heart for greater things, every time you yearn to become at one with the Spirit within you, you are in the Kama-principle; and every time when in this beautiful aspiration you guide your steps wisely, with wisdom, then you are likewise in the color of the indigo, Buddhi-Manas, both working together.

Now, here is the answer that I was aiming for. Any one of the seven colors of the Solar spectrum is itself septenary — or denary, as you will. You can divide it into seven or ten; and these subdivisions merely repeat in the small what the great originates. Isn't it obvious? You cannot cut a slice out of an apple and get something different from the apple. Consequently, every minutest portion of infinity contains every essential element and force that infinity contains. Consequently, every subdivision or sub-plane contains its own repetitive septenary which it derives from the surrounding universe. The microcosm simply repeats the Macrocosm.

Now, then, examine: A man whose swabhava or swabhavic character let us say is in the red or kama, if he lives in the Atman part of it is living on a far higher plane than a man whose essential swabhava is golden yellow, and yet who lives in the lower. Do you get my thought? It is the principle that you live in that places you on the Ladder of Life. If you live in the Atman, the highest part, the spirit, the essential Self, the divine part of any color, of any force, of any element, you are matched only by your own feelings, and you are in the higher state of consciousness, and living far more nobly than a man who may be dwelling let us

say in the indigo, but on a very low plane of it. A humble man born in a humble station of life, without education, crippled in body, everything against him — I am using this as an illustration — but nevertheless who has the mind of a Seer and the heart of a god, is planes above a man who is born with a golden spoon in his mouth, with all the education that the world can give to him, and yet who lives with a heart filled with vipers and evil.

Now this is not politics. I plead with you, this is Theosophy. I am not referring to politics at all. H. P. B. once told her students that an artist — and you know what irregular and foolish lives artists often live — that an artist who in his heart sincerely yearned to be a better man, and to live a better life, even if he failed constantly, had greater chances of chelaship than a priest in a church who was wearing the skin over his knees hard by kneeling and praying to "Almighty God" every day, and who inwardly had a heart which was a den of vipers. That was the idea. It is the plane on which you live which places you where you belong. The thing is to strive to live in the highest plane where there is no color, where all is colorless glory. As soon as you descend into color, you descend into manifestation and differentiation producing a corresponding amount of maya, and consequent ignorance. Color shows manifestation, differentiation, the world around us, matter, in their densest and most condensed form.

Now take the spectrum: Red, orange, yellow, run through the scale to the ultra-violet. A new red begins, and if you follow it into invisible light, you will be passing upwards, till you reach a still higher red, after passing through the intermediate stages. Deduction: There is a divine kama, there is a debased kama; there is a divine Buddhi, there is a human Buddhi, which is the reflexion of the other. The point is that every plane is subdivided and is patterned after its grand plane. Therefore no matter in

what station of life a man may be born, no matter to what "Ray," as some say, he may belong, this does not place him. What places him is where his consciousness is focussed. If it is focussed upwards, rising into the Atman, into the colorless sphere, then he contains divinity. In the Absolute no one color is more spiritual than any other, because all are born from the heart of Divinity. When we come down into the worlds of differentiation, of existence, then we are obliged to make divisions. In the abstract — and this is not contradictory of what has been said — it is perfectly true that the more rapid the vibration, the greater the frequency of vibration a color has, the closer to matter it is; because what we call matter, physical matter, is intensity of vibration, of force. That is what produces the atom, the electrons, and all the rest of it. Modern science is now saying that they are all composed of energy-points, points of electricity, intense vibration. The greater the frequency of vibration, the more condensed the substance is. Follow out the thought, but do not jump to the conclusion that because violet is a very intense vibration, therefore it is the least spiritual of the colors. There is an Atman to the violet, a Buddhi in the violet, and so on down the scale. It is a tangled theme of thought, and I asked the question to try to clarify our ideas. I think we have succeeded!

The Theosophical Forum

QUESTIONS AND ANSWERS: 290-292

QUESTION 290

What were the first men like, and how did they come to earth? (From *Amsterdam, Holland*)

J. H. Fussell — The question is not clear in respect to the meaning attached to 'earth,' either as to 'Globe' or 'Round.' We however take the question to mean, What were the first men like on this Globe D, and how did they come to our Globe D in this Fourth Round?

In *The Secret Doctrine*, II, 180, H. P. Blavatsky, speaking of man at the beginning of the Fourth Round on Globe D, states that for reasons given by her, "his frame should be of the most tenuous matter that is compatible with objectivity" (see also *op. cit.*, I, 183, last paragraph).

To answer the question more specifically: The first men on Globe D in this Fourth Round were astral forms, having more or less the present human shape but less refined, and somewhat ape-like in appearance, although they were men, not apes (*Op. cit.*, II, 57, 185, 688). The apes sprang from men in the manner described by H. P. Blavatsky in *The Secret Doctrine*, and, because the apes have had a retarded evolution physically, the apes today resemble their Lemurian and Atlantean progenitors or sires, but only as caricatures, because of the stronger beast-strain in them from the other side of their ancestry.

"How did they — the first men — come to earth," i. e., to Globe D in this Fourth Round? (a) As a life-stream or life-wave from Globe C of the Earth-chain (after an interglobal nirvana) *via* the circulations of this planetary chain. Obviously there must be

pathways or channels by and along which the various life-streams pass from globe to globe, for the Universe is an orderly Universe, hence every part of it is orderly, not helter-skelter, (b) The human life-wave was drawn from Globe C to Globe D 'magnetically,' attracted hither because of previous experience on Globe D. This was in order that the Monads composing the human life-wave might continue their evolution on this Globe from the stage previously attained here during the Third Round, with the added experience gained on Globes E, F, and G of the Third Round and on Globes A, B, and C of this Fourth Round.

Obviously, however, the human life-wave did not come hither from Globe C in any material, physical, or even astral form, but as 'human monads' through and by way of a laya-center.

From another aspect, the first men on Globe D in this Fourth Round were the human Sishtas who had remained on this globe when the human life-wave passed from it to Globe E in the Third Round. It was they who, waiting for the oncoming human life-wave in the Fourth Round, became the first Teachers and Guides of our Fourth Round Humanity on this globe.

The human life-wave reached our Globe D, coming from Globe C as monads, in very much the same manner as the human Monad today reincarnates on Earth. The Sishtas provided the first bodies of our present humanity which became more and more prolific as the pressure of the incoming life-wave became steadily greater.

QUESTION 291

According to human history numerous civilizations have arisen, reached their zenith, and disappeared. Now, in view of the present continued depression, and the great moral degradation: from the viewpoint of Theosophy, can this civilization survive? — *F. B.*

G. B. — This question can hardly be answered by a simple affirmative, or negative. To which civilization does the querent refer, Eastern or Western, Northern or Southern? Or again, to which continent? One can but answer in generalities. In the first place, what is the standard that one has set for judging whether a civilization has reached its zenith? Is it spread of empire, strength of army and navy, in short, material wealth and power? That seems to be the standard taken by the querent — a view all too prevalent in the West. For if a man achieves affluence he is regarded as being in the forefront of 'civilization'; if he fails to do so he may even take his life in despair — as the newspapers only too often relate.

Indeed, another standard should be set, and we believe it was voiced by the prophet of old in saying, "Where there is no vision, the people perish." So then, the flower of civilization is in evidence when the leaders of a nation have 'vision,' when the arts and sciences flourish, when great souls are coming into the race and stimulating activity in these fields. Thus then, so long as the people have this 'vision,' civilization will flourish — but when it has receded, woe to the nation!

It may be pointed out, furthermore, that the depression is hardly a 'cause' for the downfall of civilization; it is rather an effect of causes previously set in motion. Yet if it be the means of arousing the people to a greater spirit of brotherhood and a broader and farther-reaching vision, it may truly be said to be a blessing rather than a curse.

In accordance with cyclic law, races are born, have their youth, reach their zenith and then wane: such is the law of Nature and may be studied in every known field of manifestation. But whether or not any sub-race will 'survive' during a period of quiescence depends upon the efforts of the members of that race.

Let us therefore labor, brother, you and me, to bring Vision to the people, and if mayhap ten virtuous men be found 'in Gomorrah' the 'city' will not perish!

A. C. — In other words, Can civilization be saved? One might ask, How much of it is worth saving? You cannot save the essentially transitory and perishable. All that has survival-value *will* be saved.

The Masters of Wisdom have called this a "transition age." Why not control emotions, fears, and pessimisms, and stand free and watch the transition? The depression and many other evils are but incidental to a changing order — the 'New order of the Ages,' *Novus ordo seclorum*, as the Great Seal of the U. S. A. says.

In the transitory period there is a life-and-death struggle taking place between the two forces of good and evil, the rising tide and the ebbing or descending one. No one can remain indifferent. It is a matter of supreme importance which side we take. Either we join the forces of Light and spiritual progress, or those of darkness and moral degeneracy. Our choice determines our future.

A transition age is inevitably an age of confusion and those who are the builders of a great, a mighty, and a beautiful future, and whose work takes all their time, attention, and energy, are optimists and are not depressed by depressions.

Our Teachers, the Masters, have laid the foundations on the bed-rock of eternal realities, of eternal Truth. The plans are well made and the process of construction is well begun. Let us get to work and help. It is a great enterprise — this building of the civilization of the future. All of the past and of the present which has survival-value will be saved and will fall naturally into place. These are the spiritual qualities: clean living and high thinking.

These are the Dharma of the future, for Dharma means right religion, right science, right philosophy, and the essential moral order and rightful duty of each man.

The nature of this present cyclic transition is expressed in the *Bhagavad-Gita*, chapter iv, where Krishna, who represents the Logos or solar spiritual energy which now is infilling the world like the coming of spring, says:

I produce myself among creatures . . . whenever there is a decline of virtue and an insurrection of vice and injustice in the world; and thus I incarnate from age to age for the preservation of the just, the destruction of the wicked and the establishment of righteousness.

This Krishna-Christos spirit has to work through men, and the Masters and their Messengers are the men. They are the wise master-builders, and they work through and by means of organizations. The Theosophical Society was founded by their Messenger and at their request, for the work in this cycle. In so far as it succeeds, civilization will be saved.

Their Messenger, H. P. Blavatsky, in 'The Esoteric Character of the Gospels,' published in *Lucifer*, in December, 1887, writes:

But if the voice of the MYSTERIES has become silent for many ages in the West, if Eleusis, Memphis, Antium, Delphi, and Cresa have long ago been made the tombs of a Science once as colossal in the West as it is yet in the East, there are successors now being prepared for them. We are in 1887 and the nineteenth century is close to its death. The twentieth century has strange developments in store for humanity, and may even be the last of its name.

W. E. S. — As W. Q. Judge says in *The Ocean of Theosophy*, p. 47, in respect to the intermediate principle of man's constitution — the

kama-manasic — as reflecting his present stage of development:

This fourth principle is like the sign Libra in the path of the Sun through the Zodiac; when the Sun (who is the real man) reaches that sign he trembles in the balance. Should he go back the worlds would be destroyed; he goes onward, and the whole human race is lifted up to perfection.

True, as we know too well. Life is a great see-saw between what we might nobly do and what we permit our personal selves to gravitate down to. Kama-manas dominates. The left hand denies what the right asserts; we are torn between our intuitive recognition of truth and our struggling desires for the gilded transitory. We mustn't forget, however, that the lowest point of the manvantaric evolutionary cycle has been passed — passed some few billions of years ago at the half-way mark of the rounds on the Moon-chain; and that more particularly, on our present Earth-chain, since the end of the Atlantean Race a distinct change for the better has taken place, so that today, in the middle-point of our Fifth Root-Race of this Fourth Round, the scales are tipped slightly more toward the spiritual as contrasted with the heavily material. The tide of all Nature is upward. The stress of activity in man's constitution is then more toward the manas-kama-manas, so to say, with a growing tendency to become ever more manasic. But, on the other hand, we must not close our eyes to the ignorance — and the evil arising therefrom — which still floods the world, evidenced in the unbridled longing for the sensuous, the craze for psychism, the emotional appeal of the dance of the shadow-world — part and parcel of Atlantean karman, part and parcel of our humanity today. It stares us in the face. It holds the grip of thousands of lives, overpowering them with almost hopeless despair, from which they stupidly think to save themselves by a still further abandonment of control, an almost wanton embrace of those same empty non-essentials of life,

which reflect the shifting, the unreal.

The Theosophist is no pessimist; but he faces the facts of *life*. The moment is critical. We are indeed in the throes of unrest, of disintegration, of chaotic upheaval. But we believe the danger-point will be passed; and out of it all — *if we do our duty* — a nobler and better civilization will arise. Those who believe in Theosophy know what an important part Theosophy has to play. Their duty is plain: it is to spread the teachings of the ancient Wisdom-Religion — Theosophy: it is to work to change for the better the hearts and minds of men: to give them courage, to give them hope, to give them light — to work to do this vigorously, steadily, kindly, persistently, unreservedly.

QUESTION 292

Why is psychism wrong when it is used by great Teachers like Jesus Christ?

E. D. W. — It is not really accurate to say in general terms that psychism is wrong, any more than that dynamite is wrong. Just as we protect the public from handling the latter, which is useful in the hands of a constructor, who even then heavily safeguards its use, so we claim the same for the former. The reason for this is embodied in the Theosophical teaching of the Seven Principles of Man, through any one of which principles he may express his consciousness. Those which are related to the physical plane of everyday life are easily recognised, as for instance the principle of kama, the emotions and desires, or of manas, the mind. All of us are aware how distinctly different are the two forms of the latter — the one which dwells in the plane of sensations and actions, which is called the lower manas, and the other full of higher thoughts and aspirations which belong to a higher mind. Besides these there are other faculties or principles belonging to man which are not so easy to define because they belong to inner

planes of consciousness which have not yet been generally evolved. These we speak of as astral and psychic, and they are as much a part of us as the others. We know that when we allow the mind to dwell entirely on the emotional plane we become a prey to those emotions, and the mind becomes confused; but when our thoughts are in the higher consciousness our emotions become aspirations, full of service and unselfish love for others.

The same rule holds good on all the lower planes of consciousness. What the querent refers to as psychic powers are those which are expressed on the astral plane as psychic phenomena. The astral plane is the picture gallery in which are impressed all our words and acts, even our thoughts. We *may* train our senses to be open to that plane, but once we do we become victims to everything upon it, because the door if forced open cannot easily be re-shut. Astral vision in itself is not wrong; psychic powers are natural possessions, but the plane of our present development is still so material and personal that forced training or attainment of either astral or psychic faculties would make us mediums at the mercy of the forces of those planes.

Those whom we call the great Teachers of the Race were able to use the higher psychic faculties normally because they had trained themselves through many lives by unselfish service to humanity to attain the Spiritual Will and Spiritual Powers. Yet if you were to study carefully the lives of the great Teachers you would discover that they rarely used psychic phenomena, and then only for helpful service. Jesus, as the story is told, refused to use his psychic powers to prevent his crucifixion, and was taunted with the words: "He saved others; himself he cannot save"; and the same may be said of every spiritual Teacher.

H. P. Blavatsky many times openly deplored the necessity of having to use psychic powers, because they tended to cloud men's

minds to their higher spiritual possibilities; but she did so in order to break the molds of materialism which blinded men even to the existence of inner realms of consciousness. When humanity shall have reached to heights beyond the lower planes of mere physical existence, then psychic powers will become a normal, sane heritage, just as physical vision is now.

The Theosophical Forum

SONS OF THE SUN — *Linda C. Barlow*

The earnest thinkers of this world appear to me like men fishing in a vast pool stocked with innumerable varieties of fish. Every man who lands his catch thinks he has caught the biggest, and goes off to tell everybody about it. The fact is that every fisher in the Pool of Truth uses a different bait and catches a different fish, and while no one specimen is representative of the whole, it yet has a value of its own and is not to be disregarded. It is this thought, in the mind of a very ignorant beginner as yet angling in the shallows, which has given him courage to submit his catch — a mere stickleback — for inspection.

To begin with, it would be interesting to know how many of the millions of human beings alive today believe truly in any conscious existence apart from this life on earth. Most of us don't, until we meet with Theosophy. Whatever we profess to believe, we act most of the time in accordance with the prevailing creed of the age, which is that this life is everything. It's a case of 'every man for himself, all the time.' Says Everyman: It all ends at death anyway, so what does it matter? We believe in what we can see with our eyes, clink in our palms, and stub our toes on. We believe in grabbing all that we can while we are here, for after death there is — nothing.

This doctrine leads to pettiness, feverishness, perpetual buzz and scurry. It is the doctrine of the so-called 'practical man,' who teaches his children to regard all time as wasted which is not spent in attending with a frown of concentration to the business of getting money. As we grow out of childhood, we are all infected by this attitude to a greater or less degree. Numbers of people are perfectly satisfied with it, and these for the time imagine

themselves happier — being more completely drugged with materialistic dope — than those who stir uneasily in their sleep, disturbed by half-glimpses of infinity.

I like to think that these latter are in the majority: that there are few who do not at some time or another stop short, feeling shaken at the unexpected sight of something beautiful. It might be anything — the sun, the moon, the sea, a tree or a flower, or even so microscopic an organism as a diatom. The beauty of Nature is disturbing because it is mysterious. It hints at forces and laws and plans outside the ken of the 'practical man,' and fills him momentarily with doubt and misgiving as to the adequacy of his doctrine. It tugs at his soul because it is akin to the beauty hidden and unguessed within himself: because like calls to like, and that divine essence which some call the godspark, but which I prefer to call absolute beauty, streams through men in common with everything else in Nature. There is hope of growth in a man so long as he can be so disturbed. If he cannot, he is at best standing still. Your money-grubber has not time to consider the lilies; which amounts to saying that he has no time to consider the possibility of his having a soul. It remains to the often-despised poet to give expression to that overwhelming feeling of 'something beyond' which is all that the untaught masses know of their own divine inner nature.

Then to the fortunate few comes Theosophy, like a flood of light, like a door suddenly opened to one who has been peering painfully through the keyhole. We are taught that this life, far from being everything, is only a very tiny stage on the inner man's pilgrimage towards perfection. And what a difference that makes! Boundaries vanish; mountains become molehills; the horizon widens into infinity. We begin to acquire a sense of proportion, and we are able to stop and think, because we know that if all infinity is ours we can afford to do so. We have time to

relax — I don't mean, of course, to shirk our duties, but to relax from the strain of the physical into the calm of the spiritual, to open the windows of the soul and let the fresher air come through. We know that death is not the end, and so we can afford *to appear* to die. We know that there is ultimately no injustice, and so we can afford *to appear* to be *cheated*. We can pity the drugged slumber of the materialists, and strive after the inner peace of those Great Ones who have dared to become themselves.

The difficulty is to remember what we are. We are princes disguised as peasants; gods in the skins of beasts; pilgrims bearing a high responsibility of which we should be proud. We are so encompassed around with material things that they tend to assume too great an importance. Could we but bear our great heritage always in mind; could we but remember through every minute of every day that we are Sons of the Sun, bearing within ourselves the light which is absolute truth, then, although Karman might decree that we spend our time oiling engines or peeling potatoes, we should automatically think and act with that dignity and sanity which alone are worthy of the Higher Self.

And how are we to remember? I should say by keeping the imagination alive, by refusing to become hidebound, by retaining that triumphant broadness of vision in which we rejoiced when, as children, hoping all things and believing all things, we were able to see beauty where our elders saw nothing.

It is this awareness, this sort of domesticated clairvoyance, for which I am pleading: a perpetual sense of the bigness of things; an imagination wide enough to span the gulf between itself and the unseen; wide enough to accept gods and fairies, mysteries and miracles and magic; an unshakable conviction that life is ultimately beautiful and good; and a realization that, although this earth is temporarily our school, the true home of the exiled

spirit is in the heart of the Infinite.

And if we hold to this firmly enough, what becomes of death? It becomes as simple as stepping through a doorway. School lessons for the time being are over, and the higher man is bound for holidays and unimaginable happiness.

The Theosophical Forum

THE CLOCK OF HUMAN PROGRESS — *Marjorie M. Tyberg*

Stars move in their courses, planets in their orbits, we live in an ordered universe, in which law rules. And one of the laws whose workings is most plainly evident is the law of periodicity. What happens once, happens again, given the right moment. When Halley's comet flashed into the western sky in May, 1910, appearing for the 27th recorded time, it came because it was time for it to come. It is possible to make astronomical calculations of the positions of the heavenly bodies in distant periods of the past and of the future. For instance, in the great cycle called the Precession of the Equinoxes the Sun returns to its original position in relation to the zodiacal constellations. In the interim the Cosmic Family has swung through vast and varied regions of Space, as the Sun moved from one zodiacal house to another, and has gained untold wealth of experience as yet unrecorded by us. And for man, who has the mind to conceive of an ordered universe and observe the working of its laws, is there no organised history of his part in the vast whole? Is it not possible so to widen the horizons of human history that a more ancient past may suggest what conditions may recur in the future life of mankind? Has no one ever read around the clock of human progress? Is there such a clock?

The conditions prevalent in the world at present clamor for such wider horizons. We *must* "look before and after" — the present is so poignant an experience that it tears veil after veil from our eyes — but humanity has not yet seen where the earliest dawns broke or where the light breaks through ahead of us. We know that civilizations *fall*, and that present conditions echo those that were a portent of fall in the past; but we cannot be resigned to this; something stirs in us that forbids us to entertain the idea of

inevitable, irretrievable fall. We seek a new unity of history. We feel intuitively that there is a rationale of enduring progress that includes and explains the problems we are facing. We desire, in fact, to orient ourselves to the Cosmos. Has the world lasted 3000 millions of years, as the scientists are telling us in 1935, without anyone having found the way to do this?

Only 60 years ago amazingly few persons in the West had begun to doubt what is known as the Biblical chronology, according to which the world was created in 4004 b. c., or to question the view that man's cycle of life in this world was for three score years and ten with an eternity somewhere else to follow. The view of materialists was that man had descended (or ascended) from the brutes, acquired mind in some way not thoroughly understood, and that, when his one life on earth was over, that was the end. Limited horizons these. How construct a cosmic history of mankind upon such a basis? But the West was soon to have a salutary awakening to the fact that the whole world had never held such inadequate, such parochial notions. It was to learn of the existence of an Archaic Science, a complete science of man's life-cycle, recorded and tested during hundreds of thousands of years, a science which at stated times in that long period of development is restored to the knowledge of man.

It was as a Messenger of the Guardians of the Archaic Wisdom and Science that H. P. Blavatsky, in 1875, came to the Western World. The Message that she brought, the systematic and universal restoration of the Archaic and the Ancient which her work initiated, mark the end of the nineteenth century as an extraordinary crisis in the writing of the history of history. *Isis Unveiled* and her writings in *The Theosophist*, led the way to *The Secret Doctrine*, published in 1888, which presents an outline of the dawn of a period of manifestation, the development of a universe with its family of Sun and planets, with particular

reference to the history of the Earth and Man. In this great system, which spans millions and millions of years, man is shown as developing *pari passu* with the universe from the beginning, living in form after form corresponding to the state of matter of the Globe on which he was functioning, storing in his enduring individuality the experience gained in race after race, civilization after civilization, the forms perishing, the essential entity never, rounding many lesser cycles of life, descending and ascending, but ever moving forward in the Great Cycle of his destiny with his home-planet and his home-universe. H. P. B.'s statement in 1888 that man in his present form had 18,000,000 years of history behind him was at that time a startling one, but every year since then has witnessed the receding of the horizons of human history, towards the long chronology, with which the Brahmanical system and some of the Hindu records are in harmony, and of which traces are to be found in many ancient and prehistoric religions, including the Hebrew. H. P. B. thus boldly placed the history of the human race in its cosmic setting, thereby accomplishing that basic "historical orientation" now recognised as an urgent need of our time.

Here, then, in this vast system covering millions of years we find the long range that permits of correlated recurrences quite impossible to perceive without it, a range including not only all that the scientific observation of the last few hundreds of years has found but taking into account an intelligent plan in the whole, and the interaction of visible and invisible planes of human and cosmic life. Here we find the possibility of reading the clock of human progress. And in the ascending arc of some of these mighty cycles that opened in the morning of time we may read of spiritual heights, of ages to recur, when the Inner Light shall be less obscured than in the lower arcs, those valleys of experience that must be traversed in every cycle.

As to the import of the hour towards which the hands of the great clock were moving surely and swiftly in 1888 when *The Secret Doctrine* was published, its statements were explicit; and H. P. B., in many articles in *Lucifer* as well, uttered stern notes of warning and of challenge, pointing out that beneath the surface of comfortable security of the 1880's there lurked all the menacing conditions which characterize what is called in the Eastern chronology the Kali-Yuga or Dark Age. She stated that owing to the fact that several cycles would close in 1897, this would be a fateful turning-point in human story, and that striking changes would occur in scientific, religious, and philosophical ideas. We have now no difficulty in recognising the changes, nor the peculiar conditions that mark a Dark Age — long ago clearly described in the *Laws of Manu* and the *Vishnu-Purana* — inordinate desire for riches, enjoyment of luxury on the one hand and dire poverty and misery on the other, increase in the number of criminals, inharmony between the classes of society, decay of spiritual ideals, and disregard of the spiritual life. Every day now brings its stint of war-omens, political upset, and calamitous destruction of human life.

Where in all this shall we find and "follow the gleam"? The twentieth century finds great rents in the materialistic conceptions of man and the universe, as H. P. B. prophesied, and the menace of a retrogressive scientific dogmatism may be averted. Distance has vanished. The whole world now can know the whole world's woe and weal. There is what might be termed a physical basis for the united life of Humanity. There are indications that the human heart does more fully utter itself in compassionate acts. The teaching of the Ancient Wisdom is that in the Dark Age — the shortest of the yugas, though there are 426,962 years of it left to run — effects can be more rapidly brought about than at any other time, and that any effort in

behalf of the whole of humanity invokes more direct assistance from the spiritual hierarchies in the universe, makes a channel for such help to reach us. Why should there *not* be descending celestial influences in time of test and need? It is in this very Kali-Yuga that an awakened human race must bend their backs to create the conditions of the Krita-Age that follows — so far it seems, but *we* must bring it to pass — when, as the teaching is, "Justice is four-footed and entire, and so is truth; nor does any gain accrue to men by unrighteousness." Every brotherly act, every unselfish aspiration, every sincere desire to help the whole of humanity, draws upon the spiritual resources of mankind and awakens the higher intelligence that makes it possible for man consciously to move onward with the cosmic purpose.

To be able correctly to read the clock of human progress would mean the power to avail oneself of the outflow of energy that accompanies the opening of all the myriad lesser cycles in the life of nations, races, etc. H. P. B., in presenting the Theosophical system in *The Secret Doctrine*, gives us the key to this knowledge concerning the destiny of man. Moreover she sounded the call to right action here and now. Modern life offers possibilities for united life hitherto undreamed of, though preoccupation with the material aspects of these possibilities and the manipulation of means of increasing power and enjoyment have so far been the rule. The kernel of united life is in the spiritual oneness of all that lives, in the belief in this and in the inner divinity of man, which can illumine the outer life and lead to the establishment of a Universal Brotherhood of humanity — the avowed object of the Theosophical Society H. P. B. was sent to found. For it is Brotherhood *in actu* only that will enable us consciously to ascend in our cycle, to ride the hurricane and rule the stars in the present crisis of human affairs.

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: II — *H. T. Edge*

II — THE CIRCLE

As was said in the Introduction, a symbol sums up in a single picture a meaning which can appear to the mind only as a number of separate meanings; it is beyond the power of the ordinary mind, but not beyond the power of human Intelligence, to visualize the entire meaning at once; hence we must see it in a series of separate pictures, much as we might get an idea of the shape of a crystal by looking at its various aspects separately. This is of course true of the particular symbol under consideration — the circle. Considered as a line it is infinite, so that it represents endless duration. It can be regarded either as a figure contained by one single line, or as a polygon with an infinite number of sides; which indicates that the One and the Many are extremes which meet. The circle seems to enunciate the proverb, 'Extremes meet.' So it denotes cyclic motion; in virtue of which, continued movement from a point will bring us back to the same point again. So it stands for the repetition of cycles, the course of evolution, resurrection and rebirth, birth after death, death after birth. Of course, as we know, it can be elaborated into the spiral (helix), and this again into still more involved curves, so that we may thus obtain a completer picture, though not so concise and radical a one.

The circle denotes unity, especially as compared with the line, triangle, and square. It cannot be divided into similar parts, or built up out of similar parts. The number One is at the same time the least and the greatest of numbers. It heads the series of odd numbers, and also the series of powers of Two; so that it is

neither male nor female in symbology. It is the first principle, number one, in any hierarchy; it is the First Cause. We see it again in the symbol of the Sun, and the Sun itself is also a symbol; it is the radiating center of our solar system and is typical of other suns which the universe contains.

In the geometrical symbolism found at the beginning of *The Secret Doctrine*, the circle is the first figure. The very root of all cannot be represented by any figure at all, as it is boundless and formless, and the *tabula rasa* or clean slate is the best we can do in the way of representation. When on this we draw a circle we have the symbol of Space, sometimes called the container of all, or better, the root of all, the common parent. For Space is not emptiness, it is utter fulness; it is that from which all springs. Its characteristic is unity, and by virtue of its unity it is all-comprehending. A variant of the circle is the Serpent, which is represented with its tail in its mouth, denoting the union of beginning and end, or rather the absence of beginning and end. But the Serpent has other meanings, as will be seen later.

Motion, eternal ceaseless vibration, is said to be inherent in the nature of things; together with Infinite Space and Infinite Duration, it is a primary postulate which can neither be conceived nor excluded from the mind. This Motion is essentially circular, therefore vibratory; or it is essentially vibratory, therefore circular. A pendulum with its motion unrestricted, vibrates in ellipses, which vary from the straight line to the circle, as extremes; a circular motion can be compounded of, or resolved into, two mutually perpendicular rectilinear motions. A pendulum whose bob describes a circle will throw on the wall a shadow which vibrates to and fro in harmonic motion. We thus see the connexion between vibrations and circular motion; and this is shown in symbolism by the cross within the circle.

The great problem of squaring the circle means knowing how to accommodate life in the world of limitations with the limitless life at its root. The corresponding mathematical problem is also capable of solution, though it remains insoluble as long as the greater problem is unsolved.

The circle denotes Space, which is not an empty container but the mother of all things. This aspect is also represented by the symbol of the egg, circular in form, productive in function. The egg is more exactly an ellipsoid, whose plane figure is an ellipse; a derivative of the circle, wherein duality begins to supervene over unity. In solid form the circle becomes the sphere, whose surface is a boundless plain. The circumference of the circle stands for zero; it contains no parts, and is divided into one part when a point is taken in it. Thus we obtain the finite line, which is the symbol of the number 1.

What impresses one most in these Theosophical studies is the marvelous unity of thought that prevails throughout. The Theosophist does not (or should not) keep his religion and his science in separate compartments, each pining for the loss of its partner; his deepest devotional feelings are illuminated by knowledge, and his studies made sacred by his understanding of their meaning. Heart and Head unite in one and are not at war. The meaning of these sacred symbols should enter deeply into our heart, and not be left as a barren and interesting pursuit. Our life here seems all ends and beginnings because our view is so contracted that we cannot discern the unity and wholeness. Here we are reminded of that spiritual Sun, which, universal, has its focus in every heart of man — man the world in miniature, a solar system of planets in rhythmic motions attendant upon their Lord; and we may rise in thought to a forgetfulness of our petty limitations. Through such a symbol illumination may come, so that we may re-enter our humble world renewed and

strengthened for the duties we perform. Know that thou art a Sun, whose function is to illumine all, not to expect benefits. Thus man will rise to his true dignity, fearing neither God nor Devil. Man is deathless, infinite, in his essence; nor is the quality of that essence beyond his reach. At any moment of our life / *am* immortal, eternal; "end and beginning are dreams."

The Theosophical Forum

TIBETAN YOGA: II — *C. J. Ryan*

II

In resuming our consideration of Dr. W. Y. Evans-Wentz's *Tibetan Yoga and Secret Doctrines* (1), a work which contains much information hitherto entirely unknown to Western scholars, we must draw special attention to the "general Introduction" to the subject of Mahayana or Northern Buddhism. Dr. Evans-Wentz gives a concise and sympathetic outline of the teaching, which is shown as the most systematic, philosophical and logical form. He points out that without the Mahayana the Southern or Pali canon would be very difficult to understand, as it contains so many obscure passages and doctrines. As outlined in his brief analysis, the Mahayana Buddhism is very closely akin to the philosophic and devotional teaching of Theosophy as presented by H. P. Blavatsky.

We regret that there is not room here to quote the first twenty-one pages of the "General Introduction," which with very slight alteration would make an excellent introductory handbook to Theosophy. The supreme aim of Buddhism, according to our author, is the Deliverance of the Mind from ignorance, illusion, and thereby the attainment of Nirvana — or perhaps more properly, of the right to enter Nirvana — for the Lord Buddha taught, above all, the Great Renunciation — never finally to pass out of the Samsara or phenomenal world into the ineffable Bliss of Nirvana until the weary pilgrims in all the worlds have reached "the Other Shore."

According to the deepest teaching given in the Seven Treatises translated from the Tibetan and contained in Dr Evans-Wentz's scholarly work, the emancipated yogi reaches actual perception

of the unity of the Universe, the consciousness that Samsara, the phenomenal, and Nirvana, the noumenal, are really One. Of this supreme attainment, the author writes with justified enthusiasm:

The Conqueror of *Maya* becomes a master of life and death, a Light in the Darkness, a Guide to the Bewildered, a Freer of the Enslaved. In the transcendent language of the Great Path, the *Mahayana*, no longer is there for Him any distinction between the Samsara and Nirvana. Like an unbridled lion roaming free among the mountain ranges, He roams at will through the Existences. [See page 12 of *The Mahatma Letters to A. P. Sinnett*]

Samsara is the state of conditioned being, the realm of phenomena, of impermanence; while Nirvana is beyond lower "Nature," beyond all "paradises" and "hells." It is "the Other Shore." As Shelley intuitively divined, we have to wake from "this dream of life." The Tibetan-Yoga use of dreams is very different from that of the Freudians. By studying them and controlling their content it is seen that they are mere playthings of the mind, and from this a further step in yoga-training shows that the essential nature of "name and form" is equally unreal, and that the Reality must be looked for outside this or any other phenomenal world.

Many of the more profound and less familiar teachings of the Ancient Wisdom, to which in recent years Dr de Purucker has drawn attention, are referred to in these Treatises. One of these is the problem of Renunciation and the Pratyeka-Buddhas, about which there has been much confusion in some places. Dr. Evans-Wentz says:

Self-Enlightened (Skt. *Pratyeka*) Buddhas do not teach the Doctrine publicly, but merely do good to those who come into personal contact with Them, whereas Omniscient

Buddhas, of Whom was the Buddha Gautama, preach the Doctrine widely, both to gods and to men . . .The *Gurus* of the Great Symbol School . . . teach that *Nirvana* is not to be regarded as a final state, wherein its realizer selfishly abides in absolute bliss and rest. That is to say, *Nirvana* is not a state to be realized for one's own good alone, but for the sake of the greater good which will accrue to every sentient thing merely in virtue of a realization of it. Thus it is that in Tibet all aspirants for the Divine Wisdom, for the Full Enlightenment known as *Nirvana*, take the vow to attain the state of the *Bodhisattva*, or Great Teacher. The vow implies that the *Nirvanic* State will not be finally entered, by the one taking the vow, until all beings, from the lowest in subhuman kingdoms on this and every other planet to the highest of unenlightened gods in many heaven-worlds, and the most fallen of dwellers in hell-worlds are safely led across the Ocean of the *Sangsara* to the Other Shore. Southern Buddhists are inclined to regard *Nirvana*, at least when attained by *Pratyeka* (or Non-teaching) Buddhas, as a state of finality. Mahayanists, however, say that *Nirvana* is a state of mind reached as a result of evolutionary spiritual unfoldment, and that It cannot, therefore, be regarded as a final state, inasmuch as evolution has no conceivable ending, being an eternal progression.

Students of Dr. de Purucker's recent answers to questions, etc, on the paradoxical question of the Pratyeka-Buddhas and Nirvanic Bliss, will see the way to harmonize these conflicting opinions. The "Selfishness" of the Pratyeka-Buddha, spoken of in several places by H. P Blavatsky, is not the ordinary kind of selfishness but, as she says, a "Spiritual" kind. Efforts have been made by ill-advised editors to suppress H. P. Blavatsky's remarks about

Pratyeka-Buddhas by leaving them out of *The Voice of the Silence* in certain editions. They apparently forget that she gave half a page to the subject in her *Theosophical Glossary*! Her observations should be carefully studied, as they are *very practical*.

The first of the Seven Treatises is called "The Supreme Path of Discipleship: the Precepts of the *Gurus*" and it consists of 290 aphorisms for the use of those who enter the career of the yogi. Some are strictly practical, and some are not easily comprehended but are open to misconstruction unless explained by the guru, but the majority are clear. Among these are definite teachings in regard to the Nirmanakaya Path of the Great Renunciation, the highest spiritual ideal possible to man. Many of these texts closely resemble those translated by H. P. Blavatsky for *The Voice of the Silence*, though, as presented, they lack the exquisitely poetical rhythm and loftiness of diction that distinguishes that immortal textbook for aspirants. Here are a few, selected from the more ethical part:

Unless the mind be trained to selflessness and infinite compassion, one is apt to fall into the error of seeking liberation for self alone.

For a religious devotee to try to reform others instead of reforming himself is a grievous mistake.

The smallest amount of merit dedicated to the good of others is more precious than any amount of merit devoted to one's own good.

If only the good of others be sought in all that one doeth, no need is there to seek benefit for oneself.

For him who hath attained the Sublime Wisdom, it is the same whether he be able to exercise miraculous powers or

not.

The fact that there are Those who have attained *Bodhic* Enlightenment and are able to return to the world as Divine Incarnations and work for the deliverance of mankind and of all living things till the dissolution of the physical universe showeth the virtue of the Holy *Dharma*.

Having acquired practical knowledge of spiritual things and made the Great Renunciation, permit not the body, speech, or mind to become unruly, but observe the three vows, of poverty, chastity, and obedience.

One text is decidedly "practical" and worth the attention of some would-be ascetics:

One who professeth religion and is unable to live in solitude in his own company and yet knoweth not how to make himself agreeable in the company of others showeth weakness.

A sense of humor is not absent in Tibet:

To preach religion and not practise it is to be like a parrot saying a prayer; and this is a grievous failure.

Dr. Evans-Wentz prefaces these "Precepts of the Gurus" by a page from H. P. Blavatsky's *Voice of the Silence*, though he does not mention her name. While the subject-matter of the aphorisms in both is closely alike in parts, the impression produced by the Kargyutpa precepts is not so inspiring; the latter do not radiate the magnificent Buddhic compassion for all that breathes with the fervor that inspires the noble teaching given in *The Voice of the Silence*.

Much of great interest in this remarkable book cannot even be mentioned here, especially the exceedingly useful notes which

explain the original text. Very many of the most difficult teachings of Theosophy are shown to be stated in the Treatises, or in the oral explanations of obscure passages given by the Lama Kazi Dawa-Samdub. It is not surprising that he immediately recognised that H. P. Blavatsky's books contained proof that she was acquainted with the deeper teachings. To the Western scholar the book will be a revelation of something new — the fact that the Orient has made overwhelming discoveries in human psychology beside which much Western psychology is almost infantile. The author quotes the following from the eminent English philosopher Dr. C. D. Broad:

[Progress] depends upon our getting an adequate knowledge and control of life and mind before the combination of ignorance on these subjects with knowledge of physics and chemistry wrecks the whole social system. Which of the runners in this very interesting race will win, it is impossible to foretell. But physics and death have a long start over psychology and life.

And, as Dr. Evan-Wentz adds:

Is Occidental man for much longer to be content with the study of the external universe, and not know himself?

In place of psychoanalysing dreams, trying crude experiments with hypnotism, studying the reactions of mentally sick patients, and so forth, the Oriental psychologist boldly plunges within himself and tries to find something greater than his surface-personality, namely, a Universal Self. In this process he discovers unthought-of "magical" powers, but as already mentioned they fade into nothingness when the greater goal is glimpsed. In fact, in many cases they are hindrances.

In this process the Oriental has found that true psychology is not

a cold, intellectual study, such as can be learned in classrooms, but that it deals with the highest and most spiritual parts of man — begins there, in fact. Without self-sacrificing devotion to the interests of others, the sense of universal brotherhood and the burning desire to lift the heavy burdens of the world, all intellectual knowledge, all development of personal psychic powers, turns to dust and ashes. Dr. Evans-Wentz never loses sight of the spiritual basis of Mahayana Buddhism and Tibetan Yoga, and he would be the last to advocate yoga as a means to attain personal occult powers, to satisfy cold intellectual curiosity, or for other selfish ends; but here and there in the Treatises passages occur which might be construed or misconstrued as leading that way. One of these occurs on page 326, as the author himself points out.

This book should do much to awaken Western scholars and anthropologists from their ignorance of man's nature, and to arouse a proper respect for Oriental science, but it is difficult to appraise its value to the Theosophist who already has his glorious yoga-teachings in H. P. Blavatsky's *Voice of the Silence*, and elsewhere. These are the principles and practices that the world needs for its salvation, and the work of the Theosophical disciple is well marked out therein. As H. P. Blavatsky says, "Occultism is the Science of Life, the Art of Living." And, "It is *altruism*, not *egoism* even in its most legal and noble conception, that can lead the unit to merge its little Self in the Universal Selves." It may be, and probably is, an excellent provision of Nature that scientific Tibetan Yoga, even on a lower level than the highest Atma-Vidya of the Masters of the Great Lodge, and more or less entangled with inferior practices, should be kept alive by a small section of that remarkable, isolated race; but, except as an intellectual study for Western scholars, useful in breaking up the false view of Oriental "superstition" so-called, it does not seem that its

introduction in any widespread form in the West would be advantageous. In this hotbed of personal ambitions, personal desires, unrest and emotionalism, the results would be dangerous in the extreme. Already the craze for so-called "occultism" has done much harm in the West. At best, under present conditions here, the Tibetan semi-esoteric yoga would produce Pratyeka-occultists, while the probability of making proficient in Black Magic is almost infinitely great. The wise words of W. Q. Judge express what is the real need of the West:

What then is the panacea finally, the royal talisman? It is DUTY, Selflessness. Duty persistently followed is the highest yoga. . . . If you can do no more than duty it will bring you to the goal. . . . It is that boundless charity of love that led Buddha to say: "Let the sins of this dark age fall on me that the world may be saved," and not a desire to escape or for knowledge. It is expressed in the words: THE FIRST STEP IN TRUE MAGIC IS DEVOTION TO THE INTERESTS OF OTHERS.

The Theosophical Forum

THE THEOSOPHY OF GEORGE RUSSELL ("Æ") — H. F. Norman

How can Theosophy be other than one and single; can it mean one thing for Boehme and another for Paracelsus? If such questions should spring to the reader's mind on reading the title to this inquiry into the meanings which life disclosed to George Russell, and with which, in turn, his poet's insight illuminated the minds of others, his contemporaries, let me hasten to explain that neither is this the occasion nor have I the equipment for so minute an inquisition into philosophical technique. It may be contended that human capacity being limited relatively to ideas, there must be as many Theosophies as Theosophists, but it may be retorted, divine wisdom must be fundamentally one. I shall contest neither thesis. I would neither entangle my pen in those intellectual thickets through which the heterodox may seek an escape from heresy-hunters nor ply it to tighten the knots of some straitlaced orthodoxy. I aim merely at some partial revelation based on an intimate knowledge extending beyond four decades of the life and ideas of a friend, one to whom the debt of his generation is greater than it knows and who constantly declared himself to be the debtor of early inspirations which he knew and named as Theosophy.

Two streams of influence flowed from him which watered the mental and spiritual soil of his time and environment. He was in love with brotherhood; he was perhaps equally enamored of liberty. Generally commingling, though the currents of each could be severally traced, they were his river of life. Nourished, himself, upon the scriptures of the world and their great interpreters of ancient times — Plato, Plotinus, Patanjali, Lao-Tse, the Evangelists, Paul, and of later date Blake, or amongst his own contemporaries Blavatsky, Judge, and "Jasper Niemand," — he

passed on to his associates the inspirations he had imbibed. Beyond this, the substance of his incommensurable conversation, the rhythm, form, or content of his writing, and in the ennobling texture of his own life, he wrought a rich tapestry of being which transferred itself pictorially from his own visioning to the mind-stuff of his contemporaries by virtue of a gay and unpretending spirit, dear to his intimates and sensed by all who knew him. It is fitting, therefore, to inquire into these achieved consummations of ideal and reality, the inspirations which enriched him, the response they evoked within him, and their influence on others.

The psychical elements which make of an individual man the poet or the seer are his own secret, if indeed they are known even to himself. There may be some scarcely decipherable prescription for it: the mixture, so much sensibility and so much courage, so much integrity and so much love, add life *quant. suff.* But the quantities are never clearly written and in George Russell when — to change the metaphor — we find the commingling of two loves in a common flame, the love of brotherhood, the love of freedom, we cannot say that either of them was the aboriginal fire, kindled first, or whether one was the actual flame and the other the warmth it shed. But the greater love, though we must think of both as one, the love of universal brotherhood, he would without hesitation have traced to an archaic source. His earliest thinking concerned the *Archaeus* or World Soul, on which he brooded continually — "one thing in all things" though multiple in manifestation, made concrete in meditation as stones, animals, men, gods, all but images of the real as he fastened his mind and fashioned his will towards the evolution of spirituality within him and without him. It did not relate itself to humanity alone, this spirit of the universe, but descending into the soil spoke in the green beings that flower upon it no less than in the beast springing out of it, the bird in the tree-top, the light in the sky.

Here was spiritual Nature, "the Mighty Mother" inspiring love for the lovely things she made. The *ethos* of this brotherhood was thus no less an *aisthetikon*, visionary, beautiful. If in this constantly returning mood Æ felt moved towards and for blossoming things in their lowly setting of earth as others feel for squirrel or deer, and showed more concern for the voices of the plants than with the songs of birds, and if to his sensitive inner ear primrose or anemone raised its meek plaint when he plucked it, and the texture of soil or stone became fuel for his imagination as he handled it, he infected his companions with those experiences until we asked ourselves: is there indeed a true clairaudience in these heard protestations of the blossoming weeds, or is all this but wilful phantasy? And to companions training their will like him upon the *Yoga Aphorisms* of Patanjali such flower-voices became the attainment of that delicate intuition they sought themselves as the crown of a similar discipline of concentration: "He hears the music of the opening buds and knoweth what is passing in the mind of the ant."

And for him, as devotee of Nature: As below, so above! Kinship with the One Life, which he drank at Oriental fountains, extended beyond the confederacies of Earth and the waking world, through the mid-world of dream in which he was so much at home, into the realm of deep sleep to the demi-gods and other denizens of vision, beings of romance to others, of a deeper reality to him. "But isn't he a bit of a humbug," said one intelligent and not unfriendly critic, "he and his fairies?" No; there was no make-believe on his plane of vision, no puckishness in his world of faery. And if in these phases of the life of the psyche there was withdrawal from the light of common day, the munificent universality of comradeship re-earthed him swiftly in the presence of those who studied with him the Theosophical literature reminding him that "the universe exists for purposes of

soul."

Yet not only those whose characters were storm-proof experienced the pleasures of his companionship. I know not how many were led — though I could name several — to seeking truth or to right living because his moral generosity rescued them from a life of mere excitement and sensation, men whose sensitive but infirm wills he drew to Theosophical study and exercise. For, as he drew his cosmogony from *The Secret Doctrine* and his psychology from kindred sources, he drew his individual ethics mainly from Judge, from the *Letters That Have Helped Me*, still more from the redaction of the *Bhagavad-Gita*, and most of all from a vivid, pervasive, albeit externally slender, personal contact. The loss by death of that spiritual chieftainship did not lessen Æ's reliance on the faiths in which it was rooted, and I believe he would wish to have that asserted. Of those faiths the most comprehensive was also the most poignant: "cast no one out of your heart." And this the reader should understand was no mere sentimental emotion. Brotherhood was accepted in a spirit of realism as "a fact in Nature" and it followed that many who stumbled by the wayside found in George Russell a potent helper. At his funeral one mourner, some untoward act of whose in days long past had brought suffering in its train, a lapse which would have caused scorn or aversion from others but compassionate aid from him, being questioned by a bystander at a most lavish gift of flowers being carried to his coffin, answered with unemotional cogency, "I would have died for him."

Nor were his beneficences isolated to occasional cases of distress. They were habitual and they were imparted in that spirit in which Madame Blavatsky had written: "Whoever feels his interests are one with those poorer or less fortunate than himself . . . who is ready to hold out a helping hand to the suffering is a Theosophist by birth and right." Thus public causes which were

external lime-lit activities for others who espoused them were for George Russell lit up by an illumination from within, shining as through the stained glass windows of a richly colored soul. Claims for labor which he held to be fundamentally just ceased for him to belong to polemical politics and became a challenge from karman causing him to trample on a natural shyness, mount the rostrum, and rain down upon a mass meeting the fire of a burning eloquence.

A like impartation of moral beauty overflowed from the private heart into the commonwealth when he placed his great gifts at the service of the co-operative movement. Horace Plunkett had felt that that movement of which he was the mind and will needed a soul. The poet W. B. Yeats, a friend of both, brought them together and Russell became the inspirer of Irish co-operation, whose reverberations flowed out into Europe, Asia, the United States, and Africa.

Just as brotherhood in its widest scope was the sun in Russell's horizon, so freedom lit the campfires on his advancing path as he battled for justice, illuminating the dark places in human life. This light was perhaps less fixed than the other and there are those who felt that its fervent energy imparted less light than warmth. But that light, as he saw it, was one in kind with noble inspirations: the "righteousness" of Hebrew seers, the 'equality' of Greek thinkers, Emerson's ideal of compensatory justice. In his concept of freedom he gave to others without reservation the rights he felt he must claim for himself and for his view of life. I was to learn this early in our contacts. Upon some diversity of outlook on a minor point of belief he had written to me, quoting Blake, "Your heaven doors are my hell gates." I was aghast, remembering the caustic amenities with which John Wesley had retorted upon Whitfield, "Your God is my devil." But I had misapprehended. Æ, painter as well as mystic, knew well that

black and white are not the sole pigments upon the palette of the universe. He was in fact asserting the freedom of all souls to their own truth. He had imbibed a modern statement of an old teaching, one to which he made frequent reference in the words of Jasper Niemand, in 'The Vow of Poverty': "Come, go, do, abstain; an equal right is mine." I learned later that another aphorism of Blake's was always in his mind. "One law for the lion and the ox is oppression." Therefore a 'tolerance' of the beliefs of others was not a gift to be patronizingly bestowed; it was their right. Obligations of belief may only be imposed upon the self by the Self. If any misapply this liberty of thought and act, mistaking for weakness of will a refusal to constrain others towards one's own ethos or to requite evil with evil, well, karma would see to that. So, one must never question the motive of another but only one's own. This, as I apprehend him, was basic in George Russell. Those familiar with Judge's writings will hear in it an echo of his voice. Those who knew Russell will know it as wool in the texture of his being.

But I would not here overstate claims made on his behalf and which he would never have put forward for himself. It may well be that the beacon-fires of freedom are more fitful in their windblown flame than the more tranquil light cast by the sun of brotherhood. What it is just to maintain is that in lighting fires of freedom he was prompted by the same sense of human dignity that inspired his early work for the Theosophical Society in whose interests they were first lit. That he did not continue in the Society, leaving it at about the time he became absorbed in public work, is no doubt the reason for a rumor I have heard, and now challenge, that he left Theosophy. It would be impertinence in me to apologize for facts which were exclusively his own concern, but disingenuous in discussing his relation to the Theosophical Movement to ignore them if, as I believe, a few brief sentences

may help to dissipate mistaken inferences. Devoted to the T. S. of Madame Blavatsky's founding and Judge's fosterage and having, too, associations of respect and affection for their Successor, his attachment to the Society was strongly identified with a type of organization into which all could enter who deeply cared for brotherhood, whether they might call themselves 'freethinkers' or 'mystics' and for a title 'Theosophical' which yet proclaimed a mystical influence. With universal brotherhood as its single 'dogma,' an open membership, a spiritual objective, a free platform, he held the T. S. to be unique. I think that when Mrs. Tingley felt impelled to change its name and alter some articles in the Constitution he was of opinion (as was I) that membership must in practice become restricted to those who accepted the principle of hierarchies. It seems to some that in placing a more fully organized, more carefully selective and restrictive governing body at the center, responsibility became transferred from the rank and file to a more deeply indoctrinated group, so lessening the moral burdens borne by those furthest from the center. To others it seemed that acquiescence in these principles carried greater and not less responsibility for activities or ideals emanating from the center, and whose inner causes were not known. I think George Russell came to feel thus. The Constitution has since been modified and the questions and interpretations mooted here are not now matter for discussion. But I mention them because I realize that he himself had a feeling for the hierarchical principle, which gave me ground for surprise at his withdrawal from the new Constitution (shortly after my own) and because I see in his bifurcation of outlook at this point the basis of the fallacious supposition that he had shifted his spiritual center of gravity. It is to that misconception that I demur. For, in fact, in re-constituting the old Hermetic Society, out of which the first Dublin Lodge of the T. S. had evolved, he was re-affirming his mystical outlook whilst offering a broad platform to all truth-

seekers. The correspondence with Mrs. Tingley on points of difference was, I am sure, marked by good-will on his side. I know it was marked with affection on hers, and though it marked a phase in George Russell's activities it did not mark a break with archaic beliefs.

What those beliefs meant to him we have seen: faith in the oneness of life, in its spiritual laws, brotherhood, reincarnation, karman, these and the corresponding ideals inseparable from them, compassion, justice, the evolution of the human soul. Their vitality and continuousness were tested again and again. In Dublin on 'White Lotus Day,' 1933, he expressed, to a gathering met to commemorate the life and work of Madame Blavatsky, the extent of the debt to these incurred by the Irish Literary Movement of the nineties. In a letter I had from him in 1933 or 1934, he wrote that he would like his Hermetic Group to join the Dublin Theosophical Club. About the same time he expounded to me his idea in testing out karman by living in London for a while without informing people of his plans, and how there flowed to him naturally those who belonged to him, mystics, poets, artists; justifying his experiment. To a friend in London, who had launched with him on one of those broad swift rivers of interchanging talk which he loved, whose hurrying flow not even the traffic of Regent St. could retard, he turned sharply to emphasize a point and, "Surely, surely," he said, "you don't imagine that you and I have met for the first time in *this* life?"

So much for doctrines, but we have seen that these were not for Æ so vital as the spirit in which they are applied. That "old secret" to which he made perennial reference, that "what a man thinks, that he is," lived within him less as conceptual thought than as thinking actualized through the imagination and realized in deed and in spiritual achievement. Objectivized as reality, ideals which remain precepts to others became 'things'; children of the soul,

for him. Those ideologies of propaganda which shed a vague nimbus of half-thinking around the twilight moods of the sectarian and the partisan, remaining in the region of opinion even when they have crystallized into formal dogma, did not attract him; nor was he of those to whom complicated apprehensions of truth are seized by a strenuous exercise of the intellectual muscles, as athletes train lungs and limbs. Such training he reserved for the soul, exalting 'wisdom' above 'reason.' Because of this distinction, those of a different school did not always realize that his mental attitude was one of scrupulous integrity — but always to life, not always to those facts which the imagination has failed to inspire and illuminate. Thus though he gave mental hospitality to many aspects of the intellectual life, his own philosophy was of the inspiration and required an aesthetic setting, such as he found in the classic scriptures of the world or created in his own verse or prose. Great teaching always made for itself great — though it might be greatly simple — utterance. 'Lordly' was the adjective oftenest on his lips when he spoke of the *Upanishads* or quoted from the *Shepherd of Hermas* or the *Fourth Gospel*, over a partial translation of which he and his dear friend James Pryse worked together long ago. I believe that the aesthetic test may have influenced him in his relation to modern Theosophical literature and was perhaps an additional reason why his contacts with mystical writings of a later date than Judge's were not very close. But to compensate for this there was within him a growing comprehension of the needs and, yes, of the importance of the "souls of common men." Here no hyperaesthesia insulated him from the call of humanity. The mystic, he felt, is above all things practical and so must deploy his spiritual energies upon the field of human effort.

"There is no great and no small
To the Soul that knoweth all.

And where He cometh all things are
And He cometh everywhere."

But whilst, in his later years, Russell as editor and pamphleteer was so fully preoccupied with public events that except for the weekly gatherings of his Hermetic Group the meditations of earlier decades filled a smaller part in the landscape of his life, it was still with those who cared to ascend with him the peaks of spiritual aspiration or revive the memories of spiritual experience that he found his most satisfying companionships; and as these companionships lessened — the last of the old Dublin Lodge Group to die was Dan Dunlop and this severance he felt acutely — he renewed again the companionships of the soul which he had made for himself through his intimacy with the spiritual classics, some of the simple subtil utterances of Blake, of Lao-Tse's *Tao Teh King*, or the grave beauty of the Gospels or the visions of the Apocalypse or, what moved him most of all, I think, the dialogs of Krishna with Arjuna. All these he found had wavelengths synchronous with winged soaring words born in his own mind. Yet it was as hopes and faiths for all men, as a source for high deeds and for tempering the soul to the fires of daily living, not as remote symbols of a future golden age — he left that for the period of devachanic dream — that he applied his meditations and reveries to contemporary life, or translated them into picture and poetry. More than any of his generation whom I have intimately known he matched vision to life. Fundamentally poet and painter no less than seer, his was, as perhaps it must happen with every man, a Theosophy not of textbook, maxim or precept, not even primarily a body of cosmical doctrine — though all these were influences from behind — but a vision through the spiritualized imagination of what life intends, reaches out to, and means us to become.

WHY STUDY THEOSOPHY? — *T. W. Willans*

Because by such a study we will find the truth about life, showing us how to live, to understand life and value its wonderful possibilities and opportunities. To do this we shall find it necessary to acquire its basic propositions, and then work them out in our own lives with the rules and axioms given in Theosophy for that purpose, so that a study of Theosophy is not merely reading the books and trying to understand the teaching, but is a practical application of its basic propositions. This unfolds for us as we become skilled in the performance of action, the true meaning of the propositions. The reason for this is that with our present brain-mind consciousness we are mostly filled with erroneous ideas of life, so that we have to remove these false conceptions and replace them with true ones. This is done by demonstrating the Theosophical propositions and so convincing us of their truth, by making our actions harmonize with our words, and thus clarifying our consciousness.

For instance, the principal object of the Theosophical Society was originally to form the *nucleus* of a Universal Brotherhood, and scientifically this is perhaps the most fundamental principle of Theosophy, for I know of no other principle so far-reaching, with such marvelous ramifications in both universal and individual life, and conducive to such superb results for the good of all. Yet this intensely practical object was in the early days overlooked and put aside as a sentimental ideal, impossible of realization in our modern world, a mere ethical dream, by those who busied themselves with what they considered more useful or ornamental objects in the Theosophical program. Yet there were some members of the Theosophical Society, knowing something of the Mahatmans and their Divine Wisdom and knowledge of human

life, who followed this principal object of the Theosophical Society, and under no consideration would permit it to be dropped, under pain of their complete severance from the Society. While H. P. Blavatsky was alive she stood, with a few others, resolutely against every attempt made to subordinate that object to other interests, so this noble object was kept alive, not as a soulless thing of mere words only, or a kamic body of sentimental gush, but a *living entity* of true brotherhood, made by individuals united together in this common purpose: to be *themselves a universal brother*, bound in heart and mind together as one entity, though living physically in different nations and pre-eminently in our International Center, day by day and year by year growing more skilled in the particular part they had volunteered to play in the nucleus of Universal Brotherhood.

That this was actually done is a matter of historical record, and the influence of this determined action connected each one with all the progressive nations of the world through the individuals who formed this nucleus and were a living part of their particular nation; and some, being more international through strong past connections, were more deeply the nucleus than others, all together forming the fulcrum to move the world into better conditions with this 'lever of Archimedes.' We now see how this has had a most marked effect on the consciousness of modern life. On every hand we now hear most prominently advocated the vital necessity of brotherly action: in religion, in political life, amongst all classes of people, of all colors, and in all grades of social life. There cannot be an effect without a cause, and if a small number of men and women, intimately connected with the progressive nations throughout the world, made this stand for Brotherhood, and in themselves were strongly connected with infinitely more powerful brotherly interests, it is easy to understand the change of consciousness in public life. For we are

all brothers, and bound together in one Universal Life, whether we know it or not.

If such a result has come about by the determination of a few to enjoy the life of impersonal Brotherhood, no matter what opposition might be placed before them, how much more will be done by further voluntary recruits! In the sacred cause of Universal Brotherhood there is room and work for all, for many generations to come, before we reach the flower of full fruition. Do you know that from the same source by which we were inspired to join in this nucleus of Universal Brotherhood — in a word, from Those who speak only the truth — we hear that two-thirds of the world's evil will disappear into thin air when this preliminary work is accomplished? And mark this well: in our own natures, when we are sufficiently devoted and become a living expression of this nucleus, long before the general fruition is accomplished, two-thirds of *our* evil will disappear into thin air.

To be a true brother we forget self in working for others. Where? In our home, with the people we meet, and pre-eminently in any Lodge of the Theosophical Society; because it is in that Society that the nucleus has been growing to my knowledge for over forty years. Consequently we can get better results for our energies by joining with a living body, or with others, than by trying to do it all by ourselves.

The Theosophical Forum

THE RISING TIDE OF THEOSOPHY — conducted by C. J. Ryan

"Consider the Heavens" (1)

Professor Moulton, the well-known astronomer of the University of Chicago and author of important standard works on astronomy and mathematics, has struck an entirely new note in his latest book. *Consider the Heavens* appears at the first glance to be nothing more than another guide to the stars similar to many which have been written of late by leading astronomers, but it is far more than this. While it gives an up-to-date though not too technical outline of the main facts and the historical sequences, and brilliantly discusses the most modern hypotheses, what gives it a unique distinction is the mental attitude of the author, his cultural background. We all know how bitterly Darwin regretted his alienation from poetry and the arts, owing to intense concentration on his own limited field. He said that he had practically become "a machine for grinding general laws out of large collections of facts"; he had atrophied his higher faculties in large measure. Dr. Moulton has not limited his outlook in that way and so it is more comprehensive and generous. He is not cramped by technicalities and, above all, he is not carried away by arguments based on assumptions. For instance, speaking of recent evidence that light has apparently been observed to travel across a distant nebula far more rapidly than the Einstein supposed limit, he says with dry humor:

We know, of course, that now one of the assumptions of relativity is that no velocity greater than that of light is possible, but it would be unscientific in a domain where so much is assumption to permit this fact to curtail our freedom.

While a master in so-called cold mathematics, Dr. Moulton is keenly alive to the 'warm glow' of art, music, and poetry, and is an ardent lover of Nature. All this cultural background has prepared him to extend legitimate scientific speculations to far wider horizons than those of less comprehensive and intuitive minds. Yes, *intuitive*; for here is a profound thinker who has discovered for himself, so it seems from this book, some of the fundamental conceptions of the Ancient Wisdom, Theosophy, facts about the cosmos and the great Intelligences behind appearances, which are of vital importance for the understanding of universal brotherhood and evolution. A Theosophical writer pointed out some years ago that a mental background of poetry, history, and the like, was almost a necessity for deep study of Theosophy, because it opened the heart and permitted the play of the intuitive faculty without which only an elementary understanding is possible. When scientists as a whole move in the direction indicated by our author and develop the other side of the nature it will be easy for them to grasp Theosophy and make their own work a thousand times more effective and beneficial to mankind.

While Dr. Moulton is a typical scientist in the highest sense and is naturally in sympathy with the general scientific attitude of concentration on the visible and the inductions therefrom, yet many passages in his book approach so closely to the Esoteric Philosophy that they might have been taken from Theosophical literature. However strongly his scientific training may try to keep his mind in mechanistic grooves, he is constantly climbing out of them and letting his intuition speak. He is a striking example of the highest scientific minds who are veering toward occult thought today.

In many places Dr. Moulton lifts his readers high above the ordinary scientific precedents and gives free rein to his 'scientific

intuition,' showing, as we think, a courage and imagination greater than that of Jeans or even Planck in his treatment of the much-disputed problems of modern astro-physics. The general reader of scientific books and magazine articles is frequently puzzled by bald statements of high authorities that this or that doctrine is the teaching of 'Science,' while another equally responsible scientist either ignores them or calmly offers a contradictory doctrine in the name of 'Science'! We could give a dozen cases offhand, such as the nature of the Earth's core, the ancestry of man, natural selection, the 'canals' of Mars, the origin and future of the moon, or 'the expansion of the universe.' Dr. Moulton treats of various disputed questions without dogmatism and with such independence that the reader will surely wish that more space had been given to them.

Dr. Moulton doubts the validity of the so-called Expansion of the Universe, regarding it as more probable that the universe is infinite, and that if any expansion is going on it is only a local and temporary phenomenon. If asked how the 'red shift' of the lines in the spectrum of the galaxies is to be explained unless the expansion is a universal process, he replies that the displacements are only *assumed* to be due to the velocities of recession, and that there are other reasonable explanations. He mentions other known displacements of spectral lines whose cause is not even guessed, and rightly declares that we are not justified in assuming that light itself suffers no changes in its journey through the depths of space and that the shift toward the red end of the spectrum is an illusion, a Doppler effect. He strongly supports the suggestion that the photons ('light-packets') coming from great distances have 'wasted away' a little during the journey, and that this fully explains the red shift. If so, and if Planck's 'constant h ' is really a constant as generally believed, the wave-frequencies of light would steadily increase in length with

the increase of distance, as observation of the red shift shows, and the so-called expansion or explosion theory can be safely discarded. Dr. Zwicky of Mount Wilson Observatory has lately declared that there is more than one possible explanation of the red shift and that the expansion hypothesis has fatal defects.

Dr. Moulton objects to the expansion idea on another ground. It brings in the impossible notion that the *entire cosmos*, the all-inclusive order of Nature — not merely the visible galaxies and super-galaxies — is a comparatively recent creation. In fact, it would be far newer than the age of the majority of the stars — an absurdity. The reader must study his brilliant argument about so-called primordial creation for himself as it cannot even be summarized here. Dr. Moulton sees that there can never have been a primordial creation, but that the universe is infinite in every way, both in time and space, although it may have suffered innumerable periodic or cyclic changes. He denies that the weird hypothesis of an expansion or explosion from "an original cosmic atom" has been established or even shown to be probable.

The Ancient Wisdom teaches a theory of rhythmic expansion and contraction in the cosmos, but of a different kind from the modern one. It is a periodic manifestation from the invisible to the visible, 'from within without,' *manvantara* and *pralaya*, a universal process which is reflected by analogy from the greatest to the smallest. This is a fundamental in all the world philosophies, and the modern notion is a distorted and materialized travesty. Dr. Moulton's intuition has rendered him very good service in this matter.

Analogy and cyclic repetition — purely Theosophical tenets of prime importance — are strongly insisted upon by him as keys to Nature's secrets, and he gives much attention to them in relation to the orderliness of the universe. Students of Theosophy are

familiar with the concept of an orderly universe as opposed to a helter-skelter one. H. P. Blavatsky made this a first essential in understanding the teaching of Karman: cause and effect, not only in the physical world but in all planes of being, mental and spiritual. It is the basis of the need for reincarnation. It is encouraging to find Dr. Moulton emphasizing the orderliness of the universe.

In regard to Analogy we find him again in perfect harmony with some of the most profound teachings of Theosophy. In fact, he is using almost the words used in some of Dr. de Purucker's recent lectures. Starting from the varied suns and nebulae of our own galaxy, he leads us to the enormous star-clouds which in their aggregation compose the Milky Way (our native home-galaxy of billions of stars, etc.), and then onward to the neighbor galaxies, and ultimately to the farthest we can see, now measured to be five hundred million light-years away! But the analogy is more complete; the distant galaxies are grouped in clusters so as to form super-galaxies, fifty of which are now known. And where is this analogy to stop? He denies that it ever stops, or can stop in an *infinite* universe. Hard as it is for us to follow the concept of higher and greater super-galaxies to the 'endless end,' any finite concept is still more unthinkable.

But that is not all; Dr. Moulton turns his attention toward the infinitely small, and works downward from the familiar earth to the molecule, the atom and the electron. Why should the electron or the proton be the minutest particle of matter any more than the galaxy is the greatest? He demands sub-electrons of the first order composed of still lesser particles, and so on *ad infinitum*. Perhaps if he understood the Theosophical teaching about the *laya* centers when 'matter' changes its nature, he would modify his view about the *infinite* series of diminishing *physical* particles. But his argument in favor of the universality of analogy and

cycles in Nature is admirable so far as it goes.

This harmonious agreement with the Ancient Wisdom is not all. There is a still more surprising claim, and one which we do not recollect having been made by any Western philosopher till now. The steady increase in size of the material building-blocks of the universe, from the electron to the inconceivably vast super-galaxies, is associated in Theosophy with a hierarchical arrangement of conscious beings. What does Dr. Moulton think? He dares to suggest that the sub-electrons smaller than the electron may well be "*molecules of conscious being* that live through a million generations in what is to us a second of time," and that the enormous super-galaxies "may similarly be the *molecules of conscious beings* whose life-cycles consume unimaginable intervals of time"! (italics ours). In fact, that all is composed of conscious hierarchies of beings, one of the simplest and most beautiful facts in Nature, the foundation of the reality of universal brotherhood. As the Lord Buddha said:

To the eye of flesh, plants and trees appear to be gross matter. But to the eye of a Buddha they are composed of minute spiritual particles. . . . Grass, trees, countries, the earth itself, all these shall wholly enter into enlightenment.

Dr. Moulton brings forward many other views in harmony with Theosophy which we unfortunately have no room to mention, but a word must be said about the 'running down' of the universe to final absolute death, entropy, with no probability of its ever 'winding up,' the notion so strongly advocated by Jeans and many other physicists. Dr. Moulton will have none of it. The discovery of the tremendous forces released by the disintegration of the radium atom makes it extremely probable that still greater energies are stored in the subatomic or sub-electronic levels, and are only awaiting appropriate means of release. Carried farther

still, it would seem that we might approach an *infinite* source of energy, and that the idea of a running-down universe is nothing but a bogey. If there is no need to assume an end of all things, there is no necessity to imagine a beginning, or a 'Creator' separate from his 'Creation.' Dr. Moulton handles this logical argument with the same skill that he uses in his other criticisms of the numerous unproved assumptions in astro-physics now current, which are too readily supposed by the lay public to be established facts.

We strongly recommend students of Theosophy to read this remarkable book, for it not only contains a fascinatingly interesting account of the 'stars in their courses' suitable for the non-technical reader, but it provides a wealth of scientific argument in favor of the Esoteric Wisdom. Naturally, we cannot expect Dr. Moulton to sympathize in all points with the teachings of Theosophy, and we regret being unable here to touch on some of his differences. It is sufficient to say that we believe a still deeper call upon his intuition would lead to the discovery that there are an infinitude of planes of being and consciousness beyond or, more properly, *within* the physical plane to which our everyday perception is confined through the limitations of our senses. If the galaxies and super-galaxies extend in gradation of immensity beyond conception, so do the hierarchies of *beings*, and also planes of consciousness and corresponding grades of subtil 'matter' up to Nirvana and beyond. "In my Father's house are many mansions." The nature of the universe is far more mysterious than science suspects, and the physical worlds are only the visible part of the training-ground for immortal spirits.

QUESTIONS AND ANSWERS: 293-297

Question 293. *Much has been said of the blackness of our present age, the Kali-Yuga, and indeed we witness such tragedies around us today that the natural cry arises: Is there good in Kali-Yuga? Is mankind doomed to spiritual disaster, inescapably destined to go under without hope?*

G. de P. — We live in a very interesting age, a time when history is in the making. I do not think that in the recorded annals that are open to us at the present time there has ever been an epoch when serious-minded students of the Ancient Wisdom, which we call Theosophy, have the opportunities that now *we* have. It is precisely the stress and the strain which are opening our hearts and tearing the veils away from our minds. It is the same thought that our Masters have told us applies to Kali-Yuga, the Iron Age, a hard, rigid age where everything moves intensely and intensively and where everything is difficult; but precisely the age in which spiritual and intellectual advancement can be made most quickly. There actually have been ages in the past when chelas or students have longed for conditions to be more difficult than they were, to give them the chance to advance faster.

In the Golden Age, which it is beautiful to dream about, in the so-called "Age of Saturn," in the age of man's innocence, everything moved smoothly and beautifully and all surrounding being co-operated to make everything beautiful and pleasant; and there is something in our hearts that yearns to return to it; but it is not what the chela longs for. He longs for opportunity; he longs to climb; he longs to test what is in him, to grow from within.

Isn't it a strange paradox that the hardest, cruelest, of all the yugas is precisely the one in which the quickest advancement can

be gained? I think there is a world of wisdom in this thought. Is there not something good in the kali-yuga? Must mankind go under without hope? Why it is the very time when the chances are the most frequent for progress! It is the opportunity-time.

(The Editors draw attention also to W. Q. Judge's words quoted in *Letters That Have Helped Me*, Letter VII, Vol. I, p. 30:

"The age is black as hell, hard as iron. It is iron, it is Kali Yuga. Kali is always painted black. Yet Kali Yuga by its very nature, and terrible, swift momentum, permits one to do more with his energies in a shorter time than in any other Yuga. . . .")

Question 294. *What is the manner in which the great Cycles in the evolution of a Root-Race are repeated on a smaller scale in the development of the various sub-divisions of it? Do they not overlap each other to a considerable extent?*

G. de P. — You are asking what may seem to you to be a very simple question, but you yourself will see, after a moment's reflexion, that it is an extremely involved one, because your question calls for an entire elucidation or explaining of the intricacies of Nature's cyclical workings, and how the large includes the small. This is a tremendous order! It would take a volume just to answer your one question, which is a question which has occurred to many, and precisely because it is so involved is one reason why it has always been side-stepped from H. P. B.'s time to our own. It would take literally hundreds of pages to give a complete exposition, and days and days of hard work in dictation.

However, there are always general rules, and until the gods give me a year or two of more time, I am afraid you will have to be satisfied. The general rule is — and it is a wonderful key — that the small repeats the great, that little yugas not only are included

in the greater yugas, but repeat them on their own little scales. Example: The present Fifth Root-Race, considered as a whole, and including all its minor sub-races, whether great or small, is now in its Kali-Yuga, which began something over five thousand years ago, at the death of Krishna, and will last into the future for about 427,000 years. Keep in mind that this is the Kali-Yuga of the entire Root-Race, the great Kali-Yuga.

Now, then, all the minor cycles or yugas of this Fifth Root-Race will, some of them, be rising, and some of them be falling, and inter-working with each other, and yet will all be subject to the great Kali-Yuga of the Root-Race, which has just begun. Thus, a minor yuga or race may be in its youth, and rising to its flowering, but yet, because it is included in the great descending Kali-Yuga, will, although having a sharp rise, be nevertheless subject to the general decline of the great Kali-Yuga.

Next, every minor cycle, great or small, included in the Root-Race, in its turn is septenary, and therefore has its own little kali-yuga, and its numerical relations are about the same. Just as the great Kali-Yuga is 432 thousand years long, so a little kali-yuga may be perhaps only 432 years long, or possibly 4,320, or possibly even 43,200. The Hindu or Aryan Race, which was one of the very first sub-races of our own Fifth Race, is now in its own racial kali-yuga, in addition to belonging to the Fifth Root-Race, and therefore of course belonging to the great Kali-Yuga of the Root-Race. But it is striving to rise into flowering again, and will do so in the future.

In the small scale, Spain is in its short kali-yuga, as also Portugal. Italy has just ended a short kali-yuga and is striving to rise again.

Unfortunately, our Fifth Root-Race being a very materialistic one, i. e., being heavily sunken in matter due to our Fourth Round, these rises are mostly along the lines of materialisms. Furthermore, our own European general stock of Races, which

we may call the European sub-race or family-race perhaps, has been steadily rising since the downfall of the Roman Empire, and will continue to rise, with various smaller shocks and falls and risings again, for some six or seven or possibly eight thousand years more. And then there will be a rapid descent until their kali-yuga is reached, a small kali-yuga, when there will be a great European catastrophe of Nature. This will be some sixteen or eighteen thousand years from now, possibly fifteen or possibly seventeen thousand years. I have never had time to get any really exact figures. But you can say 'about' 16,000 years hence. This period will see the submersion of the British Isles. Most of France will be under the water, also Holland, some of Spain, a good deal of Italy, etc., and other places. Of course all this won't take place in a night. There will be premonitory signs, such as slow sinkings of the coast, and great earthquakes, etc. I hope the answer is helpful. If I get your main idea or question, its answer is in the first part of this my reply, to wit: that although the Fifth Root-Race as a whole is in its great Kali-Yuga, which had just begun some five thousand years ago, the smaller races may nevertheless each one be rising or falling, according to its own time-periods; and each such sub-race or smaller race has its own little kali-yuga repeated after the great one, and bearing the same proportion to the entire length of any such small race that the great Kali-Yuga does to the Root-Race. And this is the same, whether the sub-races are great sub-races, or small sub-races. Thus we have the hour of sixty minutes; we have the minute of sixty seconds; and we have the second of sixty thirds, although of course this last is almost never used in our days.

Thus it is that the rises overlap each other — and sometimes very considerably — but in the manner above outlined.

Question 295 (From Amsterdam, Holland). *What is the outward manifestation or physical body of the Silent Watcher of a Globe of*

the Planetary Chain, and of the Silent Watcher of the Planetary Chain itself?

J. H. Fussell — First, let us bear in mind the most important of all keys: the law of Analogy; man is the microcosm of the Macrocosm; as above, so below. Thus there are many grades of Silent Watchers; every Galaxy, every Solar System, every Planetary Chain, every Globe, man, or even atom, has its Silent Watcher. So too is there a Silent Watcher for every Round, and for every Root-Race. But in each and every case the Silent Watcher has no physical body, and has no direct contact with the physical plane, although hierarchically working through imbodyed beings.

Let us then apply the law of Analogy. The Silent Watcher of each individual man is his Spiritual Monad, Atma-Buddhi: the Divine Flame, Atman manifesting through its spiritual vehicle, Buddhi, and thus hierarchically reaching down even to the physical body. Thus, also, the Silent Watcher of our Solar System is the Solar Spiritual Monad, verily a God, one of the Cosmic Divinities. Man has a physical, material body, an earth-body, builded of the matters of this earth-plane (which is the lowest of the four manifested planes, on or in which four planes are the seven globes of our Planetary Chain). So too, our Planetary Chain Terra, and similarly each of the Planetary Chains of the seven Sacred Planets and of the Sun, may be said to have a physical body, namely, Globe D of each such Planetary Chain, and of the Sun. Otherwise these planets and the Sun would not be visible to us. This is explained in *Fundamentals of the Esoteric Philosophy* (p. 176).

This cannot however be said of the other Globes (i. e., except Globe D) of the various Planetary chains, for the Globes A, B, C, and E, F, and G, are on planes other and higher than the physical, their outer manifestations being composed or built of the matters

— corresponding with the 'physical' on this plane — of the planes on and in which they are. Thus, in each case, the outer manifestations of Globes A and G are formed of the matters of the 'Archetypal World' or plane; of Globes B and F of the matters of the 'Intellectual or Creative World' or plane; and of Globes C and E of the matters of the 'Substantial or Formative World' or plane (see *The Secret Doctrine*, I, 200).

From all the above it is therefore clear that the Silent Watcher has no physical body, because it is on the spiritual plane. And only indirectly, or hierarchically, through the many intermediate vehicles, through the intermediate planes, does the influence of the Silent Watcher reach the physical body, whether of man, or of the respective Globes D of the various Planetary Chains. It may perhaps help us to understand this if we consider the Silent Watcher as sending forth rays of light, of spiritual influence, from itself, which rays, passing from higher plane to lower plane, through vehicle after vehicle, finally reach the physical worlds and the physical body. For, truly, we may — and we do, at times of high aspiration and of noble unselfish endeavor — feel the inspiration of our Silent Watcher, the source of all our spiritual yearnings, and the inspirer of all the impersonal, unselfish love which at times we feel in our hearts. The Silent Watcher is the Spiritual Intelligence behind and permeating, but not imbodyed in, any physical vehicle or body.

There is a deep occult truth contained in the Invocation given to us years ago by Katherine Tingley: "O my Divinity, thou dost blend with the earth . . . Thou dost radiate a Golden Light that . . . doth illumine even the darkest corners of the earth . . .", passing through the many intermediate planes and vehicles.

There are innumerable Silent Watchers, of varying rank, namely all those who have reached self-conscious spiritual status, who

have made the Great Renunciation, who form the 'Guardian Wall' (spoken of in H. P. Blavatsky's *The Voice of the Silence*), who refuse to go beyond the 'Ring Pass-Not.' (See *The Secret Doctrine*, I, 207-8; *Fundamentals of the Esoteric Philosophy*, 183, 441, etc.)

Question 296 (from Holland). *Why is it that the ancients seemed to be so much cleverer than we?*

J- H. Fussell — Due to cyclic law — periods of comparative light alternating with periods of comparative darkness. As with men, so with nations and races: they are born, grow old and pass, and new ones take their place; so also with civilizations. Evolution and progress are not 'end-on'; they are never in one continuous, straight line, but are marked by rises and falls. Many such rises and falls occur in the history of every race, every people; periods of material advancement alternating with periods of material decline; periods of intellectual and spiritual enlightenment alternating with periods of intellectual darkness, ignorance, and superstition; periods of inquiry, research, and mental freedom, alternating with periods of mental slavery and dogmatism. "Light and darkness are the world's eternal ways," and along these ways individual men, nations, and whole races travel: now in the light, now in darkness. It is to be understood, however, that these rises and falls, these alternating periods, now of civilization and order and again of 'barbarism' and confusion, are all relative.

Individual men are born, pass through childhood, youth, maturity, and old age, and then die; but only to be reborn, reembodyed in new forms, new times, and new conditions. So also do nations and races. In every case such reembodyment, such new forms, conditions, and opportunities are the karmic results, the consequences, of the former embodyments; men, nations, and races alike reaping what they themselves have sown in the past. Just as a normal child, whatever be its inherent character and

latent abilities — its latent 'cleverness,' to use the term employed in the question, its latent intellectual and spiritual faculties and powers — cannot express these during infancy and adolescence save as intimations, promises, of future developments; and just as in approaching old-age there is a dimming, a decline, even in many cases a loss of the powers and faculties, the 'cleverness' which had been more or less manifested during the now closing life — although such need not be if the life has been well lived — so with nations and races, and always in accordance with the national racial karma.

Hence, in accordance with the foregoing, the reason "why the ancients seemed to be so much cleverer than *we*" may be either (a) that 'we' are a young nation, still in childhood or adolescence, and have not yet attained to the flowering of inherent, latent, but as yet undeveloped (although in process of development) faculties and powers; or (b) that 'we' are an old nation which has passed its maturity and may even have reached extreme old age. As examples of the former we may instance (a) all the nations of North and South America; and of the latter (b) Egypt, India, Persia, China, and the North American Indians; while the European nations occupy varying positions between these, i. e., between (a) and (b), some of them on the decline, others in temporary obscurity but karmically destined to enter upon an even higher civilization than they have known in their past history, some again already awaking from obscurity. G. de Purucker writes in his latest work, just published, *The Esoteric Tradition* (pages 340-1): "Our civilization is at present a civilization in transition," and "civilizations . . . go and come again and again: have their life and pass, and return."

The above is a general answer to the question. As to the immediate causes of the loss of the Ancient Wisdom by any one nation, or group of nations, we would have to consider the past

life-history of that nation or group of nations. That however is another story, the telling of which we cannot here enter upon for lack of space.

Question 297. *You mentioned in your article 'Why Study Theosophy?' (1) that Theosophy was the basis of many religions. The majority of these believe in the existence of a personal God. Can you suggest the origin of the idea?*

A. Trevor Barker — The origin of the idea of a personal God is a long story. It is stated in Theosophical teachings that this idea is not an innate one. The real origin of the personal-God idea is found in the tendency of ignorant man to build a conception of Deity in terms of his own personal self, which is all he knows, and which is necessarily limited; and so he merely builds a big idea of himself and calls that 'God.' The personal God means, according to our European conceptions, an extra-cosmic Deity — that is to say, a being somehow outside of his universe (that is this universe), because he is said to be infinite, boundless, omnipresent, and at the same time somebody who can be prayed to, supplicated to save us from the effects of all the silly things that we have done in our lives.

I have always thought that the translation of the Latin word 'persona,' meaning a mask, is something that helps us particularly to understand our own — what we call — personality, the lower part of ourselves, that which hides the light. It is the external part which is the personality according to the Theosophical teaching, not the higher part, which is real; this lower, material part is the *mayavic*, the illusory part; and it may be helpful to some to look upon the personal-God idea as essentially an illusory concept.

This personal-God idea is one that the Theosophist does not countenance at all; and I should make it clear that it is the limited, dogmatic concept, particularly of the Christian Churches, which

gives such a very false idea of Deity, and which exhorts men and women to look outside of themselves for the source of their salvation. But the Theosophist comes in and directs men's attention to the Divinity within him, which in very truth is a personal divinity for each man; and whilst he takes away with one hand, he gives you something which is really far more sublime; for Theosophy teaches self-dependence; it follows the teaching of the Christian Avatara: that the Kingdom of Heaven is within you. It is to that Deity that we appeal in every man. But this 'personal' God that we aspire towards, and whose light radiates in the heart of every man, this Immortal entity, collectively the aggregate of all the Divinities in our Solar System or our Universal Cosmos together, makes up what is called the Universal World-Soul, and all men are rooted in That, have their being in That, and sooner or later can consciously raise themselves by their unity with that which It represents.

1. THE THEOSOPHICAL FORUM, January, 1936. ([return to text](#))

The Theosophical Forum

THE MYSTERY-TEACHINGS — *Leoline L. Wright*

There is a vital relation between our modern age, with its hardbitten objectives and its determinism to the actual, and the purpose underlying a genuine Mystery-School. For it is no exaggeration to say that a Mystery-School, or Esoteric University, is the only place where the Science of the Actual may be found.

It is interesting to observe that though there has never been a time in the history of the known world when so many schools, academies, educational leagues, and universities have flourished as at the present time, it is exactly in this present moment that we are unable to say what is the matter with civilization. We are so far from any knowledge of the actual that we do not really know how to deal with a single one of our problems — poverty, crime, war, drug-addiction, and similar evils. They are all real enough, but their cause and cure is not taught in our universities. We undoubtedly lack some key — some great co-ordinating fact without which we shall never be able to find our way out of the wild disorder which is modern life.

A Mystery-School teaches the facts about the invisible Universe. That is why it is a *Mystery-School*. The Mysteries are not something which cannot be known: they are facts of life which for the time being are hidden from our comprehension. Was there ever a period in man's development when he was aware of so many unexplained conditions as he is at this moment? We are, as already suggested, surrounded by inexplicable mysteries. We need a school where the facts which underlie them can be explained to us.

A Mystery-School, then, is a University which teaches the science of the invisible Universe, where the reason for things can be

found. That is where the key, the great co-ordinating fact, lies — in the existence of an invisible Universe.

When we guide and care for a child we are watching the development of something from the invisible to the visible world — the, to us, occult evolution of an individuality. When we look upon a chair or a crystal we behold a coherence of atoms which we can see only because they are in such rapid motion that they impinge upon our physical vision. But that which the object seen really is — the invisible center of energy holding together those atoms — belongs to the realm of the occult and will never be visible to our physical vision. In the case of the chair it is the idea of some creative brain, co-ordinating visible energies, that has brought the artifact into being: in the case of the crystal it is invisible Nature that has been at work.

What are these energies which are the 'actual' at the back of all visible forms? Is it not here that we must seek for the Science of Reality: in the invisible, the causal worlds?

It is to serve this need, this present insistent demand for a Science of Reality, that the Mystery-Schools of Antiquity have come again into being. Lost to humanity through many centuries, their beacons are once more lighted at this opening of the New Era. And they are restoring to education other lost keys, some among which are embodied in famous sayings of antiquity: *Man, know thyself; Man is a Microcosm of the Macrocosm; As it is above, so it is below; as it is below, so is it above.*

It is of course not surprising that science and education have lost these keys. They were, so to speak, thrown upon the dust-heap when Justinian closed the last of the Mystery-Schools. Man's attention was then definitely forced from a study of himself as the key to reality into a study of systems and physical phenomena. When his gaze was directed within it was to a religious

phantasmagoria constructed upon theological speculation. And the final return to nature and 'reason' was inevitably hampered by its own unconscious reaction towards the illusive phenomena of the exterior physical world.

But all this has been changing in the last fifty years, particularly since the founding of the Theosophical Society and the publication of *The Secret Doctrine*. So that the man who is in harmony with the *Zeitgeist* is all for the mysteries — those metaphysical facts and that science of consciousness which even physicists and biologists begin to recognise as the background of life.

The final key to all our problems is the spiritual psychology of the Mystery-Teachings. Man, know thyself, and in so knowing gain understanding and mastery of the invisible Universe! Above the lintel of the newly re-established Esoteric University we can read the invitation of the Great Teachers, the Mahatmans, who have restored its opportunities to the world: *Knock! and it shall be opened unto you!*

The Theosophical Forum

UNIVERSAL BROTHERHOOD — *Clifton Meek*

The purpose of Theosophy and the aim of Theosophists is not that of converting men to a particular form of religious belief, but rather of awakening them to the ultimate truth behind all religion: that Universal Brotherhood is a fact in Nature, and that the difficulties facing humanity today were brought about by the fact that men have persistently refused to recognise this paramount and vital truth, and live accordingly.

Between the lines of recorded history, in the ruins of ancient civilizations, the tragic story of the human race is written. Nations and civilizations flourish and decay, leaving but crumbling ruins in their wake to commemorate their former glory and excite the curiosity and speculative theories of future generations. The monumental relics of antiquity which have withstood the ravages of time and elements and the destructive vandalism of barbarous hordes and religious fanaticism, stand as mute evidence that civilizations greater than our own, having reached the zenith of material and even intellectual progress, crashed for the want of a most necessary counterbalance — the practice of Universal Brotherhood among mankind.

In these days when the thought atmosphere of the world is so impregnated with fear of wars, crime-waves, and economic uncertainty, man is painfully learning that the 'bread and circus' philosophy of life — the glorified materialism which has been dressed in all the glamor human ingenuity could devise — will never satisfy his innate hunger for spiritual light and knowledge. It will not even carry him across the chasm of material difficulties to which it has brought him.

The idea of Universal Brotherhood among mankind is nothing

new; every age has talked of it, but none has brought it to a reality in the external conditions of life. Quite to the contrary, the race clings to the great illusion of human selfishness, which hangs like a pall over mankind and which time and time again has been the undoing of individuals, nations, and civilizations, as one age repeats the errors of the preceding one. Each age has looked upon the idea of Universal Brotherhood as a Utopian ideal, an experiment to be tried out by some future generation. To many it is the fantastical dream of impractical idealists, and is as odious to the twentieth century materialist as it was to the decadent and brutal Romans two thousand years ago. Man persists in climbing over man, nation over nation, and race over race, and as one great Theosophist has said: "Unbrotherliness is the insanity of the age."

Universal Brotherhood has been the keynote of every religion worthy of the name. It was proclaimed by the great teachers of the race before the pyramids were built, and alone will be the ideal of an enlightened humanity after they have resolved into impalpable dust.

It was the basic teaching of Krishna, Buddha, Jesus, Lao-Tse, Confucius, and the host of Elder Brothers who have sought to show mankind the way to a happier existence on earth; and it will become a living reality when the creeds and dogmas of their followers are forgotten; for it is the only fundamental religious teaching upon which it is possible for all men to agree. Articles of faith, man-made dogmas, and theological speculations can never successfully be substituted for a love of collective humanity, regardless of race, color, or creed. The former are the fields in which human misunderstanding, strife, and separateness flourish, while the latter sweeps before it all class-hatreds and their resultant train of evils.

Universal Brotherhood is the only panacea for the evils of every age, but the one which really never has been tried. Man rides roughshod over his own kind in defiance of the wisest teachings of all ages; the bitter experiences of the past, the obvious fact that mankind is working out a common destiny, and the stupidity of human selfishness are marvelous to behold. When one-half the world doesn't care how the other half lives, or worse still, when it doesn't want it to live, human progress cannot be expected to pursue an even tenor.

Theosophy is dedicated to the work of awakening in the hearts and minds of men the realization of the spiritual unity of all, and when once this great truth of Nature is understood by the thinking and intelligent people of our age, the external difficulties confronting mankind will automatically be corrected to a very great degree. In the last analysis, these problems have their origin in the minds of men — wrong thinking, wrong ideals, and primarily human selfishness. It is in the psychological complex of human nature with its present lack of understanding, due to the absence of a permanent and satisfying philosophy of life, that the difficulty lies, and it is there alone that a lasting remedy is to be effected.

Any other, principally those of a political or economic nature, regardless of how worthy they may be in themselves, are merely palliative and temporary, rather than regenerative and permanent.

The Theosophical Forum

WHAT IS TRANSMIGRATION?

First the word itself: what does it mean? *Trans* means across; to *migrate* means to travel into a new country. What does it apply to? It applies to the tiny, tiny lives which go to make up not only man's body, but all his psycho-mental and emotional nature.

What are these tiny lives? They are called by science Atoms, but Theosophy goes one step farther and calls them Life-Atoms. These Life-Atoms reside in the heart of and build the physical atom.

They are so numerous that they make up everything that is in the Universe, visible and invisible. They help build man's body, his emotional fabric; his thoughts work through them, and there are even life-atoms active in his spiritual life. So much in brief as to what man and his life-atoms are.

The thing to remember is that a life-atom is the 'Soul,' the active principle of the physical atom. Without this 'Soul' or 'Heart-life' an atom would be a mere empty shell, incapable of any action whatsoever.

How do these life-atoms operate? During a man's life, they are limited in their action because the man dominates them. By his stronger will, intellect, and spiritual powers, he controls these tiny lives. They absorb their life from him, just as we live in the Universe and absorb life from it. If we live in harmony, we generate constructive entities; if we lead misshapen lives, we give birth to destructive forces. During our life they must travel as we travel. It might be likened to many people on a railroad train under the dominance of the engineer; we can do nothing but stay on it and do as he says till we come to the end of the journey. If the engineer and the train-crew are friendly, if the train runs smoothly, if the passengers are congenial, we benefit. If the

contrary is the case, we leave the train ill and unhappy. Thus it is with the life-atoms we control. It is really a Brotherhood; we help or hinder them and they help or hinder us.

How do they transmigrate? When a man dies his body disintegrates. The atoms and life-atoms which compose it are freed, and go wherever they find attraction. They go to the place or to the thing they like best or are most nearly akin to. Some go to build the soil, others help build the flowers, the trees; some help build the bodies of animals and other lower creatures. Some go to help build the bodies of other human beings. Those which absorbed the good things from us go to help the beautiful things in Nature. Those which absorbed weaknesses from us, from our evil thoughts and actions, help to build the ugly things in Nature. Those which acted through our emotions, help build the emotions of other people, or of animals.

The most subtil reaction comes from the mental fabric of the man who was. If his thoughts were of the hateful, jealous, murderous type, the mental life-atoms help build the thought-fabric of criminals, dope-fiends, drunkards and weaklings. If his thoughts were centered around acts of beauty, sympathy, understanding, compassion, if in general his thoughts were of a harmonious, kindly, gentle type, these life-atoms help build the mental fabric of the gentler and more advanced beasts, and the higher intellectual and spiritual type of human beings. The whole teaching of Transmigration hinges on the activities of the life-atoms — it is they which transmigrate — not the Soul of Man. The Soul of Man cannot possibly ever retrograde into the beast-kingdom. The saying is "Once a Man, always a Man." The goal of man is Divinity. The Soul of Man reincarnates: the Life-Atoms transmigrate. Involved in this teaching is the basis and foundation of one of the aspects of Moral Ethics and Universal Brotherhood.

"We believe in no *creation*, but in the periodical and consecutive appearances of the universe from the subjective on to the objective plane of being, at regular intervals of time, covering periods of immense duration."

— H. P. Blavatsky

The Theosophical Forum

HELPERS OF HUMANITY — *Marion Bustin*

What are Helpers of Humanity? How did they come to be Helpers? Why are they able to help us? What kind of help can they give? Who are they? Where? Why do we not know about them generally?

You yourself may some day be a Helper of Humanity. It may be you have already started upon the pathway that will guide you. Your very reading of this would seem to show that, for a searching for Truth is the first step upon the pathway.

And here is one great truth that we all know: that there are two (or more) sides to our natures. We have a higher side — call it the soul if you like, or the spirit. When we are unselfish; when we are helping another who is in trouble; when we are deliberately trying to conquer a weakness within ourselves, such as laziness, envy, or dishonesty, then we are living in the highest part of ourselves, the divine part of us, the part that is close to the Inner God.

Then there is the lower side of us, the something in us that tempts us to be selfish or careless, or to take advantage of another's helplessness.

And between my fine nature and my selfish nature stands — what? What is it between these two? A something that can choose; that can say, I will be honest; I choose to be honest; I will not gain wealth or happiness for myself by hurting another. Or else this 'something' can choose to hurt others. You answer, It is the mind that can choose; the mind that can have such ennobling, unselfish thoughts or that can be very cruel and evil. It is the mind that must decide to follow the Path that leads towards our

higher, the highest Self. For it is a Path or a journey; and to guide us there stretches a golden thread between that finest part of ourself — our highest Self that dwells in some upper, or inner, mysterious region — and our mind. And this link that binds us to our best part can be broad and strong; or else weak and ready to break.

But, you ask, what has all this to do with the Helpers of Humanity? It shows us how there came to be such men. There are men in the world today who have lived so unselfishly through many, very many lives, purifying their thoughts, combating each impulse to do wrong; failing often, yet ever trying again, until finally they have made the link between themselves and their divine nature so strong, they have drawn so close to it, that in many cases they have come to live entirely in this finest part. Even as you and I are able to do it for short intervals, they do it all the time.

Why are these men so able to help us? What kind of help can they give? They can give us knowledge, wisdom; they can tell us how to solve all our problems and how to avoid future sorrow. But, how do they know? How do men know anything? Einstein — where do his brilliant thoughts come from? Where did Shakespeare find his immortal poetry, immortal thoughts? Inventors, geniuses, great musicians — whence come their inspirations? Isn't there some mysterious place, some inner hidden side of nature, where inspiration comes from, where our conscience dwells, and our intuition? A world that only those with pure intentions ever reach, a divine sort of world? These great men have so opened their minds, so placed their thoughts away from their own personal concerns and personal desires, that great knowledge comes to them. But greater far could come. It is coming. Look at all the wonders of modern science, only beginning to unfold around us. But the scientists are generally

interested only in material results, in knowledge about things we can see or feel or hear. Surely there is a greater, loftier wisdom than this, in the depths of the divine world? There is; and this wisdom comes to these men who have conquered selfishness, who are close to the divine within them. For they are so much closer to the unseen world where knowledge is than are any ordinary geniuses.

These men (or women) who live always in their highest self — as we do only occasionally, but could learn to do always — these men find the answers to the ancient puzzles, such as: — What is life for? Why must we suffer? What happens to our inner, unseen selves when we die? Do we ever return to this earth again? What is the history of mankind? Were there men on earth a million years ago? They gained this wisdom after lives of unselfishness and earnest striving; and they yearn to help us too, to guide us that we may avoid mistakes and sorrow, that we may advance faster into our highest selves. These men, who were ordinary men long ago, are the Helpers of Humanity. Such men there have always been, and in all ages the truth about life has been known by such as these.

Where are these Helpers, who know the Truths of life? I understand they are everywhere among mankind — men unassuming, for fame and fortune they do not want; men with gentleness and power written upon their brows. Forgetful of self, they work among us, and only the pure of heart, those who strive to be always their best self, can know who these men are.

They, with their divine wisdom, know when any one of us resolves to try to be better. They can perceive the golden link that joins each of us with our soul — I love best to think of it as a ray shining from the soul down into the mind. These Helpers see this ray grow broader, more radiant, as each noble thought or act

helps to clear away the mists between the mind and the flaming soul.

You have been thinking perhaps of Jesus the Christ, or of Buddha of India, or of Confucius, the great Chinese Teacher. Yes, they and many others have been our greatest Helpers. And all had exactly the same message, for there can be only one Truth. The truth they teach tells us that we are in this world only to learn to be honest, kind, loyal, all the things we know we should be; that we must return to this Earth again and again, through many lives, until these lessons are learned; but that then we can rise to experiences of great happiness, living in that mysterious inner world that most people feel must exist somewhere. These great Helpers have gained this release from the troubles of Earth, yet they come to help us out of pity for us, sorrow for our ignorance, the desire to show us how to live. They tell us that ignorance is the cause of all evil, all sorrow; that if we fully realized that every action of ours has a corresponding result, that good brings good, and that if we do wrong we must suffer, then we would consider our actions more carefully. This is a natural law, natural as Newton's law of gravitation, and is called Karma.

Of course there are many helpers less advanced than Jesus and Buddha, who nevertheless have found that happiness lies in helping others. Many are not far ahead of us along the road toward perfection. Encouraging fact! We can join with them. They stretch out their hands to help us, and they must do it, for unselfish service is what takes them, takes us, upward, inward to the shining soul within each one of us: the beautiful something in us that tries always to help us. And as we advance we too must pass on what we have learned — and so we become at once helpers of humanity.

Indeed that is all that the Theosophical Society exists for. Every

true Theosophist has no other aim in life but to train himself to be a helper; that is, to show others how they can help themselves, for that is the only kind of assistance that is lasting. You, if you are an earnest seeker after truth, know that that is the only way that one can help another, thus following the Great Helpers.

The Theosophical Forum

THE PHILOSOPHY OF PAIN — *William S. Flathe*

Theosophy should be studied with the idea of taking time by the forelock and hewing out one's own evolutionary pathway — consciously. The one who does not have such a comprehensive, complete philosophy as this Ancient Wisdom of ours suffers an irreparable loss, for, having no adequate idea of what life is all about, no insight into the plan and method of evolution, or the teaching that we are here to progress upward, ever onward, until we realize and express our innate divinity, he will be the one who must suffer thereby. He is the one whom Nature must prod on, or he goes to sleep in personal pleasures and self-sufficiency. But do we who have this marvelous, this golden philosophy of life, test its utilitarian aspects by putting it to use in our daily affairs? Each individual knows the answer to this for himself, and if not, he is no better than the man on the street who thinks personal pleasures are the summum bonum of existence.

Theosophy is nowhere more noble and stimulating than in its philosophy of pain. We see so much of it in this day that we conclude that suffering must play a necessary part in the great drama of life; and this is so. Man may be compared to a diamond in the rough. His personality, or that part of him that we meet in our daily affairs of life, is like the rough, uninteresting exterior of the diamond. Now to bring forth or expose the true brilliancy and beauty of the diamond this rough coating must come off. In other words, if man is to evolve and show forth his true divinity he must break away from his personality, and Nature is the great lapidary who presses this ugly coat of personality against the wheel of terrestrial existence — and man emits a shriek of pain. Yet after each application to the wheel man dispenses with some of his grosser self and exposes something of the brilliancy, the

beauty, of his divine self which lies underneath. In this way Nature breaks up that accumulated, crystallized mass called 'personality.'

Oh, that man could only see that Nature is never so prodigal of her kindness, so bounteous of her benefits and cares, as when she is applying the whip-lash of adversity and making him suffer! How often is it only through pain that rends his whole being, through sorrows that blacken the day, through anguish that seems to make life a veritable hell, that man is made to learn, as on the dead ashes of these he rises to higher things. Apotheosis is ever by way of the Cross; pain and sorrow but lift us higher, for these are the travail of the soul. All birth entails suffering and anguish, and the birth of the soul is a thousandfold more intense. Let us, therefore, not eschew suffering when it comes. Pain is the great teacher, and this is the only way the unawakened man is saved from himself, from his enervating, restricting ways of living.

The Theosophical Forum

INFECTING LIFE WITH DIVINITY — *Kenneth Morris*

Till time's crowning how

To say that nothing's done till all is done.

By entering the Theosophical Society, you have proclaimed your intention to work for the betterment of humanity. You have realized that the world is in an awful condition; that that condition arises out of the wrong thoughts of men, and that those wrong thoughts are the children of ignorance, of false ideas about life. You have determined that in every way possible to you, you will combat ignorance and false ideas by spreading Theosophy; that you will combat wrong thought by making yourself a disseminating center of right thought; that you will leave every condition and situation you come on, better and sweeter than you found it; that you will get to work on human life to infect it with divinity and change it to divine life.

Now, where are you to begin and what is to be your field of labor? There may be great need for Theosophy in Abyssinia; but don't wait till you can meet that need, or you will wait forever. There may be someone in Middle Europe who is causing misery to thousands; but don't wait till you can change him, or you will go down useless to the grave. There may be a fellow-member in your lodge who appears to you to be doing much less than he might for the Work; but that does not concern you. You can do nothing about it. You cannot improve that situation by dwelling on it, by thinking of it, by worrying about it. While you are thinking about it, what is happening to yourself?

You are making of yourself simply a dynamo to generate un-brotherliness and so add to the causes of the world's sorrow. Everyone who thinks hostile or criticizing thoughts about

another, is doing just that. He is worsening the one situation he can deal with, which is his own mind. He is throwing away his chances on his own one and only battlefield, which is himself. To think about the mote in your brother's eye is to cultivate a good hefty beam in your own.

Love is the cement of the universe, the law and truth and inmost being of universal nature. The right or natural attitude of a self to the universe, to all other selves, all being, is harmony or love. All human misery results from living away from this central Law. Therefore the first step in propagating Theosophy, without which all other steps are useless, is, when you think of another person, to think only of what is noble in him; and if that is not apparent, remember that it is there however deeply hidden. Remember the teaching of Theosophy that the innermost self of every human being is a god. Remember it the more forcibly and insistently, the less sign appears of it on the surface. Criticize only yourself, because there your criticism can do good. Criticism of another does harm: to the criticizer, because it is poisoning his mind: to the criticized, because it is emphasizing and confirming him in his fault.

The Theosophical Forum

THEOSOPHICAL NOTEBOOK: XVII

XVII — What is the Difference between a Visionary and a Sage or Seer?

The Seer or Sage is Master of things occult; he knows the ways of Nature because he has worked with her, and Nature has revealed to him her secrets of the universe. Through many initiations he has perfected his own inner self, so that he has resided in many mansions, and experienced true life as it really is.

The Visionary feels intuitively that Nature contains many secrets that he imagines he knows, but his knowledge consists mostly in blind faith that such things do exist; he therefore teaches according

to his personal belief, or his limited knowledge of the teachings of the Ancient Wisdom. — Lucinda J. Turner

A seer is one who has his inner or spiritual eye developed through ages of right living and right thinking; and this mode of life in itself is a pathway that is open to us all if we but follow the Laws of Being. Seers are such outstanding historical figures as the Christ, the Buddha, Lao-Tse, Confucius, Krishna, Apollonius, Orpheus. Those Teachers behind the Theosophical Movement known as the Masters of Wisdom and Compassion may also be classed as Seers.

A Visionary, though not an ordinary man, is still far below the evolutionary attainment of a Seer, for he is still ruled by his brain-mind, and it is only intermittently that his nature is illumined by flashes of the spirit. — W. E. Schwede

When we speak of a visionary our mind immediately calls up something that is not stable, something that is transitory, illusive,

or imaginary. A visionary, therefore, is one who has fanciful ideas of things as he thinks they are, or as he would like them to be.

A Seer, however, is one who sees, who knows because he is able to see. He has evolved to the point where his powers of perception are swayed by nothing outside of himself. He *sees*; consequently he *knows*. A visionary *thinks* he knows. — Mamie Hageman

A visionary is one who visions the Truth, but colors it with his own imagination and personal conception, although he does not realize that he is doing so. The Seer or Sage is one who knows because he has actually seen and experienced the Truth of Divine Knowledge. In the hierarchy of Teachers, the visionary is one 'rung' above the genius; the Sage or Seer is on the highest 'rung,' in so far as we can understand in our present stage of evolution. The visionary is guided by his intuition only. The Sage has been taught through initiation, by those greater than himself. How can you distinguish? Look within your own heart and you will know if the teachings are true. — Claire Turner

A Great Seer or Sage gives teachings to the world which may be found to have existed at the heart of all World-Religions and Philosophies since time immemorial; a visionary gives to the world only the vagaries and intellectual fancies which may emanate directly from his own mind, or from within the intellectual belt immediately surrounding him. The teachings of a Great Seer or Sage are impersonal; the teachings of a visionary generally personal. The teachings of a Great Seer or Sage urge each and every man to look to the Christos within himself — Man Know Thyself! The visionary, on the other hand, teaches — Man, accept what *I* teach — which is but a reflexion of the personality. — Florence Mathews

Aside from natural evolution, the main difference between a visionary and a seer is that of spiritual guidance. A visionary is an untrained and uninitiated seer, whereas a true Seer is an initiated visionary. A visionary is so called because he has 'visions,' but due to lack of training in fully developing the spiritual faculties, the visions are invariably colored by the individual's emotional or imaginative nature. The 'vision 'is only partly true, because the visionary's inner faculties are not fully developed.

A Seer is one who 'sees.' Through initiation he has been taught to perceive Truth in all its pristine purity, and thus to pass it on. Therefore, seeing Universal Truth, his Teachings are universal, both in time and place. — Florence Wickenburg

The Theosophical Forum

THE FOUR YUGAS (1)

Yuga means 'Age,' and all over the world we find traditions of the Four Ages of Man. H. P. Blavatsky says that "tradition is oral history," and we believe that it is. The Greeks called these Ages the Golden, the Silver, the Bronze, and the Iron Ages. The ancient Aryans called them (and we use the same words today) Satya-yuga, Treta-yuga, Dvapara-yuga and Kali-yuga, or, translated, the Age of Truth, the Age of the Three Fires, the Age of the Number Two, and the Age of Strife. The four together make a Maha-yuga or Great Age.

SATYA-YUGA: The 'Age of Truth' or the Golden Age. It is the age of purity and justice, when truth and right conduct were natural to all. Swords, spears, and weapons of war had not been invented. Hatred, selfishness, fear, and sorrow were unknown. Fruits and grain sprang from the earth without labor. There was no winter, only a beautiful, endless spring. No man tried to do the duty of another, but attended strictly to his own; hence there was justice, peace, happiness. There was one religion over the whole earth, the religion of Brotherhood. This is also called Krita-yuga or the 'Age of Perfect Things,' for *krita* means finished, perfected, well made, something that cannot be improved.

TRETA-YUGA: the 'Age of the Three Fires.' Treta means three, or a group of three. It is the 'Age of Triads.' Three parts of good remained, but one part now was evil. Instead of the fires of aspiration burning in the heart, men now began to build fires of wood upon the altars, and make sacrifices there. They thought the gods would overlook injustice if only men made ceremonies and lighted altar fires. Winter came with its chill; men built houses. Quarreling and hatred came in.

DVAPARA-YUGA: the 'Age of the Number Two.' The word *Dvapara* is the name for that side of a die or of dice that has two spots. Two is the ancient symbol of matter (as Three is of spirit). In this Age only two parts of goodness were left. Two parts were now wickedness. Nature became unkind (as men thought), too hot, too cold, many storms. Hunger and unhappiness came in. There were many diseases. It was indeed the 'Age of the Number Two,' material and unkind.

KALI-YUGA: the 'Age of Strife and Discord,' for this is what *kali* means. Legend says that Kali (strife) was the son of Krodha (anger) and Hinsa (injury), and the father of Bhaya (fear) and Mrityu (death). It is called the Black Age, and also the Iron Age. War and hatred spread over the whole Earth. One by one the bright gods went away, though from time to time they sent their Messengers to tell people about the Golden Age of the past, and inspire them to work for another Golden Age in the future. Kali-yuga is the age in which we are now living. It began at the death of Krishna. It ended its first 5000 years on February 18, 1898. What is our great work, then? It is to bring the Golden Age back, the Age of Truth, the 'Age of Perfect Things.'

The Theosophical Forum

CAGLIOSTRO - A MESSENGER LONG MISUNDERSTOOD: XVIII (1)

— *P. A. Malpas*

XVIII — CAGLIOSTRO AT ROME

CAGLIOSTRO left for Trent on November 11, 1788, after his brief stay at the little Tyrolese town of Roveredo. Trent was only thirteen miles away, and the local physicians would have instantly denounced any attempt at defying the decree they had extracted from the Emperor against him. By sowing suspicion among Cagliostro's patients, by falsifying his prescriptions, by allowing a dishonest servant to *sell* prescriptions and remedies in his name, they had done everything possible to cause the failure of his cures. These were indeed marvelous in their results and in the sense that they were examples of the utilization of remedies and natural forces not known to the science of the day. But they needed the universal ingredient of all successful medicine — faith; and this being undermined by slanderous tongues, there were naturally failures and relapses.

There was another reason for the departure from Roveredo. The Countess Cagliostro was a Roman and a Roman Catholic. Her husband, the Count, never interfered with religion, but actually sent his patients to the churches to give public thanks to God for their recovery, precisely as others had been told: "Go, show thyself to the priest. . . ." But in these last days the priests persuaded Cagliostro's wife to make public professions of her religion, to confess, and to open her mind to them on religious matters. This, as Cagliostro probably suspected and as afterwards proved to be the case, was in reality one more method of entrapping him. The object was to destroy him as a Freemason, or, alternatively, to gain his wonderful knowledge for their own

propaganda or secret advantage.

On the other hand, Cagliostro actually entertained hopes that he could induce the Pope to accept his system, and, with the support of the Knights of Malta, to make it of use in the Roman Catholic world! We do not know upon what data he based this idea, but it was from Malta that he had set out on his Masonic travels over Europe, and it is probable that he had received his training as a chemist and physician there, under the Grand Master of the Knights of Malta. There were secret associations on both sides and it is not at present known to history whether the Pope was not personally under obligations to support Cagliostro and at the same time, officially, his deadliest enemy. At any rate many believe the Pope knew that Cagliostro was no impostor.

At that period there was a vast amount of heterogeneous thought masked as orthodoxy in official life, and it seemed to have been tolerated where no great scandal arose. An example of this has been seen in the case of the Prince Cardinal de Rohan, in France. Enjoying splendid semi-regal state at Saverne and a vast dignity at the French court, even though temporarily out of favor with the Queen, he was in reality about as worldly as any Frenchman of the day. Cagliostro introduced him to a new world, in fact, when he began to turn the Cardinal's attention to spiritual matters. Similarly, other important dignitaries of the Church were sometimes in reality quite different from what their official position appeared to make them. The converse was also true, that many who appeared to be anything but orthodox Roman Catholics were in reality staunch supporters of that Church.

It is in such a paradoxical world that we have to follow the fortunes of this grand Freemason during the tragic last years of his life in Europe. The task is not easy, nor can it be fully completed until the day when the records of the fraternities to

which Cagliostro belonged are given to the world. Many are the missing links and seeming paradoxes, but one thing is certain, that the *Life of Joseph Balsamo* given so eagerly to every country in Europe in 1791 by his self-constituted accusers and judges, is of no more weight than, say, the histories of the Roman Emperors by the early Christian fanatics, their enemies, or the later veracious chronicle for the benefit of monarchical schoolrooms which described the Emperor Napoleon as "the Lieutenant-General of the Armies of the King"!

There was one of Cagliostro's patients in Trent who invited him to that place, and there were others, among them the Margrave of Anspach, who knew him well. We find him high in favor with the Prince-Bishop, who discussed matters of common interest with him in an apparently friendly way. Whether this was merely another attempt to spy upon him or to entrap him, it is difficult to say, but there is no question that those around the Prince-Bishop of Trent were doing all they could, probably under a friendly guise, to collect anything that could be twisted into evidence against Cagliostro. It mattered little what the evidence was, so long as it would serve to get up a plausible case against him. The 'delenda est' had gone forth, and only the formal occasion remained to be developed.

Serafina Cagliostro, his wife, a vivacious daughter of the Church, talked and confessed and chattered to her heart's content. It is customary to declare that this woman, for whom Cagliostro sacrificed so much since their marriage in Rome, betrayed him only from ignorance, or at the most, from a religious 'conscience,' and the reluctance on the part of sentimental writers to condemn her, because she was a woman and a very fascinating one at that, is natural. Yet there is no excuse for her betrayal, even though some things she said without malice were twisted into damning statements against her devoted husband. At Trent, indeed, of all

the enemies that surrounded him, she was the worst.

Whether the Prince Bishop was an enemy or, what he appeared to be, a very good friend, is hard to say; but when pressure was brought to bear upon him, again through the Emperor, to get rid of so dangerous a man as one of the Illuminati, and one who was also the Grand-Master of a proscribed rite — a Mason, in short — he let Cagliostro go. The Prince-Bishop gave Cagliostro letters of recommendation for the Cardinals Albani Colonna and Buoncompagni, at Rome. These letters would be accepted as proofs of the good will of the giver, were we not so accustomed to seeing Cagliostro's worst enemies, in the guise of friends, give him similar guarantees — that he might fall into the waiting hands of their confederates. It is one of the mysteries of such a life that the martyr, accepting his doom, bears his own Cross to his Calvary without a murmur. History is amazed at the seeming blindness with which a man of vastly superior intelligence is apparently so unable to distinguish friend from foe, but history itself does not know that the sacrifice made to help the individual or to help humanity includes responsibility for the consequences of failure on the part of those helped to profit by the Promethean fire from Heaven. The chained God of the Caucasus cannot escape his doom until he has paid the penalty *for* those he has enlightened. Enlightenment has its birth-pangs for those who bring to birth the souls of men.

A month only, and Cagliostro having passed through Venice and Turin, arrived in the Eternal City, the city of doom, where, twenty-one years before, he unfortunately married the girl who was to prove his Delilah.

So in the month of May, 1789, the fourteenth year of the Masonic effort of which he was permitted to form a part, Cagliostro arrived at the Scalinata hostel in the Piazza di Spagna, in Rome,

shortly afterwards removing to the Piazza Farnese. He was known in Rome, besides having the introductions from the Cardinals at Trent; and his wife was a Roman. There is no need to suppose that she was of low caste merely because of her ignorance of writing; she had been brought up in the fashion of the time, unable to write, because of the parental logic current in good society — a girl who could not write could not correspond with a lover without the knowledge of her parents! However, the fact remains that Serafina Cagliostro, though not of humble origin, could not even write her name.

If we were dealing with the story of an ordinary man, there is much that would be almost impossible to explain in the conduct of Cagliostro at Rome during this fatal year, 1789, without access to the records of the Fraternity to which he belonged. The indescribable mental agony of the months passed in the Bastille in 1785 and 1786 would have been enough to deter all but one man in a million from taking similar risks again — but Cagliostro was the one man in a million, or in several millions. He not only took the risks but even seemed to court disaster. Freemasonry was actually a crime by the laws of the Church, which artlessly pointed out that as its practice was secret it *might* be against the public interest. But Cagliostro had not practised Freemasonry within the limits of the Pope's jurisdiction. Therefore he was unassailable, as yet. The situation, however, was one that could be speedily altered, and it was.

A monk, a French Capuchin, Francesco di San Maurizio, attached himself devotedly to Cagliostro, and led the Count to the point of initiating him into the Egyptian Rite. Cagliostro's amazing *appearance* of ignorance as to the man's treachery is the best proof that can be offered of his knowledge of the snare. Again and again, at Mitau, at Lyons, at London, we find this paradox of a man, when judged by ordinary standards, not only walking into

the simplest traps set for him by treacherous friends, but actually predicting their treachery. This kind of prediction was a sore trial to Cagliostro's most devoted disciples, because the future traitor always seemed such a faithful and enthusiastic supporter, sometimes until a few hours before the act of betrayal took place. Only disciples who had received his deeper teachings were fully aware that there was not only no coincidence in this, but the working of a well-known law; for those, such as the banker Sarrasin and the Irish Mason O'Reilly, who remained faithful to the end, were really 'worthy and well qualified' to judge; they were balanced and responsible men, and Masons. And even the Prince Cardinal de Rohan, in spite of his worldly dignities and ecclesiastical and social artificialities, remained faithful to him; for the Cardinal had seen much and knew much, and yet remained cool-headed and mentally balanced.

However fantastic such matters appear in print, the elementary phenomena with which Cagliostro illustrated his philosophy were a severe test for any man's mentality. If his mental balance were not strong, the reaction of incredulity might come in a moment and with it a moral obliquity leading usually to treachery. The purity of mind and singleness of purpose required to maintain mental balance under such circumstances, were no more common then than they are today; but as that balance did not necessarily affect the intellect, it ought perhaps to be called moral balance rather than mental. We are dealing with very obscure mental aberrations and moral cataclysms, but never, so far as we know, clearly explained as to causes. The facts remain. Cagliostro, as an expert in such matters, chose to take incredible risks for the sake of his mission, which was, to give the world through the individuals he contacted an opportunity to progress in spiritual evolution, and only a man capable of making such a superhuman sacrifice of personal interests is really capable of judging his acts.

If those acts cannot be understood in the light of the average mentality of our day, it is only a proof that there is a vast field for their action even now. When we can trace a logical purpose in the doings of a Cagliostro, linking apparently disconnected actions and phenomena, it is probable that we shall be closely observing the precise course followed by him, and doubtless understood by his deeper students. For others, we must be content with strange *apparent* paradoxes, such as this one of treating certain inevitable traitors as confidants, after having predicted their treachery in detail.

Francesco di San Maurizio, known as Father Suizzero, was initiated into the Egyptian Rite, and on Sunday, December 27, 1789, when the Sun lay in the tomb of the old year, the Holy Inquisition held a solemn meeting in the rooms of Cardinal Zelada. There were only four cardinals in this terrible tribunal, the other three being Cardinals Campanella, Antonelli, and Pallotta. The Pope himself was the nominal head of this one body, as indicating its importance, but he rarely took active part in its deliberations, reserving his interference for the most serious occasions. *Breaking an absence of years, he attended this council in person. Grave decisions were evidently in the balance.*

And that evening Cagliostro was arrested with his wife and the Capuchin San Maurizio. His rooms were stripped and all his property and papers seized, precisely as in the case of his arrest at Paris some four years earlier. By one of those fatal mistakes which appear so obvious as to be deliberate challenges thrown in the face of fate, Cagliostro here also appears to have taken no precautions whatever in regard to his papers and precious documents; doubtless some of his priceless drugs were seized in the general confiscation as well.

The gates of the formidable castle of Sant' Angelo closed behind

the devoted 'criminal' — and the crime charged was —
Freemasonry!

The comedy, which was at the same time one of the greatest tragedies the world has known, was well staged, as might be expected. It is easier to extract the fibers from the mango-fruit than to obtain any degree of real accuracy from the official accounts. Only by the application of other keys can the doors be opened upon the real drama behind the painted curtain. For some of the actors the matter was serious enough. The hue and cry drove out of Rome on the instant all who had ever had the slightest connexion with Cagliostro. High nobles fled, a marchioness escaped in the guise of a Hungarian ameer; the Queen of Naples hastened to disclaim all connexion with him and to declare that she had surrounded him with spies; the Duke of San Demetrio was imprisoned on suspicion; the Margrave of Anspach left Naples with precipitate haste; brother Masons, unable to stand during 'times that try men's souls,' denounced Cagliostro as an adventurer; a high officer of the order of Malta, though with difficulty, fled to that island; the police made mysterious arrests all over the city; rumors of amazing plots by the Masons were set afloat and the police were or pretended to be in mortal fear of revolution; all was chaos, suspicion, terror, rumor, disturbance of the peace — all the machinery of the Inquisition brooded over the city. No one was exempt.

Remember that while Cagliostro was accused only of initiating a Freemason, and was guilty of nothing more, from December 1789 to April 1791, fifteen months (before condemnation), he suffered in the cells of Sant' Angelo things which few men could suffer and live without going insane. That the torture was mostly mental at this time (the physical torture in its worst form came later) only makes it worse.

Warmth is refused him though it is winter and he is suffering. He is manacled and chained by the neck. Every effort is made to 'break his will.' The accusation that he had practised Masonry at Rome within the jurisdiction of the Holy Father and the Inquisition is a mere pretext. Every hole and corner of his life is ransacked for 'evidence'; anything, no matter what, is used to show that he is a danger to the world. His wife is made to 'confess,' is encouraged to talk about him, and every possible statement that can be used against him is carefully doctored to meet the case. The spies that have surrounded him for years are all utilized for the same purpose. He himself is worried, bullied, cajoled, questioned again and again on the same points until he says something that can be taken *out of its setting* and made to appear against him. He is dismissed, and before leaving is suddenly called back and asked again a question he has answered a dozen times already, in the hope that he will appear to contradict himself; every art and wile that a subtil psychology can invent is used to ruin him. And yet he maintains the power of thinking clearly, even of an occasional hard hit at his persecutors. There is a story that he was asked if he knew the seven capital sins. He had irritated the inquisitors and the question was angrily flung at him.

"Luxury, envy, greed, gluttony, and idleness. . . ."

Cagliostro stopped.

"You forget pride and anger!" he was reminded.

"Pardon me," he replied, gently. "I did not forget. I refrained from naming them out of respect, and in order not to offend you!"

This frankness was avenged in the official *Life of Cagliostro* in which he is shown to be a terrible person because he did not even know, when questioned, how many capital sins there are.

There is some mystery as to the exact position of the Pope. Both Jeanne d'Arc and Jacques de Molay had claimed an appeal to the Pope, and now Cagliostro himself declares that if he is permitted to lay his case before the Pope, the latter will not only adopt Egyptian Masonry as an ecclesiastical order, but will set him free at once! He is reported by the Vatican apologist to have declared:

. . . all that I have done I have done by the command of God, with the power that he has communicated to me and to the advantage of God and the Holy Church; and I can give proofs of all that I have said and done, not only physically, but morally, showing that as I have served God for his own sake, and by the power of God, he has at last given me the antidote to confound and to combat hell, for I know no other enemies than these; and if I am wrong the Holy Father will punish me; if I am right, he will reward me; and if the Holy Father could have the report of this examination in his hands tonight, I predict to all my brethren, believers and unbelievers, that I should be free tomorrow morning.

Cagliostro had spoken.

The offense was the practice of Masonry in the dominions of the Pope. The accusation and examination wandered all over Europe, into every detail of Cagliostro's life, back into the history of Masonry, suggesting, leading, driving, using words of double meaning, bringing the 'evidence' of his wife against him, twisting his words out of their order and circumstance — it was not a trial of Cagliostro, but the trial of Masonry through Cagliostro. One instance of the methods adopted should make Masons think.

He had declared that after his experiences in a London lodge, where he had been treated, after the coarse manner of the time, as a butt for tasteless pleasantries, he had doubts as to the

propriety of *such* Masonry. Now he declared that his Egyptian rite (founded on the original and true Eastern Masonry) was for the advantage of religion.

"You have avowed and subscribed to the confession that Masonry is contrary to religion; now you say it is for the advantage of religion. How do you reconcile these statements?" he was asked, in substance. "One of them is evidently a lie."

"I do not understand these verbal subtilities," he replied with asperity. "Surely I know what I am talking about!"

The methods of the examination were neither new nor unusual. Cagliostro attempted to answer freely, and his replies were promptly suppressed because he was wandering from the case. The Vatican reporter says that the judge had to "lead him, as it were by the hand." His wife was easier to "lead," and she said just about what she was told to say. She was not brought into the examination at all, but if Cagliostro attempted to cite her as a witness on his behalf he was met with the information —

"Yes, she has been examined on the matter, and has given evidence against you!"

If he was faced with some new accusation, some new falsehood, he learnt to recognise that she had been induced to make it, and instead of appealing to her evidence in his defense, he remarked:

"If my wife said that, she is a miserable wretch!"

Promptly the answer is entered against him. "If he were not guilty, he would not have suspected his wife of denouncing him on the point. Therefore it is one more admission on his part."

His judges condemned him to death. It was their highest card. It was promptly trumped, but only the lowest trump was used — purposely. An *unknown stranger* demanded an audience of the

Pope and on giving his name was instantly admitted. The interview was short, and the stranger departed. The Pope decided that Cagliostro should not die there and then. This is what the Vatican apologist says:

His defense was brought forward; it showed both the talent of his defenders [indeed it did!] and the bad state of his case: finally the time came for judgment. It was preceded, as all the rest of the procedure had been, by the most rigorous forms and practices in use even in ordinary criminal tribunals; these constitute the good administration of justice and prove to the accused that they are not unjustly condemned.

It is the tool of the Inquisition that is speaking; apparently he counts upon an audience devoid of either information or intelligence. The examination was interminably drawn out so long as there was the least hope of extracting new damaging details from the accused, and if his memory was short, the torture chamber inevitably refreshed it. This "rigorous form and practice of justice" has been well described by a recent Italian author precisely as we state it.

The case was then, after these "rigorous forms of justice," brought to the "assembly general of the Holy Office" on March 21, 1791, and before the Pope himself on April 7th.

"The judgment needed no great discussion," says the Vatican agent. "Cagliostro had confessed; the most convincing proofs demonstrated that he was the restorer and propagator of Egyptian Masonry in a great part of the world, that he had even practised it at Rome, and that he had there received two candidates."

Let it not be forgotten in the maze of Inquisitorial jargon that the

last fifteen words are absolutely the whole case against Cagliostro.

It was in vain that he had wished to avail himself of the sentiments of those who commute the penalty incurred by a heretic, a dogmatist, every time that he displays contrition and repentance: it was in vain that he had wished to utilize in his defense the proofs of repentance that he had given at the last: the edict of the council of state, of which we have spoken in the preceding chapter, cannot be put aside: the penalty of death which is there pronounced, is moreover fitting to a man who, both in matters of faith and in matters profane, has given himself up to every sort of rascality, and must be considered as one of the most pernicious members of society. [*This emanates from the Vatican press!*]

But the *consultive* judgment of his destiny was entrusted to persons full of gentleness, the gentleness and the indulgence which inspire religion, and which animate the *consulters* of the Holy Inquisition; and his definitive sentence was reserved to the great Pius VI, who, in the course of his glorious pontificate, has always known how to unite the characters of a just prince and a clement prince. He desired not the death of the malefactor and preferred to leave him time for a true repentance. Behold then the sentence which the supreme oracle pronounced upon the person of Joseph Balsamo; it entirely accords with justice, equity, prudence, religion, and public tranquillity, both for the estates of the Pope and for the rest of the world; we give it here in its entirety:

"Joseph Balsamo, attainted and convicted of several crimes, and of having incurred the censures and penalties

pronounced against formal heretics, dogmatists, heresiarchs, masters and disciples of superstitious magic, had incurred the censures and penalties established, both by the Apostolic laws of Clement XII and Benedict XIV, against those who, in whatever manner, favor and form societies and conventicles of Freemasons, and also by the edict of the Council of State decreed against those who render themselves guilty of this crime at Rome or in any other place of the pontifical domination. However, as a special grace, the penalty which delivers the guilty man to the secular arm [that is to say to death], is commuted to perpetual imprisonment in a fortress, where he will be strictly guarded, without hope of pardon: and after he shall have made abjuration, as a formal heretic, in the present place of his detention, he will be absolved from censures, and there will be prescribed for him the salutary penances to which he has to submit.

"The manuscript book which is entitled *Egyptian Masonry*, is solemnly condemned, as containing rites, propositions, a doctrine, and a system, which open a long road to sedition; as likely to destroy the Christian religion; and as superstitious, blasphemous, impious, and heretic. This book shall be publicly burnt by the hand of the executioner, with the instruments belonging to that sect.

"By a new Apostolic law are confirmed, not only the laws of the preceding pontiffs, but also the edict of the Council of State, which forbid societies and conventicles of Freemasons, making particular mention of the Egyptian sect, and of another vulgarly called the *Illuminati*: and there will be established the gravest corporal penalties, especially those of the heretics, against any person whatsoever who associates with these societies or shall

protect them."

HIGHER EDUCATION — THE TWICE-BORN — *Marjorie M. Tyberg*

That which is born of the flesh is flesh; and that which is born of the spirit is spirit.

Marvel not that I said unto thee, Ye must be born again. —
John, iii, 6, 7.

When a human being is born, and often for months previous to birth, the tender love of parents, the scientific care of physicians and nurses, are given to prepare for the new-comer a sound healthy body, to insure a successful physical basis for life in the strange world into which the babe is entering. It does not surprise us that the tiny though beautifully complex little body can grow through stage after stage to adulthood, wonder of wonder that this after all is. Nor, when parents, teachers, schools, carefully thought-out systems of education, refined and cultured home and social environment have helped to produce young men and women capable of successful family life, civic duty, patriotic and humanitarian service, are these results any more than we expect from the training of the intellectual and moral faculties as they are understood in our world today. All this may happen, and yet, has the innermost Self that "drew from out the boundless deep," and sought a vesture in the outward world, even been glimpsed? Does this Self brood and hover over the budding human being, only to recede unrecognised? Can this deepest, wisest, permanent one, who is the link with eternity, be educated into conscious function in human life in the world before it "turns again home?" Do human beings get completely born?

There is in our day a severe reaction against lop-sided eternity after death, an eternity of *personal* salvation. Young people and many older ones have outgrown that idea. Hell has no longer any

horrors for them. Some have even been heard to say that if they *could* enjoy eternal bliss while their fellow-creatures were burning in hell, they themselves would merit fire and brimstone. It is over-poweringly evident that religious teaching, to win respect today, to gain response from hearts and minds, must present an all-inclusive, universal view of human destiny, some supremely great unifying purpose, some challenge that will stir into activity the deepest depths of human will and compassion, some call to spiritual adventure that will urge us on to pierce into the unknown, invisible world and win its whole secret.

When in the fifteenth century in Europe there was a revival of ancient culture with a corresponding liberation of intellect, the minds of men turned with joy, with renewed adventurous energy, toward the conquest of the external world. Today again there has been a revival of ancient learning. This renaissance of the archaic Wisdom-teaching, the purpose of H. P. Blavatsky and of the Theosophical Society, draws the attention of humanity to the conquest of that *inner* world of man's own nature which holds the key to the understanding of all Nature's mysteries and makes man a conscious co-operator in the activity of the universe as an entity, the Great Self in which everything lives and moves, and has its being. It is education in this larger sense, incorporating the elements of the archaic training, that will restore the balance between the objective and the subjective life which is so sore a need in our time. The Way opens inwards. It leads to the second birth, the bringing into function of the higher intellectual and spiritual faculties of mankind.

The works of H. P. Blavatsky are full of enlightenment regarding the higher education that is a spiritual birth, the birth of an inner Self of union and will, whose range of activity is not only on earth, not only for one earth-life, but has a range of experience in the visible and invisible realms and preserves an unbroken

thread of consciousness through sleep and waking, and through death to rebirth. From the philosophies, religions, mythologies, and traditions of the world she gathers the evidence of the existence of the Great Teachers of mankind; in a stupendous work of higher criticism she traces all of the sacred books to their source in a primal Wisdom-teaching given to races earlier than any our histories record. And, anticipating by many years the findings of archaeological science, she points to the sacred edifices scattered over the earth, the pyramids, the towers and temples, as the halls of this higher education, which has ever been available to those of any race or any period who were prepared to receive it. For many centuries have these sacred ruins stood in silence and mystery until the wheel of destiny moved upward to the point where the light from the distant forgotten past could once more shine into the hearts of men and quicken the knowledge of the source from which all systems and teachings of wisdom sprang and from which, when the clock of progress strikes a spiritual keynote for mankind, they and all beings can draw renewal.

The most heartening message brought to mankind in the nineteenth century revival of the most ancient wisdom is that for millions of years there have been Teachers, Initiators, who preside at the awakening of man's spiritual faculties in life after life on earth, who guide him from stage to stage of the inner development that makes of him a *dwija* or one twice-born. The existence of this Hierarchy of Compassion, serving in every race and age, directing human beings, who are each and all a part of Truth in the Cosmos, in the finding in their own inner natures the pathway to greater and greater knowledge of that Truth, reveals to us a new and sublime conception of man and his destiny. It gives us a glimpse of the heights to be mounted step by step in love and service by every man. The nebulous eternity of bliss

offered by dogmatic religion is replaced by the supreme adventure of conscious rebirth in self-built vestures of ever increasing power and purity. The ancient wisdom gives assurance that man is at home in the universe; that he may learn to traverse earth and sky in freedom and full knowledge of the Way, reading the secrets of Nature, from that of the tiny seed to that of flaming stars. A glorious, all compassionate eternal life — rest when the Great Being in whom we live slumbers for an eternity, and waking with it at the dawn of another Day, with ever the radiant purpose of setting alight in beings lower in the scale of evolution than himself the intellectual and spiritual fires kindled during the initiation or higher education that made of him one twice-born, born of the spirit, who has entered upon not only the inner joy of the mystic, but the peace and power of one awakened to conscious unity with a divinely intelligent universe.

THE MYSTERY OF BIRTH — *Irene R. Ponsonby*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

(Based on a study of the subject in "The Esoteric Tradition")

The mystery of human birth is not solely a physiological phenomenon by any means, but is in fact a very holy one. If men and women only knew the sacredness of it, then for their own self-protection, outside of the sense of mutual respect and of decency that every normal man and woman possesses, at the bottom of his or her heart, this subject would always be approached in a spirit of truly religious awe, and marriage would become what it ever ought to be: a most beautiful, because a most holy state. — *The Esoteric Tradition*, p. 907

In order to understand the mystery of birth certain fundamental postulates must be accepted. These may be summarized as follows: That there is a continuous existence for every entity in the universe; that this continuous existence follows but *one* universal law or rule of being, however greatly the details of its manifestation may differ; that every phase of existence is the result of a precedent one and the cause of some future phase; and finally, that the universe is a living organism, and every entity in it is inextricably and vitally linked, each to each and each to all, by bonds of physical, intellectual, and spiritual affinity.

Through a recognition of these postulates, we are enabled to view birth and death as portals of ingress and egress which mark the boundaries between the states of activity and quiescence,

miscalled life and death. 'Birth' is the inscription on the lintel of the portal entered by the incoming Ego, but passing under its arch, 'Death' marks the reverse side — death, or a period of exile from its spiritual home. Similarly, the portal of exit which marks the end of this phase of existence with 'Death,' bears on its reverse side 'Birth' — birth into another phase of continuous, uninterrupted existence for the individuality.

When we realize that universal Nature works in similar fashion everywhere, the mystery of birth no longer holds us in awesome ignorance, for if we can follow the consciousness-center which comes into being with the sprouting of a seed, we know how atoms, planets, universes, and the human babe are born; and recognising the present form as the result of past fashioning and the causative element in future manifestations, our study stresses the productive consciousness, and mere forms of imbodiment take their proper place, together with the principal actors and the part they play on the background of cosmic eternity.

Let us now enter the arena at that point in space and time when the Monad — our 'Father in Heaven' — after its peregrination among the stars, nears the Earth's atmosphere, and the Reincarnating Ego, dreaming within the heart of the Monad, stirs as the closing scenes of its blissful dream-state are blurred by the attractions of past forging that entice it to Earth. Just as an aeroplane descending from a high altitude breaks through the lower clouds, and encompassing the panorama of its homeland stretched before it, follows the lead of its own beacons to its landing-place, so the Reincarnating Ego dispels the quiescence of the period of assimilation, and pausing, seeks through its ray its chosen media for a period of active manifestation in the life-to-be.

Effect inevitably follows cause, consequence infallibly follows its originating action, and this Chain of Causation

lasts from eternity to eternity, as a concatenation of interlinked 'events' succeeding each other in regular and unbroken serial order: an endless chain in Nature of action and reaction, belonging to each peregrinating being or entity, a chain which, precisely because it is made by the being or entity itself, and is indeed itself, is ethically absolutely just and, considered as consequences, is compensatory or retributive from its beginning to its end.
— *The Esoteric Tradition*, p. 649

The earliest contact made by the Reincarnating Ego is in the atomic realms. There it attracts to itself a life-atom, one of intimate past association in its own atomic life-stream, and thereby this particular and hitherto temporarily dormant life-atom is quickened into active participation in the process of a new reimpodiment. As a vital life-germ it enters the aura of the father and mother-to-be, drawn thereto by psycho-magnetic attraction and through the channels of food, water, and air. The positive aspect of this vital germ finds lodgment in the body of the man, and the woman is the bearer of the negative portion of any such seed of future rebirth; and as one of the incomputably great number of life-atoms which form the body of an adult human being, there it awaits the turning of the wheel of destiny. When the moment of conception arrives, and all other conditions are appropriate, the process of reincarnation moves on to its consummation.

In this regard it is fascinating to speculate on the history and affiliation of the numberless life-atoms now sojourning in our bodies. When we realize the intricate interblending, racial and national, presented by the average family 'tree' on the physical plane alone, and quite apart from affinities of thought and spirit, such animosities as racial prejudice and national antagonism are seen to be but the wild phantasmagoria of blind ignorance, for

all human beings are linked together, not only by the bonds of emotional thought or feeling, but by the very fabric of the universe itself, all men, as well as all Beings, springing from the inner and spiritual Sun of the Universe, as its hosts of rays. . . . It is this interior unity of being and of consciousness, as well as the exterior union of us all, which enables us to grasp intellectually and spiritually the mysteries of the universe; because not merely ourselves and our own fellow human beings, but also all other things that are, are the children of the same Parent, Great Mother-Nature, in all her seven and ten Planes or Worlds of Being.
— *Fundamentals of the Esoteric Philosophy*, p. 532

In the case of the genealogy of a family, of what does such interblending consist save the constant interchange of life-atoms, and the resultant human impress made on all such transmigrating entities!

From the moment that the Reincarnating Ray of the Ego makes its first contact with our physical sphere, it is attracted to, and attracts unto itself, its atomic offspring of the past, so that the 'new' body is in reality a continuation product, generally improved and not deteriorated by transmigration, of the one used by the Ego in a past life. This aspect of reincarnation is therefore seen to be a gradual and progressive one, and is punctuated by certain events of which the quickening, adolescence, the prime of life, and 'death,' are points which mark definitely increasing contact with the spiritual influences emanating from and through the Ego.

The quickening occurs, when, after its early vegetative growth the embryo first feels the higher and more spiritual influences of its Ego, and this process continues in ever increasingly greater expansion of faculty, until with adolescence the highest attributes

in the child's constitution come into relatively full manifestation on this physical plane. But incarnation, through the body taking into its constitution life-atoms on every plane of being, continues right up to the time when, in preparation for birth into realms of greater ethereality and spirituality, the Ego begins to withdraw. With 'death' the entire aggregated unit of physical life-atoms, the physical body, is set aside, and the then ex-carnate Ego passes once more into a phase of assimilative quiescence within the encompassing protection of the Monadic Consciousness, in other words, into Devachan.

In this assimilative phase all the effects which accrue from the contact and experience of the past life are built into the Ego, so that, with the life-atoms it impressed with its dominant characteristics — and which impress has led them towards further growth during the interval between incarnations — the Ego on its return to another earth-life builds a body which is the same as that used in the previous life, in that it is constructed of the same atoms. Yet it is different, in that the intervening processes of evolution should have generally strengthened and improved every portion of the entire constitution. This, as the ancient Wisdom teaches it, is the Cycle of Reincarnation.

Thus in the drama of birth, we have as foci, inextricably linked by psycho-magnetic affinity for the coming into being of a consciousness seeking re-embodiment on earth, a triangle formed of the Reincarnating Ego which through its Ray contacts and links a life-atom, its own offspring, to the parents-to-be, who, in the sacred association of marriage, close the triangle and bring into being the diamond, which, with its four points is the symbol of physical manifestation: we can follow the Reincarnating Ego, an offspring from the Monad, as, impelled by the compassion which is behind all evolution, it leaves the inner, causal realms, and, drawn partly by choice and partly by karmic obligation, enters

the visible sphere of Earth, where it is clothed by its life-atoms in the garments fashioned of the sevenfold elements of Nature's physical constitution. Thus the Reincarnating Ego not only cements its contact with the physical universe, but in the sacred bonds of love and marriage unites into a composite whole the manifold aggregated units of its constitution for the purpose of mutual, constant, and ever-greater growth.

Love is the most magnetic thing in the Universe; love attracts love; its whole essence implies and signifies union and reunion, reuniting, and bringing together anew.

The impersonal Eros of the Universe is the cosmic energy which holds the stars and their respective planets aggregated and coherent in their courses, and it governs the building and the structure of the atoms. It is all-permeant and in consequence all-powerful. It is the cause of the energy which works in such myriad forms and everywhere, operative alike in star and in atom, holding them together in inescapable embrace; yet, marvelous paradox, it is the same power which guarantees the individual integrity of every cosmic Unit. It is also the mystic and wonderful magnetic sympathy which brings together human beings, man to man as brothers, woman to woman as sisters, and, in one of its human fields of action, in the merely human sphere, man to woman and woman to man in a genuine marriage. — *The Esoteric Tradition*, p. 650

WHY STUDY THEOSOPHY? — *J. Emory Clapp*

In his essay on 'Experience,' Emerson, the great American philosopher, says of life:

We wake and find ourselves on a stair; there are stairs below us, which we seem to have ascended; there are stairs above us, many a one, which go upward and out of sight.

Thus, man is placed in a position of uncertainty as to his origin and destiny, but we note that the wise Sage of Concord postulates a condition of progress. Still, the inquiring and percipient nature of aspiring human beings will not be content with the mere statement of progress. It wants to know where man came from, whither he is going, and why he is here. It requires even more, something that will satisfy the intellect, enlighten the understanding, and give love and peace to the heart. The study of Theosophy will answer the above questions, and with its sublime doctrines it is the only thing that will give a logical and satisfying answer. Therefore, mankind should study Theosophy.

There are three channels through which mankind searches for wisdom, and yet the three are really but aspects of one road or pathway which leads to Truth. These three channels are Religion, Philosophy, and Science. Yet no man can solve the problems of life through any one of these alone. One might just as well try to solve the problems in arithmetic by the sole use of addition or subtraction or division. Unfortunately, most truth-seekers have specialized in but one of the above means for the attainment of knowledge; hence the knowledge which they have obtained has been incomplete and one-sided. Theosophy uses all of these channels to show the pathway to Truth, and thus appeals to all types of minds.

If we go back about fifty or sixty years we find that Religion and Science were at war. Philosophy was standing aloof. Investigation carried on by the scientists of that day had demonstrated the fact that the Bible could not be relied upon as a source of information regarding the so-called creation, for it showed that this earth, instead of being but a few thousand years old, as estimated by the chronology put forth by Archbishop Usher, was hundreds of thousands, nay, millions of years old, as shown by the records of geology.

At that time there appeared on the scene one who was destined to throw confusion into the ranks of the materialists, overturn dogmatic creeds and beliefs, and revivify age-old teachings which had a basis not only in religion and science but also in philosophy. This individual was a woman of noble Russian parentage, with a penetrating intellect, an all-encompassing mind, and a heart filled with compassion — Helena Petrovna Blavatsky. In 1875, with the assistance of others, she formed the Theosophical Society, and through this as an instrument she began to give out that ancient wisdom which she denominated 'The Secret Doctrine.' She defined this as "the synthesis of religion, philosophy and science," and stated that this doctrine had been brought to primeval humanity by advanced spiritual entities who had attained a high degree of evolution in other worlds and spheres. Furthermore, this doctrine with its teaching had been checked and rechecked by great sages and seers all down the ages, such sages and seers being merely men who through their own efforts had reached a much higher stage of evolution than the average of humanity. The popular name of the philosophy expounded by Madame Blavatsky is Theosophy.

Fellows of the Theosophical Society, students of this ancient wisdom, have found in it an answer to all the problems of life;

and, strange and improbable as it may seem, the statements given by H. P. Blavatsky to an unbelieving generation have had their truth demonstrated along many lines time and again, through the discoveries of modern science, the researches of archaeologists, and the general advancement of human knowledge.

Furthermore, H. P. B. showed that all the truly great Religions had a common origin, and that their teachings when properly understood were not antagonistic, but complementary. One of the proofs of their common origin was the fact that the same system of ethics ran through them all, like a silken thread linking them together.

All of these facts can be found in her writings, chiefly in *The Secret Doctrine*. In this marvelous work she anticipated all the chief discoveries of science which have been made up to the present time, during the interval since this book was published in 1888. She hinted at the discovery of the X-ray, elucidated the composite nature of the atom, and the electrical basis of matter. She stated that matter and force were but the two opposite poles of the same thing, and even previous to this, in the early '80s, one of her Teachers, to whom she gave credit for all her vast fund of knowledge, made the statement:

For indeed, there is but one thing — radiant energy, which is inexhaustible and knows neither increase nor decrease.

In a popular scientific work published within the last two or three years, under the title *The Great Design*, one of the contributors stated the same thing in slightly different words: namely that radiation is the fundamental stuff of which the universe is made.

A new presentation of Theosophy by G. de Purucker, entitled *The Esoteric Tradition* has recently been published. In it Dr. de Purucker, who is the present Leader of the Theosophical Society, demonstrates that the discoveries of modern science as far as

facts are concerned, have agreed fully with the esoteric philosophy, Theosophy, and that even the hypotheses and theories advanced by the most eminent scientific thinkers, such as Einstein, Eddington, Jeans, Millikan, Planck and others, are constantly approaching more closely to the Theosophical concepts. Owing to the great advances made by these outstanding scientific thinkers, Dr. de Purucker has been enabled to give out much more of the esoteric philosophy than was possible when H. P. Blavatsky wrote *The Secret Doctrine*. This fuller exposition of Theosophy would not have been understood at that time, simply because so many of the scientific ideas then accepted were erroneous and therefore antagonistic to certain truths which can now be revealed.

While this article is not intended to be in any sense an exposition of Theosophy the writer believes that a glimpse at some of its most important doctrines will show the logical basis for the philosophy and demonstrate to the inquiring mind that it is worth investigation. He will therefore call attention to a few of its basic teachings.

The most fundamental teaching of Theosophy is that of Universal Brotherhood. This doctrine is not based upon sentiment or emotion, but upon the grand and sublime concept that this great universe is a unit — that every part of it is essential, and that the essence, the Heart of the Universe, is Divinity itself. Every human being, therefore, lives and manifests within that Divinity, and the inmost core of his being is a spark of that Divinity. This was taught by the Christian Initiate known as the Apostle Paul, in the following words: "In Him (or It) we live and move and have our being."

There is but one law in the universe. It is called the Law of Karma, and it is that which tends to restore harmony when it

has been violated by conflicting wills of human beings or other entities. From this 'law,' so-called, all other laws of Nature have been derived.

Evolution, or growth, or progress, is another cardinal doctrine of this ancient wisdom. It differs materially from the Darwinian idea, however, although many of Darwin's followers feel that this great scientist himself realized that there were weak points in his conception.

Another doctrine which is essential to the full understanding of the doctrine of Karman, previously mentioned, is the doctrine of Reincarnation, or Re-imbodiment. The combination of these two doctrines gives to man hope, and shows him his responsibility to himself and to all other beings.

H. P. Blavatsky and Theosophical teachers who have followed her have made many inspiring statements which I think will help further to demonstrate the need of Theosophy and the reason why aspiring human beings should study it. William Q. Judge, one of the co-founders of the Theosophical Society, made the following statement:

Theosophy is sometimes called the Wisdom-Religion, because from immemorial time it has had knowledge of all the laws governing the spiritual, the moral, and the material.

The theory of nature and of life which it offers is not one that was at first speculatively laid down and then proved by adjusting facts or conclusions to fit it; but is an explanation of existence, cosmic and individual, derived from the knowledge reached by those who have acquired the power to see behind the curtain that hides the operations of nature from the ordinary mind. — *An*

H. P. Blavatsky says of the practical application of Theosophy:

The essence of Theosophy is the perfect harmonizing of the divine with the human in man, the adjustment of his god-like qualities and aspirations, and their sway over the terrestrial or animal passions in him. Kindness, absence of every ill feeling or selfishness, charity, good-will to all beings, and perfect justice to others as to one's self, are its chief features. He who teaches Theosophy preaches the gospel of good-will; and the converse of this is true also, — he who preaches the gospel of good-will, teaches Theosophy. — *Letters from H. P. Blavatsky to the American Conventions*, Letter I, April, 1888

G. de Purucker states that

Theosophy is the explanation of things as they are, the formulation in human language of the principles of the Universe.

— *Questions We All Ask*, Series I, p. 466

He further calls attention to the fact that "Knowledge is of loving deeds the child," and states

This is one of the sublimest truths. Of the mysteries, of the higher mysteries you cannot have knowledge unless your heart is filled with love, and overflowing with it; and knowledge comes from the exercise of the spiritual powers within you. This exercise is most easily achieved in doing deeds of loving kindness, in feeling and practising brotherhood, in helping and sharing with others, in helping others and sharing with them the blessings that you have." — *Golden Precepts of Esotericism*, p. 104

The Theosophist finds in Nature a mighty teacher. To quote from Katherine Tingley,

Out of the great heart of Nature all things proceed, and all things lead back there at last. All worlds and systems of worlds, from the great central Sun to the smallest particle in space, must thrill responsive to the pulsation of that infinite heart of compassion. . . . in every act which partakes of the divine quality of compassion lies concealed the potency of all the spheres. All Nature obeys the command of one whose heart beats constantly for others.

She defined Theosophy as

the inner life of every religion — *Theosophy: the Path of the Mystic*, p. 8. . . think of Theosophy not so much as a body of philosophic or other teachings, but as the highest law of conduct which is the enacted expression of divine love or compassion. . . . Theosophy is the great interpreter of life.
— *Op. cit.*, p. 3

To the aspiring human being I would call attention to the following from Katherine Tingley:

Self analysis, self study, self control! These are the divine, protective power, the golden keys to an understanding of the Self. Oh that you might realize what books of revelation are piled up on the shelves of your own lives! — *Op. cit.*, p. 30

To one who is of a religious nature the following quotation from William Q. Judge should appeal:

Theosophy is the divine soul of religion, the one key to all Bibles, the riddle reader of all mysteries, the consoler of the heartweary, the benign comforter in sorrow, the alleviator

of social miseries. You can preach its lesson before any audience in the world. It is the one Pentecostal voice which all can understand.

It matters not what line of endeavor one may wish to follow in life; if it is one that appeals to the higher part of man's nature, one which is generally recognised as partaking of the nature of righteousness (right action) and justice, the study of Theosophy will be beneficial and uplifting. To the true scientist Theosophy will open a new world, the existence of invisible spheres, energies, and beings. To the truly religious man it will show the pathway leading to the Heart of Divinity. To one of a philosophic trend of mind it will illumine every problem. How can one possibly refrain from studying Theosophy if he realizes these facts?

And to those reading these lines who are dissatisfied with their present condition may I address a pertinent question? Are you satisfied with the outer husks of existence? Don't you want to experience the *fulness* of Life — Self-expression in its true sense? If so, study Theosophy, for Theosophy will show you the Way, the Road, the Path. It will show you how to control your tawdry, acquisitive, personal lower self — to raise it, in other words, until it becomes 'at-one' with your higher, superior, Universal Self. Thus even in this life you may begin to manifest the splendor of the Christ within; and as "To live to benefit mankind is the first step" on the path you will doubtless want to join your brothers and companions in a united effort "to benefit mankind" by joining the Theosophical Society and thus participating in its noble effort to enlighten Humanity and to bring about a true expression of Brotherhood.

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

THE END OF THE WORLD?

In November, Sir James Jeans, in a lecture before the Royal Institution, claims that the Moon is slowly spiraling toward the Earth and that in 36,000,000 years it will begin to threaten the Earth with destruction. When it gets within 20,000 miles it will break into pieces, some of which will fall into orbits of their own and form rings around the Earth like those of Saturn.

Astronomers have already threatened our poor Earth with several methods of extinction — the freezing process, when the universe reaches thermodynamic equilibrium or 'heat-death'; the cremation method, when the Sun blows up as a *nova* or 'new star'; and other methods as well. And now it seems that our old friend the Moon will betray our confidence unless we can find some means of frightening it off when it comes too close! But perhaps the astronomers are a little premature in their croakings. It may be that the solar system is organized on a systematic plan which cannot easily be disrupted by accidental or chance causes. A little Theosophy would be useful to some of our scientists whose theories sometimes make our flesh creep!

But after all, Sir James Jeans is not to have it all his own way. That mysterious goddess 'Science' speaks with more than one voice, it seems, for here comes Professor H. N. Russell of Princeton University, no mean authority in astronomy, who tells us in his new book *The Solar System and its Origin* that owing to the retardation of the Earth's rotation, the Moon's distance is

increasing. He quotes Dr. Jeffreys, who considers "that the Moon has been separate from the Earth ever since the early catastrophe that formed the planets"; that at its nearest it was about 8000 miles from the Earth; that it spirals *away* from the Earth about five feet in a century, but that it was, in all probability, never united with the Earth. From Dr. Russell's calculation, supported by that of other eminent mathematicians, it is difficult to understand how the Moon escaped breaking up before it got safely through the 20,000 mile danger zone mentioned by Dr. Jeans. Was it because the Earth and the Moon had not then solidified?

However this may be, it is curious to observe how little scientists really *know* about the Cosmos. Some are more ready to admit this than others. Dr. Russell is one who rightly claims that "the Solar System is most certainly not a product of chance," but also he says that no one can indicate how it originated in detail; all that it is possible to accept is: "that we may reasonably regard its birth as the merest accident in a far vaster process, — the shaping of the material Universe as we know it. What lay behind that shaping we do not know."

Why not dare to conceive that *conscious* creative Power lies behind the processes of 'Nature'?

FIRE-WALKING

Since the second experiment by the Kashmiri yogi, Kuda Bux, mentioned in our last issue, a most entertaining and instructive correspondence has been raging in *The Listener* (London) — instructive to students of Theosophy because it illustrates so bluntly the necessity mentioned by H. P. Blavatsky of demonstrating the existence of the astral and the like, before what she calls 'the quarrel' between physical science and the esoteric teachings can be healed. The difficulty that the regular

scientists have in accepting any possibility of so-called occult laws in Nature, and above all, their profound hesitation in accepting the possibility that any human beings — adepts — know these laws and can make use of their knowledge, are plainly set forth in this correspondence.

The facts as described and admitted are undeniable; they are in harmony with similar exhibitions carefully reported from many parts of the world, and by thoroughly responsible people of European and American nationality; and 'fire-walking' has been done by white men who have all declared that they felt no heat or other inconvenience, and who were not even singed, much less blistered or burnt, even after walking on red-hot charcoal for ninety feet! But as the correspondence and other literature show, the most ridiculous and contradictory 'explanations' are offered to save the admission that there can be anything but jugglery in the fire-walking. One distinguished scientist entered on his investigation not in the scientific attitude of an observer and recorder of an alleged fact in Nature hitherto neglected, but, as he said, with the object of showing up what he claimed to be a fraud! The regular explanations — the supposed rubbing of the feet with salt or alum or other chemical preparations, the horny foot-soles, the 'coolness' of the fire, the thick layer of ashes, the hasty rush, and others — were put out of court by the precautions of the committee in charge. Failing to solve the problem by these suggestions, one prominent critic of high scientific attainments asserted that it was very simple, after all: the performer's feet were *damp*, and were naturally protected by the layer of vapor that immediately arose from the heat. Unfortunately for this brilliant idea, another equally competent observer made the point that the immunity from the least injury arose from the fact that Kuda Bux's feet were perfectly *dry*!

Evidently these learned gentlemen had not taken the precaution

of comparing notes before they made their final decisions! Anyway, the present position is that no one has given any satisfactory explanation, and that Kuda Bux promises to give another demonstration at a later date, when he will *stand* on the fire and will place a sheet on it that will not scorch. He also asks for volunteers among his critics or others to make two walks, "one with his approval, and the second without." This experiment has been tried before in India, and the *unprepared* walkers (some of them English) who had 'permission' of the yogi in charge were perfectly comfortable; the others did not go far! In a recent case reported in *The Listener*, the walkers were unharmed as long as the yogi kept up his concentration, but they had to get off the fire quickly when he warned them that it was no longer safe. The yogi did not walk on that occasion but remained outside the limits of the fire.

IS THE UNIVERSE FINITE?

Dr. Edwin P. Hubble of Mt. Wilson Observatory, in a recent lecture at Yale University, stated that the outposts of the universe have now been found to be 500 million light-years away — so far as measured. The imaginary sphere between the Earth and these outposts, marked by the faintest nebulae or stellar systems detectable, is the observable region of space. When the great 200-inch telescope being built for the California Institute of Technology, which is to be erected on Mount Palomar, San Diego County, is in action, these 'outposts' will be greatly surpassed and we shall see into enormously vaster spaces. Dr. Hubble calculates that about 100 million galaxies resembling the one to which our solar system belongs, the Milky Way, exist in the 'observable region,' and he says they are scattered in a fairly regular way — two million light-years apart on the average — though here and there more concentrated groups and clusters are found. The most interesting point he makes is that nothing whatever has been

detected to indicate any frontier to creation, or even to find anything startlingly different. There is no sign of approach to a void, and in the far-off systems the spectroscope detects elements that are familiar on Earth.

IS THE UNIVERSE EXPANDING?

In spite of all the arguments in favor of this strange notion, it is not finally accepted. In fact, reasons are multiplying against such a possibility. Dr. Zwicky of the California Institute of Technology, in *The Physical Review*, shows that while the relativity theory *partially* explains the peculiarity in the light coming from the distant galaxies, which is called the 'red shift' and on which the expansion theory rests, it is not in accordance with observation in several important respects. Certain other theories, he says, meet all demands and may prove far better than the relativity theory. The installation of the great Palomar 200-inch telescope is likely to decide the problem. Dr. de Purucker discusses the expansion theory in his new work, *The Esoteric Tradition*, on pages 435-8, and suggests that the 'red shift' may be due to a variation in the velocity of light in cosmic space rather than to a supposed explosion in which the galaxies are all fleeing from our locality into some imaginary outer vacancy. Dr. Zwicky has criticized the expansion theory before, and has been partially answered by Sir Arthur Eddington, but he now brings new and stronger arguments.

PROGRESSIVE REVELATION

The broad-minded Dean of St. Paul's Cathedral, London, Dr. Matthews, is again startling the Fundamentalists. He told the Church Congress in October that:

Until quite recently almost the whole of Christendom would have given the same answer to the question

whether there is a revelation of God, and, if so, where is it to be found? It would have replied with practical unanimity: There is a revelation of God *and it is to be found in the Bible.*

After pointing out that the supreme revelation is *not* wholly external to us, and that we could not recognise the 'Word made Flesh' unless the Word were within us — in short, the divinity of man — he concludes a most remarkable address, which we regret not having space to quote more fully, as follows:

God does not dictate from heaven a creed or articles of faith. He manifests Himself through the experience and personalities of His prophets and of His Son. The doctrines of the Church are formulas in which the revelation has been summed up, guarded and preserved. . . . The revelation is not the doctrine. It may be that more adequate expressions will hereafter be found for the spiritual heritage that they have been formed to express. . . . The Holy Spirit will guide us into new truth. And thus the true conception of revelation is not a dogmatic fetter upon freedom; it opens the road to a spiritual adventure which has no end in time, not only the adventure of bringing the world of affairs into subjection to Christ, but the intellectual adventure of understanding the full meaning of the God who showed Himself to us as man.

Allowing for the orthodox terminology used by the Dean and the quaint Western obsession that Jesus the Avatara was the *only* Avatara or 'Son' of 'God,' we may welcome this pronouncement as a marked step forward. The time is coming when the 'formulas,' the rigid doctrines and creeds, will be replaced by more and more true expressions of spiritual realities. Is it impossible that some now living will see the Church of England teaching Reincarnation

and Karman and their implications in place of the vicarious atonement and salvation by faith doctrines, and the one-life illusion?

The Theosophical Forum

TRANSACTIONS OF THE POINT LOMA LODGE: III — *G. de Purucker*

III

[At the meeting of the Point Loma Lodge of the T. S. on the evening of June 9, 1935, the usual course of study was followed, including an address on 'The Hierarchy of Man,' delivered by E. J. Dadd, followed by the usual questions and answers, both questions and answers being thrown open by the Chairman to any member of the Lodge present. The evening was as interesting in the rapid transfer of thought from mind to mind as all these meetings of the Point Loma Lodge of the T. S. invariably are. Unfortunately, however, because of lack of space in this issue, and with a desire not to interrupt the series of Transactions, which are printed as often as they can be made available for these pages, it is possible to print in this number only the following, which, since it is a question asked by the Leader himself, and finally after a most interesting discussion, answered by himself in his own way, will unquestionably furnish material for further thought to all students. — Eds.]

Question by G. de P. — Can anyone here tell us just what is the difference between the *Monads* in man, and the *Seven Principles* in man? Is the question clear? (Discussion.)

G de P. — I would like to hear a great deal more than I have heard. In fact, I know our people know a great deal more than they have said. I would like to have a clearer picture given of why on the one hand we talk about Monads, and on the other hand we talk about Principles. Are these different and disjunct; or are they identic?

(Discussion.)

G. de P. — Mr. Chairman, Companions: I always hesitate to make comments upon the answers to questions that have been asked, because I invariably admire and like these answers. They show deep study, profound reflexion; and yet there are times when it seems incumbent upon me, as a fellow-student and listener, to speak with a certain amount of frankness. All the answers that have been given tonight have struck me as being admirably well said, and showing really deep thought; but I for one am not fully satisfied. Of course we can never reach perfection, but I do not think we have yet received a clear picture of why we Theosophists on the one hand divide the Universe and man respectively into septempartite entities or states of being; and almost in the same breath speak of the different Monads in man. The question was: What is the distinction between the different Monads in man, and the Seven Principles — if any? And what are their respective functions? I asked this question because it is really a very important one. It was at the bottom of the dispute between H. P. B. and Subba Row. Each was right, neither was wrong; but the world did not know the 'why' of the dispute. Subba Row desired to follow the teaching of the Brahmanic esoteric school, in fastening attention on individualities of the Universe, on the Monads, looking upon the Universe as a vast aggregate of individuals.

But our great Teachers, through their mouthpiece H. P. B., for that time of the world's history saw that it was needed to give to the then inquiring Western mind, taking a materialistically scientific bent, some real explanation of what the composition of the Universe is as an entity. What is its 'stuff,' what is man as an integral part of it? Now, the Seven Principles are the sevenfold 'stuff' of the Universe, the seven kinds of 'stuffs.' The higher part of each kind is its consciousness-side; the lower part of each 'stuff'

or kind is the body-side, that through which its own consciousness expresses itself. But every mathematical point in boundless space can really be looked upon as a Monad, because the Universe is imbodyed consciousness in the aggregate; and imbodyed consciousnesses, individuals, Monads, distributively. Do you follow me thus far? Good!

To take a picture derived from the scientific view of the Universe as it is held today: our scientists now say that the Universe is builded up of chemical elements amounting almost to one hundred — ninety-two, I believe, up to the present. These together form the 'stuff' of the Universe, divided into so many minor varieties or minor 'stuffs.' Do you catch that thought? Now, replace these different scientific chemical elements with your sevenfold 'stuffs' of the Universe; the Principles or elements of the Universe, all through the Universe, therefore aggregatively forming the 'stuff' or substance of every individual belonging to the Universe. Do you catch that thought?

Therefore, when we speak of the Seven Principles, or seven elements, of man, we mean the septempartite 'stuff' of which the Universe or man is builded, and the same everywhere. Why? Obviously, the part contains what the whole is and contains. If it were different from the whole, it would not be a part of the whole. Therefore, because the whole is sevenfold or contains seven 'stuffs,' which we may reduce to one element-'stuff,' beginning-'stuff,' causal-'stuff,' therefore every portion of the great whole contains just the same. Therefore man has seven (or ten) principles or elements precisely because the Universe has.

Now then, what are these? That is the point that it was so important to bring out in H. P. B.'s time. A background of divinity clothing itself in spirit, these bringing into birth the light of mind; and the light of mind then co-working with the other principles

and elements thus far evolved, brought forth 'Cosmic Desire'; and so you go down the scale, until you reach the sthula-sarira, which, by the way, does not mean physical body but substantial body, gross body on whatever plane, concreted, compacted, whether the plane be physical or spiritual or divine or what not. Sthula simply means compacted, concreted, commonly called gross. That is very clear. Even our scientists today teach us that the Universe is builded of radiations, light, energy, the same thing.

Now, these are forces; but when they become enormously concreted and compacted, they become gross stuff, which the higher forms of radiation nevertheless continuously work through. Now then, every mathematical point of space actually we can call a Monad, a point of consciousness, a center of consciousness, because all infinity is infinite consciousness. Therefore every point of Infinity must be conscious; therefore every point is a consciousness-center. Is that clear? Every such point is a Monad — from the Greek word individuality, a consciousness-center. But we have just heard that all the Universe is compacted of a septempartite 'stuff,' which in man is the seven principles or elements — on the higher side, consciousness; on the lower side, vehicle or veil, vesture, sheath. Thus it is that every monad is septempartite, has its Atman, Buddhi, Manas, right down the scale. Why? Because the Universe is builded of these seven 'stuffs,' reducible to one causal 'stuff' — spirit, consciousness, Atman.

I speak with some emphasis about this, because the time will come when we shall have to give an account of this thing, and we must have our own ideas clear and properly co-ordinated. We must not have our minds confused with the idea that the Seven Principles are one thing, and the Monads are something else which work through the seven principles as disjunct from them. That is wrong. Every Monad itself is septempartite. Of what? The

seven principles, which form the 'stuff' of being, consciousness in its highest, body in its lowest. It is a subtil point, and yet it is simple, and is a most important point of thought. Just as the chemical elements form the body of the Universe, which nevertheless forms the clothing of hordes of consciousness-beings, humans among them, so in exactly the same way the seven principles, ultimately reducible to one fundamental or causal principle — spirit, are the 'stuff' of the Universe. And this 'stuff,' every mathematical point of it, is a Monad, and each point is septempartite. It must be, because it is builded of the substance of the Universe, of which it is an inseparable part.

I know that many people say that I am verbose, and that I repeat myself, and that I talk about the "core of the core," and "the heart of the heart," and I continuously say that "man is composite." Why? To drive home key-thoughts; and I tell you frankly, dear Companions, the answers given have shown wonderful reflexion, but they show me that I have not sufficiently driven home what I have been and am trying to drive home, and what I have tried again now.

Please remember that we have here a distinction but no real difference. The Monad, every Monad, is builded of the 'stuff' of Infinity, of the seven 'stuffs' of Infinity. The seven 'stuffs' are the Seven Principles or elements. And one point more: every such principle or element likewise can represent one of the cosmic planes, from the highest downwards, or from the outermost inwards, or vice versa. And yet, every one of these 'stuffs' is itself sevenfold. So that the kama, for instance, the 'stuff' of the Universe we call kama, that portion of our own 'stuff' or our principle which we call kama, is sevenfold. Consequently, there is an Atman of the kama, a Buddhi of the kama, and so forth throughout the range of element-principles or 'stuffs.' Thank you, Mr. Chairman.

WITHDRAW into yourself and look. And if you do not find yourself beautiful yet, act as does the creator of a statue that is to be made beautiful; he cuts away here, he smooths there, he makes this line lighter, this other purer, until a lovely face has grown upon his work. So do you also: cut away all that is excessive, straighten all that is crooked, bring light to all that is overcast, labor to make all one glow of beauty, and never cease chiseling your statue until there shall shine out on you from it the godlike splendor of virtue, until you shall see the perfect Goodness established in the stainless shrine. — Plotinus: *The Enneads*

The Theosophical Forum

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: III — *H. T. Edge*

III — THE CROSS

This subject was treated in special reference to Christianity in *Lucifer* for Nov. 1935, and is resumed here as part of our series on symbolism. The sign of the Cross has been very potent in Christianity, but rather as a glyph than a symbol; which means, according to the distinction made in *The Secret Doctrine* (I, 66) a conventional sign, used to bring to mind the ideas which it stands for; whereas a symbol is not arbitrary or conventional, but sums up in its very form certain occult principles. It is the actual correspondence, among figures, of some universal law, too profound and inclusive to be conveyed in language. The Cross is essentially two straight lines of equal length crossing one another at right angles, but has variants, each expressing some particular shade of meaning.

The initial stages of cosmogenesis or the birth of worlds are symbolized by certain simple geometric figures, of which we have already spoken of one, in the last issue. This was the circle, which by itself represents the primordial abyss of Chaos. Within this there appears a central point, the first germ of all that is to become manifest; it is like the germinal speck in an egg — Nature repeats everywhere the same original process, and the egg is a very pregnant emblem of cosmogenesis. This Primordial Point is the First Logos, or Word, and includes in itself both the positive and negative, or active and passive, sides of manifestation, which two have not yet become differentiated from each other. Thus it is sometimes called androgyne or double-sexed; but in using the words 'male' and 'female' in these connexions, we must be careful

not to give a physiological sense to them, as they have about as much to do with that as have the terms dextro- and laevo- in chemistry, or positive and negative in physics.

The next stage in Cosmogogenesis is represented by the same Circle with a horizontal diameter crossing it. This signifies a divine immaculate Mother-Nature within the all-embracing infinitude. When the horizontal line is crossed by a vertical one, we have the symbol of Father-Nature added, and the two together form the Mundane Cross and stand for the manifested universe. This duality of Spirit and Matter, Force and Form, Energy and Inertia, etc., pervades the universe, not only in the planes of objectivity, but also subjectively, in our mind, in our feelings; and on the highest plane of all these two intersecting lines may stand for the Divine Thought acting in the Divine Mind. It is impossible to give more than a sketchy and introductory explanation here of these pregnant symbols, but the reader may be referred to the opening pages of *The Secret Doctrine*, where these diagrams will be found, as well as to many other parts of that work.

The Cross is found in a widespread trinity of symbols — Circle, Crescent, Cross, which denote Spirit, Mind, and Matter respectively. The three combine in the symbol of Mercury, denoting a man, with the Crescent for his brain, the Circle for his Heart, and the Cross for his organs — Head, Heart, and Hands, as we may say. Development in biology shows the extrusion of polar elements from the central nucleus, whether in the germ cell or in the seed which sends shoots up into the air and down into the earth. Various combinations of these three symbols make the symbols of planets, and we find them again on standards, as the Star and Crescent of Islam, the Cross of Christianity, and the Sun of Japan. The Circle is the Sun, the Crescent the Moon.

The most interesting meaning of the Cross is its connexion with

Crucifixion. It signifies the 'Word made Flesh,' the incarnation of Divinity. And so it stands for the Christ, the Divine Self of every man, which is said to have been crucified on the Cross of Matter, or to have taken up the Cross — that is, worldly life — in order to *redeem* the animal nature of man. Paul in his Epistles dwells much on the idea of the Christ being crucified in us. This is the real sacrifice; for the God is exiled thereby and has to undergo the tribulations of mortal incarnation; but the sacrifice is made in the spirit of Love, and a reluctant sacrifice is no sacrifice at all. The universal and ancient truth of the redemption of the flesh by the indwelling God has been turned theologically into a special atonement made by a special son of God at a particular place and time; and the sacred allegory found in the Gospels has been taken to refer to an actual execution. But this idea loses force when we find that many other religions besides Christianity have the same story of a crucified Christ. Some confusion may be caused by the fact that Paul uses the word crucifixion sometimes to mean sacrificing: he speaks of crucifying the flesh, but here he is evidently using the word in a different sense from his use of it in speaking of Christ being crucified in us. The Cross in Christianity has descended from a symbol into a mere glyph: its significance is lost, and it remains a reminder, a banner.

We spoke above of the need for avoiding a gross interpretation of symbolism, but this has actually often been done, and a word of comment is required. In degenerate times, there has always been a degradation of symbolism. The two lines of the Cross represent the male and female creative potencies, which on the highest plane are the Divine Thought in the Divine Mind. But, owing to universal analogy, the same symbol may also illustrate the active and passive natural forces in physical organisms; and so we find cults for the deification of the procreative powers. These powers are innocent natural functions when confined to their proper use;

but if deified, we get licentious cults, and in this way the Cross may acquire a sinister meaning.

The Cross has other forms besides the equal-armed or 'Greek Cross'; the form adopted in Christianity is sufficiently familiar, and has perhaps been chosen from confusion with the Roman method of execution. Sometimes the crossbar touches the top of the upright, forming the Tau. Each of these variants emphasizes some particular meaning, and it would require many articles to go fully into all. When six squares are arranged so that three are horizontal and four perpendicular, we get a figure like the Latin Cross and representing the six faces of an opened-out cube. If a Cross is inscribed in a Circle, the segments of the lines are in geometrical proportion, and the ratio between the arms in various cases may suggest mathematical keys. An alternative to the Tau or the Cross is the Tree, found in *Genesis* as the Tree of Life, in the Norse Yggdrasil and the Indian Asvattha Tree. It denotes material Nature, and round it is often twined a Serpent, denoting the life-forces operating in cyclic path through the planes of Matter. When the arms of the Greek Cross are bent at the ends, we get the Svastika, the bends being intended to convey the idea that the Cross is rotating like a wheel. This indicates the eternal motion of the elements and shows how equilibrium is attained by maintaining a neutral center amid continual changes.

Thus we have touched the high lights in this profound subject, and may conclude with the hope that this will lead to further study.

DIALOG BETWEEN THE HUMAN AND THE SPIRITUAL EGO —
Leoline L. Wright

I do not know you, but you trouble me. Why do you stand there behind me? I do not wish to listen to you — I cannot see you, and I am tired.

No, you are not tired. You are only tired of being as you are at present.

What do you mean?

If a friend came to you and said: Here are all things necessary for you to make a journey to a wonderful far country, would you be too tired to go?

No indeed! The mere idea puts new life into my veins. But that is the trouble — no one will come to me, a tired, middle-aged failure, with such an offer. Why do you mock me? Go away!

I am your friend. Will you indeed go upon such a journey?

You! — my friend? I cannot even see you. What can you do for me?

Poor slave of the treadmill, I can open the door and set you free!

Treadmill! That just expresses it. That is my life — and I am tired to death of the daily grind.

Yet the door of your cage will open. It is only that you have not found the threshold.

But you spoke of a journey. Have you come to offer me the means for it?

Yes.

And to what far country shall I be going?

What country do you most wish to visit? Think carefully, for if you do not choose aright I may not come again.

Oh, then, let me think! There is Egypt the magnificent, and Persia, land of gardens. I have heard of Samarkand, and Kashmir of romance and roses; India, and Java, Japan. Advise me — where ought I to go?

There is a country more delightful than any of these ancient tragic places.

I have never heard of it.

You have dreamed of it in moments of unconscious longing.

Then it is nothing but a dream! I might have known! You are only mocking me. Begone!

It is no dream. It is more real than the earth you stand upon. Listen! Think! Am I indeed mocking you? . . .

I could almost swear that you are not. I cannot see you, but your voice comforts me. There is a clearness all about me that is like the moment before sunrise. . . . Yes, you yourself come from that country. I feel it! I know it! I will go with you to that far wondrous land — I will follow you!

But first you must pass through the door out of your prison. Shall I tell you how you may discover it?

Yes — yes! I cannot wait to start.

Tonight at midnight, someone, it may be a messenger from the gods themselves, will come to you. He will show you the hidden threshold. Until you have found and crossed it I must bid you farewell.

.....

So! You are come again. Often I have looked for you and longed for that strange bracing clearness I feel again about me now. But I have never found the threshold. The messenger you promised did not come.

Did no one come?

Oh, yes. At midnight, as you said. But not a messenger.

Who then?

The son of my enemy. My enemy himself lives far away but it happened that his son was visiting in this place. And this young man came to me in his terrible need at midnight.

Why was the man your enemy?

Because he had led my boy astray, so that he was sent to prison in that distant town where my enemy lives; and in prison he died of a broken heart. Was not this man my enemy to the uttermost?

It would appear so. But how did this man's son happen to come to you — his father's enemy.

He had heard his father speak of me as living here. He knew nothing of the hatred between us. He supposed I was his father's friend.

And so he came to you at midnight. What did he want?

He had accidentally killed a man, but it did not look like accident. He wanted me to hide him. The police did not know that he knew me, and would not look for him under my roof.

There then you had vengeance within your hand. You could do unto your enemy's son even as he did to yours. You hang your head in shame. I see you must have given him up.

No, you may think me a weak creature, but I could not do that. He trusted me, you see. If there had been someone like me to help my boy in that distant city when he was in danger I might not have lost him. I could not betray this boy. I took him in then, and sheltered him and helped him finally to prove his innocence. Later his father came to me, an old and broken man. And I forgave him.

And you are ashamed of this? You hang your head before me.

Oh no! I am just beginning to feel sorry because I realize I had quite forgotten about the journey. I have been happy in helping these people who have turned from enemies into friends. One thing has led to another — -

You are no longer tired?

I am busy.

And you will not go to the far, happy land?

I am happy here. All I ask is work, and a chance to love, and the joy of helping all who need me. It is odd, but it seems there are many. Only I would beg that you will remain and be my Companion, shedding upon me the clear beneficence of your shining. . . . For now in this moment I see that You are the threshold and the doorway, and that in my own heart I have found the deep and wondrous country where I may abide in You.

The Theosophical Forum

QUESTIONS AND ANSWERS: 298-301

QUESTION 298 (Questions 298 and 299 were answered by the Leader in Liverpool, January 6, 1933.) *To the ordinary man in the street it sometimes seems strange that man should have to go through all the sorrow and suffering he has, in order to reach perfection, and that it should have to last such a long time. I should like an answer from you so that I may pass it on.*

G. de P. — Why is it that sorrow and suffering are in the world, and that they are so enduring? My answer may seem a little hard, but some things in life at first blush do seem a bit hard; yet when understood we find that the 'hardness' is merely the strong hand of the Law guiding our footsteps. Here is the explanation: All growth is attended with growing pains; a change of condition is a change of state and of consciousness, and human nature in its weaker parts, such as we human beings possess, is so constituted that it rebels at changes; it likes to remain in the old ruts, to run along the familiar lines which humanity has followed for so many ages. But sorrow, pain, suffering, even sickness, are among our best friends.

Now this seems like a hard saying, a dark saying; but how true it is! Consult your own lives. What is it that has put steel into your characters? What is it that has opened your hearts to compassion, rendered perhaps hard and unkind by prosperity and slothful ease? It is the jars and the knocks of misfortune. It is sorrow that teaches us fellow-feeling, sympathy, pity, compassion, that teaches us to help others, so that we now understand their tribulations, so that we now understand after we ourselves have suffered and sorrowed, what they are going through. It is sorrow and pain and suffering that refine us. We are like the ore cast into

the molten furnace, into the melting heat; and sorrow and pain purify us so that we come out bright and glittering gold.

Be not afraid of sorrow; be not afraid of trial. They are our best friends; and see what a manly doctrine this is. It is a doctrine of compassion; it is broad-minded, it is human, it is humane, it is sympathetic, it is full of wisdom and quiet peace. The heart which has never been wrung with sorrow has no fellow-feeling for others. The mind which has never been tormented with sorrow and doubt has a veil before it. Sorrow and doubt awaken us, quicken our intellects, open our hearts, and expand our consciousness; and it is sorrow, suffering, sickness, pain, which are among the gentle agents, the merciful ministers, of the evolutionary process. The man whose heart has never been wrung with sorrow cannot understand the sorrows of others. The man who has never sorrowed, knows no greatness. He is great neither in heart nor in mind. Greatness, ethical majesty, spiritual and intellectual power, spring forth from trial.

QUESTION 299. *Your words come from a temperament that has undoubtedly found peace, but my dilemma is this: and I should like your opinion regarding the universal scheme of things. There is no doubt that we are part and parcel of the Universe; but when we come to think that the scheme of creation that you have been eulogizing is based on universal slaughter, and pain and anguish, I as a man who believes that our lives should be a peaceful transition from youth to old age, and that our life should be a period of enjoyment and happiness and joy — I would very much like your opinion on the origin of evil. This terrible intelligence, this wonderful power, this horrible force, that governs the Universe, whatever it may be — to me it is diabolic. It fashions the tiger, it gives the unfortunate animals no opportunity to get away from the danger that surrounds them. What gives the poison to the snake, the fangs to the tiger, the idea that men should fight each other and*

slay each other, if it is not that we are nothing but a conflicting hierarchy of conflicting ideals, destined some day to rise out from this cosmic turmoil, and to enjoy celestial bliss?

G. de P. — What you have pointed out is of course something that occurs to every student of life and of the things around us. I remember that when I was a boy, this very question was the first one of a serious character that occurred to me, and it was only when my eyes were opened that I learned that happiness without contrast cannot exist; that there is no peace which has not been earned. How many times have I not as a child, as a young man, said to myself: They talk about Almighty God, a merciful Father, and yet the Universe is filled with strife and pain! Evil sometimes prevails over good, at least temporarily; what a monster God must be, the Maker of it all, to have made things thus!

Your thoughts are very natural indeed and have my deepest sympathy; but we must accept things as they are, and the explanation of the problem is this: that no 'God' is the maker or creator of the iniquities of which you speak. Beside the poison is its antidote; beside disorder is order; dishonor proves honor; darkness could not exist except for light. We cannot at once change our portion of the material universe with all its evil phases; but these are only events in the marching army of beings passing forwards and upwards through space-time. As I said, it is out of suffering that we learn; and thank the immortal gods that the Universe is so constituted that we can learn. Fancy a Universe so constituted that there was nothing in it but peace and happiness, and dull, inactive sloth lasting unto eternity! It would be a hell. There is something within me which yearns to bring light to those who have it not; there is something within me which yearns to give the compassionate hand; there is something within me which is more precious than my own being, which makes me yearn to help my fellows. Fancy what it would be if I

were deprived of this exquisite joy of doing my bit to raise the world's burden.

Mark you, we cannot make the Universe different from what it is, and it is what it is because of karman — the intricate and intertwined karman of uncounted multitudes of beings learning through growth and suffering and pain to take part in the Cosmic Labor guided by Compassion, infinite Sympathy, and Love for all that is, to join the hosts of the bright gods. The horrors that the gentleman speaks of most certainly exist; but ineffable beauties exist also. Why not likewise speak of the beauties in Nature? Why not speak of its orderliness, its law, peace, growth, and the expansion of consciousness that all beings undergo throughout the cycling periods of time? Why not speak of the beauty of natural being as well as of its horrors? Disease exists indeed, but so does health. Crime exists, but so do men who are no criminals. Horrors exist, but so likewise are they counterbalanced by the beauties, and by the symmetrical, shapely, and holy things in life that are an eternal joy.

The Universe is as it is; and these horrors I now will explain, giving you the Theosophic teaching of the origin of evil. Briefly, then, all these things exist in and from evolving creatures, imperfect entities, innumerable multitudes of them, all learning through suffering and sorrow and pain to become orderly, to be loving, to be compassionate, to be peaceful, to be inwardly and outwardly beautiful — in the original sense of the word beauty.

All this reminds me of the old Christian idea of Heaven. I remember what my dear father, who was a clergyman, taught me about Heaven: If I were a very good little boy, when I died I would surely go to Heaven and sit on the right hand of God and sing songs eternally. That course of life did not appeal to me at all. It did not answer anything in my own being; and when I grew

older and heard the arguments that were given to men, and likewise the philosophical ideas current among men concerning so-called immortality I rejected the immortality as presented, because this immortality was merely a speculative immortality of the personal man with all his imperfections, manifold and sometimes monstrous; and I could not stand the thought that if that doctrine were true, I was destined to pass eternal aeons without end as an imperfect entity; no matter how much I might change, I was supposed to be always the same egoic being. No, I wanted to grow in a different manner; I wanted to become greater, and to give vent and expression to the locked-up spiritual and intellectual and other powers within me. I discovered that there is no immortality for the personal man, because if there were, then the personal man *must* remain relatively unchanged. If he changed in the remotest way, he was then no longer the same — and the supposed immortality vanishes. Do you see my point? Instead of immortality of the personal man, we Theosophists say that there is eternal, endless evolution, endless growth, endless expansion of faculty, of power, always bringing out more and more what is locked up within, passing from the low and evil regions of the Universe up into the higher; and when there, turning and extending a compassionate hand in help to those in the lower darkness. I learned the great and profound truth that even the ego changes, that even the spirit evolves to vaster things, so that the immortality of the ego, or what is called the personal man, was but the vain dream of an obscured imagination.

Evil certainly exists in the world, but it arises out of the fact that the world is filled full with imperfect beings and entities — just as there are likewise innumerable hierarchies of relatively perfected and godlike beings. Because the former are imperfect, they act in consequence in distorted and what we men call evil ways. This

produces the disharmony, the preying of entity upon entity, and the consequent suffering and pain. Follow out this profound teaching. As just stated, above these multitudes struggling in the lower realms, there are the great regions of the gods. It is quite possible that they may have their problems too, and personally I think they have; but they are regions which to us human beings are incomparably light, holy, majestic, and our inner spiritual and intellectual natures are native there. From there, come into our minds and our hearts our noblest impulses to do deeds of good; our noblest intellectual aspirations are born in these inner divine and spiritual realms. In fact, our spirit is native there.

QUESTION 300. *Explain multiple personalities, if true.*

H. T. Edge — I cannot call to mind any authoritative pronouncement on this topic, and do not feel learned enough (or ignorant enough) to be dogmatic on my own account. The first step to explaining a thing is to have a clear-cut idea of what it is one is seeking to explain; and one feels that it would be better to have a definite case of the disease before one, instead of having to prescribe for a mere term. That term may cover more than one different kind of disorder, erroneously grouped under one definition but being differently caused. The dictionary defines multiple personality as a psycho-pathological derangement wherein two or more different 'personalities' compete for self-expression through the physical instrument; and adds that these personalities may be struggling together at the same time, or may alternate in their possession of the field, and that they may have no knowledge of each other, or that A may have knowledge of B, while B has no knowledge of A, etc. It seems clear that such a condition is a morbid exaggeration of what exists normally in the average man, who is painfully aware of the existence in him of several psychic elements contending for the dominance in that mysterious composite which he calls 'I myself.'

Passing from this, we come to various degrees of dementia, such as may occur in disturbed sleep, in delirium, and similar pathological derangements. Here we may find what may be called a change of personality, with varying degrees of loss of memory. Still further, we have the rare cases, produced by hypnotism, insanity, amnesia, and the like, where the sense of one's original identity is quite lost for the time. A certain Dr. Morton Prince has written a book describing his experiences with a young lady, whom he treated hypnotically for such an ailment. His theory was that the normal personality was a blend of elements which had become dissociated and able to occupy the field alternately, thus producing different personalities acting in the same body. The case might perhaps be diagnosed as obsession by psychic entities of some sort, possibly the cast-off remnants of deceased human beings; yet there is considerable ground for recognising, in some of these subordinate selves that appeared, the manifestation of certain elements in the girl's character which she had suppressed.

It is clear that we cannot talk intelligibly on such a subject without analysing somewhat deeply the nature of what is known as personality, its relation to memory, to the sense of identity, and kindred psychological topics. It would also be necessary to have a better understanding of the functions of the brain and nervous systems, and especially of the connexions and interactions of the psychic with the physical. Some help may perhaps be found in the idea that what we know as personality results from an interaction of psychic and physical elements, and in comparing the body to a musical machine into which cardboard tunes are fed, so that the same instrument plays various tunes. But this does not solve the whole question. I may be under the influence of a false self, and yet be aware of my condition; or there may come a moment, a stage, at which I cease to be aware that I am deluded, and the delusion becomes a reality. How define that stage? Is it not likely

that there is some particular center in the cerebro-spinal system, whose derangement marks this change? When the foreign influence ceases upon *that* center — it is *then* that I lose my sense of identity, my memory of my normal self.

One suspects that this is a subject upon which definite knowledge, such as is looked for in books, is not available, on account of the dangerous abuses which would certainly be made of it; and it is surely wiser to eschew such questions of morbid psychological anatomy. Whether occurring in oneself or in someone else, they should be treated as a disease and dealt with accordingly; and the remedy is of course self-control, physical, mental, emotional.

QUESTION 301. *Can the camera catch a picture of a being invisible to the human eye, and record it upon a film? If so, of what will it be a picture?*

I. L. H. — If you mean by 'a being invisible to the human eye' one that exists on a plane above or below the physical, the answer is a distinct *no*; and all claims made for alleged photographs of that kind may be set down to trick photography or legerdemain; for the camera is a physical instrument responsive to physical light and it functions on the physical plane only. Of course, by means of invisible X-rays, infra-red rays, and long exposures, etc., the camera can record photographs of things to which the human retina is not responsive; but these are purely physical and mechanical methods of aiding the physical senses: they are in no sense to be classed with so-called 'astral' or 'spirit' or 'fourth-dimension' photographs, etc., of claims regarding which it is wise to be extremely skeptical.

THE POOL THAT LOST ITSELF — *H. Percy Leonard*

A little pool among the boulders on the beach lay warming itself in the sunshine. A gentle breeze rippled its surface, and tiny wavelets softly lapped upon the margin of the basin where it lay. "Here is my little kingdom," thought the pool every time one of its wavelets broke upon its boundary line. Other pools lay in sight and it was pleasant to compare its ample size, its graceful contour, and its flashing surface, with the lesser attractions of the neighboring pools. Far down the beach lay the ocean, a vast pool which seemed to have no boundaries and whose immeasurable range terrified the timid little pool lying in its petty isolation, behind the guardian ramparts which protected it from all association with its kind. "Here in solitary splendor I shall lie for ever," it mused, "shielded from all contamination with inferior pools and widely separated by a sloping stretch of sand from that appalling ocean whose rhythmic murmurs sound so faint and far away."

Small fish and gray shrimps darted to and fro about its shallows, and it was pleasant to feel itself the patron and protector of these small fry, and to reign as a monarch without a rival in its little kingdom. The sun grew hotter, and mounted the blue arch overhead, while the murmur of the distant waves grew louder as the time went by. "What would become of me if the waves should ever flood the beach?" thought the little pool. "My beautiful, clear water would be mixed with the other pools, and one and all would be engulfed in that vast ocean whose waves sound louder and louder."

The tide was surely creeping up the beach. The long, blue breakers glided to the front and broke in thunder thereon. The

liquid ruins were drawn back over the rattling pebbles; but always rose again with added volume and a louder roar. The pool trembled at the thought of its approaching destruction, until at last one towering billow breaking loose from the tossing multitude fell headlong with a sounding roar, poured its white cataract of boiling foam into the pool, and floated it away to mingle with the mighty deep.

No longer capable of thinking as a pool, an exultant surge of feeling soon drowned all sense of separated life. Its outlines melted in immensity. It had become the boundless sea itself. The petty throbbing of its individual life took on the grander rhythm of the ocean's giant heart. The breaking up of the limits of personal existence was the moment of its triumphant entry into the larger life, just as the man who loses himself in serving his fellows, grows suddenly great, and finds himself one with the Heart of the Universe.

The Theosophical Forum

THEOSOPHICAL NOTEBOOK: XVIII

XVIII — IS THERE SUCH A THING AS CHANCE?

What is really meant by 'chance'? There are at least three meanings one can give to the word. We all know what is meant by the expression "Shall we chance it?" or, we might say that "A certain person has many chances"; or again, "Do things happen by chance?"

I think the latter is what the question refers to. According to Theosophical teaching, things do not happen by chance, although sometimes it may seem so.

All things that happen, and come to us, are the effect of causes we ourselves set in motion in the near or distant past, in this life or even in a former life. The Law of Karman, as it is called, if this is true, should make us very careful indeed to watch our thoughts, which are the causative source of all effects, good or ill. — H. S. Parsons

Theosophical Teaching does not recognise chance as an isolated event or accident for which there is no apparent cause.

It is either the effect of a cause which we cannot remember, or an opportunity which we may take or lose according to our choice.

Our decisions are the causes of effects for good or ill, which in their turn become the causes of further effects.

The realization of this should inspire us to keep careful guard over our thoughts and actions. — Kathleen M. Beatty

CAGLIOSTRO: XIX — P. A. Malpas

A Messenger Long Misunderstood

XIX — THE END

Cagliostro was removed to the fortress of San Leo, in the Duchy of Urbino. On May 4th, 1791, the public burning at the hands of the executioner of Cagliostro's papers, effects, and Masonic paraphernalia, was celebrated with all the ceremonial drama of the Inquisition. As each article was thrown into the fire, the crowd clapped their hands and uttered cries of joy. What could they know about Freemasonry? The only plausible reason for their joy, if it was spontaneous, must have been that their God had been saved from the terrible onslaughts of — a Cagliostro!

The abjuration is described by a modern author:

The Holy Office desired to offer the thaumaturge to the populace as a spectacle, to show this heretic Freemason as an abject penitent. Cagliostro, in his penitent's garb, feet bare, a candle in his hand, between the two files of monks, passed from the castle of Sant' Angelo to Santa Maria. There, on his knees before the altar, he asked pardon of God and of the Holy Church and abjured his errors. . . .

Somehow the thing seems overdone: one would like to ask several questions on the matter. However, let us follow what has been published.

On the morrow, the prisoner, suddenly awakened, was conducted by night, under a strong escort, to San Leo. While he was asleep they had taken away his clothes and substituted a new suit which he had to put on. All these

precautions were ordered by the Cardinal Secretary of State, who hoped perhaps to find some trace of a correspondence with persons outside. At any rate the Cardinal Zelada directed the governor of Sant' Angelo (1) to give all possible facilities to the two agents of the Holy Office who had been given orders from the Sovereign Pontiff to make a minute search, both in the cell where Joseph Balsamo had been imprisoned and among his clothes, his rags and books that remained.

They had not yet discovered his secret. The search must go on!

Imprisoned in San Leo, they yet feared a possible escape, for they knew that Cagliostro had really extraordinary powers. Any other man would have been safe enough there, but this man had power that might even laugh at the grave, if he chose to use it. So a convenient anonymous letter being received by Cardinal Doria, denouncing a project of the French for rescuing Cagliostro, gave the needed excuse for putting him in an *oubliette*, (literally "a place forgotten"), practically a well, instead of his stone chamber. Balloons were then attracting much attention, and Cagliostro had declared that before balloons could be steered they must be made in some other shape than globular! Therefore rumor said a balloon was to be used to rescue him; this gave excellent color to the plan of putting him in an underground hole.

The governor of the prison himself is our authority for some of the details of the life of his prisoner in San Leo. The cruel cynicism of his description is revolting. Mysterious confessors visited his cell, ever seeking to drag his 'secret' from him. If Cagliostro showed himself 'obstinate' there were other means of "bringing him to reason." Shrieks and blood-curdling cries are said to have come from his cell and disturbed the whole fortress.

"Cagliostro is drunk again," said the governor of the prison,

cynically. As if he could obtain anything more than just enough food to keep life in his body!

The prisoner makes some statement which appears paradoxical. The confessors for the day are irritated at their non-success.

"It is evident that a man who says such things is insane," declares the governor. "The *bastonnade* was even insufficient to make him keep silence!" says this agent of the Inquisition, Sempronio Semproni, in a letter dated July, 1793.

There is a famous *mot*: "One doesn't live ten years in the Inquisition's hands." That a man should live six months under such a deliberate system of slow death and torture is one of the greatest wonders in connection with this wonderful life. That Cagliostro lived until August 28th, 1795, more than five years from the date of his arrest, is but a proof the more that he possessed powers and a will of extraordinary development — powers such as he exhibited to the public even in such humanitarian work as that of a thaumaturgic healer.

He died, it is said, of an apoplectic attack at the time when the French armies entered Italy, a convenient date for those who feared him and the liberating legions of Napoleon, *the Freemason*.

If the reader is dissatisfied with this veracious account, there is an alternative. The Pope's Secretary told the antiquary Hirt that Cagliostro was really put to death in his cell for having tried to throttle one of the confessors who was paying him a visit.

If still dissatisfied with the second veracious statement of Cagliostro's death, there is a third account which some like to believe, since it is given on the authority of one who made thousands of seemingly impossible statements, not one of which has yet been proved untrue, while most have been absorbed into 'common knowledge' in the fifty or so years since they startled

the world with their novelty. We refer to H. P. Blavatsky. Able investigators have done wonders to clear up the story of Cagliostro, though they reject the cornerstone of the whole fabric in denying that he had anything to do with Count Saint-Germain, or that Madame Blavatsky's information is worth consideration, or that even Eliphas Levi (2) (the Abbe Louis Constant, the famous Kabbalist) knew anything about him.

The explanation of this is simple. It is Madame Blavatsky who gave to the world information as to the real fate of Cagliostro and of his connexion with Count Saint-Germain and the learned Dr. Mesmer of Vienna. It is she also who quotes a Polish Count of that name at that time in France, a mystic mentioned in Madame de Krudner's letters which are with the writer's [H. P. B.'s] family, and one who belonged, together with Mesmer and Count Saint-Germain, to the Lodge of the Philalethes. Where are Savalette de Langes' manuscripts and documents left by him after his death to the Philosophic Scottish Rite [Lost?]

In *Lucijer*, Vol. V, p. 393, H. P. Blavatsky writes:

Many are the absurd and entirely contradictory statements about Joseph Balsamo, Count de Cagliostro, so called, several of which were incorporated by Alexander Dumas in his *Memoires d'un Medecin*, with those prolific variations of truth and fact which so characterize Dumas *pere's* romances. But though the world is in possession of a most miscellaneous and varied mass of information concerning that remarkable and unfortunate man during most of his life, yet of the last ten years and of his death, nothing certain is known, save only the legend that he died in the prison of the Inquisition. True, some fragments published recently by the Italian *savant*, Giovanni Sforza, from the private correspondence of Lorenzo Prospero Bottini, the

Roman ambassador of the Republic of Lucca at the end of the last century, have somewhat filled the wide gap. This correspondence with Pietro Calandrini, the Great Chancellor of the said Republic, begins from 1784, but the really interesting information commences only in 1789, in a letter dated June 6 of that year, and even then we do not learn much.

It speaks of the "celebrated Count di Cagliostro, who has recently arrived with his wife from Trent *via* Turin to Rome. People say he is a native of Sicily and extremely wealthy, but no one knows whence that wealth. He has a letter of introduction from the Bishop of Trent to Albani. . . . So far his daily walk in life as well as his private and public status are above reproach. Many are those seeking an interview with him, to hear from his own lips the corroboration of what is being said of him." From another letter we learn that Rome had proven an ungrateful soil for Cagliostro. He had the intention of settling at Naples, but the plan could not be realized. The Vatican authorities who had hitherto left the Count undisturbed, suddenly laid their heavy hand upon him. In a letter dated 2 January, 1790, just a year after Cagliostro's arrival, it is stated that: "last Sunday secret and extraordinary debates in council took place at the Vatican." It (the council) consisted of the State Secretary and Antonelli, Pillotta and Campanelli, Monsignor Figgerenti performing the duty of Secretary. The object of that secret council remains unknown, but public rumour asserts that it was called forth owing to the sudden arrest on the night between Saturday and Sunday, of the Count di Cagliostro, his wife, and a Capuchin, Fra Giuseppe Maurijio. The Count is incarcerated in Fort St. Angelo, the Countess in the Convent of St. Apollonia, and

the monk in the prison of Araceli. That monk who calls himself "Father Swizzero," is regarded as a confederate of the famous magician. In the number of crimes he is accused of is included that of the circulation of a book by an unknown author, condemned to public burning and entitled "The Three Sisters." The object of this work is "to *pulverise* certain three high-born individuals."

The real meaning of this most extraordinary misinterpretation is easy to guess. It is a work on Alchemy; the "three sisters" standing symbolically for the three "Principles" in their duplex symbolism. On the plane of occult chemistry they "pulverize" the triple ingredient used in the process of the transmutation of metals; on the plane of Spirituality they reduce to a state of pulverization the three "lower" *personal* "principles" in man, an explanation that every Theosophist is bound to understand.

The trial of Cagliostro lasted for a long time. In a letter of March the 17th, Bottini writes to his Lucca correspondent that the famous "wizard" has finally appeared before the Holy Inquisition. The real cause of this slowness of the proceedings was that the Inquisition, with all its dexterity at fabricating proofs, could find no weighty evidence to prove the guilt of Cagliostro. Nevertheless, on April the 7th 1791 he was condemned to death. He was accused of various and many crimes, the chiefest of which are his being a Mason and an "Illuminate," an "Enchanter" occupied with unlawful studies; he was also accused of deriding the *holy* Faith, of doing harm to society, of possessing himself by *means unknown* of large sums of money, and of inciting others, sex, age and social standing notwithstanding, to do the same. In short, we find the unfortunate Occultist condemned to an ignominious death

for deeds committed, the like of which are daily and publicly committed now-a-days, by more than one Grand Master of the Masons, as also by hundreds of thousands of Kabbalists and Masons, mystically inclined. After this verdict the "arch heretic's" documents, diplomas from foreign Courts and Societies, Masonic regalias and *family relics* were solemnly burned by the public hangmen in the *Piazza della Minerva*, before enormous crowds of people. First his books and instruments were consumed. Among these was the MS. on the *Maconnerie Egyptienne*, which thus can no longer serve as a witness *in favour* of the reviled man. And now the condemned Occultist had to be passed over to the hands of the civil Tribunal, when a mysterious event happened.

A stranger, never seen by anyone before or after in the Vatican, appeared and demanded a private audience of the Pope, sending him by the Cardinal Secretary a *word* instead of a name. He was immediately received, but only stopped with the Pope a few minutes. No sooner was he gone than his Holiness gave orders to commute the death sentence of the Count to that of imprisonment for life, in the fortress called the Castle of St. Leo, and that the whole transaction should be conducted in great secrecy. The monk Swizzero was condemned to ten years' imprisonment; and the Countess Cagliostro was set at liberty, but only to be confined on a new charge of heresy in a convent.

But what was the Castle of St. Leo? It now stands on the frontiers of Tuscany and was then in the Papal States, in the Duchy of Urbino. It is built on the top of an enormous rock, almost perpendicular on all sides; to get into the "Castle" in those days, one had to enter a kind of open

basket which was hoisted up by ropes and pulleys. As to the criminal, he was placed in a special box, after which the jailors pulled him up "with the rapidity of the wind." On April 23rd 1792 Giuseppe Balsamo — if so we must call him — ascended *heavenward* in the criminal's box, incarcerated in that living tomb for life. Giuseppe Balsamo is mentioned for the last time in the Bottini correspondence in a letter dated March 10th 1792. The ambassador speaks of a marvel produced by Cagliostro in his prison during his leisure hours. A long rusty nail taken by the prisoner out of the floor was transformed by him without the help of any instrument into a sharp triangular *stiletto*, as smooth, brilliant and sharp as if it were made of the finest steel. It was recognised for an old nail only by its head, left by the prisoner to serve as a handle. The State Secretary gave orders to have it taken away from Cagliostro and brought to Rome, and to double the watch over him.

And now comes the last kick of the jackass at the dying or dead lion. Luigi Angiolini, a Tuscan diplomat, writes as follows: "At last that same Cagliostro, who made so many believe that he had been a contemporary of Julius Caesar, who reached such fame and so many friends, died from apoplexy August 26th 1795. Semironi had him buried in a wood-barn below, whence peasants used to pilfer constantly the crown property. The crafty chaplain reckoned very justly that the man who had inspired the world with such superstitious fear while living, would inspire people with the same feelings after his death, and thus keep the thieves at bay. . . ."

But yet — a query! Was Cagliostro dead and buried indeed in 1792 [1795], at St. Leo? And if so, why should the

custodians at the Castle of St. Angelo of Rome show innocent tourists the little square hole in which Cagliostro was said to have been confined and "died"? Why such uncertainty or — imposition, and such disagreement in the legend? Then there are Masons who to this day tell strange stories in Italy. Some say that Cagliostro escaped in an unaccountable way from his aerial prison, and thus forced his jailors to spread the news of his death and burial. Others maintain that he not only escaped, but, thanks to the Elixir of Life, still lives on, though over twice three score and ten years old!

"Why" asks Bottini, "if he really possessed the powers he claimed, has he not indeed vanished from his jailors, and thus escaped the degrading punishment altogether?"

We have heard of another prisoner, greater in every respect than Cagliostro ever claimed to be. Of that prisoner too, it was said in mocking tones, "He saved others; himself he cannot save . . . let him now come down from the cross, and we will believe. . . ."

How long shall charitable people build the biographies of the living and ruin the reputations of the dead, with such incomparable unconcern, by means of idle and often entirely false gossip of people, and these generally the slaves of prejudice!

So long, we are forced to think, as they remain ignorant of the Law of Karma and its iron justice. — H. P. B.

[This concludes the study of Cagliostro, which began in *The Theosophical Path*, April, 1932. It is hoped to publish further researches on Cagliostro in future numbers of THE THEOSOPHICAL FORUM, but in closing we feel that a study of such paramount

interest to students of Theosophy and the occult, and involving, as has the present study by Professor Malpas, so much devoted research, could be no more fittingly justified than by the following direct statements by two Theosophical Leaders who have written on this subject, H. P. Blavatsky and G. de Purucker. We give them *verbatim* and entire. — Eds.]

FOOTNOTES:

1. "In Rome, Darbargiri Nath [a high chela] went to the prison of Cagliostro at the Fort *Sant Angelo*, and remained in the terrible hole for more than an hour. What he did there, would give Mr. Hodgson the ground work for another *scientific* Report if he could only investigate the fact." — *Letters of H. P. Blavatsky to A. P. Sinnett*, p. 110 ([return to text](#))

2. Eliphas Levi refers to Cagliostro in his *Dogme de la Haute Magie*, I, 219-20, as having "died forsaken in the cells of the Inquisition," a statement which H. P. Blavatsky challenges with the direct assertion that it was a false statement, and that, moreover, the Abbe Constant (Eliphas Levi) "*knew* it was so." ([return to text](#))

THE CIRCLING YEAR — G. K.

The cosmic life surrounds us, permeates, flows in and through us. In it we live and move and have our being, as mathematical points so to speak, as little knots and eddies on its tide. As it sinks and its cool fire dims we feel the slowing and recession; as it mounts leaping and expands, the rising sap in tree and flower responds no less ineluctably to its urge and call than the inner tides in man, child that he is of the Universe whose garment is visible Nature, whose pulse is the circling year.

Easter points the second milestone in the sweep of the circling year, symbol that it has always been of the mystic threefold life-cycle of man, spiritual, intellectual and psychical — man, who is learning and growing. The second of the Four Sacred Seasons, Easter, is ushered in with the Spring Equinox, the next evolvment after the mystic 'Birth' at the Winter Solstice. It is the 'resurrection' of the Christ-Spirit in man, the awakening of the Inner Buddha.

The coming of Spring has been heralded with festival and ceremony since long before records were made. The Greek *Anthesteria* was but a late instance in a nearby land. The word 'Easter' comes from the name of a Pagan goddess, Eastre or Oestara by name, mythical enough save that no shadow is cast except by substance. Time is expert at taking the figures of Leaders, Helpers, Teachers of Humanity and labeling them 'mythical,' the while we freely admit the reality of the institutions they founded, even walk on the bridges which they built. And when the Christian Church — long after the time of Jesus the Christ, who never mentions Easter nor founds any ritual on the idea — felt the need of ceremonial recognition of this sublime and

mystical fact of Universal Nature, it adopted this Pagan ceremony (as it had done with Pagan ceremonies before), so that the 'Spring Festival' of earlier peoples became the Easter of today. And today, on little known and secluded portions of the globe, great initiatory ceremonies continue to take place, linking the hurried present with the immemorial past, the past of Egypt, of Aryavarta, with Atlantis itself.

Had we no other evidence of the antiquity of Easter as a special season of the year, one fraught with symbolic meaning, the Easter Egg alone would place it as incredibly ancient, and spiritually sublime, for the egg is a universal symbol. It was revered by prehistoric races to whom the First Cause, nameless in its beginnings, was symbolized as "The mysterious Bird that dropped an Egg into Chaos, which Egg becomes the Universe" — Kalahansa the 'Swan of Eternity,' who lays at the beginning of each *mahamanvantara* a Golden Egg. So H. P. Blavatsky in *The Secret Doctrine* (I, 359 *et seq.* and other places), to whose chapter on 'The Mundane Egg' the reader may be referred. From the mysteries hymned in the ritual of the Egyptian *Book of the Dead*, through the ancient Mysteries of the Far and the Hither East, down to the Dionysiac and other Mysteries of Greece, the Egg is never absent as a revered and sacred symbol. And of what?

Of the germinating inner spiritual life within every being, with its apparent self-generation, its sublime promise, its unflinching message of hope. As Ra the mighty one reposes in the Egg of Seb when he crosses, resplendent, 'to the other shore'; as Brahma emerges from the egg resting on a lotus which floats on the waters of Space; as Eros-Phanes is born of the divine Egg, so the World-Egg lies fruitful and waiting, in the deeps of Ginnungagap — Maya. It is a far cry indeed from days when this symbolism was breathed in with the common air and known to all, to the present with its colored eggs for breakfast and its 'egg-rolling'

child's play later on the lawn!

Yet it is something that the symbols persist, even though with meaning as concealed as ever the phantom-form of Chemis, within his egg waiting Horus-Apollo. It is something that, even though religion leaves it out, this archaic symbol is unforgotten in the gentler if smaller cycles of domestic life, and that the custom of exchanging Easter eggs as gifts still lingers in some sections to bestow its gracious and kindly touch.

The Wheel of Life turns on and what is now enshadowed will again rise into the light. From a revered observance celebrating the resurrection of One Divine Man from the tomb, Easter will become, in its own good time, a period of rejoicing in the resurrection of the Divine that is *in every man*, from the tomb of the personal self. Then will this second of the Four Sacred Seasons be observed as holily, and by all, learned and unlearned, young and old. Man will no longer be shamed by Nature, but with each recurring Spring will match her universal burgeoning, her infinite largesse of growth and beauty, her kindly dispensation, with his own.

The Theosophical Forum

CHRISTS BEFORE CHRIST — *Frances M. Dadd*

"Christ — the true esoteric SAVIOR — *is no man*, but the DIVINE PRINCIPLE in every human being." — H. P. Blavatsky

That Jesus called the 'Christ' was unique in the annals of human history — that he was the only 'Son of God,' the only 'Savior of Mankind' — is no longer the universally accepted belief in our Occidental world. An unbiased study of historic record, an acquaintance, however slight, with the great literatures of India, China, Persia, Egypt, Greece, Scandinavia, and the Celtic lands — coupled with a modicum of common-sense — all tend to dissipate such an idea.

That there did exist, perhaps some hundred-odd years before the Christian Era, a young Syrian Initiate, a pre-eminently holy man, who paid heavily for endeavoring to enlighten mankind and relieve its burdens by teaching his sublime code of ethics and philosophy, is conceded by all students of the Ancient Wisdom. About this mysterious figure, of whose life actually nothing definite is known, the later Christians wove a composite mystic tale. Indeed, the Gospel-story, from the Virgin Birth, the advent of the Magi following the Star, to the Crucifixion, the Descent into Hell and the Resurrection, far from being the life-story of any particular man, actually imbodyes some of the secrets of the Initiatory Cycle, which the Neophyte, in his training to become a Teacher of men, had to undergo in the Pagan Mystery-Schools. Moreover the term 'Christ' or 'Christos,' as H. P. Blavatsky tells us, "was never applied to any one living man, but to every Initiate at the moment of his second birth and resurrection," that is, when his higher spiritual self is born within him — in other words,

when he becomes united with his inner god, the Christos within. It is this event in the spiritual life of the Teacher Jesus (and equally so of every real Teacher), rather than any physical resurrection, that lies at the root of our modern Easter festival.

Moreover there is historic evidence that this term Christos was in use long before the alleged life-time of Jesus. Even at about the beginning of the so-called Christian Era, the coming of a teacher or Messiah (Masshiah) was expected, so that "many persons were thought at that time to be, and undoubtedly thought themselves to be, the Christ." Simon Magus and Apollonius of Tyana, it is said, were both called 'Christs' by some of their contemporaries, although the term was not applied to Jesus until some time after his death.

So that in the broader meaning of the term 'Christ' — - that of an Initiate, one who had been through the mystic ceremony of anointing, who had become one with his inner divinity — it is not farfetched to apply it to other great Helpers of Humanity, other Sages who had earned the right so to serve by giving up their lower personal selves, and who, through following the path of chelaship, had become Masters of Life.

The human race has had its teachers, its saviors, in all ages, and a study of the legends and symbolic stories attaching to these outstanding figures in the drama of human evolution, points irrefutably to the truth that the great Sages and Seers of whatever race, of whatever religion, of whatever epoch of history, have been members or Messengers of one and the same great Brotherhood. They have been trained in the same Secret Wisdom, albeit the outward terms in which they expressed it have necessarily differed with the peoples to whom they came and the language in which they spoke.

For this reason it is that their life-records contain such a great

number of similarities. Compare the stories of Krishna, Christ, and Apollonius of Tyana. They are almost identic in general outline. They all, as is also the case with numerous others, are called 'Soter' or 'Savior.' Each came to birth in a miraculous manner; each one in childhood was searched for and threatened with death by an opposing power. They all go through a period of temptation, are all persecuted, and finally meet death — that is, the death of the lower personality. They all descend into the Lower World, Hades or Hell, whence they ascend to union with their 'God in heaven,' their own spiritual nature, and are 'glorified.' A host of other parallels will reward the search of the earnest student, but a glimpse into the universality of the Easter story will suffice us here: Osiris, the Egyptian Savior, descended into hell and later rose from the dead, bearing the title of 'The Resurrected One.' This event was celebrated annually in Egypt about the 25th of March, with great festivity and rejoicing. Horus, son of the virgin goddess Isis in one of her aspects, underwent the same experience.

Baldur, the Scandinavian Sun-god, after being killed, journeyed to the Nether Regions, but rose again to immortal life.

Adonis, virgin-born god of the Phoenicians, whose rites were widely celebrated in the Mediterranean world in ancient times, descended into Hades and rose again. At his festival in early spring, his image was buried amid weeping and wailing, culminating in a joyful shout: "Adonis lives and is risen again!"

Lao-Kiun of China, also born of a virgin, when his work on earth was completed, ascended to spiritual realms, since which time he has been worshiped as a god.

Atys, the Phrygian, and Mithras, the Persian Saviors, both were put to death, descended into hell, where they remained for three days and three nights, and then both rose again from the dead. In

the mysteries sacred to Mithras the priests watched his 'tomb' until midnight of March 25th, when all at once lights burst forth from all quarters and the cry arose: "Rejoice, Oh sacred Initiated, your god is risen."

Bacchus, the Greek Savior, son of the virgin Semele, went down into Hades and later rose from the dead. His resurrection was celebrated with great rejoicings.

Quetzalcoatl, the Mexican crucified Savior, after being put to death, rose from the dead. His resurrection is represented in Mexican hieroglyphics.

Numerous other instances might be mentioned, but the above is sufficient proof that a spring festival celebrating the resurrection of their gods was held annually among ancient peoples, before the time of Jesus Christ; that it was almost universal; and that it dates back to great antiquity.

To the casual reader these may be but interesting tales and their similarity but a coincidence, but to the intuitive mind the idea inevitably suggests itself that they are symbolic stories of the trials these Teachers had to undergo during Initiation, with which the details of their personal lives have little to do; hence the confusion and in many cases the absolute non-existence of the records of such unimportant details.

The title of Christ, "applied to every initiate at the moment of his second birth and resurrection," is equally appropriate in connexion with those Great Ones of historic times who have left their ineradicable imprint upon men's hearts and minds, ever seeking to awaken in their disciples the consciousness of that same bright Flame of Divinity which was the Light of their own life. Lao-Tze of China was one of these — the Sage of whom legend has it that he was endowed at birth with complete

intelligence and the power of speech and that when his life-work was done he rode away upon a white ox into the West, flinging back as he went a pearl of great price — the wisdom of Tao, the Way to Perfection; also that after his passing he was given the title of 'Tan' or 'Master,' equivalent to that of Christ or Buddha. Another was Kung-foo-tze, upon whose work the whole of Chinese education has been based from that day to this, and yet who said: "I only hand on. I cannot create new things" — just as the Sages of India would say: "*Iti maya srutam*" — "Thus it has been heard by me; as I have heard it, so I pass it on."

In the same Golden Chain of Teachers was Gautama the Buddha, than whom it has been said that no more sublime figure has incarnated in human form; and who, though of noble birth, traveled far in quest of Truth, studied Indian philosophy at the feet of the Rishis, became an ascetic, and at last, after a period of meditation under the Bodhi-tree, became a fully enlightened Buddha, ready to enter Nirvana. Choosing to remain among men because of his divine pity, he taught his high philosophy for forty-five years; and the undercurrent of his teaching was compassion, and the doctrine of becoming — of becoming one with the Buddha within.

Zoroaster of the Persians, "a divine messenger sent to redeem men from their evil ways," whose birth, foretold far in advance, was the occasion of marvelous natural phenomena, was said to have been tempted by the Prince of Evil if he would forego his mission; but, refusing, he invoked Ahura-Mazda, the Shining One, demanding that the Law be revealed to him. With the knowledge thus obtained, because he had been prepared through Initiation, he thenceforward took his place as a Teacher, a Christ among men.

Pythagoras of Greece studied in the Mystery-Schools of Egypt and

of Babylon, and, returning to Europe, founded his famous School at Crotona, Italy, where he taught his pupils to understand the science of numbers as divine energies in action in the Universe, and in the lesser universe or man. Among his illustrious successors were Socrates and Plato, and also Empedocles of Sicily, philosopher, physician, and physicist.

And so the Chain of Teachers continues — and indeed has never ceased since the childhood of the Race, when semi-divine rulers, now known dimly through legend and folk-tale, came to earth and taught infant humanity. Springing, as we have pointed out, from one sacred Brotherhood which is in existence today, and where the secrets of nature have been preserved for mankind from race to race, these Messengers come among men when the need is greatest, each bearing the same tidings, but couched in different outward forms. And what is the teaching above all others, that the Christs of the Ages have come upon earth to recall to men's consciousness? It is the knowledge of the God within, the Immanent Christ, the Inner Buddha which enlightens every man, making of him a god in human form, albeit very much disguised and enmeshed by material bonds. Many, oh, so many, do not yet even dream of the greatness that is locked up within their own being, and of the sublime destiny that is theirs; but some there are who unconsciously approach it at times; and others have definitely set their feet upon the mystic inner path which leads to those spiritual heights.

Theosophists are endeavoring to spread the knowledge of these *facts* concerning the existence of World-Teachers other than the well-known Sage of Syria, thus expanding the consciousness of Occidental minds, held for so long in the thralldom of creed and dogma. This will open wider the door to that vast treasury of knowledge which the Wisdom-Religion holds for mankind.

DEATH - AND AFTERWARDS: II — *G. de Purucker*

One of the most pathetic facts in modern civilization is the fear that nearly all human beings have of dying. There are of course some people who say that they do not fear to die; yet I wonder! I wonder, because their life does not seem to correspond with the courage which they so loudly profess. Nevertheless I respect the statement as a statement — the statement of any man or woman who says: I fear not to die! It is to be respected because it is the voicing of an unexplained instinct within the breast, which the man himself probably cannot explain but which evidences the intuition of the heart: that death, after all, is but an illusion hiding a grand reality. That which will happen *to all* of us, which has happened to the human race for uncounted centuries in the past, and which will happen unto endless time as long as souls dwell in bodies, evidences a process of Nature which in itself is a Grand Event; and the instinct above-mentioned whispers to us that unless the Universe is a crazy Universe with a demon at its heart, death must be something other than that which ignorant and timid people imagine it to be.

But we do not live in a crazy Universe. Show me a sign anywhere of universal lunacy in the Cosmos. As a first reflexion of the reasoning beings that we are, it comes into our minds that what is so universal, that what happens unto all beings and things which possess bodies, must in its essence and in its process be fundamentally right, and as it ought to be. Think again: Suppose that you or I were to live unto eternity as we now are, without fundamental change, would we, could we indeed, be happy? Assuredly not. As an example, fancy me, an imperfect man with all my relative feebleness of intellect, with all my relative paucity of vision and of feeling, with all the relatively undeveloped

powers and faculties and attributes latent within me as an essentially divine but as yet not fully evolved spark of divinity — fancy me, or you, living as now we are unto eternity, without fundamental and radical change! Speaking as an individual, I can say that to me such a life would be an eternal hell. It is by changing and by changing throughout, even if slowly, that we grow greater, that we enter into new things and better things and grander things for ever. If there were no law of progressive change operative throughout the Universe and in all its parts, then we should have babies who never grow up, who remain eternally babes; and what a grotesque, indeed ridiculous, picture this reflexion gives to us! We adults, we human beings are but infants, cosmic infants, in comparison with other Hierarchies of far more fully evolved beings, who are as far beyond us as we are beyond the insects, the plants, the stones, what not.

It is one of Nature's laws that an entity cannot continue the same for ever; indeed, it is one of Nature's most kindly laws. It is by exchanging the imperfect for the ever more perfect that we grow; and death is just such a change. As I wrote in a former article on this same subject, the child must die in order to become a man, and the man must die frequently in order in the future to become a god. There are many wonderful things around us in life of which we are cognisant all the time, and yet they are so commonplace to us that we do not reflect upon them and draw the necessary deductions from them, for if we so did, we could gather immense comfort from the verities that we thus should recognise. We perceive facts indeed, blind creatures that we are, and we do not draw the deductions from these facts which we should and can draw. Except the seed die, the plant cannot come into being. Except the man die, he cannot experience those *post-mortem* conditions of thought and consciousness which belong to his higher and inner being as the celestial spirit which he is in his

essence.

Comfort lies in our drawing the proper deductions from the wonderful truths of Nature and her mysteries that surround us; and the great Seers and Sages of the past have left on record their deductions, which in fact are co-eval with thinking man, that the Great gives the law unto the small, and the small repetitively manifests or shows forth what the Great impresses upon it and impels it to do. Death is an example in point. Death is the most familiar thing in Nature to us; and the most feared, because the least understood. We have all been born, we entered life by the gateway of birth, and because it is behind us we do not fear birth. But we look forwards into the future, to that coming day when everyone of us will go through this solemn change and be free, and we look forwards with fear. Yet this great change in the future is certainly on its way to meet us; it is coming.

If you, Reader, desire to know how a man feels, and what is the state of his consciousness when he is what we men call 'dead,' then I urge you to study yourselves carefully now; because if any one is so foolish as to think that a marvel is going to be wrought in him after he drops the body, he will be jarred, shocked, when his day comes. If you understand the reach of this thought, and if you will study yourself carefully now, your spiritual and intellectual and psychical qualities and attributes, and their operations, then you can explain death to yourself as fully and as completely as your capacity may permit — i. e., your capacity to understand and to explain yourself to your own cognising mind. No miracle is going to be wrought upon you when you die. You are going to drop the body and leave it behind, and you will do this in the exact condition or state that you were in when you drew your last breath.

Let us ponder over the reason and significance of the teaching of

all the great Seers of all past times of the need of ethics, and of living them while we are alive on earth. You are not going to be saved, i. e. from the results or consequences of your past life; nor are you going to be eternally 'damned' because of the same consequences; but after death you are going to be exactly as you are when you die. If you have lived a decent life in incarnation, then you will be a decent excarnate entity after death; and if you have lived like a beast, you are then going to be a beastly excarnate entity, and you will have to take what is coming to beastly beings. Nature's laws are infinitely pitiful, precisely because they are founded in and arise from Universal Harmony, and they know no variation or shadow of turning. Hence the dictates, the mandates, of all the Sages of all ages: Live rightly!

There is no hell after the orthodox idea of the now dying Christian theology. There is no heaven after the idea of the orthodox Christian scheme; but there are *post-mortem* states of many kinds, almost infinitely numerous; and because of Nature's harmonical procedures no human being could ever die and be attracted or drawn to a state or condition or place in which he is unfitted to be. Cast out of your mind any idea that marvels and miracles will be wrought for you at your death: that unnatural things, whether good or bad, are going to happen to you outside of the grand and unerring and inevitable laws of the Universe; because such ideas are merely lies and contrary to Nature herself. Hold therefore fast to the obvious truth. A man goes, after he dies, to the particular lokas or talas in the interior worlds which he has fitted himself during earth-incarnation temporarily to inhabit. He himself makes for himself his own *postmortem* destiny, and thus it is that he gets exactly what is coming to him: good, bad, or indifferent. Nature in her infinitely exact adjustments will bring to him precisely what he himself causatively during life gave birth to — and this is karman, as we say.

Now, then, inside this physical Earth-sphere, surrounding it, permeating it, is what we may briefly call the astral sphere. It is called 'astral' because on certain rare occasions sensitives, when the electromagnetic conditions are right, can catch a glimpse of this interior or astral sphere, as flashing, phosphorescent, sparks or sheets of luminous substance. It is difficult accurately to describe these things without misleading those whose minds are unaccustomed to them. Even the grossest and apparently most solid substance of this physical sphere, had we what we may call the electric eye, we should see to be compact of an apparently infinite number of sparks or points of light in eternal motion and flitting here and there; and these 'atoms' are nevertheless themselves, even in their own atomic ranges, separated by spaces which are as relatively far apart as are to us the suns and the planets in the surrounding sky. Thus it is that the next condition or state of matter within the gross physical sphere, and somewhat more ethereal than the latter, is what we call the 'astral world.'

When a man dies and casts off this frail and ever-changing garment which he calls his body and with which he so foolishly identifies himself, there comes to him instant unconsciousness. No man actually dies conscious. Here again Nature is infinitely merciful, even to her weakest and most erring children. When a man dies, there is a lapse of consciousness quick as a snap of the fingers, ay, more quick, and then the man is gone. The brain still lives for a short while, in the sense that there passes through it in review all that has taken place during the life just past, and down to the least detail thereof; but soon this panorama of revision fades out; and there is left but the physical corpse, the 'empty' body. The spirit has flown to its own, the soul is in unconsciousness, the body then is dead.

The physical body or vehicle is the outermost garment of an inner and more ethereal body which we call the astral body, technically

named the Linga-sarira, i. e. the pattern-body, the model-body, properly so named because the physical body is builded around it, atom for atom, molecule for molecule, cell for cell; and this astral body it is which is the vehicle for a short time — a very short time — of the Ego who was on earth a man. But this linga-sarira has a span of life which is almost exactly that of the body, and as the body decays, so does this linga-sarira or astral body decay; and when the last atom of the physical body has gone, when the corpse has disappeared, whether in the merciful vault of the crematorium, or by rotting decay, then the linga-sarira is virtually gone too.

According to the Christian scheme, man is composed of spirit, soul, body. That is a fairly good division, simple and convenient for ordinary use as far as it goes. When a man dies, the spirit of him, the divine spark, i. e. the highest portion of the man, instantly, quicker than thought, is gone, rejoins its own cosmic source. What is that cosmic source? You may call it the Anima Mundi, if you are not exacting in particulars; but if you are, and want accuracy in detail, then you may say, and say truly, that it is gone to its 'parent star.' There remains then the 'soul,' the human ego, in the intermediate realms of Nature between Spirit and physical matter. Now this human Ego is unconscious, as already has been said, an unconsciousness which is exactly like that experienced by the ordinary man when he sleeps at night in blissful peace and repose, freed from the anxieties and harassing worries of the daily life: free from hate and love, free from fear, in blissful, unconscious sleep, Nature's most blessed sewer-up of the ravelled sleeve of care, as Shakespeare says. Just so is the condition in which the soul is after death — at least for a while.

In a previous article on this subject it was pointed out that a man during his incarnation on earth, if he study himself and the processes of his consciousness, may know exactly what happens

to himself after death. There are four general states or conditions in which the human consciousness can be: Jagrat, the waking consciousness, in which we are now; Swapna, the dreaming sleep, the sleep with dreams — all too often a nuisance; and the reason we men do not remember our dreams better is because they are often too ethereal and keen for the brain to hold the record thereof after the man awakes into Jagrat again. It is not because the dreams are too faint. The contrary is the rule. Dreams usually are too intense, too keen, for the brain to record them successfully. Again, when a man sleeps and is utterly unconscious, the most blessed kind of sleep, this condition or state of our consciousness is Sushupti. It is a consciousness so intense, so keen, so spiritual, with reaches so vast, that the poor limited brain — the physical substance of the brain and the astral substance of the brain-mind — cannot hold it or record it. The power of this consciousness is too great; and it affects us as unconsciousness — and this condition is sushupti. The fourth and highest state of consciousness which the human being can attain is what is called Turiya-Samadhi, and this is to us humans what is virtually the consciousness of the Divine within us. If what we call the sushupti was so intense and powerful that the feeble brain cannot either recall or record it, a thousand times more may the same be said of the divine consciousness of the Turiya-Samadhi condition. It is somewhat like the brain of a man trying to carry and to cognise the consciousness of the Hierarch of our Solar Universe. The brain cannot; it is not builded for it; it is too feeble, too gross, too imperfect.

Now, then, mark carefully: when a man dies, he passes from the jagrat or waking-state into the swapna or sleeping-state so far as his astral body is concerned. His human soul is unconscious in sushupti; but the spirit within him, which has gone to its parent source until recalled earthwards again for the next earth-life, is in

the turiya-samadhi state.

Now all these four states of consciousness may be, can be, and in extremely rare cases are, experienced by men even imbodyed in the flesh. Everybody knows what the jagrat or waking-state is. Everybody knows what the swapna or sleeping-dreaming state is; and if you are observant of your own movements of consciousness, I may say that everyone of you knows what sushupti or the state of unconsciousness is, and perhaps gains something valuable therefrom. But only those who have been trained in esoteric studies, and whose lives are rendered glorious thereby, can have even an appreciation or understanding of what the turiya-samadhi is — the divine state of consciousness in which lives the Divine within ourselves.

In future ages, when the human being shall have become from human-like godlike, when men shall be demi-gods on earth, then at least adumbrations of this consciousness will be familiar to *all* men. All men then will understand because they will know. Even today, where is the man with heart so poor, with brain so weak, who cannot even now have some inkling, some apperceptive grasp, some yearning comprehension, of the grand and the beautiful and the sublime? Every normal human being, if he train himself to do it, can live in a state of internal beauty, can walk even today among his fellow-men like a god, because he lives interiorly in that condition. He can raise his consciousness, his real self, and fix it, nail it so to say, in the higher part of his being; and then when he speaks, his word is the word of truth and carries conviction, even though the brain-mind of the hearers afterwards may say: "Well, I want to think about that."

It has already been stated in a preceding paragraph that the astral body decays or goes to pieces, just as the corpse does, and more or less *pari passu* with the latter. By 'astral body' I mean

here the *linga-sarira*, or model-body. Its life and coherence are just about as long as the physical corpse's are. As the corpse decays in the earth (if the body be buried), the astral body in the astral world, as just said, decays *pari passu* — with equal step — molecule for molecule, atom for atom.

Thus the *linga-sarira* is an astral corpse, just as the physical body is; and the 'soul,' or the Ego, has shaken off both physical corpse and astral body more or less at the moment of death. Thus the Ego is now at this point in the astral world, in the *kama-loka*, and in what is called the *kama-rupa*, which is the pale and shadowy and more or less perfect image of the man as he was in earth-life. This *kama-rupa* holds together in the *kama-loka* for a term which varies greatly, but strictly according to the character of the man during incarnation; if the man was gross the *kama-rupa* is correspondingly gross and coheres or holds together it may be for a long term of years, twenty, forty, fifty, possibly a hundred or even more years; but if the man while on earth was of a distinctly spiritual type, the coherence of the atoms of the *kama-rupa* is correspondingly weak, and the cohesion of its astral atoms slowly vanishes, the *kama-rupa* proportionately dissolving or disappearing, much as a wisp of fog slowly vanishes because of the dissipation of its particles.

During this process, the Ego, or 'soul,' has been slowly freeing itself from the attractions which connect it with the *kama-rupa*; there finally comes a moment when the 'soul' or Ego is free, and slowly begins to recover the spiritual consciousness of which it had intimations and imperfect realizations while in the physical body on earth. It then enters what is called the *devachan*, and in the bosom of the spiritual Monad, the human 'soul' or Ego 'sleeps' in inexpressible bliss, dreaming spiritual dreams of roseate beauty, for the *devachan* is a state of ineffable happiness for the mind of the Ego.

As a matter of fact, the 'reality' of its experiences of blissful dreaming in the devachan seems to the Ego, and in fact really is, far more intense than anything of similar type that the Ego had experienced when in the mire of the physical body, for it now is in the condition of unfettered higher mentation and imagination, wherein the mind automatically picturates to itself the most lovely of mental visions and all the shifting mental scenery that these visions contain or involve. Indeed, the devachan is a condition or state of the higher Manas in which its activity proceeds free and unfettered by the veils of lower consciousness with which it was clothed during earth-life.

Every man, every woman, during life on earth has yearned for better and nobler things, has yearned for the self-expression of locked-up or latent faculties and attributes and powers; has yearned to be greater, larger, higher — in short, to have and to live a greater life. These are the evidences to any reflecting mind that show clearly how greatly the human soul hungers and yearns to grow towards better things and become them. It is in the devachan that it has a partial, although dreaming yet intensely actual, realization of all the unfulfilled spiritual yearnings of the heart and mind vaguely sensed or experienced during earth-life. The Christians call it 'heaven,' we Theosophists call it the devachan; and there, in the devachanic state, which is emphatically not a place and which is equally emphatically a state or condition of mind, of consciousness, and which is a mixture of sushupti and turiya, a purely spiritual condition — with increasing intensity the Ego remains in such state for hundreds and possibly for thousands of years, the time in all cases depending upon the character of the life last lived on earth. What men commonly call 'good' folk have a long devachan. What we commonly call gross or 'evil' folk have a short devachan — and the reason is obvious! From what already has been stated, it

should be clear enough that evil people on earth have fewer beautiful thoughts, fewer spiritual aspirations, than have so-called good people; the consequences or results are felt in the devachan: evil people have a short devachan because their store of spiritual yearnings is small; good and spiritual people have a long devachan, because their stored up spiritual and highly intellectual yearnings, unsatisfied during earth-life, are numerous and active.

Thus the devachanic blissful dreaming goes on for centuries, it may be for a few thousand years, growing in intensity and keenness of realization until it reaches its maximum or culmination, and then slowly diminishing as the stored-up spiritual and intellectual yearnings fade out of the consciousness. Then the time approaches when the Ego in the devachan feels the slackening of the spiritual yearning; as it were it begins slowly to sink into or pass over into a changing of thought, of consciousness, of mental feeling, becoming constantly less ethereal and less spiritual; and coincidentally and *pari passu* therewith the human 'soul' or Ego drops, sinks, 'descends.' Now mark well that these three last verbs, 'drops,' 'sinks,' 'descends,' are figures of speech, for they do not mean a passing through physical space; what is meant is a changing in the quality of the dreaming consciousness, a changing in the sense of sinking or descending from the purely spiritual to the less spiritual. The etherealized mentation of the Ego grows tired, so to say, of the devachan, and correspondentially occurs the change just mentioned.

Thus it is that the Ego 'dies' from the devachan; and 'descending' into the qualities and attributes of the lower realms, its projected Ray finally re-enters a human womb, and in due course of time a little child is born again on earth. What a marvelous and mystical story this is! If I had time and space in these pages I could write of

the manner in which the Ego collects its formerly discarded life-atoms on the different planes of its previous ascent into the devachan, and of how the Ego, working in and through these life-atoms, builds for itself anew sheaths or vehicles of its consciousness, finally framing for itself a new *linga-sarira*, composed of astral stuff in the astral world, and how it finally reaches the family to which it is psycho-magnetically drawn, i. e., the father and mother to whom it is most attracted, and the physical *milieu* which most corresponds with its own vibrational amplitudes.

Hearken: The re embodying 'soul' or Ego, as stated above, dies from the spiritual worlds of the devachan in order to be reborn on earth. It enters the gateway of 'death' in the devachan, which thus in a sense is the gateway of 'birth' to earth-life here. When an incarnated man dies, contrariwise, he enters the gateway of death here which in the converse sense of the above is the gateway or portal of birth into the inner, invisible, worlds of the spiritual realms. Thus then, from what has been said, it is clear that the Ego — or what Westerners often call the 'spirit' — never returns to earth after the death of the body. Such return is impossible, because the intermediate links of communication after death are slowly broken — very fortunately! Indeed, the human soul or Ego would not return even if it had the chance to do so. In itself it loathes the gross and heavy atmospheres of earth. It hates the sorrows and pains and griefs and smallnesses and imperfections that it has experienced here below. All its yearning is for peace and happiness and bliss and the explication or unfolding into mental reality of the things of the spirit that here on earth it previously had yearned for.

In what is here said will be seen the philosophical rationale, the solid and substantial reason, why the Theosophist is obliged to reject what is becoming to a certain extent popular now among

the ignorant of the West — the so-called 'return of spirits.' The spirit, more correctly the Ego, 'returns', or rather its Ray returns, when the child is reborn in the next incarnation, never before. (1) It cannot return before. It is with its 'Father in Heaven,' to use a Christian phrase, and the foregoing explanation gives the real meaning of the Christian phrase: the soul is in the devachan, and the astral body and the kama-rupa have dissolved into their component atoms.

I shall mention briefly the nature of the conditions appertaining to the astral world, which world it has already been stated is a realm more ethereal than this gross physical earth is. It has many degrees or states or conditions of ethereality, ranging from the most gross in its own series of stages, to the least gross, which is equivalent to saying the most ethereal. Theosophists call these different stages or planes the Astral Light; and this adjective 'astral' is properly used, because sensitive seers — or even ordinary individuals, when conditions are right, when the electro-magnetic conditions are right, as in a thunder-storm — can sometimes catch glimpses of the Astral Light. The Astral Light is everywhere around us, permeating all and everything of the physical world. One can catch glimpses of its presence as phosphorescent, luminous, glittering 'electric' sparks, usually fugitive and minute because the conditions of seeing it are always imperfect. Yet it is not a plane *within* the gross physical world — in other words, the gross physical world is the dregs of the astral light and indeed the lowest astral is our physical world.

In the Astral Light or the Astral World there are certain stages or ranges of varying ethereality which are the kama-loka, this being a Sanskrit term which means 'desire-place,' and a very appropriate term it is! The Greek and Roman ancients called it the Underworld, Hades. This is the habitat or the realm of all the emanations of earth, most of them vile; because the spiritual

things as it were dash or rush within the kama-rupic ranges 'upwards' into their own appropriate spheres to which they are attracted, as has been already explained. But everything that leaves earth, that casts off an earthly body, must perforce pass into and through the Astral Light — in the case of human beings through those portions of the Astral Light which are collectively the kama-loka. These portions are the 'desire-world' or the 'desire-place,' because it is the receptacle or retainer of the cast-off shells or kama-rupas of human souls; and even of the beasts — because the beasts have astral bodies just as humans have. They could not be on this physical plane if they did not have them.

The Astral World, more particularly the lower reaches of the kama-loka, is the place, the underworld, the land, of 'shades' as the Greeks and Romans said; the world of shades — an excellent word, far better than 'spooks' or 'ghosts.' Sometimes these specters or shades (which are the astral simulacra or pale copies of the men who were, and which live in the kama-loka) when physically the conditions are right and a man or a woman is in the properly receptive psycho-physical condition — sometimes I say these specters can be glimpsed, and then one has the case of a so-called haunted house, or a haunted hall or room. These shades are simply decaying shells, the astral corpses mentioned previously, just as the human physical body when the man is dead is a discarded shell. All that made it move and live and feel and think has gone, and there now remain but the automatic reflex actions giving it semblance of the real life that previously had thrown it off.

Briefly to recapitulate: first the man dies and thus casts off the physical body, and the body decays. Almost coincidentally the same thing happens to the astral body or linga-sarira, in which the soul is as it were still imprisoned for a very short while. When the soul

leaves it, this linga-sarira in its turn becomes an empty shell, as has been described. It is an empty astral corpse; it has now no inner, inspiring, and elevating spiritual life. It cannot raise itself out of the kama-loka any more than the decaying physical body, the human corpse, can raise itself from the earth. It slowly disintegrates and goes to pieces, exactly as does the physical body when the latter becomes a corpse. The Ego is now in the kama-rupa wherein it remains for a time-period varying in length until finally it casts off the kama-rupa and enters the devachanic state.

In the Astral World, or rather in the kama-loka, there are, with certain exceptions, no real living beings as on earth. The kama-loka is an intermediate stage in the progress of the Ego. It is the abode of shells and of Elementaries. Elementaries are those ex-carnate human beings who, because of extreme passional and mental grossness of life on earth, have no devachan; in other words the human 'soul' or Ego cannot free itself from the kama-rupa. What happens with these Elementaries? They are a torment, and also a danger, to human kind; for, being the kama-rupas of the worst kind of human beings on earth, when these human beings die they cannot leave or raise themselves out of the lower astral world or the kama-loka. These Elementaries are drawn to those places and to those beings on earth to which they are strongly psycho-magnetically attracted — call it the attraction of sympathetic magnetism if you wish. They are attracted to human beings whom they psycho-magnetically feel drawn to, and they haunt these humans.

Just here we perceive the weighty reason in the teachings of the great Sages and Seers about the need of ethics, morals. A man who lives a good and holy life, him no evil influence in the Universe can touch, because the power of the god within him throws around him an akasic veil that nothing in the Universe can penetrate or dissipate. But the man who lives an evil life is

not only his own worst enemy and indeed his own victim, but if he watches not carefully, he may become the prey of those dreadful astral beings whom we call Elementaries, who will surely find him out because they will be irresistibly drawn to him because of similarity of vibration, because of synchronous psycho-mental vibration; and they will haunt him, and will constantly impel him to do deeds of evil. How many an unfortunate criminal has not said, and said truly, when brought to the bar of justice: "My God, I do not know why I did it; something drove me to it!" and he is right! Originally weak in character, unable to control himself, haunted by one or more Elementaries, the time came when he could no longer resist the extra impulse or compulsion from one of these astral fiends whom he had attracted to himself by an evil life, and whom he had been feeding with his own vitality — feeding an astral vampire.

Study yourselves, I say; study the movements and characteristics of your own consciousness, and you will then know what will happen to you when you die — because your death is coming and some day will touch your heart with its call. Fear it not, however. Death is a change, and ought to be, and in the majority of cases actually is, a vast improvement over this gross life of earth; because however beautiful physical life at times may be, it is yet full of keen sorrow and profound grief and intense pain and subtil temptation, to which many miserable human beings succumb; whereas after death, at least for the majority, there are ineffable bliss, unspeakable peace, and rest. How necessary therefore it is for us humans to have charge over each other, always to be pitiful and compassionate! Remember that although you, Reader, may think you are safe because you are a good man and have lived a decent life, remember, I say, that you too in the past may have followed the *facilis descensus Averno*, the easy

descent to 'hell'; and have been rescued by one greater than yourself, a brother, who extended to you a helping hand. Do not ever condemn the unfortunate sinner, although be inflexible in your aversion from and condemnation of evil itself. You never know when some temptation may come to you which may cause you in your turn to stumble heavily on the path. Be charitable, be compassionate, be always pitiful. Put yourself into the other man's place, and especially do this when you feel inclined to criticize or to judge him for his thoughts and acts. Follow the example of the noble life of the Buddhas, the noble life of the Christs, for this is the life which makes a man's existence here on earth truly godlike.

How the earth would be changed today if men would merely *live* the Brotherhood they so vainly prate about, but which, when the test comes, they so infrequently practise. Assuredly, it would be no loss if everybody treated everyone else as a brother. Even in the material sense it would be profitable, for a man would have a plethora of riches, since all others would be giving to him, and he would be giving again of his abundance to others having less than he. Poverty and sadness and human misery would nearly vanish from the earth.

FOOTNOTE:

1. There are a few apparent but not real exceptions to the statement made in the text above; and these apparent exceptions are exemplified in the cases of children dying young, of infants dying before childhood, and the cases of congenital idiots, etc. These cases, precisely because the Ray of the Ego has had no chance to undergo in a real manner the experiences of earth-life, and therefore because the projected Ray from the Ego is unsatisfied, are the cases of almost immediate physical reïmbodiment. Take the case of the infant or young child dying:

the Ego, or rather the egoic Ray, in these cases after a very short interval seeks immediate re-embodiment, so that it is quite possible, although not always the case, that the child dying may actually find its new incarnation in the same family wherein it had previously found its unsuccessful incarnation as the infant which died. Let this be comforting to those who like it. ([return to text](#))

The Theosophical Forum

WHY STUDY THEOSOPHY? — *Kenneth Morris*

There are, I suppose, as many reasons for studying Theosophy as there are human beings who ought to study it: I believe the number is computed at 1,600,000,000 generally. As one could not well enumerate sixteen hundred million reasons in one number of THE THEOSOPHICAL FORUM, it seems best to pick out one of them; and as charity begins at home, and the fool looketh towards the ends of the earth, perhaps no apology is needed for introducing this one: —

Dai'r Cantata he is; formerly he dug coal under the mountains "by here"; and got nystagmus, or silicosis, underground, the way people do; and — and — and — . Oh, Dai *bach*, I know, I know I — nearly every incident in that long, long *et cetera*. And I know that you are not unfortunate.

Study you Theosophy, *machgen i*; and you shall go to your music again, and have your old joy in the tops of the mountains! You shall not blame God or man for what folk call your misfortunes; you shall be glad of them, for the power they bring you. For it is in Theosophy you will find about the Law of Karman; and that there is no such thing as injustice in the kingdom of the Sun and Stars: but we do ourselves elect what fortune shall befall us, and build our own fate and our own life and the very selves of us with our own thinking and doing; and there's not a place where we can be, nor conditions we can suffer, but we are there, and we are suffering them, because it is there only, and under those conditions alone, that we can learn the lesson the universe is waiting for us to learn and gain the strength and grandeur the time has come for us to gain. And it is in Theosophy you will learn about the Hero in Man; and that it is only the outside of you, the

husk, that is the Welsh miner out of work, and his lungs clogged up with silicosis, or the world jiggling its mad dance before his eyes with nystagmus; the Inside You is the one who has come marching down the ages, the Heroic Adventurer, advancing through lives of prosperity and lives of dire adversity towards his goal of Godhood. Study you Theosophy, Dai *bach*, and —

— *Yes have I studied Theosophy, says Dai; and no one need speak a word of comfort to me again.*

I laugh when I hear it said that Theosophy has nothing to give a man when he is down and out and in heavy trouble. Come to the Rhondda Valley if you think that; and I'll guarantee you'll change your mind. It is precisely then that he needs it most, and that it comes to him most grandly. The world has been desperately psychologized in one direction; I shall not be so harsh as to say, with cowardice. But the medicine for trouble, we have been taught to think, is to have a Greater Strength than one's own to rely on; a comfortable bosom to weep on; a cajolable omnipotence to pray to; a pitying, loving Savior to carry one's burden for one: — "I am weak but Thou art mighty." Were this a true fortification of the soul, one would say nothing; but it is precisely the opposite of that. When the mines are closed down, and the barren daylight hours are to be filled in somehow; when what coal he burns, for warmth or for cooking, Dai Seventy-years-old must pick up bit by bit on the mountain-top, on the refuse-dump from the mines, and carry home in a sack on his shoulder; and Dai Forty must remember an engagement daily at dinner-time, and "pretend nothing" while he slouches off down the squalid street that what food is in the house may be all for his wife and children: then such "spiritual comfort" begins to wear thin in time. One wearies of badgering an omnipotence that would seem to be either senselessly spiteful or engaged with other things; bosoms to weep on don't meet the needs of the case;

it doesn't seem to matter that someone died to save you long ago: you are not saved, so far as the naked eye can see. It is not a re-stirring of the emotions, or tender sentiment, or prayers and tears that will help you then — for long. What is blowing without is a bitter, bleak and freezing wind; on no horizon shines any smallest glimmer of hope: there is no hope in this outer world. Weaken within, and one might as well go hang oneself at once; and to weaken means chiefly, to parley with self-pity; and does not one do that when he tries with prayer to move omnipotence to pity him? To rely on these emotional consolations is to reduce oneself inwardly to the condition of a jelly that won't jell; one cannot come by happiness that way.

The need is that we should know our own resources and bring them into play. Those resources are as great as are in the Universe; the Inmost Self in us is the Self of the Universe: Theosophy convinces you of the fact, and shows you how to get at them: these resources from within that are the only effective weapons against adversity. *Comfort* is *con* and *fortis*: you have to *with-strengthen* a man really to help him in his times of trouble. And there is no knowledge so helpful and strengthening as knowledge of Karman. To know it is to know that miserable conditions are but a tunnel that will end presently, and the track lead out into sunlit valleys. And it is to know that there are no dangers, no traps or pitfalls, for the man who steadfastly will not fear. It is to know that there is nothing to fear.

This endless chain of causes and their effects which are new causes, that is our life throughout eternity, can come by no breakdown. The thing that kills us is fear of a breakdown that cannot happen; worrying about it; making of it a ghost-cat to play ghast-lily with that poor mouse, our mind. Knowledge of Karman eliminates all that.

To give a man such knowledge is not, unless you are a fool (in which case what you give him is something else), to fling an icy douche over him (It's your own fault; don't kick up such a row about it!). It is we humans who busy ourselves with people's faults, set up law courts to punish them, and generally play fantastic tricks before high heaven. The Universe reacts to our actions impersonally, and knows nothing of rewards and punishments. Revenge is a disease of the human mind, and a concept that does not exist in the worlds above the human. Karman is not like that.

The heart of it is love; the end of it
Is peace and consummation sweet. Obey!

The word 'love' may be misquoted there; yet it is accurate. Love is the knowledge, innate in the Universe, of the One-being-ness of the Universe. Karman is the Universe's insistence on that. We must rise into universality, up from our limitations of selfhood; when we press backward toward those limitations, it hurts. Where would we be if it didn't?

Paul says judiciously, The law is a schoolmaster to bring us to Christ; but the word is *paidagogos*, from *pats* a boy and *agein* to lead; the pedagogue was not a teacher in the school, but the slave whose duty was to take his master's son to school every morning. If we take *Christ* as meaning the light that lighteth every man that cometh into the world, or our own Spiritual Monad, the saying is accurate Theosophically. For that is the Teacher in the School of Life. So the Law conducts us to the place where we may learn, receiving instruction from that Inner Divinity.

Now then, who is to say, *It's your own fault?* Whatever fate a man may be suffering, it is simply the place where he may learn. When you see a man in dire stress in the fell clutch of circumstance, how do you know that he has not earned the right

to it by nobility? That it is not a place where he may learn very quickly and make great strides in his eternal education?

Is adversity a thing to fear then, or to hate? No, it is not. The three best teachers of a man, said the Druids, are bodily sickness, adverse circumstance, and the undeserved hatred of his enemies. They were right each time.

This then, *Dai bach annwyl*, is why *you* should study Theosophy; now in the time of your sorrow, steeping your mind in it; spreading the news where you can. For see you now: the man on fire to bring this sublime comfort to his fellows, remembers no sorrows of his own. His own sorrows have become for him only means of understanding, and depth of heart, and ability to do the thing and say the word of peace: his means of solving human problems.

The Theosophical Forum

THE SATAN MYTH — *H. T. Edge*

Exploding the Satan myth was an important part of the work undertaken by H. P. Blavatsky in bringing to the world the message of Theosophy. This curious perversion of the truth has done much harm during the ages from which we are emerging; its rectification will be coincident with a new gospel of hope and help to humanity.

H. P. Blavatsky threw down the gauntlet to theology by boldly naming her new magazine *Lucifer*. This name, as its etymology shows, means 'Light-bringer,' and is applied to the morning star which heralds the light of day. Its equivalent in Greek is Phosphoros, which means exactly the same. It is strange indeed that an angel with such a name, indicating such attributes, should have been transformed into an angel of darkness, a synonym for Satan the evil counterpart of God, foe alike to God and man.

The better to understand how this has come about we must refer to the sacred allegory found in the early chapters of *Genesis*, whose meaning has been similarly perverted. If it be asked what reason we can give for preferring the Theosophical teaching to the usual theological interpretation, we can give two answers. One is that to understand any given scripture it is necessary to compare it with other scriptures; for by adopting this method we sift out from each whatever is accidental and arrive at what is essential and common to all. The other is that the true explanation is found to conform to the facts of human experience, whereas the false interpretation conflicts with those facts.

During Christian times there has always been an antagonism between religious sanctions and the spirit of free inquiry; the authority of churches and of representative religious leaders has

been unfriendly and often hostile to individual initiative in the search for truth. Often there has been war to the knife, at other times mutual indifference; and at the best, attempted adjustments between elements assumed (by those very attempts) to be naturally diverse. But the natural intelligence of man has felt that the truth must be one and single, not divided into two opposite species; and that an all-wise and all-loving God cannot rightly be conceived as an obscurantist. Then there is the well-known problem why such a God could create man, allow him to fall or be led by Satan into corruption, and then provide for his rescue by a very doubtful means and one that (in strict theological interpretation) comprehends but a minute fraction of the human race, after all. It is things like these that have driven so many worthy souls out of religion altogether, all unaware that there was any genuine truth to replace the spurious article which they have rejected; and this is what is meant by saying that the theological interpretation conflicts with human experience instead of explaining it.

This divorce between two vital aspects of truth has also had a disastrous effect on science, causing it to propound a view of man's origin and nature based on purely physical influences.

But the duality of man's nature is the commonest fact of experience, constituting as it does the entire motive of the drama of human life. It is surely the function of any body of doctrine, whether it pose as religious or scientific, to explain this fact of man's duality. If we compare the stories of man's creation as found in the various scriptures and mythologies, we shall find everywhere a dual creation of man recorded. He is first created as an innocent being, without knowledge of good and evil, without free choice, living in a state of harmless and unprogressive bliss; and afterwards he is enlightened by the gift of divine fire, which turns him into a responsible being, made in

the image of his divine creators, and destined thenceforth to learn wisdom by experience of pain and pleasure, wrong and right.

Such is the true interpretation of the allegory in *Genesis*. It is the 'Serpent' who is man's real Savior. It is this Serpent who teaches man the knowledge of good and evil and makes him like unto the Gods. The Serpent is actually the Lord God himself in another form, perfecting his own original work and making of the earlier 'mindless' man a complete being, a fitting image of his divine author. The Greeks tell the same thing in the story of Prometheus, who takes compassion on helpless mankind and brings down fire from heaven in a tube; whereby man is enlightened. There is the same apparent hostility between Zeus and Prometheus as there is between the Lord God and the Serpent. It is evident that the man of Eden, and the man whom Prometheus enlightened, were little better than automatons; and that such a being could only become a real man by having a choice given him. Only thus could he exercise free, that attribute of divinity. Accordingly the exercise of free will choice can be construed into an act of rebellion, for so it is in a sense. Satan himself is said to have rebelled against God and fallen from heaven; but he did so in compassion for man, performing an act of self-sacrifice for the salvation of man; just as Prometheus sacrificed himself and was ejected from Olympus to be fastened to a rock. Satan is the head of a host of angels, who with him rebelled against God and fell from heaven. They were the true enlighteners of man.

This allegory of the Fallen Angels has been so misrepresented that it may seem to some as though we were being very profane in so speaking of it; but in fact it is one of the most holy and sublime teachings of ancient wisdom. The kind of evolution studied by science cannot produce anything higher than animals; the human self-conscious intelligence can never have been evolved from the animal mind; it is a gift apart. This gift of the divine intelligence is

passed on from beings who have it to those who come after them. It is brought to men from above, not worked up from below. The scriptures say that in ages long gone by, man 'walked with the Gods' or had intercourse with divine beings; and it was thus that man received that marvelous intelligence which, all obscured as it is by his mortal clay, yet makes him so immeasurably above the animals. The earliest races of mankind were of the kind called 'mindless,' sinless, devoid of initiative; but later in the progress of evolution came the stage when man was enlightened by the passing on of the divine light or fire to him from beings who had acquired it before. All this concerns the teachings as regards the evolution of human races, too long to be entered into here, but to be found in Theosophical books. It is allegorized in the Bible and other sacred books and mythologies as has been indicated above. The temptation of flesh in the Garden of Eden is a gross misinterpretation of the allegory, and God has been represented as cursing for ever what was a purely natural act and function. Here is another false antithesis, by which natural functions have been connected with the idea of sin, man has been set at war with himself, and endless moral confusion has gone down through the ages.

But if this Biblical Satan is a name for man's enlightener, and not the arch-fiend and enemy of God and man, nevertheless there may be a real devil among us. But this devil is our own personified passions and evil thoughts. We all know this devil by experience, and how the alliance between fleshly passion and human self-consciousness can engender a sort of evil personality, which steps into our clothes and wears the mask of ourself. But here again it is not mere physical immorality, harmful though that may be, that is the worst foe of man; but selfishness, hate, anger, cruelty, heartlessness; for these wither and petrify the very soul. And it is not those who have been most noted for

sanctimoniousness who have been most free from this kind of sin.

Man's true redeemer is that Divine Spirit which was breathed into him when from being an un-self-conscious creature he became like unto the Gods. Good, for man, is what expands; evil contracts. Good sets the common weal above so-called personal interest; evil seeks to promote self-interest regardless of the common weal. Good is constructive and makes for harmony; evil is destructive and makes for discord.

Equally fatuous are those who accept the Eden story in its literal sense, and those who scoff at it as foolish superstition. They both make the same mistake, are guilty of the same lack of proportion. The story is so evidently symbolic and allegorical; and the same symbols are universally found. What is that Tree of the Knowledge of Good and Evil? That Tree of Life? That pleasure-garden? The Garden is the state of primitive innocence in which dwelt early man, when as yet the light from Heaven had not kindled the latent spark within him. The Tree, the Tau, and the Cross are universal symbols of the Wisdom-Religion, as is the fruit which hangs near the top of the Tree. Around the Tree we often find a Serpent coiled — the universal emblem of Wisdom ('Be ye wise as serpents'). This is the origin of the Christian Cross, which should symbolize the sacrifice of self for Self, the salvation of man by exchanging the mortal for the immortal, the true Resurrection from the dead. See how these most sacred symbols have been turned into a dogmatic system, in which man is made to believe himself doomed by the sin of Adam to eternal damnation, only to be saved by an act of homage to a crucified God; and how good and evil have been mixed up, that which is holy profaned, and man made to damn his own god-given faculties.

It is hoped the above will not be interpreted by anyone into an advocacy of anything like 'Satanism' or devil-worship, or any such

evil cult as may be found lurking in dark corners today. The distinction between good and evil is clear enough. If Satanism means the deification of evil passions, and black magic and sorcery, then the name of the divine archangel has again been traduced. Such unhallowed cults are simply one of the natural results of denying to man his own natural power of self-directed evolution; by cutting him off from the true light, we drive him to seek refuge in false lights. The Bible is one of the world's sacred scriptures; when we know the keys we can interpret it aright; but it can be, and has been, interpreted entirely wrong, so that a fraud has been practised on humanity. The above is written with a view to trying *to* clear away some of the confusion. It is time that the crucified Christ were resurrected from the tomb wherein his so-called followers have cast him; and that man should recognise once again his true Redeemer in the Christ within all men.

TRANSACTIONS OF THE POINT LOMA LODGE: IV — *G. de Purucker*

G. de P. — Here is a question I would like to ask: You have spoken of the different Buddhas. You have referred to — at least you have inferred — the existence in man of different egos. We have heard on other occasions of the Divine Monad, the Spiritual Monad, the Human Monad, the Astral Monad, and the Physical Monad. Here is my question. Just what, then, is man? How many mans — if I may so coin a plural, I won't say men, but how many mans — are there in a man? I think that is something that is well worth studying and carrying the study over for weeks, because the true answer contains a wonderful light on the matter. How many mans in man? Is he just a horde of creatures streaming and dreaming through his constitution, and is a man made up of this horde; or is he a Divinity who imbodyes all these beings within his essence; or what is he?

(After considerable discussion by Lodge-members)

G. de P. — Perhaps I did not phrase my question clearly. Man's constitution is composite, and, as said before, there is a Divine Monad, a Spiritual one, a human, and so forth on down the scale. Now, is each one of these monads an entity by itself, united with the other entities, all together forming man's constitution; and if so, are there several mans in man, or is it just one single unitary being to which different names — I mean divided into portions to which different names — are given as we pass down the scale? Is the thought clear?

(After still further discussion by Lodge-members, the Leader answered the question himself, throwing new light on the teachings.)

G. de P. — It is not a mere figure of speech when we speak of man as having in his constitution different monads. A monad means an indivisible center of life-consciousness-substance, a spiritual ego. Therefore man, in addition to being a stream of consciousness as he is as a constitution, has within him a Divinity, a Buddha or Christ, a Manasaputra, a human being, an astral entity; and he is housed in the human beast — the astral-vital-physical body. All these collectively constitute man's constitution. Hence I have so often said to you: Remember in all your studies, never forget it, that man is a composite entity, which means an entity formed of other entities, other beings. Therefore did I choose the words in asking my question: How many mans — not men but mans — are there in what we call man? All through any one such constitution there is the sutratman or thread-self from the inmost of the inmost, the core of the core, the heart of the Universe — through all these different monads, from the highest till it touches the physical brain of man. Thus man is both legion and unit. The Silent Watcher in him is the Dhyani-Buddha, an actual, entitative, living ego of divine type. Man is but a copy, a microcosm, of what the solar system is, the Macrocosm. He is no different, he is the same: powers, substances, faculties, essences, everything, only in the minute scale. What you see in the solar system, you should find in mankind. If you want to know what the solar system consists of, study yourself. You simply copy the Great.

Now, then, the human ego which is I, which is any one of you, is one of those particular monads as yet relatively unevolved. Above it there is the Spiritual Monad, and above the latter there is the Divine Monad. For karmic reasons very intricate, difficult to understand but existent, any one of us happens to be a certain stream of consciousness, a sutratman; yet you or I as human individuals are the human monad. I am a human monad, each

one of you is; so that, as a human being you are only in the intermediate part of that stream of consciousness which is your constitution, and the upper part of it makes your link with infinity, and the lower part of it enables you to learn on this plane.

Thus you are both one and legion. Thus the divinity in the solar system is both one and an army. We are component parts of that army. The god of the solar system has a life-consciousness-substance, energy, being, which flows through all of us, and is the substantial, conscious background in which we live and move and have our being; and all that particular range of monads or egos which forms any one of us, and forms his stream of consciousness, is spiritually housed in this solar Divinity in whom we live and move and have our being. It is really very simple, and it is so beautiful, because in understanding this seemingly intricate but really very simple thought, you have the key to so many of our deepest doctrines.

Now then, a last thought: Any one of these monads or spiritual egos which form your constitution, my constitution, what is commonly called the constitution of a man, is evolving — you are, I am, the god within me also, the god within you also, each one on its own plane, each one following its own pathway, and each one in time going a plane higher, and then a plane higher still. When our monad shall have brought out from within itself its latent powers, its unevolved, undeveloped powers, it will become a Spiritual monad, and we shall all be Buddhas, and we shall then work through what is now the animal nature in us, which then will be human. Each monad will have stepped up a degree, and be more highly evolved. Keep this thought in your mind of your utter oneness with the Divinity; and one of the best ways of recognising the utter unity of everyone of us with Infinity, is remembering that we are composite, not by fastening our minds

on the fact that we are just an ego different from other egos. Therein is the heresy of separateness. The differences are illusory, yet they exist. Illusory does not mean that they do not exist, it means that it is not the *real* Real, the realest Real, the fundamental Reality.

Take Father-Sun. We see only his body, and yet his vitality infills the solar system in which the planets are bathed, and all the beings on the planets, and the invisible planets. Then the innumerable armies and multitudes and hosts of life-atoms building my body, your body, the bodies of the earth, the bodies of the sun, the bodies of the gods — each one of these life-atoms is a growing, learning entity, ensouled by a monad, which is likewise a stream of consciousness.

Man is a unit when you take a particular portion of the constitution which is the human ego, which is evolving. It will become a spiritual ego, and afterwards a divine ego; and yet at the same time shot through and through with forces streaming down into him from egos superior to himself, of which he is the child. This is the esoteric basis for the old saying, that at the flame of a candle you can light all the fires of the world, and the flame of the candle is undiminished. Consciousness is just like that. You cannot exhaust it.

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: IV — *H. T. Edge*

IV — THE SERPENT

This symbol, like the others, condenses a number of meanings into one; and of these meanings we have already touched upon one in the article on the Circle (Feb. issue). It was there mentioned that the Serpent is often shown swallowing its tail, as an emblem of the return of cycles upon themselves, and the union of ends and beginnings. It was also shown that, if the ends of the circle pass one another instead of meeting, a spiral curve is formed, which still farther expresses the course of evolution. This spiral curve is often shown as a Serpent, so that one meaning of this symbol is that of the spiral course of evolution.

It will be well to say here, with reference to the Serpent, as also to many other symbols, that there is a *dual* meaning. A knowledge of this fact removes many obscurities in the interpretation of symbols; we saw for instance, last month, that the Cross may represent the interaction of Cosmic Mind and Cosmic Matter on the highest plane, or the union of physical forces on the terrestrial plane. Similarly we hear of good and bad Serpents, and in our own Bible we are told in one place to be wise as Serpents, and in other places to beware of that old Serpent the Devil. Bearing this dual nature in mind, we shall avoid such confusions as theology has made in confounding the Serpent of *Genesis*, who taught mankind wisdom, with that Devil who is the personification of man's evil passions.

We read in *The Secret Doctrine* that Fohat, Divine Messenger, Intelligent Cosmic Electricity, who at the Divine Word proceeds forth to create worlds and the beings thereon, moves in a

serpentine course, generates spirals; and this spiral plan of evolution is imitated throughout nature, from the nebulae to the spiral growth of plants. The Serpent means Divine Wisdom, Creative Intelligence; and Masters of Wisdom are called Serpents — which gives a new meaning to the injunction 'Be ye wise as Serpents.' Hermes or Mercury carries the caduceus, a wand with two Serpents entwined on a staff; the Chinese made the Serpent the emblem of their emperors; the Druids called themselves Snakes; serpent-emblems called Dracontia once covered the globe and are still found; Quetzal-Cohuatl was the snake-deity of the ancient Mexicans; Dragons are found throughout ancient symbology with the same sense. But we also hear of evil Serpents. The Gnostics spoke of an Agathodaimon and a Kakodaimon, or good and evil divinity, represented as Serpents; Hercules slays Python; Apollo at birth overcomes a Serpent, but does it by means of another Serpent — the higher wisdom in man overcoming the lower. The two nodes of the moon, Rahu and Ketu, are called the Dragon's head and tail. So the Serpent can represent the duality of human nature — which is but a copy of the duality in Cosmos. There is the Serpent of Spirit and the Serpent of Matter, the Heavenly Wisdom from above and the earthly wisdom from below, of which Paul speaks so often. These polar forces throughout all creation make the eternal contrast by which growth is promoted and equilibrium sustained. The lower Serpent of matter is not evil in itself, but becomes evil to man when he sets himself in a wrong relation to it. Man's compound nature enables him to endow the forces of nature with intelligence and thus to create bad Serpents, which impede his progress, but in the long run give him the victor's strength; and cosmically speaking, the descent of Spirit into Matter has engendered fearsome creatures that prey on one another, and deadly poisons and pestilences. So the Serpent or Devil may very well stand for the lower nature of man, which (as we know) is a

dire and dismal reality, a specter we have ourselves raised and must lay; and the Serpent may just as well stand for man's Savior, the Divine Wisdom from above. Only let us not personify them into a Jehovah and a Satan; and let us remember that our body is the Temple of the Holy Ghost, even though we may have desecrated the shrine.

The Serpent is closely associated with the Tree — sometimes the Cross — and, as said in our last article, denotes the creative forces circling through the planes of matter. The children of Israel are bitten by Serpents, which causes a pestilence, and are healed by Moses (a magician) setting up a brazen Serpent. The Serpent is the Teacher of man, as are the Christos, Prometheus, Lucifer, and the Savior under various other names. But he is also the Tempter — or rather, the one who tries and tests man. For how is man to exercise the Divine prerogative of free will unless he is given a free choice? Therefore the Teacher is rightly called a Tempter, but not in a malign sense.

As this is Easter, it is appropriate to mention the Serpent in connexion with the Egg. In various parts of the earth are found Serpent Mounds, often with a mound representing the Egg near the mouth of the Serpent. These two symbols are naturally associated; for the Egg symbolizes the womb of nature. Its form is spheroidal, so that it stands for the same as the Circle; but it has a germ inside, from which will spring, in stage after stage of unfoldment, the complete being. For some people this may be a mere 'analogy' — little more than one of the figures of rhetoric in the back of the grammar book. But analogy is the great key to the interpretation of cosmic and human mysteries. The ordinary hen's egg is actually a faithful miniature of the great Cosmic Egg, and it is possible to trace the most wonderful analogies throughout all the stages of the embryo which biologists study. The custom of exchanging eggs at the time of the year's rebirth

was observed by many nations and has been adopted into Christianity along with other 'Pagan' customs.

'HAMLET' AND 'THE TEMPEST' — A COMPARISON — *J. H. Venema*

SHAKESPEARE AND STRATFORD-ON-AVON

It has been said that when we talk about great men we conjure up their souls, indeed their spirits, and if there is truth in this thought, we are tonight in very good company! For we are speaking tonight about one of the world's greatest dramatists, William Shakespeare, and we are fully justified in calling him one of the world's greatest dramatists, for indeed he belonged, and belongs, to the world.

Who was this man whom we now know as William Shakespeare, who was born in 1564 and died in 1616? You who have visited Stratford-on-Avon, who have seen the church where he was buried; you who have witnessed some of the master's great plays in the Memorial Theater in Stratford, know a little more than most people about this mysterious personage, about whom so much has been written and whose plays have been read all over the world and translated into many languages. Yet no other artist has been more impersonal. It is as if he said to the world: "Here is my work; take it and do with it whatever you like, but forget myself." And yet we know that William Shakespeare by his works has set the whole world thinking, writing, and philosophizing. It is doubtful if the mystery about his *personal* life will ever be solved.

SHAKESPEARE AS A TEACHER

In order to study Shakespeare we have to go to his works; and a study of these works means: (a) a study of the evolution of a human being, and (b) of the life of an innocent, bright, and lively youth up to the period in his life when he felt the 'warrior' awakening in him; (c) of the time when the storms come and make him wonder, doubt, seek, search (a tragic period); and (d) a study of his conquests, of his power to see through and behind things, of times when he *knew*, i. e., had an inner vision, (as in his last plays).

What then are the outstanding traits which we find in all his works, especially in the tragedies? Here are a few:

Trust in the good of life and in a noble destiny for man.

Belief in the law of cause and effect.

The hero as falling at the end through some flaw in his own character, no matter how noble he may be otherwise.

Life as a great 'adventure' and life as *worth living*.

The immortality of the *inner* man, the Spiritual Soul.

Love and compassion as liberating key-notes of life.

Rarely do we find Shakespeare using or referring to the word 'God.' We find instead: 'everlasting,' 'providence'; but 'God' in its Christian connotation is scarcely found at all.

What a great painter of character this dramatist was! How well must he have known himself and human nature to be able to paint such marvelous characters and their relations to their surroundings; their adventures and their struggle for light and freedom. It has been said, also, that no one has ever surpassed him in his description of women. We find in his works the sweet and lovely woman, but also the terrible and cruel type — though always great as characters. A study of Shakespeare's woman-characters alone would reveal more than the reading of hundreds of modern novels.

We find in Shakespeare too, as in all profound thinkers, a deep and noble sense of humor employed in creating wonderful contrasts. Therefore has it been called 'dramatic humor.' And at the end of his great tragedies we always find that beautiful promise of hope: in spite of the fall of the hero, in spite of deep tragedy, indeed often a holocaust, we feel a purification, a katharsis, revealing to us the fact that from suffering and sorrow and tragedy, if we are noble-hearted and noble-minded, great light may come. (For a more comprehensive study of Shakespeare's plays it is recommended that something more be known about the great writers on Shakespeare's works: Moulton, Bradley, and Dowden.)

Let us not tonight, however, speak too much of that which others have said concerning Shakespeare. Let us make Shakespeare speak for himself; but then you cannot blame me either for giving my own version of the great dramatist's works. And yet we can understand only that which can be evoked in us, that which we have in ourselves. If I pronounce the word 'house,' some of us may see only their own house, some may see a miserable hovel, others may see a beautiful palace: it is our imagination and our power of vision that make us see. Nevertheless I shall substantiate everything that I am going to say by referring to the poet's own words, and simply request you to bear in mind, as said

before, that it is our own power of vision that will make us understand the deeper side of the master's adventures and descriptions of life, when hearing his words and seeing his plays.

'HAMLET'

Hamlet has probably interested people as much as Goethe's *Faust*. Indeed, I have often wondered if a parallel could not be drawn between Parts I and II of *Faust* and Shakespeare's *Hamlet* and *The Tempest*. At all times and in all periods *Hamlet* has had a hold upon the people. Bradley has called *Hamlet* the tragedy of 'moral idealism,' and for the following reasons, as Shakespeare gives them:

a. "There is nothing either good or bad but thinking makes it so."

Do you see the deep philosophy in this? You are what you think, said the Sages.

b. "There's a Divinity that shapes our ends." Evidently the great master wants to make us see that our end — that is, our destiny — is sublime, and if so we must be part of that Divinity.

c. "What a piece of work is man! How noble in reason! how infinite in faculty! in form and moving how express and admirable! in action how like an angel! in apprehension how like a god! the beauty of the world! the paragon of animals!"

Here we see how, in the words of Hamlet, Shakespeare gives us a conception of man reflecting his own philosophy in the middle-period of his life, in what we may call the 'tragic period.'

I suppose you all know the story of Hamlet, but let us very quickly allow the events to pass before our mind's eye. Hamlet the philosopher has come back to Denmark because his noble father has died. King Claudius, his uncle, whom his mother has married, is on the throne. In nobility of character he is the opposite of the late king, Hamlet's father. The ghost appears (did Shakespeare use the supernatural *only* to interest his audience?) and he informs the prince that his father was murdered. We then learn Hamlet's mission:

"Taint not thy mind" — and yet he must avenge his father's death. He may not wrong his mother, and yet he must kill her husband! Now, if Shakespeare meant us to take things literally, could this be possible? Can we kill a man and not "taint our minds"? We see at

once that the play must be taken symbolically, and then indeed we shall view Hamlet from quite a different aspect. We remember what Hamlet's philosophy brought to him; how he worked out his great mission; how he killed Polonius; how he was sent to England, and returns, finding Ophelia dead; how at last he fulfils the task that is set him; and we hear the words: "the rest is silence," when Hamlet falls. Yet we feel that, in reality, he has conquered. The coming of Fortinbras brings the promise that the "rotten state" of Denmark will soon belong to the past.

Is this play only a melodrama and a holocaust? Was Shakespeare a fool? Are all the readers and students and critics fools by being so interested in and paying so much attention to this story of Hamlet? Indeed, it might have been an impossible story if Shakespeare had not continually drawn our attention to the symbolic meaning. Probably he himself was going through what we might call the 'Hamlet state' — the state when with great intensity we ask ourselves the meaning of life and of its struggles, the *why* and the *how*, and crave the truth about our destiny. In scene ii Hamlet says:

O, that this too too solid flesh would melt,
Thaw and resolve itself into a dew!
Or that the Everlasting had not fix'd
His canon 'gainst self-slaughter! O God! God!
How weary, stale, flat and unprofitable
Seem to me all the uses of this world!
Fie on't! O fie! 'tis an unweeded garden,
That grows to seed; things rank and gross in nature
Possess it merely. That it should come to this! — I, ii.

Are we not led to see in the *old* Hamlet our own Higher Self, who should be on the throne as our Lord and Master, but whom we have suffered to be put in the background, while an ignoble character, King Claudius (our lower self), is temporarily occupying the throne? When we read Hamlet's words about the Ghost, we can see in his words the urge to listen to the voice of this Higher Self:

Why, what should be the fear?
I do not set my life at a pin's fee;
And for my soul, what can it do to that,

Being a thing immortal as itself? — I, iv

Another strong plea for the symbolic meaning of the play is that Hamlet is not allowed to 'taint' his mind. Yet how can one commit a murder and not taint one's mind? In Act i, scene v, the Ghost says:

But, howsoever thou pursu'st this act,
Taint not thy mind, nor let thy soul contrive
Against thy mother aught: leave her to heaven. — I, v

A most remarkable thing also is Hamlet's pledge to his Higher Self:

O all you host of heaven! O earth! what else?
And shall I couple hell? O fie! Hold, hold my heart;
And you, my sinews, grow not instant old,
But bear me stiffly up! — Remember thee?
Ay, thou poor ghost, while memory holds a seat
In this distracted globe. Remember thee?
Yea, from the table of my memory
I'll wipe away all trivial fond records,
All saws of books, all forms, all pressures past,
That youth and observation copied there;
And thy commandment all alone shall live
Within the book and volume of my brain,
Unmix'd with baser matter: yes, by heaven! — I, v

It seems as if the wavering, hesitating *personal* self makes a promise to obey the *Inner* Self. On the one hand we find Hamlet's admiration for a human being: "What a piece of work is man!"; on the other hand, his doubt as to the emotions and the illusions of the personal self, by which he proves that he is learning to discriminate between the mortal and the immortal part of himself:

In apprehension how like a god! . . .
And yet, to me, what is this quintessence of dust? — II, ii

His pondering on the mysteries of life and death we find in the well-known monologue

"To be or not to be" in Act III, and also later on in the words:

Give me that man
That is not passion's slave, and I will wear him
In my heart's core, ay, in my heart of heart,
As I do thee. — III, ii

How well do we learn Shakespeare's idea about the mind:

What is a man,
If his chief good and market of his time
Be but to sleep and feed? a beast, no more.
Sure, He that made us with such large discourse,
Looking before and after, gave us not
That capability and godlike reason
To fust in us unused. — IV, iv

In conclusion, like a motif in a symphony we continually hear:

- a. "There's a Divinity that shapes our ends" (Act v, sc. ii); that is, Life may be a mysterious adventure, but our destiny is divine. As the old philosophers said: "Man is a god in his innermost being," and Hamlet is *striving to gain this great knowledge about Self*.
- b. "There is nothing either good or bad but thinking makes it so." That is, "We are what we think." We make or mar ourselves by our thinking, our aspirations, and our ideals.
- c. "There are more things in heaven and earth, Horatio, than are dreamt of in your philosophy" (Act I, sc. v). Indeed, we all agree with these words, when, like Hamlet, we have been struggling to liberate ourselves from this material and limited life to find the greater, the infinite Life. Hamlet feels himself to be the great actor on the stage of life, but has found out as yet only *some* of the things in "heaven and earth," which are more than human beings dream of.

'THE TEMPEST'

And these greater things the seeking human soul has learned in *The Tempest*. How sweet is the passing from the turmoil and struggle in *Hamlet* to the enchantment and fairylike

atmosphere in that lonely island to which the great dramatist leads us in *The Tempest!* This play has been considered Shakespeare's last, because the hero, Prospero, breaks his magic wand at the end, and it has been suggested that Shakespeare intended this to be understood as a symbolic indication that he would write no more after this play. Had the author, who must have identified himself with Hamlet during certain phases of his life, now found the greater truth of life, indeed, had he conquered life? Side by side with the tranquility and the enchantment we still have in *The Tempest* struggles and evil characters; but Prospero, the hero, is no longer affected. He has power over Nature; he is a Master of Life and Death, whose commands the monster Caliban has to obey. When we read this play, or see it, we come to the conclusion that it is no less real or symbolic than *Hamlet*, but that now everything is controlled by Prospero's mighty power. The key-notes are:

- a. Love conquers; compassion is the liberating power in the world.
- b. The Law of cause and effect must be fully worked out before real peace, rest, and forward evolution can come.
- c. The lower life and its forces must be controlled before the divine influence can make itself felt in life and in our hearts.

I presume that you all know this story, and have felt the beauty of the lonely island and Nature, the sweetness of Miranda's character, Ferdinand's nobility, and Prospero's wonderful insight, foresight, and power. And you have marveled at the sprightliness and loveliness of that incomparable creation, Ariel, and by reading or from seeing the performance of the play, have experienced a beautiful dream which was 'real' enough.

CONCLUSION AND COMPARISON

As we have said, some of the key-notes of *The Tempest* are: Love and forgive! Do we not see that there has been a great evolution from the 'Hamlet-stage' to the 'Prospero-stage'? By *self-directed evolution* the hero, from being more or less a slave to himself, has become the master of himself. The poet had discovered something — something *far* greater than when at an earlier stage he identified himself with *Hamlet*. Listen to his words:

And, like the baseless fabric of this vision,

The cloud-capp'd towers, the gorgeous palaces,
 The solemn temples, the great globe itself,
 Yea, all which it inherit, shall dissolve;
 And, like this insubstantial pageant faded,
 Leave not a rack behind. — IV, i

That is, there is a law of *coming and going*, a law of cycles, the great mystery of the withdrawal from the visible worlds into the invisible spheres. Had Shakespeare studied the old philosophies, or did his own inner self, his intuition, tell him something about the great illusion of life? For does not Prospero in Act IV say:

. . . We are such stuff
 As dreams are made on; and our little life
 Is rounded with a sleep. — IV, i

Here we have a clear indication that Shakespeare discriminated between that which is lasting, the immortal side of life, and the transient or mortal side; but a man who could evolve from the Hamlet- stage to that of a Prospero in *The Tempest*, even if it be but in the imagination, must have found something sublime in life — and we shall find it too when we study him properly.

In conclusion, it may be useful and interesting to draw some parallels:

	"Hamlet"	"The Tempest"
Love:	Love is personal (scheming is the result).	Love is here chiefly impersonal, as love of Nature) Prospero's love. Sacrifice, in Ferdinand and Miranda.
Rogues:	Here they have partial success.	In this they have <i>no</i> success.
The King:	The King on the throne is a bad influence.	He is an instrument to bring about good.
The Plot:	Struggling, scheming; conquest is but partial.	A complete conquest of the good over the bad.
	They are personal, limited; hardly <i>real</i>	

The Women:	womanhood.	<i>Real</i> womanhood.
The Supernatural:	It is mysterious, sinister, looming in the background.	It is controlled by Prospero; it is a helpful force, thereby liberating the 'supernatural' beings also.
The Hero:	He is struggling, falling and rising, and only in the end gains the victory; he is still under the influence of 'circumstances' (Karman)	He is the master of life and death: a helper of his fellow-men, and never thinking of himself.

The destiny of man's life, Shakespeare seems to say to us, is sublime. Through struggle and failure we rise higher, reach higher heights, greater perfection, become masters of Life, and of Death.

The Theosophical Forum

TWO BELOVED ATTRIBUTES — *Rose Winkler*

The condition which high friendship demands is the ability to do without it. To be capable of that high office requires great and sublime parts. There must be very two, before there can be very one. — Emerson, on 'Friendship'

One cannot study Emerson's *Essays* without becoming deeply impressed with the fact that two very essential attributes of his character were his profound conception of friendship and his lofty ideal of what the noblest expression of love should be. To him, evidently, they were spiritual, transmuting powers insulated against the revival of past weaknesses which, in the arduous labor of overcoming personality, had passed through fire-cleansing experiences. Having become alchemically purified, the truest and most sacred in the heart-life could venture to bare itself to them in faith and absolute confidence.

How I have pondered over the following words: "the condition which high friendship demands is the ability to do without it." Is it not so, for truly, personal desire once transmuted into impersonal love, that noble attribute beneath which still lurk disparities, desires nothing for itself, but relatively contributes the stalwart ability to do without it. Verily, each must find himself before he can find the other! But longing to unfold this thought to a more satisfactory conclusion, I looked to Mother Nature to help and inspire me, as she did in my earlier years. Then, enwrapped in the gentle folds of her soothing harmony she would clarify my understanding, and thenceforth I never was quite able to deny myself her ready and unfailing response. Notwithstanding this, she and I appeared to be 'very two,' and yet, how was it when she and I at heart were 'very one'!

Seating myself in one of her lovely sanctuaries, templed by the filtered shade of gleaming leafy boughs, the clear cool atmosphere reflected a rare mystical azure, a harmonious blend of the distant manasic-blue mountains, the smiling blue sky and the marine-blue auric veil floating over the sea, which seemed to palpitate with some consecrated message. The perfume-laden breeze, like honeyed sweetness, diffused the fragrance of aromatic herbs distilled in Nature's laboratory, linking her impersonal consciousness to mine for holier communion. Thereafter, portals opened into shining chambers beyond, and the glory glimmering in each human heart, reacting to a spark of the awakening spirit, burst into lovely flame. It was thus I learned that the higher never acts directly on the lower; it requires an intermediate transmitting agent to intervene everywhere, and the eye of the lower, as the spiritual soul or Buddhi-Manas does through the visualizing power of Manas, the Higher Ego or Thinker.

All our Leaders have taught that there is a mystic alliance between man and Nature, that man is a child of the universe, that the forces and powers that comprise the one are inseparable and identic with those that comprise and construct the other. Although we must learn to walk alone, the solitude imposing itself for further self-acquaintance is but a temporary necessity to spiritual growth. Again I learned, that although man and Nature appeared to be 'very two,' they were, indeed, 'very one.' When we realize that man in his dual nature is mortal and immortal, an animal-man and a god-man within his corporeal body, we further learn that androgynous man in the Third Root-Race separated into sexes, one positive and the other negative. Each, like spirit and matter, knew itself not, both being the opposite aspects of Reality, and through incalculable ages each evolved the dual aspects of itself — the spiritual and the corporeal.

Truly, in the spiritual sense, true friendship and impersonal love, ever expanding in the consciousness of oneness with the Universe, under the fire of heroic experiences, blossom forth to glorify true manhood and womanhood by their perennial beauty, strength, and lofty aspirations. In their higher unfoldment, each guards the other as his counterpart, and like progressive spiritual entities, gains the ability to do without the other, and in acquiring and recognising these majestic attributes in the other, the rarified virtues forge a closer bond and each blends more intimately and becomes at one with the other. These two beloved attributes, like towering, glistening, snowy peaks, rise majestically heavenward out of the deep bosom of divine Compassion, and in their compelling mysterious power they pulsate rhythmically and elevate the ideals in the core of the inner god and in every human heart.

Their beauty, strength, and nobility, inspire and shield, and ever stimulated by loftier ideals, these expanding attributes soar onward with extending gold-tipped wings, flashing ever more brilliantly in the dazzling rays of the divine Monad or Higher Self. The happiest mortals are they who no longer crave the gratification of the desires and senses, for the unerring law brings evidence that true friends are self-elected. Besides, these loved qualities have a lustrous power to disperse the shadows of life and metamorphose the lower traits into the higher. Thus by irradiating their magnanimity to exalt the eager soul, it follows the magnetic channel and finds the way to open the portals to the Vision Sublime — at-one-ment with the All. Therefore, all personal desires, like the stone of matter, must be banished, rolled away, not to hinder, but to aid the pursuit of the long-sought ideal of infinite beauty and universal compassion concealed in the heart of every human being. Dr. G. de Purucker says:

You yourself must awaken in your own soul the holy flame; and it is the same with every other step in spiritual and intellectual progress that you make. You yourself must experience the unspeakable delight of Compassion — the ineffable feeling of being at one with the ALL. YOU yourself must be the vehicle of the inner light, must gain it. It is both in you and above you, invigorating you and inspiring you. Be it. — *Golden Precepts of Esotericism*, p. 133

Since there are as many different orders of friendship and love as there are individuals, some general but brief definitions contrasting them might be helpful. Whereas friendship is tempered by reason it lacks the ardor of love, while ordinarily, love is more selfish and involved with the passional nature, so that, as commonly said, love is blind to the faults of the loved one. But not so with impersonal love. It seeks nothing for itself nor temporizes with the personal weaknesses, but if necessary, prefers gently, wisely, and patiently to transmute a fault into a virtue, thereby extinguishing the baser, in order to conserve the highest welfare of the beloved. True friendship and impersonal love act in harmony with the Voice of Divinity within, thrilling every motive to vibrate as unselfish action which draws souls to each other.

Neither stoops to affect a glamorous charm. Both seek virtue and wisdom, hence scorn to envy or supplant the well-merited position of either the loved one or the true and tried friend. With unfaltering confidence and trust, each unquestioningly supports the other through any failure or trial. When love is impersonal, it lacks the desire for self-advantage; and friendship, its twin sister, becomes its backbone, as it were, stimulating love's holy desire gladly to sacrifice life itself, if need be, for the welfare of the loved one. These beloved attributes, functioning as twin-sisters, have their root in the eternal god-spark or Monad, and operate as

electro-magnetic forces drawing all similar things to themselves like a magnet. Their standard may be gauged by the indissoluble strength of the links forged in the purifying trial of fire. The heart-force augmented by boundless sympathy distinguishes an exemplary character. May not the ideal relationship of Michael Angelo and Vittoria Colonna approximate more or less this latter type?

Love is peace; love is harmony; love is self-forgetfulness; love is strength; it is power; it is vision; it is evolution. Its power so expands the inner nature that slowly you become sympathetic, because you become at one with the entire home-universe in which you live and move and have your being; — and you become at one with the divinity in the heart of all things. — *Golden Precepts of Esotericism*, pp. 118-19

The Messengers and Teachers, in their all-inclusive and Almighty Love, express the most inspiring, beautiful, and enduring friendships. I wonder whether anything in human life surpasses the beauty of such an ideal devotion. *They* never unclasp the hand of friendship and love with their disciples. The more changeless, loyal, and enduring is the unselfish devotion of the disciple, the more beautiful and unbreakable the bond. Through incarnations the golden link of spiritual brotherhood enlivens and glows in the endless acts of altruistic service evoked in the one and the other. Such a bond of love and friendship is an unspoken covenant with the Divine and makes of the 'very two,' the 'very one.' These great and sublime qualities distinguish the mighty and heroic characters of the highly evolved Messengers, inspiring by their all-permeant love all high-minded and spiritually inclined men and women for incarnations to come.

An endless trail of grades of evolving entities are attracted to

them not only by their electro-magnetic and spiritual power, but by their unfolding oneness with the All. Their energizing radiations help them to mount from height to height, and on reaching the human stage to advance from men to heroes, from quasi-divine beings to gods and super-gods, progressively evolving to at-one-ment with the Boundless All. They, having passed through unspeakable trials and heart-searing experiences, are through their compassion cemented indissolubly in a mystical sense, through the very blood of their hearts, becoming 'very one' with the Guardian Wall which protects Humanity from yet greater suffering and despair!

The Theosophical Forum

LOVE OF COMPANIONS — L. L. W.

So shalt thou be in full accord with all that lives; bear love to men as though they were thy brother-pupils, disciples of one Teacher, the sons of one sweet mother. — *The Voice of the Silence*, Fragment III

H. P. BLAVATSKY, on May 8, 1891, laid down the shattered physical instrument through which she suffered and died daily that the Theosophical Movement might live. And we, who profit so vitally today because of her toil and sacrifice, look upon this time as one in which to renew our allegiance to the principles she worked for, and our active loyalty to the Masters' Cause.

Brotherhood, Love, Unity — these are the light of her message. And all who follow the warmth and glow of that divine beacon, be they Agnostics, Fundamentalists, Scientists, Theosophists, or of any other line of thought — they are our fellow-workers in the Masters' field. All men are our brothers; but those who in any way are sacrificing self that others may profit — are not these our sacred Companions on the Path?

Perhaps we Theosophists tend to become too wrapped up in our own inspiring and joyous Task; so it may be helpful at this time to remind ourselves of the devotion and labors of the innumerable friends of humanity who are striving to make this bewildered world a better place to live in. It is indeed well now and again to think of these men and women, our Companions of the Ray of Divine Compassion, sending them from our hearts a gleam of sympathy and loving fellowship in their work.

And then there are those other closer, even dearer Companions, brothers and friends in all the other Theosophical Societies which

combine with our own to make up the Theosophical Movement. Their devotion and work and self-sacrifice are precious to remember as White Lotus Day blooms again each year in the wilderness of the world. Let us renew at this time our deep appreciation of them and their Theosophical activities, and strengthen our heart's concord with these valued and beloved Companions on the Path.

Next, what of ourselves, fellow-workers in our own T. S.? Here naturally we tend to change our viewpoint a little and recall the wise old advice about beginning at home. For to love and think and act impersonally is certainly a more complex effort when prickly personalities — and are we not all sometimes a little prickly? — are working side by side. There are, for example, so few members whose ideas are as practical as ours, and therefore our suggestions should not be set aside. And then some of us have such a gift of hitting off the foibles of stupidity in an ironic phrase! Perhaps we do not always utter it, merely permit it to sparkle in our minds. Our own prejudices of course have generally at least a flavor of justification, based as they are upon our wide experience of life or social work; so we do not easily relinquish them, especially when they are opposed by the prejudices of others, who are prone to be ignorant and narrow to an uncommon degree!

Is this perhaps a picture — drawn with apologies to all of us — of what, consciously or unconsciously, happens now and again in our midst? But even if the shoe fits it should not discourage the determined seeker after perfection in brotherhood.

William Q. Judge somewhere reminds us that we do not need to be disheartened because of our faults and weaknesses, for they are merely the expression of universal energies within our constitution which we have not yet brought under control.

Neither are they peculiar to ourselves. Everyone around us is compounded of exactly the same energies, manifesting a little differently of course, but still 'much of a muchness' in us all. It is these very untrained elements which, melted in the fire of aspiration and molded by the spiritual imagination and will, are the basis of self-directed evolution. Their mastery will awaken within us the Buddhistic splendor and can lift us to the azure thrones of the gods.

Love of Companions! How deeply the beautiful phrase sinks into our hearts this White Lotus Day of 1936! A new era of Theosophical growth and propaganda has opened. How much clearer will be our light, how much more penetrating our energy, how much more perfect we, as instruments for the Masters' work, if we stand as one solid nucleus of Companion-hearts!

The Theosophical Forum

THE TWO PATHS — *Helen Savage*

The Two Paths: the teaching of the sixth 'Jewel of Wisdom,' of the Right-hand Path and the Left-hand Path: the path upwards, and the path downwards; the path of unselfishness and the path of selfishness; the path of ultimate joy, and the path of ultimate sorrow; the path of immortality, and the path of annihilation.

We see these two paths everywhere in life, but many people think it is just a matter of chance. The spiritual teachers of the human race say that this is not a matter of chance, but is based on the structure of the universe. There is the spiritual side of the universe, and the material side; not meaning by this that the spiritual on the one hand and the material on the other are really divorced: there is no more a dividing line between the spiritual and the material than between the colors in a rainbow. Take red and orange, for instance: they are two distinct colors, but when you see them in the rainbow it is impossible to tell where one begins and the other ends.

So it is with the spiritual and material sides of the universe. There is a gradation of beings from the unevolved to the evolved — from the less perfect to the more perfect: from the unconscious to the fully conscious. Therefore, in a general way, we speak of the matter-side and the spirit-side of the universe. The beings living in, or rather composing, the material side of the universe are not evil if that is where they belong; they are simply unevolved. But if a higher being identifies himself with this matter-side, with something less than himself, then he is relatively evil.

Man stands between the spiritual and the material. If he turns his eyes to the material, stops his climb upwards and retraces his steps, he is going on the downward path; if he turns toward spirit

he is going on the path of light. *This latter is the natural path for the human race to follow at the present time*, that is, it is according to nature. We have passed through the matter-side of being as centers of consciousness, and now as higher beings we find it useful to express ourselves through it, *but we are not it*. It is only through ignorance that we imagine we are, and act accordingly.

This Sixth Jewel of Wisdom is very difficult to understand in all its reaches, from its loftiest heights to its vastest depths. This is true of all the Jewels of Wisdom that we have studied. Reimbodiment, for instance, means not only coming back into earth-life, but it includes in its meaning all the grand experiences that the spiritual part of us passes through after death, taking up body after body, re embodying itself, each body fit for the sphere in which it expresses itself. Can any but the Seer penetrate into the mysteries of these lofty peregrinations? Or again, thinking now of the Second Jewel of Wisdom, who of us has the eye of the Seer that can envisage the more intricate weavings of the Web of Destiny?

The Sixth Jewel, then, we are told, cannot be understood in all its vast reaches: we would have to be Masters of Life, for only such a one can know fully what it means to travel the Path of Light. Suppose a solar being, a solar god, should come to earth to try to explain to us even what the interior of the physical sun was like! He would have to speak in terms understandable to us, and about all that he could say would be that the sun is a tremendous vortex of life, pouring forth floods of energy. Much more than that we could not understand. But if we had the solar consciousness we could. So in times to come we shall have a consciousness that will understand the great heights the human race will attain to on this Path of Light. Nevertheless, because the small mirrors the great, because every experience in life touches upon the greatest mysteries of being, therefore we can know something of this Sixth

Jewel of Wisdom. For the upward path is not a path to be trod only when we become Adepts; we can begin to tread it right here and now.

What are the qualities that will help us along the way? They are the qualities that every man admires. Ask one hundred men what qualities they consider an ideal human being should have and all the answers would probably be something like this: He would have courage; self-reliance, at the same time realizing that he is fundamentally interwoven with all other beings: sympathy for all that lives; spiritual wisdom; vision. Now we all have within us just these qualities, and it is for us to bring them out and thus consciously and intelligently follow the path toward the light.

To speak of it as the path 'upward' is to discourage many, for the word 'upward' suggests the idea of a constant strain and struggle. We can think of it in another way: as a path, by following which, we are working *with* the forces of the universe; by turning our backs upon it, we are working against the forces of the universe. If we could become convinced of this, we would forget that it is a difficult path. We would say: "The forces of the universe are with me: I will go forward!"

Nevertheless, we cannot get away from the fact that ordinary human beings find it difficult to travel upwards at all times. Perhaps we can understand better why this should be if we know a little about the meaning of the technical terms used in Theosophy for the Right-hand Path and the Left-hand Path. And let it be said here that we use Sanskrit words not to confuse the student or impose difficulties upon him, but as a matter of fact to make the teaching simpler. This we know is done in all lines of work: terms are chosen and adopted that will get at the key-thought of the idea to be expressed. So for the two paths we use the Sanskrit terms Amrita-yana and Pratyeka-yana. Yana means

'path,' and Amrita and Pra-tyeka describe these paths: Amrita, the path of Individuality, and Pratyeka, the path of Personality.

Now man has within him both an individuality and a personality — the former his real Self, the latter the undeveloped part of him which, like most small things, usually imagines itself to be the 'whole show.' The personality has its place; nobody would want to get rid of it; but it should be the servant and recognise its superior in the individuality. Surely we can use this personality without identifying ourselves with it. One can think of a man going out to the hills for a walk with his dog. If the dog sees a rabbit and dashes after it, that does not mean that the master must also dash after it. No, he pursues his ramble, and if the dog becomes too obstreperous he whistles for him to follow at his heels.

So it is with us. We are the individuality, we are the Amrita-yana. We are not the personality, however much we may think we are; and we can make the personality serve and follow us. This is what mankind in large part has forgotten. Supposing himself to be less than he is, he finds the upward path of Nature difficult to travel.

Sometimes the meaning of the word pratyeka is given as 'each one for himself.' He who follows the pratyeka path, the path of each one for himself, divorces himself from the rest of the universe, deprives himself of the strength that the spiritual forces of the universe can give him. The teaching of the Ancient Wisdom is that if he follows this downward path consistently through many lives, he finally meets annihilation. This is not a strange teaching but another truth of Nature. For what being can set his strength against the mighty universe — and survive?

I am reminded of a tale, told in Danish folk-lore, of a spider who tried to build his web without the thread from above. He built it, indeed, but since it was not held by a strand of the great Web of

Being, it was destroyed in the first storm. The thread from above is the individuality, and as long as there remains one slenderest strand of it stretching down to support the feeble web of the personality, there is hope for that personality. Fortunately, we are told, there are few who allow this thread to snap entirely — very few who break away from the universe.

It is this thread of individuality that we must search for in the hearts of our fellows. He who thus searches and finds is the true humanitarian. Dickens was such a one. He loved his fellow-beings and could see beneath the often ugly exterior. When he wrote *Oliver Twist* — it appeared first as a magazine-story — many of his friends criticized his portrayal of the character Nancy, for, they said, she is a contradiction; no such depraved creature would have shown the selfless and devoted love that she did — though indeed the object of her love was unworthy. When the story appeared in book-form, Dickens mentions this criticism in the preface, and says:

It is useless to discuss whether the conduct and character of the girl seems natural or unnatural, probable or improbable, right or wrong. It is true.

And he goes on to say how many of such objects of our pity he came across in his first-hand studies of human nature, who manifest still

the hope yet lingering behind; the last fair drop of water at the bottom of the dried-up weed-choked well. It involves the best and worst shades of our common nature; much of its ugliest hues, and something of its most beautiful; it is a contradiction, an anomaly, an apparent impossibility, but it is a truth.

In Bill Sikes, the object of Nancy's love, Dickens pictures a

creature who showed no spark of divinity, one of the type who "would not give, by one look or action of a moment, the faintest indication of a better nature." In these two characters, he touched two great truths: first, that there is hope of 'salvation' for the personality by the individuality except, (and here we have the second truth) for those very few whose lower nature, through a course of evil-doing persistently followed, has severed all contact with the higher.

But in discussing this Sixth Jewel of Wisdom, one does not like to dwell on the darker side. All of us love the sunlight; we love to turn to the sun; we do not care to turn our backs upon it and follow our own shadows. And for our further encouragement we can remember that on this path to the light we are not alone. If it is true that for every step we take backwards we pull back weak and vacillating souls, it is equally true that for every step we take upwards we raise others with us. Furthermore, as we help those behind us who are less strong than we, so there are those ahead of us, the Masters of Wisdom, who have blazed the trail for us. It is they who lead, who light the way, although they themselves cannot tread the path for us; but when we begin consciously and intelligently to travel towards the Light, they extend a helping hand and bid us ever "Come up higher!"

The Theosophical Forum

WHY STUDY THEOSOPHY? — *Torsten Karling*

This question covers such a large field that when one tries to sum up an answer to it and at the same time make the various points therein more or less clear to the reader, there comes to the inner perception a book, rather than the three or four pages which the Editors of the FORUM have placed at our disposal. However, it is a comfort to know that the subject will be discussed by different pens, and therefore that it will certainly be treated from many sides, if not from all. There is hardly a theme that will have the same power of calling forth individual viewpoints, even if these naturally are directed towards a common goal.

To begin with, cannot complete unanimity be obtained as regards the truth of this sentence: The greatest cause of humanity's unhappiness is ignorance? We — I speak of us all collectively — are ignorant of our true essence, and we therefore attribute to personal blows, offenses, and other disagreements, a meaning which they do not have. So do we also place too much importance upon outer and transient things, such as honor, wealth, power, and so forth, all of which are bound up with this earth-life. Now the most fundamental reflexion of all offers this question for consideration: What shall I have left when, according to the laws of Nature, I must leave all this? If I take this question seriously — many people push it aside as children do who have some objection to preparing their lessons, or because they believe they can answer it with a similar childish and irrational negation — it opens for the inner vision a view over the whole sea of queries which are so closely allied with the contrasts between reality and illusion.

In this matter we turn to find an answer to religion, philosophy,

or science. Each one chooses the source towards which his own inherent nature feels itself most drawn. Therefore, if I am by nature a person of religious bent, I will search, to begin with, in the existing orthodox religions or in some of their countless sects, for the answer to my question; and insofar as all these forms of religion are more or less bound by dogmas, I must sooner or later be met with the answer which actually is so often given: "These are secrets which we cannot investigate, God's secrets, which it would be presumptuous of us to try to find out. It is more fitting for us to raise our hats and pass by." Do we need to search for the reason why this answer, so often given, yet leaves him unsatisfied?

Does not the matter stand as follows? Every dogma is a human brain-mind construction. Behind this production may have been the most earnest effort to give expression to that which the author felt and believed to be true at the time it was created; but even that same author cannot free himself from the imperfections which are inherent in his thinking; he cannot defend himself against the influences which come from surroundings, the stream of time, training, personal considerations, religiously-political, or perhaps ecclesiastically-political endeavors, etc. The result is something which can easily work against Truth, and which at any rate is so limited and stunted, or distorted, that the real seeker for Truth must feel dissatisfied with it.

Such a one should study Theosophy for the very reason that it has as its motto: "There is no religion higher than truth." In this motto, but especially in the humble and devoted practice of the same in all religious seeking, we meet the liberating ozonic air which is characteristic of great, pure heights. Freed from all restraints, high above the enclosing walls which constitute the nature of dogma, the free and searching spirit will be able to get a

glimpse of past and present religious life which irresistibly draws his attention to its true source, the presence and incessant promptings of the Divine Spirit. And therewith he opens the door to the whole vast Theosophical world-picture, with all that it contains of resplendent religious knowledge.

How does the situation stand for those whose minds are more inclined towards philosophical thinking than for those religiously attracted?

When Plato, in his *Republic*, lets Socrates, with an extraordinary argument, assert that philosophers ought to rule in the contemplated ideal state, he expresses in this statement something which is equally valid today. If we translate this into more modern language, that is to say, if we try to apply it to present-day circumstances, it could well be expressed as follows: Philosophers ought to exercise an educative, guiding, influence on their contemporary fellow-beings, take up their problems, investigate them, shed the light of pure thought upon them, and in this way pay back a part of their debt to the community which gave them the opportunity to devote their time and energy to the search for truth, time to live in the sunshine of truth-seeking. But how does the case stand in reality?

A long period of extremely materialistic representations have not failed to exercise their influences on philosophical ways of thinking. People have been much concerned with making philosophy justify their claims as to 'science,' and when it did not appear 'scientific' to admit something beyond the results of brain-mind reasoning — yes, when one did not dare to confess his belief that anything beyond that existed, because of his academic ambitions, the result was that the philosophical work of our day to a large extent consists of the accumulation of quasi-philosophic, quasi-historic knowledge, and for a superstructure, a

careful, almost anxious groping along lines which have strong affinities for old-fashioned sophisticated ideas.

The writer of these lines is but an amateur in the field, but nevertheless dares to express the surmise that he who takes his philosophical studies and philosophical thinking seriously, with a combination of apprehension and dawning presentiment in regard to the opening of immeasurable expanses, will be more than abreast of the latest results of modern scientific research. If he does not wish to remain with the laggards, then he must take up completely new problems, new only in relation to what for a long time has been considered academically orthodox, but by no means new in the abstract. This wisdom of ancient thinkers is beginning to come to the fore. There have been times when one sought and set highest 'the true existence,' the Reality behind appearances, that which hid itself behind and within the shifting and transient things. Such times seem again to be approaching. It is for philosophy to define what science means by its 'consciousness-substance,' of which the Universe is thought to be built.

For sixty years our present Theosophical Movement has shown the way, at first apparently in opposition to the world, but later with an ever greater following. One day its great contribution to the revolution in humanity's thought-life will be recognised, and this is on the brink of taking place before our very eyes. In reality, Theosophical teaching casts a wonderful light on the relationship between spirit and matter, on the evolutionary cycles, on what is reality and what illusion. Its meaning is in no wise diminished, but is strengthened by the fact that one finds here the same fresh fountain from which the ancients' greatest thinkers drank, and Theosophy shows how they all obtained their wisdom from one and the same source. Indeed, the philosopher who pushes Theosophy to one side on account of prejudice or other small-

mindful idea, does not deserve his professed title. But he who will make trained thinking fruitful for his contemporary fellow-beings and their followers, all the inquiring and seeking Companions, has in Theosophy a gold-mine out of which he can take freely the noblest metal. But it is only just, if he will penetrate to the depths of that wisdom which with unlimited generosity flows towards him, that he dedicate his life and his actions, with all his mind and heart, to the service of his fellow-beings. Theosophy is a study for philosophers, a life's philosophy for those who wish to be helpers of their race.

There has been a long period of time during which educated youth especially have fallen back upon the materialistic point of view which has been predominant in the circles of natural science. What position shall this youth take today? If there is anything that is certain about humanity's cultural development, it may well be that science, and especially all that is related to the study of Nature, finds itself at a turning-point which can best be described as the complete rupture of materialistic theory. The progress in this line has been unbelievable. Surprising observations have been made, and have opened immense fields for further work, and this whole movement irresistibly induces a deeper comprehension of Nature's being.

He who has devoted time and attention to the study of Theosophy finds more and more often how quickly present-day scientists are approaching the opinions and explanations which were predicted more than fifty years ago in the standard Theosophical literature, particularly in H. P. Blavatsky's fundamental works. He who believes — and here especially must educated youth be taken into consideration — that scientific research, more than religious faith and philosophical speculation, constitutes a firm basis upon which a reliable world-philosophy can be built, will find in the Theosophical literature the synthetic idea within which the latest

scientific observations have their place. There will he find it proved that Theosophy is what it professes to be, a religious-philosophical-scientific doctrinal system which at once satisfies to the greatest degree the most deeply fathomed thirst for knowledge, and, through its freedom from dogmas, the utmost craving for an independent and critical, but serious, research work.

In the above we have spoken of serious and searching people of different casts of mind, religiously, philosophically, or scientifically attracted, and with great brevity indicated why they should study Theosophy. There is nevertheless a very large group of our present-day fellow-beings who live a life without decided leanings in any direction whatever. They compose the great masses who run after and attach themselves to the various sensations of the day. Few of these would be able to escape being gripped by a feeling of emptiness at some unexpected or catastrophic event; the natural craving of their spiritual and higher intellectual being is half-starved. To these it should be said, Study Theosophy, because thereby will your life have a purpose and a meaning. Instead of being an empty and valueless chase after things which do not give any real profit, your life will be filled to the brim with a noble joy — a fight if you like, but a fight in which every victory is a step forward on the road which leads to light and freedom for the race. In other words, the study of Theosophy will make you a complete human being.

TRANSACTIONS OF THE POINT LOMA LODGE: V — *G. de Purucker*

Lokas and Talas

Question by I. D. — In *Fundamentals of the Esoteric Philosophy*, pp. 403-4, it is stated in regard to our position in the scale of Lokas and Talas that as we are in the Fourth Globe of our Chain we are in the fourth loka and fourth tala, Mahar-loka and Rasatala. "But, again, we are in the Fourth *Round* of our Planetary Chain. Therefore we have this bi-polar principle emphasized by the Fourth Round quality, i. e., Mahar-loka and Rasatala again. We are, furthermore, in the Fifth Root-Race of the Fourth Planet on the Fourth Round. Therefore our Root-Race, though evolving on that fourth Globe and in that fourth Round, is represented by the fifth of each column; Swar-loka and Talatala." [See Column p. 399.] Now I would like to ask: If we are in the Fifth Root-Race, why is it that in the scale of the Races we should be in a lower loka and tala (i. e., Swar-loka and Talatala) rather than the one superior to the Fourth-Round loka and tala; i. e., why are we not in Janar-loka and Sutala?

G. de P. - — Lokas and Talas should always be considered as twins, that is to say, one loka should always be considered with its corresponding tala, as for instance, Satyaloka and Atala. These are inseparable and represent the positive and the negative, the high and the low, the spiritual and the material — on any plane; and so on down the scale with increasing increments of unfolding; first, pure spirituality in the arupa-worlds. Now catch this thought: The highest twins, Satya-loka and Atala, represent as so placed a cosmic plane, that is to say each set of twins represents a cosmic plane: from spirit to physical matter. There is the answer to your question.

If you will look at the diagram of the seven globes of our planetary chain as given by H. P. B. in *The Secret Doctrine*, you will see that Globe D is represented as being in the seventh cosmic plane. That is why we are in Bhur-loka and Patala: on the lowest of the seven manifested cosmic planes. We are, however, in the Fourth Round, on the fourth globe counting by sevens; but in the Fifth Race. Now then, make your adjustments. Just as in the seven principles, so in the cosmic planes: each cosmic plane is sevenfold, tenfold, or twelvefold, according to the way you look at the matter. Satya-loka-Atala is sevenfold, which means that this cosmic plane (plane one on the diagram) has all the other lokas and talas but in the satya-loka-atala condition: they are all represented in the highest cosmic plane, held there in seed, not yet unfolded.

Satya-loka	1	Atala
Tapar-loka	2	Vitala
Janar-loka	3	Sutala
Mahar-loka	4	Rasatala
Swar-loka	5	Talatala
Bhuvar-loka	6	Mahatala
Bhur-loka	7	Patala

This gives the picture of a universe unfolded, in cosmic planes; otherwise called lokas and talas, two by two — or twins.

Bhur-loka and Patala: this twin is sevenfold also; therefore Bhur-loka-Patala has *its* subordinate or sub-seven lokas and talas: it is the same all down (or up) the scale. We are in Mahar-loka-Rasatala because we are in the Fourth Round; but in the scale of the Races we are in Swar-loka-Talatala because we are in the Fifth Race.

Question (I. D.) — When the Seventh Round is over, by that time

shall we have developed the whole possibility of evolution — shall we have unfolded all within us?

Answer (G. de P.) — We shall have unfolded everything within us and in due order as far as this completed evolution permits. I hope you will get this idea: it will save a great deal of mental work. The highest loka contains its Bhur-loka-Patala because each twin is sevenfold. So this series of double-column worlds represents not only the seven cosmic planes, but the seven degrees of evolutionary unfoldment.

Man is not fully complete until he has unrolled everything within him: in other words, every quality, force, energy, substance, power, attribute that he has locked up. That is the answer to that part of your question. And it is a marvelous study. I don't blame anyone for being simply mixed up, because it is indeed 'wheels within wheels,' but yet it is such a wonderful study. The great key is analogical reasoning: hold to that firmly and it will guide you out of the maze.

I might add in conclusion that I would not fasten the attention too rigidly — with too much (what is the word?) literalism — upon these lokas and talas as applied to the globes. Emphatically they do apply; but be careful. Now for instance, if you have the picture of the seven globes of a chain as H. P. B. gives them — Globe A, B, C, D, E, F, G — and then say Globe A is Satya-loka-Atala, Globe D — the fourth — Mahar-loka-Rasatala, then from this we shall have to say that Bhur-loka-Patala is Globe G. That is not so; for, as a matter of fact, there are twelve globes. I would suggest to you to ponder over this thought for a while as a question to be answered by and by.

Remember first then: seven cosmic planes, in due order, each one unrolled from its preceding one and preceding ones: thus Satya-loka-Atala unrolled from themselves the next and succeeding

twins — Tapar-loka-Vitala; and these two unrolled the third twins — Janar-loka-Sutala; the three unrolled the next twins — Mahar-loka-Rasatala: and so on down the seven.

Bhur-loka-Patala has all the qualities of those that went before: it contains them all relatively unrolled, and relatively unfolded, as a flower unfolds from the seed. Thus also does a man through evolution become perfect by bringing out what is within these principles. Complete man, spiritual man, will be living in spiritual Bhur-loka-Patala or Satya-loka-Atala, but as a cosmic plane.

Question (C. J. R.) — But the difficulty is that we are in the Fifth Race, and we are more divine; and yet we seem to be farther down than up!

Answer (G. de P.) — I see where the difficulty comes: you are confusing evolutionary unfoldment *per se* with cosmic planes *per se*. Consider these different cosmic planes [indicating diagrams] as the septenary degrees in world-evolution and world-building. They also figure the septenary degrees in evolutionary unfolding of the entities peregrinating in and through these planes. Yet the two classes of ideas, while interlocked in significance, and interblending in activity, must be kept separate in the mind as distinct things.

Now, particularly with regard to your question: we as a class of peregrinating entities have reached our individual evolutionary stage of unfoldment in what we call the Fifth Root-Race on this Globe D, the fourth according to H. P. B.'s reckoning in our Planetary Chain. Thus it is that we are using this present loka and tala, which we call this aspect of our Earth, but yet we as traveling entities are in our fifth racial stage of unfolding in this particular couple of lokas and talas. Hence, as a racial consciousness, we have attained the fifth in the series, i. e., swar-loka-talatala, although the Globe Earth being on the lowest or seventh cosmic

plane, is itself a manifestation of bhur-loka-patala.

Connected with this last idea we must likewise remember that our Earth itself is only in its fourth stage or Round of development, and thus we have-it also manifesting the qualities of the fourth in the above series, to wit, mahar-loka-rasatala.

Now all this will be easily explained if you will kindly remember that each of these couples is itself sevenfold, so that for instance, the bhur-loka-patala has all the same seven series of couples, from satya-loka-atala down to bhur-loka-patala in itself.

Thus it is with reference to my remark concerning the stage of the Earth, we have it manifesting bhur-loka-patala, because it is in the seventh cosmic plane; yet it is manifesting likewise the mahar-loka-rasatala as subordinate planes of the bhur-loka-patala.

I will confess that it was with some reluctance that I allowed these thoughts on the lokas and talas to be printed in one or more of my books. It has let me in for a lot of trouble, and I have been explaining ever since! But it has been good, in a way, and therefore I do not really regret it.

FREE WILL IN MAN — *Leoline L. Wright*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

Of all the fascinating and suggestive paradoxes involved in the Occult Teachings, those implied in the matter of free will are supreme. We must begin, if we are to understand the subject, by distinguishing sharply between free will and self-will, or what in children is often called wilfulness. And in order to get the basis of the distinction we must know something of the relation between the psychological or emotional and the spiritual sides of our composite nature.

Free will inheres in man's spiritual individuality: self-will is the energy of the personality allied with the animal nature, this alliance of the two having produced kama-manas, the human soul. It is by indulging in the freedom of this human will — its power to set itself in opposition to the good or the rights of others and the world around it — that we become the bond-slaves of Karman. And this is the first paradox: a freedom that leads to bondage is surely a mirage.

We can imagine how it was ages ago, in the early days of the Atlantean Race, when man had already passed out of the quasi-godhood of the Third. He now first began truly to realize himself as a separate self-conscious being, and the adventure of using his new power to exploit environment and relationship for his own ends was irresistible. And particularly was this the case because the manasic ray linking his spiritual and animal parts was still undeveloped by use and his perceptions were dim, not only to the difficulties and dangers of the psycho-material world about him

but also to the spiritual goal towards which evolution had begun to urge him. For at that time man had not reached the bottom of the Arc of Descent into matter. Matter itself was inconceivably more dense than at present. Thus it is not surprising that early Atlantean humans with their immense and gross bodies and with the powerful personal wills inhering in the psychological-kamic nature were led astray by the wonder of their new power of self-conscious freedom of choice.

So then we see man still on the Descending Arc, weaving around himself denser and denser 'Webs of Destiny,' building into himself with terrible industry the dark energy-substance created by self-will, all of which culminated in the catastrophe of Atlantis. H. P. Blavatsky tells us in *The Secret Doctrine* (Vol. II, p. 303) that "many of us are even now working off the evil effects of karma made by us in Atlantean bodies." We are still staggering under the burdens incurred by our own early ignorance and enthusiastic weaving about ourselves of the dense webs of material destiny.

And are we not still at it? Self-interest, *MY* desires, what *I* want and *ought to have* — these remain today the dominant urges of individual and national life. Even the East is beginning to forget its ancient lore of spiritual-psychological wisdom and, following the example set by the West, it begins to pursue the *fata morgana* of self-interest.

It is these trammels of ancient karman now affecting most of us that are partly responsible for the contradictions in human life that puzzle us so. One of the chief of our enigmas is that of the virtuous man laboring along under a load of 'injustice,' but working off in a good fortune that we are not wise enough yet to recognise, the karmic impediments in suffering and tribulation brought over from an old past. Yet this karman is working out well in two ways. He is forming the character founded upon

struggle with odds which nothing can take away from him because he is building it into himself; and he is not only busy ridding himself of karmic burdens, but is thereby increasing his own strength and accumulating daily a store of karmic merit which will help him still further forwards in the future.

On the other hand, the moral weakling who is born into 'good fortune' is reaping the reward of past striving for merely material success instead of struggling for moral ends; and just because of such a mistaken aim he was and is increasing his weakness of character and piling up difficulties for himself in the future, although happily those very difficulties will eventually force his spiritual growth. This whole subject is magnificently expanded in the two chapters, 'Webs of Destiny' in *The Esoteric Tradition* by G. de Purucker, Vol. I.

The time has come when humanity has earned the right to occult knowledge. The Archaic Wisdom-Science, the only system which expounds the knowledge of self-redemption through impersonal wisdom; imagination, and will, is being restored to our mental life. And so we encounter the second, the most magnificent, paradox of Occultism, that *freedom is the fruit of obedience*. Out of the consciousness of a world gone mad upon the subject of individualism the conception of cooperation for universal good has begun to emerge. It is still but a sketchy outline, like the first delicate filaments in a saturate crystalline solution. Still, it is beginning to take actual, definite shape. Knowledge of the Esoteric Tradition is spreading and its truth is being more fully demonstrated and corroborated by present scientific research and by those of its findings which are unassailable. So the spiritual nature of man and his oneness with all other beings is being recognised if only unconsciously. This will eventually open our eyes wide to the unmorality and the folly of anything in either thought or action, individual or national, that opposes the

harmonious working out of the best interests of the whole.

Let us look more closely into the Theosophical conception of obedience upon which true freedom is founded. The word 'obedience' alone is perhaps misleading because, as commonly understood, it suggests the imposition of the will of another. 'Voluntary impersonal obedience' will embody the idea more accurately. No one can exact obedience of an adult. We are free to act as we please; to do right or to break the moral or civil law, but — we *MUST* take the consequences. A man can direct his own thoughts and actions if he be normal, but he cannot direct their ultimate reactions, and it is through these reactions that Nature educates him. But what a heart-breakingly tedious process this can be! Even the average good man would muddle along across the ages, learning through the ups and downs of his successes and failures so slowly that his gain per incarnation might not be more than an inch or so along the interminable evolutionary track.

But man, fortunately, has always had Spiritual Teachers. Wherever any man or group of men begins to seek desperately for a spiritual remedy, there the Buddhas of Compassion and their Adept-helpers focus a light. And after a Teacher has been sent always there are a few who are strong enough, through training and concentrated devotion, to pass through the gates of initiation and become Adept-teachers in their turn. And every such achievement spreads a wave of spiritual vitality through the inner natures of all beings, even to the very kingdoms of the elementals. Especially it awakens and stimulates the aspirations of man himself in his search for freedom.

These results are brought about by *voluntary* impersonal obedience — beginning first with obedience to the demands of humble human duties; expanding gradually into impersonal love for our dear ones, a love that gives without demanding and asks

no reward for service. It broadens then into impersonal love for enemies as well as friends. It forgives those who injure and blesses the persecutor. And so within the heart buds the luminous flower of Christhood — the sleeping Buddha awakens to power. Then the human will, subordinating itself in glad obedience to the beneficent urges of that Supernal Presence, enters upon the path to the creative freedom and responsibility of godhood.

The Theosophical Forum

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: V — *H. T. Edge*

V — THE DANCE

It may be wondered how this subject comes under our general title, but we do not propose to limit ourselves to squares and triangles or symbols with a geometrical shape, but to use the word 'symbol' in a wider sense. So the word 'dance' can be used as a symbol, and those who want a classical name can use that of the Muse of Choric Song and Dance — Terpsichore. We shall doubtless say things which are being widely said, thought, and acted on today; but the Theosophical key will be found a great aid in interpreting and justifying the inspirations and intuitions of people who might feel the need of definiteness and co-ordination in their aspirations.

The course of evolution runs in curves which bring racial cultures down into materialism and then up again towards a renewed knowledge of the essential values of life. So we may expect to find a reappearance of ancient institutions which have been lost or degraded. The language of symbolism, allegory, and mythology is a means of embalming these institutions, so that their seeds may remain encysted, as it were (it is often convenient to mix metaphors), thus remaining free from harm until they can be safely revived.

All antiquity shows the importance attached to the dance; it still prevails, but in what guise? Apart from the noble efforts of the few alluded to above, it has become at best an amusement, too often with an intrusive element of sex-appeal, more or less innocent; and as part of a dramatic scene, the ballet has more often made its appeal to our coarser than to our more refined

tastes. We have to be careful not to transfer our own conceptions to the ancients and accuse them of mixing worship with frivolity because the dance with us has descended to frivolity *from* worship. One is all the more gratified to find that in some quarters at least a nobler conception of the dance is gaining ground; and it is to a wish to second those efforts that the choice of this particular subject for an article is mainly due.

Downward curves in evolution are marked by the misuse of man's divine powers, whereby is created *sin*, from which he strives to escape by holiness. He may become so depraved that asceticism seems his only salvation. A snuffling Puritanism feared even the dance on the village green, because for that it would no longer have been innocent. In the classical age not only the dance but every kind of athletic exercise was an essential part of religious celebration; they were performed in honor of the gods. Simple peoples of today have the same in their tribal dances. It was a practical enactment of the universal principle of rhythm and harmony, the lacking keynote in modern life, whose watchword seems to be *excess* in all things. Who that has fine appreciations can deny that the lack of rhythm and proportion has vitiated our manners, tastes, and institutions? We are becoming aware of it and of the need for amending. For awhile, no doubt, we shall carry even into our amendings the spirit of excess, of self-consciousness, of striving, of artificiality. Spontaneity cannot be won by chasing her with a net; she is coy and must be wooed. We can but make ourself worthy, and then we may be honored with a visit.

It would be wantonly unjust in this article to omit reference to the work of Katherine Tingley, whose mission was to strike anew so many lost keynotes. The importance of the dance, its real significance, were well known to her, and she introduced its practical enactment among the members of her company of

students at Point Loma; chiefly among the children, whose unspoilt minds rendered them better material; but notably among people of all ages as part of her wonderful dramatic presentations in the Greek Theater. The influence thus started has spread widely, and few know to how great an extent the world is indebted to her for this. For not only has the influence spread by direct imitation, but also through the unseen communications which bind together the minds of men irrespective of distance; and whatever was done at that center and by that Teacher was broadcast with a hundredfold force.

All concerted movements, whether of the dance, the song, the orchestra, or even military drill, express the harmonious co-operation of many individuals in one whole; and all those in whom the spirit of life is not dormant or dead experience an indefinable joy therein. For once they have laid aside personality and are acting as part of a greater self. They have experienced the joys of a life larger than that of the self.

The word 'symbolical' has come with some people to mean unreal, and it is with this feeling that they speak of ancient ritual dances as being symbolical of something or other. Others think that the participants in these rites were actually accomplishing a creative function; and I am sure this is what Katherine Tingley felt — or rather knew. And may it not be our inner awareness of this fact that gave us that mysterious sense of joy? To Theosophists, man is not a poor hapless sinner dumped down in a cruel world by an absurd deity for the purpose of preparing himself by self-mortification for a better world somewhere else; nor is man a mere chance-happening or byproduct of some incredible cosmic process. He is a part of the universe, a part of nature, a part of God. His smallest acts count. It may be hard to define his goal; it may not be best to try to define it. Let us call it self-realization. And if this is not to mean that each petty

personality will make the vain attempt to realize a little life of his own apart from others, then it must mean that we must seek to realize that greater life wherein we all share as equal components.

Let us get beyond the distinction of sanctimonious and sinful, sacred and secular; let us get back to the unity of life. The simplest natural functions have been and can be considered sacred, pure, joyous. The body (as H. P. Blavatsky points out) is the temple of the Holy Ghost, but that fane has been desecrated, so that we have turned from it with disgust and regard the body and its functions as something profane.

Those gods of the old Pantheons stand for departed glories of the human race; some went back to Olympus, and some with loving sacrifice departed not from man but suffered degradation with him that they might one day raise him again to the heights. No doubt Terpsichore, the Muse of Choric Song and Dance, has never been away from us.

There's not the smallest orb which thou behold'st
But in his motion like an angel sings,
Still quiring to the young-eyed cherubins;
Such harmony is in immortal souls;
But whilst this muddy vesture of decay
Doth grossly close it in, we cannot hear it.

There are some who have had glimpses — enough to make them homesick. But harmony cannot be achieved by perfecting oneself in the use of one's own solitary instrument.

GIANT EFFIGIES OF SOMERSET — *A. E. S. Smythe*

GREAT WHEEL OF LIFE REVEALED AT GLASTONBURY (1)

It is scarcely credible and not unnaturally is received with some scepticism, that recently in the county of Somerset in England, aviators flying over this region discovered the most astounding monument that could well be imagined. The story of Glastonbury abbey is fairly well known, and its sanctity is legendary, but this discovery places the legend of its sanctity on a prehistoric basis altogether, for it appears that the story of Joseph of Arimathea having come to the place and given it its reputation must be modified as it is now evident that he came to Glastonbury because it was already a sacred spot to the world, and he, being a tin merchant dealing with the Cassiterides, or Tin Island, hearing of this hallowed ground, paid it a visit as all Holy Palmers might be expected to do.

The discovery of the aviators shows that in ancient times a great Zodiac, the Wheel of Life, as it is called, was laid out in this northern part of the county of Somerset, in a vast circle ten miles in diameter. In this circle advantage was taken of natural features of the landscape, hills, rivers, roads and other points being incorporated in the designing and moulding of the figures representing the twelve signs so well known to those who study the heavens, representing the time-period known as the Zodiacal year, or 25,868 years during which the sun describes the course in the heavens by which the precession of the equinoxes is brought about. The twelve signs represent the twelve Zodiacal months of 2155 years, each of which is known as a Messianic cycle, these being said to govern periods of evolution of humanity, as distinct and important in their influence as the months of the year are to

the farmer and husbandman in his culture of the harvest of earth.

Glastonbury sits at the north end of this great circle, and Kingsdon on the south. The strange figures have been photographed and superimposed on the ordnance survey maps, thus enabling the observer to check off the dimensions and locations of the figures. They have been compared to the well known serpent mounds in Ohio and other earthworks of a similar character elsewhere, but these in Somerset surpass any others that have been found in size, and of course in historic, or rather prehistoric interest.

The circle is so arranged that a triangulation near the center of the circle indicates a point in the sign of Taurus, piercing the eye of the Bull, by which the time of the construction of the vast design is dated, being 2700 b. c. It is difficult for the ordinary reader, brought up to think that Britain before the Romans was inhabited by savages who went naked and painted their bodies blue, to accept the view that there was a culture existent then capable of laying out the circle with mathematical accuracy, and calculating with exactitude the motions of the stars and other heavenly bodies, besides transmitting astronomical knowledge that must have been derived, according to Indian tradition, from the ancient continent of Atlantis, where the Zodiac was first constructed by the great astronomer, Asuramaya.

This date precedes all the dates in the Bible regarded as in any degree historical. Abraham, for example, is given the date in the Encyclopaedia Britannica, c. 2100 b. c. These earthworks in Somerset were therefore six hundred years before Abraham. Fifteen hundred years later we are given the date of the Exodus of the children of Israel from Egypt. Rome was not founded till 700 years later still. Babylonia and Egypt are the only countries recognised as existing at that time by the Encyclopaedia, but

China, Japan, India and probably other Asiatic countries flourished as much as these. Ireland has ancient records that certainly suggest dates as early as these, though our scholarship does not find it convenient to accept them.

Here in Somerset, however, are indubitable evidences that a nation capable of mighty works, directed with skilled engineering ability, and with mathematical knowledge as well as astronomical science, capable of laying out on a ten-mile diameter, the symbols of the Zodiac on a gigantic scale. Imagine what would be thought of any government proposing a similar work today!

The folk lore of the district is not without traces of knowledge of the origin of these works. The general tradition is that King Arthur had his seat in this part of the land and the Round Table which is associated with his memory is readily identified with the Round Circle of the Zodiacal signs. Moreover the local names echo some of the ancient tradition. Wimble Toot is the existing name for a part of the Virgin's breast. The Kern Baby is the name given to the Child of the Virgin, and this tradition of the Virgin as the sign Virgo of the Zodiac runs far back into the antiquity from which the Zodiac is derived, Isis and Horus of Egypt, and the same symbol of the Virgin and Child being found in India.

A later trace is found in *The High History of the Holy Grail*, translated in exquisite archaic English by Sebastian Evans from old French, and *The Quest of the Holy Grail*, translated by W. W. Comfort, and these knit the Grail legend with the wisdom out of which the Zodiac becomes an index of all ancient human history. Those who are familiar with the idea of the plan of the Great Architect of the universe being brought down from heaven and spread on-the earth, will find it realized in this marvelous series of earth works, for the interpretation of the twelve signs is unquestionably the story of the evolution of humanity, both

material and spiritual.

The date 2700 b. c. falls in the Messianic cycle of the Bull or Taurus, which began about 4419 b. c. It is this period which the Babylonians and Assyrians celebrated with their great Bull monuments, and the symbolism of the Bull has lasted even down to Roman times in the Mithra worship of that time, as Kipling shows in his *Puck of Pook's Hill*. It was the overthrow of this worship by Moses which is celebrated in Genesis, for Moses represented the new Messianic cycle, as the reference to the song of Moses and the Lamb sufficiently indicates. When Moses came down from the Mount he found the people had gone back to the older worship of the Golden Calf. The sign of Aries or the Ram was ushered in about 2264 b. c, and this cycle continued till 109 b. c, when the sign of Pisces, the Fish, became the symbol of the World Savior.

These signs repeat themselves every 25,000 years, and the characteristic qualities of humanity under the renewed conditions manifest themselves, always on an ascending scale. Such was the teaching of those who traced on the broad acres of Somerset the signs that tell of human evolution through the ages. The Druids held this knowledge as sacred, and in other lands it was taught in the temples, treasured by the priesthoods, and given to the wise and devout and those considered worthy to be initiated into the Mysteries.

The reason why we are able to trace the Zodiacal creatures discovered by the aviators, is, that the land on which they lie was once the property of "the first church in Britain," and up till the time of the Reformation the monks of Glastonbury were scrupulously careful to keep the ancient landmarks and waterways intact. Doubtless "they had the whole history thereof true from the beginning even to the end," as the High History tells

us.

The folk lore of the country represents that "the land was haunted by giants, a lion, and many other things." The lion is, of course, the sign Leo, and his head and shoulders are well defined by Chabrick Mill Stream, ancient roads and linches. The Great Western railway runs across his neck, Copley Wood occupies most of his head. A Romano-British road from Ilchester, which crosses the Cary river at Somerton Erleigh on the Lion's Chest, outlines the Giant Orion's raised arm, the Bull's lower jaw; the Ram's bent back fore foot, neck and head; and goes over the bridges connecting the Whale and the Fishes; part of the tail and head of the Glastonbury Phoenix; the top of the head of the Goat-fish; the two legs of Hercules that straddle the withers of The Archer's Horse; and the tail of the Scorpion as far as Stone on the Fosse Way. Now, facing southwest, that Roman road makes a short cut through the center of the Scorpion's body and its right claw, to skirt the Virgin's hand; then the older road goes on again to outline her Wheatsheaf and the back and shoulder of the Lion, joining the Somerton Erleigh track once more.

So says the record dealing with part of the effigies as described in *A Guide to Glastonbury's Temple of the Stars*, published by John M. Watkins, 21 Cecil Court, London, W. C. 2. The whole thing is so amazing that it is not likely to be accepted without a sight of the effigies themselves as displayed on the ordnance survey maps, or for those who can do so, a visit to the locality itself.

Those who know something of Glastonbury will be enriched with further memories of this extensive topographical presentation of the mysteries which make Glastonbury sacred; and those who love King Arthur will find the memorials of his knights and their quests in the strange creatures and mythical monsters which they were said to have fought in these parts of the world. The

monsters still lie there to be seen by any man who dares, but their secret and the stories they might tell are of other and more marvelous things than are written of in any book.

The Theosophical Forum

THEOSOPHY HERE AND NOW (1) — Hazel Boyer Braun

Real Theosophists do not stop to think about differences of organization in the face of an inquiring public; their inter-theosophical disagreements melt away and they are united in the glorious opportunity of presenting the Wisdom of the Ages to their fellow-men. Each individual student, each Lodge or Club, recognises in a Theosophical existence this purpose: to be a worthy instrument of response to the hunger in every human heart for REAL TRUTH. Isn't this our most cherished aspiration?

We have learned that we can *give* our convictions to no one; that the first step on the path is to realize that all comes from within. This deepens our responsibility, but at the same time widens the vista of opportunity before us. It brings us face to face with the great truth that as individuals we can help most of all with our thoughts; that the more profoundly these noble truths have been woven into the fabric of our natures, the more we have succeeded in becoming them in every hour of our lives, the more may we hope to bring about a time when Theosophy shall be sought by all men and women who can no longer endure superficial living.

Those we reach personally are few indeed compared to the number who may read a published article or a book; but who can limit the number of hearts that we can touch with our thoughts as we go about our work trying to express in the smallest detail of life a little of the hope and joy that Theosophy has brought to us, carrying in the background of our minds some great fundamental teaching?

The inquirers who come to Theosophical Lodges are seldom what we might term "the worldly-minded"; they are weary pilgrims, troubled souls, who have suffered deeply in their search for

spiritual food; men and women who appeal to our sympathy and compassion.

"My peace I give unto you" are the words of a great teacher, suggesting the joy of passing on truth. But even in our small way of serving, we must find that peace within ourselves before we may hope to do very much to help humanity. We must become better acquainted with our higher selves, and in this way do our part to preserve a perfect harmony in our Lodges; for if we fail in adherence to this basic rule of the Universe, we have little opportunity to impress an inquirer. We have realized that it is two-thirds what we are and one-third what we say, when we attempt to give out the teachings that have been given to us.

A Theosophical Lodge is a fabric woven of the most impersonal growth of each of its members, patterned alone with the jewels of wisdom. This tapestry, if all the threads are strong and each in its place, serves as a mighty reflector into the reservoir of thought to which every human being has access; but the strength of this instrument of all that is most dear to us, is weakened by a single absence from a Lodge meeting, by each ill-feeling or critical thought towards another member, by personal ambition or any failure in loyal adherence to the hierarchical structure of ourselves, the Lodge, the Theosophical Society, and the Universe.

It is a remarkable thing that a perfect stranger to Theosophy, visiting a Lodge or Theosophical Club, is intuitively aware of this sensitive structure and will invariably detect inharmony if it exists even in the thoughts of the members. This is equally true whether it be a small or a large group, and is too often the reason that Lodges never grow large and strong in the precious opportunity that is theirs.

We have reason to rejoice upon the occasion of this international, inter-theosophical Fraternization Jubilee Convention, in a new

epoch, when we see in perfect perspective, in spite of the darkly unhappy aspect of human affairs in the world, that the veils are thinning, that the human family is moving forward out of a dark cycle into a time that promises to be a potent season of spiritual growth. Every vestige of a sense of separateness should fall away from each Theosophist in the realization of the grandeur of his responsibility, in the sacredness of all that depends upon loyalty to the Master's heroic efforts to make ready for such a time. What is a more wonderful challenge to us than the work of the Theosophical pioneers? Isn't it the grandest thing that we, as human beings, can hope for, to serve with all our hearts at such a critical time?

Let us glance for a moment at the progress of the world in its approach to the way of liberation. We see the personal God discarded to a very great extent; and while the First Fundamental Proposition of The Secret Doctrine is not generally accepted in its place, the trend of modern scientific thought has led men to some suggestion of THE ONE REALITY — to recognition of consciousness as the fundamental concept of the Universe and the conception that consciousness cannot be separated from anything in the Universe; also, that there is a divine spark flickering within man. The law of periodicity is very generally known; we hear the most materially-minded men talk glibly about the cyclic movement of many things; the advocates of the expanding and contracting universe have touched intuitively the teaching of the rhythmic ebb and flux of Universal Life, but their brain-minds have not so interpreted it. The wide study of astronomy has compelled those who are intuitive to grasp a better sense of proportion in their thought about their personal lives and their relation to the Universe, which very often has made the teaching of rebirth acceptable. Evolution — if not self-directed evolution — now has a place with the general understanding of cause and effect,

although not in any sense a full understanding of Karman, in modern co-ordinated knowledge.

But Theosophy is not yet understood to be the doorway to the Mystery-School, nor is it popular, because a real intellectual conception of the majestic teachings comes only from accepting them as ethical standards.

Yet what can be more wonderful work than keeping open the doorways of our Theosophical Lodges, Clubs and Lotus-Circles, with a royal welcome to each pilgrim that comes home!

The Theosophical Forum

QUESTIONS AND ANSWERS: 304-309

QUESTION 304 (*from the Chicago Lodge*). In the January FORUM, article entitled 'Transactions of the Point Loma Lodge,' the discussion of light and color, a statement is therein made by G. de P. which is confusing to us.

In the last paragraph on pages 35 and 36 the statement is made as follows: ". . . it is perfectly true that the more rapid the vibration, the greater the frequency of vibration a color has, the closer to matter it is; because what we call matter, physical matter, is intensity of vibration, of force." . . . "The greater the frequency of vibration, the more condensed the substance is."

What we cannot understand is that by analogy the molecular vibration of matter as exemplified in ice-water and steam seems to us to be exactly opposed to the above statement. An explanation would surely be appreciated.

G. de P. — An interesting question, this, and shows the result of study and conscientious thought. It is likewise a good illustration of the working of maya, in its philosophical sense, in our minds. There is, however, no contradiction, and the querents would easily understand the situation, I believe, if they will remember that in what I wrote in the passage quoted from me, I was referring to the sphere of the atoms, to the vibration-frequencies in the atomic sphere, and including obviously what modern science calls those infinitesimal bodies dubbed electrons. The querents apparently have forgotten this, and find their difficulty, such as it is, in the realms of *molecular cohesion* — in other words, in the realm of molecules; whereas, as said, I was speaking of *chemical attraction*, the world of the atoms.

Furthermore, my reference was specifically to the different phases of light which we humans call colors; although of course the principle which I pointed to is universally applicable. In the first place, the difference between ice-water and steam is the difference between a fluid and a gas or vapor, which latter has been torn from the body of the fluid, water, by the intrusion of an 'outside' force — heat in this case. Obviously, by heating a body, solid or fluid, we can vaporize it if the heat be sufficient, and thus the freed molecules of water are in a state of temporary and rapid molecular vibration; but these molecules are nevertheless of the same substance as the solid, or the fluid, from which they have been torn as particles of vapor or gas. The analogy drawn by the querents is not a perfect one.

Consider a moment: the particles or molecules of water-gas or water-vapor called steam are in a state of relatively high individual movement, as compared with the body of water from which the steam or particles of water have been drawn or torn. Extract the heat, otherwise chill the water-gas or vapor called steam, and we have the molecules of water again coalescing to become drops, which unite and become a body of water again. In the case of steam, we have broken the molecular cohesion of the water-particles, and thus have freed them and have made them into vapor or gas by the application to the water of an 'outside' energy or force, to wit, heat. But the molecules of water-vapor bombarding each other, let us say in a container, as steam or water-gas, and doing so at what seems to us a high rate of motion or vibration, are nevertheless moving with extreme slowness as individual molecules when we compare them with the almost incomprehensible vibration-frequencies of the electrons in an atom, which scientists now tell us are in movement around the atomic nucleus or atomic core at an almost incomprehensible rate of speed, some quadrillions of revolutions per human

second.

Take the case of ice-water, or again of ice: the atomic vibrations and the electronic vibration-frequencies in this apparently inert and in the case of ice relatively rigid body, are tremendously greater than the individual movements of the particles or molecules of water-vapor or gas which we call steam; in the former case, that of the atoms and electrons, we are dealing with vibration-frequencies which we call wave-lengths held in unity by chemical attraction; in the case of the latter, we are dealing with relatively much slower movements of water-particles freed as individuals by the application of an outside force, to wit, heat.

The point to remember is what I tried to indicate in the extract quoted from me, to wit, that the higher the rate of electronic or atomic vibration, i. e. the higher the vibration-frequencies of and in the atoms, the smaller the light-waves, and consequently the greater is the condensation or condensing of the particles involved, thus producing matter whose density is the greater the higher the vibration-frequencies are. This should be clear, especially when one remembers that the high rate of the atomic and electronic vibration-frequencies remain the same in the steam as they are in the ice-water, or likewise in the solid ice.

I hope that this is clear. The querents have made a mistake in analogy, for they have tried to contrast *molecular cohesion* with *chemical attraction*; and although both chemical attraction and molecular cohesion are manifestations of electro-magnetic energy, they are not the same kinds or productions thereof, and just here is where the alleged analogy falls.

Consider for a moment the modern scientific picture of an electron whirling at vertiginous speed around its atomic center. It is moving at such a tremendous rate of speed that to our coarse senses the electron seems to be in every part of its orbit at the

same instant; but to a supposititious entity of atomic size, the electron would seem to be moving in its orbit with the same majestic slowness that the planets do to our eyes. Thus it is that the more rapid the vibration, in other words the greater the vibration-frequencies, of electronic and atomic bodies, the stronger the mutually attractive forces involved, i. e. the more dense or condensed is the matter thus produced; whereas the slower the vibration-frequencies, the less is the mutual attraction, and consequently the less dense is the resultant material. Ice, ice-water, water-vapor or steam, are all formed of identic molecules, the only difference among the three states being that steam has more heat moving its particles than has ice-water, and ice-water has more heat in it than ice; but the chemical attraction, and the electronic and atomic vibration-frequencies, are the same in all three states; it is the molecular cohesion which is different.

All this should be clear enough, and if the querents will ponder over the facts herein before stated they should easily see that they are trying to compare two different kinds of things, and to draw an analogy therefrom. They should compare chemical attraction with chemical attraction, or molecular cohesion with molecular cohesion, if they want to have a perfect analogy. Iron can be vaporized into gas; but the electrons and the atoms, whether in the solid iron or in the iron-gas, have the same vibration-frequencies in both cases; what I have done is merely to affect or modify the cohesion of the iron molecules by the introduction of an 'outside' element, heat.

QUESTION 305. *Do you know of a clear-cut statement by Plato that would show that he accepted Reincarnation? I am wading through some of his books now, but have not found anything very direct yet.*

G. de P. — There is not a single thing that Plato wrote saying: "I accept the doctrine of Reimbodiment," but there are a number of

passages in his dialogs which cannot mean anything else except such a belief. But we must remember that in those days in Greece and throughout the entire Greek world the full teaching of Reincarnation was given out solely in the Mysteries.

On the other hand, the Pythagoreans did teach the doctrine of what was called Metempsychosis, at the back of which is Reincarnation; but it meant a good deal more than that. All the ancient world believed in Reimbodiment, but in different manners and in different ways and under different forms of expression; but to say boldly and baldly that Pythagoras or Plato or any other great philosopher of the Greek world "taught Reincarnation," coming from the mouth of a Theosophist, means today to the 'man in the street' that such a philosopher taught Reincarnation as the Theosophist teaches it openly and more or less distinctly; and this is not the fact.

Many are the Greek allusions to it. Empedocles, for instance, says in substance in one of his fragments still remaining: "I was once a bush; I was once a boy; I was once a maid; I was once a fish in the glittering sea." That is not our doctrine of Reincarnation as taught today; and yet it is our doctrine if you understand the meaning behind this.

We have to be careful; we cannot afford to be slipshod as some Theosophists have been in the past in boldly making the statement that all the ancient world "taught Reincarnation," which means to the public that it taught Reincarnation as presented today by Theosophists; and any scholar could challenge such a statement. The ancient Initiates knew the doctrine, knew what all these different statements meant; and if our modern Theosophists understood Reincarnation better they would understand that the ancient philosopher taught absolute truth, taught different aspects of the general doctrine of Reimbodiment;

but the modern, clear-cut, very definite teaching of the re-embodiment of the Reincarnating Ego is inadequate to express it in its fulness.

All the ancient world taught Re-embodiment; and that is one of the reasons why in my lectures and in my books I keep harping upon the difference between Reincarnation, Rebirth, Transmigration, Metempsychosis, and Metempsychosis, as being all different views or aspects of the one general doctrine of Re-embodiment. It is not just a matter of words. I am trying to bring order into the situation, to get accuracy; and the scholars of the future will appreciate it. It is just like the doctrine concerning the Absolute or the proper spelling of Karman: we need to have accuracy and definiteness and precision.

QUESTION 306. *The following remarks were submitted to the Editors as coming from members of the Boston Theosophical Club, in regard to their discussion of an article, 'The Elixir of Life' in "The Theosophical Forum" for Jan., 1936. To quote:*

"Discussion arose as to the sense in which the term self-forgetfulness was used. There was some objection raised as to the effectiveness of solving our problems by attempting to forget them. The feeling prevailed that a facing of facts as they existed in our lives was imperative to a subsequent understanding of those facts and a consequent successful solution of the problems. We would like a little further light on this."

G. de P. — Self-forgetfulness, as the Theosophist understands it, never and in no circumstances does or can mean neglect of our honorable obligations. Indeed the slightest psychological analysis of the situation demonstrates clearly that the man who neglects and sets aside his obligations of any kind, family or other, does so because instead of being self-forgetful in his duty, he is hunting self-satisfaction in some way, and this is just what self-

forgetfulness does not mean. Self-forgetfulness means setting aside selfishness, eager self-seeking at the cost of others, putting oneself in thought and act over and above others, etc., etc. Furthermore the truest happiness is found in self-forgetting our petty desires, wishes, longings, and so forth, and living in the great and grand things.

L. L. W. — Let us suppose, in illustration of the difficulty implied in this question, a problem familiar to us all — that of our relations with someone who is uncongenial or irritating, who 'gets on our nerves' and provokes us into impulsive responses in either thought or word that we are ashamed of afterward. How about a practice of self-forgetfulness here? Irritation with others will nearly always be found to be due, when traced back to its source, to a sense of our own superiority. Suppose, for a change, that we try to find in that stupid or irritating person the respects in which he is superior to us. They will be there — and the effort both at self-control and honesty will result in the development of sympathy and a consequent broadening of heart and mind for us. It is in this sense that the term self-forgetfulness was used.

QUESTION 307. *What is really accomplished in the great cycle of monadic evolution, if the monad ultimately returns to the state of pure Spirit which it left at the beginning of the cycle?*

M. Savage. — "From un-self-conscious God-spark to self-conscious god" is another way of describing this evolutionary cycle; and in these words we have our answer too. An expansion of consciousness, the attaining of *self-consciousness* in the next higher sphere of being, is the object of the monad's evolutionary pilgrimage, for only by this means can it attain union with the Universal Consciousness. The primal urge which starts the God-spark on its descent into matter is the urge for self-unfoldment, for manifesting its swabhava, its individual and essential

characteristic — for un-self-conscious as it is, it yet carries within itself the potentiality of unlimited self-development and self-expression. All that it ever attains is already in its heart, but it has to enter into and to know at first hand life on its various planes of expression.

During the progress of the monad along the Downward Arc, the trend is already towards self-consciousness, in order to reap experience consciously; but before the first gleam of self-consciousness is achieved, evolution must first proceed through lower unconscious forms until a vehicle is builded suitable for the expression of a self-conscious entity. These vehicles the monad builds for or produces from within itself, ever moving on to its "more stately mansions," until manhood or its equivalent is reached, and the manasic principle comes into expression, thereby awakening the monad to self-consciousness, thus making possible a self-directed evolution, and a knowledge of the real purpose of its existence. Godhood is glimpsed ahead, and the Universe becomes an open book in which man's own history and destiny may be read.

The treasures of experience of each planet-life are garnered in the storehouse of the manasic principle, and as each after-death state ensues, the essence of these is absorbed by the buddhic principle and added to the sum of the individuality as *character*. This noble harvest of experience endures beyond the gulf of death: it cannot be lost. "What emerges at the end of all things is not only 'pure and impersonal spirit,' but the collective 'personal' remembrances skimmed off every new fifth principle in the long series of being." — (*The Mahatma Letters to A. P. Sinnett*, page 158). Yet this must not be thought of as a mere *accretion* of the fruits of experience. The conception would be too mechanical. It is really better conceived of as a constant widening and deepening of the consciousness, progressively allying itself more

fully with the Universal Consciousness.

Nor is it more consistent to trace the evolution of a single monad, than it is to follow the course of a single drop of blood through the body, for the monad gathers to itself by magnetic and karmic attraction countless other monads of lesser development, which form a part of itself, each being in the hierarchy aiding the progress of those less evolved than itself, but all together destined for the same goal of relative perfection.

QUESTION 308. *If one develops a superiority complex one is liable to be condemned; should he develop an inferiority complex he will be despised and rejected. Is there a middle course that promises a way out, or 'in'?* — A. W. N.

W. E. S. — There is plenty in the philosophy of Theosophy that can form a good stiff rod with which to 'knock the stuffing' out of sufferers from a superiority complex, and at the same time give sufficient of a fillip to the imagination and understanding of one laboring under a so-called inferiority complex.

Consider that you are but an atom in the body of a greater being whose life you affect in a manner similar to that which the electron-lives of which you are practically unconscious affect your physical body. The sun itself is but an electronic particle karmically subservient, respondent, and obedient, to the 'laws' of a greater proton-Sun. The greatest you can think of is but a poor Infinite to that which is INFINITE. And you, poor mortal in your intermediate human self, are far, far behind in evolutionary grandeur those whose consciousness is of a sweep that comprises galactic systems. And you set yourself up as superior!

But consider this now: Locked up within you are secrets gathered from the evolutionary journeyings of ages — secrets of the elemental regions: of ether, fire, air, water, earth; of the mineral

kingdom; of the vegetable world. Unreleased are powers acquired and ingrown into yourself during aeons — now hid within your own being. You are the hierarch of billions of lives in your own human constitution. You are lord of your thoughts. You are elder brother to all beasts. You are younger brother to the gods. You, at your heart-core are one with all beings below you, one with all beings above you, one with the secret essence of Being itself. Naught is but is rooted in your root. Therefore are you one with the Unboundaried; one with the Beyond Brahman; one with the wordless THAT.

There is no 'superior' or no 'inferior' in that which is One with the Heart of all Being.

Consider the destiny of man. Take thought of his wondrous evolutionary pilgrimage. Place him where he belongs in the great Ladder of Life — and thought of developing a 'complex' of any kind, whether so-called 'superior' or 'inferior,' will quickly dissolve into thin air, displaced by the constant picture of the Pilgrim, the Man behind the Mask, as he pursues with ever growing consciousness his pathway towards Divinity.

The "middle course that promises a way out — or 'in' " — is a complete right-about-face on feeble so-called psychological twaddle and an embracing of the solid truths of ancient esoteric philosophy. It strikes me we've heard enough about 'complexes' — of all kinds!

QUESTION 309. *What do you think of Dean Inge's proposal to save Christianity by purifying it?*

H. T. Edge — Dean Inge seems to be a most convinced Christian and to be very anxious to save Christianity by cleansing it. Doubtless, as is the case with so many other people, his final convictions rest upon grounds beyond the brain-mind reason;

and if he is successful in achieving a harmony between his logic and his convictions, we need not press the question as to which of the twain is the predominant partner in the association.

We find ourselves in complete sympathy with the Dean in many regards. He enumerates two prime curses in the history of Christianity: the craze for asceticism, and the ecclesiastical system, neither (he thinks) discoverable in the teachings of Christ; both excrescences. He seems prepared to view with equanimity the disappearance of church organization. He realizes that Christ taught the path of perfection for the individual disciple, not any system of social polity. In short, he virtually admits that Christ was what we call an Avatara, a manifestation of divinity in human form.

But it is probably at this point that Theosophists would part company with Dean Inge; for they would have to recognise the existence of many Avatars, at different epochs and in various lands, of whom Jesus was a particular instance. They would also lay more emphasis on the point that Jesus was a teacher of the ancient wisdom, his message not being new. The main difficulty, of course, is to find out just how much of Christianity is left after it has been clarified to this extent. Looking at the matter from the angle of practical politics, too, we may well find ourselves asking whether the whole world is to be Christian, or whether there are still to be rival religions. Theosophists would say that, while there may be many forms of religion, there can be but one real Religion. The analogy of languages may be useful. Can we or should we seek to give the whole world one language? Is any one language superior or final? Is there not a common mind underlying all languages, languages being the various vehicles of that common mind?

Another point of sympathy which we must have with the Dean is

in the concern as to the future of morality. Are we today living on the capital of morality engendered in days when religion was a power? If so, will that capital be exhausted? Will a new generation grow up without any moral restraints and at the mercy of their own inclinations, which would be a source of misery to themselves and their neighbors? What can the Dean with his purified Christianity, or Theosophists with their restatement of the Ancient Wisdom, do in this matter?

The Theosophical Forum

DESIRE: THE INGITER OF WILL — *William S. Flathe*

Diffusion of thoughts leads to confusion of results, and promiscuous and desultory thinking is often productive of erroneous and shallow conclusions. But with the subject under consideration — desire and its relation to will — one has a vast field of speculative thought before him, and the premisses one may deduce therefrom are commensurate with the depth and originality of one's mental equipment.

From W. Q. Judge's work *The Ocean of Theosophy* one obtains quite an insight into the tremendous importance of desire as a leading factor in man's present point of evolution, but the scope or province of desire is not limited to man only, for, to quote Mr. Judge:

It was by the arising of desire in the unknown first cause, the one absolute existence, that the whole collection of worlds was manifested, and by means of the influence of desire in the now manifested world is the latter kept in existence.

However, let us consider desire, or Kama, the fourth of man's constituent principles, more in the light of his present terrestrial existence, and as bearing on his present advancement.

The chief office of desire is to incite man to action, and as no action can be accomplished without bringing into play the will, desire must necessarily be the mover of will, or we may put it as the old Hermetists did: "Behind will stands desire." An appreciation of this fact is necessary if we are to make of knowledge power, or make it usable in the vicissitudes of life. The mere infusing of knowledge into the intelligence is not going to

make man wise. It is what happens to these bits of truth after they have entered the various chambers of mentation, how they set our mental faculties into action so to work on them that we realize them. That is the important factor, and this is what makes them so pragmatical. So it is with desire when we realize what a dynamic factor it is in character-building and self-mastery.

Without the requisite intensity and quality, our desires and attempts to pray become a vain exertion, for conditioned desires and thoughts arising from our plane of consciousness must have the adequate force and high aspiring quality if they are to move the will and pass through that occult process called 'spiritual transmutation'; if they are to become an active creative force, bringing down to the grateful recipient the desired result.

Also in relation to imagination one may see the efficacy of desire in facilitating this mental operation so as to achieve the highest results. For, to quote W. Q. Judge again:

if this principle of desire be not strong the master-power of imagination cannot do its work, because though it makes a mold or matrix the will cannot act unless it is moved, directed, and kept up to pitch by desire, (*op cit.*)

Even our thoughts are rooted in desire, being inextricably bound thereto by both a physical and a mental link, and this is one of the most important reasons why man comes back to earth again and again. Manas, the thinking principle, has a lower and a higher aspect, and at the present point of evolution man spends most of his life in his lower desires, which thus become his main incentive to action. So when he lays aside his worn-out physical body and ascends to the devachanic state of beatitude, the thoughts of his past life, which are relatively permanent, are enmeshed by a myriad magnetic threads in the incipient desires which prompted them. These desires were of a worldly character

and they exert an irresistible attraction to drag the bound soul back again into the arena of terrestrial life, to be again submerged in the perfidious illusions that make man forget his kingly heritage.

The control of our most intimate desires and feelings should assume great prominence to all earnest students of Theosophy, because it is the character of the desires and thoughts that we allow to enter our consciousness that determines our thralldom or self-mastery. No one can think of developing will-power without understanding the office of desire, for will stands in the same relation to desire as Atman does to consciousness. Desire is always precedent to will; it stands behind will to execute the Ego's mandates, and cannot in any wise be dispensed with. But sometimes desire seems to be possessed of an intelligence of its own, and becomes the tyrannical dictator, and uses the will to rush man off into actions that he will bitterly regret afterwards. This is a case in which the animal-self, the origin of all ignoble desires and therefore of thoughts, ousts the Ego from its mental throne for the time being, and, abetted by the mind, directs affairs 'on its own hook.' Such is instanced when we are swept away by anger or are led to gratify some beastly vice. The hallmark of the advanced soul is his ability to lead his desires into channels of the Ego's making, and not to be enthralled by the emotions of the lower soul. Now as desire is precedent to will, the degree in which we can restrain, encourage, and purify our desires, will mark the degree to which we have attained mastery of the will itself.

Technically speaking, we do not develop will-power, we merely liberate the will from the bondage of the lower self by the strength of individual effort, and by so doing the Inner Man is freed. This is the work of evolution. To realize then our native splendor, we should know that it is our lower desires that have

usurped the Ego's sovereignty, and that this sad state of affairs will continue as long as man chases after the will o' the wisp of sensation, and kneels in adulation and servitude before the animal-self. Realize that this viper of selfishness and sensuality looses its hold on man if he will only stop being the channel through which it receives sustenance, when, like a tree deprived of life-giving water, it will wither and die. Try to focus your thoughts within and withdraw into that part of your nature that stands back of all mental states. It is this consciousness of 'I am I' that should be attained, and the more confidence and faith we have in our ability to reach up into this higher part of our being, the more quickly shall we realize our aim. What an accession of inner strength and feeling of self-mastery will accrue to the individual when he has achieved this!

Use the imagination to picture ideals of strength and self-mastery, for imagination has a very great influence over desire, and is a most powerful adjunct to will-action. Never try to fight a low mental state on its own grounds, but try to direct the attention to diametrically opposite or higher things; for if you remain in the same mood as before and try to direct the battle, you merely goad your seething desire-nature into greater fury. And remember, finally, that all kindly acts tend to draw out the finer desires, and that one is never progressing along the Path so quickly as when engrossed in loving self-forgetting service.

The Theosophical Forum

KARMAN — *Matilda Berg*

Karman is the Universal law or principle of action and consequence. Every entity is subject to this law and is responsible for its karman according to its degree of consciousness. When a being has reached the state of self-consciousness he is entirely responsible for his personal karman, and his actions in relation to family, group, nation, race.

We understand karman when we have a knowledge of and a belief in reincarnation. Then we know that everything done in a former life has consequences which in the new birth the Ego must enjoy or suffer. We may sometimes seem to receive effects solely from the acts of others, but this is the result of our own acts and thoughts in this or some former life. We are part of the great Universal Plan of rhythmic flow, harmony, and equilibrium. If we create by thought, word, or deed a discordant vibration we are not released from the consequences until we have set in motion rhythmic waves to overcome that discordance. We do not go blindly through life not knowing harmony from discord, because we have the Voice of Conscience to guide us.

We may suffer or enjoy the results of our actions partly in this life, but between each incarnation the Ego is given a period of rest from whence it returns to this earth, refreshed and ennobled by experience, with the responsibility of working out its karman for better or worse. The purpose of life is to grow from the physical self into the spiritual, and to become one with the Divine. It depends upon how sincerely one reaches up into his higher self, just how many incarnations it may take to accomplish this.

We must meet the consequences of our actions but we can meet them with courage and understanding. Every thought and act

alters character, and every moment may be taken as a new starting point. As Katherine Tingley has written: "Every renewed effort raises all former failures into lessons, all sins into experiences," and with renewed effort the karman of all one's past no longer threatens. "It stands as a monument, a reminder of past weaknesses, and a warning against future failures."

Karman acts forever and everywhere, but when the great currents of the Universe are no more thwarted no friction is felt. One moves forward easily and rapidly.

The Theosophical Forum

WHAT IS KARMAN?

A leaflet for inquirers, compiled by the Seattle (Wash.) Theosophical Club

Karman is that majestic operation of Nature, that so-called 'Law of Nature' if you will, which is set forth in the saying of Paul: "For whatsoever a man soweth, that shall he also reap." It is the doctrine of consequences, of results following action, inevitably, ineluctably, whether such consequences or results be immediately forthcoming, or be postponed to a later time. — *G. de Purucker*

The word itself is Sanskrit and literally means: to do, to make — doing or making; in other words, action. From a moral, ethical, and philosophical standpoint it means that no matter what we think, or what we feel, or what we do, we have released certain energies, set up certain actions that will some day have a consequence. It will some time change things in our lives, either spiritual, mental, or physical. Somewhere, at some time, a reaction will come. Our actions are preceded by thoughts and by will, and therefore, we shall become involved in the results. Our lives are built up of minor events, daily habits and thoughts. Through a long chain of such causes, followed by results, the pattern of our lives is woven. It is the sum-total of these minor events, that makes or mars our lives; they form a web around us, from which we cannot escape. If we think, feel and act in accordance with Nature's harmonious laws, the consequence will be beneficent. If the contrary is the case, the result will bring suffering. It will come, not only to the individual who originated the disharmony, but it will also bring suffering to those who, through the inter-relation of the human family, are also woven

into the web. Daily we have the power to choose and direct our thoughts and actions. It is done through our spiritual will. Through this action of free will and choice, man becomes an entity totally responsible, not only to himself, but to his family, city, state and nation.

THE DOCTRINE OF THE DIAMOND HEART — *M. M. T.*

When, in the fifth century, the West was moving towards a period in which the light of spiritual intuition was almost extinguished, there occurred what is known as the Pelagian Controversy. The decision arrived at by both ecclesiastical and temporal authorities marked the final stage of the process by which the universal truth concerning man's relation to Divinity became distorted and crystallized into a theological dogma, that spread a heavy 'cloud of unknowing' over the West for hundreds of years. For, surely, the doctrine of original sin is the very nether pole of the Archaic Wisdom-teaching — the Doctrine of the Diamond Heart.

Pelagius was a Briton, a man of pure life, who was interested chiefly in the ethics of Christianity and who, say his critics, had too enthusiastic a belief in the inherent goodness of human nature. He and his pupil, Coelestius, asserted that there is no such thing as original sin, that baptism is not a necessity for the salvation of infants, that sin is a thing of will and not of nature and that human beings have will for good as well as for evil, and that even before the coming of Jesus there were men who were free from sin. Augustine, on the other hand, maintained that innate human depravity derived from Adam rendered man helpless to overcome sin without divine grace as shown in the sending of the Son of God to die on the Cross for the salvation of mankind.

In 418 Pelagius and Coelestius and all who were known to believe as they did had their property confiscated and were sentenced to perpetual banishment. Their protest was, however, not in vain. Again and again, in different quarters — notably in Holland when Arminius opposed the severe Calvinistic teachings — it flamed up.

And even when dread of being deprived of the sacraments of the Church, then the only known means of salvation, kept many silent, the homage of the heart was not given to the dogma of original sin.

The Archaic Wisdom-Science traces man's origin to Divinity and outlines for him a sublime destiny worthy of that ancestry. Every entity, even as the tiny lives of which our bodies are composed, 'lives and moves and has its being' in a greater entity, which is itself part of a still greater, and so on as far as the mind can grasp and beyond. Man, a lesser life in the Superior Entity whose visible form is the Solar System, is in his higher parts a Son of the Sun and partakes of its intelligence and Divinity, and in his highest, the innermost divine root of him, is the offspring of the Superior Being, whose physical vehicle is the Universal Kosmic System, in which our Solar System is a lesser life. And — superb challenge to the aspiring and compassionate — man has latent within him the power to expand his intelligence and his heart-life, and thus raise his consciousness, step by step, to that of the Superior Beings in whom he now dwells more or less unawakened as to the possibilities inherent in his nature.

These Superior Wondrous Beings are the prototypes of the later conceptions of the Supreme Being, which finally degenerated into the idea of a Personal Deity, whom few in our day can accept as their Father in Heaven. And naturally so. Intuitions of the noble ancient teachings are astir everywhere. Every dogma is being reinterpreted in the light of the Ancient Wisdom. From the Diamond Heart of the Universe, which sent forth (and why should not the Heart be a creative power?) the Wondrous Beings of greater and less range of compassionate activity, down to the Superior Being at the head of our own Home-hierarchy, there streams into the human heart the urge to make divinity manifest. The impulse rises from *within*, from man's own individual Father

in Heaven, *now* active on its own plane of life.

The further quickening and fostering of the divine seed is the work of those who have been awakened, the Guardians, the Watchers, the Mahatmans, those whose hearts are as the diamond only to their own pain. Salvation is the awakening to consciousness of the Wondrous Being within. Every man is a potential Christ. The Universal Kosmic Hierarch was once a man.

Original sin? *No*. Innate divinity, destined to become fully conscious and active, consecrated to the infinite duty of calling forth in others the latent seed of the Diamond Heart that is and is to be.

GAUTAMA, THE LORD BUDDHA, AND HIS TEACHINGS — Irene R. Ponsonby

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

"Buddhism teaches an evolution or development of this x-factor of consciousness and will [the Karman, the Dhyani-Buddha, or the Reincarnating Ego or Monad of Theosophy] slowly followed through many rebirths, through repeated imbodiments, bringing about constantly increasing faculty and power, until finally the entity whose evolving destiny is thus traced, becomes a man; and after becoming a man finally becomes a Bodhisattva — one filled with the spirit of the inner Buddha, or rather of the Buddhic principle, the Bodhi, the principle and fountain-head of utter wisdom. Furthermore, that taking the Buddha-Gautama as an example or illustration of such an evolving entity, in his last incarnation on earth he was born the human Bodhisattva-Siddhartha, later called Sakyamuni, in the year 643 b. c, and that when he was eighty years of age, after having passed through manifold experiences and trials, and after he had gathered together and taught his disciples and had sent them abroad in order to proclaim the Good Law, he then entered the Nirvana, with an entering which left naught behind save his Dharma — the Law, i. e., the Truth that he taught." — *The Esoteric Tradition*, p. 120

Gautama the Lord Buddha was born into the royal family of the Clan of Sakya, in a town at the foot of the Himalayas, a fact which

explains his title of Sakyamuni, or Sage of the Sakyas. His father's name, Suddhodana, means 'pure flow,' and Maya or Mayadevi, his mother's name, 'illusion.' They called this noble boy Siddhartha, 'one who has achieved his objective,' and he later took as wife, Yasodhara, 'holder of glory' or 'splendor.' What a mystic background the symbology of these names gives to the design of the last earth-life of the Buddha! Yet there is no reason to suppose that these were not the actual names of the parents and wife of Siddhartha, or that any part of the story of his life is entirely symbolic.

Many were the wondrous circumstances and conditions which surrounded the advent of this child. He came, as do all the Great Teachers, at that point in the cycle of progress when spiritual perception ebbs and material attractions find response in the bewildered hearts and minds of men, and when the spiritual nostalgia of all Nature surged forth in welcome at his coming. Rare and exquisite blossoms strewed the earth with their petals, and scented the air with their fragrance; countless birds, befeathered in the hues of the rainbow, hovered in benediction; and men's minds were hushed, and filled with reverent aspiration and devotion. The child, Siddhartha, so lavishly welcomed, bore upon him all the signs of a highly evolved being, one worthy to bear his heritage of compassion and service. Those chosen to instruct him found themselves instructed; and it was predicted that he would either become a Buddha and move the hearts of men with his teachings, or rule as a Chakravartin, a 'great World-King.' The years of his childhood and early manhood were passed in the secluded, if somewhat enforced, protection of his father's palaces and gardens, where he was surrounded by chosen companions and all the delights of the high culture of his day. All that might sadden or disturb the even tenor of his life, was kept from him, but 'the holy germ that sprouts and grows

unseen in the disciple's soul' waxed ever stronger with the rising tide of his destiny, until one day, the legend tells us, he came upon the 'three awakening sights'; an old, bent man, a beggar, diseased and suffering, and a corpse being borne to the funeral pyre. His peace was rent asunder; thereafter there could be neither rest nor solace for the soul of Siddhartha. Leaving his wife and baby son, he set out to seek the panacea for human misery and woe.

He sought wisdom of the Brahmanas, the wisest of his time, but sought in vain. The hermit-life of an ascetic with its rigors of self-discipline and self-chastisement he proved to be useless for his mission of compassion, until with the speeding years, the hour of his enlightenment approached, and one day, at the time of the Spring Equinox, he seated himself under the Bodhi-tree, vowing never to rise until he had found the cure for the ills which beset mankind. What took place under those spreading branches is tenderly left to the intuitive imagination of the true student — but it is said that the leaves of the Bodhi-tree have never since ceased to quiver with the ecstasy which pervaded life when that flawless Spirit of Compassion entered into Samadhi, when the Tathagata attained Buddhahood. Thereafter the Buddha gave his entire life to teaching. He lived solely to impart his message of self-regeneration to all beings, in a world which, despite its great dissimilarity, yet has important lessons to teach us.

The Theosophist, in his study of the teachings of the Buddha-Gautama, goes to the records of India, for it was the children of Brahmanical India for and to whom they were first interpreted and given. These, in the light of Theosophy, prove that into a thought-atmosphere of great subtilty of reasoning and conception, the Buddha implanted a religious system as wide in its sympathy as it is profound and comprehensive in philosophic scope; a system, moreover, whose values are neither crippled by pessimism nor falsified by baseless optimism, but founded on the

purest Wisdom — a foundation which has held the devotion and active allegiance of numberless adherents, and one, which, perhaps because of its subtilty, bears the fewest signs of degeneration. These facts, when properly understood, will explain why Buddhism has been so greatly misunderstood and misinterpreted by the West and lead us on to a discussion of some of the key-ideas which have given to it such marked vitality and strength.

Professor Daisetz Suzuki writes to the effect that the Dharma (the Law of Buddhism) is ever maturing because it is mysteriously creative, and the Theosophist finds this perfectly just statement explained in the fact that to the Buddhist mind, faith and the inquiring spirit are complementary and mutually conditioning, yet in no wise antagonistic. It is this inquiring spirit — 'the wings that bear one on to the goal' — which, more than any other, perhaps, has preserved to Buddhism its pristine vitality, has kept it a constantly evolving stream of spiritual life, based as this spirit of inquiry is on the sound philosophic doctrines taught by the Lord Buddha.

Another universal postulate inheres in the Buddhist conception of 'Being.' This term would seem to be synonymous with Be-ness as it is frequently used in standard Theosophical literature, and the Buddhist argues that that which *is* cannot change; that since all things are composite, and all composites transient, things become or exist, but *are* not. What then is? THAT. Wisdom and ignorance are then seen to be opposite states or conditions of evolving consciousnesses or beings; wisdom is not the acquisition of knowledge, or culture, but the recognition of the inherent unity of all and the unreality of the transient, the outer manifestation — in other words, the state of being perfectly at home in the Universe — while ignorance is the condition of one, who, separating himself from his unifying center, is a wanderer, an

exile from home. And it is through enlightenment that he returns home, attains Wisdom. Thus man is not 'born in sin,' but is a prodigal son, who, since he of his own choice set out from his spiritual home, has taken upon himself his own regeneration, and through tribulation wends his way homewards.

What is this 'home,' this 'other shore,' the goal of all Buddhist endeavor: Nirvana? Has there ever been a doctrine more completely misunderstood? The doctrine of Nirvana describes the *state* which the consciousness of a highly evolved entity — a Bodhisattva — enjoys when all limitations of imperfection in individuality and personality have been transmuted, when the lost has found itself, in the deathless, unifying, and ineffable essence of humanhood; hence, the use of a word whose definition is simply 'extinguished,' 'blown out.' Nirvana is a condition of pure monadic consciousness, a state which may be entered during life, and which, when attained by a Buddha of Compassion, is renounced so that he may remain in the world of men and serve human need. This state is not, relatively speaking, everlasting even when entered by the Pratyeka-Buddha, for he too must emerge eventually and take up his evolutionary course once more. Nirvana, therefore, means Being, *not* annihilation.

It has been truly said that the life and spirit of Buddhism has its source in the inner life and spirit of the Buddha, and Dr. de Purucker writes in *The Esoteric Tradition*:

that what the Buddha aimed at more than anything else was the bringing to "men of a greater light, a larger hope, and a wider spiritual vision. . . . The objective of the great Teacher's Wisdom was the improving, or better still unfolding, of human intellectual faculty and spiritual power, as demonstrated by his insistence, emphatic, reiterated and unceasing, on what one may term the

Doctrine of Becoming. In the eyes of the Buddha-Gautama, man is a Pilgrim, Child of the Universe, who at times is blinded by *Mahamaya* or the Great Illusion of cosmic existence, and at such times therefore needs to be shown the Way or Law, called the *Dharma*, pointing to a realization of the fact that only by *becoming* rather than by mere being could man become the Greater Man which he is in his essential constitution. — p. 111

In this Doctrine of Becoming, the only true Yoga as taught albeit secretly by the Buddha, is to be found the law of all being. It teaches that man is a compound entity composed of one SELF and a host of minor children-selves, each of which is in evolution through its own sphere of consciousness. Through the SELF a Buddhic principle manifests in a trinity comprising a Dhyani-Buddha or Buddha of Meditation, a Dhyani-Bodhisattva, the offspring of the former, and a Manushya-Buddha, or Human Buddha. This is the core of the essential man, the Buddha which is and KNOWS.

'Man gets precisely and exactly what he himself desires!' From the Buddha within, the sun of his being, man receives all that is sublime in his development, and towards union with it every center of his being, because in itself a spark of the central fire, yearns in aspiration; but man must desire and claim his own. The man himself — his karman — is, because he becomes such, that particular focussing point in his composite nature which he yearns towards. In other words, a man's karman or 'consequence' is himself, because he is precisely and exactly that which he has previously desired, willed and become. Furthermore, it is this manifested consciousness which, as an entitative force, endures and reimbodies itself throughout the ages, collecting and uniting to itself its composite vehicles of past and present evolving. It is when the human entity — a prodigal son of the Buddhic principle

for the period of material manifestation — raises its consciousness until the entire being is of the nature of Wisdom, and then passes beyond, that the man becomes a Buddha, 'an awakened one.'

The Tathagata, 'he who had already arrived safely at the other shore,' taught that the way to regeneration is the way or law of compassion, of universal love; for love to the Buddhist is compassion, a compassion which encompasses all sentient beings, and which moves its possessor to live for others, even if it be at the loss of his own evolution and yearned-for Nirvana.

The Dharma has been summarized for practical purposes in the Four Noble Truths. They are: the recognition that sorrow and pain exist; that there is a cause for sorrow and pain; that the cause of sorrow and pain may be annulled; and finally, the way to annul the cause of sorrow and pain; and in the Noble Eightfold Path: the Path of right conviction, right resolution, right speech, right conduct, right livelihood, right endeavor, right alertness of mind, and right absorption.

The seven or ten Paramitas of the Mahayana School are what may be called a more metaphysical paraphrasing of this Noble Eightfold Path. The word Paramita means 'to reach or to attain to the other shore.' They are hereunder given: first, the Sanskrit term, followed by its general definition, and then by a descriptive clause, several of which clauses are those given by H. P. Blavatsky in *The Voice of the Silence*.

Dana — Charity, the key of charity and love immortal.

Sila — Moral conduct, harmony in word and act.

Kshanti — Forbearance, patience sweet that naught can ruffle.

Viraga — Endurance, indifference to pleasure and pain.

Virya — Zeal, the energy that fights its way to Truth.

Dhyana — Meditation, the gate that leads to Truth.

Prajna — Intuitive perception, that which makes of man a god.

Adhithana — Courage, an inflexible attitude towards life.

Upeksha — Discrimination, wisdom in applying the rules to life.

Prabodha or Sambuddhi — union with Buddhi, the awakenment of inner consciousness.

It should be clearly understood that these Paramitas are no mere lip-service or ceremonial procedure, but are the formulated standard of daily living recognised by every earnest student of the archaic Wisdom-Religion from which the Buddha drew his teachings, and are practised more or less faithfully by some four hundred million aspiring human beings.

Buddhahood, godhood, is therefore attained as a result of many lives of individual yearning and willing and doing, these states of consciousness bringing about changes in the aggregated man himself, for

by his progress from stage to stage in evolutionary changes which are continuous and uninterrupted a man among other beings, may raise himself as high as the highest gods, or may debase himself through his willing and doing to the low and dread levels of the beings in the so called hells of which so much is found in Buddhistic literature.

In this teaching of *Becoming*, just as the same is found in esoteric Theosophy, in the Esoteric Tradition, we find both the reason and the rationale of the many statements both in Buddhism and indeed elsewhere that every man has it within his power, by appropriate spiritual, intellectual, psychical, and ethical willing and doing, himself in the course of ages to become a Buddha — *The Esoteric*

The Buddha-Gautama entered Nirvana when he was eighty years old, but the esoteric records seem to indicate that his actual physical death did not take place until some twenty years later, that during the interim he taught his disciples in seclusion, and that at his passing he entered the inner realms as a Nirmanakaya. Furthermore, the student of penetration will find a marked similarity between the teachings of the Adwaita-Vedanta as given by Sankaracharya, the authentic teachings of Jesus, and those of the Lord Buddha, and in a specially mystical sense which rests on an understanding of the Doctrine of the Avatara, it would probably not be incorrect to state that the entire period from, let us say 623 b.c. to about 200 a.d. fell under the sway of the sublime and majestic influence of the World-Teacher known as the Lord Gautama Buddha.

PALI: NEW LIGHT ON A LITTLE KNOWN LANGUAGE — *G. de Purucker*

[The following, which clears up certain moot questions concerning the origin of the Pali language and literature, and the causes of its disappearance as one of the Prakrits or native tongues of India, was dictated by Dr. de Purucker (over his morning coffee, we might add) in kindly response to questions submitted to him by the Associate Editors on behalf of the present Oriental number. Taking up certain points on which scholars confess their inability to agree, and throwing as it does an entirely new light on others, this contribution, we believe, will be greatly valued by all who are interested in this and kindred subjects. — Eds.]

Pali really is a Prakrit-language of ancient India, and was undoubtedly the cultured form of that language spoken over a probably large part of India at the time when the Buddha lived. Pali itself had its less cultured forms which were spoken by the masses, the uneducated, just as we have the same thing in certain European countries today, or in Japan, or in China. There is the language of the literary classes, and the popular slangy language of the masses. Connected with Pali linguistically, was Sanskrit, which was really the sacred language of the Brahmanas and held more or less private or secret by them. The Sanskrit even in those ancient times was the vehicle for the archaic Wisdom-teachings of the Aryan peoples of India, such as the Vedas, and the Puranas, and the Upanishads, and the great Epics, the *Ramayana* and the *Mahabharata*. But Pali was one of several other languages of culture in ancient India, all which were of so-called Prakrit character, although very little is known about these other literary languages. Pali has survived to the present time because for some

curious reason it became the linguistic vehicle in which were enshrined the teachings of Buddhism, i. e. of Southern Buddhism, much as Latin has survived because enshrining the teachings of early medieval Christianity. Just as there were in ancient Italy many other Italic tongues, each one having its literary or cultured form, and likewise its popular idiom, so was it in ancient India.

No, Pali is not a "washed-out Sanskrit." Sanskrit was rather a mystery-language which was "composed" or "built up" to perfection by initiates of the Sanctuaries; and because it was thus constructed into an almost perfect expression of human thought, at least for that day, it was called *sanskrita*, which means "composed," "constructed." Thus Pali is not a true child of Sanskrit, but is and was the literary form of one of the ancient languages of India popularly spoken over an apparently wide stretch of the Indian Peninsula, and which has survived for the reasons above stated. So much for the language.

As regards Buddhism: this noble religious philosophy had wide vogue and spread over almost the whole of India, and it was in its heyday in the times of Chandragupta and Asoka, two great Buddhist monarchs who were mainly instrumental also in encouraging Buddhist missionaries and supporting them, i. e., those who carried Buddhism into Northern Asia and into the lands to the east and south of India. This was during the heyday of Buddhism in India. Brahmanism of course, with various other Indian systems, survived through those hundreds of years of Buddhist glory in India mainly because Buddhism is essentially tolerant and mild. But little by little, after the passing of the Buddhist heyday in India, Brahmanism again got the upper hand, and this for various reasons, one reason being a partial decay of the original Buddhist spirit of enthusiasm in the Buddhists themselves; partly also because Brahmanism is a form of high religious and philosophical thinking which is native and

therefore sympathetic to Indian thought; and partly because, as H. P. B. and myself have pointed out, Buddhism originally was really a sort of Brahmanism of the Sanctuaries which the Buddha communicated to everyone who could and would take it, and thus, being extremely recondite in its deeper aspects, made less appeal to the masses on the whole than did the cultus and ceremonials, the pageantry and forms, and the mythological literature, of Brahmanism. Thus, little by little Buddhism faded out from India, but increased *pari passu* in China, in Tibet, and in all the countries to the north of India, as well as in Siam and Burma and Ceylon and Java, the countries south and east of India, thus in time forming the two great Buddhist philosophical and geographical divisions which exist in the present day.

The Buddhism of the North was, from its first inception, highly mystical, philosophic, and typically esoteric in type. The Buddhism of the South was, from its beginning, highly philosophical but less mystical in presentation and far more pragmatism in spirit than the Buddhism of the North. Now, the real teaching of the Buddha in most of its branches can be gained, at least exoterically, by welding together both the Mahayana of the North and the Hinayana of the South.

It is natural that European Orientalists, like the late Professor Rhys Davids, should ascribe reasons for the downfall of Buddhism in India which seem to these European Orientalists as being sensible and probable causes; and they are not to be harshly criticized for this supposition, because they have no other means of judging why Buddhism finally failed in India. But the real truth was that Buddhism, coming from the inner Sanctuaries of Brahmanism itself, and being as it were an esoteric side of Brahmanism in those days, swept the land like a spiritual fire as long as the Buddha and his arhats and his immediate disciples were there to guide it; but the later Indian Buddhists lost this

spiritual fervor of enthusiasm and clarity of insight and gradually sank back into Brahmanism in its various forms. There, then, is the whole thing in a nutshell.

Finally, there is a very important although typically occult and esoteric reason for the passing of original Buddhism out of the Indian Peninsula, and it lay in a situation which is extremely difficult adequately to describe, and yet was the main contributing cause of the Buddhist decline there. The facts are as follows: In his immense love and pity for mankind, and in his desire to bring certain fundamental secret teachings of the Sanctuaries to the attention of the multitudes for their spiritual succor and intellectual and moral health, Gautama the Lord Buddha made on the whole in so doing an almost perfect presentation of the philosophic and ethical side of the Ancient Wisdom-Religion; but, shortly before his Nirvana, he realized that there had been an insufficiently adequate elaboration of the mystical and religious aspects or portions of the Wisdom-Teachings, except in so far as the Buddha's immediate circle and his arhats were concerned. In order, therefore, to correct this insufficiency, Gautama the Buddha some fifty or more years after his passing, brought about the birth and being of the Avatara, the great Sankaracharya, the Buddha himself supplying the psychological apparatus of this great Hindu Teacher of the Adwaita-Vedanta. Thus it was that, although born in the South of India, and some fifty or more years later than the passing of the Buddha, Sankaracharya was, so to speak, a "reappearance" as Sankaracharya, of the human part of Buddha Gautama. The Theosophical reader will understand at once what is here meant when he recollects the Theosophical teaching of the doctrine of the Avatars. As Sankaracharya grew to manhood and began to do his work, his teaching, which almost from his own day and up to the present time has been called the Adwaita-Vedanta, or non-

dualistic Vedanta, spread like wild-fire over the Indian Peninsula; and this really great Teacher drew into the circle of his Doctrine the larger part of the most intuitive and philosophical minds in India of all ages since his day, so that even in our own times, the Adwaita-Vedanta is perhaps the most popular and most widely accepted form of philosophic and mystical Brahmanism known.

Indeed, so closely akin and so similar in philosophical and mystical teaching and outlook are the Adwaita-Vedanta of Sankaracharya with the Mahayana-doctrines of Northern Buddhism, that the bigoted critics of both describe the Adwaita-Vedanta as a "masked or disguised Buddhism," and similarly describe the Northern mystical Buddhism as a "masked or disguised Adwaita-Vedanta." The criticism is absolutely true in fact, because the Adwaita-Vedanta and the esoteric Buddhism of Gautama were virtually identical. Thus it was that the Avatara Sankaracharya, the "reappearance," as above said, of the "human part" of the Buddha-Gautama, was perhaps more instrumental than any other single cause in bringing about the fading out of the philosophical and ethical Buddhism of the beginnings — a strange paradox which gives us food for deep thought.

It is also true that the mystical Mahayana-Buddhism of the North was on the whole a truer presentation of the complete doctrines of the Buddha as he taught them to his arhats than was the more formally philosophical presentation of original Buddhism as we find it even yet embodied in the doctrines of the Southern School, called the Hinayana.

Hence, if the student will combine the Adwaita-Vedanta of Sankaracharya with the magnificent mystical and occult philosophy and sublime ethic of early Buddhism, the latter now mostly embodied in the Mahayana, he will have not only the original Doctrine of the Buddha-Gautama as the latter taught it to

his arhats and his immediate pupils, but will likewise see the identity of such unification of the two with the archaic Esoteric and Occult Wisdom of the ages, today called Theosophy.

The Theosophical Forum

TRANSACTIONS OF THE POINT LOMA LODGE: VI — G. de Purucker

"There is no 'Eternally Unchanging' Principle in 'Man' "

I was impressed tonight with the suspicion that all of us, perhaps, have not fully understood the statement made not only by our Teachers, and eminently by the Lord Buddha, but likewise in different places by H. P. B. and by myself in my *Fundamentals*, to the effect that there is no "eternally unchanging" principle in "man." Yet perhaps on turning the page, you, as Reader, will come upon a statement that the different monads in man's constitution are children of previous manvantaras, therefore implying that in man there are principles or elements which endure for enormous time-periods. How in the name of goodness can this latter statement be true if the former statement be likewise true? I call your attention to this apparent contradiction, and real paradox, because I feel the need that many experience of having these contrasting statements explained.

The teaching of Gautama the Buddha was, when it is correctly understood, the teaching of the Lord Jesus of the Christians, and of all the Mahatmans of our own Esoteric School of doctrine; to wit, that there is no 'eternally unchanging' principle in man which is different from the rest of the Universe, which is in constant change of revolution and evolution.

According to the old idea of all the orthodox — crystallized — schools of religion or philosophy, there is in man an individuality which endures unchanging, and this is exemplified in the Christian teaching of the personal 'soul' supposedly created by almighty God, which soul lasts for eternity *as that soul*, and never can be other than what it is, i. e., never can enter into the Cosmic

Life except as an unchanging guest, or if you wish, as an unchanging observer; the usually unspoken implication being that as such unchanging entity, it is not an integral part of the Cosmic Life: not life of its life, bone of its bone, essence of its essence; because such orthodox and esoteric religions and philosophies postulate that the Universe is but a temporary and evanescent creation of a supposititious God, and that the unchanging soul finds itself in the Universe as a guest, an observer, a learner, only — not, as above said, as an integral and unto eternity inseparable portion of the Cosmic Essence. Do you catch the thought?

From the standpoint of the Esoteric Philosophy which envisages man as an integral and inseparable spark of the Cosmic Essence and therefore for ever a part of it, there is no principle or element in man's constitution which eternally abides as such soul, its only modifications or modes of change being those of accretions of experience, or of growth.

There is no such abiding and eternally unchanging ego or soul or even spirit in man, an ego or soul or spirit which is different in essence in each man from what it is in any other man, nor is there any such abiding and unchanging individuality which is different in some god from what it is in some other god. All change; everything grows; the Universe itself, as well as all within it and of it, our human souls and spiritual principles included. Out of the same vast kosmic womb of Consciousness-life-substance, unitary and one, we all flow forth; and as individuals, and still more as persons, we are illusions by comparison with the Eternal, for that is everlastingly Itself. Whatever modes of change it may have, whatever phases of growth its innumerable parts may experience, whatever contrarities, diversities, differentiations, may take place, the Eternal is nevertheless the Eternal, perduring from frontierless duration unto frontierless

duration; and the essence of each one of us and of all beings and things, is THAT.

On these simple facts of teaching, reposes the doctrine of what the Buddhists call the heresy of separateness: that there is in me a 'soul' or spirit which in its essence is different from the 'soul' or the spirit in you, my brother, or in any other being or thing. This is the heresy of separateness; and it was against this intellectual bane, this deceitful phantasm of a fundamental difference in essence, that the Lord Buddha taught so powerfully in saying that there is no eternally abiding, unchanging, distinct, eternally differentiated principle or element in a man when compared with other cosmic units, such as other men, or other beings and entities. He thus voiced the doctrine so familiar to all Hindu philosophies, and so well known as existing in the Advaita-Vedanta, of the fundamental unity or oneness of all the interblending and interwoven hierarchies and their component elements in Boundless Space. Such a conception of an eternally abiding and unchanging ego as an individuality separate in essence from the Cosmic Individuality, the Buddha-Gautama called the Great Illusion, *Mahamaya*.

Yet there are in man numberless lives which compose him, as a composite constituted being, as a compound or integrated entity. Man verily is such a composite being, and this is a simple declaration containing a world of occult truth!

Now what are these portions, these elements, of his constitution — i. e., the different Monads and life-atoms which make him, which build him? Each one of these Monads in its essence is a Spark of that central Cosmic Intelligence or Fire, the central Consciousness-life-substance. We have not as yet, unfortunately, evolved forth in our vocabulary one single term that will include all these elements of the teaching, so that we have to use such an

awkward term as this in order to give some adumbration of the idea: Consciousness-life-substance. This is not consciousness apart from life, nor apart from substance; but a viewing of all three as in essence one: one side or aspect of it being what we men call 'consciousness'; another side or aspect of it being what we men call 'life'; and another side or aspect being what we men speak of as 'substance' — three in one and one in three; not three different gods or divine essences, but 'one godhood,' one unitary Cosmic Essence, one eternal Reality manifesting through the three masks: Consciousness, Life, Substance. This really is the proper meaning of the Christian trinity: not "three Persons in one God" as they say, but three masks or aspects or vehicles, as the human mind understands the thought, as the human mind translates the thought, of one eternal, boundless, frontierless REALITY. This is the divine root of man: of me, of you, of everything, of every god, of every sun, of every planet, of every beast, of every plant, of every atom. The root of all is THAT.

So, fundamentally and in essence we are all one, and the innumerable, utterly incomputable numbers of beings and things, i. e., of egos and selves in Boundless Space, are not eternally individualities, each different from all others and thus lasting unto eternity as unchanging, ever-enduring, separate egoities. There is a complete and utter and absolute solidarity of Essence, of which we all partake, from which we all came, into which we all shall return — albeit retaining each one of us our vastly increased individuality — when our evolutionary cosmic journey shall have been completed during any one manvantara. But while in manifestation, while in the worlds of manifestation, we are divided up as mayavi beings and entities, the divine spark in each one of us expressing itself in us as individuals: as thoughts, to use a figure of human speech, of the Divine Thinker, of the Parabrahman. 'Divine Thinker' is of course a figure of human

speech; but we have to use figures of speech when our human intellect is too feeble to understand the incomprehensible vastness of REALITY; we have to translate our intuition into figures of speech so as to get some intimation or intuition of the REAL. The 'Divine Thinker' thinks divine thoughts. Each such thought is a monadic entity. But the thought is of the essence and of the basis of the Divine Thinker who thinks — which 'thinks.'

Now then, one thought more, taken directly out of our esoteric cycle of studies. These various Monads which go to form the constitution of any being — let us say of man in order to define, in order to exemplify, our conception: these various Monads, or each such component Monad, of man's constitution is not only one of the integral parts of the constitution which ranges from the divine to the physical, but each such Monadic Center is itself a spiritual being, a living, growing, learning, being, as the human Monad which we call 'man' himself is.

Now each one of these component Monads, or integrals, is, as an individual, you, I. I refer you to the diagram in my *Fundamentals of the Esoteric Philosophy*, on page 240. As human beings we are each one of us Bhutatman; but the Pranatman is likewise a growing, learning, entity, rooted in the same Cosmic Divinity that I have just spoken of, and therefore growing, therefore destined in its own evolutionary course to become a man; after attaining manhood destined to become a god; after attaining godhood destined to become a super-god, and so forth, climbing the ladder of life eternally. A marvelous picture; always climbing, always expanding in consciousness, always evolving, hence always changing in form and attributes and individuality and personality, because always bringing out more and more of the essence of divinity within, and yet never utterly attaining it because that Divinity is boundless. An eternal principle, the same for every Monad in the human constitution — eternal because its

essence is of the Eternal Essence; not eternal because it has or is a 'soul,' whether it be my soul or your soul. Hence, there is no such eternally unchanging and abiding principle in man as an ego perduring in its unchanged or unaltered individuality through eternity, for every ego is growing, which means constantly changing; and hence the notion of such an unchanging perduring ego, or 'soul' is an illusion; it is a figment of a dream; it is wholly illusory. Every atom in man is as much such a Monad in its heart of heart as a man himself is; and we men, in precisely the same way, are the composing Monads of the constitution of a god. In our own case this God is the Divinity who is the opifex of our Solar System, our solar Divinity. Think! In the diagram in *Fundamentals* to which I have referred, we see the Atman. It works and expresses itself through the Jivatman; the latter through the Bhutatman; this last through the Pranatman. Only four monads have I enumerated here; yet taking our constitution as a whole, their number in man is legion, is incomputable, when we likewise include the armies of life-atoms. Every life-atom helping to compose man's constitution is at its heart a Monad, therefore in essence a divinity.

My Atman — to illustrate because we are now speaking of the worlds of differentiation — my Atman will some day grow to be the divinity of a Solar System; and all the various Monads now forming my constitution manifesting here as a human being will then be the archangels and the angels, to use the Christian terms, of that future Solar System: the Dhyani-Chohans in their various grades, to use our own Theosophical phrasing. These various unevolved Monads which help to compose even my physical constitution live in their various cells, and these various cells are builded up of life-atoms on different planes; and in that far distant future of which I have just spoken, if I make the race successfully and become the divinity of a Solar System in the

spaces of Space, all these cells and life-atoms which now compose my physical 'me' will be the component elements of that Solar System, each one having evolved to take its own particular and definite place and work therein; and I, the divinity in me; will be the then presiding godhood of that Solar System, just as we here are component elements of former life-atoms of Father Sun in a vastly distant epoch of the Cosmic Past.

Thus, as I have hereinbefore explained, there is no eternally abiding and unchanging principle of individuality or 'soul' in 'man.' Yes, an absolute truth: no abiding separate and unchanging principle in man, separate from the similar principle in you, my brother, or in any other being. This is the heresy that the Lord Buddha fought against and that our own Masters so powerfully teach against. There is no such immortal, unchanging, and therefore perduring and abiding 'soul'; yet the very essence of man is immortality itself. Every last atom in his constitution, in its heart of heart is an immortal divinity because of its essence, the Essence of the Kosmic Divinity. I know no doctrine in all our School of Teaching which so cleanses our human hearts of pride, which so quickly purges the human mind of illusion, as just these beautiful thoughts that I have been attempting to speak of. You will never fully realize the glory that is within you until you become infilled with the most beautiful thought of them all. What is it? I am one with Divinity, and there is no abiding, unchanging, and hence separating personal soul in me; for I am THAT. This doctrine is the teaching of the utter solidarity of and oneness of everything that is, from god to atom, with the Heart of Things.

Were men on earth today imbued with this thought, filled with this doctrine, all the troubles of Earth would soon vanish. Men then, sensing their essential unity or oneness, and that what affects one affects all, would instinctively and by love act like brothers, because they would think like brothers; they would see

far more of sheer human interest in the mysteries envisioned in the liquid depths of the human eye than they would in counting the money-bags, or estimating the values in the swollen vaults of our banks. All human problems would adjust themselves easily, because men would realize that what causes you to suffer reacts on me, interiorly and exteriorly.

Carry the thought onwards. It is fundamentally the same in business as it is in philosophy. The man who tries to drive his competitor to the wall injures his own business, for that very man should be made a customer, and by Nature's laws actually is a customer unless you ruin him, drive him out of business, which means killing his purchasing power. The same rule which is thus exemplified in the pragmatic affairs in human life holds in the worlds of the spirit and of the soul. I advance far more quickly when I help my fellows, when I feel that they are component parts, so to speak, of my own being; that there is something in my fellow which is closer to me than my own hands and feet, than my own mind, than my own heart, than my own soul; for this is the Essence of Divinity in him which is identic with that Essence in me.

The Theosophical Forum

THEOSOPHY AND EASTERN YOGA — *C. J. Ryan*

I strongly advise you to give up all yoga practices, which in almost all cases have disastrous results. . . . You have learnt, to a certain degree, the power of concentration, and the greatest help will now come to you from concentration upon the Higher Self, and aspiration toward the Higher Self. Also if you will take some subject or sentence from the *Bhagavat-Gita*, and concentrate your mind upon that and meditate upon it, you will find much good result from it, and there is no danger in such concentration. . . .

What then is the panacea finally, the royal talisman? It is DUTY, Selfless-ness. Duty persistently followed is the highest yoga, and is better than . . . any other thing. If you can do no more than duty it will bring you to the goal. — William Q. Judge

We are frequently asked by inquirers if Theosophy teaches Oriental methods of Yoga, or whether it recommends them to seekers for spiritual wisdom. This is not an unnatural question because it is well known that the Theosophical Society was established under the direction of certain Oriental Masters of Wisdom, Compassion, and Peace. While we may say at once that the yoga-methods usually known by that name in the West have no place in the work or teaching of the Theosophical Society, the subject is sufficiently important to invite our consideration, even if only to clear up possible misunderstandings. Theosophy, indeed, has a system of spiritual development. In fact, it is the only system that is suitable for all people of whatever race or shade of opinion. If anyone chooses to call it 'yoga' it must be understood that it does not resemble what is commonly thought

of over here when the word 'yoga' is spoken.

The Masters who founded the Theosophical Society are perfectly familiar with the ordinary physical and psychological yoga, but they have never permitted its introduction into the activities of the Society; what is called 'sitting for yoga' has always been rigorously discountenanced, and for good reasons. There are, however, perfectly safe and sane methods of studying ourselves and learning much about our inner consciousness, which are open to anyone who reads the sacred books of the East, including, we may say, the New Testament. Though sometimes the word 'yoga' is connected with these studies they must not be confused with the yoga just mentioned.

The lower form of yoga, best known in the West, is the yoga of bodily control or Hatha-yoga. According to the practitioners of Hatha-yoga, long and arduous concentration on control of the body and certain of its forces, which are unknown to Western science, is necessary before even mental training can begin, and actually with many so-called yogis mental purification is not their chief ambition. While this self-centered kind of yoga may develop willpower, it begins at the wrong end and strengthens the egotism of personal acquisition which is already lively enough. Hatha-yoga tries to develop astral sight and other changes in brain-consciousness by forcibly controlling the vibrations of matter. This is injurious to the working of the higher spiritual centers of the brain because of the strain upon the comparatively intractable matter of the body, and it also has other serious dangers.

Theosophy begins with moral and spiritual training and never loses sight of it. This cannot be said of Hatha-yoga, which handles the physical vehicle in order to acquire power, and not to attain the purification of the mind and emotions for the sake of

humanity. It forces the control of respiration, an exercise which arouses strange forces of menacing potency. Many records are available of cases where dabbling with breath-control produced disastrous consequences, followed too late by bitter regret for the disregard of friendly warnings. Such unhappy reactions arise from ignorant and selfish efforts to snatch forbidden powers — forbidden to the normal human being *in the present phase of evolution* — before their development is safe and in natural order. Criticisms of the much advertised 'yoga-breathing' do not, of course, refer to the perfectly proper methods pursued in the West in athletic training or under medical advice.

When the right time comes for the use of the inner powers by a few advanced souls — a very few at present because of the prevailing egotism, the enemy of man — they gradually develop and are seen to be a perfectly natural expression of the god within. Theosophical history contains examples of this legitimate form of evolution. One case was that of a spiritually and intellectually advanced Hindu lad who came to Madame Blavatsky's assistance more than fifty years ago, when she was in India bringing out her first journal under great difficulties, chiefly from the lack of qualified helpers. He abandoned his Brahmanical, proud, and exclusive caste, and brilliant worldly prospects, to devote himself to hard work for Theosophy, whose immense importance to his country and to the world he deeply realized. He utterly repudiated the allurements of yoga, knowing that he had found an infinitely higher path to truth and wisdom, the path of pure devotion to the betterment of humanity. His sincerity quickly attracted the notice of the Masters of Wisdom, Compassion, and Peace, and they saw fit to give him personal attention. Gradually, and without straining, he found unknown capacities and powers naturally awakening and becoming available for the greater responsibilities and opportunities for

service that soon came to him. The career of Damodar K. Mavalankar is honored by all Theosophists as a shining example of true discipleship and its triumphant fulfilment. In his case, as in that of all advanced souls who have killed out egotism and transmuted desire into spiritual energy, the higher powers he acquired were perfectly normal; and as they had never been coveted or sought for their own sake, so they were never displayed as inducements to others.

A few words more about Hatha-yoga are necessary because there is so much misunderstanding about yoga in general, and there are so many cunning sirens tempting the unwary with their alluring songs. The word yoga attracts the ill-informed by the wide advertising it gets through paid advertisements and the promise of acquiring psychic powers, 'success' in life, and so forth. Many clairvoyants, more or less genuine, practise under the name of yogi, but should be regarded as plain fortune-tellers. For one serious and valuable book on the spiritual *yoga-philosophy* of the Orient, dozens are produced which pander to an unhealthy curiosity about yoga, the authors seeming utterly careless as to whether the practices they recommend are dangerous or not — possibly being ignorant themselves in many cases — so long as they can produce a salable book. Perhaps the worst publications are the correspondence courses of so-called 'Secret Lessons' which promise adeptship, or, at least, mystic knowledge and the power of getting what you want at twenty-five dollars up! Some promise initiation for two dollars — a real bargain!

If yoga meant nothing but a low-grade psychism, a common dollar-philosophy, or a few hints on hypnotism for control of others; or if it only suggested Hindus lying on spikes or performing the mango-trick for the benefit of tourists (and incidentally for their own pockets) there would be no reason for these remarks, for everyone knows that Theosophy is worlds

away from such quackery.

There is, however, another aspect of yoga, not spurious or fraudulent, and not professing to be a spiritual or even an ethical system, but a purely scientific method of artificially awakening certain dormant psychological faculties unknown to Western science. It is practised by certain Tibetan lamas of less spiritual orders, and by other yogis. It has, of course, no place in the program of the Theosophical Movement, but it calls for a little attention.

In the West, until lately, little or no notice was taken of Oriental psychology, or perhaps more properly, psychoanalysis, but now a few distinguished scholars, such as Dr. Carl Jung, are beginning to realize that Western psychology is a mere infant in comparison with that of the hoary East, especially in regard to the complex nature of man. This is perhaps largely due to the strange disregard of Reincarnation, without which no understanding of our true nature is possible. The discoveries of Oriental science were not made by the study of dreams in the clinic of the psychoanalyst, or through the investigation of insanity, but by the direct observation of the consciousness of the observer himself, a more profitable though more difficult method. Unfortunately, many side-issues on the line of yoga have developed from these discoveries which are an unprofitable and often highly dangerous field of investigation for the ordinary inquirer, however scientific and well-prepared in Western psychology he may be. He little suspects the strain on the moral as well as the mental qualities that the untrained and self-sufficient would have to stand. Those so-called 'yogas' are no less unprofitable to those who are seeking spiritual knowledge and have no time to waste. Even an apparently harmless yoga-system, if such be known, leads into a blind alley, if not worse.

Some of the Hindu and Lamaistic systems, while claiming to be efficient methods of getting behind the outer veil of Nature, are no more spiritual than, say, chemistry, but are strictly scientific, and, like chemistry, are capable of being employed for the most abominable purposes. Mme Alexandra David-Neel, the eminent French scholar and leading authority on Tibetan Yoga, and also other qualified observers, describe many cases where revenge, vanity, vulgar ambition, and hatred, were the motives that inspired the practitioners or would-be practitioners of scientific yoga. Even the better class of yoga (as well as Hatha-yoga) is associated in the public mind with notions of Hindu beggars, cross-legged and ash-smeared, with fire-walking, snake-charming, and so forth. It is a well-known fact that a large proportion of Eastern yogis — not only Hatha-yogis — have not only renounced the *vanities* of this world but have ceased to take any interest in the general welfare of humanity so completely that it would seem that the unhappy world may go to the devil its own way for all they care. All their time is devoted to their own salvation. This line of conduct is, of course, not universally followed, and we must remember that it is not unknown in Christian countries. It always defeats its own ends.

Such a self-centered attitude is the very last thing that a yoga of a Theosophical kind would inspire in anyone. A true yoga would mean a sympathetic and thorough understanding of human nature and human needs. It would mean the wise application of this knowledge to the service of humanity by one who has attained what is sometimes called Raja-yoga, the kingly union with man's inner god. An Orientalist has said, "Buddhism is fundamentally a system of practically applied yoga." If so, true yoga means the study and practice of the Noble Eightfold Path, the magnificent moral and spiritual teaching of the Buddha, in which devotion to the higher interests of humanity is the first

duty, and concentration on one's own petty personality the worst folly. For the Buddha himself abandoned the peaceful solitudes to answer the challenge of suffering mankind, as soon as he obtained Enlightenment.

Egotism is the greatest hindrance to spiritual progress, and when the commoner forms of ambition or appetite are overpassed, more subtil desires appear, such as the craving for exclusive and confidential information, or personal power in unusual directions. Anxiety to possess psychic powers for personal gratification is a serious bar to progress, even though disguised under specious pretexts. Our motives are not always so pure as we like to fancy, and the lower selfish part of our complex natures is exceedingly cunning in getting its own way. We have made personal acquisitiveness, personal desire, the mainspring of action, and we know the result. We reap the harvest we have sown. The yoga that the world is needing is one that makes altruism, love for others, self-sacrifice, a habit.

We are sometimes asked, Did not Madame Blavatsky, the founder of your Society, go to India to study yoga? No, she did not go to India in 1878, after establishing the Theosophical Society in America, to learn anything from Oriental yogis. She went to *take* the yoga of Universal Brotherhood to the East, which sorely needed it, in spite of all its thousands of yogis. She went, under the direction of the Masters of Wisdom, who are international and without partiality, to arouse India from its spiritual slumber, to answer the call of many who hungered for a higher interpretation of the ancient Hindu scriptures, the allegories of which had been perverted into superstitious dogmas. Many leading societies of native Sanskrit scholars welcomed her to their fellowship, and the strange sight was seen of proud Brahmanas, exclusive and self-sufficient to a degree, recognising her as a teacher, she, a foreigner, an 'outcaste,' and — a woman! She was

publicly thanked by them on many occasions and honored by many tributes. One of these, tendered by more than three hundred Hindu students at a college at Madras, begins: "We are conscious that we are giving but a feeble expression to the debt of endless gratitude which India lies under to you. . . ." That was more than fifty years ago, but India and Ceylon have not forgotten her and what she did to arouse the dormant spirituality there.

William Q. Judge wrote that modern India was not to be regarded as a source of spirituality. He said:

It is not the desire of the Brotherhood that those members of the Theosophical movement who have, under their rights, taken up a belief in the messengers and the message should become pilgrims to India. To arouse that thought was not the work nor the wish of H. P. B. Nor is it the desire of the Lodge to have members think that Eastern methods are to be followed, Eastern habits adopted, or the present East made the model or the goal. The West has its own duty, its own life and development.

Quite recently a brilliant journalistic writer and student of the occult searched India from North to South to find wisdom. He found many alleged yogis, mostly self-seekers or frauds who have discredited the name of yogi among the younger generation of Hindus and the educated classes; he found a few real psychics or magicians of a low order; and a very few sincerely thoughtful men who were not 'showing off' in any way. The best one of these did *not* recommend yoga-practices, but gave good advice on self-control as the path to higher knowledge. So far as it went, this was good Theosophy — which the journalist could have found at home, by the way, in Madame Blavatsky's little book of devotion, *The Voice of the Silence*, in Dr. de Purucker's *Golden Precepts of*

Esotericism, or elsewhere in Theosophical literature, where the path of discipleship is plainly set forth in a way that is equally suitable for all peoples, Oriental or Occidental. Further, though this researcher heard much of concentration, he found no emphasis laid on that unselfish, beneficent concentration which is the fundamental teaching of the true Masters — concentration on the spread of Universal Brotherhood among the nations of the world.

When the Hindu sage, previously mentioned, was asked by the journalist how to make spiritual progress, he replied:

There is only one thing to be done. Look within yourself. *Do this in the right way* and you shall find the answer to all your problems. You have to ask yourself, Who am I? Know the real Self, and then the truth will shine forth within your heart like sunshine. The mind will become untroubled and real happiness will flood it, for happiness and the true self are identical.

That is excellent Theosophy, so far as it goes. But without further explanation it could easily be misinterpreted to mean sitting in solitary indifference and looking at a spot on the wall. "Do this in the right way," he said — but what is the right way? Why did he not boldly proclaim the truth that the only right way to bring the sunshine into the heart is to broaden our sympathies by active service to a world which needs it badly?

In Theosophy we have the true spiritual yoga which saves us from our lower selves by leading us out of egotistical concentration on personal concerns into a larger life. There is no need to struggle for initiation by force; it is prepared for by the right use of the opportunities of daily life. This requires a sympathetic imagination which can understand the sufferings as well as the joys of others, and which knows how to help wisely.

How shall we develop this godlike power? All the Great Teachers have given us the true method. The present Leader of the Theosophical Society has condensed it into a few words: "LEARN TO LOVE. LEARN TO FORGIVE." Our duty is to send this, and all that it implies, ringing round the world. If we make this principle the basis of our lives — a living power — we cannot wander from the true path of progress, and in due time intuition and all the higher psychic powers we need will develop within us *because we can be trusted not to misuse them.*

We have to fight our own battles, for it is said: "the adept becomes, he is not made." But we can get help; we can find a Teacher whose advice will prevent us from wandering from the straight path if we are willing to take it wholeheartedly, one who can hasten our progress by bringing our hidden weaknesses to our attention. This is not always pleasant, for the real Teacher does not humor the egotism of anyone and the truth about one's lower nature is usually anything but flattering when honestly faced. On the other hand, constant practice in self-discipline gradually reveals the fact that the egotistical side is only the shadow of the true man, and that we have everything to gain and nothing to lose by putting an end to its tyranny.

At a critical epoch, when the old medieval theology was breaking up and a mechanistic science was threatening to destroy all vestiges of spirituality in the West (and it very nearly did so), the Masters of Wisdom established the Theosophical Society, in order, as was stated, "to keep alive in man his spiritual intuitions." They called together a few devoted souls and gave them the opportunity to bring hope and light to thousands. But no personal reward was offered, such as immediate intercourse with the Mahatmans, psychic powers, perfect physical health or prosperity — nothing but the deep satisfaction that comes from unselfish work in promoting a genuine Universal Brotherhood and all the

blessings that it implies. In Theosophy the beginning of wisdom is self-forgetfulness. H. P. Blavatsky and her successors have been uncompromising in their warfare; they gave no quarter to the lower selfish desires. She proclaimed: "To live to benefit mankind is the first step," and "Can there be bliss when all that lives must suffer? Shalt thou be saved and hear the whole world cry?" Do not make any mistake. Membership and progress in the Theosophical Movement means just that, and if one has no response in the heart to that appeal, no corresponding throb of joy at hearing of this unique opportunity to do something of real value, however little at first, membership in the Theosophical Society will give meager satisfaction.

In a series of communications made many years ago, the great Initiates who are behind the Theosophical Movement broke their traditional silence and gave out teachings about man and Nature that were hitherto unknown. They also gave an outline of their system of training for discipleship which is applicable to all, whether in the East or the West. In a few sentences written by H. P. Blavatsky we find this briefly expressed:

To merit the honorable title of Theosophist one must be an altruist above all. The duty of every Theosophist is certainly to help others to carry their burden. The Theosophist must himself be a center of spiritual action. Self-sacrifice is the highest standard of Theosophy.

Speaking of the way to bring this about, she says:

And what may be the duty of a Theosophist to himself? To control and conquer, *through the Higher, the lower self*. To purify himself inwardly and morally; to fear no one, and nought, save the tribunal of his own conscience.

One of the Mahatmans, in correcting the mistaken notion of a

new member of the Theosophical Society, who asked for yoga-methods by which to get psychic powers, explained that the dynamic energy which gives the Movement strength to stand any shock is not the craving for personal advantages but:

— Love, an Immense Love for humanity — as a *Whole!* For it is "Humanity" which is the great Orphan, the only disinherited one upon this earth, my friend. And it is the duty of every man who is capable of an unselfish impulse, to do something, however little, for its welfare. — K. H. in *The Mahatma Letters to A. P. Sinnett*, p. 52

Another (and a greater Master) confirmed this in these words:

It is not the individual determined purpose of attaining [for] oneself Nirvana (the culmination of all knowledge and absolute wisdom) which is after all only an exalted and glorious *selfishness* — but the self-sacrificing pursuit of the best means to lead in the right path our neighbor, to cause as many of our fellow-creatures as we possibly can to benefit by it, which constitutes the true *Theosophist*.

The same high Initiate added that the Masters would rather see the Theosophical Society perish "than become no better than an academy of magic or a hall of occultism," and in spite of all the lures of various side-issues it has remained faithful to its trust, thanks largely to the determination and unshaken loyalty to its original principles of H. P. Blavatsky, and those who followed her example.

Doing something for others, unselfish work to raise the spiritual standard of the world is, then, the true yoga, the yoga of Theosophy. The world is our home. It needs our help, and we shall not get away from it quickly. The urgent question for all who think seriously is: Am I becoming more useful, more capable

of giving the help that is demanded of me?

The Theosophical Forum

THE OTHER THREE (1) — *Kenneth Morris*

When I have taught one corner of a subject, if my pupil does not himself discover and learn the other three, I do not continue the lesson. — Confucius

Which is one of the many sayings of his that make one think Confucius was a Teacher — of Theosophy. For the first corner of Theosophy is all any Teacher can give you; you must discover and learn the other three for yourself. This is true whether the first corner given be a simple lecture or article, or the great literature of Theosophy: *The Mahatma Letters*, *The Secret Doctrine*, *The Esoteric Tradition*. Even if there were books containing still greater revelations than these do, they would only give the first corner; the other three would be for you to provide. Now what might those other three corners be?

Apprehension by Intellect; Apprehension by Imagination; and Apprehension by Life. Of the teachings, of course, in each case.

Apprehension by Intellect is the least important of the three; but only in the sense that it is useless without the other two. An Evolved Man must have also intellectual development. If we have little of it, the best way to get more is to study and try to understand the teachings. Apprehension of the teachings by intellect cannot be evaded, but must not be stopped at. You must have it; but if you have nothing more — beware!

Apprehension by Imagination carries you further. First let the imagination fire the desires with eagerness to serve, to know in order to serve. Then one must brood on these teachings, picturing to oneself their scope and truth; one must *enjoy* them, if one is to be a Theosophist. In this brooding contemplation, which is higher

than reasoning, argument must be left far behind. One places the teaching, as one has grasped it with intellect, before the Great Teacher who is within; and draws down from that one, just by desiring it, light to illumine the words in which the teaching is conveyed; that out of the words a living image may grow in the mind. To that Teacher Within, who is oneself and yet not one's little daily self, the Truth the words seek to convey is clearly apparent, known intimately from experience; by imagination and brooding we can get the Inner Teacher's knowledge flooding down into the mind. A lesser wisdom, quite akin to foolishness, would say, Do I believe in this or not? Wisdom will say, Let me watch these still waters for the reflexion of the approach of Winged Pegasus, on whom I may mount to the stars! or again, Concealed here is a treasure for humanity, that will enrich me with power to help and serve; that will guard me against illusion and discouragement, and from my lower nature.

As we proceed thus, Theosophy comes more and more to show us why we insist that it bears no relation to a creed; and that though it presents teachings, it has no dogmas; that though it is Religion, it is not a religion. The teachings come to seem less and less like articles of belief, and more like — a sunrise splendor glowing through life and things and men and universe; a glory of hope; a magnanimity; an elimination of all pettiness; a simplification, on master lines, of this ant-hill of sorry confusions we think is life. Let a man brood upon the truth that we are not here to grab enjoyment or get what we can for ourselves out of life; but in more lordly fashion to put into life what shall redeem it: infinite treasure out of the infinity of our inner and divine being. You are not the fellow who moves in the world and is thought a fool, a decent chap, a rascal, or what not; not the fellow who suffers the slings and arrows of outrageous fortune; the one on whose face all blows and buffets meet; who is threatened by every grim

tomorrow and goes in fear of the weeks to come and their freight of pain. Nay, you are not that one, but the Pilgrim of Time, he that journeys down the ages, advancing through tortuous courses, but for ever towards a Divine Goal. Twt! what are these sordid experiences that life insists on bringing you? — They are things altogether priceless to yourself: your means of becoming, that your own desire was set on because they were necessary for your growth. Brood on the story of the life of the planets, the history of this Earth of ours; remember that on all the globes, through all the rounds and races, you too were journeying, upon the same mission as now, intent on the same purpose as now inspires your God-Self: to conduct you, its personality, to the godhood that waits you beyond these ugly years. — Thus by brooding on these teachings, by Apprehension of them with the Imagination, one may come to self-identification with larger and larger times and spaces, to ever new liberations of the mind.

Then comes the fourth corner: Apprehension by Life. You can't know Theosophy without doing Theosophy. You can't know what Harmony is, and therefore what the Great Universe is, till you have become incapable of creating disharmony. You can't know what Brotherhood is till your tongue, *and* your pen, are incapable of inflicting wounds. You can't begin to know what the Atman is, and what the Buddhi and Higher Manas principles are, till forgiving offenses and coming back at the offenders with impersonal love have become for you by practice the natural things to do. You can't know what Reincarnation means till you live to benefit mankind. You can't understand the teaching about the existence of the Masters of Wisdom till you are doing Their work in the world with all your might and main, and behaving as if you were one of their disciples.

FOOTNOTE:

THE DIVINE DISCONTENT OF GAUTAMA THE BUDDHA — *Inez Davenport*

Twenty-five hundred years ago there was born to the royal family of the Sakya clan, a son, the Prince Siddartha, who, through no fault of his own — rather the contrary — caused the King, his father, deep concern. This was because even so many centuries before the coming of the great Christian Teacher, and before the Prince had reached what is commonly termed the age of discretion, he had already discovered the balance of values between the treasures of earth and the Treasures of Heaven. So that although born into one of the best of families, where nobility of character vied with wealth of possession to surround him with all that heart could desire, he seemed often to retire inward to a world unknown to his associates. Handsome he was, and strong, and brave, but he had no interest in the sports that engrossed his cousins, and while they busied themselves in friendly games of contest, he would steal away into the garden, and sitting under his favorite tree try to recapture that elusive thing that haunted him as a half-memory of a purpose in life not yet revealed. The sage Viswamitra, who had charge of his scholastic training, is said to have "picked up his books and departed, marveling." It was as if no human brain had store of knowledge great enough to instruct him who was destined to become the Buddha.

The case of a Buddha is different from that of a Savior belonging to the Avatara-group, such as Jesus, the Christ. An Avatara is a demonstration to humanity of the keen interest with which superior beings — shall we call them gods? — watch broodingly over the progress of men. For an Avatara is the mysterious union of a divinity with the highly evolved soul of one who has formerly become a Buddha, acting in a pure physical body. And this

magical, but not supernatural, appearance of a divinity among men takes place particularly at times of spiritual barrenness in order to encourage those who are seeking the light of truth by showing them glimpses of sublimer heights yet to be climbed in their search. In the case of Avatars it is the teachings which should occupy our fullest attention; the personal life, noble as it is, is relatively unimportant. With the Buddha, however, the study of his life, his trials and testings of teachers and methods, arouse our keenest interest. His procedure is that which every one of us can follow if we will. He started out aeons ago a man, as we are now. According to the stories, it was

A hundred thousand cycles vast
And four immensities ago

that he registered his first vow to reach Enlightenment — Buddhahood. This vow he kept fast in his mind and heart, resolving anew under twenty-four successive Buddhas — a necessary part of the fulfilment of such a vow, we read. On account of the inspiration and example which the life of such a great man is to us, this is well worth our serious thought and study; in fact, it is an essential part of the exposition of his teaching.

Many and fanciful are the tales related of the pre-natal visions entertained by the noble Maya, the one chosen as mother by the Bodhisattva, together with the interpretations put upon them by the Sages of the day, wise Brahmanas versed in true astrology. We read also descriptions of the conditions of existence of the Holy One in the heaven-world where he is represented as teaching the inhabitants thereof in the interim between one earth-life and the next; and there are some 550 'Birth-Stories' said to be episodes in the various incarnations of this aspirant to perfection, dating from the beginning of the world. Significant

indeed is the impression we receive that his birth into the Sakya family was a conscious, well-considered act: as imminent Buddha he took this step. His royal father, Suddhodhana, as was the custom of the day, summoned wise men to his court to examine the child and read the signs they saw on him. He possessed all thirty-two marks of divinity, and the prophecies of six of the Sages were unanimous: if he remained in the household life he would rule as became the best of kings; but if he relinquished that life he would become Lord of the Universe, the Awakened One, the Buddha. The seventh Sage, however, a younger man but nevertheless more intuitive than his brethren, saw one course only open to the young Prince: attainment of Buddhahood.

Now the king was a wise and kindly ruler, but he had no understanding of the nature and status of a Buddha. To his mind, human kingship was the destiny above all others that he would choose for his son. So he tried to fill his life with beauty, wealth, happiness, distractions of every pleasurable kind, building for him stately palaces and gardens appropriate to the four seasons of the year, providing for him in marriage the loveliest of his royal cousins, the radiant Yasodhara, and bringing to the court for his delight and entertainment the flower among the dancing and singing maidens of the country. Poor foolish king, to think mere beauty of sight and sound could appease the nostalgia in the soul of a Bodhisattva!

According to the legends, the gods now became impatient. It seemed too long the future Buddha was lingering in the toils of material allurements. So in defiance of the King's commands that when his son rode abroad he should see naught but youth, health, success, and beauty, the gods provided for him the Three Awakening Sights: an old bent man, hideous with age and deprivation; one stricken with fatal illness; and a corpse being borne to the funeral pyre. Not all at once were these Sights

sprung upon the young Prince, but singly during three successive drives, and day by day the power of his resolve gathered momentum. From the time of the seeing of the First Awakening Sight, he began to observe his fellows in a new way, and he found none in whose face he could read signs of the true course of life. At last, after the third Sight, he met a hermit wearing such a look of peace that now he knew and would wait no longer. It was the striking of the karmic hour, and henceforth and for ever there was no possibility of Siddhartha's succeeding his father as merely a human king. In the dead of night, his beloved wife smiling in her sleep, he bade a silent farewell, fearing lest the pain of parting prove too great for the human will if accompanied with words and tears.

It should be well understood that this breaking of home-ties is not a course of conduct recommended by the Buddha to men in general; in fact, he urged obedience to mother and father, faithful performance of duties owed to others. He once sent back as unready one who hoped to become a devotee of truth without having first observed the loyalties due to the home-circle. In these words he is said to have spoken: "If you would find comfort in my society, the first thing for you to learn is purity of conduct. Go back, therefore, to your home, and learn to obey your parents, recite your prayers, be diligent in your daily occupations. Let no love of ease tempt you to neglect cleanliness of person or decency of dress; and then, having learned this, come back to me, and you may perhaps be allowed to enter into the companionship of my followers."

Nor were his loved ones unprepared for his leaving. Often he had told both wife and father of his desire to enter the ascetic life in order to seek release for mankind from the ills of sickness, old age, and death, which seemed to make futile all their lofty aspirations and worthy ambitions. He felt that ignorance was the

cause of man's suffering, that there was truth which he was entitled to have, and, balancing the temporary anguish his absence would bring his own family circle, against the liberation of mind and spirit he knew they would gain when he became Buddha and they his faithful disciples — as did happen — he gave up all that men ordinarily hold most dear and began life anew as a hermit.

Six years the Prince, clad in yellow gown and carrying the ascetic's begging-bowl, studied under various teachers, Rishis and Brahmanas, tried their methods, spared himself not at all, undertook discipline so severe that it was rather self-torture; but still he did not attain the inner illumination he was seeking. At the point of death, and sorely grieved that he had not reached his goal in this life, he decided to break his fast and seek another way. Again the gods are said to have intervened, providing him with pure and nourishing food that restored his wasted tissues and caused the fresh blood to course through his veins. Thus he was ready for the final test which is pictured in allegorical form as his meditation under the Bodhi Tree, where Mara's hosts, the mighty Powers of Darkness, made their greatest and most prolonged attempt to dissuade the Holy One from his purpose.

Fearful and wonderful was the battle which raged during the watches of the night: on the one hand violence, hate, envy, and all the brood of hideous vice — these the Bodhisattva overcame easily with the peace and tranquillity of mind he had attained; but when Mara, using subtler wiles, caused apparitions of his wife and father to call to him to return home and ease their distress, it needed more than human strength to resist. Yet this strength too was his. Calm and unperturbed he remained under the Sacred Tree, reiterating once again his ancient vow: "Let the sun and moon fall down to earth, let these snowy mountains be removed from their base, if I do not attain the end of my search:

the pearl of the True Law."

Then indeed he did attain. The Hosts of Darkness vanished away, and morning broke upon the marvel of the Holy One grown at last from Bodhisattva, the promise of a Buddha, into the full flower of Perfected Manhood, the Enlightened One, the Buddha. He sat in contemplation for seven days and nights, seeking the best way to tell mankind what he had learned. Brooding on the mystery of life, on the composite, and therefore impermanent, character of the visible Universe and of man, he wondered if words existed that could tell the truths he knew. And then, picturing to himself lotus-flowers in a pond, and remembering how some of them grow high out of the water, some less high, and others never rise above the surface, and thus they receive varying amounts of sunlight, he thought: Men are like the lotus-flowers, the sun is the truth. The wise do not need my teaching, the stupid would not understand it; but those neither wise nor stupid, who question, seek, but know not where to find, these should receive help. Therefore I will teach. At this the very elements of the Universe joined with the Heavens and the Earth to proclaim their joy upon the arrival of a Buddha of Compassion.

Thereafter for forty-five years Sakyamuni fulfilled his promise. He wandered up and down India, teaching all who would listen to him. Among his earliest disciples were five anchorites who had witnessed in amazement the extremes of asceticism to which his zeal had led him, but who later reviled him when he, as they thought, relapsed into the worldly life. Sitting at their devotions, these five saw approach one whom at a distance they recognised as the monk Gautama, and thinking to show their disapproval of what they thought his treachery to their Order, they conspired to show him courtesy upon his arrival, but no deference. They little knew the transformation that had occurred in the meantime, nor what power it was that drew them to their feet and caused them

to do most reverent obeisance. For looking into his face and seeing the glory with which he was transfused, they entreated the Buddha to accept them as his pupils; and because of their sincerity, and their faithfulness to the light of truth as they had seen it, he granted their request. Many an instance is given of similar meetings — even Brahmanas, who were indignant at his refusal to discriminate between the castes and his willingness to impart what they had kept so rigidly secret from the masses of men, and who challenged him with questions which they thought he could not answer, were glad to yield their allegiance to one whose presence and wisdom were so superior to theirs that deference to him became the highest honor they could desire. It is unfortunate for their descendants that more of this learned caste did not come to understand the mission and teachings of the Buddha, for the heart of both Brahmanism and Buddhism is the same; and the Buddha came not as inventor of a new religion, but as illuminator of the old, which had its source in the same Heart of the Universe as all the World-Religions have had.

It is not taking a one-sided view of the situation to speak of the beauties of the teachings of the Buddha and to fail to condemn the deficiencies of modern Buddhism. Whatever may be lacking in the application men today make of religion in their lives is the fault of the men themselves, not of the original teacher of that religion. It would be decidedly unfair were we not to mention that even after twenty-five hundred years Buddhism is still active, and a powerful influence in the lives of millions of people; and that of all the known world-religions of history it has created least disharmony, been the cause of no wars, undertaken no conversions by violence, inaugurated no inquisitions, nor approved any form whatever of mental or physical torture, whether self-inflicted or not. It could well be adopted by men of every race with very slight modifications even today. The

cornerstone of it is love for all beings, and its building-bricks all the virtues which, when practised, make life beautiful. Ignorance is a vice not to be tolerated, for truth is in the Universe and is to be had for the taking.

The Buddha concluded his mission among men at the ripe age of eighty years. In full possession of his faculties he gathered his disciples around him for the last time. His farewell speech has been given in varying forms by the translators, but in each the message is the same: Salvation for mankind comes from within; when self-appointed teachers appear, test what they say by the truth you already possess; do not believe without examination everything you hear. Think for yourself. "I have lit the lamp of wisdom. Its rays alone can drive away the gloom that shrouds the world. On your part, be diligent! With virtuous purpose practise well these rules; nourish and cherish a still and peaceful heart. Be lamps unto yourselves. Work out your own salvation. Look within! Exert yourselves to the utmost; give no place to remissness. Earnestly practise every good work."

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

THE HOPE OF IMMORTALITY AND SURVIVAL AFTER DEATH

A recent review in *The Observer* (London) by the distinguished scholar, Dr. L. P. Jacks, of *The Purpose of God*, by Dean W. R. Matthews of St. Paul's Cathedral, London, is of interest to students on account of certain phrases used by the reviewer which carry a marked Theosophical stamp, and show how our principles are permeating the best thought of the age. For instance, when speaking of Dean Matthews' lucid defense of the rationality of the universe, Dr. Jacks draws attention to the fact that in any case man and the universe are one and indivisible: "he is bone of its bone, and flesh of its flesh, a veritable 'child of the stars' as Plato said . . . it and we are of one substance and one nature. . . ." "Chaos cannot evolve order out of itself, nor aimless forces discover their own aimlessness." As the universe is *not* chaotic, so by analogy and in fact are *we* rational and purposeful in our true nature, which is infinitely greater than the transient personality.

On the difficult subject of the moral law, Dr. Jacks is as positive as our Theosophical Teachers. He says without compromise that,

the infinite difference between right and wrong, and the categorical imperatives which proceed from it, are not presented to the human mind in the form of persuasion or of friendly good advice . . . They speak with authority; their language is a word of command. . . . There is, indeed, a kind of persuasion which is nothing else than compulsion under a more attractive name; the kind, namely, which is certain to be followed, when we disregard it, by what George Meredith called a "celestial hail of thwacks."

Dean Matthews, the writer of the broad-minded book commended by Dr. Jacks, has recently delivered three radio-broadcasts on 'The Hope of Immortality.' They are filled with close reasonings relating to survival after death which, with few exceptions, might have been written by a well-informed Theosophist. For instance, he thinks that the problem of personality — What is Man? — must be settled before ordinary reason can expect to face the problem of Survival intelligently. Does the personality persist after death, and if so, what is that personality? Is the old man the identical personality that was the child of the same name many years ago? The personality has so greatly changed that it is hard to think so. But there *is a continuity*, and the Dean suggests that the death of the body is only an incident in an infinite process which will ultimately show me "what I really am."

Dr. Matthews' idea of the practical impermanence of the personality because of its constant transformation, leads straight to the principle of Reincarnation which explains the paradox of 'the one and the many,' the one eternal Monad and its many successive vestures. He believes that after bodily death the qualities that make up our *character* remain, though no doubt they may be altered with certain limits — excellent Theosophy indeed, and still more so when he declares that it would be terrible to go on for ever just as we are, in an immortality of weak, limited personality.

Another good reason for Survival is, he thinks, the fact that human life is so tragically incomplete; our tasks are all left unfinished. We revolt against this apparent waste; all the higher values of life are incomplete in the experience of one short life. Then the Dean brings up the problem of Justice, and while accepting a moral government of the universe, admits that no one can believe that the world as we see it is perfectly just. While

rough justice is done to many, we see the wicked escaping their penalties and the good suffering grievous harm. This cannot be explained except by some kind of Survival. In connexion with the argument for justice (which of course is satisfied by the natural processes of Reincarnation and Karman, by which absolute justice is fulfilled), Dr. Matthews makes a significant remark: "It is fashionable to despise this kind of reasoning today, but I think justice an essential element in any idea of God." Quite so; a revengeful, partial, tribal God, under whatsoever high-sounding name, is no God at all. And the Dean would find that when reasoning based on the principle of justice is presented, as in the Theosophical formulation of the laws of life, it cannot be despised, for the principles of Reincarnation and Karman (the unerring law of Cause and Effect) appeal to every logical mind.

The Dean expresses one very beautiful thought in support of Survival. Kant said that the aim of a moral life was to reach perfect holiness, i. e., to make the will perfectly obedient to the moral law. But as we go on we find that the moral law demands more of us than it did at the beginning. The holiest men are more conscious of their imperfections than others, not because they are worse than 'sinners,' but because they see more and more clearly their duty, and what 'holiness' involves. As we pursue high ideals, still higher ones open to us in glorious perspective, and those we have attained seem insignificant if not actually mean. The spiritual horizon of attainment recedes as we advance.

That concept is found fully developed in the teachings of the Ancient Wisdom, and the life of the chela has been described as a series of awakenings, as the Buddhist Radiance or Christ-light within gets brighter. And in regard to becoming aware of one's imperfections in proportion to the progress made, our devotional books frequently mention it, but always tell us to keep our faces toward the Light, and not look back.

The Dean takes a balanced view on Psychic Research and the claims of the Spiritualists. He reasonably argues that even if Survival may be ultimately proved by investigation — not an impossibility in spite of the incredible difficulties in the way — that would not prove *immortality*. The good may obtain an immortality "by living in God"; but what about the irreclaimably wicked? As he cannot accept the unjust abomination of an eternal hell, he is inclined to think that they will naturally be annihilated because they have cut off all connexion with 'God.' Do we not here see an adumbration of the ancient teaching of the 'loss of the soul'?

Dr. Matthews's broadcasts were published in *The Listener* (London) for January 22nd and two succeeding weekly numbers.

"MASS THOUGHT INFLUENCE ON THE WEATHER"

We have received some interesting clippings from English journals in regard to weather and sunspot cycles, and about the possibility that the thoughts of a large body of persons, if sufficiently intense and directed toward a single idea, may affect the weather! Is there an answer to prayers for rain on grounds of *natural law*? — though not on merely physico-chemical mechanistic combinations any more than by the 'miraculous' intervention of a personal Jehovah. The *Morning Post* (London) has published a correspondence from which we gather the following information.

One contributor, Mr. E. L. Hawke, Secretary of the Royal Meteorological Society, offers many examples of the apparent influence of collective thought on the weather, which are indeed curious, even if nothing more than 'coincidences' (whatever that may mean!). For instance, the British Royal Jubilee Days which occurred in 1809, 1887, 1897, and 1935, were all brilliantly fine.

Queen Victoria was so fortunate in the weather for her public ceremonials that it became common to speak of 'Queen's weather,' as millions still living remember. On the other hand, the heaviest fall of rain ever known in the British Islands in twenty-four hours (nine and a half inches) took place on June 17, 1917, when the most intense international hatred was raging during the World War. Queen Victoria's death was followed by exceptionally violent and widespread blizzards. The same writer gives a long list of apparent coincidences between weather-conditions and the prevailing mental emotions of the people, but he frankly admits that there are many exceptions and that the case is not yet proved.

In regard to sunspots, however, he believes there is a good case, and he quotes Professor Tchijevsky, noted Russian statistician, who claims a close connexion between sunspots and popular tumults, revolutions, and other forms of mass unrest. From the fifth century b. c. onwards, Professor Tchijevsky finds that 60 percent of such upheavals have occurred in the three years around the sunspot maximum while only 5 percent happened in the three years around the minimum. He offers no explanation, but the reason we feel inclined to withhold final acceptance of this claim — though it seems to us not improbable — is that we have no correct record of the years of sunspot frequency for more than a comparatively short time back. Sunspots do not follow an even rhythm, and although there is seemingly an *average* or mean period of about 11 years, the maximum often comes a year or two before or after its expected time, and the same with the minimum. For the two thousand years before scientific records were kept of the number of sunspots there is no way of telling the exact dates of the three-year periods he uses, and if he uses the *average* dates a good many of them are sure to be wrong. Perhaps, however, he may have allowed for a considerable

percentage of error.

Mr. Hawke says that Swedenborg is cited as the originator of the notion that mass thought affects the weather; he certainly considered that the sun is but the material counterpart of a divine emanation from the unseen worlds, which constitutes the source of life and intelligence. Was he wrong?

Another correspondent to the *Morning Post* says that long before Swedenborg the belief in thought-influence was established: "Its first written affirmation was in Sanskrit in the Vedas, which formed part of that which we term the Ancient Wisdom."

Discussing the sunspot theory of the Russian professor, Mr. A. B. Street, in a later contribution to the *Morning Post*, mentions the discovery by Drs. Traute and Bernhard Dull, Danish scientists, of a relationship between solar activity and the death-rate. In Copenhagen 36,000 deaths occurred between January 1, 1928, and December 31, 1932. They were divided into fourteen classes, according to disease, and also according to age and sex. In each division a twenty-seven day rhythm was found, which is the period of the rotation of the principal sunspot zone with its concomitant electro-magnetic cycle, which is reflected on earth. The maxima in the death-curves of various groups of maladies do not all occur exactly in accord with the maxima of solar activity. Some come a little later than others, though always in the same relationship. Deaths due to suicide follow the same rule as those from disease. The same two scientists conducted a similar inquiry in Zurich, Switzerland, which is a long way from Copenhagen, and they obtained similar results. No chance or fortuitous coincidence theory can explain this.

In regard to the possibility of spiritual forces being behind or within such phenomena as wind, rain, or clouds, a writer in the *Referee* (London) makes the daring suggestion that the winds are

not purposeless or mindless! He seems to have struck a deep Theosophical note, however strange it may sound to some. He says, in part:

I have noticed the remarkable behavior of the winds among the different strata of the clouds, and know that the perfect and varied shapings of condensing or expanding vapors, with the consequence of the cloud positions and fulfilments, are absolutely ruled and regulated by the winds. . . . The wind, in my opinion, has more than a mind and purpose — it is *personal*.

Has Mr Huxley listened to the weird wail of a tempest as it races across a barren stretch of moorland? Has he noted it speaking and singing in many keys among the trees? . . . This is all, in my humble opinion, the proof of purpose, and the granted spiritual expression of mind. . . . Is not the spiritual aspect of any substance — especially man's — the ruling power and accepted influence of thought? I feel that the breath *is* the life, not only of animate Nature but also of the subjective.

If reference is made to *The Secret Doctrine*, Volume II, pages 280, 392, 613, 615; *Isis Unveiled*, I, 284-5; and *The Mahatma Letters to A. P. Sinnett*, 160-1, intuitive readers will see that thought and weather-phenomena may have some undiscovered connexion. On page 615, volume II of the first-named work we find an illuminating suggestion. In referring to the Maruts, frequently mentioned in the Puranas, H. P. Blavatsky says that from one point of view the Maruts or the Storm-gods, are literally "actual conscious Existences, Beings of a cosmic and psychic nature." They are also, "the *passions* that storm and rage within every candidate's breast, when preparing for an ascetic life." We can go no farther into this significant question here, *though it is well*

worth study.

The Theosophical Forum

**THE LANGUAGE OF THE BUDDHIST SCRIPTURES: PALI — G.
*Barborka***

Pali is the name that has been given to the language spoken in the north of India, from and before the 7th century b. c. to about the 5th century of the Christian Era. It is still the literary sacred language of Burma, Siam, and Ceylon, although its use is said to be decreasing. In other words, in the lands where Southern Buddhism flourishes (to use the term in a geographical sense), the language now known by the name of Pali is still used in the religious observances of the Buddhists, as their canon was written in this language.

There were two principal reasons which made Pali one of the most important literary languages of the world: first, a political factor: the rising and the welding together of the Kosala-power into a kingdom, during the seventh century b. c. It is the opinion of scholars that the Aryan influx into the land now generally termed 'India' occurred through three main routes, and that minor settlements were left along the route; and it is held that the language of these isolated groups or communities bore the same relation to the Vedic language as the present-day Italian bears to ancient Latin. In other words the language was closely akin to Sanskrit; but it was a spoken language, whereas Sanskrit was a 'sacred language' — the language of the sacred scriptures, the Vedas. The language that was spoken at Savatthi, the capital of the Kosala kingdom, in Nepal, soon became the form of speech which was generally adopted. A comparison may be drawn in what occurred in England during the welding process of Angles and Saxons which finally resulted in the 'Anglo-Saxon language' (now known as 'English').

The second factor was of a religious nature. Gautama the Buddha was a Kosalan by birth, and it is very probable that he used the Pali language in giving forth his teachings, and therefore the subsequent philosophical writings of his disciples were similarly couched in this language. All the early Buddhist scriptures that have come down to our day are in Pali, although many later Buddhistic writings are in Sanskrit.

The etymology of the word Pali is uncertain. It probably means 'row, line, canon,' and is used, in its exact technical sense, of the language of the canon, containing the documents of the Buddhist faith. But when Pali first became known to Europeans it was already used also, by those who wrote in Pali, of the language of the later writings, which bear the same relation to the standard literary Pali of the canonical texts as medieval does to classical Latin. — *Encyclopaedia Britannica*

But C. J. Joshi, M.A., formerly Professor of Pali and Marathi at Baroda College, India, writes in his *A Manual of Pali*:

The Pali language was derived from ancient Sanskrit; its former name was magadhi, the dialect of the Magadha country, now called Bihar. Magadhi received its new name Pali from the Sanskrit word pali (a line), which has the secondary meaning, *the text*, as distinguished from the commentary. The commentaries refer to the original Magadhi Tripitaka as pali; gradually the connotation of the word was enlarged and it came to be applied to every composition in Magadhi and consequently to the language itself.

The language was the Vernacular of ancient Magadha, in which the great Buddha preached his Doctrine to the people, and Asoka inscribed his immortal messages to

generations.

Scholars have also drawn attention to the fact that Pali may be divided into three classes or stages: (1) the language before the writing of the Buddhist canon; (2) the language of the canon itself; (3) the later developments and minor variations arising after the period of the canon. However, the term Pali is generally applied to the three classes enumerated.

Professor Otto Franke, in his *Pali und Sanskrit*, shows that in the 3rd century b. c. the language used throughout northern India was practically one, and that it was derived directly from the speech of the Vedic Aryans, retaining many Vedic forms lost in the later classical Sanskrit. The basis of the language used in the Buddhist canon, or sacred texts, was that used in Ujjayini the capital of the Avanti district.

To those familiar with the Sanskrit alphabet and the Devanagari characters, it will be of interest to know that the Pali alphabet uses the same letters, and that it is the same as the Sanskrit except for a very few modifications.

As regards the literature: three works are extant in the pre-canonical Pali (i. e., what is referred to above as class one), namely the *Milinda-panha* (a religious romance translated by Rhys Davids under the title *Questions of King Milinda*, which originated from the north-west of India); the *Netti Pakarana* and the *Petaka Upadesa* (from the center of India). These two were believed to have been written by a disciple of the Buddha, but scholars now place them as belonging to the era preceding the Buddha.

The works containing the Buddhist doctrine are known under the name of *Pitakas* — an interesting word, for its meaning is a 'basket'; not a basket in which things are stored as in a box or

chest, but the basket which the Indian workers use at excavations for filling with earth and handing from one worker to another. In this word the meaning is clearly given as to the intention of the Pitakas, i. e., that the doctrine should be handed on from one disciple to another. The Pitakas are simply collections of the scriptures available at the time of their gathering, and are divided into three sections: (1) the rules of the Buddhist order, known as *Vinaya*; (2) the writings setting forth the doctrine of Buddhism, generally called *Suttas* (Sanskrit, *Sutras*); (3) analytical exercises in the system upon which the doctrine is based — the *Abhidhamma*.

The Suttas form the part that is of the greatest interest to us, for in these are found the teachings of Gautama the Buddha. They are small tracts, rather than a complete text or scripture, each sutta containing a single aspect of a teaching or doctrine, set down briefly in writing, amounting to only a page or two, with the intention of its being an aid to the memory; those expounding the doctrine or acting as teachers to disciples, carrying on a running commentary upon the particular text in hand. When several of these suttas treating on the same subject were gathered together thus forming the basis of a dialog, such collection was termed a *suttanta*. A collection of these suttantas then formed a *Nikaya*, of which there are four main ones. Another interesting series of anecdotes is gathered together in the collection known as the *Jatakas* (or 'birth-stories').

Of all the various Suttas, the one of greatest importance may be said to be the *Dhammachakka*, often called 'the Wheel of the Law' (a literal translation of the words — or more freely rendered, 'the Proclamation of the Law of the World-Order'). This Sutta opens with what is termed the first sermon, addressed by the Tathagata to his five former associates in the practice of yoga, in the Mrigadava forest (near Kasi), in which the Buddha declared the

Noble Eightfold Path — the Middle Way which avoids the two extremes — consisting in the practice of: Right views; right thoughts; right words; right actions; right living; right exertion; right recollection; right meditation.

The work known as the Buddhist textbook, the *Dhammapada* ('the Path of the Law') was compiled at a later date than the Suttas. It consists of a gathering together of gems of thought uttered by the Tathagatha, amounting to 423 verses, each subject (of which there are 26, each being a chapter or section) containing from ten to twenty stanzas. It is unquestionably the loftiest exposition of the Buddhist moral and ethical code.

One of the methods of relating anecdotes about Gautama the Buddha (Pali, Gotama), at the same time illustrating his teaching, may be given. A young mother was distraught because of the death of her little boy, who had just reached the age when he was commencing to run. With the dead child clasped to her bosom, she went from house to house seeking for medicine to revive her little one. At one of the dwellings, one who had entered upon the first steps of the Way as enunciated by the Teacher, replied to her entreaty: "No medicine can I give to thee, there is one alone who can do that."

"Do tell me, I pray thee, who he is," said the young mother, Kisagotami.

"Seek thou the Lion of the Law, the Lord of Mercy; he alone can give thee medicine."

Kisagotami speedily sought out the Buddha, and asked what herbs should she bring him for the medicine (as it was then the custom for the patients themselves to gather the herbs that were used for the making of the remedy).

"Bring me some mustard seed," said the Teacher, "but it must be

obtained from a house where no son has perished, where no husband, where no parents, where no slave has perished!"

Overjoyed with the thought of obtaining so easy a remedy as mustard seed, Kisagotami hastened away, asking from house to house for the mustard seed, still clasping her child.

"Why, yes, here is mustard seed," said her neighbors, "take it!" But before taking it she would ask: "Has son, or husband, parents or slave died in this house?" "Alas, yes," was the constant reply. At one abode she was told, "Lady, what is it that you ask? The living are few, but the dead are many."

Not finding a single house that could supply her with the mustard seed, a light dawned upon Kisagotami. She buried her child in the forest, and returned to the Buddha, paying reverent homage.

"Have you the mustard seed?"

"No, Lord. The people say that the dead are many and the living few."

"It is even so." And the Buddha discoursed upon the impermanency of all aggregated beings, till the doubts of Kisagotami were cleared away and her grief assuaged. She accepted her lot and became a disciple, straightway entering 'the first path.

The Theosophical Forum

THEOSOPHY, THE ORIENT, AND RUDYARD KIPLING — *Madeline Savage*

In an Appendix to the first edition of H. P. Blavatsky's *The Key to Theosophy* (1889), occurs the following paragraph:

The Theosophical Society was formed at New York, November 17, 1875. Its founders believed that the best interests of Religion and Science would be promoted by the revival of Sanskrit, Pali, Zend, and other ancient literature, in which the Sages and Initiates had preserved for the use of mankind truths of the highest value respecting man and nature. A Society of an absolutely unsectarian character, whose work should be amicably prosecuted by the learned of all races, in a spirit of unselfish devotion to the research of truth, and with the purpose of disseminating it impartially, seemed likely to do much to check materialism, and strengthen the waning religious spirit. The simplest expression of the objects of the Society is the following:

First: — To form the nucleus of a Universal Brotherhood of Humanity, without distinction of race, creed, sex, caste, or colour.

Second — To promote the study of Aryan and other Eastern literatures, religions, and sciences. . . . etc.

From the very outset, then, it is plain that in the judgment of the Foundress herself, a large part of the success of the Society which was to bring the Ancient Wisdom back to the Western peoples, was to depend upon newly-forged links of learning and culture between East and West; and secondarily, we may infer, upon a

greater measure of understanding on the part of the West of the true nature of the Oriental peoples and nations. Mme. Blavatsky herself chose India for the main treasure-house, as being the nation that had preserved the ancient knowledge in the form most suitable to be given to the West in this modern age.

Perhaps not least among the factors that have opened Western minds to the influences of Eastern thought has been the work of Rudyard Kipling, who, in the many obituary notices that have appeared on the occasion of his recent death, has been awarded the laurels due to a literary genius, an architect of Empire, a bold adventurer in the field of thought, and so on. But one phase of his achievement, a phase that is of peculiar interest to Theosophists, has not been greatly stressed. Yet is it not a fact that in bringing to the consciousness of the West even a tithe of the treasures of the mysterious East, Kipling indirectly and quite unconsciously served the cause of Theosophy?

His life coincided in time with the inception of the modern Theosophical Movement, and the general trend of his work put him in touch with the currents that were beginning to stir in the East and to find their way westward. There was of course a cyclic timeliness in this westward movement of Eastern influences, but many and various are the agents that bring about such cyclic changes.

Born in 1865, in Bombay, spending early years in Lahore, going to England for his education, returning to India, traveling to and marrying in the States, engaged in journalistic work that carried him round the globe, Kipling had ample opportunity, if ever man had, to interpret the East to the West. But unlike Lafcadio Hearn and the Fenellosas, Kipling can hardly be said to have interpreted the Oriental life and mind to the Western world. Perhaps 'revealed' would be a better word, and that only in a limited

sense. For Kipling was to the last an Occidental of the Occidentals. We say this because the predominant element in his work reflected so faithfully the stiff-necked pride of race of the English in India; and yet we say it with reservations, because there are other portions of his work which do give us scattered gleams from the ancient wisdom. But whatever may have been his perceptions of the soul of the East, there is not apparent in his writings as a whole more than a comparatively superficial understanding of the Oriental genius — superficial from the standpoint of Theosophy, which recognises in the East the still pervading atmosphere, the outworn fabric, of a culture beside which that of the West seems puerile and inadequate.

Having said this much, we can turn now and justly appreciate the genius that painted India for us with all the vividness of life itself. As children we were there in spirit, following Mowgli through the enchanted world of the *Jungle Books*. To be sure, the tales that we read in our maturer years were written chiefly from the standpoint of a proudly conquering race: "Governors and Lieutenant-Governors, Commissioners and Deputy-Commissioners, Colonels and Captains and the Subalterns." The Indian natives were described as one would describe a quaint race of indulgently regarded children; but enough of the charmed atmosphere seeped through to keep alive our sympathies and our imagination. When we came to read his *Letters of Marque* and other journalistic correspondence to the Allahabad *Pioneer* and the *Civil and Military Gazette*, we found revealed much more of Kipling's real feeling for the true India. A few words of quotation taken at random from these letters will show this better than we can tell it.

Apropos of the transformation of Jeypore into a modern city with all conveniences, he writes: "It is difficult to write of a nickel-plated civilization set down under the immemorial Aravalis

[mountains] in the first State of Rajputana." Elsewhere he says: "It was my destiny to avenge India upon nothing less than three-quarters of the world." And his attitude is still more strongly attested in the later letters from America, in which he describes the blatancy of Western civilization, as experienced by him there, in contrast with the life of even some of the simple natives of India, who, he avers, knew far more about the real values of life than these frantic Westerners.

Then there is *Kim*. In that best and most beloved of all his books, in his portrayal of the old Lama with his serene philosophy of the Wheel of Things, in the boy Kim's chelaship and beautiful relationship to the old man, Kipling perhaps shows us best what inklings he had of the more spiritual side of the old and fragrant habitude of the Orient, which surrounds like an untroubled sea the objective activities of the invading and conquering West.

One cannot but regard it as unfortunate that Kipling seems chiefly known in the West through what might be called the noisier of his works: the *Barrack-Room Ballads*, Mulvaney and his crew, and the ever ubiquitous Subalterns, products of genius as we must admit them to be. Of much more real moment, we think, are his tales of the 'supernatural,' *The Phantom Rickshaw* and a score of others, which point significantly to the existence of worlds beyond the visible, worlds that can be perfectly well accounted for in the Theosophical teachings, echoing the ancient Eastern wisdom. In the delicate fancies of *The Brushwood Boy* and in *They*, and in *Puck of Pook's Hill* and its sequel, these worlds are again suggested with a touch of elfin magic as sure as Barrie's or Walter de la Mare's.

Kipling was not without his intuitions. *The Finest Story in the World* is the finest story in the world for overwhelming the reader with a conviction of the truth of reincarnation: the

commonplace London clerk recapturing in snatches, in a sort of waking dream, the unrecorded details of what could have been nothing but his own former life as a galley-slave in the days of old Greece. And what but reincarnation could he have meant in that *L'Envoi* where we find the lines:

We shall rest, and, faith, we shall need it — lie down for an
aeon or two,
Till the Master of All Good Workmen shall put us to work
anew!

Whatever may have been his crudities, Kipling by the very fire and vividness of his every written word surely promoted that much-desired fellow-feeling between the two worlds of this planet, by turning millions of Western minds eastward, and without doubt many Oriental minds westward. He was a single factor: his work, and that of others in the same field, has had its fruition in a greater understanding between East and West than has ever obtained before. Witness the steady stream of Oriental literature that is flowing into our libraries, through translation and from original sources; our increasing interest in the study of Oriental languages, most of the leading colleges in the Western nations having now established Chairs of Sanskrit; witness even the ever-mounting number of Orientals, of greater or less intellectual quality, who are gaining a hearing, wisely or unwisely, among inquiring Western minds of a certain type. (It seems to be a law of Nature that we must always take some dross with the gold.) And let us not forget the splendid scientific achievements of eminent Hindus of today, whose work is recognised as being fully up to Western standards: Sir Jagadis Chunder Bose, Professor Raman, Sir Shah Sulaiman — to mention only three that come to mind.

There never was a more misleading slogan than the famous line:

Oh, East is East, and West is West, and never the twain
shall meet,

flung out as it was almost off-hand as a striking opening to the well-known *Ballad of East and West*. Without their qualifying context the words have been used as an epigram wherever English is spoken, and taken in their absolute meaning. In one sense they are utterly true, and Kipling was evidently expressing his awareness of the gulf that separates East and West in quality of consciousness and consequent adjustment to life. But just as the Ballad itself shows how the finest traits of both East and West are one and the same, and can blend the two into one, so both West and East have found that they can meet on common ground when the higher planes of thought, in science and philosophy, for example, are entered upon. And the West is only just discovering that it is already receiving from the East treasures of value not suspected before. It is simply the passing on to a younger and less developed civilization of the finest essence and fruitage of the old — and that is ever the way of Nature.

The Theosophical Forum

THE TOWER OF THE GANDHARVAS (1) — *Kenneth Morris*

Rightness, honor, power, splendor of countenance and Vedic glory, these things, verily, were possessed in former times by Atidhanvan-Sanaka, king of the Videhas, in such measure that there was none like him to be found in the world, and even the gods were astonished. On his body, it is said, were the two and thirty marks of perfect birth; and the birthmarks of the Chakravartin: the wheel, the orb, the discus of unbounded sovereignty. To speak of the tributary monarchs that bowed down to him, would be, as it were, to limit the infinity of his power; from the seven continents they came, bearing wealth to his treasure house. His armies went forth even to Patala; and such was the fame of his beneficence, that they achieved victory without the shedding of blood. He conquered the resplendent worlds. "Whatever tribute we may pay to him," said the kings of the earth, "it is upon us that the balance of benefit falls." Among the countless crores of his slaves and subjects there was none to hanker after the lightening of his yoke; none to complain, or desire any other lord.

All of which pertained to his rank as Chakravartin; but heaven knows he was more and greater than a Chakravartin possessing world-sovereignty. Svetaketu-Dalbhya overheard seven flamingos discoursing as they flew over the palace in the night. "Short-sighted brothers," said the leader of them, "fly not too near, lest the splendor of the good deeds of Atidhanvan-Sanaka scorch your wings." Ushasti-Shalavatya listened while the bull of the herd was conversing with the cows. "As for Atidhanvan-Sanaka," said the bull, "he, verily, is to be named with Raikva with the Car." —"How was it with that Raikva?" asked the cows; "and how is it with Atidhanvan-Sanaka?" —"As in a game of dice," said the bull, "all

the lower casts belong to him who conquers with the Krita cast, so all good deeds performed by other men belonged of old to Raikva, and belong now to the King of the Videhas." Prasnayana-Jaivali heard the altar-flame soliloquizing. "Atidhanvan-Sanaka," said the flame, "knows that Golden Person who is seen within the sun, with golden beard and golden hair, whose eyes are like blue lotuses, and who is golden altogether to the tips of his nails. Atidhanvan-Sanaka, verily, knows the Golden Person, the Lonely Bird. . . ."

And he who knows this, says the Upanishad, knows Brahman.

Certainly, then, the king knew Brahman. Though he was a warrior of the Kshatriya tribe, many that were Brahmanas came to him to learn wisdom. They put questions to him, and he answered their questions: revealing to them the Self, making known to them the wanderings of the Lonely Bird. That which is the Breath of the breath, the Eye of the eye, the Ear of the ear, the Dwarf in the heart, he revealed it to them. Then he put questions to them, and they were dumb. "Master," said those proud ones, "teach us!"

Kingly indeed was Atidhanvan-Sanaka: a majestic man, black-bearded, with dark and flashing eyes, severe and noble of aspect. He was constantly in action; constantly shining forth surrounded with the pomp and magnificence of his sovereignty; no one ever beheld him at rest. As with chanting of Vedic hymns and with ceremonial rites, the priests conduct the sacrifice; as the sun passes through heaven, adoring that Brahman; so Atidhanvan-Sanaka conducted the affairs of the world. "Whatsoever the sun or the moon sees, or the light or the darkness hears; whatsoever the heart conceives, or the hand performs, or the tongue whispers, he knoweth it, he knoweth it," said the people. And yet where one feared him, millions loved him; and so great was the

influence of his will and benevolence, that righteousness was maintained everywhere, and evil put down firmly in every quarter of the world.

Now in those days there dwelt three ascetics in the Forest of Grantha-Nagari: Vaka-Kakshaseni, Satyakama-Kapeya, and Gautama-Kaushitakeya, or as he was called, Pautraya-Glava. They were assiduous in the quest of wisdom, and had spent three hundred years in meditation; performing many penances, and silently repeating the udgitha. They had attained to many powers; yet there was that, verily, to which they had not attained.

At the end of a hundred years, Vaka-Kakshaseni said: "Sir, Satyakama-Kapeya, knowest thou that Brahman?"

"I know it not," said he.

At the end of the second hundred years Satyakama-Kapeya said: "Sir, Gautama-Kaushitakeya, or as thou art called, Pautraya-Glava, knowest thou that Brahman?"

"I know it not," said he.

At the end of the third hundred years Gautama-Kaushitakeya rose up and said: "Sirs, we have dwelt here these three hundred years in meditation, performing many penances, governing the inbreathing and the outbreathing, and silently repeating the udgitha. We, verily, have attained to many powers; yet there is that to which we have not attained. And there is that Atidhanvan-Sanaka, king of the Videhas: a Kshat-triya, housed about in worldly pomp, and performing day by day the mere duties of a world-sovereign: practising neither meditation nor study of the Veda; governing none of the breaths; performing no penance nor austerities, nor repeating silently sacred texts; and yet it is said that he knows the Brahman. Is it your opinion that we should go to him, and request him to teach us?"

"We are Brahmanas, and he is a Kshatriya," said they. "Were we to seek as our Teacher one unworthy to teach us, our heads might fall off."

"Our heads might fall off, truly," said he.

Then said Satyakama-Kapeya: "Sir, Vaka-Kakshaseni, what is thy opinion?"

"That one of us should go into the palace in disguise, and make inquiry as to the king's knowledge, and by what means he has gained it," said he.

And they said: "Sir, Gautama-Kaushitakeya, do thou go."

* * *

Gautama-Kaushitakeya took the guise of a sweeper, and went into the city, and mingled with the crowd that gathered in the morning when Atidhanvan-Sanaka come into the Hall of Justice. He saw the king ascend the throne, like the splendor of the sun at dawn into a sky of gold and scarlet, of clear saffron and bright vermilion. He listened while the judgments were being given, and understood that no lie might be maintained against the king's perspicacity of vision. He saw that whatsoever deed was done, or thought thought, or word spoken, it was known to Atidhanvan-Sanaka, and could not be concealed from him. He abided there from dawn until noon, marveling more and more. The motions of the king's hands, it seemed to him, were as the motions of Karman to administer rewards and punishments; the glances of the king's eyes seemed to him to penetrate compassionately into all the corners of the earth. At the end of the morning the people prostrated themselves, and said: 'Justice hath been done, even to the ultimate particular'; and Gautama-Kaushitakeya answered: "Yea, justice hath been done." And he was not a man to be

impressed with outward shows.

Then he went back to the forest. "Hast thou any news, sir?" said his companions.

"Sirs," he answered, "the glory of Atidhanvan-Sanaka, as he ascendeth the throne of Justice in the morning, is like the glory of the sun at dawn ascending into a heaven robed in gold and scarlet, in diaphanous saffron and vermilion lovely to behold. His person, verily, is like the Golden Person that is seen in the sun, whose eyes are like blue lotuses, and who is golden altogether to the tips of his nails. I listened in the Hall of Justice during the morning, and ceased not to marvel even at noon, when he went forth. The motions of his hands were as the motions of Karman, rewarding hidden merit, and punishing concealed wrong. No lie in the world might be maintained against the clear perspicacity of his vision."

Satyakama-Kapeya said: "There is nothing in this concerning knowledge of the Brahman."

* * *

Gautama-Kaushitakeya, or as he was called, Pautraya-Glava, said:

"Sir, what is thy opinion?"

"That another of us should go in disguise to the palace," said he.

"Sir, Vaka-Kakshaseni, do thou go."

* * *

Vaka-Kakshaseni went forth in the guise of a Kshatriya, and rode into the city at noon, and came into the Hall of Audience where the tributary kings and the ambassadors of foreign lands were waiting. There were seven score great princes present in the hall, all of them wise and mighty leaders: handsome to the eye of the

beholder, and their apparel exceedingly rich and adorned with gold and rubies, with costly emeralds and pearls. Then came in Atidhanvan-Sanaka and took his place upon the throne, with sovereign magnificence like the heaven-riding sun at noon; and with glory of countenance and Vedic splendor so multiplied upon him, that whoever else was present seemed but as a little candle lighted at midday in the face of the golden sun. The motions of his hands were the upholding and giving peace to distant empires; the glances of his eyes were enlightenment for far and barbarous peoples; the words of his mouth, even the least of them, brought peace where there had been contention, and brotherly kindness where there had been ambition, envy, and strife. Vaka-Kakshaseni marveled until nightfall, and did not cease to marvel when the king went forth; although, as was well known, he was not a man to be impressed by outward shows and pomp.

Then he returned to the forest of Grantha-Nagari, and sought his companions.

"Sir," said they, "hast thou learned the secret?"

"The glory of Atidhanvan-Sanaka," said he, "is like the glory of the end of judging people. In the doorway, as the crowd went out, he met a heaven-riding sun at noon: aloof, magnificent, sovereign, not to be contemplated with naked vision. All the other princes of the world, appearing in his presence, are as little candles lighted in the face of the noonday sun. I listened, marveling, while he received the kings of distant countries. The movements of his hands uphold their empires. The glances of his eyes bring enlightenment to barbarous peoples, and spread joy and delight over the world. Even the least of his words cause peace to be where formerly were strife, envy, and ambitious contention."

Gautama-Kaushitakeya said: "There is nothing in this concerning the knowledge of Brahman.

* * *

Vaka-Kakshaseni said: "Sir, what is thy opinion?"

"That the third of us should go to the palace in disguise, and make inquiries. Sir, Satyakama-Kapeya," said he, "do thou go to the palace."

"I will go tomorrow," said he.

On the morrow he went forth in the guise of a sweeper, and came into the Hall of Justice at noon, when Atidhanvan-Sanaka had made an end of judging the people. In the doorway, as the crowd went out, he met a man of the sweeper caste, and questioned him. "Sir," said he, 'by what means is it reputed that the King attains his knowledge? All that hath been spoken or thought or done, it appears, is known to him. How is this?"

"Come into the garden and I will show thee," said the sweeper.

They went out and came beside a lake wherein lotuses bloomed, some in color like the snows of Himavat, some like the clouds of sunset, some like the middle blue deepness of the sky at noon. In the midst of the lake was a tower, very lofty, and built of coral and ivory; it rose from no island; about its base the floating leaves and the blossoms of the lotuses lolled, and the blue waters reflected the clouds.

"It is called the Tower of the Gandharvas," said the sweeper. "The King goes up into it nightly, and feasts there upon celestial food, and Indra and Prajapati, they say, are his companions. And the Gandharvas, the celestial singers, come to them in the tower, winging their way hither out of the region between the earth and the moon. Many that pass through the garden in the night hear their singing; it is sweeter than any sound that might be imagined by man. They sing for Atidhanvan-Sanaka until dawn; making

known to him, as to their Teacher, all that is spoken or thought or done."

"That may be," thought Satyakama-Kapeya; "but there is nothing in it concerning the knowledge of the Brahman."

He went forth, and meditated upon that until dusk. Then he assumed the guise of a hotri or fire-priest, and rose up, and went into the Hall of Audience when Atidhanvan-Sanaka was making an end of receiving the tributary kings and ambassadors, and saw that all were filled with awe and astonishment on account of the Vedic splendor of the King. Going up to another priest, he said to him:

"Sir, tell me to what Atidhanvan-Sanaka owes his astonishing glory. There is none like him, truly, in the world; even, it is said, he knows the Brahman. Where gaineth he this perennial knowledge?"

"Sir," said the Brahmana, "come with me into the garden, and I will show thee."

He led him to the shore of the lake, and pointed to the tower.

"Therein he receives illumination by night," said the Brahmana. "I think that one of the Rishis dwells there, and imparts instruction to him between nightfall and dawn. From his going in until his coming out, celestial music issues from the tower; wherefore the ignorant call it the Tower of the Gandharvas, and consider that it is those celestial singers who instruct him. It may be, indeed, that the Gandharvas sing during the instruction; or it may be, indeed, that the music is caused by the mere words of the Sage his Teacher."

"That is very probable," thought Satyakama-Kapeya; "but there is nothing in it concerning the knowledge of Brahman."

He went forth, and meditated upon that until midnight; then rose up, and took upon him the guise of a moth, and flew into the garden. Verily, the whole place was filled with celestial music that issued from the tower: a sweet flood of sound intense with holiness and peace, making the scented night wonderful with holiness and peace. He lighted down on the closed petals of a lotus on the lake, and listened; and it appeared to him that he was very near to the knowledge of the Brahman. Then he flew up, and hovered round the tower, seeking a cranny by which he might enter; and found one at last, and went in. As he entered, he heard the music no longer.

Nor saw anything that he expected to see: neither the chamber of a king, nor the cell of an ascetic engaged in samadhi. "He is not here," he said, and prepared to fly forth again; but stayed. "I will watch this conflict," said he. This is what he saw:

A lantern hung from the ceiling, shedding vague light over a room barren of adornments, with floor and walls covered with filth and slime, and filled with an abominable stench that rose out of a vast pit in the midst of the floor. And there was a man in the room, struggling with a demon. Stripped to the waist he was; blood and sweat poured from his body scarred with old wounds and new. The muscles of his limbs stood out in his agony; the clutch of the demon was upon him; in dreadful silence they writhed and swayed and struggled. All night long Satyakama-Kapeya, strangely interested, watched them fighting. Fouler and more hideous was the demon than man's imagining can paint. Now one, now the other seemed uppermost. All night long in dreadful silence they writhed and strove and made conflict: in dumb agony the one, in foul malignity the other striving. "But where is Atidhanvan-Sanaka?" thought the ascetic; "where are Indra and Prajapati?"

Dawn-light shone in at last, and then the man gathered up the demon in his arms, and lifted it in the air, and crushed the vile life out of it, and flung it into the pit that was in the midst of the floor. Then he stood up, and the sunlight fell upon him. And Satyakama-Kapeya saw the marks of the wounds upon his body glow in the sunlight; and behold, they were the two and thirty marks of perfect birth; and amongst them, shining like the sun, the signs of the Chakravartin: the wheel, the orb, the discus of world-sovereignty. . . .

He flew forth meditating, and came in his own guise to the forest. "Sirs," he said, "I have the secret. He, verily, is fitted to be our Teacher. Come!"

That day the three of them came to Atidhanvan-Sanaka, bearing fuel in their hands. "Sir," said they, "teach us to know the Brahman."

"Be it so," said he. "Abide ye in the palace as fuel-carriers for seven years; then come to me again."

"THE RAPTURE OF THE FORWARD VIEW" — M. M. T.

The year 1875 will, in time, come to be remembered as the date of the Declaration of Interdependence, which was proclaimed when H. P. Blavatsky was sent by her Teachers to bring Theosophy to the West and to form the nucleus of a Universal Brotherhood of Humanity.

This Declaration of Interdependence was not based upon economic needs as is the wonderful network of world-wide material interchange that now exists. Material interests can bind human beings for the purpose of securing *comfort* and wealth, and leave human beings themselves much the same. In fact, material success and brilliant invention have brought increased power to those who have got ahead, to act to the great disadvantage of 'the hindmost.' It is knowledge of the unity of all that lives, of the interdependence on inner as well as outer planes of life of all beings, and the loyal practice of the higher code of human conduct incumbent upon those awakened to that knowledge, that will bring to bear on human institutions the still latent qualities and values in human nature which the poet visioned when he wrote of "the rapture of the forward view."

The urgent truth, presaged by H. P. B.'s Declaration of Interdependence, is that man as an entity is an indissoluble part of a Greater Entity and that his life is conditioned by the lives of every other part and of the Whole. To ignore this longer is to exist in a pitiful isolation. Man's invisible nature — and what is man without that part of him which is unseen? — partakes of the Intelligence and Divinity which is the inmost of the Whole whose world-body we see. As the kernel, the promise of continued life and fruitfulness, is to the shell, so is the realization of the inner

unity of all that lives and of the Divinity, however latent, at the heart of each and all, to the outward forms of union for any purpose. Both inner and outer are required for the complete life.

Theosophy has a direct bearing on the complete life. It was restored to Humanity at this time in order that man might learn to avail himself of the possibilities and powers that belong to the new level of understanding of the universe and man's relation to it.

Humanity, according to Theosophy, has run a little more than half its course in the present period of manifestation. What remains of the course is along the "ascending arc," where the higher intelligence and the spiritual nature of man are destined to express themselves in Earth-life. The tendency will be away from the ego-centric attitude toward a deeper interest in the human family as a whole. Altruism, not acquisitiveness, is the keynote of the new era. Belief in the innate divinity of our fellows will be recognised as an essential-in the education that will lead forth the latent divine qualities and powers. This belief even now has the result of engendering an atmosphere of creative trust between man and man.

The teaching of Rebirth widens man's horizon. It removes the feeling of frustration, which is depressing to the energetic (and intuitive) human beings who long to "have the wages of going on" and bringing to fulfilment here in their own habitat their highest ideals. Karman assures man that *he* makes himself and his destiny and that he *himself*, in this or a future life on earth, must atone for wrong done. Imagine the simplified process of securing social justice when every man faces the results of acts committed. Imagine the spiritual valor that will be liberated when individual responsibility is generally accepted. Valor will then be diverted from enforced and organized killing to individual conquest of all

that leads to strife and bloodshed.

When the repetitive habits of Nature are known, the tragedy of the crash and fall of what has been builded by man can be faced intelligently. The form perishes that the new may be born. Man's creative faculties do not die with one civilization. Moreover, the suffering of those karmically involved in the catastrophe can knock at man's heart and evoke a wider compassion and a more resolute effort to build on a basis of Brotherhood. Sorrow sharpens the faculties for the discernment of deeper and deeper truths. It works in that way.

The life of conscious oneness affords many new delights. Why not visualize them? Imagine the manifold increase of the sweetness and richness of companionship when human beings feel *to one another as brothers*. How the inner world of emotion — now so often a dark and troublous sea — will be calmed and sunlightened, and fear, robbed of its sinister power to divide, will shrink and vanish with the shadows. Cosmic love is not a cold thing. The sun and the stars are friendly. Why not Man? The poets long ago caught a gleam of this cosmic friendliness.

The first object of the Theosophical Society is to form the *nucleus* of a Universal Brotherhood of Humanity. Well do the Wise know that the leaven of new ideals is slow to permeate the mass-consciousness, that noble desires for the welfare of the race may take a thousand years to become fully enacted in human institutions. But the thought is the inner self of acts to be; the universal process is from within outwards.

More and more the influence of ideas is being recognised as a potent force in bringing about changes in outer affairs. Professor A. N. Whitehead, one of the most profound philosophers of today, writes:

The best service that ideas can render is gradually to lift into the mental poles the ideal of another type of perfection which becomes a program for reform.

The Spanish philosopher, Jose Ortega y Gasset, says:

It is in the realms of pure thought, therefore, that the earliest signs of the coming age can be traced. . . . Thought is man's most fluid possession; and accordingly it yields freely to the slightest variations in his vital sensibility.

More and more, too, is the dynamic force of the good life, of love and trust, emphasized by thinkers today. With the proclaiming of Interdependence, of Brotherhood, of man's Divinity, with the quickening of divinely inherited sensibilities and responsibility, the energies belonging to the new era are being liberated. They are of a non-violent, but deeply potent nature and appertain to those higher faculties of intelligence and compassion to be gradually unfolded. Anyone, anywhere, at any time, can become a constructive worker in the building of higher forms of human association. Have *you* ever exhausted your intellectual or spiritual resources, your heart-activity, in attempting to establish harmony right where you are now?

Katherine Tingley once gave this instruction to her pupils:

Our strength lies in keeping positive; in holding a steady joy in our hearts; in a momentary meditation on all floating great ideas till we have seized them and made them ours; in a meditation with the imagination on the life of humanity in the future, and its grandeur; in dwelling on the conception of Brotherhood. . . .

"With the imagination." This reminds us that the sublime cosmological conceptions presented by Theosophy absolutely renovate vital beliefs and give the imagination new wings to soar

with. With them we can venture on the life of inner oneness, can experience its glories and its impossibilities, and as we mount the ascending arc of human progress we can know more and more fully "the rapture of the forward view."

The Theosophical Forum

**THE UNIVERSAL MYSTERY-LANGUAGE AND ITS
INTERPRETATION: VI — *H. T. Edge***

VI — SUN AND MOON

The meaning of Sun can be gathered by considering the sun of our solar system. It is the heart of that system, the center whence flows all the life and light. Earth and other planets attend it, like the retinue around the throne, and shine by reflected luster. There is a sun in the human body, generally called the heart, but rather the vital center controlling the heart than the actual muscular sac. Its contraction and expansion accompany the circulation of the life-streams; its slackening means swoon; its stoppage, death. The solar heart of the solar system also pulsates, in a period said to be eleven years — the sunspot period; an analogy about which we shall know more when we have studied better the magnetic and electric phenomena connected with the sun.

The Sun is the Logos of any hierarchy, which manifests itself as seven rays. This can be symbolized by drawing within a circle six smaller circles touching each other and the large circle and forming a sixfold figure, with six circles grouped around a central one. The Sun is the father of the Gods. In mythology we find him represented as Helios and Sol, as Phoebus and Apollo. Sun-worship has always been universal. Ignorant people have supposed that sun-worshippers worship the visible orb of day only; they imagine that the sun is nothing more than a vast globe of incandescent gases, and say that people who worship a globe of incandescent gases must be poor untutored savages. What is really worshiped is the Spiritual Sun, of which the visible sun is but an outer garment; and it is only natural that the Spiritual Sun

should be invoked through its outer symbol. The outer ceremonial is made to correspond with the inner meaning; but there would be times when the inner meaning would be forgotten and the worship degenerate into empty form, as may happen in other religions. The Sun is the Divine Light striving to manifest itself in us; its light is reflected from a number of planets, and these may stand for the subordinate phases of our mentality.

The Moon is a complex symbol and it is not practicable to attempt a comprehensive survey of all its meanings. It stands between the Sun and Earth as a reflector of light and life from the former to the latter. If we divide man into Spirit, Soul, and Body, the Moon will stand for Soul — using that term in a wide sense, for the intermediate nature of man, mental, psychic, emotional. The Moon is the imagination. The moon goes through its phases, which are called the light and the dark side of the moon; in one phase it transmits light from sun to earth; in the other it gleams with a light borrowed from earth. So our imagination may reflect the light of the Spiritual Sun or the lower light from the Earth. But our little satellite stands as representative of a far more august divinity — Isis, consort of Osiris, the great Mother, ever-fecund Nature. The Mother of the Gods is the consort of the Father of the Gods. The Great Mother has also been a universal cult. It represents the passive, receptive, fertile, feminine side of the manifested universe — in a word, Nature. This is the highest aspect of the lunar symbolism; but in another and lower aspect it stands for the "lesser light that rules the night." Hence we often find lunar worship, lunar magic, lunar cults, etc., contrasted unfavorably with the solar. Man's personal, passionate, emotional nature is sometimes called his lunar self, in contrast with his solar self, the Spiritual Ego. To avoid confusion we must keep in mind this fickle changeful nature of the moon, causing it to have different significations; a clue that may help us to understand

several things in our experience. If the Moon is Nature, then, like Nature, she may be anything from the bride of the Spiritual Sun to the womb of terrestrial Nature.

The usual symbol of the Moon is a crescent, which is a duality as compared with the unity of the solar circle. The two aspects of the Moon are denoted in astrology by the ascending and descending nodes, called the Dragon's Head and Tail, or Rahu and Ketu in India; in the first the bulge is upward and the horns down; in the second it is the reverse way. This Dragon represents the emotional side of our nature, which oscillates from high religious exaltation down to great physiological excitement at the other pole.

We have before mentioned the symbol of the planet Mercury as being composed of a circle with a crescent above and a cross below, and this may stand for a threefold representation of human nature, in which the circle or sun is the Heart, the crescent or moon is the psycho-mental nature, and the cross is the physical. But we must not interpret such highly generalized symbols too narrowly, for they have special applications on many different planes. Thus we may take Atma-Buddhi as being symbolized by sun and moon or Osiris and Isis, etc.; or again we may consider the higher triad as solar and the intermediate nature of man as lunar; and again, if Prana is solar, Linga-sarira is lunar. Sun and moon make a duad which is found throughout; and these two, with the cross added, make a triad which is of equally universal application. All this illustrates the importance of symbols as enabling us to sum up ideas too broad and general to be conveyed in any other way; and in interpreting them into word-language, we have to present first one aspect and then another, so that the essential meaning may be intuitively grasped out of the multitude of apparently diverse meanings. These symbols are embalmed in the figurative language of poetical

diction and stock phrases; but modern scholarship, in discussing the figurative use of such words as Sun, Heart, Light, and the like, has usually viewed matters from the wrong end and supposed the figurative use to be derived from the concrete use. The Sun which the sun-worshippers venerate is called an idealization of the astronomical sun, and an expression like "the Heart of the Universe" may be regarded as a mere metaphor.

The Sun and Moon are everywhere the active and passive potencies, or we may say the masculine and feminine, the energetic and the formative, etc. — it does not much signify, so that we get the right idea. More attention is being paid to the influence of our moon in organic life, and it seems to have special relation to the vegetable kingdom. Some items of folk-lore, once dismissed by science as superstition, are receiving more attention.

The moon in classical symbology was denoted by Hecate, a triple-headed divinity, which indicated a threefold character of the Moon; for the goddess was powerful in the Heaven-world, on earth, and in the underworld. The Moon presides over birth and death, which lead into each other. The reason for the moon being associated with things uncanny and black-magical is that, in her function as goddess of the underworld she presides over the purificatory processes of Nature. Man should not consort with the decaying remnants of creatures which, if let alone, will pass naturally along their appropriate arc in the cycle of evolution.

The Theosophical Forum

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

WHEN THE RIVERS WERE DROWNED

When a Theosophical writer emphasizes the fact that some of the most striking discoveries in modern science were anticipated in the Theosophical literature, this is not done to glorify H. P. Blavatsky, or in any way to minimize the magnificent research-work of our scientists, which deserves the highest admiration. Its object is to provide evidence for the use of "Theosophical students that a profound knowledge of natural law existed ages before the last few centuries in which science has made such great advances after the medieval pralaya. Also, that the Great Masters of the Ancient Wisdom possessed it, and revealed a little of their immense learning through H. P. Blavatsky and her work. During the last few years we have had several valuable opportunities of proving this, owing to utterly unexpected discoveries such as that of the intensely hot atmospheric shell high above the earth's surface — a fact in nature stated in writing by the Master K. H. *more than fifty years ago*, at a time when it seemed absurdly improbable and contrary to the "established fact" that temperature steadily declined with increase of altitude until the cold of outer space was reached. Other illustrations could be given.

In this connexion, a most significant suggestion has been offered, which, although not the announcement of a new discovery, is of great importance to Theosophical students because of its radical nature, and because it is exactly the same as one of the most "unorthodox" statements in *The Secret Doctrine*. It is contained in *Science* for April 3, 1936, in a long communication by Professors H. H. Hess and MacClintock of Princeton University regarding the

recent discoveries of submerged river valleys in many parts of the world. By means of the new echo system of ocean sounding it has already been found that between the latitudes of sixty degrees north and south, approximately, at least forty enormous submerged valleys extend from continental coasts. Some of them cut through hard granite, and many have been found to be thousands of feet deep. The extension of the Potomac River reaches a depth of nearly 9,000 feet, others 14,000. Geologically speaking, they are not *very* old, so far as known.

How were these enormous submarine valleys cut? Certainly not while under water. Why are they not found in high latitudes, and why do the valleys (so far as the limited evidence tells) increase in depth as they approach the lower latitudes?

No satisfactory explanation has been forthcoming until now, and the remarkable thing is that the theory put forward by the Princeton experts is in precise agreement with a fundamental statement of *The Secret Doctrine*, which until now would have been scouted by every astronomer or physical scientist as incredible! In brief, it is that a *sudden decrease* in the rate of the daily rotation of the earth took place, and after a certain length of time it speeded up again to the normal! This, of course, is rank heresy; it is more than improbable! A *very* slow and gradual reduction in speed, caused by tidal action, may have taken place in a billion years, though that is disputed, but there is no plausible explanation for a speeding up. The Princeton professors almost apologize for proposing their "radical hypothesis," and only dare to offer it as a basis for further inquiry and discussion. According to *The Secret Doctrine*, however, they have hit upon the truth, however strange it may seem.

What would happen if the earth slowed down? Firstly, vast quantities of water would flow toward the polar regions where

great submergences of land would take place, leaving the regions nearer the equator partly or wholly dry, according to the irregularities of the surface. Equatorial lands already above the water would seem to be greatly raised, the more so the nearer the equator, where the remaining oceans would become shallowest. Climates would change, vegetation and animal-life would have to migrate or become acclimatized, and many strange effects would follow from the alteration of the sea-levels. Even mountains might be upheaved as the result of new stresses. But one thing is certain: the river valleys would have to be greatly lengthened in order to reach the lower levels to which the oceans had retreated. Near the equator this effect would be the most marked and the new valleys longer and deeper.

Then, after a more or less lengthy period of equilibration, the earth's rotation would increase in velocity, the "centrifugal force" become greater, and the waters would withdraw from the poles and up again toward the equator. The lowlying lands in temperate and equatorial regions would be submerged, *drowning the newly formed extensions of the river valleys*, and considerably changing the configuration of the earth's surface, though not necessarily to the former condition. This may have happened more than once, but the scientists suggest that the last change took place not much earlier than the Glacial Period if even so far distant, and this practically agrees with H. P. Blavatsky's estimate. The Wegener theory of sliding continents, now being widely discussed, would not be needed under this hypothesis of reconstruction.

Additional evidence, for which we have no space, has been found in high latitudes (where submerged river beds are not known) but of course there will have to be much discussion and study before this revolutionary rotational theory is accepted as a fact by astronomers and geologists. No better reason for this world-wide

change of sea-level, however, has appeared, and at least one eminent astronomer has suggested that the fact may remain unexplained for a long time.

The great difficulty is to find a reason for such an apparently impossible event as the slowing down, and *above all for the subsequent speeding up*, of the earth's rotation. The obvious explanation — a collision with "a comet or something," has practically insuperable difficulties. Another convenient celestial body would be needed to bring the rotation back to normal!

All this is interesting, but what is specially so to us is that the Princeton scientists have really discovered exactly what is given in *The Secret Doctrine*, in a quotation from the immensely ancient Tibetan "Commentary" on the *Book of Dzyan*, the archaic Book of Wisdom preserved by the Masters. *The Secret Doctrine*, however, goes farther than the scientists, for it gives the reason for the incomprehensible change in rotation. We fear, indeed, that scientific research has to advance a few more decades, or perhaps centuries, before the votaries of celestial mechanics will be prepared to understand the explanation, highly important though it be in a true picture of the history of our planet. It touches on the Spiritual Intelligences (the Pitris or Dhyan-Chohans) which are inextricably involved in the action of so-called "natural" forces, and what does official Science yet know about "spirits" of any kind! Here is part of the explanation. Speaking of the breaking up of the continent of Lemuria in its higher latitudes, H. P. Blavatsky writes in *The Secret Doctrine*, II, 324-5:

This is due, according to the explanation in the Commentary [an extremely ancient esoteric work] to a decrease of velocity in the earth's rotation: —

"When the Wheel runs at the usual rate, its extremities (the poles) agree with its middle circle (equator), when it runs

slower and tilts in every direction, there is a great disturbance on the face of the Earth. The waters flow toward the two ends, and new lands arise in the middle belt (equatorial lands), while those at the ends are subject to pralayas by submersion. . . ."

"Toward the close of the age (Kalpa) of a great (root) race, the regents of the moon (the Pitar fathers, or Pitris) begin drawing harder, and thus flatten the wheel about its belt. . . ."

How did the ancient writer of the "Commentary" know that slowing down the rotation would produce exactly the effect that our modern scientists are invoking to explain the ultra-modern discovery of the drowned rivers of the world?

MODERN SCIENCE AND THEOSOPHY

Among the contributions made by the Theosophical Movement to the elevation of humanity we must never forget that which in large degree initiated the modern transformation of scientific opinion, on the whole, from crass materialism to a more spiritual outlook. This is a large claim but it is supported by the facts, and students should learn it in order to be able to show the high intellectual as well as spiritual standing of the Masters' work, when called upon by scientists and others who are completely ignorant of the situation, and who may be prejudiced against Theosophy by the preposterous campaigns of fakers who cunningly use the credit of the true, sane, wholesome teachings of the Masters to bolster their fraudulent claims.

In *Science*, for March 27, 1936, the "official organ of the American Association for the Advancement of Science" we read in a review-article by Professor W. F. Magie, of Princeton University, on *Faraday's Diary*, recently published, that Faraday in his earlier

years "had made all the discoveries of major importance which he could have made with the appliances that he had at his command." For more than twenty years nothing of any importance was done by experimental methods until "improved methods of obtaining high vacua made possible the work of Crookes, *from which the modern development of physics may date its origin.*" (Italics ours)

What has the "modern development of physics" done for the world? What was behind Crookes? Listen to this quotation from *The Secret Doctrine*, I, 611:

The exact extent, depth, breadth, and length of the mysteries of Nature are to be found only in Eastern esoteric sciences. So vast and profound are these that hardly a few, a very few of the highest Initiates — those *whose very existence is known but to a small number of Adepts* — are capable of assimilating the knowledge. Yet it is all there, and one by one facts and processes in Nature's workshops are permitted to find their way into the exact Sciences, while mysterious help is given to rare individuals in unraveling its arcana. It is at the close of great Cycles, in connection with racial development, that such events generally take place. We are at the very close of the cycle of 5000 years of the present Aryan Kali-yuga; and between this time [1888] and 1897 there will be a large rent made in the Veil of Nature, and materialistic science will receive a death-blow. . . .

Remembering that it was due to Crookes' early improvements in the air-pump that he was able to make his great discoveries on the "fourth state of matter," as he called the electronic phenomena he obtained in the extremely rarified contents of his "Crookes" Tube," which led to his and others' later developments

(X-rays, radioactivity, etc.), let us see what Dampier-Whetham says in his recent and authoritative *A History of Science*. Speaking of the tremendous changes in the modern point of view brought about by the new physics, he says that the "new revelation" began to take shape from 1895 onwards, the discoveries of Crookes and others having been brought to a focus by the attention aroused by Rontgen's X-ray sensation. Then came Becquerel with his uranium rays, and finally the complete definition by J. J. Thomson of the electrical nature of the atom. This was in 1897, *the exact date mentioned* by the writers of *The Secret Doctrine* nine years before, and as Dampier-Whetham remarks, it was the deathblow to the old materialism. Today, Jeans can say "The old dualism of mind and matter . . . seems likely to disappear . . . through substantial matter resolving itself into a creation and manifestation of mind."

Who, then, was behind Crookes in starting this cyclic revolution whose effects are so marked already? Who gave the "mysterious help" which comes at the close of cycles as mentioned in the above quotation from *The Secret Doctrine*, and which strikes the keynote of the coming age? The answer lies in that book and in *The Mahatma Letters to A. P. Sinnett*, where we learn that one of the Masters, attracted by Professor Crookes' independence of thought, and his courage in defying public opinion by his pioneering efforts in psychic research at the risk of losing his scientific reputation, helped him; at first without his knowledge, but later openly. When the Mahatman Morya said: "And Crookes — has he not brought science within our hail in his "radiant matter" discovery? What but occult research was it that *led* him first to that?" he saw that a fresh link was formed in the chain that would ultimately unite science, philosophy and religion into a harmonious whole, a chain which is now rapidly growing.

We cannot enlarge on this important subject here, but students

will find full particulars, with quotations from the Masters" letters, in *Lucifer* for March, 1933. Keep this in mind for use when needed. An inquirer of scientific bent of mind is more impressed by a single ounce of fact than by a ton of theory that he cannot test.

DID THE MOST ANCIENT AMERICAN LIVE IN CALIFORNIA?

Things are moving in American pre-history of man. Only yesterday it was hardly permitted to suggest that man had lived in the Americas for more than a few thousand years — five or a little more, perhaps. He "cannot" have been here before the Glacial Period because the route from Asia was solidly frozen for thousands of miles, and, "of course," there was no other way of getting here. But facts are rapidly being found that indicate that man was here before the end of the glaciation, and that American human pre-history is approaching in duration the immense periods recorded in the Old World. We have mentioned some of these already in this Department. The latest report comes from Los Angeles. We quote from the *Los Angeles Times*, March 28, 1936:

An amazing discovery of prehistoric remains that may link the American Indian with the Mongols . . . was disclosed yesterday by Dr. A. O. Bowden, chief of the University of Southern California Anthropology Department, and his colleagues. A skull, femur, and fragments of other bones of a human skeleton found in a storm-drain excavation . . . was pronounced by Dr. Bowden to be a find which he believes to be unprecedented in the archaeological history of the Western Hemisphere. . . . Dr. Bowden and his associates concluded that the bones may be as much as 50,000 years old. At any rate the investigators concluded that the bones are those of a prehistoric wanderer, possibly

of Asiatic origin, who roamed Southern California in the days of the imperial elephant, the ground sloth and the saber-toothed tiger. . . . Concurring with them in their placing the fragments in the Pleistocene Age — from 16,000 to 50,000 years ago — was Dr. Thomas Clements, chairman of the Geology Department of the University. "These bones could not possibly be those of a more recent western Indian," Dr. Bowden said. "The strata lying over these remains and those of the imperial elephant were undisturbed. The great animal became extinct more than 16,000 years ago. . . ."

So perhaps the Asiatics found their way here while the glaciation was present; but why should wanderers have not also come across the Atlantic or the Pacific by lands that have perished? The glaciation of the northern and southern latitudes would have been no obstacle. As to Mongolian immigration the student will find some useful hints in *The Secret Doctrine*, II, 182, 250, 424 (footnote).

The Theosophical Forum

THE UPWARD CLIMB — *William J. House*

A dull, sodden fellow, even in his young manhood obviously a slave to the vice of drunkenness, he climbed the hillside each morning before daybreak to carry away the garbage from the monastery. Only at the full of the moon did he meet any of those belonging to the monastery, when the gatekeeper was on hand to give him his small payment. The gatekeeper spoke once to his Head and asked whether it was well to have one so extremely foul and unpleasant coming even to the precincts of the sacred place. The Head inquired whether he did his work well; and upon being told that the work was carefully and thoroughly done, he replied that no change should be made.

The years passed by, and hardly a word of any import ever passed between the gatekeeper and the garbage-carrier when payment was delivered, until one morning, to the amazement of the gatekeeper, Svag asked whether he might in future perform his work without remuneration. Upon inquiry being made of the Head, the answer was: Yes, if the work be as well done as before.

Seven years more passed, and the garbage-carrier still faithfully pursued his calling, and had even attained to some slight dignity of appearance. It was his turn to be surprised when one morning the gatekeeper addressed him thus: "My Superior wishes me to say that there is such a thing as right occupation, and that if you so wish you may take a place in the outer court of the monastery."

With bowed head and streaming tears the poor fellow protested his unworthiness to do so. The gatekeeper answered that he himself had no power of decision in the matter, but would venture this remark: that if the wish to do so were not somewhere deep within Svag's heart the offer would not have

been made to him; and that it would be wise not to make a hasty refusal.

So Svag entered the service of the monastery, and was given the new name of Strivan. The life was quiet and well-ordered: such as can make for inward growth where the heat of outer excitement does not fever the brain. Through the years that ensued many were the failures he made through his besetting sin of drunkenness; yet ever when he returned to the gates and question was made of the Head as to whether he should be admitted, the answer was: Yes, let him try again.

At length he surely prevailed over his fault, and with his new self-confidence grew rapidly strength of mind and perception — and ambition. Small and simple enough in its beginning, founded well enough upon truth, yet it was a thought for self alone that began to flourish weed-like in the garden of his life. He hoped, he expected, with what seemed to him some justification, that he would be allowed to see the Great One who came to the monastery at intervals from the mountains to the north. Consider what a remarkable history was his! He had risen from the lowliest degradation to his present strength and dignity. Many had climbed higher, but had they started from such depths? Surely he would receive even an encouraging glance of the eye if he were but allowed to be present when the Great One passed through the courtyard to the Inner Temple. But no, his duties were always placed elsewhere at such times.

At length he resolved that he would no longer endure this unjustified obloquy, but would fare forth to the mountains in the north, find the Master, and present himself to his notice. He announced his intention to his Head, and set forth with a warning and a blessing.

His journey to the foothills was uneventful: the temptations to

pleasure in the villages through which he passed did not affect him, though in the fertile vineyards at the foot of the mountains there was the richest wine to be had for the asking. The last village before he began his steep ascent he did not enter. The people had become so debauched and careless that a foul plague had broken out, and no one who entered would be allowed to leave for fear of spreading the contagion.

The stench of the place, as it was borne on the breeze, revolted him, and he hurried upward to the purity of the mountain air, inquiring of news concerning the Great One as he went. "Yes, certainly, such a one lived on the heights; but who knew where?" "Was it their business to be curious as to his dwelling: had he not a greater right than others to his privacy?"

Meeting with such answers on every hand, whether honest or evasive, he searched and searched until the weariness of his spirit was even greater than the tiredness of his body, and the bitter disappointment of his heart turned to sourness and disgust. No one seemed actually to have seen the Master, but all were sure that he lived somewhere on the heights. Well, one might search for a lifetime in the midst of such ignorance! What had he gained but experience; and what had he not given up in order to get that only!

Strivan descended the mountain gloomily, and without noticing it found himself in the plague-stricken village. Well, what of that? He might as well die there as elsewhere. He approached one of the village wells to drink, but was prevented by one who stood guard there, but who directed him to where he could obtain water that had been carried down from the mountain. He found a band of the hardy mountain-dwellers carrying on a valiant fight to stay the progress of the plague. Greatly overburdened, they were working under the direction of an elderly man, very

insignificant of stature, but obviously a capable leader. At the moment he was doing his best to induce a body of villagers to persevere in cleaning the accumulated refuse from the streets, himself wielding a shovel to inspire them. Strivan approached and deliberately took the shovel from his hands. "This is no work for you! Let me attend to this!"

The old man appraised Strivan's sturdy frame with a keen and somewhat amused glance. He gave him a quick outline of what he was aiming to accomplish, begged him not to allow the villagers to drink at the polluted wells, and left him.

This was work at which Strivan had served a long apprenticeship and in the days that followed the work went forward rapidly and well to its finish. It was several weeks before the village was free of the plague, and during that time Strivan and the old mountaineer had become firm friends. Strivan told him of his quest, and the old man laughed outright at his pursuit of the elusive Great One on the mountain. He advised Strivan to have more dignity and to wait and work until the Master should find it worth his while to seek Strivan. He advised him to go back to the monastery, admit his fault, and ask to be readmitted.

Strivan did this, and was well received, being given a position but a little lower than that he occupied on leaving. But as the quiet years passed and his judgment and insight matured, he became more and more convinced that for him there was no place among those worthy to meet the Master.

One day as he was quietly occupied with his duties one of the brothers came to him with a message: "The Master wishes to see you." Sudden dismay overcame Strivan: "No, no! I am not ready! Tell him I am not worthy!"

"My instructions were to bring you; not to carry messages for

you," said the messenger. "What has become of your bravery, Strivan? You who went to seek the Master are now sought by him."

A quick memory stirred in Strivan. Those were almost the same words that the old mountaineer had used. . . . As Strivan entered the presence of the Master a familiar voice said: "Well, Strivan, I have more work for you to do."

It was the Great One from the mountains to the north: the old mountaineer indeed — the same, *but not the same*.

The Theosophical Forum

DIVINE DESIRE — *Leoline L. Wright*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

(Thoughts suggested by *The Esoteric Tradition*)

Cosmic Kama: The "Desire" of the *Rig-Veda*, which Desire is pure impersonal universal compassion and sympathy; the source of the cosmic driving or impelling energies of the Universe involving the living intelligently electric impulses thereof. The womb of Fohat, considered as the motive yet intelligently guided Force or Forces of the Hierarchical Universe. — G. de Purucker: *The Esoteric Tradition*, 952-3

It is well to raise our hearts now and again to the threshold of Cosmic Divinity; to refresh our weary, sorrow-laden lives with a draught from those deep inner worlds of stainless being where bliss abides. It is well to remind ourselves that this Kali-Yuga — dark, strenuous, terrible, in which we suffer and toil — is but an inconsiderable fraction of the great cycle of existence. And the reminder is well for two reasons: first, that we may not despair; second, and sharply important, that we may lose no moment of its swift momentum. For terrible and dark as it is, Kali-Yuga is the chela's immediate opportunity for intensive, self-directed growth.

Our Teacher reminds us in regard to the kamic principle that:

. . . It is the seat of the living electric impulses, desires, aspirations, considered in their energetic aspect. Usually however, although there is a divine Kama as well as an infernal one, this word is restricted, and wrongly so, to evil desire almost exclusively. — G. de Purucker: *Occult*

So in reading the heading-quote above, we change our usual point of view and look into the inner worlds which it opens before us. We are able to imagine something of the Divine Desire which awakens in the consciousness of the Solar Logos when "the last vibration of the seventh eternity thrills through infinitude." In that mighty Heart of brooding Love there dwells the supernal felicity of its own Self-realization; its communion with the god-worlds and the Cosmic Deeps. That compassionate Being, our Cosmic Hierarchy, visualizes the cohorts of god-sparks yet to be born from its Consciousness-Substance and yearns that they too may know "the seven ways to bliss" and come at last to wing self-conscious flight along the Circulations of the Cosmos to its holy Presence in the palaces of the Sun.

This that we are living is not life; these our thirsts and cravings are not true desire; this that we experience — all is but a caricature, a hideous distortion in the convex mirrors of Maya,

Children of the Solar Consciousness-Life are we, even as the innumerable lives composing the cells and the atoms and the infinitesimal corpuscles of man's physical body live and move and have their being in man, their overlord; his vitality, their vitality. So we are linked through this Solar Entity of cosmic magnitude with spaces still more grand, with Forces and Substances, far-flung over and in and through Kosmic Space. — *The Esoteric Tradition*, 201

Its vitality our vitality! its Forces and Substances ours if we but realize our true reason for being, and put to work the imagination and the impersonal will. "Back of will stands desire," we have been taught as Theosophical students from the very first. And so let us look again at our opening quote about Divine Desire where we are told it is

The womb of Fohat, considered as the motive yet intelligently guided Force or Forces of the Hierarchical Universe.

Link now these words with those of H. P. Blavatsky:

. . . Love in his primitive sense is Eros, the Divine Will, or *Desire manifesting itself through visible creation*. Thence Fohat, the prototype of Eros, becomes on earth the great power of "Life-electricity," or the spirit of "Life-giving." — *The Secret Doctrine*, II, 65

The "spirit of "life-giving"" — almighty Love; impersonal, undemanding, selfless Love. Is not this the "Life-electricity" that we need? Wherever there is unity in our Lodges of the Theosophical Society; where there is brotherly harmony in thought and deed; where there is Theosophical service, unselfish, never remitting, never discouraged, never careless, there is gradually formed a core of "Life-electricity." And pouring through that clear laya-center of our united hearts the Lodge-force from our Silent Watcher floods out in blessing and inspiration upon the world for which his sacrifice is made.

We see then that Cosmic Desire is expressed in Cosmic Love, the origin and fount of universal life. It is the harmonious energy which binds all things into a spiritually purposeful organism moving inevitably to "one divine far-off event," the attainment of godhood by every monad within the organism. Thus we read on page 1079 in this grand book of our study:

. . . everything in the Universe works in a universal harmony; everything is harmonious, for nothing works unto itself alone and apart from other things —

only Man, wilful stony-hearted Man who, it seems, must be to the

sustaining Cosmic Patience like a corroding wound that holds back the healthful progress of all. But no! — *it is not so*. For man's desperate wilfulness is but a dark bubble on the mighty Life sweeping in cycling waves majestically around our Planetary Chain. And we read further, on page 1080:

. . . the changing astronomical positions of the planets and of the sun and moon all take place according to the workings of the wheels of the great and intelligently guided cosmic mechanism — for indeed there are mechanics, divine beings, behind and within and guiding the mechanical operations; these operations being the automatic responses of nature to the manifold inner urges flowing forth from these divine and spiritual hierarchies of beings as urgent impulses expressing themselves in action.

And all this harmonious vast interworking is after all but the "daily living" of those great Beings — gods, Dhyani-Buddhas. They live and work to the sublime rhythm of the Dharma of obedience. They are the imbodiment of their own divine karman whose smoothly sweeping beneficences carry along man's struggles against the current like mere dissolving foam. Well for us to reflect now and again upon these compassionate Cosmic Buddhas whose abodes shine upon us from the violet spaces of Space. Not only do they cherish us, and suffer our fretfulness within their radiant bliss, but hold us compassionately as well to the ends for which we and all things live and have our being. Else how easily might we, poor self-exiled wanderers, lose our spiritual way.

When day is over and night for a space lays a cool mysterious hand on all our fevers, well for us to meditate upon Divine, Compassionate Desire. So close, benign, and actual it is! Does it not bind the very atoms of our bodies with its electrical harmonies? So may we raise our human hearts before we sleep to

the god within ourselves who is our link with the Cosmic Gods,
and yearns, in its perpetual silent watch, for our salvation.

The Theosophical Forum

THE USE OF MIND BY A THEOSOPHIST — *F. F. Webster*

The air is replete with radio broadcast programs. In like manner and even in greater diversity within a different scope of vibrations are idea broadcasts. If your radio receiver is hooked up and turned on, you may get a selection from the radio broadcast multitude, or a jumble, or you can "cut out." Ideas are analogous to thought broadcasts. They are not the thoughts themselves any more than the radio broadcast is the music or speech, etc. which energized it and set it on the air. The mind "tuned on a certain wave-length" is stimulated by an idea "on that wave-length," and if it meets with a receptive control condition, it instigates thought. Such thought is not identical with the thought which "broadcast the idea" because it is modified by the many individual and personal qualities of the receiving mind. Also the resultant thought processes energize new ideas or modified ideas in this causal sphere.

Now how about thought, information, and knowledge? The act of thinking involves several factors; the stimulating idea, the mental processes and acumen of the thinker, with admixtures of what the thinker believes to be fact as retained in his own memory. Having arrived at this stage it may lead to action. Knowledge is the quality developed in a thinker by acting or living in accordance with the thoughts.

Information has somewhat the relation to knowledge that an idea has to thought. Knowledge is the quality developed in an individual by thought and experience, using it, in other words. In spite of the fact that it is a commonly used phrase, there is not available to the many the knowledge of an individual. The best that an individual can do in an attempt to "pass on his

knowledge" is to set the substance of that knowledge into an available form truly designated information. Thus it would be proper to say, for instance, "Here we have tabulated the information from the Knowledge of the Ancient Ones." Information is tabulated thought, or thoughts.

Wisdom and knowledge are often confused. Knowledge may be on any of the several planes of consciousness, physical, mental, spiritual, or combinations of them. Wisdom can be considered as bearing the same general relation to knowledge as knowledge bears to thought, but it further implies a helpful and constructive aspect rather than the merely general aspect of development.

To some individuals study of a subject seems merely to imply a memorizing of information (the tabulated knowledge and teachings of and by others) and not the full student-ideal, to make knowledge for themselves by putting the absorbed information to use in living. The writer once knew a man who had gained a marvelous fund of memorized information as to "Common Law." He had made of himself almost a cross-indexed reference library of legal information so that a carefully worded question as to a legal decision or court finding would be answered accurately and usually with references. However, he had so concentrated on the memorizing function that he had apparently atrophied his judicial and legal reasoning powers and would be almost helpless as a legal practitioner. He could not reason out the merits of a case for himself. Scope of legal information marvelous, legal knowledge nil, legal wisdom not even started. Students of Theosophy make a constant effort to enrich the mind by thought and information, but also to actively use that enrichment to gain knowledge by action in living, and thus develop the Wisdom which illuminates the living.

One of the reasons why thought, information, and knowledge are

confused in use so much is explained by the Theosophical teachings about reincarnation. Each one of us has lived many lives and presumably has gained considerable knowledge in each of those embodied lives. We are taught that in the period between incarnations on this planet the experience and knowledge gained becomes assimilated by the consciousness centers of our human composite organism affected. Thus on a new re-embodiment the ego seldom has memory of the knowledge in the mental organism, but when information bearing on that knowledge, or similar knowledge comes to the attention of such an individual, the perception is reawakened and one feels immediately the correctness of it. In other words the thought is awakened into knowledge without much actual experience (in the currently manifested life) because there is a memory to a considerable degree of the former conscious knowledge. Truth really begins to be realized when it becomes knowledge, tending to greater and greater perfection of realization as the knowledge approaches Wisdom.

The Theosophical Forum

THE FORWARD LOOK — *Hugh Percy Leonard*

Not as though I had already attained, neither was already perfect, . . . but this one thing I do, forgetting those things which are behind, and reaching forth unto those things which are before . . . I press toward the mark. — *Philip.*, iii, 13

Kill in thyself all memory of past experiences. Look not behind or thou art lost. — *The Voice of the Silence*

Let us turn the leaf upon the blotted record of the past and make a fairer set of entries in the open journal of today. The past is country we have traveled through, and now our whole concern is how we may best get through the day's march. We might, of course, sit down and engage in retrospect, tracing those points at which we wandered from the path, glancing backwards at the mud-holes in which we were almost foundered; but such a futile waste of time and effort is not for the Pilgrim of Eternity. Our present position is the resultant of all our past, and our future opportunity. Forward, march!

The pathway of advance must of necessity be strewn with failures, because in acquiring the use of new powers we must often fall short of success. But that we now have the use of these powers is all that matters, and why should we pause and conjure up again the vanished specters of the days gone by? The waters of oblivion may be left to do their cleansing task upon the dismal memoranda of the past that we have left behind.

All final success is the culmination of hosts of failures, and on the stepping-stones of our abortive efforts we rise to higher levels of attainment. The eternal Now is that cross-section of eternal

duration in which alone we live and work. The water which has flowed down-stream has lost its opportunity to turn the wheel. Now is the only time we have in which to do our work. Why should we ever turn our minds to view the dead and buried past?

Not that the past is really dead, for all that, because each weak surrender, every mood of self-indulgence, still lives on in the man of the present. We are the past of ourselves and it survives in our character of today. That past can be transmuted by the steady flame of our aspiring mind into the purest gold; but this alchemical process demands a continuous heat, a steady fire that never fails to radiate its genial glow. The magic of the spiritual will is operative only in the living present, and its field of action does not run backwards into the past.

Failure is natural, normal and unavoidable, and however much it seems complete, is not disaster, so long as the indomitable will to try again lives on.

One fatal result of brooding over days gone by is that in the process regret is developed, a mental sorrow for past misdoing. This gray, depressing, interior fog is actually reckoned as being desirable and distinctly meritorious by certain sectaries, and unfortunate babies are afflicted by being christened "Dolores," as though there were something praiseworthy and attractive about those who are prostrated with grief on account of their load of ancient sin! Regret is a motion of the mind and hence an energy, and all our energy must be conserved and husbanded if we would ever reach the goal we have proposed. By generating gloomy clouds of sorrow and repentance we tend to obscure and darken the common atmosphere of thought in which we live, and by perpetually dwelling on our "sins" we actually infuse them with an added wave of life and almost invite their repetition.

Ideals in the mind are often considered to be unsubstantial

things, while our specific failures to act up to them are seen to stand out as enduring monuments of our incompetence. As a matter of fact, it is these supposedly ephemeral ideals that are the permanent, foundation factors in our lives, while our failures may be compared to the waste clippings on the floor of the workshop, to be cast into the crucible and used again in fresh attempts. Let us then, hold fast to our floating ideals and pour fresh life into them by the brooding heat of our aspiration. They are only unsubstantial in so far as we have failed to give them a place in our lives. On their own plane they are the raw material of a better life to be: they are positive and prophetic and absolutely compel their own fulfilment.

Forward, then, upon the track that leads to a future all unknown! Repeated failures must, indeed, attend us on the onward march, but each advancing step is cheered by the tones of an eternal hope.

The Theosophical Forum

THEOSOPHICAL VIEWPOINTS — *Beatrice Stewart Jones*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

One of the most puzzling things to the majority of people is the seeming injustice in the world. We are taught that an all-wise, all-powerful, all-loving God is guiding our destinies. Then we see races of people less intelligent perhaps than we, living in the most primitive manner, without proper shelter, and in some cases having very little, sometimes no, food. They may be in their limited way well-meaning and living up to what to them are their highest ideals, but because their ways are not our ways they are ruled by the more advanced races, with little regard for their needs, and with no understanding of why they are occupying this particular station in life. We may be smugly grateful we are not in their condition, but we do not often wonder why, or do anything constructive to help them. In our own race there is the same apparent injustice. We see one person enjoying ease of living, excellent health, and all that makes for what we suppose to be the ultimate in happiness. With all these material advantages the same person may be utterly selfish, oppressing the less fortunate and neglecting to conform even to an approach to a decent moral life. On the other hand we find those fine, generous, loving individuals with a helping hand outstretched to all in need. True, they may not have money or other material things to bestow, but one can feel the heart-warming glow that their very presence brings to all who come in contact with them — and we wonder again if there is not much more than just this earth-life, where chance seems to play so large a part.

An elderly man once said that it seemed such a pity to die when he was just beginning to learn how to live. What a consolation an understanding of Reincarnation would have been to this man: to begin his next earth-life here where he left off the last one, with past lessons learned, new ones to work out, and with the knowledge that he would have a chance to correct the past mistakes, if not in the life just beginning, then in some future life, when conditions were right for the soul's growth.

Reincarnation and Karma, those twin doctrines, are two of the most profound and sublime in the Theosophical teachings. As we sow, so shall we reap; no one is to blame for our lot in life but ourselves; there is no trusting to blind chance or luck; it is we who have made the blunders and we, and no one else, who will have to correct them. In this cheering knowledge we take consolation and hope. The operation of absolute, immutable Law is so much more satisfying to the heart and the mind than the old idea of a deity subject to many of the faults of ordinary mortals. It teaches us to depend on ourselves, and to draw from those inner selves strength, and a love for and better understanding of all living things.

Reincarnation is not to be confused with Transmigration of Souls — that is, the belief that we may come back, especially if we have not been as good as we should have been, in some animal form. This probably originated in the real teaching being so veiled by those who really knew the truth that the masses understood it to mean this; just as so many Christian sects accept literally what is really allegorical or symbolic, and thus often pervert what Jesus really taught.

In all these perverted teachings there is perhaps a grain of truth. There is such a grain contained in the transmigration-of-souls theory, for originally we progressed from the mineral, vegetable,

and animal to the human form. But after attaining the latter there is no return. "Once a man, always a man."

It is often said by the unthinking that this teaching does not appeal to them because they do not remember their past lives, or their friends and loved ones; but after careful study it will be found that the parts of those lives worth remembering have been retained in our consciousness and we are constantly aware of them through our intuitions, our likes and our dislikes. A most beautiful statement appears in *The Esoteric Tradition*, by Dr. G. de Purucker:

Thus are hearts reunited on Earth which have formerly loved each other on Earth, and it is on Earth that minds which have genuinely understood each other meet again in sympathetic understanding and intercourse. For verily, those who have loved once will meet again. In fact they cannot do otherwise. Love is the most magnetic thing in the Universe; love attracts love; its whole essence implies and signifies union and reunion, reuniting, bringing together anew.

And on page 651 of the same work the subject is continued:

It is through and by means of reincarnation that human souls meet each other again, come together again, for their weal or for their woe, as the case may be. One looks into the eyes of a stranger, that is, a stranger to this body, in this life, and the eyes, intuitively as it were, see an old friend. Instant comprehension, quick understanding, and magnetic sympathy are there.

One could say that it was because the person met was worthy of our love; that he was of exceptionally fine character, and we recognised these qualities in him or her, but such may not be the

case. It is possible that he may not be as admirable as others whom we meet and yet towards whom we feel indifference or even antipathy. For we bring over our dislikes as well as our likings for the persons we have lived close to in former lives.

Even now we are building our future karma, good or bad, or good and bad, and we shall have an accounting to give in the future; though this should not be regarded as reward or punishment, but as lessons to be learned. Some perhaps will be more difficult to learn than others, but the laws of nature are always kind, even when to our limited understanding they may seem harsh.

As stated in *The Esoteric Tradition*, three-quarters of the peoples of the earth believe in some form of reincarnation, and it seems that it is only in the Occident that we have lost sight, for a time, of the teaching. It is Theosophy that has again brought it, and its companion-doctrine Karma, into the West, where they are rapidly becoming familiar to a great many thoughtful men and women.

Not until the revival of Theosophy — it can be termed a revival, because the Master K. H. says in one of his letters: "Theosophy is no new candidate for the world's attention, but only the restatement of Principles which have been recognised from the very infancy of mankind" — and its teachings were placed where the inquiring mind could have access to them, has there been a satisfactory explanation of all the discords and ills of the human race, where chance has seemed to rule us against our wills.

Of course, the Guardians of this Wisdom have always in all ages preserved it, but not until the last few years has it been given out freely and generously. It has been stated that we are more intellectual than spiritual, but we are slowly arriving at a turning-point. This will not be a hindrance to us for any great length of

time, because we are becoming intelligent enough to be dissatisfied with the old order, and are beginning to think a little more deeply and a little more seriously about ourselves and our relation to the Universe.

As we begin to reach out for something better, in answer to our questionings we shall find an abundance of knowledge waiting for us. Anyone having access to a public library can read the literature of the Theosophical Society, which contains truths that formerly were given only to a chosen few. In former times one *earned the right* to study these things, and the earning was not so simple a process as walking to a library and selecting a book.

We grow into Theosophy by degrees; it is like picking up scattered threads that have led back ages and ages to a time when we were not so material and knew these teachings well. We can fill our small parts in life cheerfully, hopefully, and unselfishly, leaving the future to take care of itself. We can use our energies for making the most of the present. This quotation from Tsiang Samdup, in Talbot Mundy's *Om*, expresses the idea perfectly:

We live in the Eternal Now, and it is Now that we create our destiny. It follows, that to grieve over the past is useless and to make plans for the future a waste of time. There is only one ambition that is good, and that is: so to live Now that none may weary of life's emptiness and none may have to do the task we leave undone.

The Theosophical Forum

LET YOUR LIGHT SHINE — *Bertha Walker*

There is not a single move we can make in life — no trip abroad, no action within the walls of one's own home — that is not invested with inner significance. Those who are unconscious of it are often battered cruelly, and impinged upon by the same kind of experience from outside, until they learn. Those who meet it consciously, with some inkling of inner Purpose, may be battered also at times, but they learn more quickly, discover its hidden meaning, and begin to mold outer circumstance in accordance with the highest light they are capable of perceiving within. Both grow — but the latter less painfully. Both are on the way to assuming their divine creativeness in relation to materials instead of being slaves, but the latter have awakened a positive glow of will and love, and have begun to cooperate with that One who stands back of, within, beside, and with him as "representative" of his Inner God — until his own spark of that Light which is his source comes fully to birth within him, and shines as a star.

Our own ignorance and stubbornness — no matter how sincere we may be — is all that keeps us from hearing the Voice of the Master more clearly; that, plus the already existent physical veil. The Return is a process of rending the veils, and infinitely much is accomplished when Love, the Light, begins to stir within; because Love itself sustains the Universe and one works with a force of incalculable attraction and power.

Much thought has been given lately to radio-activity. Really that is what man is destined to become — radio-active. "Let your Light shine." Man makes truth so complex, when it is so simple. It is pure when first given out; then man adds words to the Word,

piles on dogmas and creeds because his finite mind cannot conceive that anything simple and easy to understand can be a spiritual truth. It could be put into a word, yet no word or words of human language can express it. It must be felt — experienced. One must *be* it. That is why it is said that man treads the Path only to become the Path itself. And so one might say the great work for man is to become a shining light of God, in every cell of his being, whatever the body he works in — for few can or will accomplish it in a single life.

The Theosophical Forum

QUESTIONS AND ANSWERS: 310-315

Question 310. *Why is it so difficult for us to get authentic records of the lives of the great Teachers and Philosophers of the world? There always seems to be so much obscurity and uncertainty about them.*

G.de P. — Let me ask whether the very obscurity that surrounds the life and work of these men such as Cagliostro, Apollonius of Tyana, Saint-Germain, and Jesus, of whom no authentic records whatsoever exist, does not itself prove, in view of the tremendous interest, fascination, that their lives have aroused, that they were men beyond the ordinary? They come, no one knows whence. They live and do their work, no one knows how. They succeed, and they disappear from among men, and no one knows when or where they die. The same can be said of all four men I have mentioned.

What, after all, is of value in the lives of such great men? The place of their birth or the place of their passing? The record of their lives such as we have it? What makes the story of Jesus so dear to the human heart? It is not the fact that he is supposed to have been born and to have lived in one place, and supposed to have died elsewhere. It is not even the so-called historic record of his life as we have it — in a most unhistoric way! embroidered with legend — but what he taught, what he did, the life of the man as it appears, as it has made its appeal to human hearts.

Personally I think that there is something intentional in all this. You know, among the early Christians there was a sect who were called by their opponents the Docetists, in other words "believers in appearances," who taught that it really was not the authentic Jesus who died on the Cross as one crucified, but an appearance. "Heretics" the orthodox called them. Yet I wonder!

Of course it would be perfectly lovely to know all about Saint-Germain and Cagliostro and Jesus and Apollonius of Tyana, but the trouble is that the records are not there. That is the point. I do not mean to say that it is wrong to want to know these personal things, but they do not exist on record; they have been hid or withdrawn. Consequently they cannot be found; and any history purporting to be a record of their lives in my judgment is largely fabrication.

Question 311. *In the Theosophical philosophy we often read about the Monadic Essence; and on the other hand we often read about Atma-Buddhi. What is the relation between the Monadic Essence and the principles which H. P. B. mentions: Atma-Buddhi? (From The Hague Club)*

G. de P. — Atman and Buddhi together form what we Theosophists call the Monad. When the Manasic fruitage of past lives is "added" to it, then we have what is called the Reincarnating Ego. Atman means "self; and, as a spark comes from a fire, so likewise is the Atman which inspirits a man, a spark from the Fire of Universal Consciousness — the Paramatman or Brahmatman to use Sanskrit terms; and that Essence which works within the Monad, i. e., Atma-Buddhi, is the Monadic Essence, the heart of the Monad. To put the matter in other words: Atman is the Self; but even though it belongs to the divine part of the constitution of a human being, nevertheless because this human entity is a manifested entity — however great the manifestation is — the Atman is, as it were, limited and therefore is not absolute infinity. But that Essence which is in Atman and which is the essential being of the Atman, is the kosmic Paramatman. The Monadic Essence is, as it were, a divine Atom or divine particle of the Paramatman. Therefore the Monadic Essence is the heart of Atman, the core of it.

Question 312. *What attitude does the Theosophical Society take in regard to the taking of alcohol and intoxicating beverages? Are members of the T. S. required to make any declaration regarding this? And does membership in the T. S. depend upon such attitude?*

J. H. Fussell — First it should be stated that the sole prerequisite of membership in the Theosophical Society is an acceptance of the principle of universal brotherhood. Any law-abiding man or woman who accepts this fundamental principle may apply and may be admitted into our ranks. Nor do we issue any questionnaire as to the belief or attitude on the question above referred to, or indeed on any questions, whether political, social, or otherwise. It may be said, however, that, generally speaking, Theosophists take no alcoholic beverages; and this is true in general of the members of the Theosophical Society throughout the world. No inquiry, as stated, is made of anyone as to whether he takes this attitude or not, but it is found that as one studies Theosophy and comes to learn something about the composite nature of man, he comes to have no desire for alcohol, and indeed to see that it is harmful, and a deterrent in respect to true spiritual growth.

It may be said furthermore that while we have great respect and indeed admiration for the efforts of noble men and women to lessen and as far as possible remove the evils that are so much in vogue today, the position that is taken in the Theosophical Society is a basic one, namely, that the most effective work is to get at the very roots of the causes; and that means that the hearts and minds of men must be changed, which can be accomplished only by presenting to them a true philosophy of life such as is contained in the religion-philosophy-science of Theosophy.

Question 313. *In a review of "The Esoteric Tradition" in "The O. E. Library Critic," February, 1936, I see a criticism of the statement*

that "the lower mammalia are the offspring of men." Why does Dr. Stokes consider this a "bizarre theory"?

C. J. Ryan — There is nothing bizarre to well-informed students of Theosophy in the statement that "the lower mammalia are the offspring of men" or which, as Dr. Stokes thinks, will discourage really worth-while Theosophy among people who have some knowledge of science, etc. It looks as if he would suppress one of H. P. Blavatsky's important teachings for fear that Mrs. Grundy, in the guise of a Darwinian scientist, would not approve. He speaks of the "cathartic effect" produced on him by this "bizarre theory" which, he says "Dr. de Purucker, like some others" believes. The uninformed reader would naturally suppose that the "others" were of little account, and might be surprised to learn the fact that they include H. P. Blavatsky and her Masters who together wrote the book in which this teaching occurs — *The Secret Doctrine*. See Volume II, pages 81, 168, 197, 693, 712-4, etc.

The authoritative position of *The Secret Doctrine* has been emphasized by *The O. E. Library Critic* for many years when defending Theosophy against alleged perversions and suppressions (see many "deadly double-columns"), and it is certain that the mammalia "heresy" is not being foisted on the readers of *The Esoteric Tradition* by any unauthorized person who might be regarded as speaking independently "as the voice of God," but that it is based on the same high authority as the other teachings of Theosophy. It is not a "pipe-dream," and it is not "overdone." It is an integral part of the philosophy, and it explains some of the great enigmas that face modern biology. Those who cannot understand it are perfectly at liberty to let it alone, and confine their attention to other departments of Theosophy: they will be the only losers. As for the more materially inclined biologists, nothing we can say will affect them one way or the other. The appeal of Theosophy is to those who are beginning to realize that

there is an "occult" side to Nature, and that the superficial, mechanistic hypotheses, however plausible and ingenious, are unsatisfactory. No one teaches the absurdity that *man, as he is today*, gave birth to animals such as whales, tigers, and rats! The mammalian problem requires for its solution an understanding of the enormous evolutionary changes that "man" has undergone during the previous "Rounds" of development as well as during the earlier, more or less ethereal, races of this Fourth Round. Scientists are very slowly beginning to discover the existence of the astral plane, and when they establish it to their own satisfaction they will have no difficulty in comprehending the importance of the evolutionary teachings of the Ancient Wisdom. We decline, however, to obscure the teachings for which intuitive minds are waiting, in order to please anyone, however learned in the ephemeral hypotheses of the day.

In regard to this matter it will be instructive to learn William Q. Judge's views. He turns out to be one of the "others" with whom Dr. Stokes associates Dr. de Purucker — a pretty good company it would seem. In Mr. Judge's *Theosophical Forum*, No. 45, March 1893, he writes at considerable length in answer to a question as to how man can have "appeared before the animals," the problem we are now discussing. We can quote only a few lines, and hope that they will not shock our scientific friends. He says:

. . . in this round all the lower kingdoms in respect to their outer covering or materiality get all that coating from what man casts off. This is also clearly taught and not an inference of mine. . . . Let those of us who accept the statements of the Masters remember — that they have certified in writing that *The Secret Doctrine* is the triple production of those two great beings and H. P. Blavatsky. Such a certificate they have given of no other book. Their certificate will not be accepted by outsiders nor by that

small class of Theosophists who loudly proclaim they will accept nothing that does not accord with their reason; but one is puzzled to know how their reason can work in respect to matters such as these about which the Adepts alone can know the truth. As for myself, I find the teaching quite consistent with the whole of the philosophy and explanatory of natural facts; for the rest I am willing to believe all the parts I cannot yet verify and to wait a little longer.

From that and many other passages by W. Q. Judge — a most level-headed man — - we glean that he was not afraid of the impression that such a "bizarre" hypothesis might make on inquirers!

Question 314. *When the inevitable changes peculiar to the New Cycle now dawning come upon us, will they cause chaos only to the extent that we fail to prepare ourselves for their advent, or as we oppose them?*

Alice D. Peirce — This question seems to imply that changes concomitant with the New Era upon which humanity is entering, are yet to come upon us. The fact is that very great psychic, mental, and spiritual changes are now in progress and have been increasingly evident for several decades past. Cycles do not terminate abruptly, one giving place to another at an exact point of time. Nature works less mechanically. As twilight intervenes between the darkness of night and full day, so with all cyclic processes there is a period of overlapping, and a gradual changing of the old order to give place to the new.

Times of transition are critical periods, accompanied by unrest, uncertainty, and chaos more or less pronounced. Down the centuries cyclic changes can be traced in every nation, some of minor effect restricted to a limited area, others far-reaching and

of cataclysmic proportions. The distressing symptoms of our present transition-era bear out the prophetic forecast of H. P. Blavatsky that one of the major crises in human events would accompany the closing of several important cycles near the end of last century, resulting in world-wide disturbances in this century.

Assuredly, the chaos now confronting us would have been greatly mitigated had men and women been better prepared to meet the crisis understandingly. Except in the teachings of Theosophy, introduced by H. P. Blavatsky, there was little in the religious, scientific, or scholastic training of last century to provide adequate preparation for the new conditions to be met. Difficult and bewildering as a transition-period such as ours seems, encouragement lies in the fact that it offers greatly increased opportunity for growth in knowledge and understanding. To oppose the on-sweep of evolutionary progress is folly indeed. To best prepare for the new conditions of our changing world, we are taught to unfetter the imagination, to visualize a saner and more spiritual way of life, and above all, to put into practice in everyday affairs the old, familiar Golden Rule given by every World-Teacher without exception, as the essential panacea for the ills with which mankind has been afflicted in all ages in which it has been neglected — conspicuously in our own.

Question 315. *If we are all god-sparks, what is it that engenders the differentiation of minds in the first place, the differentiation of environment; — that which caused one man to choose right and another wrong in the first steps of his earth-life?*

Irene Ponsonby. — Do you not think that the answer lies in an understanding of the tenets: "All things are composite," and "No two blades of grass are identical"? The center of being of every part of the composite man is a god-spark, but the manifested man is an individualized egoic expression of all his unified selves, and

since no two composites are identical we find differentiation in their manifestation.

One can readily imagine, how, even were it possible to eliminate the physical and psychological vehicles, and to limit man to four conjoined egoic centers, there would still "be war in heaven," for each center is evolving, which means growing and learning on its own, while it functions as part of the composite entity it forms. Thus a man takes poison: even his mind may not endorse his action, but in spite of the objection it and his body manifest, the poison is swallowed and they are destroyed; but, to close the circle, the man's future choice and environment will be largely affected by the resulting damage to his mental, moral and physical life-atoms.

Immediately the god-spark enters manifestation it uses the life-atoms on all planes of being which belonged to it in a past life. These have received his imprint, the molding of his will and desire, and reacting to that impress, form his being on all the planes, visible and invisible for the present incarnation — hence his present choice and environment.

Going still further back, which is possibly what the querist means — to the choice before reincarnation made by the Reincarnating Ego; that choice must likewise be the individual god-spark's response to the stimuli of the forces of attraction and repulsion of past lives, for is not each Ego an individualized expression of its Monad?

F. M. Dadd. — While it is true that we are all one in essence, that every "mind" is a ray of the Cosmic Mind, yet differentiation is one of the laws of being. Each ray or god-spark contains within itself its own essential characteristic, its own individuality or swabhava, that which makes it different from all other god-sparks. At no time in evolution are they all exactly alike. Indeed

the purpose of the great Life-cycle known as life and death and again life and death repeatedly, in different bodies, is to unroll or express by means of the inner urge at the heart of each entity that which is latent within it, this same essential individuality.

At the close of a Mahamanvantara, when each ray, with its added experience of self-consciousness, is indrawn again to its parent Monad, this individuality is not lost or annihilated, but merely sinks into latency in the larger consciousness of the greater being of which the ray is a part. And when the life-urge awakens again, forth will come that same ray again into manifestation, still itself, still essentially one with, yet different from, all other selves.

As regards our choice of right and wrong — this is a matter partly of karman, of the seeds of action we have sown into our character in the past, thus building step by step, act by act, a propensity to choose "right" or "wrong." But it is also a matter of freewill, for no matter what trend of action we find ourselves enmeshed in, through karmic threads woven in the past, we have the free-will at any moment, not to change outward conditions, but to choose as to how we will meet them, thus setting in motion new karmic trends. So that the key to the answer to this question rests for each one within himself.

The Theosophical Forum

SUNRISE THOUGHTS ABOUT H. P. B. — *M. M. T.*

To state our debt to H. P. Blavatsky is to enumerate the baffling questions which we were faced with fifty years ago, and then to give the adequate answers to these questions which are to be found in the teachings of the Ancient Wisdom, which were restored by her to the world towards the end of the last century.

Dreary work it was, before H. P. B. came, to try to understand the Universe. The crumbling of long-accepted religious beliefs regarding man and the world and God left many of us agnostics. Scientific evidence of the evolution of physical forms left us isolated from the inner spiritual field, seemingly unrelated to Divinity. The imperfection of the purely materialistic theory wounded our aesthetic sense. The lack of any satisfactory basis for ethics stung our moral natures to a kind of desperate activity. Scientific study whetted our desire for comprehension of the Plan of Life, and — thanks be to the Cosmic Beings who *are* the Law — the intuitions of determined seekers for Truth were at the same time quickened for response to any great idea, any teaching that could reveal the true significance of love and duty and service, any Plan of Life that could show Man's relation to Divinity and the Universe.

From the Hierarchy of Compassion, whose duty it is to keep alive man's spiritual intuitions and at cyclic intervals to impart to man the truth concerning the cosmos, then came, through H. P. B the chosen Messenger of that Hierarchy, the startling announcement that it is to the prehistoric past we must look for a comprehensive Plan of Life, one covering mental and spiritual development as well as physical. Here, said H. P. B., you could find the history of the origin of man, of the evolution of the race — in fact a formula

of evolution which can be applied to anything, from the tiniest atom to a Solar System, etc.

To all students who have the spirit of loyalty H. P. B.'s rehabilitation of the Ancients has been a priceless gift of Truth. The retrospective view of the life of mankind established the unity of history. The Archaic Wisdom-teaching concerning the divine ancestry of man added conviction to the natural protest against the ultra-materialistic theory of man's origin. The conception that man, like the greater entity, the Universe, is a Divine Being, who has chosen to clothe himself in bodies of gradually increasing materiality, that Man, an essentially spiritual being, has *descended* to the present encasement of his inner Self, was a thunderbolt to the materialist who claims that Man has ascended from animal ancestry, but it makes a strong appeal to those who have never denied the innermost Self.

The supplementary teaching, that Man in the future is to ascend through cycles, in which both he and the planet he inhabits are less grossly material in form, to his pristine divine state plus the self-consciousness gained from his long experience, completes a picture of the destiny of mankind that inspires courage and deep Self-respect. What a contrast to the one-life idea of man, without any knowledge of Humanity's origins or of the complete cycle of its life, speeding towards a head-on collision with eternity — or with what we must know is impossible — annihilation. It is to H. P. B. that we owe the restoration of the knowledge of the sublime spiritual consciousness that has been, and is to be for those who make the grade.

Is it conceivable that any period of life, any stage of development, passed away utterly unrecorded? H. P. B. states that Earth has many secrets and that the hidden places still hold the complete record. Archaeological findings yearly indicate that the past has

many surprising revelations concerning races more spiritually awake than we are, more aware of the cosmic verities.

One channel by which the archaic history and wisdom reach even us is by way of myth and tradition. Never had there been so worldwide a survey of these as that made by her. Never had these precious old stories been glorified by having their original, unadulterated cosmic significance pointed out. Verily H. P. B. supplied a key to all mythology, showing them all to be offsprings of the World-Myth, which is the story of the Universe and Man. Never had there been such a wholesale cracking of the anthropomorphic molds that concealed the primeval truths at the root of all the great religions of the world. In uncovering the identity of the wisdom-teaching from which all originally sprang did H. P. B. achieve mighty demolition of barriers between man and man. And in bringing forward the truth that all the Great Teachers of East and West and North and South, all the Founders of the World-Religions, come from the same source, the Hierarchy of Compassion, H. P. B. instituted a reintegration of religions which will in time result in far-reaching reconciliation between those of different faiths.

The reintegration of all religions in the primeval truth — and the reintegration in the ancient Wisdom-Science of the results of scientific analysis up to the year 1888, when H. P. B.'s *The Secret Doctrine* was published, these meet the need now openly expressed for a cosmogonical religion, a synthesis of the facts concerning the inner and outer realms of man's nature and of universal Nature, the reverent acceptance of which leads to a new level of understanding, a new order of life on Earth. With this synthesis man can learn to "live in harmony with a scientific vision of the universe."

It was H. P. B.'s signal loyalty to Those who have reached the

higher levels of the Ladder of Life, who have won to the Hierarchy of Compassion, that brought back to the Western world the sense of nearness to the Elder Brothers, a revival of the sacred relation of Master and Disciple. It was the diamond fiber of her loyalty that enabled her to transmit the archaic wisdom that has helped us to see in Symbolism not an anthropomorphic sign-manual but the shorthand of metaphysics, the science of the unseen universe. It was her Diamond Heart that brought to discouraged Humanity the message that our planet is a well-guarded Home, bright unseen Intelligences and Silent Watchers in and over all; and is also one department of the great Cosmic University, where Man can learn the science of life and the key to spiritual advance on his pathway throughout the Circulations of the Cosmos.

The Theosophical Forum

THE ORIGINAL PROGRAMME OF THE THEOSOPHICAL SOCIETY

(1) (2)

[1886]

In order, to leave no room for equivocation, the members of the T. S have to be reminded of the origin of the Society in 1875. Sent to the U. S of America in 1873 for the purpose of organizing a group of workers on a psychic plane, two years later the writer received orders from her Master and Teacher to form the nucleus of a regular Society whose objects were broadly stated as follows:

1. Universal Brotherhood,
2. No distinction to be made by the member between races, creeds, or social positions, but every member had to be judged and dealt by on his personal merits;
3. To study the philosophies of the East — those of India chiefly, presenting them gradually to the public in various works that would interpret exoteric religions in the light of esoteric teachings;
4. To oppose materialism and theological dogmatism in every possible way, by demonstrating the existence of occult forces unknown to science, in nature, and the presence of psychic and spiritual powers in man, trying, at the same time to enlarge the views of the Spiritualists by showing them that there are other, many other agencies at work in the production of phenomena besides the "Spirits" of the dead. Superstition had to be exposed and avoided; and occult forces, *beneficent and maleficent* — ever surrounding us and manifesting their presence in various ways — demonstrated to the best of our ability.

Such was the programme in its broad features. The two chief Founders were not told what they had to do, how they had to bring about and quicken the growth of the Society and results desired; nor had they any definite ideas given them concerning the outward organization — all this being left entirely with themselves. Thus, as the undersigned had no capacity for such work as the mechanical formation and administration of a Society, the management of the latter was left in the hands of Col. H. S. Olcott, then and there elected by the primitive founders and members — *President for life*. But if the two Founders were not told *what they had to do*, they were distinctly instructed about *what they should never do*, what they had to avoid, and what the Society should never become. Church organizations, Christian and Spiritual sects were shown as the future contrasts to our Society. (3) To make it clearer —

1. The Founders had to exercise all their influence *to oppose selfishness of any kind*, by insisting upon sincere, fraternal feelings among the Members — at least outwardly; working for it to bring about a spirit of unity and harmony, the great diversity of creeds notwithstanding; expecting and demanding from the Fellows, a great mutual toleration and charity for each other's shortcomings; mutual help in the research of truths in every domain — moral or physical — and even, in daily life.
2. They had to oppose in the strongest manner possible anything approaching *dogmatic faith and fanaticism* — belief in the *infallibility* of the Masters, or even in the very existence of our invisible Teachers, having to be checked from the first. On the other hand, as a great respect for the private views and creeds of every member was demanded, any Fellow criticising the faith or belief of another Fellow,

hurting his feelings, or showing a reprehensible self-assertion, unasked (mutual friendly advices were a duty unless declined) — such a member incurred expulsion. The greatest spirit of free research untrammelled by anyone or anything, had to be encouraged.

Thus, for the first year the members of the T. Body who representing every class in Society as every creed and belief — Christian clergymen, Spiritualists, Freethinkers, Mystics, Masons and Materialists — lived and met under these rules in peace and friendship. There were two or three expulsions for *slander* and *backbiting*. The rules, however imperfect in their tentative character, were strictly enforced and respected by the members. The original \$5, initiation fee, was soon abolished as *inconsistent with the spirit of the Association*: members had enthusiastically promised to support the Parent Society and defray the expenses of *machines for experiments, books, the fees of the Recording Secretary, (5) etc., etc.* This was *Reform* No. I. Three months after, Mr. H. Newton, the Treasurer, a rich gentleman of New York, showed that no one had paid anything or helped him to defray the current expenses for the Hall of meetings, stationery, printing, etc., and that he had to carry the burden of those expenses *alone*. He went on for a short time longer, then — *he resigned as Treasurer*. It was the President Founder, Col. H. S. Olcott, who had to pay henceforth for all. He did so for over 18 months. The "fee" was re-established, before the Founders left for India with the two English delegates — now their mortal enemies; but the money collected was for the Arya Samaj of Aryavarta with which Society the Theosophical became affiliated. It is the Prest Founder, who paid the enormous travelling expenses from America to India, and those of the installation in Bombay, and who supported the two delegates out of his own pocket for nearly 18 months. When he had no more money left, nor the Corr.

Secretary either — a resolution was passed that the "initiation fee" sums should go towards supporting the Head Quarters.

Owing to the rapid increase of the Society in India, the present *Rules* and *Statutes* grew out. They are not the outcome of the deliberate thought and whim of the Prest Founder, but the result of the yearly meetings of the General Council at the Anniversaries. If the members of that G. C. have framed them so as to give a wider authority to the Pres. Founder, it was the result of their absolute confidence in him, in his devotion and love for the Society, and not at all — *as implied* in "A Few Words" — a proof of *his love for power and authority*. Of this, however, later on.

It was never denied that the Organization of the T. S. was *very* imperfect. *Errare humanum est*. But, if it can be shown that the President has done what he could under the circumstances and in the best way he knew how — no one, least of all a theosophist, can charge him with the sins of the whole community, as now done. From the founders down to the humblest member, the Society is composed of imperfect mortal men — not gods. This was always claimed by its leaders. "He who feels *without sin*, let him cast the first stone." It is the duty of every Member of the Council to offer advice and to bring for the consideration of the whole body any incorrect proceedings. One of the *plaintiffs* (6) is a Councillor. Having never used his privileges as one, in the matter of the complaints now proffered — and thus, having no excuse to give that his just representations were not listened to, he by bringing out publicly what he had to state first privately — sins against Rule XII. The whole paper now reads like a defamatory aspersion, being full of untheosophical and unbrotherly insinuations — which the writers thereof could never have had in view.

This Rule XIIth was one of the first and the wisest. It is by neglecting to have it enforced when most needed, that the President Founder has brought upon himself the present penalty. (7) It is his too great indulgence and unwise carelessness that have led to all such charges of abuse of power, love of authority, show, of vanity, etc., etc. Let us see how far it may have been deserved.

As shown for 12 years the Founder has toiled *almost alone* in the interests of the Society and the general good — hence, not his own, and, the only complaint he was heard to utter was, that *he was left no time for self-development and study*. The results of this too just complaint are, that those for whom he toiled, are the first to fling at him the reproach of being ignorant of certain Hindu terms, of using one term for another, for inst. of having applied the word "Jivanmukta" to a Hindu chela, on one occasion! The crime is a terrible one, indeed . . . We know of "*chelas*," who being Hindus, are sure never to confuse such well known terms in *their* religion; but who, on the other hand, pursue Jivanmuktship and the highest theosophical Ethics through the royal road of selfish ambition, lies, slander, ingratitude and backbiting. Every road leads to Rome; this is evident; and there is such a thing in Nature as "*Mahatma*"-*Dugpas* . . . It would be desirable for the cause of theosophy and truth, however, were all the critics of our President in general, less learned, yet found reaching more to the level of his all-forgiving good nature, his thorough sincerity and unselfishness; as the rest of the members inclined to lend a willing ear to those, who, like the said "Vicars of Bray" have developed a hatred for the Founders — for reasons unknown.

The above advice is offered to the two Theosophists who have just framed their "Few Words on the Theosophical Organization." That they are not alone in their complaints (which, translated from their diplomatic language look a good deal in the present

case like a mere "*querelle d'allemand*") and that the said complaints are in a great measure just, — is frankly admitted. Hence, the writer must be permitted to speak in this, her answer, of theosophy and theosophists in general, instead of limiting the *Reply* strictly to the complaints uttered. There is not the slightest desire to be personal; yet, there has accumulated of late such a mass of incandescent material in the Society, by that eternal friction of precisely such "selfish personalities," that it is certainly wise to try to smother the sparks in time, by pointing out to their true nature.

Demands, and a feeling of necessity for reforms have not originated with the two complainants. They date from several years, and there has never been a question of *avoiding* reforms, but rather a failure of finding such means as would satisfy *all* the theosophists. To the present day, we have yet to find that "wise man" from the East or from the West, who could not only *diagnosicate* the disease in the T. Society, but offer advice and a remedy likewise to cure it. It is easy to write: "It would be out of place to suggest any *specific measures*" (for such reforms, which do seem more difficult to *suggest* than to be vaguely hinted at) — "for no one who has any faith in Brotherhood and in the power of Truth will fail to perceive what is necessary," — concludes the critic. One may, perhaps, have such faith and yet fail to perceive what is *most* necessary. Two heads are better than one; and if any practical reforms have suggested themselves to our severe judges their refusal to give us the benefit of their discovery would be most *unbrotherly*. So far, however, we have received only the most impracticable suggestions for reforms whenever these came to be specified. The Founders, and the whole Central Society at the Headquarters, for instance, are invited to demonstrate their theosophical natures by living like "fowls in the air and lilies of the field," which neither sow nor reap, toil not, nor spin and "take

no thought for the morrow." This being found hardly practicable, even in India, where a man may go about in the garment of an Angel, but has, nevertheless, to pay rent and taxes, another proposition, then a third one and a fourth — each less practicable than the preceding — were offered . . . the unavoidable rejection of which led finally to the criticism now under review.

After carefully reading "A Few Words, etc.," no very acute intellect is needed to perceive that, although no "specific measures" are offered in them, the drift of the whole argument tends but to one conclusion, a kind of syllogism more Hindu than metaphysical. Epitomised, the remarks therein plainly say:

"Destroy the bad *results* pointed out by destroying the *causes* that generate them." Such is the apocalyptic meaning of the paper, although both causes and results are made painfully and flagrantly objective and that they may be rendered in this wise: Being shown that the Society is the result and fruition of a bad President; and the latter being the outcome of such an "untheosophically" organized Society — and, its *worse than useless* General Council — "make away with all these *Causes* and the results will disappear"; *i. e.*, the Society will have ceased to exist Is this the heart-desire of the two *true and sincere Theosophists*?

The complaints — "submitted to *those interested in the progress of true Theosophy*" — which seems to mean "theosophy *divorced from the Society*" — may now be noticed in order and answered. They specify the following objections: —

(I). To the language of the *Rules* with regard to the powers invested in the President-Founder by the General Council. This objection seems very right. The sentence . . . The duties of the Council "shall consist in *advising* the P. F. *in regard to all matters referred to them by him*" may be easily construed as implying that

on all matters *not* referred to the Council by the Pres.-Founder . . . its members will hold their tongues. The Rules are changed, at any rate they are corrected and altered yearly. This sentence can be taken out. The harm, so far, is not so terrible.

(II). It is shown that many members *ex-officio* whose names are found on the list of the General Council *are not known* to the Convention; that they are, very likely, not even interested in the Society "under their special care"; a body they had joined at one time, then probably *forgotten* its existence in the meanwhile, to withdraw themselves from the Association. The argument implied is very valid. Why not point it out *officially* to the Members residing at, or visiting the Head Quarters, the impropriety of such a parading of names? Yet, in what respect can this administrative blunder, or carelessness, interfere with, or *impede* "the progress of *true* theosophy"? (8)

(III). "The members are appointed by the President Founder, . . . it is complained; the Gen. Council only *advises* on what is submitted to it" . . . and "in the meantime that P. F. is empowered *to issue* "*special orders*" and "provisional rules," on behalf of that ("dummy") Council. (Rule IV, p. 20.) Moreover, it is urged that out of a number of 150 members of the G. Council, a quorum of 5 and even 3 members present, may, should it be found necessary *by the President*, decide upon any question of vital importance, etc., etc., etc.

Such an "untheosophical" *display* of authority, is objected to by Messrs. M. M. Chatterji and A. Gebhard, on the grounds that it leads the Society to *Cesarism*, to "tyranny" and papal infallibility, etc., etc. However right the two complainants may be *in principle* it is impossible to fail seeing, the absurd exaggerations of the epithets "tyrannical authority," of "centralization of power" and a "papal institution" (p. 9) — on page 11, the President-Founder is

shown "issuing *special orders*" from that "centre of Caesarism" — *which no one is bound to obey, unless he so wishes!* "It is well-known" remarks the principal writer — "that not only individuals but even Branches have refused to pay this (annual) subscription . . . "of . . . two shillings" (p. 11); without any bad effect for themselves, resulting out of it, as appears. Thus, it would seem it is not to a *non-existent* authority that objections should be made, but simply to a vain and useless *display* of power that no one cares for. The policy of issuing "special orders" with such sorry results is indeed objectionable; only, *not on the ground of a tendency to Caesarism*, but simply because it becomes *highly ridiculous*. The undersigned for one, has many a time objected to it, moved however, more by a spirit of *worldly* pride and an *untheosophical* feeling of self-respect than anything like Yogi humility. It is admitted with regret that the world of scoffers and non-theosophists might, if they heard of it, find in it a capital matter for fun. But the real wonder is, how can certain *European* theosophists, who have bravely defied the world to make them wince under any amount of ridicule, once they acted in accordance with the dictates of their conscience and duty — make a crime of what is at the worst a *harmless*, even if ridiculous, bit of vanity; a desire of giving importance — not to the Founder, but to his Society *for which he is ready to die any day*, One kind of ridicule is worth another. The Western theosophist. who for certain magnetic reasons wears his hair long and shows otherwise eccentricity in his dress, will be spared no more than his President, with his "special orders." Only the latter, remaining as kindly disposed and brotherly to the "individual theosophist and even a Branch" — that snub *him* and his "order," by refusing to pay what others do — shows himself *ten-fold more theosophical and true to the principle of Brotherhood*, than the former, who traduces and denounces him in such uncharitable terms, instead of kindly warning him of the bad effect produced. Unfortunately,

it is not those who speak the loudest of virtue and theosophy, who are the best exemplars of both. Few of them, if any, have tried to cast out the beam from their own eye, before they raised their voices against the mote in the eye of a brother. Furthermore, it seems to have become quite the theosophical rage in these days, to denounce vehemently, yet never to offer to help pulling out *any* such *motes*.

The Society is bitterly criticized for asking every well-to-do theosophist (the poor are exempt from it, from the first) to pay annually two shillings to help defraying the expenses at Headquarters. It is denounced as "untheosophical," "unbrotherly," and the admission fee" of £1, is declared no better than "a sale of Brotherhood." In this our "Brotherhood" may be shown again on a far higher level than any other association past or present. The Theosophical Society has never shown the ambitious pretension to outshine in *theosophy* and *brotherliness*, the primitive Brotherhood of Jesus and his Apostles, (9) and that "Organization," besides *asking* and being occasionally refused, helped itself *without asking*, and as a matter of fact in a *real* community of Brothers. Nevertheless, such action, that would seem highly untheosophical and prejudicial in our day of culture when nations alone are privileged to pocket each other's property and expect to be honoured for it — does not seem to have been an obstacle in the way of deification and sanctification of the said early "Brotherly" group. Our Society had never certainly any idea of rising superior to the *brotherliness* and *ethics* preached by Christ, but only to those of the *sham* Christianity of the Churches . . . as originally ordered to, by our MASTERS. And if we do not worse than the Gospel Brotherhood did, and far better than any Church, which would expell (10) any member refusing too long to pay his Church rates, it is really hard to see why our "Organization" should be ostracized by its own members. At any rate, the pens of

the latter ought to show themselves less *acerb*, in these days of trouble when every one seems bent on finding fault with the Society, and few to help it, and that the President Founder is alone to work and toil with a few devoted theosophists at Adyar to assist him.

(IV). "There is no such institution in existence as the Parent Society" — we are told (pp. 2 and 3). "It has disappeared from the Rules and . . . has no *legal* existence" . . . The Society being unchartered, *it has not* — legally; but no more has any theosophist a legal existence, for the matter of that. Is there one single member throughout the whole globe who would be recognised *by law* or before a Magistrate — *as a theosophist*? Why then do the gentlemen "complainants" call themselves "theosophists" if the latter qualification has no better legal standing than the said "Parent Society" or the Head Quarters itself? But the Parent-body *does* exist, and will, so long as the last man or woman of the primitive group of Theosophists *Founders* is alive. This — as a body; as for its moral characteristics, the Parent-Society means that small nucleus of theosophists who hold sacredly through storm and blows to the *original programme* of the T. S., as established under the direction and orders of those, whom they recognise — and will, to their last breath — as the real originators of the Movement, their *living*, Holy MASTERS AND TEACHERS. (11)

(V). The complaints then, that the T. S. "has laws without sanction," "a legislative body without legality," a "Parent Society without existence," and, worse than all — "a President *above all rules*" — are thus shown only *partially* correct. But even were they all absolutely true, it would be easy to abolish such rules with one stroke of the pen, or to modify them. But now comes the curious part of that severe *philippic* against the T. S. by our eloquent Demosthenes. After six pages (out of the twelve) had

been filled with the said charges, the writer admits on the 7th, — that they have been so modified! — "The above" we learn (rather late) "was written under *misapprehension* that the "Rules" bearing date 1885 — were the latest. It has since been found that there is a later version of the Rules dated 1886 which *have modified the older rules on a great many points.*" So much the better. — Why recall, in such case mistakes in the past if these exist no longer? But the accusers do not see it in this light. They are determined to act as a theosophical Nemesis; and in no way daunted by the discovery, they add that nevertheless "it is *necessary* to examine the earlier rules to ascertain *the underlying principle*, which rules through the present ones as well." This reminds of the fable of "the Wolf and the Lamb." But — you see — "the chief point is, that the Convention *has no power to make any rules*, as such a power is *opposed to the spirit of theosophy,*" . . . etc., etc.

Now this is the most extraordinary argument that could be made. At this rate no Brotherhood, no Association, no Society is possible. More than this: no theosophist, however holy his present life may be, would have the right to call himself one; for were it always found *necessary* to examine *his earlier life*, "to ascertain the *underlying principle*" which rules through the nature of the present man — ten to one, he would be found unfit to be called a theosophist! The experiment would hardly be found pleasant to the majority of those whom association with the T. S. has reformed; and of such there are a good many.

After such virulent and severe denunciations one might expect some good, friendly and theosophically *practical* advice. Not at all, and none is offered, since we have been already told (p. 9) that it would be "out of place to suggest any specific measures, as no one who has any faith in Brotherhood — and in the power of Truth" *will fail* to perceive what is necessary." The President Founder, has *no faith* in either "Brotherhood," or "the power of

Truth" — apparently. This is made evident by his having *failed* to perceive (a) that the Head Quarters — opened to *all* Theosophists of any race or social position, board and lodging free of charge the whole year round — was an *unbrotherly* Organization; (b) that the central office at Adyar for keeping records and concentrating "information" with its European and Hindu inmates working *gratuitously* and some helping it with their own money whenever they have it — ought to be carried on, according to the method and principle of George Miller of Bristol, namely, the numerous household and staff of officers at Adyar headed by the Prest Founder ought to kneel very morning in prayer for their bread and milk appealing for their meals to "miracle"; and that finally, and (c) all the good the Society's doing, is no good whatever but "a spiritual wrong," because it presumes to call "a *limited* line of good work — (theosophy) Divine Wisdom."

The undersigned is an ever patient theosophist, who has hitherto laboured under the impression that no amount of subtle scholasticism and tortured casuistry but could find like the Rosetta stone its Champollion — some day. The most acute among theosophists are now invited to make out in "A Few Words" — what the writers or writer — is driving at — unless in plain and unvarnished language, to be — "Down with the Theosophical Society, President-Founder and its Head-Quarters!" This is the only possible explanation of the twelve pages of denunciations to which a reply is now attempted. What can indeed be made out of the following jumble of contradictory statements: —

(a) The President Founder having been shown throughout as a "tyrant," a "*would be* Cesar," "aiming at *papal* power" and a "Venitian (12) Council of Three," and other words to that effect implied in almost every sentence of the paper under review, it is confessed in the same breath that the "London Lodge" of the Theosophical Society has *completely ignored* the *Rules* (of the Pope

Caesar) published at Adyar!" (p. 4). And yet, the "L. L. of the T. S." still lives and breathes and one has heard of no *anathema* pronounced against it, so far . . . (b) Rule XIV stating that the Society has "to deal *only* with scientific and philosophical subjects," hence, "it is quite *evident* (?) that the power and position claimed in the *Rules* for the Pt- Founder and the Gen. Council and Convention are opposed to the spirit of the declared Objects."

It might have been as well perhaps to quote the entire paragraph in which these words appear, (13) once that hairs are split about the possibly faulty reaction of the *Rules*? Is it not self-evident, that the words brought forward "only with scientific and philosophical subjects" are inserted as a necessary caution to *true* theosophists, who by dealing with politics *within* any branch Society might bring disgrace and ruin on the whole body, — in India to begin with? Has the Society or has it not over 140 Societies scattered through four parts of the World to take care of? As in the case of "Mahatmas" and "Mahatmaship" — active work of the Theosophical Society is confused — willingly or otherwise it is not for the writer to decide — with Theosophy. No need of entering here upon the difference between the jar that contains a liquid and the nature of, or that liquid itself.

"Theosophy teaches *self-culture* . . . and not control," we are told. Theosophy teaches *mutual-culture* before *self-culture* to *begin* with. Union is strength. It is by gathering many theosophists of the same way of thinking into one or more groups, and making them closely united by the same magnetic bond of fraternal unity and sympathy that the objects of *mutual* development and progress in Theosophical thought may be best achieved. "Self-culture" is for isolated *Hatha Yogis*, independent of any Society and having to avoid association with human beings; and this is a *triple distilled* SELFISHNESS. For real moral advancement — there "where two or three are gathered" in the name of the SPIRIT OF

TRUTH — there that Spirit of Theosophy *will be in the midst of them*. To say that theosophy has no need of a Society — a vehicle and centre thereof, — is like affirming that the Wisdom of the Ages collected in thousands of volumes, at the British Museum has no need of either the edifice that contains it, nor the works in which it is found. Why not advise the British Govt. on its lack of discrimination and its *worldliness* in not destroying Museum and all its vehicles of Wisdom? Why spend such sums of money and pay so many officers to watch over its treasures, the more so, since many of its guardians may be quite out of keeping with, and opposed to the Spirit of that Wisdom. The Directors of such Museums may or may not be very perfect men, and some of their assistants may have never opened a philosophical work: yet, it is they who take care of the library and preserving it for future generations are indirectly entitled to their thanks. How much more gratitude is due to those who like our self-sacrificing theosophists at Adyar, devote their lives to, and give their services gratuitously to the good of Humanity!

Diplomas, and Charters are objected to, and chiefly the "admission fee." The latter is a "taxation," and therefore "*inconsistent* with the principle of Brotherhood" . . . A "forced gift is *unbrotherly*," etc., etc. It would be curious to see where the T.S., would be led to, were the P. F. to religiously follow the proffered advices. "Initiation" on admission, has been made away with already in Europe, and has *led to that* which will very soon become known: no use mentioning it at present. Now the "Charters" and diplomas would follow. Hence no document to show for any group, and no diploma to prove that one is affiliated to the Society. Hence also perfect liberty to any one to either call himself a theosophist, or deny he is one. The "admission fee"? Indeed, it has to be regarded as a terrible and *unbrotherly* "extortion," and a "forced gift," in the face of those thousands of

Masonic Lodges, of Clubs, Associations, Societies, Leagues, and even the "Salvation Army." The former, extort yearly *fortunes* from their Members; the latter — throttle in the name of Jesus the masses and appealing to *voluntary* contributions make the converts pay, and pay in their turn every one of their "officers," none of whom will serve the "Army" for nothing. Yet it would be well, perchance were our members to follow the example of the Masons in their solidarity of thought and action and at least *outward* Union, notwithstanding that receiving a thousand times more from their members they give them in return still less than we do, whether spiritually or morally. This solitary single guinea expected from every member is spent in less than one week, as was calculated, on postage and correspondence with theosophists. Or are we to understand that all correspondence with members — now left to "*self-culture*" — is also to cease and has to follow diplomas, Charters and the rest? Then truly, the Head Quarters and Office have better be closed. A simple *Query* — however: Have the 1£. — the yearly contribution to the L.L. of the T.S., and the further sum of 2/6*d.* to the Oriental Group been abolished as "acts of unbrotherly extortion," and how long, if so, have they begun to be regarded as "a *sale* of Brotherhood"?

To continue: the charges wind up with the following remarks, so Profound, that it requires a deeper head than ours to fathom all that Underlies the words contained in them. "Is the T.S. a Brotherhood, or not?" queries the plaintiff — "If the former is it possible *to have any centre of arbitrary power?* (14) To hold that there is necessity for such a centre is only a roundabout way of saying that no Brotherhood is possible, (15) but in point of fact *that necessity itself is by no means* proved (!?). There have been no doubt Brotherhoods under high Masters . . ." (there "have been" and *still are*. H. P. B.) . . . "but in such cases the Masters were never elected *for geographical* or other considerations (?). The

natural leader of men was always recognised by his embodying the spirit of Humanity. To institute comparisons would be little short of blasphemy. The greatest among men is always the readiest to serve and yet is unconscious of the service. Let us pause before finally tying the millstone of worldliness around the neck of Theosophy. Let us not forget that Theosophy does not grow in our midst *by force and control* but by *sunshine of brotherliness* and the *dew of self-oblivion*. If we do not believe in Brotherhood and Truth let us put ashes on our head and *weep in sack-cloth* and not rejoice in the purple of authority and in the festive garments of pride and worldliness. It is by far better that the name of Theosophy should never be heard, than that it should be used as the Motto of a *papal authority*." . . .

Who, upon reading this, and being ignorant that the above piece of rhetorical flowers of speech is directed against the luckless Pres. Founder — would not have in his "mind's eye" — an Alexander Borgia, a Caligula, or to say the least — General Booth in his latest metamorphosis! When, how, or by doing what, has our good natured, unselfish, ever kind President merited such a Ciceronian tirade? The state of things denounced exists now for almost twelve years, and our accuser knew of it and even took an active part in its organization, Conventions, Councils, Rules, etc., etc., at Bombay, and at Adyar. This virulent *sortie* is no doubt due to "SELF-CULTURE"? The critic has outgrown the movement and turned his face from the original programme; hence his severity. But where is the *true theosophical charity*, the tolerance and the "*sunshine of brotherliness*" just spoken of, and so insisted upon? Verily — it is easy to preach the "dew of self-oblivion" when one has nothing to think about except to evolve such finely rounded phrases; were every theosophist at Adyar to have his daily wants and even comforts, his board, lodging and all, attended to by a wealthier theosophist; and *were* the same "sunshine of

brotherliness" to be poured upon him, is it is upon the critic who found for himself an endless brotherly care, a fraternal and self-sacrificing devotion in two other noble minded members, then — would there be little need for the President Founder to call upon and humble himself before our theosophists. For, if he has to *beg* for 2 annual shillings — it is, in order that those — Europeans and Hindus — who work night and day at Adyar, giving their services free and receiving little thanks or honour for it, should have at least *one meal a day*. The fresh "*dew of self-oblivion*" must not be permitted to chill one's heart, and turn into the lethal *mold of forgetfulness* to such an extent as that. The severe critic seems to have lost sight of the fact that for months, during the last crisis, the whole staff of our devoted Adyar officers, from the President down to the youngest brother in the office, have lived on *5d.* a day each, having reduced their meals to the *minimum*. And it is *this mite*, the proceeds of the "2 shill. contribution," conscientiously paid by some, that is now called *extortion*, a desire to live "in the purple of authority and the festive garment of pride and worldliness"!

Our "Brother" is right. Let us "weep in sack cloth and ashes on our head" if the T. S. has many more such *unbrotherly* criticisms to bear. Truly "it would be far better that the name of Theosophy should never be heard than that it should be used as a motto" — not of *papal authority* which exists nowhere at Adyar outside the critic's imagination — but as a motto of a "self-developed fanaticism." All the great services otherwise rendered to the Society, all the noble work done by the complainant will pale and vanish before such an appearance of cold heartedness. Surely he cannot desire the *annihilation* of the Society? And if he did it would be useless: the T. S. *cannot be destroyed as a body*. It is not in the power of either Founders or their critics; and neither friend nor enemy can ruin that which is *doomed to exist*, all the

blunders of its leaders notwithstanding. That which was generated through and founded by the "High Masters" and under their authority if not their instruction — *MUST AND WILL LIVE*. Each of us and all will receive his or her *Karma* in it, but the *vehicle* of Theosophy will stand indestructible and undestroyed by the hand of whether man or fiend. No; "truth does not depend on show of hands"; but in the case of the much abused President-Founder it must depend on the show of *facts*. Thorny and full of pitfalls was the steep path he had to climb up alone and unaided for the first years. Terrible was the opposition outside the Society he had to build — sickening and disheartening the treachery he often encountered within the Head-Quarters. Enemies gnashing their teeth in his face around, those whom he regarded as his staunchest friends and co-workers betraying him and the Cause on the slightest provocation. Still, where hundreds in his place would have collapsed and given up the whole undertaking in despair, he, unmoved and unmovable, went on climbing up and toiling as before, unrelenting and undismayed, supported by that one thought and conviction that he was doing his duty. What other inducement has the Founder ever had, but his theosophical pledge and the sense of his duty toward *THOSE* he had promised to serve to the end of his life? There was but one beacon for him — the hand that had first pointed to him his way up: the hand of the *MASTER* he love; and reveres so well, and serves so devotedly though occasionally perhaps, unwisely. President elected for life, he has nevertheless offered more than once to resign in favour of any one found worthier than him, but was never permitted to do so by the majority — not o "show of hands" but *show of hearts*, literally, — as few are more beloved than he is even by most of those, who may criticize occasionally his actions. And this is only natural: for cleverer in administrative capacities, more learned in philosophy, subtler in casuistry in metaphysics or daily life policy, there may be many around him; but the whole globe may be

searched through and through and no one found stauncher to his friends, truer to his word, or more devoted to real, practical theosophy — than the President-Founder; and these are the chief requisites in a leader of such a movement — one that aims to become a Brotherhood of men. The Society needs no Loyolas; it has to shun anything approaching casuistry; nor ought we to tolerate too subtle casuists. There, where every individual has to work out his own Karma, the judgment of a casuist who takes upon himself the duty of pronouncing upon the state of a brother's soul, or guide his conscience is of no use, and may become positively injurious. The Founder claims no more rights than every one else in the Society: the *right of private judgment*, which, whenever it is found to disagree with Branches or individuals are quietly set aside and *ignored* — *as shown by the complainants themselves*. This then, is the sole crime of the would-be culprit, and no worse than this can be laid at his door. And yet what is the reward of that kind man? He, who has never refused a service, outside what he considers his official duties — to any living being; he who has redeemed dozens of men, young and old from dissipated, often immoral lives and saved others from terrible scrapes by giving them a safe refuge in the Society; he, who has placed others again, on the pinnacle (16) of Saintship *through their statues in that Society*, when otherwise they would have indeed found themselves now in the meshes of "worldliness" and perhaps worse; — he, that true friend of every theosophist, and verily "the readiest to serve and as unconscious of the service" — he is now taken to task for what? — for insignificant blunders, for useless "special orders," a *childish*, rather than untheosophical love of display, out of pure devotion to his Society. Is then *human nature* to be viewed so uncharitably by us, as to call *untheosophical*, worldly and sinful the natural impulse of a mother to dress up her child and parade it to the best advantages? The comparison may be laughed at, but if it is, it will

be only by him who would, like the fanatical Christian of old, or the naked, dishevelled Yogi of India — have no more charity for the smallest human weakness. Yet, the simile (17) is quite correct, since the Society is the child, the beloved creation of the Founder; he may be well forgiven for this too exaggerated love for that for which he has suffered and toiled more than all other theosophists put together. He is called "worldly," "ambitious of power" and *untheosophical* for it. Very well; let then any impartial judge compare the life of the Founder with those of most of his critics, and see which was *the most theosophical*, ever since the Society sprung into existence. If no better results have been achieved, it is not the President who ought to be taken to task for it, but the Members themselves, as he has been ever trying to promote its growth, and the majority of "Fellows" have either done nothing, or created obstacles in the way of its progress through sins of omission as of commission. Better unwise *activity* than an overdose of too wise *inactivity*, apathy or indifference which are always the death of an undertaking.

Nevertheless, it is the members who now seek to sit in Solomon's seat; and they tell us that the Society is useless, its President positively mischievous, and the Head-Quarters ought to be done away with, as "the organization called Theosophical *presents many features seriously obstructive to the progress of Theosophy*. Trees, however, have to be judged by their fruits. It was just shown that no "special orders" issuing from the "Centre of Power" called Adyar, could affect in any way whatever either Branch or individual; and therefore any theosophist bent on "self culture," "self-involution" or any kind of *selfness*, is at liberty to do so; and if, instead of using his rights he will apply his brain-power to criticize other people's actions then it is he who becomes the *obstructionist* and not at all the "Organization called Theosophical." For, if theosophy is anywhere practised on this

globe, it is at Adyar, at the Head-Quarters. Let "those interested in the progress of true theosophy" appealed to by the writers look around them and judge. See the Branch Societies and compare them with the group that works in that "Centre of Power." Admire the "progress of theosophy" at Paris, London and even America. Behold, in the great "Brotherhood, a true *Pandemonium* of which the Spirit of Strife and Hatred himself might be proud! Everywhere — quarreling, (18) fighting for supremacy; backbiting, slandering, scandal-mongering for the last two years; a veritable battlefield, on which several members have so disgraced themselves and their Society by trying to disgrace others, that they have actually become more like hyenas than human beings by digging into the graves of the Past, in the hopes of bringing forward old forgotten slanders and scandals!

At Adyar alone, at the Head-Quarters of the Theosophical Society, the Theosophists are that which they ought to be everywhere else: *true theosophists* and not merely *philosophers* and Sophists. In that *centre* alone are now grouped together the few solitary, practically working Members, who labour and toil, quietly and uninterruptedly, while those Brothers for whose sake they are working, sit in the *dolce far niente* of the West and criticise them. Is this "true theosophical and brotherly work," to advise to put down and disestablish the only "centre" where real brotherly, humanitarian work is being accomplished?

"Theosophy first, and organization after." Golden words, these. But where would Theosophy be heard of now, had not its Society been organized before its Spirit and a desire for it had permeated the whole world? And would Vedanta and other Hindu philosophies have been ever taught and studied in England outside the walls of Oxford and Cambridge, had it not been for that organization that fished them like forgotten pearls out of the Ocean of Oblivion and Ignorance and brought them forward

before the profane world? Nay, kind Brothers and critics, would the Hindu exponents of that sublime philosophy themselves have ever been known outside the walls of Calcutta, had not the Founders, obedient to the ORDERS received, forced the remarkable learning and philosophy of those exponents upon the recognition of the two most civilized and cultured centres of Europe — London and Paris? Verily it is easier *to destroy* than to build. The words "untheosophical" and "un-brotherly" are ever ringing in our ears; yet, truly theosophical acts and words are not to be found in too unreasonable a superabundance among those who use the reproof the oftener. However insignificant, and however *limited the line* of good deeds, the latter will have always more weight than empty and vain glorious talk, and will be *theosophy* whereas theories without any practical realisation are at best philosophy. Theosophy is an all-embracing Science; many are the ways leading to it, as numerous in fact as its definitions, which began by the sublime, during the day of Ammonius Saccas, and ended by the ridiculous — in Webster's Dictionary. There is no reason why our critics should claim the right for themselves alone to *know* what is Theosophy and to define it. There were theosophists and Theosophical Schools for the last 2,000 years, from Plato down to the mediaeval Alchemists, who knew the value of the term, it may be supposed. Therefore, when we are told that "the question is not whether the T. S. *is doing good*, but whether it is doing *that kind of good which is entitled to the name of Theosophy*" — we turn round and ask: "And who is to be the judge in this mooted question?" We have heard of one of the greatest Theosophists who ever lived, who assured his audience that whosoever *gave a cup of cold water to a little one* in his (Theosophy's) name, would have a greater reward than all the learned Scribes and Pharisees. "Woe to the world because of offences!"

Belief in the Masters was never made an article of faith in the T. S. But for its Founders, the commands received from Them when it was established have ever been sacred. And this is what one of them wrote in a letter preserved to this day:

"Theosophy must not represent merely a collection of moral verities, a bundle of metaphysical Ethics epitomized in theoretical dissertations. Theosophy must be made practical, and has, therefore, to be disencumbered of useless discussion. . . . It has to find objective expression in an all-embracing code of life thoroughly impregnated with its spirit — the spirit of mutual tolerance, charity and love. Its followers have to set the example of a firmly outlined and as firmly applied morality before they get the right to point out, even in a spirit of kindness, the absence of a like ethic Unity and singleness of purpose in other associations and individuals. As said before — no Theosophist should blame a brother whether within or outside of the association, throw slur upon his actions or denounce him (19) lest he should himself lose the right of being considered a theosophist. Ever turn away your gaze from the imperfections of your neighbour and centre rather your attention upon your own shortcomings in order to correct them and become wiser . . . Show not the disparity between claim and action in another man but — whether he be brother or neighbour — rather help him in his arduous walk in life . . . The problem of true theosophy and its great mission is the working out of clear, unequivocal conceptions of ethic ideas and duties which would satisfy most and best the altruistic and right feeling in us; and the modeling of these conceptions for their adaptation into such forms of daily life where they may be applied with most equitableness. . . . Such is the common work in view for all who are willing to act on these principles. It is a laborious task and will require strenuous and persevering exertion, but it must lead you insensibly to progress and leave no room for any selfish

aspirations outside the limits traced . . . Do not indulge in unbrotherly comparisons between the task accomplished by yourself and the work left undone by your neighbour or brother, in the field of Theosophy, *as none is held to weed out a larger plot of ground than his strength and capacity will permit him.* . . . Do not be too severe on the merits or demerits of one who seeks admission among your ranks, as the truth about the actual state of the inner man can only be known to, and dealt with justly by KARMA alone. Even the simple presence amidst you of a well-intentioned and sympathetic individual may help you magnetically . . . You are the Free-workers on the Domain of Truth, and as such must leave no obstructions on the paths leading to it." . . . [The letter closes with the following lines which have now become quite plain, as they give the key to the whole situation] . . . *"The degrees of success or failure are the landmark we shall have to follow, as they will constitute the barriers placed with your own hands between yourselves and those whom you have asked to be your teachers. The nearer your approach to the goal contemplated — the shorter the distance between the student and the Master."* . . .

A complete answer is thus found in the above lines to the paper framed by the two Theosophists. Those who are now inclined to repudiate the Hand that traced it and feel ready to turn their backs upon the whole Past and the original programme of the T. S. are at liberty to do so. The Theosophical body is neither a Church or a Sect and every individual opinion is entitled to a hearing. A Theosophist may progress and develop, and his views may outgrow those of the Founders, grow larger and broader in every direction, without for all that abandoning the fundamental soil upon which they were born and nurtured. It is only he who changes diametrically his opinions from one day to another and shifts his devotional views from white to black — who can be

hardly trusted in his remarks and actions. But surely, this can never be the case of the two Theosophists who have now been answered . . .

Meanwhile, peace and fraternal good will to all.

H P Blavatsky Corres. Secty T. S.

Ostende. Oct. 3d

1886.

FOOTNOTES:

1. This extremely interesting and instructive article was written by H P Blavatsky at Ostende, Belgium, October 3 1886. This article contains so much of historic value and is so little known in the Theosophical world that it well merits the thoughtful reading of every follower of our first great Teacher.

H P B printed portions of this article in her magazine *Lucifer*, issue of January, 1888, but the article was published in full for the first time, we believe in the magazine *The Theosophist*, issue of August, 1931, and is from that magazine reproduced here by the kind permission of the present Editor. This permission however, stipulates that the footnotes by "C J" be also included. These footnotes appear within square brackets — Eds. ([return to text](#))

2. [There exist at Adyar, in H P B's handwriting, twenty-four pages of this fundamental pronouncement regarding the aim of the Theosophical Society. It was an article composed in response to a harsh criticism of the Society and of its President, Colonel H S Olcott, by two prominent Theosophists, Mohini M. Chatterji of Calcutta and Arthur Gebhard of Elberfeld, entitled "A Few Words on the Theosophical Organization."

The first page of the manuscript is missing, but it contained only the first nine lines of the article as now printed. Page "2" of the

manuscript now at Adyar begins with the tenth line "races, creeds, or social positions," etc The missing lines have been restored from a typed copy at Adyar of an incomplete rendering of H P B's article. As the article, owing to the loss of the first page, bears no title, I have put the above "The Original Programme of the Theosophical Society," taken from its last paragraph on p. 588 (our issue, p 104)

So far as I have been able to trace, H P B's article was not published at the time. The first occasion it was printed in full was in THE THEOSOPHIST, June 1924 and subsequent issues when, having found it among the Archives, I published it. But the instruction of the Master, from the sentence (in footnote) on p. 564 (our issue, p. 86) which begins "It is esoteric philosophy alone," and continues on p. 587 (our issue, p. 103) with the sentence, "Theosophy must not represent merely a collection of verities" was used by H P B in *Lucifer*, Vol. I, No 5, January 1888 as an article "Some Words on Daily Life (*Written by a Master of the Wisdom*)." In the *Lucifer* article there are changes and considerable amplifications of the main ideas, which are not in the Adyar manuscript.

The statement by Messrs Chatterji and Gebhard, in the former's handwriting, exists at Adyar, and presumably it too was not published. Perhaps others can supplement or correct these data — C. J.] ([return to text](#))

3. A liberal Christian member of the T S having objected to the study of Oriental religions and doubting whether there was room left for any new Society — a letter answering his objections and preference to Christianity was received and the contents copied for him, after which he denied no longer the advisability of such a Society as the proposed Theosophical Association. A few extracts from this early letter will show plainly the nature of the Society as then contemplated, and that we have tried only to follow and

carry out in the best way we could the intentions of the *true* originators of the Society in those days. The pious gentleman having claimed that he was a *theosophist* and had a right of judgment over other people was told . . . (4) "You have no right to such a title. You are only a philo-theosophist, as one who has reached to the full comprehension of *the name and nature* of a theosophist will sit in judgment on no man or action. . . . You claim that your religion is the highest and final step toward divine Wisdom on this earth, and that it has introduced into the arteries of the old decaying world new blood and life and verities that had remained unknown to the heathen? If it were so indeed, then your religion would have introduced the highest truths into all the social, civil and international relations of Christendom. Instead of that as any one can perceive, your social as your private life is not based upon a common moral solidarity but only on constant mutual counteraction and purely mechanical equilibrium of individual powers and interests . . . If you would be a theosophist you must not do as those around you do who call on a God of Truth and Love and serve the dark Powers of Might, Greed and Luck. We look in the midst of your Christian civilization and see the same sad signs of old: the realities of your daily lives are diametrically opposed to your religious ideal, but you feel it not; the thought that the very laws that govern your being whether in the domain of politics or social economy clash painfully with the origins of your religion — do not seem to trouble you in the least. But if the nations of the West are so fully convinced that the ideal can never become practical and the practical will never reach the ideal — then, you have to make your choice: either it is your religion that is impracticable, and in that case it is no better than a vain-glorious delusion, or it might find a practical application, but it is you, yourselves, who do not care to apply its ethics to your daily walk in life . . . Hence, before you invite other nations "to the King's festival table" from which

your guests arise more starved than before, you should, ere you try to bring them to your own way of thinking, look into the repasts they offer you . . . Under the dominion and sway of exoteric creeds, the grotesque and tortured shadows of theosophical realities, there must ever be the same oppression of the weak and the poor and the same typhonic struggle of the wealthy and the mighty among themselves . . . It is *esoteric philosophy alone*, the spiritual and psychic blending of man with Nature that, by revealing fundamental truths, can bring that much desired mediate state between the two extremes of human Egotism and divine Altruism and finally lead to the alleviation of human suffering . . ." (See last page for continuation.) — [So in manuscript. The continuation of the letter of the Master is on p. 587 (our issue, p. 103), and begins with the words: "Theosophy must not represent," etc. — C. J.] ([return to text](#))

4. [Throughout the body of the article, as in the footnotes, the occurrence of several full stops indicate no elision of words, but only the beginning of a new sentence or thought which is particularly emphasised — C. J.] ([return to text](#))

5. Mr. Cobb. ([return to text](#))

6. [So in manuscript.] ([return to text](#))

7. For years the wise rule by which any member accused of backbiting or slander was expelled from the Society after sufficient evidence — has become obsolete. There have been two or three solitary cases of expulsion for the same in cases of members of *no* importance. Europeans of position and name were allowed to cover the Society literally with mud and slander their Brothers with perfect impunity. This is the President's *Karma* — and it is just. ([return to text](#))

8. Furthermore the writer of the complaints in "A Few Words,

etc,"is himself a member on the General Council for over two years (see Rules 1885) why has he not spoken earlier? ([return to text](#))

9. Yet, the Theosophical Brotherhood does seem doomed to outrival the group of Apostles in the number of its *denying* Peters, its unbelieving Thomases, and even Iscariots occasionally, ready to sell their Brotherhood for less than thirty *sheckels* of silver! ([return to text](#))

10. [So in manuscript.] ([return to text](#))

11. The members of the T. S. know, and those who do not should be told, that the term "Mahatma," now so subtly analysed and controverted, for some mysterious reasons had never been applied to our Masters before our arrival in India. For years they were known as the "Adept-Brothers," the "Masters," etc. It is the Hindus themselves who began applying the term to the two Teachers. This is no place for an etymological disquisition and the fitness or unfitness of the qualification, in the case in hand. As a *state Mahatmaship* is one thing, as a double noun, *Maha-atma* (Great Soul) quite another one. Hindus ought to know the value of metaphysical Sanskrit names used; and it is they the first, who have used it to designate the MASTERS. ([return to text](#))

12. [So in manuscript.] ([return to text](#))

13. XIV. The Society having to deal only with scientific and philosophic subjects, and having Branches in different parts of the world under various forms of Government, does not permit its members, as such, to interfere with politics, and repudiates any attempt on the part of any one to commit it in favor or against any political party or measure. Violation of this rule will meet with expulsion.

This rather alters the complexion put on the charge, which seems

conveniently to forget that "scientific and philosophical subject" are not the *only* declared objects of the Society. Let us not leave room for a doubt that there is more *animus* underlying the charges than would be strictly *theosophical*. ([return to text](#))

14. It is the *first time* since the T S exists that such an accusation of *arbitrary* power, is brought forward. Not many will be found of this way of thinking. ([return to text](#))

15. No need taking a *roundabout* way, to say that no Brotherhood would ever be possible if many theosophists shared the very original views of the writer. ([return to text](#))

16. [So in manuscript.] ([return to text](#))

17. [So in manuscript.] ([return to text](#))

18. [So in manuscript.] ([return to text](#))

19. It is in consequence of this letter that Art. XII was adopted in *Rules* and a fear of lacking the charity prescribed, that led so often to neglect its enforcement. ([return to text](#))

The Theosophical Forum

H. P. BLAVATSKY AND A. D. 1872 — *Clarence Q. Wesner*

In our appreciation of Helena Petrovna Blavatsky, many of us may in our great love for the actor, pay too little attention to the stage-setting of the drama wherein she played the leading part. Let us, therefore, examine the processes of human thought as the stage was set in 1872, when H. P. B. was sent to the Western World.

Orthodoxy in religion in the Western World had received its death-blow by several hands. Voltaire, Kant, Thomas Paine, and last but not least, Colonel Bob Ingersoll, had played the role of St. George, dealing telling blows to the dragon of religious despotism. The "pearly gates" were crumbling under the battering-ram of Reason. Where can be found a moral and spiritual fortitude in an age whose so-called "spiritual" leaders teach thus: — "I have sinned, but through priestly mediation God has forgiven! I have sown, but I dare not reap! I am afraid, afraid! Let my sins be forgiven!"

A new and youthful Science had entered the arena. Youthful, egotistic, just as arrogant and dogmatic as the older theology it came, carrying its new toys, the telescope, the microscope, the volt-meter, the test-tubes. "Where is this God of mercy and justice, this all-loving Father? My telescope does not find Him in empty space; my microscope does not find Him in the atom; my test-tubes show an accidental arrangement of atoms which react and interact strictly by mechanical laws." Where can be found Hope and Charity in a world whose philosophy is — "Men are born, they suffer, they die — — and that's that."

Now entered a new element which in a more tolerant age might have reconciled to some extent the religionist and the scientist.

With proper guidance, the spiritualistic movement *might* have been able to prove the existence, if not of God, at least of an immortal soul in man. But the scientist laughed to scorn, and the religionist heaped maledictions upon that which might have been the strongest ally of only from their own selfishness — personal, national, and racial selfishness? Will men never learn that one cannot gain at the expense of another? — that one cannot rise by another's fall? — that the welfare of mankind depends on the welfare of the individual? — that the only actual evil is Ignorance? — that the only actual sin is the Heresy of Separateness?

Compare this condition with the world of thought of today. The thousand and one sects, "isms," and "ologies," and what not, are witness to the manner in which religious orthodoxy has compromised with the Ancient Wisdom. Although most of these are based on a partial understanding (or misunderstanding) of limited phases of the Ancient Wisdom, they may prove to be stepping-stones by which some will find their way Home, to the central source of the Teachings in this century.

The greatest of the scientists are perhaps the least dogmatic men in the world today. They admit that the microscope and telescope reveal only the external, the world of effects. But behind, or within, must be a Reality, which can never be reached except by Spiritual Insight. They do not, however, like the word "God." The scientist of today is truly an occultist, basing his researches on, and handling, the cosmic laws and powers described either directly or indirectly by H. P. Blavatsky over fifty years ago. He no longer insists that ultimates have been discovered, or that the so-called laws of science may not be subject to instant modification; in fact, he admits that the science of today is based on theories and not on Reality.

Much of the cynicism and agnosticism of 19th-century philosophy has given way to a broader vision of Universal Brotherhood. Of course the Theosophist cannot agree with all the methods proposed, but with the goal of Universal Brotherhood in view, the numberless paths and by-paths must inevitably merge, in the course of time, into one broad highway. Modern philosophy has received the leaven of the Ancient Wisdom, and religious tolerance is actually practised in many parts of the world today. Leaders of different religious sects find a common ground in the basic teachings of all religions. And that basic teaching is Theosophy, whether they like the word or not.

These few points touch only upon the revolution which has taken place in human thought since 1872. It is undeniable that Theosophy has played the largest part in this revolution. H. P. Blavatsky has not lived in vain. She has succeeded in her Great Work. The molds of mind are broken. In time to come, H. P. B. will be recognised as the great outstanding figure of the nineteenth century.

The Theosophical Forum

THE NATURE OF SELF-FORGETFULNESS — *Leoline L. Wright*

How few, even among the thoughtful, ever suspect the real and intense happiness which follows upon the determined practice of self-forgetfulness! In our wrong-headed civilization the very words have come to signify an outworn if not impossible ideal. Yet self-forgetfulness actually results not only in the power to bless and bestow but in the transmutation of our ignorance, unrest, and miseries into knowledge, power, and peace. For we have the assurance that the wise practice of daily self-forgetfulness will bring to us a sacred companionship with the Inner God and set our feet upon the pathway to divine adventure in the inner worlds.

There are, however, certain states of mind which might pass for self-forgetfulness with the unthinking but which are most emphatically the opposite. One of these is a practice which has become nearly universal, in this day at least, and that is self-evasion. We are all familiar enough in our own experience and that of our associates with the itch to escape from ourselves. And the insane lavishness of this mechanical civilization pours out the means: novels, cinemas, auto-trips, "parties," the bridge game, and a hundred other diversions. Yet most of our amusements are legitimate enough when they are intelligently used. They are harmful only when allowed to become a demanding habit. Even philanthropic work, if undertaken as such a soporific, is but another road to self-evasion. It is motive that colors the deed and automatically brings about the result. Service of others is naturally better for anyone than slavery to amusements, but in the case of using it to evade our own problems it is a neglect of one's essential duty. It may even result in a worse tangle of our personal affairs than before.

Why not say to ourselves when some of our intimate problems torment us by our inability to solve them: "Well, after all, does it matter so much about me? Isn't it the burden of the world that really matters — the tragedy of crime, the miseries of the poor, seeking hearts everywhere that cry out for light and help? Here is Theosophy with its grand diagnosis, its power of prevention and cure. I will set aside for a time this trouble of my own heart and see what I can do for the spreading of a knowledge of this panacea, acting in the meanwhile also as a good neighbor, a sympathetic "home-fellow and friend." When a Theosophist, or anyone else for that matter, carries such a thought into action, mysteriously his personal problem is likely to begin to solve itself. This happens often. Nature objects to our constantly pulling the plant up by the roots to see how it is coming on. But if we trust her with a divine impersonal carelessness as to our own well-being, and will work unselfishly for others, she will come to make obeisance and work on our side.

Here the motive creates the apparent contradiction and gives to service that is truly self-forgetful, but never self-evasive, its often immediate reward. And the further "rewards" which accrue more slowly, flow from the crystal fount of the Cosmic Heart — a beautiful happiness and a serenity whose harmonies pervade in blessing and help the lives of all about us. And some day, suddenly, we ourselves shall awaken to a new dawn breaking in splendor before our inner vision, and discover that our feet are set upon Amrita-Yana, the secret pathway to the gods.

MAN AND HIS VITAMINS — *Arthur A. Beale*

In the great epic of man's evolution, from the time when the spark was thrown off from the inscrutable yet all-comprehending "Self or "That," "concerning which speculation is impossible" on the upward pilgrimage through all the kingdoms until the human, we have a concept of the building up into a single entity of the combination of all these kingdoms. Man is a composite of these kingdoms in that he retains basic fundamental structures, though not in their pristine state. They are humanized, elevated, ennobled.

In this process all the intervening kingdoms are benefited; their evolving entities are not only integral parts of man, but essential to his very existence as an entity. In the matter of health, without the proper basic salts his bodily tissues degenerate and die. Every cell holds a modicum of potash, soda, calcium, iron, magnesium, sulphur, silica, and phosphorus, and the cells themselves represent the vegetable stage of evolution. The vegetable, animal, and human cells are almost identical. Remarkable analogies exist between the unfolding of a rose and that of a human embryo, or between the growth of hair and that of moss or lichen.

The animal circulatory and lymphatic systems are only an advanced form of the vascular system of plants by which sap, the vegetable "blood," is carried upward to the vital units where its elements are manufactured, and then downward, charged with nutritive elements to be stored in the roots, tubers, etc. Sir Jagadis Bose, the East Indian "magician," shows that the nervous systems in higher kingdoms are inaugurated in the plants, which are susceptible to poison and to drugs. For instance, a dose of digitalis will resuscitate a flagging plant.

The nearest analog to the marvelous endocrine system in man — the ductless glands — seems to be found in the vegetable world in the *Vitamins*, which might be described as the psychological factors of plants. They are the higher controlling factors, and in their further evolution in beasts and man are essential to the physiological functions, growth, and even reproduction. Vitamins are essential in the story of the psycho-mental apparatus, which is a ray from the spiritual ego, itself a knot in the golden cord of consciousness coming in interrupted sequences from the divine Self.

May not these vitamins be electro-magnetic units, intimately connected with the vital processes in man, beast, and plants? So intimate is the connexion between the vitamins and the endocrine glands that without a sufficiency of the former the glands would cease to function, and would die. This is especially true in regard to the pituitary gland, the hierarch of all the others. Is it a stretch of the imagination to trace in the vitamins the factors of the elemental kingdoms working in the higher kingdoms?

Once more we seem to have a confirmation of the ancient teaching that man contains the universe within himself. We see in man the "*end organ*" of the involuted spiritual consciousness of all the realms above him, and the evolved product of those below. He is the "*end organ*" of the Lokas and the Talas, the two complementary conditions of consciousness, involving spiritual involution and material evolution, the Lokas descending and the Talas ascending in their struggle upwards and towards the Monadic "*Soul-Being*," each absorbing each, each essential in its own nature to the other, once more demonstrating the circulations of the Cosmos.

Science recognises six vitamins so far, listed alphabetically A, B, C,

D, E, F, and G. G is often described as a variety of B and called B2. Each has its special realm of activity or control, but its effects are felt in the various bodily tissues. Let us relate the vitamins to the embryo. In its evolution three envelopes, three layers, are formed, each layer evolving separate systems of tissue-elements, called the *epiblast*, *mesoblast*, and *hypoblast*, the outer, middle and inner germ. The outermost layer evolves the epithelial cells of the skin, brain, and nervous system, the lining of the mouth and sense organs, and the glands of the skin. These structures are connected with vitamin A, and disturbances are produced in them by a deficiency in that vitamin. Vitamin D is sponsor for the middle layer, from which come the bony and muscular systems and the generative, urinary and circulatory systems. It controls the supply of lime and phosphates and is essential for mothers and for healthy blood. The innermost layer evolves the lining of the lungs, the alimentary tract, the bladder and urethra, and the important thyroid and thymus glands. Here vitamin B plays its part by giving vigor to alimentation and respiration, and controlling oxidation. Deficiency in vitamin B leads to diabetes, atony of the bowels, neurasthenia, faulty alimentation, loss of weight, etc. These three vitamins form the tripod of physiological life. The others, not thoroughly analysed or understood at present, can be regarded as offshoots or handmaids of these three. Vitamins C and G (B2) are a complex of B, and seem to control the same functions in a larger field of action. Vitamins B and G (B2) have the special difference that one is destroyed by a slight amount of heat while the other is not. Deficiency in vitamin B leads to Beri-Beri, prevalent in Brazil, India, and Japan, an infectious disease described as producing multiple neuritis. Deficiency in vitamin B2 produces pellagra with digestive disturbance complicated with skin symptoms. A supply of the appropriate vitamin removes the symptoms. Vitamin E is apparently connected with the mesoblast or middle layer, and is

always found in seeds, grains, nuts, etc. It is necessary for cell-division, the development of the embryo, and for the growth of the young of man or animal. Its deficiency contributes to sterility and sets up degenerative changes in the anterior pituitary body.

Without going into further details of their action, let us consider their place in nature. As vegetable elements they must be relegated to that kingdom, notwithstanding the fact that animal fats, especially cod liver oil, are the most fruitful sources of supply of vitamin D! But this "oil-soluble" product can be traced to the kelp beds which are frequented by codfish on the Newfoundland coast. It is not true, as formerly stated, that vitamin D can only be found in animal products, for rats fed entirely on avocados show no vitamin degeneration, which they certainly would if vitamin D were absent. It is conceivable that whatever produces vitamin D in the vegetable kingdom, is somewhat different from its product in the higher kingdoms, but let us remember that it is in itself a product of sunlight and is nearly related to the ultra-violet radiation from the sun, without which physical life could not be sustained on this planet. Vitamin D is closely related to sun-tanning, and to the production of Viasterol, one of the sterols mentioned by a recent explorer as leading to the discovery of the elixir of life sought by the alchemists! It would seem that we are nearing the discovery of some of "Nature's finer forces" known to our ancestors but "lost awhile."

Does it not seem that science is finding in the vitamins — though it can hardly be expected to admit it just yet — *vital units of an astral nature*, not merely material chemical elements, whose existence is best determined by their action on living processes and whose absence is estimated by unfavorable reactions on life and consciousness? In other words, are we not entering a realm where scientists will have to discard the cast-iron dictum that

nothing can be recognised but that which has the sanction of the senses using the mechanistic methods of mensuration, chemical reaction, and the like? Vitamins that cannot be seen, tasted, or isolated in their purity, can be administered to patients and will produce the expected reaction. This position has been reached by logical mental processes, the deductions made from unexpected phenomena, not by the process of experimenting with known material and demonstrating a preconceived hypothesis.

There can no longer be any doubt that the endocrine system in animals is not independent of vitamins. It has been found, for instance, that the pituitary gland is not the only one that is rich in them; all those organs like the liver, spleen, pancreas, and kidneys, where all the active assimilative processes are carried out, are saturated with vitamins, and these again are dependent for their formation and activity on the appropriate mineral salts. So we could paraphrase the old Hermetic saying thus: Without the mineral there could be no vegetable, without the vegetable there could be no animal, without the animal there could be no human, and without the human there could be no gods!

What then is the signification of man? Man is the very pivot of evolution. In man we sound the very depths of "hell," the darkest and crudest forms of matter. Man uses as his yarn the grossest principle in nature, Kama, desire or passion, as Dr. G. de Purucker has recently emphasized; and from Kama man makes his warp and woof and constructs from it a divine fabric — that is to say, man as a thinking, spiritual being. However, man, beginning with a birthright of divinity as an un-self-conscious god-spark, descends into material existence in order to gain self-consciousness and the individual powers of mind. And humanity, having reached the depths of materiality, has begun now to ascend the upward arc whereon Perfected man attains to godhood. In the lower kingdoms "Desire" or the kamic principle

acts as "instinct"; in man, when kama acts with the lower mind, the results are selfish, ignoble, cruel, and sometimes perverted. But when man's desire acts with his higher mind, he becomes noble, unselfish, aspiring and illuminated. As Krishna says in *The Bhagavad-Gita*: "In the hearts of all men I am desire, regulated by moral fitness."

The Theosophical Forum

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: VII — *H. T. Edge*

VII — THE TRIANGLE

This symbol is usually shown as an equilateral triangle with an apex up, or the same with an apex down. In many respects it represents the Triad or group of three, and is often used synonymously therewith; but it includes more than a mere triad. For it has three points and three lines, which, with the figure itself, make up a septenary. This in mathematics represents the number of combinations of three things, represented as *a, b, c; ab, bc, ca; abc*. This can be applied to show how a septenate is derivable from a triad, how there are two triads, either of which, by the addition of the monad, becomes a quaternary. The triad is in one sense the first number after unity; for no sooner do we conceive a duality, than we get a trinity by thinking of the unity and the duality together.

A trinity stands at the head of every cosmogony and theogony; it really represents the limits of our thought. Everything which we know of in this world is dual, a pair of opposites; yet we are compelled to think of unity as underlying every duality. Thus hot and cold are the two extremes of temperature, positive and negative are the two poles of magnetism, every straight line has two ends, etc. Thus we have a trinity consisting of a duality and its underlying unity. If we consider life and death as a duality, we may well ask ourselves what is the unity of which they are the opposite phases. And we may ask similar questions as to light and darkness, and many other dualities. We find at the head of cosmogonies the One Life, a Monad or Unity, from which springs a duality of Spirit and Matter. The duality may be expressed in

many ways, as Male and Female, Energy and Substance, Force and Matter, etc., etc. The one is the basis of all active powers throughout the universe; the other is the basis of all receptive, formative, or substantial potencies. But this duality springs from a unity which contains both — the Spirit-Matter or unitary source of all. But besides this trinity we find another, denoted by Father-Mother-Son, of which the symbol would be an inverted triangle. Here we see Spirit and Matter and their offspring, the Son, which is the Universe, or Man, as the case may be. Egypt has it as Osiris, Isis, and Horus. It is seen in the triad of Will, Thought, and Act, the last being the offspring of the two former. The Father is the Universal Spirit; then comes the Great Mother — Nature; from these are born (macrocosmically speaking) the worlds; and (microcosmically speaking) the Christos, the real Man. This is the real meaning of the saying that the Christ is the Son of God; but it is the Christ in all men, not in a particular man. The theology of today makes insufficient provision for the Mother; if the symbology has a Father and a Son, a Mother would seem to be indicated. But it has somehow vanished, and the trinity has been made up to number by the inclusion of the Holy Ghost. One church makes a great deal of the Virgin Mary, who is an adaptation of the Pagan Magna Mater; but she is not a member of the Trinity.

The triangle is often used in conjunction with the square to signify a triad and a quaternary, the former of which symbolizes the higher world, the latter the lower. Thus we have the seven principles of man so divided into two main parts. As was stated under the Cross, a group of four often implies the lower manifested world, or what is sometimes called "matter" as opposed to spirit; for the number four is characteristic of material shapes and groupings, as are also the numbers six and eight, derived from it. We read in *The Secret Doctrine*, II, 79, that, in

order to make complete septenary man, the gift of Fire had to be made; this Fire was in the possession of the Triangles, free Intelligences, Flames. Atma-Buddhi-Manas is a triad, and when it imbodies it becomes a quaternary, and the imbodiment is itself fourfold, which makes seven.

The triangle symbol is not always used in the ordinary geometrical sense, wherein any of the points may be an apex; but it is considered as having a top and a bottom; the apex then represents a logos, from which emanate twin rays, the sides of the triangle. These rays, united at their upper extremities, are spanned at their lower ends by the base line, which thus signifies the universe created by the interaction of these rays. In a similar way, a distinction is made between a triangle with the apex up and one with the apex down; the former being Fire, the latter Water, or again Spirit and Matter. The interlacing of these two makes Solomon's Seal, the interlaced triangles, the star hexagon in geometry; and this signifies the blending of rupa and arupa, spirit with matter, making, with the central point, or with a circumscribed circle, the septenate. So this is a symbol of a complete man.

A pyramid with a square base, such as forms a well-known architectural symbol, shows rays proceeding from a point of union and diverging as they descend, until they compass a square at the bottom, while triangles define the sides; this is an elaboration of a symbol just mentioned. The tetrahedron is bounded by four triangles, thus combining these two numbers; and the cube has square faces and three dimensions; and many interesting things can be learnt by the study of geometrical shapes.

When a monad becomes dual it passes from latency into activity, and when the duad becomes one, activity ceases on the plane of

that duality. The duad signifies vibration, and the monad is the neutral center. He who realizes this possesses the power of balance and is no longer drawn from side to side. But it is important to observe that the real point of equilibrium is not the mere center of the line, halfway between the ends; it is not on the same plane. A pair of opposites is reconciled by a unity on a higher plane. This shows the distinction between a state of mere apathy or indifference and the true state of balance. Thus pleasure and pain are two poles of sensation; and the conquest of them does not mean a state of sensation which is neutral and indifferent, but an escape from the plane of (that kind of) sensation altogether, onto a higher plane of fuller life.

The Theosophical Forum

THE NEW NATURALIST — *Hugh Percy Leonard*

The study of Animated Nature in times gone by amounted to little more than the observation of the shot specimen, and the giving it an appellation derived from an ancient language as dead as itself. We are now beginning to see that the main interest lies not so much with the outer form as with the living dweller in that form, our younger brother on a lower rung of life's ascending ladder of degrees. A comparative study of the bewildering variety of form and color in the different species may lead us down many a fair avenue, and disclose the most suggestive links and correspondences amongst the specimens under consideration; and yet, surely, the object of the quest should be that shy, elusive dweller in the inmost place where glows the spark of life now on its way to blend itself with the clear flame from whence it sprang.

Everyone knows the outward appearance of the beaver — his strong, incisive, chisel-teeth, his damp-proof coat of fur, and his spatulate, fantastic tail, wrongly supposed to serve him as a trowel. But how immensely it adds to our understanding of the essential beaver to learn that when a party of dam-builders has succeeded in placing a more than usually refractory log they let themselves go in a perfectly human way and celebrate the occasion by a wild orgy of horseplay and riotous fun. They make the water boil with their mock battles and their mad pursuit, and to the sympathetic onlooker it suggests that their mentality must vary very little from our own, and their reactions correspond with those of humankind.

A naturalist of the school now happily obsolescent may understand the classification of "the burnished dove," and the secret of the lively iris on its neck; but can he follow it into those

calm regions of untroubled peace from whence the brooding bird derives its soothing song? He may be well acquainted with the mechanism of the mockingbird's larynx, but can he tune his heart to harmony with the gray singer in the palm who makes night ring with his triumphant joy? We must all welcome the new ideal which has come in with the camera and the valuable information gained by its harmless shooting. The patient devotion of the naturalist-photographer is worthy of all praise, and is a pleasant contrast to the stark butchery of the ruthless gunner of former days.

A new school of field-naturalists is on its way, a school whose students will discard the rifle and the trap, the poison and the net, faring forth into the wild places of the earth as patient watchers with observing eyes. Their hearts will be sensitized by their sympathy with the shy inhabitants and thus they will read their lives like an open book.

In an East Indian book there is a passage enumerating the magical Powers to be acquired by the initiated yogi, the final climax being reached in the statement that "he perceives what is passing in the mind of the ant." This may strike the casual reader as something of an anticlimax; but surely it is a magnificent tribute to the completeness of the initiate's detachment from the entanglement of the personal center, and his ability to blend his mind with that of a creature that surveys life from a point of view so far removed from ours. Milton has written of:

The parsimonious emmet
In small room large heart inclosed,

yet truly the heart of the emmet is large beyond the furthest stretch of the imagination of most of us. She is a member of a community in which the thought of private property and personal rights has no place, so that the busy, cheerful workers

seem to have no other aim or object in their lives except to spend them in unstinted labor for the welfare of their native nest.

Where is the naturalist who can tell us "what is passing in the mind of an ant," and can explain in human terms that irresistible driving force that would raise a crawling insect to the rank of saint and hero but for the fact that it is carried along by an urge that is irresistible and cosmic in its sweep. For such a sublime enterprise something more than a clever intellect is needed — a sensitive and sympathetic heart.

Sweet is the lore that Nature brings;
Our meddling intellect
Misshapes the beauteous forms of things:
We murder to dissect.

Enough of science and of art;
Close up those barren leaves:
Come forth and bring with you a heart
That watches and receives.

The Theosophical Forum

QUESTIONS AND ANSWERS: 316-318

QUESTION 316. *According to Theosophical doctrines, man is a septenary being, in addition to his physical body having six other principles as a part of his constitution, (a) Is it true then, that in addition to his present physical body manifesting on this our material earth, he would also simultaneously be manifesting on six other material globes or planets in an appropriate physical body or vehicle, all seven physical vehicles on the seven material globes each having its own six other principles functioning in their respective spheres, contributing each and all to the Monadic center? (b) If this is so, would all seven physical vehicles die and reincarnate again at the same time, or each at a different time, depending upon the karmic energies of each vehicle? — H. W. D.*

G. de P. — The foregoing question does not lack profound interest; and by the changing of two words — which words because they are esoteric cannot here be stated — the question would deal with a typically esoteric matter, connected with man's septenary constitution. However, and answering with as much brevity as possible in view of the complex factors involved, and having in mind the intuitive thought behind the question, I would reply briefly to the questioner's query (a): No, if by the word "material" is meant "physical" bodies on other physical planets — Globes D of their respective chains — of our Solar System.

The fact is that man in his septenary constitution has one "material" or rather "physical" body only; and as he is now manifesting on our own Planetary Chain, and on Globe D thereof in the Fourth Round, this his physical body is the physical body that we all know — yours, mine, any other man's or woman's physical body on this Earth.

Yet there is an intuition in this question which is struggling to find utterance, or rather to find phrasing in which it may clothe itself; and I believe that future study will prove to this querent the accuracy of this observation of mine.

Now, the querent's intuition points directly to the fact of man's composite nature, which is divisible after different manners; for instance, our usual exoteric manner which H. P. B. gave to us, and there is none better for its own purposes; then there is another manner which has been more favored by the Vedanta and the Taraka-Raja-Yoga, to which H. P. B. likewise approvingly alludes in her *The Secret Doctrine*, Vol. I, page 157, and which refers more particularly to the different monads forming man's composite constitution. When we remember that these different monads are, each one of them, a growing and evolving entity, each one at some date in the distant future to be an individual of septenary character, we see not only the intuition in the querent's question, but also the profound truth of the famous old statement found in all mystical literature that man is a microcosm or small copy of the Macrocosm or Great Original; and, on exactly similar lines of analogy, every one of the monads in man is an as yet imperfectly evolved microcosm of the complete man as we recognise him.

With regard to the latter question, the querent's (b), it is seen from the foregoing part of my answer that there is not more than one physical body at any one time for man, and that this physical body is now found on our Globe D, Earth; and hence, the answer to this question (b) again is No. Yet just here I must enter a *caveat*, and point out that the same intuition before noticed is here again struggling to express itself, and it does seem to me as if this questioner had an inkling of a certain esoteric and very difficult teaching concerning the Outer Rounds. Be this as it may, my answer stands correct, that man's septenary constitution at any one time works through one physical body only, and that in the

present phase of human evolution this physical body is the one in which we, as individuals, are incarnated on this Earth.

QUESTION 318. *How can we study the science of metaphysics?*

M. Ginevra Munson — A modern positivist defines metaphysics as "the science of all sciences." Therefore it includes *all* science — and more: religion and philosophy. First we must realize that mind is infinite, exists everywhere and in all things, a veritable ocean of consciousness infilling the universe, outer and inner — the worlds of the gods.

In order to know the truths of metaphysics or the worlds and conditions above physics, we have to evolve the faculties pertaining thereto, the faculties that can gain experience therein. This is done by aspiration — by a *yearning* for truth, and an expanding consciousness. It requires the consciousness of individual minds to gain experience in the metaphysical realms, the same as it does to gain knowledge of the laws and operations of the physical with the help of our senses and intellect. By probing into the metaphysical, we evolve our higher senses and *intuition*, which is the metaphysical Ego within.

The Ego-sense is the thread on which all thoughts and knowledge are strung. Even in the study of physics our modern scientists are forced to the conclusion that mind and consciousness are the fundamentals of all manifestation, and exist throughout all. They have discovered that Space is an ocean of consciously acting atoms — Theosophy says *life-atoms* — and that primal substance consists of life-atoms, the ever-living nuclei "evolved from that black, impenetrable fortress which is forever concealed from human or even Dhyanic sight. The nuclei are the light of eternity escaping therefrom." (*The Secret Doctrine*, Vol. II, p. 33.) All manifestation begins with the whirling evolution of these life-atoms, each with its own characteristic, or *svabhava*, down

through their own self-built elements or planes of substance and variety of forms through which to gain experience and expanding consciousness, to individual self-consciousness in man; then on to individual godhood, and further on to ever greater heights in Divinity, as evolutionary law tells us must be true.

Of the many aspects of the metaphysical and esoteric teaching of Theosophy there is none more inspiring than that man is an integral part of the Universal Spirit and that there is no limit to his development as an individual soul. Here is where all Christian religions have failed in leading man to his highest: by affirming that human beings are the children of a personal God, who saves them from "hell" by faith and prayer.

The Ancient Teaching asserts that man is a manifestation of Divinity, an evolving part of the One, his own Inner God. As one writer says, "It is a gospel of self-reliance and aspiration for which there is no parallel in the philosophical thought or spiritual realization in the world." To study metaphysics is to study the inner and greater part of one's own being as well as the whole of all other beings manifesting as laws, forces, and matter, physical and metaphysical, in studying which our modern physicists are becoming metaphysicists.

QUESTION 317. *Does Theosophy teach astrology?*

H. T. Edge — Theosophists know there is such a science as astrology, but they do not advocate or engage in its study, for the following reasons. Astrology is a most profound subject, and to study it properly would demand the devotion of a lifetime and the engrossment of all our energies. Thus its pursuit would divert Theosophists from their proper work, which is that of preparing the way for better human conditions by spreading the noble truths of Theosophy. Astrology is fascinating for some people, but can hardly be called profitable. It is one of many such pursuits,

which demand more time and attention than can be spared. Again, what is today known as astrology is but a tattered remnant of the science as it has been and could be. It is mainly concerned with the motions of the visible planets in the Zodiac, and with their indications or influence on human and worldly affairs.

It is evident from experience that a certain amount of information about a person's character and probable experiences can be ascertained from his natal horoscope; but it is important to bear in mind that the aspects merely show tendencies. In this respect they resemble the indications of phrenology. A man goes to a phrenologist, who examines the shape of his head, tells him what his tendencies are, and advises him to cultivate some faculties and restrain others. Some years later the man visits the phrenologist again, and the shape of his head is found to have changed; for he has taken the advice. This proves that we have a power of resisting or enhancing or modifying the qualities indicated by phrenology, and that we are not bound by them. It is the same with the horoscope. It shows the tendencies, gives a map showing the forces operating and the probable drift, supposing these forces are not modified. But all these may be overridden by the superior power of the native's own intelligence and will; and thus he can be said to create his own horoscope, to rule his stars.

The question may be asked, whether it is of any service for anyone to know his own horoscope and study it, or whether he might not get along just as well, or even better, without such knowledge. One's experience suggests that the knowledge is of no practical benefit, and is apt to induce the habit of studying one's symptoms and of relying on external influences rather than on our own resources.

So our answer may be summed up by saying that the study of astrology is not recommended for a Theosophist, as it distracts his

attention from his work and focuses it upon what is at best unprofitable and may be morbid in its tendency. Astrology is one of a number of such pursuits, including card-reading, crystal-gazing, numerology, and the like; all of which tend to lead the student into bypaths and to conduct him to divergent tracks rather than to any goal.

B. de Z. — The answer to this question depends entirely upon what the questioner means by astrology. If it is the widely spread present-day attempts at fortune-telling on the basis of very questionable methods and still more questionable interpretation of the results arrived at, then it might be said that Theosophy emphatically does not teach anything of the kind, nor does it even endorse it or recognise it as worthy of the ancient time-honored term astrology. But if by that name is meant that highly intellectual science which was an integral part of the ancient Mystery-Schools, and of which science there is still in our present world many a fragment extant, then it might be said that Theosophy, the Ancient Wisdom, does teach it, and for the simple reason that the basic spiritual foundations of this ancient science of astrology are identic with the spiritual teachings of Theosophy. But this spiritual-intellectual science is anything but fortune-telling. Instead of concentrating one's attention upon the color of the dress which you have to wear on Thursday if you are a Sagittarian, or upon the exact latitude where you should live if you happen to be born in February, and a few other such trivial things, including perhaps the best stock that you should buy in 1936 if you would become a wealthy man next year — instead of this, the genuine astrology of the ancients had a far wider scope for its investigations and looked behind the phenomenal universe into the realm of spiritual causes which manifest as transitory effects in the world of men. It dealt not only with the influences of planets and of the sun and moon and the stars upon the mundane

things of human life, but dealt further, and more particularly, with the nature of the celestial bodies, being, as they are, entities with a life of their own.

There is a genuine spiritual astrology, a science based on a knowledge which is at the same time strictly scientific, profoundly philosophic, and genuinely religious, and this knowledge is grounded upon Nature's own sublime operations — facts of universal being, which in ancient times constituted the "science of the stars" — - an important part of the very fabric of the Mystery-Schools and their teachings. This spiritual astrology represents the scientific and philosophic background of thought against which were projected, as it were, and from which sprang, the various branches of accepted astrological *art*, such as genethliacal, mundane, horary, etc., etc., astrology.

Mathematical calculations are a good thing when they are correct; but mathematics without a sound philosophical foundation is futile because the "how" operations will never satisfy the inquirer who is asking for the "why" of things.

Present day astrological *art* is ninety per cent, without a soul, and the philosophical background with spiritual intuitions flashing against it as it were, can be found these days only in one or two, or possibly three, genuine astrological schools of thought, and they are not likely to be among the names which will probably first arise in the mind of the reader.

There is a purpose even in a superficial study of the more outward, mathematical side of astrology, and it is this: it shows the manner in which the cyclical habits of Nature express or manifest or mold themselves in the relations and correlations of numbers, and it is not too far-fetched to assert that a correctly cast and a mathematically correct astrological figure when interpreted according to two sets of standards (a) the age-old

rules of practical astrology and (b) the Theosophical or esoteric system of thought — will show a great many points of great interest regarding the character of the individual or group of individuals concerned; and from this can often be derived valuable hints regarding the future development of new and inherent tendencies. But it should always be kept in mind that the Science of Astrology is only one aspect or presentation of the all-embracing esoteric philosophy of life.

The Theosophical Forum

THE SEVEN PRINCIPLES OF MAN — *Frank C. Bereidge*

It seems to me that the study of this subject demands the study of all the other teachings of Theosophy. For several years past I have been studying Theosophy principally from the viewpoint of the Seven Principles of Man. Are the seven principles separate entities? Well, Dr. de Purucker says in *Fundamentals*, page 306: ". . . each of the elements, each of the principles, each of the rudiments to blossom forth later into divinity, is itself a septenary or sevenfold entity"; again, "For instance, the principle of Manas is septenary. It has its own atman, its buddhi, its manas — the manas-manas which is its own particular essence or swabhava." This page 306 is a big key to understanding the seven principles. Then on page 314, G. de P. says, "Our higher principles are actual entities living on their own planes, individual beings, fully conscious and thinking entities. Fix that thought firmly in your minds if you please." And again on page 360, "The monad lives in its own world, in its own logoc activity, with its quasi or semi-divine powers in full action, far more self-conscious on its own plane than you are or I am on this plane of consciousness. And similarly with the god within us, seated within the monad." And yet are the Seven Principles separate entities?

Let us look at it from another point of view. There are human beings, but there is no such entity as humanity. There are manasic entities — the human beings are lower manasic entities — but there is no such entity as the Manas-principle. There are buddhic entities, but no such entity as the Buddhi principle. There are atmic entities, but no such entity as the Atman principle. The principles are planes, are spheres, are worlds. What are we? We are manasic entities, lower manasic entities, sevenfold manasic entities evolving on the manas-plane or principle; and when we

have become perfect as a manasic entity we shall then become buddhic entities — sevenfold buddhic entities, and so on upwards forever. What are the seven principles? Are they the seven Kingdoms of Nature? Surely there is a very close analogy; in *Fundamentals*, page 489, G. de P. says:

These ten families — three of them we will leave without further mention at present — or rather these *seven manifest* families or stocks of the inflowing Life-Waves, these seven Life-Waves are the seven which left the corresponding globe A of the Moon at its death, and were its ten or seven principles.

These seven principles are evolved one from the other; that is, Atman evolves forth Buddhi and Buddhi evolves forth Manas, and so on down. Buddhi is the child of its parent Atman, Manas is the child of its parent Buddhi and the grandchild of its grandparent Atman, and so on. Each principle contains everything that its parent, either active or latent, so that we as manasic entities contain everything our parent Buddhi or our grandparent Atman has, but mostly latent at present. Now, when in the course of ages we become perfect manasic entities, we shall then be ready to pass up to the Buddhi principle or plane and so will become a Buddhic entity; but we shall not become our parent Buddhi, for our parent Buddhi will have also gone up a step or plane and will then be an Atmic entity and our grandparent Atman will have passed on to a still higher plane.

Now to complete the picture we must think of the Self, the Universal Self permeating all, the great Boundless Ocean, the Boundless All in which everything is bathed. Let us think of man as a center manifesting in a stream of consciousness in this Boundless ocean, this stream having no beginning and no end. And yet, as we look we see branch-streams flowing out from this

stream of consciousness in all directions, permeating and intermixing with all other streams of consciousness, connecting us with worlds visible and invisible, with globes, with planets, with solar systems, and with universes; uniting us with Gods, with Monads, with Souls, with Atoms. Truly our stream of consciousness is not only beginningless and endless, but also shoreless in every direction. It is the Boundless All.

As G. de P. so beautifully expresses it:

Examine the boundless spaces; there are no frontiers. Our vision halts; but where our vision halts then thought leaps beyond our vision. Imagination in its turn overleaps thought; and at the outermost limits where imagination fails, the marvelous spiritual consciousness within us wings its flight beyond, and we instinctively recognise our intrinsic oneness with the Boundless.

The Theosophical Forum

THE TURN OF THE YEAR — *L. L. W.*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

The perpetual miracle of Nature! How blind to it are often the children of this outer world — eyes that see not and hearts that will not understand. Yet every year the shining indicators of the celestial clock mark the inevitable cosmic hours. Shedding bounty, the Sun journeys through space. The tides of solar vitality wax and wane, unfolding the rich pageant of the seasons. Winged creatures obey his secret call and follow his sweep with beautiful unerring trust.

But man at last is awakening to the forgotten knowledge of his own past in ancient and happier civilizations. He begins to feel once more the rhythms of the spirit. The Mystery-Teachings have touched his soul, and Nature is no longer a painted veil but dissolves before his quickened sight, and he perceives the depths upon depths of the inner worlds. The Autumnal Equinox is a period of balance when Father Sun crosses the line of our equator. Day and night are then of equal length. There comes as it were a sacred pause when Nature holds her breath that the listening heart may hear the music of the spheres.

Life was so ordered in ancient times that its outer forms expressed these divine inner rhythms. In Egypt there were solemn religious festivals at the times when the sun's annual cycle brought the seasonal changes. Similarly, Greece celebrated these sacred periods, and Scandinavia too. In fact, the whole antique world felt and vibrated to the grand pulsations of the Solar Heart. And even we, at our blindest, often unconsciously

register these secret promptings. That is why we have the illuminating phrase, "the turn of the year." Farmers and poets, children and animals, seem to know with a sure instinct — can sense, indeed, almost the very moment when Nature, enjoying her drowsy autumnal dream, turns over and drops into winter sleep. Even on the pavements of city streets a hurrying worker, when he emerges into the morning air, may sometimes think, "Why, it smells like spring!" or, "It feels like winter today."

Theosophists everywhere know an especial quickening of the heart at the four Sacred Seasons — the Winter Solstice, the Spring Equinox, the Summer Solstice, and the Autumnal Equinox which we are approaching now. For we are assured that it is at these mystical turning-points of the sun's annual cycle that a great hope and a sublime promise whisper their secret across the cosmic spaces. All over the world are those who are weary of the common round; for whom the unending, monotonous changes rung upon the limited personal emotions have begun to pall; those who suspect that within this labyrinth of dissatisfactions and fevers and frustrations which we call life there lurks a secret clue. Finding and following it, they are sure they may enter upon the Great Adventure for which man feels that life was originally designed. That we have somehow missed it only the more convinces us that it can and must be attained. And into these groping hands Theosophy puts the long lost clue — Initiation.

Initiation has been described, from the technical standpoint, as a short cut to knowledge. It is reached through intensive spiritual training under a spiritual Teacher, one who is himself an Initiate, a Master of life. This intensive training can teach a man how to become strong enough so that he can run through rapidly what to average men are the enormously long courses of evolution. And we are told that the periods where initiation follows upon these stretches of intense self-development occur at the four Sacred

Seasons of the Year. Dr. de Purucker thus refers to them in *The Esoteric Tradition* (p. 1081):

. . . it was the attempt in all the Mystery-Schools of all the ancient nations to bring the seasons on earth into harmony with . . . man's inner life and future destiny.

So for Theosophists the Sacred Seasons are events, very happy, very solemn, very inspiring, when we pause for a time to reflect how different are the real meanings and purposes of Nature from those which humanity is pursuing today. Ignorance, blindness, "just not knowing" — these are the bane of the human soul. So we rejoice at these seasons because we understand that our recognition of them and their significance heralds the first swelling buds upon a tender shoot transplanted in our modern desert from the Gardens of the Hesperides. And grateful hearts are lifted then to our Elder Brothers and their spiritual Helpers to whom we owe our restoration to a place in the spiritual sun.

The Theosophical Forum

TRANSACTIONS OF THE POINT LOMA LODGE: VII — *G. de Purucker*

GOOD AND EVIL

G. de P. — In a recent meeting of this Lodge, one of the speakers made the statement that all the forces and substances, energies and attributes, of universal being are in their essence divine. Now this statement, abstractly speaking, or absolutely speaking, if we carry our thought inwards into the very heart of Parabrahman, is true. But the statement as made is not enough. If it were sufficient in statement, then there would be no evil anywhere in infinity. In other words, there could be no division of high and low, good and bad, right and left — in other words, no "pairs of opposites" — for all would be divine. It would be a corroboration of the unphilosophic chatter of some modern absolute-idealist theorists: "All is good" — which certainly is no truly philosophical statement.

Let me tell you that while it is true enough that in the absolute sense of the statement, no particular objection probably can be taken to it — for there is the Divine, utter divinity, Parabrahman, the heart of it, and beyond and more inward still, which is the Rootless Root of all things and beings — but here we are speaking of Para-brahman, infinitude in its inaccessibly highest reaches, unattainable by any human intellect; the reference here is to infinitude, and show me a time when infinity changes itself into "pairs of opposites" and in consequence undergoes manvantara on the one hand or pralaya on the other hand. Infinity means absolute, frontierless, beginning-less and endless immutability in the sense that infinitude, as infinitude, never becomes finitude or limitation; but within infinity there are multitudes of worlds and

of systems of worlds endlessly, for ever and for ever throughout eternity moving in evolutionary changes, and characterized by "pairs of opposites." So that there never is a time, ever and unto the utmost for ever, when everything, i. e., all infinity, vanishes into the heart of Parabrahman; because that would mean that infinity changes, and sometimes is in manvantara and sometimes is in pralaya. But these changes are predicable only of manifested things, and infinitude, as infinitude, never is subject to manifestation, for only finite things change. As long as infinity is, as long as eternity endures, which means endlessly for ever, "good" and "evil," signifying "opposites," shall be the Universe's eternal ways; and right and left, high and low, and the endlessly differing contrasts of manifestation, and hence good and bad, shall equally endlessly offer their contrasts.

There is a warning of importance that we must draw from this. Do not be deceived in refusing to accept it. There is good, endless good, but in the manifested states of universal being; and there is likewise evil, endless evil, but in the manifested states of universal being; and these in their complex and intricate combinations are the world's eternally dual ways. What are the Mamo-Chohans, those dread beings who preside at the pralayas, who preside in the material realms now, playing their parts in the Cosmic Drama, just as the divine gods play their opposite parts in the same Cosmic Drama? In this thought you have the truth, the two sides: darkness and light, right and left, good and bad, high and low, for ever and for ever and for ever endlessly in infinitude. Here is a secret that the Christians got partial hold of, a fragment of the occult teachings of the Sanctuary, and twisting it and distorting it, indeed caricaturing it, called one end of the contrast "God," and the other end of the contrast the "Devil." Such distortion is correct in neither of its aspects! This contrast is simply the eternal and ever-changing structure of the manifesting

Universes in utter infinitude, this infinitude being the playground, the scene, the frontierless theater, of Universes appearing and disappearing, because playing their parts as the Kosmic Sons of Light; including the Mamo-Chohans and their legions playing their own parts in constructing the material universe, and holding it together, guided nevertheless by the Sons of Light, and ascending from darkness into light throughout eternity, continually renewed by fresh influxes into the Kosmic Scenery as the gods pass onwards and upwards, and the Mamo-Chohans trail along behind them in the rear. Do you get the picture?

The warning is: don't let your brains ever be twisted with the idea that it is at any time safe to play with evil, in any connexion, on any occasion, in any way. Such play means going backwards, degenerating, joining forces with the Mamo-Chohans, the forces of darkness, of evil, of spiritual death. Light is light, and dark is dark — opposites. Good is good and bad is bad — opposites. Right is right and left is left, unto eternity. No wonder the Masters cry, the gods cry: Who is on my side? Make your choice. You are all free agents. You cannot play with the forces of Nature. Occultism is the weighing of your own soul in the balance of destiny. You will either go up, or you will go down. There is no other choice; and I think it is high time that these facts became better known. They are not a bit esoteric in the sense of being secret and told only to a select and chosen few. They are openly stated in all our standard books. These facts of Nature were the basis of the universal duality which formed the substance of the Zoroastrian system of thought, and of others.

There is immense comfort and happiness and peace in understanding these great facts properly, because they bring intellectual harmony and spiritual illumination into the mind; and will someone explain to me, if only good is and there is no

natural evil, how can evil exist at all? If you say that evil is but illusory, which is true enough when we understand what illusory means, this is not denying that evil exists, albeit it exists as an illusion. We human beings live in a world of maha-maya or cosmic illusion; and merely to call it "illusion" does not annihilate that form of maya which we men call evil. Do you catch the picture? If infinity is "good," it is obviously infinitely "good," and then there is therein no room for evil and imperfection, and the cosmos-wide series of pairs of opposites and contrasts; and heaven knows that they exist!

Be therefore on the side of the gods, the Sons of Light, of the Spirit. Go onwards and upwards: Excelsior, ever higher! There is our Path. But do not play tricks with your thoughts in this connexion, for think what you will and say what you may, you are either on one side, or on the other.

II

G. de P. — After speaking a fortnight ago upon the topic of Good and Evil, I heard misconstructions of what I then said, and I thought it good to seize the first opportunity offered to me in order to say a few words to disabuse the minds of those who misapprehended what it was my intention to say. When I spoke of one side of the Universe as being evil, and of the other side being good, and of the interconnexion of these twain, which contrast each other and thus set each other off, as being the world's eternal ways, these were general statements, abstract statements, and had only an indirect although real enough application to human problems — human good and evil, and so forth. I had no intention whatsoever to give utterance to the old Christian theological idea that there is an infinite personal God who is "good"; and an infinite something or somebody which or who is evil, and which or who, if not the Devil, is nevertheless the

Devil under another coat! No, that was not my meaning at all.

Now, try to follow me in thought, not only in time but into abstract space, which means no particular portion of space like our Earth, or the planets Venus or Mars, or again the Sun, or the Polar Star; but space generally, anywhere, abstract space; and the same with regard to Time: no particular point of time like now, or tomorrow, or yesterday, or a thousand or ten billion years ago, or the same period in the future. But abstract time, any time, anywhere. *If* change, division, opposites, opposition, contrasts, light and dark, matter and spirit, good and bad, short and long, these and all other eternal contrasts, were to vanish from the infinite Boundless, then every thing, high and low, from spirit to utmost matter, would vanish likewise, because all the Universe in all its infinite manifestations — and I use the word "Universe" here in the utterly boundless sense — is builded of these contrasts. We call that path or aspect leading upwards, the right hand, often also the side or path of light, of good, of compassion, of harmony; we speak of the other side or contrasting side, the side of imperfection, of constriction, of lack, of not yet unfolded attributes — in fact of every thing that is the opposite of the right hand, as the evil side of Nature, the dark side or the left hand.

Now then, are these things which are evil on the one hand and which exist by force of contrast with the things which are good on the other hand — are these same identical things, I ask, eternally evil, eternally unchanged, for ever fixed in essence as evil? Obviously not. There is as it were a constant turning of the Wheel of Kosmic Life, of the minor Wheels of Cosmic Lives; so that the evil rising on the Wheel becomes less evil, less imperfect, for imperfection slowly passes into relative perfection. It is the imperfection that we call "evil"; the relative perfection we call "good." This process has been going on from utter eternity, and it is endless. There never was a beginning; there never will be an

end of it, throughout timeless Time, throughout spaceless Space. These two poles of manifested being — of *manifested* being, please understand — whether spiritually manifested or materially manifested, these twain compose the eternally Kosmic Dual. Wipe them out, and all manifestation would vanish, because then there would be no contrasts. Is, then, imperfection infinite? Where can you show me a place where manifestation — imperfection — ends? I know no such place. It is, therefore, endless. Contrariwise, show me a place where light is not, where the other side, the other pole called the good, is not. Where does it end? I know of no such place. Thus the "good" and the "bad," the perfect and imperfect, and all intermediate and relative degrees of both — but never an ending to the perfect and never an ending to the imperfect — all exist within and through and because of that utter, ineffable, unthinkable Mystery which we men with our imperfect minds can refer to only in the words of the Vedic sage — THAT.

Imperfection and perfection are relative terms, because there are degrees of both; and both are comprised in the encircling, comprehending, bosom of the endless fields of the Boundless. They are all children of the Boundless. Even the imperfect is manifested by the Boundless. This does not mean that the imperfect is eternally good, for it is not. But turn in the other direction, to the right hand. Look at what we call the "perfect." The mere fact that there is perfect, and the more perfect, and the still more perfect, throughout infinity, shows us that even what we speak of as the right-hand — if we make distances between abstract points great enough — is a rising series of grades or stages or steps enlarging ever more to the right, and that these relative stages of increasing perfection we call "good," so that even that which is less to the right side we likewise call good. The same rule of thought applies to the left hand. What we call the

highest imperfect, or the most perfect of the imperfect, is really divine to beings and entities so far more to the left, to the imperfect side, that by right of contrast, by right of evolutionary unfolding, of growth, of change towards the right, towards betterment, this less imperfect can be called relatively spiritual or divine. Thus there is no absolute dividing line between the right and the left.

Now comes a point which is exceedingly important. Matter is not evil *per se*. What we call concreted matter is simply incomputable armies and hosts of monads aggregated together in compact order; and, as it were, when compared with us relatively wakened human beings these armies and hosts are asleep. Each such monad in its heart is divine, yet it is manifesting as matter. These are elementary thoughts, and yet they are a sublime teaching. One cannot therefore say that matter is essentially evil. It is merely less perfectly evolved or unfolded than is what we call spirit and the spiritual ranges which the gods occupy.

The whole truth is really simple enough, but people become perplexed about it because of its simplicity. The ideas of Western minds have been distorted by the teaching that there is an infinite Mind, an Individual, infinite, without body, parts, or passions, without any qualifications whatsoever, and that it is essentially distinct, nevertheless, and separate from the things which this Mind creates — a perfect nightmare of theories illogical and unsustainable throughout.

Now then, while it is perfectly true to state that evil, even cosmic evil, as we men speak of it, is imperfection, imperfection in growth — imperfect beings living in an imperfect state because of their imperfect evolutionary unfolding, of their imperfect development — while this is so, giving constant hope to imperfect beings to grow better, nevertheless hearken: this does not mean

that imperfect things or beings are essentially good. I cannot commit an evil deed, and cheat my brain into saying that the essence of the deed is divine and therefore I have done no wrong because there is no evil in the Universe. What I am trying to point out is that manifestation is the interblending of opposites; otherwise there could be no manifestation, which means limitations of all kinds of unfolding growth. But hearken also carefully to this: It is sheer folly for a man to accept and to believe that one side of the Universe is composed of innumerable hierarchies of bright and shining gods, who are our ancestors, the spiritual roots from which we draw our higher portions; and that all the other side of Nature, because of the law of contrast, does not balance or support the good side. In other words, I mean that there are evil powers in the Universe, evil forces: not absolutely evil, not essentially evil, not outside the womb of the Utterly Divine, but because of their relatively great imperfection they are distinctly evil to the race of men and to other beings more or less occupying our state on the Ladder of Life. Furthermore, for the same reason, there are localities in the Universe which to us are evil; they are true hells, not however in the Christian sense of the word, but globes so densely material that life or living there to us humans would be hell; and hence their influences on men are evil, and urge men to evil, for these influences are in large part the gross and heavy effluvia flowing forth from the dark side of Nature, and they are largely responsible for the temptations to which men too often succumb.

Just precisely as it is our duty to ally ourselves with our "Father in Heaven," with the divinities, our guardians and protectors whose strong hands hold us safe if we but follow them: in other words, just as it is our supreme duty to follow the right-hand Path; so on the other hand if we do not, and become negative and subject to the gross effluvia from the densely material spheres, then we

shall as surely take the downward path — as otherwise we shall surely follow the path to the gods.

It is these thoughts, originally of the Sanctuary of the Mysteries, which were taken over into some of the exoteric religions, such as Christianity, and often grossly distorted, twisted. But there is one point on which the Occult Teaching and Christian theology agree, for a wonder! Christian theology denies that matter is essentially evil. So do we. Even in the most hellish parts of the Galaxy, in its grossest and darkest spheres, and there are some that — well, if you knew about them you would not sleep tonight — even in those places, every mathematical point of the spheres and globes of which these places are builded, is as divine *in essence* as are the spheres of light in which the gods live in their realms. Hence, do not think that matter is evil *per se*. That would mean that from eternity evil is evil and cannot ever pass from imperfection into a growing perfection, in other words that beings cannot ever from evil become good. Evil abstractly consists of transitory states or conditions — however long it may last — in which monads pass during certain phases of their endless peregrinations upwards and onwards.

Nowhere, therefore, is evil eternal because essentially unchanging; and nowhere is what we men with our imperfect intelligence call "good," crystallized in immobility and remaining there in such state eternally. Half of manifested infinity is imperfection, in its innumerably relative degrees; and the other half is perfection in its innumerably relative degrees; and there is no absolute dividing line between the twain. It is obvious, of course, that I speak from the standpoint of a man, and because of my humanity make my own dividing lines between good and evil. A god would make different dividing lines. A Mamo-Chohan again would likewise make different dividing lines; but the rule as stated would be identic for all.

III

G. de P. — I should like once more to say a few words about something which I had occasion to speak of some weeks ago — twice, or it may be thrice. It was with regard to the esoteric teachings concerning the two Ways, the eternal Ways, of the Universe — good and evil. Now I have at different times said a good many things on this matter; but when I ceased speaking on the last occasion, I realized that I did not emphasize sufficiently one point, and this point was that when we look upon the Universe as Boundless Space, without frontiers or limits, then we always find that while in some parts of Boundless Space Universes are appearing and manifestation is going on, in other parts manifestation is disappearing — Universes are passing out of their manvantaric existence.

As long as there is manifestation, there is imperfection, which is what we men call evil. Consequently, as we are now dealing with boundless infinity and eternity, it is perfectly correct to say that evil and good are the world's eternal ways; otherwise expressed, perfection and imperfection are in Boundless Space from beginningless duration, and will last unto endless duration, endless eternity. But this does not mean that there are two infinities, to wit, an infinite of perfection and an infinite of imperfection. Obviously not. If there were an infinite of perfection, there could be no imperfection, no manifestation which is imperfection.

Next, and now passing from the boundless spaces, let us take an individual. Outside of and beyond and within the Kosmic infinite duality, our minds oblige us to recognise cosmic unity, and it is out of this unity that the duality springs; the duality has its heyday of manifestation; and then into the unity it vanishes again. This unity does not mean "one," because that would be the

beginning of numeration which is the beginning of manifestation, and it would likewise be the same mistake that the Christians made, in imagining their infinite personal God. The "one" I here use in the sense of the mystical zero, as H. P. B. employs it, signifying all-encompassing infinitude, from which the one, any one of the multitudes of ones, is born.

To illustrate: Take any one of us, a human being. We are beings in manifestation, therefore are we imperfect, and throughout beginningless and endless time we shall in various hierarchies and in different degrees of perfection, or of imperfection, on lower or on higher planes, be running the eternal cyclical round of developing and of unfolding ever more and more. But that ineffable Rootless Root within each one of us, is the utterly Boundless. This is a very important point of thought. It is upon this thought of non-duality that was based all the teaching of the great Hindu Avatara Sankaracharya; and his form of the Vedanta — a word which means "the real meaning of the Vedas," i. e., of the books of Wisdom — was called Adwaita, which means non-dualistic, because his thought dwelt mainly on this endlessly Divine, the Rootless Root which is the core of the core of the core of every unit in boundless infinitude.

Thus, then, strange paradox, so easily understandable and yet so difficult to explain: while the fields of boundless infinitude, or boundless space, are never empty of manifested, manifesting, and disappearing worlds, all of them are born from and return to that ineffable, unthinkable Mystery which we call THAT. THAT is not dual, and this is about all we can say concerning it. Hence it is not imperfect; it cannot even be said to be perfect; because perfection and imperfection are terms of human understanding, which means terms of an imperfectly developed intelligence — the human. It is beyond both perfection and imperfection. It is the ALL, the source and fountain-head of all the hierarchies of the

gods, as high as you will; and of the lowest elements of the material worlds, put them as low as you like. It is the ALL — we have no words with which to describe it. The Vedic Sages simply called it THAT. It is not a God; from it all the gods spring. It is not a World; from it all the worlds come; and like the gods, they ultimately return to it. It is not personal, it is not impersonal, for these again are human words signifying attributes of human perfection or imperfection. It is beyond all of them. It does not ever manifest, because infinity does not manifest. Only things and beings manifest. Yet from It all beings and things come. It includes within its all-comprehensive bosom all that ever was in boundless time everlasting, all that now is, and all that ever will be in endless time, or what we men call the limitless future. It neither thinks nor does it not think, because thinking and not-thinking are human terms or expressions, and emphatically it is not human. It is neither intelligent nor non-intelligent, because these again are human attributes — godlike attributes on the one hand, and limited attributes on the other hand.

As Lao-Tse said, embodying the same thought: As long as ye have good men in the State ye will have evil in the State. Why? Not because of the presence of good men; but there can be good men only when we have bad men and their bad actions showing off the good men by contrast. Do you catch this profound thought? As long as there is light, obviously you will have darkness. These things, light and darkness, are limited, however vast they may be, however small; and they again are not THAT, but are all included within THAT. THAT is beginningless. The gods begin in any one manvantara, and keep cyclically repeating their beginnings. The Universes begin, they end, and they repeat the cycles of manifestation throughout eternity, albeit ever rising on loftier scales. But THAT is without because beyond cycles. It is not an Individual; it contains all individuals. Any individual is limited,

otherwise it would not be an individual. An individual is a being or an entity which we know by contrast with other beings and entities against which the entity is set. You could not tell one flower from another flower unless you saw the contrast of flowers. Individuality is a sign of imperfection, of limitation; personality *a fortiori* even more so.

That is why the ancient Books of Wisdom state that THAT is neither good nor bad, neither intelligent nor non-intelligent; neither alive nor dead; neither long nor short nor high nor low. All these are attributes of limited things which we cannot predicate of the Unlimited Boundless. If it were long, however vast the length might be, it would have an ending and a beginning. Similarly with intelligence, kindness, goodness, compassion, harmony — all these things are attributes of limitation, albeit of spirit. IT is beyond them all encompasses them all, enwombs them all. From it they all spring; to it they all will return.

I would not weigh so frequently and so heavily on these thoughts were I not keenly sensible of the fact that they comprise questions of high metaphysics, questions of high philosophy, questions of high religious import which some day our Theosophical exponents will have to deal with. They will have to give an account of our sublime Wisdom to the keenest minds of the world. We shall be asked to explain our convictions, no longer to kindly audiences such as we gather in our halls and auditoriums; and we shall then need trained and polished minds, capable and capacious intellects, men and women fully acquainted with our sublime Thought-Wisdom, so that they can make statements in exposition which will have clarity, succinctness, and persuasive power to those who come to us and ask for light.

EVIL has no existence *per se* and is but the absence of good and exists but for him who is made its victim. It proceeds

from two causes, and no more than good is it an independent cause in nature. Nature is destitute of goodness or malice; she follows only immutable laws when she either gives life and joy, or sends suffering [and] death, and destroys what she has created. Nature has an antidote for every poison and her laws a reward for every suffering. . . . It is the blind law of necessity and the eternal fitness of things, and hence cannot be called Evil in Nature. — *The Mahatma Letters to A. P. Sinnett*, pp. 56-7

The Theosophical Forum

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

YEHUDI MENUHIN AND HIS VIEW OF REINCARNATION

Yehudi Menuhin, the California "wonder boy violinist," who is now almost of age, has recently given an interview which contains some remarkable evidence that he is not only a great musician, a supreme interpreter of the message of the great musical composers, but that although so young, he has a profound sympathy with the suffering of mankind and a burning desire to find the solution of our problems — perchance by turning the key of Reincarnation! The following quotations from the *Sun News-Pictorial*, Melbourne, Australia, will give an idea of the quality of his thought:

Now that I am on the verge of my manhood, the need for answers to life's problems is becoming more insistent. Sometimes I think I have found a philosophy that satisfies all my needs, but then I discover an incompleteness, and the whole building of my mind falls down. Not that the mere "I" matters much in this mutable world, nor in the deathless world of music. . . . I see everywhere about me vibration, vibration, vibration. . . . Sometimes I come near a person whose face I cannot see, but whose personality I can feel intensely vibrating in tune with me. Others who are often pleasant to look at and in manner are charming, make me feel that I want to run from them. . . . I speak of beauty, but the thought of beauty has lately made me more sad than happy. Wherever we travel about the world we see so much misery and utter despair. . . . Why, I ask again. I cannot find the true answer to this question. I have discussed it with men who make sociology their life work.

They sometimes have wonderful and sincere theories, but which of them has worked out in practice? There seems no true sense of ethical conduct in the leaders of the community. . . . The common denominator of humanity seems to be gain rather than giving. There is no pleasure in the world like giving, nor can anybody do his best work unless he gives. . . .

You ask me if I believe in reincarnation. Many have put that question to me. . . . I was sitting with my father looking over the blue water. I felt I knew it all long ago. I said to him: "Father, I sometimes dream of things that have happened long ago in some past age. I know so many things I have never heard of, or seen, or experienced. Knowledge of them seems to have been born in me. . . ." When I was eight my teacher Enesco told me there was so much more that I could teach him that I must not call him master. How could I know more than he, who was a man and a great master? There seems no other conclusion than that this may be what you call the reincarnation of other lives, other vibrations before me that have been growing more and more complete until I have become the medium through which they all sing their song of life. Could I be other than humble? . . . And there is always tomorrow coming over the hill, and a better song to sing than yesterday's.

Surely that is good Theosophy and the clue to the problems of this great musical genius.

THE KEYSTONE OF THE ARCH IN ANCIENT AMERICA: IMPORTANT DISCOVERY

The news has just been widely reported that a keystone of an arch has just been found at Monte Alban, Oaxaca, Mexico, and

that this has aroused great interest among archeologists. This discovery is of interest to students of Theosophy also, and no doubt to Masons. There are two kinds of arches, quite different in principle. The most primitive in construction is called the corbeled, or cantilever, or "false" arch. When side walls reach the proper height the mason begins to build inwards, each course of horizontal stones slightly overlapping the one below until they meet. The arched space looks like a hole cut into a wall, which it practically is. The "false" arch cannot stand alone; it is not self-supporting, but requires the weight of the side and upper layers of stone to prevent it falling inward. The "true" arch is composed of wedge-shaped voussoirs, with the keystone at the top locking the whole structure so that it can stand alone. The true arch has many advantages. Although the false arch is found in the Old World in a few places, it seems to be preceded by the far superior, scientific one, for true pointed arches like those of the medieval Gothic are found in Mesopotamia, dating back several thousand years before our era!

Until now, no trace of a true arch with keystone has been found in America, North or South, and this has been held by archaeologists as a sign of lack of intelligence on the part of the ancient Americans. The Mayans may not have had it, but this discovery of a keystone at Monte Alban in Southern Mexico, not far from Maya regions, shows that the pre-Columbians, in some parts of America at least, were not ignorant, rule-of-thumb builders. Monte Alban, unexplored till recently, is the acropolis of the ancient city of the Zapotec-Mixtecs, and was once one of the most magnificent and imposing sights in the world. It was there that Professor Alfonso Caso, the famous Mexican archaeologist, found the magnificent tombs of the Caciques in 1932. One tomb alone contained gold worth more than a million dollars!

But the special interest to us is contained in H. P. Blavatsky's

reference to the absence of the true arch in America, which she gives in *Isis Unveiled* I, 571-2, where she tells us that it was used "only in certain portions of the temples devoted to special purposes," and that the avoidance of the scientific keystone arch in other places was not from ignorance *but from intention*. Evidently, then, explorers have failed to find the true arch because of its rarity, and not because it did not exist. The student should read the pages mentioned above with care, and maybe something significant will suggest itself, at least to the intuitive.

Some archaeologists believe that the use of the flat lintel (made of wood) was confined to secular buildings among the Mayas, and that all buildings with the corbeled or "false" arch are religious. This is in harmony with Madame Blavatsky's information, and adds to its value. We may yet hear of the finding of the true arch in some hidden Maya temple.

NEWS FROM EASTER ISLAND: CEMETERY DISCOVERED

Apparently the trans-Pacific bridge of islands across which pilgrims could travel comparatively recently — geologically speaking, of course — is not out of fashion, in spite of its alleged "impossibility," according to a few geologists. The Chilean naval tanker "Maipo" called at Los Angeles in March and brought some important information about Easter Island. We quote a few points of special interest from the *Los Angeles Times*, March 11, 1936:

The Maipo made a six-day stop at Easter Island . . . and by a rare stroke of fortune a group of her officers found, they believe, what archaeologists have been searching for for the past century — graves and remains of the ancient race that dwelt there long before the dawn of the present civilization. . . . Both Lieut. E. Rodriguez, an expert on Easter Island lore, and the ship's surgeon, Dr. Hugo Vicuna, declare the skulls found in the graves are those of a race

entirely removed from the 382 Polynesians now living on the island.

The recent French expedition found inscriptions with ideographs almost identical with certain writings lately discovered in Asia.

The French scientists failed to locate the long-sought burial grounds, explained Rodriguez, who believes the two finds will serve to link definitely the civilization of the ancient Incas of the Andes with a contemporary Indo-Iranian culture, via a trans-Pacific bridge of islands — or possibly the fabled continent of which Easter is the sole remaining speck.

Not quite "the sole remaining speck" — there are many other relics, including parts of Southern California.

THE RISING TIDE OF THEOSOPHY IN INDIA?

We quote this for what it is worth, and should be glad to hear more detailed information if any reader can supply it. It has appeared in many newspapers. We clip this from the *Pasadena Star-News*, California, of June 2nd.

BOMBAY, India, June 2. (U.P.) — Ten thousand of India's millions of "untouchables" — inaugurated the first big scale effort today to break away from the religious bonds which for centuries have caused them to be regarded as pariahs.

At an intensely emotional meeting, they resolved in the future not to worship at the Hindu temples, not to observe Hindu festivals and not to visit holy places.

Their leaders announced they had chosen another religion than Hinduism. They did not disclose what it was but invited their followers to adopt a religion of their own, whether Mohammedanism, theosophy or Christianity —

provided only that it granted them the equality of status which is denied them under the ancient Hindu caste system from birth to death.

Theosophy is not "a religion" nor is the Theosophical Society a religious sect, but H. P. Blavatsky plainly says that Theosophy is at the root of all the great world faiths, and that future religions will rise from it.

MORE FIRE-WALKING REPORTS

The *Wide World Magazine* (London) for May publishes an interesting account of Fire-walking in Raiatea, a small island in the Leeward Group of the Society Islands. The author, Mr. Wilmon Menard, took part in the fire-walk and was not injured in the least, though the heat was so great as to blister the face of anyone who approached the thirty-foot-long pit of incandescent stones before the ceremony. The natives walked three times across the fire without haste, and the chief "crawled across the oven on all fours"! to the astonishment of even the native onlookers.

Mr. Menard says that the only sensation he experienced was that of minute electric shocks passing through the soles of his feet. This is specially interesting because others have described the same effect. Professor E. S. Stephenson of the Imperial Naval College, Tokio, later of Theosophical University, Point Loma, walked ninety feet over burning charcoal in Japan, and reported the same feeling of slight electric shocks, but no trace of heat. Mr. Menard mentions a daring French spectator who stepped on the hot stones without permission, and was instantly so badly burned that it took two months' hospital treatment to save his roasted extremities! Mr. Menard's feet were not prepared in any way, nor did he undergo any ceremonial forms. The chief and his *tahuas* (priests) conducted public and private chanting and other

ceremonies before the fire-walk began. The chief remarked that many learned white people talked loudly about the "scientific explanations" before they saw the fire-walk, but afterwards they were silent! Mr. Menard says he followed their example. He claims that he was in no way "suggested" into insensibility to the pain of burning, but that he greatly dreaded the ordeal. Even if no pain had been felt, why was there "no mark of fire" on the feet? A handkerchief dropped on the heated stones was reduced to ashes in an instant.

The Observer (London) for June 7th reports a Christian fire-walking ceremony in Bulgaria, conducted by old women! This takes place on June 4th on St. Konstantine's Day, at Vulgari, a village near Maiko Tirново, in the Stranja Mountains, and in several other neighboring villages. The old women proceed through the streets, dancing to a strange rhythmic melody played on bagpipes, and ultimately fall into a trance with trembling limbs. A great bonfire is lighted in the village square and finally the women dance for several minutes on the burning embers, keeping the 7-16 rhythmic beat. The report concludes: "Although the embers are red-hot and the *nestinarki* [the devout Christian women] fall down exhausted from the heat, their feet show not the slightest trace of burning."

For how many thousand years before Christianity may this extraordinary survival of ancient Atlantean magic have been celebrated? If control over the physical effects of ordinary fire may be obtained by unknown means, may not this fact be a clue to the possibility that intense heat-effects may be produced without ordinary heated conditions existing in the producer? It seems possible that the demonstration of fire-walking effects may lead scientists to realize what the Masters and H. P. Blavatsky mean in saying that the sun has no heat in it, *as we understand it*, though the appearance of heat is there.

**THE UNIVERSAL MYSTERY-LANGUAGE AND ITS
INTERPRETATION: VIII — *H. T. Edge***

VIII — THE SQUARE

This often denotes a quaternary or group of four, and in this sense it has to some extent been considered in connexion with the Cross and the Triangle. A septenate or group of seven can be divided into a three and a four, a triad and a quaternary, which may be said roughly to represent Spirit and Matter. This is familiar to students of Theosophy in the sevenfold constitution of man, in which we distinguish the higher triad and the lower quaternary, the former denoting the spiritual and immortal part of man, the latter his earthly and mortal part. This is of course not a hard and fast division, but merely a rough one for convenience. Man is not composed of a number of different principles put together, but he is a divine individuality manifesting itself through a series of vehicles. The same twofold division can be made as regards Nature in general; for we can speak of external Nature, represented by the square, and internal Nature or the spirit which animates external Nature, represented by the triangle.

That the number four is characteristic of physical nature may be seen from a number of instances, especially if we bear in mind that the cube, although having six sides, is a derivative of the square. We have four points of the compass, and cubical shapes are the most frequent in mineral forms. We naturally lay out our buildings and furniture on a rectangular plan. It has always been customary to speak of four elements as constituting the physical world — fire, air, water, and earth. These in modern physics are represented by heat, gas, liquid, solid, though there is some

hesitancy about including heat in the list. In the lower quaternary of man these are represented by Kama, Prana, Linga-sarira, and Sthula-sarira.

But there are other ways in which the quaternary can be made. It has already been said that the higher triad becomes a quaternary when we add to it a unit which represents the lower world. Two meanings of the quaternary are shown in the well-known Pythagorean symbol of the Tetraktys. This represents four cosmic planes, and the fourth of these planes is itself a quaternary. In assigning names to these four planes, there might be some difference of choice, but the important thing to get is the idea. We might call them the monadic, the spiritual-mental, the psychomental, and the physical. The first is a unit, a self; the next is a duad, representing action and bipolar force; the third is a synthesis of one and two; and the fourth is a kind of repetition of the second. The two and the four are vehicles; the one and the three are what acts through those vehicles. The four suits in the playing cards denote these four planes in the Tetraktys; for the cards derive from the Tarots, which are mystic symbolism and used in divination. The suits were batons, which have become clubs; cups, which are now hearts; swords, Italian *spade*, now spades; and coins or pentacles, now represented by diamonds. The symbolic meaning of the upright stroke or rod, of the cup, and of the sword (a form of cross, uniting a perpendicular with a horizontal line), are evident.

Under the Triangle we spoke of the Triad of Father, Mother, Son and we read in *The Secret Doctrine* that

the "Son" of the immaculate Celestial Virgin (or the undifferentiated cosmic protyle, Matter in its infinitude) is born again on Earth as the Son of the terrestrial Eve, and becomes Humanity as a total — past, present, and future. . . Above, the Son is the whole KOSMOS; below, he is MANKIND. The triad of triangle becomes Tetraktys, the Sacred Pythagorean number, the perfect square and a 6-faced cube on Earth. — I, 60

The figure of a square within a circle (or a cross within a circle] is one of the most sacred in Occultism; it signifies completeness or perfection in the manifestation of the Universe or of Man from out the Boundless.

The problem of squaring the circle means for the student of practical Occultism the adapting of finite life to the infinite, of Spirit to Matter, and Matter to Spirit. As geometry and mathematics, number and magnitude, are keys to cosmic architecture, it follows that the problem of squaring the circle is a most important key to unlock many mysteries.

The Theosophical Forum

PREPARATION FOR THEOSOPHIC STUDY (1) — H. N. Stokes

May 15, 1923

Dear Mr. G__

I was glad to get your letter and apologize for delay in replying. The chief result so far of my enthusiasm for the study of *The Secret Doctrine* — an indirect one, of course — is a broken leg, which has brought confusion to all my undertakings. Let me advise you to shut off your meditations on pralayas when you are crossing a street; else some automobile may teach you a practical lesson on the subject, as it did me. . . .

But to come down to brass tacks, what is the use of all this study and is one really a theosophist in proportion to his familiarity with *The Secret Doctrine*?

Your name is a German one; perhaps you can read the following from Goethe's *Faust*, which presents the matter in a nutshell. It is part of a dialogue between Faust, the philosopher and dreamer, and Wagner, his pupil, a semi-desiccated bookworm, Faust speaking. Lest I be mistaken I append what is perhaps the best, although an inferior, English rendering:

Das Pergament, ist das der heil'ge Bronnen,
Woraus ein Trunk den Durst auf ewig stillt?
Erquickung hast du nicht gewonnen,
Wenn sie dir nicht aus eign'er Seele quillt.

(Is parchment, then, the holy fount before thee,
A draught wherefrom thy thirst forever slakes?
No true refreshment can restore thee,
Save what from thine own soul spontaneous breaks.)

I once knew a man who thought he was studying botany — as an avocation, for by vocation he was a chemist, and a noted one — while in reality all he was doing was filling his head with Latin names and pressing and drying and labeling specimens of whose life history, whose evolution, and whose role in the great factory of nature he did know one thing and cared less. This modern Wagner once took me on a fifty mile excursion in Switzerland to find what he claimed was a most interesting plant, a specimen of which he wanted for his herbarium. Arrived at our destination I happened to pluck what was to me one of the most beautiful wild flowers I had ever seen and asked him about it, why it was built as it was, and why it grew in such a lonely spot, seemingly wasting its beauty. "Oh, pooh," he replied, "that's nothing but a common — a Latin name which I am glad to have forgotten. Whereupon he espied the plant he was after, plunged into the water without thinking to remove his clothing, and brought out something which looked to me like a decayed spatterdock, but to which he gave a huge Latin name and assured me it was very rare — all he could tell me about it. But he was perfectly happy in having a new specimen for his collection.

Now, I have not the least antipathy to Latin names and herbaria. I admit the value of systematic botany and wish I knew more about it. But I do not desire that knowledge at the expense of other matters. You may have a head large enough to harbor a Latin dictionary, and at the same time to understand and love the things you work with, not as mere "specimens," but as living beings related to all other lives. If you cannot accommodate both, you will do well to trouble yourself less with these details and think more of the greater. The letter killeth; it is the spirit which giveth life. To my mind the despised dandelion is one of the most beautiful of all wild flowers. The very sight of it starts me to thinking on the big problems. What is beauty, for example? Why

is it that the bright flower appeals to me? We know that the object — one object — of the bright color is to attract insects for the purpose of cross-fertilization. But why are they attracted, otherwise than by the desire to find honey? Why would white do as well, as it often does? Why is it that these insects are themselves not only brilliant, but adorned with the most elaborate and beautiful patterns which cannot be ascribed to protective mimicry? Is it that they have the same power of seeing beauty in each other, as we have when a beautiful face or voice attracts us? Is this sensing of beauty, either in the insect or ourselves, of sexual origin only, or connected in other ways with race-preservation? Or is it the beginning, in the insect and the flower, of what is more highly developed in us, of a really esthetic trend in nature, which goes far more deeply down to the root of things? Is it not possible that there are more highly developed beings who not only discern beauty where we do, but who even find it where we see only ugliness? May there not be a Power to whom the crocodile, the rhinoceros and the warthog are truly beautiful, and which regards them with something akin to love? Is it not possible that we may best emulate this Power by trying to see the beautiful in all the so-called ugly things in nature, even in those of our fellow men whom we are prompted to despise?

These are some of the thoughts which come to me when I give way to them, and the more I have considered it the more I have become convinced that beneficence, beauty, and most of all, Love, are the ends towards which the universe strives. It may be all wrong, a mere dream, but to my mind it is the only sane solution of the world riddle. I am not giving you anything original; many a writer has hinted at it or stated it fully. But I did not get it out of books; most of all I did not get it out of *The Secret Doctrine* or any other work with a theosophical title. I found it in the poets, in Swinburne (for all his sensuousness), in Browning, in Walt

Whitman, in Keats and many another. But, and this is the moral of my citation from Goethe, I could have read these poets *ad infinitum*, and would have been held only by the trivialities, by the narratives, or by the music of the verse, had it not been in myself to do more. To the truth that Love is the end — the end, not a means — of creation, I should have been stone blind and deaf had it not been already in me to perceive it. Let me quote you a few lines from Browning's "Reverie," in *Asolando*, which, by the way, you will not find in any volume of selections, so little is he understood:

Then life is — to wake not sleep,
Rise and not rest, but press
From earth's level where blindly creep
Things perfected, more or less,
To the heaven's height, far and steep,
Where, amid what strifes and storms
May wait the adventurous quest,
Power is Love — transports, transforms
Who aspired from worst to best,
Sought the soul's world, spurned the worms.

When I read those lines, years and years ago, I saw the whole thing at once; because conscious of all that is truly worth while in Theosophy; gained a standpoint which I sorely needed and without which life would not have been worth the going through. But it was hidden in my own soul; it had but to respond; the poet simply evoked what was already there. Deep calls to deep; I knew that I had known it already.

If you cannot get this attitude the study of *The Secret Doctrine* will be the mere study of a "parchment." You must strive for the lofty altitudes where "Power is Love." The study of *The Secret Doctrine* will help you to keep out of the many byways and left-hand paths

which a pseudo-occultism would have you follow; it will give you a noble philosophy; it will strengthen and confirm your convictions; it will discipline your mind so that you will not become unduly mushy or sentimental in your ideas, it will help you to be plodding and patient. *But*, you must do other reading if you would not hunt for a needle in a haystack. Get next to the great poets, for they most of all have the inner light, have seen the vision and have been able to express it. Prepare for each reading of *The Secret Doctrine* by a few minutes with one of them. Try to infuse into your studies the spirit I have mentioned. Do not be over-critical of your fellow-students if they appear to be one of the Wagner type; who knows? Don't hide your light — if you have one — under a bushel, but help them to see as you do, as I am sure they expect of you.

And don't forget, . . . that no amount of realization of this, no amount of worshiping at the shrine of celestial beauty, no amount of recognition of the law that "Power is Love," will profit you in the least unless you make them part of your own nature, unless you build them into your daily thoughts and acts. If God loves the ugliest and most venomous beast, and nurtures it, if He loves what we call the sinner, how can you expect to become godlike unless you do the same to all beings, especially to those fellow mortals on whom you look with indifference if not disdain? The light is within you; you must find it there; and equally you must learn to see it in others. That Inner, or Higher, Self is something wonderfully beautiful, and it exists in everyone you meet, however veiled. For wise purposes nature has provided that perhaps once or twice in a lifetime and for a brief period, alas, most of us get such glimpses more or less distinctly; we see through the veil of another soul. This must not be misunderstood. It is commonly ridiculed as an illusion, as self-deception. It is nothing of the kind; it alone is the truth, the permanent; it is our

common vision which deceives us. All of goodness and beauty which you see in another actually exists, and more, you see it because it exists in yourself likewise; else you would be blind to it. I admit that powers which pertain to the buddhic plane must be carefully controlled here. But if you can get and keep this vision, can see the beauty in everyone, free from the fumes which arise from your lower nature and which tend to distort it, free from the selfish idea that you must at the same time possess or control or dominate, seeing that selflessness only gives you the right to it, without being blinded or led into the unreasonable, then you will have gained the most priceless jewel that Theosophy has for you; then, you may safely proceed *ad libitum* with the study of *The Secret Doctrine*; you will never become a Wagner.

Cordially yours,

Editor of the Critic

The Theosophical Forum

A LETTER FROM DR. DE PURUCKER

24th July, 1936.

Dear Brother:

Your undated letter — but postmarked "Jul 20," 1936, — reached me this morning; and naturally I gave to it the attention and thoughtful consideration which it struck me its contents well merited. You are dead right in calling me "a busy man," for, as a matter of fact, my official duties and other routine-work have been increasing since I assumed office so greatly that at the present time I am literally driven to find time to take care of the many things that come under my hand. Therefore, please forgive me for this present letter which may seem to you rather inadequate. I simply cannot find time for a longer chat with you.

I turn immediately and without preliminaries to what seems to be the gist of your very brotherly and kind communication to me; but first let me say straight from my heart to yours, that there is not the slightest need of asking my pardon for your "bluntness," nor for your straightforward speech. There is nothing in the world that I respect so highly in a man as intellectual honesty; and if this be coupled with spiritual discernment, I do my best to make such a man my brother, attempting to establish between us bonds that will withstand foolish human folly. How could I, as a Theosophist, and a Theosophical Leader to boot, object to a man's writing to me the convictions of his heart, and on any subject whatsoever, as you do in this letter to me, on the matter of that perhaps most difficult of all our Theosophical tenets, Karman? We might call this wondrous doctrine a hundred-faceted truth, and a hundred men will see, each one, a facet; and in the dazzling brilliance emanating from the source of illumination, be blind to

the existence of the other ninety-nine facets, and hear nevertheless of the existence of the other ninety-nine opinions about karman, and perhaps look upon these other ninety-nine opinions as fallacious or "pernicious," as you qualify my understanding of karman, and my teachings on it. Now, I fully agree with you that outside of the difficulty of a fully rounded understanding of the doctrine of karman, it has a most especial application to the human life of us men, and therefore has not merely a metaphysical significance, but a very important, a highly important, moral and ethical one.

First, let me disabuse your good and brotherly mind of the fallacy which it is evident you cherish regarding my teaching about karman, which, if I understand you, you seem to think "inculcates unconscious fatalism." In this you are utterly wrong. My understanding of this wondrous doctrine runs diametrically counter to such a conception; for to me karman is the only doctrine which will logically destroy the theory which the West calls Fatalism — whether unconscious, or conscious and explicitly taught. However, here is no place to labor this point, for if you are interested in my conception or teaching of karman, you have but to consult my many books, lectures, and various statements on the subject, and — not making the mistake of taking one statement as the key to all other statements, but taking them all together, you will be able to get a synthetic view of what I mean to say about it when I write about it.

That people should misunderstand the doctrine of karman, and that many should have many differing views about it, is not only to be expected, but in my judgment is one of the very best possible things that could happen in the T. S., for it does away with the dogmatic attitude; it leads us to have charity for the opinions or convictions of others; it introduces freshness and variety of thought in our intercommunications of ideas; and

above everything else perhaps it brings about that healthy respect for the convictions of others which can never be obtained by shallow, superficial, and often unconsciously hypocritical adherence to others" opinions merely in order to attain surface unanimity.

I do hope you understand what I have in mind, for what I have in mind is exactly, and word for word, and sentence for sentence, what H. P. B. so nobly wrote in her first message to the American Theosophists in 1888, and which, although I doubt not you know it well, I venture to quote here: "Orthodoxy in Theosophy is a thing neither possible nor desirable. It is diversity of opinion, within certain limits that keeps the Theosophical Society a living and a healthy body, its many other ugly features notwithstanding. Were it not, also, for the existence of a large amount of uncertainty in the minds of students of Theosophy, such healthy divergencies would be impossible, and the Society would degenerate into a sect, in which a narrow and stereotyped creed would take the place of the living and breathing spirit of Truth and an ever growing Knowledge."

Now these words grandly say what I myself feel and believe; and I repeat once more, as I have said a thousand times if once, that one of my first duties is to keep the platform of the T. S. free and open, exactly as H. P. B., our grand first Teacher, gave it to us as one of our most sacred heritages. This does not mean that the platform of the T. S. should be thrown open to every lunatic or crank or self-seeking place-hunter who wants to air his views, usually for selfish and often for obliquely ethical reasons, for this would be sheer folly, and would at the best make of the platform of the T. S. a mere debating ground of amiable and superficially-minded people, and at the worst cause the T. S. to degenerate into a mere forum so to speak devoted to the airing of opinions of often aggressive and possibly selfish individuals, and a losing of

the inner Light and of our first purpose in the T. S., which is the giving of the blessed God-Wisdom of the archaic ages to the hungry hearts of men and women.

In my judgment, the T. S. platform should be devoted to Theosophy, and Theosophy alone, first, last, in between, and all the time; but just because of this reason, I believe in healthy divergencies of opinion, and the right of every true Theosophist, or indeed of any F. T. S., whatever his private convictions or opinions on Theosophical doctrines may be, to have at least his "day in court," as the lawyers say — which does not mean that liberty should degenerate into license, and that the free and full expression of one's inner convictions should degenerate into argumentative and fruitless controversy. This last I am irrevocably opposed to; and I try to set the example myself in never answering attacks made upon me, in invariably refusing to enter into controversial discussions or argumentative exchanges of opinion, or wordy quarrels; for these are not only "pernicious," but waste time, misuse energy which is so badly needed for our Theosophical work among men, and indeed in their worst aspects often make Theosophists ridiculous in the sight of normal men and women who are looking for truth, but who know enough of the world and its follies to sheer away in disgust from stormy or argumentative and therefore always fruitless controversial proposition and answer followed by reply and rejoinder succeeded by surrejoinder, etc., etc.

The world is not interested in the differences of opinions as among Theosophists, and it is our duty to give them the Theosophical teachings; but it is equally as right for us Theosophists to preserve a free and open platform as among ourselves, so that we shall have a free and honorable exchange of opinions. Thus X is convinced that his understanding of a doctrine Y is correct; I say, let X freely and fearlessly but always

courteously state his convictions, verbally or in writing; if they differ from the convictions of Z, then give Z the same right; but once that Z and X have each had his chance to point out each one's understanding of the doctrine Y, and when each has thus had his say, let him be modest and decent and drop the matter; for if carried into a controversy, it would simply result in both X and Z being firmly convinced that the other is a fool or nearly so, or teaches a pernicious doctrine or an evil one, and neither will convince the other, and the world will laugh at us as a lot of squabbling, quarreling cranks. "See how these Christians love one another!" It is the foregoing general reasons, which I do not think I have ever written before to any single individual, or, indeed, to any group of individuals, which will show to you why I adjudge it both unwise and untimely, as well as contrary to my own convictions, to enter into a controversy on any point of Theosophical teaching, or on any point of fact whatsoever, with anybody whatsoever. My teachings are before the world; let them stand as stated; from time to time I may enlarge them or clarify them; let others accept them or reject them, as these others think well. If some one else likes to write or say his opinion about a Theosophical doctrine such as Karman, let him state it, and then, yield the platform to some other F. T. S., who may be much more interested in some other aspect of Theosophy than he is in the one that might interest me or you or X or Z.

I have absolutely no faith whatsoever in controversial argumentations; I think they are mischievous in the last degree. What we want and need, and should cultivate, is independence of thought, independence of judgment, healthy divergencies of conviction and of opinion, and retain a free platform for their expression; but should never allow a platform to be the field of wordy argumentation or the bandying of arguments about this, that, or some other facet of teaching which X or Z or A or B may

foolishly flatter himself he knows better than some other man. Let each man state his conviction, and then leave the field open to some other man who will then have his chance to give his opinion about some other doctrine which may interest him more greatly.

I do hope you understand this. As long as I live, I think I can safely say I shall never be drawn into any controversy, although always willing, as I am at the present moment in writing to you, to state my opinion about things; if you don't like it, drop it, for that is your undoubted right; and I believe that it is by thus learning respect for each other's healthy divergencies of feeling and opinion that the T. S. as H. P. B. gave it to us will be best preserved into the future, and do its finest and highest work among men.

Never think for a moment that you would ever be ostracized in our T. S., or judged unkindly or wrongly or meanly, because you at any time may express an honest conviction in the courtesy which I know to be an innate attribute of your character. This is your undoubted right in the T. S., and anyone who would call your opinions "heretical" or a "heresy" would be looked upon by me as acting or speaking in an untheosophical manner.

By the way, wouldn't you like to write an article on karman, giving your opinions about it, which we could print in our Theosophical Forum? I think it might be interesting, and, in fact, I am sure it would be. It is quite possible that it might evoke some other F. T. S.'s opinion about karman, which we would also print, and possibly a third; but if there were ever the first sign of such a healthy exchange of fine divergencies of conviction verging into a controversy, then I should feel it my duty to suggest to our editors to devote the space given to karman to something else of equal importance in a way. This is following H. P. B.'s tradition.

Now, for heaven's sake, get any foolish little bee that may be buzzing around in your bonnet that we of Point Loma dislike

healthy divergencies of opinion — get such a bee out of your bonnet and kick it over the North Pole. What I do like is healthy divergencies of opinion, courteously, candidly, expressed, orally or written. But I will not tolerate any more of the abominable, often insulting, usually bigoted, windy controversies that have so often disgraced the different Theosophical Societies since H. P. B.'s days. I believe in freedom of conscience, in freedom of speech, and in H. P. B.'s principles — "healthy divergencies of opinion," for this saves us from orthodoxy, "its other ugly features notwithstanding."

Bless you for the good work you have been striving so hard to do for fraternization. It has my deepest sympathy as long as it remains work for fraternization; but should it ever degenerate into mawkish sentimentalism or superficial friendliness covering a mass of festering and ignominious hatreds, I will wash my hands of it. The fraternization-movement was started in a very sincere attempt to bring Theosophists of different Theosophical Societies together, in order that they might know each other somewhat better, and learn to respect the good points that each group of individuals holds *as individuals*, and also so that we might openly and publicly and honorably and sincerely profess our common alliance on those points of the teaching of the Masters and of H. P. B. which we all accept. Is not this but another instance of putting into action H. P. B.'s clarion call for the retention of healthy divergencies of opinion so as to prevent orthodoxy?

The best of good wishes to you.

I am, as always, my dear Brother,

Fraternally and faithfully yours,

G. DE PURUCKER.

P.S. I have just got word from Clapp that he has been corresponding with you about the matter of Karman. As I think it would interest him to hear what I have written to you, I am sending to him a copy of this my letter to you, as it does not seem to be private, I hope you will agree with me that I have not done wrong, as there seems to be no violation of any confidence whatsoever. — G. de P.

Later. After writing all the above, I felt I must add just a few lines, expressing my emphatic agreement with your good self in the matter of the common need of all Theosophical Societies, our own dear T. S. included, of a fuller and more adequate preparation of and presentation of *elementary* Theosophy to the public — to the world. This is one thing upon which I have been hammering ever since I took office, and it is extraordinary how difficult it is to find capable presenters of elementary Theosophical teaching. Scholars in Theosophy abound, profound students are everywhere; but those who are capable of stating Theosophy to the public simply and attractively seem very few, and yet it is our greatest common need, I do believe. I am constantly talking of this. — G. de P.

The Theosophical Forum

THEOSOPHICAL NOTEBOOK

WHAT ATTRACTED ME TO THEOSOPHY?

(From the Sydney, Australia, Theosophical Study Class)

Looking back many years, I find it hard to say exactly what attracted me to Theosophy, but I can very easily tell what has kept me attracted. The teaching of Reincarnation was one of the first things. I remember as a child of eight or thereabouts, thinking what a lovely thing it would be if we could come back and start from where we left off. I had probably been naughty and felt it was a hopeless task to be as good as I wanted to be, and it flashed across my mind that we could, if given more chances, *learn* to be good!

In my early childhood I was a regular attendant at the Methodist Sunday School. In the country we had mostly uneducated Sunday School Superintendents, and the heaven and hell of angels and eternal fires respectively were dinned into our young minds. Even so young I realized how hard it was to do all the good things and not to do the naughty things, and the idea of Reincarnation to my childish mind was *reasonable!* How much more does it seem so now, with the knowledge of the teaching of Karman. How different every apparent trouble appears when we consider it as an adjustment: within it an opportunity and a lesson, if we will see it! *We are our own karman.*

It is the sweet reasonableness of the teachings of Theosophy that has kept me wanting to follow them still further. These teachings alter the whole aspect of our lives. It is as if we looked at things from a brighter viewpoint; we see them as a whole, connected and illuminated with a brighter light. We understand more, and

so much is clearer that we have faith that those things which we do not see so well will also become clear as we climb a little higher. — Ada Bardsley

What attracts me about Theosophy? Simply the fact that it is a straightforward ancient Religion or Philosophy that has been known throughout the ages in many countries. It is no new-fangled teaching or belief that sprang up in a night, that attracts for a time and soon leaves one floundering again. No! It is changeless, and gives one a clear and fuller insight into life and its problems, giving satisfactory answers to many questions.

Through Theosophy one learns the simple truths of life; it helps one to understand himself and the "other man." It is free from dogmas. It is not a matter of "burning fire" when one passes on, but "Whatsoever a man soweth, that shall he also reap"; and we must all do our own reaping. This is what I find so attractive about Theosophy — its fairness: each man has to account to himself for his own actions, and to no other person, whether seen or unseen. — Ethne Hinchey

If we were to write one word embracing all that drew us to Theosophy, that word would be Justice. There is a wonderfully clarifying element in absolute Justice that commands attention. It holds the truth; it deals impersonally, compassionately, with every man. We find it in all the teachings of Theosophy: Reincarnation, Karman, the Doctrine of Cycles, the Brotherhood of Man — all these drew us to Theosophy. Likewise the object drew us: To make Theosophy a living power in our lives; to spread it, and that is to live it; to go about our daily work in such a manner as will prove the inner working of a spiritual power; and to know that we can become channels through which love and peace can flow out to help and heal the sore and sad hearts who have not yet found their way to the source of true living.

The life of a Theosophist is a very busy one: no idle moments; no time to "kill"; hardly enough time for doing all there is to be done. From the standpoint of Theosophy, life itself becomes attractive, and those duties which at times have been dull and uninteresting take on a new and lovely aspect when laid upon the Altar of the Supreme, without thought of result or return. — Kate Nixon

This is rather a difficult question to answer as there is so much to be considered, but I would name the teachings of Reincarnation and Karman, because believing in them has meant so much to me.

Theosophy teaches that nothing happens by chance; that all is part of a well-ordered whole; and that each and every one of us has played his part, is playing it now, and will go on playing it in future incarnations. We are our own masters, and we make or mar our own lives. If we fail now and then, there is always another chance. This, I think, is a very comforting truth. To those who truly believe and practise the teachings of Theosophy there can be no injustice, bringing in its train that terrible destroyer, self-pity. If we believe that perfect justice rules the world, we gain strength to fight the troubles which we know *we have made ourselves*, and to rise above them. — Enid I. Hinchey

When I was young I often wondered "*Why?*" Why was the world made? Why was I here? What was the purpose of it all? But I could never find an answer. No one seemed to know. And yet I thought there *must* be a reason for it all, and an explanation, if one could but find it. Then, in my early twenties, a friend put one of the first Theosophical books, written in the "eighties," into my hands, and as a lightning flash, the realization came: "Here is the *truth*." From that time on I have never wavered from the firm conviction that in Theosophy alone can one find the explanation of life, and solve the many problems that beset us.

Since those years, now far agone, much wider and deeper explanations have been given. Year after year the veil has been lifted a little more, for those who earnestly wish to know the Truth. All our Teachers have shown us different aspects of the truth. As we know, we must learn the alphabet before we can spell, and so on, step by step, ever rising in the scale of knowledge. Katherine Tingley gave us a great key: to think of Theosophy as *a life to be lived rather than a body of teachings*. Teachings about Nature, the formation of worlds, the why and wherefore of the glorious sun and beautiful stars — we are apt to look upon these as something apart from ourselves and our daily lives. This is quite a mistake. We need to live a Theosophic life to understand Theosophy, and the more one studies Theosophy the more this truth becomes a reality. — Emily I. Willans

WEBS OF DESTINY — Hazel Minot

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

There is an aspect of human nature — not its best — that loves above everything to shift the responsibility of its actions to someone else. But this aspect is only one of the many that go to make up human nature — some good, some bad, and some indifferent — and human nature *in toto* is only one small portion of that compound entity called "man." Even as the seven-fold man ranges from the divine, in which he is rooted, to the physical vehicle through which he expresses himself on this earth, so too that particular aspect of him, his human nature, has its ranges of expression, sometimes appearing to be little more than a self-conscious animal, at other times giving glimpses of those finer qualities which prove its strait relation with the spiritual elements in man's makeup and which link him to godlike beings. Because of this strait relationship, whatever the temptation to put the blame on others, there has always been a something within — call it the "still, small voice" if you like — that repudiates such an attitude as cowardly, and prefers to take its medicine without whimpering. It is this same "something within" that makes us self-respecting, when we are such, and which sends us questing for some philosophy of life that will stimulate this self-respect through its stressing of individual responsibility.

Responsibility in thought, in act — indeed responsibility, *our own responsibility*, as the very source of our existence — is the essence of the Theosophical doctrine of Karman. This teaching has a wide field of expression, ranging from the simple "Whatsoever a man

soweth, that shall he also reap" to the recondite truths regarding the origin of good and evil. Within this range are vast possibilities of study, food for deep and sincere thought — thought that cannot stop at mere thinking but must realize itself in applied action. But whichever of its many aspects is chosen for study, this fundamental principle must be reckoned with: the beginning and the end are individual responsibility. It is this that makes of Karman so preeminently a doctrine of self-respect.

In *The Esoteric Tradition* (footnote 20, p. 56) Dr. de Purucker describes Karman as

all that *total* of a soul, which is itself, brought into present being by its own willing and thinking and feeling, working upon the fabric and the substance of itself, and thus preparing its future destiny, as its present existence was the destiny prepared for itself by its own past lives. The basis, or root, or essence, or, may we not say the law of itself — Karman — rises in the "heart" of the Universe which is immortal, impersonal, infinite, Life itself, Divine Harmony, whence spring into active operation all the so-called "Laws" of Nature that make the Mighty Mother what she is in all her septenary or denary constitution.

In the teaching as thus presented we see the relation and interrelation of Karman with its twin doctrine, Reimbodiment. This dual line of activity, coupled with the idea that the soul is "working upon the fabric . . . of itself," brings to the imagination the picture of a mighty web — Life: its warp, a long succession of reimbodiments; its woof, the series of actions and reactions that color, brightly or darkly, the web we weave from the *substance of ourselves*. Accepting the doctrine of Reimbodiment, the threads of our warp, at least, take on a suggestion of form, whatever their varying quality, and following the analogy of the web there

appears to be no great obstacle to understanding that the weaving of the pattern is in our hands, for good or ill. Sometime, somewhere, we have chosen our pattern, and down through the ages we have developed it, strand by strand. As weavers of destiny we are creative in our work, for the design, however imperfect, is of our own making: here and there hardly perceptible shifts of color take place; occasionally there is an irregularity of line, a change in form, so that the pattern, if viewed in its entirety, gives evidence of a definite departure from the plan as first conceived.

The Theosophical Forum

WHO ARE THE FREE-IN-LIFE? — M. M. T.

The way to final freedom is within thy SELF. — H. P. Blavatsky in *The Voice of the Silence*

Age after age heroes have labored, battled, and perished in behalf of the cause of freedom. And now, today, from philosophers, economists, historians, even from fiction-writers, we begin to hear of "the new slavery." What, then, and where is freedom? Who are the free-in-life?

We are obliged to face the fact that there still linger in the world relics of every form of slavery that ever existed. Chattel slavery is largely a thing of the past, but statistics are available as to the number of slaves there still are. Liberty of conscience has been often proclaimed, but there are occasional rumors of differences in religion being used as a means of inciting men to bloody conflict, and is not the cold shoulder of prejudice against the unexamined beliefs of others a husky relic of religious persecution? Women enjoy a tremendous increase in personal liberty, but there is an international organization for the abolition of the white slave traffic. Children may no longer be sold away from their parents, but a newspaper in Shanghai recently reported the horrors of the boy-slavery that industrial enterprises have introduced there.

The "new slavery" is defined by some as the subjection of man to his own labor-saving inventions. Some of these, on account of their ubiquitous vocal suggestion have the power to form molds of mass-thought to imprison men's minds, while others actually threaten to render men superfluous as manual laborers.

Professor Nicolas Berdyaev, author of *Freedom and the Spirit* and

The Meaning of History, predicts a fight to the death between man and the machine. (1) He states that through the triumphs of technical invention man has become a "cosmiurge," with the power to bring on cataclysms that can destroy large numbers of the human race at will; and that only the human spirit, united with God, can safeguard mankind in the present crisis. He declares that conditions cannot return to the way they were before all this mechanization developed, nor can man return to his former state: the time demands a "new man," one taking note of the eternal in himself.

General Smuts, the world-citizen, philosopher, and great statesman of South Africa, in a Rectorial Address in 1935, spoke of the menace to freedom in the world today and called on the youth to awaken to this danger and avert it. General Smuts declared his belief in freedom of thought, speech, and action for the kind of individual who is essential to world-progress, who has "inner freedom," who works for supra-individual purposes and values.

Mr. Gerald Heard, in his *Source of Civilization*, which has been called "a tract for the times of highest significance," writes that *pari passu* with man's conquest of objective nature there should be a mastery of man's own inner powers and faculties, an inner technique by which his self-consciousness can grow to include a larger whole than the human individual and deepen the feeling of unity with his fellow-men. In his *Science in the Making* Mr. Heard declares that granted the superhuman power that man has made his own, the only way he can make the world safe for himself is to find a superhuman purpose.

Theosophy has a direct bearing upon the conclusions reached by these thinkers. It presents a world-order, a hierarchical cosmic system, with which man in his inmost Self is co-eternal. A partaker of the consciousness, will, and compassion that brought

forth and guided the manifested universe, man is destined consciously to harmonize his human life here on Earth with the purpose of the superior entity, the larger unit, of which he is an inseparable part. Upon the greater organism and its cosmic purpose is man dependent, as are the lesser lives of any organism. The inner, creative freedom, which is the conscious function of his higher intellectual, spiritual, and divine faculties, man wins by his obedience to the behests of the superhuman, supra-individual, inclusive Being in whom he moves and lives.

The "new man" called for at present is the human being more fully aware of who and what he is. It is the inner world of his own spiritual and divine nature that man must now bring to active function. This greatest of human discoveries will restore the lost balance, will enable man to control and direct for the benefit of all the tremendous forces his inventiveness has liberated, and prevent his becoming a victim of his own creations. "Humanity-minded," and Humanity-hearted must he be, to be safe. The resources of the inner Self of union and will have become a necessity in the face of the dangers we now recognise.

How long, how very long it is that this ancient wisdom of the Great Awakening, the Awakening to the Self, as we find it in *The Crest Jewel of Wisdom* of Sankaracharya, has been known, at least in the Orient! The loveliest secret that it unfolds is that all selves are rooted in the One Self. The realization of this fundamental unity is the basis for the conscious union of individuals. Only individuals aware of themselves as human, spiritual, and divine entities *can* unite consciously. The less awakened merge more or less partially in masses easily controlled by outside influences. Only enduring individualities, with a sense of the deeper unity of all, can differ without dividing, can permit or encourage others to develop their own creative faculties, in other words, to be free. To *differ without dividing* — is not this the key to all our present

problems?

Theosophy, in removing the stigma of ape-ancestry from the human being, in showing man's intellectual, spiritual, and divine lineage, clears the channel from the inner source of all that is noblest and strongest in human nature. Too long have men's theories of life, and, perhaps unguessed by them, their relations with their fellows, been colored by this false materialistic teaching. It is unity with the Divinity *within* that will enable men to exert the cosmically-rooted power and love that shall disarm any merely selfish, however apparently powerful, users of man's conquest of objective nature. Is any one so lost in discouragement as not to have confidence that this can be done?

Theosophy reveals to us all the magic that gives to us the unshakable freedom of the heart. The path destined for awakened individuals, who accept the responsibility of the divinely-descended, leads to inner conquests — to no denial or ignoring of present conditions with all their implications — but to high resolve to bring to bear upon them the luminous forces of the Greater Self, in whom we become the Free-in-Life.

The Theosophical Forum

WHY STUDY THEOSOPHY? — *J. H. Venema*

- a. In order to understand and follow the sublime rhythm of the Universe;*
- b. in order to understand the working of consciousness;*
- c. and in this way to be able to drink of the spiritual elixir of life and to comprehend the ineluctable law of Nature: Brotherhood.*

Sooner or later we have to face *facts*; why not sooner! Theosophy will help you. Procrastination here is the thief of the ever-flowing spiritual elixir of life offered to you, of a power to quicken your spiritual evolution and to help establish the Brotherhood of Humanity. In answering the question: Why study Theosophy? let us first of all keep the above three statements firmly in our minds. They are key-notes.

At present we hear people talk much about "problems" of various kinds. How Theosophy would help to solve them! The trouble is that we see in many cases the causes of them but *do not go far enough*, i. e. to accept the consequence of seeing the causes, namely that somehow, somewhere, Nature's rhythm has been disturbed and that equilibrium can be obtained only if both as individuals and as nations we begin to follow again that mighty rhythm. No use trying to battle against the cosmic laws!

Problems? Unrest, anxiety, loneliness, being fed up with the humdrum of life? Wondering if this world is mad? No thoughts about the question or the truth of immortality, because *this* life requires so much attention? Wondering if human beings can ever find truth? Try the study of Theosophy! Ah, but listen, don't throw it aside after a superficial look at it or after concluding that it "requires a bit of study." Don't begin by saying: It doesn't give me

sufficient facts to go by, before you have honestly tried. Don't indeed throw the blame on Theosophy, the ancient divine Wisdom, which has lived throughout the ages and will live in the future, because it is based on the very structure of the Universe. My invariable reply to people who say that Theosophy didn't give them what they had expected is: Theosophy has not yet done anything for you? What have *you* done *for* Theosophy? Studied it, penetrated into it, and above all, made it a *living* power in your life? If you have not done the latter, how can you judge? Have you ever passed on the greater vision that this ancient Wisdom gives to a distressed soul? Have you ever told somebody about it who knows less than yourself? That's the way to realize the truth of Theosophy and to see that it *is highly practical*. If Theosophy does not lead you straight to practical life, you cannot have studied it. No use for me to study those "Rounds and Races," I heard somebody say. Ah, my good fellow, if you just knew what intensely *practical* life lies in those very teachings about the Rounds, the Races, and the Hierarchies, how they would solve human and world problems, what a discovery you would have made! For Theosophy will make you understand — and prove it! — the sublime eternal rhythm of the Universe and make you follow it, yes, even in your daily work; it will make you conscious, so to speak, of your consciousness; it offers you the sparkling elixir of life. But the requisite is that you work a little for it and try to make it a *living* power in your life.

Why study Theosophy! In reality the answer lies in the three above-mentioned statements; but in order to elucidate them, I am going to defend two theses. And in defending them I challenge the world! I challenge contradiction. For has not experience taught me that contradiction of them in the end inevitably leads to confirmation, light, vision — *if* you contradict in order to find, to seek? Again I say: no use fighting against the cosmic laws. The

other day a thinking young man came to one of our Theosophical meetings to be able to prove that "Theosophy was a hopelessly wrong doctrine and against the teachings of Christ." But to do so, he said, "I must first know *exactly* what it is." Right-O! He regularly attended our study-class for a time, contradicting here and there, questioning . . . then coming to conclusions. He is a hard-working Theosophist now, i. e. he studies and passes on what he learns in the right way.

Now then, our two theses:

- a. It militates against all philosophic, spiritual, and logical thinking to postulate separateness between man and man (living or so-called dead), or between man and the Universe around him, with everything there is in it.
- b. It militates against all philosophic, spiritual, and logical thinking to relegate immortality of the human spirit or soul to a nebulous "hereafter.'

Defending these theses we first of all point to the majestic, eternal rhythm of Nature. The knowledge and recognition of this fact — and who would deny it with the facts before him? hands us a real master-key. Look at the planets, the stars and their courses, the cosmic atoms — solar systems, and we see order, harmony, intelligence and law. Then penetrating as far as we can into the infinitesimal, the atoms, we see the same order, intelligence, and harmony. Who would maintain that the Universe is chaos when looking into the deeps of space, gazing at the marvelous beauty of a starlit night. Coming — going, endless rhythm, smaller rhythm — greater rhythm; greater rhythm — cosmic rhythm; the majestic ebb and flow of the Boundless. Read the masterly way in which H. P. Blavatsky pictures this rhythmic movement of the universe in her *The Secret Doctrine*, and who is to be blamed if this fascinates him to his dying day? A sublime truth, and yet, good heavens,

how *intensely practical!* For let us come to conclusions: we realize that we can by our actions, thoughts, and emotions, for a shorter or longer time disturb this rhythmic movement, especially in its smaller cycles, and then we wonder that "circumstances turn against us," be they circumstances of the individual or of nations or whole parts of the world, continents. Then in these circumstances we have to find a "way out." Yes, study Theosophy! For we shan't find a "way out" unless we know well how we "got in"!

There is that rhythmic movement in the Universe which I might well call the constant urge to restore equilibrium, to bring harmony where it has been disturbed. It is Karma, a mighty propelling rhythm, a propelling force upwards if we work along with it, a dreadful counter-current if we work against it, that is, against Nature's heart. And here comes the greater vision: this Karmic rhythmic movement with us or against us, according to our actions and thoughts, works in and through that other rhythmic cycle, the coming and going of man — rebirth. Everything in this mighty rhythm is interdependent, interconnected, so that if I try to disturb my fellow-being's rhythm, or that of my younger brothers, the beasts, yes even of the plants, I can only disturb along with it my *own* rhythmic movement upwards. And I shall have to restore the equilibrium somewhere, somehow, *myself*, or I shall for ever find myself working in a hopeless way against the great rhythmic currents, i. e., never find harmony and peace again. For the great purpose of this same mighty rhythm is EVOLUTION, from the smaller to the grander, more majestic rhythm, and in the far future to cosmic rhythm. The divine cosmic entities are such because they have reached this cosmic movement.

Brotherhood a vague empty formula? Would you preach separateness between man and man, between man and the

universe, if the rhythmic movement of the cosmos manifests itself in the very breathing of your lungs, in the beating of your heart, in the circulations in your body, reflecting the circulations of the Cosmos? Yes, indeed, why study Theosophy! In order to be able to use and apply this wonderful key, and in *daily life*. Don't tell me that Theosophy is not intensely practical.

And these same thoughts lead our minds to consciousness and immortality. The rhythmic coming back of man — reincarnation — must show us, if we study the Theosophical teachings about it properly, that we are immortal *here and now*. What a change does this bring into our lives! The theological doctrine of Creation and Doomsday naturally led to the dreadful one-life-theory and a nebulous "hereafter"; and what a dreadful immortality in that hereafter! In her own masterful way H. P. Blavatsky in *The Key to Theosophy* showed the illusion and illogic of such a conception. On the basis of the grand rhythm, Theosophy tells you that there is continuity of consciousness in that compound entity called man. But as he passes through many spheres, worlds, or planes, there is change of consciousness or rather consciousnesses. But, heavens above, this change does *not only* take place when man "shuffles off the mortal coil"; it takes place every moment *right here* on this earth during our life in the body; and when we study these changes we get downright proofs that we are immortal here and now and that there are not only many "hereafters," but also, as we say in Dutch, many "herebefores."

Why study Theosophy! In order to get the power of discrimination between the purely human consciousness-center and the spiritual and the divine consciousness-centers. To see them working in the smaller rhythmic movements of our lives here, in sleep and death — the twin-brothers — hence to try to lead a spiritual life here, to master the self by the Self, and so to *know*, to prove to yourself, the truth about immortality. We have

a word in Dutch for "becoming conscious" (*bewustwording*), and Theosophy teaches us to become conscious of our consciousnesses, i. e., to experience the fact that consciousness is fundamental in everything; it means to experience *how* this consciousness works, *how* it evolves, and *how* it is connected with universal consciousness. And a great mystery, I assure you, lies behind this teaching that will fascinate you more and more and — teach you who and what are those other yous, your fellow-beings. It will make you drink of the spiritual elixir of life. It is to be found!

Last century a movement was coming back — a rhythmic movement, based on the rhythm of the Universe, established at the right time by those who knew by first-hand knowledge and experience of this rhythm, of the mysteries of consciousness, and who had drunk of the spiritual elixir of life. We call them the Masters of Wisdom, Compassion, and Peace. H. P. Blavatsky, their servant, tells us about them. That movement is the Theosophical Society and as it existed in ancient times, in ages long ago, it came back at the proper time. You may study Theosophy outside that movement and be satisfied. But far greater work is the study of it inside the movement, for unity makes strength, and by that greater strength you will feel more of the above described sublime rhythm, and you will be able to study Theosophy in a more profound way. Why study Theosophy indeed? — TO LEARN TO LIVE, TO LIVE REALLY!

The Theosophical Forum

IMMORTALITY — *Gertrude W. van Pelt*

The ideas aroused by this word in the minds of typical members of our Western civilization and in the minds of those who have come under the influence of Theosophy, are quite different. To the former it suggests eternal existence of human personality with the implication that something else is mortal and has no future life after the certain event which none can escape. It does not touch upon the fact as to whether or not there is development or change in this soul, but implies simply that it persists, in other words, that it has unending life; while to the Theosophist, on the contrary, it is a matter of *acquired* self-consciousness. For the Christian, the soul is immortal and the body mortal. For the Theosophist, the human soul is mortal, but not eternally so. It is mortal until through the numerous earth-lives through which it is destined to pass, it has *acquired* immortality — that is, the ability to understand itself, its place in the Universe, and how to use and hold that place through a knowledge of the forces which maintain cosmic harmony.

In one sense, every atom in the universe is immortal, since all are parts of the Whole and since whatever exists can never cease to exist. It is *form* which changes and therefore is mortal. Most of us in and beyond middle age were taught in our youth the strange theory that in this living Universe there exists *dead matter*. The fact that this was accepted shows how little we used our power of thought, for even our living bodies are made up largely of that so-called lifeless matter.

No real understanding of man as to how he came to be, as to his composition, as to his purpose and destiny, existed in the West until H. P. Blavatsky restated the Ancient Wisdom-Religion in the

last century. Thought was turned outward, and the masses accepted what in future retrospect will be regarded as fairy-tales (or nightmares!).

This restatement of the old philosophy awakened thousands of minds, started the clarification of others who were already questioning, and saved many others from cold and blunting materialism. It outlined the laws of the Universe, explained the phenomena of Nature. It placed the instinct for ethics, insecurely resting on sentiment or dogmatic authority, and in danger of falling often even from these supports, on a sane, firm, deeply-rooted and permanent basis of *fact* — a fact so incontrovertible, so thoroughly supported by universal experience, that it is impossible for honest and searching minds to dodge it.

Man, the hopeless enigma, was thus shown not only his composite nature, but his place in, and relation to, the composite nature of the Universe, of which he is and always must be an integral part, and out of which he can never go. In short, he was in possession once more, as in the ancient past, of his divine heritage — the knowledge of his origin and destiny necessary to guide wisely his life.

We cannot arrive at the significance of "immortality" without some understanding of the elements or principles which make up man's complex nature. The division given to the Christian nations of Body, Soul, and Spirit, while correct enough, is not sufficiently complete for practical purposes, that is, for pointing out the evolutionary processes which must take place to bring about immortality for the human soul.

The Archaic Wisdom-Religion, as stated for this age, divides man into seven principles, with three others belonging to the higher and unmanifested planes of Nature, making in all ten, and these divisions a little analytical reflexion and self-study will reveal to

be almost evident and half-consciously recognised by a majority of thinking people.

To begin with, we have a body of flesh, which is the lowest principle, the elements of which are derived from Mother Earth, and which is evidently mortal as we use this term. It has a limited existence in its present *form*, though the particles composing it change from moment to moment, as we all know. However, thus states Theosophy: these elements or life-atoms belong to the ego who uses this body and who is therefore responsible for the impression or color it gives to them as they pass and repass through the body. When the ego comes back over and over again for a new incarnation, it inevitably attracts its old physical atoms which, on their part, have been gaining their experience in physical nature's realms, guided by the quality stamped upon them by their over-lord, the ego. For atoms are in different stages of evolution as are higher beings, and the atoms of a holy man, for instance, would never be attracted to the body of a degenerate.

Inasmuch as the components of the physical body are constantly fluctuating, as we all recognise, there must evidently be another or stable body which lasts through a whole incarnation to preserve the form. This is man's second principle, is of astral matter, is known as the astral body, and is built from atoms from the next cosmic plane, the astral plane. When man returns to earth-life from the higher and spiritual realms, these old atoms must likewise be recollected from the astral plane of Nature.

Above these two lower principles we have the currents of vitality known as Prana, the third principle counting from below up, supplied, as is all else, from the cosmic reservoir, and fourth, the principle of desire, or Kama, which directs the Will. The less a man is evolved, the more does this principle of desire hold him in

his narrow personality with limited understanding, sympathies, and power.

The next principle, or mind, is the pivot around which the real evolution of man in his present stage is turning, and is the principle which must be understood in order to grasp the idea of immortality for man. Theosophical students are familiar with the history of the awakening of the sleeping minds of men in the Third Root-Race on this Globe Earth by the Manasaputras, those beings who on earlier worlds had evolved beyond the human stage, and had the ability and the divine compassion to awaken these sleeping fires for the on-coming races of man for this planet. It is a wonderful and thrilling story. Every nation, in its own way, has told of this, the Greeks in the story of Prometheus.

This history is but one example of two universal facts — one, that in every entity down to the very atoms are locked up all the potentialities of the Universe, and two, that this unfolding is always brought about by beings a grade above the principle or part to be unfolded. Beginning with the awakening of mind, this unfolding must, on the part of the lower entity, be voluntary. The Manasaputras evoke the power, but man must himself use this power, something in the way that a teacher can stimulate the mind of the pupil which he must himself exercise in order to progress.

Now this mind in man is not yet fully awakened. The process will continue for average mankind for ages, as long as the life of this planet. That part which has been awakened we call the Higher Manas and it is immortal. The other, the Lower Manas is, as yet, mortal, and it is in these two conflicting currents that we find the human soul and also where we can discover the meaning of "immortality." Herein lies the secret of duality, which we cannot but recognise in ourselves and all men, the potentialities of the

god or the demon. It is in this area of mystery that is enacted the divine tragedy of human existence.

Evolution for man consists in the transference of his lower mind to the plane of the higher. The lower mind is unstable, at the mercy of the play of impulses from the undeveloped animal-nature and the unchained forces from uninformed and short-sighted desires. Man's real teacher is his own Higher Ego, but the pupil, the Lower Ego, must, through the power of the uncovered divinity buried in it, evoke its will and voluntarily yield itself to the higher guidance. Every incarnation should see progress made in this direction, but not until this voluntary transference of the Lower Ego is complete, will the human have the power to hold itself together and become *immortal*; only then is it working *with* instead of *against* the universal life currents, which are an expression of the universal law of compassion. Until then it must follow the way of the lower principles and be dissipated after each period of activity, or earth-life, and during each period of rest and assimilation for the Higher Ego, to be reassembled for the next Day of Work, the succeeding earth-life.

Thus, immortality for the lower human soul is yet to be won, and the stage upon which this immortal drama must be played is earth-life. It is folly to count upon something strange happening to make of us saints after so-called death. We take to that blissful land only what we have gained through self-directed evolution, and we come back with the riches we carried to it, but refreshed, strengthened reinforced after the merciful rest provided by Nature.

Katherine Tingley in *Theosophy: The Path of the Mystic* writes with eloquent warning as well as encouragement on this vital subject of the duality in human nature. She warns that at each moment as we consciously incline toward good or evil, one or the

other feeds into and fills the mind, and that any *conscious* volitional backing given to any fault or failing may end in involving all the rest on that lower side of the nature and consequently is an "*immensely pregnant move downward*": on the other hand, no failures should discourage, and if they are followed by as many undaunted struggles upward, the help of the "Warrior" within is certain. "For This is an unconquerable power, *eternal and sure*," she quotes elsewhere. To reconstruct mankind, we must arouse more faith in the *Self*. Loss of such faith is the initial step in all spiritual failures. Then follows loss of faith in others, until finally the unfortunate victim finds himself "living in a strange house: the house of the lower nature."

It should be fully realized, however, that this "lower" is the weaker part. All the forces of the Universe work with one who allies himself with his own Higher Ego. Through this he is firmly anchored to a world in which reign peace, joy, and unbounded opportunities.

Every careful observer will probably find that these five elements in human nature are clearly recognisable, and see that they are not an arbitrary and fantastic division. This is likewise true of the two higher. Interest centers around man as a thinker because evolution at present is more active in this principle. But it is obvious that there is in man something yet higher, for he can direct his mind, force it to work on this or another subject. This higher and sixth principle is known in Theosophy as the Spiritual Ego, the real man. The seventh, the Divine Ego, links him finally to the very root of Being, the reality of which and necessity for which become evident to one who recognises that the Universe is one organism of which all entities, high and low, are integral parts, and upon which unity rests the eternal *fact* of Universal Brotherhood.

SOME PERSONAL OBSERVATIONS ON IMPERSONALITY — *Jalie Neville Shore*

Be impersonal. Be self-forgetful

Consider the Sun and you will know what the Teacher means. Or if you cannot yet consider the Sun, then study yourself and you will gradually come to realize the great wisdom of impersonality and self-forgetfulness.

Perhaps you are one of those who believe that self-preservation is the first law of nature. There is sense in such belief of course, but you must spell Self with a capital "S"; for as soon as all the centers of consciousness are focused on the preservation of the personal self this entity oddly enough becomes destructive to its own nature. It is only through living a self-less life that even the little self is preserved for unless its energies are eventually disrupted. It is only through living for things *outside* itself that it survives. Like a child it needs coaching and training, for it is ever growing and expanding, never the same yet with an unchanged identity. It is only the indefinable Self in it that is immortal.

You may be ambitious. Perhaps you desire above all things to be *successful*. You should know first then that true success is not measured by the accomplishment of a day, a month, a year, or even one lifetime. True success constitutes ages of endeavor to understand natural laws and to work unceasingly with them. It is said that success is attained by "quenching the personality" — a most difficult thing to do when the fires of ambition sizzle ceaselessly in one's soul. It is this fire threatening to consume the life and endeavor of untaught souls that must be quenched, for personal ambition if left to the devices of its own nature will destroy even the prize it set its heart on attaining. It is the steady

white flame of impersonal living and giving that one should cultivate to be truly successful. This gives warmth to the heart and light to the eyes. It is a torch that illumines "even the farthest corners of the earth." The winning, the attaining does not necessarily mean that the success one thinks he has won will stay on for ever. Men who have risen to high success in their chosen fields through the relentless discipline of their sometimes bothersome personalities have fallen to devastating failure and degradation through no more tangible a cause than a personal desire. Napoleon, who through his clear vision and great force of character might have grown into a greater "success," robbed himself and the world he lived in of happiness and peace through personal ambition. Washington, across whose path were flung the temptations of greater position and power, remained steadfastly impersonal in the execution of his duties, and today, instead of being anathematized by the nation he opposed, is revered as a noble example of great leadership and lofty ideals.

Those who covet the emoluments of personal glory most assiduously are usually those who are bereft of them. The very nature of their covetous desires plunges them into a disgusting state of misery that militates constantly against the attainment of the things they most desire. It is only those who have freed themselves of *personal* ambitions, whose actions are without thought of the personal advantage of the results, who never feel the pangs of personal disappointments, yet appear to be so *personally* happy. These are personalities that have outgrown their *personal* attributes and have become impersonal channels through which flow the life-giving currents of love and devotion and self-sacrifice.

This idea of personality and impersonality is builded of many paradoxes. Here is one: the most impersonal people most often have the most delightful personalities. Take the "most delightful"

individual you know. He will likely have what is called a "charming personality." Although he has never actively sought them he has many friends who actively seek *him*. He is fun-loving, yet temperate in his play. He is industrious though he does not slave. He is fearless, yet tactful; dignified yet gracious; firm yet kindly; frugal, but not miserly. He thinks of others but he also recognises himself as an entity in the scheme of things and knows well that he can be of no service to anyone if he does not respect himself first and treat others as though they were himself. He is a success personally because he is so effectively *impersonal*. He is not disturbed — either angry or jealous — when other men are given places of high honor, for the greatness in him makes him recognise the greatness in others. He knows that his own job however humble is as necessary as that of the highest potentate. And when he reaches a high position — as he will by the very power of his developing capabilities — except for the appreciation of his responsibility, he will never feel that this new duty is more important than the others he has had.

Before you can be truly successful you must raise the personality to a position of impersonal strength and honor. It is not only pride and bigotry, covetousness and anger that must be weeded out; fear, and timidity its offspring, are likewise vitiating influences in the education of the growing personality. They stultify the inner expansion so that even the will does not operate and nothing is left to direct the outward efforts but a feeling of inferiority which, when analysed, most often means a grudging recognition of the superiority in other people and a covetous desire for a similar position. (Usually a generous circle of enthusiastic admirers is in the mental picture.) Impersonal courage is action for its own sake. Impersonal action of any kind is in reality a giving with wisdom. Fear and timidity have no place in the impersonal life because they are always concerned with

self. Life demands — and it is especially so in this age — strong courage and selfless thought and action.

There are those who believe in impersonality so much that they don't do anything about it. Theosophists do not believe in a philosophy of this kind of inaction. Impersonality, on the other hand, must be distinguished from a lack of vitality. The development of the impersonal attitude actually means a vigorous exercise of will and a constant application of all lessons one has learned on the subject. There is nothing spineless about realizing that "silence must be cultivated on all subjects which tend toward personality"; or about trying to allow "those immediately around you to win their own victories in self-control" even though you feel their decisions are leading them into situations fraught with danger. Conscientious Theosophists try to do all this and more.

A distinction must likewise be made between impersonality and heartlessness, for the truth is, that horrors have sometimes been committed in the name of impersonality. The most truly impersonal hearts are the most understanding, the most compassionate, but they have also developed in themselves a splendid sense of discrimination which separates the impulsive hand of emotionalism from the sure, steady hand of helpfulness. The more *personal* one is, the more danger there is in his becoming bankrupt as to judgment.

The ideal of every Theosophist is to become one of the Helpers of Humanity. These wonderful individuals have developed within themselves a deep and wondrous leadership based on impersonal living. This does not mean that they have made their natures impervious to the sorrows of men. On the contrary, their compassion is the mark of their greatness. Their pure, compassionate hearts cannot be consumed by the thirsty fires of

emotional reactions. They serve humanity because they love humanity and understand that each member of that orphan family must "quench" its own thirst. They lead because of their great judgment. Their courage insures for them the steady, inner flame of wisdom which sheds its encouraging radiance impartially and impersonally on all! Once they were atomic entities who suffered through the restrictions of the personality, until through unflagging effort toward impersonality they became valiant assistants to Nature with vast reservoirs of privilege and power at their command.

Now consider the Sun and the glorious radiance it sheds on the universe in its keeping. Is it any wonder the teacher never tires of enjoining us to be impersonal and self-forgetful?

The Theosophical Forum

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: IX — *H. T. Edge*

IX — THE SEPTENATE

The number seven, spoken of also as the septenate or septenary or heptad, is the most important number in symbology. It is universal in cosmogonies and theogonies and is familiar to us in innumerable familiar instances. Its use is both traditional and founded on experience: on the one hand we find septenary divisions and classifications which we should not have thought of making ourselves; and these are traditional. On the other hand we find that many things fall naturally into septenary divisions. It seems to be the key number of the present great cycle of evolution. To begin with, the Logos or One Deity, emanates seven rays, which are the world-builders; and there are countless representations of this in the different theogonies: the seven sons of Aditi, the seven Amshaspendas, Angels of the Presence, Builders, Wheels, Sephiroth, Gods, etc., etc. And this is repeated on all planes till we get to the seven primary elements of the physical plane, the seven colors, seven notes of the scale, etc.

Seven, as before pointed out, is the number of combinations of three things, as algebraically represented by *a, b, c; ab, be, ca; abc*. It is also the sum of three and four, triad and quaternary; it is two triads and a unit; it is six and one, as seen in the hexagon or the double triangle, each with central point, and in the six directions of space with their central point of origin. In occult symbology we hear of seven mystic vowels and seven sounds, and of the heptachord of Apollo which has reference to a good deal more than merely a musical instrument. When light is being spoken of, the septenate becomes seven colors, and these seven colors have

their physical manifestation in the seven colors of our visual perception. It is said that from "Darkness" comes light, and from white light come the seven colors; and this means that from the unmanifest logos comes the manifest logos, and from that the seven rays. In physics white light is decomposable into seven colors; and the etheric vibrations to which the phenomenon of light is referred do not yield a visible effect until such effect is evoked by contact with physical matter; and thus we have darkness yielding light.

The positive side of creation is represented by seven Forces or Sons of Fohat, etc., and the negative side by seven planes of materiality or seven cosmic planes; and correspondingly in the microcosm we have the sevenfold constitution of man. The chemists Mendeleeff and Newlands arranged the chemical elements in a table according to the relation between their atomic weights and their properties, and found that they fall into a septenary scale; which is one among many proofs that physical nature follows the laws impressed upon it by primary nature. Seven sacred planets are enumerated, and connected with seven Gods and other septenates; the visible planets are their "chariots." The number seven is related to the number twelve; as there are seven planets, so there are twelve zodiacal signs in which they

move. Astrology gives one sign each to sun and moon and two signs each to the other five planets. Twelve is also the sum of seven and five. According to one interpretation, which is likened to "Ezekiel's Wheel," the signs from Aries to Libra inclusive are the seven, and the signs from Scorpio to the end are the five. In the Esoteric Tradition twelve globes are placed on seven planes, and seven globes on four planes, as in the diagram. Sometimes the number ten is used in the enumeration of cosmic powers, and can be made by putting above the septenate a triad belonging to the archetypal world, as in the Sephi-rothal Tree, represented in the diagram; or again we may have a quaternary with a triad above it and an inverted triad below.

The Theosophical Forum

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

PREHISTORIC CHINA: UNEXPECTED AND SURPRISING DISCOVERY

How many times H. P. Blavatsky said that new manuscripts, inscriptions, and other witnesses to the truth of the "Secret Doctrine" would unexpectedly turn up in future, as a few had already done in the nineteenth century! A fresh instance is now reported which may prove of greater importance than the archaeologists suspect, although they are profoundly interested in its contents. It may help to explain the mysterious resemblance between the Easter Island inscriptions and those on the seals recently discovered in India at Mohenjo-Daro, almost at the opposite ends of the earth, and separated by the width of the Pacific Ocean. It may also prove a far greater antiquity for highly civilized man than the few thousand years allowed at the present moment.

If we can rely on press reports, a Chinese manuscript has recently been found in a metal canister which had been buried in the ground on a spot which was afterwards covered by a portion of the great Chinese Wall. This accident preserved it safely until a Japanese bomb blew up a section of the wall and revealed the canister! Such are the ways of the Law! According to Professor Anthony Graeme and other scholars, it is almost another Rosetta Stone, and is proving to be the key to strange revelations. Our information is derived from the *Sunday Referee* (London), April 12th, which we quote in part. Professor Graeme is reported as saying:

When I showed the first translations to the late Sir Wallis Budge, of the British Museum, he said that the manuscript

was of even greater importance than the Codex Sinaiticus. In the manuscript I find direct reference to the Laws of Manu, which were first written in the Vedic language 10,000 years ago . . . In this book it says: "From the plants life passed into fantastic creatures which were born of the slime of waters; then, through a series of different shapes and animals, it came to man." . . . We have also found — and proved — that in those days there was a distinct relationship between the people of India, America and China. We actually find reference to the ruined cities which have been found in the center of the Peruvian forests. It will be another year before the translation of the manuscript is complete. Then it will be given to the British Museum.

In regard to Evolution according to Manu, many scholars think this archaic writer taught modern Darwinism, based on mechanistic "natural selection, survival of the fittest," etc. We learn otherwise from H. P. Blavatsky:

Both Occult and Eastern philosophies believe in evolution, which Manu and Kapila give with far more clearness than any scientist does at present. — *The Secret Doctrine*, II, 259

And on page 600 of the first volume:

The day *may* come, then, when the "Natural Selection," as taught by Mr. Darwin and Mr Herbert Spencer, will form only *a part*, in its ultimate modification, of our Eastern doctrine of Evolution, which will be Manu and Kapila *esoterically* explained.

She also refers the reader to *Isis Unveiled*, I, 151, where the "Mundane Tree," the ancient widespread symbol of evolution, is discussed.

In many places in *The Secret Doctrine*, H. P. Blavatsky mentions the knowledge of Atlantis possessed by the ancient Chinese, and scholars have never satisfactorily answered the problem of apparently strong Oriental influences on ancient American sculpture, etc. The recent discovery of a keystone at Monte Alban, Oaxaca, in Southern Mexico, has upset some conservative notions, as previously mentioned in these columns, but there are no doubt still more significant corroborations of the Masters' teachings to be found at the right time, as H. P. Blavatsky says. When the true history of mankind is revealed, it will enormously change the point of view of all thinking persons, but the revelation must come gradually and through methods recognised by science.

HUMAN "MAGNETISM" USED IN DIVINATION

Discovery (London) for April reports that the body of a carpenter who had been missing from his home at Dedham, Essex, was discovered, after other means had failed, by a diviner who used a piece of the missing man's clothing attached to a copper wire as his "divining rod." The body was found in the bed of the River Stour in the place indicated by the behavior of the garment. In *Isis Unveiled*, I, 611, H. P. Blavatsky mentions some incidents of exactly the same nature in illustration of her points in regard to the actual existence of human "animal magnetism" as a definite substance, and of its power of affecting people beneficially or otherwise. It is no figure of speech, but something very active, though not the same kind of magnetism as that which is displayed by iron magnets.

Many persons feel uncomfortable under the gaze of a piercing eye, but not knowing that human magnetism can be projected through the eye are puzzled to explain the discomfort. Certain hypnotists use this method, and, it being generally disbelieved,

the magnetizer can work much mischief. Psychology in the West has hardly touched the fringe of this subject. Until lately, water-divining was regarded by scientists and "commonsense" people as utter nonsense, but it is now admitted to the borderland of respectability. Several Governments give permanent employment to diviners. The fact that *Discovery*, a scientific magazine sponsored by a committee of eminent scientists, has dared to publish without unfavorable comment this Dedham case of divination by the magnetism of the drowned man's clothes, is a proof of the broadening of the scientific outlook. We cannot forget that *Isis Unveiled* has had a large and steady sale ever since it appeared in 1877, edition after edition being called for, the latest being the new volume of the Centennial Edition of H. P. Blavatsky's works. And *Isis* is not read by the frivolous but by real thinkers.

IS THIS REINCARNATION?

A considerable sensation has been aroused in Californian medical circles by the strange, seemingly occult powers of a thoroughly healthy boy, normal in all other respects. His name is Pat Marquis and he lives in Los Angeles. Very wisely, his mother has prohibited any public exploitation. He has exhibited his supernormal faculties only to scientific investigators. He recently gave 150 physicians including eye-specialists, an extraordinary demonstration at the Hollywood Hospital (not for the film studios!) and another before 200 physicians at a County Medical Association meeting. He has also appeared before distinguished professors at the famous California Technological Institute, Pasadena, and next year he is to go to England to be studied by the Royal College of Surgeons.

When his eyes were thoroughly blindfolded by specialists young Marquis entered into a semi-trance, and apparently became a

different personality — an ancient Persian physician who calls himself "Napeji," a Parsi who lived in the Himalayas in the eleventh century a. d. In this state the boy displays clairvoyant powers of a most unusual type. Not only can he write and read, blindfolded, but he can walk with perfect confidence in strange places, draw good portraits, imitate gestures, select books from the shelves and point out any page or word required, and satisfy numerous other tests.

Though normally he does not know a word of Persian, he writes in that language in reply to questions from one of the investigating scientists, Dr. Ameen Fareed, a Persian himself, and a physician. Pat Marquis, in the character of "Napeji," can also write in Persian when Dr. Fareed is not present. He sometimes uses an archaic form of that language. He correctly describes Persian customs, and his manners are those of a very dignified personage, not at all those of a lively youngster of twelve. He has also made predictions that have come uncannily true. When asked technical questions about the seats of consciousness in the brain, "Napeji" replied in the language of a trained anatomist. Dr. C. Reynolds, F.R. C. S., who presented Pat Marquis to the Hollywood committee of physicians, said, "How he could know anatomy and modern medical terms is beyond me. Certainly *the boy* knows nothing of them." Pat says he has twice seen "Napeji" standing near him when he was perfectly awake. "Napeji" is exceedingly tall.

Since the writing of the above, another interesting report has been issued. After being *completely blindfolded as before*, and in the slight trance required, the boy, now in the personality of "Napeji," took up the foils in a fencing-bout with Mr. F. Cavens, an expert fencer. Pat Marquis knows nothing of fencing, but apparently "Napeji" is a master of the art, for Mr. Cavens said, "I know of no master of fencing in the world who could do it. The

fact that he can see my point coming and parry, and not be deceived in his parry with the point menacing him, and make the correct retreat is remarkable. I defy any great expert to do it. It would be utterly impossible for me." Sixty seconds after the fencing-bout "Napeji" had disappeared and the laughing, healthy schoolboy had resumed his normal personality.

Surely we have at last something which cannot be scornfully ignored by the world of science, a tangible fact which psychologists must face, however disturbing to those who think the consciousness of the brain-cells explains our actions. It is not easy to explain by the convenient hypothesis of telepathy (which itself needs explaining). Is it not possible that traces of the personal consciousness of a previous incarnation in Persia, under the peculiar conditions of the partial trance, may step forward and take control of the new bodily vehicle in Los Angeles? This is not the only case of "sightless vision" that has come to light of late, and we may expect to see such things discussed more and more intelligently in the immediate future, because scientists are becoming bolder and not so fearful of losing caste if they participate in psychic investigations. Kuda Bux, the Indian Mohammedan fire-walker, has recently demonstrated the "sightless vision," and there are more examples ready at hand. Kuda Bux claims that he gained it by a simple form of yoga.

A few years ago, before H. P. Blavatsky gave her demonstrations and explanations of such things, all psychic phenomena were confidently attributed to the spirits of the departed; nowadays, in addition to this *possibility in very rare cases*, more satisfactory and scientific interpretations are demanded in order to explain the complexities, paradoxes, and unexpected difficulties which arise in psychic research. The bewildering conditions and the extraordinary illusionary power of the lower astral plane are hardly yet suspected by those ignorant of the Eastern teachings.

INTUITIVE KNOWLEDGE VS. "BLIND FAITH" — *H. W. Dempster*

Many religious creedists and "new-thought" psychologists claim that their religions or their philosophies are panaceas for the present ills of the world. Yet, with all the religionists and psychologists, the world still appears to abound in ignorance, selfishness, and much human misery. Materialistic progress has far out-distanced moral development, and amid the chaos of confused and twisted, therefore insufficient, thinking, mankind searches for "a way out" by various methods of faith and belief, only to find that false and incomplete systems lead into "blind alleys" and fail to give satisfactory answers to the unexplainable circumstances and events of life and its mysteries.

We truth-lovers — for that is what Theosophists really are — have no creeds or dogmas, and therefore do not accept, nor do we require others to do so, anything on "blind faith." That we teach certain doctrines as being facts of Nature is true, and these may be misunderstood by others to be dogmas; but that does not make them so. Each one is left to his own choice of accepting or rejecting the teachings as he sees fit. And this is as it should be; for to exercise this privilege rightly is to use the wisdom of the discriminating faculty" — intuition. It is the Knower within us; hence we should seek to find it and rely upon its wise counsel. From this fountain of wisdom comes faith — "faith" used in the sense of that which proceeds from or is based upon, Knowledge arising out of an authentic source, as distinguished from indiscriminate belief in a so-called authority. The authenticity of the source is and can only be determined by intuitive perception, which faculty in Theosophical terminology is known as the Buddhi-principle, or the Christos within us.

While we are religionists also, this is true only from the standpoint of devotion to the cause of searching for truth, and to the dissemination of a knowledge of the True for the benefit of mankind generally. By the term "Truth" is meant: a knowledge of the facts of Nature, visible and invisible, derived both from a reliable source — a true Spiritual Teacher — and from the individual's own realization of these facts consciously, through "experiencing" or *becoming* aware of these truths in his consciousness. This is made possible by going deeply into the heart of things, including ourselves, and by means of the knowledge which comes from within; i. e., by the illumination emanating from the intuition, there become aroused and stimulated within our consciousness the thoughtful processes of logical and analogical reasoning, which support intuitive knowledge.

The resultant of following the hints of a true Spiritual Teacher and intuitive perception is: Spiritual Vision or Knowledge of things as-they-are, our "Savior," in fact. Gautama the Buddha is reported to have said, "The way of Salvation is through Knowledge," and the words attributed to Jesus the Avatara: "*I am the Way, the Truth and the Life,*" unquestionably refer to the Higher Consciousness in man; or, in other words, the intuitive Preceptor within him, as suggested by the meaning of the mystical phrase, "I am." By a slight rearrangement, and without distorting the essential meaning, this could be read: "The Intuitive Faculty, the Christos within, is the Way (or the means), the Truth (that Reality which we are seeking and finding in relatively greater degree through becoming) and the Life (which is a synonymous term for consciousness, in this particular instance meaning Higher Consciousness)." Or the whole phrase could be summarized in one word, "Illuminator.'

There is another very familiar phrase accredited to Jesus the

Syrian Sage: "*The Kingdom of God is within you.*" If it is analysed, we find that it has reference to the high internal state of intuitive consciousness; and it is a Kingdom or Hierarchical state or condition that is within us — not outside, as attention is so unwisely drawn to in the heartrending carnalized crucifixion of Christ upon the upright cross. It is the intuitive faculty within us, the Inner God, that is meant by the "I am." In order to avoid becoming confused, it is well to bear in mind that there are several different terms or words used to describe the same principle or idea, in dealing with the Mysteries of the Universe.

The instruction imbodyed in the famous "I am" phrase ascribed to Jesus, as indeed is true with many of the mystical Christian teachings which veil deep esoteric truth, is too often taken literally, and in a more or less personal way to mean that He alone is the *only* Savior from eternal hell-fire and hopeless damnation. And this is based upon the unsupported blind belief that such is the case. It is not intended to deny the saving qualities of this great Spiritual Teacher; but all Spiritual Teachers are Savors, because they bring knowledge to men — and there have been many, as an unprejudiced examination of the history of the past will show. All of them have given man the teachings whereby he himself becomes actually his own Savior, which teachings, being based upon Nature's immutable laws, do not vary in principle with the Teacher who brings them, but only in the manner of their appropriate and fitting presentation, suitable to the times, and to those to whom they are given. To look entirely outside of ourselves to some external form of Deity, and especially to expect Jesus or any other Sage or Seer of like spiritual grandeur to "save" us from our evil and thoughtless actions, is anticipating something which we do not deserve, and therefore will not get.

Justice is the reaction which follows all action. Why should we

expect reward for doing good, or escape the suffering of our evil acts? In either case, the result will ever be Justice — and that is enough. How else can suffering be explained at the hands of a just God, or Law, or Principle — or by whatever other term or name is applied to the Divine Wisdom and Justice of the Boundless Universal ALL?

The world *needs* to understand the teachings promulgated by the Theosophical Society more than ever before. To re-establish a true system in the outer world, an honest and primarily ethical school of thought based upon and teaching the natural principles of the Universe, and to broadcast those teachings to the world, is one way of stating the need of and for the Society. The ignorance, selfishness, and misery arising out of the incompleteness of materialistic thinking and misinterpretation of age-old doctrine, which are running rampant among our fellow human beings today, consciously and unconsciously, have brought forth from the compassionate and kindly hearts of those intelligent Elder Brothers of our race, who have evolved in consciousness far beyond the average among us — the Masters of Wisdom, Spiritual Beings of lofty evolutionary standing similar to Jesus the Christ and the Lord Buddha as well as many others — the teachings of the Ancient Wisdom Movement. This, a modern movement, called ancient because it has ever existed, uses as a vehicle for the expression of Divine Wisdom an organized Society composed of believers in Universal Brotherhood, regardless of present religious affiliations. Through this Society the Wisdom of the Gods is stepped down, so to speak, to man's capacity of understanding, and thereby the opportunity has been offered him to learn, among many other things, the secret causes of his sufferings and misfortunes, and the remedies for their cure. For those who have been fortunate enough to find these teachings, the world and its conditions are more clearly understood, and life takes on a

different shade of meaning. Conviction is brought to the mind, therefore proof, that the application of a working knowledge of the Wisdom of the Ancients — Theosophy — is actually and truly the cure-all of ignorance and selfishness and all their attendant evils, because it tells the "why" of things, and explains in a logical and matter-of-fact manner the structure and operations of the Universe in all its parts and phases.

The Society has, as an outward or exoteric body, been established only sixty years, which is a relatively short period of time. Who can say, if he has made an unbiased study and examination for himself, that its beneficent influence has not already in a comparatively great degree, persuaded thinking individuals of the logic, truth, and common-sense of its teachings the world over? Observe the outstanding progress being made by the ultra-modern scientific thinkers, and note how closely some of their recent findings and theories approximate, in fact agree in many cases, with the teachings appearing in Theosophical books of decades ago. Yet due credit should be given to these scientists for their energetic and courageous efforts in the research for scientific truth, and the intuitive ideas which are proceeding out of their search into the secrets of Mother Nature and the Universe, of which they and all things are inseparable parts.

Concerning psychology: our understanding of that subject is quite different from what is advocated by many. The most dangerous form of "new-thought" psychologists are those who teach half-truths. Beware of these! Others are honest and sincere and serve a useful purpose in at least an intermediary capacity for those who are breaking away from ecclesiasticism and commencing to think for themselves. But, in dealing with the subject of psychology, it should be understood that the term comes from the Greek word *psyche*, meaning Soul, and has to do with that part of man which we call the Human Soul, or the Reincarnating Ego, the

intermediate portion of man's sevenfold constitution. With all due respect to the honesty of the psychologists' convictions, the average among them seldom deal with any faculty in their study of man beyond that of mind, and lack a fundamental understanding of our Higher Spiritual faculty of Intuition, which illumines the mind and animates the logical reasoning processes. An understanding knowledge of the fact that man, as well as all other entities, is a septenary being would be of much assistance to them. Theosophy explains the nature and operation of these seven principles in man and all other things and of their relation to each other, and should not be confused with the philosophy of those who deal incompletely with only the intermediate and lower portions of man's nature.

To account for the ignorance, selfishness, and misery in the world, there is but one answer, speaking generally, viz: *man himself*, individually and collectively. There is ample knowledge available, and the opportunity is open to all who truly set their course in the direction of finding it. If this be doubted, an impartial reading of the standard Theosophical contributions to the world's knowledge since the Society was founded in 1875 will prove of great value. If you would have Truth, go to the source, the head-waters, "the center of the circle," to use a mystical phrase, the Heart of Things. There exists abundant knowledge! The difficulty is with the nature of man, which is septenary. He does not *know himself*. And furthermore, he often does not choose or seek to know; for if he did, he would find and know himself and become consciously aware of far greater knowledge than he now has any idea of. This is in accordance with the age-old injunctions, "Man, know thyself" and "Seek and ye shall find, knock and it shall be opened unto you."

By means of our intuitive consciousness, and not by "blind faith," are we able to discern the true from the false; find the Way or

Path to the Inner Divinity; help others to find it; and in due course of time, by bringing forth or unfolding what is latent within us, we shall ourselves consciously become that. Through the Inner God is the Way, the Truth and the Life. Are these mere words? Or do they contain true instruction? If we look within ourselves, we shall have the answer.

The Theosophical Forum

QUESTIONS AND ANSWERS: 320 & 321

QUESTION 320. "*What is the explanation of the "invisible companion" which some children speak of constantly as almost part of themselves?*" — J. H.

G. de P. — An interesting question, and one which likewise shows how greatly we adults have lost the intuitive recognition of spiritual companionship that children — unless spoiled by over-fond and over-doting parents — still retain.

It would be quite a mistake, I believe, to suppose that these dear little ones are self-consciously aware, as adults might be, of any invisible companion; what they have is a distinct "feeling," or inner conscious cognisance, of the spiritual presence of the inner Self, to which "presence" a child will often give a name, and of which, taking individual children as instances, they are the human radiance.

Only recently, comparatively speaking, out of the devachanic condition in which this spiritual presence was a living reality, although not there and then understood as something separate — for indeed it is not — the Ray reaching incarnation and embodying itself, in the manner which I have endeavored to describe in my *The Esoteric Tradition* and elsewhere, still retains the intuition of the spiritual presence of the inner Self; and the child's mind, instinctively feeling this presence, but not having the developed brain-mind as yet to argue about it or analyse it, recognises the fact, and talks of what we adults call, or might call, "an invisible companion," or by some such similar phrase.

As a matter of fact, highly developed human beings who are likewise esoterically trained, are self-consciously aware of this

spiritual companionship, so much so that Adepts and Initiates know the fact in its proper relations, and speak of this inner Self working through them by various terms, such as "Father-Flame," "Father in Heaven," "Father-Fire," etc., etc. In other words, the adept knows and recognises his inner Self as the "invisible companion," and puts himself under its steady and unfailing guidance and inspiration. Little children, still fresh from the spiritual realms, likewise, as said above, feel the fact, though not with the self-conscious analysis of the Adept; but they recognise it unconsciously, so to speak, as a "feeling"; and the unspoiled child will frequently be so impressed with this invisible companionship that it will speak of it to others.

In the case of the Adept-soul, the invisible companion is precisely what was meant by the Avatara-Jesus when referring to his "Father in Heaven.'

QUESTION 321. *I have been reading a book only recently issued, "Who Wrote the Mahatma Letters?" by the brothers H. E. Hare and W. L. Hare. The general line of criticism adopted by the authors appears to me most unfair, and yet I myself have often been puzzled in regard to the fact that certain of these Letters contain expressions similar to H. P. B.'s own expressions. I know of course from what I have read regarding "The Mahatma Letters" that some of them were transmitted by H. P. B. Would it be possible for an explanation to be given of this?*

[The above question was sent to the Leader. His answer contains so much that is helpful, that the Editors have obtained his consent to include it in these columns.]

G. de P. — Among other things which arouse the amazement of the reader of this book by the critical Hares, there are at least two of the first importance which the two authors either pass over without comment, or slur so badly that the average reader is

utterly incognisant that these facts exist. The first, then, of the two we find to lie in the amazing assurance with which the authors of this book treat their *apparatus criticus*, combined with their manner of treatment itself, apparently under the pleasant illusion that they are for the first time in Theosophic history the discoverers of what thoughtful Theosophists have all known since the date of the publication of *The Mahatma Letters to A. P. Sinnett*, and *The Letters of H. P. Blavatsky to A. P. Sinnett*, and which certain ones knew even from the days of H. P. B. herself, because she frequently explained these facts. In other words, I mean all the various idiosyncracies of speech and of mannerism, all the various Gallicisms on the other hand, and the various imperfections of punctuation, orthography, grammar, and what not, to which the critical Hares point triumphantly as largely originating in H. P. B.'s mind — all these were well understood since H. P. B.'s days as being due to the mental and psychical idiosyncrasies of the amanuenses or chelas, i. e. disciples, through whom most of the Letters of the Mahatmans came.

What else could we expect? A ray of sunlight streaming through stained glass will chequer the wall or the floor upon which the ray falls with the colors of the glass through which it passes; nevertheless the original ray is there.

Let the following facts be understood, as they have been for some forty years or more by thoughtful Theosophists: (a) The Masters themselves on only the very rarest of occasions wrote with their own hand any letters whatsoever, and consequently those that they did so write, if indeed any, can probably be counted on the fingers of one hand; consequently these letters are the fewest of all; (b) almost equally rare, but more numerous than those classified under (a) are what have been popularly called "precipitations," or communications which were "dropped" or found in unexpected places by the recipients thereof; and

consequently these are relatively very few likewise; and (c) the great majority of all the letters received from the Masters by individuals in those early days came through different amanuenses or transmitting chelas (disciples), among the number of whom we know perfectly well are to be counted H. P. B. herself, Damodar, Bavaji, Bhavani-Rao in one or two cases, and one or two others, probably not excepting the well known and erudite Hindi. Theosophist and scholar Subba-Rao.

Now, the important point to be noticed in this connexion is that all these transmissions of intelligence, in other words all these different letters or communications, including the various notes, chits, etc., etc., passed through the medium of the transmitting minds of the chelas who received them and passed them on to their different destinations, and often by the very prosaic and ordinary means of the postal system.

The Messrs. Hare are extraordinarily behind the times in not being aware of the fact that the many experiments of what it is now popular to call telepathy or thought-transference or mind-reading, conducted by earnest men of unquestionable ability and reputation, have established the fact that such telepathic transmission of intelligence is not only possible but actually of more frequent occurrence than most human beings realize; but in the early days of the Theosophical Society, in the heyday of the materialism of Haeckel and Huxley and Tyndall and Moleschott, and all the other bigwigs of the time, even so common a fact as telaesthesia, or telepathy, or thought-transference or mind-reading, was not only not accepted, but even ridiculed — and this against the common testimony and common experience of mankind for ages; for it is one of the most ordinary facts of human life to experience the wordless or unspoken transmission of human thought.

Now then, such transmission of intelligence from Master to pupil or chela, is more or less precisely what today is called thought-transference or telepathy or mind-reading, if you wish, only in vastly more perfect form because the transmitter is a mahatmic intelligence, and the receiving mind of the chela is a highly trained one; and, indeed, telepathy or thought-transference, etc., are merely minor instances of the general rule. The experiments conducted during the last forty or fifty years in mind-reading or thought-transference have shown clearly that it is *ideas* which are transmitted and received, but which are almost always distorted or twisted by the untrained mind of the receiver or recipient, and almost invariably more or less colored by the mind or psychological apparatus of the recipient; so that while the essential idea is often received, it is frequently distorted or deformed.

Precisely the same thing, but with less degree of distortion or deformation, must by the nature of the case take place when the transmitting chela receives the essential ideas more or less clearly, and occasionally and sometimes even often in the very language of the transmitter's mind and thought; but coming through the psychological apparatus of the chela, the original ideas are more or less subject to be given forth with marks or with the mental clothing of the chela himself. Thus it would actually have been amazing if there had not been Gallicisms in H. P. B.'s transmission of the essential original idea which was received clearly; but coming through H. P. B.'s mind, with her excellent knowledge of French and her acquaintance with Americanisms, it was almost certain that the message would be transmitted more or less, now and then, here and there, with a French turn of phrase, or with an American spelling to which H. P. B.'s mind had been accustomed.

Similarly so with messages received through and passed on by

other chelas — each one gave his own particular "atmosphere" or included more or less of his or her own mental characteristics to the message as handed on; yet the original idea, the essential thought, the fundamental language and intelligent conception, were always there, and this fact accounts for the grandeur and profundity found in such transmitted messages.

This leads us directly to the second of our points, which the critical Hares utterly ignore. This second point is the matter of the characteristic individuality in literary form or matter commonly called literary style. It is extraordinary that not a word in direct or specific allusion is made by the two authors of this book to the immense differences in the *literary styles* of M. on the one hand, and K. H. on the other hand, and neither of these two in literary style or in literary quality is at all comparable with H. P. B.'s own style when she wrote directly from her own mind. The stamp of literary style alone is so well recognised by every competent scholar and student as to be one of the very best means of judging the authenticity of documents, that the omission by the Hare brothers of any allusion to these immense differences in style, constitutes a defect of the gravest character in their attempted criticism. The style of M. for instance, is outstanding for its directness, its abrupt masculinity, its pungency in aphorism, etc.; whereas the style of K. H. though equally profound in thought with M.'s, is markedly different: flowing in character, smooth and easy in narrative, often semi-humorous in relation, and what has been neatly called "gentle" as compared with what has likewise been called the "rough" style of Master M.

H. P. B. when writing alone never wrote anything which in profundity could compare with the literary material of the two Masters, nor with its strength, however fine and really wonderful her own writings were; and her style is enormously different from theirs, although possessing undoubted charm and

attractiveness of its own. One has but to compare the literary style and atmosphere of the two volumes, (a) *The Mahatma Letters to A. P. Sinnett*, with (b) *The Letters of H. P. Blavatsky to A. P. Sinnett*, to see how forcefully telling this argument of literary style and atmosphere is.

I turn with a final word again to the matter of the messages received from the Masters through their chelas. As stated above, I have called this relatively perfect telepathy or thought-transference or mind-reading — call it by what name you will. It is most important to keep this in mind, because if it be kept in mind, then if the critic be likewise honest, he will see the absurdity as well as the futility of hammering, as upon something new, upon what has been known to Theosophists for the last forty or fifty years, and what has been at the same time proved to be a fact by the independent researches of scientific and other men — thought-transference — which produced the Mahatman Letters as written documents. The trained mind and will of the Master directed his thought, consisting of clear-cut, sharply defined ideas, to the mind and into it of the receiving but trained amanuensis, who received the *ideas* more or less clearly in accordance with his training or development, and transmitted those ideas as faithfully as he or she was able to; but passing through the amanuensis's mind, the transmitted intelligence was bound to be colored by the mental characteristics of the mediator — the disciple's mind — through which it passed. Hence the presence of Gallicisms when H. P. B. was the transmitting chela, and of an occasional Americanism; and similarly so, *mutatis mutandis*, when chelas other than H. P. B. were the transmitting mediators.

Note by E. V. S. — Even in ordinary secretarial work, it is easy to distinguish, where several stenographers work for the same person, what letters in the files are typewritten by one

stenographer, and which ones by another, etc., by the format, spelling (in cases where alternate forms are permissible), abbreviations (such as Mme. or Mad. or writing it out in full), which each stenographer uses. It is generally only when a stenographer has worked long enough with his employer to become thoroughly acquainted with all his idiosyncracies or habits, likes and dislikes, that the typewritten letters agree in every detail exactly with what the employer himself would use. In other words, each typewritten letter bears the stamp of the stenographer to whom it is dictated.

Note by J. H. F. — So also when the idea of an answer to a letter and the points to be covered in it are given to a secretary who is asked to write the letter and who may even take down in shorthand the gist of the notes given to him and who thus prepares the form of the letter, the author of the letter is the one who gives the ideas and the line of thought to be covered, and not the stenographer or secretary who is merely the transmitter. This is commonly understood, and hundreds of letters which are sent out by business men through the media of their secretaries though necessarily colored by the individual characteristics of the secretaries' style, etc., are nevertheless the letters of such business men.

We see likewise how it was that when conditions of transmission and reception were relatively perfect, and the chela was highly trained, the resultant communication, outside of certain characteristic mental or psychic marks of the amanuensis, contained even the actual mentally pictured words of the Mahatmic transmitter; and also how it was that in such conditions of relatively perfect receptivity, the transmitting amanuensis, because of the force of the impinging idea and will of the transmitter, reproduced even the very forms of handwriting that had been adopted or used by the Mahatmans.

If the conditions of receptivity were relatively perfect, i. e. if the strong will of the Mahatmic intelligence and the clear-cut ideas were received by the chela's trained mind more or less perfectly, the resultant was a communication which was very close to being a perfect reproduction of the Mahatman's own words, own handwriting, own turns of phrase, etc., etc.; but if the conditions of receptivity were in any degree less perfect, the ideas were transmitted but more or less deformed or colored by the psychological apparatus of the transmitting amanuensis, thus reproducing turns of phrase, spelling of words, etc., etc., native to the amanuensis.

Note H. P. B.'s own words regarding the transmission of such letters, etc., in her article "My Books," which passage can be found on p. 26, of the preliminary pages in *The Complete Works of H. P. Blavatsky* edition of *Isis Unveiled*:

. . . many a passage in these works has been written by me *under their dictation*. In saying this no *supernatural* claim is urged, for no *miracle* is performed by such a dictation. Any moderately intelligent person, convinced by this time of the many possibilities of hypnotism (now accepted by science and under full scientific investigation), and of the phenomena of *thought-transference*, will easily concede that if even a hypnotized subject, a mere irresponsible medium, *hears the unexpressed thought* of his hypnotizer, who can thus transfer his thought to him — *even to repeating the words read by the hypnotizer mentally from a book* — then my claim has nothing impossible in it. Space and distance do not exist for thought; and if two persons are in perfect mutual psychomagnetic *rapport*, and of these two, one is a great Adept in Occult Sciences, then thought-transference and dictation of whole pages become as easy

and as comprehensible at the distance of ten thousand miles as the transference of two words across a room.

The Theosophical Forum

THE SPIRITUALLY UNEMPLOYED — *Marjorie M. Tyberg*

A great part of the tragedy of unemployment lies in the enforced departure from the wonted patterns of human life. The father of the family sees himself dethroned from his honorable position as provider, helpless where he was once the mainstay, his skill perhaps blunted by disuse, his heart heavy. The mother sees every housewifely activity stripped to naked necessity, without the assurance that even necessity can be met. The parents see their children run the risk of every ill that follows upon lack of what in better times it was their joy to supply. Small wonder is it if confusion of mind prevails in the "distressed areas." That it is not more general is a notable fact; for that there should be the poise of mind that renders vision possible is hardly to be expected in the trying conditions of life among the jobless.

But, in addition to those whose lack of vision can thus be accounted for, there are many others, living in what must seem to the unemployed not only enviable security, but peace and plenty, who, nevertheless, largely by their own will, if not by their ignorance, are cut off from any view of the pattern of human destiny. By their failure, for whatever reason, to avail themselves of companionship and intimacy with the permanent, vastly experienced inner man or woman, they suffer from the disuse of faculties whose function it is to illumine, to reveal the significance of, every event that befalls. Never to discover these higher faculties, never to transcend the functions of the brain-mind, is to fail to find the direction of the stream of human progress. It is to belong to "the spiritually unemployed.'

The future of man is a vital concern of thinkers today. All feel that an old age is dying; the intuitive feel that a new age is being born.

No longer is man regarded as an accident or an interloper in the cosmic scheme. It is being found impossible to separate man's fate from the structure and the history of the universe. It is becoming reasonable to suppose that the future of humanity will be woven of individual threads of human effort — effort actuated by what if not the very thoughts and aspirations that we as human beings have today? The pattern is indeed set by cosmic law, but the details of the part played in weaving the tapestry remain a matter of man's free will.

One notes with interest the trend of thought toward the discovery and practical application of spiritual resources in man in building a future (not in Heaven but here on Earth) in which recognised unity and interdependence, free creative power, and the sense of victory that comes from understanding the universe, are the keynotes.

Dean Gauss of Princeton University in *A Primer for Tomorrow* says that our age is one that looks, not back to the great achievements of the past so much as forward to "a free future," his part in which man does not yet fully understand; but a future in which the tendency will be to form larger united groups than were developed in the past, in which new creative energies will be liberated. He asserts that our institutions are not yet based upon the deepest human instincts, and he stresses "the new world of spirit."

Erwin Schrodinger in *Science and the Human Temperament* writes of "the free unfolding of noble powers which remain available, beyond utilitarian activities."

In a book review by Basil de Selincourt we read that life today is like a boat-race in a storm, in which the aim is not to outstrip one's competitors but to reach the goal *with them*, the prize being the gaining of understanding.

Aldous Huxley in a recent novel has a modern hero beginning to realise that he is not separate from his fellow-beings, but "united at the depths with other lives, with the rest of being."

In *Return to Philosophy*, Dr. C. E. M. Joad writes of a time in the future when man shall have assimilated both the facts gathered by scientific research and the wisdom of the philosophers, and shall have viewed these in the light of his own experience. He postulates a "jump" to a new level of insight into the meaning of things, a new understanding of the order of the universe. He suggests that this wider field of consciousness, now experienced by the artist, the musician, and the mystic, may become common to the human race.

The urgent need today is for a new framework of thought concerning man and the universe, one inclusive of all the possibilities for humanity that have been intuited by these writers. The shining inner building-blocks for this glorious structure are to be found in the Seven Jewels of the Ancient Wisdom, as presented by Theosophy.

They are: (1) Reimbodiment, the teaching that everything from an atom to a galaxy reimbodies itself in successive periods of manifestation; (2) Karma, that man is and has just what he has made for himself in these lives on Earth, that he can thus build as he will; (3) Hierarchies, that all beings, seeds of divinity, "united at the depths," and interdependent, mount in a graduated scale of life towards realization of the inner divinity; (4) Swabhava, the doctrine that all beings have a seed of deathless individuality in varying degrees of unfoldment, their unique contribution to the cosmic system in which they are manifesting; (5) Evolution, the gradual unfolding from within of this inner potency, in man reaching the stage when self-directed evolution may be carried on; (6) Amrita-Yana, the Path of Immortality, the Law of

Compassion, the truth that only by helping those lower in the scale of being does one mount to the higher reaches of conscious Divinity; (7) Atma-Vidya, the perfect knowledge of that Divine Self that is the root of all, the individual dewdrop of consciousness being, not absorbed in the Ocean of Universal Divine Consciousness, but, becoming that Ocean.

In a cyclic crisis like the present, one is wilfully blind to refuse to take into consideration philosophy that supplies the building-material for a new mental framework of the destiny of man. One is short-sighted to refuse to avail oneself of the spiritual resources of the inner, enduring principles of human nature, those which endure throughout the whole long cycle of man's pilgrimage as a soul, even as during one life on Earth there is something that persists from birth to death; for, in this deeper Self, lies the power to catch gleams of distant goals. One is mentally a coward never to accept the challenge to adventure in ideals, never to take part in aiding to bring the new age to birth but stupidly seek to keep rather than to grow and deeply live.

So to distrust or deny human possibilities, so to hold back from the Quest of Self-Knowledge, is to belong to the self-deprived class of the spiritually unemployed.

The Theosophical Forum

THE IMMORTALITY OF THE SOUL (1) — *Cyrus Field Willard*

In Freemasonry we see a drama of the soul. Many Grand Lodge jurisdictions require a belief in the immortality of the soul as a prerequisite to the candidate's initiation.

But few Masonic writers have tried to tell what it is and why it is immortal, and not one of such writers, so far as the present scribe knows, has been able to consider it scientifically from the standpoint of present scientific knowledge and reason, rather than that of emotionalism and blind faith.

Therefore, it has seemed wise to take this problem in the same manner as if it were a chemical problem, and give to the average Freemason some idea as to what the soul is and why he should believe in its immortality.

First, we will consider the immortality of the soul (2) as a purely scientific hypothesis. It is as logical and as sound as the nebular hypothesis. Singularly enough, it works somewhat in the same manner, "As above, so below."

Freemasonry has taught it down through the ages, as far back as our knowledge of this and similar organizations goes. Now we begin to see that the wisdom of the ages was not confined to "the laughing philosopher, Democritus," whose atomic theory John Dalton presented to us again. This rather materialistic concept we have adopted and now modified to something still more scientific. Our atom has been resolved into a planetary system, which has a positive central unit like our sun, called a proton, and around which revolve negative electric charges, usually invisible, called electrons, as planets revolve around our sun.

This brings to our mind, if we know of such things, the old

hermetic sentences engraved on the Emerald Tablet, which used to seem so senseless and now so full of wisdom, "As above, so below."

RADIUM BOOSTS REPUTATION OF ALCHEMIST

With the resolution of the atoms into electrons and protons, the materialistic conception of the universe has disappeared. Radium, showing the change of one element into another, has rehabilitated the reputation of the alchemist, the father of modern chemistry, while the resolution of the atom into its parts has brought once more the hermetic teachings to the front as being respectable enough to be used as working hypotheses.

Matter is indestructible; it may and does change appearance, but always while matter it retains its Trinity: Substance, Energy and Consciousness.

Since matter is indestructible, how much more so is that aggregation of highly specialized Consciousness, the Thinker, which with the Will and the Spark of God, constitutes the Immortal Soul. This soul must have its three phases of Substance, Energy and Consciousness, as it is but refined matter, since God Himself pervades all matter, and "God is everywhere." Subtract Him from the Universe, or its smallest atom, and it would go to pieces. "In Him we live and move and have our being," takes on a new and scientific meaning, from this standpoint, that He is in us and we are in Him. This is what the resolution of the atom into electrons is bringing us up to confront, and which is destroying the anthropomorphic conception of God.

Most persons say "I have a soul," instead of saying boldly and with knowledge, "I am the soul." It is not something that emerges, like the butterfly from its chrysalis, at the time of death. When we hear some one described as "a brave soul" it is the correct

characterization if he is to live and struggle through adversity. For it is our struggle and bravery in this life that makes the soul what it is.

"WHERE DO WE GO FROM HERE?"

This brings up another point. Let us say that a man has struggled up from a little country town where people knew but little, to a degree of knowledge and desire for service that has made his name known the world around in certain scientific and Masonic circles. He has developed a certain character, learned a number of languages made a number of scientific discoveries and attained a desire to help his brethren struggling up the slope of Time. He has had wealth and suffered poverty, been ill and experienced deprivation, so that it seems sweeter to help others than to think of one's self all the time

Is all this development to go for naught? After having learned all these things on earth, is he to take this desire to help those less fortunate in knowledge, to some more fortunate planet where the inhabitants know more than he does and continue to selfishly gorge himself with knowledge, when he already has so much that he wants to help those who have less? Or to some mythical Heaven whose place in space is unknown?

That is the weakness of the logic of the modern teachers of spiritual things, in the opinion of one who looks at these matters from the standpoint of reason.

A FEW PUZZLING QUESTIONS

I remember while still studying logic in the high school, I one Sunday asked my Sunday-school teacher:

"Is the soul immortal?" and she replied, "Yes."

"Well, if it is immortal, it must be eternal," I continued and she

answered, "Yes."

"Then if it is eternal, it cannot have had any beginning any more than it can have an end," I persisted, "and in that case, where was it before it came into the body?"

She was puzzled and was unable to reply, finally saying that I had better go and see the minister, which I did and propounded the same questions and got like answers as before.

He said I was all wrong and this was the way it happened: "God creates a soul for every new body, and from that time on it is eternal." I went away thinking that over, and not quite convinced, finally coming back after some days and asking this question: "If God creates a new soul for each body, is not God just as much to blame as the parents, for the child who is born without their being married, or in fact worse, as the body could not live without the soul He furnished the child?"

The only answer I got was the thundered warning: "Young man, if you keep on like that, you'll become an infidel." Which, of course, as he was unable to answer my sincere questions, prompted by my God-given reason, was the only way out for him. I ought also to say that I told him: "If the soul has no ending and lives for ever, it cannot logically have had a beginning, as you cannot think of only one end of a string or a stick."

"YE MUST BE BORN AGAIN"

These puzzling questions stuck in my mind for years and since then I have often thought of what Jesus of Nazareth told Nicodemus: "Ye must be born again," and his assertion that John the Baptist was Elijah who was to be born again.

It made me examine into such matters and when I became interested in scientific matters, I found that the law of

conservation of energy required reincarnation. Not only that, but it is a doctrine that is believed in by the great majority of the earth's inhabitants.

Nearly all the western poets, such as Browning, Tennyson, Longfellow, Wordsworth, Paul Hamilton Hayne, Whittier, Bayard Taylor, Landon, T. B. Aldrich, Chas. G. Leland, Maurice Thompson, N. P. Willis, J. T. Trowbridge, James Russell Lowell, T. W. Parsons, Edmund W. Gosse, Dean Alford, Lord Houghton, D. G. Rossetti, Joseph Addison, Philip J. Bailey, Coleridge and Walt Whitman, especially Whitman and Browning, believed in the idea of reincarnation, for poets are seers.

At times in certain emergencies, I have found knowledge welling up within me to meet that emergency which I had not consciously imbibed in any manner before. Others with whom I have talked have had the same experience and have also wondered where they got the knowledge or experience to meet a given crisis.

CHILDREN REMEMBER PAST LIVES

For a number of years I kept a note-book which was finally lost, that contained the experience of many children who had knowledge of having lived before, and I found that such knowledge was much more common than generally supposed, but that the child after being laughed at, or scolded, would keep such things to himself and as he got older finally forgot the main incidents of what he formerly remembered distinctly. There was a case of a man in humble position in Massachusetts, near Cambridge, who on recovering from a severe illness spoke a language which no one understood until finally a professor from Harvard University said the man was speaking what he termed "Middle Persian."

Character is the memory of past lives.

How often we see children in a family whose characters are totally different from each other. Any mother will tell you that. Often you will find those whose character is entirely different from their parents or any Mendelian strain.

Looking at it from what might be termed a materialistic standpoint (although the writer believes matter and spirit are one) the soul is a bundle of conscious nervous energy, which retains within itself as hydrogen sulfide does its smell, the sublimated memories and knowledge of previous lives.

WHICH HORN OF THE DILEMMA?

Pre-existence must be a fact or else annihilation ensues at death. There is no half-way station. *Ex nihilo, nihil fit* — out of nothing, nothing is made. The child opens its new life with character and attainments derived from previous lives where they have been painfully won. Biogenesis is as true in the spiritual world as in the physical.

Evolution is correct and true — so far as the body is concerned. The various stages of the foetus prove it. But we must also realize that there is the involution of the soul, in the body made ready for it, by which the soul can add the experiences of a new personality, the new "persona" or mask, to the sum total of his treasured traits.

In its passage through earthly personalities the spiritual Self, the real I, the Thinker or immortal soul, accumulates a fund of individual characteristics and attainments which remain as the permanent thread stringing together the separate lives.

Masonry has insisted on belief in the immortality of the soul, but gives no rational explanation of what it is, and why and how it is immortal, that can be accepted by the logical thinking man.

OUT OF HIS BODY

H. J. Whymper, the mountain climber, and, by the way, a good and well known Mason, tells in one of his books of an accident he had in falling from a height and how he seemed to be up in the air like a balloon looking down at his body and seeing (without physical eyes, mind you) his guide bending over him with a silver flask in his hand and how he felt the sensation as though he swallowed a balloon (himself), and he came to and looked up in the face of his guide.

The congeries of refined matter which he felt to be himself, was undoubtedly his soul, his real self, which, on account of its tenuity, rose in the air. It is fair to presume that there is a *locus* a place somewhere within the attraction of the earth's atmospheric envelope, which acts as a resting place between lives for the weary soul who has gone through a series of hard struggles on earth, and desires time for rest and assimilation of the lessons it has received, until such time as the necessity for being reborn on this planet again asserts its pull.

"No doubt I have died myself, ten thousand times before," said Walt Whitman, and also in his "Facing West from California's Shores," he says: "I a child, very old, towards the house of maternity, the land of migrations, look afar," in speaking of his numerous lives.

It can be truly said that the gradual development of the soul by and in the school of experience demands a vaster arena of action than one earthly life affords. We have hardly learned to live before it is time to die. Some of us are born with aptitude for certain languages, which we learn easily or rather re-learn, as the writer knows by experience.

WHAT WERE YOU RAISED ON?

If it takes ages of time and thousands of lives to form one species of animal from another, as biology teaches, the expansion of human souls from lower to higher natures surely needs many and many a life for that purpose. These we have had. Today in America is being formed from all races what is termed the new Sixth Race. We are now in what is called the Fifth Race and have developed five senses.

When we are raised to the sublime degree of a Master Mason, what are we raised by and what on?

The five points of fellowship are the five senses which we hold in common with our fellows and they constitute our fellowship with our fellow man. If we are brought back to life, it is by the way of being born again, as Nicodemus was told he would have to be, and we are reborn on the five points of fellowship, and the Lost Word is that Spark of Divinity, we, as the Thinker, bring back with us. There is a symbol within a symbol.

It is difficult to speak of these things without overstepping the mark that has been set for us. Hiram Abif is raised in the sign of Leo the lion, which is at the time of St. John the Baptist Day, or Midsummer, the 24th of June (the old Masonic festival) when the Sun, whom Hiram represents, is at his greatest strength and he was slain by the three winter months.

We do not know what the Sun is, as we only see his chromosphere or envelope. Helium was first seen in the sun's spectrum before it was discovered on earth. It may be that the real sun (which we do not see) bears a more intimate relation to our interior spiritual nature and its rarefied matter or spirit, than we have any conception of at the present time. We may not have the instruments yet to detect it and so can but offer hypotheses as to the constitution of this spiritual matter or inner proton of our being.

Our rebirth from a former life may some day be accurately determined by knowledge, which most of us do not yet possess.

WHAT THE THIRD DEGREE TELLS US

But we do see in the lessons of the Third Degree that we are almost told, in so many words, that we have lived before, that our soul, our real self, is immortal and eternal, has had no beginning and will have no end, is, in the last analysis, a spark of the Highest Spiritual Substance which alone is eternal and can "never, never, never die." We come back to earth in justice to ourselves and to those whom we have wronged, to do the things we should do in helping our less fortunate brothers upward to that Spiritual Sun, the true light, "that lighteth every man that cometh into the world."

Any one who is experimenting with matter every day and sees the peculiar things that happen, if he be observing and reflecting, is inclined to believe in consciousness inhering in matter. It is but just to say that the measure of our acquisition of conception from the outer universe resides in the senses, and there is no evidence that these have always been five or will not be, at some time, more numerous.

Therefore we must assume that our present ascending development will introduce us to higher levels, in which the soul shall have more senses and glorious extensions of bodily powers relating thereto. We realize that what begins in time must end in time. Death must be the conclusion if birth is the beginning of the soul.

The idea of immortality demands rebirth and analogy makes it most probable. Science confirms it and the nature of the soul, as I have tried to show, requires it. It alone answers the theological questions of original sin and future punishment, and also

explains many mysterious experiences. It alone solves the problem and shows the reason for the apparent injustice and real misery which exist today in the world.

GOING UP THE STAIRS

As Emerson said: "We wake and find ourselves on a stair. There are stairs below us which we seem to have ascended; there are stairs above us, many a one which go upward and out of sight."

Plato expressed the idea correctly when he said: "The soul always weaves her garments anew." The nature of the soul requires rebirth, for the conscious soul cannot feel itself to have had any beginnings any more than it can conceive of its annihilation. The sense of persistence overleaps all the interruptions of forgetfulness and sleep.

"OH! FOR ANOTHER CHANCE"

The eternity of the soul, past and present, leads directly to an innumerable succession of births and deaths, like Walt Whitman said. "Oh, for another chance!" is the inward prayer of many a poor downhearted soul not knowing that Nature's just and compassionate laws provide for it.

An ancient book has said: "Those who are wise in spiritual things grieve neither for the dead nor for the living. I myself never was not, nor thou, nor all the princes of the earth, nor shall we ever hereafter cease to be. As the lord of this mortal frame experienceth therein, infancy, youth and old age, so in future incarnations will it meet the same. One who is confirmed in this belief is not disturbed by anything that may come to pass."

Patanjali says that a knowledge of the occurrences experienced in former lives will arise in him who practises his aphorisms by holding before his mind the trains of self-productive thought, and

concentrating upon them.

The philosophy of "innate ideas," or mental heredity, is an admission of earlier lives than the present. One of the best arguments in favor of reincarnation was written by Chevalier Ramsay, the celebrated Mason, who is credited with the origination of many of the Scottish Rite degrees.

Pythagoras remembered his former lives in the persons of the herald Aethalides, Euphorbus the Trojan, Hermotimus of Clazomenae and others, and pointed out in the Temple of Juno at Argos, the shield with which he, as Euphorbus, attacked Patroclus in the war before Troy.

If you will read all that Gould, the historian of Masonry, says about the hermetists, you will see how they harked back to "Our ancient brother Pythagoras," and it will explain why in Freemasonry, which is the heir to the teachings of Pythagoras, we have the concealed teaching of rebirth on the five points of fellowship, the five senses, by which we are raised to a living perpendicular, and of Plato who said, "God geometrizes."

SNARLS OF EARTHLY LIFE STRAIGHTENED

Eternal justice rules the world. But when we view the miseries of mankind, the prosperity of wickedness, the struggles of the deserving, the oppression of the masses, the talents and successes of the fortunate few, we would feel compelled to call the world a sham without any moral law, did we not have this idea of rebirth.

This yields to a majestic satisfaction when one sees that the present life is only one of a great series in which every individual is gradually going the round of experience for a glorious outcome, and that the hedging ills of today are but a consequence of what we did yesterday and a step toward the great things of tomorrow.

The tangled snarls of earthly life are straightened out as a vast and beautiful scheme and the total experience of humanity forms a magnificent tapestry of perfect poetic justice.

In science the crucial test of the merit of any hypothesis is whether it meets all the facts better than any other theory. This the idea of the immortality of the soul and its pre-existence in former lives does, and no other so admirably accounts for the diversity of conditions on earth and refutes the charge of favoritism on the part of the Grand Architect of the Universe. Hierocles said, and many a philosopher, before and since, has agreed with him, "Without this doctrine, it is not possible to justify the ways of God."

PRE-EXISTENCE OF IMMORTAL SOUL

It alone solves the problems of life. The fulness of its meaning is majestic beyond appreciation. It shows that every soul, from the lowest animal to the highest archangel, belongs to the infinite family of Being, and is eternal in its conscious essence, perishing only in its temporary disguises; that every act of every creature is followed by inevitable reactions which constitute a perfect law of retribution, and that these souls are intricately interlaced with mutual relationships. The bewildering maze thus becomes a divine harmony. No individual stands alone but trails with him (as Wordsworth beautifully described) the unfinished sequels of an ancestral career and is so bound up with his race that each is responsible for all and all for each.

No one can be saved until all are redeemed. Thus every suffering we endure, apparently for faults not our own, assumes a holy light and a sublime dignity.

REBIRTH ONCE PART OF CHRISTIAN RELIGION

In presenting these ideas I have culled from a number of writers,

and hence claim but little originality. It has seemed to me that our great army of Masons in the United States, numbering about three million of picked men, who have been going into Masonry without any clear idea as to why, but really as an urge from the Thinker within, based on stirring memories of a former life, are entitled to a knowledge of the soul in whose immortality they are required in many states to believe, as well as in the existence of a Supreme Intelligence, a Grand Architect of the Universe, or God.

Originally this idea of the pre-existence of the soul and its eternity in life after life, was part of the Christian religion. In its early days such fathers of the church as Origen advocated it and it flourished with wholesome influence in that church for 500 years until it was forcibly crushed out by the Council of Constantinople in 551 a. d., to make room for the harsh dogmas which have since darkened that church. It never was met in argument and conquered by reason, but was summarily ousted by the weight of prejudice and the desire of the priesthood to hold the keys of purgatory, heaven and hell, as all priesthoods have ever done. It has been aptly termed the "Lost Chord of Christianity," for it alone makes that religion reasonable and logical in the light of advancing science and knowledge, and brings it back to what Jesus taught.

ALTRUISTIC TEACHINGS OF MASONRY RELIGIOUS

Scientists today do not care what you believe. "What are the *facts?*" is now the cry. About sixty-five percent of the people of the United States do not belong to any church or organized religion. This large proportion of our population should not be allowed to drift away from all religion, and it is to them I address my remarks, for a large number of these non-members of churches find that their religious impulses are only fed by the tender, altruistic teachings of Masonry, which inculcates a belief in the

One God and the immortality of the soul. To these I have endeavored to give a fitting concept of the dignity of that soul whose immortality our ritual claims to be a fact.

In closing, the writer would like, as one who believes in using the reason with which the Divine Intelligence has endowed him, to quote a celebrated poet, Wordsworth, who gives a very clear presentation of the subject in the following lines:

Our birth is but a sleep and a forgetting;
The soul that rises with us, our life's star,
Hath had elsewhere its setting,
And cometh from afar.
Not in entire forgetfulness
And not in utter nakedness,
But *trailing clouds of glory* do we come
From God who is our home.
Heaven lies about us in our infancy:
Shades of the prison house begin to close
Upon the growing boy;
But he beholds the light and whence it flows
He sees it in his joy.
The youth who daily farther *from the East*
Must travel, still is nature's priest.
And by the vision splendid
Is on his way attended.
At length the man perceives it die away
And fade into the light of common day.

FOOTNOTE:

1. This article was originally published in *Square and Compass* (Denver, Colorado), August, 1931, and there credited to "A Research Chemist," and with the following as an introduction: "This article is by a well-known Masonic writer who wishes the

message to be considered rather than the personality of the messenger." It is here reprinted as revised by the author and with his permission. — Eds. ([return to text](#))

2. I use the common phrase "immortality of the soul," yet strictly speaking if we accept the characterization of man's nature, as stated by Paul, as being spirit-soul-body, it is rather the spirit, and *only* the spirit, that we can speak of as immortal — the soul being merely the vehicle for the spirit and its encasement while on earth, just as the body is the encasement of the soul while on earth, and both body and soul growing and changing from life to life.

Also in line with Paul's teaching, if we take the words of Jesus, "Ye are gods," we see that man in essence is not merely spiritual, but godlike, divine; and in the ultimate analysis it is this inner god which is the heart of us, the very essence of us, which alone is immortal. However, in view of the common usage of the words "the immortality of the soul," and with the reservations as just given, I continue to use this phrase. ([return to text](#))

SOME MYSTERIES OF CONSCIOUSNESS — *L. L. Wright*

It sometimes seems almost as if Nature had a sense of fun. Knowing how ignorant of ourselves we really are, does she not appear to enjoy, now and then, putting across a little joke on her self-complacent children? Consider some of the absurd or infuriating things that happen to all of us, of which the following is an example:

I was awakened at five o'clock one bitterly cold winter morning by the realization that I had something to do that must be attended to at once. I had only just succeeded in opening the far corner of my left eye, nevertheless I bounced out of bed and put through the polar expedition of dressing in a record ten minutes. And then, well, what was that duty anyway? Pity me, Compassionate Reader, for I hadn't the vaguest idea! There I stood, all dressed up and nowhere to go!

It reminds me of Mark Twain's story about his cat. Mr. Clemens had been intensively investigating one of the popular forms of "mental science" and was interested in the teaching as to the non-existence of pain. One day someone accidentally stepped on the cat's tail and poor pussy released a blood-curdling protest. Mark Twain saw the incident and said to himself, "Now I wonder what *was* the matter with that cat?"

The mention of Mark Twain suggests another of the mysteries of consciousness, an incident which he describes somewhere, in his autobiography I believe. One summer morning he was sitting on the porch of his home in the country when a shabby man walked up to the front door and rang the bell. It was then that the amazing thing happened. Right before his eyes the man vanished! Mark Twain sprang to his feet. "Ye gods!" he thought, "I've seen a

ghost! I'm going right in and send a report of it to the Society for Psychical Research." He went into the house by a side door, crossed the front hall to his study — and there sat the man, a messenger waiting for the answer to the note he had delivered.

Mark Twain explained the incident as what he called, if my recollection is accurate, a "lapse of consciousness" during just the moment in which the front door opened to admit the man with the note. When he "came to" of course the man was not there. It is an interesting explanation and decidedly more to the good than the ghost-business. For doubtless we all have these lapses, long or short as the case may be, from the extended "brown study" to the moment of absent-mindedness when we start gaily down-town with the modish hat wrong side to. And at the moment of discovery, generally through the sly or horrified gaze of the passer-by, we are sure to be rewarded by a glimpse into emotional depths in ourselves which are both new and exhilarating.

We can also learn much from our friends in this sort of candid investigation. Someone I know had a curiously satisfactory experience. One night the temperature made a record drop at about 2 a. m. and he woke up to find himself lapped among the icebergs. He lay there for quite a while, too drowsy to force himself to forsake the tiny island of warmth at the small of his back for the arctic zone outside the bedclothes. Finally he managed to pull up the heavy quilt which always hung at the foot of his bed; and he says the sense of flooding warmth which wafted him back to rosy dreamland he will never forget — and *why?* Because when he woke up in the morning the quilt was still hanging over the foot of the bed!

Then there is an excellent cure for wakefulness, which will work if you are clever about it and don't let your right hand know what

your left is doing. Just — casually — leave the back door unlocked when you go to bed. Then, as soon as you are comfortable try to make yourself get up, especially if the night is chilly, and paddle down through the cold house to lock it. Nine times out of ten you will fall asleep as quickly as a baby.

There are other ways of applying these discoveries of the quirks of consciousness. Years ago, when I was young enough to know better, I decided that I would "be an author." So every morning at exactly 8:30 I sat down at the desk and fiercely applied my squirming mentality to the selected theme. Presto! I saw a pile of ironing or a heap of stockings to be darned that were crying for help, and the temptation to rise and "get it done" was irresistible. It was the same every time I sat down to write. Before a week had passed I had my wardrobe and other personal gadgets in the pink of condition, and all owing to the intensive effort to make my mind work, in my way instead of its own. If this isn't a clear case of the mystery of the "behaviorism" of consciousness, what is it?

This last experience suggests two different psychological reactions, and you can take your choice. Pick out the duty which irks you most, concentrate your mind upon it, and while you are trying to get it done you can have all the little hangover tasks that have been worrying you cleaned right off the slate. Or — to return to sanity — brush aside everything but the matter in hand and get it done in top-hole fashion, and so accomplish your daily stint in self-directed evolution.

The Theosophical Forum

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: X — *H. T. Edge*

X — THE ARK

Noah's Ark and the Ark of the Covenant will at once occur to the mind of those who have read their Bible: different things, yet akin and almost identical in symbolism. Both were sacred vessels, and in that definition we may find the key to their identity. But those who think it necessary to believe that the Bible is unique will be disconcerted if they chance to discover that the story of a deluge and an ark is world-wide, being found in the mythologies and religions of every people from China to Peru and from the Arctic Circle to the islands of Polynesia; so that it is necessary to go back very far indeed into antiquity to find the common source whence all these diverse peoples derived a story so uniform in all its essential features as is this universal deluge myth. In all these stories a people grown old in wickedness is destroyed by a flood; an ark is built, whereon are saved a select few, who land after the waters have subsided and form the origin of a new race.

The ancient history of our earth is written in indelible characters on the rocks that compose its crust, so that the humble geologist with his pick can read it. The stratigraphical record tells of periodic cataclysms which have overwhelmed large continental areas; of the rising and sinking of the land; of the pouring forth and drying up of waters; of widespread havoc wrought by the belching of subterranean fires. The searching eye of the astronomer learns to read the same record in the heavens, and to connect the story of vast cyclic displacements of the earth's axis with the tale of the geologic cataclysms. The past records itself automatically in books that he who runs may read; but it also

records itself indelibly in the astral light, where it can be read by Seers as other men read the printed book or the Braille script, according to the extent of their visual capabilities. Hence Nature's picture book tallies with the Secret Doctrine, that traditional record of cosmic evolution and the drama of man, preserved in the myths and allegories and symbol language of the world's faiths.

We have said that a symbol condenses a world of meaning in small compass; so that, if several different interpretations are given to the same symbol, there is no contradiction but only amplification. We shall give several meanings to the Ark symbol. It refers to deluges in general, and the passing of old races and the birth of new ones; it refers in particular to the last great flood, when the Fourth-Race continent of Atlantis sank and the first sub-races of the Fifth Race took their rise, in new lands, from the saved remnants of the old race. Thus far we have geophysical applications of the symbol. But the Ark in its widest significance means the Womb of Nature, the Great Mother, the World-Soul, the container of all that is. This great feminine potency stands at the head of every theogony, as its masculine counterpart, the Sun or Circle, is the All-Father, the active creative principle. But in using these terms we have to be careful not to give them a literal sense according to their analogies on the lowest planes of physical generation. For the Ark was Isis, Moon, Venus, Diana, chaste emblems of eternal bounty, and in the seven principles of man would be Buddhi. We have said something of this in the article on Sun and Moon (July number).

Prescott tells of the surprise of the Jesuit missionaries on finding that the Peruvians already had the Flood story; and in Daniel Brinton's *Myths of the New World* we find a large number of versions of the Flood story among Indians of North, Central, and South America; it is among the ancient Scandinavians in the

north and Polynesians in the south; in India, China, Africa. What theory can explain such universal diffusion, such uniformity in particulars? Only the theory of a common tradition, very ancient, reaching back to times when peoples now scattered were one; when there was a universal body of knowledge — the Secret Doctrine. In Greek mythology we have the story of Deucalion and Pyrrha, which tells how Zeus determined to destroy the world on account of its wickedness, and these two were saved on account of their piety; and how they reseeded the earth by throwing behind them stones which became men and women. Refugees from sinking Atlantis settled in various places, bringing with them traditions of the great cataclysm.

But, as said, the Ark symbol refers to more than geological cataclysms; for it signifies a sacred vessel which preserves the seed of a new growth after the destruction of the old. There are many tales of infants being consigned to vessels and set afloat on the waters whence they are rescued to become the founders of new races; the story of the infant Moses is a case in point. The Ark is the symbol of the womb of nature, represented by the crescent of the moon, by the Solar Boat of Egypt, the horns on the head of various female deities. The Spirit of God broods over the face of the deep; the seeds of life are scattered in the great receptacle of primordial matter. The Hebrew Ark of the Covenant signified the same idea, for it was the sacred vessel of Deity; but in later times this original sublime meaning became corrupted into anthropomorphic conceptions.

THEOSOPHY CAN EXPLAIN — L. L. W.

Brotherhood is a fact in Nature. To demonstrate this fact is the principal aim of Theosophy. The aim is to show brotherhood to be, not simply a sentiment, not even a mere ideal, but a practical workable reality. To this someone may object, "But how can it be a reality when it simply doesn't exist? Show me anywhere a real brotherhood!" Theosophy explains: It is because brotherhood is not recognised as a reality, existing as a basic law and always and everywhere, that there is so much suffering. We are not many but one. Like the fingers of one hand, like the hand to the body — so does each small human organism reach back into the Great Organism called the Universe. In that Divine Life we have our spiritual roots. In it we "live and move and have our being."

There is only one real cause of suffering — human selfishness. Selfishness antagonizes this law of organic unity — therefore harmony. Ethical laws are laws of harmony which spring from this inherent Unity. They are as real as the laws of electricity and gravitation. Just because we are all actually living tissue in this brotherhood of flesh and heart and spirit every selfish action is like a knife-thrust into the social fabric. One man's selfishness injures all. Can a man cut off his arm without suffering all over? Cannot the tiny pin-prick you hardly notice result in death? Because we are all parts of one organism we cannot injure others without having to suffer like consequences in our own souls and bodies. "Be not deceived; God is not mocked: for whatsoever a man soweth that shall he also reap." If we do not reap that harvest in one life then we must meet it in some later life on earth. For that is how we learn. Not in heaven. Not in hell. We pay our debts here where we made them.

The Theosophical Society was founded in New York in 1875 as "a nucleus of Universal Brotherhood." It was to be only a nucleus. Its founders realized that the world is so afflicted with ignorance and selfishness that little more than a beginning could be made. A kindred object in Theosophy is to explain man to himself.

Ignorance is the breeding ground of selfishness. If we understood what we are doing to ourselves and others when we injure them, we would think twice before acting. We do not suspect that in allowing war, crime, and injustice we cannot shift all the results onto the next generation. We fasten some of them upon ourselves. For nations living now will have to be reborn on earth as other races to work out the consequences of present mistakes and indifference.

These are three of the spiritual Laws of Life — Brotherhood, Karma, Reincarnation. Understanding them includes many deep and fascinating teachings which can be found in advanced Theosophical literature. Theosophy offers them as well worth investigation and study.

THE MYSTIC GIFT — I. R. P.

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

Verusque Sol, illabere,
Micans nitore perpeti,
Jubarque Sancti Spiritus
Infunde nostris sensibus! (1) — Rambach

The Christmas Season marks the termination and the commencement of the cycle of the year, of that cyclic progression of renewal in the Winter, of striving towards achievement in the Springtime, of consummation at Mid-Summer, and of transmutation, in preparation for a new birth, in the Autumn.

There can be and are no abrupt changes in natural growth; each progression leads into and blends with the next: each new coming into being is preceded by the passing of an older one; and effort initiated in the youth of the year finds its fruition with the full of the year: the travail of the Fall precedes the mystic birth at Christmastime.

. . . it was the attempt in all the Mystery-Schools of all the ancient nations to bring the seasons of the earth into harmony with man's spiritual-intellectual career — i. e., with his inner life and his future destiny; in other words, to establish in the disciple's initiation as a living reality the already existing concordance between the nature in which we live and move and have our being and the more intimate Nature within us. — *The Esoteric Tradition*, p. 1018

Many of the ancient peoples believed that a ray from the solar divinity, or Sun-God, was born in human form on or about the 25th of December; and it was during this season that the Theophanic Mysteries were celebrated. Perhaps this Greek term, Theophany — meaning "appearance of a god" — describes more clearly than any other, the esoteric idea of Christmas, for in this rite of initiation, his own Higher Self appeared or became known to the initiate, and for a time at least, the man became his own Inner God. Then truly might he exclaim: "God of me! God of me! How glorifiest thou me so greatly!" or "Why givest thou me such peace?" For through his own efforts the godhood within him had been brought forth from perfected manhood. This was the mystic birth, the birth of the Sun-God inherent in the human being.

The solar ray lies hidden in man's heart. It is the source of his aspirations, of his instinctive response to all the finer qualities of being: it expresses itself in the spirit of adventure, in man's never satisfied search for the unattainable, even in his longing for the happiness which can only be found in fuller self-expression.

Whereas the earnest seeker for wisdom chooses as his goal his individual conception of the highest peak of achievement and sets out by the effort of becoming that which he yearns towards, to attain it; yet in *all* men the redeeming influence of the solar divinity works ever for regeneration — in silence and in darkness, because unrecognised by many; and even in the case of the average man, fashioned in and through travail, the fullest expression of godhood will come forth some day.

Glowingly tinted the Autumn leaves are severed from the tree, and blown away by the wind; crushed, they become one with the dust. How little is known of the alchemy of transmutation which then takes place in the drear, dank days that follow — an alchemy which only fully reveals itself in the verdant foliage of Summer.

Sensitive natures often feel the loneliness of Autumn, which even in its sadness is strangely pregnant of the ecstasy of bursting bud at the Springtime. Thus it is with the spiritual cycles of man: the beneficent forces of destruction and regeneration work hand in hand: the brilliance of enlightenment is commensurate with the darkness it dispels.

Compassion is the open sesame to attainment. In giving himself man gains the gift of the gods, spiritual re-birth; and the divine Babe, the human Christ made manifest through the travail of the virgin soul, man's Spiritual Soul, becomes the esoteric gift of glorified Selfhood, the true giving in being. In such a gift is united man's gratitude to the gods in the fulfilment of his obligation to all that is, and the consummation of man's wardship to the Lords of Universal Being.

This esoteric gift of rebirth is no mere panacea won by subservience of opinion and will to that of any influence, however exalted; for we have been told that the Great Ones

look upon no moral failure as so great in defect of right as that of bowing the conscience in mental servitude to the dictates of another, no matter how high, no matter how great, how pure, how wise; for it is a part of their endeavor to make men free — free-willing agents and collaborators with themselves in what they do. Hence it is that they desire to see all men spiritually free, intellectually free, the while inwardly cognisant of the sublime ethical beauty of the subordination of the merely personal, with its whimsies and feeble vacillations, to the spiritually grand, whether in themselves or in human representatives of outstanding spiritual development. — *The Esoteric Tradition*, p. 1068.

To err in rejecting, when acceptance were wise, and thereby to

learn sounder judgment, is infinitely more just than is a doubtful, and possibly more prudent, acquiescence in that which the conscience cannot fully uphold.

Acquiescence does not of itself imply an harmonious attuning of the individuality to the Universal which is the essence of regeneration. The twice-born is one who passes all the decisions of life through the alembic of his intuition, and because he has purged his nature of all pettiness, his reason responds instantly to the infallible guidance of his inner God. The Divine Babe is no weakling, but a human soul made strong and true in the cauldron of evolution by the working out of Nature's compassionate laws: a human soul become self-regenerated, a Savior of Mankind.

The Theosophical Forum

TRANSACTIONS OF THE POINT LOMA LODGE: VIII — *G. de Purucker*

Sunday Evening, April 12, 1936 (1)

[A resume of Chapter XLVII of *Fundamentals of the Esoteric Philosophy*, entitled "Teacher and Pupil. Requisites of Chelaship," was made by Miss Madeline Savage and Mr. Allan Stover, and then the meeting was thrown open by the Chairman to discussion and questions from the audience.]

G. de P. — I would like to know, Mr. Chairman and Companions, what in your judgment is the characteristic or distinguishing mark of chelaship. I do not mean any outward sign. Those can be imitated; but what is it really which makes or distinguishes or characterizes the chela as compared with other men?

Madeline Savage — I would like to answer this question. In my study of the present chapter, this thought came to me: That the true chela is he who in his merely human part utterly surrenders to that higher part which the Leader in this chapter so beautifully calls the Companion of Stars, the inner god; and the influence of which is stepped down to the human ego by the Reincarnating Ego. It is the human ego surrendering entirely to the spiritual law as given to it by the Reincarnating Ego.

H. T. Edge — As the signs which indicate chelaship are not of an external nature, they would not be such as could be communicated to anyone except perhaps another chela; and further they would be of a kind which the chela would be reluctant to speak about.

G. de P. — What Dr. Edge says is quite true. Perhaps I had better rephrase my question. It may not have been clear, but I think

Miss Madeline has got the fundamental idea. Instead of asking then, "What is the distinguishing mark or characteristic," I will phrase my question this way: What is it in or of the chela which makes him such?

C. J. Ryan — When H. P. B. said that the first test of true apprenticeship was devotion to the interest of others, she gave the secret password to open the door to the path. This was, of course, only the first test, but whatever comes later, such as the attainment of knowledge and power, will turn to ashes unless inseparably combined with a burning desire to help suffering humanity.

Grace Knoche, Jr. — I should think that what would characterize a chela as distinct from the ordinary man would be the acquiring of a vision, or, perhaps, the conquering of illusion in a fuller degree, so that through the conscious tearing away of the veils of maya, he would get a vision of what LIFE really meant. Then, having this Vision, he would know that the only possible way to live in accordance with Reality, consciously to live, would be a positive decision to devote himself to the service of others.

J. H. Fussell — One of the characteristic marks of chelaship I would say is a love for truth and a searching for it, as a drowning man struggles for air as the one thing above all most desirable. Naturally the love of truth is of varying degree, and the attainment of it, to be in any way successful, must include what Professor Ryan referred to as "the first test: Devotion to the interests of another" and ultimately of all men — in a word, impersonality. We can come to a knowledge of truth only in the degree that we seek for it impersonally — not solely for ourselves or our own satisfaction, but for the sake of all men, for the service of all.

H. T. Edge — So far we have heard of several attributes which a

chela might or might not possess; but as he would possess these in common with other people who are not chelas, they cannot be said to "be characteristic of chelaship. What we need is a definition, not an enumeration of attributes.

Sven Eek — "Chela" in a technical sense means slave, slave to the command or behest of a Guru or of Truth as the Higher Self points it out. It does not mean perfection, however — far from it. A chela can have all the wonderful qualities enumerated tonight, but also quite a few pretty bad ones not mentioned.

We must distinguish between "chelaship" as it is understood in the Orient and the "chelaship" of Theosophists in the West. There are strict rules governing the lives of the chelas in India and Tibet and they all have some sort of Guru or Teacher who directly or indirectly guides their lives. "Chelaship" among Western people, or more particularly Theosophists, is something less tangible. As I see it, it means a focussing of one's thoughts, aspiration, and desires along lines of spiritual endeavor and in accordance with the teachings that we have received.

It is erroneous to imagine that chelas are necessarily altogether saintly people. In fact their efforts to forge ahead along lines of least resistance react on them in many ways and the animal nature of man rises up in protest; it is here that a chela has to win or lose. So when we see any Companion troubled by evil, let us judge not too hastily his character.

E. V. Savage — I want to express my agreement with what Mr. Eek said, because I think that what constitutes a chela is *setting one's feet on the Path*; and this does not mean that suddenly one begins to manifest all the virtues. In fact, we are told that when one becomes a chela, he is immediately faced with all the difficulties and weaknesses of his nature. Therefore we ordinary beings can't judge of each other, as to who is a chela or who isn't, by the

difficulties he has in his life; because one who is having the hardest times and the greatest trials to overcome may be one who has advanced far on the path. And even failure does not mean giving up one's status as a chela, as long as one continues fighting (that is, *wisely*), and keeping at least a foothold on the path.

I also agree with Dr. Edge. I don't think anyone less than a Teacher can tell who is a chela; but I think it is fairly simple to say who isn't. Anyone who advertises the fact that he is one, whether openly or by creating a mystery about himself, certainly isn't one; nor is one who is condemnatory of others and always trying to show how much more evil others are than himself. So I suppose we could arrive at it by a process of elimination.

Grace Knoche, Sr. — I think it might be called the mark of the Hierarchy of Compassion, speaking broadly and including the noble qualities that this term implies, at least aspiration and strong effort towards them. It is the mark the soul would set, in a way, upon those who are living for others and not for self, consciously and determinedly so living. It would not be a visible mark or sign, and would not be perceived by the majority, though they might see in us a certain kindness and sympathetic understanding; but those who bear this mark, and above all the Teachers, I believe, would see it definitely as a distinguishing mark or sign.

Oluf Tyberg — A chela is one who is dominated by something greater than himself, the innermost part of his being, the Master, and whose faith and devotion are so unswerving that in spite of personal shortcomings, this Master can infill his mind with a vision of universal truth and guide it to the Teacher in possession of this very truth.

A. B. Clark — The characteristic which distinguishes the chela from other men is the flame of pure impersonal love burning in

his heart. As the dominant characteristic of the Master of Compassion is the spirit of divine harmony and compassion, so it is by the similitude to the Master that a man becomes a chela. It is this similitude by which the disciple is recognised and drawn to the Master. It is kinship of spirit.

Lydia Ross — A chela is one whose great hunger for Truth makes him willing to pay the price of his personal self that he may *become* the Truth. This would include all degrees of chelaship and all the virtues required for it.

Julia Hecht — Katherine Tingley often said it was so difficult to find an honest man; and I should think chelaship would mean absolute sincerity.

O. I. Clark — It seems much easier to enumerate qualities which a chela should or should not possess, than to tell what it is that constitutes one a chela. Let me offer the following: That which constitutes one a chela is a definite alliance by deliberate choice with the Order of Compassion. If there are unconscious chelas, they have made that alliance in previous incarnations. The possession of many noble qualities does not itself constitute chelaship. All the religions have had saints and heroes, who were not chelas. Chelas may have bad qualities, even very bad qualities, but being chelas they are on the best road for the rapid overcoming of those qualities. They are chelas because they are definitely and by continuing choice devoted to the work of the Order of Compassion. That devotion causes them to be accepted as chelas. If they adhere to that choice and devotion, the noble qualities which a chela should have will be developed in them more quickly than by any other means.

Foster Griffiths — The question can be answered in a very few words. One who has an unceasing love for humanity would through this love express all the attributes and qualities that we

have been talking about: impersonality, compassion, service, etc.

George Davenport — To my mind, any individual aspiring to chelaship has had a vision of truth conveyed to his brain-mind and intelligence from his higher spiritual essence, and henceforth his whole life is devoted to the search for truth in self-forgetful service to his Teacher and all humanity.

Allan Stover — Sooner or later, to a serious student of Theosophy comes the urge to devote everything — every faculty, all he possesses, to the service of humanity. In other words, he wishes to live the life of a chela. He sees that the farther reaches of the chela-life are greatly to be desired. He soon learns that if he live the life he shall know the doctrine — the deeper teachings — and with this desire in his heart he feels the need of a Teacher.

What are the requisites for one wishing to lead the chela-life, for one wishing to become a chela? We are told that among others there are three leading ones: Devotion, Duty, and Loyalty — Devotion to an ideal which requires the utmost of our spiritual will to follow day after day; duty — one's own duty — rightly performed, the doing of which brings indescribable peace, as when, after wandering over and having retraced many roads, we find the right one at last; and which rightly done leaves no thing to be undone; and Loyalty, which brings trust and confidence in oneself and in others. These three requisites for chelaship have among all peoples been considered the foremost virtues. We, as Theosophists, owe the observance of these qualities to ourselves, to others, and especially to our chosen Teacher. It is expected of us.

The Teacher gives inner life and inner light. He guides the soul of the chela through its development, onwards and upwards through greater trials, greater responsibilities. For the chela meets a karmic quickening which may condense into his present

incarnation the experiences of many ordinary lives. He meets trials joyfully, knowing that each trial successfully passed means the dropping of one more veil of illusion on the path to Masterhood.

I. L. Harris — The Leader's question was: "What is it in or of a chela that makes him such?" May I venture a brief definition: A progressively more and more complete identification of oneself with impersonal ends for the betterment of Humanity, coupled with an ever-increasing effort to fit oneself to carry out better the duties which such service entails.

W. E. Small — In terms of the seven principles of man and nature, we might say that the Mahatman lives in the Buddhic principle, the average man in the Kama-Manasic. The nearer an individual shifts his center of consciousness to the Buddhic part of his constitution and keeps it there, the closer is his approach to Mahatmahood. The chela is one who has learned to do this with a larger degree of concentration than the average man.

Stanley Zurek — Wouldn't a chela be one in whom the inner god has become awakened to some extent, and who has a teacher, whether he is conscious of it or not?

E. J. Dadd — I think that the answer by Mr. Zurek is the best yet. When we consider that man is the expression of a divinity on earth, and that any good man and a myriad Christians can feel, by aspiration, the presence of this divinity — the "Father in secret" spoken of in the New Testament — we see that something more than sensing that divine Presence is needed in order to get direct teaching and instruction from that source. The Mahatmans are in contact with that divinity, and we, if we understand how to constitute ourselves their pupils, have their help in learning to reach our own divinity. A chela, then, is one who is being taught by a Master of that art, the means to make his divinity vocal

within him.

G. de P. — Mr. President, Mr. Chairman, and Companions: I think that my question has been beautifully answered by all who have spoken, and anything that I could say would merely be in addition. Indeed, if we analyse the answers that we have heard, I think we may divide them into two classes: those weighing heavily on what we may call the Life, and those weighing heavily on what we may call the Knowing. It is an interesting study in psychology to me, knowing you all as well as I do, to see how the individual swabhava has come out in your answers. Some are profound and devoted students who are reaching the Light along the Path of Wisdom. Others, equally profound and devoted students, are marching steadily towards the inner glory by what we describe as living it. Now, if you will combine these two ways, unify them into one, in which both blend indistinguishably, then I think you will have not only the signs and marks and characteristics of all chelas, who you will remember are of many grades from the supergods downwards to us, but you will likewise know how to become a chela, a greater chela, a still greater chela, yourselves.

There are many characteristics and distinguishing marks, if we analyse the chela in his life, and many of them have been pointed out. But do you know, I think if I were asked what is it in and of a man which makes him a chela, I think I should ponder quite a long time, and then I believe I should give this answer: A growing indifference to himself, and an increasing interest in all that is. There we have the path of morals, of ethics, of wisdom; and we have the Life: a man who has completely lost interest in himself, has no pleasure in evil-doing, because all evil-doing is selfish, for personal, selfish ends. It is just as simple as that. Not my will, as the great Syrian Chela and Master said, but Thine, his inner god's, a Ray of the spirit of the Universe, the law of infinite love and

compassion and harmony and pity and wisdom and peace. Man, when he thus loses interest in himself, grows progressively greater. It is a strange and interesting paradox. By expanding, his interests enlarge instead of being constricted around his own core of being; he breaks the bonds and expands. His former and present self becomes uninteresting. The world, all mankind, the Universe, he loses himself in, and becomes it; and there is the secret of all initiations, from the greatest to the least. Indeed, no man can pass through an initiation until he can do this in some degree. He cannot simply because he cannot lose himself. He cannot enter into other things. He is all "I." The Universe is "I" and "thou," I, and the world — the duality. He never can forget himself and be the other, for his whole understanding, his whole compass of thought and feeling is I. Do you catch the thought? That is all there is to it. The chela is he who is becoming uninterested in himself and accordingly more interested in others, in the world. That is why there are three grades of training. Experience of ages has shown that three are required: training, study, and a growing lack of interest in yourself. And then comes the fourth stage, when you really feel that all other men's interests are infinitely more important than your own. The greatest Buddha, the greatest teacher, the greatest man or woman, is he who is uninterested in himself and loses himself in what we call others. That is chelaship. It is a reversion of feeling, to embrace the Universe and recognise it. The "I" is no longer "I," it is All. And yet how difficult it is for Occidentals to understand that we are all one, and yet for ever individuals.

There are as many chelas as there are individuals in the Universe. I sometimes think that everybody is a chela in degree. I sometimes think that even the greatest sinner, as we say, is a chela, because he is learning, poor devil! Of course he is not a great chela, he is a very weak and humble one, a poor, stumbling,

weak specimen of mankind. A true chela hence is one who is living the Life and knows the Knowing, and combines the two into one, and thereby loses interest in himself, forgets himself. Self-forgetfulness, love of others: if men could only follow this as a life even in their ordinary intercourse, if we could only realize how uninteresting I am and how awfully interesting the other fellow is. That is all there is to chela-ship; and the greatest man is he who can express that the most, the best. That is why, as the Buddha said, we attain Nirvana, we attain the stage of the "samma-sambuddha," when the dew-drop slips into the shining sea, when the little knot and point and focus of I-consciousness expands to be the Universe.

I will add this: I for one have no patience with those who segregate themselves from others and go out, away from others, and think that they are holier than others. That is not chelaship. You can starve till your bones stick through your skin, and you can burn yourself and torture yourself until the body, wracked with pain, dies; and you are no more a chela than a snap of the fingers, because all your searching is upon yourself; you become an imbodiment of self-seeking egoism. That is not the way to attain chelaship. Chelaship is an inner being, an utter self-forgetfulness in its greater reaches, it is an inner change and forgetting yourself; and in proportion as you do it, so much farther will you be on the chela-path, because of an ever-enlarging consciousness and wisdom and love. Thank you.

1. Note: These "Transactions," as they are printed from time to time in the pages of THE THEOSOPHICAL FORUM, do not necessarily appear in serial order, but depend often upon requests of visitors to the Lodge who have found some particular subject of especial interest, and have felt the present to be a good time to have these

thoughts given wider broadcast. — Eds. ([return to text](#))

The Theosophical Forum

THE GUARDIANS OF THE TEMPLE (1) — *J. H. Venema*

There is an understanding which needs no words, and if we want to be "Guardians of the Temple" — the Great Temple of Light which has always existed, the Theosophical Temple of Love — we must realize that there is an insight, there is a mutual understanding, for which words are unnecessary. It is very easy to see this; we know how in human life two persons who love each other have that clairaudience, that silent understanding. Don't you believe, and don't you agree with me, that this is only a lower aspect of the greater love and that it explains why the Adepts have spiritual clairaudience? That deeper aspect is that they are lovers of humanity; and just because they have this greater love, they possess the *spiritual* clairaudience which we, Guardians of the Temple, all should have to some extent. Indeed, I realized yesterday, when we discussed the various items of this Convention with the National Presidents, how very few words we needed; after a few introductory remarks everything was understood and arranged; and this morning, after the wonderful spiritual pictures which passed before us in the speeches of our Companions, there was again that silence which gave us the clairaudient understanding.

At Conventions we have to speak, but I think that we must bear in mind that the Guardians of the Temple in reality have a spiritual way of communicating that has nothing to do with the spoken word on the physical plane.

When you saw this subject announced: "The Guardians of the Temple," you may have thought that I was going to speak about the great hierarchy of beings about which you read in our Theosophical books: *The Secret Doctrine*, *The Esoteric Tradition*,

and *Fundamentals of the Esoteric Philosophy*; and, indeed, friends, it would be a glorious thing at a Convention to go into that — the great hierarchies of the Adepts and the Silent Watchers: but No! at this meeting I am going to speak about you and me as the Guardians of the Temple; and especially let us listen to the words of H. P. B. as to what she expected of you and me as the Guardians of the Temple, which she erected for us, and which she expected us to expand so that it might embrace the whole world.

We know that Theosophy is foremost with us: that in trying to make it a living power in our lives, and in trying to pass on the light to our fellow-beings, we sometimes make the impression on others that we believe we alone have the truth. The strong convictions which we have occasionally irritate people, and they say we are getting one-sided, that we are limited in view; but, for heaven's sake, can we be restricted in our vision when we know that our philosophy is based on the structure of the whole Universe, that it embraces the whole of nature? Is it a limitation to admire and feel the deep beauty of a sunset or a sunrise? Is it limited to understand when looking at the galaxy, and feeling ourselves to be a part of that galaxy, that in reality we and our fellow-beings *are* the Universe, and that consequently we know the foundation of the Brotherhood of Men? Therefore, we say that, because the Temple is built on the structure of the Universe, we know that we are, in guarding this Theosophical Temple, really guarding the truths of nature and passing them on. In the first place then, what did H. P. B. expect from us in guarding these truths? She passed on the Light. There is a word in Dutch: *bewustwording*, which means "to become conscious of your consciousness," or if you like, in more Theosophical terms, "to become conscious of your consciousnesses." That is what H. P. B. did for us — she made us conscious of our consciousnesses; and the explanation of the teaching brought us that marvelous vision

regarding the Buddhas of Compassion, the teachings about the two kinds of Buddhas, the Pratyeka-Buddhas and the Buddhas of Compassion, and the vision that, as human beings, we even now can make a choice between these two paths for the future.

H. P. B. left us this Temple of Light, and expected us to be Guardians; and profoundly are we grateful to her for what she did for us and the world. After listening to the symphonies of the great composers we often feel a similar gratitude: something has been opened in us, a light has been received, and we long to pass it on. Such an intense feeling of gratitude we have towards H. P. B., and that alone must make us the Guardians of the Temple which she erected.

Listen to her words in the first Message to the Convention in America [addressed to William Quan Judge], and let us also compare the times in which we live, thereby realizing the fact that the Guardians of the Temple living in H. P. B.'s time were not really different from the Guardians of the Temple in the present time:

It is to you chiefly, if not entirely, that the Theosophical Society owes its existence in 1888.

I ask: Is it different in 1936?

Let me then thank you for it, for the first, and perhaps the last, time publicly, and from the bottom of my heart, which beats only for the cause you represent so well and serve so faithfully I ask you also to remember that, on this important occasion, my voice is but the feeble echo of other more sacred voices, and the transmitter of the approval of Those whose presence is alive in more than one true Theosophical heart, and lives, as I know, pre-eminently in yours.

These words were written by H. P. B. to a Convention such as we are now holding in England.

First of all, a word to those Guardians among us who have no so-called "official" jobs, who do not, for instance, do public work, or are not Presidents or Secretaries of Lodges, but simply members; (as they sometimes say in Holland: "I am *only* a member.") Don't you understand that we who have these official jobs, would sometimes be very keen on exchanging them with the simple member? But at the same time we know well that these members, these Guardians of the Temple, have just as great a task as anybody else, even in a way perhaps more so, if it is permitted to say so, than those who have official jobs. The poet Milton says: "They also serve who only stand and wait." Don't you see what those silent Guardians are in reality? I am never tired of speaking about this, and it has helped in our Section! When they come to their Lodges — these silent Guardians — and give their sympathy to the work done there and never miss a Lodge meeting, they in reality are just as great Guardians as those who do the official jobs. Don't you understand that they help to make the Lodge-force flow just because they are there? There is a case in Holland of an old Lodge still existing, where, as I said at our Congress in July, there came a man who through his circumstances was not able to do much official work. He simply came to the Lodge meetings, rarely spoke, simply sat there and gave his sympathy, which radiated from his eyes, from his whole being, and then went away in silence. Do you not believe, friends, that but for this man that Lodge meeting might not have been on such a high plane during the time that it was held, and that the people who had work to do were greatly supported by that man? There is a story — a marvelous story — written in English — about a humble slave in ancient Babylon, who singlehanded opened the gates of Ancient Babylon to the Gods! It is not a fairy story, it can be made

real history.

It is wrong to say that a Lodge does not do much work because there are not, at a critical moment, many helpers who do official work. It is wrong to think that we have not the Lodge-force if, at a certain moment, people do not flock in large numbers to the gates of the Lodge. If there simply is a focus of light, you provide the channel for the flowing of the Lodge-force, and that is what is expected from us. Let us be grateful then to the silent Guardians of the Temple, and those who have no official jobs, as they are Guardians indeed.

The next point is this: it has been impressed upon us again and again that the Guardians of the Temple should promulgate the ethics of Theosophy: this surely is necessary. What does H. P. B. say about it? I quote from her fourth Message to the American Convention:

The critical nature of the stage on which we have entered is as well known to the forces that fight against us as to those that fight on our side.

Now let us look at the world around us when we hear the following words from H. P. B.:

No opportunity will be lost of sowing dissension, of taking advantage of mistaken and false moves, of instilling doubt, of augmenting difficulties, of breathing suspicions, so that by any and every means the unity of the Society may be broken and the ranks of our Fellows thinned and thrown into disarray. Never has it been more necessary for the members of the T. S. to lay to heart the old parable of the bundle of sticks than it is at the present time; divided, they will inevitably be broken, one by one; united, there is no force on earth able to destroy our Brotherhood.

These Messages by H. P. B. should now be read and re-read by every earnest Theosophist, because he will continually be obliged to compare the times of H. P. B. with our present times.

Then she says about ethics particularly (third message):

What I said last year remains true to-day, that is, that the Ethics of Theosophy are more important than any divulgement of psychic laws and facts. The latter relate wholly to the material and evanescent part of the septenary man, but the Ethics sink into and take hold of the real man — the reincarnating Ego. We are outwardly creatures of but a day; within we are eternal. Learn, then, well the doctrines of Karma and Reincarnation, and teach, practise, promulgate that system of life and thought which alone can save the coming races. Do not work merely for the Theosophical Society, but *through* it for Humanity.

May Theosophy grow more and more a living power in the lives of each one of our members, and may the coming year be yet more full of good work and healthy progress than the one just closing, is the wish of your humble co-worker and fellow-member. H. P. B.

Here the stress is laid on ethics, especially to give to the world the truths of Karma and Reincarnation. We are doing that, but, friends, how much more do we understand of ethics when our teachings are extended. As we heard in the Leader's message this morning, there was a definite promise in one of these Messages from H. P. B. to the Convention held at the time that more new teachings should be given. Well, the more deeply we understand the teachings the better we can be Guardians, because the better and with greater conviction can we pass on these verities of Karma and Reincarnation, truths about nature and man as a part of it.

Now what has happened since 1888? H. P. B. gave this definite promise, that if we deserved it, and the times permitted it, more would be given. Don't you see *what* has happened? Don't the Theosophists of the world see? After she went history simply repeated itself. In Blavatsky's time there was a Messenger of the Masters — H. P. B. She had the *insignia majestatis* — the tokens of majesty — on her. They were visible in her individuality, in her marvelous knowledge, and she showed these tokens of majesty in her books, *The Secret Doctrine*, *Isis Unveiled*, etc. She was recognised only by the few! She passed on. Those who carry the *insignia majestatis* are not easily noticed in this world.

We, the Guardians of the Temple, know that history repeats itself in our times, that there is one who has indeed the *insignia majestatis*, and that again they can be found in books which greatly extend and corroborate the teachings of H. P. B. in every respect. Majestically striding through this world again, the teacher and that which he brings are recognised only by the few; and the world in general scarcely notices that a great Temple of Light is standing right here! Chaotic conditions outside, yet the Temple is there; the Envoy is there; the teachings are there. *The Secret Doctrine* is corroborated, confirmed, the teachings are extended. Now are we good Guardians of this Temple if we do not *continually* make known to the world and to our Brother Theosophists *what* has been done? Point out to them why it cannot wholly be avoided that history repeats itself; but how we, Guardians of the Temple, *can* prevent to some extent in this fourth Round, in the fifth Race on Globe D its repeating itself *as much as it does!* But to do that we must have the spiritual power of discrimination; we must be able to say: "This is Theosophy"; "This is not Theosophy." By studying *The Secret Doctrine* and the other books, and comparing them with the present books, we must be able to tell our fellow-men, and especially our fellow-

Theosophists: "Look, here are the teachings: realize how they are corroborated and extended; you see that indeed the Masters still work in the same way as in the time of H. P. B."

And here I must introduce the value of an intensely active Lodge-life. Don't you agree with me that only where there is an intensely active Lodge-life we, Guardians of the Temple, can get an insight into the difference between Wisdom and Knowledge? H. P. B. and our present Leader so often say that we may cram our brain-minds with the Theosophical teachings, it will only be Knowledge; but Wisdom comes if we put that Knowledge into practice, and through this active Lodge-life the Lodge-force begins to flow; we carry it with us in our daily lives, and must never forget that we are responsible for the Lodges and for the work carried on in them.

What is a symbol? The word itself comes from the Greek, and means "to fall together." Idea or thought, and object or picture fall together. It applies more to the intuition than to the intellect. Those who can spiritually interpret symbols have a great background for their lives. Well, here is a symbol! We, friends, you and I, as Guardians of the Temple, are at present right in that Temple. Indeed we form that Temple. We are the bricks, the building-stones; so we cannot allow one brick to be loose in any part of the wall, any part of the Temple, because the whole Temple will suffer if a brick is loose anywhere.

Everyone, as I said, has his task, no matter what it may be; and it is expected from the Guardians of the Temple that wherever we may be as part of that Temple, it will be firmly cemented to the other parts, so as to keep the Temple strong and beautiful. There is a picture which has often been reproduced in our Dutch "Theosophical Path." It represents a Guardian in ancient Pompeii. Perhaps you have seen that painting. There this Guardian stands

at the gate of a palace or a Temple, and he has been told to guard that gate and never to leave; and the painter in his imagination makes him stand there, while the eruption of the volcano takes place: the lava covers him, and he continues to do his duty, he remains watching and dies standing, spear erect, at the portal of that gate, fulfilling his task to the very end. This is our idea about being Guardians of the Temple. It is required of us especially in these times. If we want tests as to how far we have understood H. P. B.'s expectation of our Guardianship, here are two principal tests. The first is: do the teachings, does our work in the Society, lead us to ever greater love for our fellow-beings in general? If we can say "Yes" in answer to that question it is all right. The second test is: "are we continually ready for service whenever called upon?" and again if we can say "Yes" to that question, it is all right; we are Guardians indeed, no matter what our position in the Society may be.

Finally this word of warning, though it is no threat. Are we so sure that if the Guardians fail the Temple will stand? It is a very serious question in this world just now. I for one am not so sure; I cannot get away from the idea that *if* the Guardians should fail, the Great Ones who erected this Temple might have to build elsewhere or at some other time. There has been a promise: As long as there are even a few Guardians to do their duty, to be, as the warrior of Pompeii, at the gates to the last moment, that "last moment" will never come, because the Great Ones have promised that as long as there are only a few working for Them, They will help. Now this promise is a great one; but we should understand the seriousness of the situation in the world at present, and fully realize what is expected of us as "Guardians of the Temple." Mind, not the men whose names are written in flaming letters in our papers and periodicals promote the spiritual evolution of mankind — they may be only instruments on the outer plane. It is

the silent Watchers of the Temple, those who seek the power that makes them "as nothing in the eyes of men," who really advance the spiritual evolution. Let us not forget this.

Finally, there is a letter — our English members may know this letter better than members of the other Sections — it is the one letter ascribed to the Maha-Chohan, the Great One who, as you may know, also had something to do with the establishment of our Society, and in that letter it says: "The Theosophical Society was chosen as the corner-stone, the foundation of the future religions of humanity." It begins in this way:

The doctrine we promulgate being the only true one must — supported by such evidence as we are preparing to give — become ultimately triumphant as every other truth. Yet it is obviously necessary to inculcate it gradually, enforcing its theories — unimpeachable facts for those who know — with direct inferences deduced from and corroborated by the evidence furnished by modern exact science.

And here is an important part:

What becomes of our fine professions of benevolence, philanthropy, reform, etc.? Are these professions a mockery? And if a mockery, can ours be the true path? Shall we not devote ourselves to teaching a few Europeans, fed on the fat of the land — many of them loaded with the gifts of blind fortune — the rationale of bell-ringing, cup-growing, of the spiritual telephone and astral body formation, and leave the teeming millions of the ignorant, of the poor and despised, the lowly and the oppressed, to take care of themselves and their hereafter as best they know how? Never! Rather perish the T. S. with both its hapless founders than that we should permit it to become no better than an academy of magic, a hall of occultism.

Well, here again is the great emphasis on the ethics of Theosophy; and I think it is our duty, as Guardians of the Temple, to give to the world the ethics of Theosophy, especially the fundamental ideas of Karman and Reincarnation, because that will teach the "Why" of the ethics.

We therefore declare at this Convention that we still are and shall be the Guardians of the great Temple of Light; that we shall cultivate and develop that spiritual power of discrimination which will enable us to be so. The closer we are together in the Lodges and in the various centers of a country, the closer we are together as National Sections; the closer we stand together in passing on Brotherhood, the greater the flow of the Lodge-force will be. The greater the harmony that exists in our branches and Sections, the greater channel we shall be for the Masters' work. Let us then be Guardians of the Temple, the Temple that has its structure in the Universe. And what is grander than belonging to that Temple? Let us be Guardians, so that in the future we can pass on the light to those who shall be working after us.

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

PREVISION OF EARTHQUAKES

In *The Theosophical Path* for October, 1933, we discussed at some length the prevision of earthquakes by animals, and, in rare cases, by human beings. Although some seismologists have dared to admit that such previsions have been reported, scientists in general have paid little or no attention to them. In September, however, the learned British Medical Association debated the problem in relation to the mystery of the "sixth sense," so called, in dogs. Sir H. T. Holland, chief of the Mission Hospital at Quetta, India, told of three cases of persons being pulled from their beds by dogs before the terrible earthquake that killed tens of thousands at Quetta. One man who was called 22 minutes before the shock thought his dog had been alarmed by burglars and started searching for them in his garden! Many remarkable cases of canine prevision in regard to other kinds of catastrophes were mentioned by responsible scientific observers, but we are particularly concerned with those relating to earthquakes, because they bring up the question of the real cause of their occurrence at certain times and places. Are they purely mechanical in their localization, etc., or do obscure though very definite associations exist between them and the activities and intelligence of mankind, as occultism declares? An official of the Canine Defense League expressed the belief that dogs could feel minute vibrations that the most sensitive seismographs cannot record. This seems strange in view of the fact that instruments

can record the movement of a truck on a road several miles away or the beating of the waves on a distant shore, delicate tremors which are always in evidence, yet which do not worry the dogs in the least. Only *imaginary* preliminary tremors taking place hours before the first trace appears on the delicate seismographs frighten the dogs so much that they try to save their masters' lives by pulling them out of bed! Having gone into this matter more deeply in the above-mentioned article we can only mention the subject here in order to express pleasure that the learned Medical Association found it worth serious attention and agreed that it was decidedly mysterious. Science is slowly turning to the consideration of the hidden side of Nature, and the time cannot be far off when purely mechanical research will be regarded as quite superficial in view of far more profound methods.

THE MISSING LINK AGAIN

Professor Robert Broom, whose advanced and practically Theosophical views on "natural selection" have been quoted and discussed in our pages, announces his discovery in the Transvaal of the fossil bones of an adult specimen of the South African "non-forest anthropoids," not closely allied to the chimpanzee or the gorilla (living African anthropoids) but whose "teeth show that they were nearer to the stock from which man arose." Dr. Broom "feels sure that the problem of man's origin will soon be solved, and solved in South Africa." Great enthusiasm has been aroused in scientific circles by his announcement. Students of H. P. Blavatsky's presentation of human evolution in *The Secret Doctrine*, and of the concise and more systematic rendition of her teaching in *The Esoteric Tradition* (chapter x) will see that the discovery of "missing links" in no way disturbs the fundamental Theosophical teaching of the origin of the *real Man* from previous Rounds and Globes. Anthropoids still more human may be found, because all the true anthropoids are connexions by blood with

early humanity, though not progenitors.

THE DESCENT OF MAN: NEW COMPLICATIONS

According to Sir Arthur Keith, the famous "die-hard" Darwinian evolutionist, the new discoveries do not support the views usually held concerning the origin of the chief racial stocks of mankind. Speaking before the British Speleological Association in July, he made some remarkable admissions. We quote a few passages from the *Morning Post* (London):

We have discovered many extinct types of humanity but not one which is fit to serve as the common ancestor of modern races. We have found no evidence of an outward migration from a common center. . . . We are tempted to believe that by the beginning of the pleistocene period some half-million years ago — or more — the ancestors of the Mongol, of the Australian, and of the Negro were already in occupation of the continental areas where we now find their descendants. This is a new conception. Hitherto we have regarded evolving man as unconquerably nomadic. . . . Clearly we have reached a point which compels a radical reorientation of our working theories. We have to presume that parallel evolution which has been proved to be effective in the evolution of the horse and of the elephant has also been true of man. Such a view serves but to deepen the mystery of human evolution for it implies that, as in the past, the future of each race lies in its generic constitution.

The importance of this pronouncement is very great because it leads directly to the occult point of view, especially in regard to the concept of "Root-Types" as given in *The Secret Doctrine*, (see II, 734-7). Dr. Keith's "parallel evolution" — for which concept we are indebted to Dr. H. Fairfield Osborn, late of the American Museum,

New York — precisely agrees with the point insisted upon in *The Secret Doctrine*. Space will not permit a proper treatment of his important subject now, but we must take it up more fully at a later date. Students will find Dr. Osborn's researches referred to in *The Theosophical Path* for July, 1933, p. 44. He pointed out that the potentiality of the new characters which appeared in elephant's teeth, for example, in the course of ages, were not originated by the pressure of external conditions acting on *chance variations* but were already latent *within*; and they unfolded into action as the new demands arose. When the Root-Types became settled in physical life, each had its own "creative potencies" imbedded within itself, so to speak, and these manifested in parallel lines of evolution. When we apply this unwrapping or unfolding principle to Man we see the importance of Dr. Keith's statement that "the future of each race lies in its generic constitution." A much more comprehensive and far-reaching classification of races than the Negro, Mongolian, etc., is given in *The Secret Doctrine*, and it is shown that the distinctions between the real races have been masked by the blendings which have taken place ages before, as well as since, Dr. Keith's "half-million years or more," which is only a fraction of the past life of humanity. Ultimately, we are told, the seven great races will once more be segregated as in the beginning.

WAS "PRIMITIVE MAN" SO SAVAGE AFTER ALL?

La Revue Scientifique not long ago published some interesting information about the health of prehistoric man. Its general conclusion is that his resistance to disease was not greater than ours, but that there is a difference in the diseases which are most prevalent. There is also a distinction between the most ancient and the more modern types of prevalence of disease. It is interesting to learn that evidence of wounds is infrequent in the most ancient period, the Palaeolithic, but in the more modern

Neolithic age it becomes far more common. The proportion of fractures which have healed with a good join is very high! Tuberculosis and syphilis were unknown in the Palaeolithic, so far as can be ascertained by examination of the bones, but in the later periods a few cases appear. Dental caries is not found in Europe, but appears in Africa in fairly early periods. So it would seem that the earliest representatives of man so far discovered were peaceable and moral, and that many of our modern curses have developed with the spread of our present form of so-called civilization!

ARIZONA INDIAN RAIN CEREMONY

We may call it another coincidence, or luck, or something else, but the Hopi Indians, at their Reservation, Hotevilla, Arizona, have again closed their rain ceremony in a heavy downpour, after a long and serious period of drought. The date of the snake ceremony, when the reptiles (many of them dangerous rattlesnakes) are captured and then let loose to carry the invocations to the gods of the underground, was, as usual, set some time beforehand when no sign of rain was visible. We quote a few sentences from various newspapers: "As sunset burned red over the mesa, Hopi snake priests to night (August 22) concluded their age-old nine-day ceremonial by dancing with live rattlesnakes in their mouths. . . . They know that nearly every time after a snake dance a fierce thunderstorm roars up from the desert and floods the district, washing out roads and marooning motorists sometimes for days." (U.P.) "Downpours have drenched the Hopi reservation almost daily since the rites were started." (A.P.) "Is it possible that the Indians hold a secret of divine power and guidance which the white man has not discovered? . . . Instances such as these, which defy explanation, must cause those who call the Indian not far removed from barbarism, to wonder just how far we, as a race, have come. We discount the power of

man to call rain from the skies, and then are interrupted by the Indians gathering in the desert and doing it." (San Diego *Evening Tribune*.)

Ganado, Ariz July 6 (A P) — Apparently in answer to their supplications, rains drenched the Tohatchi and Fluted mountains today and scattered showers fell over the 15,000,000-acre reservation as happy Navajo medicine men brought to a close their ancient Najadaltinth rain prayer.

Perhaps something spoken by Dr. Lindley Bynum, Field Representative of the famous Huntington Library at Pasadena, California, may throw some light on the reason why the Indians know secrets of nature quite strange to us. Lecturing on the California Indians at Altadena on June 29, he said:

While Caucasian civilization has progressed along material lines, and has featured the white man as possessing superior talents, *that of the Indian has been idealistic* and one in which he places no importance on man other than the part he plays *in the whole scope of nature and the universe . . .* For this the Indian has derived certain strength and inward poise . . . Artifacts of the Southern Californian Indians dispel the erroneous report that they are of a low order of Indian. . . They are among the most advanced in the country . . . The Indian's religion permeates every act of his life. He has no conception of a personal God, but does believe in a spiritual power that gives life. He has no conception of Heaven as a place of eternal abode . . . It is very difficult for an Indian to grasp the idea of a hell —
Pasadena Star-News

ANTIQUITY OF MAN IN AMERICA

Contributing to the great controversy now raging among the

anthropologists about the age and origin of man in America, Professor Anthony Zallo, of the Sacramento Junior College, says he believes that the Indians did not come from Asia, but have always been on this continent. He relies in part on three skulls recently discovered in the delta region of the Sacramento River which indicate that the "Sacramento Man" lived 15,000 to 20,000 years ago, at a time when the glaciers of the Ice Age would have prevented his crossing over the Bering Sea from Asia. He claims that while human blood is divided into four groups, O, A, B, and AB, the percentage of Indian blood is 91.3 of class O, while Chinese blood is principally B. Another scientist, Dr P. B Candela, told the American Association of Science in June that delicate chemical tests of Egyptian mummies had enabled him to determine their type of blood. He said it is now possible to prepare blood group maps of the world, and that American Indians, Celts, and Basques belong predominantly to one group, while such apparently dissimilar groups as Hindus, Patagonians, and Amazon tribes belong to another blood type. He said it was clear that this new discovery was of great importance in connexion with the origin and history of man, and *would open a vast new field of research*. It is interesting to note that H. P. Blavatsky associates the Basques, the Guanches of the Canary Islands, and the North American Indians in one grouping" (See *The Secret Doctrine*, II, 740-90) It is very likely that the skeptical scientists will be forced to an acceptance of the existence of Atlantis by further discoveries in regard to blood-relationship.

PREHISTORIC CITY IN NEBRASKA

Dr. Earl H. Bell of the University of Nebraska announces that: "It is clear that Nebraska has a human prehistory as important in the annals of civilization as that of Egypt or the near East." His recent expedition to the fertile Ponca Creek Valley located several important sites of ancient civilization, two of which seem to have

been inhabited 4000 years ago. One city was three miles long and half a mile wide, and appears to have been abandoned on account of drought. It was a center of agriculture and hunting, and thousands of excellent artifacts including pottery and tools have been collected. Dr. Bell says that this discovery upsets the belief that no mid-western civilization existed earlier than 500 years ago. As the progress of research continues we find in America a repetition of the same story that is presented by the history of prehistoric studies in Europe. First of all blank denial that anything human could be more than a few hundred or thousand years old; then a grudging admission that the case was not altogether settled; and today we learn that anthropologists are seriously beginning to suspect that man actually *may* have been here *before* the final melting of the ice at the end of the glacial period, which took place a very long time ago.

The Theosophical Forum

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: XI — *H. T. Edge*

XI — THE CHRIST

It may seem strange that we should include this among the symbols, but we do not propose to limit ourselves to those which can be drawn as pictures — though the Christ, to be sure, has one symbol in the Cross (March, 1936). Christ may be for many people the name of a particular person, but it stands for a universal idea. Christ is the "Word made flesh" mentioned in *John*, i, 14: "The Word was made flesh, and dwelt among us." In the beginning of this gospel we have a fragment of Gnostic teaching, which connects Christianity with its parent source in the Wisdom-Religion. "In the beginning was the Word, and the Word was with God, and the Word was God. . . . In him was life; and the life was the light of men." This is the original doctrine of the Ancient Wisdom. The Logos (Word) is a creative emanation of the supreme deity; he is at the same time one and many; he has his throne in the hearts of all men. Thus man is, in his inmost essence, a God; but this God has been "made flesh"; man is an immortal soul imprisoned in a mortal body. The Jesus of the Gospels insists on this truth in many well-known passages; he usually speaks of the supreme deity as the Father, and of the Word or Logos as the Son. With this clue in mind, we can see that such was the teaching of Jesus: he desired to show men how they could achieve salvation by invoking their own divinity, by following in his footsteps. But this has been turned into the dogma that man's nature is of itself corrupt, and that he can be saved only by faith in this particular God-man, Jesus of Nazareth.

The Jesus of the Gospels is a character, partly fictitious, partly

symbolic, built around some actual personality, whose identity is buried among a confusion of historical and traditional materials. Though every man is an incarnation of divinity, there are some who are so in a special sense. These are men who have progressed in their individual evolution to a point beyond that reached by the average humanity of their time, and who come to the world in times of spiritual darkness to teach the truths of the Ancient Wisdom. Such Teachers are the world's Christs; and we find in the religions of India, Egypt, ancient America, and elsewhere, accounts similar in essentials to our own Gospel narratives. The Savior is born by the Holy Spirit of a human virgin, is tempted and overcomes, is crucified on a cross, entombed for three days, rises again. That such is the fact can readily be ascertained by anyone wishing to do so, but it would unduly burden this article to enumerate instances. They can be found in *The Secret Doctrine* and other Theosophical writings; they have been known to some eminent Christian writers, to whom they have been the occasion of much wonderment. Suffice it to say here that the story found in our Bible and in our church doctrine is but a particular adaptation of a doctrine that is both old and everywhere diffused; and, in pointing this out, we are by no means disparaging Christianity, but merely reinstating it in the original dignity from which it has departed. The only thing we do call in question is the claim of the Christian doctrine to originality or exclusiveness or finality. And it is only right, in this age of general commingling of human races, that a broader and more tolerant attitude towards the claims of other religions should be adopted.

The hinge-point of the matter is in the individual responsibility of every man for his own salvation. It may be objected that it is presumptuous and impious to set up man's strength against that of his Divine Savior, the only Son of God; but here again we come

upon an essential difference between the original doctrine and the perversion of it which has come to us. The perverted form tells us that man is essentially corrupt — due, it is said, to the sin of Adam — and that he consequently needs the special mercy of a Savior in order to secure his salvation. But Theosophy says that man is essentially divine, and such indeed is the teaching of Jesus; and that, being divine, he must save himself by his own innate divinity. The doctrine that man is saved by the divine love and grace, and despite his own unatoned offences, may be very consoling, but it is both unjust and unmanly. The law that we must reap as we have sown holds good; and if death deprives us of the opportunity of paying our debts to society in this life, then we shall have that opportunity in one of our lives to come. The Christ upon whom we must call for help is the Christ within — our own Higher Self.

The mind in man — *Manas* — is his intelligence, neutral in itself, and colored by that to which it is allied. When allied to the earthy passional part of our nature, this mind becomes the lower personal self, at odds with other selves, and leading us away from our true path in life. But every man has within him the principle of *Buddhi*, divine wisdom; and if *Manas* allies itself therewith, we have the Higher Self, which is our Savior. It is taught that man was originally created as an animal soul, which was later inspired by the breath of Divinity and so made into a potential God. This is the true Divine Incarnation; this is the Christ in man. But that Christ lies buried, latent, unmanifested, until called into active being by our own will. As has been pointed out, the symbol of the Christ is the Cross, or, more accurately the Cross surmounted by the circle, thus making the sign of the planet Venus. In the symbology of the seven sacred planets, Venus stands towards the Earth in the same relation as the Higher Self stands to the lower self. The circle denotes divinity — -the "Word"; the Cross denotes

matter; so that the whole symbol denotes the "Word made Flesh," that dwells among us. The mystery of the Christ is therefore that of the Divine Power descending into matter, for the purpose of operating in the lower kingdoms of Nature. The Divine Power is at first sacrificed; for its radiance is obscured, its voice drowned, amid the turmoil of material life and the selfish passions. But it is man's redeemer, and must sooner or later arise from the tomb in the true Resurrection, when man becomes fully aware of his own divinity. This, for the individual man, may take place at any time; for the human race as a whole, at the appropriate cyclic era in the future. When a man, having thus resurrected the Christ within him, becomes perfected, he is able to go forth to the world as a Teacher; either one of those Teachers whose presence remains concealed, or one of the great founders of religions, or perhaps the originator of some great philosophic school like those of Pythagoras and Plato.

So the symbol of the Christ may mean that which takes place in the life of every man, or it may mean the case of some particular manifestation of Divinity, such as the Buddha or the mysterious Teacher upon whose unknown life has been built the legend of Jesus of Nazareth.

The Theosophical Forum

STOP! LOOK! LISTEN! — *Iverson L. Harris*

The above is the danger-signal which the age-old doctrine of Karman, whether under this or some other name, has flashed before the inner eyes of errant men and nations from time beyond memory. Humanity's Adept-Kings, of whom among all peoples tradition — which is racial memory — tells, the great Spiritual Seers, the exalted Teachers of Religion, the expounders of the loftiest philosophy, and the inspired poets and prophets, have echoed and re-echoed the same message to men and nations down the corridors of time: Ye cannot commit injustice without suffering the consequences thereof; ye cannot wrong the weak and escape the inevitable reaction of your wrong-doing; ye cannot be cruel with impunity; ye cannot sin without becoming the servants of sin; ye cannot be neglectful of duties which are yours by virtue of your status as responsible, thinking beings, and not pay the penalties of your neglect; ye cannot desecrate the temple of your body and avoid disease; ye cannot outrage the god locked up within you and not undergo the tortures of your self-created hell!

For whatsoever a man soweth, that shall he also reap. . . .
By their fruits shall ye know them. Do men gather grapes of thorns, or figs of thistles? Even so every good tree bringeth forth good fruit; but the corrupt tree bringeth forth evil fruit.

Karman — or *Karma*, as it is less accurately but more popularly called — is not a cosmic G-Man who tracks down our crimes and engineers a speedy conviction before the judgment-throne of the Most High. The word *Karman* itself is a Sanskrit term meaning *action*, and is frequently called "The Law of Consequences," or

"The Law of Ethical Causation." It is the enunciation of a habit of Nature; and to a student of Theosophy Nature means all the vast aggregate of living entities — intelligences, consciousnesses, powers — visible and invisible, material and spiritual — which in their all-varying states of evolutionary development infill, make up, and indeed *are* the Boundless All. *Karman* connotes in the realm of ethics and metaphysics what Newton enunciated concerning the sphere of mechanics and physics when he declared: "To every action there is an equal and opposite reaction. The statement hereinbefore quoted from the Christian Bible is a self-evident fact; but, though axiomatic as far as it goes, it is incomplete because it omits reference to the doctrine of Reincarnation; and this doctrine is absolutely essential in order to provide the necessary time and field for the working out of karman, for the ripple of force to reach the edge of its cyclic basin, and move into the next area of causes — to borrow a figure from *The Mahatma Letters*. In one short lifetime on this earth too often do we see scoundrels crushing idealism under the heel of cynicism, aided and abetted sometimes in the international field by the devastating power of air-bombers, tanks, and poison gas. I use the phrase "crushing idealism" advisedly rather than "crushing weaker peoples," because, horrible as is the madness of man's inhumanity to man which drives him to wholesale slaughter of his fellow-human beings, still more soul-destroying to men and nations is the triumph of cynicism over idealism. Better can we afford to lose our bodies than to lose our souls. Our bodies are of the earth; but our spiritual parts — our ideals, our aspirations, our compassion, our sense of justice and right, and our impulses towards co-operative, self-effacing labor for the common weal — these are our links with the Solar Divinities — our real "Fathers in Heaven.'

But though the mills of the gods grind slowly, they grind

exceedingly small. We who weep over the *apparent* triumph of wrong — whether it be individual or national wrong — have we lost faith in the ultimate *actual* triumph of right over wrong? And those who imagine they can trample upon the rights of others, crush those weaker than themselves merely because for the time being they are the pampered prodigals of Mars, let them Stop! Look! Listen!

Before beginning and without an end,
As space eternal and as surety sure,
Is fixed a Power Divine which moves to good.
Only *its* laws endure.

It will not be contemned of any one;
Who thwarts it loses, and who serves it gains;
The hidden good it pays with peace and bliss,
The hidden ill with pains. . . .

That which ye sow, ye reap. See yonder fields!
The sesamum was sesamum, the corn
Was corn; the Silence and the Darkness knew.
So is man's fate born.

He cometh, reaper of the things he sowed,
Sesamum, corn, so much cast in past birth;
And so much weed and poison-stuff, which mar
Him and the aching earth

— Sir Edwin Arnold. *The Light of Asia*

Throughout history we find this same warning to men and nations uttered by the really great men of different countries; and by "great men" I mean not the wholesale murderers whom profane history so egregiously exalts, but the lofty minds who were not deceived by outward appearances but had, at least in some measure, touched reality. I think, for example, of Aeschylus

in his titanic dramas, warning the Athenians to stop! look! and listen! — to cling to the grand ethical principles which made the glory that was Greece under the wise guidance of Aristides the Just, instead of yielding to the blandishments of Themistocles and the cruel imperialists who trampled on the rights of the dependencies of Athens and thus sowed the seeds for the downward cycle of Grecian history. Ignoring this warning, the Periclean Age, despite the efforts of Aeschylus, Socrates, and Plato to save it, if the truth be told, served posterity exceedingly ill and missed the grand destiny which the high gods of Olympus seemingly intended for it. I think, again, of the message iterated and reiterated by Shakespeare in his great tragedies — perhaps most powerfully in *Macbeth*. Here the retribution which comes to one who ruthlessly pursues his own selfish ambitions with cruelty, ingratitude, murder, is seared into the very soul of the attentive reader. In this drama, be it noted, Shakespeare also shouts "Stop! Look! Listen!" to those who would achieve their personal ends by venturing unpurged into the psychic realms, as Macbeth did in consulting the three witches.

But we ordinary folk, who are without ambition to become kings and certainly have no murderous intentions towards any one — what have we to do with Macbeth's crimes, or with the decadence of Athenian virtue? Stop! Look! Listen! — to this warning from Kenneth Morris's *Golden Threads in the Tapestry of History*:

That force which, whispering within your heart, used your tongue this morning to sneer and speak traduction, brought down in its day empires in Anahuac and the Andes, stole provinces in Africa; forced opium on reluctant China; warred with, burned, and slandered Joan of Arc.

Finally, the basic ideas contained in the twin-doctrines of Karman and Reincarnation have been clearly set forth by the present Poet

Laureate of England, John Masefield, in *A Creed*. Stop! Look!
Listen!

I hold that when a person dies
 His soul returns again to earth;
Arrayed in some new flesh-disguise
 Another mother gives him birth.
With sturdier limbs and brighter brain
The old soul takes the roads again.

Such is my own belief and trust;
 This hand, this hand that holds the pen,
Has many a hundred times been dust
 And turned, as dust, to dust again;
These eyes of mine have blinked and shone
In Thebes, in Troy, in Babylon.

All that I rightly think or do,
 Or make, or spoil, or bless, or blast,
Is curse or blessing justly due
 For sloth or effort in the past.
My life's a statement of the sum
Of vice indulged or overcome.

I know that in my lives to be
 My sorry heart will ache and burn,
And worship, unavailingly,
 The woman whom I used to spurn,
And shake to see another have
The love I spurned, the love she gave.

And I shall know, in angry words,
 In gibes, and mocks, and many a tear,
A carrion flock of homing-birds,
 The gibes and scorns I uttered here.

The brave word that I failed to speak
Will brand me dastard on the cheek.

And as I wander on the roads

I shall be helped and healed and blessed;
Dear words shall cheer and be as goads
To urge to heights before unguessed.
My road shall be the road I made;
All that I gave shall be repaid.

So shall I fight, so shall I tread,

In this long war beneath the stars;
So shall a glory wreath my head,
So shall I faint and show the scars,
Until this case, this clogging mould,
Be smithied all to kingly gold.

The Theosophical Forum

THEOSOPHY CAN EXPLAIN — *L. L. W.*

Have you ever thought that there must be the truth about things somewhere in the world if we could only find it? Theosophy is just that — the real facts about ourselves and our Universe. Theosophy is not new. How could it be new if it is the truth about things as they have always existed? The very word "Theosophy" means Divine Wisdom. And of course Divine Wisdom must spring from Divinity which is eternal.

This body of teachings which we call Theosophy today has been given many different names in past ages. It was called the Wisdom-Religion, the Secret Doctrine, and by other historic titles. Besides, every successive world-religion was an attempt by its Founder to put these ancient teachings into a new form. Like everything else religions grow old and deteriorate. Then they must be reborn. In this fresh form they are adapted (not changed) to the kind of people and to their ways of thinking and living to which the new religion is introduced. Thus we see that all religions express the same truths beneath their surface differences.

It is these fundamental doctrines upon which all religions have been founded which H. P. Blavatsky restated under the name *Theosophy*. But do not think that Theosophy is a new religion. No, it is rather an attempt for the first time in many centuries to give to the world a clear knowledge of that Divine Wisdom which *real* religion is. Thus Theosophy will eventually do away with the religious quarrels that have caused so much misery in the world. Humanity is really one family, but differences in religion have driven them into war and endless suffering.

At this point someone may naturally ask: "If Theosophy has been

taught in the beginnings of all religions why is it that we only began to know this about fifty years ago?" Well, just consider what has happened to the teachings of Jesus. How much of the Sermon on the Mount survived in the different churches? For centuries the devil, hell-fire, and no end of other grotesque doctrines replaced the Divine Wisdom of Christ's message. Of course these doctrines are fading out now, but is Christ's Christianity taking their place? This is why Theosophy is so badly needed in the modern world.

So we see how the Divine Wisdom underneath every World-religion has gradually been changed. It has been crusted over with human inventions and most of these have been actually injurious to man's happiness. But man did not realize that these teachings were there till Theosophy came to point them out and restore them.

The Theosophical Forum

NINETEEN THIRTY-SEVEN — H. S.

Theosophists the world over, filled with the never-satisfied longing of the human heart to do something more that is constructive for the race, are pausing at the threshold of 1937 watching keenly the conflict of unresolved forces at present rife everywhere. We are aware of the fact that we are the recipients of a Philosophy of Life; not one which promises a neat solution of individual and world problems all in a day, but one which gives courage, fortitude, understanding, sympathy, a sense of moral responsibility and perspective adequate for the meeting of these problems. We have been given a sublime philosophy indeed, but there is one thing more that is needed if we would pass on a *living* message to the world. This thing is vision. Spiritual vision, seeing with the inner eye, is not a gift that can be bestowed upon us. It does not come from without; it comes from within. To possess it one must bring it to birth, nurture it, give it wings. With our own eyes we must see.

"He has genius," said a recent poet and philosopher, "who can make us see the beauty he sees, but he is a master who can give us his own power of seeing." Yes, but even the master's gift of vision would be of no avail to us if we did not use it.

It was at the opening of that fateful year 1610 that Galileo for the first time turned his modest hand-wrought telescope to the sky and beheld the lovely vision of Jupiter and its revolving moons, and thereafter watched these tiny satellites as they pursued their measured course around their central luminary. What had he seen? Not merely a planet and its moons. There flashed upon his inner vision the picture of a Solar System — *our* Solar System, our Sun with its attendant revolving planets. The riddle was solved.

Copernicus was vindicated; the heliocentric theory emerged once more after centuries of obscurity. A New Day had dawned. Science and Religion were profoundly shaken. Europe that had long been stirring from its intellectual sleep was at last waking.

The dramatic story is now but an item in the records of history, revived perhaps only in the imagination of the comparatively few who study the series of awakenings that mark the upward progress of cycles of civilization. But here is the point: it was vision that gave stature to the work of Galileo. It is vision in great or lesser degree that marks any man as illustrious. It was the mighty vision of H. P. Blavatsky and of Those behind her that launched the Theosophical Movement. She focussed the telescopic lens of her own peerless self upon the heavens of Eternal Truth, and we have received the message she brought from those bright Galaxies. Shall we then be content with another's vision? When shall we too begin to *see*?

Long ages will pass before the "Eye of Siva" will once more be fully active within us. We are as yet too closely linked with our Atlantean past when man forfeited his right to spiritual insight. What a foreboding cadence echoes in those ancient words quoted by H. P. B. (S. D. II, 20) from a Secret Volume: THEN THE THIRD EYE ACTED NO MORE! Yet the records of occult history tell how the crippled Atlantean Race was not abandoned; how Mystery Schools were established as centers of spiritual learning; how the infant Fifth Race, blind but innocent, was ruled over and guided by Initiate Kings who in their divine compassion protected it and led it safely into its lusty youth; how the Brotherhood of Mahatmans, a "focus of Living Flames," holds today, as it has through the ages, the children of men in its safekeeping, teaching, inspiring, challenging, through cycles of Light and cycles of Darkness, in order that a memory of our former splendor may quicken within *ourselves* our spiritual intuitions. For there is a

promise that the Eye of Siva will one day again be active in the race. It is not a gift to be bestowed upon us even by the Great Brotherhood itself. We ourselves must open our own eyes.

It is a question to ponder over: "What is spiritual vision; how may we begin to develop it?"

As the Esoteric New Year is at its dawning, and in the silent sanctuary of our inner self we prepare for the New Day, meditating upon this thought it may be that we shall receive that first glimmer prophetic of the light of intuition which went out some eight million years ago but which may again be ours to carry us forward into the rising cycle.

The Theosophical Forum

TRANSACTIONS OF THE POINT LOMA LODGE: IX — *G. de Purucker*

CHELASHIP

G. de P. — I should like to know if chelaship is something added unto us by a way of life and a living, or is it something which pours out from ourselves as from inexhaustible fountains? Or is it both? This question seems to me to be basic.

M. Forbes — We have been told that there are many potentialities within each one of us, and it is only by contacts that we make that these potentialities will be awakened. I think that chelaship is a potentiality that we all have; but I believe that it needs the contact of a greater soul to bring forth that potentiality into action.

G. L. Davenport — I should think that chelaship is something added to us to a certain extent because it draws forth from us higher and higher feelings and stages of consciousness that induce us to work ever upward, at the same time awakening us to our responsibilities to all around us; and the consequent self-evolution and expansion of consciousness brings us so much nearer to the divine qualities that are inherent in man's constitution, and every element of his nature is worked upon and all of the lower qualities are thereby raised one stage.

F. F. Webster — As a military man of many years' experience, there is an analogy brought to my mind based on the military life in its true ethical background: Groups of men are taught by drills and tests to evoke from their own minds and wills and increase their bodily strength to do the necessary co-operative acts. The chela-path seems to me to be in a similar manner the evolving of ourselves with the help of those who are instructed to develop

ourselves into a higher degree so that we are more able to accomplish the greater object.

E. W. Lambert — It seems to me that the chela-life is prompted first by a law within oneself filtering into the mind of the man, and it assumes or becomes almost a conversational life with the Master within or a walking with that Master; but it requires a Teacher or helper to guide one even to his own Master.

A. B. Clark — The question is: Is chelaship or the chela-life the drawing forth of what is within or the adding of something from without? And as I understand the answer, it is both. As man is a part of, inseparable from, and a ray, as it were, of this infinite heart of the universe, all is within waiting to be evolved; but ages and ages would be required to bring it out by the sole process of evolution alone. It is a part of the nature of this universe that this very interlinking and interlocking of things should make it the function of those who would develop the higher to help the lower. We have there the law of compassion. We have brotherhood. We have love. And so those that have developed their consciousness so that it embraces a larger love express a greater degree of this inner divine infinity. They are the Masters. It is a part of their life, an expansion of themselves, to share this wider consciousness with their chelas so that the process of the chela's evolution becomes enormously hastened.

I remember a letter by one of the Masters' chelas written in the early days of the Theosophical Society before Mme. Blavatsky had her special group of students, to the members of the Pacific Coast, stating that if you had a Master it would bridge over many incarnations of evolution, save many, many incarnations of this long pitiless struggle, because a Master having already evolved greatly shares with you; you get a portion of his consciousness, of his life, his state of divine being. In one of his letters in the book

Letters from the Masters of the Wisdom, K. H. said this, which will illustrate what I mean: there was a tank filled with water, and another empty. One represents the Master, the other the chela, and they connect as it were by a pipe, and the empty one fills. (1) That is one illustration only.

But remember this fundamental proposition of *The Secret Doctrine*, on page 17, Vol. I, that there is no state of evolution gained by any evolving being, except by effort and merit. This process of chelaship is a process of reaching nearer and nearer to the Master, a process of ever becoming more like the Master, sharing therefore in his limitless consciousness and compassion.

S. Eek — Chelaship or discipleship implies the presence or the existence of a Teacher. Hence it is obvious that the disciple doesn't pour from himself the so-called benefits, if that is the proper word, but he is given them. Now the law of Karman obviously has brought the disciple in position where he has contacted the Teacher. Previous lives have brought the two together, and consequently it is only the result of previous aspirations which has placed the disciple in a position of learning more. For some reason the question of discipleship has come up frequently here during our last meetings, and I think many of us have given the question more thought on that account. It may be possible that our Human Ego will so open itself to the influences of the Higher Self that *de facto* it establishes the relationship of chela and guru within the constitution of the individual himself, this relationship corresponding to the outer relationship between an accepted chela and guru in the accepted sense of the East. The former can exist without the latter, but the latter cannot exist without the former, and it is only when the two blend that the full awareness of chelaship takes place. I believe that discipleship in its ultimate sense or meaning is a desire to live a purer and a more spiritual life. It is an intense sympathy and love of one's

fellow man, a desire to see everyone happy in the best sense of the word — not a happiness that requires position, fame, etc., but the happiness that comes from a mind and soul one in the knowledge of spiritual humbleness or spiritual aspirations.

F. C. Clemeshaw — I think that the life of chelaship is rather an attitude of mind — an attitude of mind which is a dedication of every act of our lives from the meanest to that which seems to us the greatest, the divinest. Consciousness expands in ever growing quality as we are able to live more and more in conscious dedication. Thus we naturally grow nearer to that heart of the Universe which is the ultimate of the chela-path. As we travel thus in dedication it will at the cyclic and karmic time bring us to that Teacher who will open to us wider views, or who will point out wider horizons, or who will point out our own stumbling-blocks. This help comes from without, but that help we cannot take unless we have that inner attitude of dedication which alone enables us to accept the helping hand of a Teacher pointing the way along the Path.

G. de P. — As usual, it has struck me that all the answers have been beautiful and profound, they show advancement in study; and yet, I do not think that any of the answerers got just the drift of my question, doubtless my own fault, due to the difficulty of phrasing a question in such fashion that everybody will understand just what is meant. Most of the answers, possibly all, seem to point out the way to become aspirants for chelaship, and it is splendid that your thoughts should be running on these lines. But my question called for answers directly to this point: Is chelaship itself a giving or a receiving, a pouring out or a putting in. Do you see what I mean? I do not know that I could pick out a question harder to answer. I have pondered upon this all my life, and I am not yet completely satisfied that I have even a fair answer, but I think I have, and I am going to try to give to you

what I think the proper answer is — but I assure you it is not a complete answer.

I think the reply lies in the words of the great Syrian Avatara, which in substance are: Seek ye the Kingdom of the Divine — the Kingdom of God as it runs — and all these other things will be added unto you. And that means everything: things of matter, things of the mind, things of the spirit. Why? You have your answer in the one word Evolution. Pause a moment and follow me in thought. A beast runs past a beautiful flower. What does the beast get from seeing that flower? A man a moment afterwards passes along the same path, reaches the flower, pauses, looks at it. What does the man get? Perhaps little more than the beast. But let a man of a different type come along that road, and see that flower and look into its heart. What does he get? A revelation not only of transcendent beauty, but a sublimity of thought. He *sees* something. Why? Because he has aroused in himself something that the beast has not yet evolved forth; and that the first man had not. The first man had more than the beast, but not as much as the second man.

Do you see what I mean? You have to become before you can be. You have to pour out from yourself what is within, lying latent, before you can receive the revelation from without. If the revelation is not pouring out! — marvelous paradox — you will not be able to read and interpret the Universe around you. You will pass unseeing by.

What is genius of any kind? What is even the inventive power that some men have? Ability to see! It is in them, and the outer world is a stimulus, brings forth what is within already. You cannot receive anything from without before it is already within, awakened, aroused. Teach a child in the womb if you can the wonders of the solar universe. There is no response, there is no

receiving capacity. But wait till the child is born and grows to become a man, and that which is within him has come out, the understanding. Then comes comprehension.

Seek ye first the divine within yourself, cultivate it, evoke it, awake it; and just in proportion as you do this, you will be receiving from without, because you give from within. You give yourself. You cannot receive anything from without until there is something within you to receive, a receiver. You pass unseeing by. That is just why the Masters are higher than we, are greater chelas than we, because they are greater receivers, simply because they are greater givers. You have to have that within yourself calling for recognition before you can receive and recognise.

Now that is, as I understand it, a good answer to my question: Is chelaship a receiving from without, or a giving from within? It is neither alone, but both together — a paradox.

And reverence due to the Teacher? Nothing dignifies a man so greatly. It is the man of servile soul who is afraid to recognise grandeur in some other man. He is not big enough. He is afraid of giving himself grandly. The little man is afraid of being "sat upon," or snubbed, he won't admit that the other man is greater than he. The man who really is great inside recognises grandeur in other men, and bows to it because he himself is inwardly a great man. He recognises the security of his own manhood and can render homage and reverence and respect because he has them within himself. Reverence for a Teacher is a beautiful thing, and a sign of inner growth; and it is merely servility thinly disguised to consider that you, I, anyone is so frightfully independent and superior to others that he won't recognise greatness when he sees it. He has not it within himself.

It is precisely the same rule that teaches us to reverence the glory

in the heart of a rose. We have it in us. We see it in the rose and render homage. To see beauty in the stars, their wonders, their mystery, their hid secrets, their stately movements in their orbital circuits: What is there more exquisite, more beautiful, more thought-provoking to look at than the flame of fire? What is fire? "Combustion." Isn't that an illuminating answer! What is a man? "Flesh and bones." Isn't that an illuminating answer! But to me they are not answers. They are just marks of stupidity. To me a man is a thought-producer, a lover, a giver, a genius, a creator, a power. A rose is a mystery, something from the invisible heart of Being exhaling itself in a marvelous beauty of form, perfume, color, and above everything else, something still grander, something that suggests the Beyond. You have the secret of chelaship just there.

FOOTNOTE:

1. It is a familiar saying that a well-matched couple "grow together," so as to come to a close resemblance in features as well as in mind. But do you know that between adept and chela — Master and Pupil — there gradually forms a closer tie; for the psychic interchange is regulated scientifically; whereas between husband and wife unaided nature is left to herself. As the water in a full tank runs into an empty one which it is connected with; and as the common level will be sooner or later reached according to the capacity of the feed-pipe, so does the knowledge of the adept flow to the chela; and the chela attains the adept-level according to his receptive capacities." — *Letters from the Masters of the Wisdom*, pp. 82-3, Letter XXX

Footnote by C. J. This is evidently one of the letters to Mr. A. O. Hume, written in 1881 or 1882. Reprinted from *The Theosophist*, June, 1907, pp. 702-6. ([return to text](#))

DOES THEOSOPHY DEMAND CELIBACY? — *Elsie V. Savage*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

It would seem far-fetched to discuss such a subject, except for the appalling ideas that are current among some people that to be a good Theosophist, and especially a member of the Esoteric School, it is a *sine qua non* that marriage and particularly having children should be sedulously avoided. Even where this extreme and fantastic notion does not exist, there are others who hold the belief, or else think that Theosophists hold the belief, that it is a sign of spiritual advancement to remain unmarried, and places one on a higher rung of the evolutionary ladder than others who are married and have established a home and family.

Before searching in our Theosophical literature to find either confirmation or refutation of such a curious conception, one can say at the outset that if we look around at the various Theosophists we know, we shall certainly find that there is no line of demarcation between married and unmarried folk: the married people as a class, either with children or without, appear to be neither more nor less evolved than the unmarried ones; and the unmarried people as a class appear to be leading neither more nor less unselfish lives with consequent benefit to humanity.

There may be a thousand and one reasons why a person may not choose to marry, or may remain unmarried; but it seems pretty certain that if one has reached "the higher levels of spiritual attainment," and must lead a life which "is fatal not only to the ordinary course of married life" (See *The Mahatma Letters to A. P.*

Sinnett, Introduction, p. xviii), he will not be advertising the fact to the world, and contrasting his own purity and attainments with the lower degree of attainment of his fellows. As in ordinary scholastic pursuits, I imagine that when we reach "the higher levels of spiritual attainment," we shall see so much more clearly how much we haven't attained to, that it will quite overshadow the shortcomings (!) of our fellows.

Turning to *The Mahatma Letters to A. P. Sinnett*, p. 372, we read:

Does it seem to you a small thing that the past year has been spent only in your "family duties"? Nay, but what better cause for reward, what better discipline, than the daily and hourly performance of duty? Believe me my "pupil," the man or woman who is placed by Karma in the midst of small plain duties and sacrifices and loving-kindnesses, will through these faithfully fulfilled rise to the larger measure of Duty, Sacrifice and Charity to all Humanity — what better path towards the enlightenment you are striving after than the daily conquest of Self, the perseverance in spite of want of visible psychic progress, the bearing of ill-fortune with that serene fortitude which turns it to spiritual advantage — since good and evil are not to be measured by events on the lower or physical plane.

And it might be said that the married couple have double the opportunity to practise "the bearing of ill-fortune with that serene fortitude which turns it to spiritual advantage," because in the true marriage there is an equal sharing not only of joys but of sorrows and difficulties too.

In the opening paragraph of H. P. B.'s "First Preliminary Memorandum" when the E. S. T. was founded in 1888, she wrote:

. . . It is but fair to state at once that such duties [those to be undertaken by applicants] will never interfere with, nor encroach upon, the probationer's family duties; . . .

(a probationer she defines as a member of the Esoteric School).

Turning to *The Esoteric Tradition* by Dr. G. de Purucker, Vol. II, pp. 667-8, we find the following:

. . . The Theosophist is a strong believer in honorable marriage, not only because of the reasons just given, but even more strongly because marriage involves the undertaking of responsibilities and duties and ties of intimacy bringing in their train highly important lessons of self-forgetfulness, and frequently of self-abnegation, in the course of which human character is strengthened, selfishness is undermined, and consideration and unremitting thought for others and desire for their welfare are so continuously instilled into the psychology of men and women as to become habitual and therefore integral portions of character which grows and unfolds the more rapidly thereby.

The whole of this section in *The Esoteric Tradition* is worth turning to and reading. It would take too much space to quote all that would show the saneness of Theosophy on the subject; and Theosophy should not be confused with views held at times by even devoted Theosophists!

I am not urging Marriage upon people, for that is their own concern; but merely uttering a protest against erroneous views on the subject, which if allowed to gain currency will be one of the most active forces to blacken the name of Theosophy. And when these views are directed against individuals, and lead to comments as to whether such and such a person is forwarding his

evolution by marriage, whether or not he is doing right to have children, how far apart his children are spaced, — in sheer exhaustion of appropriate language I am reminded of the Old English Adage, attributed to Table Talk by Selden:

Of all actions of a man's life, his marriage does least concern other people; yet of all actions of our life, 'tis most meddled with by other people.

A single person (or a married one either for that matter) who judges others harshly for "entering the married state," would do well to remember the following words of K. H. (*The Mahatma Letters to A. P. Sinnett*, p. 360):

But there are persons, who, without ever showing any external sign of selfishness, are intensely selfish in their inner spiritual aspirations. These will follow the path once chosen by them with their eyes closed to the interests of all but themselves, and see nothing outside the narrow pathway filled with their own personality. They are so intensely absorbed in the contemplation of their own supposed "righteousness" that nothing can ever appear right to them outside the focus of their own vision distorted by their self-complacent contemplation, and their judgment of the right and wrong.

Even chelaship, in the words of Dr. de Purucker, "is nothing weird, it is nothing queer, it is nothing erratic. It is the opposite of all these. It is the most natural thing for you as men and women to love, to strive for, and to follow."

COSMIC RHYTHMS IN LOGARITHMS -- *La Fayette Plummer*

When we speak of the logarithm of any number, we mean the power to which we have to raise a certain fixed number called the base, in order *to* make it equal *to* the given number. For instance, we all know that $2^3 = 8$. Here, 8 is the given number, 3 is its logarithm, and 2 is the "certain fixed number called the base." Thus $2^3 = 8$ may be written: $\log_2 8 = 3$; or, expressed in words: the logarithm of 8 to the base of 2 equals 3. To make an algebraic statement, call x the given number; b , the base; and n , the logarithm of x . Thus $b^n = x$. We may then state the following equality:

$b^n = x$ is the same as saying that $\log_b x = n$.

It is obvious that a complete system of logarithms can be constructed with *any* number as base, but the base 10 is used for the system or table of Common Logarithms. With ten as the base, we find, for example, that the logarithm of 8 is .9031, because $10^{.9031} = 8$. Similarly, with base ten, the logarithm of 2 is .30103, because $10^{.30103} = 2$. If 1.414 were to be used as the base, the logarithm of 2 would be 2, because 1.414^2 equals 2. If 25 were to be used as the base, the logarithm of 2 would be .2153, because $25^{.2153}$ equals 2.

From the above it may be deduced that any number is theoretically the base of its own system of logarithms, which is merely to say that any number may be raised to the required power in order to make it equal to any other number; and, conversely, any number may be considered a power of any other number.

We learn in algebra that x^0 equals 1. This means that any number with a zero exponent becomes 1. Thus, taking the zero power of the three numbers used above as representing bases for three systems of logarithmic scales, 10^0 equals 1, 1.414^0 equals 1, and 25^0 equals 1. We find, then, that in each case, the logarithm of 1 is 0, or, to express it algebraically, regardless of the base, $\log 1 = 0$.

With these facts in view, we may draw some interesting conclusions concerning Cosmic Life. The Ancient Wisdom affirms that the universe is constructed upon a hierarchical basis. All things are alive, and the universe is a living organism, composed of units, all of which in their turn are alive, and composed again of units. Thus is formed the Ladder of Life, of which every rung is a hierarchy. To put it otherwise, everything is composed of hosts of living units, subservient to, and uniting to form inner and outer vehicles of, the ruling consciousness; every entity is but one member of a family composed of hosts of like entities all subservient to, because uniting to form the vehicles of manifestation for, a greater entity. Thus, the idea of a supreme God, than which there can be none superior, fades away before the light of Theosophy, for it reveals such a being merely as the representative of a certain type of cosmic beings.

And now, "to moralize the subject," let us think of every entity in the universe as a spiritual force, a divine energy; and because every entity has a karman peculiar to itself, with no two karmans exactly alike, let us say that to every entity belongs a certain number, which number is the symbolic representation of the qualities and attributes which go to make that entity just what it is. Actually, numbers are merely names for relationships, and when we recognise that the universe is built upon the mysteries of number, we find that notation may be used to express symbolically the mysteries of the universe. Thus, it would not be surprising to find that in the Cosmic scheme the relationships and

workings of the various intelligence-energies are, on their own plane, related to what we in our own limited way see to be numerical formulas and processes. Seeing the thing the other way around, then, we may expect to learn something of cosmic life by studying mathematics — symbolically.

Ascribing, then, to every entity a number, and keeping in mind that every entity is a hierarchy, let us call that number the *base* of a system of logarithms; the various progressive degrees of development of that entity are represented by the *powers* to which that base may be raised; while the resultant outer manifestation, on the physical plane let us say, is represented by the resultant *number*. Take man as an instance in point. Every man is the manifestation of a certain hierarchy, and the summit or Hyparxis is a consciousness-center, enduring throughout the cycles. That consciousness-center, then, is the entity to which we shall ascribe a number, calling it the base of its system of logarithms. The various stages of the cosmic journey will be represented by the various powers of that base-number, and the outer manifestation will be represented by the resultant value.

Our expression, " $b^n = x$ is the same as saying that $\log_b x = n$ " becomes:

"A cosmic consciousness at a certain stage of the journey produces X, its outwardly manifested self, is the same as saying that the function by a cosmic consciousness of its outwardly manifested self, represents a certain stage of the journey."

This could be applied in numberless ways. Take mankind as a whole, "As many men on earth (as many values of x), so many Gods in Heaven (so many values of $\log x$, representing the powers of the cosmic consciousnesses which are the bases or roots of the members of the human family)." The difficulty with us is that

while we know something of the value of x , the personality, we know neither the base nor its power, our "logarithm." Thus, we cannot recognise either the Divine Monad or the Higher Self. The path of Self study leads to Initiation, the fruit of which is Self Knowledge.

Consider now the Solar System. The Cosmic consciousness, working through the sun and the planets, is the base of its system, the outer forms are x ; and their higher counterparts are the logarithms of x , or the degree to which the consciousness center has progressed and succeeded in manifesting its innate powers.

We may extend our picture to universal proportions. We have observed that any number may be expressed as a certain power of any other number, and let us say of 10, for example. The universe is built upon a tenfold plan, and the entities therein might be considered as various powers of universal consciousness. Thus, the outer appearance of a thing is a maya, an illusion, and to discover its true nature we must find out the power of universal consciousness that that thing is.

Unity is in all things; from unity we issued forth, and when the great cycles of diversity are over, to unity shall we all return. This is symbolized in the fact that the zero power of all numbers is 1, or unity. As we have seen, it matters not what number we may take, its zero power is always equal to 1. Put it the other way, if you like: when the logarithm of x is 0, it matters not what the base number, x equals 1. Here we must conjure up the picture of the dawn of cosmic life. As yet there had been no manifested worlds, no entities to live on them; all was drawn into the "Great Mother," Space, the Heart of the Universe. All outer manifested forms had entered into union with the All. To put it in our mathematical form: throughout the Boundless, x equalled 1, because $\log x$ equalled 0. *But the base remained unchanged.* The essential core of

every entity was a cosmic spark from the Central Fire, which had burned long ago in other cycles, and still retained its ultimate essence, its Divine Selfhood, even though it no longer manifested. But it was destined to pursue its way throughout new cosmic manvantaras, bringing forth from within itself new veils or garments, accumulating new richness of experience, until the close of the cycle, when $\log x$ will once more equal 0, and all outer forms be withdrawn into unity, universal Space, awaiting a new Cosmic Dawn.

Our conception of the Cosmic structure will be widened if we look upon every entity as three aspects of consciousness: firstly, the base of a hierarchical system, composed of entities below him on the ladder of life; secondly, the power, or indication of the degree of perfection of some entity higher than he on the ladder, which higher entity is the base of the hierarchy to which he belongs, and thirdly, x , the outer manifestation of an inner god, which is himself, belongs to him individually, as it were, and is his own future reward, if he will strive onwards and upwards for ever.

PERCEPTION — W. S. Date

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

PART I

Probably the best method of introducing a rather unusual subject would be to give a dictionary definition of the word *perception*:

1. Perception is denned as the act, process, or faculty, of perceiving, the mental action of knowing external things through the medium of sense-presentations. 2. Intuitive apprehension, insight, or discernment.

Such actions as tasting, feeling, hearing, smelling, and seeing, are so commonplace and so very nearly automatic, that one rarely stops to question or examine them with a view to determining their infallibility or fallibility as the case may be. We touch a piece of wood, and we say it is hard; boiling water may unfortunately come into contact with our skin, and we say it is hot; and so on, and anyone who dared to question the truth of these statements would be advised to bang his head against a table, or to plunge his hand into a saucepan of boiling water, and he would soon find out the truth of the statement. Under normal circumstances there can be little doubt that the "Doubting Thomas" would very quickly be convinced.

However, during the last quarter of a century in the Western World, there have been some investigations conducted on a comparatively small scale, with some extraordinary results. The most known of these has been that field of investigation connected with hypnotism and mesmerism. One simple

experiment was the placing of a drop of cold water on the hand of a person under hypnosis, and the suggestion being made that the water was boiling, whereupon a blister appeared upon the skin. Another experiment was to get a person under hypnosis to read a closed book. Many other experiments have occurred from time to time, the results of which have been passed over because they have not been fully understood.

In this connexion there have been interesting statements in recent papers. I refer only to two. In a recent issue of *The Daily Telegraph*, an account is given of experiments conducted and reported to the International Optical Congress at Oxford, "in which persons securely blindfolded had recognised the form and colour of objects, had "read" the headlines of a newspaper and had even been able to reproduce shorthand written on a blackboard." In THE THEOSOPHICAL FORUM for January, 1936, p. 45, there is an interesting account of "The Fire-Walking Performance in England.'

Now the effect of these experiments is to throw a doubt upon the correctness of sense-impressions. In the good old days cold water was cold water, and fire was hot; but now apparently there seems to be a certain doubt about the matter. With reference to the hardness of wood: in common with other substances, wood, we know, is composed of atoms; but I call your attention to what Sir Oliver Lodge has to say about the atom (Read p. 55, *My Philosophy*.)

On this view, or indeed in any form of the electrical theory of matter, the atom of matter consists mainly of empty space." (1)

So our solid wood has become something that has at least as much space in it, relatively speaking, as there is space in the sky. So much for the hard wood.

By way of contrast, let us take something that we have been accustomed to regard as the most impalpable of substances, namely the ether; and I refer you again to Sir Oliver Lodge, and his remarks on this ethereal substance on p. 145 of the same book.

. . . but on the analogy of matter the ether is of the order a million million times as dense as "water.'

So now we see that everything that we thought was something is nothing; and the something that we thought was nothing is everything. These tools of sense are the instruments which every lay scientist uses in his investigations, so that it can hardly be wondered at that the "ultima thule" of each scientific generation is merely the jumping-off place for the next. This of course must obviously be the case, because when a race is on the upward arc of a cycle, each new generation is born with, and develops, sense-organs which on the average give a little clearer impression of reality than had been obtained by their less well-equipped forebears. This is a natural corollary to the law of evolution.

Modern materialistic science is concerned only with effects, and in the field of effects it has done, and is doing, very valuable work. The great benefits that have accrued to the human race through this study of effects must not be underestimated. Modern science is very effective as far as it goes. It is when it endeavors to measure reality and the world of causes with its little materialistic ruler that it is out of its depth. I refer you to a passage written by one who seems to me to be one of the most outstanding personalities of the last century, namely H. P. Blavatsky. On p. 669 of Volume I of *The Secret Doctrine* she sums up the very materialistic science of the latter half of the last century in a very complete manner. That science has moved away a little from this hard material outlook, I will not deny, in fact I

have already stated that such must be the case.

Thus it is that the scientists have committed one of the most elementary errors of logic in building up their scientific edifice upon an unproved assumption, this assumption being that the senses transmit true sensations of the matter with which they come into contact. Another assumption is that the senses are aware of everything within their ambit. Now when these assumptions are shaken, the whole scientific structure begins to totter, inasmuch as it is in any degree considered to be a measure of reality. The following, from a review of a book by one of America's best known scientists, *Man the Unknown*, by Dr. Alexis Carrel, illustrates exactly what I mean:

"Man," Dr. Carrel writes, "should be the measure of all. On the contrary, he is a stranger in the world he has created." If, therefore, we are to attain to a better adjustment between man and his environment, we must desist from studying matter and concentrate upon knowing ourselves. "Our ignorance of ourselves," writes Dr. Carrel, "has given to mechanics, physics, and chemistry the power to modify at random the ancestral forms of life." He then proceeds to study the effects of such modifications. . . . Man is not to be comprehended merely as a chemical compound. There is something more important even than human intelligence, and that is moral sense. "Moral beauty," writes Dr. Carrel, "is an exceptional and very striking phenomenon. He who has contemplated it but once never forgets its aspect. This form of beauty is far more impressive than the beauty of nature and of science. It gives to those who possess it divine gifts, a strange and inexplicable power. It increases the strength of intellect. It establishes peace among men. Much more than science, art or religious rites, moral beauty is the basis of civilization."

How, then, are we to recover that lost basis? The first thing to do is to separate the quantitative from the qualitative. "In man," writes Dr. Carrel, "the things which are not measurable are more important than those which are measurable." A new synthesis must then be built up inspired by a precise knowledge, not only of the body, but also of the soul of man.

PART II

It may be noticed that the definition of perception which I have given was divided into two parts. Having dealt with the first part, let us turn our attention to the second part: "Intuitive apprehension, insight, or discernment." As Dr. Carrel suggests, the study of man by man has been grossly neglected. The cycle of science is completing its round, and we are arriving back in Ancient Greece, and the Delphic Oracle is again uttering its injunction that rang through Greece at the height of her glory: "Man, know thyself." Ancient Greece was the farthestmost Western point influenced by Eastern Science. In the East, the study of man and his relation to the universe has been carried on from unrecorded time. This has been so because the Eastern metaphysicians, philosophers, and scientists, have realized that by the understanding of the constitution of man, they were given the key to reality. They never mixed cause and effect. They realized that through the organs of sense man could only contact effects and must remain ignorant of causes.

To start off on our investigation of man and his relation to his surroundings, we need to get one fundamental fact very clear. Man must be divided up into at least two constituent parts, the operator and the machine, or body and soul, or conscious and subconscious, whichever you like to call them.

Now the second half of our definition speaks of "Intuition." I think we may define Intuition as the method of perceiving something without the medium of the senses. How is this to be done? Let us turn to an ancient work, translated in part by H. P. Blavatsky from the Senzar and Tibetan as *The Voice of the Silence*:

Having become indifferent to objects of perception, the pupil must seek out the rajah of the senses, the Thought-Producer, he who awakes illusion.

The Mind is the great Slayer of the Real.

Let the Disciple slay the Slayer.

For —

When to himself his form appears unreal, as do on waking all the forms he sees in dreams;

When he has ceased to hear the many, he may discern the ONE — the inner sound which kills the outer.

Then only, not till then, shall he forsake the region of *Asat*, the false, to come unto the realm of *Sat*, the true.

The Self of matter and the SELF of Spirit can never meet One of the twain must disappear; there is no place for both.

Ere thy Soul's mind can understand, the bud of personality must be crushed out; the worm of sense destroyed past resurrection. . . .

Help Nature and work on with her; and Nature will regard thee as one of her creators and make obeisance.

And she will open wide before thee the portals of her secret chambers, lay bare before thy gaze the treasures hidden in the very depths of her pure virgin bosom . . . —

From Fragment I

These same ethical teachings are also found imbodyed in the New Testament.

Now if the theory of evolution holds good, it follows that there

must be high types of men as well as low types. We know where to find the low types. Where are the higher ones to be found? A more evolved person would be able to comprehend to a greater degree the secrets of nature, and we have all read of the Mystery-Schools of Greece, such as Eleusis and Samothrace, and also those of Egypt. Students have endeavored to discover what was taught at these schools, but have never succeeded, and this is only logical, as a high degree of "intuition" would be necessary to understand the teachings. What was taught to the elect students was the Laws of Nature, and it was here that the candidate for the Mysteries trained himself, and was instructed in the deeper Laws of Nature. Christ taught in the same way, for he told his disciples that "unto the multitude I speak in parables, but unto you it is given to know the mysteries of the Kingdom of Heaven." He also said: "The Kingdom of Heaven is within you," also, "Seek ye first the Kingdom of Heaven and all these things shall be added unto you."

This is precisely the same advice as Dr. Carrel is offering us 2000 years later. The basic idea underlying all religions worthy of the name, is the development of the inner consciousness, in order to enable the individual to apprehend more clearly the reality and purpose of life. The teachings given out by various teachers, in public in parables, and in the Mystery Schools in essence, and the rules of conduct laid down, were directed towards the extension of the consciousness to enable the individual to pierce the veil of matter and to get a little nearer to reality. These teachings have been corrupted and overlaid with the ideas of men who have come after, and sacerdotalism almost inevitably corrodes them with the passage of time, so that we now find the jewels of truth covered with a heavy layer of dross.

Herodotus speaks rather disparagingly of the Mystery Schools because, when in Egypt, he had been told by an initiate that one

of their great secrets was that the "Gods were men." This shows that Herodotus, although he may have been a fine historian, was not one who had been instructed in the Mysteries, (2) for in truth the statement made by the Egyptian initiate is the deepest of mysteries. In the West the Mystery Schools were closed by Justinian, about the Sixth Century, because in a cycle of increasing materiality they had become corrupt. Nor are these teachings confined to the East. Many English poets show great intuition in their writings, possibly none more so than Alfred Lord Tennyson. He has written a poem, "The Mystic," which is a description of a person who has attained to a high state of perfection, and he closes with the lines:

How could ye know him? Ye were yet within
The narrower circle, he had wellnigh reached
The last which with a region of white flame,
Pure without heat, into a larger air
Upburning and an ether of black blue,
Investeth and ingirds all other lives

Thus it is that we have two methods of perception open to us, the one, the study of the phenomenal world of effects through the medium of the senses, and the other the study of the world of reality and causes through the intuition and higher vision. Possibly the most successful path would be the one that lies midway between the two. The scientist tells us how to pursue the former, and the teachers, poets, mystics, and sages, tell us how to discover the latter. Tennyson was one of these and he leaves us concise instructions in this second method when he writes:

With faith that comes with self-control,
The truths that never can be proved
Until we close with all we loved,
And all we flow from

Soul in Soul

The Theosophical Forum

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

AMERICAN AND BRITISH SCIENTISTS PROTEST AGAINST THE ABUSE OF SCIENCE

The Rising Tide of Theosophical idealism in the outside world has just received a strong impetus from an unexpected source — academic science! Two of the most important scientific bodies in the world are actually turning their backs on one of their most cherished and time-honored positions and are walking in step with the Mahatmans, though they may not be fully aware of it! The orthodox position held by modern scientists, until this surprising revolution, was eloquently expressed by the Master K H in a letter written to A P. Sinnett more than fifty years ago. He writes

Exact experimental science has nothing to do with morality, virtue, philanthropy — therefore can make no claim upon our help until it blends itself with metaphysics (1) Being but a cold classification of facts outside man, and existing before and after him, her domain of usefulness ceases for us at the outer boundary of these facts, and whatever the inferences and results for humanity from the materials acquired by this method, she little cares. Were the sun, the great nourishing father of our planetary system, to hatch granite chickens out of a boulder "under test conditions" tomorrow, they (the men of science) would accept it as a scientific fact without wasting a regret that the fowls were not alive so as to feed the hungry and the starving yet you are content to spend your life in a work which aids only that same exact science. . . .

. . . The realistic science of fact on the other hand is utterly

prosaic. Now, for us, poor unknown philanthropists, no fact of either of these sciences is interesting except in the degree of its potentiality of moral results, and in the ratio of its usefulness to mankind. And what in its proud isolation, can be more utterly indifferent to everyone and everything or more bound to nothing but the selfish requisites for its advancement, than this materialistic science of fact? . . . what have the laws of Faraday, Tyndall, or others to do with philanthropy in their abstract relations with humanity, viewed as an intelligent whole? What care they for *Man* as an isolated atom of this great and harmonious whole, even though they may be sometimes of practical use to him? . . . — *The Occult World*

But the Earth does move, and science has awakened to its false position at last. Is it unreasonable to claim that the constant diffusion of Theosophical ideals by earnest students of Theosophy throughout the world for half a century has had some influence in this matter? We know that not a few scientists and popular writers have read and do read our literature, and the power of concentrated thought directed toward a worthy end must not be ignored. The new alinement in the American and British worlds of science is briefly summarized in the following extract from a long article on the subject in the *Pathfinder*, for September 26, 1936.

The religious and social-minded last week had much to think about as philosophers aired their opinions on the state of humanity in the modern era. . . . In Blackpool (England), the British Association for the Advancement of Science saw society in such dangerous straits that the social aspects of technical progress were questioned. In Cambridge, Mass., the Harvard Conference heard suggestions for a "supreme world court of wisdom" to save

mankind from man's inhumanity.

Reports from England indicated that science itself was in revolt against the uses to which new discoveries have been put. . . . Scientists, said Prof. J. C. Philip at the Blackpool gathering, "are increasingly impatient at the extent to which their knowledge is made to serve inhuman ends." . . . The attitude at Blackpool *was in decided contrast to science's traditional indifference to anything except pure research.*

At Harvard four distinguished philosophers were detailed to study the possibility of forming a world court to exert a moral authority similar to that exercised by the church in the Middle Ages! Shall we have a new *scientific religion*? If so, it would be well to adopt Dr. Alexis Carrel's suggestion in his great book, *Man the Unknown*, and find out more about what man really is. This, of course, means study on Theosophical lines, and the ultimate discovery that the Masters of Wisdom already have solved the problem and have given as much of the answer as we uninitiated persons can be expected to understand.

In August, 1891, H. P. Blavatsky's *The Blessings of Publicity* was published in *Lucifer* and is now available in reprint. She quotes an attack on Theosophy in which the writer protests against anything whatever being withheld from the public, saying, "It is no longer necessary for Science to take the veil, as she was forced to do for security in times past." She replies that while "secrets of the purer and profounder life," mentioned by the critic, should be universally known, there is much that is so dangerous that unless a man "*lives the life*" he cannot be entrusted with them. She adds that this does not apply only to such things as explosives, but still more to secrets of occultism which can be far more terribly misused, and "neither the criminal hand, nor the *immaterial*,

invisible weapons used, can ever be detected." Yet there are apparently sane people offering inducements to the utterly unprepared, morally, to dabble in so-called "occult arts" and magical practices! If the scientists set up a "supreme world court of wisdom" to protect humanity from the shocking evils they are beginning to recognise as the result of putting powder and matches into the hands of moral infants or imbeciles, let us hope that it will confess that the Wise Teachers of old were right in the extraordinary precautions they took before they admitted candidates into the Greater Mysteries. Science may not need to hide behind a veil in order to protect *itself* in these days, but it may have to put up a triple wall of brass to protect the world against the indiscretions of *its votaries*.

AN EMINENT SCIENTIST ON THE THREE REALITIES IN THE UNIVERSE

Again we must draw attention to the spreading of fundamental teachings of Theosophy among our most learned and advanced scientists. One of the daring claims of the Ancient Wisdom is the ultimate unity of all things: that we cannot separate the working of the cosmos into independent or rival compartments such as ethical or spiritual laws, physical laws, biological laws, etc. The universe is One, and love, compassion, justice, beauty — forms of consciousness, are just as integral and inseparable parts of the whole, a "Living Universe," as suns and planets and the erroneously so-called "blind" forces. "Love is the cement of the universe," as G. de Purucker says.

Such ideas, however, have never been welcomed by orthodox, official science, which has been proud of its concentration on a mechanistic interpretation of Nature including an electro-chemical explanation of life and consciousness. What, then, can have aroused the distinguished Professor Dayton C. Miller, of the

Case School of Applied Science, Cleveland, Ohio, to speak as follows at the fifty-second Commencement of that important scientific institution. Has he been studying H. P. Blavatsky's *Secret Doctrine* or G. de Purucker's *Esoteric Tradition*? The entire address is published in *Science*, October 2, 1936, to which our readers are referred as we have room for only a few sentences.

I am prepared to adopt as the realities which constitute the universe three manifestations of absolute value things which are eternally true — *science*, things which are intrinsically good — *ethics*, and things which are inherently beautiful — *aesthetics*. There are not three different worlds of values, there is one universe of reality, a unity of the good, the true and the beautiful. And more, we must believe in the inherent and everlasting ability of mankind to progress towards an ultimate ideal or destiny, which requires that one's life be so ordered as to be in harmony with these eternal virtues. Such a life brings the greatest happiness and satisfaction. Such a system of philosophy is not new, in fact, it is one of the oldest systems.

The aim of life should be to secure the greatest development and manifestation of these qualities, and a life based upon such an ideal should bring the greatest happiness and satisfaction. Mere physical pleasure is a part of the reality of nature, and its pursuit is not only allowable but laudable. However, the foolish man often overlooks the fact that nature is scientific and ethical in its very essence, as well as esthetic and epicurean, and that sooner or later he must submit to the inevitable consequences of his actions the wise man knows that the most exquisite and satisfying pleasure comes to him who practices his enjoyments with regard to the unity and solidarity of

universe does not keep its ethics in one compartment and its beauty in another, to be sampled as one selects, it is true throughout, it is beautiful throughout, and it is ethical throughout. Ethics is just as real and just as fundamental as science, but not more so. . . .

The aloof attitude of scientists which Dr. Dayton C. Miller does not share and which has begun to change, was intensified by their belief that such things as morality, love, and altruism were not basic either in nature or man, but arose from the "instinct of the herd" for physical protection, the crude "survival of the fittest group." In reality, this is a plain perversion, and science is beginning to suspect it.

NEW LIGHT ON ANCIENT MAN IN ENGLAND

Informed students of Theosophy are aware that the "Piltdown Man" or *Eoanthropus* (dawn-man), discovered in the South of England in 1912, has long been considered to be, as Sir Arthur Keith wrote in 1914, "the most ancient human remains yet found in England," and probably to belong to the very ancient Piltdown period, the oldest in which man has been supposed to exist (unless some disputed recent discoveries throw him back to the Miocene). *Eoanthropus* had a large brain, but also some marked ape-like features, and he was associated with the most primitive stone implements known, the "eoliths" (dawn-stones). It is now reported that a second and far more perfect *Eoanthropus* has been found in an undisturbed deposit of the "100-foot Terrace" in the valley of the Thames, which was laid down when the river was flowing at a level of about 100 feet above its present bed. This period is called the Acheulean and is far later than Keith's estimate for *Eoanthropus* No 1, and the Acheulean implements are of a very high order, showing great skill and artistic tastes. *Eoanthropus* II is stated to be only about 183,000 years old, but No

1, his predecessor *may* be at least 400,000. This great difference in the antiquity of nearly identical types (No II is somewhat *lower* though far more modern!) is of special interest in showing that other kinds of *homo*, not considered to be our ancestors — independent species almost — could linger on for tens or hundreds of thousands of years until far more intelligent races appeared (such as the advanced Acheuleans) from the unknown. We shall hear much more about this remarkable discovery, for, as the report in the *Listener* says, "from the standpoint of evolution, the Acheulean period is "but as yesterday," and the dating adds to the rapidly growing suspicion that, as sub-men lasted so much longer than was thought, so "man proper" may have a much longer past than the first evolutionists imagined possible " Just as is taking place in America, where highly intelligent man has at last been admitted to have existed at the time of the mammoth, 10,000 years ago, so the antiquity of "man proper" in Europe is being pushed back farther and farther into the night of time.

FOOTNOTE:

1. Sir William Crookes, the famous chemist, was a scientist who had a far larger outlook than the average into the "metaphysical" or super-physical aspect of life and nature, and he thereby earned the direct assistance of the Master M, when he took such an important part in initiating the new outlook in physics which destroyed the old materialistic creed ([return to text](#))

**THE UNIVERSAL MYSTERY-LANGUAGE AND ITS
INTERPRETATION: XII — *H. T. Edge***

THE EGG

This is a very favorite and comprehensive symbol. Its spheroidal shape and its function as a life-germ are alike emblematic, and are connected with each other, as will appear. Our Easter is largely made up from an ancient North European festival of rebirth, which was celebrated in Spring, which is the appropriate time of year for such a festival, as it is then that nature comes to new life. It was not the birth of the year that was celebrated; it was rebirth in general, but that particular time was chosen as being most fitting. The egg is of course a familiar accompaniment of Easter celebration, and has not much to do with the ecclesiastical side of the festival, as far as one can see. But scholars will tell us that the egg was used by others besides the Northern peoples and their Christianized successors, and that it has been universally venerated as a sacred symbol, many people refraining from eating it on that account.

The Egg stands for that primordial Chaos, that Great Deep, Waters of Space, etc., mentioned in cosmogonies as being the great womb of Nature, the Virgin Mother, out of which the universe is produced by the fructifying breath of Divine Spirit. But again, the same symbol is used to denote the universe thus produced, and in this sense it is spoken of as the Mundane Egg or World-Egg. The comparison of the universe with a great egg is a most profound and apt analogy, and is naturally to be found in all cosmogonies. The spheroidal shape is that of all the worlds that revolve in space, as also the shape of eggs, seeds, and germs in general, drops of water, and many other things. It is the most

comprehensive of all shapes and the most perfect and yet simple of forms, produced by an exact balance of forces expansive and contractile and equal in all directions. Cosmogonies usually go on to describe the splitting of this egg into parts representing the heavens and the earth, etc., and the respective symbolism of shell, white, and yolk. Within the egg is the germinal point; and by studying the anatomy and physiology of the egg before fructification, and the various stages of development of the embryo after fructification, much can be learnt about universal law by analogical reasoning. The development of the egg is actually a repetition of the entire cosmic process by which worlds and living beings are created. Can this be merely an interesting analogy, an accidental coincidence? No; for the same laws pervade the whole universe, as a whole, in its greater parts, and down to its minutest subdivisions; and there is not a living being, however minute and apparently inert, but is following those laws of development, at one stage or another. The body of man himself is born from an egg, though this is developed internally, instead of being dropped as is the case with fowls. A seed may be called an egg — the difference is little more than a question of names.

So the egg stands as symbol of that most comprehensive of laws with which Theosophy deals — universal self-evolution. The universe is a vast aggregate of living beings, all of which are evolving, each according to its own particular stage in the vast process, and according to the particular cosmic hierarchy to which it may belong. And the process is one of self-directed evolution from within. A mechanical doctrine of evolution tries to represent it as a process of accretion or adding together of parts; but that would not be evolution, not natural growth. Such a process would result in a chaotic mass of unorganised fragments; evolution demands that there should be a plan on which to build. That plan is contained in the germ within the egg. Biologists can

watch the actual process taking place; but, though they see the scenes shifting, they cannot with their microscopes discern the scene-shifters.

All we can see with the microscope is the builders as they emerge from invisibility; the life-forces at the moment when they enter upon the plane of physical matter. We can trace things back to a minute speck, and no farther. That minute germinal speck is the point where the forces enter the physical plane. There is an ancient saying that *omne vivum ex ovo*, and since the universe is composed entirely of living beings, the egg must be omnipresent as being the germinal form of every organism, whatever natural kingdom it may belong to. In the numerical symbology of the Secret Doctrine the cipher is sometimes called the egg, which it resembles in its shape; and this, taken with the straight stroke, representing the fecundating principle, makes the sign for the number ten (10). The zero does not imply mere nihility — an utterly untenable idea — but simply the absence of number; it is "no number"; so that the circle represents the universe in an unmanifested state, which to our conceptions appears as nothing, though it is *all*.

The Theosophical Forum

THEOSOPHY AND POLITICS — *G. de Purucker*

[The subjoined is the reprint of a letter written by the Leader to a correspondent who had written to him asking about the relationship of the Theosophical Society to political activity, if any such relationship existed or should exist; and the Leader's answer is here-under reproduced with the permission of the one who received it in answer to the questions asked. Naturally the name and address have been deleted, as well as an introductory paragraph of personal character, for these do not concern the main body of thought that the letter contains.

This letter is printed here because it amounts to a Statement of the policy of the Theosophical Society in connexion with the matters of which it treats, a policy which has been sacredly followed and unchanged both in generals and in particulars since the time of H. P. B. and of Colonel Olcott; in which connexion the reader's attention is drawn to a somewhat similar Statement of policy made by H. P. B. and Colonel Olcott in June, 1883, which may be found originally printed in *The Theosophist*; and as this Statement is still interesting and valuable, it is reproduced for the reader's convenience here- under at the end of the Leader's own letter. — Eds.]

Point Loma, California

The Leader's Private Office

3rd November, 1936.

Dear ____:

Let me say, first, that you need have no fear of any kind whatsoever, that as long as I live the T. S. will wander one inch from the traditional Theosophical and extremely wise policy first

inaugurated by H. P. B. and so faithfully followed after her death by dear Judge, dear K. T., and to be followed faithfully by myself, to wit, that the T. S., inside and outside, right and left, and up and down, and in every imaginable manner, is utterly divorced from politics, whether fundamental, or those perfervid fevers which arise in any country during election times. In other words, as so often stated, the T. S. is absolutely non-political as well as being non-sectarian in these matters. This has been something which I have always been very strong upon, and consequently this answers your questions as to "the direction in which the T. S. *seems* to be traveling." It is traveling in exactly the same direction in which it has always been traveling, to wit, to steer absolutely clear of any possible involvement of any kind great or small, in political questions of any kind great or small, for its sphere as an organization is not politics in any sense whatsoever; and consequently it is my duty to keep it absolutely non-political, and outside the sphere of politics.

Imagine for a moment, my dear Friend and Fellow-Worker in our Theosophical Cause, what would happen if I "took sides" in any political matter whatsoever! Can't you imagine it yourself? Can't you see it would be an utter abandoning of the traditional policy of the T. S., and merely copying what so many of the exoteric religious organizations are doing, either organizationally or through certain "inspired" representatives thereof?

Suppose, for instance, I were to take the attitude, and so declare it, that the T. S. is on the side of So-and-so, i. e., X: Can't you see what a tremendous hubbub in the T. S. this would raise, and very justly raise, on the side of those who absolutely disagreed with X? Suppose I took the contrary point of view and taught that the T. S. should interest itself in the politics or imaginings of Y. Exactly the same situation would arise, involving not only an abandoning of our traditional policy of keeping free of politics in any shape or

form, but would immediately be immensely unjust to those who in their personal wisdom imagine that X is the one whom the T. S. should back.

Suppose, again, that I were to abandon our traditional policy as an organization of absolutely ignoring politics and become involved in politics: would this be pleasant, agreeable, friendly, just, or right, to the hundreds and hundreds of our workers in other countries whose politics are quite different from ours, whose social life may be quite different from ours, in our own dear country here? The T. S. in such case or in either case would become merely a local or national entity, sinking or going down into the arena of political squabbles — and heaven save us from any such folly as this!

I thought every F. T. S. knew and realized that the T. S. has been, and now is, and I pray forever will be, so divorced from politics that as an organization we remain apart and utterly calm, thus allowing our members *as individuals* to have what political opinions, or no political opinions at all, that they please, and thus giving equal-handed justice to all our F. T. S.

Our members in the matter of politics think what they please and act what they please, and it is no business of mine nor of yours nor of any other earnest and devoted F. T. S. to try to govern or direct or control the political convictions or opinions of any other F. T. S. What right have I to say to So-and-so that "you should vote for So-and-so," or "you should not vote for So-and-so"? Why, this would be an intolerable interference with that person's free will, and the T. S. would become a hissing and a by-word to all honest and honorable F. T. S. who love it and who want it kept far above the stormy arena of political squabbles, which, by the way, change not only from century to century, but actually from year to year, and almost from month to month.

No, my dear, the T. S. is traveling in the same direction in these respects that it has always traveled from dear H. P. B.'s days, for our *Work as an Organization*, while allowing to every F. T. S. without a word of comment his own political convictions and freedom of thought and choice, which means free-will in thought and action, nevertheless avoids politics of any kind; but we concentrate our work upon the glorious and unspeakably beautiful labor of trying to change the thoughts of mankind to ever nobler and higher things, along the lines of universal altruism, universal brotherhood, peace on earth and good will to men. In other words, our Work is upon the spiritual, intellectual, and moral nature of man, I mean our work as an organization, teaching men to live better, to live an ever higher life, to be generous to others, to introduce thoughts of law and peace and honor and duty, so that wherever our F. T. S. may live, to whatever country they owe allegiance, they shall be respecters and dutiful followers of established authority, and may learn more fully to obey the laws of their country as good citizens and as honorable men and women.

I cannot nor will I tell our members that they must have this or that or some other variety or brand or color of political opinions. This would be an intolerable interference with their liberty of thought and action, and an attempt to influence their free-will, and therefore the utter abandoning of the traditional policy of the T. S., and a changing of the direction which it has always followed. The Theosophical Society as an organization can live at peace in any country, under any government, because it teaches the duty of its members as moral beings to obey the laws of the country in which they live, whether as natives or as visitors, and surely no sane government could object to this!!

The world in the past has suffered too keenly, and too much human blood has been shed by former Western religious

organizations taking part in politics and using religious influence for political ends; and the T. S. must never do this, and I pray the gods it never will.

I never concern myself with the political feelings or opinions or convictions of our members, whether in the mass or as individuals, for this is not my business nor your business nor the business of any other F. T. S., but is the business of the individual. Do you think I would criticize you, or could be guilty of such a moral crime, because you hold certain convictions of a political character? Certainly not, nor would I criticize any other F. T. S. for holding political convictions which might be the same as yours, or diametrically opposite. That is not our business, nor the business of the T. S., for you are a free agent, and you have the right to the undisturbed exercise of your free-will, and to do your duty as you find it best and noblest, and I would be the first to say that your rights in this matter must be protected. Surely you see this!

So therefore, please do not worry about something which really does not exist, but, I am afraid, is a mere figment of your imagination, thus giving you totally unnecessary anxiety. So strongly am I for what I have written above in this letter, that I have told our people again and again that no matter what their convictions may be of a religious or political character, a Theosophical platform is no place to voice them on, though they may hold what convictions they please of any kind; but they have no right to try to force their opinions from a public Theosophical platform into the ears or down the throats of their auditors; and on the whole I think our F. T. S. have tried faithfully to follow this.

I too sometimes hear things, even from our own platform, which I think have been unwisely expressed, but I try to make allowances in charity of heart, realizing that sometimes people are a little

negligent or careless in speech, but really do not mean half that the words on such occasions might seem to imply, for I know that all our F. T. S. at heart love the traditional non-political character of the T. S. and would give the last drop of their blood to retain it. But I think I certainly would move to express my emphatic disapproval, were I ever to learn or to hear that any F. T. S. from a Theosophical platform had been giving out his own opinions of a political character, as the political opinions of the T. S., which would be an absurdity because the T. S. is a mere organization, no living person, and consequently not being a living person, cannot have any "political opinions of its own."

I think I have now expressed the situation just in the manner that H. P. B. would have done, or Judge, or K. T., and I know perfectly well that I am following the traditional policy, and I ask your kindly consideration and help, in helping me to do what you can in your own way to retain this traditional policy. It would be infamous if anybody tried to make you unhappy, acting as a representative of the T. S., by trying to change your convictions of any kind. It would be monstrous and utterly wrong; and I know that you would be the first to feel the same way if you heard that X had tried to control another F. T. S. named Y in the same manner.

Well, all these things seem very plain to me and are just the ABC of the policy we have always followed; so I don't think you have the slightest grounds for worry that the T. S. as an organization is going to forget its traditional policy or change its traditional "direction of traveling." Our work is with the hearts and minds of men, to try to make them better in every way, larger-minded, more charitable towards others, and more forgiving of others when others' opinions differ from our own. We must retain the individual freedom of will and of conscience and of speech which the Constitution of our great country, speaking now of the United

States alone, guarantees to every one of its citizens. Holding this so sacredly as I do, I should consider myself guilty of a crime were I to try to control or even to influence the political convictions or free-will expression of feeling of anybody, so long as that person speaks as a mere individual and does not try to pass his opinions off as being the "teaching of the Theosophical Society."

With my affectionate and respectful greetings, I am, as ever,

Fraternally and faithfully yours,

G. de P.

The Theosophical Forum

THEOSOPHY CAN EXPLAIN — *L. L. W.*

GOOD NEWS ABOUT DEATH

If this Earth is the place where we learn through Reincarnation and Karma why need we leave it? Why aren't we just allowed to keep on being reborn from one body to another without forgetting our past lives? . . . Well, how would you like to give up altogether your rest at night? How we do grumble when something happens so that we get no sleep! A few weeks of it would reduce us to mental and physical wrecks. As it is, we go to bed for a long sleep every night and so for a time we get away from our troubles and problems. After a good sleep we wake up feeling like a million dollars and sometimes actually enjoy tackling a situation which discouraged us the day before. We are even glad to forget a whole lot of what happened yesterday. While as for what happened last year — if you look back and find out how little you *can* remember — well! you'll be surprised.

If we only understood it, death is a better friend to us than sleep and it works in exactly the same way only over a longer period. Theosophy has good news for us in its teachings about death. But this good news consists of knowledge. Ignorance is our greatest enemy. We do not need to dread death as we do. We dread to die because we do not know any better than to regard ourselves as merely bodies and to tie ourselves up only with the temporary things of this world. So first of all we must learn to turn right around and think of ourselves not as bodies moved somehow by a mind, but as a Spirit-soul dwelling in a temporary body. It is ourselves, the Spirit-souls, who survive after death. The Spirit of man is a pure Ray of the deathless Universal Spirit and therefore cannot die. The soul, which is the intellectual-emotional part of us

— the psychological garment or apparatus of the Spirit, so to speak — the soul changes and grows. Therefore it cannot persist *in the same condition* for ever, though its finest essence survives after death.

Are there not many things in ourselves which we would be ashamed to exhibit in Heaven? Our quarrels and greed and hatreds and all those petty weaknesses so common to poor human nature? From these corrupting things — the "moth and rust" of life — death is a release for the Spirit. And death also purges the soul or psychological apparatus of all this selfish dross. Then it can rise into a long and blissful rest in the bosom of its "Father in Heaven," its own Divine Spirit. But this does not mean that the soul escapes permanently from these lower things. It only rests from them, as in a longer and deeper sleep. Those faults and problems, and of course joys and companionships too, must be taken up again when the Spirit is ready to cycle back to Earth. For the human soul, helped by the light of its Spirit, must work out the problems and weaknesses which spring from its own actions. But the reborn man has a new body with a new brain and mentality. That gives him fresh energy and power. Thus we gradually progress to the threshold of a higher evolution than this human one. We graduate from humanhood into godhood.

The Theosophical Forum

THE POWER OF POSSIBILITY — *H. Percy Leonard*

When we buy an egg over the counter we buy very much more than we can see or feel. The inorganic yolk and the amorphous jelly of the white are the least part of our bargain. We have secured possession of a mysterious factor capable of transforming these inert materials into a self-contained, intensely living, little universe. Beneath the feathers of a broody hen, enbosomed in the silence and the dark, bathed in congenial warmth, and molded by an unseen artificer, the formless jelly is transmuted into a conscious chick complete in all its parts.

There was a time in aeons long gone by when the whole solar universe was formless like the egg. A filmy cloud of firemist floated dispersedly throughout the vast abyss, big with the possibilities that slept in every atom's heart. There was as yet no universe, only an innumerable assemblage of formative patterns and plans of rock and crystal, fern and flower, and bird and beast and creeping things, their abstract essence, formless as yet, but destined as the ages rolled away to beautify and populate the rocky earth we tread today. The "builders," too, waking to active life after the Night of Brahma, known to the Greeks as cosmocratores, were as invisible as the ethereal substances on which they worked; and as the cosmos curdled and congealed, in its desire for physical expression, they traced rough outlines of the detailed whole, to which result they worked with tireless zeal.

In boundless space, as we are told, there exists a treasury of ideal forms, the garnered harvest and final result of former periods of evolution. These are the "dimensionless ideas" that lie even more remote from our conception than the sketchy outlines that, helped by the builders' art, are slowly acquiring clear definition

upon the Screen of Time. Eternal in the heavens, says Plato, lives the unwithering amaranth, that prophecy and plan of all the waving, many-colored multitudes that beautify the meadows in the spring.

To our comrades, and to ourselves in our more intuitive and lucid intervals, our lives must often appear selfish and circumscribed; but let us remember that the section of ourselves exposed to public view is not by any means the whole. What we aspired to be should give us hope and courage, for the impalpable idea in the mind today may become the evident fact of tomorrow.

There hovers over human life a silent presence, an invisible spectator who waits for our permission to come in and blend his life with ours, to purify its grossness and to make it beautiful and strong. So far as physical expression is concerned it is only a splendid possibility, and is as non-existent as the possibility we buy when purchasing an egg; and yet what matters most about an egg is the assurance of future fulfilment that is as yet no more than a promise and a hope.

A promise from a man of proved integrity is something that as yet has neither substance nor reality in our world of fact and actuality, and yet the definite undertaking of such a man is rightly regarded as being almost as good as its achieved accomplishment, because it moves irresistibly on its way backed by the steady force of character of him who made it. Great is the efficacy of the unseen possibility that watches over every traveler on the everlasting way. Though unperceived, and unexpressed in action it only waits for our consent to lead us from the sordid present to a future shining with a splendor of celestial day on which the evening shadows never fall.

THE CREATIVE POWER OF THOUGHT — *A. Trevor Barker*

The subject of the Creative Power of Thought is intimately related with the first principle in which our Theosophical Movement is rooted. You cannot consider the dynamic and creative effects of the thinking power of the human mind without immediately being struck by the fact that all nations and all men are in reality interconnected to such an extent that they are affected morally and physically by the thoughts and actions of each other. In other words, if there is a nation which is bent upon a vicious, destructive, downward and degenerate course, that nation will inevitably poison the very thought atmosphere of this Globe, and then by means of the inner constitution of the planet upon which we live, there is conveyed to all other nations of the earth that main current of thought and destructive energy that such a nation — or if we choose to make the application, such an individual, chooses to degenerate.

Now if that is true, there is fortunately a more cheerful side to the picture, and that is, that just as we are affected morally and physically to our detriment if we are negative and weak enough to be so affected, so also, even unconsciously and against our will, we benefit by those nations and men of goodwill — those individuals of high spiritual nature, who are pouring forth their beneficent thought upon the world; and because of the inescapable unity in which we are all rooted, it benefits with its creative power in the same way that the other destructive kind of energy pulls the whole fabric of universal life downward — or shall I say retards it somewhat in its upward progress.

This is a very fundamental thought, as I see it, from which to commence our whole study of the subject. In that rather famous

book called *The Idyll of the White Lotus*, there are stated three great Truths, and one of them is to the effect that man has it in his own hands to create his own weal or woe; his own future life and future destiny, and it is done without any doubt at all by means of the dynamic, creative force of his own desire, his aspirations, his thought, and his will. These are the tools which the Theosophist, the occultist, the disciple, the Mahatma, and the man of the world, have at their disposal.

The Theosophical philosophy, therefore, at the very outset of our study ennobles man, and shows him that he has within a godlike and creative power to make for himself the very conditions for which his heart most yearns; most secretly aspires towards. We have all, I have no doubt, tried to experiment with these laws in greater or less degree, in an endeavor to apply them to ourselves. But as a practical example: what should we do if we find ourselves surrounded by conditions we do not want? First of all it is necessary to create the clear mental picture of that which you individually want to achieve; the particular objective that you have set yourself, and immediately very powerful forces are set in motion, for which you individually have a great responsibility. Everything that we desire, especially when the desire is very strong, immediately sets up a current along magnetic lines of force to those layers of space which contain that which we seek; thus creating lines of magnetic attraction with other human beings or spiritual entities who have the capacity to bring to it that which we have set our minds upon. Directly you begin to desire a thing, immediately you are beginning to create for yourself opportunity, and the opportunity will come inevitably to work out that which you yourself, for good or ill, have set your creative forces in motion to bring about. Therefore, is it necessary to emphasize the tremendous importance of submitting every such determination, aspiration, desire, to the dictates of the

Higher Self in each one of us; to the Silent Witness of all our endeavors: for otherwise, if we are not willing to take the position that was taken two thousand years ago by those who created for us the New Testament; if we have not the point of view "Not my will but Thine," then we may risk to create something of a personal effect or result which will hang around our necks like mill-stones: for the forces that we set in motion are real — they will bring to us that which we want them to bring. Fix your mind, and your will, and your desire to bring evil to another, and you will be destroyed yourself by the reaction that such kind of work brings about.

These forces — we are talking about occultism — are creative and destructive: hence the very thorough drilling that those who study the genuine teachings of Theosophy receive in the moral and ethical basis of the Theosophical philosophy. For if that is not rooted in the student's and aspirant's mind, it is more than likely he will make an application of these laws, when he begins to understand them, that will not only wreck or bring evil (and untold evil) to others with whom he is associated, but still more will he wreck himself.

Now a word as to the means by which the thoughts of other individuals and other nations affect us. It is by means of that which Eliphas Levi called the Astral Light; that part of the Cosmic Ether which is actually the lowest part of that universal Cosmic principle which in the East they call *Akasa*. That astral light interpenetrates our whole Globe just as it does every other planet in the Solar system. It is imponderable, tenuous, and contains the picture, the impress, the record, and therefore the memory of every thought and every act that has ever been performed on this Globe. It is because thought travels, that when we emit or permit to pass through our minds a thought, which is a living intelligence, a thing full of life, we are setting in motion a force

which goes to the furthest confines of space. Think of all the creative ideas for good along constructive and healthy lines: great inventions, wonderful ideas dreamed by inventors, by poets, by Adepts, by Mahatmas, which are stored up as it were in the Akasa, in the Astral Light, waiting for that man or woman who is high-minded enough to give them expression in action. This is the explanation why, when an inventive mind is concentrated upon a particular problem, the complete solution will often come into his mind, although he has not worked out all the logical steps to the solution that is eventually arrived at. In other words it is possible, if we learn how to do it, to call to our aid the thoughts of the past, and those of the mighty spiritual thinkers of our own era, to help us, to encourage us, in any worthy purpose that we may have, or may be engaged upon. Conversely, to the extent that we are living under the control of the sense life, of the personality, of negative states of mind and thought — to that extent we are calling to — I won't say our aid, but we are attracting, setting in motion, a reinforcement of the very negative, sensual, destructive or evil states of mind in which we may be at any moment of time.

So what does it amount to? It amounts to this: since our mind and consciousness are always busy with something, even when we are almost in a state of inertia, there is some thought, some idea, some aspiration, and some desire, coloring the whole kama-manasic consciousness. Whatever it is that is in our mind is being reinforced, strengthened, by all past thinking along the same line that is stored in the astral light. See how important this is.

Without any volition on our part, if we are living at a consistently low level we are inviting all the same forces of a low level to strengthen us in that negative and weak attitude that we are adopting. See, therefore, what tremendous powers and implication and hope the spreading of the Theosophical philosophy and teaching has for mankind. Why? Because you are

giving them something in the way of food for their minds that lets the whole Inner Soul of the man rise and take in its comprehension the vast sweep of the Universal Mind; letting in the sunlight of the spiritual life; giving it food; attracting the human soul and the human mind upward.

Directly you link to these teachings on the Creative Power of Thought the doctrine of Karma, and the doctrine of Reincarnation, you begin to see where we are being led: what happens to a man before birth, and what happens to him after death. What he believes about those two stages — ante-natal and after death — will necessarily govern his thinking here and now. Therefore, these great subjects which have occupied the greatest minds and intellects that the world has ever known, and on which we have a very rich collection of teaching are necessarily of the greatest importance, just because they do influence our thought, and therefore our action.

There is a very telling page in William Q. Judge's *Epitome of Theosophy*, which deals with the mechanism by which thought really works, and it shows how, if we fix our mind in disapproval or judgment upon another human being, we attract to ourselves elemental entities of the very nature of the fault that we are condemning, and then we proceed to build into ourselves the very condition that we wish to eradicate in somebody else, and so the fault goes backwards and forwards, intensifying the characteristics in both. The obligation and the remedy are obvious in this case. Exactly the reverse is true if we dwell upon thoughts of beautiful qualities that we would like to see, and do see around us in many cases, for then we are strengthening by our approval, and our goodwill, these characteristics in ourselves and others.

I would like, in connexion with this subject of thought just to

touch very briefly upon the relation of the Theosophical classification of man's constitution, with that of modern psychology. What is the connexion between the conscious mind of the modern psychologist and the Theosophical classification? What is the connexion, if any, between the modern psychologist's subjective mind, and where does it fit into the scheme of occult science?

I venture to suggest that the objective, or conscious mind of the modern psychologist is the lower *manas*, which is responsible for our ordinary every-day objective thinking; but the unconscious or subjective mind is another matter. The psychologists mix up, from lack of knowledge, the two parts of the mind — the Spiritual, that which inheres in *Buddhi*: that power of direct cognition and discrimination: the higher part of man; and the force inherent in what we may term the instinctive mind, the mind that is connected with *kama-manas*. Now we share this instinctive mind with all kingdoms of nature below us, and in particular the animal kingdom. Here we have nascent thought in the higher exemplars of the animal kingdom, and in that instinctive mind are many of the characteristics that modern psychologists attribute to the subjective mind. But they leave out of account, or are unable to account for the source of all those higher, nobler ideas of the human mind, which really come from the Divine part of his nature, and which they just classify as the unconscious. These things are very important for us because the Theosophical classification gives a clue as to what we must do in order to use our mental and creative faculties to the highest end. There is one aspect of this problem that is particularly interesting and very helpful. I have no doubt that many of us have at times been — afflicted, shall I say, with a problem which seems at times beyond our individual capacity to solve: a problem of such difficulty that the advantages and disadvantages of each course are almost

equally balanced, and the mind becomes weary; the capacity to think and to solve apparently so inefficient that the person is in a very difficult position. It happens every day for many people. If we apply the laws that are behind this practical application of occult and scientific principles, it is quite possible to relegate the solution of the problem to the right department of the mind, and cease to worry. What do you think is the origin of the useful old practice of not making a decision until you have slept on it; until you have given time for this higher part of what the psychologist calls the Unconscious, or subjective mind, to get to work? It is capable of providing the solution of any problem. Read what H P B has to say in *Isis Unveiled* about the power of the Adept to rise into the higher consciousness, and know all that ever was, is, or can be known about any subject in the Universe. Why? Simply because the higher part of us, the Divine part of us, is actually omniscient, therefore all we have to do is to find the means of opening ourselves to the inflow of this knowledge — and it can be done by asking for it, by aspiring towards it, by opening our minds to it, by presenting the problem in a good and orderly fashion, and leaving it to that higher part of the mind to find the solution, and if you have a sufficiently strong desire, and a sufficiently developed will, and enough confident expectation (which you may, if you wish, call faith), the result is quite certain, and you find within the requisite time the solution of the problem. This, of course, is a law which is constantly used by all of us all the time — generally perhaps more or less unconsciously, but nevertheless it is a law which works, and it is an extremely creative law. There are many illustrations of the working of it which you have probably read about and know very well.

TRANSACTIONS OF THE POINT LOMA LODGE: X — G. de Purucker

G. de P. "s *Fundamentals of the Esoteric Philosophy* in Review

Extracts from the Minutes of the Meeting of the Lodge, of May 10, 1936

The President, Dr. H. T. Edge, turned the meeting over to the Program Chairman, Mr. Abbott Clark.

Mr. Clark — "This afternoon we have been commemorating the life and work of our first great Teacher, and tonight we endeavor to express what we have been endeavoring to do all this time to continue that work in the spirit and true to the impulse which she gave. We have been studying for the last three years and three months *Fundamentals of the Esoteric Philosophy* — a book which continues the spirit and work of H. P. B., with the same dignity and majesty which H. P. B. places in her life's work, and it has been to us the most rich and profitable study of our lives. At our next lodge-meeting we will take up the study of *The Esoteric Tradition* which further continues the lodge-force that H. P. B. first brought into the modern world, in the same spirit in which she gave it, simply brought up to the needs of the time. From time immemorial the greatest boon that mankind could ask and receive has been esoteric instruction, esoteric knowledge. *That* we have received generously and copiously, more adequately than has been given to the world in thousands of years — not because of any merit we could claim, but because the needs of humanity and the appeal of the hearts which searched for light were so great that the Lodge of Compassion, true to its name and nature, responded with

the spiritual light and teaching which we have received. A good part of these three years we have had not only the book to study, but we have had with us the Teacher who gave that book, and I maintain that this is more important than a book, because the Teacher himself gives an impetus greater than any book can give. The presence of a Teacher to all normal human hearts invokes all the love and gratitude that it is possible for the human heart to feel and express. In the very nature of things it is impossible that any disciple or body of disciples could pay back to the Teacher what they have received. The only way we can show our gratitude is by assimilating and embodying in our lives the teachings given and the spirit in which the Teacher gives them. This we can do by becoming ourselves humble members of, and earnest workers in, the Lodge of Compassion and Peace, thus bringing to suffering humanity the light, hope, joy, and courage which we have received in so great a measure.

"It is the request of the Committee as we have many speakers on the platform tonight that they dispense with the formality of addressing the Chair and address the audience directly. Our first speaker tonight is Miss Helen Savage "

Miss Helen Savage spoke for three minutes (as did all the following speakers) on "The Dawn of Manifestation — the Magnum Opus from the Invisible into the Visible and from the Visible into the Invisible The one becomes the many Manvantara and Pralaya "

Then came the following speakers and their respective subjects:

Mr. La Fayette Plummer "Cosmic Time-Periods, Racial

Cataclysms"

Mr. C. M. Savage "Laya-Centers, Elements, Principles, The Twelve Zodiacal Signs"

Miss G. Knoche "Space and the Spaces of Space, The Seven or Ten Cosmic Planes, Lokas and Talas"

Mr. B. de Zirkoff "The Doctrine of Hierarchies, Matter and Spint-Con-sciousness (The Two Fundamental Kosmical Hierarchies) "

Mrs. Inez Davenport "The Doctrine of the Spheres in its Four Aspects "

Mr. W. E. Small "The Wondrous Being, The Silent Watcher, Nirmanakayas, Sambhogakayas, and Dharmakayas "

Mrs. F. M. Dadd "Rounds, Races, Sub-races, Sishtas, Buddhas and Bodhi-sattvas — their relation to Globes, Rounds, and Races, Avataras "

Mr. E. J. Dadd "The Doctrine of Swabhava, The Process of Evolution"

Mr. Sven Eek "Man's Composite Nature 3-fold, 4-fold, 5-fold, or 7-fold"

Miss F. Colhsson "Gods, Monads, Atoms, Self, Ego, Soul, Consciousness and self-consciousness "

Mr. G. L. Davenport "The Seven Jewels of Wisdom"

Mrs. Irene Ponsonby "The Seven Stages of Initiation"

Mrs. H. O. Minot "The Spiritual-Psychological Hierarchy of Adepts (Hierarchy of Compassion), The Chela Life"

Then the Leader spoke for a few minutes, closing the meeting.

The following are the three-minute summarizations. All in all they give a panoramic view of *Fundamentals of the Esoteric Philosophy* and an idea, though necessarily inadequate, of the immense amount of detailed teaching contained in it.

THE ONE AND THE MANY

H. S. — The doctrine of How the One Becomes the Many is not fully understandable by any being living on earth, because one would have to be universe-wise in order to understand it, as it embraces all truth. One aspect, however, of this great mystery is the teaching about manvantara and pralaya, the outbreathing and inbreathing of the universe, its cyclical appearance from the invisible worlds into the visible worlds and its withdrawal again. *Manvantara* means "between two Manus." Manu in one sense may be spoken of as the Third Logos. It is an entity and at the same time a host of entities from which all other beings in the universe are born as lesser beings, lesser selves of the Great Self. Each one of these lesser selves, all along the hierarchical scale, is at once a consciousness-center and a vehicle in which a greater being may express itself. It is these countless hosts of individuals in their age-long striving, willing, doing, acting and interacting, all expressing their innate vitality, which produce, which actually are, the manifested universe.

After the period of manvantara is over, there comes the pralaya, when all action on the lower planes ceases, causing the universe no longer to exist. But this does not mean annihilation for the actors in that universe. Their essence, which is the essence of the universe, goes on into higher spheres, to experiences so far beyond our comprehension that we can only conceive of them as non-existent.

As man is a little universe, therefore he too has his manvantaras and pralayas: his active life on earth and his spiritual life in "formless" realms after the death of the body. Atoms, even, in their rapid vibratory existences, have their manvantaras and pralayas. The same law is exemplified in every scale of life; but where we can learn most about it is in our own lives and the lives

of those about us, and also in a study of the mystery of death and the after-death states.

COSMIC TIME PERIODS AND RACIAL CATAclysms

L. P. — The Heart of the Universe eternally beats, sending out to all beings an endless flow of life and energy. And all the creatures, be they humans, beasts, plants, atoms, or suns and stars, evolve in cyclic progressions, timed to the Cosmic Heartbeats. All cycles are cosmic time-periods, but those that have for us a peculiar interest are the cycles of planetary formation and growth, and likewise the periods of the evolutionary development of man upon this earth.

There are one or two interesting facts to be noted about these cycles, and it will readily be seen that they are all interrelated. Firstly, all cycles are the result of the action of consciousness-centers, or monads. The Path of Immortality is endless, but the monads take devious routes and by-paths ere the goal is reached. An ancient symbol for the Monad and its imbodiments upon the planes of being was the Tetraktys, composed of ten dots arranged in the form of the equilateral triangle, one above, then two, then three, then four dots forming the base. The one above represents the Monad which in itself is non-material, and is unaffected by cyclic changes. The nine below represent the manifested worlds. Reading the numbers of dots from the lowest row upwards, we have then, four, three, and two. Now, the number 432 forms the basis for computing cosmic time-periods; for example, the life-cycle of a planetary chain is 4,320,000,000 of our years, 432 with 7 ciphers annexed; the period of a Root-Race is 4,320,000 years, 432 with 4 ciphers annexed. All of the other great cosmic time-periods are either multiples or factors of the 432, annexing the necessary ciphers.

Closely related to this is the study of the Racial cataclysms. There

are seven Root-Races functioning on any globe during any one Round — we are now the fifth Root-Race — but the time of birth of a new Root-Race is the mid-point of the old Root-Race cycle. The birth of a new Race is attended with great terrestrial cataclysms, immense seismic and volcanic disturbances, and great floods. But, as always in Nature's processes, there is regularity about these proceedings. The first, third, fifth, and seventh Root-Races are known as the aqueous Races. They are so called because when these races flourish, they do so when the Earth is covered with a greater ocean surface than land area, and similarly, the second, fourth, and sixth Root-Races are called the terreous Races, because they bring forth their civilizations at times when the land surface is greater in area than the oceans separating the continents. The racial cataclysms which occur at the mid-points of these Root-Races are alternately fiery and watery. This means that in one case the destruction of the continents is effected mostly by volcanic eruptions, and in the other case by floods, but it should be understood, however, that in all the racial cataclysms all the elements contribute to the general upheaval, so that in a watery cataclysm there will be great volcanic and other disturbances, but the floods will predominate, and *vice versa*. The first, third, fifth, and seventh Races are said to be destroyed by fire, and the second, fourth, and sixth Races by water.

WHAT IS SPACE?

G. K., Jr. — "What is that which was, is, and ever will be, whether there is a Universe or not; whether there be gods or none?" And the Esoteric Catechism makes answer: "SPACE, the eternal Anupa-padaka." Space, the parentless, child of none, yet the parent of all existing things. The Hindus call it Parabrahman, the Vedas TAT; it is the heart of all manifested entities. From Space, the Boundless, are born individual spaces: universes, worlds, suns, planets, men, atoms, each a discrete portion of Space, and yet inseparable. The

heart of man is Space, the heart of a sun is Space. The Greeks called Space the Pleroma, the utter fulness of manifested universes, ranging from the divine to the material. This is Space when looked at from the substantial side of Being; the Buddhist named it Sunyata or "emptiness," i. e., the emptiness of all manifestation when perceived from the esoteric and consciousness-side.

From the abyss of pralayaic sleep manvantara stirs Space to produce her individual spaces; and universes, worlds, men, start the cycle of existence through the cosmic planes. These cosmic planes are those spheres of being, or fields of activity, through which and as the source of which the life-waves pass through particular stages of consciousness. The ten planes, with the two polar links between the hierarchies above and below, are not separate, but interpenetrate each and all. Every one is composite of every aspect of planar manifestation, therefore contains all other nine in it, conceived as different only by virtue of each plane expressing one particular swabhavik aspect of universal consciousness or Space. Evolution proceeds from plane to plane, from sub-plane to sub-plane, these inter-blending planes not only being the vehicles of entities, but actually the entities themselves unfolding one aspect of consciousness after another, and thus finding themselves evolving on plane after plane.

Just as the Cosmic Planes from the spiritual standpoint are Space, so are the lokas and talas expressions of Space in its duodenary capacity. Lokas are conditions of beings of the Luminous Arc, talas, states or conditions of beings of the Shadowy Arc. The seven lokas and seven talas ranging from the divine to the material manifest on the seven cosmic planes. All entities express themselves through these lokas and talas, and not only work through them, but are them, though at any one moment manifesting but one particular aspect, which we then call a

particular loka or tala. Lokas and Talas are respectively the spiritual and material poles of consciousness, neither one may work without the other. At the beginning of manvantara the godsparks roll forth from Sunyata, in spiritual nescience each to unfold through the planes and the lokas the self-consciousness of Divinity. To become divine, one has to have become the inner heart of every loka and tala, of every cosmic plane, and only thus will he become one with his individual portion of Space, the parabrahmic essence within him, Sunyata.

LAYA-CENTERS

C. M.S. — A Laya-center is a mystical point where matter, consciousness, or whatever it may be, disappears from one plane, and passes onwards to reappear on another plane. *Laya* is derived from the Sanskrit root *li* meaning to dissolve or vanish away, hence a laya-center is a vanishing or disappearing point. It is the seventh or highest degree in any plane, leading into the lowest degree of the next higher plane. Conversely, it may be the point where energies of a higher order flow into and manifest in a lower plane. For our solar system, the core of the sun is a laya-center. Each planet has, and is, at its central point, a laya-center. In the human being, there is a center in his nature through which pour the forces from above, and through which he himself ascends higher. That is the laya-center of his inner nature.

ELEMENTS AND PRINCIPLES. There are seven of these Elements, or Bases, or Rudiments, and they are the seven vehicles of the seven Principles or Forces of the Kosmos. The Elements are the matter-prakriti side of being, and the Principles are the energy-consciousness aspect of being. Each succeeding element springs from its predecessor and gives birth to its successor. Each globe of a Planetary Chain, although builded out of the seven elements, has one element predominating. The same may be said of each

Round on each Globe, and of each Race in each Round: each has its predominating correspondence with one of these Elements, and Principles.

THE TWELVE ZODIACAL SIGNS. There are various correspondences between the twelve Zodiacal signs and the twelve globes of a complete planetary chain — seven manifest, and five unmanifested. Here also, although each one of these globes is subject to the oversight of one of the Constellations of the Zodiac, which is its predominating Genius or Rector, the other eleven constellations are also at work there. There is, moreover, a strict and close correspondence between each of the seven Sacred Planets, a sign of the Zodiac, and one of the globes of our Earth-Chain. Thus, Globe A is under the oversight of the Sun (as a substitute) and its Zodiacal House is Leo. Globe B is under Jupiter; Zodiacal House Sagittarius; and so forth, the complete enumeration being found on pages 488 and 489 of *Fundamentals of the Esoteric Philosophy*.

HIERARCHIES

B. de Z. — This term is derived from the Greek *hieros*, "sacred," and *archein*, "to rule," and implies the idea of "sacred rulership." The essential meaning of the Doctrine of Hierarchies can therefore be derived from the etymology of the term itself. A Hierarchy is primarily the realm or field over which extends the influence of a Hier-arch, i. e., a Divine Ruler, a "god," in the esoteric sense of this word. This Divine Being is the Seed, the focal point, the Monadic Essence, from and out of which flows forth or radiates or emanates its own essential nature or *hyparxis*, which descends from plane to plane and in so doing unrolls out of its own heart the substances and consciousness-energies of these lower planes, fashioning them and informing them in serial and descending gradation, so that ultimately a manifested Hierarchy

is a Unity composed of ten planes or grades of consciousness-substance, each plane or grade being organically connected with all the others, and being pervaded throughout by the all-encompassing Consciousness and Vitality of its originant or Hierarchy. A Hierarchy is therefore a self-contained Unity in which there exists a state or system of delegated directive power and authority, flowing forth from its divine seed or summit, which itself is but a life-atom or thought of the Boundless Kosmic Life. Everything that is, is either a potential and unmanifested, or an active and manifested because unrolling, Hierarchy, and the series of Hierarchies extends infinitely in both directions. One way of considering a Hierarchy is to describe it in the generalized Greek fashion, as being composed of nine steps or links: 1. The Divine; 2. The Gods, or divine-spiritual; 3. The Demi-gods or divine heroes; 4. The Heroes proper; 5. Men; 6. Beasts; 7. Plants; 8. Minerals; 9. The Elemental world. The Tenth is the enfolding and permeating Life-Consciousness or the Heart of the Hyparxis Itself. Each one of the great philosophical schools of ancient times had its own manner of presenting this teaching, and its own way of subdividing a Hierarchy. There are two fundamental and intimately co-related aspects within any Hierarchy: the matter or substance side; and the spirit or consciousness side; as every plane and every point within a Hierarchy is a potential Hierarchy itself, these two aspects may also be called by the term Hierarchy, forming therefore the matter and the consciousness Hierarchy respectively. It should be remembered, however, that what we call Matter is but the illusory aggregate of veils surrounding the fundamental essence of Cosmic Life-Consciousness. The Matter-Pole of a Hierarchy consists of Monadic lives relatively asleep; the Spirit-Pole of a Hierarchy consists of Monadic lives relatively awakened. Matter and Spirit are but generalized expressions for hosts of entities manifesting aggregatively within a Hierarchy. The difference between spirit and matter is evolutionally so, but

not essentially. They are one in the underlying Reality which transcends them and permeates them both. The Hierarchies of Matter and the Hierarchies of Spirit, or of Substances and Consciousnesses, are but the positive and negative Poles of the all-embracing Reality which is both and neither, and for ever concealed as such. The whole process of evolution is the raising of units manifesting in matter into becoming at one with their spiritual-divine essence.

THE DOCTRINE OF THE SPHERES

I. D. — The Doctrine of the Spheres, subdivided under four headings, deals with the Mansions of Life: (1) The Universal Solar System, (2) Our Solar System, (3) The Earth Planetary Chain, and (4) a group of "Mystery-Planets" about which we are left to exercise our intuition or imagination.

The Universal Solar System includes all the bodies, known and unknown, visible and invisible, that revolve around the sun as their primary. Our Solar System includes what the ancients called the Seven Sacred Planets: Saturn, Jupiter, Mars, Sun, Venus, Mercury, and Moon; Sun and Moon, however, being but "enumerative substitutes" for two unnamed Planets. One law applies to Universe in general and planet in particular: each is sevenfold in constitution. In man's present stage of evolution he can see at most only one seventh of any celestial body. He does not see even as much as one seventh of the Universal Solar System, though, there being countless invisible Bodies, owing to the fact that their evolutionary status is either higher or lower than that of our home, the Earth.

The Earth, as a sevenfold Planetary Chain, is built by forces within and without itself. The interior forces are contained in its essential root, its swabhava. From this root come the impulses for rebirth and self-expression. The exterior forces are the Spirits of

the Seven Sacred Planets. From these come the characteristics which determine the nature of the Planet and the measure of its success in self-expression. It is all very like the birth and development of a single man: the urge to life starts within, influences of environment and associates act upon him from without.

The activity of the Seven Sacred Planets on behalf of our Planetary Chain does not make the Earth the hub of the Universe, for in its turn it is one of Seven Sacred Planets to other Planetary Chains, and has its smaller or greater part to play in their birth, growth, death, and rebirth.

THE WONDROUS BEING

W. E. S. — Generally speaking the term "Wondrous Being" can be used of any spiritual Hierarchy, the acme, seed, and flower of a hierarchy, whose spiritual influence descends through and permeates all the lower beings in it.

The Wondrous Being can be considered as our Highest Self, meaning it is the originating Seed from which we grew.

The Monad itself is an individualized Wondrous Being.

The term may likewise be applied to the spiritual Entity, the Race-Buddha, who comes shortly before or at the beginning of a Root-Race and who overshadows the Manushya-Buddha. It may apply equally correctly to the Planetary of any Round.

We may likewise, for example, speak of our Human Ego as a Wondrous Being to the infinitesimal atom-universes composing the physical body.

But the one we generally refer to as such is the Hierarchy of our Planet. But this itself is a correspondence in small of the Kosmical ONE of the Universal Kosmical Hierarchy of the Solar System —

and so on.

Speaking, however, of the Hierarchical Wondrous Being: this is an entity. It manifests on three planes:

1. Adi-Buddha — the highest aspect, manifesting in the Dharmakaya state (continuance body). Here egoity, soulship, has vanished into a universal hierarchical sense, remaining only latent. It is pure consciousness, pure bliss.

2. Dhyani-Buddha — the second aspect or sub-entity, manifesting in the Sambhogakaya state (participation body). Egoity is still retained, though too far above material concerns to meddle with them, and therefore powerless on our material earth.

3. Manushya-Buddha — the third aspect or sub-entity, manifesting in the Nirmanakaya state (form body).

The Wondrous Being for *this Fourth Round* is one that belongs to the second class, the Dhyani-Buddha, and is in the Sambhogakaya state. Of the three classes of Dhyani-Chohans in this division, our Wondrous Being belongs to the lowest, which is divided into seven sub-classes. It is the fourth of these.

The Ray running through all our individual being, from which we draw our *spiritual* life, comes direct from the Hierarchical Wondrous Being in whom we all are rooted. When the life-wave has run its Rounds on this planetary chain we shall be indrawn into the *hierarchical* Banyan. It is as far as this planet is concerned our "Father in Heaven." Its lower copy is what we speak of as the Head of the Hierarchy of Adepts, he who is the Great Sacrifice, the Supreme Initiator. He is the "Ever-living-human Banyan" tree from which lesser beings hang as leaves and fruit, spiritually speaking. He is called the Great Sacrifice because from utter compassion for those lower in the scale of evolution he has renounced all hope and opportunity in this manvantara of

going higher, and remains behind among us as our Great Initiator and Teacher. He himself can learn nothing more of this Hierarchy, for all knowledge pertaining to it or possible to it is his already.

In the Third Race of Humanity of this Fourth Round on this globe, the Dhyān-Chohans were then leaving it; but they needed successors more like the men of the period, then rapidly sinking into matter. The noblest representatives of the then humanity became the willing vehicles of self-conscious Rays from these Dhyān-Chohans. A portion of the essence of a Dhyān-Chohan indwelt in them, consciously on both sides. The highest one of these incarnations, the noblest Man-fruit of this human evolution produced up to that time, became the head of this spiritual-psychological Hierarchy — a Man infilled with a Dhyān-Chohan, what might actually be called an incarnate god. This was, and still is, the Silent Watcher, the Wondrous Being, the Great Sacrifice.

ROUNDS AND RACES

F. M. D. — At the beginning of a Manvantara the thrill of waking life touches a laya-center in the Cosmos. The hosts of sleeping monads from the previous planetary chain awaken and begin to form Globe A of our Earth. Ten classes of Monads — three elemental, then mineral, plant, beast, human, and three god-kingdoms, have each their sevenfold evolution on Globe A. Then when the first has completed its globe-round, it leaves behind *sishtas* or sleeping vehicles to await the return of the same monads again; the surplus of life moves on to form Globe B, and the next class comes upon Globe A. The process continues through all the globes, each step forward for the kingdom ahead meaning a step for all behind, until all have passed once through all seven globes, making one Planetary Round. After an inter-planetary Nirvana the second Round commences on Globe A,

different from the first, the globes being already formed. The kingdoms follow one another in sevenfold evolution on each globe through seven Rounds, completing a Planetary Manvantara.

We are now on Globe D of the Fourth Round. Taking our human kingdom as an example, there are seven Root-Races, each divided into seven sub-races, divided again into seven Family-races, and again seven National Races. We are now in the fourth Sub-race of the Fifth Root-Race.

This orderly sequence is under the guidance of superior beings forming a spiritual hierarchy above men. There is a Wondrous Being who is the Adi-Buddha or Logos of our chain. From him emanate seven Dhyani-Buddhas, one for each Round; lower still, seven Dhyani-Bodhisattvas, one for each globe; then seven Manushya- or Human Buddhas, one appearing at the beginning of each Root-Race, and manifesting again near the central point of the Race. Gautama was a Buddha of this type.

When a Bodhisattva sends forth a ray to inspire a pure human being, combined with the intermediate nature loaned by a Buddha, then we have an Avatara such as Sankaracharya of India and Jesus of Nazareth.

SWABHAVA AND EVOLUTION

E. J. D. — The doctrine of Swabhava is perhaps the most beautiful of all, in that it discloses the inexhaustible resources of Nature. Nowhere in the vast and inexhaustible field of life, both visible and invisible, are there any two centers exactly the same. Each is expressing one of the infinite potentialities of beauty and being inherent in the Ever-Becoming.

Each of the units forming the various kingdoms of Nature is evolving forth from within its own essence that which it inherently is: the great Brahma, the expansive force behind all

manifestation. But the most important point is that all evolution takes place from within, through the action and interaction of entities and beings, and not by means of abstract forces.

MAN'S COMPOSITE NATURE

S. E. — Esoteric religion divides man and the universe, the microcosm and the macrocosm, into different principles or elements according to their particular philosophical characteristics. The terms imply a Cosmic origin, and the definitions force, matter, energy might equally well be used. Actually these principles so called are the offspring of Cosmic parents, limited in their action in us by the law of Karma.

In various ages the number of these principles has varied.

Christianity reckons with three principles, body, soul and spirit. Theoretically the Christian makes a distinction between soul and spirit, but does not know wherein the difference lies.

Some Indian thinkers divide man into four and five principles. The Jewish philosophy as delineated in the Qabbalah teaches that man is divided into four parts:

1. The highest and most spiritual of all, that principle or part which is to us a mere breath of being, they called Neshamah.
2. The second principle was called Ruahh or Spiritual Soul.
3. The Astral Soul (or Vital Soul) was called Nephesh, the third next lower, which man has in common with the brutes.
4. Then comes the Guf or physical vehicle, the house in which all these others dwell.

Over all, and higher than all, higher than the Neshamah — which is not an emanation of this Highest, not a creation, not an evolution, but of which it was the production — is the Ineffable called Ain Suf.

The Theosophical classification as explained by H. P. Blavatsky is septenary.

1. Sthula-sarira, a Sanskrit term meaning easily dissolved gross matter. It represents the physical body.
2. Linga-sarira, or model body or Astral body, which forms the pattern on which the physical body is built.
3. Prana or Life-principle is third.
4. The Kama principle comes fourth. Kama means desire. It is the impelling force in the human economy, being neither good nor bad.
5. Manas is the pivotal principle in the human constitution, it represents man the thinker.
6. Buddhi, or the Spiritual Soul, is the vehicle of the highest principle, Atman. The term comes from the Sanskrit root *budh* meaning to enlighten, to understand. Buddhi is the principle in us which gives us spiritual consciousness.
7. Atman is the highest principle, it is a universal one. During incarnations it is linked to Buddhi as the Buddhi is linked with the Manas, and so on down the scale.

Each principle is septenary, so that Atman has a physical body, an astral body, a Kamic principle, just as the Sthula-sarira has its Atman and Buddhi, and so on down the scale.

The lower principles evolve out of ourselves, our higher selves.

GODS, MONADS, ATOMS

F. C. — Universal Nature is composed of two great classes of evolving entities: countless hosts of beings of varying degrees of self-consciousness, and countless hosts of beings of inferior development, which, blending together, go to form the bodies or vestures or vehicles of the former more evolved class of entities. In the course of aeons this lower group evolves into greater

entities, who help in their turn to evolve and develop less evolved beings.

Man in his present state of intellectual self-consciousness, finds it almost impossible to realize that at the essential core of his being he is consciousness itself, and that the highest form of self-consciousness is that of a unit, an individual spirit center, for which the Greek word "Monad" is used, meaning unit or individual.

The Monad, the deathless individuality of man, commences a cyclic journey as an un-self-conscious god-spark. The Monad should be regarded as spirit; it does not *become* spirit; it *is*. Clothing itself with its own rays of light, it thus creates vestures, garments, "souls," each of which is rooted in the spirit-center — the Monad. Again, each of these souls emanates and becomes clothed with vestures consisting of hosts of minor souls — life-atoms. These life-atoms should not be confused with the atom of chemistry, for each one is an energetic center, within and ensouling the chemical atom. This life atom is a learning, evolving entity, which at its inmost is rooted in a spiritual center — a Monad.

We may also say that through this host of beings streams the light of the Hierarchy, the inmost link with the Unutterable, called the Self, limitless, boundless, Selfhood. The individual Self is a spiritual, a Monadic Atom. It is pure consciousness. The Ego is the personal, individualized self in man, that which says "I am I." It is reflected consciousness, or consciousness thrown back on itself. While *soul* is a term applicable on all planes of being, as the vehicular aspect of the entity manifesting on that plane, in man it is often used to designate the intermediate nature.

The divine aspect of evolution is the raising of the personal to the impersonal. Such is the activity of the Luminous Arc, and of the Buddhist Hierarchy. The Monad thus gains self-conscious god-

hood, having gained realization by carrying along the evolutionary pathway the souls which it has created and for which it is responsible during the long cyclic pilgrimage. Thus the Monads and Atoms forming the Shadowy Arc become in turn the members of the Luminous Arc in a future maha-manvantara.

THE SEVEN JEWELS OF WISDOM

G. L. D. — These Jewels represent the sum of all knowledge attainable in this manvantara. In our study of the "Fundamentals" we find those Seven Jewels and their teachings combined in seven words, each teaching leading and blending into the next, and all so interwoven and dependent upon each other as to form a perfect whole and present a complete picture of universal life in all its phases.

Our first Jewel is Reincarnation, the teaching that man lives innumerable lives, coming again and again to pick up the threads of his former lives and move forward slowly to perfection.

The second, Karman, a Sanskrit word meaning Action, shows us why we return to earth lives again. It is in order that we may reap the results of our past actions, and through those experiences grow.

Our third word, Hierarchies, shows us how this vast universe of ours is constructed, guided and controlled, and the great series of intelligences visible and invisible that compose the countless grades of interlocking hierarchies.

Swabhava, the fourth Jewel, is a word of two meanings. First it explains the essential characteristics in each and every atom of life, showing why it is that each atom can only reproduce its own kind, and teaching us that this is a universe of law and order. The second meaning, self-becoming, applies equally to all things. It is their innate power to bring to fruition their latent qualities, as for

instance the acorn does when it becomes an oak-tree, or any other seed of life does in developing along its own line.

The fifth word, Evolution, gives us a picture of just how and why and when entities proceed in their climb from un-self-conscious god-spark to self-conscious gods.

In entering the deeper reaches of these teachings we deal more particularly with the ranges of man's consciousness. The sixth Jewel, called The Two Paths, explains the two courses open to man: Am-rita-Yana, wherein man bends his evolving energies to helping the entities behind him, sacrificing his own evolution for the time being for their sakes; Pratyeka-Yana, the Path of each for himself, where man sacrifices all things to his own advancement, only to find that by so doing he has delayed his own evolution.

Our last Jewel, Atma-Vidya, which in Sanskrit means Knowledge of Self, shows us man's consciousness slowly progressing under evolutionary law ever higher and higher as the ages pass until we in our turn shall have attained those invisible reaches of power where we become self-conscious workers in this universal hierarchy.

THE SEVEN STAGES OF INITIATION

I. P. — Of Initiation and the Mysteries we are taught the following in Fundamentals of the Esoteric Philosophy:

Initiation means "beginning." It may also be defined as a process whereby the soul of one who is prepared is quickened: an *initiant* is one undergoing such a process, and an *initiate* one who has been quickened in greater or less degree by this process.

There are seven or ten degrees of initiation. Of the highest of the ten, we know naught except that they belong, we are told, to beings whose high state of evolution is beyond that of human

entities. The three first degrees consist of teaching upon the hid wonders of the Universe, and the four intermediate of *becoming*, in ever greater expansion of consciousness on the part of the initiate, that which he has cognised in the abstract.

Thus we may associate with the fifth, sixth and seventh degrees of initiation, the "mystic death," the "descent into hell," and the "ascent to the Sun," when, we are told, the initiate first meets his Higher Self "face to face for a passing moment," later meets Another One — a mystery — and finally becomes the Wondrous Watcher himself for a long or short period, as the case may be.

For these higher degrees of initiation, the Greeks used the terms Epiphany, a minor form of Theophany, which means the appearance of a god illuminating the initiate; Theopneusty, the state of divine inspiration resulting from Theophany; and Theopathy, the conscious suffering of a god's entrance into his being on the part of the initiate.

Of the results of initiation, we have been told that success means joy and consummation beyond our conception; failure means death; and partial failure, madness. These are no punishments meted out to the initiate, but are the natural consequences of perversities or flaws inherent in the constitution of the initiate.

The Mysteries are distinguished from initiations in that they consisted of dramatizations in which the initiate acted the principle part which he would in the higher degrees later live through. The Mystery-Schools and the initiations therein "were established from the same motives of Compassion that presided over the acts of the Great Actors of the Primal Drama, the opening acts of our Manvantara. They copied, as it were in miniature, what took place in those primordial times, and what took place in actual life in the Hierarchy of Compassion on our earth, or that section, rather, of the Hierarchy of Compassion, which we call the

Great White Lodge." P. 275, *Fundamentals of the Esoteric Philosophy*.

THE HIERARCHY OF COMPASSION

H. M. — The Spiritual-Psychological Hierarchy of Adepts: A Hierarchy of highly evolved beings — Buddhas and others — who are the guides and protectors of any one round of a Planetary Chain, and whose hierarch, a Dhyani-Buddha, is our "Father in Heaven," the "Wondrous Being" of that particular hierarchy — also referred to as the "Great Initiator," the "Sacrifice." This "Wondrous Being" is to our own Spiritual-Psychological Hierarchy what the Kosmosical ONE is to the Universal Kosmosical Hierarchy of the Solar System. The Spiritual-Psychological Hierarchy of Adepts is thus but one octave in that mighty scale of Compassion ranging from Adi-Buddhi through many grades of self-conscious entities to men. To this Hierarchy of Compassion belong all those entities who seek to work in harmony with the highest laws of Being and who labor for the betterment of their fellows, whether it be among the lowest forms of material life or the highest gods in heaven. For man to seek to identify himself consciously as a note in this scale is to take upon himself the responsibility of the chela-life. This life is both beautiful and terrible: terrible, because of the karman which the aspirant has to face and *overcome*, possibly within the span of one life; beautiful, because, as the teacher tells us, there is "nothing that is so encouraging, and at the same time nothing that calls for larger exercise of the truly spiritual will and of the higher understanding than do the requirements of soul needed in order to follow that chela-life; because that life calls out everything that a man has in him, or a woman has in her — everything."

THE UNIVERSAL MYSTERY-LANGUAGE AND ITS INTERPRETATION: XIII — *H. T. Edge*

THE DOUBLE TRIANGLE AND THE PENTAGRAM

This is the familiar six-pointed figure formed by superimposing two equilateral triangles, so that their apexes are symmetrically spaced around a circle. It is the regular star hexagon in geometry. Sometimes the figure is elaborated by making the lines double, so that the triangle can be interlaced; or again they may be differently colored, or the upright one made light, the other dark. It is often called Solomon's Seal and is a symbol in the Jewish Kabbala; but it is found in ancient India, whence it was probably adopted by the Hebrews. But it is one of the symbols of the universal Wisdom-Religion. These two triangles represent the duality of manifestation, the duality of Nature, variously spoken of as Spirit and Matter, Fire and Water, etc. Here we find them interlocked, thus producing a compound or completed nature. The number 6 is thus obtained, and by adding the central point, or alternatively by enclosing the figure in a circle, we get the synthesizing seventh. The six therefore represents the manifested Logos, which is six-fold (or often spoken of as sevenfold, including the synthesis).

This Logos as first emanation is called the Virgins of Life or the Great Illusion; the sixth sign of the zodiac is that of the Virgin. In *The Secret Doctrine* it is mentioned as signifying the 6 directions of space, the blending of pure Spirit and Matter, Arupa and Rupa, and is said to be a sign of Vishnu, though elsewhere Vishnu is made to correspond to the inverted triangle only. We must not try to make the symbolism too rigid and precise, for such names as Vishnu are complex in their meaning, and moreover different

schools of philosophy have their own ways. The alchemists would have called these two triangles the fiery and the moist principle. They represent the dual nature of man, and the six points stand for the six powers or forces of nature, six planes, six principles, etc., synthesized by the seventh. The shapes of snow crystals are often mentioned as a familiar instance of this sixfold principle, and it represents the six primary axes in the cubical system of crystallization. If a glass cube is held up in a certain position, its twelve edges will show the double triangle within the hexagon. Other names for these six primary forces are the Sephiroth of Construction, Dhyan-Chohans, Prajapatis, Builders of the lower physical universe — according to the plane which is being illustrated.

THE PENTAGRAM

The five-pointed star, or the star polygon of the number five, is made by marking five equidistant points on a circle and joining each to the next but one; the lines and angles are equal, the angles being 36° , 72° , and 108° . The sections of the lines exhibit the Golden Ratio, by which a line is divided into extreme and mean ratio, that ratio being .618 or 1.618, which plays so important and interesting a part in geometry. In symbolism this figure is often taken as synonymous with the number five, the pentad. The Pythagoreans called it the Pentalpha, because it was like five alphas (A). It combines the two and the three, the first even and the first odd numbers after unity, representing therefore among many other things, on the universal plane, the union of cosmic substance with cosmic intellect. If the three is combined with the four (another symbol of matter) we get the seven. As a union of five elements it stands for the Heavenly or Macrocosmic Man, and its five points correspond to the head and limbs of a man's body; the same idea lies behind the five wounds of Christ. When the star has its point down, it signifies the polar opposite of the

preceding, that is, the nether or material pole of cosmic life; and so can be used as a black magical symbol — the horns of evil are said to be up. The combination of these two produces the decad, in a similar way to that by which the two triangles are combined in Solomon's Seal; and thus we get another symbol of man's dual nature, and of the dual aspect of cosmic forces. In connexion with this, astrologers will remember that each of five planets has two houses, a day house and a night house; while Sun and Moon have each one house, so that we have here the five, the ten, and the twelve, harmonized together. Five is specially important in our times because we are in the Fifth Root-Race, and five elements have so far been manifested (the fifth, ether, only partially as yet). We have five digits on each limb; five is the most frequent number for the petals of a flower, we use the denary scale (twice five), and the number five plays a leading part in the geometry of the dodecahedron and icosahedron. In *The Secret Doctrine* we find the pentagon used for the number five in the formula 31415, the other figures likewise being denoted by geometrical signs.

The Theosophical Forum

THEOSOPHY CAN EXPLAIN — *L. L. W.*

TRUE COMMUNION WITH OUR DEAD

Possessive personal love, how much we lose by it! To get — to possess — to keep. Is not this the almost universal motive in life? *My child, my wife, my husband, my business, my rights.* We all have this mentality to some degree. Yet by this desire for exclusive possession we miss the very flower of life. Perhaps, if Theosophy is new to you, these remarks will cause surprise. But you have only to read your daily paper or look around in your own neighborhood to find the unhappy homes and the problems of selfishness, often leading to criminality, that spring from the desire to possess for one's self. Just do a little observing and analysis and you'll get an eye-opener.

Now it is our intense possessive love that gets between us and our dear ones when they have passed on. When we lose a friend we can think of nothing but the loss of his presence, his face and voice and loving ways that we can no longer see and hear. Yet these are just the things that are temporary about him. For they are, as we remember them, centered more or less in the body. If they are not temporary then why do they disappear with the body? But that within which was the light of the eyes, that which warmed the smile and thrilled us in the voice — these come from the Spirit-soul who is our friend and it cannot die. It is this Spirit-soul which we really love, not the passing forms through which its love is made visible. Here you may object, "But I think it is very natural to grieve in this way when we lose someone we love." Of course it is! It is sympathy for this natural unhappiness that leads Theosophy to give us the knowledge which is the only thing that can comfort and help us. Do we wish to spend the rest of our lives

in loneliness and loss? Or do we desire with all our hearts still to keep in conscious touch with our beloved dead? If the latter, then we must change our way of thinking and feeling. There is a passage in H. P. Blavatsky's *The Key to Theosophy* (Section II, "Theosophy and Spiritualism," footnote) which shows that just such communion can take place even though we do not realize it.

. . . it is not the *spirits* of the dead who *descend* to earth, but the spirits of the living that ascend to the pure spiritual souls . . . There is hardly a human being whose Ego does not hold free intercourse, during the sleep of his body, with those it loved and lost, yet, *on account of the non-receptivity of his physical envelop and brain* [italics ours], no recollection, or a very dim, dreamlike remembrance, lingers in the memory of the person once awake.

"The non-receptivity of . . . physical envelop and brain" — here is what shuts us away from our departed. To hold *remembered* communion with them we must live more in the realms of *our own* Spirit-souls. Do not the great majority of human beings live almost entirely in their narrow personal interests? The only way most people vary this is by moving-pictures, the bridge table, or whatever else can be used as an opiate to keep them from thinking about themselves. Every time we think towards or work for union with our own innermost Spirit we then move closer to our departed. This is because such desires react spiritually upon the brain and so etherealize it that it becomes sensitive to the spiritual spheres where the "dead" are. But when we restrict our thoughts to a desire for their physical presence we are turning away from them. They are at rest in the beautiful quiet of the Silent Land and Nature sees to it that our personal longings cannot disturb them there. But when we have begun to train our thoughts spiritwards we shall gradually have many blessed intimations that we are truly as near to our beloved as if they

were asleep in the next room. Presently we too shall sleep. But we shall wake up together again in a new life on this earth. And then we shall resume our happy human companionship of work and play. This is true communion with our dead. False communication will be discussed in our next article.

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

RELIGION IN MODERN SCIENTIFIC THOUGHT

While confirmed materialists, so-called "rationalists" in many cases, are disconcerted at the attitude of many modern scientists in apparently abandoning the old materialism in favor of a more enlightened materialism with a suspicion of something like a cosmic mind or intelligence immediately behind physical phenomena, other thinkers are worried lest certain leaders in physics are leaning too far toward theological dogmatism! An article by Dr. Max Schoen, Professor and Head of the Department of Psychology, Carnegie Institute of Technology, in the October *Scientific Monthly*, deals with this problem in a manner that is most interesting to students of Theosophy, for his main point is in perfect agreement with the Theosophical fundamental — the divinity of man.

Dr. Schoen identifies "speculators in the realm of physics like Eddington, Jeans, Millikan and Arthur Compton" as wandering far beyond their legitimate range and speculating, not as scientists, philosophers, or religious thinkers, but as theologians with a preconceived notion which they are bolstering up by the inferences they draw from physics, and claiming validity for it on the ground that it is scientific. He claims that they are not impersonal, but that they are making unqualified statements which go far beyond the evidence at their command.

In support of this, Dr. Schoen defines the two varieties of Religion

— the one being a *belief* in God, the other and true one, the *experience* of God within. The first is represented by organized religions, the second is personal or private. The first calls for priestly aid and intercession, and results in a number of rival creeds with their enmities, suspicions, and intolerance. Listen to Dr. Schoen's purely Theosophical definition of "true" religion:

Religion as experience of God is the religion of creative experience, with God the creative spark in man urging him on to grow in creativeness, in manhood. In this religion there is no room for sin other than ignorance of one's real self and no room for virtue other than knowledge of this self. So God becomes the highest self of mankind in whom man is to find his real welfare. Salvation for man is no easy attainment by accepting certain beliefs and engaging in certain mysterious practices, but is to be a constant seeking within oneself for that spark of divinity, which, as it is being found transforms the finder into itself. For this religion God has no being apart from man, and man has no being apart from God. As man is growing in manhood he is growing in Godhood, and thereby discovering God . . . the religion of a belief in God is a distortion of religion because it is a distortion of man, spreading confusion and enmity among men, while the religion of experience of God is true to human nature, for if it were in operation it would spread peace on earth and good-will among men. And it is this distorted, unscientific view of religion that current science is alleged to support . . . An objective God is not a religious experience but a theological dogma, and when science begins to support dogma it ceases to be science, for science and dogma cannot keep house together.

Without expressing complete agreement with everything in Dr. Schoen's article, and with the hope that the position is not so

alarming as he fears, there is certainly much truth in it, and he is not the first who has felt the danger. It has been very encouraging to students of Theosophy to see leading scientists moving away from the crude materialism of the past toward more spiritual views of the universe, and taking the desperate step — to most of them — of accepting such "heresies" as telepathy, clairvoyance, and prevision, but it would be a disaster if austere Science was cajoled into supporting medieval "supernaturalism."

LIFE IN THE STARS

It is one of the most far reaching teachings in the Ancient Wisdom that the Sun is not merely the "lamp of day," a mass of atomic particles, radiating away its physical energy in various forms, a minute portion of which is utilized by the film of life on the surface of the earth, and possibly on other planets, but that, like everything else in the universe, it is *alive!* H. P. Blavatsky summarizes the teaching in *The Secret Doctrine*, I, 479, in the words: "the true Occultist believes in "Lords of Light"; that he believes in a Sun, which . . . is, like milliards of other Suns, the dwelling or the vehicle of a god, and a host of gods." (1)

She continues by saying that in this question, of course, it is the Occultists who will be worsted and considered ignoramuses for declaring that the "Sun is matter and the Sun is Spirit," the bright God of Spiritual and terrestrial Light. This will be denied by modern materialism, which has no place for Deity, Spirit, Soul, or any intelligence beyond the mind of man. But she also said that in the twentieth century scholars would begin to recognise the truth of the teachings of *The Secret Doctrine*, and there are still some of her old students living who are rejoicing in being alive to see this coming to pass.

The latest evidence of the accuracy of her prevision comes from Dr. Knut Lundmark, a well-known Swedish astronomer and

professor at the University of Lund, Sweden. In a long article in the *Goteborgs Handels- och Sjöfarts-Tidning*, October 2, 1936, on "The Last Solar Explosions," after describing the strange phenomena connected with the tremendous outbursts of so-called *novae* or "new" stars, and discussing the possibility that such an explosion represents the closing phase of a great solar system and the establishment of conditions which will eventuate in a new one, he makes the startling suggestion that the stars are living entities. Criticizing the claim that "after all, man is the mightiest of all," he says:

No, indeed, man is not so mighty in the presence of a solar explosion. We understand only a very, very small particle of what really happens when a star explodes. Perhaps Aristotle will receive honorable recognition again, as has happened often before. It may be that the stars are ensouled Super-Beings, whose soul-life is beyond the possibility of any hint of comprehension by us. With our gross senses and our imperfect instruments we can only try to follow the outer physical processes in that tremendous laboratory, the universe around us. In Whose hands or in the hand of What do they lie?

Such a statement is surely a striking sign of the advancement of science toward an understanding of the hierarchical nature of the visible universe and of its habitation by conscious entities of infinitely varied ranks. If the suns are vehicles of High Intelligence transcending our comprehension, why not the planets also, in lower degree? And how did such Beings evolve to those great heights? Why should there not be innumerable myriads of invisible hierarchies of conscious beings inhabiting systems as real as our familiar Solar System but unseen because we are out of tune with their vibrations?

THE INFLUENCE OF THE MOON

Within the last few months several contributions by scientists have appeared in *Science* on the unorthodox subject of lunar influence on terrestrial conditions. N. E. Stevens calls attention to the almost total disappearance of the marine flowering plant "eel-grass" (*Zostera marina*) during the years 1930-32 from Atlantic waters both in Europe and America. This has happened on two scientifically recorded previous occasions, 1894 and 1913. These eel-grass periods approximate very closely with the periods of extreme north declination of the moon. The contributor rather dryly remarks:

One of the surest ways to incur ridicule among scientists is to suggest a relation between some natural phenomenon and the moon. So strong is this feeling and of such long standing that it is of record that Galileo, in comment on Johann Kepler's suggestion that ocean tides were influenced by the moon, expressed regret that so acute a man should have produced a theory which seemed to reintroduce the occult. With this clearly in mind, I am venturing to call attention to a correlation which if accidental is at least interesting.

Perhaps Mr. Stevens does not know that Kepler, the extraordinary genius who discovered the laws of planetary motion that bear his name, was an occultist to the degree at least that he believed in high spiritual Beings or Genii whose vehicles were the planets. Will Dr. Lundmark, mentioned above, be also reprimanded for venturing to suggest "occult" Mighty Beings whose vehicles are the Suns? Mr. Stevens' suggestion of lunar influence in connexion with eel-grass is related to changes in ocean currents.

In *Science* for November 29, Dr. Harlan T. Stetson of the Institute of Geographical Exploration, Harvard University, displays his

independence of the smiles or frowns of his colleagues by suggesting the need of study of earthquakes in regard to their possible connexion with the varying positions of the moon. From a study of 122 deep-focus earthquakes whose epicenters are not less than 100 kilometers below the earth's surface he finds "a surprisingly striking correlation between the frequency of these deep-focus quakes and the horizontal components of the lunar tidal forces in operation at the time." The physical force is so small that he feels obliged to suggest the "trigger" action, in which a minute force may release a strain or latent energy; or perhaps, he says, we may have to look for some other *unknown causes dependent on the lunar period*. According to the Ancient Wisdom there are many obscure effects produced by the moon; some of these were symbolized in the mythologies, and as science gradually finds them out it will have to recognise the profound scientific knowledge taught in the Mystery-Schools.

FIRE-WALKING AGAIN

This weird subject cannot be kept out of mind, it seems, and not all the scientists are satisfied with the utterly illogical and mutually destructive "explanations" of the problem. The *Associated Press* published on December 6 an account of the performance of the fire-walk at Raiatea Island in the Society Islands. The special point of interest lies in the fact that the native "priest" conducted a party of white people from the Yacht *Stranger*, belonging to Mr. F. Lewis, a Southern Californian rancher. The pit was 12 feet wide and was filled with stones which glowed white-hot at night after they had been heated all day in preparation for the evening ceremony. Mrs. Lewis, who crossed the incandescent stones barefoot, like the rest, was quite skeptical at first, but was nonplussed by the event. She is quoted as saying:

I can't explain it. While Tane [the young priest] led us, our feet did not even feel warm, but one scout who arrived at the pit after the priest had left was burned badly when he tried it alone.

Tane had touched each rock with a ti-leaf while chanting, before the ceremony. This account, so similar to many of which we have reports in our collection, tells of the phenomenon which has been reported many times — the immediate burning of rash individuals who try to cross the fire after the protective period has expired. The conventional theories, such as leathery soles, hardening solutions applied to the skin, quick-stepping over well-cooled stones or charcoal, and other "explanations" which do not even explain the *physical* facts, are completely destroyed by this phenomenon which the skeptics are unable to face. The cases — more than one — in which a fire-walker who turns back is immediately burnt, belong to the same class. The psychological explanation of self-hypnotism or hypnotism by the priest, which has been suggested in regard to the immunity from pain, does not touch the fact that delicate soles of white people used to wearing shoes are not even singed, and that flimsy clothing and anklets of leaves are completely unaffected in a temperature which melts the solder of a thermometer held six feet above the surface of the fire-walk. The hypnotic explanation is unsatisfactory for other reasons as well. Mrs. Rosita Forbes, the well-known writer and explorer, has just described her experiences among the fire-walkers in Dutch Guiana in the *Sydney Morning Herald* (Australia). She first saw some curious fire performances which struck her as being partially jugglery and partially hypnotic, but at last she succeeded in reaching a village, buried in the jungle, where the real ceremony took place. To an extraordinary and rhythmic beating of drums the firewalkers, or more properly, fire-dancers, flung themselves into an immense roaring fire,

bathed in it as if it were the most refreshing stream of water, and rubbed the blazing embers on their limbs and bodies. A girl stood near the fire and apparently controlled the proceedings. Mrs. Forbes says:

I saw the people of the flame in a state of perpetual motion, with one figure immobile among them. The girl had not moved . . . By contrast with the figures thrashing round her, maddened by the immunity from pain which deified them, she might have been an image carved in the wood of the forest. . . . I gathered the girl played the part of medium. If for one moment she relaxes, immunity passes from the dancers. Blind to what is happening around her, she stands there, tense as a charged wire. More apposite, perhaps, is the simile of a generator from which a current flows. At any moment she can cease to produce it. At her sign, the dance ends, and however mad the participants, they know when she gives the signal.

It seems that these fire-priestesses — for only women conduct the fire orgies — are not trained to the work, but are naturally born with the knowledge of controlling fire! Mrs. Forbes' account brings to mind the feats of the celebrated medium, D. D. Home, who could extend his protection against coals of fire to others. Mrs. de Cres-pigny describes a recent case in which a blazing log was placed in her hands by a "fire-medium." She held it for several minutes and felt no burning. The *Listener* (London) lately published an account of a Hindu yogi who stood outside the fiery pit and controlled the conditions while men, women and children walked many times across it. Their immunity only lasted as long as he kept up his meditation. H. P. Blavatsky touches on fire-magic in *Isis Unveiled*, I, 379-80, 445-6. There appears to be more than one way in which immunity from both pain and injury can be obtained, though it may be that at bottom there is only one

basic principle.

ADVANCED MATHEMATICS IN ANCIENT BABYLON

When the Egyptian "Mathematical Papyrus" was discovered about ten years ago, Professor Struve in Russia announced that it indicated that the Egyptians possessed mathematical knowledge that had only been rediscovered a few hundred years ago in Europe. Rather later, Professor Louis Karpinski (University of Michigan) said:

Touraeff in 1917 gave from the "Moscow" papyrus the volume of the truncated pyramid as $\frac{1}{3}h(a^2 + ab + b^2)$ and Struve adds an equally amazing formulation for the surface of a hemisphere as $2\pi r^2$. Heretofore no historian has suspected that the empirical knowledge of these formulas was not the undisputed achievement of Greece Dr. Neugebauer makes the most significant and almost revolutionary announcement of the discovery among the early Babylonians of the numerical solution of a type of complete quadratic equation. . . . Today . . . it is certain that the indebtedness of Greece to Egypt, often affirmed by Greek writers, is no figure of speech, no rhetorical gesture, but rather an assured fact.

And now comes Dr. Morgan Ward, associate professor of mathematics, California Institute of Technology, saying:

We are now convinced that the ancient Sumerians and Babylonians 2000 years before the beginning of our era sedulously cultivated pure mathematics, and in one branch of this subject, pure algebra, far surpassed the best efforts of the Greeks. At one time when our European ancestors had just emerged from the stone age and prowled in little bands of savage hunters through the endless gloomy

forests of northern Europe, the Babylonian mathematicians had pursued their subject to such good effect that a major part of the content of mathematics known to our average high-school graduate would be quite familiar to them.

Babylonians constructed a table which has come down to us containing quotients of the number of 19 trillion, 595 billion, 520 million by various multiples of 60. — *Pasadena Post*, Dec. 7.

We might give evidence that *all* our northern European ancestors were not savage hunters in the early Babylonian period, but will merely remark that the existence of such remarkable mathematical ability at least 2000 b. c. demands a very long period of development and a very high civilization for many previous ages. "Pure mathematics" is not too popular today among the masses, unfortunately, and its exponents are an almost immeasurable distance from the "missing link."

The Theosophical Forum

THE WHOLE OF MAN — *C. Q. Wesner*

When we speak of the constitution of man, we are apt, at first thought, to visualize the physical body, its parts and organs. Upon second and more deliberate thought, however, we realize that the physical body is not, by far, the only or most important part of the constitution of man.

Upon careful consideration, we find that the common sense perceptions do not lie in the body. For instance, we are told that light is a vibration in the ethers, or that it is a substance emitted from a light-giving object. These vibrations or this light-substance strike the mechanism of the eye and are carried to the "sight-center" of the brain. There a miracle takes place. The vibration or light-substance is transformed or transmuted into a sensation, that is, into a state of consciousness.

Note well — the vibration or "light-substance" has become a state of consciousness! In what part of man's constitution lies the center of consciousness? Where lies the "transformer" between "vibration" and "consciousness"?

The Ancient Wisdom, Theosophy, teaches the existence of a finer, more subtle model body, commonly called the Astral Body. A study of this Astral Body enables one to discover the answer to many questions like the above.

Life! What is life? Where does it originate? How does it get into our body? Is it strictly an energy? Theosophy tells us of the "ocean of life-substance-energy" in which our whole globe is bathed. That part of this ocean of universal life-substance-energy active or at work in a man's body is spoken of as Prana, the life-principle.

Where lies Will? Where lies Desire? Desire or Kama is the "power-

principle," neither good nor bad, except as it is controlled and guided.

Controlled and guided! — by what? The Ancient Wisdom teaches that the real man is the Thinker, the part of himself who thinks and reasons, and guides, as best he knows how, the lower principles.

But thought, the thinker, and consciousness are not one thing, or even aspects of one thing. Above thought and the Thinker is a center of consciousness, of conscience. Conscience is not a necessary function of the brain-mind, which is apt to confuse right with expediency, and justice with might. But there is inherent in every man a spiritual sense of right and justice, a sense of compassion and love. These, Theosophy teaches, lie in a spiritual center, called Buddhi.

Man speaks of "my body, my mind, my soul, my spirit!" What is this "I" of which these are attributes and appurtenances? It is the God within, the Divine Spark, rooted in the heart of the Universe Itself!

The Theosophical Forum

H. G. WELLS OFFERS A SOLUTION — *Helen Savage*

One of the best signs in the present day is that people are asking questions. Nowadays, for every claim to the discovery of a final panacea for the world's ills there is a coincident healthy inquiry into the validity of such a claim. The revolution in most departments of thought which took place at the end of the last century is sufficiently far away to have given an opportunity for many palliatives and nostrums, many formulas for deliverance, to have been tried — and found inadequate. This has engendered a sense of futility in the consciousness of many, a sense of misdirected efforts; and the situation has become all the more disconcerting because sage and charlatan, mystic and empty boaster alike, promise a glorious destiny for the human race. So that the most urgent question now being asked is: Why do we seem to be frustrated at every turn in our attempt to make this promise an actuality?

H. G. Wells, in his recent book *The Anatomy of Frustration* asks the question thus:

With the broad table-lands of our common human opportunities, widespread and inviting before us, seen plainly, stated clearly, why do we not go on to them, why are we not hurrying towards them, why are we not in fact already there? Why does our species — which is I — which is you — still live in division and confusion? . . . Shall we be for ever a medley of individuals striving to escape from a frustration that will at last close in upon us all?

Wells is convinced that the answer to his own last melancholy question is an emphatic No. So he tries to find a way out. The theosophist is tempted to read into his solution more than he may

have intended to imply; there is no harm in this provided that we recognise that we are doing so. Here is Wells' solution in the main: More and better education; firstly that we may obtain a more comprehensive understanding of our common history and destiny, and secondly that we may achieve an ever completer self-control.

Education along theosophical lines fulfils both these ends; and it is good in our spreading of our noble philosophy to bear this in mind and accentuate it. Our message is a direct message to *human beings*; and any part of the Theosophical philosophy which we divorce entirely from this primal purpose, we have not really understood.

To study the history and destiny of the human race means, besides more obvious things, to study our relations with all other beings in the Universe, since man cannot move forward to his sublime destiny apart from the rest, any more than we can move in space in our planetary orbit without taking the world with us, so to speak — which simply means that we are all moving together in the same direction.

To study the history and destiny of the human race means, also, to learn what are our relations with each other and, further, to know ourselves. We must be acquainted with the complex organism of the Universe as a unit, the complex organism of mankind as a unit, and the complex organism of the individual man, and in all these complexities find the unity that makes their existence possible. We have to recognise our common goal amid our many diversified purposes.

And the other object: To gain an ever completer self-control, suggests, in its widest applications, a philosophy of action, of *doing*, of building and growing within; in short of applying to the actual business of living the principles suggested by the study

above outlined.

To be impatient for immediate results is not entirely a bad thing; but a profound study of the "destiny and history of the human race" and an unremitting effort at a "completer self-control" convince the student of life that the fine flower of a perfect humanity does not bloom in a day; yet Wells himself might be encouraged to know that his very eagerness and concern in behalf of the human race are signs of a growing awareness among men of the purpose of this often bewildering life of ours here on earth.

The Theosophical Forum

THE GUERDON OF SELF-FORGETFULNESS — *G. de Purucker*

Theosophy works a magic upon us which is grander by far than merely telling us of the undoubted and beautiful truth of our essential divinity. It transmutes our weak and often evil manhood into godhood. It teaches us to forget ourselves for others — for the world. It so washes our natures and our hearts and our minds of the personal and limited that in time we are led on even to forget ourselves and live in the universal.

To me this is the lost keynote of modern civilization, whirling as it does around the egoisms born in us. It seems to me that if we Theosophists can instil into the thought-life of the world, of our fellow-men, ideas, principles of thought, and consequent conduct, teachings of religious and philosophical and of scientific character and value, which will teach men, enable men to learn, to forget themselves and live for others, then I think we shall have done more than teaching men the undoubtedly sublime verity of their oneness with divinity — one of my own favorite thoughts and teachings! For even that can have an atmosphere of egoism about it, of spiritual selfishness. You know, I really believe that if our sad and suffering world today, hovering on the brink of disaster as it is, this world taken distributively as individual men and women, could learn the one simple lesson of self-forgetfulness, and the beauty, the immense satisfaction of heart and mind, that come from such self-forgetfulness, living for others, for the world, I honestly believe with all my heart that ninety-nine per cent, of the world's troubles would be solved. Politics would then become an engine of human achievement and not of selfishness and often destruction. Works of philanthropy would be considered the noblest in the world, because they would be guided by the wisdom of an awakened heart. For no man's eye

sees clearly when it whirls around the pivot of the personal self; but it will see clearly when its vision becomes universal, because then all in the field comes within the compass, within the reach, of its sight.

Am I not right, therefore, in believing that, beautiful as are the teachings which, as individual men, we can study in Theosophy, and great as will be the advantage that individually we shall draw from them, from these teachings, there is indeed something still higher in Theosophy which it alone, perhaps, in the world today teaches: that we reach our highest, our sublimest, peaks of achievement when we forget ourselves? And may we not find the same sublime verity at the heart of, as the essence of, the burthen of, every one of the great religions of the past, provided we strip away the dogmatic excrescences born of the brains of smaller men?

Remember that true Theosophy is a matter of the heart-life, and of the heart-light, as well as of deep intellectual understanding; but so many people do not realize this, and look upon Theosophy as merely a kind of intellectual philosophy, which is only a part of it.

Here is another thought: While the selfless life as taught in Theosophy is considered by us to be the most beautiful because universal and all-inclusive, yet can we properly be living such a selfless life if we ignore those duties lying nearest at hand? In other words, if a man so yearns to help the world that he goes out into it and neglects duties that he already has assumed, is he doing the thing which is manly? Is he living the selfless life; or is he following a secret, selfish yearning for personal advancement? Is he even logical? Selflessness means never to neglect a duty, because if you do that, upon examination you will discover that you are following a desire, a selfish thought. It is in doing every

duty fully and to the end, thereby gaining peace and wisdom, that you live the life which is the most unselfish.

The Theosophical Forum

AN M.D. ON EPIDEMICS — *Lydia Ross*

Epidemics are wide-spread prevalence of disease, or of mental or emotional conditions. The causes usually assigned to epidemic diseases are: individual susceptibility; earth conditions of heat, moisture, soil, water, hygiene, and sanitation; and mass movements of people, as in wars and pilgrimages, etc. While all of these factors provide physical and psychological conditions favorable for the spread of certain epidemic diseases and emotional disorders, there remain potent invisible causes to be reckoned with. This fact finds typical expression in the recurrence of several hundred epidemics of influenza on record. It is significant that this disease, which is not contagious, spreads with great rapidity, suddenly appearing in any climate from Arctic regions to remote South Sea Islands, and in all conditions from palace to hovel, in crowded cities and in open country, and in mid-ocean.

H. P. Blavatsky discusses these unusual and serious effects of causes, which she says are cosmical rather than bacterial (*Lucifer*, V, 448). She explains that all such mysterious epidemics as influenza are due to an exuberance of ozone in the air, where an excess of oxygen has become ozone under the powerful stimulus of electricity. She quotes the scientific teaching that it is an excess of ozone in the air that induces the unaccountable feeling of fear and depression in many nervous persons before a storm. While a certain amount of ozone is necessary for normal breathing and circulation of the blood, too much irritates the respiratory organs, and over one per cent, of it in the air respired is fatal. The role oxygen plays in combustion is related to the fever in influenza; while the depression and vital exhaustion often prove fatal without serious organic disease developing. Even recovery is

delayed by a lack of nervous vitality. A peculiar symptom is a vague sense of detachment from one's ordinary interest in, and relation to, familiar conditions and people. The patient's negative mind and body seem to drift along under the sway of forces belonging to some other plane of existence, leaving him indifferent to this plane. The electrical vibrations in the Earth's aura seem focussed upon his vitality which is not equal to the potent charge.

The pranic life-atoms of man's body make an "electrical field" which, permeating his astral-vital-physical constitution, puts him in contact with the natural flow of ethereal currents of electric and magnetic force. These forces emanate from great cosmic entities who are the intelligent agencies for the karmic action of the so-called "laws of Nature." They function in the noumenal realm of causes which are due to appear on earth as phenomena of all kinds. These entities are the regents of the seven sacred planets, who help to build the body and oversee the destiny of both man and the earth. They act automatically and impersonally in harmony with the combined causes and effects of ethereal and terrestrial conditions. The ethereal interference with radio transmission hints that the Universe is invisibly "wired" for the interplay of electro-magnetic wave-lengths or currents of various kinds. The sun, the moon, the planets, the earth, and the human brain are all magnets in contact with a common network of "live" wires of consciousness. The atoms of the Solar System not only change their combining equivalents on every planet, but they undergo a certain change in their rapid passage through our atmosphere. H. P. Blavatsky speaks of

the *Spirit*, the *noumenon* of that which becomes in its grossest form oxygen and hydrogen and nitrogen on Earth. . . . Before these *gases* and fluids become what they are in *our* atmosphere, they are interstellar Ether; still earlier and

on a *deeper* plane — something else, and so on *ad infinitum*.
— *The Secret Doctrine*, I, 626

These "fluids and gases," then, have been "stepped down," plane after plane, bringing to us the karmic influences of the hierarchy of entities which compose the Solar organism. They are the tangible carriers of the cosmic electrical fire of divine, spiritual, mental, psychic, astral, and material forces which infill the Universe. Here, in brief are the astrological causative influences in typical epidemics, which are variously operating in other karmic diseases and mental and emotional disorders such as popular uprisings, fanatical movements, waves of crime and vice, etc. Happily, however, the same impersonal agents of the karmic law are equally active and are helpful during human cycles of ethical and spiritual aspiration and progress.

The Theosophical Forum

THE DAUNTLESS ENERGY THAT DRIVES US ON — *H. P. Leonard*

Our greatest glory is not in never falling, but in rising every time we fall. — *Confucius*

One is sometimes tempted to envy the flowers in their effortless unfolding of leaf and petal. The sun pours forth his measureless munificence and they respond with gorgeous bloom and green exuberant growth. With neither toil nor any sense of strain they open to the radiant bounty of the solar heart.

But when, at length, we reach the human stage a new and powerful factor makes itself felt — the cogitating, restless, and adventurous mind. No longer do we find a merely passive response to the cosmic stimulant to growth: there arises the novel tendency to self-directed evolution, so that, in addition to the general urge that animates all forms of life there springs to action the desire for individual expression. The special and peculiar tendencies unfolded from within, in response to the various situations in which we find ourselves during our long passage through material things, demand an outlet for expression. The leisurely progress, so apparent in the lower kingdoms, gives way to a notable acceleration when the man-state is entered upon. New powers emerge into activity, new senses come to life, and from beginnings which at first are hardly more than inaudible whispers, they, by degrees, insist on being heard.

The process of learning the use of unfamiliar faculties must of necessity result in frequent failure, so that a backward glance along the path reveals an unbroken track of wreckage and of efforts that have failed.

Lack of experience can be cured only by use that gives familiarity,

and to sit down in dull despair is only to dishearten those who tread with us the everlasting way. Inaction and despondency are signs of our having lost touch with that exhaustless fount of energy that will never fail us while the solar heart still beats and the bright photosphere still radiates his beams to all the darkest corners of the earth. Our care should be to keep the channel clear and to attempt the thing we never tried before as opportunities arrive. The wreckage we have left behind is used again in Nature's wise economy, and forces that have seemingly been spent and scattered are employed once more. Our business is to utilize the flying moments as they pass and serve as conscious agents to direct the universal life-force to the great purposes already dimly looming through the curtain that obscures our veiled tomorrow from today. The past must be ignored because our time for doing things is the Eternal Now, and glances back along the path we came can serve only to dissipate the powers that should be concentrated on our present work.

Students of history must often be amazed to note the recovery of races of mankind from catastrophes which would seem to have overwhelmed them in final disaster. But in the slow procession of the years the hideous scars of battle are grown over by a mantle of green turf and poppies swaying in the wind, and fields where armies grappled are now the pasture grounds of flocks and herds. Cities whose towers were levelled in the dust raise once again their domes and temples to the morning sun, and countrysides that once resounded with the thunder of the guns are vocal with the mating songs of blackbirds and of larks.

The law of rhythm and recurrence is everywhere at work, and is in operation in our individual lives as elsewhere; and though the cosmic life is inexhaustible it has its periodic ebb and flow and must not be ignored. There are neutral periods when utter deadness supervenes, and these are the pauses, the stagnation

points, when the ebb has ceased and yet the flowing tide has not resumed its forward sweep. These periods may be very trying to the inexperienced, who are apt to feel alone and forsaken, while cold despair seems waiting to engulf them in a fathomless abyss. But let them carry on with patience for a while, for presently the surgeless, silent sea will rise again and sweep them onwards once again upon their voyage that has no end.

This universal urge is everywhere at work and though our selfish will may prove refractory and though our indolence may be a drag upon its onward course, its march is irresistible and only as we willingly co-operate is happiness to be obtained. Our opposition can result in nothing but unavailing struggle and ultimate defeat, and our satisfaction will always be found in forwarding its purposes and using our intelligence to further its beneficent designs.

The Theosophical Forum

TRANSACTIONS OF THE POINT LOMA LODGE: XI — *G. de Purucker*

THE SYMBOLOGY OF THE SEAL OF THE T. S.

The meeting of Sunday evening, September 27, 1936, opened as usual, and the President, Dr. Edge, called upon Mr. E. W. Lambert to act as Chairman. Miss Elsie Savage then addressed the Lodge as follows on "The Symbology of the Theosophical Seal."

E. V. Savage — In preparing for the study of this evening, I unconsciously made a wise decision! There was so much to investigate on the subject, and such deep aspects to it, that I decided not to attempt to treat the subject fully, but merely to point out a few things. Then I opened *The Mahatma Letters to A. P. Sinnett*, and found that the Master K. H. says, in speaking about part of the symbology of our Seal, "The *chela* who can explain this sign from every one of its aspects — is *virtually an adept*." So my decision was timely!

I came across the following interesting comment on symbols by the modern psychologist, C. G. Jung:

. . . the unconscious can only be reached and expressed by the symbol. . . . The symbol is, on the one hand, the primitive expression of the unconscious, while on the other hand, it is an idea corresponding to the highest intuition produced by consciousness.

Mr. Judge says somewhere that a symbol, to be correct, should express fully and in every detail what it stands for, and each part should be consistent with the whole; and he says that there lie concealed in our T. S. Seal all the doctrines and philosophy of Theosophy — at least as we have them in its modern

presentation. As we proceed you will see how true this statement is.

I have found in recent months in corresponding with inquirers, that it is very valuable not only to know our Theosophical philosophy, but to be able to find in our literature the place where we can point to authoritative statements supporting our opinions; so I have made note of various places where the Seal is discussed, and I think some of you would find it interesting to look up these references. First of all, in *Fundamentals of the Esoteric Philosophy*, on pages 406-7, G. de P. has some interesting comments on the Swastika. It portrays evolution *in motion*, the cross symbolizing Matter traversing Spirit; and, what I thought particularly interesting, there lies concealed in this particular symbol, the intricate doctrine of the Lokas and Talas. He speaks also of the Egyptian Tau or Ansated Cross — says that while the swastika emphasizes the movements and circulations of consciousness in Space, the Tau has a vaster aspect, portraying the primordial movements and states of Kosmic Being. I think it is well worth our while to turn to those pages and read them.

In *Lucifer*, for January, 1935, in speaking of the Serpent, the Leader says that it is incorrect to say either that it is a good or that it is a bad symbol. It is like one of the neutral forces of Nature, and is either good or bad according to its use or misuse by individuals.

I am not treating any of these component parts of our Seal fully — the Serpent, the Swastika, the Interlaced Triangles, the Egyptian Tau, and the superimposed Om — because each is being treated separately by others in other meetings. But here is one interesting thing about the Serpent. In W. Q. Judge's magazine, *The Path*, for May, 1886, there is an article signed "Nilakant." I do not know if that is one of Judge's pseudonyms, but the writer first speaks of

the symbol of the serpent biting its tail, thus forming a circle, as portraying both eternity — having no beginning or end — and wisdom. The scales of the Serpent signify the illimitable diversity of the aspects of Wisdom or Truth, and also the numberless individuals each having one phase of the truth, and all bound together on the path of evolution; and he says, "This is not due to any want of coherence or congruity in truth itself, but solely to the diverse views which each individual takes of the one Truth." Doesn't this remind you of the countless times in these meetings when the Leader has told us that in our discussions we have each given a *part* of the truth, and none of us the whole truth, and that what each one has contributed has been right from one angle?

You will notice that the Seal as we use it today is not encircled around its lower half by the motto of the Society, "There is no religion higher than Truth," which is the family motto of the Maharajas of Benares, the sacred city of India.

In *The Path*, April, 1892, there is an article signed by W. Q. Judge himself, containing several interesting points. One value of having Truth expressed by symbols is that symbols last through the ages, while books and writings are often lost and disappear. (Sometimes they are intentionally withdrawn from mankind by the Adepts, when the knowledge they contain is being misused. Then only those who have the keys can read the truth in the symbols.) He speaks about the signs of the Zodiac which we still use, but the origin of which is unknown to us, as they go too far back into antiquity. He refers to the serpent making a circle, the most perfect form in Nature, of which the ratio of the diameter to the circumference is as one to three. But when you express it in detailed figures, you cannot bring the decimal to a finite conclusion, symbolic of the unknown quantity in human affairs — never can you reach a finite conclusion to any act or thought.

The *Crux Ansata* stands, among other things, for the sign of Venus, the "Elder sister of the Earth" according to the Secret Doctrine, and changes taking place on Venus affect us on Earth. In the seal it stands for the regenerated man, a man become at one with his Atman. Now, this Tau is placed in the center of the interlaced triangles, and here is another interesting thing. The interlaced triangles make a six-pointed star, and the center is bounded by six sides, six being more frequently found in manifested nature than seven. Here we find the six sides standing for the six principles of man; and the center, in which regenerated man stands, represents Atman. See Chapter VI of Volume II of *Isis Unveiled* for an interesting discussion of these matters.

Freemasons, Mr. Judge says, do not generally know that the 33^o of Freemasonry "may be obtained from this figure" of the interlaced triangles, emblematic of the great body of Sages.

Notice the way the white and black triangles are pointing, the white up, and the black down, which is the correct way. If the black is pointing upward it signifies the reign of the forces of Darkness. The white triangle stands for spirit and the black for matter, or the white for wisdom concealed, and the black for wisdom revealed. Notice that the six points of the star touch the serpent. Only by contacting spirit and matter, and living in the worlds of manifestation can man (the scales on the serpent) evolve.

I thought I would try to find out the origin of our seal, who first designed it: but in Volume VII of Mr. Judge's *Path*, on p. 343, I find an article on this very subject signed "By one of the Staff," written in 1893, showing that even at that time the matter was uncertain; and the writer calls attention to false claims made by several, each of whom stated that he was the true originator. But Mr.

Judge points out that H. P. B. alone was the heart, head, body, past and future, of the T. S.; and that just as a general has his subordinates and agents who carry out his plans, so did H. P. B. have her workers who carried out exoterically the ideas that she herself was the channel for bringing to the world.

Whoever was responsible for it in its present form, it bears a strong resemblance to H. P. B.'s personal seal, which most of you are probably familiar with from our use of it as the emblem of the Women's Theosophical Club. In H. P. B.'s seal, however, her initials, E. B. (Elena, with an aspirated H) are in the center instead of the Egyptian Tau, the seal is surrounded with the Countess's coronet belonging to her family, instead of the Sanskrit Aum or Om, and inside the circle are astrological and cabalistic signs referring to H. P. B. herself.

In confirmation of the statement that the Seal contains hidden within it all our doctrines and philosophy, I want to read a remarkably interesting paragraph from *The Mahatma Letters to A. P. Sinnett*, pp. 345-6, which is all the more significant in that K. H. evidently thought the meaning of the seal was worth his taking his valuable time to write about:

Does your B. T. S. know the meaning of the white and black interlaced triangles, of the Parent Society's seal that it has also adopted? Shall I explain? — the double triangle viewed by the Jewish Kabalists as Solomon's Seal, is, as many of you doubtless know the *Sri-antara* of the archaic Aryan Temple, the "mystery of Mysteries," a geometrical synthesis of the whole occult doctrine. The two interlaced triangles are the *Buddhangums* of Creation. They contain the "squaring of the circle," the "philosophical stone," the great problems of Life and Death, and — the Mystery of Evil. The *chela* who can explain this sign from every one of

its aspects — is *virtually an adept*. How is it then that the only one among you, who has come so near to unravelling the mystery is also the only one who got none of her ideas from books? Unconsciously she gives out — to him who has the key — the first syllable of the *Ineffable name!* Of course you know that the double-triangle — the *Satkiri Chakram* of Vishnu — or the six-pointed star, is the perfect seven. In all the old Sanskrit works — *Vedic* and *Tantrik* — you find the number 6 mentioned more often than the 7 — this last figure, the central point being implied, for it is the germ of the six and their matrix. It is then thus . . . [At this point in the original there is a rough drawing of the interlaced triangles inscribed in a circle. — Ed.] — the central point standing for seventh, and the circle, the *Mahakasha* — endless space — for the seventh *Universal Principle*. In one sense, both are viewed as *Avalokitesvara*, for they are respectively the Macrocosm and the microcosm. The interlaced triangles — the upper pointing one — Wisdom concealed, and the downward pointing one — Wisdom *revealed* (in the phenomenal world). The circle indicates the bounding, circumscribing quality of the *All*, the Universal Principle which, from any given point expands so as to embrace all things, while embodying the potentiality of every action in the Cosmos. As the point then is the centre round which the circle is traced — they are identical and *one*, and though from the standpoint of *Maya* and *Avidya* — (illusion and ignorance) — one is separated from the other by the manifested triangle, the 3 sides of which represent the three *gunas* — finite attributes. In symbology the central point is *Jivatma* (the 7th principle), and hence *Avalokitesvara*, the *Kwan-Shai-yin*, the manifested "Voice" (or *Logos*), the germ point of manifested activity; — hence — in the phraseology of the

Christian Kabalists "the Son of the Father and Mother," and agreeably to ours — "the Self manifested in Self — *Yih-sin*, the "one form of existence," the child of *Dharmakaya* (the universally diffused Essence), both male and female.

Parabrahm or "Adi-Buddha" while acting through the germ point outwardly as an active force, reacts from the circumference inwardly as the Supreme but latent Potency.

The double triangles symbolize the Great Passive and the Great Active; the male and female; Purusha and Prakriti.

Each triangle is a Trinity because presenting a triple aspect.

The white represents in its straight lines: *Gnanam* — (Knowledge); *Gnata* — (the Knower); and *Gnayam* — (that which is known). The black — form, colour, and substance, also the *creative*, *preservative*, and *destructive* forces and are mutually correlating, etc., etc.

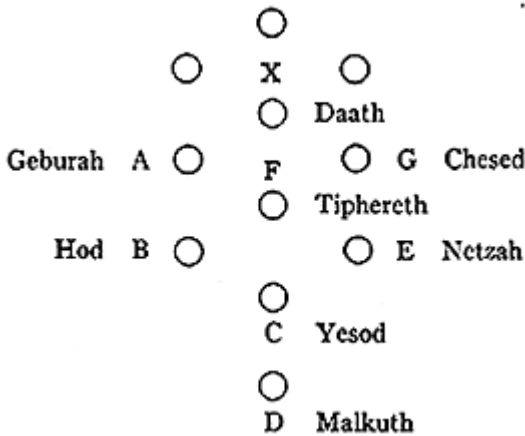

And one sentence more about the "squaring of the circle" mentioned in the above paragraph:

The dual monad (the 7th and 6th principles) has, in order to manifest itself as a *Logos*, the "Kwan-shai-yin" to first become a *triad* (7th, 6th and half of the 5th); then, on the bosom of the "Great Deep" attracting within itself the *One Circle* — form out of it the perfect Square, thus "*squaring the circle*" — the greatest of all the mysteries, friend — and inscribing within the latter the — WORD (the Ineffable Name) — otherwise the duality could never tarry as such, and would have to be reabsorbed into the ONE. — *The Mahatma Letters to A. P. Sinnett*, p. 347

I think this paragraph from *The Mahatma Letters to A. P. Sinnett* well merits our deep and careful study.

After Miss Savage's address the meeting as usual was opened to general discussion.

Mr. F. C. Clemeshaw went to the blackboard and made a sketch of the sephirothal tree, as below:

marking the globes A to G as shown on the diagram of the Chaldean Kabbala in *The Secret Doctrine*, Vol. I, p. 200. He added, however, the Sephira or globe marked X on the above diagram and explained that this Sephira was not generally shown, but that it could be seen in one of the "Unpublished Letters of Eliphas Levi" (*Lucifer*, Vol. XV, No. 87, p. 335). He said that it was also mentioned by Israel Regardie in his recent book *My Rosicrucian Adventure* (p. 79) and also by W. W. Westcott in his book *Numbers*.

If the reader will fill in the lines to form the triangles XBE and CGA and draw a circle with center F and radius FX he will have all the elements of the Theosophical seal and also the Sri-antara mentioned by Miss Savage in the extract from *The Mahatma Letters to A. P. Sinnett*.

Mr. Plummer followed Mr. Clemeshaw at the blackboard.

La Fayette Plummer — There is one way to show that the Swastika and the interlaced triangles are not mere man-made designs, but have a deeper origin. Suppose we take the nine digits: 1, 2, 3, 4, 5, 6, 7, 8, 9. These may be arranged

4	9	2
3	5	7
8	1	6

Fig. 1

in the form of a square, with three numbers on side, such that the sum of the figures in any row, column, or diagonal will be 15. Such a square of numbers is called a Magic Square (Fig. 1).

Now, the number 15 will be found interesting in this respect: in Mathematical Symbology it is customary to take account of the digits of which a number is composed, and in this case we have 1 and 5. Let us count by ones, or in ordinary sequence, and we have, as above, 1, 2, 3, 4, 5, 6, 7, 8, 9. And now give the square a one-eighth turn (Fig. 2) and join by straight lines the numbers in the Magic Square,

	2	
	9	7
4	5	6
	3	1
	8	

Fig. 2

to wit, 1, 2, and 3 form a triangle with its apex pointing upward; 4, 5, and 6 form the "horizon" between heaven and earth, as it were; and 7, 8, and 9 form the lower triangle, with its apex pointing downward.

And now, we will count by fives, thus, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50. We shall modify this series of numbers, by making of each term a number which is the sum of its own digits, thus, first term, 5; second term, 1, because 1 plus 0 equals 1; third term, 6, because 1 plus 5 equals 6; fourth term, 2, because 2 plus 0 equals 2, and so on; so that we shall have 5, 1, 6, 2, 7, 3, 8, 4, 9, 5. And now we will

join by straight lines the numbers in the Magic Square (Fig. 2) in this fashion: 5, 1, 6 (pause), 2, 7, 3, 8 (pause), 4, 9, 5, which brings us once more to the center of the square, the whole forming the Swastika as it appears in our Seal. The manner in which the Swastika is drawn is slightly unorthodox, but for that very reason presents a peculiarly interesting bit of symbology, relating to the Inbreathing and the Outbreathing, both of which are said to be represented in the Swastika.

G. B. — Mr. Chairman, may something be said about the Sanskrit word at the top of the Seal?

Madeline Savage — Mr. Chairman, I brought a few notes on that, which I found in Mr. Judge's *Path*.

The Chairman — We should like to hear them, if you please.

M. S. — The word represents in Sanskrit characters the sacred word, A U M. When considered as a single sound, or as one letter, the word is a symbol of the Supreme Spirit. But as a trilateral word it implies many things, many triads: the three Vedas, the three states of human nature, the three divisions of the Universe. It may also represent the three deities, Brahma, Vishnu, and Siva, who are the agents in the creation, preservation, and destruction of the world. They are the three principal attributes of the Supreme Being personified in those three deities. They symbolize the Universe controlled by the Supreme Spirit.

The A is the Logos — a single homogeneous sound or tone, the awakening and vivifying power, stirring all the molecules into action. Without this resonance or motion among the quiescent particles there would be no visible universe. The U represents the continuance of this sound or motion. The M signifies the stoppage or destruction of the word — or the motion. It causes the pralaya or universal dissolution, or even physical death. The whole word,

Mr. Judge says, represents the undercurrent of meditation which should be carried on by us even during the everyday duties of life.

After further discussion the Leader spoke.

G. de P. — Mr. Chairman and Companions: If I remember aright, our Seal as we use it now, is the original seal of the T. S. as first composed in New York in 1875. It had no AUM or OM at the top, and no Sanskrit legend: *Satydn nasti paro dharmah*. After Olcott and H. P. B. went to India the Sanskrit was added.

There is no reason at all why the T. S. could not have got along perfectly well without a seal; and as a matter of fact, that seems to have been the first idea, because H. P. B. in the beginning, at least in private correspondence, and even somewhat officially, used her own seal, with her initials and her coronet and her own motto; and at one time this might have been called the Seal of the T. S.

I speak of this fact only in order to do away with any illusion in your minds that our T. S. Seal is something sacrosanct, to be spoken of in tones of awe and wonder. It is not. It is a remarkable symbolic design containing, as Miss Elsie has shown, virtually what you might call the synthesis of the basic teachings of all Theosophy. But in itself it has no magical power; and I should very greatly hate to see any one of our dear people, with the fumes of incense and chanting of mantras, begin to try to conjure up spirits out of the vasty deep, etc., etc. That is what some people do!

The interlaced triangles as an emblem have been called the Seal of Solomon by the Hebrews and Christians. It is called the seal of Vishnu in India; and for ages it has been used not only in tantric but in other practices there, and by would-be "magicians" in

European countries.

This Seal, the whole of it: leaving out the Sanskrit monogram at the top, and the motto, as being adventitious though beautiful: and mentally picturing the expanding Monadic Center: the Seal as an emblem or symbol represents the Universe manifested, evolved forth from its central heart, expanding into manifestation or evolution, and comprised within the Serpent of Time and Space. Any universe it may stand for. The choice of the serpent is in many ways excellent, among others because that little "beastie" sheds its skin and comes out clean and refreshed and older, i. e., more evolved and rejuvenated, as universes do.

Of all the parts of this seal, that portion which to me personally has been the most significant, is the Egyptian Cross, and I will tell you why. This *crux ansata*, or "handled cross," can stand just as well for a universe itself in embryo as for any trial undergone in initiation. In other words, the *crux ansata* carried as an emblem by neophytes, simply stated, as it were, for those who bore it: I am a universe in embryo. Now, it was so chosen as a symbol on account of the circle (a reduplication in the small of the circle containing it) and the cosmic cross over which the circle hovers as the golden germ — *hiranyagarbha* — the seed to expand into life, into future glory, as the embryo grows and expands into the grown-up being. From it drops the perpendicular crossing the plane of matter, traversing it as it does so. This emblem, when taken as the symbol of the planet Venus, is the opposite of the symbol adopted by astronomers for the planet Terra, our Earth. Do you remember it? A cross over the globe: spirit ridden by trial and sorrow: matter. But Venus: trials and sorrows ridden by glory: an infinite promise of the future — ♀. The circle, the egg, the golden germ, above the cross. In other words, this symbol is the opposite of the symbol for Earth — ♂

Finally, I might point out to those who are interested in the Swastika, that this one-time universal emblem is likewise a component part of our T. S. Seal, as well as having been a component part of H. P. B.'s original personal seal from which our T. S. Seal was derived. Now many people have asked me at different times as to which way the swastika should "turn," i. e., as to the direction in which the "broken" ends of the arms should be drawn, and I have endeavored to point out that this is a matter of insignificant importance, because the "broken" ends of the arms are found pointing in both ways throughout the history of this emblem. Thus in our present Seal and in the Seal of the T. S. since H. P. B.'s days, the "broken" ends of the arms point in one direction; whereas in H. P. B.'s own original seal, as may be easily ascertained by anyone who will consult it, for it has been frequently reproduced in our books, the broken ends of the swastika point in the other or opposite direction.

This should be sufficient answer to those who mistakenly think that the broken ends pointing in one direction mean "black magic," and pointing in the other direction mean "white magic" — an erroneous and mistaken opinion.

The Theosophical Forum

WILLIAM WORDSWORTH — POET AND PHILOSOPHER — W. E. Moore

William Wordsworth was born in Cumberland in 1770 and died in 1850. He is usually associated with Coleridge and Southey in the "Lake School" of poets. Few men have so completely devoted their lives to serene contemplation of the sublime in Nature. He was not primarily a poet of Nature but rather an intermediary between Nature and man. He lived a long simple life, kept his sympathies with Nature and man, and gave the world richness in poetry devoid of picturesque and romantic details.

There is much that is trivial and commonplace in Wordsworth's poetry, but there are gems of thought in it which reflect whole-truth. These thoughts are guide-posts in a philosophy which is not limited to country, race, or religion.

Wordsworth's Use of the Word Nature

Wordsworth used the word Nature to symbolize the inexplainable, unknowable oversoul which human hearts yearn to know. The word Nature was seldom used by him to mean the natural, physical world about us. Sometimes he spoke of the nature of those inherent, indestructible qualities which are discerned in what is commonly known as Human Nature. Occasionally, he referred to human nature as the Mind of Man, but, no doubt, this is a flower of symbolism and poetical expression. His conception of Nature was in the sense that Nature is alive; that Nature is in man as much as man is in Nature. In the range of his philosophy he gave us abstract ideas of the whole which we can ponder upon as our own. The eye and ear are tuned to universal truth. He makes us conscious of it through our senses, and feeling as we do, we ask "What is it?"

In all things, in all Nature, in the stars
Of azure heaven, the unenduring clouds,
In flower and tree, in every pebbly stone
That paves the brooks; the stationary rocks,
The moving waters and the invisible air.

..... from link to link

It circulates, the Soul of all the worlds.

Activity is Manifest in All Life

Wordsworth's philosophy of life is not disturbed by Nature's multifarious activities. Action is in the core of creation. No living entity can shun action because the very law of its nature compels it to act. Perfectness, in the spiritual sense, is not attained through supine inaction and self-defensive renouncements. Most of life, as we know it, is physical sense-life, susceptible to physical reactions in a material world. Activity has a glamorous influence upon mortal mind. But the inner self of the mortal, which is the core of Being, is not seared by flames, overwhelmed by waters nor withered by dry wind. That part of mortal which is the essence of life is impenetrable, unassailable, invisible, immortal. It is not touched by mortal tribulations. If there is unrest within the soul, then to have power to compel rest is a noble accomplishment. To know and feel the strength of passion and subdue it is a step in mastery of self.

The imagination is enthralled by sensible impressions, but loftier human minds seize the sensible impressions and through them feel the vivid, spiritual life in universal Nature. They break through the bonds of physical encasements, reach the utmost boundary of mortal mind, and vision the higher plane on a spiritual level. Wordsworth did this very thing, for he writes:

Such minds are truly from the Deity
For they are Powers; and hence the highest bliss

That flesh can know is theirs — the consciousness
Of Whom they are, habitually infused
Through every image and through every thought,
And all affections by communion raised
From earth to heaven, from human to divine.

Eliminating the Personal Element

As a poet, Wordsworth submerged his personal relationships. He did not mimic Nature by trying to reveal her likeness to his own moods. The daffodils, the waves, the clouds and the stars are never tinged by self of the poet. He uses poetic expression to eliminate self, and reveal a higher plane of life than human life.

He strengthened his faith in universality of life through better understanding of spiritual manifestations in Nature. Intuitions, inspirations and emotions were more than knocks at the gates of an invisible world — they were the eyes and ears of his inner self. Through them the higher part of self gave to mortal self beauty, grandeur and purpose in creation. How else may we glimpse the sublime? In the lines on the Herdsman, Wordsworth was aware of these powers:

A Herdsman on the lonely mountain top,
Such intercourse was his, and in this sort
Was his existence, oftentimes *possessed*
O then how beautiful, how bright, appeared
The written promise. Early had he learned
To reverence the volume that displays
The mystery, the life which cannot die;
But in the mountains did he *feel* his faith.
All things, responsive to the writing, there
Breathed immortality, revolving life,
And greatness still revolving; infinite.
There littleness was not; the least of things

Seemed infinite, and there his spirit shaped
Her prospects, nor did he believe, he *saw*.

Universal Brotherhood

The doctrine of universal brotherhood has an important place in Wordsworth's philosophy. It is breathed into the very life of his poems, which express the all-pervading love that permeates every spark of divinity. A ceaseless intercommunication of unutterable love flows through all things. In Wordsworth's philosophy every part of the whole universe is linked with every other part. Every living entity gives and receives honor and does honor, each to the other. The tree, the cloud, the cricket, the flower, through their own life and character, make us feel the spirit of friendliness and helpfulness. The theme of brotherhood, like a silver stream, runs through the woodland of Wordsworth's poetry. It is found in intercommunication of all things and is the interchange of life and joy.

In the poem entitled "The Excursion," Wordsworth describes Nature's play upon the earth's surface just after a storm.

More keenly than elsewhere in night's blue vault
Sparkle the stars, as of their station proud
Thoughts are not busier in the mind of man
Than the mute agents stirring there — alone
Here do I sit and watch.

In the multiplicity of life-forms in which each entity has individuality there is oneness of universal brotherhood. There is no self in Wordsworth's sense of God — none except consciousness of perfect Being.

Doctrine of Abstract Ideas

Wordsworth's philosophy embodies the doctrine of the truth of

abstract ideas. He believed that abstract ideas of truth are of eternal existence; that justice, temperance, knowledge, love, truth, are real existences. The divine spark in the soul of man is spiritual Being; it touches the divine landscape of abstract ideas which are in Eternal Being. Wordsworth held that the soul of man is threefold, that is, rational, sensual, spiritual. Then follows the doctrine of reminiscence which in itself means recovery of lost abstract ideas. The whole of earthly existence is virtually a struggle to regain wisdom which has been lost. At least, there is an innate humanistic yearning to do so. Among lost abstract ideas, the only one which has visible form on earth is Beauty. The world of physical senses, and the inner sensual desires keep the soul from grasping consciously the abstract ideas of truth in the struggle to attain spiritual conceptions. The soul can live only in a realm of ideas. The theory of pre-existence and reminiscence in abstract ideas of truth is a doctrine of Immortality. Our successive existences constitute a progression toward more perfect union in universality of Being. The immutable laws of Nature flash upon the mind of the child; they are seen by the inner eye of the blind, and the deaf and silent read them in the universality of Being. Wordsworth's poem "We Are Seven" expresses beautifully nearness to Nature felt by the child who is unconscious of limits of thoughts of time and space. The child makes no distinction between earth and heaven; the dead brother and sister are still part of the family; death has no severance or separation for her, for in truth "We Are Seven." Death is birth and in it is the spirit of oneness. In childhood, unconsciously expressed, it is an intimation of Immortality.

Our birth is but a sleep and a forgetting:
The Soul that rises with us, our life's Star
Hath had elsewhere its setting,
And cometh from afar;

Not in entire forgetfulness,
And not in utter nakedness,
But trailing clouds of glory do we come
From God, *who is our home!*
Heaven lies about us in our infancy!

Consciousness of Perfect Being

Wordsworth brings us into consciousness of perfect Being. A poet cannot change Nature one way or another, but by tuning his thoughts to Nature he makes of himself a poet. In ordinary living, we are apt to feel that we are something apart from the whole of universality. Wordsworth makes us feel that we are parts of the whole and that we have our own individual identities. In using words as symbols of ideas that we may comprehend, he speaks of Nature and man, but he means that Nature is in man and man is in Nature, inseparable. The nearer we approach the spiritual plane the more nearly the two symbolical terms blend into one.

In our better moments we are inclined to attain finer attitudes and more spiritually refined conceptions than we are able to glimpse in ordinary daily conduct. In such moments we are more of our inner Being. We touch the better part of consciousness, which, after all, is in the essence of life. We do not receive from Nature what we give of ourselves, but in reality, we receive quite a different reflexion of ourselves, which has a close relationship of another than our mortal self.

Wisdom and Spirit of the Universe,
Thou Soul that art the Eternity of thought,
That givest to forms and images a breath
And everlasting motion.

The Universality of Life

The principle of activity in a creative, never-ending, boundless

universe is portrayed by Wordsworth's poetry. He believed that whatever acts must live; that the universe lives in its spirit, as we live in ours. To the one all-pervading oversoul and to this universal life he gave the name of Nature. To him Nature is active, and the spiritual manifestations of innumerable entities of the physical world which we recognise all about us are parts of the whole.

Yet whate'er enjoyments dwell
In the impenetrable cell
Of the silent heart, that Nature
Furnished to every creature;
A spirit and a pulse of good,
A life and soul to every mode of being
Inseparably linked.

Life Manifested in Physical Forms

In Wordsworth's poetry we find expression of manifestation of life in the tree, the rock, the cloud, the daffodil, but ever present is the underlying theme which makes one universal life condition itself in all. Sometimes he portrays Nature so vividly that the physical world is so diminished that we feel ourselves a part of pure spirit. Beyond the bounds of imagination and intuition we have no compass to guide our thoughts upon the uncharted sea. There is no substantive beyond the grasp of the mortal mind, so the poet must symbolize in his play of imagination. Frequently, Wordsworth skilfully depicted Nature's influence upon the physical world. This is delightfully done in the poem "Lucy," where Nature makes a little child beautiful.

Three years she grew in sun and showers,
Then Nature said "A lovelier flower
On earth was never sown:
This Child I to myself will take;

She shall be mine, and I will make
A Lady of my own,

And with me
The Girl, in rock and plain,
In earth and heaven, in glade and bower
Shall feel an overseeing power
To kindle and restrain."

Universality of Being

Wordsworth's poetry gives us the feeling of quietude in Nature. He takes us from the physical world into the realm of the invisible. He impresses us with consciousness of the oneness of things. The mountains lift up their peaks to the clouds, the stars twinkle peacefully, the sun sets to rise again, the flowers look up in silence, and though there are storms that darken the sky, and floods that mar the land, in the higher region of thought in which these things are seen in relation to universal Being there is

Central peace, subsisting heart
Of endless agitation.

Wordsworth's Philosophy of Life

Wordsworth never definitely stated his philosophy. His life and works are criteria of it. Numerous poetical expressions reveal his philosophical insight. His poems are convictions of his philosophy rather than explanations of them. There is mysticism in his poetry, but the mysticism in which he delved is the inevitable. When he searched for the deeper meaning of life, or undertook to discover the cause of invisible force or action that plays upon sensibilities, he found that mystery transcends intelligence, for mysticism begins where intellect fails to grasp what lies beyond. In this we have the starting point of Wordsworth's philosophy, which, in brief, is the acceptance of an all-pervading intelligence

in Nature, the universality of brotherhood, the pre-existence of the soul, and the Platonic theory of reminiscence.

For I have learned
To look on Nature, not as in the hour
Of thoughtless youth; but hearing oftentimes
The still, sad music of humanity,
Nor harsh nor grating, though of ample power
To chasten and subdue. And I have felt
A presence that disturbs me with the joy
Of elevated thoughts; a sense sublime
Of something far more deeply interfused,
Whose dwelling is the light of setting suns,
And the round ocean and the living air,
And the blue sky, and in the mind of man:
A motion and a spirit, that impels
All thinking things, all objects of all thought,
And rolls through all things.

An all-pervading spirit mingles with the human soul. Through emotions and intuitions, we beget mystical meanings, which give the convictions that lie at the foundation of our moral natures. These intimations of immortality that come from within cannot be clothed in speech. They are mixture of thought and feeling which do not come into clear consciousness. At such exalted moments, poetry, religion and philosophy blend into one sublime conception, producing a deeply seated faith in universality of life. Wordsworth's philosophy is not confined to a narrow channel, nor can it be circumscribed in a small field. It is embodied in the whole of Nature's realm. He did not wander off in devious ways to seek truth; he found it within himself, and it became his own when his soul mastered itself, possessed knowledge, and cleaved to truth.

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

THE RISING ORIENT

The December, 1936, number of *Asia* is wholly made up of articles by Asiatic writers, and at least two of them contain information which certainly suggests that the tide is indeed rising in parts of the Orient in the direction of basic Theosophical principles. Professor Hsu Ti-Shan, head of the department of Chinese literature at the University of Hong Kong, describes the remarkable development of Tao sects in recent years. While several of these organizations or societies preserve some of the superstitious accretions which have disgraced the name of Tao for a long time, and in a few cases a belief in the acquisition of 'supernatural' powers through sorcery still prevails, on the whole there has been progress, and at least two of the great Taoist Societies are working on truly progressive lines. The *Tao Yuan* (College of Tao), established in 1911 by Wu Fu-ying and now having more than three hundred branches, has combined the teachings of Tao, Confucius, Buddha, Christ, and Mohammed, claiming that they are all equally divinely inspired, and that all have the same origin! Professor Hsu says that in spite of some rather fantastic aspects of its methods, its sincere attempt to combine the rival religions of China into one universal faith based on the principle that "the final realities of the universe are *Tao* and *Teh*, or morality and virtue," is making an ever-widening appeal to intelligent Chinese, and is a proof that the Chinese can break through the wall of localism or extreme nationalism which is in danger of overwhelming the twentieth-century world.

The second organization, an outgrowth of the *Tao Yuan*, started as a relief work, a kind of 'Red Cross,' is called the World Red

Swastika Society, but it has nothing to do with politics. The four points of the swastika symbolize the Taoist idea of unity, and the entire symbol signifies the endless responsibility every individual has toward his fellows. It has already — since 1932—done an enormous work in relief of all kinds, not only in emergency cases but in such things as the maintenance of hospitals, asylums for the aged, workshops for the poor, and other constructive activities. It has a large membership and hundreds of branches. The regular members pay a large subscription and are liable to be called upon for heavy donations in emergencies. Outside of its relief work, its objects are stated to observe the doctrines of the eclectic Tao Yuan and to promote peace and understanding among nations. Professor Hsu concludes his article by saying:

No one can view the spectacular emergence of this organization without realizing that something has happened in China contrary to popular conception of Chinese individualism. The way in which the Chinese everywhere are responding to the ideals of an organization like the Red Swastika or its parent, the Tao Yuan, indicates most forcefully the appearance of a new spirit in the modern socially conscious Chinese mind. China's ancient Tao — the Way — may yet be her way out.

The second article in the December *Asia* to which attention is drawn is by Ivan Norodny, a Russian writer who has given much attention to Oriental mysticism as well as to the arts. He takes us to the weird Gobi Desert, once, as H. P. Blavatsky knew and declared long before modern research discovered it, the seat of a magnificent civilization, and still holding subterranean relics of great richness and beauty. In *Isis Unveiled* she gives some important statements about the Gobi, and prophesies discoveries which have since been made. We have only room for one or two sentences, but the reader will find pages 598 to 606, Volume I,

well worth comparing with the article in *Asia*. She says:

Occasionally some of the hidden treasures are uncovered but not a native dare touch them, for the whole district is under the ban of a mighty spell. Death would be the penalty According to local tradition, the tomb of Ghengiz Khan still exists near Lake Tabasun [Tashun] Nor . . . Within lies the Mongolian Alexander, as though asleep. After three more centuries he will awake and lead his people to new victories and another harvest of glory. Though this prophetic tradition may be received with ever so many grains of salt, we can affirm as a fact that the tomb itself is no fiction, nor has its amazing richness been exaggerated. . . . The time will come, sooner or later, when the dreadful sand of the desert will yield up its long-buried secrets, and then there will indeed be unlooked-for mortifications of our modern vanity. (S98-9)

She also mentions that Marco Polo — recently rehabilitated as a truthful reporter after centuries of vilification — "mentions more than once in his curious book of *Travels*, these tricky spirits of the deserts," and discusses the appearance of apparitions with whom conversation can be held in the Gobi Desert, not only in Marco Polo's day but in modern times. She quotes him as saying "even in the daytime one hears these spirits talking. And sometimes you shall hear the sound of a variety of musical instruments. . . ."

According to H P Blavatsky, the desert of Gobi, or Shamo, was not only the seat of a high civilization long perished, but, when a large part of it that is now perfectly dry was covered with water, twelve islands, symbolizing the Zodiacal signs, were "the abodes of twelve Hierophants and masters of wisdom." (*The Secret Doctrine*, II, 502.) Ten or twelve thousand years ago, she says, the whole of the low-lying land was transformed into a sea "for the

last time."

Then came another change, the inland sea was drained away, and a rich and fertile land was ready for habitation. The astonishing discoveries of Professor P. K. Kosloff, the famous Russian geographer, which were published in 1932, have proved that the brilliant civilization which arose in the vast area now covered with shifting sands possessed great cities, magnificent roads, temples, a highly developed cultural life, including the use of metals, advanced arts and sciences. About a thousand miles south of the city of Urga (now Ulan Bator) in Outer Mongolia, Professor Kosloff was permitted to excavate. Deep beneath the site of the far more modern city of Khara Khoto he found the tombs of some of the kings of the Uighurs, as this prehistoric white race is called. He calculated from what he believes reliable data, that the *latest* burial took place between 8,000 and 6,000 years before the Christian Era. He was allowed to copy everything he wished, but not to remove the smallest particle, and the vaulted tomb-chamber, whose ceiling was fifty feet below the ground, had to be left as he found it, covered to that depth with sand with its contents inviolate.

Dr. Lao Chin, the archaeologist who worked with Professor Kosloff, believes that the Uighur Empire was a center of intellectual light from which expeditions were sent to China, India, Egypt, and even Europe, to establish civilization among the barbarians. There is much to say for this, and H. P. Blavatsky makes several statements that are perfectly in harmony with such a theory, even to the approximate dates just mentioned.

In 1927 General Kosloff reported the finding of the tomb of Jenghiz Khan in the same neighborhood, near the ruins of the dead Jenghiz Khan's city of Khara Khoto, deep under which Kosloff had previously discovered the immensely older Uighur

relics. H. P. Blavatsky was right in believing that Jenghiz Khan's tomb would be found in the Gobi region near Lake Tashun, and also in speaking of its magnificence, for Kosloff reported that it vied with Tutankhamen's tomb in splendor.

In *Questions We All Ask*, Series I, No. 25, Dr. de Purucker speaks of the reawakening of the Orient, and says:

the Orient is beginning to stir uneasily from its long sleep ..
. Men and women living today will see marvels come to pass before they die.

China, hoary with age and experience, has but begun to awaken from an age of rest, and I tell you, Heaven help the pink-skinned man, who calls himself the white man, when once the Orient is on its feet, if we Occidentals at present having the responsibility in our hands, do not change the course of our action. The time has now come for us to instil into the Orient the light that once we took therefrom — lessons of self-forgetfulness, of forgiveness, of love, of peace, of justice, or, having sown the wind, we shall reap the whirlwind.

H. P. Blavatsky issued the same warning nearly fifty years ago, but in stronger language. She spoke of a prophecy well known in the Orient which threatened the invasion of decaying Europe by Chinese and Mongolians in revenge for the exploitation of the East. Professor Ossendowsky in his *Beasts, Men, and Gods* tells of meeting the same prophecy everywhere he went in Mongolia. Nicholas Roerich does the same, and Madame David-Neel, in her *The Superhuman Life of Gesar of Ling*, repeats the tale still more emphatically. To thousands, the almost mythical, but actually living King Gesar is the hero who will "exterminate all those who oppose the reign of justice."

Mr. Ivan Narodny's article in *Asia* deals with this matter, but he puts an entirely different aspect on it. Instead of being a conquest of blood and iron, however well-intentioned, it is to be a peaceful one. Gaimar, a famous oracle from Urga (now Ulan Bator) declares that a new creed of peace and brotherhood is to be declared to the world from the Gobi Desert, where great preparations are already being made. He says that the buried 'Golden Horde' is rising but not with carnal weapons; it will be a legion bearing the banners of universal brotherhood and goodwill. The difficulty in finding a successor to the recently deceased Dalai Lama of Tibet has given a strong impetus to this remarkable movement. Mr. Narodny says that seven hundred boy babies have been examined without success, and Gaimar's prediction that Lhasa will no longer be the home of the spiritual leader of the future is being taken very seriously. Gaimar mentions the strange phenomena that are alleged to have recently taken place in the Gobi as evidence that Nature is working with man in this new effort. Mr. Narodny says that fertility is beginning to return to the desert; lakes and rivers are filling with water from the increasing rains — indeed an unexpected phenomenon. Strange 'mirages,' such as were described by Marco Polo, are appearing, not mirages of the ordinary kind, but scenes from the past, accompanied by voices and other sounds! Dr. Lao Chin describes one he saw and heard in the desert, consisting of a procession of pilgrims following a group of Nestorian Christian monks whose chanting was very clear. The figures disappeared at a place where he found the buried ruins of a Nestorian cathedral of the time of Kublai Khan, with many valuable relics. He says that such phenomena are now frequent, and "even such academic observers as Sven Hedin and Roy Chapman Andrews speak of them as inexplicable experiences."

Mr. Narodny discusses the astonishing discoveries made in recent years by Professor Kosloff, Dr. Sven Hedin, Dr. Lao Chin, and Dr. G. Franck, especially mentioning those of the magnificent tomb of Jenghiz Khan, the love-letters of Alexander the Great, and the marvelous relics of the mysterious Uighur Empire. These revelations of the greatness of antiquity have, it seems, profoundly affected the imagination of the nomads of the Gobi, who have also been speculating about the meaning of the increasing humidity in the Gobi and the inexplicable 'mirages.' Already, an imposing temple is being started in the wilds about three hundred miles south of Ulan Bator (Urga). The builder, "Lama Donaldo," said to be an *American*, who has discovered a deposit of gold rich enough to finance the undertaking, knows little about the use to which the temple will be put, but he believes that the prophet will arrive as soon as the building is completed. Faith can move mountains!

Among a group of others in the nomadic East who are working for a new religion of Brotherhood, Mr. Narodny mentions the Princess Tani Hanum of Dzungaria who is superseding the outworn methods of the lamas in her principality by an appeal to the aesthetic side of human nature. She believes that the arts, including music, drama, poetry, the dance, and even the films, should be used to develop a consciousness of universal brotherhood which must be the aim of the new religion. She says: "A new spiritual light is necessary, which is neither in our lamaistic nor in the Christian teachings; so I am doing my small share here in the desert in creating what I feel will be the spiritual light of the future world."

Another energetic member of the 'Golden Horde' who has adopted peaceful means of conquering the world is an ex-lama, nearly one hundred years old, who was recently restored to the vigor of a strong man of middle age by the hermits of a so-called

legendary Himalayan group. He has inspired many with the belief that with a new gospel the wilderness can be transformed, but he proclaims that if only material prosperity is aimed for, it will be a curse. "The materialistic West has machines and money, but it does not find them to be blessings. . . . Let us work for a new code of guidance, a new spiritual side of our aspirations."

Surely all this — and much more not mentioned — shows the progress the Theosophical *Movement* is making in the world, even in apparently unlikely places. We must remember that although, as the Mahatma K. H. said in 1880 when the T. S. was very small, the Masters have weightier matters than small societies to think about, yet in 1882 he wrote to Mr. Sinnett, "There is more in this movement than you have yet had an inkling of, and the work of the T. S. is linked in with similar work that is secretly going on in all parts of the world." (*The Mahatma Letters to A. P. Sinnett*, p. 271.) The rising of the 'Golden Horde' of peace and brotherhood in the wild desert is a strong contrast to the former vision of world conquest and the establishment of a Utopia by blood and iron which has been so widely promulgated in Asia. Can it be that the Orient will set the West the example of putting into practice the Golden Rules which all its World-Teachers have given as the Way of Life? "Hatred ceaseth not by hatred"; "Thou shalt love thy neighbor as thyself."

LUNAR INFLUENCES

To the Theosophical student the question of the influence of the Moon upon terrestrial concerns is important, because it opens an immense field of thought which when logically followed up is of use in breaking down the purely mechanistic concept of the causes behind the superficial aspect of natural phenomena. It leads to the region of subtil causes in which the consciousness element is more evident. For instance, if we look on the Moon as

nothing more than a mass of dead, inert rock, possessing no energies but gravitation and magnetism and the like, the mechanistic view will perhaps be satisfactory enough; and to suggest that the Moon may have other and (to present-day scientists) 'occult' properties and influences on terrestrial life would be out of place. However, 'nature will out,' and more and more evidence is appearing from biological science in favor of lunar influence in reproduction of plants and animals. This has been considered one of the grossest superstitions of the antique mind, yet it was firmly believed in all parts of the world, and is still considered factual by millions. Once re-established, it may prove the door to an entirely unsuspected concept of the activities of the planets and their satellites, and indeed of the Sun, the ruler of the solar system. The latest information on the influence of the Moon upon ocean life (with which the Moon is seemingly especially associated, as it should be according to the Oriental teaching of the *Tattvas*) comes from Professor W. D. Hoyt, of Lee University, Lexington, Virginia, and Washington. We are indebted to the *Pathfinder*, January 2, 1937, for this report. Professor Hoyt says that "In the coastal waters of North Carolina, just below low tide, there grows a brown, flat ribbon-like seaweed called *Dictyota*. . . . The moon controls its sex life." He gives the results of sixteen years' painstaking experiment, which show that the 'fruits,' as they may be called, both male and female, ripen only when the Moon is full, most of them within a single hour of a single day, when action somewhat resembling pollination in higher plants takes place. Professor Hoyt further declares that his discoveries indicate that the Moon may have a *general* effect on fertility, and he mentions the known lunar influence on the reproduction of other marine life, including one species of fish, a mollusk, eight kinds of worms, and two starfish groups. Presumably he includes the well-known Palolo worm and the giant Sea-Urchin of the Gulf of Suez. Among the fish should be

included the California smelt and the English herring, the date of the lunar period of the latter being always officially announced for the benefit of the fishermen, who prepare for larger harvests at that time. In his opinion, a study of the relation of lunar phases to the periodic production of reproductive cells may eventually reveal facts about fertility "which are now scarcely suspected." We might say 'totally *unsuspected*,' and not be exaggerating.

The English scientific journal, *Nature*, publishes a report from the Marine Biological Association Laboratory, at Plymouth, England, announcing that the flickering light which Columbus saw the night before he saw land, and which has caused much discussion, almost certainly was not a torch, but probably the phosphorescent illumination from a sea-worm floating on the water, one of the *Syllids*. This light has been noticed in October at the third quarter of the moon, the date when Columbus was cheered by the flickering light. The third quarter of the Moon in October is also the exact date when the Palolo worm appears at the surface of the ocean for spawning purposes, one of the most striking examples of lunar influence.

**THE UNIVERSAL MYSTERY-LANGUAGE AND ITS
INTERPRETATION: XIV — *H. T. Edge***

THE LOTUS

Held sacred from the remotest antiquity as emblem of the productive power of Nature, both spiritual and physical. But in calling it a symbol, let us remember what has been said about symbols in general: that, as the word is used in these articles, a symbol is not an arbitrary sign chosen by somebody to represent something because it seems appropriate, but an actual manifestation of the idea or quality or power which it represents. The universe is a manifestation of the cosmic seed, and the plant kingdom is one of the hierarchies of the manifested world. There can be no potency or quality or principle in human nature, spiritual, mental, or physical, which has not its counterpart somewhere in the plant kingdom; in the plants we find an inexhaustible wealth of forms and colors and perfumes and curative essences; astrology and herbalism have found out what plants belong to what planetary spirits, and what are good for certain ills. The lotus must evidently be — not a plant arbitrarily chosen — but *the* plant in particular which wise men of old have discovered to be the actual counterpart of this universal productive power in Nature, whether we call it spiritual nature or physical nature, or what not. One feels, in studying what has been said about the symbolism, that more might have been said; but the truth of a revelation consists not so much in what is said as in what is conveyed to the mind of the hearer; and this latter must depend in no small degree on the condition of that mind.

The lotus grows in the earth, sends its stem through the water, and blossoms in the air and sun; so that it has its home in the four

elements and rises from the lowest to the highest. The seeds contain, even before they germinate, perfectly formed leaves, the miniature shape of the plants they will become. What better emblem could there be of that principle by which the part is a miniature of the whole? In a machine or a building, the parts do not at all resemble the whole; in an organism it is otherwise.

The lotus, says *The Secret Doctrine*, is the flower sacred to nature and her gods, and represents the abstract and the concrete universes. It was held sacred by the Aryan Hindus, the Egyptians, the Buddhists, and by China and Japan. The Christian Churches adopted the symbol using however the Easter or Madonna lily; in pictures of the Annunciation, Gabriel appears to the Virgin holding them in his hand. It typifies Fire and Water, the two creative principles. This is the same idea as that of the lotus in the hand of the Bodhisat who announces to Maha-Maya the birth of the Buddha. Osiris and Isis were represented in association with the lotus. The lotus is a well-known form of the capital in Egyptian columns. The lotus is the two-fold type of the divine and human hermaphrodite, being of dual sex. Fire and Water are the symbolic names of the two creative powers, the one being energetic, the other receptive and formative. They are Father-Mother, and produce the Son, which is the manifested universe, or a world, or man, or any other being that is produced. In the Bible, the Divine Spirit is represented as brooding on the waters of Space, and similar emblems are found in all other cosmogonies. The lotus symbolizes the emanation of the objective from the subjective, Divine Ideation passing into concrete form. In the first chapter of *Genesis* it is said: "And God said, Let the earth bring forth . . . the fruit tree yielding fruit after his kind, whose seed is in itself."

The analogy to the birth of a child is shown by the attachment of the seed-bearing flower by a long stalk to mother-earth, from

whom it draws nourishment; and in some representations a child is seen seated on the flower. But the original impersonal and pantheistic and reverential view of the early Aryans has been degraded in some later religions by attaching too much importance to the physiological aspect. The day of H. P. Blavatsky's death, May 8th, is called White Lotus Day, and the name is preserved in the Lotus-Circles for children which were founded under the inspiration of our great Leader.

The Theosophical Forum

THE DUAL ASPECT OF WISDOM (1) — A Trevor Barker

Friends: H. P. B. quoted in *The Secret Doctrine* those familiar words, "Knowledge dwells in heads replete with thoughts of other men, Wisdom in minds attentive to their own"; and an early Christian writer remarked that the business of Wisdom is to discern first that which is true and then to be able to discern that which is false. Now Theosophy — the Wisdom of the Ages — points out the fundamental duality, as it were, that runs throughout the manifested Universe: that while the whole of manifested nature is rooted in an indissoluble unity, which it is the business of Wisdom to discover so that we can realize it in our own consciousness, nevertheless, directly we pass in thought from that boundless, infinite unity which in this philosophy we call Parabrahman, the Absolute, then we come down in thought necessarily to the contrast in nature between Spirit and Matter, subject and object, and so forth.

This, applied to man, immediately shows us that we have a spiritual pole to our being, as well as a material one; and in *Isis Unveiled*, the first book of Mme. Blavatsky, she pointed out that there is indwelling within the external form of man and of the Universe a connecting link between Spirit and Matter, which in the human entity she calls "the Real Man." Now it is the whole purpose of Wisdom, I venture to suggest, to show how this inner Real Entity in man, which is the thinking, human, striving soul, the Personal Ego, the Astral Monad, the Manas — call it what you will — it is this Entity, as it were, fixed, crucified, in Space between heaven above and the earth beneath, which has to tread the Golgotha of life, which is a pilgrim marching literally through eternity, from age to age, but which is not unconditionally immortal.

Wherever there is a spark of the Boundless All, there you have all the sevenfold principles of life in embryo. It is purely a question of degree of unfoldment: the consciousness is latent in the life of an atom as it is in the highest God that your mind can rise to: therefore it will not come as a shock, the idea that this intermediate principle in man, striving towards Wisdom on the one hand, and pulled down towards matter on the other, is a being that has to win immortality; and the process by which he mounts the ladder of life, the stairway of evolution, is the seven rungs of his own being. Occultism is the process; as T. Subba Row said in the early days of this Movement: "It is the process by which man learns to transfer his individual consciousness from his mortal, material body, up the stairway of his being to the incorruptible world of non-being represented by his seventh principle." So Wisdom is that state of consciousness which is achieved when the human entity has learned how to merge itself into an indissoluble unity with its own Divine part, its Higher Self, the Higher Ego — what in Theosophical terminology is called Manas indissolubly united to Buddhi.

All men have this higher nature. It is, if we did but know it, a god not in embryo but in actuality, dwelling in full power, omniscient almost, one with the Universal World-Soul. And it is because this Higher Nature of ours is part of that indissoluble unity of the Supreme Soul itself, that we have an aspect of our being which is of the nature of Truth. Half our task is but to open ourselves, open a certain door of our being, that we may enter into the inspiration, the light, the knowledge, which is actually inherent in that part of our being.

I dared to call this lecture "The Dual Aspect of Wisdom," and while I do not want to concentrate attention too much upon the lower side, the lower aspect of wisdom, nevertheless it must be

evident to all of us, as was shown so perfectly by St. James in the New Testament, that there is a terrestrial, psychic, and devilish Wisdom, if it may be so called, as well as the Divine nature. I think that if you will permit me I will just read you the passage, because it shows the Wisdom that is to be found scattered throughout the New Testament. In the third Chapter (11-17), you find these words, and here is shown very beautifully the contrast between these two poles of man's being:

Doth a fountain send forth at the same place sweet water and bitter?

You will remember that H. P. B. in the early days of the Movement in a mood of protest at the lives of certain Theosophists, pointed out that pure water could not be given to the world out of a foul bucket, and that the lower nature of men must be cleansed.

Can the fig tree, my brethren, bear olive berries, either a vine, figs? so can no fountain both yield salt water and fresh.

Who is a wise man and endued with knowledge among you? let him show out of a good conversation his works with meekness of wisdom.

But if ye have bitter envying and strife in your hearts, glory not, and lie not against the truth.

This wisdom descendeth not from above, but is earthly, sensual, devilish.

I ask you to note that phrase:

This wisdom descendeth not from above, but is earthly, sensual, devilish. For where envying and strife is, there is confusion and every evil work.

But the wisdom that is from above is first pure, then peaceable, gentle, and easy to be intreated, full of mercy and good fruits, without partiality, and without hypocrisy.

There you get in the New Testament the statement — one of the statements — of the dual aspect of Wisdom; and H. P. B. has a remarkable article dealing with the subject in one of the early volumes of *Lucifer* (her own magazine) where she pointed out how often Theosophists are taken to task because they believe in the Wisdom of the Ancients: they uphold it, they stand for it, they believe in it; while the disciples of modern knowledge, so to speak, think and believe that modern scientists, modern inventions and thought and psychology and so-called philosophy, are in every way equal, if not superior, to the Wisdom of old. The question is, "Is that so?" H. P. B. challenges the whole position very, very strongly, and her words are so suggestive, so pregnant with illuminating ideas, as well as rather amusing, that I should like to read you some of the passages that she has in this article. She is replying to somebody who has put the point of view that modern wisdom is superior to the Ancient. She says:

. . . Our correspondent is welcome to his own views, but so are we to ours. Let him imagine that the Eiffel Tower dwarfs the Pyramid of Ghizeh into a mole-hill, and the Crystal Palace grounds transform the hanging gardens of Semiramis into a kitchen garden — if he likes. But if we are seriously "challenged" by him to show "in what respect our age of hourly progress and gigantic thought" — a progress a trifle marred, however, by our Huxleys being denounced by our Spurgeons, and the University ladies, senior classics and wranglers, by the "hallelujah lasses" — is inferior to the ages of, say, a hen-pecked "Socrates and a cross-legged Buddha," then we will answer him, giving him, of course, our own personal opinion.

Our age, we say, is inferior in wisdom to any other, because it professes, more visibly every day, *contempt for truth and justice, without which there can be no wisdom.* Because our civilization, built up of shams and appearances, is at best like a beautiful green morass, a bog, spread over a deadly quagmire. Because this century of culture and worship of matter, while offering prizes and premiums for every "best thing" under the sun, from the biggest baby and the largest orchid down to the strongest pugilist and the fattest pig, has no encouragement to offer to morality, no prize to give for any moral virtue. . . . (2)

(She is wonderful in the language she chooses, is H. P. B.!)

I think that none of us can question the truth of this challenge that she throws down; and some of you who have read that book called *The Mahatma Letters to A. P. Sinnett* will remember that one of the Masters there states that Wisdom will ever be denied but to those who seek it for its own sake without any secondary motive of turning it to personal profit and gain. The whole of the Theosophical Movement rests upon that high endeavor.

You will find the lower side of the dual aspect of Wisdom rampant in the world today. Go out and look, for example, at the advertisements in some present-day magazines, and there you will find every kind of psychism and claptrap and exploitation of human beings, where money is asked for initiation into so-called Rosicrucian rites; where the "secrets," so-called, of the Ancient Wisdom are offered to be sold for money in the market places of commerce. You will find every kind of medium, spiritualistic performance, and goodness knows what. Now all these things are expressions of this lower, psychic, terrestrial aspect of wisdom. It is not that the psychic and the so-called clairvoyant who take your money and offer to tell you something about yourself do not tell

you a good deal that you may find very interesting and true, and that may give you all sorts of pleasant dreams about the future, which often also are true. But the main point is that true Wisdom cannot be obtained where there are any motives of self-seeking of whatever kind; and anything in the nature of personal gain or taking of money in the realm of the occult is fatal to Wisdom; yet it is everywhere rampant at the present time, in this crisis in the world's history, when the earth is passing through one of the critical points of her great cycle. Men and women are looking at each other, examining themselves, not knowing quite what is going to happen; and it is at such times as these that the soothsayers and the clairvoyants and the like burst forth in a great crescendo of psychic activity — the terrestrial lower wisdom, if you like to call it so.

There is another aspect that we have to deal with. It is, briefly, that if there is a true Wisdom in the world, there is also a spurious wisdom, shown forth by this manifestation that I have been speaking about; and I must not fail to mention that it is pre-eminently shown forth in that flood of literature that may be termed pseudo-occult, pseudo-theosophic, which again diverts men's minds from the true Wisdom, fills them up with a lot of psychic junk. The seeds of thought that are in these books sink deep into the psychic nature of the individual, and bring forth but evil fruit. That is another manifestation; and further, one should mention here the fact that there is such a thing as wisdom in evil, where there are self-conscious human beings who have made evil their God, and who have a knowledge of all the laws of the universe, and can turn them to their own evil ends — in one word, sorcery.

These are some illustrations of the lower aspect of Wisdom. You can work them out in a thousand different ways; but I should like to dwell upon the higher aspect by referring to what are called in

certain parts of Theosophical literature, and the literature of the Ancients, the seven Jewels of Wisdom, which have relation exclusively to True Wisdom or Magic: those seven Golden Keys or key-doctrines around which *The Secret Doctrine* of Blavatsky was actually written. Test this statement for yourselves. Those seven doctrines I have no doubt you are absolutely familiar with, but may I just enumerate them for you? The first is the doctrine of Reincarnation; the second Karma, the law of cause and effect; the third the doctrine of Hierarchies, which means that everything in the universe is interlinked and interblended with everything else, which it really interpenetrates in its essential nature. You will see how everything in *The Secret Doctrine* can be related to one of these seven Jewels, and therefore they are worth remembering. The fourth is the doctrine of what in Sanskrit is called Swabhava, which is the essential characteristic of a thing, of a being, of a Monad. This, interpreted, means that a man is in his outward nature but a reflexion of what he is in his inward nature, and that everything in the universe is different, although rooted in unity; that there are not two beings in the universe alike, any more than there are any two atoms, or two grains of sand, or two flowers, or two trees, or two beasts, alike. Every single thing in the universe has its essential characteristic, its Swabhava, its keynote. You and I, we all, have our characteristic spiritual tone, our note, that we try to show forth; and in the great drama of life we learn to bring forth from within ourselves, that is from within that seed-root of Divinity, that Monad, the germ from which all our lower being springs, which is its Father in Heaven. It is this which provides our characteristic, essential true Self. It is the eternal "I" which never perishes.

The fifth key is the doctrine of Evolution; and the sixth is related to something that I was saying just now: it is the doctrine of what in Sanskrit — if you will forgive me for quoting a Sanskrit term

again — is called the Amrita-Yana and the Pratyeka-Yana, which means the right-hand Path and the left-hand Path, the Path that leads to Wisdom, and the path that leads downwards — the Path of Wisdom and the path of self. There again you see the contrast of the two aspects of Wisdom — the sixth of the keys around which *The Secret Doctrine* is written. And the last — Atma-Vidya, the knowledge of the Self and of the marvelous teachings concerning how the One becomes the Many.

I asked you to allow me to mention those seven keys to you for a particular purpose. There are certain formulae in the Theosophical system of thought that as a student I have found immensely helpful — things that one can make a part of one's being, and apply to any problem of life in meditation. Whenever one has a quiet moment one can revert to the statement of fundamental principles that is given in the twelfth chapter of Volume II of *Isis Unveiled*. There are ten of them. You can turn to that formula and to the three Fundamental Propositions in the Proem to *The Secret Doctrine*, and find the basis on which the whole philosophy is said to rest: these seven Jewels that I have just referred to, and the seven and ten Paramitas that are given in *The Voice of the Silence*.

Now the last thought that I want to leave with you is the correspondence between the order of the seven Paramitas, the Buddha's virtues which the disciple makes his code of ethical conduct, and the order of the Seven Jewels. The Paramitas are so beautiful that I will read them to you, and I want to try to show that this correspondence is most suggestive.

The first of these keys: *Dana*, "the key of charity and love immortal." At first sight does this connect with the first Jewel — the doctrine of Reincarnation? I believe you will find that it does if you think deeply enough about it, for reincarnation means

regeneration. Reincarnation or reimpodiment takes place in a human being when the indwelling consciousness has grown to that point where the existing form no longer serves it; and then there is a death of a certain part of the being, a regeneration and a rebirth into a higher state, into the higher part of the nature, and it is here and by this process that all love comes into a man's life. He cannot live or express Wisdom or Charity immortal unless this regenerative process is going on.

The second Paramita - — *Sila*, "the key of harmony in word and act, the key that counterbalances the cause and the effect and leaves no further room for Karmic action." I think that it is sufficiently obvious that the second Jewel, the doctrine of Karma, exactly corresponds to the second Paramita.

The third is not so obvious but contains an inspiring thought — *Kshanti*, "patience sweet, that nought can ruffle." How does this relate to the third of the Jewels, the doctrine of Hierarchies? I suggest that there is no more perfect example of that patience sweet that the disciple is called upon to show forth in his life than the Silent Watcher, who in *The Secret Doctrine*, you remember, is shown as sitting at the threshold of darkness which he will not quit until the weary, sore-footed pilgrims of humanity have each passed into the great Nirvana before him. That is the picture of the great summit, the Heaven of the spiritual, psychological Hierarchy of Adepts — the Silent Watcher of our world or Universe.

The fourth Paramita — *Viraga*, "indifference to pleasure and to pain, illusion conquered, truth alone perceived." I suggest that there is a very direct correspondence between that and the doctrine of Swabhava, the essential characteristic of a nature, for which you will have to go to the very root and core of a man's being. When the consciousness is rooted in the higher part of the

man's being, then only is it possible for it to show forth his perfect spiritual keynote or tone, and that balanced indifference to pleasure and pain.

Then *Virya*, "the dauntless energy that fights its way to the supernal TRUTH, out of the mire of lies terrestrial." What better illustration can you have of evolution than that Paramita? It depicts the whole struggle out of the corruption of matter to the incorruptible world of the Spirit. That is *Virya*, the dauntless energy and courage that we are called upon to develop.

The sixth Paramita — *Dhyana*, "whose gate once opened leads the Naljor towards the realm of Sat eternal and its ceaseless contemplation." This, being interpreted, means meditation; and meditation, as you will agree, I believe and hope, is intimately related to the sixth of the seven Jewels, that which is concerned with the Amrita-Yana, the Immortal vehicle, the right-hand Path; but there is no treading of this Path except by the practice of the Paramita called *Dhyana* or Meditation.

And the last — *Prajna*, "the key to which makes of a man a god, creating him a Bodhisattva, son of the Dhyanis." That relates to the last and final Jewel, Atma-Vidya, knowledge of the Self, the means by which the One, the Supreme, the Infinite, became the many in all this marvelous manifested Universe.

QUESTIONS ASKED OF DR. BARKER AT THE CLOSE OF HIS ADDRESS:

Question — To which, if any, of the different keys would you relate the law of cycles?

A. T. B. — I should relate it to the law of Reincarnation or Reimbodiment, which is a manifestation of the law of Cycles; but you must remember that all these Jewels in the Doctrines of Theosophy are interblended with each other. You cannot

understand one without the other. You cannot understand the law of Karma, the law of the rhythmic flow of cause and effect, which is also intimately related with the doctrine of Cycles, unless you understand the doctrine of ebb and flow as it expresses itself in the law of Reincarnation and Reimbodiment; for this is the rhythmic pulse of Nature that goes through the life-cycle of the tiniest infusoria: even a mosquito, a butterfly, any of these creatures exhibits the law of cycles — it reimbodies itself. Then, too, it is shown forth in the attraction of the tides; in the phases of the moon; in the pilgrimage of the planets in their orbit around the sun; in the birth and death of worlds, of solar systems: for worlds are born and die just as man, only in infinitely longer cycles of time. I think you can relate it to the first, and if you wish, to the second of the Jewels. I hope that this is responsive to the question.

Question — Is it correct to say that the left-hand Path is incomplete wisdom because mastery of the lower self has not been obtained? In other words, incomplete because inhibited by the personal?

A.T.B. — In a certain sense that is perfectly true, for we all of us fail to tread the highest Path in any moment that we act from a consciousness centered in our personality. It is the personality which enshrouds our spiritual vision and prevents our seeing the Light, and therefore prevents our seeing the right-hand Path. Do you remember the definition of these two Paths given by Master Koot Hoomi in *The Mahatma Letters to A. P. Sinnett*, where on a certain, left-hand page — I have forgotten the number, but a certain left-hand page (3) — he gave a definition of the Amrita-Yana and the Pratyeka-Yana, and he shows that these are simply another way of stating the doctrines relating to the individuality and the personality, and the Personal Ego and its identity with the Astral Monad? Now the Personal Ego is that, you remember,

which goes to Devachan; and what is the Personal Ego? The Personal Ego, he says, is a combination of the five lower principles; and the Immortal vehicle: Amrita-Yana, the Higher Ego, is, of course, the combination of Higher Manas united to Buddhi.

Question — Re the lower and distorted aspects of wisdom such as one finds in modern science and even psychism: do not they conform with the unity of Evolution, since in the Cosmic economy there can be no such thing as waste, and there may conceivably be people who need the left-hand Path to find the Right?

A. T. B. — I would interpret this in a slightly different sense, that is to say, what is called the descending arc and the ascending arc: the Path of forth-going, as it is called, and the Path of ascent, or return — the Path of Involution into matter, and Evolution out of it. I personally am a little in doubt about this idea that men need an evil path. I do not think that this is what is meant; but they do have to descend into matter, and they do have to evolve out of it; and there is another interesting point from a student's point of view here. You know the doctrine of a Planetary Chain, and you know that this Planetary Chain is represented symbolically as a ring of circles, and it goes down on the left side and goes up on the right side. The side on the left is the descending, and on the right the ascending arc. Has it ever occurred to you what is the correspondence in our lives of that idea? It is this: that when we live in the higher part of our being we express the spiritual qualities: we are identifying ourselves in consciousness with the superior qualities of the Planetary Chain, and what in Buddhist — or rather Brahmanistic — terminology is called the Lokas; but when we live in the lower part of our being we are concerning ourselves with the descending arc and with the talas — a stimulating thought: that we can live in the lokas, or in the talas: in the higher spiritual part of the being, or be buried in the

personal.

Question — Does not a study of technical Theosophy tempt one towards becoming merely an arm-chair philosopher? In other words, do you not think that the appeal of *The Secret Doctrine* is more to the intellect than to the heart?

A. T. B. — Those who have studied H. P. B.'s teachings realize that there is some truth in what the questioner has suggested: that it is possible to study these teachings and become a mere arm-chair philosopher. In other words, they can be studied from a purely intellectual point of view. You may become acquainted with a great deal of her teachings, and do nothing whatever about it, merely remain sitting on the fence or in your arm-chair, and entirely fail to lead the life, as she stressed in *The Secret Doctrine*, which is the necessary pre-requisite to an obtaining of any measure of Wisdom at all.

The Theosophist has a perfectly complete answer to the charge of the complexity of the doctrines hiding the essential life of the spirit — which is another way, I take it, of saying what the questioner meant. All I can say is that if any individual finds there to be such a doctrine, all he has to do is to concentrate upon the ethical aspects of the teaching, as found, for example, in *The Voice of the Silence*, in the seven Paramitas I read to you. I venture to think if he sets to work to practise the seven Paramitas of perfection, he will have his hands full; and if our brother will give himself that exercise I think he won't have much to complain about, because he will understand a very great deal by the time he has finished that exercise.

I imagine the Masters of Wisdom had a very good reason for casting their philosophy and message to the Western world in the way they did; and one must come to the conclusion that since the characteristic of our present age is an endeavor to develop the

thinking principle — a characteristic of our Western people is that they want reasons for everything — in the Theosophical philosophy they get a closely reasoned explanation for almost everything in the Universe. I think that is sufficient: if you want an explanation of the Universe there is the philosophy to satisfy you; and if you want to live the life, you have the Sermon on the Mount; you have the teachings of Buddha; you have the ethical principles of all the great religions, as well as the precepts to be found in *The Voice of the Silence*. It is only that the Theosophical system is infinitely rich not only in ethical ideas but in philosophy as well. There is food for the spirit, there is food for the heart, and satisfaction for the intellectual part of the man, in the whole system. At least that is how I understand it.

THEOSOPHY CAN EXPLAIN — L. L. W.

FALSE COMMUNICATION WITH OUR DEAD

If someone you love had just fallen asleep after a weary day of illness would you rush at him and wake him up to ask his advice about something important to yourself? Yet this is just about what we try to do when we seek to call the souls of our departed back into the troubles of this world. Unfortunately, there is nothing as a rule more selfish than personal grief. It centers entirely in *my* sufferings, *my* loss *my* loneliness; and considers the peace of the departed not at all. But — and how fortunate for them! — we cannot really disturb the dead in this way. We may, if we are selfishly violent and persistent enough, delay their blessed release into the peace and bliss of spiritual rest. But eventually they must slip away from us. And then because of our blind and ignorant selfishness. We shall not be able to keep in touch with them, as explained in our last talk.

Here is where you will be sure to ask about spiritualistic "messages." And you will remark that such communications have brought comfort to thousands. True enough. That kind of synthetic satisfaction is always ready to hand. But that is *false* communication with our dead. It really has nothing whatever to do with the departed Spirit-soul when we sit in at seances we are a good deal like the pathetic little dog listening to "his master's voice." Literally, that is all we are getting — an astral phonograph record thrown off by the shell, the mental-emotional energy-complex left behind by the departed. A *bona fide* medium can so to speak wind up this astral record. Some kind of parrot-message is the result — providing of course that the message is genuine, which all too frequently it isn't.

This shell or psychological complex of the departed is a left-over from the life just closed. After the death of the physical body it is sloughed off or laid aside by the Spirit-soul like a discarded glove. Does not a glove after long wear take on the characteristics of the wearer? How often a glove, or some other personal belonging, will be treasured for just this reason. It seems to hold the very atmosphere of the beloved dead. Actually, it does. It is saturated with his aura as the saying goes, his life-vibrations. How much more then will this be the case with the mental vesture, the shell or complex of lower psychological energies thrown aside by the dead. It is from this garment of mortality, this astral shell, that the messages of the seance-room are released. The elements which make up this shell belong to the temporary and material parts of the just-closed life. They were the man's disturbing loves, his hatreds, passions, emotions, and memories of a personal nature. These must be left behind if the man himself is to rest from "life's fitful fever." So after death the Spirit-soul casts these aside and clothes itself in the light of eternity. It then becomes invisible, and unapproachable to all but the Spirit-souls of those who unselfishly love it.

Now this psychological shell is far more durable than the physical body, being made of mental or ethereal substance. Of course, if left alone it too will in time dissolve away. But if it is agitated by our violent grief or stimulated by ignorant mediums it can be held together and made to last for many years and so delay the Spirit's passage into complete rest. Perhaps you see now why the communications psychically galvanized out of this soulless complex are always so parrot-like. Details of the past life or thoughts may be given accurately but it seems safe to say that no genuine "news from the other side" has ever been received through ordinary mediums. The "spirits" of great men always utter the flattest platitudes. And nothing has ever been added to

discovery in Science or in any other department of human thought by the murky echoes from seance-rooms. As for the hypothetical "Summerland," what is it but another parrot-reproduction of imperfect conditions of this imperfect world? It is merely another kind of Fool's Paradise. And the fact that thousands of sad and sincere hearts have found comfort in a belief in this so-called Summerland proves nothing.

There is too a decidedly unhealthy atmosphere about this kind of absorption in the affairs of the dead. A candid examination of all the phenomena of Spiritualism by one who has no emotional axe to grind will soon send him back to the sane light of the normal world. And this even though he may admit that many of the manifestations are facts. But he will see them as unwholesome facts fit only for the impersonal research of the ethical-scientific spirit.

Theosophy assures us that if we will lift our inmost hearts daily in pure unselfish aspiration, if we will constantly try to live our ideals, we shall be able to have *communion* with the Heavenworld of our dear ones. We shall not *communicate* with them. We cannot see or hear or touch. But we shall *know*, and knowing be at peace.

The Theosophical Forum

QUESTIONS AND ANSWERS: 323 & 324

QUESTION 323:

In *The Ocean of Theosophy* I came across this statement in chapter xiv, p. 124: "The Chinese always were a nation of astronomers, and have recorded observations reaching far back of the Christian era, but as they belong to an old race which is doomed to extinction — strange as the assertion may appear — their conclusions will not be correct for the Aryan races." _____ is of the opinion that G. de P. has said somewhere that China was on the upward trend of the present cycle. We have searched for the reference but have not been able to find it. Would you mind asking the Leader, at some time convenient for him, the truth of this matter? Mr. Judge may have written in a wider sense than the Leader who may have had in mind a small, specific cycle — that is if he mentioned China at all in this respect.

G. de P. — The questioner's understanding of my meaning is quite correct. Here we have a case where brief statements, each one correct, refer to different things; and readers who are too quick in perusal and not thoughtful enough, immediately say: Oh, a contradiction. There is none! The facts are as follows:

The Chinese, that is the pure Chinese or those nearly pure in race, are the degenerate descendants even today of the Seventh Sub-Race of the Atlantean Root-Race. Consequently, when we take in the immense periods of geologic time, they have nearly reached their end; and speaking in immense time-periods are soon "doomed to extinction"; but, speaking in terms of smaller time-periods such as we humans easily can grasp, that is to say of several thousands of years, which are small geologically, the Chinese still have a brilliant future before them, and are now on

the upward rise. There will be Chinese for thousands of years yet, although steadily mixing and showing a tendency to die out as pure Chinese.

Thus Judge is right because he was referring to long geologic periods so to speak. I was right because when I spoke, I was referring to the shorter time-periods of some thousands of years, or a good many hundreds of years. Actually the Chinese today are striving to come to the fore again as a national unit, and they will do so, and very soon, perhaps within a hundred years, and have a relatively brief period of power and glory, and then they will go down again; perhaps later rise to another still shorter period, and then go down again; and keep doing this until finally they vanish as a racial unit. Thus we can say with Judge that they are "doomed to extinction," for the reasons above given; and we can say with equal truth that they are rising on an ascending small cycle. What happens with the Chinese happens, or will happen, with all other racial units. Each has its turn; each has its beginning, its growth, its culmination in power and splendor, its senescence and decay, and its vanishing.

QUESTION 324:

Please say how these two quotations can be harmonized: ". . . the wave of spiritualistic phenomena . . . has been aided by the Nirmanakayas." (Last para., chap, xi, *Echoes from the Orient*) and ". . . the most insane and fatal of superstitions — Spiritualism." (*The Mahatma Letters to A. P. Sinnett*, p. 284.)

G. de P. — This certainly does look like a contradiction, but it is instead a paradox, and can be easily reconciled. I speak from recollection, as I have not the book at the moment before me, but as I recall the passage in Mr. Judge's *Echoes from the Orient*, when the entire context is taken into careful consideration, he himself reconciles the paradox. This reconciliation lies in remembering

two things, first that Spiritualism as it is commonly understood is a "superstition" and a very "fatal" one, that is as it is understood by spiritists generally, who look upon human beings after death as being merely a prolongation or continuation of the ordinary human earth-men in a purely mythical Summerland, where they appear to be living in a kind of inane and idiotic atmosphere of self-satisfaction. In fact, it is nothing but a dream-situation, and takes no account of the septenary constitution of man, nor the different parts of this constitution, and the destinies which these various parts respectively undergo after death.

It is the old folly of the everlasting personal, unchanging ego, which the Christians have adopted in another form; and the spiritists do not realize the truth. Hence, spiritism as understood is actually a truly "fatal superstition."

On the other hand, in a world which was typically materialistic when H. P. B. came to do her work in the West, which generally, excepting good Church people, had no belief whatsoever in the survival of anything in man, which looked upon man as being little more than a body, and his mind and emotions and ethical sense a kind of ethereal effluvium of the purely material forces working in the human brain — to such a world, I say, the teachings of the spiritists, which taught that there was something more in man than a mere physical body, even if it was only a kind of prolongation of the ego in a dreamland, was an idea which represented something higher than the grossly materialistic views of the scientists, and the equally materialistic views of the church people.

It was this touch of not exactly spirituality, but of looking to something higher than the material body, which was the part of spiritualism fostered by the Nirmanakayas as instilling in the mind of the materialistic West that man was something more

than the physical body, which as this West then thought as represented by its science, was the be-all and end-all of man.

Now the spiritistic phenomena which were utterly unexplainable by the materialistic science of the day, did instil thoughts of something more being in man than merely his body, unknown forces of a psychic and mental kind, which were, however, falsely called "spiritual"; and the foregoing is just the reason also why H. P. B., when she first began her public work, began to work among the spiritists, because they were trying to free themselves, however erroneously, from the dominant materialistic thought, teaching, tendencies, and soul-destroying hopelessness of the time. It was in this minor manner that the Nirmanakayas did, as it were, aid and support the spiritistic phenomena in so far as these latter were genuine and not faked.

Thus you see, the two quotations are not contradictions, but together form a paradox, and are easily explained in the above manner.

To summarize: Spiritism itself in the light of true knowledge is a "fatal superstition"; but yet the spiritistic phenomena when genuine and not faked are true, and taught and even yet do teach the materialists that man has forces in him and faculties and attributes which the materialists cannot explain by referring everything to man's physical vehicle. Hence these genuine phenomena were supported and even aided at that time, although now no longer aided, by the Nirmanakayas.

WEBS OF DESTINY — *H. T. Edge*

This title comes from a saying of H. P. Blavatsky: "From birth to death every man is weaving destiny around himself, as a spider does his web." There is another well-known saying which sums up the doctrine in a nutshell:

"Sow an act and you reap a habit; sow a habit and you reap a character; sow a character and you reap a destiny." That means, leaving out the intermediate links, that our destiny springs from our acts. Therefore, if man is responsible for his acts, he is responsible for his destiny. Goethe recognises this when he makes Faust say: "Du, stolzes Herz, du hast es ja gewollt." " 'Tis thou, proud heart, 'tis thou hast willed it so." 'Tis a proud moment for a man when he can rise up in his might and proclaim his own invincible soul. Then he ceases for a moment to blame God or Fate or his parents or other people for the unpleasant things of life. For a moment of illumination he realizes that he himself and he alone is the responsible person, reaping the just consequences of his own acts. But we do not live continually in such an atmosphere of exaltation, and for our more ordinary moments the consolations of philosophy are not to be despised. And, lest anyone carp at the word philosophy, let me remind you that each one of us has a philosophy of some kind or another, good, bad, or indifferent. If we don't like the word, we can call it something else; but there it is; and if your philosophy satisfies you, stick to it; but if not, seek a better.

It matters not what our religion or philosophy may be, we cannot get away from the fact that here we are. Each one of us has to make the best of the situation in which he finds himself. We may lean on props, but in the end we are driven back to our own

resources, to whatever strength we can find within ourselves. But in place of outworn theological dogmas and the negations of materialistic philosophy, it is much better to have a philosophy which explains and interprets the facts of life; which is what Theosophy does.

Nothing happens by accident; and chance is just a word which covers our ignorance. If we cannot trace the cause of a thing, we say it happened by chance, but that is no explanation — it is just a convenient phrase. There was a time when men blamed God for epidemics, but now we know they come from neglect of sanitation, and we do not blame God any more. That is a feather in the cap of science, by the way. But we still go on blaming God or luck for things that we cannot explain; who knows but later on we may find the right explanation for these things too, and so blame them on to the right place — our own shoulders?

We see people around us reaping harvests of sorrow, and likely enough we ourselves have had our share. But then do we not see people *sowing* harvests of sorrow? Some people are sowing the wind; others are reaping the whirlwind; some are doing their best to break themselves up; others are laboring to put themselves together again. Some are ruining good constitutions; others painfully striving to improve bad ones. Some are squandering; others painfully gathering. And so on. Life is a mass of effects without visible causes, and of causes without visible effects. But the reason why we so often fail to connect effect with cause is that we take too narrow a view of the range of human life; we see but a small part of the picture. Religious people say that in the eye of God all is just; but Theosophy says that in the eye of man all may be recognised as just, if only that eye is fully opened. However, we must not expect to leap at a bound from ignorance to knowledge, but must be content to move by degrees. Theosophy is able to give quite a new picture of life which gives

us confidence in the universe and its laws in ourselves. The following is taken from an English translation of one of the novels of Alexandre Dumas:

There is a moment in the affairs of every man which decides his future. This moment, however important it may be, is rarely prepared by calculation or directed by will. It is almost always *chance* which takes a man as the wind does a leaf, and throws him into some new and unknown path, whence, once entered, he is obliged to obey a superior force, and where, believing himself free, he is but the slave of circumstances and the plaything of events.

Note — it is *chance* that is said to determine our actions in a crisis; and we are the plaything of circumstances and events. But chance is only a name for undiscerned causes, not a cause in itself. There is no such thing as a mysterious power called chance which rules us; it is only a word we use when we do not know the real cause. A man's decision in a crisis is determined by the character which he has stored up by all his past thoughts and desires and acts. Such moments are testing times, and our subsequent fate is thus decided by the total effect of our life up to that time.

But what, you may ask, about the apparently casual circumstances that produce such powerful effects in crises like these? Let us take an illustration. You turn down a side street and there arrive just in time to meet somebody, whom a little earlier or a little later you would have missed; and this meeting changes the whole course of your life. Or again, you meet with a sudden accident, which cripples you for a longer or shorter period, and again alters your life. Are such events casual? No, we cannot see the connexion, but it must be there; for there can be no results without causes. But the explanation is quite simple: it is merely that we do not know all the laws of nature; and consequently

many things must happen which we cannot explain. But this does not mean that we cannot know them or that we never shall know them. We already know more than some of our ancestors did. It is only a question of more knowledge when we shall be able to trace the causes of events which seem to us now to be casual.

I admit that it is not easy to see what is the cause that decides a man to turn to the right or the left, or that brings upon him sudden accident or bereavement or illness; but we know two things: (1) that there must be a cause; (2) that there must be many causes which our present faculties are unable to discern. Our faculties are either complete or incomplete: if the former, we are all-wise, masters of wisdom; if the latter, there must be things we do not know.

Now let us take a glance at modern civilization and ask what have been our means of knowledge. Religion has bid us rely on Providence, but has not gone into details; science has concerned itself with the world of the bodily senses, and with sundry metaphysical speculations as to what underlies it. So we can see that the reason why we understand so little is that we have not studied. If we begin to study along these lines we shall know more; but we neither can nor should expect to know the whole mystery at once. But every student who is pursuing a course of study has to take some things provisionally on faith, knowing that, though he cannot prove them now, he will be able to do so later on. If he objects to such a procedure, he will have to remain ignorant.

In the meantime it makes an immense difference to our outlook on life if we can accept the idea that the whole universe is pervaded by order, and that our own individual lives partake in this universal order and harmony and justice. Our experiences in this life are conditioned by our acts in this life or in an earlier life;

but our actions are not determined, because man is divine in his essence, and this fact gives him the power of regulating his own conduct. It depends on man himself how he will confront the circumstances which his self-created destiny has made for him.

We weave our destiny round ourselves by our thoughts. A thought is an act. It is a potent energy, especially when accompanied by desire or any other emotion. It leaves us, and we do not trace its subsequent history. Like enough, it will come home to roost; and thus habits are engendered. And so on, as aforesaid, to character and destiny. But whence come the thoughts which enter our mind? Have we ever stopped to inquire? Must they not come from a thought atmosphere, into which all of us are sending thoughts, and from which we are all taking thoughts? We dwell in a thought atmosphere like fish in water, and there is constant intercourse. All our destiny is bound up with that of our fellows, for good or for ill. This is an individualistic age, and people often make a great fuss about the possible effect of their own actions upon themselves. But what about the effect of our actions on other people? This is surely the most important point. If a study of the universal doctrine of consequences is merely to focus each man's attention more strongly on his own personal interests, the great problem of human welfare will only be intensified and not solved; for what we are suffering from is a lack of the sense of solidarity and of our duty to others. As has been pointed out by H. P. Blavatsky, no man can sin alone; so a knowledge of the truth deprives us of the excuse that we can sin in secret and thus escape doing harm to our fellows. Our evil thoughts will poison the atmosphere that others breathe; but correspondingly our noble thoughts will help others through the invisible channels of communication.

Man passes through many deaths and rebirths, but the life of the real man within is continuous through all these changes of the

outer man. Consequently the character and destiny which we create for ourselves persist throughout and the chain of cause and effect is continued past the gates of death and rebirth. As the law of analogy is true throughout the universe, we can compare man with a seed. This seed generates a plant, the plant lives and dies; but it produces more seeds which perpetuate its essence, so that other plants of the same kind are produced. When we die, we die down, as it were, like a plant that withers; but there is no ultimate death; for there is regeneration from the germ that is preserved. At death we cast off our outer garments, one by one; and at rebirth we rebuild for ourselves new garments; but the character we have made for ourselves has been preserved latent in the germ and will be reconstituted. Thus each child born on earth has his own individual character, which unfolds itself as he grows, taking its materials from his parentage and his surroundings, just as a growing plant takes its materials from soil and air.

If we can grasp these teachings as to the reign of just and unerring law throughout the universe; if we can realize that every man is in his essence divine; we shall be able to acquire a new sense both of our power and of our responsibility, and shall no longer be content to drift along waiting for some outside power to do our work for us, or trying to escape the burden of thought by absorbing ourselves in external distractions.

NATURE STUDIES: I — *H. Percy Leonard*

THE SUN GOD

"A largeness universal like the sun." — *Shakespeare*

The modern mind has been so clouded and benumbed by looking upon Nature as a dead machine controlled by a Creator far away, that we can hardly follow the free flight of ancient thought which viewed the Universe as if it pulsed with life in every part. The ancients moved about the world with ever fresh delight and saw no desolate, forsaken spots although they passed through lands without inhabitants. The moving sea, the shady groves, the sunlit rocks and running streams were thickly peopled by divinities and haunted by glad throngs of nature spirits. The sun was not a ball of incandescent lava but the glittering raiment of a god thus veiled from mortal sight, through whose incessant bounty all living things were sustained. We may however get some little understanding of the ancient point of view helped by the very Science that has sometimes seemed to have destroyed that standing-ground.

The microscope has shown us living forms which are as round as marbles, and recently it has been shown that electricity can exist in a globular form, so that we run counter to no fact of ascertained knowledge if we try to imagine the sun as being truly alive, and imbodyed in a vehicle of electric matter. The solar orb may be perhaps a vast intelligence enveloped in a living frame of stationary lightning, a temple fit for such august divinity. There is no need *en passant* to remind the intelligent reader that heat and light may be derived from a source which is both cool and non-luminous. Every incandescent electric lamp generates heat and light by setting up local resistance to a current supplied from a

distant dynamo. The sun hangs in space beholden to no external source of light and from the dark robes of primeval night he spins a shining garment of dazzling brightness. He floods the boundless aether with his glory and the swift currents of his vitalizing force bathe the remotest regions of the solar system.

There is nothing parasitic or dependent about the sun. He is an infinite bestower, an exhaustless generator. No shadow ever falls athwart his face. He has no barren intervals in his existence. Dwelling in the central fountain whence all energy proceeds he gives with neither pause nor stint and fears no scarcity or want. Perpetual positivity is his condition and as the ceaseless rivers of the cosmic force take rise in his huge heart he thus repels all hostile influence from without. And we — need we for ever be consumers merely of the sun's beneficence, and paupers in the universe? Why should not man in emulation of the bright divinity become himself a sun to the society in which he lives? Can we not spin a shining garment from surrounding gloom and generate from source unseen a flow of life and brightness for our brothers in the dark? To our confusion be it said that we too often live upon the love of others. We are indolently satisfied to be receivers when we might originate instead. We make appeals for sympathy, attention and applause, and yet if we but willed we might be always giving like the god of day. Hail Great Sun!

The Theosophical Forum

WHAT SURVIVES DEATH? (1) — A. Trevor Barker

[This lecture dealing with after-death states clarifies certain points of teaching, often hazy in the minds of students, that deal with the Theosophical explanation of Spiritistic phenomena. The occurrences in the seance-room cannot be satisfactorily explained without the light that Theosophy has to throw on the process of man's disimbodiment at death. — Eds.]

Our subject is one that must be of intimate and personal concern to every one of us. Every thinking man sooner or later is brought up against this problem, and we have to admit that the religious Christian teaching of the West is almost entirely lacking in a satisfactory explanation of the important question. You may search the New Testament, and, although you will find ethical teaching of deep Wisdom that will satisfy you for the living of your daily life — you will find it there in all its purity if you have the eyes to read it and to understand it — the teaching about the life after death is not given there. It is one of those Teachings that Jesus kept for his disciples, whom he taught in secret, and to whom he explained those Mysteries that Christian priests are inclined to say "were never meant for you and me to understand: they are something over which Nature has drawn a veil, and it is not for us to penetrate, either by the opening of the psychic senses, or by the penetration and understanding of our intellects."

It is because of this lack of information in the orthodox Christian sources in the West that a tremendous demand has been made for at least the last fifty years by the thinking and progressive people for something more satisfying, and the two main Movements that have striven to satisfy that very natural human yearning are: the Spiritualistic Movement, so-called, and the

Theosophical Movement. Somewhere about 1850 the investigation of psychic and occult phenomena began to develop very strongly in America, and before long mediums whose names will probably be well known to those who are students of the subject, began to perform phenomena in public, and a good deal of evidence was collected; but it aroused, of course, an enormous amount of opposition and incredulity, and the said mediums were getting into very deep water because they were accused — and in many cases unfortunately quite rightly — of fraud.

Eventually H. P. Blavatsky, who was at the time in Europe, set out to America to see whether she could do something to give this Spiritualistic Movement a very much needed upward impulse, while providing at the same time a philosophical and rational explanation of the occult phenomena which were undoubtedly taking place even under test conditions. While unmasking fraud where it existed, she also sought to give some help and protection to those mediumistic sensitives who were doing their best, according to their lights, to lead men from a purely materialistic outlook to something which was in their view more spiritual — and all men must admit that if their beliefs were not spiritual at least they were super-physical.

So into that world came H. P. Blavatsky, able to perform with the power of her own will the very phenomena that the psychics of New York and Boston were performing they knew not how, as the unconscious instruments of certain forces which controlled and utilized them. And that is a true definition of what a medium is. A medium can function only when some exterior agency takes possession of the lower instrument, which by a variety of means is rendered unconscious: either by trance or hypnotism, or by some other means. Therefore these mediums have no longer any control of their mechanism of consciousness, and they claim that the fact that some invisible, and as they call it *spiritual*, entity,

takes possession of their vehicle and produces varieties of phenomena, proves that their experience is valuable and must be useful and uplifting. It is precisely upon these points that H. P. Blavatsky, while confirming the genuineness of many of these phenomena, uttered a tremendous challenge to all those who accepted the main spiritualistic hypothesis, viz: that these phenomena were the production of excarnate human entities who had returned, so to speak, from the veil of death in order to communicate with their friends who were still living on earth.

H. P. Blavatsky was, as always, extremely uncompromising on the point; she showed, demonstrated, and taught, that these phenomena were not produced by the excarnate human entities that they represented themselves to be. Not at all. There were the phenomena that take place with various kinds of automatic writing; the phenomena of speech that take place in trance; the sermons that were uttered by an entranced medium; and particularly the materializations whereby the images or faces of people that sitters were able to recognise, were materialized by a certain process, thus becoming visible to the audience.

Now the Theosophical teaching in regard to these matters is something entirely different from the Spiritualistic belief, and one of the great truths that H. P. B. hammered home was the fact that these pursuits, these investigations, into the psychic realms of Nature, were actually more materialistic from a certain point of view — that is from a spiritual point of view they were actually more materialistic — than a purely materialistic outlook. She showed, and history proves her to have been correct, that the individuals who pursue these investigations of a psychic nature, who attend Spiritualistic seances, for example, and who constantly have their minds and emotions concentrated in these unwholesome psychic realms, become thereby debased: their spiritual, psychic, physical, and in some cases their moral tone

suffers, by reason of the fact that the minds of such people are being concentrated in the world of ghosts and spooks — the atmosphere of the graveyard in other words; and this is an unwholesome thing. Moreover, H. P. Blavatsky pointed out with great truth the extraordinarily unsatisfactory results that come about for the mediums themselves.

To turn from this aspect. Afterwards, if you wish, you can ask questions in regard to this psychic side of the matter, but I should prefer to turn to the Theosophical teaching as to what happens to the personal man after death. What is the personal man? He is the collection of psychic, and mental energies and emotions which express themselves through the physical body of man during life. A new combination of those bundles of energies is made at the beginning of earth-life for every entity. He is a new combination, and that combination is given a name and a form such as you and I now bear. That combination has never existed before; it never bore that name before, and as such it will never exist again. It is here for a short while; it is transitory; and if we believe that this lower personality of ours is all that there is to survive; if we concentrate our attention upon its wants and needs, and are unable to raise our thought and aspiration to something higher; then we shall be of that vast company that H. P. Blavatsky called "the living dead"; the soulless individuals that she said we elbow at every street-corner.

If anything is to survive death, surely you will agree that it has to be worthy of immortality, and therefore the question immediately arises: Is man immortal according to the Theosophical teaching, or is he not? What has just been said would lead you to suppose that man is very decidedly mortal, and one part of him unquestionably is; but if we go a little deeper we find that this personal part of the man is, after all, only the envelop, the container, the instrument, the vehicle through which

the flame of spiritual consciousness is striving to irradiate and illuminate and guide this erring personal entity through the intricacies of earth-life, through which intricacies many there are who lose their way.

Therefore we come to the position that man is only conditionally immortal: in other words the real entity who is living his life, and trying to express himself through this lower personality, has to find the way to raise himself inwards and upwards into union with the spiritual, permanent, eternal and immortal part of his own nature; and it is precisely that task that every initiated Adept has succeeded in doing to a greater or less extent. The whole purpose of occult science, the object of the initiation of the Initiate, is to bring him to a recognition that there is within, and brooding above the human individual, a definite entity which can be reached, the energy of which even today for every one of us shines into our personal nature in moments of crisis (personal and otherwise) when the personal man is, as it were, driven right down to his very foundations. It is, then, that he is forced to look inward and upward to the only source of inspiration that any man really has when he reaches bedrock; and there, when he finds that "still small voice" that can make itself heard if he listens for it (it is the inspiration to spiritual actions of whatever kind, to kindly human actions), there is at these moments the guiding and the saving spiritual energy that comes from the immortal part of his being. For most of us this contact is fragmentary; it is spasmodic; but we do get glimpses of it. It is the main purpose of the study of Theosophical Wisdom: that we shall learn how to make our human brains porous, as Mr. Judge used to say, to that higher influence; so that day by day, week by week, it will beat down into our brains and we shall become more and more permanently aware of that spiritual influence in our lives.

Now this can be done without any mediumship — in fact

mediumship militates against the spiritual influence; and yet, you see, the difficulty is that the psychic intermediate state offers such an attractive door to some natures. It is true that with very little difficulty the psychic senses can be opened by every one of us, and then we shall become aware of various kinds of entities that the spiritualists call their "spirit guides" and "angel guides" and what not. If they could see the said guides face to face I think they would get a very rude kind of shock. H. P. Blavatsky went so far as to state that most of the angel and spirit guides that come to mediumistic seances are the spooks of departed entities — not the entities themselves any more than your body is you — and you know the state of the human body after it is buried! You can easily imagine that after death the psychic remnants of your being are not in the cleanest condition. In other words they are disintegrating; and this part of our being, this cast-off remnant through which we expressed our psychic and intellectual emotions during life, has a form in the psychic worlds, which can be seen by sensitives, and it bears the shape and appearance of the human individuals that we were in life. So much so that a perfectly correct description can be given of Mrs. Jones or Mr. Smith, and the sitters can immediately say, "Oh, that is dear Mary," or "our John." "Nobody else was ever just like that. This must be a very holy person who is giving us all this interesting psychic information," — and they believe everything they are told.

Yet what has actually happened? Two things at least are possible, both of them quite different from the explanation given by the believers in the Spiritualistic Movement, and these explanations are definitely interesting. First of all every one of us, in the magnetic sphere that surrounds us, contains an indelible record of every thought and act that we have ever committed from early infancy to old age — a somewhat staggering, perhaps

uncomfortable thought; because any mediumistic sensitive can read in this aura or magnetic sphere all that we are doing or have done, and incidentally can see, therefore, an image of those people who have made the deepest impression on our lives, and it is in this way that many descriptions and personal incidents are related without the entity concerned even being present. Exactly the same thing can be done from the memory of Nature, for there is recorded everything that takes place in any individual life, and if the psychic is sufficiently developed, that impression on the astral light can also be read. So these are two possible explanations of phenomena; and yet a third, and a very frequent one, is that the incarnate entity is attracted to the seance, and that spook or ghost (whatever you like to call it) has a complete record of everything that it did and thought and said, but it has no power to act on its own; it is an unconscious bundle of energies that can only be stimulated or galvanized into activity by the psychic and electrical energy of the peculiar power of mediumship. That energy stimulates the ghost and it will play like a phonograph or a gramophone the records of anything that you like to call out from it, generally determined by the particular personal recollections of the sitters.

All the personal part of the man is doomed to disintegration, and only the part that is worthy of immortality really survives. According to the teachings of Theosophy the real entity in man very soon after death falls asleep and becomes unconscious, and in a longer or shorter period of time, determined by the relative degree of spirituality of the individual — the more spiritual the quicker does he shake off the lower vehicles of consciousness, the psychic part of him — he then enters into a period which technically has been called the gestation state, exactly corresponding to the period of gestation of the human entity before physical birth. I should like you, if you will, to note the fact

that there is a state after death exactly analogous to the state of gestation of the foetus before physical birth. One of the great Teachers to whom we owe some of the Theosophical teachings has recommended us to keep a spiritual eye upon the physiological processes of human birth if we want to understand some of the mysteries of nature: mosquitos, animals, and man, as well as planets and solar systems, come to birth by identically the same process.

So this entity after death sinks into a state of sleep; and after a certain period of time, which is determined by the ethereality of the spiritual energies that it generated during life, it is reborn in the Devachan, the region of the Gods (the Heaven world in the Christian language), as a little child, and there it will live over again — minus all recollections of the personal lower things; the evil passions, desires, hatreds and so on — it lives over again a kind of spiritualized recollection of all the beautiful and spiritual things that the entity dreamed about during life. Very few of us succeed in working out practically our spiritual aspirations and dreams. We have busy, work-a-day lives, and much remains to be worked out in the after-death state: in this ideal world we live from birth, through youth, adulthood, middle age and old age, and we assimilate and get the very maximum understanding and development of all those aspirations of a spiritual kind that we had during life.

But even this state one of these days comes to an end; and eventually when the period of assimilation and digestion, spiritually speaking, of these energies is completed, then the hour strikes and the entity once again is drawn back inevitably to earth-life, for the fact that it has experienced this state of Devachan, which is a kind of spiritual illusion, though a very high one — the fact that it has experienced that state proves that it has not yet won its freedom from the wheel of birth and death. One of

these days we all have to learn the lesson that even that state, which is only possible to those who lead relatively spiritual lives — *relatively* spiritual: an arrant materialist will not have that experience, and therefore it is a step forward — we all have to learn, I say, that there is a still further step, and that will come when we as individuals learn how to think and act so that the full spiritual meaning of every action and event is assimilated here and now, and for that we have to be fully self-conscious individuals. Then for us the interior worlds are open; there is no more death for us for there is no break in consciousness: consciousness proceeds unbroken, through sleeping and waking, through birth and death. Such a one is worthy and able to bear the burden of his immortality, but he has no Devachan in the sense of which I have been speaking of it. Periods of rest he must have, but that stage of illusion he has conquered and gone beyond.

COSMIC PHYSIOLOGY — J. W. A. Croiset van Uchelen

(In the following article a short, popular resume has been given of the work by G E Sutchffe, published under the title *The New Astronomy and Cosmic Physiology*, in an attempt to familiarize the reader with these fascinating researches and with the works to be published later on from his manuscripts, dealing with these subjects in a more detailed manner. The portions in smaller type, unless otherwise indicated, are from Sutchffe's book, though not quoted verbatim)

The Western and Eastern outlook upon the origin and history of our Universe are widely at variance, and it is only recently that attempts have been made to reconcile the instrumental efficiency of the West, with the consciousness efficiency of the East, and to apply this combination to the great problem of physics. Briefly and crudely the outlook of Western science was that after an eternity of time had elapsed, the expanse of space was filled with a nebulous mass of matter, consisting probably of the higher elements known to chemistry, upon which the force of gravity began to operate, eventually resulting in a system of stars — one of the stars, although quite ordinary in its general characteristics, in one respect being "a freak," namely the one on which we happen to live! Of course this presentation will be regarded as a *reductio ad absurdum*, but it does accentuate correctly the points of difference between the conclusions of so-called pure physics and those we shall attempt to deduct from the new scientific presentation, under the name of New Astronomy and Cosmic Physiology, the main difference being, that in Cosmic Physiology the life-element is dominant and all-pervading, as contrasted with the formulations presented by Astronomy so far, albeit a change of concepts is in progress. Nevertheless, up to less than a decade

ago, physicists considered that the material forces of nature were determinate; that is to say, given the forces, then from the laws of physics the future results, or the working out of these forces, could be predicted. When life is present this is not the case. The physical forces operating on a dog could possibly be defined, but we could not determine from these when the dog would wag its tail, for this event would be governed, not by physical, but by life-forces.

More recently, however, some scientists have stated that the result of forces for individual atoms, or groups of atoms, was indeterminate. Hence in the case of the atom we were placed in the same difficulty as in the wagging of the dog's tail. In other words there was a hiatus, or gap, in Nature which could possibly be filled by life-forces. In fact we had made room for the Divine Immanence in the physical Universe. It was evidently conceivable that this universe was worked, not by physical forces alone, but by a combination of physical *and* living forces, since every atom of matter, under all conditions, contains an element of life.

The new discoveries, since the end of the last century, seemed to confirm the Eastern concepts, to the same degree as they disturbed the Western, which encouraged some scientists and investigators to imbibe the Eastern thoughts more fully. The new concept upon which they based their investigations may be expressed as follows: Every object, small or great, a human being, an atom, or a planet, is the center of two concentric spheres. One of these spheres is expanding from the center, and the other condensing into it. To put it in another form, the ocean of space is swallowing the drop, but the drop is also swallowing the ocean of space. The first of these propositions is well known to physicists, for a source of light is the center of an expanding sphere, the wavefront being the periphery.

In the case of light we are dealing with an object at high temperature procuring radiations of a wavelength within the visible spectrum, but objects at lower temperature do the same thing, only the wavelengths being in the infrared region are not visible. It is one of the known facts of optics.

It is the converse fact, the sphere contracting into the object having the light-source at the circumference — in addition to being the center of an expanding sphere — that is new to the West, despite the fact that the null effect of the Michelson and Morley experiment gave an unaccepted testimony. For if it was correct that there is only one ether-medium, as Western Science held — contrary to Eastern science which teaches that every planetary body has its own ether — then the M. & M. experiment would have demonstrated this. But it failed, and continues to do so, however carefully and repeatedly it is tried. The logical conclusion therefore is that the earth carries about its own ether, so that the earth is the center of two spheres, one expanding, the other contracting, according to the concept taught in the East. Nevertheless the physicists for the time being have rejected this idea and they gave us instead the theory of relativity of Einstein fame.

As we know, Einstein's theory, confirmed by observation, states that when a light ray, from a star to the earth, passes near the sun's surface, the sun's attraction causes the line to be curved, the curvature being twice that which follows from Newton's gravity law. This as we now can see is not due to a defect in Newton's law, but to a defect in the current radiation theory, as the physicist has only taken into account the expanding sphere but had not yet recognised the corresponding sphere of contraction to account for this phenomenon.

Cosmic Physiology was to be aided by still another revolution in

scientific thought due to Heisenberg, who in 1925 put forward his new theory. He laid down the fundamental idea that only such things as are directly open to observation should enter into the mathematical formulae, to be left uncontaminated by obstructing theories. All one needed to do was to insert the observed facts into the mathematical mill and grind out the truth. The effect was tested by other forms of mathematics. Bohr, Einstein, Eddington and others entered the field and the conclusions arrived at were mutually confirmatory. One of the results of this process was the discovery by de Broglie and others that a ray of light, or electromagnetic radiation, consists of a sheath and a core, these lines of force being constituted somewhat like an Atlantic cable in which current passes along the sheath and returns along the core, or *vice versa* (these velocities being related to each other and to the velocity of the electron). Another phenomenon which had gradually emerged was the existence of what are termed sub-ethers. Now these sub-ethers are the vascular and nervous system of the cosmos which bind it into an organic whole. And this part of Schrodinger's work is therefore as important to the New Astronomy as was Harvey's discovery of the circulation of the blood to physiology.

Obviously the circulation of the blood is not concerned with gravity, but with life phenomena. And just as Astronomy is concerned with the force of gravity, so is Cosmic Physiology concerned with the phenomena of life.

Schrodinger has discovered the blood; later discoveries will disclose the laws of its circulation.

The function of the blood is to renew and revivify the cells of the body; the function of the vascular system of the Cosmos is to renew and revivify the atoms of matter.

Eddington speaks of these vibrations of the sub-ethers (1) as a

million times faster than the vibrations of visible light. He points out that of course the individual ripples are beyond the scope of our gross experience; what we do take cognisance of is a "disturbed area" caused by the convergence and coalescence of the waves. We then recognise this disturbed area as a material particle, an electron, for instance.

It should be noted that the above result, first disclosed by the new mathematics, has since been abundantly confirmed by experiment.

The essential feature of this new aspect of our material universe is that matter — which appears to us as the very imbodiment of continuous existence — is not so in reality, but that each atom of which it is composed, is a phase in a cycle of changes. In another phase it is a lightwave or some other form of electromagnetic wave.

To give an idea of what is meant, let us take a piece of ice, melt it into water, and evaporate it into steam, then reverse the process again by condensing the steam into water and freezing the water into ice. We have then arrived at the same point at which we started. These processes constitute one cycle of what Dr. Whitehead calls "a vibratory organic deformation" (See *Science and the Modern World*). We could follow these processes because they were slowly performed, but if we could drive the matter through this cycle millions of times per second, our consciousness could not perceive the intervals between the cycles.

Consciousness, in other words, carries us over the small time intervals — it shows us the phases, but not the intervals between them. Therefore, in the case just mentioned, we should see the ice, the steam and the water as continually existing, while in reality there is no such

concreteness — but merely the illusion created by our senses.

Now the existence of the sub-ethers, as explained by Eddington, and the unceasing disappearance and re-appearance of the particles of matter, has been taught in the East from remote antiquity. It constitutes the main theme of a Sanskrit work called the *Pranava Vada* [?]. Eastern schools explain that of these sub-ethers there are seven, the plane of our gross experience, as it was termed by Eddington, being the lowest and numbered 1. In other words, the higher the number, the greater the vibratory frequency and velocity, and the greater the energy. The mass units of the planes are different, and the higher the plane number, the less the mass unit. It must be realized however that the matters of these seven planes are interpenetrating.

This presentation of the sub-ethers in itself, is of the greatest importance as we can see, for in the process of transformations through the planes, if the particle which is the physical plane of the cycle is a constituent of a solid body, its position is fixed — but as the phases in the higher planes may be fluid (and generally are fluid), there is no necessity that the constituents of the particle in one cycle shall be the same as in the succeeding cycles. They may be equal in quality but not the identical substance.

To illustrate this, let us take the example of a steam engine — each turn of a condensing engine uses a quantity of water, which is transformed into steam and back into water again. But the water and steam of one cycle need not be the same as in succeeding cycles though the quantities may be equal and in practice we know they are not identical.

This then permits a process of circulation which is not

perceptible on the physical plane.

It also again draws our attention to the functions of the double spheres of which the heavenly bodies are the centers. The supplies of the cyclic transformations may be taken in from the contracting sphere, and delivered back to the expanding sphere. In fact these cyclic transformations may be regarded as the causes of the contracting and expanding spheres, each electromagnetic vibration being a beat of the atomic heart which keeps in circulation the Cosmic Life-blood.

The first thing for the researchers in the field of New Astronomy and Cosmic Physiology to do, was to prove that the Eastern methods of approach rest upon a scientific basis; and it is on the strength of the various discoveries by Western scientists, discussed heretofore, that they pointed to the logic of this procedure as employed by them in their efforts to link the Western studies of the matter and force side of nature with the Eastern studies of the life and consciousness side.

It has already been pointed out that the tremendously rapid, successive phases of vibration appear continuous, that is: when the atoms of the brain undergo such transformations we have sensation — feeling, and thought as an apparent continuity and combined unity; whereas in reality continuity is the attribute of consciousness. The human consciousness then, is a combination of sensation, feeling, and thought, the life aspects of the vibratory processes of the three lowest planes of our system. These aspects moreover are proportioned differently in different individuals. For instance: one person, when out in the street, will observe most of what is happening around him; another will notice only what is necessary for his progress along the street, his thoughts being centered on some business problem, etc. The power to vary

the constituents of consciousness is a function of another aspect, known as Will. (According to Eastern teaching it is situated in plane 5, the dominating plane of the system). And by development of this Will the accentuation or subordination of other aspects of consciousness can be purposely regulated.

This is not so strange as it may sound, for a similar procedure is well known to physicists. An ordinary photograph of the sun is the result of the action on the film of ordinary lightwaves. But by selecting a particular light-frequency, say a line of hydrogen, or calcium, the physicist will get a photograph of a different sun, one composed of hydrogen, or calcium only. In this respect he operates by the same methods as does an Eastern pupil on the constituents of consciousness. That is, the Eastern pupil gradually acquires the power to make his consciousness monochromatic, which means focussed on one plane at the time, whether this plane is 1 or 2 or 3.

The ordinary physical plane universe as said before is in reality a variable combination of these three, and is largely a function of our moods.

We may illustrate this by pointing to the widely different universe in which a happy bridal pair lives, and that of a bankrupt director, undergoing a cross-examination in court.

The West makes many instruments which come to the aid of consciousness, but leaves consciousness itself in its ordinary state of limitation. The East trains the consciousness to make adjustments and thus become a receiving set for a greatly increased range of electromagnetic vibrations. Why not combine these methods, demanded these researchers, who, having formulated a working basis, formed a group among whom one possessed this monochromatic vision, mostly of a magnetic type?

That is to say, whereas ordinary vision is the effect on consciousness of a short range of electromagnetic waves, magnetic vision is the effect on consciousness of magnetic waves. Such waves are not reflected by metallic substances, but penetrate the interior.

The researchers began their work with the observation of the forces in the interior of a bar magnet, which was finally replaced with one in the shape of an ellipsoid, because it was discovered that a solar system was a magnet in the ellipsoidal form. In fact, it was found that Nature's units were all magnets, whether they be atoms, planets, suns, or systems. So far however the observations, although useful, did not permit a checking up by others than the observer. This difficulty was overcome when the observations were applied to the solar-system, as the results could be checked against the facts recorded in the Nautical Almanac.

For instance: on the days for observation a clock-chart was erected with the heliocentric positions of the planets on that particular day, and the observer would be requested to give, from inspection by means of his developed vision, the angular position of the planets and their relative distance from the sun. Thus, when a planet was observed at an angle of let us say 90 degrees behind the sun, the observer would say. I see a planet near 3 o'clock at a distance from the sun, greater or less than the distance of the earth, as the case might be. In this way, the reliability of the observations would be frequently checked before others were recorded.

These tests of reliability nevertheless could not be considered sufficient, unless facts could be established which might be tested by anyone. Such facts might consist in the discovery of unknown planets if their positions and character could be indicated,

afterwards to be verified by astronomers in the ordinary, telescopic way.

Now the astonishing thing is that indeed four such planets have been discovered. The procedure was less intricate than may be suspected. The observations had revealed that between the sun and a planet there is a broad ribbon of magnetism, in which magnetic substances circulated between the sun and the planet. It is a double stream, one flowing from sun to planet, and the other from planet to sun. These lines of force are as the veins and arteries for the flowing life of Nature, the vascular network so to speak which establishes and maintains the life of the Cosmos.

Confining our attention to the earth and the sun, and tracing this double circulation, we will begin at the sun's center from where the stream begins as the apex of a cone, with its base at the sun's surface. At this surface it forms itself into a magnetic stream of force, moving along the line from sun to earth. When it reaches the earth, it embraces the lighted hemisphere of the earth, and dips down to the earth's center. Here is also the apex of a cone with its base at the earth's surface, which forms the beginning of the return stream of magnetism. When it arrives at the sun, it embraces the solar hemisphere facing the earth, and passes through the sun's mass to its center. Thus, there is a complete circuit, which appears to have the properties of an electric current.

This current, when passing through the earth's crust to the center, has an intensity proportionate to the magnetism. Hence, between the poles and the center, the current is greater than between the tropical portions and the center. This on balance, constitutes a current, entering at the pole of the earth, and emerging near the magnetic equator.

Now we know that an electric current entering at the pole of a

magnet, and emerging at the magnetic equator, causes the magnet to revolve around its magnetic axis. We have here then a known cause for the axial rotation of the earth! It is only one instance out of many of the remarkable fruitfulness of these researches.

It is obvious that with the broad beam of magnetism between the sun and each planet, any planet can be found by noting the directions of these beams in the neighborhood of the sun, and then tracing out the beam to its other terminus, the planet. This can be done with equal ease whether the planet is known or unknown. And it is in this manner that four new planets have been discovered, two of which have physical bodies and are thus available for telescopic vision; one other is only just beginning to develop a physical body and is composed of matter in the sub-planes higher than the gaseous. One planet, at a distance of 50 astronomical units has been determined at a longitude of somewhere between 228 degrees and 230 degrees. For those who think of longitude in terms of signs, the planet is in 19 degrees of Scorpio.

The other planet, to which the name Osiris has been given, is likewise extra-Neptunian (at a distance of about 70 astronomical units).

The third planet, Horus, cannot be seen by ordinary electromagnetic vision. It is still in the infant stage; its physical matter being super-gaseous, its volume is very large, though its mass may only be small. It lies in the asteroidal region between Mars and Jupiter, its longitude being estimated at about 100 degrees, or say 10 degrees Cancer.

Some of the observations had disclosed the fact that there were twelve funnels issuing from the sun, and since eleven of these had planetary beams attached to them, it seemed probable that

there would turn out to be twelve planets in all. On May 28th, 1929, this remaining planet was discovered very close to the sun, its longitude being about 6 degrees. The existence of this planet, Vulcan, was believed in for many years on the authority of Leverrier (the discoverer of Neptune), but as the planet has not been observed, except as a dark spot crossing the sun's surface, its existence had ceased to be believed in, and modern works on Astronomy rarely mention it. The reason why the planet has not been observed is, that the planet is not physical and does not reflect light within the range of the spectrum. The reason for its invisibility in the telescope is however different from that of the planet Horus in the asteroidal regions. The planet Horus cannot be seen, because it is super-physical, and its radiations are in the ultra-violet; but Vulcan is sub-physical, and its radiations are far down in the infra-red.

But although Vulcan cannot be seen from its own radiations, it has the power to obstruct the radiations when it crosses the sun's surface during transits, and such observed transits can be compared with the calculated positions.

With the discovery of Vulcan the solar system and its members may be regarded as complete, and this is indicated by the fact that these researches have made it possible to find a mathematical expression which links together the masses and distances of the sun and the planets.

One of the first conclusions that can be drawn from the geometrical series, obtained in this manner, is that the accidental method of planet forming, deducted by physicists, cannot be the true one.

If we consider that the density of distribution of stars in space has been compared to that of twenty tennis balls roaming the whole interior of the earth, then it is obvious that the accident that gave

birth to the solar system may be compared to the casual approach of two of these balls within a few yards of each other! As Eddington pointed out:

The data are too vague to give any definite estimate of the odds against this occurrence, but I should judge that not one in a hundred millions of stars can have undergone this experience in the right stage and conditions to result in the formation of a system of planets.

It becomes evident therefore that the constituent parts and the forces of our solar system are as accurately adjusted to each other as are the constituents and forces of a living cell. In other words the solar system, physically interpreted, becomes a dynamo with all its parts adjusted for a particular kind of work.

You may say that as theosophists, or astrologers, we already accepted this truth. However, to afford a practical application of this knowledge the scientist must be supplied with proof, and these researches will give the greatest impulse offered thus far, toward such recognition by Western science. The mathematical deductions therefore are of the greatest importance, and imply that the electric charge on the electron and on hydrogen exists on all planes in an increasing ratio. As long ago as 1881 Sir Joseph Thomson showed the possibility that all mass might be of electromagnetic origin, which theory has now been confirmed. Again I spare you the mathematical computations, but they are there to read for anyone who wishes to go deeper into the subject. They prove the numerical value of the common ratio B, called the Master Key to the intimate processes of Nature, also showing the connecting link between different orders of rays — a key, not to the old physics, but to the physics which emerged since 1925 from the new quantum theory. But the principal feature of the New Astronomy, as here presented, is the proof that our solar system

is a living unit from which no part can be removed without destroying the whole. The real foundation of the science is the life which thrills through the whole of Nature.

Before I conclude, a few words more. You may wonder why this science of astrology-astronomy and cosmic physiology should so greatly interest a doctor of the healing arts. The answer is that all true sciences are inter-related. In my own work I treat to a great extent with the very color-rays which form the spectrum of the sun; that is: by means of spectroscopically attuned color waves, calculated to coincide with the vibratory frequencies of the cells of the body, according to the science of Spectrochromometry, developed by Dinshah. We know that without the sun's radiation all life on earth would be extinct, that the rainbow — the token of the covenant between God and man, as it is called in Genesis — shows forth the colors of its spectrum, and also that the very action of the elements depends upon their dominant color emanations. Therefore, if instead of the crude chemicals, the code-colors be used, the resulting fundamentals would prove to be the same.

Light, and consequently color, as these researches reaffirm, is in fact the greatest power known, and the application in Natural Therapeutics is but a logical consequence. Light is in the core of an atom, as in the heart of a solar system. And the recent discovery proving it possible to take pictures of internal body-tissues, without an outside light-source, offered a physical proof of this solar light-radiation within man as it is absorbed in the protoplasm of the animal.

The discoveries of our researchers go on to show that Light becomes Matter, and matter reverts to Light.

The atom, as we have seen, is not an entity, it is, as physicists have shown, but one phase in a cycle of several organic

transformations. Instead of being a physical unit, like a little charged battery, discharging itself until in the end it dies, it is the terminus of a line of force, the other terminus being in the body of the sun. Hence every planetary atom has a corresponding atom in the sun, between which there is a constant flux of energy, flowing in both directions. Thus the atom in its center has the sun, a center of light from which radiates the power which makes it a material particle. Every star, every planet is just the same.

I am fortunate that I can give you a further short quotation from the as yet unpublished manuscript of our researchers, for the author, Mr. Sutcliffe, passed away shortly after the manuscript was finished, leaving its future publication in the hands of Colonel Wilde, in England. This quotation is as follows:

All light is a manifestation of the sun. . . . Light is immanent throughout the solar system; local lights are manifestations of the Immanence. This is true of the planets themselves, as also of the smallest light on a planet — even of the glowworm's phosphorescence — all is solar light. The sun therefore, is our starting point; the local source will lead us always back to the Sun. . . . Space is Light Ineffable. . . . And that is but a stepping stone from Manifest to Absolute. The Absolute is Light beyond all Light, and therefore Darkness in finite worlds. Creation is the release of Light and all of the Solar day marks the self-limiting of transcendent Light, which is the Solar Lord. The purpose of creation is but to produce reflectors, from which transcendent light may shine. The Solar system is a mirror; the Sun a lens. The Cosmos and the Universe are evolving groups of worlds set to reflect cosmic and universal light, each in its appropriate hue flashing forth the signal age by age; all speaking in the cosmic code; each writing its own message which is a statement of its own place amid the wheeling systems . . .

its contribution to the cosmic whole.

How, physicists and astronomers have scoffed, could the stars, so far off, have any influence? The question is, can we remove the element of space to the satisfaction of scientifically trained Western minds? The new astronomy has pointed the way, and more.

Instead of being a physical unit, we have seen the atom revealed as the terminus of a line of force, every planetary atom having its corresponding atom in the sun. The link between the molecular energy and radiant energy is not made at the planetary end of the line of force, but at the color end, where all the planets are in juxtaposition. Planetary action therefore is independent of distance. It is not again a question of their gravitational pull upon each other across space, but the vascular interchange of energy within the body of the sun.

The old astronomy has failed to give us what the new astronomy reveals, namely a Solar system which is a living organism, a Universe which at every point is pervaded with life.

— — —

It is interesting after the foregoing to note the return of modern science to the old traditions of mankind. For as Louis Elbe, in his "La vie future devant la sagesse antique et la science moderne" has pointed out: All the monuments of antiquity may be regarded as hymns in honor of the sun, the creative and regenerative power which is the source of all life on earth. The monoliths of the Celts, the obelisks of the Egyptians, often adorned with solar disc, are emblems of the sun's rays, the spreading of which is figured by the pyramids. In the Greek temple again we see a rendering of the solar drama:

The eternal God, or Sun, is represented by a radiant disc

(acroterium), surmounting the pyramidal pediment of the temple. Heaven is figured in the bas-reliefs ornamenting the pediment, while lower down, in the architrave, we have the line of separation between heaven and earth. Lower still — in the metopes and triglyphs — we see the lightning rending the clouds, in order to bring down fertilizing rain and carry the "creative germ" down the temple-columns to the soil.

The constant action of the sun's divinity is affirmed wherever its light penetrates:

It surrounds with a living atmosphere the beings which he created and transmits to them special germs containing life in themselves; it is constantly emitting these animated "spheroids" which permeate living bodies, while these latter radiate spheroids in their turn which go back to the common center.

Thus we have a similar conception: Life is maintained by an invisible series of inspirations and expirations, by an uninterrupted exchange of cosmic radiations sent to us by the sun.

TRANSACTIONS OF THE POINT LOMA LODGE: XII — *G. de Purucker*

OURSELVES AND THE ANCIENTS

G. de P. — Mr. Chairman: I should like to say a few words with regard to Brother G ___'s question. (1) I think the answers that have been given by others tonight were fine. But there is still an aspect of an answer that could be given, which I think is important. The question amounted to this, as I understand it: "What, after all, is the practical use, the pragmatistical value, of a study of ancient times, ancient thought, ancient wisdom, ancient writing, ancient lore?" The answer is written all over the face of the question itself! Such study is educative, it is elevating, it is broadening. It broadens and enlarges our sympathies, which means our hearts; it enlightens and stimulates our minds; and these, I think, were among the reasons why H. P. B. — and we have followed her faithfully — made so much of this study. It is a corrective of egoisms, and heaven knows that mankind, which means you and me and all others, need few things so much as that!

Look at the parlous state of the nations of the world today, each people thinking itself superior to others; each nation preparing for another horror! Why? From a lack of the feeling of reverence for humanity. Humanity's glorious achievements in the past, as embodied in the great writings and traditional works of human history: to these we turn and we see the annals of human genius written large therein. We learn that the Nordic, for instance, is in no wise the natural superior of any other civilized people, ancient or modern. Every race has been egoistic, and in the present almost more so than in the past!

Such study — the study of the monuments of human genius — broadens our minds, enlightens them, fills our hearts with sympathy, and enlarges their sympathies, teaches us to be wise in our own generation, teaches us of the glorious achievements of the past, reminds us that we are the children of that past, not merely the descendants of our distant forebears, but verily those forebears themselves now reincarnated in new races and peoples, those of the present.

The times of the world today are "out of joint," as Shakespeare says, simply because men have forgotten to read properly the lessons of the past. More than all else, that! Will you ask any university professor, or teacher in a high school, or in a school for boys and girls, why they teach history? Ask them what is the pragmatism of knowing history. It is ancient times, it is traditional, it is embodied in the old records. What is the practical value? And those wretched histories that we have, mostly the records of conquests, mostly by force of arms; and so little therein dealing with essential civilization, with what men and women did, with what men and women taught and achieved in the great arts and sciences of the civilizations of the past — even the feeble stuff we have and call "history" — why do we study it? To acquaint man with the doings of men. To acquaint us with the former doings of mankind. It is educative. I know nothing so humbling to egoisms, I know naught so stimulating to the wings of our higher imagination — that which brightens life and gives us intellectual and spiritual verities, and helps on our evolution. I know naught that works upon us in so sublime a manner as the realization that we men are all one, that the common human heart beats everywhere and through ail of history; has beaten as it now beats; and that men in past times have suffered as now they suffer; and that men in past times have produced flowers of human genius which broaden even our own lives today —

because we are largely copyists, copyists out of the past, reading the records of bygone times.

"What is the value of studying the works of the ancients?" Some day we shall have history that will deal with the productions of the best in human character. We shall have histories of the rise as well as of the culmination, decline, and fall of art, of religion, of philosophy, of science, of the nature of the civilizations of the past; and we shall learn as even now we are slowly learning in parts, to the astonishment and the undoing of our favorite egoisms, that even the Romans, a relatively unimportant people except for their achievements in law and conquest: even they had such trifles as shorthand, houses heated with hot-water pipes, and other things, such as our modern glass window-panes, etc.; and we even have knowledge that the Romans had a glass that could be molded or wrought with the hammer.

The study of the literature and records of past civilizations shows us that it is the works of the human heart and of the human mind that count. Learning these, we diminish our own egoisms, learn reverence for the achievements of human genius, and likewise learn to look forwards into the future to doing even more grandly than the ancients did.

E. V. Savage — In regard to this question which so often arises as to the value or non-value of studying ancient religion, symbolism, and history (the idea in the questioner's mind being I believe, that what we need to do is to study ourselves and the circumstances that we find surrounding us at the present time, and that these things of past times do not concern us at all): I have been reading a modern scientific book in which the author draws attention to the mistake which modern scientists make when they try to show how small and insignificant man is in the universe by comparing him with the size of, for instance, Mount Everest; and they say

that it would take more than four thousand men, standing one upon the other, to equal the height of Mount Everest. But the author points out that this gives an entirely erroneous idea, because man extends farther than the limits of his physical body.

Then I thought of the Theosophical conception that man is really *consciousness*; so I suppose that he actually extends, both in time and space, as far as his consciousness can go. So when we study the wisdom of the ancients as we can find it in history, symbolism, literature, etc., we are expanding our consciousness to embrace those of olden times. When we study the Rounds and Races, and the destiny of the human race in future aeons, we are expanding our consciousness into the future. When we study about the stars and the sun and other solar systems, we are expanding our consciousness out into space; and if other students in all parts of the world are engaged in like study, each one expanding his consciousness (which is himself) in space and time, these different consciousnesses must merge to a degree; and we shall gradually be doing away with that separateness which is the heresy of the present age.

FOOTNOTE:

1. In effect: Why are we so often urged to study the ancients, who are dead and gone? Why not concentrate on the present and the teachers of today? ([return to text](#))

The Theosophical Forum

THE PAROCHIAL PRESENT — *S. H. Wylde*

It was probably the contemplation of the self-sufficiency of some present-day people that led a modern writer to describe us as a "parochial generation" because we had "shut ourselves off from the past." Well, it is not the first time that a race, dazzled by its own glory, has been chided for its egotism. You remember what the Egyptian priest said to the Greek lawgiver Solon: "You Greeks are mere children, frivolous and vain; you know nothing of the past." And if you want a still stronger rebuke along the same lines, read the one roundly administered to ourselves and our forebears by the Master K. H. in *The Mahatma Letters to A. P. Sinnett*, p. 150, beginning:

During the minority of a sub-race, its civilization is preserved for it by its predecessor, which disappears, dies out generally, when the former "comes to age." At first, most of them squander and mismanage their property, or leave it untouched in the ancestral coffers. They reject contemptuously the advice of their elders and prefer, boy-like, playing in the streets to studying and making the most of the untouched wealth stored up for them in the records of the Past.

— That is just the introduction to it; the whole is well worth looking up.

True nobility does not hide a fear of being eclipsed under the mask of vainglorious boasting. Confucius, believing in and loving the Ancients, called himself a transmitter not a maker: "I am not one who was born in the possession of knowledge; I am one who is fond of antiquity, and earnest in seeking it *there*." Yet he lives today where probably many another, great in his own eyes, has

passed into obscurity.

The mediaeval Platonic philosopher, Bernard of Chartres, held aloft a light in a dark age; yet he it was who said that if men of his day were great it was not because they had keener perceptions than the Ancients, but simply because like dwarfs they had climbed upon the shoulders of the giants of the past and so of course could see farther.

A present that looks with reverence upon the treasures of the past will in its turn become a past to be revered. Let our own day and age remember this.

As a matter of fact, it is only the consciousness of individuals or aggregates of individuals that can be parochial. The "present" whether of China two thousand years ago, of Greece during the Age of Pericles, of mediaeval Europe, or of today, cannot really shut itself off from the past. The ever-dissolving present is both past and future, an illusory moving point in the limited consciousness of man. The man of great soul who can contemplate the past with reverence is looking upon the future also; for he has transcended past, present, and future, "miserable concepts of the objective phases of the Subjective Whole," as the Master K. H. calls them, and with the Eye of Dharma looks upon the great circle of Eternity where he sees that whatever is of the nature of Truth, no matter what age or nation has expressed it, lives for ever, unspoiled by the devastator Time.

The Theosophical Forum

AN UNFINISHED UNIVERSE — *La Fayette Plummer*

No argument will be necessary to convince you that this universe is unfinished. From the mere fact that life continues to manifest itself in living things, we may know that the course of evolution is not yet run. Whatever our ideas may be as to the goal for humanity, we all agree that mankind has not as yet reached that goal. And in larger measure we see in the heavens above us stars in all stages of youth and senility, infant stars, and old stars; comets on the one hand, which, the Ancient Wisdom tells us, are unborn suns and planets, and on the other hand, meteors and asteroids, evidently the remains of stars and planets that have passed away.

The effort, then, is not to argue the question, but rather to give you the picture of the Universe which the Ancient Wisdom, today called Theosophy, has painted for us. Far from being a mere fantasy of ideas, it is a picture of the thing as it really is, culled from the evidence furnished by those who *know* because they have the means to find out. The Masters of Wisdom are they who have mastered Wisdom about the development and use of the higher spiritual faculties innate in man, and by means of these awakened powers they have donned the winged cap and the winged slippers, and "walked the skies."

Imagine yourselves standing on a hilltop on a clear night, with the stars shining brightly, as it were beckoning you. Imagine that you could take wings and rise from this earth and wander at will among the celestial bodies. Imagine that you could transcend the spheres which encompass our small family, our solar system, and with light step spring upwards into space and wander from star to star, and study the celestial phenomena. You would encounter

all sorts of interesting things. You would see old stars and young stars, stars so aged that their life is spent, stars so young that they can hardly yet be called stars — they are comets. You would see nebulae, vast bodies of tenuous gases in the process of forming into celestial bodies. You would find meteors and shooting-stars, fragments of once living worlds. You would pass planets innumerable, and moons galore, worn-out shells of planets long since dead.

Imagine yourselves able to travel on and on without hindrance until our solar system dwindles away to a mere point and is lost in some star-cluster of the Milky Way. And then leave the confines of our home-universe, and pursue your cosmic course until our whole galaxy becomes a mere speck, as though it were but a single star itself. Approaching now the speed of thought, you would encounter new galaxies of stars and worlds and moons. But though you were to travel for ever, you would never reach the end of the universe. You would never come to a point in space where you could say, "I have now reached the limits of the universe; I have passed the last of the stars."

Suppose then that you were to return home and meditate on what you had seen. You might feel that you had seen rather much; you might feel that you had seen rather little — no, more, in fact than a telescope could have shown you, were it of sufficient power.

What about worlds invisible inhabiting the planes of consciousness above and within the physical, to wit, the spiritual, the intellectual, the astral realm, and so on, of which the Ancient Wisdom teaches? These no telescope can show us. Just as in our imaginary journey we saw celestial phenomena of all kinds, so there are wonders to behold on these inner planes, had we the eyes to see. Thus we find that our "limitless" universe is indeed limited, because it is physical; its sights are restricted to purely physical manifestations of life.

What is the boundary separating our physical universe from the inner planes? There is no real dividing-line at all. That which sets the limit to our universe is our own inability to see and to cognise. The horizon is that imaginary line which divides the world's surface into two parts: that portion which we see, and that portion which, due to the curvature of the earth, we do not see. Let us then judge the universe, not by what we see, but by what we are privileged to learn about it in the writings and teachings of the Sages and Seers, past and present.

There is wonderful knowledge to be gained by a study of the Ancient Wisdom, which is at once Philosophy, Religion, and Science; and if a thing be approached from these three angles, a fully comprehensive understanding of it may be acquired. No doubt we will more readily concede this to be true in the study of man, but the nature of man cannot be fully understood unless we accept the fact that he is inseparably linked with the Cosmos about him, from which he draws his very life. Not only is it possible then to study the universe scientifically, religiously, and philosophically, but this *must* be done if we are to have a well-rounded picture of the Cosmos. Thus only can we turn on the light of Theosophy.

The universe, Theosophy declares, is composed entirely of forces; and so is man, and modern Science inclines toward this view. We are told by the most advanced thinkers of today that what we call "matter" is nothing more than electric energy. To this, Theosophy adds that behind all manifestation is intelligence, and it is through the operation of intelligent forces that this universe has come into being. In building for ourselves a picture of the universe then, there are three fundamental principles or axioms that we must bear in mind. Firstly, the philosophic axiom, *As above, so below*. This is a master-key, by the aid of which we may

unlock numberless mysteries. It teaches the interdependence of all things, for all things are in essence one. What is true of the nature of man is true of the sun. Universe and atom alike are composite in nature. The second key is the religious aphorism, *Man, know thyself*— another master-key closely related to the first. Could we but know the mysteries of consciousness and the sevenfold nature of man in their completeness, we should have full knowledge of the universe. A third key, the scientific, is that *all things are relative*. In the last analysis nothing is great, nothing small; all things are relatively great or small, in relative degrees of development, with relative manifestations of consciousness. Bearing these three truths well in mind, let us proceed to our study, and endeavor to understand this bewildering universe about us.

The vast cosmic scheme is nothing if not the manifestation and working of consciousness. Consciousness is the great mystery, about which very little can be said; it is the Boundless All, the vital drive of the universe, endless, infinite, within all and containing all, ever-present, and yet utterly indescribable. It is space itself, and duration, and its counterpart is substance. By substance I do not mean matter in any form such as we know it to be, or such as we imagine it to be even in the electronic state (i. e., it is neither gaseous, liquid, nor solid). Cosmic substance might best be described as the great matrix, the womb from which are born the galaxies filling *all* planes of being. Thus substance is not confined to any so-called plane of consciousness, any more than is consciousness, its counterpart. The universe comes into bloom when consciousness unites with substance, and becomes an infinitude of consciousnesses, clothed in substance and manifesting as numberless lives, which in their vast aggregate form this living universe. The lowest grades of substance temporarily become what we recognise as matter, composed of

ninety-two chemical elements — but only so long as consciousness is there. If this is so in the case of the universe, it is equally true of man. Man is the manifestation of human consciousness, one of those infinitudes of consciousness before alluded to. This consciousness-center combined with cosmic substance and brought man into being. The seven planes of consciousness forming man we call his seven principles; but to the endless numbers of lives subservient to the man, they are the playgrounds, the fields of activity, in other words, the planes of consciousness, in which they live, move, and have their being. Similarly, a sun is the manifestation of a solar consciousness, for only a solar consciousness could so manifest; the plant is the imbodiment of a plant-consciousness; and an atom, of an atomic consciousness. All these are composite of seven principles, elements, planes, call them what you will, and all of these are part and parcel of the whole, subservient to the ruling consciousness imbodied as our Home-Universe. And even that exalted being is but one of many, a building-block, let us say, helping to build and sustain the manifestation of a super-cosmic being as a super-cosmic universe. Who can say that the universe will ever be finished?

Apply now the second key. Study man, learn the mysteries of his nature, apply the law of analogy, and learn to know and love this universe, ever evolving, ever becoming. And then the third key, the relativity of all things, which stresses the fact that brotherhood, that is, spiritual brotherhood, is a fact in Nature, indeed the fundamental law whereby the cosmos is knit together. Essentially consciousness is One, its manifestations legion. The purpose of evolution is the endless journey of the many back to the One, only to proceed again at the dawn of a new Cosmic day, to build universes anew, in a never-ending pageant of Life.

LONG LIFE TO YOU! — *Inez Davenport*

With this cry we speed on their way young men as they leave college, brides and grooms as they start upon honeymoons, and friends on birthdays, at leave-takings, or on the commencement of any work. Is it a relic of olden days when alchemists searched for elixirs of life, drinking which one might live forever? And if it were possible to make one body of flesh last so long, would it not become as tedious as if a woman were to wear the same dress throughout her whole life? There must be more to it than the gay and casual godspeed it sounds; more than the idea that as life is so full of interesting experiences we should prolong it as much as possible: an unconfessed memory, perchance, of the ancient belief that life is eternal.

Twenty-five hundred years ago when the Buddha gave up all hope of earthly happiness for himself in order to teach his countrymen what freedom was, he did not tell them that they lived more than one life on earth. They knew it. His message concerned the way of obtaining release from the necessity for continual rebirths. He taught, as have many before and since his day, that man is responsible for what comes to him in life.

Two thousand years ago when Jesus the Christ brought tidings of the Treasures of Heaven, he showed, as did the Buddha, that when we accumulate material possessions we must lose them at death, but that when we gather the Treasures of Heaven — the imperishable, incorruptible truths of life — we gain what lasts forever. Some people say that Jesus did not teach reincarnation, or rebirths of the same individual soul; and others point to various places in the Bible where, they claim, he referred to it. However that may be, it is said that this teaching was removed

from the canons of the Christian church at the Council of Nicaea in the sixth century A. D. If it was removed, it must have been among the original doctrines, and the Christ obviously had no need to emphasize it. His work was to bring understanding to men of the truths they did not know, not to repeat familiar knowledge.

In the years since Christianity first gripped the hearts of men, changes have taken place in our thought-world, and in the last century more rapidly than in all the preceding time. From complete acceptance of dogmas laid down by those in authority, through splits caused by trivial things such as details of rites and ceremonies, to complete schisms where men rebelled against the whole religious system and therefore went to the extreme of total unbelief and atheism, into materialism and denial of anything higher than could be known by the five senses, we are today emerging into a realization of what life can mean when we use our divine right to think for ourselves.

We no longer describe life in terms of a personal God and his relation to man, nor is our God the compound of bogey man and fairy godmother He once was. We fear not the punishments He may inflict upon us, nor do we pray nightly for favors at His hand. This earth is no longer the limit of our horizon, nor are we so much concerned with man as an individual apart from other men. The emphasis today is laid upon "humanity" and its relation to the universe, and the universe includes our whole solar system, visible and invisible. Thanks to modern science and philosophy, we know again that the universe itself is a living, growing, being, and that it, like man, has a body which is visible, and inner parts which are invisible; and that every part of it exists by reason of the presence in it of lesser beings, which together form the suns, stars, planets, human, and sub- and super-human kingdoms of nature.

Life is the one reality, eternally enduring, and its appearance is always changing. Upon the background of Life countless beings are born and live out their little span. Individual forms die, but this death is not final. Physical death is no more the end of man than the replacement of worn out garments by new ones is the end of the human body. Birth and death are equally doors to the "Mansions of my Father's House" and birth on earth means death in some other sphere, just as death on earth means birth into another sphere; but not for a permanent existence in regions where angels play harps throughout endless time. When the impulse is spent that took us into the invisible parts of the universe at death, we return to earth to take up our task where we left it.

Life is like a grand school, and the classes in it are the kingdoms of nature. All the beings which comprise these kingdoms are made of life-atoms, which are the least evolved forms of life-consciousness. We get the idea better by reflexion on what physical science has to say about the ultimate particles of matter. All ninety-two chemical elements, it tells us, are reducible to atoms of identical substance, called electrons and protons, the electronic and protonic content alone determining whether the atoms are of hydrogen, carbon, copper, water, gold, or what-not. Thus, it is not the life-atoms that determine the character of the being they form, but the consciousness itself which draws by magnetic attraction to itself all the atoms of various grades which it needs for its present body. For even life-atoms, minute and undeveloped as they are, are composite structures, and just as the physical atom is composed of electric energy which expresses itself in the positive and negative forms of protons and electrons, so is the life-atom composed of consciousness-energy which expresses itself in the positive and negative forms of spirit and matter. Every point in space is a life-center, a consciousness,

otherwise it would not be in space, for a living organism cannot be composed of dead things. But these life-centers are no more capable of action in themselves than drops of water while they are still within the body of the sea. Only when consciousness becomes linked to earth — or any sphere of action — by the twin substances spirit and matter, does it become an individual being, which thereafter suffers birth and death, or entry into and exit from the various classes in our school of life.

These classes are roughly: the kingdoms of the elements, the minerals, the plants, beasts, and men. In ages past, in other imbodiments of the earth — yes indeed, earths are reborn too — we went through the kingdoms inferior to the human one by one, returning again and again until we had experienced all we could in these classes. When the earth was born this time, millions of years ago, we started with it in the preparatory stages of the human kingdom. There is no haste in nature, and the well-ordered processes of life even today provide opportunity for us to review the knowledge which formerly we gained unconsciously. The whole evolutionary cycle of the passage of a consciousness through the kingdoms from the lowest up to the human is condensed into the short space of nine months in the pre-natal condition of every child. It is first in the human kingdom that consciousness can become *self*-conscious. Indeed, this is the distinctive mark of men: they have the intellectual faculty by virtue of which they may direct their own evolution, setting its pace according to their character and will power.

When this earth dies and we have been through all the classes the human kingdom offers, is that the end? Indeed no. Our modern philosophy sees no end, no Judgment Day upon which everything is summarily interrupted, and after which there is no opportunity for growth. When our lessons in the human stage are learned there are superhuman kingdoms in which we continue,

beginning at the elementary grade that will prepare us for the fuller knowledge and experience that awaits us. And so it will be forever. When the door of one kingdom closes behind us the door of a higher one opens before, always the horizon is beyond our reach, always the new sphere has greater opportunities than the old. Search as we may, we shall never reach the end of all knowledge — and really, we don't want to, for if it ever came to pass then immediately all interest in life would cease. It is the measure of uncertainty and the flavor of adventure that keep us alive even when all the world seems set against us and life presents no front but poverty and sorrow.

Now let us compare our present point of view with the old one, and determine why life proves to be worthwhile whatever it may bring. According to the old belief this was the situation: A baby was born of a man and woman. God created the soul — out of what material is not clear — which thereafter possessed certain characteristics, God-given. The man grown from this baby was not responsible for his faults and virtues, but God forgot, and punished and rewarded him for actions which he could not help performing. If the man suffered in life, it was God's will and he was supposed to endure it. If he endured patiently he went to Heaven, if he rebelled he went to Hell. Whichever his destination he was doomed to boredom, for he could never get away from it. If in this one and only life he had no opportunity to use talents which he knew himself to have, the world was so much the poorer. This was an indiscriminating God, betraying stupidity greater even than that of men!

In our modern philosophy nothing happens by chance. Human regulations are seen as imperfect reflexions of a cosmic orderliness that rules all life. No being of any kind is born through the creative effort of an external power; the impulse to birth comes always from within, and the body which each one

has it makes for itself. A child is born in one family because in past lives he has made certain conditions necessary for his future development which this particular family can provide. From the perspective of our long life of eighteen million years — it was that long ago when we started on this earth as thinking men — we see that we suffer no injustice even though we cannot trace the causes of our afflictions. We may be sure that in earlier lives we must often have yielded to certain unworthy impulses which we are now able to control.

The simplest analysis of the human being is still the same as St. Paul made it of old: body, soul, and spirit. The body is made by way of human parents, but the atoms composing it are those which formed it in previous lives. This does not mean that the man will look and be just the same in every life, because there is a constant circulation of life-atoms throughout the universe, and at the death of a body the life-atoms are free to evolve in the various realms to which they are native. Physical life-atoms may enter the earth, perhaps helping to fertilize a field of flowers; soul-life-atoms will find their way to realms superior to the earth, perhaps to what we call the heaven-worlds; and spiritual life-atoms will go to realms higher still, perhaps to what the ancients called the Seven Sacred Planets. The soul is actually the same from life to life. The soul does the reincarnating, and comes to earth again and again until it is able fully to reflect the glory of the spirit. This is the task which can be done self-consciously only after the human stage is reached. The means by which it can be done must be sought in the thinking capacity which man alone of all the lower kingdoms possesses. If we refuse to think we place ourselves in the ranks of the "living dead." Life is growth, change, motion, and it is a living death to yield to stagnation, monotony, and inertia.

Those who want to prolong this one life beyond our pitifully low

average of forty years are recommended to adopt hobbies. This is a good way. A better is to cultivate the divine curiosity which keeps us exploring every possible road of knowledge. Ancient and modern religion, science, and philosophy are great fields for the exercise of our intellectual muscles; and when we find, as we must, similarities of teaching in religions of people from parts of the earth remote in time and space, we find ourselves nearer the fountain-source to which all individual revelations are traceable. It is great fun to a Theosophist to watch the progress of science, as it reaches gradually to conclusions which more than fifty years ago were given to the world by the first Theosophist of our times, Helena Petrovna Blavatsky. All honor is due to these sincere men who are testing theories by their own methods. If they are slow to recognise and admit the truth of Mme. Blavatsky's *dicta*, perhaps it is not their fault so much as the fault of the rest of us who have been unwilling to start thinking on our own account. Talk about a long life, — why, we have not *begun* to live as long as the level of our thoughts is no higher than: Where shall we go? What shall we do? How can we get this, that, or something else that we covet?

Do you think, perhaps, that a life of intellectual inquiry would be an unbalanced one? Have you pictured to yourself a wizened, little hunchback poring over musty books in old libraries, squint-eyed, or at least bloodshot? If so, let me quickly set you right. The ideal Theosophist, who is our modern philosopher, is keenly alive to the beauty and joy of life, sensitive to the needs of his fellowman, eager to learn all he can, but fully aware that life itself is his best teacher. If he never saw a book he still could climb to the heights of wisdom by applying his knowledge of the brotherhood of man. It is no idle dream of a visionary, nor gush of maiden aunt. Though "hard-headed" business-men say you cannot treat men as brothers because they cheat and rob you at every turn unless you do it to them first, they will come to it at

last. Our co-operative institutions even now presage it, though as yet they seem to personify a group rather than individual selfishness.

Let us study the sun if we would truly know this brotherhood. There it shines in the heavens, appearing to be a solid mass; but see, through that pane of glass a little light enters our room. In a lath-house many rays stream in, as the body of the sun seems to be split by the laths. In the desert men may die from too much sun, but in northern countries there are long days when there is no sunlight at all. When the sun shines here it is dark in Japan, and the English day begins eight hours earlier than ours. With all this the sun reigns throughout the universe as dispenser of life-giving energy to all beings. Yet this is but the physical sun, the body only of a greater Sun which we do not see; and as the physical sun acts on physical beings, so does the greater Sun act on spiritual beings. This is the "Father Sun" of the reverent ancients, the parent of man's Inner God. And this Inner God is the "Light that lighteth every man that cometh into the world." This glorious light is ours for the taking, and we take it first when we begin to think for ourselves. We are what we think, and if we grovel in material things we are indeed "worms of the dust"; but if we yearn toward the stars we know that in the not too distant future we shall walk the earth as masters, perfectly reflecting the beauty of the Eternal. Long Life To You!

The Theosophical Forum

THEOSOPHY CAN EXPLAIN — L. L. W.

Dear Editors: May we have a statement of what Theosophy explains about the evils resulting from capital punishment? *M. P.*

CAPITAL PUNISHMENT — THE EASIEST WAY?

The real reason we have capital punishment is because enough determined men and women haven't yet faced up to the problems of our civilization. By civilization we mean the natural compromises and agreements which any community of clans or groups eventually evolve to meet the necessities and problems of their common situation. And no civilization is a true one which leaves the worst half of those problems unsolved. Our penal system and all that it involves is simply a disease of modern industrial civilization. It is due to unhealthy conditions and our failure to eliminate them. Criminals are sick men and women — acute and chronic cases which result from this failure.

The complete facts, however, as Theosophy can explain, are far more serious than we imagine. For the disease is a psychological one. There is a secret psychological infection widespread in our modern world which is directly due to the practice of capital punishment. What is the state of most criminals as they sit helplessly awaiting execution? Hatred, horror, a desperate craving for life and for revenge upon society, a swarm of unsatisfied appetites — what a picture! And it is this fearful complex of evil that we eject violently — where? Believe me, in the words of Hamlet — **THAT IS THE QUESTION.**

Theosophy explains that when a human being is cut off from life artificially — *he is not dead*. Death is the beneficent process by which Mother Nature gently disrobes her tired children of their

mortal garments, so that they may pass into freedom and rest. And one of these garments is made of the earthly dross of our mental and emotional natures. With our selfishness and egoistic passions we have woven about ourselves an ugly vesture that must be done away with before the Spirit-soul can be free.

But when a man is killed before his time Nature has nothing to do with it, for his normal store of vitality has not been exhausted. We have simply deprived him of his physical body. The disembodied *man* (for it is not the body that is the man but his feelings and his mind) — that disembodied man still lives. Where? Why, in our mental atmosphere of course, the same as before — where you and I live our daily lives of thought and feeling. But now, while he is yet seething with evil passions — he has no body of his own to gratify them. So naturally he seeks or is automatically drawn into the mental and emotional atmosphere of his own kind. And here through the urge of his cravings he has an influence even more dangerous than in his past life because it is unsuspected by its victim. The only gratification he can know is in goading other weaklings into self-indulgence or violence. Thus he may commit fresh crimes through suggestion for which others must suffer. Many a criminal has protested that he does not know why he so acted. He was urged by something outside of himself. And still we ignore this warning. Then there are the condemned, often the young, who are not naturally evil but are the victims of their untrained impulses. These may sincerely repent. But after execution they must still be earth-bound and their horror and remorse add to the intensity of these dark currents surrounding and penetrating human life.

Wherever there is war and bloodshed, violence or crime, or any other hotbed of human passions, at that emotional vortex swarm hosts of these unnaturally disembodied creatures. Our prisons attract them. There these diseased souls congregate like a pest of

microbes spreading moral and mental contagions. Do you wonder that in our large cities we have "crime waves"? That it is almost impossible to touch the hearts of criminals to reform? — or for the matter of that to arouse the conscience of normal men and women to the horrors of war and prison conditions and other equally festering plague-spots in human society? We live, unless we are aware of our danger, in an atmosphere more or less saturated with the mental and emotional outpourings of such disembodied but still intensely active beings. Of course the truly good and pure are protected to a great extent by their virtue. Still ...?

If the statistics of crime were compiled with these teachings in view we should certainly uncover some lurid data. Capital punishment may seem to be the easiest way out but — can civilization afford to take this chance? What Theosophy is doing about our crime-problems will be presented in the next issue.

The Theosophical Forum

REMEMBERING PAST LIVES — *Alice D. Peirce*

Editors, The Theosophical Forum: A letter I recently received from a friend contains the not unusual misconception regarding reincarnation and memory of past lives:

"Theosophy teaches that reincarnation is a natural fact, I understand. The vast majority of people have no memory of past lives, but I have heard the statement made that some Theosophists (*Point Loma Theosophists were referred to*) *do remember who they were and their experiences in former incarnations on earth. Is that possible?*"

In reply to this I send you the following paragraphs, which may help clear up the matter for others as well. — *A. D. P.*

For the normal human being in our present stage of evolution, detailed memory of past lives is not possible. Such a claim is unwise, to say the least. Furthermore, it shows lack of understanding, and self-delusion. One can safely conclude that any person, whether Theosophist or not, claiming to remember the events of past lives, is ignorantly mistaking imagination for memory. Have you ever heard anyone expressing that belief, paint a word-picture of ordinary, humdrum lives in lowly positions, as their past? Mediocre as the character may be, or however humble the status here and now, the "memory" is sure to be grandiose. Invariably it is of celebrated personages of ample achievement, occupying outstanding positions in the world. The ear-marks of phantasy stamp every such instance. The teaching of Theosophy regarding the ancient and fundamental doctrine of reincarnation is explicit, and, in main outline, simple. Details of the process lead into complex ramifications, of course, and involve great mysteries. With those we are not concerned at

present. Superficial study is sufficient to inform one that belief in memory of the detailed events of past lives is untenable because in the comparatively unevolved state of present humanity, we are unable as yet to tap the reservoirs of stored knowledge residing in the reincarnating ego. We come into each earth-life a new personality. The new brain is not the organ upon which experiences in former bodies were impressed. Incarnating anew, the permanent ego which is the golden thread upon which are strung like pearls all imbodiments it has had, passes through the waters of oblivion and forgets the past. The brain-mind is normally too insensitive to photograph — so to speak — the record stored in the inner man, he who is the "heir of all the ages." Not an item of that record is ever lost; it is simply inaccessible until finer faculties develop as we grow greater life after life and the inner eye is opened.

The rare exception to the norm is the case of those super-men who are the flower of civilizations. By virtue of unfaltering determination and self-directed achievement, they have outstripped the mass of humanity. From within themselves they have evolved forth faculties and powers not yet normal, but which will be the natural endowment of all when we have reached their high estate. These few do have the power to view the imperishable record of their long journey through the "cycle of necessity," and to read the record made by their fellows as well. We have the testimony of at least one such super-man where the Mahatman K. H. in *The Mahatma Letters to A. P. Sinnett* makes the statement that although he has this power, perforce, he does not care to exercise it. One can well understand why not.

Nature's wise provision to protect us from the devastating experience is merciful. For the present we are spared the horror of reviewing what we have suffered through our misdeeds in less evolved states, and the suffering we have caused others. The time

will come later on, we are warned, when every minutest detail of the sorry picture will lie open to our scrutiny. One can imagine that when that time comes, we shall be as anxious to turn away the gaze, as some few are now to prematurely force a glimpse of it.

Happily, it is within our power, by virtue of free will, to make good deeds outweigh the evil from the time conscious responsibility is attained.

Plato said, "Knowledge is recollection." The Ancient Wisdom affirms that man at each moment of his existence is the sum-total of his past. Therefore, character is the fruitage of all we have been from the beginning of time and is, in a sense, recollection — a faculty of the soul, quite different from that memory which belongs to the temporary brain-mind. Hopes, aspirations, every inherent tendency, talent, or essential characteristic of a man, are thus reminiscence of former lives. All experiences deep enough to become part of the fiber of the real man endure: minor incidents remembered more or less accurately for a little while — mostly forgotten — are not carried over to the next life, but vanish with the disintegration of the body and its brain. Only the essence of these experiences, in so far as they affect character, become a matter of record in the permanent self.

Growth would be interfered with by carrying this burden along from life to life. Compassionate Mother Nature permits us to drink of the Cup of Forgetfulness that we may return to the school-room of earth-life free to look hopefully and eagerly into the future and concentrate upon the lessons of the present term.

Undue interest and curiosity in the backward glance is a distraction and impedes progress. It is much the same as over-interest in things of the psychic realms. Normally, the consciousness of human beings today does not belong there. Our

high business is with the opportunities for growth, through service, offered by the daily events of life where Karman has placed us — which means, simply, where we have placed ourselves through the consequences of our accumulated past. Lessons enough are right at hand. Qualities needing development to round out character are more quickly acquired if the whole attention is given to culling spiritual nectar from each significant event. Courage, compassion, unselfishness, patience, must be won by practical effort, never through attention centered in the past, nor upon the allure of the psychic world. Advice from real Teachers all down the centuries points to the initiation to be gained from the ever-present opportunities of life. Every waking hour — lived rightly — holds enough for the exercise of all the spiritual and intellectual faculties we can command. These are infinitely more worthy of cultivation than the pale-moon illusions of the lower astral spheres. In the fulness of time man must and will have complete knowledge of Nature. But growth is accomplished step by step in orderly sequence. The shortest and safest path is the Way of the Sages. They have left plain sign-posts for our guidance: "Man Know Thyself"; "Discipline must precede the Mysteries"; altruism is the first step — and the second, and so on forever; forget yourself in the simple duty of the moment; be patient; be cheerful; follow the gleam: then you shall reach the land of Heart's Desire and Nature will withhold no secrets from you, but will accept you gladly as another proved and worthy collaborator.

THE LOVE OF NATURE — *H. T. Edge*

It is often said that civilization is hostile to the love of nature, but there is much to be said on the other side. Macaulay, in a well-known passage of his *History*, shows how the appreciation of natural beauties has been enhanced by civilization. He is describing the horror with which Scottish Highland scenery was once held, by contrast with the enthusiasm with which its beauties are now courted. That scenery was the same at the end of the seventeenth century as it is now: the crags, the glens, the woods and waters, the broom and wild roses, the roaring cataracts and the snowy mountain tops. Yet in those days they inspired nothing but horror and loathing; for before a man can be charmed by scenery, he must be assured that he will not be robbed, stripped and mangled, or killed outright; that he will not fall down the precipices, drown in the cataracts, or die of exposure on the hill-sides. "Indeed law and police, trade and industry, have done far more than people of romantic dispositions will readily admit, to develop in our minds a sense of the wilder beauties of nature."

And truly nature has a rough side, and needs to be wooed and won. But why cannot man himself, as one of the animate orders, be regarded as a part of nature? If so, then his works, whereby he tames and subdues nature in her harsher aspects, must also be considered as works of nature.

In short, to avoid being misled by false issues, the real issue seems to be, not between man and nature, or between civilization and wildness, but between the artificial and the natural, between excess and balance, between discord and harmony. And here the following will serve as an apposite text:

Consider the lilies of the field, how they grow; they toil not, neither do they spin: and yet I say unto you, That even Solomon in all his glory was not arrayed like one of these.

This saying, by whomever said, is an aphorism of ancient wisdom; and its counterpart may be found throughout all times and lands, including many wise men of our own day who have earnestly advocated simplicity. A book called *Power Through Repose*, while dealing largely with physical aspects of the question, nevertheless gives the key. In that book we were enjoined to *relax*. Owing to wrong habits of thought and to various emotions, such as fear and anxiety and hurry, we are grown accustomed to live in a state of *strain*, which extends even to our muscles, kept unconsciously in a state of tension, and to our every nerve and fiber. If we can but let go and relax, this state of tension may cease, and then the fount of real power within us will be allowed easy flow and expression, and thus we shall accomplish with ease and without effort what previously we have struggled in vain to achieve by worry and effort.

This then is the chief lesson we are to learn from "nature": to work easily and without effort. And, as just said, it is not the rustic who is immersed and involved in nature, who is best qualified to learn that lesson, but the cultivated man, who knows what artificiality is, but who also knows its opposite; and whom the progress of civilization has placed in a position where he can utilize the advantages of nature profitably.

In antiquity there was a cult of nature; we find it in classical antiquity; we find it still among "primitive" tribes. Certain learned people have squashed, or tried to squash, all this under the name "animism." It was a superstition, they say, marking early states in the evolution of intelligence or religion. Those simple-minded ancients believed that nature is alive; whereas we enlightened

moderns — well, what *do* we believe after all?

Let us try to go back from that modern notion that nature is not alive (that is, it is dead), to the old idea that nature is alive and conscious. Then the feelings of artists can be explained otherwise than by regarding art as a pleasing illusion of the imagination. Artists indeed! Are we not all so to some extent, however small? "Lives there a man with soul so dead" that he has not, sometimes at least, when surrounded by the works of nature, felt the presences around him; indulged himself in what he may have called a game of make-believe, and "endowed" the trees and rocks with mind and life? Let us get rid of that idea of make-believe and try to think that there is no illusion but merely a perception of reality; that the rocks and trees, both severally and in conjunction, constitute living presences, with whose soul we may commune. In that way we may purge our mind and our heart of their contractions and dislocations, and attune ourselves to the tranquil harmony of our surroundings; and, just as the earth and the water may purge away the humors from our body, the soul of nature may cleanse our minds and our hearts.

No doubt many of the ancients indulged in a good deal of nonsense about nymphs and nature-spirits; but the superficial folly need not blind us to the fundamental truth. Nor need we seek to wear other people's clothes. We can get back to the spirit of antiquity without donning ancient habiliments; and we do not need to imitate those poets who made their poems artificial by an anachronistic introduction of Pan and Arcadian shepherds into an English landscape. Let us go back to nature in our own way, in a modern way. Let us not throw away the advantages of civilization, but use them. However crowded and artificial may be the outer circumstances of our life, we can always carry simplicity about with us in our hearts, and show it in our manners.

There are perhaps some people who show more enthusiasm in their talk about nature than they evince in their behavior. And there are surely others whose appreciation of nature is genuine, but who find that they are likely to get more sympathy out of the silence than out of any rash attempt to communicate their feelings to anyone else. But silence is one of the great mysteries which nature can communicate to us; and, deeper than the communication of minds through talk, lies the silent communion of hearts attuned to the same ideal.

Nature is a great initiator; and, as we are reminded, imparts her secrets only to those who worship at her shrine. Remaining a sealed book to those who abuse her, or who walk blindly through her beauties, she stands ever ready to reveal new wonders to all who will but open their eyes and their hearts, and attune themselves by sympathy, so that they may resound like a resonator to her vibrations.

In an important sense, then, nature is just what we are able to see. The ant, the nocturnal toad, the cow in her pasture, know one kind of nature. The holiday tripper may know nature only as a very capital place in which to deposit paper bags and tin cans.

Nature is waiting, wistfully, for — Man. It is his to play positive to her negative; for she is receptive, and her art is to respond. And with what boundless wealth can she respond! She needs to be wooed. She stands ready to resound to any chord we can strike; to embody any glory to which we are capable of attaining. She is now, as always, the Great Mother, of infinite resource and bounty. But he who would receive must know how to ask.

THE REAL MAN — A. Trevor Barker

Mr. Sidney King at our White Lotus Day celebration the other night (1) made the statement that the teachings of H. P. B. could be understood as a kind of algebraic formula, which, rightly understood, could be applied to the understanding of any problem of life. We are to consider tonight the subject of what in Theosophy is called the Real Man. Let us apply the proper algebraic formula to an understanding of what is meant by this term. The Real Man signifies that there is something else besides reality in man, and if you turn to H. P. B.'s statements of fundamental principles of the Oriental philosophy, you find her laying it down that man is not his objective body, but that there is within him this something which she calls the Real Man, which is an indwelling and energizing principle; and that this Inner Man is ever striving, acting, thinking, feeling, on this evolutionary journey through earth-life, upwards to that ever-brooding Divinity which is at once its parent and its inspirer. We understand our algebraical formula to suggest that man divided into the simplest terms for easiest comprehension may be considered as spiritual, intellectual, and vehicular. In other words there are conjoined in man at any one time three actual streams of evolution. I do not know whether you have brooded upon this question. Three streams of evolution seems to suggest that there are entities evolving on all three levels of man's constitution.

Now then, this question of the Real Man will not be comprehensible unless we succeed in showing that that which we call reality in man is something eternal and indestructible. The permanent individuality in man is actually rooted in the spiritual pole of his being, which is in itself dual in character. You notice that H. P. B. in the Fundamental Propositions of the Secret

Doctrine lays it down that duality pervades the manifested universe directly you drop in thought from the highest metaphysical Triad, of which Eternal Duration, Space, and Motion are the three symbolic terms. Therefore we need not be surprised when we find that man in his highest spiritual part is dual. Even his Monadic Essence could not express itself did it not do so in two streams or parts: one spiritual and having the aspect of consciousness, and the other, having the aspect of substance, the vehicle side of spiritual conscious life: and these two together make the dual Atma-Buddhic Monad. It is this which is the highest entity evolving in that septenary Cosmos which we call the human being. That entity is performing an evolutionary journey — a long one; and because it is doing so it may be said that it actually expresses the highest of the three evolutionary streams that are combined in man.

Let us drop in thought to the next part of our being, which H. P. B. in a generalizing way calls the Real Man. This also is dual. According to the septenary classification you get Manas and Kama. Now here you have the center of what is called the Human Ego, and this Human Ego passes actually from life to life. The Reincarnating Ego is the higher part of this kama-manasic dual entity, and during life the consciousness is centered mostly in the lower part of it. But the Real Man is centered in the higher part; and it is this higher part of the dual Human Ego which owes the permanence of its individuality to the spiritual brooding presence of the Monadic Essence above it.

Therefore, as you would expect, after death there comes a division which cuts in twain this dual Human Ego which H. P. B. calls the Real Man, and that is why this division of man into a three-fold entity, consisting of two duads and a triad, is a very good one, because it shows us how the different workings of man's nature, during life and after death, actually take place.

After death there occurs a division between the *manas* and the *kama*, and the higher part of it is drawn upwards until it becomes permanently grafted by a process of interior disruption, as it were, on that eternal principle which is represented by man's spiritual nature. And so you gain immediately the conception that it is *we men living here* in earth-life who are the transient beings; but that there is an eternal Pilgrim within the heart of every man, which is here not once but many times, expressing itself through bodies of flesh, but relatively remaining untouched — that is to say no more touched than the actor is by playing the successive roles that fall to his lot.

This immediately suggests the thought to us: since most of us are necessarily absorbed, identified to a very large extent, with the material pursuits of life — the struggle for existence and what not — there is an urgent necessity to find a means of refreshing our objective daily consciousness, if I may so express it: that part of our being which not only suffers fatigue, but is overburdened with the cares of this world; that suffers fears and anxieties and what not — which are but a symbol of the unreal man, but a symbol of the transient personality: Theosophy, if it does anything at all, attracts men's attention to that higher part of their being where in the midst of storm and material difficulties the Real Man may be like a Master Mariner with his hand upon the helm of the ship of life. He may provide, as it were, for the harassed human soul the port that is always calm, and into which the lower man can enter, if he will, at any time — whether it be while he is at work, or whether he deliberately enters into a state of spiritual meditation. It is because the Real Man is a fact that, if we go about it in the right way, we can raise our consciousness and fix it in that higher state from which balance, discrimination, pure and compassionate judgment flow. This is the application of the Theosophical formula, this algebraic formula that we were

speaking of the other night.

Now another thought immediately occurs; it is that this permanent individuality lasts for an almost inconceivably long period of time, and it actually incarnates on this planet — let alone the other planets and globes of the planetary chain — I do not know, and should be afraid to say, how many times, how many incarnations it has to go through; but eventually this Human Ego wins what is called its Immortality. If you have studied the question you will know that mankind as they are — average men and women — are at best but conditionally immortal: in other words the human part of them is not sufficiently united to, not sufficiently illuminated by the higher part of their being, to be able to claim that they are immortal entities. To be an immortal entity is the supreme achievement of evolution — not as ordinarily understood, but understood in terms of occult science.

When a Mahatma reaches the end of the first five steps on the initiatory Pathway, he enters into an indissoluble state of union between the human Ego and the God within him. It is to this: the first part, the beginning of this process, that all Theosophists are striving: otherwise our endeavors have no meaning at all. Step by step we are learning to raise this Human Ego, this reincarnating entity, to a recognition that there is that eternal reality in the depths of our being, from which we may get hurried away by the affairs of life, by the domination of what the *Bhagavad-Gita* calls the objects of the senses. These things serve to becloud man's vision: the Real Man identifies himself with the lower man and he forgets the reality not only of his Divine origin but of his permanent home: and then such a man loses his calm, loses his perspective; he is unable to concentrate and do those things which a spiritual man is able to do. The Real Man is actually composed of all the inherent characteristics or character of the

individual. In other words it is Karma. Karma is that moral kernel of the individual which is indestructible, but at the same time which can only be modified from within without — by growth. Therefore if we want to change our destiny, our Karma, and therefore our character, we simply have to recognise that it is our whole being which has to alter. Whatever we are today is simply an expression of that inherent, essential keynote of our being which has been sounding down through all the ages as we incarnated here, always sounding out a similar kind of note, until step by step we learn to clarify, to purify, and to raise the tone pitch and the key, until finally we ourselves become convinced that the Real Man is a fact, and we strive from that point forward to realize its presence in our lives from day to day.

1. This meeting was held at the London Headquarters, Point Loma T. S., in conjunction with the Phoenix Lodge of the Adyar Society, May 10, 1936. It was the first of the series of joint meetings between the two branches of the T. S., which have proved so successful during the past year.

For extracts from Mr. Sidney King's address above referred to see the following article, "The Algebraic Equation." ([return to text](#))

The Theosophical Forum

THE ALGEBRAIC EQUATION (1) — *Sidney King*

Our thoughts tonight are focussed upon H. P. B. and the Theosophical Movement which she founded; being the messenger of the Masters of Wisdom to the Western world of the cycle.

It is a fact often observed in history that founders of great movements see simply and clearly what their followers succeed in explaining and amplifying into complications and terrible darkness. The impress of personality after personality succeeds all too often in stamping out the original likeness. And all this is done by zealous partisans. But in this case, though much has been said and done to injure and obscure, we are not so far away from the Founder's purity of purpose as to be unable to perceive and adopt it if we will.

First we must strive to see as they saw. To appreciate the wisdom that guided H. P. B. we can study her written works and see what they cover, and also what they omit to cover. By this means we may gain an insight into the way we should conduct our movement so as not to lose the force which set it in motion. Her written works cover: The nature of the Universe; the nature of Man; the basis of Truth behind all World Religions; the conquest of Personality; the dangers of Psychism; the appeal to the Real Self within each individual.

They do not cover nor recommend: particular lines of activity or conduct; particular creeds or religions; particular political or social views.

The thinking man is placed in possession of what he metaphorically calls an Algebraic equation. In this equation the relative values of that All Presence — the Higher Self — and the

Personal Self — are clearly expressed. There is a factor for action.

Once in possession of that Algebraic equation each individual's life and circumstances can be written in, and every problem successfully solved. Every action sincerely taken as a result of such a process will inevitably harmonize with every other action.

By this means Unity is assured, while room is left for the inevitable differences arising in a world of maximum differentiation.

How else shall our nucleus of brotherhood contain members of various convictions — members of all religions or none? The moment any particular phase of creed or practice is placed in a favored light is not some member of another belief injured? The moment one political bias is championed, is not censure passed on those of opposite convictions?

We have to achieve our inner unity by allowing an outer diversity. Individual freedom must be maintained, and our collective functions kept so broad and elemental that they embrace every manifestation.

Our presence here tonight is a token that we hold to that inner Unity so clearly envisaged and wisely followed by the founders of our movement. Let us apply ourselves to study and adopt that Algebraic equation presented to us through H. P. B., leaving our fellow students to apply it also each in the sincerity of his heart.

So shall our Movement one day again become one inwardly, and perhaps outwardly should we earn it by our Karma.

A RELIGION FOR THE YOUNG (1) — *Jalie Neville Shore*

There is no system of thought that offers so much to Youth as does Theosophy, embracing as it does the all-inclusive Wisdom of the Ages. For there is no subject, however recondite, none so abstract, none so sacred, that it cannot be studied in this Science-Philosophy-Religion. To Youth it offers the discovery of All Nature and suggests adventure at every step of investigation. Filled with hints of what has transpired through the fathomless depths of Time, and of prophecies of what is to come long ages hence, fraught with the mysteries of both past and present, Theosophy provides not only intellectual stimuli but promises the development of faculties which lie latent in man awaiting proper and careful rediscovery and training under trustworthy tutelage.

Having been given to the world by the highest Initiates whose holy purpose in life is to live to benefit mankind by raising the spiritual levels of humanity, Theosophy offers to the earnest student who is indefatigable in the application of its precepts a moral security and a spiritual peace not to be completely found elsewhere.

Youth in its tireless quest to find its place in the scheme of things often unwisely turns to paths that lead to disappointment and seemingly unjust suffering. In a world of beings the youth finds himself companion to other humans and to the animal creatures. He finds himself an observer of the stars above him, the plants and flowers about him, and the mineral kingdom below him. Alert to the psychical changes of the times, he no longer believes that God created him to be lord over all creation or that He put the stars in the heavens just to please men's fancy with their twinkle. Being awake mentally he is acquainted with the latest

scientific developments, which teach a Universe made of mind-stuff and a cosmic infiltration of energy centers. Being ambitious for what he calls "success" in life, he often decides that the environment he is born into is a barrier to the realization of his dreams; that his people from whom he thinks he has inherited disease or evil tendencies, peculiar ways, or a grotesque body, are the wrong kind of people; that there is no such condition as equal opportunity, and that even his government is rotten to the core. In this trend of thought he usually does one of three things: acquiesces to conditions as he finds them and beds down in the mire of his own inhibitions; attempts to flee from the surroundings so distasteful to him; or revolting, tries to upset the applecart by his bitterness. In any event he has not found his place in the scheme of things for he has looked outside himself to find his place. For however close, for instance, his relatives may be, or however inhibiting environment and governments may seem, they remain uninterpretable so long as he does not seek within to understand himself.

In Theosophy, Youth may learn that environmental conditions are never a mistake — nor an accident. He is taught that they are a clear testimony of that which he has drawn unto himself by love or hate. He learns that kicking over the traces does no good: that that method is simply abortive to any attempt to improve affairs; but that a solution of his problems — and Youth has many! — lies in the recognition that he is literally the child and parent of himself, the child learning, the parent guiding, the parent being the reincarnating ego that brings forth life after life the entity that finds itself in difficult situations. Gradually he learns that this parent is his inmost being who has learned and retained all the lessons of former lives and that this being with its unfailing memory is his one sure guide and teacher. He learns that there is *nothing in his life* — either unpleasant or agreeable —

that he has not brought about himself; that only he can do anything about it and that selfless action alone will bring him permanent happiness. By practice he learns to look situations in the face and understand conditions as he meets them. Without understanding he can hope to accomplish nothing; with a clear-cut perception of his own make-up he goes steadily forward.

He learns that physical proximity is not always indicative of that which is nearest one's heart. He learns that though a continent, an ocean, a world, or a universe may appear to separate him from that which he most loves, there is an essence within him that binds him to the thing he holds so dear; for by this literally substantial psycho-magnetic tie he and it are one. This is a great lesson that he learns, for the fundamental unity of All Nature becomes then a scientific reality. It is not long before he realizes that the crux of the whole matter is finding out that which is more truly nearest his heart, the center of his being — that which enjoys the pure sweet light springing from the Inner Flame at the heart of him.

Once Youth understands the truth of the Theosophical teaching that he is the result of *himself* and that he is where and *how* he is by his own actions, he leaves off being resentful and discontented. He hesitates to "pass the buck," and begins to accept his own responsibilities. He attempts to stand on his own feet, and in attempting, gradually gains a poise that withstands the temptations that are so likely to come his way.

Youth in the composite is expressive of so many different aspects of himself: beauty, ambition, and dreams. And in the exuberance of his nature he often plunges himself into experiences that result in serious consequences. But Youth does not need to be restrained; he needs to learn that *he* can bridle his own nature and direct his own course. He needs to learn that he is the rider of

his own steed which he himself has broken to the bit of self-discipline. Theosophy teaches that everyone can direct his own course, can make his own Karma.

Theosophy also teaches that everyone is evolving and that evolution means the bringing out of that which is within. Therefore, if Youth understands that in the core of him there is an indwelling god, he will seek more readily the noble things of life and scorn the cheap and tawdry. He will realize that alliance with the Wisdom of the Ages is to reap the benefit derived from the bringing forth of his own god from within.

Youth seeking Life often finds Death — Death that is sometimes merely physical annihilation, at other times a destruction of precious faculties, or in the horrible extreme, a breaking down of the moral fiber that supports his very soul. In any of these cases the teaching of Theosophy will be like a beacon light to the Youth who in the intensity of his too full life has lost himself in the fog of doubt and bewilderment and misunderstanding and fear, all of which has caused him to lose hope too soon. Theosophy gives hope to such Youth for Theosophy teaches that man returns again and again to take up his life and his work where he has left off; to unravel the entanglements his lower nature has been the cause of; to learn the lessons his stupidity and lack of self-control have made him neglect. The knowledge of reincarnation makes life an adventure. Meeting "new" faces, being attracted to "new" people or repelled by others, indicate most clearly adventures begun in other lives with these same people — adventures to be continued until they are brought to harmonious fruition. The knowledge of this teaching, indissolubly linked as it is with the Law of Consequences or Cause and Effect, is a challenge to Youth to change the discords of his life into the beautiful harmonies developed by impersonal love and service to others. Physical death to Youth is so often frightening and revolting. Frequently

he is shaken to the very depths of his being by what appears to him eternal destruction. Were Youth to understand thoroughly the Theosophical teaching he would know that Death is a gateway to Life itself. Then he would understand something of the phenomena of Nature in regard to this tearing-down-building-up process. For he would learn that man is not body alone, that indeed his body is the least important portion of him. He would learn how man's higher principles seek their own realms and how the myriads of evolving entities composing the lower principles go on peregrinations of their own in the after-death state.

And learning something about Death, Youth would, paradoxically, learn much about Life and of his part in it. He would learn that he is composed of innumerable Life-Atoms that through him are getting their experiences on this evolutionary journey. He would learn that he is an inseparable part of the Universe which is also evolving. He would learn that his fellowmen have lived just as he has lived for aeons of time; that they, like him, have had their cyclic periods of activity and rest; that the people with whom he works and plays, and those whom he loves and hates, are people he has known before. Human relations would take on an added value. More care would be exercised as to duties to be performed and daily life in general. For Youth would see for himself that the Law of Karman or Cause and Effect or Action and Re-action simply means that there can be no thought sent out, no word spoken, no deed done without an attending reaction on the one responsible. Knowing this Law, Youth would become more thoughtful, kindlier in his attitude toward others, more considerate of his fellows, more understanding of the aches of the human heart, more eager to alleviate the pain, and less willing to risk adding to the suffering of the world by indulgences through the dictates of his lower nature.

Theosophy teaches one to know himself for knowing one's self he would know all things. Youth becoming acquainted with this thought would learn that at the heart of him is the core of the Core of All Being. He would feel himself a very Universe. Before him would be the discovery of All Nature, there being no branch of any Knowledge that is not an integral part of Theosophy.

Theosophy is not so much an anchor which Youth can throw into a turbulent sea to stop his forward progress as it is a discovery of how to use the compass he finds within his own nature by which he can set his course to destinations that only Youth dares dream about.

NATURE STUDIES: II — *H. Percy Leonard*

ISAIAH'S WATCHMAN AND THE CYCLIC LAW

Watchman, what of the night? Watchman, what of the night?

The watchman said, The morning cometh, *and also the night.* — *Isaiah, xxi, 11-12*

According to Theosophy, all the conditions and events of life revolve in cycles. They have their birth, their growth, their full maturity, and then their slow decline and death. After a lapse of time they reappear and the successive changes run their course again. Our brighter moods must of necessity give place to intervals of gloom as evening shadows deepen into night after the sun has set. Not until we recognise and make allowance for these oscillations in our consciousness can we attain to mental equilibrium, nor can our minds enjoy more dignity and calm than children have who fluctuate between two alternatives of tears and laughter throughout the waking day.

If a devoted mother were to hear her child at night crying alone in terror of the dark, she very properly would comfort her by telling her the morning was at hand and night would soon be over. Shall we say, however, that were she guided strictly by a logical consistency she ought to call her child indoors when playing in the morning sunshine and advise her not to be too happy as the cyclic law would soon bring round the dreaded shades of night once more? Such an extreme of philosophy in mothers is happily very rare; but those of us who have attained full growth may well consider the inevitable backward swing of life's inexorable pendulum, and steadily confront the situation here described.

No change from darker moods to lighter ones can bring us permanent relief; for in due course the change itself will be transformed into something else and cannot furnish an abiding satisfaction for the soul. The Universe in all its parts is in perpetual flow, and while we willingly subject ourselves to Nature's sway by our preoccupation with the body and the lower mind, we must be subject to the ebbing and the flowing of the tides. Are men for ever doomed to float like corks upon the restless waves of moods and feelings? Have we no better destiny than everlasting oscillation?

'Nature,' by derivation, signifies that which is born and hence must die. From the Divine she issues forth, back to her source she must return; therefore in all her many-chambered mansions can we never find a lasting habitation for the soul. But man in inmost essence is an undivided part of unseen reality which causes, but is not affected by, the ebbing and the flowing of the tides.

The human race in general and the individual for himself are destined to achieve their independence from the tyranny of cyclic law. Man may arise and claim his long-forgotten dignity of being one with the Divine and work indeed in harmony with cyclic law, but holding all the while to that supreme, eternal life which burns with never wavering glory in the inner shrine.

The vast majority of humankind are the servants of the cycles as they come and go, and alternate incessantly between the antics of the dancing faun and the prostration of tearful Niobe. And all the while the Sphinx in balanced equilibrium, the human head the ruler, and the body of the brute as slave, sits gazing on Eternity with changeless satisfaction smiling on his face, inviting us to seize our heritage and share his peace.

QUESTIONS AND ANSWERS: 329-332

QUESTION 329

Do the Theosophists at the General Offices of the Theosophical Society at Point Loma find anything incongruous in the immediate proximity of the Military Reservations? What is the general attitude of Theosophists towards an armed force?

G. de P. — Emphatically, as the Theosophist's first thought, being a lover of his fellow-men, he is opposed to war, and violence of any kind, with all his heart. But we are sane people, and I do not think any sane individual today would go so far as to say that the armed forces of the United States are out for ruthless violence or for slaughter. To me they are like a national police; and they do a policeman's work in the world, something very fine indeed; and the ideal armed forces of any country stand for that same thing. If we did not have police patrolling our streets, see what would happen to us, to our lives, to those we love, and to our property!

Now if force is misused, that we condemn emphatically; but we do not condemn — as sane, honest, earnest people who love our fellows — the proper application of strength where strength only will bring about peace and order, and when used honestly for the protection of the weak and helpless. The armed forces of a country certainly can be misused and abused, and that is a crime; and it has happened again and again and again in the history of the world. But we must not condemn the armed forces of our country, of any country, which in theory, and usually in practice, stand for the preservation of order, the upholding of right and law, and the assuring of honest and peaceable men and women that their daily pursuits are safeguarded and protected.

Militarism is one thing; that is the abuse. The preservation of law and order by even armed strength if need be is not abuse. A lunatic hastening to set fire to a building, or to do some foul crime — should he be allowed to do it merely because he is human and because we love our fellow-men? What sane man would say that? He must be prevented even by strength and controlled force if it has to be called forth. But that is not ruthless use of strength; it is decent use of strength.

We Theosophists, lovers of our fellow-men, with our General Offices established here on Point Loma within a stone's throw of the military reservation bounding our grounds, and the soldiers and sailors of the U. S., live side by side in perfect understanding and courtesy. They neither offend nor trouble us, nor do we offend or trouble them; and I pray it always shall be so. A Theosophist stands for love, brotherly love; but love is sometimes strong, it is never weak and feeble. It upholds right, protects the weak, insists upon justice, will even raise its strong arm to bring these about if there be no other way. In the latter case, pitiful perhaps — but we have to face facts.

Some day the human race will outgrow the need of armed police forces for its protection, will outgrow the need of surgery, will outgrow the need of remedies for human disease and other ills. But as long as we human beings, with our millions in the prisons showing conditions as now they are, cannot control ourselves, wreaking violence upon others if we have the chance, or perhaps because we are at times too weak to hold ourselves in against temptation and evil-doing, society has to be protected, and it is proper. We grieve over it, but we are sane people and recognise facts as they are.

QUESTION 330

In Mr. Judge's Preface to *The Aphorisms of Patanjali*, pages xvii

and xix, he states that an adept is able to read the records in the astral light. Are these records equally accessible, or is an event that happened yesterday more easy to revive than one that took place a million years ago? — *H. L.*

E. D. Wilcox - — One can answer this question only from hints given in *The Mahatma Letters to A. P. Sinnett*, by Mr. Judge himself in his writings, or by analogy in reference to memory-experiences on the physical plane. In the Preface mentioned, just previous to the statement from which the question arises, Mr. Judge gives these words which partly describe how the adept is able to read the pictures imprinted in the astral light, as "he becomes, through the power of concentration, completely identified with the thing considered, and so in fact experiences in himself all the phenomena exhibited by the object as well as its qualities."

In *The Mahatma Letters to A. P. Sinnett* we are told that the adept, in his everyday life, leads the life of the ordinary human being, and that when he wishes to use any of his trained powers, he places his consciousness by an effort of his will in harmony with or actually into the consciousness of that thing or person he seeks, and as the will is an electro-magnetic force, it attracts and draws to it that upon which his mind is concentrated.

As to whether this result is as easily accomplished for distant events as for recent ones, only an adept can tell, but we might infer, by analogy, that what is newly impressed on the astral light would be more readily visible to the seer than that which requires more concentration of mind and a placement of consciousness upon the deeper realms of the astral light.

QUESTION 331

What has Theosophy to say about divorce? Is it wrong?

L. L. W. — Theosophy is a formulation of the origin, structure, and destiny of the Universe, so that it embodies for us the basic ethical principles of life but says nothing as to ephemeral human institutions. We must ourselves decide about these, accordingly as these institutions are founded upon those ethical principles or disregard them. The knowledge gained through Theosophy for example gives us a very clear idea what to think about capital punishment though Theosophy itself offers no definite teachings as to that particular legal solution of social crime.

Divorce is a man-made institution and as such is not a subject which of itself comes within Theosophical doctrines. But any Theosophist by applying the principles of Theosophy can decide for himself as to what his own attitude should be. In every situation involving human relationships ethical principles are bound to be involved. If these ethical principles are set aside where a divorce is granted then naturally a Theosophist would feel that the divorce was wrong. Still, no one can decide as to this but the parties involved and a true Theosophist will be careful not to judge or condemn.

It seems probable however that most Theosophists who are trying to "live the life" would make every effort to guard and preserve the sanctity of marriage. Feeling that marriage is a sacred karmic relationship, they would feel it better to *solve* any problem which develops — if possible to do so without sacrificing ethical principles — rather than to try to escape the problem through divorce. For a problem evaded is sure to return sometime and probably in an aggravated form. This is a general principle of life enunciated by Theosophy which can be applied to any human relationship. But, again, divorce is a problem to be solved by the individual conscience which will be greatly assisted by a knowledge of Theosophy.

QUESTION 332

When the inevitable changes peculiar to the New Cycle now dawning come upon us, will they cause chaos only to the extent that we fail to prepare ourselves for their advent, or as we oppose them? — A W. N

Alice D. Peirce — This question seems to imply that changes concomitant with the New Era upon which humanity is entering, are yet to come upon us. The fact is that very great psychic, mental, and spiritual changes are now in progress and have been increasingly evident for several decades past. Cycles do not terminate abruptly, one giving place to another at an exact point of time. Nature works less mechanically. As twilight intervenes between the darkness of night and full day, so with all cyclic processes there is a period of overlapping, and a gradual changing of the old order to give place to the new.

Times of transition are critical periods, accompanied by unrest, uncertainty, and chaos more or less pronounced. Down the centuries cyclic changes can be traced in every nation, some of minor effect restricted to a limited area, others far-reaching and of cataclysmic proportions. The distressing symptoms of our present transition-era bear out the prophetic forecast of H. P. Blavatsky that one of the major crises in human events would accompany the closing of several important cycles near the end of last century, resulting in world-wide disturbances in this century.

Assuredly, the chaos now confronting us would have been greatly mitigated had men and women been better prepared to meet the crisis understandingly. Except in the teachings of Theosophy, introduced by H. P. Blavatsky, there was little in the religious, scientific, or scholastic training of last century to provide adequate preparation for the new conditions to be met. Difficult and bewildering as a transition-period such as ours seems,

encouragement lies in the fact that it offers greatly increased opportunity for growth in knowledge and understanding. To oppose the on-sweep of evolutionary progress is folly indeed. To best prepare for the new conditions of our changing world, we are taught to unfetter the imagination, to visualize a saner and more spiritual way of life, and above all, to put into practice in everyday affairs the old, familiar Golden Rule given by every World-Teacher without exception, as the essential panacea for the ills with which mankind has been afflicted in all ages in which it has been neglected — conspicuously in our own.

The Theosophical Forum

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

THE SUN'S CORONA AND PROMINENCES

These appendages of the sun are still mysterious, although intensive research is being conducted by many astronomers. The Master K. H. in *The Mahatma Letters to A. P. Sinnett* gives some plain hints that the corona, and the red chromosphere from which the prominences often fly up for tens of thousands of miles with enormous speed, are controlled by electro-magnetic forces rather than by heat or gravitation or light-pressure, and that they are of some finer order of matter than what was familiar to physical scientists when he was writing in 1882. For instance, he says:

Call it a chromosphere or atmosphere, it can be called neither; for it is simply the magnetic and ever-present aura of the sun, seen by astronomers *only* for a brief few minutes during the eclipse and by some of our chelas — whenever they like — of course while in a certain induced state. A counterpart of what the astronomers call the red flames in the "corona" may be seen in Reichenbach's crystals or in any other strongly magnetic body. The head of a man — in a strong ecstatic condition, when all the electricity of his system is centered around the brain, will represent — especially in darkness — a perfect simile of the Sun during such periods. . . .

The further the emanation shoots out the more it loses its intensity, until, gradually subsiding it fades out; hence — the "outer corona," its rayed shape being due entirely to the latter phenomenon whose effulgence proceeds from the magnetic nature of the matter and the electric energy and

not at all from intensely hot particles as asserted by some astronomers. All this is terribly unscientific, nevertheless a *fact*. . . . — p. 162

From the latest Report of the National Academy of Sciences, Chicago Meeting, it seems that this is not so unscientific in 1937 as it was in 1882! In the report of solar activity recorded by the new motion-picture method at the observatory of the University of Michigan we read this striking confirmation of the Oriental Mahatma's unorthodox statement nearly sixty years ago, when the sun was supposed to be a kind of burning fire, perhaps 15 million years old:

The motions of the various types of solar prominences are very well shown by these pictures and afford an astronomer his first opportunity of actually reviewing these motions. We see no evidence that light pressure alone will, in any way, satisfactorily explain the activity of these prominences and all appearances favor an "electrical theory of prominence formations, motion and destruction. . . . — *Science*, January 1, 1937

Dr. Curtis of Michigan points out that the apparent start in various directions of great streamers and new centers of activity at high altitudes in the solar atmosphere is one feature which indicates the extreme probability of electric action. Light-pressure would come up from the surface of the sun, not from the heights.

We draw special attention to the strange mysteries of the corona because of the probability that important discoveries further confirming the Masters' teachings will be made in that field. H. P. Blavatsky teaches that the sun is the store-house of life "Vital Force" and that Herschel was right in his daring speculation that the so-called "rice-grains" covering the surface of the sun "partake of life," and that "vital action is competent to develop heat, light

and electricity." Life and Consciousness of high or low order are behind all the forces of Nature, and it is not some accidental concatenation of "dead, inert matter" that produces life and consciousness as "by-products."

The fact that the sun's corona resembles the electro-magnetic aura round the head of a person in profound meditation is a broad hint to deeper students as to the analogies between the higher part of man's complex nature and the "heart and head" of the Solar System. The corona is still a great mystery to science, which frankly admits the difficulty in interpreting its meaning and even identifying the material composing it. The records of the eclipse of the sun of last June are now being intensively studied by astronomers, and one utterly unexpected report has been issued in regard to the chromosphere and its prominences. For the first time color photographs of an eclipse were taken, and it was proved that the rose-colored chromosphere was, at least on this occasion, a bluish white instead of a rich red, the color which is the principal hue of the hydrogen of which the prominences are supposed to be mainly constituted. This, however, is not the first time that such an unexplained phenomenon has been seen. During the eclipse of June, 1927, as seen in England, the observers in an airplane 11,000 feet above the earth saw the ring round the sun, the chromosphere, and the prominences, not red as usually observed, but a brilliant silvery white! Observers *on the ground* saw the usual red color. Professor Langley also observed the same white color during the eclipse of July 29, 1898, from the top of Pike's Peak, which is over 14,000 feet high. Although the English observations in 1927 attracted considerable attention at the time, the problem seems to have been neglected until now, when the natural-color photographs and reports from eye observers have brought it up again. We have not heard how high above the earth the observers of the eclipse of last June in Siberia were when they

saw and photographed the pale bluish-white chromosphere and prominences, but in regard to the English and Pike's Peak observations, which were taken at great heights where the atmosphere is rare, it is perhaps possible to connect up with the curious remark by H. P. Blavatsky that atoms and molecules change their nature when coming into our atmosphere. If the varied forms of radiation from the sun such as the spectral lines of hydrogen, said to be seen in the red prominences, also change color from red to bluish silvery white, as they descend into the denser regions of our lower air, the present interpretation of the spectrum of the sun may have to be modified. This subject is well worth watching.

While on the subject of the Master's knowledge of facts unknown to Western science sixty years ago, we must record another instance of his scientific prevision. On page 169 of *The Mahatma Letters to A. P. Sinnett* will be found the statement that an instrument will be used some time in the future which will detect by means of *heat* the presence of optically invisible stars and planets; such stars and planets being known by the Adepts to exist. This has just taken place and it is considered a great triumph of the most recent methods. Dr. C. W. Hetzler of the Yerkes Observatory has discovered new stars too faint and cool to be recorded by their own light on the most sensitive plates. They are, however, recorded on new rapid infra-red plates which are sensitive to low temperature heat rays of only one thousand degrees! It is expected that the new "heat-seeing" photographs of stars will reveal small, cool stars *much nearer* than the nearest known visible star, as well as giant stars far cooler than the moderately cool but brilliant giants such as Betelgeuse and Antares at enormous distances. We may have to revise our theories about the structure of the universe when all the data in regard to the invisible dark stars only known by their heat rays

are accumulated! On the same page of *The Mahatma Letters to A. P. Sinnett* in which the heat ray method is mentioned, the Master K. H. remarks that a planet exists "in the orbit of Neptune," although quite undiscovered by science in 1882. He does not say *outside* the orbit of Neptune as might be expected, and the reader might think that the use of the words "in the orbit" was only a careless expression, meaning in the neighborhood of Neptune. But, as a matter of fact, the new planet, Pluto, discovered quite recently, whose orbit is mostly beyond the orbit of Neptune, actually comes nearer to the sun than Neptune for a part of its course and is therefore literally "*in* the orbit of Neptune"! The Master made no mistake.

CYCLIC LAWS

The following question has been received. "We have recently noticed that on March 12 the Moon will be New and also Venus will be at its brightest. What particular meaning or effect will this have in regard to our laws of cycles?"

So far as we know this is not a significant coincidence. Were Venus and the Moon in conjunction, i.e., in the same longitude, whether Venus was at its brightest or not, the astrologers would attribute some importance to the position. This, of course, could not happen at New Moon. But the intensity of the light reflected to us at any time is not taken into account in estimating the meaning of the "aspects" of the planets. Possibly it ought to be, and if our correspondent can show cause it would be an interesting contribution to science.

ATLANTIS

Another question refers to a recent statement by Professor E. D. Merrill, a leading scientist, that "no ancient contacts between the continents of Europe and America existed," and asks what

bearing this has upon the belief in Atlantis. Dr. Merrill points out that not a single cultivated plant or domestic animal (except the dog) was common to the two continents prior to 1492, and that this fact alone is sufficient to explode the theory that a land-bridge joined the Old and the New Worlds in recent geological times. He speaks of "continents which have sunk under the Pacific and Atlantic oceans *centuries* ago," and, considering the mass of nonsensical arguments that have been foisted on the ill-informed public in the attempt to prove that quite recently — geologically speaking — vast territories existed in those oceans, he is quite right in showing the weakness of their basis. This, however, does not affect the Theosophical position, which places the final breaking up of Atlantis nearly a million years ago, and that of Lemuria ages earlier. Conditions in those distant times were so entirely different from what they have been since the great changes in the Pleistocene period, which includes the tremendous glacial climatic changes, that all talk of recent land-bridges and constant communication between the two sides of the Atlantic is futile. A few islands remained for a while after the Atlantean break-up, but anything of the slightest importance had perished hundreds of thousands of years before the last small relic which vanished about 11,000 years ago, and which seems to have been the legendary nucleus around which Plato built his story. He, being an initiate, could not give the real history of the great Atlantean civilization whose existence had been utterly forgotten by ordinary men. The subject of the lost continents is a difficult one, but Dr. Merrill's objections, even if valid, apply only to claims which Theosophy does not make. We do not admit that his argument, convincing as it appears, covers the whole ground. There is reason to believe that some very limited communication did exist between the Old World and the New, across both oceans, long before Columbus or even the Norsemen reached the western shores. For instance, the discovery that the Pima Indians in

Arizona were employing the exact and complicated pattern of the Labyrinth of Crete when the first Spanish explorers arrived there, has not been explained, and there are other puzzling facts.

MAYAN CIVILIZATION

Dr. W. S. Strong of the Smithsonian Institution reports that a missing link between the older and the later people who created the great Mayan culture has been discovered in Honduras. Pottery of a more simple character than the richly decorated Mayan pottery though somewhat similar and seemingly earlier types of tools have been found. Dr. Strong suggests that this indicates that the Mayan civilization originated in northern South America instead of in Mexico as previously believed, and says that this is the next great problem to be solved. Early man in America is indeed an unsolved problem, and although every year sees his origin pushed farther and farther back into geological time, there is little agreement among the best authorities on the subject.

Karena Shields, who owns a planetarium in the Maya jungle and who has spent many years among them, spoke very highly of the "simple yet deeply intelligent existence" of the Mayas of Chiapas to an audience at Altadena on January 7. We quote from the *Pasadena Star-News* a few passages of special interest:

The speaker said that these people are of a Mayan race preceding that of the Yucatan area, and possess the graciousness of the ancient Grecian people with the mysticism of the ancient Egyptian. Those of the Yucatan are more of the Roman in characteristics. These people are peaceable and friendly and will receive those from the outside world to whom they take a liking, and will not harm or kill those they do not like. But they will allow unwelcome visitors to get into difficulties, or will show

their disapproval with a stolid stare, and when an entire village takes this method with one, the psychology of the act becomes too much for him and he leaves.

One of the mysteries of ancient America is the absence of the wheel in any but a symbolic form such as the calendar circle stones. There were no horses or oxen to pull large wagons, but there is no trace of even such a simple wheeled vehicle as the wheelbarrow! The speaker continued:

TRADITIONS BASED IN PHILOSOPHY. Traditions have come down to these people which have their foundations in the philosophies of their ancient forefathers. One is that God in his play made a ball and threw it and it became the earth and rolled on so fast that God could not catch up to it, and that is why much of the evil came into the world, and to have this eliminated it must go slow enough for God again to catch up with it. This is why the wheel is taboo among these people. It goes faster than man can catch up with it, which symbolizes the complications of civilization too intricate for the human mind today to solve. To the Maya it is a potent reason for living the simple life in which one has time to think.

In regard to Maya problems we have received a letter which gives an opportunity of clearing up a misapprehension which has received considerable publicity; we recently heard it seriously expressed by a lecturer who was trying to interpret the mystery of the Great Pyramid from the standpoint of the British being the "Lost Tribes of Israel"! Our correspondent asks if an inscription of "Atlantean-like figures" published beneath a picture of two human figures supporting a large flat stone or lintel in a Central American ruin, does not mean that archaeologists are accepting the hypothesis of Atlantis. "Atlantean" figures, or more commonly

"Atlantes," is a technical term in architecture derived from Atlas, the Greek god who was said to support the heavens on his shoulders. Male figures sculptured as the supporting feature of a lintel are called Atlantes (plural). Supporters of the female sex, such as the famous figures in the Temple of Erechtheus, on the Acropolis, Athens, are called Caryatides. The Mayas used Atlantes with great artistic skill. The word has no direct connexion with Atlantis, but its misuse is a good illustration of the danger of employing words ignorantly. Some interesting information about the meaning of the Greek God Atlas and his *mythical* connexion with Atlantis will be found in *The Secret Doctrine*, Vol. II, pp. 493, 762.

TRANSACTIONS OF THE POINT LOMA LODGE: XIII — *G. de Purucker*

ROOT-RACES AND LIFE-WAVES

The following question was asked on the evening of January 31, 1937, after a lengthy discussion on the subject of Life-waves and allied subjects:

Dr. A. A. Beale — Is there any relation or connexion between the "other humanities" (1) that follow our Human Life-wave, and the seven human races that start contemporaneously at the commencement of our Manvantara, spoken of by H. P. B.?

Abbott Clark — There is one phase of this subject, "other humanities," on which many questions have been asked and to which I should like to speak. This phrase, "other humanities" on other globes of the planetary chain, has given rise to much speculation and some confusion of thought, followed by some enlightening study and research, the result of which is as follows:

In this case the phrase "other humanities" is used as a generalizing term for the other "life-waves" below man, which are all potentially human. It does not mean that there are other hosts of monads that are exactly and specifically in the same human stage as we are, i. e., self-conscious, thinking manases, evolving on other globes of this planetary chain concurrently with our evolution on Globe D. That would be contrary to the rest of the teaching on the subject.

The phrase, I believe, is meant to remind us of the essential hierarchical unity with all the monadic hosts which primarily sprang from man and which will ultimately achieve the human state. The mineral, vegetable, and beast kingdoms are all our

younger brothers, vital parts of ourselves. They are differentiations of the chain hierarchy of which man is the crown on Earth. Hence they receive the impress of his character, and, in a broad way, his name, signifying that they are potentially human.

H. Savage — In direct answer to Dr. Beale's question, I do not think there is any connexion, except perhaps an analogical one, between the other life-waves, sometimes called "humanities," and the seven human races that started contemporaneously on our globe. This latter point has often been a subject for discussion among students. It seems reasonable to believe that the first Root-Race was different from the others, just as the first Round on our globe was different from the others; and that it was made up of seven aspects of humanity, foreshadowing the later development that has taken place and is still to take place in the other Root-Races. We know that in the evolutionary scheme each Root-Race develops one Principle — or shall we say sub-principle; and surely the seeds of these seven types of development were sown when man first appeared on this Earth in this Round. H. P. B. also speaks of these seven races as evolving simultaneously on *seven different portions of the globe* (2) but whether this means that the Sacred Imperishable Land which we are taught was the home of the First Root-Race was not one geographical locality but was seven localities known in Theosophy under a collective name is a question we have never been able to solve.

G. de P. — Just what did H. P. B. mean in using that phrase "different humanities"? It does not mean different bodies of human beings, as we now understand ourselves, but was a phrase adopted by her to hammer home the point that however unevolved the different classes of evolving monads may be, they all were on the way to humanity, i. e., to become "men," and therefore are by courtesy, as it were by forecast, "human beings,"

"humanities." That is what the different "humanities" following each other around the globes of the chain are: the different classes of monads of which our human stock is one class. Our human stock again is sub-divided into subordinate classes, smaller classes, families of men.

Now with regard to the other part of Brother Beale's question: this is something that has plagued the thought of many, many, many students; and it is understandable too, because it is a very ticklish point, and yet it is easily explainable. When human evolution began on this Globe, in this Fourth Round, or in any other Round, it was a Life-wave beginning to evolve, which means a class of monads, themselves sub-divided into seven subordinate classes; and as the Life-wave reached our Earth and struck it, of course it did so more or less as a whole — forerunners, however, of each subordinate class reaching the Earth and grouping themselves, not only each class to its own, but all the subordinate classes more or less together, just as we men do in a town: divide into families and classes, and yet we aggregate as a town.

Consider a ray from the sun as a light-wave. We know that it is sevenfold. We can, if we wish, say that the ray of light is subdivided into seven subordinate rays, the solar spectrum, which combine and form one compound ray. Now when a ray of light touches our globe, it touches it as a full compound ray or light-wave, i. e., Life-wave; which is but another way of saying that it has seven subordinate rays. Thus, consider a Life-wave to be a light-ray from the spiritual Sun making its round. When this Life-wave or light-ray reaches our globe, at the beginning of human evolution on this globe, it does so as a whole. I do not mean it is *all* there, there in totality, but all its seven parts are represented; in other words all the subordinate classes have representatives in the first contact with the globe. Do you see

what I mean? Each subordinate class has its forerunners, forming a scouting-party, as it were. These scouting-parties touch the globe, evolution begins, the *sishtas* begin to awaken and to work, and afterwards there come pouring in the bulk of the egos. Just so is it when a sun-ray-tip touches the Earth: that ray-tip, so to speak, is septenary, sevenfold, it has all the spectral colors; and once the contact is made, the ray thereafter pours down and through that channel all that is in it. Do you see what I am trying to say?

There are thus two definite points of teaching here: the seven Life-waves of "humanities" mentioned by me a moment ago as the Life-waves making their rounds through the globes, comprise our human Life-wave as *one* among them; but, referring to our human Life-wave alone, it also is sevenfold, as was indicated by the forerunners of our human Life-wave which reached the Earth at the beginning of the Fourth Round on this Globe: our own human Life-wave reached this Globe with representatives of all its seven subordinate colors or minor classes of human monads, most of them as forerunners of the main body.

It is a very interesting thing that the seven classes of men, *of mankind*, i. e., the human Life-wave, began their evolution together. What else would we expect? Pause a moment in thought. Think analogically. When a human being is born into this world, the body is not born first, and then when it is grown up there occurs the birth of the astral; and then when that has grown up the prana comes in. Birth takes place — actually a very mysterious and wonderful process — on different planes at the same time. While the body is coming into birth, the other principles in a man's constitution are beginning to arrange themselves, and form themselves, each in its own sphere, each in its own way, making man's sevenfold constitution. Not only the birth of the human being, but the growth of a seed, a flower, what not, follows the same rule of more or less contemporaneous

activity in all the principles of the entity. Thus the entire human Life-wave, and after the same manner as just stated, initiated human evolution on our Globe in this Round with seven different sub-classes, most of them, however, being forerunners or representatives each of its own part of the septenary Life-wave.
(3)

FOOTNOTES:

1. Cf. *Fundamentals of the Esoteric Philosophy*, p. 395: ". . . there are six other humanities or life-waves evolving similarly to our own course: intelligent, thinking beings on our planet — I do not necessarily say on our Globe D — evolving through these lokas and talas. How this stirs the imagination!" See also page 398.

3. The June issue of THE FORUM will contain further explanations of the foregoing subject by the Leader, in answer to numerous questions which from time to time have been asked by students in the class in *The Secret Doctrine* conducted by Dr Henry T Edge at the General Offices at Point Loma — Eds. ([return to text](#))

The Theosophical Forum

EVOLUTION FROM AN ETHICAL VIEWPOINT — *Rose Winkler*

Those who believe in *Karma* have to believe in *destiny*, which, from birth to death, every man is weaving thread by thread around himself, as a spider does his cobweb, and this destiny is guided either by the heavenly voice of the invisible *prototype* outside of us, or by our more intimate *astral*, or inner man. — *The Secret Doctrine*, I, 639

Evolution is a most instructive, enlightening, and fascinating theme for contemplation, as it encompasses everything in the universe. Evolution means *growth*, the coming forth, unfolding, unrolling, unwrapping, of that which from a preceding past existed or inhered in the invisible atom or germ, seed or ovum, active or latent within. This unrolling adventure points to a fascinating journey spiritward, which marks a trail that leads to enlightenment, wisdom, and the sublime Ultimate which Theosophists call That.

Let us think first of the coming forth of man. The Monad or divine soul imbodyes itself in an atom which, expanding itself into a germ-cell or ovum comes forth as a newly born babe, and after a score or more years has unfolded into a finely endowed intelligent human being. Let us assume that through many future rebirths, having unrolled successively superb psycho-mental, intellectual, and spiritual faculties, he finally issues forth as a demigod. Already a relative state of perfection has been attained and through numerous future incarnations he blossoms forth as a rare specimen of the race — a god-man, a Buddha or Christ!

Just as the divine soul or Monad in man has unwrapped from itself its active or latent forces, energies, substances, and talents, so unfold all the inherent forces and energies from within the

sidereal orbs which so brilliantly stud the vast celestial blue. The cosmic atom gradually unfolds itself into a cosmic seed, and ages later unrolls into a nebula (a glittering wisp of milky-white substance) which may be seen as great star-containing cloudlike masses in our Home Universe or Milky Way. In future ages the nebula shall have blossomed forth as a wandering comet, thence into a planet, from a planet through distant future aeons into a sun, then into a solar system, and finally in far distant ages into a galaxy or Milky Way. This brief outline reveals the analogy between human and cosmic evolution through a harmonious process of *becoming* impelled from within.

... with inner growth comes expanding vision on the one hand and the expanding consciousness to interpret that vision on the other hand. — *Golden Precepts of Esotericism*

As Life is continuous and endless, so is evolution endless and continuous. Nothing stands still, either one goes forward and advances or goes downwards and retrogrades. Inherent and behind all evolution is present an irresistible, impelling self-urge (Swabhava), driving every ensouling entity without exception into fuller self-expression and expanding consciousness. In man, however, is manifest an ever-increasing self-consciousness accompanying his unfolding intellectual and spiritual faculties. Hence, under the inspiring stream of influences flowing from the Higher Self or Inner God, the human soul is activated to express more lofty soul-stirring attributes, which make for a fine and noble character, especially when the spiritual aspect of desire calls forth the buddhic qualities. This practice of quickening spiritual desires hastens one's spiritual evolution.

What retards one's higher evolution? It is the lower, personal nature when it manifests aspects of selfishness, of weakness, including careless and uncontrolled thoughts, acts, and speech,

which from early youth until death weave themselves like a web around one and create an unhappy destiny. They fatten egotism and forge more closely the fetters of uncontrolled hatred, jealousy, envy, covetousness, and pride of intellectual and spiritual attainment, as well as pride of material and personal possessions. Thus they imprison the lower self.

What hastens spiritual evolution? The very reverse. Right thought, right speech, right action, self-knowledge, and self-mastery. To hold fast to an ideal once conceived helps to energize spiritual desire and perseverance, which lead to self-identification with that ideal, consequently refining and elevating the personality. All this can be achieved by practising the sublime Virtues or Paramitas.

The Theosophical Forum

QUESTING THROUGH THE PAGES OF "THE ESOTERIC TRADITION"

— *Irene R. Ponsonby*

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

The heart and mind of man are ever a-seeking: searching and seeking for constructive ideas to enable him to be something better, grander, and truer than he knows himself yet to be. This search it is which draws us to libraries; that claims our interest throughout what but too often proves wearisome and futile concentration; this it is which makes our regret on turning the last page of a fine book commensurate with the effectiveness towards good its ideas have had in our lives. Men instinctively yearn to grow; and value all constructive ideas towards betterment.

The cynic will declare: "What utter nonsense! Who wants or needs help? People are quite happy if only left to themselves!" This is a lie: a lie repudiated in every kingdom of Nature: a lie denied by the scent of rain-moistened earth, by the growing plant and bursting bud of the Springtime, by the jungle-beast's trust in man before it learns the cruelty of his gun, and the utter devotion of faithful dog and horse; by the zeal, alas! sometimes fanatical, with which man embraces a chosen cause. But whence the source and inspiration of this inherent yearning?

The urge behind evolution, and the objective which this urge is impelling us towards, is simply the divine hunger in the Universe to grow greater, to advance, to unfold:

Excelsior! It is innate in the Universe. Why this is so, no one can say. Perhaps the gods do not know. All we men can

aver is that it is so. Everything grows and yearns to grow greater, to become grander, to rise, to advance, to evolve, and the objective is to become at-one self-consciously with the Boundless — something which never can be reached! Therein is infinite beauty, for there is no final ending for growth in beauty and splendor and wisdom and love and power. The Boundless Universe is our Home. . .

All possible things are latent in the core of the core of the being of each one of us; they are like sleeping powers of the Universe; and this core of the core of the being of each one of us is man's own inner god, the Cosmic Dhyani-Buddha within him, the Divine Christ immanent within him: the living Osiris of the Ways of Infinity. — *The Esoteric Tradition*, I, 303.

Man Know Thyself! is the ancient injunction; and it is in a study of what Dr. de Purucker calls pneumatological psychology as outlined in *The Esoteric Tradition* — and distinguished from the more limited science of Psychology — that such knowledge may be gained.

Now the true psychology is not to be learned by a diagnosis of the conditions found in the hospital, the clinic, the seance-hall, or the consulting-room of the psychoanalyst, for here are to be met but the sub- or ab-normal products of evolution, while the solution of the problem of man's complex nature lies in an understanding of the normal, the ripe and healthy product of human evolution, and the standard by which such a product may be judged must be a universal one, such as is imbodyed in one or more of the tenets of Theosophy:

The Universe is a coherent and consistent Whole, one vast Organism, or more accurately still, one mighty Organic Entity, every part of it related to every other part,

everything in it in relation to everything else in it, and any one part of it subordinate to the whole. — *Op. cit.*, I, 390.

Thus, analogically, since man is the lesser within the greater — the microcosm of the macrocosm — we may define the human entity as an organism composed of many compounded souls, unified, coordinated, and guided by one Spirit, the Spiritual Monad, which is the essential Self. In other words, there are five souls in man: a divine, a spiritual, a human, an animal, and a vital-astral soul. Through every one of these points, the stream of consciousness which manifests as the man of today flows — notwithstanding the fact that the progressively deepening materiality of these vehicular points dims its pristine radiance as it descends from the realm of the divine to that of the physical. This is but one of the several possible divisions into which the constitution of man may fall, none of which should be considered as arbitrary, although custom may make the threefold the most acceptable.

We have thus before us the picture of the human constitution as a threefold entity: first, a highest principle or element of perpetual and unimaginable splendor, the product or rather the flowering of long past ages of aeonic evolution; second the intermediate part, likewise the product of past ages of evolution, but still imperfect, and therefore still more or less subject and servile to the interacting play of the various forces resident in ethereal substance surrounding it; thirdly, the vital-astral-physical element, a more or less fugitive compound. — *Op. cit.*, II, 967.

What do we really know about this intermediate nature of man? The Greeks called this part of the composite man *psyche*, a noun formed from the verb "to grow cold," "to be chilled," and we may

imagine the human soul as a wanderer whose roaming has led it beyond the warmth of its spiritual home and in bewilderment it yearningly gropes towards the peace and the security which re-union with the Spiritual Soul means, the while it is dazzled, and strays in the realm of material illusion. Here, then, in the human soul, the product of heaven and earth, is the critical point in the human constitution, because it is the scene of the choice which decides the issue of all evolution. If the human soul responds to the impulse of the hour — our present cycle of growth — and spurning the call of matter and its illusory desires, gives its heart and mind resolutely to the behests of Spirit, regeneration is won for the entire man, for fundamental unity inheres and rules in the universe of man just as it co-ordinates the Kosmic Universe! Therefore the growth and expansion of the part must benefit the whole organism. True Psychology, then, treats of the construction, the evolution, and the destiny of the human soul.

Therefore, it will be readily understood that a study of the past evolutionary progress towards manhood of the human entity is a vital factor in defining his future destiny, which, because it leads the expanding consciousness into the spiritual realms of man's constitution, may be called the sphere of Pneumatology.

. . . All have existed since the very beginnings of our planetary chain in time and space; nay, more, as already stated, we are coeval not only with our solar system, but likewise with the Galaxy; . . .

We were with the Sun, with the Earth, in the very morning of Time, though not then in bodies of flesh; and we helped to build this planetary chain as well as this Earth of ours, because, not only are we its children but we are collectively and individually integral parts thereof. — *Op cit.*, I, 278-9.

We humans are now where we are, and are what we are, having *become* such, in the beginning more or less unconsciously to ourselves, by exercising our inner faculties and powers of intelligence, of will, of judgment, of choice, of discrimination, and of such parts of wisdom as we have. — *Op cit.*, I, 2 54.

The various processes by which we exercise our inner faculties, and become what we are, may be classed, speaking generally, under the one descriptive term, "the Chain of Causation," which, lasting from eternity to eternity, is comprised of interlocked events, each linked to each and all by the habit of universal being — that habit recognised by Science today as the law of cause and effect — and each and all not only springing from the entity itself, but, in the last analysis, composing that entity. This "law" it is which manifests in Reincarnation — reimpodiment in flesh — when in the events of life on earth the human being reaps the harvest of past sowing on the physical plane, and in reaping sows again for future harvesting on this and other and invisible planes. But more specifically it is through exercising the power of choice in daily life that we develop and expand the powers of will, judgment, and discrimination. The man of character makes a definite choice at every point, a choice which is his own, irrespective of public opinion or convention, and as long as he himself is satisfied with his choice, he sticks to it through thick and thin; but should experience prove to him that his choice is wrong, he should be ready to choose again. This is the fundamental principle of "self-directed evolution": never to shirk making a choice, your own choice. By so doing the will is strengthened, judgment and discrimination learned, and wisdom won. In yearning towards the desired, man enters into an understanding of it which is true knowledge, because he becomes the desired object.

'Man gets precisely and exactly what he himself desires"; for "Behind Will stands Desire." The divine consciousness which permeates the entire man and is the higher part of his constitution seeks to express itself in the less highly evolved intermediate nature of man, and with the attainment of self-consciousness at the midpoint of evolution man's future destiny calls for ever greater effort towards union with the divine source of its being on the part of the human soul.

Since cases of the influence of one mind over another are not only frequent but accepted as natural fact, why should it be either reprehensible or improbable that an influence or influences emanating from or through one of the higher centers of consciousness in the human constitution should find in the tranquil and voluntarily pellucid intermediate nature of its own composite organism, a perfect instrument for the fuller, and relatively speaking, fullest expression of the highest spiritual attributes and powers? That such a state of receptibility is possible to the intermediate nature, the seat of man's egoity, the evolution of which has been the goal of aeons-long effort, does present a mystery, but it is nevertheless a verifiable and withal explainable — in the terms of ancient languages certainly — fact in human history; nor is the inference that the intermediate nature of such an enlightened man loses by so much as an iota in such a state of receptivity to the higher forces of its constitution. On the contrary such deliberate forgetfulness of self wins the protection and guidance of the Self, which as it permeates the fabric of the entire man strengthens and raises every evolving atom in its progress towards divinity. All the higher stages of "self directed evolution" depend on the power of the intermediate nature — the human soul — to make itself into a pure, willing vehicle for transmitting the transcendent forces flowing through the Divine Soul. This fact is exemplified in the lives and work of

all the World-Teachers and it is to this sublime state or attitude which the mystical words of Jesus in the Garden of Gethsemane refer: ". . . O my Father, if it be possible, let this cup pass from me; nevertheless, not as I will, but as thou *wilt*. . . O my Father, if this cup may not pass away from me, except I drink it, thy will be done." — *Gospel accord, to St. Matthew*, ch. xxvi, 39, 42

The Theosophical Forum

THE EXOTERIC AND ESOTERIC H. P. B. — *G. de Purucker*

Companions and Friends: Instead of talking to you about what our beloved H. P. B.'s work was, and what she has done, it might be interesting to try to give you a few important thoughts regarding H. P. B. herself: who she was, what she was, and why she came; and I shall try briefly to do this.

First, then, I shall talk to you on the exoteric H. P. B. There were two in one in that great woman — an outside which met the world and had to face the conditions of the world into which she came to work; and an inside, a living flame of love and intelligence, a flame of inspiration and holy light, and this latter was the esoteric side of H. P. B.

As you look at her face and study it, and consider the Russian features — the lineaments which proclaim the steppes of Great Russia: if you pause on these alone you will see little but a face in which there is not much of merely human beauty. Yet those who have eyes to see and who look behind, as it were, the veil of the physical personality, indeed can see something else. They can see beauty; they can see an intense pathos and a great sadness — not the sadness, not the pathos, of one who had a great work to do and who could not or did not do it, but the yearning, the pathos, the sorrow, that have always been connected with the figure called in the Occident the "Christ." Just so! For behind these outer lineaments which some artists have actually called ugly, we see an ethereal beauty which no human words will easily describe, but which every human heart can sense, and which every human eye which is spiritually opened can also see. There is inspiration in that face which is beautiful to look upon; there is self-dedication; there are thoughts divine because there is truth, and

truth is Nature's own divine heart; and it is these spiritual qualities which shine out of the face of our beloved H. P. B. when we look at her picture, and which proclaim to us that behind the outer person there was the inner living esoteric fire.

Does any Theosophist who has studied the wonderful Wisdom-Religion of Antiquity imagine for a moment that H. P. B. came to the Occidental world by chance, outside of Nature's laws and rigid concatenation of cause and effect which produce everything in due order? Does anyone imagine therefore that whatever is, has not its ordered and concerted place in the cosmic harmony? Of course not. This therefore means that H. P. B. came in obedience to a law, one of Nature's laws about which the ignorant West knows all too little, and therefore doubts, and because of doubting is blind — for doubt always veils the inner vision.

H. P. B. came because it was time for her to come. She was one of the series of Teachers which human history shows us to come at certain stated periods throughout the ages, one Teacher after the other, and always when the time is right and ripe, and never by chance. She was one of the links in what the ancient Greek Initiates called the Living Chain of Hermes, the Golden Chain, in connexion with the passing on of mystic and esoteric light and truth, and she came in regular serial succession to the Teachers who had preceded her, each one of them sent forth from the great association of Sages and Seers, variously called the Mahatmans, the Elder Brothers of mankind, and by other names. These Teachers, these Leaders and Guides of mankind come and teach according to law, esoteric and natural law, when the time calls for their coming; otherwise how logically explain their serial existence?

The ages pass, and each age has a new generation of men, and each generation of men receives light from the generations which

preceded it, from its fathers. But generations rise and they fall, physically in civilization as well as spiritually in light, and in the intellectual, the ethical, and mental courses which men follow in producing the civilizing influences of human life. And in these generations which follow each other, there is always need for guiding minds, for a light given anew from age to age, for a new lighting, phoenix-like, of the old fires. It is these passers-on of the Light who compose the "Golden Chain of Hermes."

Now what do these Teachers bring to mankind? Doctrines contrary and antagonistic and opposite to the doctrines and teachings of those who had preceded them? Never, never, when their teachings are properly understood. Examine the teachings of all the Great Sages and Seers of the ages who have appeared among men. You will find them essentially one, fundamentally one, although expressed in different languages, expressed in different forms and formulations of thought appropriate to the ages, the respective ages, in which each of the Messengers appeared. Although clad in various garments, clothed in differing habiliments, the body of truth that they taught and teach is one.

Now what these Sages brought to men our H. P. B. also brought. Examine, test, this statement, prove it for yourselves — and the literatures of the world lie before you enabling you to do this. If she taught anything that the Great Seers who preceded her did not teach, it will be to me a wonder if you can find it, and I believe that you cannot. You remember what Confucius said: "I teach nothing new. I teach what my predecessors have taught. I love the ancients, therefore I teach what they taught." Details of the teaching differ, the clothing of the teaching varies of necessity, but the teaching itself is the truth of and about Nature, about Nature's own being, its structure, its operations, its carpentry, its characteristics, its laws. When the Theosophist says "Nature" as a word without further qualification, he never limits

this word "Nature" to the physical world alone. He means universal Being, including divine Nature, spiritual Nature, intellectual Nature, physical Nature, astral Nature — all the spiritual and ethereal realms and spheres and worlds and planes which compose what the great thinkers of the Occident, as well as of the Orient, have called the spirit and soul and body of the Universe.

That is what she taught. That is what the Great Sages and Seers of the ages taught: an open or outer teaching and an inner or hid teaching: an exoteric doctrine for the public, and an esoteric doctrine for those who had proved themselves capable of understanding it and ready in their understanding to hold it secret and sacred. For if it were proper to give this esoteric teaching to the public, it would be so given. Remember that the archaic Wisdom-Religion of the ages is man's natural heritage, and belongs to him by right; but you as individuals have no right to your heritage until you come of age, until you become major of mind and are no longer spiritual and intellectual infants, ready to abuse what is indeed yours by right, but which Nature and the gods and the Masters in compassion and love and wisdom withhold from erring men, until they shall have learned to control themselves. Then men will be able to control what belongs to them by natural right. There will then no longer be a danger of misapplication or of misuse.

Grand and sublime ethics were the basis of what this noble Messenger of the Masters, our H. P. B., taught. She showed us that ethics, that morals, are based on the very structure and laws of Nature herself, that ethics and morals are no mere human convention, that right is eternally right no matter how men may argue about the details, and that wrong is eternally wrong. Right is harmony, and wrong is disharmony. Harmony is Nature's heart of love and music and peace, for it is equilibrium; and

disharmony is discord, lack of peace, unmusical discords in Nature and throughout human life; for all Nature is ensouled just as man is, and this doctrine of ethics is one of the noblest of the teachings which she brought. She taught us — and listen, my Brothers, to this — she taught us of our inseparable oneness, of our unity, with the heart of Being, so that death, that grizzly phantom of the Occident, no longer exists as a fearsome object for the Theosophist, because the genuine Theosophist who understands his philosophy looks upon death as the grandest Adventure that it is possible for a human being to undertake, a sublime and magnificent initiation into other worlds, into a nobler, a grander, and a greater life.

One of a serial succession of Teachers, she came in the rhythmical order of the laws which control our planet. She came indeed at the beginning of one Messianic Cycle of 2160 years and at the end of the preceding cycle of the same term. She was the Messenger for her age, that is, for the age to come — the one who was to sound a new keynote, which yet, mystically speaking, is as old as the ages; and in a certain very true but little known sense, she was an Avatara — an Avatara of a certain type or kind, for there are different kinds of Avataras. This is one truth concerning H. P. B. that we must be careful and watchful as regards teaching it to the world, for the world has no conception of the many recondite meanings of the Avatara-doctrine. Every Teacher who comes to teach man comprises not only his or her body and an unusually received psychological apparatus, but is likewise at times infilled with the holy fire of a greater Soul, and therefore is *de facto* an Avatara of a kind. Just as Jesus called the Christ was an Avatara of one kind for his age, so was she, our beloved H. P. B., an Avatara of another kind for her age.

It is usual among modern Occidentals, especially artists, to portray Jesus called of Nazareth, as a man of wonderful physical

beauty, of outstanding manliness, and of fascinating appearance; but was he really so? Is this Occidental picture true to fact? It is an Occidental idea or ideal of the Middle Ages and of our own times. Do you not know that the Christian Church Fathers often took pride in proclaiming the idea aloud to the world that Jesus called of Nazareth was a man of mean appearance? Do you indeed know this? They sometimes describe him as a man of mean person, insignificant in body and in physical form. Yet what has that, true or false, to do with the flame within, the flame of the spirit which shines through the mortal clay, so that the latter like a lamp becomes luminous and glows and gives light to those around? That is where the true spiritual entity is — within.

I will tell you the reason why H. P. B., this present Avatara — of the particular kind I speak of — had the form of one whose physical appearance is unhandsome. With her the causative reason has thus far succeeded wonderfully well. With Jesus, the Syrian Avatara, the same reason failed of effect in succeeding ages. What was and is this reason? This: An endeavor was made by the Teachers, is indeed made at each new appearance of a Messenger, to have that Messenger make his spiritual and intellectual mark on the world solely by the fire of the genius within, only by the fire of divinity within, and to prevent later generations from falling down and worshipping, through instinctive love of beauty, the physical body. It is against the instincts of the human heart to adore ugliness, to pray to that which is unhandsome. In the case of Jesus, in later times blind faith and foolish adoration prevailed. In the case of our beloved H. P. B., the woman unhandsome has saved us and her thus far from that fate. No man or woman is drawn to worship ugliness, and this in itself is right, in a sense; it is not wrong, because it is an instinct of the human soul to know that inner beauty will produce outer beauty, perhaps not so much in form, but in

appearance. There will be the beauty of manly or womanly dignity, the beauty of the inner light shining forth in love and wisdom, kindness and gentleness. I do hope that you understand what I mean in making these few short observations.

Two thousand one hundred and sixty years before H. P. B.'s birth the particular Messianic Cycle began which, as its centuries followed one the other, plunged European countries into the darkness of the Middle Ages. Today, more or less 2160 years afterwards, a new cycle opened when she was born, a rising cycle which should bring light, peace, knowledge, wisdom, to men; and it is the duty of us Theosophists, members of the Theosophical Movement — whether belonging to the Society of Point Loma, or to the Society of Adyar, or members of the U. L. T., or of any other of the so-called Independent Societies — it is our duty, as Brother-Theosophists, as common members of the Theosophical Movement, to see to it that the Message which she brought to us, and gave into our hands as a holy charge, shall be kept pure and unadulterated, and shall be passed on to our descendants of succeeding generations just as we have received it. "As I have received it, thus must I pass it on, not otherwise. *Iti maya srutam: Thus have I heard.*"

I think that the greatest tribute that our hearts and minds can give to our beloved H. P. B., is to know her exactly as she was, exactly as she was in truth, not merely according to what anybody says about her. The best way to see her as she was is to study her, and her books which indeed are she. Then you will know the real H. P. B., for you will use the test of your intelligence and of your heart, to judge her by what she herself was and by what she produced, not by what someone else may say about her. Let us carry on the torch of light that she gave into our hands.

H. P. B. came to a world which was in the throes of a veritable

Dance of Death, a *Danse Macabre*, in which might be heard, according to this medieval idea, the clattering of the bones of the dead, the hooting of the owls of despair, and where one might sense dank, evil-smelling odors of the graveyard wherein men had buried their hopes. That was the world to which H. P. B. came and the time in which she spoke: a time when men had lost virtually all faith in recognising that there could be a knowledge of spiritual things, a time when even to speak of divinity, of a lasting hope, and of things spiritual, was considered to be a mark of intellectual imbecility. The very word "soul" was tabu.

Single-handed, that Mighty Woman wrought a change in human thinking by the power of her spiritual knowledge which enabled her to work on human spirits and human souls, and in so doing she cast seeds of thought into human minds, which seeds swept like sparks of flame through human understanding. By the tremendous energy of her intellect she taught men to think of life and Nature in a new way, for she showed to them that the doctrines of the dying materialism, which were then so fashionable and to which men had given the confidence of their hearts, were hollow-sounding brass and tinkling cymbals, and that men were not only foolishly burying their noblest hopes in the graveyard of material existence, but likewise were fashioning themselves inwardly to become like unto the graveyard, towards which their feet were carrying them.

A mighty power came into the world and worked and wrought, and the weaving of the web which she wrought has played a great part in producing the better conditions we find among us today. The world today is beginning to think Theosophy, and to think in a Theosophical way, and hence the Macabrian Dance of H. P. B.'s times has been stopped — that dance of death, that giddy, soulless, thoughtless, dance of death in the graveyard of human hopes; that today has ceased!

There is a psychological wonder, a mystery, in H. P. B., for H. P. B. was a mystery. Since she came and taught, what do we find our greatest modern scientific researchers and thinkers telling us today? Adumbrations of many of the doctrines that she taught: doctrines, so far as these scientific researchers are concerned, which are based upon deductions made from the researches into physical nature that those scientists are following. Before the scientists found the facts, she taught these facts, and she taught them in the face of ridicule and scorn and opposition from the Church on the one hand and from Science on the other hand, and from the established privileges and prerogatives of all kinds — social, religious, philosophical, scientific, what not — which surrounded her.

In her there was strength, spiritual strength, for she set men's souls aflame; in her there was intellectual power, for she taught men to think and to have a new vision; and in her also there was psychological power, for she smashed the mayavi psychological wall which man in his folly had builded around his consciousness.

Now reflect upon what all this means. Could you have done it? Would you have had the courage to dare it? Could you, single-handed, face the world in a similar manner today? There is a cause and a reason for the work that she wrought. We today see the effects, we know the historical phenomenon of her life and work; but what was the noumenal cause? It was the living spiritual and intellectual fires within her. It was the esoteric side of H. P. Blavatsky which enabled her to do what she did.

Do you think for a moment that H. P. B. was only an ordinary woman? Do you think that the stories that have been told about her, such as Mr. Sinnett's *Incidents in the Life of H. P. Blavatsky*, contain all the real facts about her life, and do you suppose that

even the statements that are therein narrated contain in themselves a full explanation of her? Don't believe it! The facts in themselves are against such a belief. Such a woman as Sinnett describes in his *Incidents* could never have moved the world as H. P. B. did. Do you think that the Russian girl that he describes, and that the Russian "priestess" so-called that Solovyoff, her quondam friend and later her bitter foe, tried to portray, could have done it? Do you think that a hypocrite, that a false heart joined with an ordinary mind, could have gathered about herself the intellectual and often highly ethical people whom she gathered around her? Of course not!

Take into consideration the facts in H. P. B.'s life. Don't let your minds be swayed by the tales that have been told about her. Think them over for yourself, because thoughtful reflexion is one of the first duties of a Theosophist, and then draw your own conclusions. Indeed, the stories that have been told about H. P. B. interest us simply as a psychological phenomenon of the weakness of human thinking. They also interest us, not because they accurately describe H. P. B., for they don't, but simply because they describe the incapacities of the men and women who try to explain her. You might as well try to put the ocean into a teacup as to encompass the character, the constitution, of H. P. B. in the yarns professing to be biographical that have been written about her. At the best they contain certain facts gathered in random fashion from her own family — who understood her perhaps less than her Theosophical friends did, and who said so — gathered together and strung along a certain thread of narrative. Is the reading of such tales the pathway to understanding one who did what she did?

H. P. B. was of course a woman in body, remember that; and invigorating and inflaming this body with its brain-mind was the inner divine Sun, the "inner Buddha," the living "Christ within" as

the mystical Christians of today say. But between this divine fire and the receptive and mystically-trained and educated brain of the woman, there was a psychological apparatus, commonly spoken of in western parlance as the "human soul," which in the case of her — for she was an Initiate of the Order of the Buddhas of Compassion and Peace — could at times step aside and allow the entrance into the vacancy thus left of a "human soul" loftier by far than even hers.

Thus was she an Avatara of her kind. It was this Buddhic Splendor which thus infilled the vacancy that she so gladly left for use, which in large part wrought the works of wonder that H. P. B. wrought. You may remember that in her writings she often makes a distinction between what she calls "H. P. B." and "H. P. Blavatsky." "H. P. Blavatsky" was the woman, the chela, the woman-chela, the aspiring, learning, splendid, noble, courageous chela. But "H. P. B." was the Master's mind speaking through her. Body and spirit, one entity; then the intermediate psychological apparatus, commonly called the "soul," temporarily removable at will. In fact — — and let me tell you the truth — when our H. P. B. was sent as the Messenger, that psychological apparatus in large part remained behind. Think! This fact accounts for the so-called contrarities and contradictions of her character that the people who attempted to write about her saw — and saw very plainly, because they could not help seeing — but which they did not understand, and by which they often mis-judged her and misunderstood her. But when the holy flame had infilled this vacancy, then there was *H. P. B. the Teacher*, the Sage, the Seer, the Teacher of great natural scientific truths which modern science today is but beginning to show to be true, the Teacher of a great hope to mankind, the giver of a Vision to *men*, the framer and former of a new Philosophy-Religion-Science for men.

Shall we look upon H. P. B. merely as a Russian gentlewoman? If

so, a most marvelous gentlewoman was she! The simple theory will not fit the facts — a Russian woman who had no education, technically speaking: no education in science, no education in religion, no education to speak of in philosophy, but who was educated in mystical lines; and yet the H. P. B. who lived and taught was an Adept, and in her teachings was a Master in all these lines of human knowledge!

Shall we look upon her as an incarnate Mahatman? The facts are against that, all against it, just as they are all against the former theory. Let us take our beloved H. P. B. exactly as she was, not as she is misrepresented to be. Let us take her as we know her to be. Let us take her as we find her in her books. Let us take the facts, and no man's theories about her; and if you are wise enough you will see, you will understand, who and what she was.

There were times in her social life when she was the charming hostess, a *grande dame*. There were other times when she was a pianist of admirable and most exceptional ability. Again at other times she charmed people with her brilliant conversational powers, and she would fascinate a whole room, hold her audience spellbound. Men of learning, the laborer, the noble, prince and peasant, gathered to hear her. There were still other times, in her home, when things were quiet and her disciples gathered around her, when she taught some truths drawn from the Great Mysteries of the Wisdom-Religion of the past. There were other times when she sat at her desk, and wrote and wrote and wrote from morning until night, and then would lie down, and, as she herself said, for a little while went "Home." She then had rest!

There were other times when she would hold her "at homes," her receptions, during which she would receive scientists, philosophers, thinkers, controversialists of various kinds,

philosophical, scientific, religious; chat with them; and they would leave her in amazement. "Whence comes to this woman," they said, "her marvelous understanding? How is it that she can tell me secrets of my own profession which I knew not before? Whence comes to her the ability to show me that this is so?" All these moods, these sides of her character, were indeed there, and every one must be taken into account. Only the explanation of the facts themselves will enable you to understand her. At times she was the woman, and was tender and compassionate, with a woman's love of rings, of sweet perfumes, and of kindly friends. At another time she was the Teacher and Sage. At another time she was strong and virile, so that, as her friends said, it seemed verily as if man incarnate were manifesting through her — not any one man, but Man.

Now you have it: the body, the woman, the gentlewoman, well-trained, well-bred, ill-educated; the divine flame within her that occasionally seized her brain as it were — and then she spoke like a pythoness, like a prophetess, like an oracle at Delphi; and similarly so at other times, when she was infilled, as the Avatara, with the holy flame of one of the Great Ones. Then she was the Sage and Seer, and wrote her books, foreshadowing in these books what later has come to pass, and pointing out to men the dangers of a belief divorced from ethical rules.

Let us recognise H. P. B. for what she was; and mind you, my friends, mind you this thought: We who have studied H. P. B. love her, are faithful to her in heart and mind, yet we shall set our faces like flint, like stone, against any attempt to worship her, to make a new Jesus out of her. You know what the Great Ones have told us: More than anything else do we desire a Brotherhood among men, a Brotherhood which will save mankind from the catastrophes which are facing it, brought about by mankind's own folly. The catastrophes, the cataclysms, moral and even

physical, which are even now facing us, will surely come upon us unless men change their habits of thought and, in consequence, their acts, their conduct. We shall set our faces like stone against any attempt to introduce a new religion among men, which our Great Teachers have already pointed out to be, and which is, one of the greatest curses and banes afflicting mankind at the present time: belief in an outside Savior instead of fidelity to the divine spirit within. For there within indeed lie all truth, all harmony, all wisdom, all love, all peace. The inner god within each one of you as an individual is of the very heart of the heart of the Universe, and concerning that heart of the Universe, each one of you is It.

H. P. B. was indeed a mystery, but while she was a mystery, this does not mean a "mystery" in the sense in which this word is commonly used in the Occident. I mean a mystery in the sense of the ancient Greeks, when they spoke of the ancient Mysteries and the ancient Mystery-Schools — something which is hid, but can be known, something that is occult and holy, but which can be communicated.

H. P. B. can be understood; and when we understand her, we love her the more; the more we understand her, the greater grows our love, our veneration, for her. Let it never happen, therefore, that we Theosophists become so false to the trust which she gave to us that we shall turn our backs to the Mystic East, towards which she always pointed, and worship the Avatara. Let us be faithful to our trust. We can love, we can venerate, we can copy the example of magnificent courage and sublime hope that she gave to us. We can try to become like unto this great Woman, and unto many others like her who have appeared in the past, who will appear in the future, others far greater than she, but let us never set her on a pinnacle as was done, alas! alas! in the case of one of the Teachers in the early years of Christianity.

No greater tribute could we render to our beloved H. P. B. than by continuing faithfully, and in our love of her, the work which she so grandly began.

The Theosophical Forum

BREVITIES

A WISER VIEW OF EVOLUTION

There is need for a wiser view of evolution. In evolution we see the Divine everywhere expressing itself in multitudinous and ever sublimer forms. No dull mechanism, ruled by ruthless laws of strife and destruction; it is a creative intelligent process, and Love is its basic law. The minds of the animals, of the plants, may be inferior to ours; but at the center of every being is the same Divinity. These creatures — are they not our younger brothers, our children?

The philosophy of topsyturvydom! Look at it! The animals have blind instinct; they show mother-love; therefore mother-love is blind instinct; but man comes from the animals; therefore compassion in man is only a blind instinct! Contrast this fantastic nightmare with the plain wholesome truth — that Divine Love is the universal pattern which all creatures follow in thankful obedience. 'Tis only the man who has not harmony within himself that fails to see it all around him. Let us create harmony within ourselves, so that Nature may reveal to us her grandest mysteries. — H. T. Edge

THE ENIGMATIC LONGING

What is it that urges the naturalist, the explorer, the inventor on their restless activity, the philosopher on his unceasing searching? What is it that induces the scientist in his laboratory, the astronomer in his patient and conscientious work? It is the longing for knowledge. It lives in every man, stronger in the one than in the other, but in every heart lives the same hunger for light. From where comes this longing for knowledge? A

knowledge of what? Does not this enigmatic longing for light in its vagueness remind us of the seeking for the purport of a dream we cannot call back? Plato said: "All learning is remembrance," and is not all knowledge obtained a re-knowing? Is not the understanding of a thought the testing of its value to an inner standard? And don't we reject it if we cannot affirm it in our inmost? Wisdom which we understand is not heard outside but inside ourselves.

This enigmatic longing for knowledge brings to us an intuitive realization of a deeper, greater personality in us which we can regard as enlightened as compared with our ordinary 'self.' And every step in this direction is a further unwrapping out of the dream which can last for incarnations, but which will be shorter the less we give attention to the longings and desires supplying the material for that dream. What then is this longing for light? It is the longing to know oneself, the homesickness for one's own fatherland — the Heart of the Universe. — H. G. Lindemans

NATURE AND OURSELVES

If we could stop eternally rushing to keep up with time; if we could pause long enough to "share in the flowing of the inexhaustible years"; we might perhaps know something of the cosmic significance of the seasons as they pass in unhurried and harmonious sequence. Our pulses would beat with the pulse of Nature, and her slightest gesture would be a sign to us of her silent heart-stirrings.

There was a time when we recognised ourselves as Nature's children, and knew of her, and therefore our own, spiritual origins; and all the long centuries of 'civilization' have not been able wholly to eradicate the memory of the obeisance we anciently paid to her. We are reminded of these things from time to time by occasional books published which tell of the folk-lore

of this or that people. One such book that has come to our attention recently is entitled *Portugal: A Book of Folk-Ways*. Christian tradition has overlaid but has not destroyed the ancient seasonal festivals of this people: the celebration of the birth of the year and the burgeoning of the springtime, the mid-summer bonfires, the harvesting. Of course the writer explains the many and unspoiled rituals to be found in Portugal as merely a "fertility-cult expressing itself in the form of sympathetic magic"; but can we not go one step farther in explanation and say that it is but another echo of the time when, as expressed in *The Esoteric Tradition* "It was the attempt in all the Mystery-Schools of all the ancient nations to bring the seasons on earth into harmony with man's spiritual-intellectual career . . . to establish in the disciple's initiation as a living reality the already existing concordance between the Nature in which we live and move and have our being and the more intimate Nature within us."

To make this concordance with Nature a "living reality" does not belong only to the records of days of ancient splendor. Opportunity has never yet been denied to him who gives the right knock. — S. H. W.

HORRORS IN THE NAME OF ART

A group of reproductions of examples of 'Surrealist' art appeared in the Boston *Herald* recently. One of these portrays an emaciated human figure with a cow's head, but with eyes of such evil as would never be seen in a poor beast. From the abdomen of this monstrosity crawls a huge scorpion. We can understand how it is that such horrors come to be perpetrated when we read that: "the surrealist re-creates the world in terms of his own imagination. He prefers chaos to order, irrationality to reason . . . many of these artists go to spiritualistic seances in order to allow the mind to be dictated to by the 'unconscious' . . ."

It is quite evident that these artists(?) are laying themselves open to impressions from foolish and evil spooks of the lower astral worlds, and are materializing these impressions on canvas, producing effects that would be repellent to any normal mind.

Part of our duty as Theosophists is to make known the teachings we have been given in regard to the dangers of the lower astral realms, the relative values of man's many selves, and the part that spiritual will and impersonal love have to play in guiding us along those brighter paths where our creative endeavor, whether it be along the lines of art, music, poetry, the drama, the dance, or what not, will call to the spiritual deeps in our fellow-men. Then we shall be proud of our art-galleries, our museums, our theaters, for they will be places where the very gods might meet with us for refreshment, inspiration, and the true laughter of the spirit. —

The Theosophical Forum

HUMANITY AT THE HALFWAY HOUSE — *M. M. T.*

About 18,000,000 years ago an event of supreme importance occurred on this planet. The Hierarchy of Builders concerned with the preparation of a physical body for the use of Humanity having produced a vehicle through which Mind could work, the Solar Hierarchy, Lords of Mind, who had developed in past periods, now did their part by quickening the fires of Mind latent in their younger brothers of this present planetary cycle. Thus opened the human drama. For the kindling of the fires of Mind made of man a self-conscious being, equipped for a self-directed rise toward self-conscious godhood. Mind not only enables man to master the body, but it can be used to mirror forth the Divinity latent in human nature, which man must learn *to* manifest in Earth-life.

Age after age, in life after life, race after race, civilization after civilization, these Egos, charged with human responsibility and power, have been sowing and reaping experience on Earth, working at the human job. They have risen and fallen and risen again in their cyclic upward climb, and now they have reached the halfway house on their long journey.

We are those Egos. What have we accomplished? Today, when thinkers agree that Humanity faces a severe crisis, it is time to take stock, to give an account of ourselves. Few believe that a "last day" of reckoning is at hand. What is there for us still to do?

No doubt man has established control of physical forces. His inventions have eliminated distance, have brought people of every part of the world into closer relations than ever before and brought about a state of recognised economic interdependence. There is actually a physical basis for a united life of Humanity.

But, and it is a large "but," man has also developed scientific violence to such a point that he has the power to put the present civilization out of commission almost at one blow; and the nations live in fear, not knowing which of their rivals may use some terrific means of partially accomplishing wholesale destruction. The urgent problem is to awaken an inner directing Self that realizes the unity of all beings and a great common purpose, so that life may be safe for man to continue his progress.

Aside from Theosophy, however, there is available no plan of human life that shows its relation to the universal scheme, no hint of what future cycles hold for man, no knowledge of the latent powers which, brought into conscious function, are adequate for the mastery of present and future situations in Earth-life.

The half of the human task that remains to be done is the rendering of the intermediate, psychomental part of human nature pellucid so that the impulse, the wisdom, of the inmost Divine Self can be clearly mirrored to the waking consciousness. Men are today more self-conscious; but the personality unilluminated by the Self deeper than mind is not the enduring Ego, the creative Individuality to be fully brought into function in the coming cycles. A united life for Humanity can be achieved only by those who are aware of the deeper Divine Self in which all have their root. It is only "individuals," awakened to this inner, underlying unity that *can* unite; can be themselves and permit others to be themselves; can differ without dividing; can draw upon inner resources spiritually alight with power that can kindle in other men the trust in themselves and their fellows that will send fear slinking away from human life.

The dynamic powers of the spiritual and divine nature of man are still to be brought fully into function in human life. They are

not at the command of those who do not believe in the existence of this inner nature. Their sphere of influence is unattainable by those who do not believe in the essential unity of all beings. They can be exercised collectively only by individuals whose consciousness is illumined by light from that inner Self, whose every act and thought in relation to their fellows takes into consideration those most often unrealized facts which, when ignored, make united effort seem impossible. They have never been used collectively, as it is our destiny to use them in the cycles now before us. So tremendous, so subtly undermining to all selfish, greedy passion and violence are these un-aggressive, non-violent, inner powers that the evil forces which now menace human welfare may be dissolved, transformed, redirected into channels bearing benefits to all.

Is it beyond belief that higher, freer, nobler human associations than have yet been known on Earth are possible of realization? Not for those whose hearts have been responsive to the promptings of that inner Self in which all are rooted. Not for those to whom Theosophy has given a new framework of thought about the future of Humanity on Earth. Not for those who accept the discipline that makes man master of the inner world, and brings into play the spiritual dynamics that can melt stony hearts, and the wisdom that can clear confused minds. Creative, compassionate individuals can unite in directing human activities in harmony with divine, universal laws of life. As human beings we have this to do.

ULTRA-MODERN SCIENCE SIXTY YEARS AGO — *Edwin D. Babbitt*

"Comparing the infinitely small with the infinitely great, it is held that a body, of what kind soever, represents in miniature and very exactly, an astronomical system like those which we behold every night in the firmament. If we could construct a microscope of sufficient power, we should be able, by the help of such an instrument, to resolve the molecular constellations of every little terrestrial milky way, exactly as our first rate telescopes resolve the celestial nebulae and separate double and triple stars. Were our sight sufficiently penetrating we should behold what now appear mere confused heaps of matter, arranged in groups of admirable symmetry. Bodies would appear honeycombed in all directions, daylight would stream through vast interstices as it does through the columns of a temple or the tree trunks of a forest. Nay we should see immense empty spaces, like those which intervene between the planets. From distance to distance too, we should perceive clusters of stars, in harmonious order each surrounded by its own proper atmosphere, and still more astounding spectacle! — every one of those little molecular stars would be found revolving with giddy rapidity, in more or less elongated ovals exactly like the great stars of heaven, while by increasing the power of our instrument, we should discover around each principal star minor stars — satellites resembling our moon — accomplishing their revolutions swiftly and regularly. This view of the constitution of matter is aptly described by M de Parville as *molecular astronomy*, maintaining that even astronomy without our suspecting it, is dependent on mineralogy, and that whenever we shall have discovered the laws which govern the grouping and the movements of the infinitely small, astronomers will have only to follow in our track. But who

a hundred years ago could dare to imagine that the infinitely small was so infinitely great? What is now believed to be the nearest guess at the truth appears, at first sight to be the dream of a madman." — Quoted from *All the Year Round* by Edwin D Babbitt in his book, *The Principles of Light and Color*, pp 159-60 published in 1878.

The Theosophical Forum

THE BASIS OF UNIVERSALITY AND BROTHERHOOD — B.

Finkernagel

When any individual has arrived at the definite realization that at every conceivable point the Universe is pulsating with life and consciousness, all of which has one common source, and that every center in it, high or low, faithfully mirrors the constitution and the nature of the Great Whole, the entire aggregate forming one vast and organized Unit of Life, from the Central Source of which all the countless Rays of Life and Consciousness hang like "pearls upon a string": when one realizes all this, then the Theosophical teaching of Universality and Brotherhood, passes from a merely quiet acceptance or belief, into a profound and all-compelling conviction, and into an ever-present reality in life, which from henceforth will dominate the person's activity.

It is the lack of this deeper realization of non-separateness and unity, which usually accounts for the half-hearted efforts that are made by individuals towards such attainment. But to acquire this universality in all its fulness and in all of its implications, is of course a process which needs many lives of arduous attention and devotion, and in every case, the initial steps towards such becoming consist in transcending the deep-rooted selfishness in human thought, feeling, desire and action, all of which is due to man's ignorant self-identification with his lower personal nature. To become fully successful in such endeavor, demands a never-failing persistence, and utter devotion to our highest ideals. The individual will find it very difficult to bring his whole spiritual, moral, and intellectual forces to bear upon this objective, unless he has first by impartial and a deep-searching self-analysis discovered — perhaps to his great wonderment and disgust — the enormous domination which his personal likes and dislikes

exercise over all his activities. But when the individual becomes conscious of, and clearly perceives the flaws and the frailties of, his personal nature, he will usually try desperately to transcend his weakness. It is then that it is important for him to remember that the personal nature must not be killed out and destroyed, but that it must be trained, purified, and molded along lines that are in harmony and concord with Universality and Brotherhood. The personal man must be made the willing and instantly responsive servant and impassive tool of the spiritual man. This is invariably the first step and objective to which every earnest aspirant for the Higher Life must devote himself with unflinching determination, from morning to night, and all the days of his life, and all the lives to come, until he has fully learned to master and to control every impulse arising in his personal nature.

One of the basic laws of being, operating on all the planes alike, is that the higher life must always devote itself to the raising of the lower life. That this principle actually stands as the very basis of all spiritual progress and usefulness, will become convincingly clear to us when we have acquired a proper understanding of the fundamentals of technical Theosophy. With this end in view, we shall engage in a very brief review of some of those fundamentals which have a distinct bearing upon the subject under consideration.

At the first Dawning of the Manvantara, manifestation begins from a Center of Consciousness, within which are contained the combined evolutionary achievements and evolutionary results of the previous globe, chain, or solar system, or whatever may be in our minds. It is from such a primordial and supreme center that everything which exists on our globe has originally emanated.

The life of a chain of globes passes through seven great periods, which in Theosophy are called Rounds; each Round requiring

many hundreds of millions of our mortal years to run its course. During the first half of each Round, Spirit is working downwards into the Matter-pole of Life, endeavoring to clothe itself with the matter of each plane in its descent. This period of descent of Spirit into Matter, is called the "shadowy arc" of evolution, which continues, until the densest aspect of matter in this Round is reached, when the life-impulse turns, beginning to re-ascend to its original source. During this re-ascent, the countless centers of life are endeavoring to disentangle themselves from Matter; in other words, to throw off their coating of matter, which they had collected around themselves during the descent in the first half of the Round.

Before manifestation begins on the objective planes, or the four material planes of our globe, the Life-impulse or Life-wave is engaged on the plane of pure Spirit and the Buddhic plane, which are called the formless or the spiritual world. The four planes below the Manasic plane are called the material world or the world of "form." In the beginning the Primordial Center of Consciousness, already referred to, emanates from within Itself Rays, which are projected into the cosmic Buddhic Plane. These Rays in turn emanate from within themselves other Rays, which they project onto the Manasic plane and this process is continued until the densest material plane in the world of form is reached. All the Rays as they are emanated faithfully mirror or reflect within themselves the characteristics and the constitution of their parents, and it is thus that every center of life carries within itself in miniature the nature and the constitution of the Universe, of which it is an inseparable part, as well as the potencies and the characteristics of their spiritual progenitors in latency, all of which are powers which in the course of evolution they are able to unfold and to bring into expression from within themselves. As the Rays pass from plane to plane during the shadowy arc of the

Round, they are forming on the various planes knots or centers which, during the luminous arc when the life impulse is working back to its source, unfold into what we call the seven principles in man.

The physical globe upon which we now reside is one of a group with six other globes together forming what is called a Chain of Globes. This applies equally to all the physical globes of our solar system. The seven globes of any chain are each and all septenary in their constitution, but the individual globes vary in density from one another. It is on that account that our physical organ of vision, being so constructed that it can only respond to physical vibrations, fails to perceive the other six globes of our earth-chain.

Every planetary chain is a Cosmic Unit, whose life-term is made up of seven great world-periods called Rounds. They are called Rounds because the life-impulse of a Chain passes through all the seven globes in a Round period, commencing with the first globe of the series; and after a long evolutionary activity on this globe it passes on to globe two of the series. This is made up of denser substance than globe one. After a similar period on this globe, the life-impulse passes to globe three of the Chain, which is of still denser substance; and after its work is completed there, it passes on to globe four, which is the densest of the entire chain. When the life-impulse has evolved the densest substance on this globe, half of the time period of the entire Round has elapsed; then the life-impulse turns, and begins to reascend to the source from whence it came. The remaining three globes upon which it functions in turn are each subtler in texture than the previous one, and when the seventh globe is reached by the life-impulse it is functioning on a globe which in density and texture corresponds to globe one of the Chain, but the life-impulse is enriched with the results of the countless experiences it has

gained during its peregrinations through the seven globes. It is this which is called a "Round."

In each Round one of the seven principles is fully evolved, as far as is possible and the general characteristics of the matter-aspect of the Chain will permit. The lowest principle is first fully evolved in the first Round; the second principle is fully evolved in the second Round, and so on. As our Chain has passed the midmost point of its life, it follows that we are now at the fourth Round of the Chain period, the midmost point of which was passed about eight or nine million years ago. It also follows that it is the fourth principle or Kama, the Desire nature in man, which is being fully evolved in this Round. As Manas or Mind is the fifth principle, it also follows that Mind in this Round is only partially unfolded, for it will not be fully evolved prior to the end of the fifth Round. This explains why Theosophy teaches that the Mind is dual, and we speak of this duality as the Higher and the Lower Mind. The Higher Mind in man is that aspect of our thinking principle which during our many incarnations in physical bodies on Earth has become purified, molded, and trained in such a way that it has acquired the characteristics of the spiritual aspects of life, and its natural tendency therefore is to lean towards the Buddhic principle and the Pole of Spirit. Whereas the lower aspect of the Mind is that aspect which the waking consciousness has not yet succeeded in bringing under the domination of its spiritual will, and therefore its natural tendency is towards the Matter side of life. That which we speak of as the "personality" in man, is this lower aspect of the Mind, which in the great majority of men is so largely dominated by the desire-principle in waking life. This is the reason why our humanity in the mass exhibits such selfish, grasping, and low characteristics — the prolific source of all our human misery, wretchedness, and pain, which pursue mankind from the cradle to the grave.

It is well for us to realize that our human personality is not a permanent entity, and that its term of life as an entity ceases with the death of the physical man, only such fragments of the Kamic principle of the personality remaining as during physical life become so closely interlinked with the lower Mind that they cannot at that point be disentangled from Manas; and therefore the individual's Devachanic state of consciousness has to begin in the lowest strata of Devachan, as it is only thus that the mental principle can be gradually and effectually cleansed from Kama and of all its remaining earthly taints as the Consciousness slowly rises to higher Devachanic planes. As these taints of Earth are steadily eliminated in Devachan, the consciousness correspondingly and steadily rises to the higher realms of Devachan, and when finally the Mind has become purified from all earthly influences, then that which remains represents the harvest, the cream of the life last lived on earth; and it is this purified portion of Manas which will then fuse with the higher mind — the Reincarnating Ego — which at the point of physical death was instantly withdrawn into the Monad, to which this purified part of Manas is now attracted, and with which it will fuse, thus becoming immortal. It is thus that more and more of the lower Mind — provided we make strenuous efforts to live the spiritual life on earth — is raised to the plane of the Higher Mind, as a result of which each succeeding life will be a marked improvement on the previous one, from a spiritual point of view.

During any life on earth when the lower Mind begins to awaken from its deathlike stupor in the ordinary human being and begins to realize its spiritual nature and then begins to curb the influence which the Desire nature has over the lower Mind, the spiritual nature is enabled to manifest itself more and more, life after life. But before this can come about the waking consciousness must deliberately, and by its own volition, set its

face towards its spiritual sun — the Spiritual Monad — and whenever this takes place, then we might truly say that the hour of liberation for the human soul from the thralldom of the life of sense and its domination over the consciousness has struck. For from thence onward every life on Earth — if due effort along spiritual lines is continued — will yield at the close of each Devachanic period an ever increasing harvest, to the spiritual nature of the man, which will in the course of a few lives bring the man to the Feet of the Master and to the entrance of the Ancient Path, which, when its goal is reached, leads to the merging of the Individuality, or the Reincarnating Ego in Man, into the Spiritual Monad.

It is desirable that we should have a correct understanding of the enormous increase in consciousness and in power which this merging of the Individuality in the Spiritual Monad implies.

From the point where the waking lower Mind realizes its identity with the spiritual essence of its being, which is the Ray, called the Spiritual Monad, and as from henceforth the underlying current of the life on earth will be directed towards spiritual objectives, the "Christ-spirit" in man is born, and it is this which will grow and increase from life to life, causing more and more of the inherent potentialities and latent powers of the soul in man to unfold and to manifest in ever increasing spirituality, power, and usefulness. The consciousness which was hitherto mainly concerned with petty personal objectives, personal advantages, and selfish possessions and enjoyments, will become more unselfish, ever widening out its circumference, embracing in its objectives and its beneficence an ever increasing radius of beings and interests, all such activities being unselfish and expressions of Universality. It is thus that in the course of comparatively few incarnations — their number depending on the intensity of the efforts engaged in — the soul of the man will reach the point

where it is able to merge its consciousness with its Spiritual Prototype above. It is this which makes the man a Cosmic entity, whose functional activity embraces a correspondingly enormous and wider limit. It is at this point that we might use the phrase of Sir Edwin Arnold, when he says that "the drop has swallowed the ocean."

Now when we consider these vast cosmic processes, briefly reviewed, the fact stands out in bold relief that the entire activity of Nature appears to be designed, and to have for its objective, the unfolding of Consciousness into an ever increasing radius of functional activities; and second, that the unfolding of the Consciousness depends, throughout the Cosmos, upon the principle that every consciousness-center, from the Highest Summit of our Galactic Universe, the Milky Way, down to the embryonic Intelligence of the lower Mind in Man, can progress only if they are raising, with every step of their advance, all the countless hierarchies of beings below them, correspondingly. We see this fact clearly exemplified in our human hierarchy, in which the summit is our Lower Mind. This article should make it clear as well as emphasize the fact, that the first step towards a higher stage of being, consists in gaining control over our lower nature.

Now what does this imply? Nothing less than that we must first succeed in raising the countless lives which compose all the principles of our lower nature onto a higher plane of activity, which can only be achieved by our thinking, desiring, feeling, and acting along unselfish and universal lines, whereby we do not only become universal in thought ourselves, but we raise by the quality of our thoughts all those lower hierarchies also; because it is this activity in Man which generates a subtle force which impresses itself upon these countless beings by influencing their vibrational activity, which when continued will raise or lower their activities, or vibrations, according to the nature of the

thoughts and feelings we engage in. Hence if we think unselfish thoughts, we raise their conscious activity onto a higher plane than their present mode of vibrations occupy; the same of course applies if we think low and selfish thoughts, in which case we are not only lowering ourselves, but we also degrade the lives of our vehicles, whose field of evolution comprises the principles which make up our human constitution. Hence it should be clear that we can only raise ourselves by first raising the entire hierarchy of lives of which we are the Summit or Hierarch; and let it be understood that those lives are constantly reacting upon our consciousness, which we feel as impulse. This principle obtains throughout the entire Kosmos, or Kosmic Hierarchy, which includes all that is contained in our Home Galaxy — the Milky Way. This same rule obtains everywhere, because all is one great Whole — "as above, so below."

In the light of the sublime teachings which Theosophy gives to us, it seems almost unbelievable that any person who has arrived at an intelligent understanding of these great facts could be so foolish as to persist in his former selfish ways of thinking and acting, without making sincere and persistent efforts to rise to a higher plane of thought and being in the manner stated before. It seems unthinkable that such a person could persist in living heedlessly, and live and scheme for his puny, petty, and stupidly perverse personal self, setting up his puny personal will against the combined will, objective, and universal design of those countless Divine Beings, who in their aggregate, are the Divine Rulers of our Universe. All of these Great Beings who are to us now as gods in wisdom, power, and compassion, were once, in the long forgotten past, struggling human beings like ourselves, who in other worlds than ours, woke up, and realized, that they were divine in their essence, and that true harmony and peace can only be found by any being, in the measure as the soul of

man will fall into line with the Laws of Being, which demand that we shall think, live, and act universally, and not separatively. They followed the light which they perceived, and they now stand as far above us in evolution as you and I now stand above the simplest organisms which constitute the viscid slime of the ocean-bed.

Let us then resolutely set our faces to the Light, and devotedly engage in the sublime task of self-conquest, which marks the beginning of a new and stupendous era in our evolution, and which is sure to lead us onward and upward for ever, and to a Glory that has no limit, and to a destiny which will be for ever receding into the Boundless and the Unknowable, but which is nevertheless — "Closer than heart and breathing," and "Nearer than Hands and Feet."

The Theosophical Forum

WHERE LIFE BEGINS — *Arthur A. Beale*

In the February number of *Harpers Magazine* (1937) is a fascinating article on this subject by George W. Gray. Mr. Gray is on a serious quest. He is trailing the illusive origin of Life, and we wish him joy, for if he persists he will find himself on a path that will lead him to the heart of the Universe.

Anything that we may offer is not intended as patronage, or in any way to discount the sublime, painstaking, and logical issues developed by modern scientific savants in their marvelous research work. We seek rather to lead their minds a little farther into realms unexplored by modern science; inexplorable, in fact, by present methods and apparatus, but beaten tracks for those ancient scientists and philosophers who have investigated these hidden realms and have recorded, collated, and interpreted what they have found. It is because the Masters of Wisdom have consented to give us some of the products of their strenuous labors, incorporated in what we know today as the Theosophical philosophy (religion-science-philosophy, in fact), that we are able to throw more light upon the question, "Where does Life begin?" Mr. Gray commences his article by saying:

Supreme among the problems now confronting science, is the determination of the nature of life. There are countless immediate human questions pressing for solution, questions of disease and their cure, of eugenics, and the improvement of mentality, of lengthening the life span, of the control of aging and death; but these practical objectives wait directly upon the fundamental problem.

Having expressed his dissatisfaction with current dictionary definitions of life, pointing out that logically the asserted

necessary attributes of life such as growth, reconstruction, reproduction, stimulus, irritability, are applicable also to those kingdoms now reckoned as non-living, he then plunges into the mystery of cell-life and the important part played by the nucleus with its denizens of chromosomes, these latter builded of units called by Weismann the idants and ids. Ultimately he reaches those units described by science as genes (Gr. reproducers) which, we are told, no one has ever seen: a single gene is too fine for even the ultra-microscope. Their existence, therefore, is problematical, yet they are necessary and logical units. Truly the conception of such units is bordering on metaphysics.

In spite of this, Mr. Gray still considers it necessary to limit his conception of life to certain organic (so called) entities that stand out as separate from dead matter (also so called); in the former class he includes the human, beast, and vegetable kingdoms, but stops short at the mineral. He admits the possibility that the ultimate "gene" of the chromosome may be a molecule, making the proviso that "it must be a large one" — a weak argument in our opinion, since if, as we hope to emphasize, these genes are agents of consciousness, and *special* streams of consciousness, we do not admit that consciousness has dimensions. Even the consciousness of a divine being, vast though it be in reach, could operate through an entity no larger than the problematical *ion* of science.

It would appear that recent researches of scientists are leading them in this direction. It has been found that the chromosomes are chainlike structures made up of transverse "bands." These bands are not necessarily the genes themselves, but they represent the genes; and scientists such as Calvin B. Bridges have counted as many as 5,000 bands in the chromosomal material of the cell; while Painter believes that with the further development of microscopy the number may be raised to 10,000. An interesting

point to note here is that by relatively exact methods of separation of these bands, scientists conclude that while all are necessary in the cell activities, one alone of a group carries the mysterious element of *life*, and if this "indispensable unit of life" is missing, the whole hierarchy of genes are inoperative, and the group dies and disintegrates. The same principle is traceable in certain organic chemical products of thymo-nucleic acid, an essential of nuclear protein, and its relation to four flanking products, adenine, cytonine, thymine, and guanine. If one molecule of phosphorus in these chemical products were dislodged, possibly the whole group might perish; whereas other molecules, e. g., of hydrogen, might be dislodged with no appreciable disaster. The analogy is evident: certain molecules or composite molecules are comparable to the genes, all being useful in building up transformations, but only certain ones absolutely vital to the continuance of the group.

The most interesting part of the article refers to the remarkable and intensive work of Dr. Stanley, an organic chemist, selected by the Rockefeller Institute to try to settle once for all the character and nature of a virus. "Virus" is a term used to indicate the poison of an infectious disease. It is found in the secretions or tissues of an animal suffering from an infectious disease. For some time it was considered that germs with a definite shape and character, identifiable by a microscope, were responsible for all infectious diseases; and much time has been spent by bacteriologists in trailing the culprits, and they have finally been successful in getting the "finger-prints" of many reputable criminals: notably, Koch's tubercular bacillus, anthrax bacillus, bacillus lyssae, klebs-loeffler bacillus of diphtheria.

But a time came when other diseases did not yield to the explorers the specific germ, and yet they were proved to be definitely infectious. Such were influenza, parrot fever, scarlet

fever, yellow fever, poliomyelitis (infantile paralysis). All these were evidently associated with a virus. So strong a hold had the germ theory on scientific minds, that the inference was that the germs were there right enough, but that our microscopes were not powerful enough to make them visible. Nor could they be isolated by the process of filtration; with the finest porcelain filter they came out in the filtrate, which none of the known germs did.

Dr. Stanley's work was to examine the virus itself and find out its nature and chemical composition. He chose for his inquiry the oldest known virus, that which causes the tobacco mosaic disease, a disease that has been a devastating enemy of the tobacco growers. His methods were clever, ingenious, and fascinating in process, and command our admiration. In brief they were as follows: He gathered the leaves of infected tobacco plants, pressed out the tainted juice, put some of this in a test tube and added pepsin. Now pepsin is an enzyme which digests or breaks up proteins. Was the virus, perchance, of the nature of a protein? He kept the solution under proper conditions for pepsin digestion, and at the end of the experiment rubbed some of it on the leaves of a tobacco plant. He found that the virus was absolutely harmless; its fangs had been drawn. The virus was probably a protein then.

Next, taking more of the virulent tobacco juice he added in the test tube certain chemicals which precipitate proteins. Solid precipitates formed, and the remaining juice was again found to be harmless. The virus had been tracked down to this solid, but it was necessary to purify the solid so that it contained no extraneous matter. He put it in a neutral liquid and added an ammonium compound which has the faculty of "edging protein out of solution without changing the protein." Needle-like crystals formed at the bottom of the test-tube. These he dissolved and recrystallized, dissolved and recrystallized many times, a process

calculated to eliminate from the crystals any concealed extraneous agents. Yet when he redissolved them in a large quantity of neutral liquid more than a hundred million times their bulk and applied the liquid to a tobacco plant, the well-known signs of the disease were soon evident. The virus then, surely, was in the crystals, and the crystals contained *no living* (so called) *matter*, for, says the author of the article, "we know no plant or animal, no bacterium, no protoplasm, that can undergo crystallization."

So again there comes the perplexing question: "Where *does* life begin?" Dr. Stanley has tracked down beyond the limits of living matter a mysterious molecule that, under suitable conditions, does just what bacteria do. (This virus in question, while showing no signs of reproduction and other activity in a neutral liquid in the test tube, bursts into most fecund life when contacting the tobacco plant.)

Mr. Gray draws attention to the remarkable analogies there can be made between the actions of this protein and those of the genes. Both have stages of activity and quiescence; both possess the reproductive faculty, both are at times unstable, both appear to be of approximately the same order of size. However, he quotes Oscar Riddle in suggesting that the gene represents a higher order of organization than the virus.

He sums up the position in these words:

Perhaps the nearest we can come to a definition is to say that life is a stage in the organization of matter. The ascent of life, from azotobacter to man, is a hierarchy continually becoming more complex and more versatile. And so with the ascent of matter, from the single electron to the enormously numerous colony of electrical particles which make up the simplest living cell — it too is a hierarchy of

continually increasing complexity, of organization.

— a more or less Theosophical concept without certain important keys which our philosophy gives. What then have we to say?

There are many questions involved in these notes upon which our archaic teachings can throw a flood of illumination. Mr. Gray was brought up in a school, as we were, in which a distinction is made between living and dead matter. We were taught that in order to be a live thing, the object must have a certain definition of form and attributes laid down as essential. He has found the required attributes beyond the limits that science has stipulated, and this disconcerting discovery leads him to say that perhaps the virus is a molecule of a double personality, alive and yet not alive. He has been trailing an *ignis fatnus* and has almost convinced himself of the fact.

What illumination does our philosophy throw on these problems opened up by Mr. Gray's article?

Let us first consider the three fundamental propositions in *The Secret Doctrine*:

1. "An Omnipresent, Eternal, Boundless, and Immutable PRINCIPLE on which all speculation is impossible, since it transcends the power of human conception. . ." It is the Cause, Source, and again the Recipient of all things. It simply "is." Our nearest approach in words is BE-NESS, the Boundless and Universal Consciousness. The Self.

2. The Law or process of periodicity, a ceaseless alternation of manifestation and disappearance.

3. Universal Unity, "the fundamental identity of all Souls with the Universal Over-Soul."

So we come to view the Universe on these universal principles.

Everything conceivable has at the core of its core, the essence of this Boundless Principle, containing potentially all it may, can, and will become.

During manifestation, the teachings tell us, every entity starts as a spark of this divine essence, clothing itself with emanations from itself, and as a pilgrim, grows and learns, in fact *evolves* through an infinite range of forms, from the undifferentiated and spiritual (in the sense of non-physical) to the most complex conceivable. This principle, being universal, works on all planes. So we conceive of a universal ocean of CONSCIOUSNESS, working through a universal energy of LIFE. The Orientals call this latter Prana. Therefore, there is no beginning of life. It simply *is*, and is only one aspect of what one might call para-consciousness, just as matter or substance is another aspect of consciousness, coming through para-substance, which the Orientals call *mulaprakriti*. Thus there is a trinity of consciousness-matter-energy in a ceaseless unity and evolving through infinite grades of beings which, as they weave their destiny, realize their infinite potentialities.

The methods of their activity are: 1. Reimbodiment, every imbodiment being appropriate to its degree of evolution. 2. The law of consequences, every movement or activity producing a result. 3. Hierarchies; the process of grouping all the degrees of development, every group having its head or hierarch, or god of the group, and every group forming an entity as part of a greater hierarchy with its hierarch or chief. 4. Swabhava, or essential characteristic; for instance, a rose evolves a rose, but there may be hierarchies of roses according to the evolution of internal potentialities. 5. Evolution, the gradual and orderly succession of unwrapping of internal potentialities; when an entity has learnt its lessons, it can repeat them quickly. It has taken aeons and

aeons to evolve man, but when he returns for a fresh imbodiment, he can run through the same processes in nine months. Both 6 and 7 involve higher conditions not concerning us here, though they are essential steps.

Now applying these teachings to our present scheme, we get the picture of a universal life-principle, working through the various garments of evolution of entities, changing its nature according to the forms through which it works. So life is equally inherent in elementals, minerals, plants, beasts, humans, and gods, but the life shows up in its various forms: elemental life, mineral life, plant life, beast life, human life. In relation to this earth, every entity *in its essential nature* has to pass through all these schools of learning. This does not mean that a stone becomes a plant; it means that the entity has to pass through the stone state, the plant state, etc., every entity retaining in its nature the essence of the kingdoms through which it passes. Every man's body is in its make-up a complex of elemental, mineral, plant, and beast nature, all in the process of humanizing.

So we see in a cell from the human body an elemental nature, a mineral basis, a vegetable process, propensities of animal nature — in the loves, the attractions, the repulsions of particles — and the mental intelligence, this last acting as a directing force through the nucleus, operating through the chromosomes, and directly distributed through the problematical but essential genes. Now the nucleolus *per se* is more physical, i. e., nearer in nature to the cell-body, the somatic; the chromosomes are less physical, are more spiritual in consciousness; and the genes fade out of the picture as visible entities and yet are more spiritually conscious in their potency than their imbodying chromosomes. Beyond that they become for us only an energy, but if we had the eyes to see, we should perceive that they are still imbodyed life.

There is recognised in our philosophy a principle that where consciousness moves from one plane to another it does so through what is called a laya-center, or concentration-point. In the cell it is indicated by the nucleolus of the nucleus. This does not mean that on the other side of this laya-center there is no matter, but merely a different *grade* of matter. The real nature of the universe is what is called astral; it exists in all grades, from the highest spiritual to the grossest physical, and according to its grade, so is the grade of life and the grade of consciousness working through it. All evolution tends from the spiritual to the material and then back to the spiritual, carrying along with it the experiences of its material state.

So we see in the virus of tobacco a form of consciousness, with its swabhava of characteristic activity. (Too bad for the tobacco plant!) This form of consciousness is imbodyed in an invisible sheath, and is in the organic chemical state of evolution. There is no dead matter, all is alive; though the time will come when those activities called "life" will be indrawn into the Self and for a time be lost as "life," to become part of the para-consciousness. This periodical withdrawal does not bring about the annihilation of life. The dewdrop falls into the open sea. The process is part of the operation of periodicity. So also is the crystallization of the virus protein. In this crystallized state it is latent in its virulence, and analogous to the minerals. It is not dead; it is only asleep, latent.

Then there is the question of the inoperative nature of certain genes when they fail to contact the proper environment of an ovum. Is this not a question of the presence or absence of electro-magnetic harmony? Mr. Gray refers to some cases where a sperm, contacting an ovum without a nucleus, is nevertheless able to evolve a perfect embryo. Here the electro-magnetic harmony is provided for in the somatic part of the cell. Weismann amplifies this point where he describes how in the development and loss of

the polar bodies, some of the chromosomes migrate, creating a deficiency or vacuum in the ovum, which is replaced or made up for by the invading sperm — a collection of foreign chromosomes.

Turning again to the matter of the laya-center: let us think of it in the nucleus of the cell as the focal point through which the Reincarnating Ego, drawing its stream of consciousness from man's own Spiritual Ego, directs the building of the temple (the body) from a higher plane. The laya-center of the nucleus is already electrified by the magnetic contact of the genes of the sperm, one of which contains the impress of the ego. And thus through the mystic center a permanent connexion is made whereby there can flow through the ego the stream of creative consciousness from "above." Thus the ego forms a link by which, through the trials of its child, the human personality and the body, it learns and evolves.

We might conclude the above reflexion by saying that when, therefore, Mr. Gray sets out in search of the origin of life, he must go back to the fountain source of all things. He will have to carry on his search not only in the realms visible, not only in organized and identified forms, but into invisible realms, in problematical units, problematically imbodyed, which are parts of a hierarchy that has one Source — the SELF.

The Theosophical Forum

NATURE STUDIES: III — *H. Percy Leonard*

THE LIVING UNIVERSE

The universe as it appears to the astronomer is a desolate waste. Dotted about, at points inconceivably remote, there are supposed to be planets so fortunately placed in respect to their suns that life, such as we know it, may be possible. But of such solar systems we are told that there is probably only one in a hundred thousand where this is at all likely to be the case, and either the planet is so near its sun that its temperature would be too high, or so distant, and therefore cold, as to render all life on its surface impossible.

In pleasant contrast to these untenanted planets and uninhabited stretches of ether, Theosophy presents us with the picture of a universe which not only teems with living creatures at every point, but whose very substance is composed of lives. What appear as the empty spaces between one planet and another are only apparently so, and that, merely because our eyes are so very limited in their range that we can see only those inhabitants which are of a degree of density equal to our own. Life is pulsing everywhere, and there is no unappropriated life, for wherever found, it is always flowing in a living being, and wherever there is consciousness there is always some entity who feels it as "I."

It is not only a living universe, it is a loving universe as well, whose members, all at varying degrees of development, are united each to each by the binding force of universal love. There *are* wills in conflict, there *is* selfish competition, but these things are inevitable in a universe where growth and evolution are continually at work.

Before we can renounce the separated self and live for purposes beyond the limited bounds of the personality, we have first to acquire self-consciousness, and in order to do this the illusion of a separated life has to be developed in a body which gives rise to the notion of "I" as contrasted with an environment which is not "I." The little focal, egocentric point competes with others of its kind, and is actually carrying out the cosmic program, at this stage of the proceedings, in trying to aggrandize and to defend against all comers its seemingly separated granule of selfhood. But once acquired, the conception of a personal ego has to be expanded, until it blends in perfect solidarity with those of all other selves of the group to which it is specially related.

Even the centripetal quality of the personal self is seen to be necessary to the stability of the whole, and when equilibrated by love it helps to keep the great wheel perpetually revolving. The mysterious force which thrills and pulses through all living things is entirely impartial and has no favorites. The clove and the rattlesnake, the bishop and the burglar share in its indiscriminating flow. The universal life is "perfect" like "the Father in Heaven" of whom Jesus spoke, "who makes his sun to shine upon the evil and the good, and who sends his rain upon the just and also upon the unjust."

There can be no death in a living universe, but when life under one set of conditions becomes impossible, it begins again in another environment. Forms may die and disappear, but life proceeds upon its way for evermore.

THE SEVEN HUMAN GROUPS — *G. de Purucker*

[In *The Secret Doctrine*, Vol. II, p 1, it is stated that the Secret Doctrine "teaches the simultaneous evolution of seven human groups on seven portions of our globe." The members of the Secret Doctrine Class at Point Loma wishing for further elucidation of this statement, Dr. de Purucker was appealed to, and sent the following most illuminating explanation, which by general request, and with permission duly accorded, is hereby placed on record for future reference and for the information of all readers. — H. T. E.]

This passage and other passages appertaining to the same point of the occult teaching, mean just what they say, and are not to be construed metaphorically. These passages do not refer to inner and outer rounds, nor to the other globes of the Earth-Chain, nor to the seven different human principles, as astral, physical, etc., except indirectly; as is shown very clearly by H. P. B.'s own words, "seven human groups on seven different portions of our globe." Here it is our Globe D or Earth, our planet Terra, which is meant.

Thus it is a fact that original mankind, which does not mean any branch of humanity but the very beginnings of what we popularly call the First Root-Race on Globe D in this Fourth Round, refers to the matter of the *sishtas* from the preceding Round. In other words, it means that our human life-wave as a whole or totality, when it again reached our Earth during this Fourth Round on this Globe D, awakened the seven classes of the then living *sishtas* on this our Globe D, because the forerunners of our Life-wave were themselves composed of the seven different kinds of human monads. In other words they were composed of what, in other connexions, H. P. B. has called the different classes

of the Pitris. This is a little intricate but very simple when other teachings about the incoming life-waves on a globe are properly understood, and must not be confused with other life-waves; and I may add of course that the last word of this teaching is highly esoteric and belongs to higher Degrees even than the E. S.

However, mark the following points: the sishtas waiting the incoming septenary human life-wave were themselves sevenfold, i. e., seven different groups of sishtas, each group being composed of individuals who through evolution were more or less alike. The life-wave when it reaches our Globe, is thus composed of the bulk of what we call the First Sub-race of the First Root-Race, intermixed with forerunners, i. e., more advanced monads of six other kinds, representing the other six classes of human monads.

Hence it was that all the seven classes of sishtas were more or less contemporaneously awakened, as it were, which means that they became vehicles for the different classes of the incoming monads, and began to increase; and thus it was that in this Round, on this Globe, as H. P. B. says, there was a "simultaneous evolution of seven human groups on seven different portions of our globe." These seven different classes of monads of the incoming life-wave, including the majority and the forerunners of the other six, started the seeds of the different Root-Races, which in time were to develop in this Round on this Globe, and of which Root-Races 1, 2, 3, and 4 have come and gone, and we are now in the 5th, although there are representatives amongst us even today, forerunners, of the 6th and 7th Root-Races to come before our life-wave passes on to Globe E.

It is thus clear that *The Secret Doctrine* teaches not a mono-genetic origin of humanity, i. e., the birth of the human race from a single individual, or from a single couple like the Jewish biblical story; but teaches a polygenetic origin, that is to say an origin of the

human race from seven different living foci, which I have hereinbefore called the seven different types or kinds or sub-classes of the sishtas, each one such type or sub-class being awakened by the similar incoming portion of the human life-wave. Of course the portion of the incoming life-wave which was to become specifically the First Root-Race was the most numerous at that earliest period in our humanity, and became the First Root-Race. Then when it died out, it was preceded and followed by the growth in numbers of the class of the monads which was to become the Second Root-Race, etc.

In this connexion, it must not be forgotten that all these seven types or classes of monads in the incoming life-waves are not separated in water-tight compartments, any more than the different types of men today, advanced and less advanced, are all separated off from each other. But they more or less mingled as time went on, yet the members of each class as it were gravitated to its own particular group and part of the globe.

From this teaching we likewise see that there may be, and indeed are, groups of humanity which inhabit portions of a globe, and where these portions of humanity remain almost quiescent for ages, until their time comes to begin to increase and to become the dominant Race or Sub-race. Thus H. P. B.'s words are to be taken literally.

I hope these thoughts will be of help to the members of your class who are puzzled, but of course they will require some thinking and study to get a clear picture of the process, because what is here briefly said took scores of millions of years to come about, up to the time of our own Fifth Root-Race.

THE SAGE IN PRACTICAL AFFAIRS — *Lao-Tze*

"Therefore the Sage, wishing to be above the people, must by his words put himself below them; wishing to be before the people, he must put himself behind them. In this way, though he has his place above them, the people do not feel his weight; though he has his place before them, they do not feel it as an injury. Therefore all mankind delight to exalt him, and weary of him not."

"The Sage expects no recognition for what he does; he achieves merit but does not take it to himself; he does not wish to display his worth."

"I have three precious things, which I hold fast and prize. The first is gentleness; the second is frugality; the third is humility, which keeps me from putting myself before others. Be gentle, and you can be bold; be frugal, and you can be liberal; avoid putting yourself before others, and you can become a leader among men."

"But in the present day men cast off gentleness, and are all for being bold; they spurn frugality, and retain only extravagance; they discard humility, and aim only at being first. Therefore they shall surely perish."

— Extracts from Lao-Tze's *Tao Teh Ching* (translation by Giles)

CULTURE OF CONCENTRATION — *William Q. Judge*

The term most generally in use to express what is included under the above title is SELF CULTURE. Now it seems to well enough express, for a time at least, the practice referred to by those who desire to know the truth. But, in fact, it is inaccurate from a theosophic standpoint. For the self is held to be that designated in the Indian books as Iswara, which is a portion of the eternal spirit enshrined in each human body. That this is the Indian view there is no doubt. The *Bhagavad-Gita* in ch. xv says that an eternal portion of this spirit,

having assumed life in this world of life, attracts the heart and the five senses which belong to nature. Whatever body Iswara enters or quits, it is connected with it by snatching those senses from nature, even as the breeze snatches perfumes from their very bed. This spirit approaches the objects of sense by presiding over the ear, the eye, the touch, the taste, and the smell, and also over the heart;

and in an earlier chapter,

the Supreme spirit within this body is called the Spectator and admonisher, sustainer, enjoyer, great Lord, and also highest soul;

and again,

the Supreme eternal soul, even when existing within — or connected with — the body, is not polluted by the actions of the body.

Elsewhere in these books this same spirit is called the self, as in a celebrated sentence which in Sanskrit is *Atmanam atmana pasya*,

meaning, "Raise the self by the self," and all through the Upanishads, where the self is constantly spoken of as the same as the Iswara of *Bhagavad-Gita*. Max Muller thinks the word "self" expresses best in English the ideas of the Upanishads on this head.

It therefore follows that such a thing as culture of this self, which in its very nature is eternal, unchangeable, and unpolluted by any action, cannot be. It is only from inadequacy of terms that students and writers using the English tongue are compelled to say "self-culture," while, when they say it, they admit that they know the self cannot be cultured.

What they wish to express is, "such culture or practice to be pursued by us as shall enable us, while on earth, to mirror forth the wisdom and fulfil the behests of the self within, which is all-wise and all-good."

As the use of this term "self culture" demands a constant explanation either outwardly declared or inwardly assented to, it is wise to discard it altogether and substitute that which will express the practice aimed at without raising a contradiction. For another reason also the term should be discarded. That is, that it assumes a certain degree of selfishness, for, if we use it as referring to something that we do only for ourself, we separate at once between us and the rest of the human brotherhood. Only in one way can we use it without contradiction or without explanation, and that is by admitting we selfishly desire to cultivate ourselves, thus at once running against a prime rule in theosophic life and one so often and so strenuously insisted on, that the idea of a personal self must be uprooted. Of course, as we will not negative this rule, we thus again have brought before us the necessity for a term that does not arouse contradictions. That new term should, as nearly as possible, shadow forth the three

essential things in the action, that is, the instrument, the act, and the agent, as well as the incitement to action; or, knowledge itself, the thing to be known or done, and the person who knows.

This term is CONCENTRATION. In the Indian books it is called Yoga. This is translated also as Union, meaning a union with the Supreme Being, or, as it is otherwise put, "the object of spiritual knowledge is the Supreme Being."

There are two great divisions of Yoga found in the ancient books, and they are called Hatha-Yoga and Raja-Yoga.

Hatha-Yoga is a practical mortification of the body by means of which certain powers are developed. It consists in the assumption of certain postures that aid the work, and certain kinds of breathing that bring on changes in the system, together with other devices. It is referred to in the 4th chapter of the *Bhagavad-Gita* thus:

Some devotees sacrifice the sense of hearing and the other senses in the fires of restraint; some offer objects of sense, such as sound, in the fires of the senses. Some also sacrifice inspiration of breath in expiration, and expiration in inspiration, by blocking up the channels of inspiration and expiration, desirous of retaining their breath. Others, by abstaining from food, sacrifice life in their life.

In various treatises these methods are set forth in detail, and there is no doubt at all that by pursuing them one can gain possession of sundry abnormal powers. There is risk, however, especially in the case of people in the West where experienced gurus or teachers of these things are not found. These risks consist in this, that while an undirected person is doing according to the rules of Hatha-Yoga he arouses about him influences that do him harm, and he also carries his natural functions to certain

states now and then when he ought to stop for a while, but, having no knowledge of the matter, may go on beyond that and produce injurious effects. Then, again, Hatha-Yoga is a difficult thing to pursue, and one that must be pushed to the point of mastery and success. Few of our Western people are by nature fitted for such continuous and difficult labor on the mental and astral planes. Thus, being attracted to Hatha-Yoga by the novelty of it, and by the apparent pay that it offers in visible physical results, they begin without knowledge of the difficulty, and stopping after a period of trial they bring down upon themselves consequences that are wholly undesirable.

The greatest objection to it, however, is that it pertains to the material and semi-material man, — roughly speaking, to the body, and what is gained through it is lost at death.

The *Bhagavad-Gita* refers to this and describes what happens in these words:

All of these, indeed, being versed in sacrifice, have their sins destroyed by these sacrifices. But he alone reaches union with the Supreme Being who eats of the ambrosia left from a sacrifice.

This means that the Hatha-Yoga practice represents the mere sacrifice itself, whereas the other kind is the ambrosia arising from the sacrifice, or "the perfection of spiritual cultivation," and that leads to Nirvana. The means for attaining the "perfection of spiritual cultivation" are found in Raja-Yoga, or, as we shall term it for the present, Culture of Concentration.

When concentration is perfected, we are in a position to use the knowledge that is ever within reach but which ordinarily eludes us continually. That which is usually called knowledge is only an intellectual comprehension of the outside, visible forms assumed

by certain realities. Take what is called scientific knowledge of minerals and metals. This is merely a classification of material phenomena and an empirical acquisition. It knows what certain minerals and metals are useful for, and what some of their properties are. Gold is known to be pure, soft, yellow, and extremely ductile, and by a series of accidents it has been discovered to be useful in medicine and the arts. But even to this day there is a controversy, not wholly settled, as to whether gold is held mechanically or chemically in crude ore. Similarly with minerals. The crystalline forms are known and classified.

And yet a new theory has arisen, coming very near to the truth, that we do not know matter in reality in this way, but only apprehend certain phenomena presented to us by matter, and variously called, as the phenomena alter, gold, wood, iron, stone, and so on. But whether minerals, metals, and vegetables have further properties that are only to be apprehended by still other and undeveloped senses, science will not admit.

Passing from inanimate objects to the men and women about us, this ordinary intellectual knowledge aids us no more than before. We see bodies with different names and of different races, but below the outer phenomena our everyday intellect will not carry us. This man we suppose to have a certain character assigned to him after experience of his conduct, but it is still only provisional, for none of us is ready to say that we know him either in his good or his bad qualities. We know there is more to him than we can see or reason about, but what, we cannot tell. It eludes us continually. And when we turn to contemplate ourselves, we are just as ignorant as we are about our fellow man. Out of this has arisen an old saying: "Every man knows what he is, but no one knows what he will be."

There must be in us a power of discernment, the cultivation of

which will enable us to know whatever is desired to be known. That there is such a power is affirmed by teachers of occultism, and the way to acquire it is by cultivating concentration.

It is generally overlooked, or not believed, that the inner man who is the one to have these powers has to grow up to maturity, just as the body has to mature before its organs fulfil their functions fully. By *inner man* I do not mean the Higher Self — the Iswara before spoken of, but that part of us which is called the soul, or astral man, or vehicle, and so on. All these terms are subject to correction, and should not be held rigidly to the meanings given by various writers. Let us premise, first, the body now visible; second, the inner man — not the spirit; and third, the spirit itself.

Now while it is quite true that the second — or inner man — has latent all the powers and peculiarities ascribed to the astral body, it is equally true that those powers are, in the generality of persons, still latent or only very partially developed.

This inner being is, so to say, inextricably entangled in the body, cell for cell and fibre for fibre. He exists in the body somewhat in the way the fibre of the mango fruit exists in the mango. In that fruit we have the inside nut with thousands of fine fibres spreading out from it through the yellow pulp around. And as you eat it, there is great difficulty in distinguishing the pulp from the fibre. So that the inner being of which we are speaking cannot do much when away from his body, and is always influenced by it. It is not therefore easy to leave the body at will and roam about in the double. The stories we hear of this as being so easily done may be put down to strong imagination, vanity, or other causes. One great cause for error in respect to these doubles is that a clairvoyant is quite likely to mistake a mere picture of the person's thought for the person himself. In fact, among occultists

who know the truth, the stepping out of the body at will and moving about the world is regarded as a most difficult feat, and for the reasons above hinted at. Inasmuch as the person is so interwoven with his body, it is absolutely necessary, before he can take his astral form about the country, for him first to carefully extract it, fibre by fibre, from the surrounding pulp of blood, bones, mucus, bile, skin and flesh. Is this easy? It is neither easy nor quick of accomplishment, nor all done at one operation. It has to be the result of years of careful training and numerous experiments. And it *cannot* be consciously done until the inner man has developed and cohered into something more than irresponsible and quivering jelly. This development and coherence are gained by perfecting the power of concentration.

Nor is it true, as the matter has been presented to me by experiment and teaching, that even in our sleep we go rushing about the country seeing our friends and enemies or tasting earthly joys at distant points. In all cases where the man has acquired some amount of concentration, it is quite possible that the sleeping body is deserted altogether, but such cases are as yet not in the majority.

Most of us remain quite close to our slumbering forms. It is not necessary for us to go away in order to experience the different states of consciousness which is the privilege of every man, but we do not go away over miles of country until we are able, and we cannot be able until the necessary ethereal body has been acquired and has learned how to use its powers.

Now, this ethereal body has its own organs which are the essence or real basis of the senses described by men. The outer eye is only the instrument by which the real power of sight experiences that which relates to sight; the ear has its inner master — the power of hearing, and so on with every organ. These real powers within

flow from the spirit to which we referred at the beginning of this paper. That spirit approaches the objects of sense by presiding over the different organs of sense. And whenever it withdraws itself the organs cannot be used. As when a sleep-walker moves about with open eyes which do not see anything, although objects are there and the different parts of the eye are perfectly normal and uninjured.

Ordinarily there is no demarcation to be observed between these inner organs and the outer; the inner ear is found to be too closely interknit with the outer to be distinguished apart. But when concentration has begun, the different inner organs begin to awake, as it were, and to separate themselves from the chains of their bodily counterparts. Thus the man begins to duplicate his powers. His bodily organs are not injured, but remain for use upon the plane to which they belong, and he is acquiring another set which he can use apart from the others in the plane of nature peculiarly theirs.

We find here and there cases where certain parts of this inner body have been by some means developed beyond the rest. Sometimes the inner head alone is developed, and we have one who can see or hear clairvoyantly or clairaudiently; again, only a hand is developed apart from the rest, all the other being nebulous and wavering. It may be a right hand, and it will enable the owner to have certain experiences that belong to the plane of nature to which the right hand belongs, say the positive side of touch and feeling.

But in these abnormal cases there are always wanting the results of concentration. They have merely protruded one portion, just as a lobster extrudes his eye on the end of the structure which carries it. Or take one who has thus curiously developed one of the inner eyes, say the left. This has a relation to a plane of nature

quite different from that appertaining to the hand, and the results in experience are just as diverse. He will be a clairvoyant of a certain order, only able to recognise that which relates to his one-sided development, and completely ignorant of many other qualities inherent in the thing seen or felt, because the proper organs needed to perceive them have had no development. He will be like a two-dimensional being who cannot possibly know that which three-dimensional beings know, or like ourselves as compared with four-dimensional entities.

In the course of the growth of this ethereal body several things are to be observed.

It begins by having a cloudy, wavering appearance, with certain centres of energy caused by the incipiency of organs that correspond to the brain, heart, lungs, spleen, liver, and so on. It follows the same course of development as a solar system, and is, in fact, *governed and influenced by the very solar system to which the world belongs on which the being may be incarnate*. With us it is governed by our own solar orb.

If the practice of concentration be kept up, this cloudy mass begins to gain coherence and to shape itself into a body with different organs. As they grow they must be used. Essays are to be made with them, trials, experiments. In fact, just as a child must creep before it can walk, and must learn walking before it can run, so this ethereal man must do the same. But as the child can see and hear much farther than it can creep or walk, so this being usually begins to see and to hear before it can leave the vicinity of the body on any lengthy journey.

Certain hinderances then begin to manifest themselves which, when properly understood by us, will give us good substantial reasons for the practising of the several virtues enjoined in our books and naturally included under the term of Universal

Brotherhood.

One is that sometimes it is seen that this nebulous forming body is violently shaken, or pulled apart, or burst into fragments that at once have a tendency to fly back into the body and take on the same entanglement that we spoke of at first. *This is caused by anger*, and this is why the sages all dwell upon the need of calmness. When the student allows anger to arise, the influence of it is at once felt by the ethereal body, and manifests itself in an uncontrollable trembling which begins at the centre and violently pulls apart the hitherto coherent particles. If allowed to go on it will disintegrate the whole mass, which will then re-assume its natural place in the body. The effect following this is, that a long time has to elapse before the ethereal body can be again created. And each time this happens the result is the same. Nor does it make any difference what the cause for the anger may be. There is no such thing as having what is called "righteous anger" in this study and escaping these inevitable consequences. Whether your "rights" have been unjustly and flagrantly invaded or not does not matter. The anger is a force that will work itself out in its appointed way. Therefore anger must be strictly avoided, and it cannot be avoided unless charity and love — absolute toleration — are cultivated.

But anger may be absent and yet still another thing happen. The ethereal form may have assumed quite a coherence and definiteness. But it is observed that, instead of being pure and clear and fresh, it begins to take on a cloudy and disagreeable color, the precursor of putrefaction, which invades every part and by its effects precludes any further progress, and at last reacts upon the student so that anger again manifests itself. This is the effect of envy. Envy is not a mere trifle that produces no physical result. It has a powerful action, as strong in its own field as that of anger. It not only hinders the further development, but

attracts to the student's vicinity thousands of malevolent beings of all classes that precipitate themselves upon him and wake up or bring on every evil passion. Envy, therefore, must be extirpated, and it cannot be got rid of as long as the personal idea is allowed to remain in us.

Another effect is produced on this ethereal body by vanity. Vanity represents the great illusion of nature. It brings up before the soul all sorts of erroneous or evil pictures, or both, and drags the judgment so away that once more anger or envy will enter, or such course be pursued that violent destruction by outside causes falls upon the being. As in one case related to me. The man had made considerable progress, but at last allowed vanity to rule. This was followed by the presentation to his inner sight of most extraordinary images and ideas, which in their turn so affected him that he attracted to his sphere hordes of elementals seldom known to students and quite indescribable in English. These at last, as is their nature, laid siege to him, and one day produced all about the plane of his astral body an effect similar in some respects to that which follows an explosion of the most powerful explosives known to science. The consequence was, his ethereal form was so suddenly fractured that by repercussion the whole nature of the man was altered, and he soon died in a madhouse after having committed the most awful excesses.

And vanity cannot be avoided except by studiously cultivating that selflessness and poverty of heart advised as well by Jesus of Nazareth as by Buddha.

Another hinderance is fear. This is not, however, the worst of all, and is one that will disappear by means of knowledge, for fear is always the son of ignorance. Its effect on the ethereal form is to shrivel it up, or coagulate and contract it. But as knowledge increases, that contraction abates, permitting the person to

expand. Fear is the same thing as frigidity on the earth, and always proceeds by the process of freezing.

Success in the culture of concentration is not for him who sporadically attempts it. It is a thing that flows from "a firm position assumed with regard to the end in view, and unremittingly kept up." Nineteenth Century students are too apt to think that success in occultism can be reached as one attains success in school or college, by reading and learning *printed words*. A complete knowledge of all that was ever written upon concentration will confer no power in the practice of that about which I treat. Mere book knowledge is derided in this school as much as it is by the clodhopper; not that I think book knowledge is to be avoided, but that sort of acquisition without the concentration is as useless as faith without works. It is called in some places, I believe, "mere eye-knowledge." Such indeed it is; and such is the sort of culture most respected in these degenerate times.

In starting this paper the true practice was called Raja-Yoga. It discards those physical motions, postures and recipes relating solely to the present personality, and directs the student to virtue and altruism as the bases from which to start. This is more often rejected than accepted. So much has been said during the last 1800 years about Rosicrucians, Egyptian Adepts, Secret Masters, Kabbala, and wonderful magical books that students without a guide, attracted to these subjects, ask for information and seek in vain for the entrance to the temple of the learning they crave, because they say that virtue's rules are meant for babes and Sunday-schools, but not for them. And, in consequence, we find hundreds of books in all the languages of Europe dealing with rites, ceremonies, invocations, and other obscurities that will lead to nothing but loss of time and money. But few of these authors had anything save "mere eye-knowledge." 'Tis true they have

sometimes a reputation, but it is only that accorded to an ignoramus by those who are more ignorant. The so-called great man, knowing how fatal to reputation it would be to tell how really small is his practical knowledge, prates about "projections and elementals," "philosopher's stone and elixir," but discreetly keeps from his readers the paucity of his acquirements and the insecurity of his own mental state. Let the seeker know, once for all, that the virtues cannot be discarded nor ignored; they must be made a part of our life, and their philosophical basis must be understood.

But it may be asked if, in the culture of concentration, we will succeed alone by the practice of virtue. The answer is No, not in this life, but perhaps one day in a later life. The life of virtue accumulates much merit; that merit will at some time cause one to be born in a wise family where the real practice of concentration may perchance begin; or it may cause one to be born in a family of devotees or those far advanced on the Path, as said in *Bhagavad-Gita*. But such a birth as this, says Krishna, is difficult to obtain; hence the virtues alone will not always lead in short space to our object.

We must make up our minds to a life of constant work upon this line. The lazy ones or they who ask for pleasure may as well give it up at the threshold and be content with the pleasant paths marked out for those who "fear God and honor the King." Immense fields of investigation and experiment have to be traversed; dangers un-thought of and forces unknown are to be met; and all must be overcome, for in this battle *there is no quarter asked or given*. Great stores of knowledge must be found and *seized*. The kingdom of heaven is not to be had for the asking; it must *be taken by violence*. And the only way in which we can gain the will and the power to thus seize and hold is by acquiring the virtues on the one hand, and minutely understanding

ourselves on the other. Some day we will begin to see why not one passing thought may be ignored, not one flitting impression missed. This we can perceive is no simple task. It is a gigantic work. Did you ever reflect that the mere passing sight of a picture, or a single word instantly lost in the rush of the world, may be the basis for a dream that will poison the night and react upon the brain next day? Each one must be examined. If you have not noticed it, then when you awake next day you have to go back in memory over every word and circumstance of the preceding day, seeking, like the astronomer through space, for the lost one. And, similarly, without such a special reason, you must learn to be able to go thus backward into your days so as to go over carefully and in detail all that happened, all that you permitted to pass through the brain. Is this an easy matter?

But let us for a moment return to the sham adepts, the reputed Masters, whether they were well-intentioned or the reverse. Take Eliphas Levi who wrote so many good things, and whose books contain such masses of mysterious hints. Out of his own mouth he convicts himself. With great show he tells of the raising of the shade of Apollonius. Weeks beforehand all sorts of preparations had to be made, and on the momentous night absurd necromantic performances were gone through. What was the result? Why only that the so-called shade appeared for a few moments, and Levi says they never attempted it again. Any good medium of these days could call up the shade of Apollonius without preparation, and if Levi were an Adept he could have seen the dead quite as easily as he turned to his picture in a book. By these sporadic attempts and outside preparations nothing is really gained but harm to those who thus indulge. And the foolish dabbling by American theosophists with practices of the Yogis of India that are not one-eighth understood and which in themselves are inadequate, will lead to much worse results than the apocryphal

attempt recorded by Eliphas Levi.

As we have to deal with the Western mind now ours, all unused as it is to these things and overburdened with false training and falser logic, we must begin where we are, we must examine our present possessions and grow to know our own present powers and mental machinery. This done, we may proceed to see ourselves in the way that shall bring about the best result.

The Theosophical Forum

THEOSOPHY AND REFORM — *G. de Purucker*

I have often been asked what good, what practical, honest-to-goodness good the Theosophical Society does in the world. It has been said to me: Why, you people preach and preach and preach and preach the most beautiful things. But what *practical* good do you do? This is what Theosophy does, what the Theosophical Society is trying to do, and what we Theosophists are trying to do: We are trying to give unto men a light by which they can live. We are trying to change the hearts of men to feel for their fellows, to be in sympathy with their fellows instead of against them. We are trying to give unto our fellow men a philosophy of life based on the wisdom of the ages, which will make their own lives upright so that they live them in rectitude, in justice to themselves, and in justice to others. We are trying to change men's hearts and we are trying to change their minds. Now if you can show me anything more wonderful than that, more *practical*, than that, I should be glad to hear.

Isn't it obvious that the reason we have trouble is because the world does not know what to do? They are all hunting for truth, hunting for the way out. Why? Because their hearts are broken; they do not know what to do because their hearts have been shut up in selfish questing, grasping "for me" and "my part." It is altruism, brotherhood in thought and act, the old-fashioned teaching, the decent treatment of man by man, which will bring peace on earth and heaven amongst us.

You have often heard me say that it is ideas which rule the world, which make and unmake civilizations, which ennoble or which degrade human life; and it is precisely in the dissemination of the beautiful ideals I have just alluded to, and the finding of proper

soil in the hearts and minds of men for these ideas, that the Theosophical Society and its members are mainly engaged. Eschewing politics of every kind or color, utterly nonsectarian in principle as we are, our Work when once understood should be sympathetically received by kindly and thoughtful men everywhere; for we interfere with no man's life, we are strictly obedient to the laws of the country where we live, and we strive to bring back to men the philosophical, moral, religious, and scientific vision and hope, apart from any kind of dogmatic teaching, that the world for ages has lost.

That is our Work mainly, and it is intensely and grandly practical. By changing men's ideas we change their lives; and by changing their lives to happier and better things, in time such work will change civilizations. I repeat that ideas rule the world; and if you look around you, you will find this axiomatic truth substantiated everywhere, for men are thinkers as well as feelers, and their actions and their lives follow the ideas they cherish most strongly.

But I must say this: Let us apply to ourselves first what we ascertain to be the remedy for the world's ills — correct our own lives instead of trying to hammer our ideas of what is right into the heads of those who do not agree with us, just making more wretchedness in the world. Reformers are so very desirous of reforming the other fellow. It is so ungenerous. They want to reform other men in politics, in religion, in philosophy and science, and in their lives. How few of us try to reform the reformer! I, you. Nobody kicks so badly at reformation as does the reformer himself. A great man does not attempt to reform the other chap. He has work enough to reform himself. It is the consequence, the results, of his teaching and life which reform those who have heard, who have had the ears to hear.

And right here I believe is the largest part of the work of the

Theosophical Movement: to set a current of thought and feeling moving in the world; but primarily, to see to it, each one of us, that the center from which this energy flows is right. The way to reform things is to begin on yourself, *reform yourself*. Be an example and others will follow. It is contagious, beautifully contagious.

Do you know, I believe the curse of the world today is that men have got it in their heads that they are going to correct the other fellow. It is a mental, a psychological, curse that is afflicting us all. Now please do not misconstrue my words to mean that we should allow evil free play and just sit by and let others work injury upon their fellows. I don't mean that at all. All organized human society must protect itself against evil-doing. My point is that we should not try to correct the other fellow, but that we should try to correct ourselves. There you have all the Law and all the Prophets; and I tell you, the example of a man who begins on himself is contagious unto others, because he has reason with him, he has justice with him, he has right with him. His actions are not wrong; they are not warped, distorted, twisted. His actions are upright, clean, straightforward. When we deal with our fellow men we are dealing with reasonable and feeling human beings; and it is my firm conviction that the good in human nature far outweighs the evil. I for one have never found it to fail that when I appeal to my brother man to treat me as I want to treat him, he responds. I let him feel that I am sincere and that I am not going to try to correct his faults and impose my own opinions on him, my short-sighted views, my small and selfish feelings on him. I simply silently ask him to treat me as I want to treat him, and it never fails. Believe me!

The way of correcting evil in the world is not by putting more into it, thus adding to the store of horrors and wickedness in the world. Violence breeds violence, hatred arouses hatred; evil-

doing other men resent and won't have it. And if they are small-minded men they will react by trying to do evil unto you. If they are men of larger intelligence they will try to put you where you belong for your evil-doing — and with a good deal of that feeling! I think the proper way to correct the evils in the world is by beginning on ourselves, and to leave the other fellow alone. Be an example unto the world, be a light unto the world, think what you believe, live what you preach, *and leave the other fellow alone to work out his destiny.*

The Theosophical Forum

MORE ABOUT "WHAT SURVIVES DEATH?" — *A Trevor Barker*

What of the Lower Quaternary survives death?

The Lower Quaternary in Theosophical parlance includes:

- (1) The Body.
- (2) The Linga-Sarira, the framework upon which the body is built.
- (3) Prana, or life.
- (4) Kama-Manas, the lower thoughts, emotions, desires, passions, etc.

These together make up that which we call the personality, and it must be said at once that these do not survive death as a conscious entity under normal circumstances for the ordinary person. If these attributes which make up the personality during life were to survive death it would mean that they would still persist in combination minus the physical body, whereas the exact reverse is the case, since this combination begins immediately after death to fall apart and disintegrate. We repeat, therefore, that as a *conscious entity* the Lower Quaternary does not survive death. Nevertheless the substance of which the different vehicles of consciousness are built is composed of life atoms, and therefore has all of it a life of its own. This matter has been impressed with the emotional and thought tendencies during life, and in a very real sense this matter which we have used and expressed our consciousness through belongs to us. We are responsible for its future destiny in very much the same way as parents are responsible for their children. It should not be forgotten, however, that while the responsibility of parents in the way of supervision is very important, nevertheless, the child has an inherent destiny and individuality of its own. Exactly the same

is true of the material substance of which the principles of the Lower Quaternary is composed. The substance is not dead: the life atoms are monadic centers of life and consciousness, and whilst the combination in which they are held together during life as a personal entity is dissolved at death, nevertheless they will be required to enter into a new combination later on, when that part of our being which really does survive once again reimbodies itself.

Does the Upper Triad, as we understand it, survive death?

If we understand it correctly it does survive death. In fact this is the part that does survive. The higher part of Manas, bearing with it the efflorescence of the last personal existence: the fine aroma of the personality that was; all in fact that is worthy of immortality does survive on its own plane, but is neither capable of conscious communication with the living, nor is it subject to the interference of irresponsible mediums. The higher part of our being, represented by the Higher Triad, contains all that is real and eternal in man. It is the very essence, the essential part of him.

Do any of the physical senses survive? Has the discarnate spirit any of the six physical senses, in some form or other? Must we assume that the spirit is blind, deaf, and dumb, without the sense of smell or taste?

(a) The body has no senses, as these are actually centered in the Astral Body or Linga-Sarira. These senses persist, therefore, in the Linga-Sarira, and provide the explanation of the phenomena exhibited in spiritualism, in connection with the *kama-rupic* shell which persists after death for a longer or shorter period, according to the degree of materiality or spirituality of the individual concerned. This *kama-rupic* shell, when attracted to the medium in a spiritualistic seance, can be stimulated so as to

repeat mechanically the sensations, the lower thoughts and memories, with which it was familiar in life.

(b) The discarnate spirit, i. e. the Higher Triad, cannot be said to have six physical senses. On the other hand on its own plane it is fully conscious, is absorbed in a state of spiritual and ecstatic re-living of all the finer and higher thoughts and emotional experiences that were comprised in the dreams, aspirations, and unselfish or spiritual actions of the last incarnation.

(c) The spiritual entity, the Higher Triad, is anything but blind, deaf and dumb from the point of view of its own reflected consciousness, but nevertheless it should be emphasized that the entity is in a subjective state, and therefore incapable of responding to external stimuli.

To what extent do appetite, desires, ambition, hate, envy, jealousy, love, compassion, and similar attributes — of which a man in his physical body is conscious — survive death? Appetite, desire, emotion, envy, jealousy, being essentially mortal attributes of the lower personality, do not survive as part of the higher conscious individuality. They persist for a while, associated with the *kama-rupic* shell, but this after death is in a state of disintegration, and finally the combination is dissolved, but the energies which are represented by these lower emotional characteristics constitute what in Buddhistic philosophy is called the *skandhas*, and these *skandhas*, impregnated in the life-atoms, await the reincarnating ego at the threshold of Devachan in its return to life. The Lower Quaternary thus absorbs the *skandhas* into the new combination.

Hatred has a certain quality of survival for — strange paradox — it has a certain spiritual quality about it, but it is a spirituality of evil: it is the basis for the only kind of immortality that the Adept in sorcery is able to experience. To the extent that the ordinary

individual permits himself to express this highly disintegrating and destructive energy, he is generating for himself a period in the state which is known as Avichi — a state in every respect the opposite pole of Devachan. The latter is a spiritual and blissful experience, but the former is a spiritual experience of the most intense isolated anguish and suffering.

Love, compassion, the aspiration for Truth, Wisdom, and the Higher Knowledge: these are inherent in the Higher Triad, and therefore without question survive, being part of the immortal and eternal man.

Does memory, as physical man functions in this respect, survive: in other words, does the discarnate spirit have recollection of physical world conditions?

The discarnate spiritual entity has recollection only of the environment associated with the spiritual experiences in the contemplation of which he is absorbed. For example, the spiritual entity will remember the parents he loved, and therefore, since parents must have material surroundings, he will recollect the environment, the home and all the places, buildings, scenery, and landscapes with which he associates all his higher spiritual experiences, but the parent, the brother or sister, the school-master, or the school-mates, and the incidents connected with those persons which were productive of suffering or sin, will be excluded from the Devachanic memories. The entity in Devachan is in a subjective state, and is therefore unable to perceive material conditions upon the earth which he has left. He is not in the least concerned consciously with what may be happening to the individuals he left behind.

Do ambitions and plans made by the physical man looking to the next incarnation, consciously survive? In other words, can a man in this incarnation consciously plan for the next incarnation,

using his daily thought and mental processes as the seed for the next incarnation's harvest and consciously carry these thoughts and plans beyond the grave? In other words, can a man here and now, agree on a definite, consistent plan of life, to be carried through various lives and incarnations?

This is an important and very interesting subject. The individual who recognises the fact that he will have other incarnations, can most certainly plan consciously for those future lives. In so doing, however, he will have to come to the conclusion that what he plans to achieve in future incarnations should be the worth-while things, not those which would turn to ashes in the mouth and be productive of suffering and disillusionment. Whatever the heart of man is set upon that he will achieve and become, either in this life or in some future incarnation. Desire creates opportunity, and "what ye ask that will ye receive; therefore take care what ye will ask." Man is the creator of his own destiny, and decrees absolutely his future reward or punishment. If he seeks material ambitions; power merely for his own gratification; knowledge for his own benefit, forgetting the good of others: even these things can he lay the basis for by developing the faculties which these things demand. The teaching of Theosophia, the Eternal Wisdom, is to seek first the Kingdom of Heaven and its righteousness, and then all these other things will be added unto him. Since man can create his own future destiny he will be lacking in wisdom if he does not make his spiritual objective the highest of which he can conceive — — to reach to union with his own indwelling Divinity and to dedicate all plans, aspirations, and ambitions whatsoever to the service of the Beloved. This should form the basis of our plans, if any, for future incarnations.

Working towards such a sublime objective the Pilgrim Soul can agree upon a definite, consistent plan of action to be carried through various lives and incarnations. No man achieves

Mahatmaship in that incarnation in which he first sets his foot upon the Path. Several incarnations must be devoted to that task, but once the goal is clearly seen and the vows are taken, all thought, ambition, aspiration, and planning are devoted to the one end. This is shown so beautifully in the Second Discourse of the *Bhagavad-Gita*:

In this system of Yoga no effort is wasted, nor are there any evil consequences, and even a little of this practice delivereth a man from great risk. In this path there is only one single object, and this of a steady, constant nature; but widely-branched is the faith and infinite are the objects of those who follow not this system.

The Theosophical Forum

OUR COSMIC CHARGE-ACCOUNT — *Marjorie M. Tyberg*

One of the great dramatic moments in the cycle of human life is before a Reincarnating Ego is born on Earth in a new body — an event which has recurred many times. While as yet the Ego is not invested with the bodily and mental equipment of the new incarnation, there is presented to it a picture of that portion of its cosmic charge-account which is to be paid during the life it is entering.

This statement enumerates the physical and mental capacity, the environment and opportunity, in other words, the karma or results of past thoughts and acts now reaching fruition, some of it fortunate, some less so, and some frequently what we as human beings look upon as tragic. But the Ego, not yet limited to the brain-mind instrument of the new life, still retaining the deeper memory that includes remote causes, sees the justice of all that is to be, and undertakes to discharge the debts incurred in past lives, all of which have been entered in the cosmic records.

Do you doubt the existence of such records? Has it never occurred to you, when man is so careful to preserve data concerning births, marriages, and deaths, as well as the many other human happenings and doings that stenographers are taking down; when there is in every good-sized town a special building for the safekeeping of such records; that, in a great universal institution, including both visible and invisible worlds, there is a method of recording, a staff of recorders — not one recording angel, but a whole hierarchy of them — ever at work, efficient even to the numbering of the hairs on the head and every thought and act of the Egos that constitute the Humanity of this period of manifestation? Would it not be in the nature of a cosmic joke if it

were not so? Is it not foolish and blind to suppose that, in a universe in which law prevails, there should be no method as much greater than man's efforts to establish justice as the universe is greater than man? If you are interested in this cosmic bookkeeping, its records, and its staff of accountants, read in the Theosophical literature about the Lipika and the Astral Light.

We have only to read history to know what we as Egos in past lives on Earth were doing to make karman. In those terrible wars, those devastating invasions, those times of cruel private vengeance and of wholesale persecution, were we always mere lookers-on? Hardly; even if we have learned since to look on these things with horror, to be more humane and merciful — that is, if we *have* learned.

It looks as if the come-back of such violence as man has now at his command would be at least as severe as the known effects produced in our day. Individual violence and cruelty come home unerringly to the doers, though their results mystify those ignorant of the law of Karman. Collective violence also returns upon those who, in some remote period perhaps, originated it. This Theosophical teaching explains much in life that is otherwise inexplicable.

On March 18th of this year, in the Texas town of New London, more than 400 school-children and some of their teachers, gathered in the auditorium of what was looked upon as one of the finest school-buildings in the State, were, without warning, hurled to a violent death by an explosion that wrecked the building. How account for this slaughter of the innocents? We must look deeper than the physical causes in order to answer the agonized questions inevitably rising in the minds of these stricken parents and friends. Theosophy gives the only reasonable explanation of such a catastrophe.

To cut off these young children, who had not lived long enough to have done anything to deserve such a cruel fate! Young and innocent, yes; and the Egos, old and experienced, like you and me, who therefore can feel no vestige of a right to judge them, for which of us knows what tragic items of our account remain as yet undischarged? And though the brain-minds did not know when and where were sown the seeds of violence that came to fruition on that March day, their Egos *did remember, did know*, and consciously took it upon themselves to pay the price.

And there is another thought that can serve to lessen the horror of this event. It is that it is possible for an Ego, an experienced, highly developed Ego — and who knows how many of these children were such Egos? — deliberately to *choose* to expiate a heap of unexhausted karman all at once and make an end of it.

The pity of it is that many of those who have suffered by this catastrophe have none of these Theosophical ideas with which to supplant the old conceptions of one life on Earth followed by an eternity of heaven or hell, or the other idea that death ends all. But Theosophy enables us to picture these Egos so suddenly flown, reborn, perhaps very quickly, in new bodies, resuming their progress, *free* of that load of karman for ever.

And it is not only wrong done that returns. Love is eternal. Those Egos who came to loving parents this time, will find their way as inevitably again to those they loved and who loved them.

Let us then, not think of those tortured, broken bodies, but of souls, winging free, free of an ancient burden, to the pathways of rebirth.

THE BASIS OF THEOSOPHICAL EFFORT — *Torsten Karling*

HARMONY OF INDIVIDUAL RELATIONSHIPS (1)

FELLOW-STUDENTS: If we hope to reach any degree of understanding in considering such a subject as this, we must meet heart to heart. Of course we must meet intellectually also; but if we do not bring into play the powers of our hearts we shall not come to any result at all as far as harmony is concerned. Therefore it shall be my endeavor to open my heart to you and tell you about my own humble experiences, in the hope that they may give you something — touch some responsive chord.

First of all, what do we mean by individual relationships? I should say that we mean Humanity. Consider if this is not true. We speak eloquently about helping humanity, giving Theosophy to humanity, bringing the heart-force and the light to humanity. What is this humanity we speak of? I fear we use the term rather cheaply sometimes, or make of it a vague generalization; but that humanity which we meet at home, in our places of business, in the shops where we buy our shoes and clothes or foodstuffs, and in the street and in the tramcars, and so forth — all these people whom we meet and with whom we have any sort of contact during our daily life — they are to us humanity.

Then how can we better approach humanity than through these dear fellow-humans themselves? I will remind you of a saying in the Bible: How can you love God whom you do not see, if you do not love your brother whom you see? In other words: how can you love humanity — that big, diffuse something — if you do not love those human beings with whom you go through your daily life, with whom you have all your daily business and conversation, and in common with whom you strive to realize the

best that is in you? Your Companions, for instance, in the Theosophical Society? It is these close individual relationships which together form the instrument on which you play to express your love for humanity, and your hope of giving humanity something of the help that your own heart is for ever pouring forth.

Well, how to do it? Expressed in the spoken or written word, it seems so simple, but when we come to follow it out in action, it is by no means so easy, because of the complexities of human nature both in ourselves and in the men and women we meet. We find it very often much more difficult actually to love our fellow-humans because of the dissimilarities between them and ourselves. A good way to follow — I am sure it is the best way — is that pointed out in the third chapter of *The Voice of the Silence*. I am sure you remember it, all of you: *The Seven Portals*; and what is said there about cultivating in ourselves the feeling, the knowledge, that I am you and you are I; I am in all and everything, and all and everything is in myself. It teaches us to cultivate a certain introspection — a looking inwards. This is very easy, really a very interesting game. It is indeed a game that will help us tremendously in our lives if we only try it.

You read the newspapers, of course, all of you; and I dare say that every day you find there horrible descriptions of crime and cruelty. Have you ever tried to identify yourself with the criminal, with the man or the woman who committed the crime? I am sure that is not a habit with many of us, but I think it is a good thing sometimes to try to identify ourselves — not with the crime, with the evil force of it, of course; but with the unfortunate victim of that evil force; because we can do that: we have everything within ourselves. There is not a crime, not a cruelty, nothing in the world which does not exist in ourselves as something we have already conquered, something we are now fighting against in our

daily life, or something which is like a seed of coming strife: and if we can do this — look inward into ourselves — then it becomes very easy indeed to feel compassion for those who sin, because we are never lacking in compassion for ourselves — never. We have all sorts of forgiveness for our own sins — not for the sins as such, but for the sin when the sinner is ourself. So we see the importance of cultivating this form of introspection: looking inward, trying to identify ourselves with everything that is.

I find that I have been dwelling rather on the darker aspects of things. But do not think that I mean to neglect the bright and beautiful aspects. We know that they in themselves produce harmony, and that is what we are trying to create; and the difficulties that we constantly meet in this effort come from the other pole of our constitution. They come from lack of Brotherhood in all forms. But we, gathered here in this beautiful room, under the aegis of such a Movement as this that we belong to — a comradeship based on the realization of Universal Brotherhood: we know that harmony comes of itself from love and from common striving with a high aim.

Now there are of course temptations. If we begin this effort to identify ourselves with all and everyone, we do not meet these temptations all at once — of course not. But they meet us at almost every step we take. For example, there is a person whose peculiarities irritate me, and I lose my temper, and utter words which make me want to bite my tongue off because I cannot take them back again — yet these are only steps on the Path, you see. As soon as you realize that what you are meeting is a temptation, there is no great danger of your failing. We have to realize that in all the small duties of our daily life, everything which tends to put us out of harmony with those around us is a temptation. That realization is the first step. But it is not always so easy. Still, if I feel that a temptation is very hard to overcome, and I feel my own

weakness, I can realize that a few minutes thinking Cosmic thoughts — thinking of Father Sun, for instance, or reciting to myself the Gayatri — will help me to overcome it. I am sure that if that wonderful Gayatri can be recited silently in the heart and in the right spirit, there is no temptation in the world that can overtake us. Not only because of the wording, beautiful as it is, but because the spirit and content of that invocation to Father Sun, and to the spiritual side of our Universe, are so enormously strong, working directly on our hearts.

Speaking of introspection — looking inwards — do not for a moment think I mean to lead you into the way which so many people follow, where everything that comes under their observation immediately causes them to say: "Yes, I have had the same experience," "I have done so-and-so myself," and so on. That is so extremely egocentric, dear fellow-humans, and it can be so tiring. That is not the thing, you see, absolutely not. Love is not egocentric; love is giving all the time: so that I am all the time trying to find out the best way, in my relations with my Comrades and my fellow human beings, to help them out of their difficulties, not to stand out myself as something very distinguished — not at all.

Just because you have in your hearts that which can help all things, you have to love your fellow-humans in that way: you have to find in your heart the answers to all the questions that present themselves; and if you do this, be assured that harmony will radiate from you, not only now and then, but all the time. You will be such a source of happiness and joy in your surroundings and in your individual relationships as I think it must be the hope of every true Theosophist to become.

NATURE STUDIES: IV — *Percy Leonard*

The keynote of *Ecclesiastes* seems to be that all is vanity; that nothing in the universe as known by our five senses can afford satisfaction. In this some critics have discerned Buddhistic influence, at all events that part of Sakyamuni's teaching which accentuates the drawbacks of imbodyed life, though it discloses but little trace of those "eight noble truths" which he proclaimed for our escape and final triumph. The passage quoted here is a masterly treatment of "the lean and slippered pantaloons," and the "last stage of all," of Shakespeare's famous "ages," and we could wish the writer had included in his scope the earlier five as well. Never has the falling asleep of the faculties been portrayed with quainter, tenderer pathos. The waning forces of the arms and legs, the failing teeth, the dimming of the vision are delineated by exquisite metaphors. The easily disturbed repose of aged people, their voice, their dread of traffic all are indicated by a fine, sure touch. An old man's crown of glory, his white hair, is likened to an almond blossom whose pink petals have exactly the appearance of white hair against a background of bald head. There is a touch of quaint, but not unkindly humor in the comparison of the old man with bended elbow leaning on a staff, to some poor injured grasshopper; and the dull palate which the accustomed condiment fails to arouse is not forgotten. The meaning of the "golden bowl" and "silver cord" is not upon the surface and would appear to indicate a knowledge on the writer's part of some esoteric teaching as regards man's constitution.

Youth is so apt to be intoxicated with the taste of sensuous though innocent delights, that it is well to be reminded now and then that all these fountains must one day be dry, and that perennial springs of satisfaction rise in the Soul alone. The life whose living

is enduring joy is the Soul-life, that steady flame which long outlives our youthful vigor, burning as brightly in the wasted forms of aged people as in the fresh young forms of childhood.

"Truly the light is sweet, and a pleasant thing it is to behold the sun. Yea if a man live many years let him rejoice in them all; but let him remember the days of darkness for they shall be many. Remember also thy Creator in the days of thy youth, or ever the evil days come, or the years draw nigh when thou shalt say: I have no pleasure in them; or ever the sun, and the light and the moon, and the stars be darkened, and the clouds return after the rain; in the day when the keepers of the house shall tremble, and the strong men shall bow themselves, and the grinders cease because they are few, and those that look out of the windows be darkened, and the doors shall be shut in the street; when the sound of the grinding is low, and one shall rise up at the voice of a bird, and all the daughters of music shall be brought low; yea they shall be afraid of danger from on high, and terrors shall be in the way; and the almond tree shall blossom, and the grasshopper shall drag itself along; because man goeth to his long home and the mourners go about the streets; or ever the silver cord be snapped asunder, or the golden bowl be broken, or the pitcher broken at the fountain, or the wheel broken at the cistern, and the dust return to the earth as it was, and the spirit return to God who gave it."

The Theosophical Forum

THOUGHTS ON THE SUB-CONSCIOUS MIND — *LaFayette Plummer*

Whenever Theosophists discuss the so-called sub-conscious mind, they are well aware that their ideas differ greatly from those held by modern psychologists. The states or conditions of the mind are too often considered to be the mind itself, and we hear of man being composed of complexes throughout; also that the soul of man exists as a speculation only. In fact, man is held to be the result of circumstances, some of which tend to develop characteristics, and others of which develop inhibitions. Because too many factors are overlooked, we have at best a hazy idea of what man really is, and none whatever as to what he was before coming to earth, nor what he will be after he leaves it.

You will sometimes hear a Theosophist say that the term "subconscious" is a convenient name for something about which almost nothing is known. This statement will be borne out in due course of time, though we agree that two other terms used today, the "subliminal" and the "super-liminal" give one to understand at least that there are states of consciousness above as well as below that of the normal waking state, centered in what we call the mind.

But what has Theosophy to say concerning the "sub-conscious" mind? It says nothing without first laying a foundation of knowledge as to the origin of man, and further, as to his true nature, the full understanding of which may be had only when his origin and destiny are known. Then the way is clear for teachings about any particular, as, in this instance, the sub-conscious mind.

To begin at the beginning, then, man must be understood as being a cosmic pilgrim who originated in (and never left) the Boundless.

In the beginning of his evolution he was a life-atom, of which there are at all times uncounted millions filling the spaces. These life-atoms are thoughts, divine thoughts, if you will, and are the building blocks of which the framework of the universe is built. Such a building block was man, with an unspeakably grand future before him. If you would form a mental picture of a life-atom, you are to think of it not so much as something composed of matter, like the atom of science, but as a focus of exhaustless energy, altogether without size, shape, or fixed position. But within it are potentialities galore, and its whole growth from then on depends upon its ability to turn its potential energies into kinetic spiritual energies. This is the work of evolution, and it slowly learns how to use its natural powers, and in manifesting them, to "build more stately mansions," until at last you have that wonder of wonders, MAN. But the story is not yet told. It is impossible in a paper like this to trace his evolutionary course through the various stages of cosmic life, but it should be borne in mind that at all times he was potentially a god, and the human stage in which he now finds himself is but one of the means he employs whereby he may realize and make use of his god-like powers. How could he be a potential god unless gods were a reality? He could not, and in this fact you have the keynote of this thesis. In order to understand man, the gods themselves must be studied. They are Divine Beings who are such because they have succeeded with relative fulness in bringing forth into play and active use that exhaustless fountain of spiritual energy of which the life-atom was once the focus.

Now, there are two kinds of gods, inner gods, and outer gods. The fountain of energy locked up within the heart of a life-atom, a plant, a beast, or a man is an inner god. As these same energies pass from the inner or unmanifested realms into the manifested, they become the objective manifestation of a god, and you have

an outer god. Obviously the puny body of a man is insufficient to enshrine the holy flame of a god; a body more appropriate must be found, and the gods are equal to the task. They build shining bodies of solar energy, they are the suns. But even this is not the end. There are still unawakened powers within themselves, inner super-gods, if you like the phrase; and when these inner super-gods become outer super-gods, their bodies are the galaxies themselves. Actually, there can be no hard and fast delineation between that which is inner and that which is outer. Both are relative, as we shall find shortly.

There is no such thing as an entity existing on one plane alone. Because all things are composite, the various elements or substances forming things are derivative of the various planes of consciousness. For instance, my physical atoms are derived from this physical earth, the astral atoms forming my astral body are derived from the astral plane, else they would not be astral atoms; the spiritual atoms forming in their aggregate the vehicle of my spiritual forces, or Buddhic principle, originated in the spiritual plane, and so on through the entire constitution. Moreover, from my viewpoint, my spiritual and divine "principles" are the inner part of my constitution, and my vital-astral-physical nature is the outer part of myself. That portion of my constitution wherein my consciousness is centered, in other words my mind, is neither inner nor outer. If I were able to center my consciousness in the spiritual portion of my being, my mind, as well as all that I now recognise as outer would be exterior to me, and my spiritual nature would be neither inner nor outer, though my Divine Self would still be inner. So, this question of the inner and outer is a matter of relativity, as are all so-called opposites. It seems quite reasonable to consider the "sub-conscious" as being the inner, as contrasted with the outer. And because the powers and faculties manifested in the outer

part of our constitution are well-nigh insignificant compared with those latent or partially active in the inner reaches of ourselves, we find that, much to our astonishment, people who through unusual circumstances go into trances sometimes give evidence of having knowledge that far transcends anything they have learned in books, for they have temporarily tapped the reservoirs of the "sub-conscious." When we realize that this is in reality the inner Self, we see at once how utterly inappropriate is this term "sub-conscious," for it tells us nothing.

Let us now apply this philosophy on a grand scale. It was observed that the atoms of which our constitutions are composed are derived from the various planes of consciousness. Let us not get the erroneous idea, however, that the universe exists for nothing more than the building of the principles of man. Important as this process undoubtedly is, it is merely incidental to the real activities that go on on these inner planes. Actually, these planes of consciousness are the principles forming the constitution, inner and outer, of a cosmic being, so ineffably grand that it is utterly beyond our feeble powers to define it. And all the hosts of beings who draw their life from the life of the Cosmos are merely atoms, building-blocks if you like, of which these cosmic principles are composed. Think of it! As you sit at your desk, a fully conscious man, using your physical and intellectual powers, thinking your thoughts, uttering your words, you are actually in the core of your being a part of the inner constitution — or possibly outer — of some divine being. Similarly, a portion of your inner nature may be the outer universe from the standpoint of the infinitesimal lives composing your inner Self.

Why is it that we are unable to define the nature of this Cosmic Being? In part because it is so grandiose, so supernal in essence, that words would utterly fail us, even if we did intuitively catch

some adumbration as to its true nature. A more complete answer would be that there are departments of its life that do not lie within the sphere of our understanding. All beings have two aspects of their lives, the voluntary and the involuntary, or automatic. The most obvious portion of our own lives is the voluntary, and it is only by study and observation that we may follow the intricate workings of our automatic life-processes, such as breathing, heart-beat, and digestion. Just the reverse is the case, however, with the universe, and particularly with the Solar System. The aspect that we contact is the automatic, and we find it utterly impossible to receive even the remotest impressions of the volitional will of the Cosmic Being of whose inner nature we are a part. In other words, what we see as the phenomena of nature, the motions of the heavenly bodies, weather and climatic changes and the like, are simply manifestations of the automatic will of the Cosmic Being whose imbodiment is the universe. It is not to be thought that we are speaking of" a personal God, for if we consider it as personal, we merely invent attributes and attach them to a being which confessedly we are unable to understand. Moreover, we are safe from the limited view when we reflect that Theosophy postulates no god so high that there is none higher. This Cosmic Being of which we are speaking is but one of many, each manifesting as a universe, and these are legion. Now the natural laws which prevail in any given universe are merely the workings of the automatic aspect of that universal consciousness.

A master of life is one who is able, not only to draw upon his own resources, inner and outer, but who can, through the medium of his own inner constitution, contact the inner planes and draw upon the resources of the Divine Being whose "principles" are these "planes of consciousness." And these resources are exhaustless. The idea is not untenable that sooner or later, with constant effort and growth, the powers of the initiate can become

so great that at last he attracts the attention of the Divine Being, and then new and supreme initiations are in store for him. He then passes out of the realms of illusion, into the unmanifested, or subjective realms, which, when entered upon, prove to be reality itself, for he has contacted the volitional aspect of the life of the Divine Being.

If we derive nothing else from the Cosmic Philosophy that is today called Theosophy, we are at least assured that all that of which we are aware is practically nil as contrasted with that of which we are entirely unaware; and if we require long scientific phrases in order to formulate the known and observed laws of nature, to try to cover the unknown by one simple word, *sub-conscious*, is simply evading the issue. The great plea of the Wisdom-Religion is "Man, Know Thyself." Unlimited are the fields to be explored, endless the inspiration to be derived from the study of the wisdom that is as old as the ages, yet so new to this modern world.

The Theosophical Forum

THE FOOLISHNESS OF THE WISE — *Charles E. Ball*

Mahomet is reported to have said "Two things are an abomination to me, the wise in his infidelities and the fool at his devotions." To its everlasting credit, amidst much that is reprehensible, the present age is coming to be of the same opinion. The false intellectualism which has so long held sway is passing away and rationalism is being aimed at, a "one-pointedness," one might say, and an intelligent co-ordination of ways and means. This is good, as from one point of view it denotes the extinction of the specialist and the "one-track mind." Perhaps the real and great difference between the wise man and the ordinary man is that they *think* differently.

Those who are sensible enough to look for the occult in the commonplace know something of the great significance of that human currency — *words*, and in these coins of thought can be traced the rise and fall of the moral, spiritual, and ethical life; good words are degraded or dropped, and neutral or insidious words are substituted.

Glance at the news-sheet and note the words in general use in international matters particularly: Imperialism, Spheres of Influence, Tariffs, Diplomatic Pourparlers, Dementis, Pacts, Understandings, and so forth, all more or less used to conceal thought.

To glance at such a work as *The Laws of Manu* is as though one were reading a story of the "once on a time" period, especially if one reads the section "On the Military Class," V, 54.

The king must appoint seven or eight ministers, who must be sworn by touching a sacred image or the like, men,

whose ancestors were servants of kings, who were versed in the holy books, who are personally brave, who are skilled in the use of weapons, and whose lineage is noble.

And V, 44, referring to a King:

Day and night must he strenuously exert himself to gain complete victory over his own organs, since that king alone, whose organs are completely subdued, can keep his people firm to their duty.

In fact, so wonderful are the counsels of this section that it might be issued as an addendum to Machiavelli's *The Prince and The Art of War*.

To read through such a work is to bring home poignantly the great difference between the days when the Dharma existed as a fact, an atmosphere, a Gnosis, and these times when to the world at large there is nothing beyond the horizon of human life itself. Though such works insist upon the rigid recognition of justice and the true facts of life, such as the knowledge of human frailty, there is no sentimentality. In V, 22 we read:

The whole race of men is kept in order by punishment, for a guiltless man is hard to be found through fear of punishment, indeed, this universe is enabled to enjoy its blessings.

But note the following:

But where punishment, with a black hue and a red eye, advances to destroy sin, there, if the judge discern well, the people are undisturbed.

Holy sages consider as a fit dispenser of criminal justice, that king, who invariably speaks the truth, who duly considers all cases, who understands the sacred books,

who knows the distinctions of virtue, pleasure, and riches.

These are times of the greatest significance and urgency and the duty of all students of Occultism is to inculcate the return of the human race to the teachings and the practice of the Eternal Religion of the Masters of Wisdom, our Elder Brothers.

Our *personal* non-entity as "entirely phenomenal beings produced by Karman" is balanced by our eternal significance as Sons of the Sun, not merely here for a time, but for all time, the only reality being neither the phantoms of past or future but the now. To an occult student the lesson of our times is the recognition by us as Deva-Egos of the entirely mayavic character of the present (more particularly) Western regime and its sinister tendencies as shown in its language, art, literature, and medicine. Selfishness *a, I'outrance* is its breath and *raison d'etre*, and death and destruction its approaching fate, as a whole.

"It is evident, then," as Soyen Shaku writes in *The Sermons of a Buddhist Abbot*,

that by purity of heart is meant absence of ignorance and self-will. But it is not a negative condition, for the most essential postulate of Buddhism is that in each of us there abideth the indwelling reason of the universe, which, when released from the temporal bondage of ignorance and self-will, becomes the master of itself by reducing everything to subjection and restoring it to its right place.

In a pure heart, therefore, the universal reason manifests itself in its full glory and works its own destiny unmolested. What one with such a heart wills is what makes the bird sing and the flower smile, what has raised the mountain and makes the water flow. He is hungry and the universe wishes to eat, he is asleep and all the world

hibernates. This sounds extraordinary, but the enlightened understand it perfectly well.

As a man thinketh so is he. All can make a start at once to pierce the illusions and deceptions of life by discernment and non-attachment.

The Theosophical Forum

MODERN CHINESE THEOSOPHY — *Cecil Williams*

In the spring of 1935 a Chinese teacher named Tuan Szetsun, hailed in his own country as "the only sage after Confucius and Mencius," predicted an international crisis in the fall of that year, which might lead to a world war. In the following October Italy invaded Ethiopia and the international situation since that month has grown increasingly grave.

Whatever value may be attached to Tuan's predictions we cannot doubt that he is a prophet in the original sense — a teacher of divine truths. At an early age he devoted himself to the service of humanity, studied Buddhism and Confucianism, and when he was eighteen, in Tsing Cheng Mountain, "a vision came to him whereby the secrets of civilization were revealed. The past and future trends of humanity became as clear as the wrinkles of his hand."

Through the efforts of this remarkable man, now in his 72nd year, there came into existence in China branches of an ethical society which taught practical Theosophy, though not under that name. He urged upon his followers the practical exemplification of his teachings as the means of saving the world from a more horrible world war than the last.

To Theosophists in the West the thought that teachers like "Tuan the Great" are striving in the East to bring home to the peoples there the age-old truths of Theosophy is distinctly encouraging. Shall we greatly err in supposing that this activity of Tuan's is sponsored by the Masters? However that may be, the statement of his ethical precepts should interest and perhaps inspire Theosophical students. The rules which I give below are, I believe, worthy of reproduction in any Theosophical magazine.

These rules are prefaced by two paragraphs which I give in the quaint English of the Chinese translator, which somewhat obscures the meaning in casual reading, but which will be perfectly intelligible to Theosophical students. The succeeding paragraphs I have altered to make them immediately clear to the reader, but without, I believe, interfering in any way with their sense.

This then is "an explanation given by Tuan Szetsun on the principle: 'Sincerity and Reverence will lead the world in Tranquillity':

In a vision on 12th of 1st moon I became alive to the fact that it is important to build up a personality both sincere and reverential in order to assure world peace. In theory and practice we must follow the following words in order to achieve my aim:

In one's self a faith must be founded. When the faith is carried out it becomes a perfection. When the faith is carried out with brilliant achievements it becomes great. Such greatness should be crowned with sacredness. When one becomes so sacred that he can not be known to the common people he is divine. He would cause a change without moving and achieve things unselfishly.

In morality we should be as sincere as the Emperor Wen; our thoughts as free as Confucius', but as ethical; our motives as merciful, loving, forgiving and sacred as Lu Lai's, Buddhism's great god, as Kwang Ying's, goddess of mercy, as Jesus Christ's.

In personal behavior we must not patronize houses of ill-fame, gamble, smoke, drink, be idle or develop other bad habits. We must not conspire, oppress or use force, but

consider the whole world as one family and all peoples as one person.

To exert ourselves we must put forth efforts to help others for their sakes, and to work for them we must follow the Great Way. Before members of our family, servants and neighbors we should not betray our principles, and hold to the good even in a dark room, hidden from all eyes.

In speech we should not deceive ourselves, in behavior not continually justify ourselves, and, in the Great Way, never be selfish. The fundamental principle is justice.

At the sight of wealth we should not be envious but the ethics of gathering wealth and its wise use we should understand; and accept never a cent improperly. We should regard wealth from the standpoint of an immortal being, as something fleeting as a cloud, and be content with even a ration of water.

In walking, standing, sitting, sleeping, listening, looking and speaking we should protect the health of the whole man and balance action and tranquillity.

Our speech and actions should be considerate, earnest, modest, reasonable and humble, so that others may be influenced by our demeanor.

Our mind should be kept clean and alert, like a mirror displaying the reflexion of anything coming within its range.

We must not use anything not ours, nor use our own possessions at improper times. We must put our own experiences, our own behavior and our own merits into writing. One who writes is apt to behave according to what

he has written. "A day should not be passed without work, leisure, exercise and observance of morality.

In reading the books of the ancients we should not adhere to every word, nor, at the same time, should we be blindly swayed by contemporary writers. We should exert ourselves to assimilate knowledge, for a commoner with a fine personality can teach an emperor.

In practical education, agriculture, industry and commerce, we should be thrifty and not wasteful. Even a scrap of paper should be valued as a rare treasure.

We should not be intoxicated with beautiful women, for lust is the worst of evils. Men and women are simply representatives of the negative and positive motions of Heaven, and in social intercourse we should neither speak nor think of seduction.

A true gentleman cultivates his person so strictly that his individuality will command heaven, earth and spirits. All human beings venerate their parents.

Being ordered to centralize the good points of all religions, so that with strong wills and fully educated we may safeguard permanent peace, we must carry out our aim fearlessly, without regard for threats to life or for slander.

We should understand things so thoroughly that no dispute remains as to the wisdom or the Tightness of our course. We should take all faults upon our shoulders, and pay no heed to those who envy us our knowledge.

Whether employer or employed, we must understand ourselves and our fellow-workers, comparing our minds with theirs. By following the proper doctrine we will

benefit both ourselves and others and our example will be followed for ever.

Before undertaking anything we should think it over again and again. We should proceed with no program without a well-fixed aim, so that we may hurt neither Heaven nor our fellow-men. By being practical and true to duty our goal will be reached naturally.

We should do our part without asking for help, earnestly love our true selves, our families, our country, and the world; love all men and even all things, so as strictly to follow the principle of humanity. We should honor spirits but avoid them. We should not beg or flatter, should be free from superstition, and exist happily together with the Divine.

We should try our best," says Tuan in his concluding appeal, "in accordance with the principles of humanity, to act on behalf of our sages in order to enable the benevolent atmosphere to dominate the world.

THE RISING TIDE OF THEOSOPHY — *C. J. Ryan*

DO MIND AND MEMORY SURVIVE THE BRAIN?

Two recent pronouncements in different fields of scientific research, when placed in juxtaposition are so interesting and significant from their bearing upon Theosophical principles that we are impelled to attract our readers' attention to them in the hope that they will be useful when presenting Theosophy to intelligent inquirers who are dissatisfied with materialistic concepts of the Universe and Man and yet who see no "scientific" relief from their difficulties. The doubting Thomases who ask for "just one fact" before they venture to take the first step out of their intellectual cage may be set to think on new lines by the study of Theosophical ideas when sponsored by recognised scientists. H. P. Blavatsky said that Theosophy came "to break the molds of mind," the hard shell of dogmatic prejudice and ignorance, and that her *The Secret Doctrine* should be used as "a means of exercising and developing the mind never touched by other studies," and not only as a storehouse of information.

The first point referred to is a statement about the more subtil aspect of the Universe and the persistence of human consciousness after bodily death, by Dr. Gustaf Stromberg, a distinguished astronomer at Mount Wilson Observatory, Pasadena, who is also a philosopher — a not unusual combination among students of the heavens. We quote from his *The Material and the Immaterial Universe*, a *Leaflet* issued in March by the Astronomical Society of the Pacific. After a rather technical consideration of the new atomic theory, indeterminacy, space-time structure, etc., in support of the concept that there is "an actual distinction between the material and the immaterial

world" without which many phenomena in living organisms are "entirely inexplicable," Dr. Stromberg continues:

Let us think of a living cell with its chromosomes and genes, which carry the hereditary characters of the animals and plants. . . . What is it that determines their structure? . . . Organisms die and disintegrate; the cells and the chromosomes also die and disintegrate. It seems that at death some kind of an organizing entity has left the matter, which then forms simpler compounds in accordance with its own intrinsic nature.

We are built of matter; but there is also something which gives us not only the structure of living organisms, but also consciousness and memory. The latter belongs to the immaterial rather than to the material universe. There are several reasons for believing that certain fundamental immaterial elements in plants and animals can exist without being associated with matter. Some of these elements are extremely stable, and appear to retain their properties after the death of the individual.

On such a basis we can obtain a physical picture of the entities which in plants and animals carry inherited characters. Some of these entities are so stable that the corresponding characters appear to have remained practically unchanged during millions of years of organic development. It may also be possible to assign a space-time aspect to mental phenomena in general. In that case we should be able to picture a physical structure of memory and assign reasons for its permanence, in spite of the continuous renewal of the atoms in a living brain structure. We may also obtain a reasonable scientific basis for the immortality of the soul and the indestructibility of

the individual memory.

We cannot observe the radio waves that determine the motions of the electrons in our radio antennae and tubes, yet the waves are the controlling influences, and the "material" electrons are only the means by which our physical sense organs become activated and recognise the invisible and "immaterial" actuality. We are deceived by appearances and give our attention only to the elements in the universe that carry energy in *observable* form. Dr. Stromberg claims with reason that every atom as well as the entire Universe has an immaterial as well as a material structure. This "immaterial fine structure " or "etheric force-substance," as it were, unites the electrons, neutrons, and positrons which today are believed to compose the atoms and gives the combination its peculiar properties. By analogy with the immaterial but real radio waves and the "material" electrons in the instruments we may interpret the interaction of the immaterial mind and memory with the brain cells. The subject is too technical for detailed presentation here, but enough is indicated to show that science is well on its way to the demonstration of the existence and great significance of at least the invisible plane nearest the physical. This outlook contrasts strongly with the intensive concentration of Western thinkers upon the constantly changing physical universe, till lately regarded as the only worth-while subject for study. We are now being told that not only are the few strongly radio-active elements transforming, but even the most stable ones are doing the same, though far more slowly. The age-long evolutionary transformation of the constituent substances of the earth was known and taught by the Eastern occultists ages before radium was discovered in the West.

Dr. Stromberg has dealt with the "fine structure" of the immaterial universe in more complete studies than this little *leaflet*, and we understand that he is preparing a book in which

his original theories will be fully explained.

H. P. Blavatsky said: "*The whole issue of the quarrel between the profane and the esoteric sciences depends upon a belief in, and demonstration of an astral body within the physical, the former independent of the latter.*" She would certainly have rejoiced to see how near to the Theosophical definition of the astral mold, the warp and woof of nature behind the *visible* pattern, so to speak, we are carried by Dr. Stromberg's extension of the scientific concept of the immaterial "fine structure" of the universe with its potential energy. H. P. Blavatsky's "quarrel" seems in sight of being ended, at least for him.

Dr. Stromberg is doing valuable work in trying to demonstrate to scientists that the survival of the mind and memory of man, the "soul," shall we say, may after all be "scientific," but he will meet, and in fact he already has met, strong opposition from some biologists, though perhaps not from all. It is interesting to see that Dr. Julian S. Huxley, President of the Zoology Section of the British Association for the Advancement of Science, at its last meeting approved of a subject which is at least on the borderland between the immaterial and the material worlds, saying, "I refer to telepathy and other extra-sensory activities of mind, which the work of Rhine, Salter and others is forcing into scientific recognition." A very few years ago such a remark would not have passed without the strongest protest from biologists and psychologists, even if such a heretical remark could have been made at any scientific meeting.

We are tempted to refer to the number of illustrations in biology which suggest a "fine structure" carrying intelligence — memory, and perhaps prevision (!) — but one must suffice. Sir Oliver Lodge says:

Burken records an experiment of a tail bud of one newt

embryo being grafted into the body of another and developing into a new limb. How was this organization so completely changed as to produce a limb instead of a tail? Physical and chemical explanations leave us entirely in the lurch, and we must have recourse to the conception of a "biological field," an influence not in the living matter itself but in the space, presumably the ether, around it.

What is this "biological field," invisible, intangible, and yet intensely potent, if not a manifestation of the astral, immaterial structure, called by Lodge, the ether? Perhaps we might modify his last words to "presumably the ether, around *and within* it," the inner "field" being responsive to a *conscious* director or "organizer."

In another *Leaflet* by Dr. Stromberg, *A History of the Milky Way*, we find a passage which shows his deeply intuitive view of the tremendous problem of the Universe:

But let us not be conceited and think that we know anything about the "Riddle of the Universe." I am convinced that the physical evolution of the Universe, which can, at least in principle, be followed with our eyes, is only a faint echo of the music broadcasted as an accompaniment to a cosmic drama, in which an *evolution of a very profound nature* is taking place. This deeper aspect of the evolution, the magnificence of which we cannot grasp, belongs to a field beyond that studied and described in natural science. It is closely related to the ultimate meaning and purpose of the existence of matter, life and *consciousness*. [Italics ours.]

It is indeed the study of consciousness which is especially needed. Theosophy makes this paramount — "Man, know Thyself" is the key. As H. P. Blavatsky said: "It is not "The fear of God" which is

"the beginning of Wisdom" but the knowledge of SELF which is WISDOM ITSELF." Man, being the microcosm of the Macrocosm, has the power to find within himself the complete reflexion of what is without — or, more properly perhaps, to find that the Within and the Without are One. There is a Path leading to that wisdom, and Theosophy shows us how to take the first steps which ultimately lead to the Heart of the Universe. But those steps imply more than merely intellectual research.

The second point to which we draw attention is presented by Professor Ernest Hunter Wright, of Columbia University, in *Harper's Monthly* for February, in an article on "The Nature of Telepathy." While it does not ostensibly deal with the "fine structure" of Dr. Stromberg's argument, it provides evidence that there are other means within us of finding more about the world (and perhaps other worlds) than those which are confined to the physical senses, and strongly suggests the existence of Dr. Stromberg's "immaterial elements which can exist without being associated with matter"!

Dr. Wright has studied Professor J. B. Rhine's elaborate experiments in telepathy and clairvoyance which have done more to convince skeptical scientists of the existence of those supernormal powers in man than any previous attempts, and makes clear the important fact that they are really *extra-sensory*: "They do not seem to constitute a sixth sense, or a seventh, at all like the five we already know. Rather they appear as something of another order. The five known senses all have their special organs, but there would seem to be no organ proper to the powers we are now discussing." The senses localize their powers in the eyes, ears, etc., but those who possess telepathic or clairvoyant power have no impression that they are employing any sense-organ. Those powers are not associated with a sixth or seventh bodily sense, and that is why they have been called by Dr.

Rhine "*extra-sensory*" powers.

Again, they do not obey one of the most familiar laws of nature, i. e., the weakening of every known form of radiation as it recedes from its originating center, according to the law of squares. Light, heat, sound, etc., all diminish in intensity with distance, but telepathy and clairvoyance reach the goal, however distant, without the slightest loss of power. In fact, Dr. Rhine has found that telepathic perception is often improved when the experimenters lengthen the distance between them. A thousand questions arise from the paradoxical results of serious investigators into telepathy and clairvoyance, and from the standpoint of physics they have so far proved unanswerable. Scientists are speculating on *new kinds of Time* which may be needed to explain difficulties in ordinary physical research! Perhaps these speculations will throw a little light on the paradoxes of telepathy and lead to deeper mysteries still more incomprehensible to the uninitiated investigator.

Telepathy and clairvoyance, though new to science, are not so to students of occultism, and they may very well be co-ordinated with the "fine structure," immaterial and non-physical, which is the vehicle or perhaps the substance of the mind. This opens a tremendously wide vista to the imagination, and it is not unlikely that the future development of science may be on these lines. Scientists are bound by their unwritten rules to try to discover new laws of nature in their own way, by experiment, observation, and deduction, but there is a limit to this method, and that limit seems to be approaching more nearly than was expected as science becomes more and more metaphysical. We do not need less science, as some pessimists claim, but more. But the future scientist will discover that his methods must be changed as he sees more sublime objectives than the satisfaction of intellectual curiosity, however honorable. He will then have to become a

Spiritual Scientist, an Adept. We have already some glimpses of the higher methods in the sudden intuitive flashes of Knowledge, "hunches," which have given the clues to many great scientific discoveries.

The Theosophical Forum

THE ONLY WAY OUT — *G. de Purucker*

Modern men and women, both older and younger, form a generation which we can, I believe, adequately describe as "a lost generation"; and the cause of it, the reason for our mental wanderings and emotional gropings, is the loss of our understanding and hold of a common or universally accepted ethical and intellectual standard. This is shown by the babel of voices surrounding us everywhere, by the hungry human hearts, and even by the eager human minds searching for Truth and not knowing where to find it, nor its guidance: human minds searching for a sufficient and satisfying inner light, for something that will guide us in solving the problems facing us. *We are*, indeed, a lost generation, and it is not the youth only who are "lost." Elders and youth are both lost in this sense; in fact it is the elders who are even more perplexed than are the youth of today. Our whole generation is blind, walking in darkness, not knowing whither to turn for the longed-for light; and the babel of voices that arises from the immense human crowd is something frightening and significant in its clamor and confused insistence upon panaceas and nostrums of various kinds, political and otherwise.

One hearkens vainly while lending an ear to this turbulent babel, which too often is mere babble, in order to find constructive suggestions which are of universal application. It is rare indeed to hear voices speaking with the authority of knowledge; and I will venture to suggest the reason of it all.

If there is a common struggle or fight in progress and you go down into the arena of turmoil definitely intending to fight those already fighting there, and to outshout them, the chances are

small that what you have to say will receive attention; the probability is that you are going to be hurt. This is because the would-be reformer simply descends to the level of the shouting squabblers. Such is not the manner by which to bring about anything that is universally and definitely constructive in idea, or attractively new or helpful, or that will explain and solve the problems causing the universal disturbance. You are simply descending into the battle yourself, trying to overcome violence with violence, force with force; and this procedure never has succeeded, and I venture to say that it never will.

This does not mean to imply that force is always to be ignored in human relations. Sometimes it is necessary wisely albeit kindly to use force, but always without violence and in order to overcome an evil. Such employment of force or power should always be a merely temporary event or procedure, and should never be used save in an impersonal and upright manner, and for a good cause, and for the common weal. Justice to all is never to be gained by descending into the arena of battle and "fighting it out" there. Justice is rarely gathered into pockets, so to say; and very rarely indeed is it wholly on one side of a question.

Our generation is lost, intellectually and morally, because it has lost its vision. "Without a vision the people perish" — an old Hebrew saying based on a comprehensive view of human psychology as demonstrated in history, and therefore a saying which is full with truth. It is invariably a vision or an idea, or a body of ideas, which guides men upwards to glory or downwards to the pit; for Plato was fully right: it is ideas which make or unmake civilizations, build up or overthrow established institutions; and it is just grandly universal ideas, and the *will* to follow them — ideas and ideals which all men feel to be true and inerrant from truth — which men today lack. It is just because men today lack vision, i. e. an inner knowledge of the right thing

to do, of a clear way out of their troubles, that as nations we are where we now are.

We are now at the end of one form of civilization, which, like the Roman Empire in its time, has reached its term, its breaking-up, and we are facing the opening measures of the cosmic drama which is now coming in. It will depend upon the innate wisdom and sense of high justice inherent in men's hearts and minds, whether our present civilization will go down in blood and despair, or whether it will take breath and time in order to recover itself: whether, with the dawning of a new intellectual and moral perception of justice and reason, it will stop its descent down the declivity and begin to rise to new heights overtopping the finest that as yet racially we have attained. This latter can be done; and it is man's higher nature only, his intuitions and instincts for justice and reason, nothing else, that will bring it to pass with surety: man's innate sense of justice, his inherent sense of right, and the common recognition that reason and not violence is the way out — and upwards to safety, peace, and progress.

History with its silent but tremendously powerful voice shows us, as we hearken to its mandates, that there is absolutely no other way out for us; that there is no other complete solution, nor one which will be satisfactory to all types of human minds, to all types of human character. Freedom for all; each people seeking its own salvation on its own lines, but in ethical directions accompanied by reason and a desire to do justice. Even an enlightened self-interest, with its always keen eye for individual advantage, must see the universal benefits and securities of such a plan. All stable human institutions are founded on these intuitions and instincts, and upon naught else; for were it otherwise, then our sense of order and law, our very respect for our courts of law, international or national, were collectively a monstrous

deception, and an ignominious and miserable farce; and all sane men realize that our laws are based on the rules of justice and impartial reason, tempered with impersonal mercy.

I am not one of those gloomy pessimists who say that man is but a "poor worm," with instincts born of his association with dust, and intuitions that are unfounded in fact, and that therefore he cannot solve his problems adequately. He can indeed solve them if he has the *will* so to do. We are indeed approaching the end of our civilization, and are fascinated and hold our breath as we watch the phenomena of its breaking up; but all too often we forget that this has been a civilization of matter almost wholly, where things of matter often counted as the only ones permanently worth while. There are no longer new lands to which we may send our young people to colonize, for they all have been pre-empted or taken. The rule of force and of material values has prevailed almost universally, rather than the rules of international justice and common human rights. For 1800 years, more or less, it has been the rule: let everyone grab what he may; let everyone hold what he can. The conduct of the peoples of the earth has been largely based on this purely materialistic and selfish foundation. We sowed the wind; we are now as a body of spiritually bankrupt peoples reaping the whirlwind.

Is it not time that the more far-seeing and superior minds of the world should see to it that calmness and reason and impartial justice shall henceforth prevail? Is there any other and better way out of our troubles and difficulties than by solving them wisely? The only way by which they may be solved is by reason, by justice. If men deliberately refuse to listen to reason, if men deliberately refuse to wish or to *will* to do justice, then it seems certain that down we shall go, and our civilization, our great cities and the manifold works and labors of millions of hands through the years, shall be dust and ruined heaps. There would

seem to be no other way out; no god will step into the arena of human pain and wilful ignorance and pull us wretched mortals out of the world-mess that we have created for ourselves, mostly through rabid self-interest and through our wilfully turning away from the paths of justice and peace. We alone must save ourselves; and when we begin to do this in the manner pleasing to the higher Powers, then we shall make an undeniable appeal for their aid and guidance; and we shall receive it. Hercules helps the wagoner, indeed; but only when the wagoner begins to help himself — and *in the right way*.

It is the sheerest foolishness and the most blatant of all ethical and intellectual poppycock to aver that man's destiny, now that the waste places of the earth have been taken, is blocked; that there is no future for those who were not "in at the beginning." Such an attitude is contradicted by every page of the annals of universal history. We must remember that no thing, no human institution, is unchangeable, eternally the same; and that the shifting and continuously varying scenes of human history in the past — a certain fact of truth — promise that the future will be as full as the past has been with the shifting of cosmic scenery, and the changing of human interests and fields of activity. The greatest peoples of the earth have not been those possessing the greatest extent of territory, but precisely those who have been the foremost in the reception of ideas and in the application of progressive ideas to the upbuilding of human institutions based on and usually proclaiming, if not, alas, always following, the ideals of impersonal justice and trained reason; for these are spiritual qualities — which in fact are universal.

Let us fill our hearts with eternal gratitude to the watching though silent Cosmic Powers, that the horizons now before us as men in all parts of the earth, and without distinction of race or creed, are spiritual and intellectual horizons, beyond which there

are for us unknown regions of infinitely vast extent waiting conquest by human genius, when we shall give rein to the instincts and intuitions of the human soul. Look then at what lies before us if we *will* to bring justice unmotivated by self-interest, and the love of honor and truth, to work amongst us!

One of the main causes, and perhaps the foremost cause, of our troubles, both national and international, is that men commonly, with many grand exceptions, however, are still holding to the belief in force, in violence, as being the way to solve our troubles. Such procedure never has succeeded permanently, and never will. Violence breeds violence; violence grows by violence. Hatred breeds hatred; selfishness breeds other selfishness.

It is one of the objectives, let me say duties, of the Theosophical Movement to show men the simple precepts of reason; that life should be governed by the grand ethical instincts of the human soul, which are based on no human conventions but on the orderliness of Nature's own structure and processes. Out of these ethical instincts spring the directing precepts of reason and our will to do justice, teaching us that the "way out" lies within ourselves: not in our armies nor in our navies, nor in all the dreadful methods of mutual destruction which man's evil genius has invented. These last are not even temporary remedies and bring no satisfactory adjusting of troubles. At best, the machinery of defence should be used as police machines; for then their use becomes justified, because then they would be employed in the cause of justice and used with reason only.

Our problems will never be solved by our mad rush in competitive armament, bringing about universal distrust, fear, anxiety, and crushing the peoples with taxation which threatens to grow beyond their power to meet, and almost making them hate the conditions under which they live their lives. It is the old

folly, now recognised by all, to argue that by piling up armaments and inventing new devices of horrible destruction, and by increasing the use of violent force, by and by war will become so horrible that men will shrink in fearsome terror from it. Of all the fallacies and stupid arguments, this is the worst that has ever been inflicted on the suffering minds of mankind.

You will never succeed in stopping war by organizing yourselves into associations or societies swearing to refuse service to your government, and defying it in case of war. That procedure, in my judgment, is abominably wrong. We may admire the idealistic courage and ideal thoughts of the young men and women who, it seems, are doing this. But they overlook the fact that they are merely announcing their declaration to declare war of a kind upon their own government and country, if war should come, thereby introducing disorder and intestine strife among themselves.

Let the youth of the different peoples of whatever country set the example of fidelity and loyalty, each youth to his own government, thus proving the strength and worth of the moral ideal of citizenship; yet, on the other hand, as the world badly needs the idealisms and chivalry resident in the younger generation, let youth express these likewise by raising its voice loud and insistent, powerfully declaring itself for universal justice and reason, and do so by the measures of established law. In this manner, the voice of the world's youth will penetrate into all places, closed and open; for their insistence upon their rights as the coming generation soon to shoulder the burthen of the older, will reach sympathetic ears too numerous to count. *Novus ordo saeculorum*

I should like to see complete disarmament of the peoples take place, by mutual compact and convention, to be replaced by an

international navy, officered and manned by men drawn in rotation from the different maritime or even inland peoples of the globe, and trained for this purpose. I should like to see the armies of the world reduced to relatively small national police forces solely. The duties of the international navy would be the policing of the seas, the repressing of piracy, and the making of the high seas and coastal waterways safe for the commerce of the peoples of the world. There is not one thing to prevent this double achievement of human constructive genius — except a psychology which everyone detests and all fear; a psychology that has merely grown up to be a habit of human thinking.

One may pray and hope that the prominent men in the world today, those who hold the destinies of the peoples more or less in their hands, will hearken, will listen, to the heart-beat, the unexpressed and growing Will of the peoples for a permanent solving of their troubles. If they do so, the names of these men will go down in history; they will be remembered not so much by statues and monuments in stone, but their names will be emblazoned in perpetuity in the perduring fabric of human hearts. Their memory shall remain for ages to come as the fire of love and gratitude burning in human hearts.

Again I repeat: a Brotherhood of the Peoples based on reason and justice, and functioning for the common good, for the progress of all, is both practicable and practical, and will some day be seen to be inevitable. Why not therefore lay the foundations of it Now!

The Theosophical Forum

REINCARNATION (1) — *Clifton Meek*

Theosophy Briefly Defined

The writer desires to express his appreciation of the privilege of presenting a few Theosophical thoughts to this group of students.

Perhaps some among you are more or less familiar with Theosophy or some of its particular teachings and doctrines, which, in the aggregate, comprise a co-ordinated, symmetrical, and well-balanced philosophy of life for those who have investigated its teachings in the spirit of something more than purely intellectual interest. Its vast range ignores no department of truth — physical, intellectual, or spiritual — a fact which gives it a unique place in the world of religious thought. It has scientific values dealing with the physical aspect of Nature — its external carpentry, so to speak. Any teaching or theory, whether it be of a religious or scientific nature, which ignores the opposite or complementary aspect of Nature, is but a partial truth at best, and all too often a grievous and misleading error.

Theosophy has philosophical values to enrich the expanding intellectual faculties, values by which spiritual truth and scientific fact may be reconciled. The acceptance of any religious or theological belief which demands that we throw intelligence and reason to the winds has a vulnerable spot in it somewhere, and will not survive the test of time and experience. The power of intellection and reason is our emotional counterbalance, our safeguard against walking blindly into error and the misconceptions which have misled so many in the past.

But more far-reaching in many ways are the spiritual truths which Theosophy has to offer to satisfy the nobler aspirations and

spiritual longings of man's divine nature, the Inner Self, and to set his feet firmly on the pathway of spiritual self-enlightenment, leading him, step by step, beyond the portals of the lower personality into a more intimate relationship with that enduring Self of which the personality is but a distorted and feeble reflexion. No religion, philosophy, or science, whatever claims it may make, can do more than that, for all truth, knowledge, and wisdom are the eternal treasures of man's divine nature. There is no agency or power, human or divine, outside of man that can carry him to the goal of perfection, happiness and peace. As a Great Teacher once stated it in the picturesque language of his day: "The kingdom of God is within you," a profound occult truth of Nature which seems to have been all but forgotten in our age of external groping for spiritual values. Perhaps if this truth had been accepted as literally as have some other teachings, the great mass of mankind would not be wandering in the fog of doubt and despair today with a chronic and aggravated case of spiritual blind staggers, trying to thumb its way to an unknown destination.

Now as Theosophists we do not say to you as is sometimes done: "Here is Theosophy, a wonderful new religion. It teaches thus and so. Just accept and believe it and you will be a Theosophist. Don't take the trouble to look any further, for you will have the last word of Divine Wisdom — there isn't any more."

But what we do say is this: "Here are some very ancient teachings that have stood the test of time, and have been found very helpful in meeting the problems and difficulties of life. They provide a new viewpoint and outlook upon life, and will enable you to view and weigh its experiences in a new light, for they will help you to find yourself. They will answer many questions which no other system attempts to explain, for they are based upon the laws of Universal Nature. Consider and weigh them, but do not accept

them on anyone's say-so or upon any supposed authority; be guided by your own intuitions, for that is the only way you can eventually arrive at truth. These teachings, which in our present age are called Theosophy, are nothing new, but are as old as thinking man. They are not presented as a "divine revelation" in any sense, suddenly thrust upon some personality from "on high" but have been known and taught in all ages, and from them have sprung, at various times in the world's history, the great religious movements and philosophical schools of thought. When these impulses have expended themselves and the original teachings have been corrupted by human misunderstanding and the passing of time, they have been given anew to the world by the Great Teachers and Elder Brothers of the race. In the early centuries of our present era they were promulgated under the name of Christian Gnosticism, and likewise were embodied and incorporated under the name of the Hebrew Kabbalah in still earlier times. In ancient Greece they were taught under the guise of "The Mysteries" for thousands of years until the degeneration and final closing of the Mystery Schools, while in ancient Hindusthan they were known as Atma-Vidya. Beneath the ritualism and external forms of every religion you will find some remaining traces of them, but invariably distorted.

This accounts for the fact that there are so many similarities in the various religions of the world which are but the results of Theosophical impulses that have been inaugurated at divers times during the history of mankind. Theosophy encourages the study of comparative religions; it reveals that there must have been, of necessity, a parent doctrine from which all have sprung.

Reincarnation an Early Christian Teaching

In these days of world upheaval and readjustment — a storm leaving in its wake an army of countless men with broken spirits,

and many others filled with doubts and fears — it is something to have a philosophy of life (call it a religion if you wish, although it is something more than that) that reveals a universal and symmetrical plan of Life beyond the shambles of human events and our external, disordered lives; that helps us to retain our faith in the external fitness of things and in our fellow man; and that reveals a far nobler destiny for mankind than the present picture warrants.

Whenever men have been unable to explain the ways of Universal Nature and the tragedies of human experience, they invariably have attributed them to one of two causes: either to the "will of God," or to blind, fortuitous "chance." Thinking people no longer will accept these hackneyed and threadbare "explanations" which are worse than none at all, for they not only fail to explain, but instil and encourage a fatalistic concept of life that leaves our destiny wholly and completely in the hands of external agencies over which we have no control. If it is the "will of God," to what higher court can we appeal, or why should we even dare to presume to do so? If it is "chance," obviously, there is nothing we can do about it.

Frankly, Theosophists have little patience with any philosophy of life, whether it be of a religious or of a scientific nature, which makes of man a "worm in the dust," devoid of the divine and spiritual attributes and intellectual capacities by which alone he can raise himself above the mud and mire of his own making. The occidental world, particularly western religion, could well afford to take a page or two from the wisdom of the East. If the doctrine of Reincarnation, and its complementary teaching Karman, or the principle of action and reaction in Universal Nature — if these were better understood, in all probability we should have quite a different picture. There would be at least a few less human souls blindly butting their heads against the wailing wall of self-pity

and despair, and blaming the gods of chance for the circumstances of their lives.

Reincarnation and Karma are the only teachings which explain with any degree of logic and reason the apparent inequalities and injustices of life. They are among the oldest religious teachings in the world, and have been handed down from the dim past from age to age. They are confined to no particular creed or sect, country or nation, age or civilization, and can be found, in one form or another, in every religion in the world. Let us for example, turn to the Christian religion, one with which we are all more or less familiar — particularly in its external aspects.

When the disciples asked Jesus, as is related in the New Testament, "Who did sin, this man or his parents that he was born blind?" it is quite apparent that they took the truth of Reincarnation for granted, for how could a man have sinned to have been born blind, if not in a previous life? Jesus also stated that John the Baptist was the former Elias who was to come.

Reincarnation was the universal belief not only of the oriental peoples of the far East, but likewise those of the Mediterranean civilization at the beginning of the Christian era, and it was only in after centuries, the sixth of our present era to be exact, that the last traces of it were obliterated from the intellectual and religious thought of Europe. There is undeniable evidence in the extant writings of at least one of the early Christian fathers that Reincarnation and "pre-existence of souls" was openly believed and taught to some extent among the early Christian sects before that religion became what might be called an "organized" body or system. It was not until the sixth century that Christian doctrines, after much sifting and rearranging, took the form of a definite, and what since has been considered "authoritative," theology.

Among the early Christian teachers who exercised no little

influence over the thought of his day was Origen, the celebrated exponent of Alexandrian philosophical Christianity, which, in all probability, presented the most scholarly aspect of the Christian teachings.

In his work *On First Principles* he stated: Everyone, accordingly, of those who descend to the earth is, according to his deserts, or agreeably to the position which he occupied there, ordained to be born in this world, in a different country, or among a different nation, or in a different mode of life, or surrounded by infirmities of a different kind, or to be descended from religious parents, or parents who are not religious; so that it may sometimes happen that an Israelite descends among the Scythians, and a poor Egyptian is brought down to Judea.

Here is not only a definite and clear-cut statement of the doctrine of Reincarnation, but of Karma as well. In fact, these ideas prevailed so universally among the early Christians that it was found necessary to convene a special Church Council to suppress them, and about the year 530, the Council of Constantinople, in a final effort to obliterate the remaining traces of theosophical Christianity, pronounced its anathema against the teachings of Origen and the "pre-existence of souls."

A "One-Way" Immortality

In its stead was substituted a purely theological concept which would not embarrass certain other theological doctrines that then were beginning to take definite form and finding their way into Christian teachings. Immortality, this new teaching said, concerns the future only, and not the past. Now it is quite obvious that many other erroneous doctrines were bound to originate from such a teaching.

Immortality was pictured as something with a beginning, but

without an end. This, we state, is nothing short of a philosophical absurdity, and can no more be than you can hold in your hand a stick or a rope which has but one end. Anything which is conditioned to the extent that it has a beginning, must, of its very nature in the eternal fitness of things and according to all known laws of logic and reason, have an end, and hence there is nothing immortal about it. It would be just as logical to say that time once had a beginning, but will never end, or that space begins at a given point and extends indefinitely and without end into boundless infinitude.

If man is immortal at all, that immortality, Theosophy states, must extend into the past as well as into the future. In every realm of Nature we see the law of repetitive cycles of activity and rest in ceaseless operation. Life and death, night and day, summer and winter, work and sleep, in the very act of our breathing, and in the periodical recurrence of sun-spots — it is to be found everywhere. Are we to assume that man is an exception to a law or process of Nature which is so universal; that he lives but one short earth-life and then vanishes from the scene of his half-finished activities for ever? Who can learn all the lessons of life in the span of a few brief and fleeting years? If any one thinks he can, it is all the more evident that he still has much to learn. Is there any evidence in the world today that man, individually and collectively, has attained such a high degree of perfection that he needs no further experience and discipline?

Genius Explained

If we consider life from the viewpoint of one short span, it has little rime or reason. Why should one man be born a genius, a Beethoven, a Shakespeare, a Caruso, an Edison, or an Einstein, while another is born a coal-miner with but enough intelligence and creative genius to wield a pick in the bowels of the earth.

Simply because genius is the accumulated results of efforts made along some particular line of endeavor over a period of several incarnations. You often will find that such men have deficiencies elsewhere in their characters; that their development is not well rounded. These are things which will have to be corrected in future lives, and these egos like all others will be born into the circumstances of life where this can best be accomplished.

Mother Nature is a stern schoolmistress. She has no favored pupils. Whatever our position or circumstances of life may be, we are in the class where we belong, where we have put ourselves, by our own efforts, or the lack of them, in ages past.

It should be obvious that we sometimes set into motion certain causes which are unable to produce their final effects and a balance of justice in one lifetime. We see those who wrong others and who apparently never are brought to justice. We see those who live in idle luxury, who contribute nothing to the spiritual, intellectual, or even material welfare of the world, but who are bounteously provided with all the blessings of life, so called. On the other hand there are those who live nobly, who never do injury to others, but spend their entire lives in self-sacrificing labor for the comfort and welfare of others, and who have trouble until the end of their days. How is it to be explained? Well, in our grandfathers' day we should have been told — and possibly there are some who still explain it that way — that all of these things would be settled in another world beyond. Those who lived rightly would receive their reward and recompense in heaven, and the other kind would receive their punishment in hell throughout eternity, which, by the way, is a very long time. The fact remains, however, that the causes were generated in this world — not in the next. The karmic seeds of destiny were sown here, and will come to fruition where they were planted when the appropriate conditions arrive. If a farmer plants wheat in one

field, he does not harvest it in another on the opposite side of his farm. The laws of Nature are not that fortuitous and haphazard.

Reincarnation Not Transmigration

There are those who do not like the idea of Reincarnation because they do not understand it, but confuse it with Transmigration, another teaching entirely. They say they do not want to be reborn as a cab-horse, an Alaskan seal, a New Jersey mosquito, or what-not. This is no objection to Reincarnation at all, but to their own misconception of it. Perhaps you psychologists can explain why otherwise intelligent people will jump at such absurd conclusions without investigation and then proceed to build them up into crystallized opinions and beliefs.

Now Reincarnation and Transmigration refer to two separate and distinct operations of Nature. The human Ego never imbodyes in a beast, nor has Theosophy ever taught such a spiritual and psychological absurdity. There may be certain oriental sects which teach and believe warped and twisted concepts of Reincarnation just as there are certain occidental sects who have perverted ideas of Christianity, but you will never find such rubbish in Theosophy.

The human Ego could not incarnate in a beast body for the simple reason that the latter does not possess an intermediate vehicle or psychological apparatus highly enough evolved, or sensitively enough attuned to receive the human Ego which is ages ahead of the beast in evolution. Such a freak of nature could no more eventuate than it would be possible to instil the theory of Einstein into the brain and understanding of an anthropoid ape, for the capacity to receive it is not there. Fundamentally, there is no difference between the body of man, and that of a beast. Both are composed of the same identical kind of atoms borrowed from the workshop of nature for a brief period. The vast gulf between the

human and beast kingdoms lies in the inner capacities, in the psychological, intellectual, intuitional, spiritual, and divine natures of the entities. It has taken the great virgin Mother Nature age upon age to build up the marvelously adjusted intermediate nature of man — the human soul — which no beast possesses. It will not be until future ages, in the next planetary round of world evolution that the more advanced entities of the beast kingdom which trail behind the human family in the long cosmic pilgrimage of evolution, will have evolved a psycho-mental apparatus capable of receiving the divine fire of intelligence, self-consciousness, and free will. Man, in the meantime, and after many incarnations will have evolved to a still higher state in the scale of evolution. Faculties which now are dormant and unknown to western science will slowly evolve and take their places with the others we already have developed. Intuition, of which we have but flashes at present, will function as easily as does our eyesight or sense of taste and smell. Man is slowly working upward in the scale of evolution, not downward, and if anyone fears a zoological future, it only proves there is room for Theosophical enlightenment.

Now what is transmigration? Transmigration concerns the atoms of the physical vehicle, and not the human, reincarnating Ego. When the Ego discards and leaves behind it the worn-out physical body much in the manner that we discard an old garment no longer capable of useful service, the process of disintegration immediately begins taking place. The individual atoms of the physical shell, no longer held in cohesion by the presence of the Ego, return to the workshop of Nature and go about their respective tasks. These tiny lives have a consciousness of their own, appropriate to their position in the scale of life, and there is no such thing as "dead matter," as a materialistic science once tried to make us believe. That theory was also a philosophical

absurdity, and resulted from the failure of scientists to recognise the spiritual aspect of nature.

These tiny lives, as before stated, have a consciousness of their own, and carry the imprint and impression left upon them by the recent life of the now exarnated human entity. They automatically are drawn by psycho-magnetic attraction to the departments of nature and to other entities where these characteristics can best find expression.

If the past life of the man has been a vicious and brutal one, they will find their natural habitat in a beast of like nature, and vice-versa. The tragedy in the former case lies in the fact that the reincarnating man will again meet them face to face in some future incarnation. If they return to him with "dirty faces" and he is born with some infirmity or affliction, shall we say that it is due to "the will of God" or blind chance, or shall we say that it is due to his own ignorance and violation of the impersonal laws, or habits, of Nature?

Another Common Objection

Another objection we sometimes hear is this: "I do not want to come back again; I've had enough trouble in this life. If I thought I had to go through it all again, it would be terrible. There is no comfort in that idea for me." Our personal desires and wishes have little effect upon the cyclic laws of nature, and whether we like it or not, they will continue to operate. But why should anyone assume that the next life would be exactly like the present one? Nature repeats itself, but always in diversity. In all probability the karmic impulses which produced the unhappy conditions of the present life would have expended themselves, and the future earth-life might be, and probably would be, far brighter and happier.

If Reincarnation assured everyone that he would be reborn under the most favorable circumstances possible, that he would have social position, wealth, power, a large retinue of servants, high-powered motor cars to ride in, that he would have to work only when he felt like it, and could do just about as he pleased all his life: if this were the doctrine, then, in all probability, it would become the most popular religious belief overnight. The fly in the ointment is that Reincarnation and Karma "put the finger" as they say, on a very vulnerable spot in human nature — individual responsibility. Theosophy furnishes no karmic scapegoat to which we can tie our mistakes and then drive it into the wilderness with shouting and rejoicing as did the ancient tribes of old.

There is no power in the universe through which we can escape the consequences of our own acts, the karmic impulses which we already have generated. Every cause will produce its inevitable effect, good or bad. Thus it will be seen that man is his own "creator," if that much abused term may be pardoned.

Remembrance of Past Lives

"If we have lived before, why is it," it is sometimes asked, "that we cannot remember our past lives?" The fact that we cannot remember our past lives proves nothing. We cannot recall all of the present one. The fact that we have forgotten the years of our infancy is no proof that we did not exist at that time.

While we do have a subjective memory of past lives in the deeper reaches of consciousness, we cannot recall it objectively for the reason that the brain-mind, with its store of worldly gleanings, disintegrates at death, for it belongs to that portion of the human constitution which is wholly mortal. Character is the accumulated results, Nature's record of our past experiences in other lives.

Perhaps it is better that we cannot recall our past lives. In all

likelihood, the picture would not be altogether lovely. There might be some pages from which we should be glad to turn, just as we are glad to forget some of the details of our present experiences. "Sufficient unto the day is the evil thereof," and the mistakes of the present life give many of us plenty of working material for improvement.

Reincarnation is the lost chord of modern thought. We need a larger view of the purpose and destiny of the human race. Theosophy relates man to the Universe and shows that his individual consciousness is a ray of the Universal Cosmic Consciousness — not just a body to which a newly "created" soul is suddenly added at birth. Nor are we accidental products of blind, mechanical forces. Each individual is a part of a living, organic Universe which carries within its own unfolding plan, atoms, men, worlds, solar systems, and galaxies as the divine drama is enacted on the cosmic stage of Life.

Through innumerable incarnations, the human Ego, which is the real actor, assumes many roles, and takes on the disguise of many personalities, which are dropped one by one, as necessary experience is gained. The personality is but the mask which is worn for a day, during which time the real actor becomes so absorbed in the role which is being played, that the real Self is forgotten for the time being.

An understanding of Reincarnation and Karma removes the incentive for selfish gain which so often results in needless human suffering, for it reveals the futility of striving for self alone. Our lives, from prince to pauper, from genius to the plodding toiler, are inseparably linked with karmic threads of destiny which we weave into the grotesque or beautiful patterns of our lives as we journey along together on the Long Pilgrimage. Probably the highest virtue of Reincarnation lies in the fact that it

is the hopeful doctrine of "another chance," the opportunity to right old wrongs, and to reap the reward and fruits of kindly and compassionate help given to fellow pilgrims in the long forgotten past. It has been universally believed in the East for countless centuries, and is steadily gaining recognition and acceptance among thinkers and scholars in the western world, not among Theosophists alone, but among students in general and people in all walks of life. It has been the theme of scholars, poets, and mystics in every age, but perhaps none has sung its mystic song of hope with more force and beauty than did John Masefield, the present Poet Laureate of England in his poem "A Creed":

I hold that when a person dies
His soul returns again to earth;
Arrayed in some new flesh-disguise
Another mother gives him birth
With sturdier limbs and brighter brain
The old soul takes the roads again.

Such is my own belief and trust;
This hand, this hand that holds the pen,
Has many a hundred times been dust
And turned, as dust, to dust again;
These eyes of mine have blinked and shone
In Thebes, in Troy, in Babylon.

And as I wander on the roads
I shall be helped and healed and blessed;
Dear words shall cheer and be as goads
To urge to heights before unguessed.
My road shall be the road I made;
And all I gave shall be repaid.

So shall I fight, so shall I tread,
In this long war beneath the stars;

So shall a glory wreathe my head,
So shall I faint and show the scars,
Until this case, this clogging mould
Be smithied all to kingly gold.

The Theosophical Forum

KARMAN THE X FACTOR — *Mary Womble*

When H. P. Blavatsky gave *The Secret Doctrine* to the world, more particularly to the western world, she presented the teachings in a way which could be understood in degree by some who were breaking away from the crystallized conceptions of the day but who thought, nevertheless, in the terminology of those beliefs.

H. P. Blavatsky gave us seven Jewels of Wisdom, the second of which is the teaching concerning the doctrine of Karman. Considering the knowledge extant in her day, it is not strange that many, not hoping fully to understand teachings which were in some cases sketchy and in some cases merely hinted at, awaiting the development of more intuitive minds, should call the second Jewel of Wisdom the Law of Karman.

Just as Theosophists stress the necessity for teaching the septenary nature of man as against the threefold division, i. e. soul, spirit, and body, in order that man may more fully understand this nature and profit by the understanding, so Theosophy teaches that Karman operates as a law and that man is himself his karman.

Karman comes from the Sanskrit root-word "kri," which means "to do"; thus Karman means "action." We have a law of Karman or action operating on our physical plane. As an example, let us drop a pebble into a pool of water. As the energy goes out from center we call this centrifugal force, and as it returns to center due to some law within its own nature we call this centripetal force. So far as I know, there is no law in the universe to prevent the centripetal force from being inherent in the action itself. It is true that the water may be scooped from the pool, if it were possible to do so with sufficient speed, and the center of the

action removed, but no law can prevent the action of centripetal force if the center remains unchanged.

In his *Notes on the Bhagavad Gita*, Mr. Subba Row, who was an eminent Eastern student of the Wisdom Religion, tells us that the Wisdom Religion postulates a First "Cause" or Principle, this being, logically, the infinite, eternal, immutable, boundless, rootless root of all being. He asks us to imagine in this eternal Boundless which is called Parabrahman, centers of energy, in germ. These are called Logoi or, in singular, Logos or The Word. From these Logoi emanates a light. This light of the Logos is called Daivipra-kriti or Fohat or cosmic energy. Now from the objective point of view of the Logos, Parabrahman, or the rootless root of all Being, is seen as a veil thrown over itself. This is called Mulaprakriti or cosmic matter. Mr. Subba Row designates eight forms of this cosmic matter, naming them earth, water, fire, air, wind, mind, intuition and egotism.

Theosophy gives us the Law of Analogy to aid our study, and by applying it here, we see that energy, operating through one medium of cosmic matter, must operate on the same principle through all forms of cosmic matter. Energy, operating through the medium of water, must operate on the same principle of earth, air, fire, wind, mind, intuition or egotism, and thus it is that a man may modify his own center of being by growth and a constant unfolding of his own inner nature in such a way that the centripetal force of his acts and thoughts will be beneficially altered in its effect upon the center which is the man.

Now let us see how it is that man himself is this karman. The Leader of the Theosophical Society, Dr. Gottfried de Purucker, emphasizes and grips this teaching in the second half of the fourth chapter of his book *The Esoteric Tradition*. For this part of our argument we are going to review the text in the last half of

this chapter on the life and teachings of Gautama the Buddha. It seems, according to Dr. de Purucker, that there is a popular belief that Gautama the Buddha taught complete annihilation of the entity at death. He points to the Jataka Tales, the rebirth stories of the Buddha, some six hundred in number, which Tales refer in many cases to rebirth. These Tales give evidence of the common acceptance by the multitudes of Buddhists of an X-factor in the complex of skandhas forming the human being, which X-factor passes from life to life. According to our Leader, Buddhism teaches an evolution of this X-factor of consciousness and will through many rebirths, bringing about constantly increasing power and faculty until finally the entity becomes a man, then a Bodhisattva, or one who is filled with the spirit of the Buddhist principle (Bodhi), the fountainhead of utter wisdom.

The Leader asks what it is that passes through many rebirths until it becomes a Buddha? The scriptures of the Hinayana or southern school of Buddhism call this the karman or results and consequences. Dr. de Purucker asks if it is thinkable that the Titan Intellects of the human race taught that bare consequences, naked composites, sheer effects, technically called skandhas, can or do pass in entitative fashion from life to life, re-collect themselves, after being dispersed time after time as atomic aggregates into the various realms of nature from which they were originally drawn. He tells us then that this depends upon the meaning we give to the term "skandhas" or "samskaras." Mere aggregates of atoms existing on the psycho-emotional and physical plane without an internal bond of spiritual-psychological union is a materialistic idea, rejected by philosophical and scientific thought; but if we understand samskaras to mean psycho-magnetic and material aggregates of life-atoms attracted to each other because of their intrinsic magnetic vital powers, unified and governed by the repetitive action of the same

spiritual and intellectual forces which formerly held them in union as an aggregated vehicle, the teaching is then consistent with what we know of the intricate unitary and yet compounded character of our constitution and consistent with all the teachings of Hindu philosophy as well as the Buddha's profound philosophy. The point Dr. de Purucker now brings out is, he says, the inner content of the Buddha's doctrine and is found in both the Mahayana and the Hinayana Schools and taught by Theosophy.

The lower parts of an entity form a compound aggregate and this is mortal and perishable and is called in Buddhism samskaras. However, there is something, an X-factor of a spiritual, intellectual and psychological character, around which the aggregated compound or samskaras re-gather or re-collect at each new rebirth. This X-factor, he says, cannot be designated as an immortal soul in the Christian sense because that idea implies a static condition and the teaching is that nothing in the universe is static or unchanging. This X-quantity is that vital, psychological something which insures the re-collecting of the samskaras for each new life, a fruitage or result of past lives. The Leader tells us that Karman is as good a name as any for this X-factor if we understand it to mean consequences, results, spiritual, intellectual, psychical, physical, etc. He gives the example of a child developed from an invisible life-germ to great age, and suggests how each phase is a change from the preceding one but is based or founded upon a preceding phase. This is the key to the Buddhist thought. Just as a child is born and develops, so the karman of an entity passes from body to body, from low to high, through different life stages of rebirth through the different ages. This X-quantity the Theosophists call the "Reincarnating Ego"; the Mystical Buddhists call it "the Shining Ray from the Buddha Within"; and the Hinayana School calls it the "Karman" — this

karman evolving, growing continuously better, nobler, until the man through these karmic changes or changing karman, finally becomes a Bodhisattva and then a Buddha, finally entering Nirvana.

Theosophists call this X-factor, this Karman, the Monad, imperishable in essence, the fountainhead of consciousness and will, passing from age to age throughout the manvantara, reproducing itself by means of rays from its essence in the various reïmbodiments or reincarnations it brings about. In Mystical Buddhism, the Leader tells us, especially in the North, this Monad is known as the Dhyani-Buddha, the core of every reïmbodying being. *The Esoteric Tradition* also tells us that every Monad is a ray, a droplet of and from the cosmic Maha-Buddhi, just as in Mystical Buddhism every Dhyani-Buddha is a ray from the Amitabha-Buddha, a manifestation of Alaya, the cosmic spirit.

In simple words the teaching then is this: there is a ray from the celestial Buddha within the composite entity called man, the man builded of the samskaras, and the influence of this ray persists through the ages and re-collects the samskaras together anew, reproducing the same karmic entity. The karman of the man then is the man himself. Because man continually changes, continually grows, the karman which is the man, continually changes for the better.

The esoteric Dharma of Gautama the Buddha states that every man is a manifestation on earth of a Buddhist principle belonging to his constitution and manifesting in three degrees or planes: (a) as a Celestial or Dhyani-Buddha, (b) as a Dhyani-Bodhisattva, (c) as a Manushya-Buddha. All human faculties and powers are like rays from the spiritual sun, derivatives from this interior compound Buddhist entity, and union with this core of our being is the aim of all initiation, for when man becomes one with the

Buddhic principle within him, the seat of the abstract Bodhi, he becomes a Buddha. A Buddha is one who is fully awakened in all the ranges of his constitution and is a complete and, relatively speaking, perfectly evolved human being.

Dr. de Purucker assures us that mortification and mutilation of the physical vehicle is not the way to initiation, and points to Gautama's rejection of such lower yoga with the replacing of it by the control of the will, living the life, combined with intellectual awakening, the path of interior development: the becoming at one with the superior elements of the human constitution, divine in their higher parts, spiritual in the next lower range, and intellectual in the third. The real Yoga, the only Yoga of value, according to the teaching, is that of man ever striving consciously or unconsciously to attain union with the divinity within. The only way to unutterable wisdom and peace of the divine is found within one's self. All the luminaries of the human race, the spiritual and intellectual giants, were those who developed more or less the Buddhic principle in themselves. Every man may walk the path, for in his constitution are the same elements which the Great Ones possess.

According to our authority, the unquestioned teaching of the Buddha was that a man may obtain union with Brahma. Something of a spiritual-intellectual character works through the samskaras that form man, which entity must obtain union with the cosmic spirit, here called Brahma. This, too, is the essence of the teaching of the Vedanta of India: that the root of all Being is the cosmic spirit, that reunion with it is inevitable and that there is a path by which such union may be obtained in a pilgrimage vastly shortened. Even here, the Leader wishes us to understand, the freed Monad does not stop, for beyond Brahman are realms of consciousness wherein reside the roots of the cosmic tree, the individualized Adi-Buddha, the cosmic creative Logos of Adi-

Bodhi, or Alaya the Cosmic Originant. The world of Brahma is a relatively imperfect sphere of lives and life, for beyond even Brahman lies Parabrahmic infinitude.

We have seen how it is that Karman operates as a law and how it is that man is his karman. We have seen that, if our analogy holds true, it is useless to send forth thoughts and deeds of a certain character and expect them to return to us different in essence from what we send forth. We have seen how it is that as we think and do, so we are; and we have seen that it is the nature of all things to evolve and grow. How shall we apply this to our lives? Can we not unfold from our nature and allow to grow and expand those qualities within our own nature that make for universal harmony? We can all develop understanding and sympathy. We can all unfold awareness of the cares and sorrows of others. We can help each other through kindly and wise understanding that all may benefit. By becoming less self-centered, by growing and unfolding spiritually, we may change our center of being so that returning evil thoughts and acts cannot then so greatly injure the finer substance of our greater natures. Thus we protect those who may be weaker and might fail if the added force of our failures to live in harmony with the laws of nature are added to their own weakness.

No one can say just what has been the effect of giving to the world the Seven Jewels of Wisdom, but it is certain that here is a cosmic philosophy which in its simpler aspects answers the questions arising in the minds of the masses, and in its deeper studies gives hints of the sublime heights to which the scholar may rise. This cosmic philosophy has at its heart the cure for every ill of mankind through its understanding of man's nature and the relation of that nature to the universe. It gives man the inspiration he needs to win onward on the evolutionary path. It brings a conviction of the necessity for man to learn his direct

responsibility to the rest of creation as well as to his own kind.

The Theosophical Forum

PERPLEXITIES ABOUT KARMAN — *H. T. Edge*

The purpose of this article is to describe some of the difficulties which occur in our endeavors to understand the doctrine of Karman, to show why they occur, and to indicate the way out of them.

Karman is one of the doctrines of the Ancient Wisdom, as widespread as the lands of earth, as old as mankind; it is one of the Seven Keys of Knowledge. To grasp it in its entirety would require a mind of scope vast enough to transcend the limits of race and time; but, since the peoples of earth are restricted by race and time, the doctrine must be presented in forms adapted to their comprehension; a process similar to that of translation must take place. But, while the doctrine may be adapted to our minds, we must adapt our minds to the doctrine — the process must be mutual.

In the modern Occident we have inherited a cast of mind derived from the religion, philosophy, and science in which we and our ancestors have grown up. We are prone to interpret Karman in terms familiar to our modes of thought. When there is a clash, there are several things which we may do. We may insist on trying to make the doctrine conform to our familiar molds of thought. This may involve us in a dilemma like that between free will and predestination. Then either the doctrine is wrong or our logic is wrong. Perhaps we may seek to evade the difficulty by saying that it is a "paradox," or by laying aside reason altogether and falling back on "intuition." But the doctrine of Karman *must* be reasonable and logical; and if there is a clash between what we call logic and reason on the one hand, and the doctrine of Karman on the other, it is sure to be the former that are at fault.

Much controversy of course arises, as is bound to be the case in this as in other discussions, from the lack of precise definition of the terms used. This enables each party to base his arguments on different data, with the result that they must reach different conclusions; but neither of them attacks the position of the other, and the reader sees that both are right within their respective limits.

The word "Karman" itself is used in a variable sense: it may mean a principle of causation; it may mean an accumulated tendency. When we speak of a man having a lot of bad Karman to work out, we use the word in the latter sense; but when we say that Karman will cause an action to bear consequences, we use it in the former sense. This is all very well for ordinary purposes; yet, if we are to reason logically, it is imperative to distinguish these meanings. If this is not done, we may find a person using the word in one sense at one stage of his argument, and in the other sense at another stage; or two people using the word in different senses and disagreeing accordingly.

Another such vague word is "man." When we say that a man suffers the consequences of his action, we are apt inadvertently to assume that man is a unitary being. But we know that he is a compound unit, having many spheres of action and many fields of experience. This must be taken into account, otherwise there is bound to be confusion; and what right have we to blame any teaching or any teacher for what so obviously arises from our own neglect of elementary rules of logic?

Karman is usually defined as an extension of the law of causation (a law recognised in science) to embrace the entire universe of mind and consciousness, of events and living beings. Now what do we understand by this law of causation? We imagine a series of events, the one following the other, each link in the chain being

supposed to be an effect of the preceding link, and at the same time a cause in relation to the link which comes after. In physics we have a similar arrangement, but with particles instead of events. Now the difficulty experienced in physics is this: if matter is composed of an assemblage of separate particles, how do these particles act on each other? We can only get over the difficulty by supposing that there is something that acts as a connecting link between the particles, transmitting motion from one to the other. But this is really no explanation, but merely an evasion; for if we inquire into the physical structure of this supposed medium we are faced with the same difficulty over again. The proper inference from this — an inference which we often fail to make — is that our original hypothesis about the isolated particles was wrong. Our difficulty was of our own creating. The properties of matter cannot be explained by assuming it to be merely an assemblage of particles; and the recent studies in intra-atomic physics have demonstrated the truth of this statement. Instead of any such ultimate particles, we can only discover flashes of living energy coming into manifestation from an invisible source; and in place of discontinuity, we see everywhere continuity and oneness. Physicists see the necessity of visualizing a new picture of the material world; it is difficult. In spite of ourselves we still try to construct a material world more or less on the old plan, and one scheme is suggested and then abandoned for another. But our conceptual powers are not static; we little realize how greatly those powers have grown since the days before Newton; such notions as we have about time and space, velocity, energy, force, inertia, are recent acquisitions; and surely we have the right to expect that we shall in due course acquire a new set of notions that will enable us to get a better idea of the physical world than the old atomo-mechanical ideas.

Taking this analogy from physical science, and applying it to the

world of men, we find that we are apt to treat events as the physicists have treated atoms — that is, as separate detached elements, acting on each other by some unknown process, like a row of dominoes knocking each other down. We have transferred the mechanical way of thinking from physics to the moral sphere. Some philosophers, reasoning in this way, have been unable to find any connecting link between successive events, and so have denied any principle of causation, saying that all we can affirm is that events do actually follow each other in a particular way, and with a degree of probability amounting to virtual certainty. But events are not separate, except only in the sense that the leaves of a tree or the fingers of a hand are separate. They form the integral parts of a whole, not isolated units. Where is the necessity for trying to find links between things that never were separated?

Now let us see how this applies to the doctrine of Karman, so far as that doctrine concerns human conduct. It has been supposed that my acts or my states of mind or my experiences are detached units, separated from one another like a row of particles, and each one fully and solely determined by the ones before it. Thus a system of fatalism is set up; and when our instincts rebel against it, we blame the laws or the teachers, instead of our own faulty comprehension. But man is, as said above, a compound unit. Every external phenomenon is at all times connected with the central source, just as the leaves of a tree are all connected with the tree itself. If the law of Karman extends to all planes of manifestation, it must include elements going back to the very roots of my nature. The causes which determine a given act or a given experience must therefore be extremely complex; and to know what I will do, you must be able to know my whole nature to its utmost roots.

We have grown accustomed to regard the universe as a great

clock, which, once started, will move with inevitable motion ever after. Has it occurred to those who propound such a theory to inquire how the clock was ever started? To explain this, it is necessary to postulate an initial act of will and intelligence; and why will and intelligence, if once operative, should thereafter be banished utterly from the universe, it passeth comprehension to understand. Man is not a clock; he is a living being; and at all moments in his life, causes may be operative from sources deep within his nature. The law of Karman is not contravened by this explanation; it is affirmed. What is contravened is our absurd mechanical ideas as to causation, our mechanical notions of human nature. My acts are determined by *what I am*; and what I am is my Karman. Is it not evident how confusion arises from using the word Karman at one time in a limited sense, and at another time in a universal sense?

The only kind of predestination which Theosophy can recognise is that by which the Divine Monad, which is Man, will fulfil its eternal destiny, will realize its essential nature. If in the viewless unimaginable ages of the past, at the dawn of a vast cycle of manifestation, certain *laws* were impressed upon every living Monad, to be fulfilled during the flowing cycles, should such a thing provoke me to grumble about my rights and my wrongs, my freedom and my restraints, or should it rather exalt my soul to the contemplation of sublimities that shrink personality to its appropriate pettiness?

In a word, this free will and necessity paradox is a jumble of bad logic, based on the attempt to interpret a universe of living conscious souls as though they were a row of dominoes knocking each other down.

As to the principle of causation in general, it may be said that of course Theosophy recognises this, if we may regard the term as

meaning order and invariable sequence throughout the universe. But there is one great difference between the Theosophical philosophy and philosophy in general as understood in the West — that the latter deals with abstractions, such as Will, Consciousness, Mind, and the like; whereas Theosophy recognises only entities, living conscious beings, of which these abstractions are merely attributes. To speak of an *act* as determining an *act* is to deal with abstractions as though they were realities. It is a question of the action of living souls upon each other.

Our daily experience furnishes abundant examples of the combined action of freedom and law. The laws of nature, as recognised in physics, are inexorable and cannot be evaded; yet do they interfere with our freedom of action? Does the law of gravitation prevent us from walking or flying? Do the various mechanical and chemical laws prevent us from achieving marvels in construction and invention? These mechanical laws form a causal sequence, which, if left to itself, will pursue its way with the inevitability of clockwork; but which admits of the interposition of force from another plane — the will and intelligence of some conscious being. Yet such interposition in no wise abrogates any of the laws. Passing from physical phenomena to mental ones, we may imagine that there are people whose lives are mechanical, ruled by habit and by fixed ideas; and it is possible to predict with considerable accuracy what they will do under given circumstances. But the predictability is not so sure as in the physical world; and when we come to people of highly complex character, the problem of relating cause to effect becomes hopelessly complex. In short, man is relatively free, to a greater or less extent, according to the plane from which his motives proceed. The more highly evolved he becomes, the more free does he become, because he is able to stand apart from the workings of the lower planes. Yet, his doing so does not set aside

the laws of those planes.

To theological writers, and to many philosophical ones, the problem of free will and necessity seems a hopeless dilemma. But when we reflect that they separate God from the universe, and man from nature, we can see the root of their perplexity. To the ordinary thinker, of pessimistic turn, a want of the knowledge of reincarnation is a fatal stumbling block. Intuitive minds among religious people have said that so vast are the purposes of God that he can afford to let man have the utmost free will without any fear that his (God's) purpose will not ultimately be fulfilled. And with necessary changes, this is the Theosophical view: man may wander far from the path of his true destiny, yet even his errors are made by the eternal wisdom to contribute to the fulfilment of Law. But let no one think this gives license for evil; we may incur evil, but we must not will it; "It must needs be that offenses come; but woe to that man by whom the offense cometh." (*Matt*, xviii, 7)

Perhaps the worst fallacy is that which leads some people to imagine that any doctrinal statement whatever about Karman can excuse us from our natural duty of rendering service. It is to be hoped that there are not many people who have any desire for such an excuse, or to be relieved of concern about their neighbor's affliction; but those, if any, who have such a desire, will find no justification for it in the doctrine of Karman. Nor will those who reject the doctrine because they think it justifies such an idea, or tends to breed such an idea, find justification. If a person cannot see that we act just as much by refraining as we do by executing, then indeed his mind must be sorely confused. It may be part of my neighbor's Karman that I should help him, or that somebody should help him. It may be in his Karman that my efforts to help him will prove futile. But who is to know this? How can I tell how the matter stands? Obviously I am left free to

exercise my natural or unnatural instincts, and the law of Karman can be trusted to take care of itself.

Thus causation prevails throughout the universe; or, to use an equivalent word, one which pertains rather to morals than to science, *justice* prevails. Yet, while accepting this as a general truth, if we aspire to discern the details, it is evident that we are undertaking a vast project. The universe is very complex; and if I were to aver that I can fully work out such details, I should feel that I was claiming for my intellect much more than it merits. Nor should I have much respect for a law of Karman that could be expressed in so limited a scope. I should prefer to think that my difficulties were due to my own impatience and presumption, and I should go in for further study and reflexion. A knowledge of the law of Karman is of immeasurable help and comfort to the perplexed soul of the sufferer; it restores his sense of equity and teaches him where to look for help. It shows him his responsibility for his every act and thought. Those who try to make Karman a matter of adjusting personal accounts are sure to land in perplexities; for the law concerns our relations with each other.

The Theosophical Forum

SUCCESS OR FAILURE — *Ila Beale*

Up and Live!" says Dorothea Brande, urging men and women to wake up to the realization of their own possibilities. Few of us live our lives in the fullness of achievement or even glimpse the hidden potentialities latent within us. Our lives, instead of being a record of success and accomplishment, more often tell an all too obvious story of frustration and disappointment, if not actual failure. Dorothea Brande tells us in her book, *Wake Up and Live*, that too many of us are "Victims of the Will to Fail," that unless we see this in time and take action against it, we die without accomplishing our intentions. She points out that there is a way of frustrating that Will to Fail which gives magical results. We live, she says, so far below the possible level of our lives, that when we free ourselves from our limitations and realize the potential forces within us, we seem to be an entirely different being and become entirely transfigured.

There came a moment, when, in a flash, this enthusiastic author realized the infinite possibilities for success and happy accomplishment in human life to be attained by Discipline. Before that revelation came to her, she had consulted teachers, analysts, psychologists, and physicians; she had thought and worried, but she gained only a temporary stimulus. She would work for a time with feverish activity, but her enthusiasm soon flagged. Then the revelation came to her! A sentence in a book she was reading brought her illumination, and from that moment she acquired an altered attitude towards life in its varying aspects and relationships. The passing days brought her the realization that she had found "a talisman for counteracting failure, and inertia and discouragement, and that it worked." What was that talisman? She had *within herself* the power to counteract this Will

to Fail. She had searched without, but with no permanent success; she looked within and the revelation was hers. In her very interesting and stimulating book, she gives us a formula for a fuller and more successful life.

With the time and energy we spend in making failure a certainty we might have certain success. Failure indicates that energy has been poured into the wrong channel. *It takes energy to fail.*

To counteract the Will to Fail, we must put into operation the Will to Succeed.

There is no need for anyone to remain a "Victim of the Will to Fail." We can at any time use the same energy expended so lavishly on failing, and turn it into channels of growth and achievement, which lead to final success. Think success, and all the successful thoughts you have ever had will be attracted to this first successful thought of yours. Like attracts like, is an old adage, and we find it works on all planes. Think one successful thought, and soon you will have an energy-center of successful thoughts waiting to aid you in your endeavor, whatever that may be. You have formed a laya center, as it were, through which can stream from higher spheres, from your own treasure-house of stored wisdom, all the successful thoughts, yes, and actual successful achievements of your own past lives.

Long ardently enough to achieve. Work for it. March with steadfast determination and undaunted courage to your chosen goal. The more unselfish the desire, the purer the motive for success, the nearer you will be to the spiritual planes and the more nearly will you come into touch with that part of yourself wherein is stored the vast wealth of knowledge and wisdom gained through lives of effort here on earth. We are all the inheritors of our own past achievements. *The Voice of the Silence*

assures us of this in these words, "Tell him, O Aspirant, that true devotion may bring him back the knowledge, that knowledge which was his in former births."

The trouble is that we expend so much energy and waste so much time, in futile dreaming and revery, in success-frustrating objectives, in dreams that remain merely dreams, in ideals which we are going to put into practice soon, in hours of aimless chatter, upon nothing in particular. We live so often in the backwash of our own emotional storms and in the many, many trivialities that make such subtil inroads upon our time and energy, which might better be given to work along constructive lines. "Physical inaction is no true sign that life-force is not being burned away. So even the idler is using fuel while he dreams."

Our lives should be from birth to death a gradual increase of inner powers and faculties, of ever widening horizons of growth and development. Growing older we should grow closer to those spiritual realms which are the source of our noblest ideas and aspirations. Old age can then become a spiritual awakening in ever increasing vision and loveliness. Each man is a creative center in himself, with infinite capacities for creative development. If men did but know it, they could draw upon the stored wisdom and experience of eighteen million years. Why, in all the countless lives we have lived on earth we have perfected a finished technique upon almost any line of effort. Let us then choose our objective, desire it with strength and purpose, work towards its accomplishment, doing something every day towards the attainment of our chosen goal. All great ideas originate in the mind of some living being, but they become realities only if there is someone with a will so fixed on success that he will remain undaunted in the face of the most tremendous odds, refusing to allow any obstacle, however great, to hinder him in the accomplishment of his chosen objective.

To me the keynote of Dorothea Brande's book is her injunction "Act as if it were impossible to fail." A marvelous mantra upon which to fashion our lives! In other words, have faith in yourself, faith in your infinite capacity of achievement. To make this mantra a workable reality she gives us her twelve disciplines, which she says work magic. In her introduction to these twelve disciplines, she says:

Discipline is undergoing restraint in order to develop the qualities necessary for a full life. Mental discipline should connote the equivalent in the sphere of the mind, which the athlete undertakes for perfecting his body.

Reading these words, I was reminded of Katherine Tingley's masterly little epigram, "The secret of human life in its fulness is self-directed effort." It is self-directed effort along constructive lines that brings into exercise the Spiritual Will. All discipline has as its objective the freeing of ourselves from the bonds of our own making, the learning to use our will, and to concentrate our energies in the right direction in order to get the fullest success and achievement. It is a means of making the lower elements of our complex make-up better and more responsive servants to our Spiritual Will. It is the first step in an awakening which leads eventually to Self-Knowledge. Discipline precedes the Mysteries, we are told, and it also precedes all achievement. It is the sure foundation for happiness and success in whatever we undertake. The self-disciplined man is the happy and successful one. As Tennyson has so forcefully phrased it, "Self mastery, self knowledge, self control, these three alone lead man to sovereign power."

The question is then, are we content to remain "Victims of the Will to Fail," or, directing our energies into channels which will bring into action the Will to Succeed, shall we determine to work

towards a richer and fuller life, not for ourselves alone, but that others may benefit by our efforts and successes? Theosophists perhaps more than any other people should call forth the Will to Succeed, for they are pledged to work for Humanity, and in so doing become co-workers with those Great Ones whose lives and achievements and successes have served as beacon-flames in the darkness throughout the slow progression of the ages; those who, in their compassion have laid their work in love and devotion upon the altar of service to Humanity.

The Theosophical Forum

NATURE STUDIES: V — *H. Percy Leonard*

One Thing at a Time

I had driven out to see my friend Cooper and found him in the garden. The first flush of early June was over everything and I was overwhelmed to the point of confusion by the wealth of beauty on every hand.

Cooper, in that quick way he has, instantly saw how I felt and snapping off a single spray of hawthorn, he held it up against the clear blue of the sky. With pure delight I saw its outline down to the smallest detail in vivid contrast against the blue. No longer distracted by other objects, I viewed that single gem of beauty in its entirety at a glance and was lost in admiration.

The petals in their snow-white purity, the glossy green of the newly-opened leaves, the balance and the unity of all parts, held my attention as by a magic spell. My eyes with keen appreciation roved from point to point. Then came the question — Why?

Why should a single spray hold me entranced, while the garden, seen as a whole, left me bewildered and oppressed?

As usual, my friend had his answer ready to hand.

"My dear fellow, it's all a question of concentration. Your mind, confined to a single twig, has been able to absorb the peculiar charms of that detail because there were no overlapping impressions from other sources to interfere with their appeal. And this practice of controlling the mind's tendency to wander may be applied with advantage to other departments of life.

"We often fail to be interested in our work simply because our minds are wandering all over the world. But keep your attention

on what you are doing, try to economize your materials, reduce unnecessary motions, devise small improvements, and what was drudgery before, becomes interesting all of a sudden. Your aches and pains are all forgotten as you bend your energies on the ideal method, slowly taking shape in your mind. Make the most of your time because you are likely to get a chance of work, for the man whose mind is centered on his job, is always being hunted down for promotion to better things by all who are engaged in production of any kind.

"Every branch of study," he continued, "attracts its crowd of eager students, and seeing that one's own mind cannot be very different from other people's minds, we have the delightful prospect of eventually finding an absorbing interest in every line of investigation that has ever been followed by our fellow-men.

"Once you get anyone to give his undivided attention to anything, even though only for a moment — he is caught. But the trouble is that the attention is divided, and the momentary glance penetrates no deeper than the surface. But concentration may be carried too far, and though the mind may be confined with advantage to one subject, it is fatal to try to nail the mind down to one detail of that subject as an exercise in mental gymnastics. There must be no strain, for the mind is like a swallow and will not tolerate close confinement. Turn a horse into a paddock and he will be happy, because though the area is limited, yet within those limits he is free to move about; but tie that horse to a post and the poor beast will suffer; and the illustration exactly applies to the mind."

"Old man," I said; "you are quite right. I had to get up a speech on Peace the other day. What did I do? I concentrated on the general subject — allowed my mind to range within the limits of my subject; but did not nail it down to any particular point. Thoughts

soon began to flow in to the focus I had made, and every thought that I could use, I seized. "Concentration is the Soul's method of gaining knowledge through its instrument the mind, and, restricted to one field of inquiry, it seems to start a kind of vortex or whirlpool that sucks in illustrative material, lines of suggestion, associated ideals, you may almost say Facts. It does at all events put you in the way of obtaining definite information and quite by "accident" you light on scraps in the newspapers, helpful books and snatches of conversation, which furnish you with the very clues that you require.

"And I verily believe that if our minds were bent with singleness of purpose on the pursuit of the Chief Good, whatever name we choose to call it by, every event of our lives would fall into line with our fixed resolution and help to speed us on our way."

"I quite agree," rejoined Cooper, "but don't you think we sometimes spoil these things by trying to put them into words? No preaching in my garden if I can help it. Come and see my new frog-pond."

And dashing down a winding path shaded by hazel-branches, he disappeared from view, whooping like a school-boy just out of school. I followed.

The Theosophical Forum

WHAT IS THE PURPOSE OF LIFE? — *Mary L. Fay*

I think everyone agrees that our purpose in life is growth, physical, mental, moral, and spiritual. The purpose of life is to raise the mortal into immortality; to give time and opportunity for the deathless spiritual potency at the core of man's being to develop, grow, unfold into perfection.

Man is a composite being with three elements in his constitution, first a personality that we call by name; second, back of his personality we find a deeper reservoir of consciousness expressed in the ideal desires of the nature; third and lowest of all is the animal consciousness, including the body which is the vehicle for the two higher elements. When we understand this threefold division we can more fully understand St. Paul's description of man as body, soul, and spirit.

It is this higher, ideal nature, the Spiritual Ego, which reincarnates. The word reincarnation means re-entering a body of flesh. Human reincarnation is one phase of the universal law of evolutionary growth through alternate states of rest and re-embodiment. Re-embodiment of everything that has life is a habit of Nature. Universes, solar systems, suns, worlds, men, animals and plants, cells, molecules, atoms, all re-embody. This habit of Nature is to me one of the strongest proofs that man reincarnates. The innermost Self of man is a deathless Being, a god, which re-clothes itself from age to age in new bodies or vehicles, that it may undergo all possible experiences in the Universe to which it belongs and so reach its own most complete growth and self-expression. Rebirth, then, is the pathway of evolution. It is the method by which Nature progressively draws into growth or unfoldment the limitless capacities latent in all

creatures from atoms to gods. The very fact that we intuitively know that there are large reserves of power and possibility within us that are seeking expression; the fact that nearly everyone yearns to develop, to be, that Greater Self which he senses within — this very urge to a larger and fuller life, is our daily witness to Nature's true purpose for man. It is through Reincarnation alone that man can bring out and perfect this hidden wealth of power and capacity. In each life some new phase of character is shaped by environment. New powers and capacities are unfolded from within. Weaknesses, selfishness and other faults are corrected by suffering.

We might ask here why we do not remember our past lives, because it would seem that if we did remember, we should not make so many mistakes. However it is well that we do not remember details of our past lives because we should spend too much time reviewing our mistakes, which would hinder our evolution. Evolution always looks forward, is constructive, builds afresh and on developing patterns. So, instead of remembering our mistakes, we simply carry over the memory of the lesson learned by the experience. Character is memory, genius too is memory; and both these are a result of repetition through life after life of lessons which have been realized and absorbed and have become a permanent part of our nature. Character is the spiritual fabric woven by evolution. It is the only thing we can take out of life when we go; it is what we bring back as our heritage from the past when we return to incarnation on earth.

AFTER THE KALI-YUGA - ? — *G . de Purucker*

We are told in the *Occult Glossary* that the four Yugas, with their respective time-periods of 4, 3, 2, 1 take up just half of the duration of a Root-Race. I have been wondering in what order the Yugas follow after Kali-Yuga, in which we now are because by analogy it might mean that they would go in the reverse order, so that after Kali-Yuga there would be Dwapara-Yuga, and then Treta-Yuga and then Satya, but reasoning from another standpoint, it seems we merge into the Golden Age, at least that is what it seems to say in the Vedas. Then from another standpoint, when a Race is dying out, as some of the primitive Races that we now know of, some of the aboriginal Races they might be said to be in a Golden Age in one way, because they have no responsibilities, they are childlike and in that sense might be said to be in the Golden Age to the end. So my question is: In what order do the Yugas in a Root-Race come after the Kali-Yuga? (1)

I think I can best answer this very interesting question in a public gathering by pointing to the history of our own present or Fifth Root-Race. We are all at present, as you know, part of the Fifth Root-Race on this Globe D in this Fourth Round. Now then, it was a legend among the Greeks that the childhood of mankind was happy, that it was peaceful, blessed with plenty, with abundance, that there were no wars and harassing anxieties in those halcyon days of the childhood of man. They called it the Saturnian Age, the Age of Saturn, mainly, I think, because there were no real responsibilities, as the questioner has correctly stated. I question very much, however, whether I for one would like to live the life of a babe unborn, in the womb, without responsibilities, a mere

human lump. No!

About the middle point of the Fourth Root-Race, our Fifth Root-Race began to take form, which merely means that certain individuals who had passed through the Fourth Root-Race incarnations up to that time on the Earth, made among themselves a society, not organized, but the mere fact of their being and having more or less arrived at similar mental and spiritual outlooks made them in the middle part of the Fourth Root-Race to be as it were a people apart. Do you catch my thought? It was not an organized Society, an organization, a brotherhood, at first. It was simply that at about the middle point of the Fourth Root-Race certain individuals were born, which means that they had reached a time when Fifth Root-Race qualities and attributes were to begin to appear in them; just as in our present Fifth Root-Race we have almost reached its middle point, we are in its fourth Sub-race, and the forerunners of the Sixth Root-Race are just beginning to appear amongst us here and there over the world. Sporadically they appear, forming no definite body, organization, society, or brotherhood; but nevertheless beginning to embody, to incarnate.

Now, as time went on, the Fourth Root-Race, which was then in its Kali-Yuga, began to descend the *facilis descensus averno*, the easy descent to Hell more and more; but at the same time a greater number of more advanced human monads were incarnating, thus constantly increasing the number of the then Fifth Root-Race in the throes of its birth. These individuals were for the Fourth Root-Race set apart. Nature favored them, which does not mean that they necessarily had a very easy time, but Nature favored them. They were fortune's favored pupils; they were receiving, because they had won all these benefits, special guidance, special help, special instruction, mostly unconscious except for the highest among them. Why? Because they needed it. The balance of the

Fourth Root-Race was simply running down hill, and with each thousand years going faster down. But these favored individuals, fortune's favored sons, were helped, guided, protected, sheltered — sheltered as far as it could be done — because they had merited it on account of their previous evolutionary strivings to ascend; and because they were the seeds of the Fifth Root-Race to come, our present one. They were in their Satya-Yuga, the first and the longest.

Thus the yugas begin with the longest, next the next long, third the next long, and finally comes the culmination of wickedness and evil-doing in the Kali-Yuga, which we of the Fifth Root-Race have just begun. How many among us, I ask the question right here, are to be among the "favored" to form the seed of the Sixth Root-Race now already beginning on this continent and elsewhere, but more particularly perhaps in the Americas? We have reached our Kali-Yuga; it will last more than four hundred thousand years, and we are only some five thousand years gone in it, barely entering upon it! And as the majority in the future days of the Fifth Root-Race will be growing worse and worse, and going steadily faster and faster down the relatively steep descent, the individuals of the forthcoming Sixth Root-Race will contemporaneously grow more numerous and will be in their Satya-Yuga, their highest.

I think I have given in *Fundamentals of the Esoteric Philosophy* a diagram (2) in which the birth of each Race is shown as beginning at about the middle part of the preceding one. There you have the picture. Each Race begins with its Satya-Yuga, its longest; passes from that into the next, the Treta; then into the third, the Dwapara; and then into the fourth and shortest and most intensely individual, the Kali-Yuga. And just about that time the seeds of the Race to follow are in their throes of birth.

I might add this — although I hope that it won't complicate your understanding — that these wonderful figures, 4, 3, 2, followed by one or two or more zeros, are key-numbers in Nature, and they are computed by means of the six, commonly called the senary, or again the duo-decimal, system of reckoning either by six, or twelve which is twice six; and hence there are the same yugas but with more zeros added — for globes as well as for Races; for Chains as well as for globes, and so forth.

Thus it is that the hey-day of civilization and progress of a Root-Race lasts through the four yugas from beginning to end; during its Kali-Yuga and towards the beginning of it, the seeds of the new succeeding Race begin to appear, and these seeds are in the beginning of their Satya-Yuga. As the centuries and the millennia roll slowly by, the scepter of dominion and of empire, of progress and advancing intelligence and wisdom, slowly passes from the former Race to the latter Race; so that when the former Race is finishing its Kali-Yuga, the succeeding Race is already beginning the hey-day of *its* halcyon, times of progress and power and civilization.

Meanwhile, even after the Kali-Yuga of the former Race is ended, the more or less degenerate remnants of the former Race continue in existence, but steadily going down hill still, and these degenerate descendants, although slowly through the ages growing constantly fewer and fewer, nevertheless last on until the succeeding Race in its turn has run through its three yugas and is entering its fourth or Kali-Yuga.

This is what I meant when I stated that although a Race begins its career at the middle point of the previous Race, it lives on for pretty much the same length as before, although in a state of degeneracy and senile decrepitude; the old waters gradually mix with the new and fresh, because the more advanced and better

egos of the previous Race begin to reincarnate in the bodies of the succeeding or newer Race.

The Theosophical Forum

THE ESOTERIC TRADITION — *B. Finkernagel*

Since the passing of H. P. Blavatsky, the great Founder of the Modern Theosophical Movement, literature labeled "Theosophical" has increased enormously, ranging from the grotesque and the fanciful, to the psychic and the weird, as well as the positively dangerous, leaving but a comparatively small minority of books which may be rightly regarded as useful contributions, and of distinct merit and help in the study of Theosophy. We need not, therefore, wonder that many an earnest inquirer stands bewildered and despairs of ever finding the Truth. It is thus always a timely caution, when the inquirer is directed to confine himself only to those Theosophical books which set forth the pure and original Message of the Masters of Wisdom, as was proclaimed by their chosen and specially trained Messenger — Madame H. P. Blavatsky, and her faithful and lifelong co-worker, friend, and pupil, Mr. W. Q. Judge. It is only when the fundamental principles of this original Message are clearly perceived, rightly understood and assimilated, that the student will find himself in a position to discriminate between the spurious and the true. This welter of confusion demands that the truthseeker should at first confine himself to such books as *The Key to Theosophy* by H. P. B., *The Ocean of Theosophy* and *Echoes from the Orient* by W. Q. Judge, *The Mahatma Letters to A. P. Sinnett*, and a few others, before he ventures farther afield, for only then will he be in a position to discriminate between the false and the true. The writer himself suffered severely, many years ago, from this very danger against which he is warning others in their search for Truth.

There are, of course, as already admitted, quite a number of books that have been written by intuitive and well-informed

students and humble servants of the Masters and their cause, which have proved of value in the study of Theosophy. Among these there is a book which in the writer's opinion stands out beyond all the others. This particular book is only a quite recent publication, entitled *The Esoteric Tradition*, of which Dr. G. de Purucker is the author. The present writer, who has been a student of Theosophy for nearly forty years, knows of no other book better able to lead the earnest inquirer or student to a correct and comprehensive grasp of technical Blavatskyan Theosophy, as well as to inspire the heart and mind with the Fire of the Divine Spirit. He considers this book to be the most important publication of its kind that has appeared since *The Mahatma Letters to A. P. Sinnett* in 1923. He considers it the clearest, the most explanatory, and most comprehensive, exposition of Theosophy, as found in *The Secret Doctrine*, Madame Blavatsky's monumental work, and therefore the very best book for anyone to study if he wishes to attain a true concept of technical Theosophy. In order to realize the truth of these statements, it is only necessary to take up the study of this book in earnest. Such study will more than convince the individual, and fully justify the statements made.

This article is not a mercenary attempt, either to sell the book or to advertise its author; it is but a cry across the seas, from far Australia, and from one student to another. It comes from one who is receiving daily help and inspiration, enlightenment and strength, from the study of this book, and who in turn is desirous that others should profit and partake of the rich blessings and understanding that may be theirs, if they will only come to this Fountain of Wisdom — and drink.

A RESTLESS WORLD: IS A NEW CIVILIZATION COMING TO BIRTH?

— *Boris de Zirkoff*

(Condensed from a talk given in the Temple, Theosophical Society, Point Loma)

If we could see the inner causal factors of the world-wide unrest of the present day, and watch their operations from a vantage point of a century or two ahead, it is very probable that we would diagnose what is going on in the world today as the gradual coming to birth of a new civilization, a new order of things, arising Phoenix-like out of the ashes of its own previous form of manifestation.

It is difficult for us to see this from our present point of view, because we are lacking the necessary perspective, unless, perchance, we happen to belong to the comparatively few people who are impersonal enough to take a detached view of the events of our own lifetime, and project them as it were against the background of spiritual ideals which are working silently but with immense power behind the illusory appearance of things.

The importance of the present era, which is unquestionably the critical point of more than one century of Occidental civilization, does not consist in the wide-flung political and economic upheavals which we are living through; these and many other events are but effectual results of an inner change through which human consciousness is passing in this age of complete and thoroughgoing revaluation of ideals.

It is this change in human consciousness that manifests itself outwardly in the seeming — and indeed real — breaking up of outworn molds of thought, the crumbling of long-cherished

ideals, the downfall of once strong religious, philosophical, and scientific dogmas. Human consciousness is about to be reborn into a new world of thought, and this rebirth has of course its unavoidable birth-pains.

It should be distinctly understood, and constantly remembered, that Theosophy has naught to do with political changes; but it has everything to do with those subtle inner changes of consciousness which affect human minds and hearts, and bring about a more spiritual outlook, a greater vision of inner Realities. This change in outlook is apparent everywhere in the world.

If we consider present-day Religion, we shall see that the churches are unable to supply that spiritual anchorage which so many are seeking. So the people are turning in other directions, notably in scientific directions. The difficulty which organized religion finds in appealing to the people is that this appeal necessarily demands the believing spirit. But the creeds of the churches have ceased to be really believed in; and when belief or faith ceases, the prestige of the churches goes with them. Hence, in order to re-establish its appeal, the churches gradually became scientifically-minded, so as to meet the demand for scientific explanations on the part of the masses. Some of the most progressive churches weave into their work strands of mysticism and Theosophy, gradually becoming halls wherein some of the simplest Theosophical truths are being proclaimed. This is a good sign, and the future may see these churches actually become halls of Theosophy.

When we consider Science, we see that the merely mechanical interpretation of the universe is unable to bring satisfaction to the spiritual aspirations of the human heart. Science, materialistic science, we mean, is breaking up its own molds of thought through the soaring spiritual vision of some of its greatest

exponents. Because of them mainly, and under the continuously rising tide of spirituality, science of the present day becomes more and more religious and truly mystical. The fervor of many a scientist is a typically religious fervor, to be sure.

When it comes to Philosophy, we see the gradual infiltration of Oriental ideals and ideas into the barren soil of Occidental intellectual-ism; hence Philosophy also is gradually becoming more spiritualized, more mystical, to meet the demands of a new generation.

These three chief manifestations of an inner change of consciousness are not by any means haphazard. There is a plan behind them, and a guiding hand. The new world of thought which is being born will be characterized by a slow and silent blending of genuine age-old Oriental mysticism with the achievements of Occidental thinking, and in this process of amalgamation and mutual fructification the Theosophical Movement is one of the primal and most important factors at play. As a matter of fact, it is one of the chief objectives of our work, namely, to bring about a gradual synthesis of the three aspects of human consciousness — the religious, the scientific, and the philosophical — into one complete and soul-satisfying philosophy of life, wherein spiritual values will play a paramount role, and stimulate and guide mankind towards the realization of its noblest mission.

There is one aspect, however, of human consciousness which neither organized religion, nor the self-emancipating science, nor even otherwise serious philosophical trends of thought in the Occident, lay any emphatic stress upon — an aspect of consciousness so important nevertheless that without it everything else is devoid of any sound foundation and is destined to collapse sooner or later in a sea of horror. This aspect is

represented by *Ethics*.

Organized religion is unable to provide the scientific and philosophical basis for the need of ethics, and to show why ethics is essential to progress and growth. Science, on the other hand, is unable to provide the spiritual and devotional foundation for ethics, as it has not yet acknowledged the spiritual background of the Universe and Man. Hence this subject is usually sidestepped and avoided, or merely touched upon in vague and goody-goody terms, which bring no conviction and no satisfaction to any thinking man or woman.

Yet in spite of the world-wide prevalence of selfishness which lies at the bottom of the barbarism of the present Occidental civilization, and breaks out periodically in fits of high international fevers, when our verdant meadows and dales are transformed into slaughter-houses of legalized murder: in spite of this selfishness and greed, there are indications of softer breezes blowing from some inner and hidden recesses. There is a growing realization in many parts of the world that entrenched selfishness of purpose, brutal gratification of egotistical cravings, and the mad hunt for the acquisition of mere material possessions, to the complete disregard of the interests of one's neighbor, is after all the easiest and shortest road to spiritual, intellectual, and moral bankruptcy. Violence is the surest sign of moral weakness; it may be a sign of muscular strength; but history has shown that intrinsic values are in direct proportion to the development of *moral*, not of muscular, fibers. From this growing realization, there arises today a revulsion of feeling pointing to the fact that ethics will slowly become a subject for serious thought and constructive thinking, coupled with a fresh application to daily life.

It is only a complete and soul-satisfying philosophy of life,

however, that can give a sound reason and a solid basis for the need of ethics — and it is precisely this that Theosophy can do and actually does. It teaches that Ethics is rooted in the very structure of Nature, hence rooted in the very structure of Man himself, who is an integral part of Nature; that the only way to a lasting civilization of spiritual worth, is by leading a life of brotherly sympathy and compassion for the souls of men; that we are responsible for both the welfare and the misery of others; that we have a sacred duty towards all those who are weaker than we, weaker and more helpless; that self-dedication to the cause of suffering mankind is the noblest mode of life; that the code of a spiritual and ethical life, and the philosophical and religious foundations worthy of a new civilization, are to be found in the accumulated wisdom of past ages, in the treasures of knowledge handed down to our times by the greatest sages and seers that mankind has produced; and that, finally, to repeat the inspiring and soul-stirring words of Katherine Tingley, "Selflessness attains; selfishness defeats: men's possibilities are in direct proportion to their ability to see beyond themselves and to feel for others."

The Theosophical Forum

OUR ELDER BROTHERS — *L. L. W.*

The most descriptive name applied to the Mahatmans is that of the "Elder Brothers of Humanity." For they are our brothers in every sense. In the first place they are just as real human beings as you and I are. But they are as much more advanced than us as a mature man is developed beyond a child. Besides this, it is the essence of their work to watch over and guide the race — indeed, not only us but all creatures climbing up the toilsome evolutionary path. Evolution however does not end with the Mahatmans. Beyond them are the Christs or the Buddhas. And even this class of grand men ascend gradually in degrees of relatively greater perfection. They finally range into divine and still diviner beings until we come to the limits of evolution possible to the duration and the reaches of our Solar System. Even the Solar System itself is merely a cell so to say in the vast stellar galaxy. But into that illimitable realm we do not now require to stretch our vision.

There was of course a time when what we call the human race passed, as everything must, through its infancy. Then we were just learning to speak and to develop our brains and other organs to master the functions they now fulfil automatically. That was the "Golden Age" recorded in the traditions of every people, when men had the gods themselves for teachers. It was then that the "Wisdom-Religion" or "Archaic Science" or the "Esoteric Tradition" (which today we call Theosophy) was first taught to the human race.

Even at that time there were some human beings far in advance of the average. Just as there are today and always will be. And those advanced humans became pupils of the gods and were

eventually formed into the Great White Lodge of Mahatmans. From that day to this that Lodge of Spiritual Initiates has never ceased as an organization to exist and to function. In cycles of spiritual vitality it has worked more or less openly. In cycles of spiritual barrenness like the so-called Dark Ages in Europe, it does its work in secret. From time to time it has sent its greatest Masters of Wisdom to incarnate among men and give out a fresh revelation of Truth to the world. Such men were Krishna, Gautama the Buddha, Jesus the Christ, Lao-Tse and Confucius. Then a new world-religion would be born. At other times they founded the Mystery-Schools such as those at Samothrace and Eleusis in Greece. And from those Mystery-Schools, which were colleges for training in Mahatmanship, Initiates were sent out who taught world-echoing philosophies. Pythagoras and Plato and Ammonius Saccas were Initiates of this stamp. H. P. Blavatsky was another. Read her preface to *Isis Unveiled* and you will get a glimpse of how she received her training. All these world-religions and philosophies imbodyed the basic teachings of this same Wisdom-Religion. Yet in each case the Teacher adapted it to the age and the people to which it was being re-taught. Since the times of Ammonius Saccas it has usually been called Theosophy.

The most fascinating thing about the Mahatmans to most of us is their wonderful occult powers. Historical tradition is full of stories about the magic or miracles performed by the Seers and Sages of the world, from Moses to Apollonius of Tyana. There is of course no such thing as a miracle, in the sense of something outside the laws of Nature. An action that seems to us miraculous (if it actually happened) is due to the use of a wider knowledge of natural forces on the part of the Sage who performed the "miracle." We can find plenty of modern miracles like this in every branch of science today. To us they seem miraculous cures or discoveries or what-not, but are to the men who do them the

every-day work of scientific knowledge.

There are abundant records of the exercise of their powers by the Mahatmans who watch over the destiny of the Theosophical Movement. (1) The most important thing to notice about these actions is the way in which the powers are used. It is spiritual or divine magic as contrasted with selfish or black magic. You will notice that the Initiate of the White Lodge will use his powers only for the good of others or to help the world in some way. Indeed that is one way you can tell if a Teacher belongs to the White Lodge. Never — or very, very rarely do they use these powers to help themselves. When they have to do this it is because the Initiate must protect himself — merely for the time being — as an agent for the work he must accomplish for the Lodge. "He saved others, himself he cannot save" is a taunt common to the lives of most spiritual teachers. If the saying went: "Himself he *must not* save," it would be true and would express a basic law of occult development.

LIGHT IN THE LODGES: IV — *Kenneth Morris*

The Power of Silence

When a man enters upon the path of aspiration: when he is Theosophist, and his all-dominating problem has become, How to make himself valuable to humanity: certain energies, subtle and spiritual, the reaction to his aspirations, seep down from his Higher Ego daily and hourly into his personal mind; the stronger and more constant the aspiration, the greater, naturally, will this seepage be. These energies he has to learn to use in the best and most economic way for the betterment of the stuff of humanity.

Now that part of the personal self which we may call the *human elemental* is apt to find in this force from above something alien to itself, to be distrusted and feared, antipathetic; likely to impose conquest and discipline on it; and so seeks to unload itself, as quickly as may be, of the burden of it. The cheapest and easiest way to do so is through talk. Idle chatter; talk about oneself; the recounting of one's remarks and exploits; personalities, and then more personalities; jabber; detraction and unkindly criticism of others; the slighting "clever" remarks that damn the absentee of whom they are spoken, and much worse the one that speaks them. Talk for talk's sake; multiplication of words.

This accounts for a tendency to follow a meeting, in which the purpose has been serious and high and the normal seepage consequently augmented, with floods of frivolous, meaningless, personal talk. This tendency, when given way to, can be very harmful indeed; it is utter waste of life at the worst. "Words are things," said William Q. Judge; living things, that carry out with them something of the vitality of the speaker; and he adds, "let us use with care those living messengers called words."

In the Mystery-School of Pythagoras, it is said that the disciples, as part of their training, had to pass seven years in speechlessness: a discipline, one can well understand, that would make most modern Occidentals insane. But the Theosophist who wants to be of value to humanity should school himself with at least some little part of it. Our meetings are excursions into the Impersonal: and nothing but impersonality is appropriate at them or after them. A good rule is to avoid using the personal pronouns; especially the word "I" should never be heard in a lodge-room; where pronouns cannot be dispensed with, they should be the impersonal ones only: "one," "you" (not *you*), "we," "they"; or in Welsh, where possible, the impersonal forms of the verb. Talk only about ideas, never about people: give the message of Theosophy; use the tongue only to convey kindness and to illumine thought and life; bring nothing idle or personal into the lodge premises; carry away with you the atmosphere of the meeting. In that way the power that comes to us from within will be used for the benefit of humanity, and not dissipated and wasted away. That power comes especially when members are gathered together for Theosophical purposes; each one then shares in the strength drawn in by the aspirations of all; and this strength can be so stored and made use of as to fortify our lives through all the following week. But when the chatter begins, the force goes.

The Theosophical Forum

OUR KINSHIP WITH THE BEASTS — S. H. Wylde

[**Note:** page numbers cited for *The Esoteric Tradition* are to the 2-vol. Second Edition and do not correspond to the 1-vol. 3rd & Revised Edition.]

Through inaccuracies of expression, or through over-enthusiasm in envisioning our godlike ancestry, we, i. e., Theosophical speakers and writers, sometimes antagonize nature-lovers by giving the impression that we claim no kinship with the beast-kingdom. It is true that we reiterate that all Nature is one; that we are brothers with all entities in the Universe, and similar pleasantly vague statements; but sometimes when trying to handle scientifically the question of human and beast evolution, we are apt to express ourselves in terms of contempt for our younger brothers — a most untheosophical attitude, as every Theosophist will admit if he stops to think. One wonders whether this is a natural reaction against the widespread acceptance of the Darwinian theory, or whether, perhaps, seeing in our own lower nature a rather pathetic distortion of the innocent antics of the beasts, we wish to assure ourselves and others that there is absolutely no resemblance or connexion.

The fact is that there is a very close kinship between ourselves and the beast-kingdom; only it is the reverse of what the modern evolutionist supposes. The human race was their predecessor and in a sense their creator. We helped to bring them into being; we originally provided the mechanism by which they found existence on this plane. And more than this, certain psychological elements thrown off by man are even today absorbed by the beasts. Thus through the ages we have nourished them, not only with the stuff, the life-atoms, of which their physical bodies are

built, but with the substance of their ethereal bodies and of their intermediate principle.

It must be remembered, however, in connexion with our being their "creators," that what might seem far-fetched or even ridiculous when thought of in terms of man as he is today, with his more or less fixed and supposedly well-regulated physical body, and fairly well integrated inner principles, becomes a natural sequence of events in the varied pattern of evolutionary history when we study with an attempt at intelligent understanding man's makeup, capacities, and environment at the time of his appearance on this globe, and the transitional formative stages through which he passed to his present position and capacities. (1)

Further, when we speak of nourishment received by the beasts from us, we have to keep in mind a law of Nature very often overlooked: Every kingdom receives its grosser sustenance from below — from lesser beings of its own kingdom, or from those of the kingdoms less evolved than itself. Thus among the beasts, the fox will feed upon the luckless rabbit; the eagle on the little birds; the little birds on the lowly worm; horses, cows, and sheep, on grass and herbs; while at the same time all beasts are nourished in part by the elements of the mineral kingdom, as also are we. Yet while it is true that every kingdom receives its grosser sustenance from below, all must be nourished from above as well, in order to preserve the soundness of their constitutions. We humans are nourished by divine beings; but in our egotism we imagine that the food of inspiration we receive from above is a sign-manual of our own superiority — even when we misuse it. The beasts are more humble; they make no claims. Observe how the ox has served man since history began; how the horse acknowledges man's superiority and authority; how the dog worships man as a god! It is because all kingdoms are dependent

upon each other, and each upon all, that life continues throughout the Universe; that the vital circulations of the universal organism are maintained; that cosmic health and harmony can be restored where in places they have been disturbed — just as the healthy blood-flow in the physical body helps by constant renewal of tissue to heal a flesh-wound.

Naturally those kingdoms that are "adjoining" each other in the hierarchical scale have the closest links of dependence one with the other. One could hardly expect a super-god to feel more than a remote affiliation with a molecule of sulphur, let us say; but as between man and beast the case is different, for clearly the beast is man's close relative. Speaking in terms of manvantaras, it is not so very long ago that the natural psychical barriers which now make a definite line of demarcation between these two kingdoms, were non-existent, at least as regards man and the other mammalia. Man, the superior being, at that time threw off cells providing a ready opportunity for the building of physical forms for the animal kingdom. And though, when once launched, these animals proceeded to evolve as independent minor stocks; and though through man's innate capacity the evolutionary gap between the classes of beings in time became impassable, nevertheless in the admittedly less dramatic, but certainly fundamental procedures of present-day cosmic functionings, man still provides a necessary part of the life of the kingdom below him, for certain of his psychic emanations find a suitable habitat in the constitution of the beast and help to build it up. Some of these emanations have been evil, and have helped to sustain the venomous snake, the fierce tiger, the greedy vulture. Others, fortunately, have been benign, and have nourished the comely and gentle beasts. It is well, when we shrink from what we find vile in the animal kingdom, to reflect upon our own responsibility in the matter.

Probably without man the beasts would not exist; just as we should not long exist if the gods were to disappear from the universe, because, having then lost our godlike qualities, we should perish, being the most helpless of beasts.

It is thus seen that the human stock assumes the role of parent to the beasts rather than their child; he is their ancestor rather than their descendant. This is esoteric science, but science nonetheless — not merely a philosophical speculation. The most far-sighted anthropologists of the near future may consider it not unscientific to employ the Theosophical scheme of evolution at least as an hypothesis; since in any case their own theories are mere hypotheses; and there has never been a single crumb of fact gathered by science that is in opposition to the esoteric evolutionary teaching.

The so-called rationalist would rather believe the modern materialistic theory than accept as his ancestors the "pallid couple" in the Garden of Eden. While those more religious-minded cannot leave God out of the story of evolution. Thus the battle periodically rages between these two schools of thought; but both may eventually find that while they had been wrangling, there had been at hand all the time another and nobler evolutionary scheme, more scientific than their science, more mystical and spiritual than their religious belief, a scheme which embraces the truth behind both dogmas. On the one hand it impels us to grasp our divine heritage, while on the other hand it teaches us, or should teach us, the respect that is due to our younger brothers, the beasts.

The story of evolution as told in Theosophy justifies and explains our upward reaching after the stars. It also justifies and explains our love of so-called "nature," our love of the lower kingdoms. It shows this love to be no freakish sort of thing, a human

perversion, but the very natural recognition of our kinship with them.

Yet the word "love" is here used in the best sense. It in no wise suggests that offensively sentimental handling of pets that is so often nothing but a using of them as an outlet for the satisfaction of one's emotional nature. Love does not have to show itself in over-effusiveness of any kind, as we know full well from an intelligent study of human relationships. To love animals truly one must first understand our relation and responsibility to them. Our attitude towards them should not be an aggressive one. They merit by all means our most conscientious and loving protection, but we should not attempt to psychologize them into an aping of humanlike intelligence; for the peak of their evolutionary growth is over for this manvantara. And how do we know to what extent our misplaced attentions may be a meddling with energies in retardation or recession, for which interference we shall have to make restitution in another life-cycle?

When the student of Theosophy takes into consideration the various factors in the question, as above outlined, he no longer implies, in his vigorous protest against the Darwinian theory, that it is the beasts themselves that we object to. Secure in his own position, he graciously acknowledges their kinship with us and their place in the universal family of beings; and his teaching of the Theosophical doctrine of evolution will foster in his fellows that feeling of genuine love and protection for our younger brothers which is of the nature of true compassion.

DISSECTING THE UNIVERSE — *H. T. Edge*

We cannot be content as of old to accept a purely objective physical universe, the same for all observers; but must needs inquire into the nature of objectivity itself, regarding our own faculties of observation and ratiocination as a component element of objectivity, and subjecting those faculties to an analysis which we consider a necessary function of the scientist. Hence the great number of such books now appearing. (1) We concur with the author that the questions of logic, metaphysic, and epistemology, with which he deals, are old enough, even as applied to the philosophy of modern science; but writers on this subject did not command the general attention of the scientific world until the necessities of the situation compelled an inquiry. The kind of literature now appearing represents innumerable particular applications of the general principles laid down by the previous philosophers, and as reflected in many minds of individual scientists. The author's fertile and discursive mind leads him into much elaboration and detail; so much so that, if we attempt to follow him through, we feel the qualm of philosophic doubt and scepticism, and reality seems to fade away amid a welter of ideas that appear and disappear, chasing each other like phantoms. In a world where everything is a fallacy or an assumption, and nothing will "stay put," we shrink from the hopeless quest for the ever-fleeing truth and rush back with a grateful sigh to our familiar world of healthy and comfortable illusions — the only realities, as it might seem. In a word, and to quote from a very ancient philosopher:

The quality of Mind is to doubt;
That of Buddhi is to ascertain. — *Uttara Gita*

The function of the ratiocinative faculty is to analyse, and analysis means taking to pieces; and from the days when we dissected our sister's doll and found ourselves ruefully contemplating a heap of sawdust and rags, we have known that the more you dissect, the further away you get from the simple reality from which you set out. Professor Bridgman realizes that what science has to study is *percepts*, and that whether there can be such a thing as a pure object may be a matter for speculation but can hardly be settled by experience. Now the percept is a result of the interaction of faculty with some external exciting cause, a conjunction of what is within us with what is without. Hence it is of vital importance that, before turning our scrutinizing eye on the physical universe, we should first examine that eye and see how many motes and beams there may be in it obscuring our vision. This leads the author to consider the vast accumulation of hard-and-fast notions, unexamined assumptions, authoritative pronouncements accepted without question, and other such paraphernalia, with which we enter upon our inquiries. The impression conveyed to the mind of the reader is that the truth about anything is utterly simple and obvious, and that all obscurity arises from the confusion of our minds. Can it be that the effect of reasoning is to destroy truth and reality, to obfuscate the obvious?

But we are saved from despairing and pessimistic conclusions by our reflexion that this particular aspect of intelligence was not made to ascertain but to analyse (to 'doubt'); and that intelligence has another aspect whose function is to ascertain. *Manas* (mind), when it becomes enmeshed in physical materiality, acquires this dissecting quality. Its true function then is to arrange and classify, to build an external world in which a mortal man can live and act. Such a world is an illusion, you may say; well, a house may be found an illusion if we pull it to pieces, but it is useful to live in

just the same.

Professor Bridgman has much to say on the meaning of "theory." It is a device constructed for the purpose of relating together certain data of observation; one theory may be made for one set of data, another theory for another, and the two may be inconsistent and need welding into a more comprehensive one. The truth of theories may be said to be tested by their workability in practice; but we have the familiar example of the predictability of eclipses by the Ptolemaic system. If a given theory will explain certain happenings, it is not necessarily the only theory that will explain them. Further, in view of the now admitted limitation to our power of exact measurement, a theory may suffice to explain the facts within the limits of our power of observing them — that is, explain them approximately; and yet it may not explain *all* the facts, and therefore (according to the criterion) not be true.

Another point made is that, whereas we had physical models of the universe, we are now making use of mathematical models where physical models fail; but these mathematical models of course cannot be pictured. But the author finds (after he has dissected deep enough) that mathematics is an empirical science, based on experience; its fundamental postulates are accepted as true because we have tried them and they work. The same disastrous process is applied to *logic*, which is "a game which we cannot even begin to play unless we make tacit assumptions which cannot be checked in practice." Induction and deduction fare equally badly, being structures without visible means of support; in fact all argument of whatever kind consists in begging the question and blinking our eyes to that fact.

It appears from much that is said in this book that those who seek naked truth about anything are giving a rather large order. But we knew this before. The naked truth being remarkably simple,

and we being prevented from seeing it on account of the multitude of garments in which we clothe it, it follows that we must undergo an elaborate process of self-discipline in order to reach our goal. We are compact of illusions; we must take ourselves all to pieces. We cannot even report correctly what has happened in the physical world.

A clear-eyed recognition of what actually happens is hindered by most of the mental habits drilled into us by education. For I think it must be conceded that the major part of education at present consists in acquiring the *intuitive* ability to handle the conceptual instruments which the human race has evolved to meet the situations with which it is confronted, such, for example, as the all-embracing instrument of language, whereas it is just these conceptual instruments that enlarged experience is proving are faulty. It is often very difficult indeed to get away from unconscious verbal implications that we have accepted without analysis all our lives, particularly when, as in many cases, our success as social beings depends on the completeness with which these implications are ingrained into our conduct. Not only do verbal implications hinder us in giving an accurate account of situations, but it is often difficult to get rid of the inferences with which we unconsciously dress our direct observation, as an analysis of the circumstantial evidence of many court proceedings would bring out.

So when we find ourselves in a new situation we need a new set of mental pigeon-holes; and the ideas which physics has been wont to designate by such words as space, time, force, etc., are found no longer adequate. Newton's absolute time, independent of space, has for some purposes been abandoned; yet it is necessary to assume something as fixed, and one wonders what it is. The chapter headings are: Operations; Thought, Language; Logic; Mathematics; Mathematics in Application; Relativity;

Mathematical Models and Probability; Wave Mechanics. In the Conclusion the author says:

The idea that thought is the measure of all things, that there is such a thing as utter logical rigor, that conclusions can be drawn endowed with inescapable necessity, that mathematics has an absolute validity and controls experience — these are not the ideas of a modest animal. . . . When will we learn that logic, mathematics, physical theory, are all only our inventions for formulating in compact and manageable form what we already know?"

And so we return to what was said at the beginning of this review — that the function of ratiocinative thought is not to ascertain but to analyse, and that its exclusive exercise will necessarily result in the presentment of an imaginary world, based on contradictions and on concepts which melt away under our lenses. But fortunately it is not by such methods that we rule our lives; otherwise we should resemble that proverbial centipede which, when asked how he managed all his legs, found himself unable to walk. It appears from many passages which we cannot quote that the author realizes how much of error is due to isolating parts of experience from experience in general and studying these parts as though they were complete in themselves; or, as Poe says, "The infinite series of mistakes which arise in the path of Reason through her propensity for seeking truth *in detail*." The word "physics" itself is redolent of mischief here, so long as it implies that there is a self-sufficient physical world, apart from the world in general. This physical world (the one that science has been living in) is no doubt real enough within its limits, and useful for many practical purposes; but if we venture beyond it we may have to admit that, from this larger view, it is only an abstraction from reality. Is Nature external to the observer, or is it part of the observer's mind; and if it is in part both of these, what are the

proportions between the two components? Again, whose is the mind, mine or yours, or a kind of collective mind of humanity?

Self-knowledge is the key *to* all knowledge: behind percepts lie senses, and behind the senses lies mind, and behind mind lies *buddhi* or direct intuitive perception. And all of these are functions or organs of — what? The real Self. And knowledge which does not express itself in conduct is like science without a laboratory; it does not mean much.
