**MORISONIANISM**, a term which has been much used in Scotland, since about the year 1841, and to some extent in the north of England, to designate a system of religious doctrine, strongly opposed to the Calvinism of the Scottish Presbyterian churches, and exhibiting in the highest degree the distinctive features both of Arminianism and Pelagianism. It derives its name from a minister named James Morison, suspended from his office by one of the Scottish Presbyterian churches in 1841, and now a Professor of Theology in the *Evangelical Union* (q. v.). The doctrinal views stated by him prior to 1841 were far from having that complete development which they soon after received from himself and his followers. The point to which prominence was first given was the universal extent of the atonement—that Christ died for the sins of all men equally; with which was naturally connected the opinion, that saving faith consists simply in a man's belief that Christ died for him, inasmuch as he died for the sins of the whole world; this further leading to the opinion, that a believer must know the reality of his own faith in Christ; and to the opinion, that every man possesses a sufficient ability to believe the gospel, without any aid of grace but what is vouchsafed to all who hear it, and in the very fact of its being preached or presented to them; and so to the tenets which have long received the designation *Pelagian*. The opposition to the standards of the Scottish Presbyterian churches is very complete regarding the fall of man, the work of the Holy Spirit, election, and kindred subjects; whilst on the subject of justification, the doctrine of imputation stated in these standards is repudiated, and the atonement is represented as a satisfaction of 'public justice,' not securing the salvation of any man, but rendering the salvation of all men possible.

**MORLAIX**, an old Breton town and seaport of France, in the department of Finistère, at the confluence of the Jarleau and the Kerlent, which below the town enter a creek of the English Channel, 45 miles north-north-east of Quimper. It is beautifully situated, and in spite of modern improvements, still contains many picturesque old houses, with projecting upper stories, carved corner-posts, and sculptured cornices. Vessels of 400 tons can reach the quays of the town. There is a considerable trade in grain, oil-seeds, hides, pigs, cattle, sheep, &c. Pop. 12,287.

**MORMONS**,\* or, as they call themselves, **THE CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS**, are a religious sect founded by a native of the United States, named Joseph Smith. Smith was the son of a farmer, and was born in the town of

\* The origin of this name will appear in the sequel.

Sharon, Windsor County, Vermont, 23d December 1805. When he had reached the age of ten, his parents removed to Palmyra, in the state of New York, and four years later, to the town of Manchester, about six miles off. The reputation of the family is said to have been of the worst kind; we are told that they avoided honest labour, were intemperate, untruthful, and suspected of sheep-stealing and other offences. These accusations are generally denied by M., but Smith himself partly admitted them, affirming that he 'had never done anything so bad as was reported of King David, the man according to God's own heart.' Nevertheless, a rude sensual religiosity appears to have been mixed up with his more carnal conduct. There is the most satisfactory evidence—that of his enemies—to shew that from an early period he was regarded as a visionary and a fanatic. This fact is of the utmost importance as affording a clue to his real character, and an explanation of that otherwise unaccountable tenacity of purpose and moral heroism displayed in the midst of fierce persecution. A mere impostor—i. e., a person who did not, in some sense or other, partly believe in his own mission, but who, on the contrary, felt that he was simply the liar and cheat that people called him—would have broken down under such a tempest of opposition and hate as Smith's preaching excited.

'When about fourteen years of age,' Smith says, 'I began to reflect upon the importance of being prepared for a future state.' He then describes how he went from one religious denomination to another, but could find nothing satisfactory—nothing but 'a great clash in religious sentiment.' Then he began to withdraw into secret places, to spend hours in prayer and meditation, and to receive angelic visits. The second of these happened on the evening of the 21st September 1823, when it seemed as though the house was filled with 'consuming fire.' In a moment, a 'personage' stood before him, 'with a countenance like lightning;' and 'visible to the extremities of the body,' who 'proclaimed himself to be an angel of God.' He informed Smith of various important particulars, as, 'that his sins were forgiven, and his prayers heard; that the covenant which God made with ancient Israel was at hand to be fulfilled; that the preparatory work for the Second Coming of the Messiah was speedily to commence; that the time was at hand for the Gospel to be preached in its power and fulness to all the nations; and that Smith was chosen to be an instrument in the hands of God, to bring about some of his purposes in this glorious dispensation.' Besides all this, the angel gave him, by way of appendix, 'a brief sketch of the origin, progress, civilisation, laws, and governments' of the aboriginal inhabitants of America—'of their righteousness and iniquity; and the blessings of God being finally withdrawn from them.' He was also informed where some plates were deposited, containing an abridgment of the records of the ancient prophets that had existed on the American continent. The angel appeared to Smith thrice that night, and afterwards paid him many visits. He told him where the records were deposited, 'on the west side of a hill, not far from the top, about four miles from Palmyra, in the county of Ontario, and near the mail-road, which leads thence to the little town of Manchester.' He advised him to go and view them, which Smith did; but the prophet was not yet holy enough to obtain possession of them.

At length, after due disciplinary probation, the angel of the Lord, on the 22d of September 1827, placed in Smith's hands the wonderful records. They were engraven on plates nearly eight inches long by seven wide, a little thinner than ordinary tin, and bound together by three rings running

through the whole. The volume was altogether about six inches in thickness, a part of which was sealed. The characters, letters, or hieroglyphics upon the unsealed part were small, and beautifully engraved. They represented an unknown language called the 'Reformed Egyptian.' Along with the records was found a curious instrument, called by Smith 'Urim and Thummin,' consisting of two transparent stones, set in the rim on a bow fastened to a breastplate. By means of these stone-spectacles, God enabled him to understand and translate the ancient records into such humble English as the 'prophet' (who had received almost no school-education, and could read with difficulty) was master of. The records contain the primitive history of America, from its first settlement by a colony that came from the Tower of Babel, at the confusion of languages, to the beginning of the 5th c. of the Christian era. These primitive colonists were called Jaredites; they were a wicked and bloody race, and finally, like the Kilkenny cats, mutually destroyed each other, millions being slaughtered in the final conflicts. Silence again settled down upon America. But a new race came directly from Jerusalem about 600 B. C. These consisted of Lehi and his wife; his four sons, Laman, Lemuel, Sam, and Nephi, together with their four wives; two 'sons of Ishmael,' and their two wives; Zoram, a servant, and his wife; in all, sixteen men and women. They are supposed to have landed on the coast of Chili. After the death of Lehi, quarrels broke out among the brothers. The Lord had appointed Nephi to be the ruler of the new race of colonists, but his elder brothers would not hear of it; as a punishment for which, they and all their posterity were condemned to have dark skins, and 'to become an idle people, full of mischief and subtlety, which did seek in the wilderness for beasts of prey.' They are the ancestors of the American Indians, who are thus, according to Smith's records, simply *bad* Hebrews. The descendants both of Nephi and of his rebellious brothers, increased and multiplied, but were almost continually at war with each other. In the time of Nephi the second, an awful earthquake announced the Crucifixion. Three days afterward, Christ himself appeared out of heaven; shewed the Nephites his wounded side and the print of the nails; instructed them for forty days in the truths of Christianity; healed the sick, blessed children, administered the sacrament, and planted churches, with apostles, prophets, pastors, teachers, and evangelists—the same order, the same priesthood, the same ordinances, gifts, powers, and blessing as was enjoyed on the eastern continent. Hostilities, however, between the Nephites and their dark-skinned brethren continued to rage as fiercely as ever; gradually the purity of their faith declined, and finally, in 384 A. D., a decisive conflict took place at the hill Cumorah, in Western New York, where the Christian Nephites were nearly annihilated; miracles now ceased, and unbelief gradually became supreme. Shortly before this, however, a prophet called MORMON had been commissioned by God to write an abridgment of all their prophecies, histories, &c., and to hide it in the earth, till God should see fit to bring it forth, and 'mingle it with the Bible for the accomplishment of his purposes in the last days.' This is the famous BOOK OF MORMON, believed by the followers of Smith (hence called MORMONS and MORMONITES) to be of equal authority with the Jewish and Christian Scriptures, and to form an indispensable supplement to them, containing God's revelations to the New, as the others to the Old World. In 420 A. D., they were finally sealed up where Smith found them, by Moroni, one of the few survivors of the battle of Cumorah.

The way in which Smith translated was as follows: he sat behind a blanket lung across the room to keep the sacred records from profane eyes, and read off by the help of his 'Urim and Thummin,' to one Oliver Cowdery, who wrote down what the invisible 'prophet' gave as a translation—Smith himself being, as he confesses, but a 'poor writer.' A farmer, of the name of Martin Harris, supplied Smith with the necessary funds to get the work printed. The *Book of Mormon* finally appeared before the world in 1830, with the names of Oliver Cowdery, Martin Harris, and David Whitmer appended to a statement, that an angel of God had come down from heaven and shewn them the original plates. This was immediately followed up by the testimony of eight other witnesses, among whom were Smith's own father and two brothers (suspected, however, it must not be forgotten, of being addicted to sheep-stealing and other nefarious practices), who affirmed that 'Joseph Smith, junior,' had shewn them the mysterious plates. These, however, are the only persons who have been so privileged. No other human being has ever seen them. Like Macpherson's Ossianic MSS., they have never been forthcoming, however loudly demanded, and of late years, all knowledge of them has become traditional.

Attention was soon drawn to the newly-published work, and a controversy sprung up regarding its real authorship. Evidence was brought forward by the opponents of Smith to shew that with the exception of certain illiterate and ungrammatical interpolations, bearing on religious matters, the so-called *Book of Mormon* was really borrowed or stolen nearly *verbatim* from a MS. romance written by a quondam clergyman, named Solomon Spalding, who died in 1816. It is unnecessary to go over the arguments *pro* and *con*. Suffice it to say, that *anti-Mormons* generally think them conclusive; while the 'Saints' consider the whole story of Spalding's MS. romance a scandalous fabrication. About 1829, Smith became acquainted with one Sidney Rigdon, originally a compositor and preacher, but who by this time had begun to promulgate a species of incipient Mormonism, and had managed to found a little sect of his own. It is conjectured by the opponents of Mormonism that Rigdon (into whose hands Spalding's romance is supposed to have fallen for some time) gave it to his new associate to further his purposes, and that the latter—in whose soul there may have been (according to our theory of his character) some rude and gross religious notions and feelings—devised the ungrammatical interpolations. This theory acquires some probability from the fact, that these religious passages do not refer to old-world faiths and the practices of an ancient ritual, but to quite modern questions, such, we are told, as were rife in the villages of Western New York about 1830. Calvinism, Universalism, Methodism, Millenarianism, Roman Catholicism, are dismissed, if not in name, yet in reality. Infant baptism is condemned; so, strange to say, are polygamy and free-masonry.

Undeterred, nevertheless, by exposure, ridicule, and hostility, Smith and his associates persevered in preaching their 'doctrine,' which was a new Americanised phase of millenarianism. They declared that the millennium was close at hand, that the Indians were soon to be converted, and that the New Jerusalem—the final gathering-place of the Saints—was to be somewhere in the heart of the American continent. The 'prophet's' house 'was frequently beset by mobs, and evil-designing persons; several times he was shot at, and very narrowly escaped;' but his fearless courage continued to bring him disciples; and on April 6, 1830, the *Church of*

*Jesus Christ of Latter-day Saints* was first organised in the town of Manchester, state of New York. Smith was fiercely attacked by the leaders and preachers of the other religious denominations, but he kept his ground stubbornly, argued pretty well, and when argument failed, had recourse to a style of zealous prophetic asseveration, which is generally irresistible with weak and ignorant people. If the orthodox preachers, however, could not baffle him in speech, they knew how to inflame their hearers with the most ferocious animosity against the new sect; and in January 1831, Smith and his followers considered it prudent to remove to a distant part of the country. They established themselves at Kirtland, in Ohio, which was to be the seat of the New Jerusalem. They now made immense progress. Their missionaries were full of zeal (none more so, however, than Smith himself), converts were made in great numbers, and churches were established in the states of Ohio, Pennsylvania, New York, Indiana, Illinois, &c. Still the eyes of the new sect turned westward—to the region of the great prairies, where they might be allowed to work out their system in peace and freedom. In the autumn of 1831, a colony was established in Jackson County, Missouri, which a 'revelation' given to Smith assured the Saints was 'the land of promise and the place for the city of Zion.' Land was largely bought; preaching was vigorously carried on, a printing-press was established, a monthly periodical, *The Morning and Evening Star*, and a weekly newspaper, *The Upper Missouri Advertiser*, were started to propagate the doctrines of the new sect; everywhere was visible a spirit of industry, sobriety, order, and cleanliness. It is only fair to the M. to state these things. Account for it how we may, they were, in many important respects, morally, socially, and industrially, far in advance of their neighbours. When Smith returned to Kirtland, he set up a mill, a store, and a bank, and continued his propagandist labours with great success, but not without savage persecution; thus, for example, on the night of March 22, 1832, a mob of Methodists, Baptists, Campbellites, and other miscellaneous zealots, broke into the prophet's house, tore him from his wife's arms, hurried him into an adjoining meadow, and tarred and feathered him! Sidney Rigdon was similarly handled, and rendered temporarily insane. Smith, however, undaunted by this brutal treatment, preached next day with his 'flesh all scarified and defaced,' and proved the folly of persecution by baptising three new converts in the afternoon. Meanwhile, the brethren in Missouri continued to prosper, but this very circumstance deepened the animosity towards them of all who were not Mormons. Whispers also began to be spread about their indulging in a community of wives. The rumour was not true, but it probably originated in some manifestations of a tendency towards polygamy—a doctrine not yet revealed, however (in fact, *contrary* to the 'revealed' doctrine on the subject), and it materially helped to inflame the hostility of the impulsive and unscrupulous backwoods-men. Smith himself affirms that the neighbours of the Saints were, 'many of them, the basest of men, who had fled from the face of civilised society to the frontier country, to escape the hand of justice.' Be that as it may, secret societies were formed to expel the M. from Missouri; their periodicals were stopped, their printing-press confiscated, their bishops tarred and feathered, and numberless other outrages were committed. Finally, the hapless 'Saints' were compelled to flee across the Missouri River, and men, women, and children had to encamp in the open wilderness on a winter-night in 1833. They subsequently settled in Clay

County, in the same state, where they remained upwards of three years. In July 1834, they were visited by the 'prophet' himself, accompanied by 100 persons, mostly young men, and nearly all priests, deacons, teachers, and officers of the church. During a brief residence of one week among them, he accomplished much in the way of vigorous organisation; next year, 1835, a further step was taken in the development of a hierarchy by the institution of a body of apostles—twelve in number—who were sent out to preach the new doctrines among the Gentiles. One of these twelve was the famous Brigham Young, who had become a convert about the close of 1832, and had soon shewn himself to be a man of wonderful sagacity and force of character. He was ordered down east among the Yankees, and made numerous converts even among this acute people. In 1837, Orson Hyde and Heber C. Kimball were despatched as missionaries to England, where they received large accessions to their numbers, especially from the masses in the great manufacturing and commercial towns, Manchester, Liverpool, Leeds, Birmingham, Glasgow, and, above all, from the mining districts of South Wales, where Mormonism, in some places, almost competed for popularity with Methodism itself. Since then, they have extended their strange evangelisation to the East Indies, Australia, the islands of the Pacific, Egypt, Palestine, Turkey, and almost every country on the continent of Europe.

About the close of 1837, or the beginning of 1838, the bank at Kirtland stopped payment, and proceedings were taken against the prophet and others for swindling. Luckily, just at this moment, he received a 'revelation' to depart into Missouri, which he instantly obeyed, with all the more alacrity that internal disorders had painfully manifested themselves in the new colony. These were at last healed; but the conflict between the Saints and the other Missourians became fiercer, more envenomed, more sanguinary than ever, assuming, in fact, almost the proportions of a civil war. The prophet and Rigdon were thrown into prison, and finally, towards the close of 1838, the whole body of Saints, about 15,000, quitted Missouri, and took refuge in Illinois. Here they obtained a grant of land in the vicinity of the little town of Commerce, a name which the M., in obedience to a 'revelation' given to Smith, changed to Nauvoo, or The City of Beauty. The country was a mere wilderness when the M. settled in it: it soon began to rejoice and blossom as the rose. Lieutenant Gunnison (a most intelligent and impartial writer) is forced by facts to be eloquent in praise of Mormon industry, and gives us a perfectly enchanting picture of the new colony. The legislature of Illinois granted a charter to Nauvoo; a body of Mormon militia was formed, under the name of the Nauvoo Legion, of which the prophet was appointed commander; he was also appointed mayor of the city, and was thus supreme in all matters civil and military, as well as religious. As early as 1838, the prophet, it is affirmed, had commenced to practically carry out his doctrine of the 'Celestial Marriage,' or of a 'Plurality of Wives;' but it was not till July 1843 that he formally received a revelation on the subject authorising polygamy. When the 'revelation' became public, considerable indignation was felt even in Nauvoo, and serious disturbances took place, the ultimate result of which was that the prophet and his brother Hyram were thrown into prison at Carthage. After a short time, it began to be rumoured that the governor of the state was desirous of letting the two Smiths escape, whereupon a band of 'roughs,' about 200 in number, broke into the jail, 27th June 1844, and shot them. Disastrous

as this termination of his career was to Smith himself, there cannot be the shadow of a doubt that it was a most fortunate thing for the system which he founded. 'The blood of the martyrs is the seed of the church.' A halo of solemn and tender glory now encircles the memory of one, who, whatever were his virtues, stood greatly in need of this spiritual transfiguration. Already, as Lieutenant Burton remarks, the Saints begin to speak of him 'with a respectful reverential *sotto voce*, as Christians name the Founder of their faith.'

Smith's death created great agitation and confusion among his followers. Sidney Rigdon and others aspired to succeed him, but the Council of the Twelve Apostles unanimously elected Brigham Young, and events have shewn the wisdom of their choice. The legislature of Illinois having revoked, in 1845, the charter given to the city of Nauvoo, and the hostility of their neighbours not having in the least abated, the Saints resolved to emigrate far beyond the boundaries of civilisation, and to seek a new home amid the solitudes of the Rocky Mountains, where they might pass their lives in unmolested peace. Explorers were sent out to examine the country, and brought back a favourable report of the Great Salt Lake Valley. See GREAT SALT LAKE, SALT LAKE CITY, and UTAH. In February 1846, the first emigrants crossed the ice-bound Mississippi, settled for a year in Iowa, and then marched under the strictest discipline across the great wildernesses. Agricultural operations were commenced almost the instant they arrived at the shores of the Salt Lake. The cheerfulness, intelligence, and zeal exhibited on all sides, were truly admirable. The world has never seen swifter, more active, more glad-hearted colonists than these singular 'Saints.' It would be unfair to shut our eyes to such facts. In judging Mormonism, we must keep them constantly in view, to prevent us from forming mere abstract and theoretical decisions, which will not in the least affect the future of Mormonism. Brigham Young arrived in the Valley, July 24, 1847, and the main body of the M. in the autumn of 1848. The Salt Lake City was soon founded, an emigration fund established, and settlers poured in from all parts of Europe and America; and perhaps a greater amount of physical comfort was enjoyed here than in any other part of the world. In 1850, the government of the United States admitted the region occupied by the M. into the Union, as a territory, under the name of UTAH, and Brigham Young was appointed governor by President Fillmore. District judges were also appointed by the federal government, but these were looked upon with great suspicion and mistrust by the Saints, who finally drove them out of the country in 1851. Brigham Young was now suspended from his office of governor, and Colonel Steptoe of the United States army was appointed his successor. He arrived in Utah in 1854, but found it prudent after some time to withdraw from the country. During the next two years, the collisions between the United States officers and the Saints became more and more frequent, and in the spring of 1856, the whole of the former were forced to flee from the territory. A new governor, Alfred Cumming, was appointed by the authorities at Washington in 1857, and also a new superintendent of Indian Affairs; besides, a force of 2500 men was sent to enforce obedience to the laws of the United States. The Saints attacked their supply-trains, and compelled the enemy to winter at some distance from the Salt Lake. In the early part of next year, negotiations were entered into between the contending parties; the M. submitted to the federal authority, and the federal troops were allowed to encamp on the western side of Lake Utah, about

forty miles from Salt Lake City, where they remained till 1860, when they withdrew.

The exact number of the Saints cannot be ascertained, but it is believed to amount to at least 200,000, of whom perhaps one half are scattered over the Old World; the rest are chiefly in Utah.

*Hierarchical Organisation.*—Mormonism is a pure theocracy; its priesthood, who rule in matters temporal and ecclesiastical, are divided into various orders. The highest is the *First Presidency*, composed at present of Brigham Young, Heber C. Kimball, and Daniel C. Wells—the successors of Peter, James, and John in the Gospel Church. Of these, Brigham Young is *primus inter pares*. The first presidency is elected by the whole body of the church, and possesses supreme authority. The second office in point of dignity is that of *Patriarch*, held at present by the nephew of Joseph Smith, whose chief duty is to administer blessings. Then follows the council of 'The Twelve,' whose functions are of great practical importance. They ordain all other officers, elders, priests, teachers, and deacons; they baptise, administer the sacraments, and take the lead in all meetings. Next come the *Seventies* (of whom there are many). They are under the direction of the 'Twelve Apostles'—and are the great propagandists, missionaries, and preachers of the body. The fifth order is that of *High-priests*, composed usually of men advanced in years. Their duty is to officiate in all the offices of the church when there are no higher authorities present. After these come the *Bishops*, who are 'oversers' of the church chiefly in secular matters, attending to the registration of births, marriages, and deaths, the support of 'literary concerns' (such as newspapers and magazines), house-visiting, and the settlement of private grievances. The duties of the *Elders* are not very precise; they are charged with the conduct of meetings, and exercise a general surveillance over the *Priests*, who correspond to the 'fixed ministry' of other sects, i. e., they preach, exhort, and expound the Scriptures. The lowest orders are the *Teachers* and *Diacons*; the former are simply assistants to the priests, elders, and bishops, and act as catechists; the latter are church-collectors, treasurers, &c.—The whole priesthood is divided into two classes, the Melchisedek and the Aaronic. To the first belong the offices of apostle, seventy, patriarch, high-priest, and elder; to the second, those of bishop, priest, teacher, and deacon. The latter can be held only by 'literal descendants of Aaron,' who are pointed out by special revelation.

*Doctrine.*—The Saints are almost incredibly materialistic in their doctrines. Their Godhead is formed on Buddhist principles. While professing to believe in the Trinity, they explain that God was once a man, who has, however, so advanced in intelligence and power that he may now be called (comparatively speaking) perfect, infinite, &c., but that he has still the form and figure of a man; he has even 'legs,' as is evident (according to Mr Pratt, an eminent Mormon) from his appearance to Abraham; though he has this advantage over his creature, that 'he can move up or down through the air without using them.' Christ is the offspring of the 'material' union, on the plains of Palestine, of God and the Virgin Mary—the latter being duly married after betrothal by the angel Gabriel. Yet he is believed to have had a previous existence, to have even made the universe out of 'informed chaotic matter as old as God,' and his worship is enjoined as Lord of all. The Paraclete is vaguely described, but is also maternal. It would appear, however, that there is an older Trinity, that of 'Elohim, Jehovah, and Michael, which is Adam.' Adam, again, is declared to be the 'god' of Jesus

Christ; Jesus Christ, the god of Joseph Smith; and Joseph Smith is now the god of this generation; but the whole affair is a mass of unintelligible rubbish. The human intellect probably never sank into more abysmal nonsense; all that can be definitely set before the mind is, that M. believe that by faith, obedience, holiness, any man may rise into a deity, and acquire the power of making, peopling, and ruling a 'world' for ever! The *second* article of the Mormon creed affirms that 'men will be punished for their own sins, and not for Adam's transgressions'—an opinion which, if not very orthodox, is considerably more rational than those embodied in the first article; the *third* article states that 'through the atonement of Christ, all mankind may be saved by obedience to the laws and ordinances of the Gospel.' The *fourth* article affirms these 'ordinances' to be: 1. Faith in the Lord Jesus (which is very curiously expounded). 2. Repentance. 3. Baptism (which takes place at eight years of age—that being, according to the Saints, the period at which moral responsibility begins). They also baptise for the dead, in accordance with St Paul's saying (1 Cor. xv. 29), and assert that at the resurrection all the persons for whom a man has been baptized will be added to his family. 4. Imposition of hands by the gift of the Holy Spirit. 5. The Lord's Supper, administered kneeling. The Saints, who are much averse to strong drinks, use water instead of wine in the sacrament, which is taken every week. The *fifth* article declares that 'men must be called to the work of God by inspiration;' the *sixth*, that the same organisation must now exist that existed in the primitive church; the *seventh*, that miraculous gifts—'discerning of spirits, prophecy, revelations, visions, healing, tongues,' &c.—have not ceased. The 'discerning of spirits' led Smith into a variety of curious speculations. He believes that the soul of man was not created, but 'coexisted equal with God. "God," he says, "never did have power to create the spirit of man at all—the very idea lessens man in my estimation—I know better!"' He also believes in the transmigration of souls. Rebellious spirits descend into brute tabernacles, till they yield to 'the law of the everlasting gospel.' The *eighth* article is decidedly liberal; it expresses a belief that the word of God is recorded not only in the Bible and the Book of Mormon, but in 'all other good books.' As for the contradictions that exist in the first, Smith admits them, but alleges that they are 'corruptions,' and that they can be removed by his or any other prophet's inspired explanations. It is said that he has left an 'inspired translation' of the whole Bible in MS. The *ninth* article expresses a belief in all that God has revealed, is revealing, or will yet reveal. The *tenth* affirms the literal gathering of Israel, the restoration of the Ten Tribes (the 'American Indians,' who are, in consequence, treated with considerable humanity by the Saints), the establishment of the New Zion on the western continent—the millennial reign of Christ on earth, and the transformation of earth into a Paradise. The *eleventh* article maintains 'the literal resurrection of the body'—to 'flesh and bones,' but not blood—blood being, according to Smith, 'the principle of mortality.' The *twelfth* article asserts the absolute liberty of private judgment in matters of religion; the *thirteenth*, declares it the duty of the Saints and all others to be 'subject to the powers that be,' whether monarchical or republican. The *fourteenth* and last is worthy of being universally accepted: 'We believe in being honest, true, chaste, temperate, benevolent, virtuous, and upright; and in doing good to all men;' also that 'an idle or lazy person cannot be a Christian, neither have salvation.'

The religious views of the M. are, it will thus be seen, an extraordinary jumble. They have something in common with nearly every sect that has ever been known. Hebraism, Persian Dualism, Brahmanism, Buddhistic apotheosis of saints; Christianity, both in its orthodox and heterodoxy; Mohammedanism, Drusism, Free-masonry, and latterly, Methodism, Swedenborgianism, Mesmerism, and Spirit-rapping, have all contributed something. The Saints do not deny this. Smith, in fact, declares that as every religion in the world 'has a little truth mixed with error,' it is the duty of his followers to pick it out, that 'all the good and true principles may be gathered together;' 'otherwise,' he adds, 'we shall never become pure Mormons.'

The great social peculiarity of the sect is their practice of polygamy. It was not so, however, at first. From 1830 to 1843, they were monogamists, but in the latter of these years, as we have seen, Smith obtained a revelation permitting, and even recommending, a plurality of wives. Still, it does not appear to have become the practice, among the M., till their journey across the prairies to the Valley of the Salt Lake. Since then, it has been boldly avowed, and defended against other Christians by an appeal to Scripture. M. are permitted to be monogamists, but encouraged to be polygamists by the 'revelation' given to the prophet, that the rank and dignity of Saints in the other world is proportioned to the number of their wives and children. A defence of the practice is also set up on moral grounds. M. assert that their community is free of the horrible sin and viciousness that prevail elsewhere; fornication and adultery, with their guilty passions and abandoned conduct, are declared to be unknown; they boast that they have no wretched prostitutes, no illegitimate children, no vile seducers; their wives are asserted (Burton and others are very strong on this point) to be happy, virtuous, and healthy, and they challenge comparison in regard to their domestic and social purity and felicity with any monogamic community in the world.

F. L. Kane (1850); *History of the Mormons*, in Chambers's *Repository of Tracts*, vol. vii.; *The Mormons, or Latter-day Saints, with Memoirs of the Life of Joseph Smith* (Office of the National Illustrated Library, London); *Voyage au Pays des Mormons*, par Jules Remy (1860); and *The City of the Saints*, by R. H. Burton (1861).

**MORMYRIDÆ**, a family of malacopteron fishes, allied to the *Esocidae*, or Pike family; having longish compressed bodies, and a slender tail, swelling out at the origin of the caudal fin. The skin of the head is naked, enveloping the gill-covers and gill-rays, leaving only a slit for gill-opening. The mouth is small. All the known species inhabit the rivers of Africa. The SHARP-NOSED MORMYRUS (*Mormyrus oxypnechus*) is regarded as one of the best fishes of the Nile. It is caught by lines baited with worms. The M. are nocturnal fishes. They are sometimes represented on Egyptian monuments, and seem to have been held sacred by the ancient Egyptians. The modern Egyptian name is *Mizdeh*. Some of the species have electric organs.

**MORNY**, CHARLES AUGUSTE LOUIS JOSEPH, COMTE DE, a French statesman, of the second

Empire, regarding whose parentage the biographical dictionaries published under imperial censorship are strangely silent. It is, however, universally believed that he is the son of Queen Hortense and of the Comte de Flahault, and consequently half-brother of Louis Napoleon. He was born in Paris, October 20, 1811. The Comte de Morny, a French nobleman resident in Mauritius, received 800,000 francs to adopt him as his son; but he was educated by his 'grandmother,' Madame de Flahault; and Queen Hortense left him at her death, in 1837, an annuity of 40,000 francs. M. entered the army in 1832 as a sub-lieutenant, and is said to have shewn at this early period a predilection for metaphysics and theology, which is indeed sufficiently surprising, if true, considering his subsequent thirst for material gratifications. He served with some distinction in Algeria; but he soon abandoned a military life, and in 1838, made his début in the world of industry as a manufacturer of beet-root sugar, and published a pamphlet on the subject. Ever since then, he has been mixed up in all sorts of commercial and financial speculations—railway companies, canal companies, French and foreign mining companies, credit societies, industrial enterprises, &c. Chosen a deputy in 1842, he quickly attained a prominent position on account of his aptitude for dealing with financial questions; but events shewed that he was not free from the reckless spirit of an adventurer, and his daring at times excited a suspicion of enormous swindling somewhere. After the revolution of 1848, he became attached to the cause of his half-brother, and was the leader of the subtle and treasonable policy of the Elysée. He took a prominent part in the *coup d'état*. His rôle was to exhibit *sang-froid*, and to throw the republican leaders off their guard. Nor did he fail of success. He passed the evening of December 1 at the *Opéra Comique*, and yet, by six o'clock next morning the deed was done, and M. was Minister of the Interior. In 1854, he became president of the *Corps Législatif*, and was ambassador to Russia during 1856—1857, where he married the rich and handsome Princess Trubetskoi. The result of his Russian mission was the establishment of intimate political relations between the two governments, and a commercial treaty advantageous to both countries. He died May 1865.

**MOROCCO**, or **MAROCCO**, called by the natives *Maghrib-el-Aksa*, 'the extreme west,' or briefly *Maghrib*, an empire or sultanate in the north-west of Africa, is bounded on the E. by Algeria, on the N. and W. by the Mediterranean Sea and Atlantic Ocean, and on the south by a line which runs from Cape Nun (lat. 28° 45' 43" N.), in an easterly direction through the Sahara to the Algerian frontier in long. 2° E. At the present day, M. includes the three former kingdoms of Maghrib, Fez, and Tafillet, and contains about 230,000 English square miles, with a population of about 8,500,000, though some estimates make it only 6,000,000. The country is generally mountainous, the Atlas (q. v.) range traversing it in several parallel chains from south-west to north-east, and sending out numerous spurs to both the coast-country and the desert. There are, however, many level tracts throughout M., especially at its western and eastern extremities, and on the borders of the desert. The central range of the Atlas forms the water-shed separating the streams which flow into the Atlantic and Mediterranean from those which run southward to the desert. The former rivers have the shorter course and less volume, but they are perennial; while the latter become dry in summer, and even when running are lost in the sands of the Sahara. The chief rivers are the

Muluya, with its tributary the Sharef, which drains the north-east of the country, and falls into the Mediterranean after a course of 400 miles; the Kos, Oom-a-beg, Bu-Regreb, Tensift, Suse, and Assaker, the last forming for part of its course the southern boundary of M., drain the central and western districts, and fall into the Atlantic; the Draba, Fileli, Ziz, and Gir, irrigate the dry plains of Tafiilet, and the first-mentioned then empties itself into the Atlantic Ocean. The subsequent courses of the other three rivers are not yet well ascertained.

The climate between the central range of Atlas and the sea is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., owing partly to the regulating influence of the sea-breeze, and the shelter afforded by the mountains from the scorching winds of the desert; but in the south-east districts, extremes of heat and cold are said to prevail, and rain is there unknown.

Among the chief products of the country are wheat, barley, rice, maize, durra, and sugar-cane; and among fruits, the fig, pomegranate, lemon, orange, and date are common; while cotton, tobacco, hemp, &c., are largely produced both for home use and export. M. is supposed to be rich in mineral treasures; plentiful supplies of copper are obtained at Tescleht, near the source of the Assaker, and gold and silver occur in several places. Iron, antimony, lead, tin, and rock-salt, the last three in considerable quantity, are also found. Owing to the character of the country and its thin population (35 to the English square mile), M. is much infested with wild animals. Lions, panthers, hyenas, wild-boars, and various kinds of deer, gazelles, &c., abound in suitable localities, and occasional devastations are committed by locusts. Ostriches are found in Tafiilet. The Moorish horses, formerly so famous, are now much degenerated. The breeding of sheep, oxen, goats, camels, mules, and asses, forms an important item of national industry. Oxen and bulls are chiefly employed in field-labour.

The inhabitants, like those of Barbary in general, consist of Moors, Berbers, Arabs, Negroes, and Jews, with various intermixtures between these races. The Moors are the most numerous, and are the dominant race in M., numbering about 4,250,000; next to them are the Berbers, or Amaziyeys, who amount to about 3,750,000, and include the Berbers of the Riff coast, and the Shellahs of the Great Atlas. Very few Europeans reside in Morocco. The state of civilisation is very low, and many of the Amaziyeys are complete savages. Excepting the Jews and the few Europeans, the whole population is Mohammedan. The negroes are generally brought into the country as slaves from Sudan.

M. is divided into four territories—Fez, Morocco, Suse, and Tafiilet. For convenience of administration, the empire is subdivided into 33 governments or districts ('ammala'), each under the superintendance of a 'caid,' whose chief duty it is to collect the imposts; but the semi-independent tribes are ruled by their own chiefs, and scarcely acknowledge the authority of the sultan. The government is purely despotic, and in the absence of written laws, the will of the sultan and his subordinates decides everything. The public officials eke out their allowances by practising extortion on those under their charge, and are in turn plundered by their superiors. The sovereign of M., called by Europeans the Emperor of M., is known among his subjects as sultan, and assumes the titles of *Emir-ul-numenin*, or 'Prince of the Believers,' and *Khalifeh-Allah-fi-chalkihi*, or 'Vicegerent of God upon Earth.' The title is hereditary in the male line, but does not necessarily descend to the eldest son.

Education consists in learning to read, write, and

recite portions of the Koran, and this quantum of education is pretty generally diffused among the people, but the art of printing is unknown, and the arts and sciences are at a very low ebb.

The only industrial arts prosecuted to any considerable extent are the manufactures of caps, fine silks, and leather. In the production of this last, the Moors far surpass Europeans, and are able to render any kind of leather extremely soft and white, by the use, it is said, of two species of plants found in the country, and unknown to Europeans. They also excel in the production of brilliant colours in leather. The yellow leather is made in M. Proper, the green in Tafiilet, and the red in Fez. There is an important caravan-trade between M. and Sudan, and also with Mecca and the Levant. The principal exports are wool, hides, grain, cattle and sheep, leather, salt, &c.; and the imports, cotton, linen, and muslin goods, sugar, tea, coffee, hardware, gold-dust, indigo, ivory, &c. Mules, horses, and camels, form the internal means of transport. Much of the Arabian trade is carried on by coasting-vessels between Tangier and Egypt, as the carriage across the desert is very costly. At the present time, two-thirds of the entire trade of M. is in the hands of British merchants.

The army consists of between 15,000 and 20,000 men, of whom one-half are negroes; there is also a sort of militia, amounting to 50,000 or 100,000 men, which is occasionally called out. The navy is now insignificant; but in former times, especially in the 16th and 17th centuries, it was very formidable to the maritime powers of Europe, and was chiefly occupied in piratical expeditions. See *ERR*.

The history of M. is, generally speaking, similar to that of the rest of Barbary (q. v.) down to the end of the 15th century. About that time, it was formed into a monarchy, and notwithstanding internal divisions, enjoyed considerable prosperity, and the confines of the empire were extended as far south as Timbuktu. This empire fell to pieces, and was succeeded in 1647 by that of the Sherifs of Tafiilet, who conquered both M. Proper and Fez, and united the whole country under one government. This is the present ruling dynasty. In the middle of the 17th c., the empire of M. embraced part of the present province of Algeria, and extended south as far as Guinea, where it came into collision with the Portuguese settlements. Since the commencement of the 19th c., the rebellions of the wild mountain tribes, the disturbances in Algeria, and difficulties with foreign states, caused by the aggressions of the Riff pirates, have greatly retarded the well-conceived measures of the various rulers for the development of the resources, and increase in civilisation of Morocco. In 1814, the slavery of Christians was abolished; and in 1817, piracy was prohibited throughout Morocco. In 1844, M. took part in the war of Abd-el-Kader against the French, in the course of which Tangier was bombarded and Mogadore occupied; but peace was concluded in the same year. In 1851 and 1856, complications took place with France concerning some French vessels which had been plundered by the Riff pirates, but in each case compensation was given by the sultan. In 1859, the Spanish government, smarting under a series of similar outrages, demanded compensation, and also an apology for an insult to the Spanish flag at Ceuta; and on the sultan's disclaiming all responsibility for these acts, war was declared by Spain, October 22, 1859, and a large force under Marshal O'Donnell invaded Morocco. Two battles were fought, several ports were bombarded, and Tetuan taken, and on March 25, 1860, the sultan yielded. A treaty was accordingly signed, April 27, 1860, by which the sultan ceded some portions

of his territory, paid 20,000,000 piastres towards the expense of the war, and granted several commercial privileges to Spanish merchants.

**MOROCCO** (Arab. *Marakash*), the capital of the empire of the same name, is situated in the south-west of the country, 4 miles south of the river Tensift, and at the north end of an extensive and fertile plain. It is surrounded by a strong lime-and-earth wall 30 feet high. The town is ill built, the streets narrow, irregular, and unpaved; the houses, generally built of the same materials as the wall, are one story high, with flat roofs, and narrow openings instead of windows. A large portion of the space within the walls is occupied with gardens, open areas, and market-places. In the bazaar and market-place, a large miscellaneous trade is carried on. M. possesses 19 mosques, of which 6 are remarkable for their size and elegance. There are several tanning and leather-dyeing establishments, some of them of great extent. The population is estimated at about 50,000.

On the south of the city, outside the walls, stands a palace of the sultan of M., occupying a space of about 180 acres.

M. was founded in 1072, and reached the summit of its prosperity in the 13th c., when it contained more than 700,000 inhabitants, since which time it has been rapidly decaying. It is now half in ruins.

**MORO'N**, a town of Spain, in the province of Seville, and 37 miles south-east of the city of that name, on the Gadeira. It is built on irregular acclivities, and contains the remains of a once almost impregnable castle, erected by the Moors on Roman foundations. The inhabitants are engaged in the culture and preparation of olive-oil. Pop. 10,500.

**MORPETH**, a market-town and parliamentary and municipal borough of England, in Northumberland, is situated on the Wansbeck, 15 miles north of Newcastle. Of the principal buildings, the parish church dates from the 14th c.; the Free Grammar-school of Edward VI., founded in 1552, has an income from endowment of £650 a year; the town-hall was erected by Sir John Vanbrugh. Flannel is manufactured; brewing, malting, and tanning are carried on, and iron foundries and corn-mills are in operation. M. returns a member to the House of Commons. Pop. of municipal borough (1861), 4296; of parl. borough, 13,794. (1871—4510, and 30,189.)

**MORPHEUS** (literally, the 'shaper' or 'fashioner'), in the Classic Mythology, the son of Somnus (Sleep), and the god of dreams. He is so named, because he shapes or moulds the dreams that visit the sleeper. He is first mentioned by Ovid, and is represented as an old man with wings, pouring somniferous vapour out of a horn.

**MORPHIA** ( $C_{34}H_{19}NO_6 + 2 Aq$ ) derives its name from Morpheus, in allusion to its narcotic properties. It is the most important of the alkaloids existing in opium, of which it constitutes from  $\frac{1}{10}$ th to  $\frac{1}{15}$ th by weight. It occurs in combination with meconic, and sometimes with sulphuric acid. It is obtained in short rectangular prisms, containing two equivalents of water of crystallisation, which are expelled at a gentle heat, when the morphia melts into a resinoid substance. Morphia is soluble in about 1000 parts of cold and in 400 of boiling water; boiling alcohol dissolves it freely, but it is insoluble in ether and chloroform. Its solutions have a bitter taste, and change the yellow colour of turmeric paper to brown. Morphia is not so easily detected in cases of poisoning by opium as Meconic Acid (q. v.). The following are the ordinary tests for it: concentrated nitric acid, when applied to a crystal either of morphia or of one of its salts, produces an

orange colour. A mixture of nitric and sulphuric acids colours it green. When it is mixed with iodic acid, iodine is liberated, which may be recognised by its brown colour and by the well-known starch-test. A neutral solution of perchloride of iron produces a beautiful blue colour.

Morphia is the only opium-alkaloid which is soluble in lime-water, and this property affords one of the best means of extracting it. A watery infusion of opium is boiled with milk of lime, filtered, mixed with powdered sal-ammoniac, and again boiled. By this means, the lime is converted into the hydrochlorate (or, more correctly, into chloride of calcium), the ammonia is volatilised by the heat, while the morphia is precipitated in a crude form, which admits of easy purification.

Morphia combines with acids to form crystallisable salts, which are readily soluble in water and in alcohol. Of these, the *Hydrochlorate* (*Muriate*) and the *Acetate*, especially the former, are much used in medicine.

The therapeutic uses of morphia and its salts are very similar to those of Opium (q. v.); but the preparations of morphia are preferable to opium and laudanum in being less liable to occasion nausea and headache. The ordinary dose of morphia, or its hydrochlorate or acetate, when given to an adult to allay pain or induce sleep, ranges from a quarter of a grain to half a grain. The British Pharmacopoeia which is now published (January 1864), and which supersedes the London, Edinburgh, and Dublin Pharmacopoeias, contains a solution of the hydrochlorate of morphia, in which there is half a grain of the salt in one drachm of the solution; hence the ordinary doses of this solution range from 30 minims to a drachm. The pharmacopoeia also contains morphia lozenges and morphia and ipecacuan lozenges, in each of which there is one-thirty-sixth of a grain of hydrochlorate of morphia.

**MORPHOLOGY.** See METAMORPHOSIS OF ORGANS.

**MORRIS-DANCE**, a peculiar and fantastic species of dance, commonly practised in the middle ages, and existing at the present day among the country people in several parts of England. Its origin is ascribed to the Moors, though the genuine Moorish dance (the *fundango* of the present day) bears little resemblance to it. The chief performer was the *hobby-horse*, so called from the light frame of wickerwork which was fastened round his body, and supplied with a pasteboard head and neck, so as to give him the appearance of a man on horseback. Bells were also attached to his ankles, and the great art consisted in so moving the feet as to produce a rude kind of concord. The other principal actors, after a rude fashion, personified the characters of Maid Marian, the Queen of the May, Robin Hood, Friar Tuck, the Fool, &c.; and the performance was accompanied by rude music, and the clashing of swords and staves, and was the chief amusement at parochial festivals.

**MORRISANIA**, a village of New York, United States, in Westchester County, on the New York and New Haven Railway, and about ten miles north of New York. It has been mostly built within the last five or six years, and is chiefly occupied by persons doing business in New York. Pop. (1860) 9245.

**MORRISON, ROBERT, D.D.**, the founder of Protestant missions in China, was born of Scottish parentage at Morpeth, in Northumberland, 5th January 1782. He studied at one of the Independent colleges, and in 1805, he was sent to Macao and Canton by the London Missionary Society, to learn the Chinese language, and to

translate the Bible into it. He reached Canton in September 1807, and in the course of a year was appointed translator to the East India Company's factory at Canton. By the year 1814 he had completed the translation and printing of the whole of the New Testament. Four years later, by the help of Mr (afterwards Dr) Milne, he had done the same with the Old Testament; and in 1822, he completed and printed his great *Chinese Dictionary* at an expense to the East India Company of £15,000. In 1816, he acted as interpreter to Lord Amherst. In 1818, he established an Anglo-Chinese College at Malacca for English and Chinese Literature, and for the propagation of Christianity. After a residence of 17 years in China, he returned to England in 1824, and brought with him a collection of 10,000 books in the Chinese tongue. In 1826, he returned to China. In 1834, he accompanied Lord Napier to Canton as interpreter, and died there 1st August. Besides the works already mentioned, he is the author of *Howa Sinee* (Lond. 1812), being translations from the popular literature of the Chinese; a *Chinese Grammar* (Serampore, 1815), and *Chinese Miscellany* (1825). In 1839, his widow published *Memoirs of the Life and Labours of Robert Morrison*.

**MORRISTOWN**, a village of New Jersey, United States of America, on the Whippany River, and the Morris and Essex Railway, 23 miles west of New York, on an elevated plain, commanding a fine prospect. It has a court-house, 2 banks, 7 churches, and several literary institutions. Pop. (1860) 6024.

**MORSE, WALRUS, or SEA-HORSE** (*Trichecus*), a genus of amphibious mammalia of the family *Phocidae*, agreeing with the rest of that family—the seals—in the general form of the body and limbs, but widely differing from them all in the head, which is remarkable for the enormous development of the canine teeth of the upper jaw, and the tumid appearance of the muzzle caused by the magnitude of their sockets, and by the thickness of the upper lip. These great canine teeth form two tusks directed downwards, and the lower jaw becomes narrow in front, so as to pass between them. There are no canine teeth in the lower jaw. The incisive

Morse (*Trichecus rosmarus*).

teeth are small, six in the upper jaw, and four in the lower, mostly disappearing from adult animals. The molars—at first, five on each side in each jaw, but fewer in the adult—are simple, and not large; they have the crowns obliquely worn. The nostrils, as if displaced by the sockets of the tusks, open almost upwards, at some distance from the muzzle. The eyes are small; and the ears have no auricle, or, in popular language, there is no ear.—There is only one known species (*T. rosmarus*), sometimes called the ARCTIC WALRUS, an inhabitant of the

Arctic seas and of the colder parts of the north temperate zone. It sometimes attains a size greater than that of the largest ox, and the tusks are sometimes two feet, or even thirty inches long; but the ordinary length of the tusks is only about one foot. The M. is a gregarious animal, and is often seen in great herds, which sometimes leave the water to rest for a while either on the ice or on the land, where, however, their movements are very awkward and clumsy, and the hunter assails them with much greater prospect of success than in the water. Hundreds have thus been killed at one time, although the adventure is not without danger, as they must be assailed with spears, their hide being thick enough to resist even a rifle bullet. The M. uses its tusks for protecting itself or young from attack, for combating with its enemy the polar-bear, for aiding it in climbing upon ice; but principally, it is supposed, for tearing sea-weed from submarine rocks; that being, there is every reason to think, the principal food of the animal, although it is supposed also to prey on molluscs, crustaceans, and other marine animals. The female M. shows great affection for her young, and will defend it to the last extremity; the young also remains beside the mother even after she is killed. When one of these animals is attacked, the rest of the herd—at least if in the water—hasten to its assistance. The M. is very capable of being tamed.—It is much sought after by the inhabitants of the most northern parts of the world for its skin, thongs of which seem to have been generally used in former times for ropes and cables—esteemed so valuable, that the Finlanders paid tribute in this article; whilst its oil—not very abundant—is employed like seal oil; and the tusks are very much valued as ivory, being superior in compactness to those of the elephant. The flesh is coarse, but is eaten by the Esquimaux. The young M. has not large tusks like the adult.

The M. has occasionally been seen on the British coasts, probably transported on icebergs from the north.

The name M. is from the Russian *Mors* or Lapp *Morsk*. The name *Walrus* is Norwegian (*Hval-ros*, Whale-horse). Another Norwegian name is *Rosmar*, supposed to be from the Teutonic *ros*, horse, and *mar*, the sea.

**MORSE, SAMUEL FINLEY PREESE, LL.D., &c.**, American artist and inventor, is the eldest son of Rev. Jedediah Morse, D.D., geographer, and was born at Charlestown, Massachusetts, April 27, 1791. He graduated at Yale College in 1810, and visited England with the American painter Washington Allston, to study painting with him and Benjamin West. In 1813, he received the gold medal of the Adelphi Society of Arts for his first effort in sculpture, the 'Dying Hercules.' Returning to New York in 1815, he became the first president of the National Academy of Design, and was appointed Professor of the Arts of Design in the university of the city of New York. He did not give his entire attention to art, but was interested in chemistry, and especially in electrical and galvanic experiments; and on a voyage from Havre to New York, in 1832, he conceived the idea of a magnetic telegraph, which he exhibited to congress in 1837, and vainly attempted to patent in England. His claims to priority of invention over Professor Wheatstone in England have been the subject of considerable controversy. See TELEGRAPH. He struggled on with scanty means until 1843, when, as he had almost yielded to despair, congress, at midnight, and the last moments of the session, appropriated 30,000 dollars for an experimental line between Washington and Baltimore. For his telegraphic inventions, M. has been rewarded by testimonials,

honours, orders of nobility, and wealth. Several European states joined in presenting him a purse of 400,000 francs, and banquets were given him in London and Paris. The recording instrument in use in America is his invention.

**MORSHANSK**, a district town in the centre of the government of Tambof in European Russia, 56 miles north of Tambof, is situated on the left bank of the Tzna, a feeder of the Oka. Its population in 1859 was 13,812. M. is the port for shipment of the corn of the provinces of Simbirsk and Saratof, the shipments annually amounting in value to 5,000,000 rubles. There is also a large market for the cattle and sheep of the south-east provinces, the average annual supply being 20,000 cattle and 100,000 sheep; also for melted grease, of which 1,500,000 rubles worth is sent yearly to St Petersburg and Moscow. The trade of the town itself is of little importance, the chief establishments being soap-boileries, flour-mills, and sailcloth manufactories.

**MORTALITY, LAW OF.** While there are few future events the date of whose arrival is more uncertain than that of death to any one man, on the other hand, the average duration of a multitude of human lives is found to be in accordance with a law which operates as surely as that of gravitation. If it be asked how many lives must we have, before we can depend on obtaining from them a duration equal to the general average, the only answer that can be given is, that the more we have the more nearly must we approach to this result; the fluctuation ultimately becoming so small as to be practically of no effect. So long ago as early in the 17th c., a certain John Graunt of London published what he called *Natural and Political Observations on the Bills of Mortality*. This work has been called 'the earliest movement in economical arithmetic, and the closest approximation to the data on which life-assurance is founded.' About the same time, Sir William Petty gave to the world many curious calculations and speculations on the same subject. In 1693, Dr Halley published the Breslan tables of mortality, and this was the first work which really raised the subject to the rank of a science. Halley's speculations had, however, been preceded by those of Pascal in France, and of De Wit in Holland; and the latter famous man is probably entitled to be considered as the first who has applied the doctrine of probabilities to the valuation of life in the question of annuities. His treatise will be found in the second volume of the *Assurance Magazine*. Halley's tables are printed in the *Philosophical Transactions* for 1693, No. 196. In 1713, J. Bernouilli's important work was published; and in 1742, Dr Price, availing himself of the principles laid down by Halley, and of data previously published by 'John Smart of Guildhall, London, Gent.,' gave tables of mortality for London. In 1746, M. Deparcieux published at Paris his *Essai sur les Probabilités de la Vie Humaine*, in which he gave six valuable tables. In one of these, computed from the registers of different religious houses, it was shewn, for the first time, that female life is superior to male. In 1770, appeared the first edition of Price's *Observations on Reversionary Payments*. The speculations of Buffon, Simpson, and De Moivre about the same time were of much importance. Mortality tables are tables shewing the operation of the law of mortality. The correct method of framing them is by analysing and collating accurate and sufficiently extensive statistics of life and death. They enable us to form a fair estimate of the number of human beings who will die at the end of a given period out of a given number alive at the beginning of it; and hence, the chance of life and

death to the individual, and the mean duration of life at any age. Tables shewing the mean duration of life have been constructed in two ways: 1st, From statistics of deaths alone; and 2d, From statistics of life and death. By the first plan, they would be deduced as follows: Suppose, on searching a parish register, that we found recorded 100 deaths of children in their first year, we should assume that, on an average,  $\frac{1}{2}$  a year of life would have fallen to each. This gives 50 years of life among 100. If we found that 60 had died in their second year, assigning one year and a half to each, we should have  $60 \times 1\frac{1}{2} = 90$  years among the 60; and so on for every age up to the oldest on the register. The sum of all the years enjoyed, divided by the numbers who have enjoyed them, will give the mean duration of life from birth; and the sum of all the years enjoyed after a given age, divided by the numbers who have enjoyed them, will give the mean duration at the given age; in both cases as nearly as the data enable us to give it; but the data are insufficient. Suppose we found by a register for 1863 that 100 children had died in their first year and one man in his 96th, it is plain that, to make this ratio a fair one, there ought to have been as many births in 1763 as in 1863. If there have been only half as many born at the former date as at the latter, then we must put two lives into the calculation to make it correct; and we must proportion our results similarly at all intermediate ages. Again, suppose four deaths at age 23 to be registered, we cannot tell how many of those born in 1840 may have emigrated from one parish, nor do we know how many born elsewhere in that year may have come into it. For the rule and formula for obtaining the mean duration of life under the second method, which is an absolutely certain one, see **LIFE, MEAN DURATION OF**. The following are the tables now most generally used by assurance and annuity offices in this country: I. The Northampton (Dr Price's). This table was framed by Dr Price from the register of burials in the parish of All Saints, Northampton, 1735—1780. Being constructed on deaths alone, it has, as was to have been expected, proved faulty. It gives the probabilities of life too low at the younger and middle ages; and those offices which still use it—and there are a good many—have some difficulty in keeping themselves right. II. The New Northampton (Nos. 1 and 2). These tables were constructed by Dr Farr. See Eighth Report of the Registrar-general for England, pp. 277—348. No. 2 is based on the deaths alone in Northampton during the seven years 1838—1844. In its results it agrees almost exactly with that of Dr Price. No. 1 was deduced from a comparison of the deaths during 1838—1844 with the census returns of 1841. It differs widely from No. 2 and from Dr Price. By the two latter, the mean duration of life is respectively found as 24.88 years and 25.18 years. By No. 1, it is 37.5 years. III. The Carlisle. This table was constructed from observations made by Dr Heysham at Carlisle, 1780—1787. It is now generally understood that the mortality in towns is understated at ages 15—35, owing to the immigration of healthy men and women from the country. Again, the female population of Carlisle was excessive during the period in question, and the extent of the observations was limited. Owing to these facts, this table gives rather too low a rate of mortality, and is a little irregular in its graduation. In a table prepared by W. P. Thomson, Esq., in a Report on the Ministers' Widows' Fund of the Church of Scotland, 1861, he shews that the lives of the Scotch clergy are about half a year better up to 44 than the Carlisle; at 45, they are equal; and at 45 to 80, they are half a year

MORTALITY.

worse. Thereafter they vary. The widows are half a year better up to 61, equal at 62, and nearly so to the end. Probably the Carlisle gives a fair mortality rate for a healthily circumstanced population. IV. The Government. These were computed by Mr Finlaison on the lives of 22,000 nominees for government annuities. They are chiefly important as giving a view of the value of female life, but this view is one which differs widely from those given either by the 'Experience' or by the 'English' table. At age 20, for instance, the mean duration of female life is, by the Government table, 5½ years more than the male; by the Experience, it is 4 years less. In some measure this wide divergence may perhaps be accounted for by the fact that the Government results are deduced from annuitants, the Experience from assured lives. V. The English (Nos. 1 and 2). No. 1 is deduced from the living by the census of 1841, and from the deaths at corresponding ages in the same year. See 5th and 6th Reports of the Registrar-general for England, where the tables will be found, and their construction explained. No. 2 is deduced from the living in 1841, and from the deaths in the seven years 1838—1844. The results for male lives only have as yet been made public. See 9th and 12th Reports of Registrar-general. Nos. 1 and 2, so far as can be seen, agree very closely, and probably give the results of the average mortality of England more correctly than any others which we have. They are the result of enormous labour on the part of Dr Farr. Both are based on the recorded ages of 15,914,148 living persons, and No. 2 on 2,436,648 deaths. The observations were taken on the plan recommended by Professor de Morgan and Mr Griffith Davies. VI. The Experience. These were prepared by a committee of eminent actuaries on the data afforded by the combined experience of 17 life-assurance offices. The tables are given in a work by Jenkin Jones, Esq., London, 1843. The objections to which they are liable are, that certain lives having been more than once assured have appeared twice or oftener as elements in the calculations; that the average term over which the observation of the offices extends is only eight and a half years; and it is probable that the mortality which will prevail in assurance societies when they have reached maturity is somewhat understated. See letter by Dr Farr in Appendix to 10th Report of Registrar-general, p. 11. Further, the data for old ages were deficient, and this of course affects the whole. Many curious results are brought out by

this table. It shows that 'town' assured life is superior to 'country;' that female assured life is on the whole inferior to male; and that Irish life is worst of all. At age 20, 'town' mean duration is 41 years, 2 months; country, 40 years, 4 months; Irish, 34 years, 11 months. The observations of the Standard Association Company do not, however, bear out these results; and they are doubtless so largely affected by the elements of *Care in Selection* as to render it impossible to found on them any conclusion of practical value. A new set of 'Experience' tables is in course of preparation. From the eminence of the actuaries who have undertaken the work, and from the great care which is being bestowed in collecting material, they will doubtless, when completed, be a very valuable set of tables. They will give the results of English and Scotch experience united, and of Scotch separately.

In all tables deduced from the experience of assurance and annuity societies, the fact of *selection* must not be lost sight of, either in using them for the sake of comparison, or as the basis of other tables. Actuaries, however, seem to be generally of opinion that the selection exercised by assurance societies does not really lower their rates of mortality below the general average; without selection, their rate would be above the general mean; for, it will be observed, that the public are continually selecting against the offices by offering inferior lives, and good lives often surrender their policies, while lives which have become bad hardly ever do so. Again, the value of medical examination gradually disappears, and in ten years at most it is held to be quite lost. See Minutes of the House of Commons' Committee on Assurance Associations, 1853; Life-contingency Tables by E. J. Farren, pp. iii.—xiii., and De Morgan's View of the Equitable Society, 1829, p. 46. Though female life is, as a whole, undoubtedly superior to male, yet as there are more critical periods in it, it is probable that the public may more frequently select it than male life against the societies. A valuable report on the Madras Military Fund has just been published, London, 1863, in which tables are given constructed on the mortality rates prevailing among the officers, wives, and widows interested in the fund. As they have been prepared by eminent men on very ample data, they will probably be very valuable to societies transacting business in India. The following is a view of the mean duration of life, at the beginning and at each decennial period according to some of the tables mentioned above:

TABLE SHEWING THE 'MEAN DURATION' OF HUMAN LIFE, ACCORDING TO VARIOUS AUTHORITIES.

| Age. | NORTHAMPTON.                           | CARLISLE.                                | GOVERNMENT.                    | ENGLISH LIFE TABLE.—DR FARR. |                |                           | Experience of Seventeen Offices to 1837.<br>Male and Female combined. | Age. |

In the present article, we have considered the law of mortality, chiefly as it bears on insurance and other monetary transactions. The wider view of the subject, as varying with occupation and in

different ages and countries, will be illustrated under the head of VITAL STATISTICS.

#### MORTAR. See CEMENTS.

**MORTAR**, a piece of artillery which differs from a cannon in the large diameter of its bore in proportion to its length, and in the circumstance that it is usually fired at a considerable angle, so that the projectile may strike the object aimed at in a

13-Inch Mortar, with Loading Apparatus.

direction more or less vertical. The object for which mortars are intended is the discharge of Live SHELLS (q. v.) or carcasses. As the projectile has a large diameter, and, except in rare instances, a very great range is unnecessary, a comparatively small charge of powder is requisite. To give this its utmost power and concentration, it is confined in a hemispherical chamber at the lower end of the bore, but of less diameter. The shell completely closes this chamber; and when the explosion ensues, receives its

full force on its centre. In the British service, the ordinary mortars range in diameter of bore from 5 to 13 inches. The 13-inch mortar is shewn in the annexed figure.

Larger mortars have, however, been tried at times, as at the siege of Antwerp Citadel in 1832, when the French brought one of 24-inches bore to the attack. This monster, owing to its unwieldiness and other causes, was a failure. Larger still than this, though perhaps more manageable, is Mr Mallet's great 36-inch mortar, constructed of iron parts welded together, for the British government, and now at Woolwich. As loaded shells are of immense weight, so heavy, indeed, as in larger calibres to involve the apparatus depicted in the fig. to deposit them in their places, and the mortar is fired at high elevations, the recoil is so great and so nearly vertical that no carriage could withstand the shock; it is necessary, therefore, that the mortar should be mounted on a solid iron or timber bed, by the trunnions, which are placed behind the breech, and supported in front by massive blocks of wood. This arrangement renders the apparatus so heavy that mortars of large size are rarely used in field operations, their ordinary positions being in defensive or siege works, and in mortar-vessels.

More wieldy, however, are the Coehorn mortars, invented by the Dutch engineer of that name, for clearing the covert-way or ditch of a fortress. This mortar is sufficiently small to be managed by one man, and is accounted useful in siege or defence operations. The French use a similar Lilliputian ordnance under the denomination of pierriers or stone-throwers. Small mortars are likewise constructed for mountain warfare: a mule carries the mortar, another the bed, and a third is laden with the projectiles. The use of mortars is diminishing at the present time, elongated shells of great weight being now thrown from rifled cannon.

**MORTARA, EDGAR**, a Jewish boy, whose case recently attracted great and painful interest throughout Europe. The facts are as follows: On the 23d of June 1868, Signor Momolo Mortara, a manufacturer and wholesale merchant of cloth in Bologna, and by religious profession a Jew, returning home about ten o'clock at night, found his house in the possession of the police, who informed him that they

had orders from Padre Felletti, inquisitor-in-chief at Bologna, to carry off his son, Edgar, who had been surreptitiously baptized into Christianity by a Roman Catholic maid-servant. The inquisitor was waited upon by some friends of the family a little after midnight, who implored delay. He informed them that he was acting under the orders of the Archbishop of Bologna, but consented to sist procedure till 'next evening.' The archbishop, however, was 'absent' from the city, and next evening the papal carbiners entered the house and 'tore the child out of his father's arms.' They carried him to Rome, where he was immured in a convent. The bereaved father immediately followed, obtained several interviews with Cardinal Antonelli, and offered to prove that the servant who said she had baptized Edgar had turned out to be a worthless prostitute, living in sin with Austrian officers. The cardinal declined to interfere, on the ground that the case did not come under his jurisdiction, and recommended Signor Mortara to apply to 'the proper tribunals.' After some weeks had passed, the child was removed to Alatri, whither his father and mother also went, and saw Edgar in a church among a number of priests, but had no opportunity of speaking to him. They returned to Rome, once more sought the presence of Cardinal Antonelli, and prevailed upon him so far that he ordered the child to be brought back to the city, and allowed his parents several times to converse with him. These interviews are described as agonising, and Edgar earnestly entreated his father and mother to take him home, but this of course was a hopeless request. He had been baptized, and baptism, no matter by whom administered, was an inviolable rite, which laid the Catholic Church under the solemn obligation of protecting its son from the snares of parental infidelity. It dared not give him up. Signor Mortara and his wife had to go away without their child. The case soon became known throughout Europe, and excited great indignation, more particularly in England. The Evangelical Alliance drew up a protest, which was signed by the Archbishop of Canterbury and above twenty other bishops, by a large number of peers, members of parliament, heads of colleges, and ministers of the gospel, by upwards of a hundred mayors and provosts, and by many other influential laymen. It was presented to Lord John Russell. The British Jews presented another. Nothing, however, has as yet been effected by their efforts. Edgar Mortara is still in the hands of the church-authorities. When Bologna, along with the greater part of Italy, passed under the sway of Victor Emmanuel in 1860, the inquisitor, Felletti, was arrested and thrown into prison. His trial, however, so far as we know, has not yet come off.

The above narrative, it is to be observed, can only be received as an *ex parte* statement; no authorised exposition of the facts, on the part of the Roman authorities, having as yet, we believe, been made public in these countries.

**MORTAR-VESSEL**, a class of gun-boat for mounting sea-service mortars, and in some cases provided with steam-power. The mortars are usually of the largest calibre, 13-inch. To enable the mortar to be properly manœuvred, and to resist the recoil from the nearly perpendicular explosion of so great a piece of ordnance, the vessel has considerable breadth in proportion to her length. The mortar is slung amidships in a massive bed. The ancient form of mortar-vessel was the 'bomb-ketch,' convenient because of the length of deck without a mast. The present vessels originated during the Russian war, and were found serviceable at the bombardment of Sveaborg.

**MORTGAGE**, in English Law, is the temporary pledging of land in security of a debt; and as the land cannot be delivered into the creditor's hand, he acquires a hold over it by a deed called an indenture, or deed of mortgage. The ordinary form of a mortgage-deed resembles an absolute conveyance, but it contains a proviso that if the money borrowed is repaid within a certain time, then the mortgagee shall reconvey the land to the mortgagor or borrower. There is a mode of executing a mortgage without any deed, which is common with bankers and others who lend money. This consists in the borrower taking the title-deeds of his land to the banker, who keeps the deeds and lends money on the faith of them. This is called an equitable mortgage by deposit of title-deeds, but in point of fact is as good as any other mortgage. Mortgage deeds do not require in England to be registered, except in Middlesex and Yorkshire; and hence a person not infrequently mortgages his property two or three times over, though the security is insufficient for all the debts. But in general this can only happen by the carelessness of one or other of the mortgagees, for the first mortgagee ought to have the title-deeds in his possession, and ought not to part with them, as they are his chief protection. A mortgagee can assign his mortgage security to another person, who thereupon stands in his shoes. If the money is not paid at the time originally appointed in the deed, then interest becomes due, and the deed is held as a security for both principal and interest. The remedy which the mortgagee has if the money is not paid at all, or not paid after due notice, is threefold. The mortgagee may exercise the power which the deed always contains to sell the estate and pay himself out of the proceeds. Or the mortgagee may enter into possession, and draw the rents and pay himself by instalments. Or he may foreclose the mortgage—i. e., he commences a suit in the Court of Chancery, the effect of which is to allow a short time to the mortgagor to pay the debt, failing which the court will order it to be sold to satisfy the debt. Another remedy is for the mortgagee to sue the mortgagor for the money in an ordinary action. All these remedies may be pursued at one and the same time. Sometimes when a second and third mortgage are given over the same estate, which is often done when the estate is large, compared with the money borrowed, it happens that the third mortgagee gets a prior title to the second mortgagee by buying up the first mortgage. On doing this, he can tack the third mortgage on to the first by the doctrine known as the tacking of mortgages. As a general rule, if nothing is said, the mortgagor or borrower pays all the costs of the mortgage transaction. Until the estate is sold, or the security foreclosed, the mortgagor has what is called the equity of redemption, i. e. he can at any time, on payment of the debt, compel the mortgagee to reconvey the property to him. Mortgages in England are not a first-class security, and hence trustees who are not specially authorised by their deed or will to invest in mortgage security do it at their risk, it being assumed that the only investment which is absolutely safe is government stock. In Scotland, mortgages are generally called bonds and dispositions in security, and form a higher and better security than in England, owing to there being a regular system of registration of deeds affecting land; and hence trustees are entitled to invest their funds there in mortgage security, which is considered as safe as government stock, and less liable to fluctuations of interest. In Scotland, there is no such practice as mortgaging lands with banks by merely depositing the title-deeds. See **BOND, DISPOSITION IN SECURITY.**

**MORTIFICATION**, in Scotch Law, is a term used to denote lands given for charitable or public uses. When lands are so given, they are in general formally conveyed to the trustees of the charity, to be held blench, or in feu. When mortifications are given in general to the poor, without naming particular trustees, they fall under the administration of the Court of Session. By the statute 1633, c. 6, it was declared unlawful to alter any mortifications, and the managers were rendered liable to be called to account for malversation. Any person entitled to the benefit of the fund can pursue actions of this kind.

**MORTIFICATION**, in Medicine. See **INFLAMMATION.**

**MORTIS CAUSA DEED**, in Scotch Law, is a deed which is made with a view to come into effect on the death of the maker. Since in Scotland land cannot be conveyed by will, as in England, it is necessary to execute an ordinary deed of conveyance, and to reserve the maker's liferent, and to keep it in his own possession until his death—i. e., to suspend its effect during the life of the grantor.

**MORTISE AND TENON** (Fr. *mortaise*, probably from Lat. *mordere*, to bite; *tenon*, from *tenir*, to hold), a form of joint in Carpentry. The tenon is a projection, generally rectangular in form, on

Mortise and Tenon :  
a, mortise; b, tenon.

the end of a piece of wood, cut so as to fit exactly into a deep groove (called the mortise) cut in another piece, so that the two are united at a required angle. The framing of doors, shutters, and such pieces of joinery, is usually fitted together with mortise and tenon joints.

**MORTMAIN, THE STATUTES OF** (Fr. *mort*, dead, and *main*, hand). The object of the statutes of mortmain is to prevent priests and others from importing a dying man to convey his land for charitable purposes. Hence, though a person can, up to the last hour of his life, if possessing sufficient knowledge of what he does, devise by will all his land to individuals absolutely, it is otherwise if he intend to give the land to trustees for a charitable purpose, as to build a church, or school, or hospital. The statute of mortmain, 9 Geo. II. c. 36 (1736), reciting that public mischief had greatly increased by many large and improvident dispositions made by languishing and dying persons to charitable uses, to take place after their deaths to the disinherison of their lawful heirs, enacted, that in future no lands or sums of money to be laid out in land should be given to any person or body, unless such gift or conveyance should be made or executed in presence of two witnesses twelve months before the death of the donor or grantor, and be enrolled in the Court of Chancery within six months after the execution. Therefore, a person on death-bed cannot in England give land, or money to buy land, for a charitable purpose. It can only be done in the life of the donor, at least twelve months before his death; and the property must be completely alienated, so that he has no further control over it. The deed must have a present operation, and must not reserve any

life-interest to the donor; it must be done at once and for ever. The policy of this statute has sometimes been questioned, and several well-known modes of evading the statute have been adopted from time to time. The act has been held to apply only to land locally situated in England; and hence, if the land is situated in Scotland, or the colonies, or abroad, a will conveying it for charitable purposes will receive effect. In Scotland, the mortmain act has no application; but the reason of this is, that the common law of Scotland contains a similar check on the alienation of land on death-bed, and which, in some respects, has a universal application. See DEATH-BED, INTESTACY.

**MORTON, SAMUEL GEORGE, M.D.**, American physician and ethnologist, son of an Irish emigrant, was born in Philadelphia, January 26, 1799. He studied medicine in Philadelphia, Edinburgh, and Paris, and in 1824 settled in Philadelphia, where he contributed papers on physiology and craniology to scientific journals. In 1834, he visited the West Indies, and made observations on the development of races. In 1839, he was appointed Professor of Anatomy in the Pennsylvania Medical College, and published his great work, *Crania Americana*, based on his collection of 867 classified skulls. In 1844, he published *Crania Egyptiaca*, based on the collection of George R. Gliddon, Esq.; and in 1849, his last work, *An Illustrated System of Human Anatomy, Special, General, and Microscopic*. He died at Philadelphia, May 15, 1851. M. may be regarded as the first American who endeavoured to place the doctrine of the original diversity of mankind on a scientific basis. See the Memoir of M. prefixed to Nott and Gliddon's *Types of Mankind* (Philadelphia, 1854), a work largely illustrated by selections from his unedited papers.

**MORTON, FOURTH EARL OF (JAMES DOUGLAS)**, regent of Scotland, was the second son of Sir George Douglas of Pittendreech, and in 1553 succeeded, in right of his wife, Elizabeth, daughter of the third earl, to the title and estates of the earldom. He early favoured the cause of the Reformation, and in 1557 was one of the original Lords of the Congregation. Sworn a privy councillor in 1561, he was appointed Lord High Chancellor of Scotland, January 7, 1563. Having been one of the chief conspirators against Rizzio, the Italian secretary of Queen Mary, on his assassination, 9th March 1566, he fled with his associates to England, but, through the interest of the Earl of Bothwell, soon obtained his pardon from the queen. Though privy to the design for the murder of Darnley, on the marriage of the queen to Bothwell, he joined the confederacy of the nobles against her. He was present at Carberry Hill, when Bothwell parted from the queen, and after Mary's imprisonment in the Castle of Lochleven, he was restored to the office of High Chancellor, of which he had been deprived, and constituted Lord High Admiral of Scotland. On the death of the Earl of Mar, in October 1572, he was elected regent of the kingdom. His rapacity and avarice made him obnoxious to many of the nobles, and as the young king, James VI., desired to assume the reins of government, Morton resigned the regency in March 1578. Subsequently obtaining possession of the castle of Stirling, with the person of the king, he recovered his authority, but was accused of participating in the murder of Darnley, and being tried and condemned, was beheaded at Edinburgh, June 2, 1581.

**MOSAIC**, the art of producing artistic designs by setting small square pieces of stone or glass of

different colours, so as to give the effect of painting. Both the origin of the art, and also of its name, are buried in obscurity; it was, however, much practised by the ancient Romans, especially for ornamental pavements, specimens of which are almost always found whenever the remains of an old Roman villa are discovered. Under the Byzantine empire; it was also much used for the ornamentation of churches, in which it formed a large portion of the wall-decoration. It was re-introduced into Italy for the latter purpose about the middle of the 13th c. by Andrea Tafi, who learned it of some Greek artists employed at Venice in decorating St Mark's. Since then it has been especially an Italian art, and to such wonderful perfection has it been brought, that most minute pictures are produced by it. Within the last few years, mosaics of surpassing beauty, both in design and material, have been produced by Russian artists in the Imperial Glass Manufactory of Russia; those shewn in the Russian department of the International Exhibition (1862) have probably never been surpassed. The pieces of glass of every shade of colour are technically called *smalts*; they are generally opaque, and are set in cement in the same manner as tiles or pavement. Some fine pieces of mosaic pavement have lately been produced in this country by Messrs Minton & Co. of Stoke-upon-Trent, and by Messrs Maw of Brosely, proving that the art only wants sufficient encouragement to obtain a high position. In Italy there are two very distinct varieties of mosaic work—i. e., the Florentine and the Roman; the former is entirely formed of pieces of stone or shell of the natural colours, and is limited in its application chiefly to floral and Arabesque designs. The latter is made of the glass *smalts* mentioned above, and has so wide an application, that most of the finest paintings of the best old masters have been copied in mosaic, and the pictures so taken form the almost imperishable decorations of the finest churches of Italy. The manufacture of the opaque glass or *smalts* for making the little square pieces called tessere, of which the pictures are composed, is a very important one, and belongs to the papal government, it is carried on in the Vatican, where, of the various kinds of coloured glass, no less than 25,000 shades are produced. Great patience and skill are required in mosaic works.

**MOSAIC GOLD.** See TIN.

**MO'SCOW**, an important government of Central Russia, lies immediately south of the governments of Tver and Vladimir. Area, 12,552 square miles; pop. 1,599,808. The surface is level, with the exception of a tract in the south-west, which is elevated. It is watered by the Moskva and the Kliazma, while the Oka forms a portion of its southern boundary. The soil, principally clayey, with some sandy and stony tracts, is, on the whole, unfertile, and barely supplies local consumption. Few of the governments of Russia, however, equal that of M. in manufactures and general industry. It contains numerous cloth, silk, brocade, chintz, paper, and other factories. China-ware is manufactured from the clay dug up in the district of Gjelsk. Many of its villages carry on special branches of manufacture, of which pins, glass beads, and small looking-glasses for Asia is one. White limestone is quarried, and is much used for building in the capital; yellow marble quarries occur on the banks of the Oka. Peat is extensively used as fuel in the factories. Among the places historically celebrated are the monastery of St Sergius, founded by one of the first Muscovite princes, and famous for its silver shrine, said to be the richest in the world; and the village of Borodino (q. v.).

**MOSCOW** (Russ. *Moskva*), the ancient capital of Russia, and formerly the residence of the Czars, is situated in a highly-cultivated and fertile district on the Moskva, 400 miles south-east of St Petersburg, with which it is in direct communication by railway. Lat. 55° 40' N., long. 37° 33' E. Previously to its being burned in 1812, M. was perhaps the most irregularly built city in Europe, and that distinction to a great extent it still retains; for, as the main object in 1813 was to build speedily, the streets rose again on the old model, undulating and crooked, and consisting of alternating houses, the most varied in character and pretensions. The general view of the town, especially that obtained from an eminence on its southern side called the Sparrow Hills, is eminently original and picturesque. Its hundreds of churches and convents, surmounted by gilt or variously-coloured domes; its gardens and boulevards; and, above all, the high walls and crowded yet stately towers of the Kremlin or citadel, produce a most striking effect. The Kremlin, situated on the northern bank of the river, forms the centre of the town, and around it, with a radius of about a mile, is a line of boulevards, extending, however, only on the north side of the river. Outside of this line, and concentric with it, is another line of boulevards, with a radius of a mile and a half; while beyond all, and forming the girdle of the city, is the outer rampart, with a circumference of 26 English miles. The Kremlin comprises the principal buildings, as the Cathedral of the Assumption of the Virgin, founded in 1326, a small but gorgeously-decorated edifice; the Cathedral of the Archangel Michael, containing the tombs of all the Czars down to the time of Peter the Great, who changed the royal burial-place to St Petersburg; the Church of the Annunciation, the floor of which is paved with jaspers, agates, and carnelians of various shapes; the tower of Ivan Veliki, 200 feet in height, and surmounted by a magnificent gilded dome, from which, as from all the domes of M., rises the 'honourable cross'; the Czar Kolokol (king of bells), the greatest bell in the world; several palaces, and collections of ancient arms and other antiquities; the arsenal, surrounded by the splendid trophy of 550 cannons, taken from the French; and the senate. The walls of the Kremlin are surmounted by 18 towers, and pierced with 5 gates. In the town, the chief buildings are the cathedral of St Vassili, remarkable for its peculiar architecture; the Gostinoi Dvor, or Bazaar; and the Exchanges. The university of M., the first in Russia, founded in 1753, is attended by 1800 students, contains a library of 89,000 volumes, museums of natural history, and a botanical garden. As intermediate educational establishments between the parish schools and the university, there are provided 4 high schools or gymnasia; special establishments are the technological, the agricultural, the oriental, 2 commercial, and 3 military schools. There are several learned societies in M., which is also the seat of a metropolitan, one of the three highest dignitaries of the Russian Church.

M. communicates by railway with St Petersburg and Nijni-Novgorod, and the construction of a third line to Sebastopol has been recently ceded to an English company. It is the seat of an extensive manufacturing and commercial industry; it imports largely, and carries on a considerable export trade, especially with Asia. Its trade is chiefly in hides, leather, oils, wool, grease, isinglass, wax, honey, feathers and down, potass, soap, iron, and copper; cotton from Asia, silks from Georgia, Persia, and Bokhara; Caucasian madder, home and Turkish tobacco, furs, tea, chemicals, and all the products of Russian manufacture, of which M. is the actual

centre. The annual imports amount to the value of 6,000,000 rubles (£937,000). The chief manufactures are woollen and worsted goods, which give employment to 181 factories, worked by 30,597 hands, and produce 17,286,000 rubles a year; cotton goods employ 357 establishments, 27,446 hands, and produce 12,330,000 rubles; silks and brocades employ 151 establishments, 12,821 hands, and produce 7,151,300 rubles; dyeing and printing employ 146 establishments, 21,685 hands, and produce 12,163,900 rubles. The other principal branches of manufacture are tanning and skin-dressing, iron, copper, and silver works, and chanderies. The total number of manufacturing and industrial establishments amounted, in 1861, to 1341, employing 106,000 workmen, and producing 66,000,000 rubles in manufactured goods. Pop. (1859) 386,370.

M. is of ancient origin for a Russian town. Its site was bought by Yuri Dolgoruki, in the 12th c., and a fortress built. In the 14th c., not only had it become the capital of the Russian religious world, owing to the residence there of the metropolitan, but it had also become the actual capital of Muscovy. In 1368, 1370, and 1372, it suffered from the inroads of the Lithuanians; in 1381, it was sacked by the Tartars. From 1415 to 1501, it was, on four separate occasions, partially destroyed by fires; and it was burned to the ground by Devlet-Girey, Khan of the Crimean Tartars, in 1571. It was taken by the Poles in 1610, and remained in their possession till their expulsion by the Russians under Minin and Pojarsky in 1612. In 1682, 1689, and 1698, it was the theatre of the revolts of the Strelitz. In 1812, from the 14th September till the 24th October, it was in the hands of the French, and it was on this occasion that, in setting fire to this their 'Holy City,' the inhabitants made such a noble sacrifice. (1871—pop. 611,970.)

**MOSELLE**, a frontier department in the north-east of France, formed out of ancient Lorraine, touches upon Bavaria, Rhenish Prussia, and the Netherlands. Area, 2329 square miles; pop. (1862), 446,457. It is watered by the Moselle and its tributaries; is richly wooded, and yields abundance of grain, fruits, and wine, though the last is of an inferior quality. Agriculture is in an advanced condition; roads are numerous, and the river-navigation important. Coal, iron, and building-stone are the most valuable minerals. There are also linen, woollen, leather, glass, papier-mâché, and other manufactures. M. is divided into the arrondissements of Metz, Briey, Thionville, and Sarreguemines. Chief town, Metz.

**MOSELLE** (Lat. *Mosella*), an affluent of the Rhine, rises in the Vosges Mountains, France, at an elevation of about 2260 feet above the level of the sea, not far from the sources of the Saône. Its course is north-westerly as far as Pont-à-Mousson, in the department of Meurthe, where it becomes navigable; then north to Thionville, near the French frontier; after which it proceeds, in a north-easterly direction (latterly, with many zigzag picturesque windings), through Luxembourg and Rhenish Prussia, joining the Rhine at Coblenz. On its way, it passes the towns of Remiremont, Epinal, Toul, Pont-à-Mousson, Metz, Thionville, and Treves. From Metz to Treves it flows through a broad valley, enclosed by rounded vine-bearing hills. Its entire length is upwards of 330 miles. Its principal tributaries are the Meurthe, the Seille, and the Sarre on the right; and the Orne, the Sure, and the Kyll on the left. The wines grown in the basin of the Moselle are noted for their lightness and their delicate aromatic flavour. The inferior kinds are liable to acidity.

MOSES (Heb. *Môshéh*; LXX. and Vulg. *Moyses*; ? Egypt. *Mes* or *Messou*; Copt. *Mo-ushe*, i.e., drawn out of the water), prophet and legislator of the Israelites, born about 1600 B.C. in Egypt (? Heliopolis), during the period of their hard bondage. His father was Amram, his mother Jochebed, both of the tribe of Levi. The tale of his birth and early education has, by tradition (Manetho, Philo, Josephus, Midrash, &c.), received a much more extraordinary legendary character than is found in Exodus; while the main features are, on the whole, the same in them all. And there is no reason to doubt the truthfulness of an account which shews us M., like many other supreme benefactors and 'suns' of mankind, struggling against an apparently adverse fate, nay for very life, from the instant of his birth. The well-known narrative, to which late traditions (contained in Philo, Josephus, the Fathers, &c.) have supplied questionable names and dates, is that M.'s mother, unable to hide the child—which was to have been drowned at its birth—longer than for the space of three months, put it into a basket of papyrus, and hid it among the Nile rushes, Miriam, his sister, watching it from afar. The king's daughter (Thermuthis, or Merris?), coming down to the river, observed the weeping child, and was so struck with its beauty, that she allowed Miriam to fetch a Hebrew nurse, Jochebed. Grown up, he was sent to the king's palace (Heliopolis) as the adopted son of the princess, and here seems to have enjoyed not only princely rank, but also a princely education. He is also said to have become a priest, under the name of Osarsiph or Tisithen, and to have been a mighty adept in all the sciences of 'Egypt, Assyria, and Chaldea'; to have led Egyptian armies against the Ethiopians, defeated them, and pursued them to their stronghold, Saba (Meroc); this place being delivered into his hands by Tharbis, the king's daughter, whom he subsequently married. The Bible contains nothing whatever about the time of his youth. He first reappears there as the avenger of a Hebrew slave, ill-treated by an Egyptian overseer. Threatened by the discovery of this bloody act, he escapes into Midian, where he is hospitably received by Jethro, the priest, and married his daughter, Zipporah. He stayed for many years in Midian, tending the flocks of his father-in-law. This most sudden transition from the brilliant and refined life of an Egyptian court, of which he had been brought up a prince, to the state of a poor, proscribed, exiled shepherd, together with the influences of the vast desert around him, must, in M.'s mind, have produced a singular revolution. The two names which he gave to his sons, strikingly express part of what filled his soul—a feeling of gratitude for his salvation from the avenging hand of justice, and the deep woe of his exile. The fate of his brethren went now to his heart with greater force than when he was a prince and near them. There rushed upon his memory the ancient traditions of his family, the promises of Jehovah to the mighty sheikhs, his forefathers; that they should become a great and a free nation, and possess the ancient heritage of Canaan; why should not he be the instrument to carry out this promise? The *Elye asher Elye* (I am that I am) appeared to him while his mind was occupied with such thoughts, and himself put the office upon his shoulders. A new king had succeeded in Egypt, his old enemies were either dead or had forgotten him, and M. returned to Egypt. Together with Aaron, his brother, the man of small energy but of fine tongue, he consulted about the first steps to be taken with the king as well as with their own people:—both of whom treated them at first with suspicion, nay, with contempt.

After ten distinct plagues (more or less akin to natural phenomena peculiar to Egypt), the last being the death of all the firstborn, Pharaoh consented to let his slaves go free, 'that they might serve their God.' M. very soon had occasion to prove that he was not only the God-inspired Liberator of his people, who, in the enthusiasm of the moment had braved the great king and his disciplined armies, but that he possessed all those rarer qualities which alone could enable a man to mould half-brutalised hordes of slaves into a great nation. Calmness, disinterestedness, patience, perseverance, meekness, coupled with keen energy, rapidity of action, unflinching courage—'wisdom in council and boldness in war'—constituted the immense power which he held over the hundreds of thousands who knew no law in their newly-acquired liberty, and who were apt to murmur and to rebel on any or no provocation. Nor were the hostile Bedouin tribes, whose territories the new emigrants approached, easily overcome with untrained warriors, such as formed the ranks of M.'s army. The jealousy of certain elders fostering seditions within, added to his unceasing vexations; and to fill the measure to overflowing indeed, his own brother Aaron, whom he had made his representative during his temporary absence on the Mount of Sinai, himself assisted in the fabrication of an idol. His sacred office as legislator he in reality first assumed in the third month after the Exodus, when, after many hard and trying marches and countermarches—from Goshen to Succoth (? Latopolis, the present Old Cairo); thence, by a *detour*, to Etham (? Ramlich), Pi-hachiroth (? Bedea), through the Red Sea, to the Desert of Shur (? Al-Djofar), Marah, Elim (Wadi Gharandel), Desert of Sin (Wadi Mocatteb, or Wadi Al-Sheikh), Dophka, Alus, Raphidim (near the Makkad Sidna Mousa)—made more trying by want of food and of water, by encounters with Pharaoh and the Amalekites, having arrived near the Mount of Sinai, he made the people encamp all round, and ascended the summit of the mountain by himself. On the incidents connected with the 'Revelation' made to the whole people, we need not dwell any more than on any other part of this well-known narrative. Suffice it to point out briefly, that the tendency of the whole Law was to make the Hebrews a people 'consecrated to the Lord,' 'a holy people, and a kingdom of priests,' i.e., a people of equals both before God and the Law. Three distinct parts compose this Mosaic Constitution. The doctrine with respect to God and His attributes; the 'Symbolical' Law, as the outward token of His Doctrine; and the Moral and Social Law. The Decalogue forms a kind of summary of all the three: the existence of Jehovah as the Absolute Being, the liberation of the people and the prohibition of Polytheism, and the Representation of the Divinity by visible images (i.—iii.). While the institution of the Sabbath, the symbol of creation and the Creator, forms the basis of all religious observances (iv.), the remaining part of the laws relate to the intercourse among the members of the human commonwealth; the gratitude of children is inculcated; murder, adultery, theft, false witness, coveting of others' goods are prohibited. The groundwork of these regulations had indeed been a special inheritance in the family of the Abrahamites from the earliest times; but the vicissitudes of fortune, the various migrations, and the enormous increase of this family, and its being mixed up for long years with the surrounding idolaters, had obliterated nearly all traces of the primeval purity of creed in the populace. The wisdom displayed even in the minor regulations of the Mosaic dispensation, with respect to their adaptation

to the peculiarity of the race, the climate, the political state of the country which they were to inhabit; in the hygienic regulations, and the rules which treat of the social and domestic relations; and, above all, the constantly-reiterated caution from mixing again with other nations, such as they found them in Canaan—and the neglect of which subsequently proved their ruin—is traced to a direct influence of Jehovah, generally indicated by the words, 'And God spake to Moses, speak unto the children of Israel.' An ample Ritual, in connection with the Tabernacle, or constantly-visible symbol of a Divine Dwelling; the allegory of an ever-new covenant represented by Sacrifices, Prayers, Purifications, kept the supreme task of being priests and a holy people unceasingly before the eyes of the nation. The tribe of Levi (q. v.), to a certain degree acted in this respect as permanent representatives; and not to Moses's sons, but to his brother Aaron and his descendants, was intrusted the office of High-priest.

When on the eve of entering into the promised land, the people broke out in open rebellion, and threatened, by a spontaneous return to the land of slavery, to undo the entire work of M.'s life. Convinced that they were not as yet fit to form a commonwealth of their own, the Liberator and Lawgiver had to postpone, for the long space of 40 years, the crowning act of his work; and, in fact, did not himself live to see them taking possession of the hallowed territory. How these years of nomadic journeying through the Desert (El-Tyh or Al-Tyh Beni-Israel) were spent, save in rearing up a new generation of a more manly and brave, as well as more 'civilised' stamp, we can only conjecture. All those who had left Egypt as men were doomed to die in the desert, either by a natural death, or by being suddenly 'cut off', in consequence of their openly defying M., and through M., Jehovah. The apparent lack of incidents during this period has indeed furnished grounds for various speculations on this subject, and critics have tried to reduce it to a much shorter space, without, however, being able to prove their point. Even Goethe, with more ingenuity than knowledge of the subject, has endeavoured to prove the 'forty' to be a mythical round number, the real time being two years. The testimonies of the Hebrew prophets and historians, however, are perfectly unanimous on the subject (cf. Jos. v. 6; xiv. 10; Amos, ii. 10; v. 26; Ps. xcv. 10, &c.), and modern criticism has mostly endorsed the number as in keeping with the circumstances. On the first month of the fortieth year after the Exodus, we find M. at the head of an entirely new generation of Hebrews at Kadesh, in the Desert of Phoran or Zin. Here his sister Miriam died. Here also, for the first time, M., seeing the new generation as stubborn and 'hard-necked' as their fathers, is recorded to have despaired of the Divine Providence; and his disobedience to the letter of the command given to him, 'to speak to the rock,' is alleged as the reason 'that his bones too had to fall in the desert.' His brother Aaron died at Hor (near Petra, according to Josephus and St Jerome), whither the Israelites had gone next. Not long afterwards, M. once more had occasion to punish with relentless severity the idolatrous tendencies of the people (Baal Peor), thus shewing that age had had no power of making him relax his strong rule over the still half-savage and sensuous multitude. Having finally fixed the limits of the land to be conquered, and given the most explicit orders to Joshua, to Eliezer, and the chiefs of the ten tribes, respecting its division, he prepared the people for his own impending death. He recalled to their minds in the most impressive language, their mira-

culous liberation, and no less miraculous preservation in the desert. Their happiness—their life—was bound up, he told them, in the Divine Law, communicated through him by Jehovah. A recapitulation of its principal ordinances, with their several modifications and additions, and reiterated exhortations to piety and virtue, form the contents of his last speeches, which close with one of the grandest poetical hymns. The law was then handed over to the priests that they might instruct the people in it henceforth; Joshua was installed as successor (while his own sons sunk into the obscurity of ordinary Levites), and he blessed the whole people. He then ascended the Mount of Nebo, from whence he cast a first and last look upon the land towards which he had pined all his life, and on which his feet were never to tread. He died upon this mountain, 120 years old, in the full vigour of manhood, according to the Scriptures, 'and no man knew his burial-place up to this day'—so that neither his remains nor his tomb were desecrated by 'Divine honours' being superstitiously paid to them.

This is a summary of M.'s life as derived from biblical as well as non-biblical sources. The latter—except, perhaps the very doubtful traditions of Manetho—belong, whatever may be the date of the respective documents of the Pentateuch, to a much later age, and bear the air of tradition and legend, grown out of those very documents, so plainly on their face, that they are of about the same importance for historical purposes as the cycle of Midrash-sagas that have gathered around M., and which are reproduced variously in Moslem Legendaries. On his office as a 'prophet':—what was the special nature of his revelations, how far the doctrines promulgated by him were traditional among the Abrahamites, and how much of his laws is due to Egyptian influences; whether part of them was first inaugurated by later generations and ascribed to him, or whether others were never carried out at all: on these and similar questions which have been abundantly raised, more especially in recent times, we must refer for fuller information to the special works on the subject. Some notices of the more important points will be found under GENESIS, JEWS, PENTATEUCH, DECALOGUE, &c. There seems, however, but one conclusion. The brief span of human history of which we have any knowledge, shews few, if any, men of M.'s towering grandeur—even with all the deductions that the most daring criticism has yet proposed.

MOSHEIM, JOHANN LORENZ VON, a distinguished church historian of Germany, was born at Lübeck on 9th October 1694, and studied at Kiel. In 1723, he became ordinary professor of theology at Helmstedt, from which he was removed in 1747 to a similar office in Göttingen. He died Chancellor of the University of Göttingen, 9th September 1755. His theological works are numerous, amongst which are a work on Bible morality, *Sittenlehre der Heiligen Schrift* (new ed., continued by J. P. Miller, 9 vols. Helmst. 1770—1778); and Discourses, *Heiligen Reden* (3 vols. Hamb. 1752, et seq.). But his most important contributions to theological literature are in the department of ecclesiastical history, in which his *Institutiones Historiæ Ecclesiasticæ* (Helmst. 1755) is familiar to every student as a work of great learning, fulness, and accuracy. It has been translated from the original very elegant Latin into English and other languages. The best English translation is that by Dr James Murdock (3 vols. New York, 1832), of which there are many reprints. Besides this, M. is the author of *Institutiones Historiæ Christianæ Majores* (Helmst. 1763); *De Rebus Christianorum ante Constantinum*

## MOSOSAURUS—MOSQUE.

*Commentarii* (Helmst. 1753); *Dissertationes ad Hist. Ecclésiasticam pertinentes* (2 vols. new ed. Altona, 1767); and *Versuch einer unparteiischen Ketzergeschichte* (2 vols. Helmst. 1746—1748). His stand-point is that of liberal orthodoxy; yet he is essentially dogmatic, and pays more regard to the mere 'opinions' of men than to the character and genius shining through them; hence, his *Church History* is far inferior in point of richness, depth, and suggestiveness to that of Neander.

**MOSOSAURUS** (MEUSE LIZARD), a genus of huge marine lizards, whose remains occur in rocks of cretaceous age. Three species are known, one from the upper chalk of Sussex, a second from the cretaceous beds of North America, and the third from the Maestricht beds. This last (*M. Hofmanni*) was first known from a nearly perfect head dug out

Head of Mososaurus.

of St Peter's Mount in 1780, and popularly called the great animal of Maestricht. Originally the property of Hofman, it was taken from him, in virtue of some clause in their charter, by the ecclesiastical authorities of Maestricht, who, in their turn, were compelled to give it up to the victorious French army, and by them it was removed to Paris. It is said that the French cannoniers, when preparing for

the siege, had instructions not to point the artillery towards that part of the town in which the precious specimen was deposited. This head is four feet in length, and the animal to which it belonged is estimated to have been 25 feet long. The total number of the vertebrae was 133; they were concave in front and convex behind, and were fitted to each other by a ball-and-socket joint, admitting of easy and universal flexion; the sacrum seems to have been wanting. The limbs were developed into four large paddles, and these with the comparatively short and strong tail, the bones of which were constructed to give great muscular power, enabled the animal to move quickly through the water in pursuit of its prey. The jaws were furnished with a single row of strong conical teeth. Cuvier first shewed the affinities of the animal. It is most nearly related to the modern monitor, but differs from all modern lizards in its peculiar adaptations for an ocean life, and in its great size. The largest living lacertian is only 5 feet in length, and of this a large proportion is made up by the tail; the *M.*, with its short tail, is estimated to have been at least 25 feet long.

**MOSQUE**, a Mohammedan house of prayer. The word is derived, through the Italian *moschea*, from the Arabic *mesjid*, a place of prayer. The form of the oldest mosques (at Jerusalem and Cairo) is evidently derived from that of the Christian Basilica, the narthex being the origin of the court, with its arcade, and the eastern apses representing the principal buildings of the mosque facing Mecca. The original forms became, however, entirely obliterated in the progress of Mohammedan architecture, and the mosques, with their arched courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary considerably in style in

Great Mosque at Delhi, from the North-east.—From Fergusson's *Hand-Book of Architecture*.

different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India, the mosques have many features in common with the temples of the Jains, while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the mosques, which commonly consist of porticoes surrounding an open square, in the centre of which is a tank or fountain for ablution. Ara-

besques and sentences of the Koran inscribed upon the walls, which are generally white-washed, and never bear any device representing a living thing, are the only ornaments of the interior. The floor is generally covered with mats or carpets; there are no seats. In the south-east is a kind of pulpit (*Mimbar*) for the Imám; and in the direction in which Mecca lies (the *Kibleh*), there is a niche (*Mehrab*) towards which the faithful are required to look when they pray. Opposite the pulpit, there

is generally a platform (Dikkah), surrounded by a parapet, with a desk bearing the Koran, from which portions are read to the congregation. The five daily prayers (see MOHAMMEDANISM), which are generally said at home—especially by the better classes—on week-days, are said in the mosque by the whole congregation on Fridays, the days of Al-Gumah, or the Assembly, the Moslem Sundays, together with some additional prayers, and at times a sermon is super-added to the service. It is not customary for women to visit the mosques, and if they do, they are separated from the male worshippers. The utmost solemnity and decorum are preserved during the service, although in the hours of the afternoon (when there is no worship) people are seen lounging, chatting, even engaged in their trade, in the interior of the sacred building. On entering the mosque, the Moslem takes off his shoes, carries them in his left hand, sets to sets, and putting his right foot first over the threshold, he then performs the necessary ablutions, and finishes by putting his shoes and any arms he may have with him upon the matting before him. The congregation generally arrange themselves in rows parallel to that side of the mosque in which is the niche, and facing that side. The chief officer of a mosque is the Nazir, under whom are two Imáms, a kind of religious official, in no way to be compared with what we understand by a clergyman of a creed, but who performs a certain number of religious rites, as long as the Nazir allows him to do so, and who, being very badly remunerated, generally has to find some other occupation besides. There are further many persons attached to a mosque in a lower capacity, as Mueddins (q. v.), Bowwabs (door-keepers), &c., all of whom are paid, not by contributions levied upon the people, but from the funds of the mosque itself. The revenues of mosques are derived from lands. With many of the larger mosques, there are schools, academies (Medressahs), and hospitals connected, and public kitchens, in which food is prepared for the poor.

**MOSQUITO** (Span. *gnat*), a name very generally given to the most troublesome species of *Culex*, and allied genera. See GNAT. The name *M.* is given, according to Humboldt, in some parts of tropical South America to species of *Simulia*, which are active during the day, whilst species of *Culex*, active chiefly during the night, are called *Zancudo*s; but these latter are the mosquitoes of other countries generally. The name was probably first used in the West Indies, where it particularly designates a species (*C. Mosquito*) very similar to the common gnat, but not quite so large, with black proboscis, and marked with silvery white on the head, thorax, and abdomen. It abounds in the warm parts of America, especially in marshy districts and in the vicinity of stagnant waters. It and similar species extend even to very northern regions, appearing during the heat of summer in prodigious swarms. Similar species are found also in similar situations in almost all parts of the world, and are almost as great a pest in Lapland as within the tropics. The bite which they inflict is painful, and their incessant sharp buzzing prevents sleep. In India and other countries, beds are provided with *mosquito curtains* of gauze, which are closely drawn, to protect the occupant, while the natives who cannot avail themselves of such protection, smear their bodies with oil. So numerous are mosquitoes in some localities in South America, that the wretched inhabitants sleep with their bodies covered over with sand three or four inches deep, the head only being left out, which they cover with a handkerchief; and travellers have been obliged to have recourse to the same expedient. Even thick clothes afford at best a very partial protection from mosquitoes being readily penetrated by the

proboscis. Mosquitoes are readily attracted to a lamp, and perish in its flame; but where they are numerous, a lamp only causes additional swarms to congregate to its neighbourhood until it is extinguished, as is often very soon the case, by their dead bodies.

**MOSQUITO COAST, MOSQUITO TERRITORY, or MOSQUITIA**, formerly a native kingdom, under the protectorate of Britain, lies on the east coast of Central America, having Honduras on the north, Nicaragua on the west, and Costa Rica on the south. The area is estimated at 15,000 English square miles, but as 20,000 miles of contested territory lie between it, and Honduras and Nicaragua, its extent would be more correctly given at 25,000 square miles. The coast is low, with many bays and lagoons, and possesses a number of good harbours. The two principal rivers are the Rio de Segovia (which rises within 35 miles of the Pacific Ocean), and the Rio Escondido, both of which flow into the Caribbean Sea. The climate is rainy, and the temperature, considering the latitude, is cool and equal, the thermometer seldom rising above 82° or falling below 71°. On the whole, this territory is one of the most healthy parts of Central America. Ague is not unusually common, epidemics are exceedingly rare, and white people who do not recklessly expose themselves enjoy the best health. The swampy grounds are generally covered with dense forests, in which dye-woods and timber-trees of great value abound. Rice, maize, manioc, and other tropical plants, are cultivated. The country abounds in deer of various kinds, half-wild horses and oxen roam in the savannahs, which are covered with tall grass, and alligators and serpents are common. The chief exports are mahogany, cocoa, ginger, sarsaparilla, and tortoise-shell, but the whole trade is inconsiderable. The inhabitants are of various races, the greater portion being aboriginal, but many are a cross between the native Indians and runaway negroes; they do not number more than from 10,000 to 15,000 in all. Their chief occupations are hunting and fishing, but a little agriculture and cattle breeding are also practised.

The *M. C.* was discovered in 1502 by Columbus, and though never conquered, was claimed by Spain till about 1660, when the king, with consent of his people, placed himself under the protection of Britain. British colonists at different times attempted to found settlements in various parts of the country, but from various causes were soon after compelled to withdraw. Of late years they have met with more success. The foothold Britain thus obtained in Central America was viewed with great jealousy by the United States, who left no means untried to effect her expulsion. During the British protectorate a sort of constitutional government was established, consisting of a legislative body, and regular jury courts. In July 1850, the United States and Great Britain bound themselves by the Clayton-Bulwer treaty 'not to occupy, fortify, colonise, or exercise dominion over the *M. C.*, or any part of Central America;' and in November 1859, Britain ceded the protectorate of *M. C.* along with the Bay Islands to Honduras, a proceeding which gave rise to much discontent among the natives of the coast, and a complete rebellion of the islanders. However, by a subsequent treaty, concluded 26th January 1860, the whole territory was finally handed over to Nicaragua.

**MOSESSES** (*Musci*), an order of acotyledonous plants, consisting of mere cellular tissue without vessels, and distinguished from *Hepaticæ* (q. v.), the order with which they are most nearly allied, by having always a leafy stem, and an operculated

capsule or urn (*sporangium* or *theca*), which opens at the top, and is filled with spores arranged around a central column (*columella*). The capsule is covered by a hood (*calyptra*); and when it is ripe, and has thrown off the calyptra and operculum, exhibits around its mouth a single or double row of rigid processes, few or numerous, but always either four or a multiple of four, collectively called the *peristome*. These reproductive organs are viewed by many botanists as female flowers or *pistillidia*; whilst reproductive organs of another kind, sometimes found on the same plant, but more generally on distinct plants, are regarded as male flowers or *antheridia*. These are minute cylindrical sacs, occurring in the axils of the leaves, or collected into a head enclosed by variously modified leaves at the summit of the stem, and finally bursting and discharging a great number of spherical or oval vesicles, through the transparent walls of which, when moistened with water, filaments (*spermatozoids*) coiled up within them may be seen wheeling rapidly round and round. As the sacs merely discharge these vesicles and perish, it is

protecting the roots of many plants from cold and from drought, and afford harbour to multitudes of insects. Some of them supply food for cattle, particularly for the reindeer, when nothing better is to be obtained, and a wretched kind of bread is even made by some of the dwellers in the Arctic regions, of species of *Sphagnum*. Some are astringent and diuretic, but their medicinal virtues are unimportant. Among the other principal uses to which they are applied by man are the packing of things liable to be broken, the littering of cattle, the covering of garden plants in winter, and the stuffing of the open space in roofs to moderate the heat of attic rooms in summer and their cold in winter—perhaps the most important use to which they are ever put, at least in Britain, and to which, as the benefit is great and easily attained, it is wonderful that they are not much more frequently applied. The abundance of *M.* in meadows and pastures is disagreeable to farmers. The best remedies are proper drainage, the application of lime, and the liberal use of other manures, by which the soil may be enriched, so that better plants may grow with sufficient luxuriance, upon which the *M.* are choked and disappear.

Several thousand species of *M.* are known. Many of the *M.* are very beautiful, and their capsules and other organs are interesting objects of study, even with an ordinary magnifying-glass.

**MOSTAR**, a town of European Turkey, capital of Herzegovina (q. v.), on the Narenta, 45 miles south-west of Bosna-Seraï. It is surrounded by embattled walls, contains ten mosques, a Greek church, and a famous Roman bridge of one arch, 95 feet in span. Silk, grapes, and wine are produced, and knife-blades and weapons are manufactured. *M.* is also a place of considerable trade. Pop. 10,000.

**MÔSUL**, a town of Asiatic Turkey, in the province of Al-Jezireh (ancient Mesopotamia), is situated on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q. v.), and 180 miles up the river from Bagdad. It is surrounded by walls, and is still in a more flourishing condition than most Turkish towns, on account of its caravan-trade with Diarbekir, Bagdad, and Aleppo, though its prosperity is nothing to what it formerly was. During the Middle Ages it supplied all Europe with its rich manufactures—*muslins*, according to Marco Polo, got their name from this town; now, on the contrary, the bazaars of *M.* are filled with the manufactures of the West. The principal causes of its diminished importance are the rise of Abushehr (q. v.) as an emporium of trade, and the opening up of the new sea-route to India by the Isthmus of Suez. *M.* is the seat of a Jacobite patriarch, and was formerly the great metropolis of all the Mesopotamian Christians (the Nestorians, the United Chaldeans, the Jacobites, &c.), but war, pestilence, famine, Mohammedan proselytism, oppression, and incessant anarchy, have greatly reduced their numbers. The population is variously estimated at from 18,000 to 40,000, of whom perhaps about a fourth are Christians. There are also about 1500 Jews; the rest are Mohammedans (Arabs, Kurds, and Turks).

**MOTACILLIDÆ.** See **WAGTAIL**.

**MOTETT**, a name applied to two different forms of musical composition—1. A sacred cantata, consisting of several unconnected movements, as a solo, trio, chorus, fugue, &c.; 2. A choral composition, generally also of a sacred character, beginning with an introduction in the form of a song, perhaps with figurative accompaniment; after which follow several fugue subjects, with their expositions, the whole ending either with the exposition of the last subject, a repetition of the introduction, or a special final subject. A motett differs in this respect from

Moss.  
(From Stark's Mosses.)

1, perfect plant; a, branches clothed with leaves; b, seta, or footstalk; c, capsule; d, operculum, or lid. 2, branch producing stellate heads, having masses of 'male' flowers, and filaments in centre. 3, spore of moss, germinating. 4, spore of moss in a more advanced state.

supposed that the spermatozoids contained in them may effect the fertilisation of the spore-producing capsules; but this wants confirmation, and their particular office as reproductive organs is not yet fully ascertained.—None of the *M.* are large plants, many are very small. Many have elongated stems, often branching; others have the stem scarcely developed, so that they seem to consist of a mere tuft of leaves. They are generally social in their manner of growth. They are among the first plants which begin to clothe the surface of rocks, sands, trunks of trees, &c., adapting inorganic matter for the support of higher kinds of vegetation. They love moisture, and are generally more abundant in cold and temperate than in hot climates. They struggle for existence on the utmost limits of vegetation in the polar regions and on mountain-tops. They dry up and appear as dead in a very dry state of the atmosphere, but revive when moisture returns. Some of them grow in bogs, which they gradually fill up and consolidate. They are of great use in

a double or triple fugue, that the subjects never appear simultaneously, but are introduced one after the other. In one form of the motett, the successive phrases of an entire chorale are treated as so many fugal subjects.

**MOTH**, the popular name of all the insects included in the section *Nocturna* of the order *Lepidoptera* (q. v.). They formed the genus *Phalena* of Linnaeus, but are now distributed into many genera and families, the species being extremely numerous. Among them are the very largest *Lepidoptera*, and also the smallest. They are distinguished from Hawk-moths, and from most of the butterflies, by their bristle-shaped antennae, tapering from base to apex. The antennae are frequently feathered or pectinated, especially in the males. The proboscis is generally similar to that of butterflies; but there are some groups of moths in which it is merely rudimentary, and these are supposed to take no food after they pass from the larva state. The thorax is generally shorter and more robust than in butterflies; the tibiae of the legs often bear a kind of spur; the wings are held either in a horizontal or in an inclined position when at rest; or, as in many of the smaller moths, are wrapped round the body. The two wings of the same side are generally hooked together in repose by means of bristles on the margin. The females of a few species are wingless.—Moths are generally nocturnal, although to this rule there are a few exceptions. They often exhibit great richness and beauty of colours, although in brightness of colour they are not generally equal to butterflies. Their food is similar to that of butterflies.—They lay great numbers of eggs, which exhibit varieties of form and colour as great as those of the insects themselves. Their caterpillars are more widely various in form and characters than those of butterflies; differing from each other in the number of their legs, and in horns, protuberances, caudal appendages, hairy covering, &c. Some are social both in the larva and chrysalis state; forming, on

Lackey Moth:

A, the belt of eggs; B, the caterpillar; C, the pupa in its cocoon; D, the moth.

their entering the latter state, very curious nests. The chrysalis of a moth is never angular nor furnished with protuberances, and is generally enveloped in a silken cocoon, pretty close and compact; although some moth chrysalids are found in a mere space filled with threads which cross each other in various directions. Silk-worm (q. v.) moths are among the insects most useful to man; but moths in general are regarded by him as injurious, the larvae of many feeding on leaves of various kinds, and often destroying valuable crops; and

the larvae of some small species proving very destructive to clothes, books, &c. The largest and most splendid moths inhabit tropical countries. Some of the most interesting and important kinds of moth are noticed in separate articles. A complete account of the *British Moths* (2 vols.), accompanied by accurately coloured plates, is published by W. and R. Chambers.

**MOTHER CAREY'S CHICKEN**, a name familiarly given by sailors to the Storm Petrel and other small oceanic species of Petrel (q. v.).—The

Mother Carey's Chicken, or Storm Petrel (*Procellaria pelagica*).

name **MOTHER CAREY'S GOOSE** is, in like manner, given to the Great Black Petrel or Gigantic Fulmar (*Procellaria gigantea*) of the Pacific Ocean; a bird of about three feet in entire length, with very long wings, and blackish gray plumage, a ravenous feeder on dead whales and all other animal garbage, and which also kills and preys upon other sea-birds.

**MOTHER OF PEARL**, the shells of the large bivalve mollusc *Melcaegrina margaritifera*, which also produces the precious pearls. See **PEARL**. These shells are collected in vast numbers in the tropical seas, chiefly on the coasts of Ceylon, Manilla, Cuba, Panama, and the South Sea Islands. Those from Panama are small and thick, and are known in commerce as 'bullock' shells; those from Manilla are finest in quality, often as much as a foot in diameter, round, and flat. There are two varieties—the white or silver-lipped, and the black-lipped. So enormous is the trade in these shells, that the imports of this country alone amount to 3000 tons per annum, the value of which is nearly £100,000. Although large quantities of these shells are consumed in inlaying fancy wood-work, papier mâché, and in making knife-handles and other small ornamental objects, by far the greater portion is required for the manufacture of buttons, which are chiefly made in Birmingham.

**MOTHER WATER, MOTHER LYE.** See **LYE**.

**MOTHERWELL, WILLIAM**, a Scottish poet and antiquary, was born in Glasgow, 13th October 1797, and educated chiefly at the grammar-school of Paisley, where, in his fifteenth year, he entered the office of the sheriff-clerk. At the age of twenty-one, he was appointed sheriff-clerk depute of the county of Renfrew. In the following year he published his first work, the *Harp of Renfrewshire*, containing biographical notices of the poets of that district, from the 16th to the 19th century. This work was but the prelude to one of far greater importance—his *Minstrelsy, Ancient and Modern*,

which appeared at Glasgow in 1827. In 1828, he commenced the *Paisley Magazine*, in which some of his finest original pieces first saw the light, and in the same year accepted the editorship of the *Paisley Advertiser*, a Conservative journal. In 1830, he became editor of the *Glasgow Courier*. He died in that city, November 1, 1835, at the early age of 38. M. displays in his best moods (but *only* then, for his inspiration was not constant, and at times he pours forth a stream of very mediocre sentimentalities) a rich, beautiful, and strong imagination, great warmth and tenderness of feeling, and a thorough knowledge of the language of a poet. His *Jeanie Morison* is unsurpassed for the mingled pathos and picturesque beauty of its reminiscences of boyish love; *The Sword-Chant of Thorstein Raudi* is perhaps the most heroic rime in the English tongue; and the little piece beginning, 'My heid is like to rend, Willie,' has seldom been read without tears. An enlarged edition of his poetical remains, accompanied by a memoir of his life, was published in London in 1849.

MOTHERWORT (*Leonurus Cardiaca*), a plant of the natural order *Labiata*, found about hedges and in waste places in Europe, and now abundantly naturalised in some parts of North America. It is not very common in Britain, and probably has been introduced. It is perennial, has a branched stem

Motherwort (*Leonurus Cardiaca*).

about three feet high, stalked leaves, the lower ones 3-lobed, and crowded whorls of reddish-white flowers. The calyx has five pungent spreading teeth. The upper lip of the corolla is shaggy on the upper side, the lower lip trifid. The anthers are sprinkled with shining dots. The plant was formerly in much use as a domestic pectoral medicine, but is now comparatively little employed. It has a strong, but not agreeable smell.—Other species of the same genus are found in Europe and the north of Asia.

MOTION, LAWS OF, are the fundamental principles connecting force and motion in the physical universe; and are obviously to be derived from experiment alone, since intuitive reasoning cannot possibly give us any information as to what may or may not be a law of nature. Though these laws are derived from experiment, it cannot be said that we have any very *direct* experimental proofs of their

truth—our most satisfactory verifications of them are derived from the exact accordance of the results of calculation with those of observation in the case of such gigantic combinations of mutually influencing bodies as that of the solar system; and it is by such proofs that they must be considered to have been finally established.

They seem first to have been given systematically and completely by Newton, at the opening of the *Principia*; but the first two were known to Galileo, and some of the many forms of a *part* of the third were known to Hooke, Huyghens, Wren, and others. We shall give them here in order, with a few brief comments, shewing their *necessity* and their *use*.

First, then, we naturally inquire, what matter would do if left to itself; and, by considering cases in which less and less external force is applied to a body, we are led to the statement called the *first law of motion*:

1. *Every body continues in its state of rest or of uniform motion in a straight line, except in so far as it may be compelled by impressed forces to change that state.*

This expresses simply the *inertia* of matter—i. e., a body cannot alter its *state* of rest or motion; for any such alteration external *force* is required. Hence the definition of Force (q. v.), as that which changes or tends to change a body's state of rest or motion.

Now, how does the change of state depend on the force which produces it? This is obviously a new question, to be resolved by experiment; and the answer is the *second law of motion*:

2. *Change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts.*

Newton's silence is as expressive as his speech. Nothing is here said about the previous motion of the body, or about the number of forces which may be at work simultaneously. Hence, a force produces its full effect in the form of change of motion, whether it act singly, or be associated with others; and whatever, moreover, be the original motion of the body to which it is applied. Hence, there is no such thing as equilibrium of *forces*; every force produces motion—and what we call equilibrium is *not* the balancing of forces, but the balancing of their *effects*. Hence, the absurdity of attempting to found the science of Statics on any other basis than is to be derived from the second law of motion; which, in fact, leads us at once (by the *Parallelogram of Velocities*, which is a purely geometrical conception) to the *Parallelogram of Forces*, and thence, with the help of the third law, to the whole subject of Statics. The second law also supplies the means of measuring *force* and *mass*; and of solving any problem whatever concerning the motion of *one* particle.

But more is required before we can study the motion of a *system* of particles—as a rigid body, or a liquid, for instance; or a system of connected bodies. Here there are mutual actions and reactions of the nature of pressure or of transference of *energy* (see FORCE) between the parts—and these are regulated by the *third law of motion*:

3. *To every action there is always an equal and contrary reaction: or, the mutual actions of any two bodies are always equal and oppositely directed in the same straight line.*

Thus, the mutual pressure between two bodies has equal, but *opposite*, values for the two. The tension of a rope is the same throughout, and tends as much to pull *back* the horse at one end as to pull *forward* the canal-boat at the other. The earth exerts as much attractive force on the sun as the sun exerts

on the earth—and the same law applies to the other attractive and repulsive forces, as those of electricity and magnetism.

But Newton goes much further than this; he shews, in fact, that action and reaction (subject to the third law) may consist in *work done by a force*, instead of the mere force or pressure itself. From this form of the third law we derive at once the principle of Virtual Velocities (q. v.), which in its application to machines is familiar as '*What is gained in power is lost in speed.*' But we also derive the grand principle of the indestructibility of work or energy: at all events in the case of the ordinary mechanical forces—and this must be regarded as one of the grandest discoveries which science owes to Newton. It is true that he merely *mentions* it, and then abruptly passes to another subject; yet we can hardly exaggerate the value of this single remark. Experimenters, mainly Davy and Joule, have since shewn that all the physical energies, as heat, light, electricity, &c., are subject in their transformations to the third law of motion, and thus the system constructed by Newton for ordinary dynamical purposes, is now found to rule the most mysterious of the affections of matter. For a development of this, see our article on FORCE.

**MOTION, ANIMAL.** Motion or progression is that function by which an animal is able to transport itself from place to place. It is enjoyed exclusively by animals, there being nothing strictly analogous to it in the vegetable kingdom. The organs employed in locomotion are of two kinds, the *passive* and the *active*; the former including all those textures which form the skeleton, and by which its segments are united, as fibrous and areolar tissue, synovial membrane, cartilage, fibro-cartilage, and bone, while the latter includes the muscles with the nerves, which convey to them the mandates of the will.

Before proceeding to notice the different modes of progression of men and animals, it may be expedient to say a few words on *standing*, or the natural attitude of an animal. This attitude depends upon the form and functions of the limbs. Most of the terrestrial mammals and the reptiles (excepting the serpents), both of which use four feet in walking, have the backbone (the vertebral column) nearly horizontal (being only slightly concave downwards), and resting, at the same time, both on the fore and hind legs. Birds, whose anterior extremities are intended for flight, stand upon the posterior limbs only, although in their case, too, the backbone is generally nearly horizontal when the animal is at rest. Man alone stands erect with his head supported on the summit of the nearly vertical vertebral column. Some other animals (monkeys, hares, kangaroos, &c.) can rise more or less erect, but in their case the attitude is obviously not the natural one.

In standing, it is requisite that the limbs should be so arranged that the centre of gravity may fall within the space included by the feet. If the centre of gravity does not fall within this space, the animal cannot stand, but must fall to that side to which the centre of gravity inclines. On this account certain aquatic birds (the albatross, for example), which have their feet placed very far back, cannot use them for walking. If an animal has four legs, it is not necessary that they should have the broad base, which is essential in bipeds. We see that most quadrupeds have comparatively small feet, while birds are furnished with long toes, which, when spread out, form large bases of support. Moreover, the flexor muscles of the toes are so arranged that the weight of the body causes them

to contract firmly, and hence birds are enabled to sleep standing without any effort.

*Walking* is the most common form of progression. When it is accomplished by two legs only, as in man, the body is inclined forwards, carrying the centre of gravity in that direction; and while one leg supports the body, the other is thrown forward to prevent it from falling, and to sustain it in turn. Hence, walking has been defined to be a continual falling forwards, interrupted by the projection of the leg. Those writers who have especially studied the theory of walking (Borelli, the brothers Weber, and Bishop) have divided the time of a step into two portions—i. e., that in which one leg only rests on the ground, and that in which both legs rest on the ground. The period in which both feet are on the ground is shorter than that in which the body is supported by one leg only. During the time the body is supported by one leg, the other leg swings from behind forwards, without the active intervention of its muscles, but by the mere force of gravity—in short, like the pendulum of a clock. When this leg is again placed on the ground, the first interval ends, and the other—i. e., that in which the body is supported by both legs—begins, and of course terminates with the raising of the other leg. The time that the body is supported by both legs diminishes as the velocity increases, and vanishes as the walk merges into a run; while, on the other hand, it attains its maximum in extremely slow walking, when it is found by experiment to amount to half the time in which only one leg supports the body. The greatest velocity of walking is attained when the time of a step is equal to half the duration of the motion of the swinging leg, and the velocity in walking of any given person depends on the time taken in making each step, and on the length of the steps; and both of these are, again, dependent on the height at which the centre of gravity of the body or the heads of the thigh-bones are carried above the ground; for as the height of the latter diminishes, the length of the step is increased, while its time is diminished, and *vice versâ*. The best walkers are incapable of acquiring a speed of more than seven miles an hour; and even this speed cannot be kept up for any length of time. The walking of quadrupeds is a similar process to that of bipeds, except that the body always rests on at least two legs. The limbs are raised in a determinate order, and usually in such a manner that the hind-leg of one side succeeds the fore-leg of the opposite side.

*Running* consists of the same succession of motions as walking; but these motions are so accelerated, that there is a period between two steps when the body is not supported on either leg; and this constitutes the essential difference between the two paces. It requires a far greater expenditure of muscular force than walking, and cannot be long maintained without considerable exhaustion. First-rate runners can accomplish a mile in a few seconds under four minutes and a half, and ten miles in an hour. (Levett in a match with Frost, which came off on the 22d of March 1852, at Copenhagen Fields, ran 10 miles 250 yards, in 52' 53", and Deerfoot ran 11 miles 740 yards, at Brompton, in an hour.) In quadrupeds there are various paces besides walking, which are known as trotting, cantering, and galloping; and as every one is familiar with the ordinary paces of the horse, we shall take that animal as our illustration. In *trotting*, the horse moves its legs in pairs diagonally. Thus, if the left fore and right hind leg be raised, and advanced first, the right fore and left hind leg will be raised the instant the others reach the ground. In fact, in trotting, the first pair are actually raised before the

other legs reach the ground, so that there is a minute interval when all four legs are raised above the ground at the same time. The velocity acquired by moving the legs in pairs (as in running), instead of consecutively (as in walking), depends upon the circumstance, that in trotting each leg rests on the ground during a short time and swings during a long time, while in walking the swing occupies a short period, and the rest a comparatively long one. In *cantering*, the animal, after advancing the two fore-legs one after the other, brings forward the two hind-legs simultaneously; and when this movement is greatly urged, the fore-legs are raised together, as well as the hind-legs, and the pace then becomes the *gallop*.

In *leaping*, the horse raises the fore-legs from the ground, and propels the body upwards and forwards by the hind-legs alone. This act in the horse is, however, mainly the result of education, and those animals that leap or spring upon their prey (as the members of the cat tribe) crouch before leaping, in order to throw the body forward with the greatest possible force, by first bending all the limbs, and then suddenly extending them. As the hind-legs are, however, the essential agents in leaping, we observe that in those animals whose natural mode of progression is leaping—as frogs, hares, kangaroos, &c.—the hind-legs are much longer, and more muscular than the fore-legs. Leaping is a common mode of progression in many short-legged birds (blackbirds, thrushes, finches, sparrows, &c.), in which the step would be extremely short if performed by moving the legs alternately. There is also a large number of insects, such as grasshoppers, fleas, &c., whose ordinary mode of progression is by leaps; and it is in this class of animals that the leaping power is developed to its greatest extent. The common flea, for example, can leap 200 times its own length. While fleas, locusts, and grasshoppers leap by means of their long and strong hind-legs; other insects, as the *Podurida*, or spring-tails, possess a forked tail, which they bend beneath the body, and which, when suddenly extended, propels them to a considerable distance.

*Climbing*, is merely walking on an inclined or vertical surface. It is usually accomplished by means of sharp nails or claws, as in the cat-tribe, the lizards, &c. In many birds, as the woodpeckers, parrots, &c., the toes are arranged in two divisions, so as to grasp branches in the manner of a hand. Bears and sloths use their arms for climbing, while monkeys use their hands, and in some cases their tails. It is only in a very few cases, as in the sloth, that this is the ordinary method of progression.

The act of *flying* in the bird is accomplished by the simultaneous action of the two anterior limbs, the wings, much as leaping is by that of the two posterior limbs. See *FLYING*; *BIRDS*. Many attempts have been made to estimate the velocity at which different birds can fly. Whether, as has been stated, the eider-duck can fly 90, and the hawk 150 miles in an hour, is very questionable; but it has been ascertained that carrier-pigeons can accomplish from 38 to 42 miles in that time.

The bats are the only mammals which possess a true power of flight. For a description of their organs and mode of flight, we must refer to the article *BAT*, where will also be found a notice of the false claims of some other mammals, as the so-called flying-squirrel, to the possession of true flight. Similarly, the actions of the flying lizard and of the flying-fish are not true flight. In no class of animals is the mechanism of flight so perfect as in insects. The dragon-fly, for example, can out-strip the swallow; and can do more in the air than any bird, as it can fly backwards and sidelong,

to right or left, as well as forwards without turning. The wings of insects, of which there may be either one or two pair, are analogous (as instruments of motion) to the feathered wings of birds, but are regarded as homologous to (or in their essential nature) branchiæ or respiratory organs. For details regarding the mechanism employed in their aerial progression by insects, see *INSECTS*.

*Swimming* is the mode of progression employed by most aquatic animals. It mainly differs from flying in this respect, that water being much more dense than air, and the body of the animal being nearly of the same weight as the water it displaces, very little effort is required to keep the animal from sinking, and hence almost the whole of the muscular force can be employed in progression. In fishes, the locomotive organs consist of the fins and tail, the latter being the great propelling organ. The swimming of a fish has been correctly compared to the motion of a boat propelled by a single oar or scull at the stern. In the same manner as a succession of strokes alternately right and left propels the boat straight forwards, so the fish advances by striking alternately right and left with its tail. The caudal fin, in which the tail ends, is vertical in fishes, and is usually considerably forked, when there is great speed. The ventral fins are for the purpose of keeping the fish in its proper position, with the back upwards, as is shown by a well-known experiment of Borelli, who, after cutting off these fins, restored the living fish to the water, when it rolled from side to side like a drunken man. The air-bladder with which many fishes are provided, and which they can distend and contract at pleasure, facilitates their swimming by enabling them to modify their specific gravity. Most terrestrial mammals, excepting man, swim at once the first time they find themselves in deep water. The reason of this is, that their limbs move in water precisely as they do on land, and no new action either as regards direction or order is required, as is the case with man, to enable them to swim. Those which frequent the water, as seals, otters, and beavers, have webbed feet like ducks and other palmiped birds, the toes being united by membranes, which, when expanded, act as paddles. A large number of invertebrate animals move chiefly by swimming. Thus lobsters move by means of a vertical motion of the tail, and many of the crabs by means of their posterior legs, which are fashioned like oars. Many insects swim with their legs, which are fringed with hairs to give additional surface. The cuttle-fish uses its long arms as oars, and darts through the water with extreme rapidity; while other molluscs erect sail-like organs, by which they are propelled along the surface of the water. *SWIMMING*, as a gymnastic exercise, is described in a separate article.

Notices of the more special modes of progression will be found under a variety of heads. See *CRUSTACEA*, *SERPENTS*, *WORMS*.

**MOTION**, in Plants. See *IRRITABILITY* and *SPORE*.

**MOTIVE**, or **MOTIVO**, in a musical composition, means the principal subject on which the movement is constructed, and which, during the movement, is constantly appearing in one or other of the parts, either complete or modified. In elaborate and long compositions there are also secondary motives.

**MOTLEY**, JOHN LOTHROP, LL.D., D.C.L., &c., American historian, was born at Dorchester, Massachusetts, April 15, 1814. After graduating at Harvard University, he spent a year at Göttingen, another at Berlin, and travelled in Italy and other

parts of Southern Europe. Returning to America, he studied law, and was admitted to the bar in 1837; but preferring literature, he wrote a historical romance, entitled *Morton's Hope* (1839), which had little success. In 1840, he received the appointment of secretary of legation to the American Embassy to Russia, but soon resigned, and in 1849, published another unsuccessful novel, entitled *Merry Mount, a Romance of the Massachusetts Colony*. He attracted attention, however, by some valuable historical essays for American reviews, among which may be mentioned one on De Toqueville's *Democracy in America*, and another on 'Peter the Great;' and having planned a history of Holland, he proceeded to Europe for materials, and after five years' labour, published in 1856 *The Rise of the Dutch Republic*, which had an immediate and marked success, was translated into French, Dutch, and German, and caused him to be elected to the French Institute and many learned societies in Europe, and to receive the degrees of Doctor of Laws from Harvard, and Doctor of Civil Law from Oxford University. He has since been engaged on a *History of the United Netherlands*, of which two volumes were published in 1860.

**MOTRIL**, a town of Spain, in the province of Granada, and 35 miles south of the city of that name, in a richly productive district about 3 miles from the sea. The hills in the vicinity are covered with vines, and the town is tropical in its aspect. Agriculture and fishing are the principal employments of the inhabitants. Pop. 12,850.

**MOTTO**, in Heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or household badge. Mottoes were originally attached to the badge when the family had one, or to the crest where there was no badge. In later heraldry, the practice is to place the motto in an escrol either over the crest or below the shield. A motto is sometimes a religious or moral sentiment, as 'Gardez la foi,' 'Humanitate;' it is not unfrequently a heroic exclamation or war-cry, 'Courage sans peur,' 'Forward.' In a great many cases it bears reference to the crest, badge, or some bearing of the escutcheon; thus, Stuart, Earl of Moray, has for crest a pelican wounding herself, and for motto, 'Salus per Christum Redemptorem;' and not a few mottoes are punning allusions to the family name—as Scudamore, 'Scuto amoris Divini;' Vernon, 'Ver non semper viret;' Fare, fae, for Fairfax; and 'Time Deum, cole regem,' for Coleridge. Two mottoes are sometimes used by the same family—one above the crest, the other below the shield. The motto, 'Dieu et mon Droit,' which accompanies the royal arms of Great Britain, is supposed to have been a war-cry, and was used in England at least as early as the time of Henry VI. Its origin has been assigned to a saying of Richard I., 'Not we, but God and our right have vanquished France.'

**MOUFFLON**, or **MUSMON** (*Ovis* or *Caprovix Musimon*), the wild-sheep of Corsica, Sardinia, Cyprus, Greece, &c. It is about the size of a small fallow-deer, covered with hair and not with wool, except that hair of a somewhat woolly character appears in winter. The upper parts are brownish, the under parts whitish; the hair of the neck is long; the tail is very short. The horns of the male are very large, approaching to those of the Argali. The *M.* lives chiefly in the higher parts of mountainous regions, and is not easily approached by the hunter.

**MOULD**, or **MOULDINESS**, the common name of many minute fungi which make their appearance, often in crowded multitudes, on animal and vegetable substances, either in a decaying or in a living but

morbid state. To the naked eye, they often seem like patches or masses of fine cobweb, and are discovered by the microscope to consist of threads more or less distinctly jointed, sometimes branched. Some species of *M.* occur on many different substances; others seem to be peculiar to substances of particular kinds, as decaying pears, decaying gourds, &c. Some of the moulds belong to the suborder of fungi called *Physomyces*. See **FUNGI**. One of these is the **COMMON M.** (*Mucor mucedo*), so plentifully found on fruit, paste, preserves, &c., in a state of incipient decay, the progress of which it hastens. It consists

Common Mould (*Mucor mucedo*), highly magnified.

of cobweb-like masses of threads, from which rise many short stems, each bearing at the top a roundish membranous blackish spore-case.—A nearly allied, and also very common species, is *Ascochloa mucedo*, which forms a bluish *M.* on bread. From a spreading cobweb-like bed rise long slender branches, terminated by spore-cases, of which the vesicle collapses into the form of a little *pileus*.—An interesting species of *M.*, remarkable for its luxuriance and beauty of colours—at first white, then yellow, with orange spore-cases, then shining green or olive, and with threads often several inches long—grows on fatty substances.—Other species of *M.* are ranked among *Hiphomyces*, a suborder of Fungi, having a floccose thallus and naked spores. One of these is the **BLUE M.** (*Aspergillus glaucus*), which imparts to cheese a flavour so agreeable to epicures, and perhaps marks it as in a condition most suitable for promoting the digestion of other aliments, of which epicures eat too much. Advantage is often taken of the fact, that a small portion of cheese affected with *M.* will speedily infect sound cheese into which it may be introduced. It is one of the few cases in which the propagation of these fungi is ever desired and sought after by man.—*Snow M.* (*Lanosa nivalis*) is found on grasses, and especially on barley and rye beneath snow, often destroying whole crops. It appears in white patches of a foot or more in diameter, which finally become red as if dusted with red powder.

Even living animals are liable to be injured by fungi of this kind. Silk-worms are killed in great numbers by one called **MUSCARDINE** (q. v.), or **SILK-WORM ROT**. Such fungi are sometimes developed on the mucous membrane and in internal cavities of vertebrate animals; and on the bodies of invertebrate animals, as the common house-fly, which, in the end of autumn, when it becomes languid, often dies from this cause. Even strongly-scented substances, if moist, are liable to be attacked by *M.* of one kind or other; nor are strong poisons, either animal or vegetable, a sufficient safeguard. *Ascochloa mucedo* springs up readily in paste full of corrosive sublimate; and the mycelium of moulds is found in strong arsenical solutions. The only sure preventive of *M.* is dryness. Many of the moulds vegetate in liquids, but do not attain their perfect development, only appearing as filamentous and flocculent mycelia. The *Vinegar Plant* (q. v.) is an instance of this kind.

Mildews and Moulds are very nearly allied.

The rapidity with which these fungi are produced is marvellous. 'In favourable circumstances, a plant will pass through every stage of growth to perfect maturation of its seeds in less than two days, the threads which sustain the ripe sporangia

being so long, and yet so delicate, as to make it a marvel that they can remain erect.—(Berkeley).

**MOULD**, the model or pattern from which workmen execute mouldings, ornaments, &c. Also, the shape or bed in which metal and other castings are made.

**MOULDINGS**, the curved and plane surfaces used as ornaments in cornices, panels, arches, &c., and in all enriched apertures in buildings. In classic architecture the mouldings are few in number, and

Classic Mouldings.

definitely fixed in their forms. There are eight kinds of these regular mouldings, viz., the Cyma, the Ovolo (or Echinus), the Talon, the Cavetto, the Torus, the Astragal, the Scotia, and the Fillet (q. v.); and each of these mouldings has its proper place assigned to it in each order. See COLUMN. In Gothic architecture, and all other styles, the mouldings are not reduced to a system as in the Greek and Roman styles, but may be used in every variety of form at the pleasure of the artist. Certain forms generally prevail at one period in any style. Thus, in Gothic architecture, the date of a building may in many instances be determined by the form of the mouldings.

Various Mouldings.

The Norman mouldings were very simple in outline, and frequently enriched with the zigzag and billet ornaments. Fig. 1 is a common Norman form.

In the early English style, the mouldings are also simple in outline, and are usually arranged in rectangular divisions, as in fig. 3, and consist of alternate rounds and hollows. In late examples of this style, the fillet was introduced (fig. 2), and

led to the more elaborate form of mouldings during the Decorated period (fig. 4).

The mouldings of the perpendicular style are generally flatter and thinner than the preceding, and have large hollows separated by narrow fillets, which produce a meagre effect.

Each of these styles has its peculiar ornaments and style of foliage; and when these are used along with the mouldings, there is no difficulty in determining the approximate date of a building.

**MOULINS**, a town of France, capital of the department of Allier, on the right bank of the river Allier, here crossed by a handsome stone bridge of 13 arches, lies 213 miles, by railway, south-east of Paris, and 95 miles north-west of Lyon. M. was formerly the capital of Bourbonnais. It is a clean, well-built town, with pretty promenades. The principal buildings are the cathedral of Notre Dame (for the enlargement of which the sum of one and a half million francs was granted in 1852), the museum, the theatre, the public library containing 20,000 vols., the new town-house, the Palace of Justice, and the college. Of the old castle, built by the Duc de Bourbon in 1530, only a square tower remains, which is used as a prison. M. carries on trade in coal, wood, iron, grain, wine, oil, and cattle. Pop. 15,471.

**MOULMEIN**, the seat of government of the Tenasserim Provinces (q. v.), situated on the north-east corner of the Bay of Bengal, at the junction of the rivers Salween, Gyne, and Attaran, in 16° 29' N. lat., and 97° 38' E. long. M., one of the healthiest stations in India, is a pretty specimen of an eastern town. It is divided into five districts, each of which is under a goung or native head of police. The streets are, for the most part, shaded with trees, principally of the acacia tribe, and the glossy jack is often seen half covering a native house, its great fruit, as large as a child's head, ripening in the sun. The principal street, about 3 miles in length, runs due north and south, and parallel with the river Salween. The native houses are constructed in the usual Burman style of bamboo, and a thatch made of the leaf of the water-palm. All are raised on piles, according to the universal custom of the country. Men walk about with the green paper chattah, or Chinese umbrella, used throughout the provinces; the *gharie*, or India cab, dashes along, the attendant imp revelling in heat and dust.

M. is backed by a fine range of hills, on whose heights flash the gilded spires of innumerable pagodas; and here, too, are built many pretty residences, commanding a fine view of the town, river, and adjacent country, which for picturesque beauty and varied scenery has few equals. M. boasts various churches, chapels, and missionary establishments, several charitable and educational institutions, substantial barracks, a general hospital, public library, &c. Vessels drawing 10 feet of water can come up to M., under charge of pilots from Amherst, and at spring-tide ships of any tonnage may reach the town. The rise and fall of the water is at that time from 20 to 23 feet. The population of M. is on the increase. In the census of 1855—1856 it is given as follows:

|                          |        |
|--------------------------|--------|
| Number of Men, . . . . . | 13,021 |
| " Women, . . . . .       | 11,610 |
| " Children, . . . . .    | 14,052 |
|                          | 43,683 |

Besides the Burmans proper, the inhabitants of M. include Eurasians or half-casts, Taliens, Chinese, Shans, Karens, Armenians, Jews, Malays, and natives of Hindustan.

M. possesses great facilities for ship-building, and

many fine vessels have lately been constructed in the building-yards of Tavoyzoo and Mopoon. The principal exports from M. are teak-timber and rice; the imports consist of general merchandise, chiefly piece-goods, hardware, provisions, and sundries.

*The Tenasserim and Martaban Directory*; Winter's *Six Months in British Burmah* (Lond. 1858); Marshall's *Four Years in Burmah* (Lond. 1860); personal observation.

**MOULTING** is the term applied by naturalists to the periodical exuviation, or throwing off of certain structures, which are for the most part of an epithelial or epidermic character. Thus, in a considerable number of the *Articulata*, the external covering is thrown off, and replaced many times during life. In some of the minute Entomostracous Crustacea of our pools, a process of moulting, similar to that which occurs in crabs and lobsters, occurs every two or three days, even when the animals seem to have attained their full growth. In the crabs, in which the process has been carefully observed, the *exuvium*, or cast-off shell, consists not only of the entire external covering, including even the faceted membrane which forms the anterior coat of the compound eyes, but also carries with it the lining membrane of the stomach, and the plates to which the muscles are attached. During growth, this moulting takes place as often as the body becomes too large for the shell; and after the animal has attained its full size, it is found to occur at least once a year, at the reproductive season. During the early growth of insects, spiders, centipedes, &c., a similar moult is frequently repeated at short intervals, but after they have attained their full size, no further moulting takes place. In the *Vertebrata* we have examples of as complete a moulting, and replacement of new skin, among frogs and serpents as occurs in the *Articulata*, the whole epidermis being thrown off at least once, and, in some instances, several times yearly. In birds, the feathers are periodically cast off and renewed; in mammals generally, the hair is regularly shed at certain periods of the year; and in the deer tribe the casting off and renewal of the antlers must be regarded as a special example of moulting. In man, the continual exuviation of the outer layers of the epidermis is a process analogous to that which takes place on a more general scale in the lower animals.

**MOULTRIE, FORT**, a fortress on Sullivan's Island, at the mouth of Charleston Harbour, South Carolina, celebrated for the repulse of a British squadron commanded by Sir Peter Parker, January 28, 1776. The fort, at that time, was hastily built of Palmetto logs and sand, with 31 guns and 435 men. The spongy wood of the palmetto was found to resist the cannon balls perfectly. The fort was afterwards rebuilt, and in April 1861, took part in the reduction of Fort Sumter, and the commencement of active hostilities in the civil war of secession.

**MOUND** (Lat. *mundus*), in Heraldry, a representation of a globe, surmounted with a cross (generally) pattée. As a device, it is said to have been used by the Emperor Justinian, and to have been intended to represent the ascendancy of Christianity over the world. The royal crown of England is surmounted by a mound, which first appears on the seal of William the Conqueror, though the globe without the cross was used earlier.

Mound.

**MOUNT**, in Heraldry. When the lower part of the shield is occupied with a representation of ground slightly raised, and covered with grass, this is called a mount in base; e.g., Argent, on a mount in base, a grove of trees ppr.—Walkinshaw of that ilk, Scotland.

Mount.

**MOUNT YERNON**, the seat and tomb of George Washington, first President of the United States of America, on the right bank of the river Potomac, in Virginia, 15 miles below Washington. The residence of Washington, finely situated on the rising bank of the river, and his tomb, with an estate of 200 acres, have been purchased by a patriotic society of ladies, to be kept as a place of public resort, and a memorial of the 'Father of his country.'

**MOUNTAIN ASH.** See **ROWAN.**

**MOUNTAIN LIMESTONE**, the basement rock of the carboniferous series in the south of England and in Wales. It consists of a calcareous rock loaded with marine remains, the greater part of the rock being made up bodily of corals, crinoids, and shells. It has a variable thickness, sometimes reaching as much as 900 feet. In the north of England and in Scotland, the marine limestones are not separated from, but alternate with the coal-bearing strata. See **CARBONIFEROUS SYSTEM.**

**MOUNTAINS.** The number and altitude of the mountains of the globe are so great that they form almost everywhere prominent objects, and operate to a large extent in modifying the climatic conditions of every country in the world. Yet the amount of solid material so raised above the ordinary level of the land is not so much as might be expected. Remembering that elevated plateaus of great extent occur in several regions, and that the general surface of the earth is considerably higher than the sea-level, it has been estimated that were the whole dry land reduced to a uniform level, it would form a plain having an elevation of 1800 feet above the sea. And were these solid materials scattered over the whole surface of the globe, so as to fill up the bed of the ocean, the resulting level would be considerably below the present surface of the sea, inasmuch as the mean height of the dry land most probably does not exceed one-fifteenth of the mean depth of the bed of the ocean.

Mountains, and especially mountain-chains, subserve important uses in the economy of nature, especially in connection with the water system of the world. They are at once the great collectors and distributors of water. In the passage of moisture-charged winds across them, the moisture is precipitated as rain or snow. When mountain-ranges intersect the course of constant winds by thus abstracting the moisture, they produce a moist country on the windward-side, and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western surface of which has a different aspect from the sloping eastern plains; and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow-line 5000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are of frequent occurrence, which open up a pass, or way of transit, at a level below the snow-line. But even these would not prevent the range being an impassable

## MOUNTAINS.

barrier, if the temperate regions contained as lofty mountains as the tropics. Mountain-ranges, however, decrease in height from the equator to the poles in relation to the snow-line.

The numerous attempts that have been made to generalise on the distribution of mountains on the globe have hitherto been almost unsuccessful. In America, the mountains take a general direction more or less parallel to the meridian, and for a distance of 8250 miles, from Patagonia to the Arctic Ocean, form a vast and precipitous range of lofty mountains, which follow the coast-line in South America, and spread somewhat out in North America, presenting everywhere throughout their course a tendency to separate into two or more parallel ridges, and giving to the whole continent the character of a precipitous and lofty western border, gradually lowering into an immense expanse of eastern lowlands. In the Old World, on the other hand, there is no single well-defined continuous chain connected with the coast-line. The principal ranges are grouped together in a Y-shaped form, the general direction of which is at right angles to the New World chain. The centre of the system in the Himalayas is the highest land in the hemisphere. From this, one arm radiates in a north-east direction, and terminates in the high land at Behring Straits: the other two take a westerly course; the one a little to the north, through the Caucasus, Carpathians, and Alps, to the Pyrenees; the other more to the south, through the immense chain of Central African mountains, and terminating

at Sierra Leone. Most of the principal secondary ranges have generally a direction more or less at right angles to this great mountain tract.

The inquiry into the origin of mountains is one that has received not a little attention. Geologists have shewn that the principal agents in altering the surface of the globe are denudation, which is always abrading and carrying to a lower level the exposed surfaces, and an internal force which is raising or depressing the existing strata, or bringing unstratified rocks to the surface. Whether the changes are the small and almost imperceptible alterations now taking place, or those recorded in the mighty mountains and deep valleys everywhere existing, denudation and internal force are the great producing causes. These give us two great classes of mountains.

1. *Mountains produced by denudation.*—The extent to which denudation has altered the surface of the globe can scarcely be imagined. All the stratified rocks are produced by its action; but these do not measure its full amount, for many of these beds have been deposited and denuded, not once or twice, but repeatedly, before they reached their present state. Masses of rock more indurated, or better defended from the wasting currents than those around, serve as indices of the extent of denudation. The most remarkable case of this kind, with which we are acquainted, is that of the three insulated mountains in Ross-shire—Suil Veinn, Coul Beg, and Coul More (fig. 1)—which are about 3000 feet high. The strata of the mountains

Fig. 1.—Suil Veinn, Coul Beg, and Coul More.—From Murchison's *Siluria*: London, J. Murray.

are horizontal, like the courses of masonry in a pyramid, and their deep red colour is in striking contrast with the cold bluish hue of the gneiss which forms the plain, and on whose upturned edges the mountain-beds rest. It seems very probable, as Hugh Miller suggests, that when the formation of which these are relics (at one time considered as Old Red Sandstone, but now determined by Sir Roderick Murchison as being older than Silurian), was first raised above the waves, it covered, with an amazing thickness, the whole surface of the Highlands of Scotland, from Ben Lomond to the Maiden Paps of Caithness, but that subsequent denudation swept it all away, except in circumscribed districts, and in detached localities like these pyramidal hills.

2. *Mountains produced by internal force.*—These are of several kinds. (a.) Mountains of ejection, in which the internal force is confined to a point, so to speak, having the means of exhausting itself

through an opening in the surface. The lava, scoria, and stones ejected at this opening form a conical projection which, at least on the surface, is composed of strata sloping away from the crater. Volcanoes are mostly isolated conical hills, yet they chiefly occur in a somewhat tortuous linear series, on the mainland and islands which enclose the great Pacific Ocean. Vesuvius and the other European volcanoes are unconnected with this immense volcanic tract. (b.) But the internal force may be diffused under a large tract or zone, which, if it obtain no relief from an opening, will be elevated in the mass. When the upheaval occurs to any extent, the strata are subjected to great tension. If they can bear it, a soft rounded mountain-chain is the result; but generally one or more series of cracks are formed, and into them igneous rocks are pushed, which, rising up into mountain-chains, elevate the stratified rocks on their flanks, and perhaps as parallel ridges. Thus, the Audes

consist of the stratified rocks of various ages, lying in order on the granite and porphyry of which the mass of the range is composed. The position of the strata on such mountains supplies the means of determining, within definite limits, the period of upheaval. The newest strata that have been elevated on the sides of the mountain when it was formed, give a date antecedent to that at which the elevation took place, while the horizontal strata at the base of the mountain supply one subsequent to that event. Thus, the principal chain of the Alps was raised

Fig. 2.—Principal System of the Alps:

1, Granitic rocks; 2, Palaeozoic; 3, Secondary; 4, Tertiary; 5, Recent.

during the period between the deposition of the Tertiary and that of the older recent deposits. (c.) But there is yet another way in which the upheaving internal force operates, viz, where it does not act at right angles to the surface, but rather obliquely, and, as it were, pushes the solid strata forwards, causing them to rise in huge folds, which, becoming permanent, form parallel ranges of mountains. The crust of the earth, in its present solid and brittle condition, is thus curved, in a greater or less degree, by the shock of every earthquake; it is well known that the trembling of the earth is produced by the progress of a wave of the solid crust; that the destruction of buildings is caused by the undulation; and that the wave has been so evident, that it has been described as producing a sickening feeling on the observer, as if the land were but thin ice heaving over water. This mode of mountain formation has been explained, when treating of the Appalachians (q. v.), which

Fig. 3.—The System of the Netherlands:

1, Silurian; 2, Coal Measures; 3, New Red Sandstone; 4, Oolite; 5, Chalk.

were thus formed. Many other ranges have had a similar origin, as some in Belgium and in the Southern Highlands of Scotland, as has been suggested by Mr Carruthers.

It is evident that in the last two classes the parallel ridges were produced at the same time. Elie de Beaumont has generalised this, maintaining that all parallel ridges or fissures are synchronous; and on this he based a system of mountain-structure, which is too universal and too geometrical to be true. The synchronism of parallel fissures had been noticed by Werner, and it is now received as a first principle in mining. The converse is also held to be generally true, that fissures differing in direction differ also in age; yet divergence from a centre, and consequent want of parallelism, as in the case

of volcanoes, may be an essential characteristic of contemporaneity. Nevertheless, Elie de Beaumont has classified the mountains of the world according to this parallelism, holding that the various groups are synchronous. The parallelism does not consist in having the same relations to the points of the compass—for these, as regards north and south, would be far from parallel—but is estimated in its relation to some imaginary great circle, which being drawn round the globe would divide it into equal hemispheres. Such circles he calls Great Circles of Reference. But beyond this, he goes a step further, and proposes a more refined classification, depending on a principle of geometrical symmetry, which he believes he has discovered among his great circles of reference. It is to be feared, however, that his geometrical speculations have little foundation in nature.

**MOURNE MOUNTAINS.** See DOWN, COUNTY OF.

**MOURNING**, a particular habit worn to express grief, especially for the decease of friends. The usages regarding mourning have varied much at different times and in different countries. Among the Jews, the duration of mourning for the dead was generally 7, but sometimes protracted to 30 days; and the external indications of sorrow consisted in weeping, tearing the clothes, smiting the breast, cutting off the hair and beard, lying on the ground, walking barefoot, and abstaining from washing and anointing themselves. Among the Greeks, the period was 30 days, except in Sparta, where it was limited to 10. The relatives of the deceased secluded themselves from the public eye, wore a coarse black dress, and in ancient times cut off their hair as a sign of grief. Among the Romans, the colour of mourning for both sexes was black or dark-blue under the republic. Under the empire, the women wore white, black continuing to be the colour for men, who did not cut off the hair or beard as in Greece. Men wore their mourning only a few days; women a year, when for a husband or parent. The time of mourning was often shortened by a victory or other happy public event, the birth of a child, or the occurrence of a family festival. A public calamity, such as a defeat, or the death of an emperor or person of note, occasioned a public mourning, which involved a total cessation of business, called *Justitium*. In modern Europe, the ordinary colour for mourning is black; in Turkey, violet; in China, white; in Egypt, yellow; in Ethiopia, brown. It was white in Spain until 1498. Mourning is worn of different depth, and for different periods of time, according to the nearness of relationship of the deceased. On the death of a sovereign or member of the reigning house, a court mourning is ordered; and in this country, it is usual at the same time to recommend the adoption of a general mourning.

In Scotch Law, if a husband die, whether solvent or insolvent, the widow will be entitled to a preferable payment out of the assets for mournings suitable to his rank. And the same privilege applies to mournings for such of the children as are to assist at the funeral. In England, there is no such privilege or distinction.

**MOUSE** (*Mus*), a genus of rodent mammalia of the family *Muridæ* (q. v.), having three simple molar teeth in each jaw, with tuberculated summits, the upper incisors wedge-shaped, the lower compressed and pointed, the fore-feet with four toes and a rudimentary thumb, the hind-feet five-toed; the tail long, nearly destitute of hair, and scaly. This genus includes Rats (q. v.) and mice; the smaller species bearing the latter name.—The

COMMON M. (*M. musculus*) is perhaps not originally British, although now so abundant everywhere. It accompanies man wherever he goes, and readily colonises every region, arctic, temperate, or tropical; its great fecundity, common also to most of its congeners, causing means to be employed everywhere for the prevention of its excessive multiplication. Aristotle made the experiment of placing a pregnant female M. in a closed vessel filled with grain, and found in a short time no fewer than 120 mice in the vessel. Of cats and mouse-traps it seems unnecessary here to speak, and equally unnecessary to give a description of the common mouse. There are several varieties of this species. That generally found in houses is smaller, and not so dark in colour, as that common in barns and farmyards. A white variety sometimes occurs, and has been perpetuated in a half-domesticated state. The common brown kind is, however, at least as easily tamed, and readily becomes familiar enough. A pied variety is not uncommon in India.—Much has been written about the singing powers of the M.; it being asserted, on the one hand, that mice not infrequently shew a strong love for music, and a power of imitating the song of birds; whilst, on the other hand, it is alleged that the singing of mice is merely the consequence of throat disease.—The M. makes a nest like that of a bird in the wainscot of a wall, among the chaff or feathers of a bed, or in any similar situation. The litter is generally from six to ten in number.—The WOOD M., or LONG-TAILED FIELD M. (*M. sylvaticus*), is a little larger than the Common Mouse. Its tail is

the ears not large. This species is not uncommon in some parts of the south of England; it is also found in the south of Scotland, although less frequently. It makes its nest among the stalks of wheat, reeds, or other grasses, weaving together the leaves and panicles of grasses, the leaves being for this purpose cut into shreds by its teeth. The nest is a very curious structure formed by mere intertwining, without cement of any kind. It is generally suspended among the stalks. It is globular, or nearly so, and entrance to it is through an opening, which almost completely closes up again.—A still smaller species of M. (*M. pumilus*) is found in the south of Europe.—An American species, the WHITE-FOOTED M. (*M. leucopus*), common in most parts of North America, and intermediate in its habits between the Common M. and the Field M., is said to depart from houses whenever either the cat or the brown rat appears in them.—The Barbary M. (*M. Barbarus*) approaches in size to the rats, and is distinguished by its longitudinally striped fur.

The name M. is often popularly given to animals considerably different from the true mice, as the *Voles* (q. v.).

MOUSE-EAR CHICKWEED (*Cerastium*), a genus of plants of the natural order *Caryophyllaceae*, having five sepals, five bifid petals, ten stamens, five styles, and a capsule bursting at the top with ten teeth. The species are numerous, natives of temperate and cold countries in all parts of the world. Some of them are among the most common weeds in Britain; others, having larger flowers, are occasionally planted in flower-borders and on rock-works. The form and hairiness of the leaves of some of the British species have given rise to the popular name.

MOUTH, DISEASES OF THE, occur in different forms, but usually begin with inflammation of the mucous membrane. The inflammation may be equally diffused, or may be chiefly or entirely confined to the mucous follicles. When diffused, it may either present no peculiar secreted product, or the surface may be covered with a curd-like secretion, or with patches of false membrane. It may further be attended with eruption, ulceration, or gangrene, any one of which may impress a special character on the disease, or it may present peculiarities from the nature of its exciting cause, as when it accompanies scurvy, or is the result of mercurial action.

The following are the principal forms of inflammation of the mouth, or *stomatitis* (Gr. *stoma*, the mouth), as it is termed by nosologists. 1. *Common Diffused Inflammation*, which appears in reddened, somewhat elevated patches, and sometimes occupies large portions of the surface of the mouth. It is more commonly a complication of other diseases than an original affection. When of the latter character, it is generally caused by the direct action of irritants, as by scalding drinks, corrosive substances introduced into the mouth, accumulated tartar on the necks of the teeth, &c. In ordinary cases, cooling and demulcent liquids (such as cream or almond oil) applied locally, an occasional saline cathartic, with a soft and chiefly farinaceous diet, constitute the whole of the necessary treatment.

2. *Diffused Inflammation, with curd-like exudation*, is almost entirely confined to infants, and is described under its popular name of *THRUSH*.

3. *Inflammation of the Follicles, and Eruption or Vesicular Inflammation*, are described in the article *ARTHRÆ* (q. v.).

4. In *Ulceration Inflammation, Cancrum Oris*, or *Canker*, an ulceration often of considerable size,

Long-tailed Field Mouse (*Mus sylvaticus*) and Harvest Mouse (*Mus messorius*).

longer; its ears are also longer; its muzzle rather longer; its under-parts lighter in colour, than in the common mouse. It is abundant throughout Britain and the temperate parts of Europe, and is a grievous pest in gardens and fields. It lays up stores of grain and other food, either in thick tufts of grass, or just under the surface of the earth. The quantity of food laid up in such stores is often wonderfully large. The Field M. is timid, gentle, and easily tamed.—The smallest British M., and the smallest British quadruped, is the HARVEST M. (*M. messorius*), of which the head and body are only 2½ inches in length, the tail being almost equally long, and to some degree prehensile; the general form elongated and slender, the head narrow,

with a grayish surface and an inflamed edge, appears on the gums, or inside of the cheeks or lips. The swelling of the adjacent parts is often so considerable, as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The disease generally occurs in children from two to six years of age. The ulcer may continue for weeks, or even months, but always yields to treatment. The febrile symptoms and the constipation which are usually present, must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of chlorate of potash (four or five grains in sweetened water every four hours), and by frequently washing the mouth with a weak tepid solution of chlorinated soda.

5. The preceding affection is sometimes the first stage of a much more serious affection—viz., *Gangrene of the Mouth*, which usually occurs in children between the first and second dentition. A sloughing ulcer forms upon the gums, or some other part of the mouth. This slough spreads, the breath becomes extremely fetid, the disease extends to the alveolar processes, and the teeth are loosened and fall out. Inability to take food is followed by exhausting diarrhoea, and death is the usual termination. Unless taken in the early stage, when tonics and the local application of caustics may be serviceable, the disease is generally fatal.

Other affections of the mouth are noticed in the articles SALIVATION and SCURVY.

MOVABLES, in Scotch law, is the technical term to denote personal as contradistinguished from heritable property, one of the main distinctions of property being between these two classes. Heritage goes to the heir-at-law in case of intestacy, or what is equivalent to it, and movables go to the next of kin. See KIN. The term movables is thus not confined to corporeal things, as furniture, cattle, goods, &c., but includes debts, bills of exchange, rights of action, &c.

MOVING PLANT (*Desmodium gyrans*), a plant of the natural order *Leguminosae*, suborder *Papilionaceae*, a native of India, remarkable, as are also some other species of the same genus, for the spontaneous motion of the leaves. The leaves are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks till they meet above the terminal leaflet, and then moving downwards by similar rapid jerks to the leaf-stalk. Sometimes one leaflet is in motion and the other at rest. Sometimes a few may be seen moving, whilst there is a partial cessation in the other leaves of the plant. A high wind causes this cessation more than anything else; the movements are more languid in a very hot dry day, and are to be seen in their perfection in warm moist weather. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones, but oscillates slowly from one side to the other. Concerning these remarkable movements, nothing more than the fact that they take place can yet be said to be known.

MOXA is a peculiar form of counter-irritation which was early practised in the East, particularly by the Chinese and Japanese, from whom it was learned by the Portuguese. One or more small cones, formed of the downy covering of the leaves of *Artemisia Moxa* (as used by the Chinese), or of the pith of various plants (as of the common sunflower), or of linen steeped in nitre, are placed on the skin over the affected part, and the ends remote from the skin are ignited. The combustion gradually proceeds through the cone and forms a superficial

eschar on the skin. The surrounding parts must be protected by a pad of wet rag, with a hole in it for the moxa.

It may be employed with advantage in certain forms of neuralgia (especially obstinate sciatica) and paralysis, and in chronic diseases of the joints. It is not much used in consequence of its apparent severity, but the pain is not so great as might be expected, and, according to some of its advocates, is less than often attends blisters.

MOZAMBIQUE, a territory on the east coast of South Africa, nominally belonging to Portugal, and placed under a governor-general, although the actual possessions of Portugal consist only of a few stations, and her authority in the country is inconsiderable. It extends from Cape Delgado, in lat. 10° 41' S., to Delagoa Bay, 26° S. The chief river, the Zambesi, divides it into two portions—M. proper on the north, and Sofala on the south. Area estimated at 283,500 square miles; pop. 300,000. These figures, however, are only to be considered approximate, as the country has no definite boundary to the west. The coasts, which comprise large tracts of cultivated soil, yielding rich harvests in rice, are fringed with reefs, islands, and shoals, and between Delagoa Bay and Cape Corrientes, and from M., the principal station, to Cape Delgado, the shores are high and steep. The forests yield valuable ornamental woods; ivory is obtained from the hippopotami that haunt the marshes; and gold and copper are found and worked. The elephant, deer, and lion inhabit the jungle; crocodiles are found in the rivers, and numerous flamingoes on the coasts. The rainy season lasts from November to March. The summer heat is very great, and the climate, which is fine in the elevated tracts, is unhealthy on the low shores and the swampy districts. Besides numerous fruits and vegetables, the grains are rice, millet, maize, and wheat. The government is in a most inefficient state, being, in most places, more in the hands of native chiefs than of the Portuguese. In former times the slave-trade was carried on here extensively; and from 1816 to 1857, four governors-general were removed by their government for countenancing, if not actively engaging in it. The colony is divided into six districts, and is ruled by the governor-general and his secretary, assisted by a *junta*. Religion and education are supervised by about twelve Roman Catholic priests, but seem to be at the lowest ebb. Fish and turtle are caught in great quantities on the islands and reefs; pearl-fishing is a source of considerable profit; cattle, sheep, and goats are numerous, and the principal exports are grain, gold-dust, honey, tortoise-shell, cowries, gums, and amber. The Portuguese arrived here in 1497, attracted by rumours of the wealth of the country and the excellence of its ports. The principal settlements are Mozambique, Quilimane, Sena, and Tete.

MOZAMBIQUE, the capital of the Portuguese territory of the same name, is situated on a small coral island, on the eastern coast of Africa, close to the shore, in lat. 15° 2' S. It is defended by three forts, is well built, and contains a large square in which the palace of the governor and the custom-house are the chief buildings. Pop. 8522, of whom 7000 are slaves, 270 Christians, 102 Banyans from Hindustan, and 1150 Arabs. In former times all the markets of the world were supplied with slaves from Mozambique. Its commerce, now inconsiderable, is chiefly with India, and is carried on by Arabs.

MOZAMBIQUE CHANNEL, between the island of Madagascar and the south-eastern

coast of Africa, is about 1000 miles in length, and about 450 in average breadth. At its northern extremity are the Comoro Islands. Over the northern portion the monsoons blow. Black whales, yielding spermaceti, abound.

MOZARABIAN LITURGY, a liturgy—traced back by some to the apostles, but by the majority of writers to St Isidore of Sevilla, who redacted it, in co-operation with the Fathers of the 4th Council of Toledo, 633—originally in use among those Christian inhabitants of Spain (Muzarabians, Mostarabians, Mustarabians) who remained faithful to their religion after the Arabic conquest. It is also called the Gothic Liturgy, and differs in some respects from the Roman. Gregory VII. first compelled most of the Spanish churches and convents to adopt the common uniform liturgy of the Romish Church. Six Mozarabic congregations alone, chiefly in Leon and Toledo, were allowed to retain their ancient ritual, but it soon fell into disuse even among these. Archbishop Ximenes of Toledo expressly founded a chapel at Toledo, in 1500, in which mass was to be said according to the Mozarabic manner, lest it might entirely fall into oblivion. He further caused a number of learned priests, Alfonso Ortiz among them, to collate all the different Mozarabic liturgical MSS. to be found in the different churches, chapels, and convents, and finally, there was edited, under his auspices, the *Missale Mistum secundum Regulam Beati Isidori Dictum Mozarabicum* (1500—1502), which has, however, by some unfortunate accident, remained incomplete. A whole third of the church-year is left out entirely. The peculiar affinity of this liturgy with the Gallican on the one, and the Greek on the other hand, makes its study extremely important for the history of the ancient Church.

MOZART, JOHANN CHRYSOSTOM WOLFGANG GOTTLIEB, one of the greatest of musical composers, was born, 27th January 1756, at Salzburg, where his father was sub-director of the archiepiscopal chapel. His extraordinary musical talents were cultivated to the utmost by his father. At the age of four he played the clavichord, and composed a number of minuets and other pieces still extant. When only six years of age, his performances were so remarkable, that his father took him and his sister, who possessed similar gifts, to Munich and Vienna, where they obtained every kind of encouragement from the Elector of Bavaria and the Emperor Francis I. In 1763 and 1764, the Mozart family visited Paris and London. At the age of seven, young Mozart surprised a party of musicians, including his father, by taking part, at sight, in a trio for stringed instruments. Symphonies of his own composition were produced in a public concert in London; and whilst there, he composed and published six sonatas, and made acquaintance with the works of Handel, recently deceased. Two years later, when but twelve years of age, he composed the music for the religious service, and for a trumpet concert at the dedication of the Orphan House Church in Vienna, and conducted it in presence of the imperial court. In 1769, at the age of thirteen, he was appointed director of the Prince Archbishop of Salzburg's concerts; and in the same year travelled with his father to Italy, where he created an unheard-of enthusiasm by his performances and compositions. He composed the opera of *Mithridates* at Milan, in October 1770, and it was publicly performed there in December of that year. At the age of sixteen, he was the first clavecinist in the world; he had produced two requiems and a stabat mater, numerous offertories, hymns, and motetts, 4 operas, 2 cantatas, 13 symphonies, 24

pianoforte sonatas, not to speak of a vast number of concertos for different instruments, trios, quartetts, marches, and other minor pieces. In 1779, he was appointed composer to the imperial court at Vienna, where he then fixed his residence, and there the musical works were composed upon which his great fame chiefly depends. His office in Vienna, however, was rather honorary than lucrative, and he lived by concerts, musical tours, teaching of music, and the small profits derived from the sale of his published works, till an offer of a large salary made to him by the king of Prussia led the emperor to give him 800 florins a year. His great opera of *Idomeneo* was composed in 1780, with a view to induce the family of Mademoiselle Constance Weber, afterwards his wife, to consent to the marriage, which they had declined on the ground of his reputation not being sufficiently established. This opera forms an epoch not in the composer's life only, but in the history of music. In construction, detail, instrumentation, and every imaginable respect, it was an enormous advance on all previous works of the kind, and established his repute as the greatest musician whom the world had seen. *Die Entführung aus dem Serail* followed. His six quartetts, dedicated to Haydn, appeared in 1785, and in 1786 *Le nozze di Figaro*. In 1787, he produced his *chef-d'œuvre*, *Don Giovanni*, which, though received with enthusiasm at Prague, was at first beyond the comprehension of the Viennese. *Così fan tutti* appeared in 1790. To 1791, the last year of his short life, we owe *Zauberflöte*, *La Clemenza di Tito*, and the sublime requiem composed in anticipation of death, and finished only a few days before his decease. He died on 5th December 1791, aged 35.

In the intervals of his greater works, M. composed the majority of the orchestral symphonies, quartetts and quintetts, which are an almost indispensable part of the programme of every concert in the present day, besides masses as familiar in England as in Catholic Europe, innumerable pianoforte concertos and sonatas, and detached vocal compositions, all of the most perfectly finished description. To Haydn M. always acknowledged his obligations; but Haydn's obligations to M. are at least as great. Haydn, though born twenty-four years earlier, survived M. eighteen years, and all his greatest works, written after M.'s death, bear manifold traces of M.'s influence. M. is the first composer in whose works all traces of the old tonality disappear; he is the father of the modern school. 'No composer has ever combined genius and learning in such perfect proportions; none has ever been able to dignify the lightest and tritest forms by such profound scholarship, or at the moment when he was drawing most largely on the resources of musical science, to appear so natural, so spontaneous, and so thoroughly at his ease.'—*Hullah*. See *Holmes' Life of Mozart* (Lond. 1845); *Otto Jahn's Life of Mozart* (Leip. 1856).

MOZY'R, a town in the south-east of the government of Minsk, in European Russia, 150 miles south-south-east of Minsk, is situated on the left bank of the Pripet, a tributary of the Dnieper. It is a town of considerable antiquity, and played a rather important part in the wars between the various Russian princes, previous to the Tartar invasion. It was unsuccessfully besieged by the Tartars in 1240. Under the Polish rule it was the chief town of a district, and remained so after its annexation to Russia in 1795. 150 barges and 200 rafts are annually freighted here with goods to the amount of 500,000 rubles. Pop. (1859) 5238.

MSKET, also written MTSCHGETHA and otherwise, one of the most ancient Georgian towns, in

the present government of Tiflis, and about 10 miles north-north-west of the town of that name. It is said to have been the seat of the Georgian kings down to the 5th c., and contained the first Christian church of Georgia, built during the first half of the 4th century. In this church the Georgian kings were crowned and buried. The site of M. is now marked by a few huts.

MTZENSK, a town of Russia, in the government of Orël, 646 miles south-south-east of St Petersburg. It is situated on the Zusha, which communicates through the Oka with the Volga. The old cathedral, built on a steep rock, gives picturesqueness to the town. M. receives historical mention as far back as 1147. Its trade, chiefly with St Petersburg and Moscow, amounts in value to upwards of 1,000,000 rubles. Pop. 13,400.

MUCILAGE, or BASSORIN ( $C_{12}H_{21}O_{10}$ ), is a modification of gum which is insoluble in water, but when moistened with it, swells up into a gelatinous mass. It is contained abundantly in gum tragacanth; and many seeds, such as linseed, quince seed, &c., and certain roots, such as those of the marsh mallow, furnish it in large quantity. Alkalies render it soluble in water, and convert it into true gum; and prolonged boiling in water produces the same effect. Nitric acid converts it into mucic and oxalic acids.

MUCOUS MEMBRANES AND MUCUS. Under the term MUCOUS SYSTEM, anatomists include the skin, mucous membranes, and true glands, all of which are continuous with one another, and are essentially composed of similar parts. As the skin and the glands are described in special articles, it only remains to speak of the great internal mucous tracts. These are the alimentary mucous membrane, the respiratory mucous membrane, and the genito-urinary mucous membrane.

The *alimentary mucous membrane* commences at the lips, and not only forms the inner coat of the intestinal canal from the mouth to the anus, but gives off prolongations which after lining the ducts of the various glands (the salivary glands, the liver, and the pancreas) whose products are discharged into this canal, penetrate into the innermost recesses of these glands, and constitute their true secreting element. Besides these larger offsets, we find in the stomach and small intestine an infinite series of minute tubular prolongations, the anatomical arrangement and function of which are described in the article DIGESTION.

The *respiratory mucous membrane* begins at the nostrils, and under the name of *schneiderian* or *pituitary membrane*, lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the *conjunctiva* of the eye; backwards, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations. From the continuity of these two tracts, some writers describe them as a single one, under the name of the gastro-pulmonary tract.

The *genito-urinary mucous membrane* commences at the genito-urinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. See KIDNEY, for example.

We thus see that mucous membranes line all those passages by which internal parts communicate

with the surface, and by which matters are either admitted into or eliminated from the body. As a general rule, they are soft and velvety, and of a more or less red colour, from their great vascularity, but they present certain structural peculiarities according to the functions which they are required to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of Epithelium (q. v.) resting on a thin, transparent, homogeneous membrane, which from its position is termed the *basement membrane*, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillæ and villi, or depressions or inversions in the form of follicles or glands, or both. The follicles are almost invariably present, but the papillæ and villi are limited to the alimentary or gastro-intestinal mucous membrane. 'The mucous membranes,' says Dr Carpenter, 'constitute the medium through which

Diagram of the Structure of an Involved Mucous Membrane: Shewing the continuation of its elements in the follicles and villi:

F, F, two follicles; b, basement membrane; c, submucous tissue; e, e, epithelium; v, vascular layer; n, nerve; V, villus covered with epithelium; V', villus, whose epithelium has been shed.

nearly all the material changes are effected that take place between the living organism and the external world. Thus, in the gastro-intestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles; whilst the villi, or root-like filaments, which are closely set upon its surface towards its upper part, are specially adapted to absorb the nutrient materials thus reduced to the liquid state. This same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glandule in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further decay. Again, the bronchio-pulmonary, or respiratory mucous membrane, serves for the introduction of oxygen from the air, and for the exhalation of water and carbonic acid. And, lastly, the mucous membranes are continuous with the cell-lined vesicles or tubes of the various glands, which are the instruments whereby their respective products are eliminated from the blood. Although the various kinds of epithelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—namely, that of protecting the surfaces on which they are placed. This protecting power is increased by the presence of the

secretion known as *mucus*, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed, is secreted in very considerable quantity. The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting both mechanically and chemically as a shield to highly sensitive membranes, it has, other uses, amongst which two may be especially mentioned—1. It communicates to the salivary, and probably to other glands, properties which are not possessed either by itself or by the pure glandular secretions; and 2. It serves to eliminate a considerable quantity of nitrogen from the system. This nitrogen is contained in the *mucin*, which forms from 2.4 to 9 per cent. of nasal and bronchial mucus. This mucin contains 12.64 per cent. of nitrogen, and is the substance which gives to mucus its viscid and tenacious character. Normal mucus is devoid of smell and taste, and almost, if not quite, neutral; and hence its constant presence in the mouth gives rise to no disagreeable sensation.

**MUDAR** (*Calotropis*), a genus of shrubs of the natural order *Asclepiadaceae*, distinguished by a coronet of fine blunt processes adhering to the base of the filaments. They are natives of the East Indies, and the bark of the root, and the inspissated milky juice of some of them, are much used there as an alterative, purgative, emetic, and sudorific medicine. The medicinal properties of *M.* have been well known in India for many centuries, and have begun to attract the attention of European physicians. It is found of great value in elephantiasis, and in leprosy and other obstinate cutaneous diseases, as well as in some spasmodic affections, and in syphilis.—The species most common in the south of India is *C. gigantea*; in the north, *C. Hamiltonii*; whilst *C. procera*, said to have an extremely acrid juice, extends into Persia, and even into Syria. *M.* is very common in India, springing up in uncultivated ground, and often troublesome in that which is cultivated. It is a large shrub, with stems often thicker than a man's leg; and broad fleshy leaves. It grows where almost nothing else will, on very dry sands, and rapidly attains a large size. The silky down of the pods is used for making a soft, cotton-like thread; but is short, and not easily spun. The inner bark also yields a strong and useful fibre, which makes excellent cordage and fishing-lines; but the mode of preparation hitherto used makes it costly.—The inspissated milky juice of *M.*, collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated.—The *M.* of medicine contains a principle called *Mudarine*, on which its medicinal virtues are supposed to depend, and which possesses the rare property of gelatinising when heated, and becoming fluid when again cooled.

**MUDKI**, usually spelled **MOODKEE**, a small town of north-west Hindustan, 28 miles south-east of the Sutlej, and 70 miles east of the city of Lahore, on the Ravi. It has a pop. of about 6000. Here the first battle in the Sikh war of 1845—1846 was fought (18th December 1845), when the British under Sir Hugh Gough repulsed the Sikhs; but at the same time lost heavily, especially in officers.

**MU'EDDIN** (*Mu'ezzin*), the Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant (*Adan*) consists of these words, repeated at intervals: 'Allah is most great. I testify that there is no God but Allah. I testify that Mohammed is the Apostle of Allah. Come to prayer.

Come to security.' [*Prayer is better than sleep*] is added in the morning, at the *Suhl* or *Fogr*. See **MOHAMMEDANISM**.] 'Allah is most great. There is no deity but Allah!' Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. The first (*Ula*) continues, after the usual *Adan*, in this manner: 'There is no deity but Allah! He hath no companion—to Him belongeth the dominion—to Him belongeth praise. He giveth life, and causeth death. And He is living, and shall never die. In His hand is blessing, and He is almighty,' &c. The second of these night-calls (*Ebed*) takes place an hour before daybreak, and begins as follows: 'I extol the perfection of Allah, the Existing for ever and ever: the perfection of Allah, the Desired, the Existing, the Single, the Supreme,' &c. The office of a *M.* is generally intrusted to blind men only, lest they might, from their elevation, have too free a view over the surrounding terraces and harems. The harmonious and sonorous voices of the singers, together with the simplicity and solemnity of the melody, make a strikingly poetical impression upon the mind of the hearer in daytime; much more, however, is this the case whenever the sacred chant resounds from the height of the mosque through the moonlit stillness of an eastern night.

**MUFTI** (Arabic, *Ecpounder of the Law*). The Turkish grand Mufti is the supreme head of the Ulemas (servants of religion and laws), and has, together with the Grand Vizir (Vizir Azim), the supreme guidance of the state, nominally ruled by the sultan. His is the chief spiritual authority, and in this capacity he is also denominated Sheikh-al-Islam (Lord of the Faith). The Imams (priests), however, chosen from the body of the Ulemas, are, from the moment of their official appointment, under the authority of the Kiskar-Aga, or Chief of the Black Eunuchs. The better class of the Ulemas are the teachers and expounders of the law, from among whom the Mollahs and Cadis are elected. The Turkish laws have their basis in the Koran; the Mufti thus, as head of the judges, acquires a spiritual authority. His also is generally the office of girding the sultan with the sword at his ascension to the throne, a ceremony which takes place at the Mosque of Eyub, and which is equal to our ceremony of coronation. The Mufti is elected and may be deposed by the sultan, and his position has in modern days lost much of its former dignity and importance. His Fetwa, or decision, although attached to the imperial decrees, imparts to it but little additional weight. Nor is his own dictum in things spiritual always considered as finally binding. The only prerogative of Muftis and Ulemas which has hitherto remained untouched, is their being exempt from bodily or otherwise degrading punishments; nor can their property ever be confiscated, but descends to their successors.

**MUGGLETONIANS**, a sect that arose in England about the year 1651, and of which the founders were John Reeve, and Ludovic Muggleton (born 1607, died 1697), obscure men, but who claimed to have the spirit of prophecy. Muggleton was a journeyman tailor. He professed to be the 'month' of Reeve, as Aaron was of Moses. They affirmed themselves to be the *two witnesses* of Rev. xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They favoured the world with a number of publications, one of which—particularly directed to the Parliament and Commonwealth of England, and to His Excellency the Lord General Cromwell—was entitled a *Remonstrance from the Eternal*

*God.* The prophets were at that time imprisoned as nuisances 'in Old Bridewell.' Another publication was a *General Epistle from the Holy Spirit*, dated from 'Great Trinity Lane, at a Chandler's Shop, overagainst one Mr Millis, a Brown Baker, near Bow Lane End, London.' [The first complete edition of M.'s works was published in 1756; another edition appeared in 1832.] The M. denied the doctrine of the Trinity; they held anthropomorphist opinions; and to all this they added many strange doctrines of their own, as that the devil became incarnate in Eve, &c. The M. existed in England as a sect till more than one-fourth of the 19th c. had passed away; but the census of 1851 shewed no trace of them, and they are supposed to be now completely extinct.

**MUHALITCH**, or **MUALICH**, a town of Asia Minor, in Anatolia, 13 miles south of the Sea of Marmora, and 37 miles west of Brusa, picturesquely situated on low hills. It is large and straggling, contains about 1500 houses and three or four khans, and is the seat of a considerable trade, chiefly in exporting silks, wool, and fruits to Constantinople. Pop. 11,000.

**MÜHLBERG**, a town of Prussian Saxony, situated on the Elbe, 36 miles south-east of Wittenberg. Pop. 3320. Here, on 24th April 1547, a battle was fought between Johann-Friedrich, Elector of Saxony, and the Emperor Charles V.—a battle fraught with the most important results to the cause of Protestantism in Germany. The battle was soon decided in favour of the emperor, Johann-Friedrich was taken prisoner, and his territories were handed over to Maurice, the representative of the ducal family of Saxony. From this time till 1552, the Catholics were triumphant in Germany.

**MÜHLHAUSEN**, an ancient city of Prussia, in the principality of Eichsfeld, on the Unstrut, 30 miles north-west of Erfurt. It ranked in the middle ages as an important imperial free city, and is still an active centre of commerce. It has manufactories for linen and woollen goods, starch, anise, and saffron works, and carpet and leather factories. Pop. 15,150. M. was deprived of its municipal independence in 1803, and made over to Prussia, with which it has since remained incorporated, excepting for a short period during the predominance of French influence in Germany, when, at the suggestion of Napoleon, it was included in the kingdom of Westphalia, but it was restored to Prussia in 1813.

**MÜLHEIM**, the name of two manufacturing towns of Rhenish Prussia, distinguished from each other as *M. an der Rhur*, and *M. am Rhein*. The former, situated on the river Rhur, 16 miles north of Düsseldorf, is a flourishing town, chiefly important on account of its trade in Rhur coal. In 1856, 22 river-steamers were built here. Sandstone is extensively quarried, and ironworks and machine-factories are in operation. Cotton-spinning, weaving, printing, tanning, and paper-making are carried on. Pop. 11,801. *M. am Rhein*, nearly opposite Cologne, carries on extensive manufactures of silk goods (employing 500 looms); there are dye-works and paper and oil mills in operation, and considerable trade and commerce. Pop. 6790.

**MUIRBURN**, in Scotch Law, is the crime of setting fire to heather. Neither owners nor tenants, except in high and wet lands, are entitled to set fire to heather between 11th April and 1st November, though at other times they may. And persons who willfully fire heather are liable to be fined and imprisoned. In England, maliciously setting fire

to heaths is one of the heads of the generic offence of Arson (q. v.).

**MUKDEN**, or **MOUKDEN**, in lat. 41° 50' 30" N., long. 123° 37' E., the capital of Shingking, the chief province of Manchuria. Its Chinese name is Fungtien-foo, signifying *affluent capital*, a translation of the Manchu Moukden, meaning *flourishing*. It lies on a branch of the river Liau, about 500 miles north-east of Peking. The town is surrounded by a wall about 10 miles in circumference, including an inner wall 3 miles in circuit, enclosing the emperor's summer residence. The palace, and the buildings connected with it, the government offices and courts, and the grounds attached, are all arranged on a plan similar to those at Peking. Great pains have been taken by the emperors to enlarge and beautify this the metropolis of the Manchu race, but with only partial success. The family residence and place of sepulture of the founders of the reigning dynasty is Shingking, about 60 miles east of Mukden. It is pleasantly situated in a mountain valley near the palisade which separates the province from Kirin. A large garrison is maintained there, which, with the salubrity of the air, has attracted a considerable population. The emperor Kienlung rendered himself celebrated among his subjects, and the city of M. better known abroad, by a poetical eulogy upon the city and province, which was printed in 61 different forms of Chinese writing. Nineteen leagues from M. is its port, Niuchwang, which has been opened recently to foreign commerce. It is shallow, difficult of access, and during many months of the year closed by ice. Pulse, cattle, and drugs are its chief exports. The houses are built of stone, and warmed by large forms of masonry, under which the fire is kindled, and in which the cooking is done; the inmates sleep upon it by night, and lounge on it by day.—*Chinese Repository*. In 1631, M. became the seat of government of the Manchu emperors, and is now the seat of several superior tribunals of a Chinese viceroy of the first rank.

**MULATTO**. See MIXED RACES.

**MULBERRY** (*Morus*), a genus of trees of the natural order *Moraceæ*, natives of temperate and warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, a 4-parted perianth, containing either four stamens or one pistil with two styles, the perianth of the female flowers becoming succulent and closing over the small pericarp, the whole spike coalescing into an aggregate fruit.—The COMMON M., or BLACK M. (*M. nigra*), is a native of the middle parts of Asia, but was introduced into the south of Europe more than a thousand years ago, and is now almost naturalised there. It is a low tree, much branched, with thick rough bark, and broad heart-shaped leaves, which are unequally serrated, and very rough. It is cultivated in the middle parts of Europe, and succeeds well in the south of England, but in the northern parts of Britain it requires a wall. The perianth and stigmas are roughly ciliated, and the fruit is of a purplish-black colour, with dark red juice, fine aromatic flavour, and subacid sweet taste. The fruit is much esteemed for dessert; an excellent preserve and a pleasant light wine are made of it. The tree often produces its fruit in prodigious quantity. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding silk-worms. The Black M. lives long; trees still existing in England are known to be more than 300 years old. It is propagated by seed, by suckers, by layers, or by cuttings. It succeeds best in a rich light soil.—The WHITE M. (*M. alba*) is a native of China, and has been there

planted from time immemorial for the sake of its leaves, which are the best food for silk-worms; on which account also it has been cultivated in the south of Europe since about 1540. In North America it does not succeed further north than lat. 43, being somewhat more impatient of frost than the Black Mulberry. The perianth and stigmas are smooth; the fruit is almost white, and is much less palatable than that of the Black M., although in this respect there is great difference among the

Common Mulberry (*Morus nigra*); fruit, leaf, and female flower.

many varieties. A rob made of it is useful in sore throat. The best variety for feeding silk-worms, on account of its rapid growth and abundant leaves, is that called the PHILIPPINE MULBERRY. In India, the White M. is treated as a bush, and cut down twice a year; the shoots, stripped of their leaves, being thrown away, although the bark has long been used in China and Japan for making paper. It grows readily from cuttings. The root has a considerable reputation as a vermifuge.—The RED M. (*M. rubra*), a native of North America, abounding particularly on the lower parts of the Missouri, endures severe frosts much better than either of the preceding, and is therefore preferred for cultivation in some parts of Europe. Its fruit is deep red, and almost as pleasant as the Black Mulberry. The wood is much more valuable; being fine-grained, strong, and adapted even for ship-building. The tree attains a height of 60 feet or more.—The INDIAN M. (*M. indica*) has black fruit of a delicate flavour, and the leaves are extensively used for feeding silk-worms in China, Cochin-China, and Bengal.—*M. atro-purpurea* has been introduced into India from China for feeding silk-worms. *M. Mauritian*, a native of Madagascar and Mauritius; *M. celtidifolia* and *M. corylifolia*, Peruvian species; *M. Tatarica*, a native of Central Asia; *M. lanigata*, the species most common in the north of India; and *M. Cashmeriana*, a native of Cashmere, produce pleasant fruit. *M. dulcis*, a native of the north of India, is said to be superior in flavour to all others.

The PAPER M. (*Broussonetia papyrifera*) differs from the true mulberries in having the female flowers collected in a globular mass. The tree is of moderate size, or, in cultivation, a bush of 6–12 feet high; with leaves either simple or lobed, a native of India, Japan, and the islands of the Pacific Ocean, but now not uncommon in pleasure-grounds in Europe and North America. The islanders of the Pacific cultivate the Paper M. with great

care. They make a kind of clothing from the bark, using for this purpose the bark of small branches about an inch in diameter, which they macerate in water, and then scraping off the epidermis, press and beat the moist slips together. The paper also, which is used in Japan and many parts of the East, is in great part made from the bark of the young shoots of this plant, which for this purpose is boiled to a pulp, and treated somewhat in the same way as the pulp of rags in Europe. When the shoots are cut, new ones spring up very rapidly.—Silk-worms eat the leaves of the paper mulberry.—The fruit is oblong, of a dark-scarlet colour, sweetish, but insipid.

MULDER, GERARD JOHANNES, a distinguished living chemist, was born in 1802 at Utrecht, where his father was practising as a physician. After obtaining the degree of Doctor of Medicine at the university of his native town in 1825, he commenced the practice of his profession at Amsterdam, where he was appointed to teach botany, and subsequently chemistry, in the newly-established medical school of that city. In 1841, he was elected professor of chemistry at the university of Utrecht, in consequence of the ability he had displayed in various memoirs published in the Dutch scientific journals. He is best known to the general reader as the discoverer of Proteine (q. v.), which he maintains to be the main ingredient of albumen, fibrin, casein, &c.; but the existence of which as an independent chemical compound is at the present day not generally admitted. He is the author of numerous excellent works on physiological and agricultural chemistry, on the chemistry of wine and beer, on diet and nutrition, &c., which, in consequence of their being written in Dutch, are far less known in this country than they deserve. His *Chemistry of Vegetable and Animal Physiology* has been translated into English by Dr Fromberg, and his *Chemistry of Wine* by Dr Bence Jones.

MULE (Lat. *mulus*, supposed to be connected with Gr. *molos*, labour, and with Eng. *moil*), a hybrid animal, the offspring of the male ass and the mare, much used and valued in many parts of the world as a beast of burden. The ears are long; the head, croup, and tail resemble those of the ass rather than those of the horse; but in bulk and stature the M. approaches more nearly to the horse. The M. seems to excel both the ass and the horse in intelligence; it is remarkable for its powers of muscular endurance; and its sure-footedness particularly adapts it to mountainous countries. It has been common from very ancient times in many parts of the east; and is much used also in most of the countries around the Mediterranean Sea, and in the mountainous parts of South America. Great care is bestowed on the breeding of mules in Spain and Italy, and those of particular districts are highly esteemed. In ancient times the sons of kings rode on mules, and they were yoked in chariots. They are still used to draw the carriages of Italian cardinals and other ecclesiastical dignitaries. Both in Spain and in South America, mules employed to carry burdens are driven in troops, each preceded by an animal—in South America, usually an old mare—called the *madrina*, or god-mother, to the neck of which a little bell is attached, and the mules follow with the greatest docility. When troops mingle in their halting-places or elsewhere, they are readily separated, as they recognise at once the sound of their own bell. Mules are comparatively little used in Britain, although it is alleged that work is done at less expense by the employment of mules than by the employment of horses.

As in other hybrid animals generally, males are more numerous among mules than females; in the proportion, it is said, of two or three to one. There is no instance on record of offspring produced by two mules; but instances occur, although rarely, of their producing offspring with the horse and with the ass. The M. is very superior in size, strength, and beauty, to the hinny, the offspring of the male horse and the female ass.

**MULE.** See SPINNING.

**MULHOUSE** (Ger. *Mülhausen*), a town of France in the department of Haut-Rhin, 27 miles south of Colmar. Pop. 43,244. M. is built on a small island between the Ill and the Rhone and Rhine Canal, and is an important station on the Strasbourg and Basel line of railway. It lies in a fertile, well-watered district, and ranks as one of the most active centres of French trade; while it is at the same time the seat of a tribunal of commerce, and of various mercantile and trade unions, which have exercised a beneficial influence on the industrial activity of the province. Its numerous manufactories produce superior woollen and fine cambric goods, excellent leather, morocco, and carpets; in addition to which, its printing and dye works for cotton, muslin, wool, and silk fabrics are almost unrivalled in regard to the delicacy of the colours, and elegance of the patterns employed. M. has extensive bleaching-works, and is noted for its cotton and woollen stocking manufactories, its breweries and distilleries, starch and straw works, and for its ironworks, in which locomotives and various forms of steam-engines are extensively manufactured. These products of manufacturing industry, together with corn, wine, and brandy, form the staple articles of its very extensive trade.

M. early acquired commercial importance, having been erected into a free imperial city by Rudolph of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th c., it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1523, M. adopted the Reformed faith. It remained a part of the circle of the Upper Rhine till 1798, when it was incorporated with France.

**MULL**, after the Isle of Skye, the largest of the Inner Hebrides, belongs to the county of Argyll, and is washed on the W. and S. by the Atlantic, and bounded on the N.E. by the Sound of Mull. It is triangular in shape, hollowed on the west side by an inlet of the Atlantic, and is deeply indented by sea-lochs, of which the principal are Loch-na-Keal and Loch Sereidan. Area about 237,000 statute acres, of which 12,450 are arable; pop. (1861), exclusive of the neighbouring islets, 6831. Its surface is for the most part occupied by mountains, generally rounded in outline, and rising in Ben More 3185 feet high. Of its fresh-water lakes, Loch Erisa and Loch Ba are the chief. Wood abounds in the north; but owing to the generally tame character of the mountains, the great stretches of moorland, and the absence of well-defined valleys, the scenery, with the exception of that on the coast, is uninteresting. The land under cultivation occurs chiefly on the shores and at the heads of the several lochs. The soil is unusually fertile; but the great humidity of the climate, and the frequency and violence of the gales, render it almost wholly unfit for agriculture. The land is principally laid out in stock-farms, and great numbers of cattle, sheep, and horses are reared and exported. Chief town, Tobermory (pop. 1561), in the north. The harbour of Tobermory is one of the best and safest in the Hebrides. A low-water pier is now (March 1861) almost completed here.

It will enable steamers to land in any state of the tide. The Sound of Mull, 20 miles long, by 2 miles in average breadth, separates the island from the mainland of Argyleshire on the north-east.

**MÜLLER, JOHANN**, historian of Switzerland, was born 3d January 1752, at Schaffhausen, where his father was clergyman and rector of the gymnasium. He studied at Göttingen under Heyne, Schözer, Waleh, and others. In 1772, he was appointed professor of Greek at Schaffhausen, and in the same year published his first work, *Bellum Cimbricum* (Zür. 1772). Already he had commenced to devote his leisure hours to the investigation of Swiss chronicles and documents. By the advice of his friend Bonstetten, he went to Geneva in 1774, where he became a private tutor; and also (1778) delivered a series of lectures on 'Universal History,' afterwards published in 24 volumes. In 1781, he was called to the Collegium Carolinum at Cassel, as professor of statistics, and a little earlier published the first volume of his great work, *Geschichte der Schweizer*. In 1786, he was appointed librarian and councillor of state to the Elector of Mainz; here he finished the 2d volume of his Swiss History; his *Darstellung des Fürstenbundes* (Leip. 1787); and *Briefe zweier Domherren* (Frankfurt, 1787). In 1792, he went to Vienna, where the Emperor Leopold gave him a situation in the privy council, and, in 1800, appointed him first imperial librarian. In 1804, he left Vienna for Berlin, where he wrote *Ueber die Geschichte Friedrich's I., Ueber den Untergang der Freiheit der Alten Völker, Versuch über die Zeitrechnungen der Vorwelt*, and an additional volume of his Swiss History. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807), having been previously dismissed from the Prussian service, secretary of state in the new kingdom of Westphalia; but died at Cassel, 29th May 1809. M.'s *Sämmtliche Werke* were published, 27 vols. Stuttgart, 1810—1819; new edit. 40 vols. 1831—1835.

**MÜLLER, KARL OTFRIED**, one of the most genial, richly erudite, and industrious classical archaeologists of modern times, was born 28th August 1797, at Brieg, in Silesia. He was the son of a clergyman, and received a careful education. He studied at Breslau and Berlin. His taste for philological and archaeological studies was early developed. The first fruit of his learning was the publication of the *Aegnetioorum Liber* (Berl. 1817), after which he soon received an appointment to the *Magdalenum* in Breslau, where his leisure hours were devoted to a grand attempt to analyse the whole circle of Greek myths. In 1819, he obtained an archaeological chair in Göttingen; and to thoroughly prepare himself for it, visited the collections in Germany, France, and England. His great design was to embrace the whole life of ancient Greece, its art, politics, industry, religion, in one warm and vivid conception—in a word, to cover the skeletons of antiquity with flesh, and to make the dry bones live. With this view, he lectured and wrote with a fine earnest animation, until the political troubles in Hanover made his position uncomfortable. He obtained permission to travel, and made tours in Greece and Italy, but unfortunately died of an intermittent fever at Athens, on 1st August 1840. M.'s literary and scholarly activity stretched over the whole field of Greek antiquity. We are indebted to him for many new and striking elucidations of the geography and topography, literature, grammar, mythology, manners and customs of the ancients. His work on the Dorians (*Die Dorier*, translated into English by Sir George Cornwall Lewis and Henry Tuffnell) forms the 2d and 3d

vols. of his *Geschichte Hellen. Stämme und Staaten* (new and improved ed. 3 vols. Bresl. 1844); his treatise *Ueber die Wohnsitze, Abstammung und ältere Geschichte des Macedon. Volks* (Berl. 1825); his *Etrusker* (2 vols. Bresl. 1828); and his maps of Greece, are works of the highest importance in the departments of ancient history and ethnology. His *Handbuch der Archäologie der Kunst* (Bresl. 1830, 3d ed. 1846; English by Leitch, London, 1850) is full of learning and of acute original observations. His *Prolegomenen zu einer wissenschaftlichen Mythologie* (Gött. 1825) led the way to a strictly historical explanation of the ancient myths. The work by which he is probably best known in England is his *History of the Literature of Ancient Greece* (Lond. 1840), undertaken at the request of the British 'Society for the Diffusion of Useful Knowledge.' M. died before finishing it; what he had finished was translated into English by Sir George Cornwall Lewis and Dr Donaldson, the latter of whom continued the work from where it left off—at the age of Alexander—down to the taking of Constantinople. The German original was published by M.'s brother (Bresl. 1841). He shewed himself also an acute and judicious critic in his editions of Varro, *De Lingua Latina*, Festus, *De Significatione Verborum*, &c. His contributions to periodicals, encyclopaedias, &c., were likewise numerous and valuable.—MÜLLER, JULIUS, brother of the preceding, was born at Brieg, 10th April 1801, educated at Breslau, Göttingen, and Berlin, and after holding several offices, finally became a professor of theology at Halle. His best known work, *Die Christliche Lehre von der Sünde* (The Christian Doctrine of Sin; English, Edin. 1856), is considered by theological critics the most acute and profound treatise written in modern times on this mysterious subject.

MÜLLER, JOHANN, one of the most eminent physiologists of the present day, was born at Coblenz on 14th July 1801. He began to study with a view to orders in the Roman Catholic Church; but in 1819 he abandoned his theological studies, and devoted himself to medicine, taking, in 1822, the degree of Doctor of Medicine at Bonn. Whilst yet a student, he wrote for a prize the treatise *De Respiratione Fetus* (Leip. 1823). He became, in 1824, a tutor; in 1826, an extraordinary, and in 1830, an ordinary professor of physiology and anatomy at Bonn; and in 1833, succeeded Rudolphi as professor of anatomy at Berlin. His physiological researches were most industriously prosecuted, and were rewarded by many discoveries, which obtained for him a high reputation in the scientific world. His works are numerous, and many of them occupied with particular topics in zoology and comparative anatomy. He died of apoplexy at Berlin, April 28, 1858. Among the most important are—*Zur vergleichenden Physiologie des Gesichtsinns des Menschen und der Thiere* (Leip. 1826); *Grundriss der Vorlesungen über die Physiologie* (Bonn, 1827); *Grundriss der Vorlesungen über allgemeine Pathologie* (Bonn, 1829); *De Glandularum Secretionum Structura Penitiori earumque prima Formatione in Homine atque Animalibus* (Leip. 1830); *Ueber die organischen Nerven der erectilen männlichen Geschlechtsorgane*, &c. (Berlin, 1835); and *Handbuch der Physiologie des Menschen* (2 vols. 4th ed. Coblenz, 1851), 'Manual of the Physiology of Man,' which has been translated into French and English. He was also the author of a large number of dissertations on a variety of subjects connected with physiology, the most important of which have been separately published. His latest investigations, on infusoria, were published in 1860. The most eminent living physiologists of Germany received their training in his school.

MÜLLER, FRIEDRICH MAX (MAXIMILIAN), one of the most eminent living orientalists, was born at Dessau, in the duchy of Anhalt-Dessau, 6th December 1823. His father, Wilhelm Müller, distinguished not only for his worth as a man, and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, October 1827. M. received the elements of his education at Dessau, and then went to Leipzig, where, under Professor Hermann Brockhaus, he began the study of Sanscrit. This he soon chose as his special pursuit; and the first fruits of his labours appeared in a translation of the *Hitopalesa* (Leip. 1844). In 1844, he went to Berlin to study under Bopp and Schelling, and consult the Sanscrit MSS. to be found there. In Paris, whither he repaired in 1845, he began, at the instigation of Burnout, to prepare for an edition of the Rig-Veda, with the commentary of Sāyanaçārya. With this view, he came to England, June 1846, to examine the MSS. in the East India House, London, and the Bodleian Library at Oxford; and, on the recommendation of the late Professor H. H. Wilson, the East India Company commissioned him (1847) to edit the Rig-Veda at their expense. The first volume of this great undertaking, printed at the Oxford University press, appeared in 1849; and has been followed by a second in 1853, a third in 1856, and a fourth in 1863. In 1850, M. was appointed Deputy Taylorian Professor of Modern Languages at Oxford; in 1854, succeeded to the professorship; and in 1858, was elected a Fellow of All Souls. While pursuing his labours connected with the Rig-Veda, M. has published treatises on a variety of philological topics, which have done more to awaken in England a taste for the science of language in its modern sense (see GRAMMAR) than the labours of any other single scholar. As an expositor of the results, whether of his own or of other men's investigations, he stands almost unrivalled; and although upwards of twenty years old when he came to England, he writes English in a way that most natives have cause to envy. Inheriting the poetic imagination and fire of his father, he has at command such a felicity and splendour of illustration, that subjects dry and repulsive under ordinary treatment, become in his hands positively attractive. Among the works referred to, we may name a translation into German of Kālidāsa's *Megha-dūta* (König. 1847); *The Languages of the Seat of War in the East* (2d ed. Lond. 1855); *Comparative Mythology* (in the Oxford Essays for 1856); *History of Ancient Sanscrit Literature* (2d ed. Lond. 1860); *Lectures on The Science of Language*, delivered at the Royal Institution, London, in 1861; a second series, delivered in 1863, is announced.

MULLET (*Mugil*), a genus of acanthopterous fishes, the type of the family *Mugilidae*. In this family, the body is nearly cylindrical, the scales are large; there are two widely separated dorsal fins, the first of which has only four stiff sharp spines; the teeth are extremely fine; the gullet is closed by an extraordinary development of the pharyngeal bones, so that only soft and thin food can pass down it; a branch of the stomach forms a kind of gizzard. The best known of this family belong to the genus *Mugil*, of which there are many species. They have a small mouth, with a fold or crest in the under lip, which fits into a corresponding notch in the upper one. The Common M., or GRAY M. (*M. capito*), is found in the Mediterranean, and along the western shores of Europe, as far as the southern and south-eastern shores of England, but becomes rare further north. The Common M. is usually about fifteen inches in length, but

sometimes two feet. The colour is steel-gray on the back, with bluish and yellowish reflections; the belly silvery white; the flanks with six or eight longitudinal lines of rosy brown. It often ascends rivers, generally selecting soft or fat substances for food, and often seeking food by thrusting its mouth into the soft mud. It is most readily taken by a bait of the boiled entrails of fish, or cabbage boiled in broth. It is easily reared in ponds, and readily answers the call which usually summons it to be fed. It is highly esteemed for the table.—A very nearly allied species, also called GRAY M. (*M. cephalus*), a native of the Mediterranean, is distinguished by having the eyes half covered with an

Common, or Gray Mullet (*Mugil cephalus*).

adipose membrane, and by a large triangular scale pointing backwards, just over the origin of each pectoral fin. It attains a larger size than the former species, sometimes ten or twelve pounds weight. It enters the mouths of rivers at certain seasons, and ascends into the fresh water. It is the most esteemed of all the mullets, and was in great request among the ancients. Enormous prices were given by the Romans for unusually large mullets, the price increasing, like that of diamonds, far more rapidly than the size. Mulletts are used fresh, salted, and smoke-dried. A preparation of their roe, called *Botarcha*, is in great esteem as a condiment in Italy and the south of France. Mulletts are often caught in the Mediterranean by angling from a rock, with a bait of paste, when they have been previously attracted to the spot by macaroni thrown into the water.—A third species of GRAY M. (*M. chelo*) is not unfrequent on the coasts of England, and even of Scotland. It is remarkable for its large fleshy lips. It swims in great shoals. In the Mediterranean, it sometimes attains the weight of eight pounds.—The AMERICAN M. (*M. albula*) is very like the Common M., but more slender, the tail large and forked. It abounds about the Bahama Islands, and extends far northwards. It is highly esteemed for the table.

The name M. is also given to the genus *Mullus* of the family *Percida*. See **SURMULLET**.

**MULLET**, or **MOLLET**, in Heraldry, is a charge in the form of a star, generally with five points,

Mulletts.

intended to represent a spur-rowel, and of frequent occurrence from the earliest beginnings of coat-armour. Gwillim, Sir George Mackenzie, and

Nisbet lay it down that mullets should always be pierced to represent the round hole in which the spur-rowel turns, but this has been by no means uniformly attended to in practice. Much confusion exists in blazonry between mullets and stars; in England, the rule most generally adopted is, that the mullet has five points, whereas the star has six, unless any other number be specified. Nisbet lays down a canon nearly the converse of this, which has never been adhered to; and in Scottish heraldry the same figure seems to be often blazoned as a mullet or a star, according as it accompanies military or celestial figures. The mullet is the mark of cadency assigned to the third son, 'to incite him to chivalry.' The word mullet is occasionally used in heraldry for the fish so called.

**MULLINGAR**, chief town of the county of Westmeath, in Ireland, is situated on the great western road from Dublin to Galway, distant from the former, with which it is connected by the Royal Canal and the Midland Western Railway, 50 miles north-north-west. Its population, in 1861, was 5359, of whom 4836 were Roman Catholics, 392 Protestants of the established church, the rest members of other denominations. It is the centre of a poor-law union of 48 divisions, comprising an area of 208,401 acres. M. is a place of little historical interest, although its immunities date from the reign of Elizabeth. Its public buildings are in no way remarkable, but it possesses several schools; among the number, one recently endowed for general educational purposes. It is without manufactures, but has considerable celebrity as the site of several of the most important horse and cattle fairs in Ireland.

**MULLION**, the upright division between the lights of windows, screens, &c., in Gothic architecture. Mullions are rarely met with in Norman

Mullion :  
Window from Carlisle Cathedral.

architecture, but they become more frequent in the Early English style, and in the Decorated and Perpendicular are very common. They have sometimes small shafts attached to them, which carry the tracery of the upper part of the windows. In late domestic architecture, they are usually plain. The fig. shews mullions (a, a) supporting tracery.

**MULREADY**, WILLIAM, R.A. was born at Ennis, in Ireland, about the year 1786. When a boy, he went to London with his parents; at the age of fifteen, entered as a student in the Royal Academy, and made good progress, aiming at first at the classic style, or what, according to the

notions of the day, was called high art. Following the bent of his genius, however, he soon relinquished this course, and devoted himself to the study of nature and the works of those artists who attained high reputation in a less pretentious walk of art. His first pictures were landscapes of limited dimension and subject, views in Kensington gravel-pits, old houses at Lambeth, and interiors of cottages. He next essayed figure-subjects of incidents in every-day life, such as 'A Roadside Inn,' 'Horses Baiting,' the 'Barber's Shop,' and 'Punch' (painted in 1812), 'Boys Fishing' (1813), 'Idle Boys' (1815). M. was elected an Associate of the Royal Academy in November 1815, and an Academician in February 1816; a strong proof of the high estimation in which his talents were held by his brethren, for the higher dignity is rarely conferred till after a probation of several years as Associate. Even in his earliest time, his works were characterised by much elaboration; but those he executed about the middle period of his career exhibit an extraordinary amount of finish and greater brilliancy of colouring, qualities that he carried further and further as he advanced in years; and though he lived to a great age (he died on July 7, 1863), he continued to work with undiminished powers till within a day of his death. A great number of M.'s best works now belong to the public, as portions of the Vernon and Sheepshanks' collections. In the first-named, there are four pictures, one of these, 'The Last in, or Truant Boy,' exhibited in 1835, being one of the most elaborate works of his middle period; while in the Sheepshanks' collection there are no fewer than 28 of his works, among which, 'First Love,' exhibited in 1840, is a remarkable example of refinement in drawing, and delicacy of feeling and expression. 'The Sonnet,' exhibited in 1839, is perhaps his highest effort in point of style; and by 'The Butt—Shooting a Cherry,' exhibited in 1848, is best exemplified the remarkable minuteness of his finish and richness of his colouring. He occasionally executed designs for publishers. An edition of the *Vicar of Wakefield*, published in 1840, by Van Voorst, embellished with 20 wood-cuts from M.'s drawings, is generally acknowledged to be one of the finest works of the kind produced in this country. M. was buried in the cemetery, Kensal Green, privately; but a movement is at present on foot to do honour to his memory by a public testimonial.

MULTAN (or *Mooltan*), an ancient and important city of India, in the Punjab, on a mound consisting of the ruins of ancient cities that occupied the same site, three miles from the left bank of the Chenab—the inundations of which sometimes reach M.—and 200 miles south-west of Lahore. In 1859, a railway to Lahore and Amritsir, 230 miles in length, was commenced. The city is surrounded by a dilapidated wall, from 40 to 50 feet in height. The vicinity abounds in mosques, tombs, shrines, &c., attesting alike the antiquity and magnificence of the former cities; and the country around is remarkable for its fertility. M. is a military station, with a small redoubt in the rear of the cantonment. Its bazaars are numerous, extensive, and well stocked; and its shops, 6000 in number, are well supplied with European and Asiatic commodities. Manufactures of silks, cottons, shawls, scarfs, brocades, tissues, &c., are carried on, and there is an extensive banking trade. The merchants of M. are proverbially esteemed extremely rich. Steamers ply between this city and Hyderabad, a distance of 570 miles; and the new railway opens up a commercial outlet from Central Asia, the Punjab and the North-west Provinces, to the

Arabian Sea by Hyderabad and Karachi. In 1849, M. was taken by the British troops under General Whish, and annexed with its territory to the British possessions. Pop. 80,966, of whom 20,000 are Mohammedans.

MULTIPLE-POINDING is a well-known form of action in Scotland, by which competing claims to one and the same fund are set at rest. It means double poinding or double distress, suggesting that a person who has funds in his possession is liable to be harassed by double distress; and hence he commences a suit called the action of multiple-poinding, by which he alleges that he ought not to be made to pay the sum more than once; and as he does not know who is really entitled to payment, he cites all the parties claiming it, so that they may fight out their claims among themselves. The suit corresponds to what is known in England as a bill or order of interpleader.

MULTIPLICATION, the third and most important of the four principal processes of arithmetic, is a compendious mode of addition, when a number is to be added to itself a given number of times. The three terms of a multiplication are the *multiplicand*, or number to be multiplied; the *multiplier*, or number by which it is to be multiplied; and the *product*, giving the amount which would be obtained if the multiplicand were added to itself the number of times denoted by the multiplier. The symbol of multiplication is  $\times$ ; and in arithmetic, the numbers are placed above each other as in addition, with a line drawn under them; in algebra, the quantities are merely placed side by side, with or without a dot between them—e. g., the multiplication of 2 by 4 may be written  $2 \times 4$ , and of  $a$  by  $b$ ,  $a \times b$ ,  $a.b$ , or  $ab$ . For multiplication of fractions, see FRACTIONS.

The operation of multiplication has been much abbreviated by the use of Logarithms (q. v.), and has been rendered a mere mechanical process, by the invention of Napier's Bones, the Sliding Rule, Gunter's Scale, &c.

MULTIVALVE SHELLS, or MULTIVALVES, are those shelly coverings of molluscs which are formed of more than two distinct pieces. In systems of Conchology (q. v.), the term is one of primary importance; but since the study of the living animals has led to arrangements very different from those founded on their mere shells, a very subordinate place has been assigned to it, as indicating a distinction much less important than was at first supposed. Thus, Chitons (q. v.), which have multivalve shells, are now placed in the same order of gasteropods with Limpets (q. v.), of which the shells are univalve; and *Pholas* (q. v.) and *Teredo* (q. v.), which have two principal valves and some small accessory valves, the latter also a long shelly tube, are placed among lamellibranchiate molluscs, along with most of the bivalves of conchologists. In conchological systems, barnacles and acorn-shells were also generally included, and ranked among multivalves; but these are now no longer referred even to the same division of the animal kingdom. See CIRRHOPODA.

MULTURES, in Scotch Law, mean a quantity of grain either manufactured or in kind deliverable to the proprietor or tacksman of a mill for grinding the corn sent there. Some persons living in the neighbourhood are bound to send their corn to be ground at a particular mill, in which case the lands are said to bestricted to the mill, and form the thirl or sucken, and the tenants or proprietors of the lands are called insucken multurers. Those who are not bound to go to the mill are called out-sucken multurers. Thirlage is thus classed among

servitudes, being a kind of burden on the lands. Such a right is unknown in England, except sometimes in old manors.

**MUM**, a peculiar kind of beer, formerly used in this country, and still used in Germany, especially in Brunswick, where it may be almost regarded as the national drink. Instead of only malt being used, it is made of malt and wheat, to which some brewers add oats and bean-meal. It is neither so wholesome nor so agreeable as the common ale or beer.

**MUMMY.** See **EMBALMING.**

**MUMMY-WHEAT** is said to be a variety of wheat produced from grains found in an Egyptian mummy. But no good evidence of this origin has been adduced—in fact, it is as good as proved to be impossible; and the same variety has long been in general cultivation in Egypt and neighbouring countries. The spike is compound—a distinguishing character, by which it is readily known, but which is not altogether permanent. It is occasionally cultivated in Britain, but seems more suitable to warmer regions.

**MUMPS, THE,** is a popular name of a specific inflammation of the salivary glands described by nosologists as *Cynanche Parotidea*, or *Parotitis*. In Scotland, it is frequently termed *The Branks*.

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands (q. v.) usually soon become implicated, so that the swelling extends along the neck towards the chin, thus giving the patient a deformed and somewhat grotesque appearance. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, supuration of the glands scarcely ever occurring. In most cases no treatment further than antiphlogistic regimen, due attention to the bowels, and protection of the parts from cold, by the application of flannel or cotton-wool, is required, and the patient completely recovers in eight or ten days.

The disease often originates from epidemic or endemic influences, but there can be no doubt that it spreads by contagion; and, like most contagious diseases, it seldom affects the same person twice. It chiefly attacks children and young persons.

A singular circumstance connected with the disease is, that in many cases the subsidence of the swelling is immediately followed by swelling and pain in the *testes* in the male sex, and in the *mamma* in the female. The inflammation in these glands is seldom very painful or long continued, but occasionally the inflammation is transferred from these organs to the brain, when a comparatively trifling disorder is converted into a most perilous disease.

**MÜNCHHAUSEN, HIERONYMUS KARL FRIEDRICH, BARON VON,** a member of an ancient and noble German family, who attained a remarkable celebrity by false and ridiculously exaggerated tales of his exploits and adventures, so that his name has become proverbial. He was born in 1720, at the family estate of Bodenwerder, in Hanover, served as a cavalry officer in the Russian campaigns against the Turks in 1737—1739, and died in 1797. A collection of his marvellous stories was first published in England under the title of *Baron Münchhausen's Narrative of his Marvellous Travels and Campaigns in Russia* (Lond. 1785). The compiler was one Rudolf Erich Raspe, an expatriated countryman of the baron's. A second edition appeared at

Oxford (1786) under the title of *The Singular Travels, Campaigns, Voyages, and Sporting Adventures of Baron Münchhausen, commonly pronounced Münchhausen; as he relates them over a bottle when surrounded by his friends*. Several other editions rapidly followed. In the same year (1786) appeared the first German edition, edited by the poet Bürger; the latest—entitled *Des Freiherrn von Münchhausen, wunderbare Reisen und Abenteuer* (Gött. and Berl. 1849)—is enriched by an admirable introduction by Adolf Ellisen, on the origin and sources of the famous book, and on the kind of literary fiction to which it belongs. Ellisen's father knew the splendid old braggart in his latter days, and used to visit him. Nevertheless, although Raspe may have derived many of his narratives from M. himself, he appears to have drawn pretty largely from other sources. Several of the adventures ascribed to the baron are to be found in older books, particularly in Bebel's *Pæctivæ* (Strass. 1508); others in Castiglione's *Cortegiano*, and Bildermann's *Utopia*, which are included in Lange's *Deliciae Academicæ* (Heilbronn, 1765). M.'s stories still retain their popularity, especially with the young.

**MUNDANE EGG.** In many heathen cosmogonies, the world (Lat. *mundus*) is represented as evolved from an egg. The production of a young animal from what neither resembles it in form nor in properties, seems to have been regarded as affording a good figure of the production of a well-ordered world out of chaos. Thus, in the Egyptian, Hindu, and Japanese systems, the Creator is represented as producing an egg, from which the world was produced. The same notion is found, in variously modified forms, in the religions of many of the ruder heathen nations. Sometimes a bird is represented as depositing the egg on the primordial waters. There are other modifications of this notion or belief in the classical and other mythologies, according to which the inhabitants of the world, or some of the gods, or the powers of good and evil, are represented as produced from eggs. The egg appears also in some mythological systems as the symbol of reproduction or renovation, as well as of creation. The Mundane Egg belonged to the ancient Phœnician system, and an egg is said to have been an object of worship.

**MUNGO, Sr,** the popular name of St Kentigern, one of the three great missionaries of the Christian faith in Scotland. St Ninian (q. v.) converted the tribes of the south; St Columba (q. v.) was the apostle of the west and the north; St Kentigern restored or established the religion of the Welsh or British people, who held the country between the Clyde on the north, and the furthest boundaries of Cumberland on the south (see **BRITTS AND SCOTS**). He is said to have been the son of a British prince, Owen ab Uricn Ithged, and of a British princess, Dwynwen or Thenaw, the daughter of Llewddlyn Lueddog of Dinas Eiddyn, or Edinburgh. He was born about the year 514, it is believed at Culross, on the Forth, the site of a monastery then ruled by St Serf, of whom St Kentigern became the favourite disciple. It is said, indeed, that he was so generally beloved by the monastic brethren, that his baptismal name of Kentigern or Cyndeyrn, signifying 'chief lord,' was exchanged in common speech for Mungo, signifying 'lovable' or 'dear friend.' Leaving Culross, he planted a monastery at a place then called Cathures, now known as Glasgow, and became the bishop of the kingdom of Cumbria (q. v.). The nation would seem to have been only partially converted, and the accession of a new king drove St Kentigern from the realm. He found refuge among the kindred

people of Wales, and there, upon the banks of another Clyde, he founded another monastery and a bishopric, which still bears the name of his disciple, St Asaph. Recalled to Glasgow by a new king, Rydderech or Roderick the Bountiful, Kentigern renewed his missionary labours, in which he was cheered by a visit from St Columba, and dying about the year 691, was buried where the cathedral of Glasgow now stands. His life has been often written. A fragment of a memoir, composed at the desire of Herbert, Bishop of Glasgow, between 1147 and 1164, has been printed by Mr Cosmo Innes in the *Registrum Episcopatus Glasguensis*. The longer life by Jocelinoe of Furness, written about 1180, was published by Pinkerton in his *Vite Antiquæ Sanctorum Scotiæ*. It appeals to two still older lives. The fame of St Kentigern is attested by the many churches which still bear his name, as well in Scotland as in the north of England. The church of Crosthwaite, where Southey is buried, is dedicated to him. The miracles which he was believed to have wrought were so deeply rooted in the popular mind, that some of them sprung up again in the 18th c. to grace the legends of the Cameronian martyrs. Others are still commemorated by the armorial ensigns of the city of Glasgow—a hazel-tree whose frozen branches he kindled into a flame, a tame robin which he restored to life, a hand-bell which he brought from Rome, a salmon which rescued from the depths of the Clyde the lost ring of the frail queen of Cadyow. Nor is it St M. only whose memory survives at Glasgow; the parish church of 'St Enoch' commemorates his mother, St Thenaw; and it is not many years since a neighbouring spring, which still bears her name, ceased to be an object of occasional pilgrimage.

MUNI, a Sanserit title, denoting a holy sage, and applied to a great number of distinguished personages, supposed to have acquired, by dint of austerities, more or less divine faculties.

MUN'NICH (Ger. *München*), the capital of Bavaria, is situated in 48° S' N. lat., and 11° 35' E. long., in the midst of a barren and flat elevated plain, at a height of about 1700 feet above the level of the sea. Its population, including the military, was, in 1862, 148,201. M., which is also the principal city of the province of Upper Bavaria, lies on the left bank of the Isar, and consists, in addition to the old town, of five suburbs, and of the three contiguous districts of Au, Haidhausen, and Obergiesing. By the efforts of the late King Ludwig, who spent nearly 7,000,000 thalers on the improvements of the city, M. has been decorated with buildings of almost every style of architecture, and enriched with a larger and more valuable collection of art-treasures than any other city of Germany. It possesses 28 churches, of which all but two or three are Catholic, and of these, the most worthy of note are: the cathedral, which is the see for the archbishopric of Munich-Freising, built between 1468—1494, and remarkable for its two square towers, with their octagonal upper stories, capped by cupolas, and its 30 lofty and highly-decorated windows; the church of the Jesuits, or St Michael's, which contains a monument by Thorwaldsen to Eugene Beauharnais; the Theatiner Kirche, completed in 1767, and containing the burying-vaults of the royal family; the beautiful modern church of St Mariahilf, with its gorgeous painted glass and exquisite wood-carvings; the round church, or Basilica of St Boniface, with its dome resting on 64 monoliths of gray Tyrolean marble, and resplendent with gold, frescoes, and noble works of art; the cruciform-shaped Ludwig Kirche, embellished with Cornelius's fresco of the Last Judgment; and lastly, the Court Chapel of All

Saints, a perfect casket of art-treasures. Among the other numerous public buildings, a description of which would fill a volume, we can only briefly refer to a few of the more notable; as the theatre, the largest in Germany, and capable of accommodating 2400 spectators, erected in 1823; the post-office; the new palace, including the older royal residence, the treasury and chapel, antiquarian collections, &c.; and the Königsbau, designed by Klenze in imitation of the Pitti Palace, and built at a cost of 1,250,000 thalers, containing J. Schnorr's frescoes of the Nibelungen; the Banqueting Halls, rich in sculpture by Schwanthaler, and in grand fresco and other paintings. In the still incomplete suburb of Maximilian are situated the old Pinakothek, or picture-gallery, erected in 1836 by Klenze, containing 300,000 engravings, 9000 drawings, a collection of Etruscan remains, &c.; and immediately opposite to it, the new Pinakothek, completed in 1853, and devoted to the works of recent artists; the Glyptothek, with its twelve galleries of ancient sculpture, and its noble collection of the works of the great modern sculptors, as Canova, Thorwaldsen, Schadow, &c. Among the gates of M., the most beautiful are the Siegesthor ('The Gate of Victory'), designed after Constantine's triumphal arch in the Forum, and the Isarthor with its elaborate frescoes. In addition to these and many other buildings intended either solely for the adornment of the city, or to serve as depositories for works of art, M. possesses numerous scientific, literary, and benevolent institutions, alike remarkable for the architectural and artistic beauty of their external appearance, and the liberal spirit which characterises their internal organisation. The library, which is enriched by the biblical treasures of numerous suppressed monasteries, contains about 600,000 volumes, of which 13,000 are incunabula, with nearly 22,000 MSS. The university, with which that of Landshut was incorporated in 1826, and now known as the Ludwig-Maximilian University, comprises 5 faculties, with a staff of 60 ordinary, and 12 extraordinary professors, among whom are included such men as Liebig, Bischoff, Schelling, Jacobi, &c. In association with it are numerous medical and other schools, a library of 160,000 vols., and various museums and cabinets. M. has an ably-conducted observatory, supplied with first-rate instruments by Fraunhofer and Reichenbach; 3 gymnasia, 4 Latin, 1 normal, various military, professional, polytechnic, and parish schools, of which the majority are Catholic; institutions for the blind, deaf and dumb, and crippled, and for female orphans, besides numerous hospitals, asylums, infant schools, &c.; an academy of sciences; royal academies of painting, sculpture, music, &c.; a botanic garden, parks, public walks, and gardens, adorned with historic, patriotic, and other monuments, and designed for the celebration of annual and other national fairs and festivals; spacious cemeteries, &c. M. is mainly indebted to the ex-king, Ludwig I., for its celebrity as a seat of the fine arts, as the greater number of the buildings, for which it is now famed, were erected between 1820 and 1850, although, since the accession of the present king, Maximilian, in 1848, the progress of the embellishments of the city has been continued on an equally liberal scale. M. is somewhat behind many lesser towns of Germany in regard to literary advancement and freedom of speculation, while its industrial activity is also inferior to its state of high artistic development. It has, however, some eminently good iron, bronze, and bell foundries, and is famed for its lithographers and engravers, and its optical, mathematical, and mechanical instrument-makers, amongst whom Utzschneider, Fraunhofer,

and Ertl have acquired a world-wide renown. M. is noted for its enormous breweries of *Bavarian beer*; and has some good manufactories for cotton, wool, and damask goods, wax-cloth, leather, paper-hangings, carriages, pianos, gold, silver, and steel wares, &c.

The present name of this city cannot be traced further than the 12th c., when Henry the Lion raised the *Villa München* from its previous obscurity, by establishing a mint within its precincts, and making it the chief emporium for the salt which was obtained from Halle and the neighbouring districts. In the 13th c., the dukes of the Wittelsbach dynasty selected M. for their residence, built the Ludwigsburg, some parts of whose original structure still exist, and surrounded the town with walls and other fortified defences. In 1327, the old town was nearly destroyed by fire, and rebuilt by the Emperor Ludwig of Bavaria very much on the plan which it still exhibits; but it was not till the

close of last century, when the fortifications were razed to the ground, that the limits of the town were enlarged to any extent. The last fifty years indeed comprise the true history of M., since within that period all its finest buildings have been erected, its character as a focus of artistic activity has been developed, its population has been more than doubled, and its material prosperity augmented in a proportionate degree. (1871—pop. 169,478.)

**MUNICIPAL ARCHITECTURE**, the style of the buildings used for municipal purposes, such as town-halls, guild-halls, &c. These were first used when the towns of the middle ages rose in importance, and asserted their freedom. Those of North Italy and Belgium were the first to move, and consequently we find in these countries the earliest and most important specimens of municipal architecture during the middle ages. It is only in the 'free cities' of that epoch that town-halls are found. We therefore look for them in vain in France or

Leather-Sellers' Hall, London.

England till the development of industry and knowledge had made the citizens of the large towns so wealthy and important as to enable them to raise the municipal power into an institution. When this became the case in the 15th and 16th centuries, we find in these countries abundant instances of buildings erected for the use of the guilds and corporations and the municipal courts. Many of these still exist along with the corporate bodies they belong to, especially in London, where the halls are frequently of great magnificence. Many of these corporation halls have recently been rebuilt by the wealthy bodies they belong to, such as the Fishmongers, Merchant Taylors, Goldsmiths, and other companies. Municipal buildings on a large scale for the use of the town councils and magistrates have also been recently erected in many of our large towns, which had quite outgrown their original modest buildings; and now no town of importance is complete without a great town-hall for the use of the inhabitants.

Municipal buildings always partake of the character of the architecture of the period when they

are erected; thus, we find in Italy that they are of the Italian-Gothic style in Como, Padua, Vicenza, Venice, Florence, &c., during the 13th, 14th, and 15th centuries. In Belgium, during the same period, they are of the northern Gothic style, and are almost the only really fine specimens of the civil architecture of the middle ages we possess. The Cloth-hall at Ypres, and the town-halls of Brussels, Louvain, Bruges, Oudenarde, &c., the Exchange at Antwerp, and many other markets, lodges, halls, &c., testify to the early importance of the municipal institutions in Belgium.

It is a curious fact, that in France, where the towns became of considerable importance during the middle ages, so few municipal buildings remain. This arises from the circumstance, that the resources of the early municipalities of France were devoted to aid the bishops in the erection of the great French cathedrals, and the townspeople used these cathedrals as their halls of assembly, and even for such purposes as masques and amusements.

Of the English corporation halls, those which remain are nearly all subsequent to the 14th c.,

## MUNICIPALITY, MUNICIPAL CORPORATION.

from which time to the present there are very many examples. The Guild-hall of London is one of the earliest. The present building was begun in 1411, and was built chiefly by contributions from the trades 'companies' of London. Of the town-halls recently erected, those of Manchester, Liverpool, and Leeds are amongst the most important.

**MUNICIPALITY, MUNICIPAL CORPORATION** (from Lat. *municeps*, from *munus* and *capio*, one who enjoys the rights of a free citizen), a town or city possessed of certain privileges of local self-government; the governing body in such a town. Municipal institutions originated in the times of the Roman empire. The provincial towns of Italy, which were from the first Roman colonies, as also those which, after having an independent existence, became members of the Roman state, though subjected to the rule of an imperial governor, were allowed to enjoy a right of regulating their internal affairs. A class of the inhabitants called the *curia*, or *decuriones*, elected two officers, called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the imperial governor. In the later ages of the empire, the Decurions were subject to heavy burdens, not compensated by the honour of the position, which led many to endeavour to shun the office. The municipal system declined with the decline of the empire, yet it retained vitality enough to be afterwards resuscitated in union with feudalism, and with the Saxon institutions of Britain. Some cities of Italy, France, and Germany have indeed derived their present magistracy by direct succession from the days of imperial Rome. This is notably the case with Cologne, where, up to the time of the first French Revolution, the two chief magistrates retained the title of *consuls*, wore the consular *toga*, and had their *lictors* in attendance, while the higher citizens were styled patricians, and the town banners bore the inscription S.P.Q.C. The Frankish conquerors seem frequently to have left the cities in possession of their municipal rights. The bishop being a shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the *defensor civitatis*. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In Southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government.

Of the cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers. Venice, Genoa, Florence, Hamburg, and Lübeck, all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance in the 13th c.; and their liberties and privileges were fostered by the Franconian emperors, to afford some counterpoise to the growing power of the immediate nobility. Nürnberg was especially celebrated for its stout resistance to the House of Brandenburg, and the successful war which it waged with the Franconian nobility. In England, the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English burghs were subject to the rule of an elective officer, called the 'Portreve,' who exercised in burgh functions similar to those of the shire-reve in the shire. The Norman conquerors recognised the already existing privileges of the towns by granting them charters. Instead of a shire-reve, a viscount was placed by the king over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns, the bailiff was allowed to assume the Norman appellation of Mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes, and performance of local duties. Titles to freedom were also recognised on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns, the trading population came to be divided into guilds or trading companies, through membership of which companies admission was obtained to the franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elective ruling bodies. As the greater municipalities grew in strength, we find their right recognised to appear in parliament by means of representatives. The sheriffs were considered to have a discretionary power to determine which towns should, and which should not have this privilege of representation. The reigns of the House of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to burghs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modelled the constitution of these burghs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reign of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with the view of creating additional parliamentary support for the ministry in power. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the 14th and 15th centuries, the municipal suffrage fell gradually more and more into the hands of restricted bodies of men, until act 1469, c. 5, gave to the councils the right of appointing their successors, the old and new council together electing the office-bearers of the corporation. This state of things continued till 1833, not without many and grievous complaints of corruption, mismanagement, extravagance, and peculation against the governing bodies. In the Scottish burghs, the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for parliamentary reform arose an outcry for municipal reform; and a separate municipal reform act putting an end to the close system was passed for each part of the empire. The English act (5 and 6 Will. IV. c. 76), entitled 'An act to provide for the regulation of Municipal Corporations in England,' conferred the franchise on the owners and occupiers of property within burgh, with

certain qualifications as to property, residence, &c. This constituency elected the councillors, and from the body of the councillors the mayor and aldermen were chosen. The corresponding act for Scotland, passed two years earlier, was 3 and 4 Will. IV. c. 76; it changed the mode of election in burghs which already had a council, and conferred councils on burghs which had none. By the Scottish act, every one has a vote who has resided for six months in the burgh, or within seven miles of it, and who possesses the requisite qualification to vote in the election of a member of parliament. In such burghs as do not send a member to parliament, the same property qualification is required as confers the parliamentary franchise. The councillors are chosen from the electors residing or carrying on business within the burgh. Nine of the smallest burghs are excluded from the operation of the act. The English act abolished the exclusive privileges of the guilds, but these monopolies continued in Scotland till 1839, when they were swept away by another enactment (9 and 10 Vict. c. 17). The Irish municipal system, which had been imported ready-made from England, was assimilated to the altered English system by 3 and 4 Vict. c. 108. It has been doubted whether the change of system has practically tended to elevate the character of the municipal government of the towns in any of the three kingdoms to the extent which its promoters anticipated.

**MUNIMENT-HOUSE**, a strong fire-proof apartment or building suited to contain archives, papers, and other valuables.

**MUNJEET** (*Rubia cordifolia* or *munjistia*), a species of Madder (q. v.), of which the root yields an excellent red dye. The plant differs from the common madder in its more distinctly quadrangular stem, its cordate-oblong leaves commonly in fours, and its red berries. It is a native of India, China, Japan, Central Asia, and Siberia. The root has long been used in India as affording a red dye; and is now an article of export to Europe, as a substitute for madder.

**MUNSTER**, the largest of the four provinces of Ireland, occupies the south-west, and is bounded on the N. by Connaught, on the E. by Leinster, and on the W. and S. by the Atlantic. It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads. Area, 6,064,579 statute acres. The population of the province, which in 1841 was higher than that of any of the other provinces, was shewn to be, in 1861, 1,503,200, or 407,208 less than that of Ulster, now the most populous of the provinces. (1871—pop. 1,390,402.)

**MÜNSTER**, chief town of the district of the same name, as well as capital of all Westphalia, is situated in 51° 55' N. lat., and 7° 40' E. long., at the confluence of the Aa with the Münster Canal, 65 miles north-east of Düsseldorf. Pop., including the military, at the close of 1861, 27,332. M., which is a bishopric, and the seat of a military council, a high court of appeal, and other governmental tribunals, is one of the handsomest towns of Westphalia, retaining numerous remains of mediæval architecture, whose quaint picturesqueness is enhanced by the numerous trees and shady allees, by which the squares and streets are ornamented. Among its 14 churches, of which the majority are Catholic, the most noteworthy are the cathedral, built between the 13th and 15th centuries, and despoiled of all its internal decorations by the Anabaptists; Our Lady's Church, with its noble tower; the splendid Gothic church of St Lambert, and the market-place, finished in the 13th c., on the tower

of which may still be seen the three iron cages in which the bodies of the Anabaptist leaders, John of Leyden, Knipperdolling, and Krechting, were suspended, after they had suffered the most horrible martyrdom; and the church dedicated to St Ludgerus, the first bishop of M., with its singular round tower, surmounted by an octagonal lantern. The Gothic town-hall possesses historical interest in being the spot at which, in 1648, the Peace of Westphalia was signed in a large hall, which has lately been restored, and which contains portraits of all the ambassadors who were parties to the treaty. The palace, built in 1767, is surrounded by fine pleasure-grounds, including horticultural and botanical gardens, connected with the academy; and these, with the ramparts, which, since the Seven Years' War, have been converted into public walks, form a great attraction to the city. M. is well provided with institutions of charity and benevolence. The old Catholic university of M. was dismembered in 1818, and its funds apportioned to other educational establishments; and the present academy, which comprises a Catholic theological and a philosophical faculty, is now the principal school. It has a library of 50,000 volumes, a natural history museum, and various collections of art and antiquity connected with it. M. has one gymnasium, a normal school for female teachers, and a number of town schools. The industrial products of M. include leather, woollen fabrics, thread, starch, and sugar, besides which there are good carriage manufactories, breweries, and distilleries. The trade is limited to the produce of the country, the principal of which are the noted Westphalian ham and sausages.

M. was known under the name of Mimigardevorde in the time of Charlemagne, who, in 791, appointed it as the see of the new bishop of the Saxons, St Ludgerus. Towards the middle of the 11th c., a monastery was founded on the spot, which in course of time derived its present name from its vicinity to the minster, or monastery. In the 12th c., the bishopric was elevated into a principality of the empire. In the 13th c., the city was incorporated in the Hanseatic League; and in 1532, it declared its adhesion to the Reformed faith, notwithstanding the violent opposition of the chapter. During the years 1535 and 1536, M. was the scene of the violent politico-religious movement of the Anabaptists, when the excesses of these pretended reformers worked a violent reaction in the minds of the people, which had the effect of restoring the prestige of the episcopal power; and although the citizens occasionally made good their attempted acts of opposition to their spiritual rulers, they were finally reduced to submission under Bishop Christopher Bernhard of St Gall, who having, in 1662, built a strong citadel within the city, transferred the episcopal place of residence thither from Koesfeld, where it had been established by earlier bishops. In the Seven Years' War, M. was repeatedly besieged and taken by both the belligerent parties. The bishopric of M., which since 1719 had been merged in the archbishopric of Cologne, although it retained a special form of government, was secularised in 1803, and divided among various royal houses; but subsequently shared in the common fate of other German provinces, and was for a time incorporated with France. The Congress of Vienna gave the greater part of the principality to Prussia, a small portion being apportioned to the House of Oldenburg, while Hanover acquired possession of the Münster territories of the mediatised Dukes of Arenberg.

**MUNTJAK** (*Cervus muntjac*, *Cervulus vaginalis*, or *Stylocercus muntjac*), a species of deer, abundant in Java, Sumatra, and other islands of the same region. It is about one-fifth larger than the

roebeek, which it considerably resembles in form. The horns are remarkable, as there springs from the common base of each an additional horn, which is about an inch and a half in length; the principal horn, which is simple, curved, and pointed, being about five inches in length. The female has no horns. The male has large canine teeth or tusks,

Muntjak (*Cervus muntjac*).

which also are wanting in the female.—Allied species are found in India and China.

MÜNZER, THOMAS, one of the leaders of the Anabaptists (q. v.), was born at Stolberg, in the Harz, took his degree at Wittenberg as Master of Arts, and for some time preached the doctrines of the Reformation in Zwickau and other places. Ere long, however, he adopted mystic views, and declaimed against what he called the 'servile, literal, and half' measures of the Reformers, requiring a radical reformation both in church and state according to his 'inward light.' He proclaimed an entire community of goods, and incited the populace to plunder the houses of the wealthy. Mühlhausen fell for a time under his sway, and that of another fanatic named Pfeifer, who joined him. He took an active part in the Peasant War, and inflamed the spirits of the insurgents by the wildest speeches and songs; but they were utterly defeated on 15th May 1525, after a severe conflict, at Frankenhausen, by the Elector John and Duke George of Saxony, the Landgrave of Hesse, and the Duke of Brunswick. M. fled, but was taken and carried to Mühlhausen, where he was beheaded along with Pfeifer and a number of others. He shewed no dignity or courage in the closing scenes of his life. See Strobel's *Leben Schriften und Lehren Thom. Münzer's* (Nürnb. 1795); Scidemann's *Thom. Munzer* (Dresd. and Leips. 1842); and Heinrich Leo in the *Evangetische Kirchenzeitung* (Berl. 1856).

MURÆNA, a genus of malacopterous fishes, of those to which the name Eel is commonly given, the whole of the eels being sometimes included in the family *Muraenidae*. See EEL. The true *Muræna* have no fins, except the dorsal and anal, which are low and fleshy. They have one row of sharp teeth in each jaw. The head is very large, and the jaws are moved with great power. The M. of the Romans, or MURRY (*M. helena*), abounds in the Mediterranean, and is sometimes of large size, four feet or more in length, golden yellow in front, and purple towards the tail, beautifully banded and mottled. It is much thicker in proportion to its

length than any of the fresh-water eels. Its flesh is white and highly esteemed. It prefers salt-water,

Murena (*M. helena*).

but can accommodate itself to a fresh-water pond. The ancient Romans kept and fed it in vivaria. The story of Vedius Pollio feeding his murenas with offending slaves is well known. This M. has been caught on the British shores, but very rarely.

Allied to the genus M. is the genus *Sidera*, found in the Pacific.

MURAL CROWN, in Heraldry, a crown in the form of the top of a circular tower, masoned and embattled. It is meant to represent the crown which was given by the Romans as a mark of distinction to the soldier who first mounted the walls of a besieged town, and fixed there the standard of the army. A mural crown supporting the crest, in place of a wreath, occurs in the achievements of several of the English nobility, and in various grants of arms made in the early part of the present century to officers who had distinguished themselves in the war. Viscount Beresford, in consequence of his gallantry at the battle of Albuera, obtained as crest, issuing out of a mural crown, a dragon's head with its neck pierced through by a broken spear, the head of the spear point downwards being held in the mouth of the dragon.

Mural Crown.

MURAT, JOACHIM, king of Naples, was the son of an innkeeper at La Bastide-Fortunière, near Cahors, in France, and was born there 25th March 1767 or 1768. He was at first intended for the priesthood, and actually commenced the study of theology and canon law at Toulouse, but entered the army, and being threatened with punishment for insubordination, deserted, and after spending some time at home, proceeded to Paris, where, it is said, he was for some time a waiter at a café, but soon obtained admission into the Constitutional Guard of Louis XVI. On the outbreak of the Revolution, he was made a sub-lieutenant in a cavalry regiment. His gallantry and extreme republicanism soon won him the rank of colonel. He attached himself closely to Bonaparte, under whom he served in Italy and in Egypt, signalling himself in many battles; rose to the rank of a general of division (1799); returned with Bonaparte to France; and rendered him most important assistance on the 18th Brumaire, by dispersing the Council of Five Hundred at St Cloud. Bonaparte now intrusted him with the command of the Consular Guard, and gave him his youngest sister, Caroline, in marriage. M. commanded the cavalry at Marengo, where he greatly distinguished

himself. On the establishment of the French Empire, he was loaded with honours. He continued to command the cavalry in the armies led by the Emperor, and contributed not a little to the victory at Austerlitz, and to many other victories. In 1806, the newly-erected grand duchy of Berg (q. v.) was bestowed upon him. On 1st August 1808, he was proclaimed king of the Two Sicilies by the style of Joachim I. Napoleon. He took possession of Naples, but the Bourbons, through the support of Britain, retained Sicily.

M. possessed the qualities requisite for a general of cavalry rather than those of a king. He was very deficient in political skill and energy; but by the moderation of his government, he won the hearts of his subjects. Even his love of pomp and show, and the theatrical splendor of his equipment, which were a subject of mirth in France and Germany, rather gratified the Neapolitans. He endured with difficulty the yoke of Napoleon, which left him little but the outward show of royalty. In the expedition against Russia, he commanded the whole cavalry, but on its failure, he returned to Naples, anxious and discontented. He joined the French army again in 1813, but after the battle of Leipzig, withdrew to his own dominions, determined on breaking the French fetters with which he was bound. He concluded a treaty with Austria, and a truce with the British admiral, and promised the allies an auxiliary corps. He hesitated, however, even after his new course seemed to have been decisively adopted; and finding his position insecure after Napoleon's overthrow, he entered into private communications with him at Elba. On the Emperor's return to France, M. placed himself at the head of an army of 40,000 men, and commenced a hasty war against Austria. He was defeated at Ferrara, 12th April 1815, and again at Tolentino, 2d May. With a few horsemen he fled to Naples, where all was insurrection and commotion; thence to the island of Ischia, and found his way to France, whilst his wife and children took refuge in the British fleet. After Napoleon's final overthrow, he found refuge in Corsica, from which he proceeded in a foolhardy manner with a few followers to the coast of Naples, and proclaimed himself king and liberator, but was presently taken prisoner, and after trial by a court-martial, was shot in a hall of the castle of Pizzo, on 13th October 1815. See Léonard Gallais, *Histoire de Joachim Murat* (Paris, 1828), and Coletta, *Histoire des Six derniers mois de la Vie de Joachim Murat* (Paris, 1821). His widow assumed the title of Countess of Lipona, and resided in the neighbourhood of Trieste, where she died in 1839. His two sons went to the United States, where the elder, NAPOLEÓN ACHILLE MURAT, settled in Florida, and published a number of works on the constitution and politics of his adopted country. He died 15th April 1847. The younger, NAPOLEÓN LUCIEN CHARLES, married an American lady in 1827, but suffered several reverses in fortune, and Madame Murat was obliged to open a boarding-school for the support of herself and her husband. Twice he attempted to return to France secretly (in 1837 and 1844), but failed on both occasions. The Revolution of 1848, however, opened the country to him. He attached himself closely to Prince Louis Napoleon; and was in 1849 French Ambassador Extraordinary to the court of Turin. In 1852 he was made a senator; and in 1853 he received the title of prince. The Italian revolution appeared to present some chances for him, but nothing came of these.

MURATORI, LUDOVICO ANTONIO, a celebrated antiquary and historian, was born at Vignola, in

the duchy of Modena, October 21, 1672. From a very early period, his predilection for historical and literary pursuits began to manifest itself; and, having entered into holy orders, without, however, accepting any ecclesiastical office, his life was devoted partly to the literature of his profession, but mainly to researches in history, both sacred and profane, especially the history of his native country. In his 22d year, he was appointed one of the librarians of the Ambrosian Library at Milan, a post which has since received equal celebrity from a successor not unworthy of the fame of M., the illustrious Angelo Mai (q. v.). Here he gave to the world his first publication, a collection of inedited Greek and Latin fragments, under the titles of *Anecdota Græca* and *Anecdota Latina*. But his most important labours were reserved for the capital of his native duchy, whither, in 1700, he was recalled by the Duke of Modena, to take charge of the celebrated D'Este Library, and of the ducal archives; his only ecclesiastical preferment being that of provost of the church of St Mary, at Pomposa. From the date of his return to Modena, M. began to devote himself more exclusively to Italian history, especially to the history of medieval Italy; and his labours in this department extended over the greater part of his life. It was not until the year 1723 that the first volume of his great collection, *Rerum Italicarum Scriptores*, appeared, and the work proceeded at regular intervals for nearly thirty years, the last of the twenty-eight folio volumes which compose it bearing the date of 1751. This immense publication, which was produced by the joint contributions of the princes and higher nobility of Italy, embraces a range from the 5th to the 16th c., and contains all the chronicles of Italy during that vast period, illustrated with commentaries and critical notices. It was accompanied by a collection of dissertations illustrative of the religious, literary, social, political, military, and commercial relations of the several states of Italy during the period, in 6 vols. folio, 1738—1742, a work which, although far from being exempt from errors, is still regarded as a treasure-house of medieval antiquities. While engaged in these prodigious labours, M. carried on an active literary correspondence with the scholars of the various countries of Europe, and contributed essays not unfrequently to the principal historical and literary academies, of most of which he was a member. He was the first, moreover, to undertake a general History of Italy from the commencement of the vulgar era down to his own time. It is in 12 vols. 4to, and still retains its value as a book of reference, having been continued by Coppi down to the year 1819. In his capacity of archivist of the Duke of Modena, he compiled, in two vols. folio, the *Antiquities of the d'Este Family* (1710—1740), as well as a series of historical and polemical treatises on certain territorial questions in dispute between the House of Modena and the court of Rome. To the department of classical scholarship, M.'s collection of *Inscriptions* (6 vols. folio, 1739—1743), which, in this point of view, was a necessary supplement to the collection of Gruter and the other antiquaries who had preceded him, is still acknowledged as a most important contribution; and he has also left works of standard merit in the departments of jurisprudence, of literary criticism, of poetry, of biography, and even of the history of medical science. In the studies of his own profession, as well liturgical and historical, as dogmatical and even ascetical, M., although he did not follow the method of the schools, was hardly less distinguished than if he had made these the pursuit of his life. Some of his opinions were regarded with disfavour, if not directly condemned; but his

vindication of himself, addressed to the learned Pope Benedict XIV., drew forth a warm and honourable testimony to the uprightness of his motives, which, without approving of the opinions to which exception had been taken, declared them free from the imputation of being contrary either to the doctrine or to the discipline of the church. Although M.'s life was essentially that of a scholar, yet his exactness in discharging the duties of a parish priest was beyond all praise, and several of the existing charitable institutions of Pomposa were founded by him. He died at Modena, January 28, 1750, in his 78th year. His works, which it would be tedious to enumerate in full detail, fill 46 volumes in folio, 34 in 4to, 13 in 8vo, and many more in 12mo. Some of these are posthumous, and were published by his nephew, G. F. Muratori, from whom we also have a life of his distinguished uncle, in 4to, printed at Omer, 1758.

MURCHISON, SIR RODERICK IMPEY, geologist and geographer, was born at Tarradale, Ross-shire, in 1792. He was educated at the Grammar-school, Durham, and having a bias for military life, next studied at the Military College, Marlow. He entered the army at an early age, and served as an officer in the 36th Regiment in Spain and Portugal. He was placed on the staff of his uncle, General Sir Alexander Mackenzie, and then obtained a captaincy in the 6th Dragoons. Quitting the army in 1816, he devoted himself to science—more especially to geology. After five years' investigation, he established what he called the Silurian system (q. v.). He found the same sedimentary strata lying in the earth's crust beneath the old red sandstone in the mountainous regions of Norway and Sweden, in the vast and distant provinces of the Russian empire, and also in North and South America. He explored also several parts of Germany, Poland, and the Carpathians; and in 1846 he commenced a geological survey of the Russian empire, under the countenance of the imperial government. M. de Verneuil was associated with him in this great work. Upon the presentation of his first report, the Emperor Nicholas gave him a decoration and a colossal vase of Siberian aventurine, mounted on a column of porphyry, with a suitable inscription. After three years' additional labour, he completed his survey of Russia, which obtained for him the grand cross of the order of St Stanislaus, and the honour of British knighthood. He has frequently held the office of President of the Geological Society, and in his anniversary address in 1844, first predicted the discovery of gold in Australia. In 1846, six years before that metal was practically worked, he addressed a letter to the President of the Royal Geological Society of Cornwall, inciting the unemployed Cornish tin-miners to emigrate and dig for gold in Australia. In 1846, he was elected President of the British Association for the Advancement of Science, and in this year received the Copley medal of the Royal Society of London. He was elected President of the Royal Geographical Society in 1844 and 1845, was re-elected in 1857, and still holds this distinguished post. His anniversary addresses to the geographers are of great interest and value. Perhaps no man living has done more to promote geographical science at home, and kindle the spirit of adventure among the explorers of distant lands. In 1855, he succeeded Sir H. De la Beche in the office of Director of the Museum of Practical Geology. In 1857, he presided over the banquet to Dr Livingstone. He presents an annual report to parliament as Director-general of the Geological Survey and Government School of Mines. So laborious has been his

life, and so various have been his labours, that a mere list of his essays on geology, &c., would fill three or four pages. M. has also prepared and published sixteen geological maps. The greater portion of his contributions to science have been published in the *Transactions of the Geological Society*, *Edinburgh Philosophical Journal*, *London and Edinburgh Philosophical Magazine*, &c. He has also published volumes on the *Tertiary Deposits of Lower Styria*, &c. (1830), the *Geology of Cheltenham* (1834), &c. (He died October 22, 1871.)

MURCHISONIA, a genus of fossil gasteropodous mollusca belonging to the family *Haliotidae*, and so named in honour of Sir R. I. Murchison. The genus consists of at least 50 species, all which are characteristic of the Palæozoic rocks, occurring in the series from the Lower Silurian up to the Permian. The shell differs from the large genus *Pleurotomaria* only in being very much elongated. Like it, the whorls are sculptured and zoned, the aperture is channelled in front, and the outer lip is deeply notched.

MURCIA, a former province of Spain, now subdivided into the smaller provinces of Albacete and Murcia, is situated in the south-east of the peninsula. It is bounded on the N. by New Castile, on the E. by Valencia, on the S. by the Mediterranean, and on the W. by Granada, Andalusia, and New Castile. Area, 10,311 square miles. Pop. 582,087. In the north-east, the province is partly level; but in the south-west, it is composed of great valleys, high plateaus, and mountain ranges. The coast comprises stretches of desert. The principal river is the Segura, which flows through the middle of the province from west to east. On the whole, M. is not very productive, and never will be, on account of the failure of water, partly caused by the destruction of the forests. The only fertile districts are the valleys of the Segura, and the side-valleys of Lorca, Albacete, Chinchilla, and Almansa. The Esparto wastes have remained uncultivated since the banishment of the Moriscos in 1610; and the canal of M., which is intended to irrigate the arid Campo de Cartagena, is not yet finished. M. is one of the most thinly peopled districts of Spain. The north yields wheat and barley; the south, maize, fruits, wine, oil, silk, and hemp. Goats, sheep, and swine are reared in great numbers. In metals, salt, and mineral springs, M. is abundant; it has also many smelting-works for iron, lead, and copper ores, brimstone and alum. The roads, however, are in the most wretched condition, and industry in general is still in a backward state. The province was frightfully devastated by a great earthquake, 18—21 March 1829. M. was conquered by the Arabs in 711; after the fall of the califate of Cordova, it became an independent Arab kingdom, but, six years afterwards, was subjugated by King Ferdinand III. of Castile in 1241.

MURCIA (the Roman *Murvi*), a large, important, and ancient town of Spain, capital of the province of the same name, on the left bank of the Segura, and near the junction of that river with the Sangonera, 50 miles south-west of Alicante. It stands in the midst of a beautiful and luxuriantly productive *huerta* or garden, 16 miles in length, and from 7 to 8 miles wide. This *huerta* forms a portion of what is called the vale of M.; is well watered, has a bright green appearance even in winter; produces wheat, flax, pulse, and vegetables, and grows innumerable mulberry, orange, fig, and palm trees. The streets of M. are narrow but clean, and the houses are gaudily painted in pink and yellow. Its squares are filled with cypress, orange, lemon, and other southern trees. It is the see of a bishop

suffragan to Toledo; the cathedral is surmounted by a tower begun in 1522, completed in 1766, and crowned by a dome from which a magnificent view is obtained. The city contains few objects of fine art, a circumstance which is accounted for by the fact that, on the occasion of its siege by Sebastiani, that general, after promising that persons and property should be respected, entered the town 23d April 1810, and rifled it of its wealth and art-treasures. Silks, linens, baskets, mats, and cordage are manufactured, and oil-mills, tanneries, and other works are in operation. Pop. 109,416.

**MURDER** is the crime of killing a human being of malice aforethought, and is punishable with death. It is immaterial what means are employed to effect the object. Blackstone says that the name of murder, as a crime, was anciently applied only to the secret killing of another, which the word *moerda* signifies in the Teutonic language. And among the ancient Goths in Sweden and Denmark, the whole vill or neighbourhood was punished for the crime, if the murderer was not discovered. Murder is defined by Coke thus: 'When a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied.' Almost every word in this definition has been the subject of discussion in the numerous cases that have occurred in the law-courts. The murderer must be of sound memory or discretion; i. e., he must be at least 14 years of age, and not a lunatic or idiot. The act must be done unlawfully, i. e., it must not be in self-defence, or from other justifiable cause. The person killed must be a reasonable creature, and hence killing a child in the womb is not murder, but is punishable in another way (see **INFANTICIDE**). The essential thing in murder is that it be done maliciously and deliberately; and hence, in cases of hot blood and snuffling, the offence is generally manslaughter only. Killing by duelling is thus murder, for it is deliberate. It is not necessary, in order to constitute murder, that the murderer kill the man he intended, provided he had a deliberate design to murder some one. Thus, if one shoots at A, and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A, and B, against whom the poisoner had no felonious intent, takes it, and is killed, this is murder. Formerly, in England, the Benefit of Clergy (q. v.) was allowed in cases of murder, till it was abolished by 7 and 8 Geo. IV. c. 28. The only sentence on murderers is now death, which is carried out by hanging. Formerly, the murderer was directed after death to be hung on a gibbet in chains near the place of the crime. Formerly, also, dissection was added as part of the sentence, and the execution was to take place on the day next but one after sentence. But now an interval of a fortnight usually takes place, and the body is buried in the precincts of the prison. Attempts to murder were until recently punishable in England like capital felony; but now attempts to murder are punishable only with penal servitude for life, or for not less than three years.

**MUREX**, a Linnæan genus of gasteropodous molluscs, of which has now been formed the family *Muricidæ*, belonging to the order *Pectinibranchiata* of Cuvier. The sexes are distinct; the animal has a broad foot, often much expanded; the eyes are not on stalks; the shell has a straight canal in front, often prolonged through part of a very long beak; no canal behind. The *Muricidæ* all prey on other molluscs, boring through the shells with their hard-toothed proboscis. The name **ROCK-SHELL** is often given

to many species of M.; and some, from the length of the beak, are called **WOODCOCK-SHELL**. Some have the shell beset with long and regularly arranged spines. The whorls of the shell are marked with ridges, or *varices*. Some species of M. are found on the British coasts. Species are found in all parts of

Woodcock-Shell (*Murex tenuispina*).

the world; the largest are tropical. The ancients obtained their purple dye (see **TYRIAN PURPLE**) from species of M., particularly *M. trunculus* and *M. brandaris*. The **VENUS COMB** of the Indian seas is *M. tribulus*, a very delicate and beautiful shell, with many long thin spines. Fossil *Muricidæ* are numerous, but are scarcely found in any formation older than the eocene tertiary.

**MUREXIDE**, Purpurate of Ammonia, or Roman Purple, a curious colouring matter obtained from guano. It is similar to the purple dye or Tyrian purple of the ancients, which was made from a species of *Murex*—hence its name. Murexide is a product of uric acid, and as this exists in abundance, and in a very free state, in guano, that material has been found one of the best sources from which to obtain it. One process used by Mr Rumney of Manchester, the chief manufacturer of this material, to produce murexide, is to dissolve uric acid in dilute nitric acid, and after evaporating for some time at a temperature a little short of boiling, whilst still hot, to add a slight excess of ammonia. Two compounds are formed by this process, Alloxan and Alloxantin, and their mutual reaction on each other results in the formation of the beautiful minute green metallic-lustred crystals of murexide, which, in combination with some of the compounds of lead and mercury, yield most brilliant red and purple dyes. The use of murexide was becoming extensive until the discovery of the aniline colours, the greater brilliancy of which has checked its employment. Murexide is used in printing both cotton and silk goods, which, under the name of the 'Roman-purple style,' has been brought to great perfection by several large firms.

**MURIATIC ACID**. See **HYDROCHLORIC ACID**.

**MURIDÆ**, a family of rodent quadrupeds, containing many genera and a very large number of species, distributed over all parts of the world, and of which rats and mice may be regarded as typical examples. To this family belong also voles, lemmings, dormice, jerboas, marmots, &c. The M. are of the section of rodents having distinct clavicles. They have three or four molars on each side in each jaw, the molars at first furnished with rounded tubercles, which wear down till they exhibit mere roughened crowns. The typical M., and those most nearly allied to them, have scaly tails. Marmots, dormice, jerboas, &c., have hairy tails. There are great diversities of structure and habits among the Muridæ. All of them feed on vegetable food, but many of them are ready also to eat animal substances.—The limits of the family M. are very differently stated by different naturalists.

**MURILLO, BARTHOLOMÉ ESTÉBAN**, was born at Seville, and baptized Jan. 1, 1618; and after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by painting religious pictures for exportation to South America, he went to Madrid in 1641, being then in his 24th year, was favourably noticed by his celebrated townsman, Velasquez, and through his influence, was enabled to study the *chefs-d'œuvre* of Italian and Flemish art in the royal collections. In 1645, he determined to return to Seville, though advised to proceed to Rome by Velasquez, who offered him letters from the king. After settling in Seville, he received numerous important commissions, and was soon acknowledged as the head of the school there. In 1648, M. married a lady of fortune; he now maintained a handsome establishment, and his house was the resort of people of taste and fashion. The Academy of Seville was founded by him in 1660, but he filled the office of president only during the first year. He fell from a scaffold when painting in Caliz on an altar-piece for the Church of the Capuchins, returned to Seville, and soon after died from the injury he received. April 3, 1682. In early life, he painted many pictures illustrative of humble life; in these, the manner was darker and less refined than that exhibited in his later pictures, which are mostly scriptural or religious pieces. In the Louvre, and in England, there are about forty of his works. Sir David Wilkie, who greatly admired and carefully studied the Spanish school, has remarked, in reference to it: 'Velasquez and Murillo are preferred, and preferred with reason, to all the others, as the most original and characteristic of their school. These two great painters are remarkable for having lived in the same time, in the same school, painted for the same people, and of the same age, and yet to have formed two styles so different and opposite, that the most unlearned can scarcely mistake them; Murillo being all softness, while Velasquez is all sparkle and vivacity.'

**MUROM, or MOOROM**, a town in the south-east of the government of Vladimir, in European Russia, 70 miles east-south-east of Vladimir, and situated on the right bank of the Oka, a tributary of the Volga. Pop. (1859) 10,328. The chief industrial establishments are tanneries and sailcloth and linen factories. The fisheries on the Oka supply the surrounding country. M. is also noted for its orchards and kitchen-gardens, the latter of which supply a great portion of Russia with cucumber-seed of the first quality. Gypsum quarries in the neighbourhood are extensively worked during winter, and their produce is transmitted by water to Moscow and St Petersburg. M. has a very picturesque appearance, and was formerly surrounded by impenetrable forests. It is frequently mentioned in the old national ballads, and is one of the most ancient towns of Russia.

**MURRAIN** is the generic term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as the mouth and foot disease. It is a contagious eruptive fever, affecting cattle, sheep, pigs, and poultry; but rarely communicable to horses or men. It is characterised by the appearance of little bladders or vesicles in the mouth, on the lips, gums, and tongue; on the udder, and in the interdigital space; causing inability to eat, and drivelling of saliva, heat and swelling of the udder, and lameness. The disorder runs a fixed and definite course usually in eight or ten days. Good nursing, comfortable lodgings, and

a liberal supply of soft, easily digestible food, are the chief requisites for speedy recovery. A laxative may be given if needed. The mouth may be washed out twice daily with a mild astringent solution, which may be made with half an ounce of alum, oxide of zinc, or sugar of lead, to the quart of water. The udder in milch cows, in which the complaint is usually most serious, should be bathed with tepid water before and after milking, which must be attended to very regularly; and the feet kept clean, and washed occasionally with the lotion used for the mouth.

**MURRAY, or MORAY, JAMES STEWART, EARL OF**, sometimes called the 'Good Regent,' was the natural son of James V. of Scotland, by Margaret, daughter of John, fourth Lord Erskine, afterwards wife of Sir Robert Douglas of Lochleven. He was born about 1531, made Commendator of the priory of St Andrews in 1538, and subsequently of the priory of Macon (in France). He joined the Reformers in 1556, and almost immediately became the chief of the Protestant party in Scotland. In 1561, he was sent to France, to invite Queen Mary to return to her kingdom; and on her arrival, he became her prime minister and adviser. In February 1562, he was created Earl of Mar; but that earldom having been claimed by Lord Erskine, the title of Earl of Moray was conferred upon him instead a few months afterwards. Strongly opposed to the marriage of Mary with Lord Darnley, 29th July 1565, he endeavoured to oppose it by an appeal to arms; but he was easily put to flight by the queen, and obliged to take refuge in England. He did not return to Edinburgh till the 10th March 1566, the day after the assassination of Rizzio, in which he was an accomplice. In April 1567, he went to France, but was recalled in August of the same year by the lords in arms against the queen, when he found Mary a prisoner in Lochleven, and himself appointed regent of the kingdom. After the escape of the queen, he defeated her forces, May 13, 1568, at Langside, near Glasgow, and was afterwards one of the commissioners sent to England to conduct the negotiations against her. By his prompt and vigorous measures, zeal, and prudence, he succeeded in securing the peace of the kingdom, and settling the affairs of the church, but was assassinated at Linlithgow by Hamilton of Bothwellhaugh, January 21, 1570.

**MURRAY, JOHN**, the name of three generations of English publishers, will for ever remain associated with the palmiest days of English literature in the 18th and 19th centuries. The founder of the house, John M'Murray, was born in Edinburgh about 1745. He obtained a commission in the Royal Marines in 1762, and in 1768 was still second-lieutenant, when, disgusted with the slowness of promotion, and panting for a more active career, he purchased the bookselling business of Mr Sandby, opposite St Dunstan's Church, London; and, dropping the Scottish prefix, became a bookseller and publisher at '32 Fleet Street.' He brought out the *English Review*, and published the elder Disraeli's *Curiosities of Literature*, &c. He could himself wield the pen, as some pamphlets remain to testify. He died November 16, 1793, and was succeeded in due time by his son JOHN, who was left a minor of fifteen at his father's death. One of the earliest hits of John the second was Mrs Rundell's Cookery-book, which proved to be a mine of wealth—more productive, perhaps, than *Childe Harold* itself. He became connected with Thomas Campbell and Sir Walter Scott, and in 1808—1809, projected the *Quarterly Review*, a Tory organ, in opposition to the Whig *Edinburgh Review*, then in

the height of its influence. The first number was published February 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought M. into communication not only with the chief literati, but also with the Conservative statesmen of the time. A still more fortunate acquaintance was that with Lord Byron, whose *Childe Harold* was published by M. in 1812. M. now removed from Fleet Street to Albemarle Street, where the business is still carried on. Here Byron and Scott first met, and here Southey made the acquaintance of Crabbe. Almost all the literary magnates of the day were 'four o'clock visitors' in Albemarle Street. Byron's pleasant verse has described the scene:

'The room's so full of wits and lauds,  
Crabbes, Campbells, Crokers, Freres, and Wards.'

M.'s dinner-parties included politicians and statesmen, as well as authors, artists, and dilettanti. M. paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell, and Irving were princely. The second John M. died in his 65th year, in 1843, and was succeeded by his son, Joux M. the third. Born in 1808, he was educated first at the Charter House, and afterwards at Edinburgh University. The age of Byron had gone by, when, in 1843, he succeeded to the business of his father and grandfather. A more practical and realistic age had succeeded, and the 'Home and Colonial Library,' issued to beat off foreign and American piracies, was the precursor of the cheap railway and other literature of the present day. A lively and vigorous competition, arising out of the wants of a new era, has somewhat altered the relation of the great publishing houses. That of Albemarle Street no longer ranks first in the extent and variety of its transactions, but many of the greatest works in history, biography, travel, art, and science have issued from the Albemarle Street press under the regime of the third Murray. Among his later successes may be mentioned Dr Livingstone's *Travels*, Smiles's *Life of George Stephenson*, and Charles Darwin's *Origin of Species by Natural Selection*. His handbooks of continental travel have lately been supplemented by handbooks of English counties, and these, it is understood, owe much to the personal assistance and superintendence of the present head of the famous house of Murray.

MURRAY, LINDLEY, an English grammarian, was born at Swatara, Lancaster County, Pennsylvania, U.S., in 1745. He was educated at an academy of the Society of Friends, and, on his father's removal to New York, was placed in a counting-house, from which he escaped to a school in New Jersey. He then studied law, and was admitted to the bar at the age of 21, and commenced a good practice. During the revolutionary war, he engaged in mercantile pursuits with such success as to accumulate a handsome fortune. His health failing, he came to England and purchased the estate of Holdgate, near York, where he devoted himself to literary pursuits. In 1787, he published his *Power of Religion on the Mind*, which passed through seventeen editions. His *Grammar of the English Language* was issued in 1795, and was followed by *English Exercises, the Key, the English Reader, Introduction and Sequel*, and a *Spelling Book*. There can be no stronger indication how entirely the systematic study of the English language was—until recent years—neglected by scholars, than the fact that M.'s *Grammar* was for half a century the standard text-book throughout Britain and America. M. wrote an autobiography to the year 1809, which was published after his death, February 16, 1826.

MURRAY RIVER, the principal river of South Australia. See AUSTRALIA.

MURSHEDABAD, a town of India, capital of a British district of the same name, is situated on the left bank of the Bhagratti, a branch of the Ganges, about 124 miles north of Calcutta. On the opposite side of the river stands Mahinagar, usually reckoned a part of Murshedabad. The town occupies a great space, being several miles both in length and breadth, but the buildings are for the most part of mud. It contains two palaces: the one, old and gloomy; the other, constructed after the European style, and of great beauty, was completed in 1840. Situated on the most frequented route by water from Calcutta to the North-West Provinces, the trade of M. is important. Formerly, it was the capital of Bengal, and so wealthy, that Clive compared it with London. Pop. about 150,000, of whom upwards of 90,000 are Hindus, and nearly 60,000 Mohammedans.

MURVIEDRO, a small town of Spain, in the province of Valencia, and 18 miles north-north-east of the city of that name, on the left bank of the Palancia, and two miles from its mouth. Pop. about 5000. It stands on the site of the ancient Saguntum (q. v.).

MURZUK. See FEZZAN.

MUSACEE, a natural order of endogenous plants, the largest of herbaceous plants, generally destitute or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivalling palms in stateliness; the long sheathing bases of the leaf-stalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the midrib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a 3-valved capsule or fleshy.—The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, whilst the fibres of the leaves are employed for cordage and for textile purposes. See PLANTAIN, BANANA, and ABACA. A very interesting plant of the order M. is the TRAVELLER'S TREE (q. v.) of Madagascar.

MUSÁUS, JOHANN KARL AUGUST, a German writer, born in 1737 at Jena, where he studied theology, was nominated to a country church, but prevented from entering upon the cure committed to him in consequence of the opposition of the peasantry of the parish, who refused to receive him on the ground that he had been once seen to dance. In 1763, he received the appointment of tutor to the pages at the ducal court, and in 1770 he became professor at the Weimar gymnasium. His first literary production, which appeared in 1760, was a parody of Richardson's *Sir Charles Grandison*, which was at that time extravagantly admired in Germany. The success of this satirical squib was complete; but as literary fame did not bring with it a corresponding amount of pecuniary reward, M. was compelled to gain his living by other means than writing; and an interval of more than eighteen years elapsed before he found leisure to reappear as an author. In 1778, he published his *Physiognomischen Reisen*, in which he endeavoured, by a good-natured yet striking satire, to counteract the absurd uses to which the Germans of his day had turned Lavater's system. This, like his previous work, was pre-eminently successful, and encouraged by the marks of popular favour with which it was received, he laid aside his incognito, and continued to devote himself to authorship. In 1782, appeared

his charming version of German folk-lore, under the title of *Volksmärchen der Deutschen*, which professed to be merely a collection of popular tales noted down from the lips of illiterate old country people; but these tales were tintured with such a blending of genial humour, quaint fancy, and strong sense, that they have become a classical work of their kind, popular among persons of every age and class. His satirical sketches, entitled *Freund Heins Erscheinungen in Holbein's Manier* (Winterthur, 1785), maintained his reputation as one of the sprightliest and most genial satirists of his country. Under the name of Schellenberg, he began a course of tales, *Straussfedern* (Berl. 1787), which, however, he did not live to complete. He died in 1787. His *Moralische Kinderklapper* appeared the year after his death, while his other posthumous writings were edited in 1791, with an interesting notice of the author, by his relative and pupil, A. V. Kotzebue. M.'s style was at once correct and elegant, adapting itself with singular flexibility to the various subjects which he handled; while the unaffected geniality and frank loving nature which are reflected in all he wrote, have deservedly made him one of the most popular writers of his day in Germany.

MUSÆUS, one of the ancient Greek poets of the mythic period, is said to have been the son of Eumolpus and Selene; according to others, the son and pupil of Orpheus. To him was ascribed the introduction of the Eleusinian and other mysteries into Greece, and the ordering of many religious rites. He was among the ancients also the reputed author of a number of poems, oracles, purificatory verses, a war of the Titans, a theogony, hymns, &c.; but of the few verses which remain the authenticity is very doubtful.—A later MUSÆUS, who probably flourished about the end of the sixth c. of the Christian era, was the author of a very pleasing amatory poem, in Greek, entitled *Hero and Leander*, discovered in the 13th c., of which the first edition was published by Aldus Manutius about 1494, and of which there have been many subsequent editions.

MUSCÆ VOLITANTES is the term applied to ocular spectra, which appear like flies on the wing, or floating black spots before the eyes. There are two kinds of muscæ volitantes—the one a perfectly harmless kind, while the other is symptomatic of one of the most serious diseases of the eyes, viz., amaurosis.

Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibres, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibres are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines, beyond and parallel to which may be seen an appearance of coloured lines or fringes. The doublings and crossings of the loops or knots in the twisted fibres appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision all these objects are imperceptible, unless the knots or fibres happen to be larger than usual, when they constitute the harmless kind of muscæ volitantes. The black lines and fringes are phenomena of the inflexion or diffraction (q. v.) of light, which are never seen except in divergent rays, and all muscæ volitantes having such fringes must be situated at a greater or less distance from the retina; and there are conclusive reasons for believing that they occupy the vitreous humour, and cannot therefore portend amaurosis; whereas

those black spots which have no fringes, and which do not move, or which move only with the motions of the eye, are points in the retina which are insensible to light, and are therefore to be dreaded as symptomatic of danger to vision. To decide, then, whether the muscæ volitantes are or are not indicative of danger, the patient should fix his eye on a white surface (as a sheet of letter-paper) after a sudden shake of the head; if they sink gently downwards, they are innocent. It should perhaps be added, that though they seem to descend, they must in reality be ascending; floating up in the vitreous humour as far as the cellular partitions formed by the hyaloid membrane will permit. See EYE. For further information on the differences between the innocent and the dangerous forms of muscæ volitantes, the reader is referred to an article by Sir David Brewster in the *North British Review* for November 1856.

MUSCARDINE, or SILK-WORM ROT (*Botrytis Bassiana*), a fungus (see BOTRYTIS) which grows on silk-worms, and often kills them in great numbers. It consists of erect branching threads, with clusters of spores at the end of short lateral branches. The spores of this fungus germinate even on healthful silk-worms, and in circumstances otherwise most

Muscardine (*Botrytis Bassiana*).

favourable to their healthfulness. They germinate also on the caterpillars of other lepidopterous insects. When this pest appears among silk-worms, its progress cannot be checked by any means known. For prevention, it is most important that the silk-worms be not overcrowded.

MUSCAT, or MASKAT, the most powerful of the Arab states, consists of a tract of country in the eastern part of Omân, in Arabia, a narrow tract along the coast of the Persian provinces of Laristan and Moghistan, the islands of Ormus and Kishim at the entrance of the Persian Gulf, and an extensive territory on the east coast of Africa from the equator southwards to Cape Delgado, in which are included the provinces and islands of Zanzibar, Quiloa, Melinda, Patta, Pemba, Juba, Nonfia, and Lamo. The whole territory of the state extends to about 176,000 square miles, and contains 2,500,000 inhabitants, of whom about 500,000 reside in Muscat Proper, in Arabia. The standing army amounts to 20,000 or 30,000 men, the navy to 87 vessels with 730 guns, the merchant-vessels to at least 2000 vessels of 37,000 tons. The value of the annual imports is reckoned at about £1,000,000 sterling, and the revenue of the state is about

£260,000. The capital is Muscat, on the Persian Gulf, a fortified town, surrounded with gardens and date-palms. It has a very good harbour, which, in the winter months, is reckoned the best harbour of refuge in the Indian Ocean, and is a most important centre of trade, where the productions of Europe, of Africa, and of the East are exchanged. The principal exports are Arabian coffee and pearls obtained from the Persian Gulf; but wheat, dates, raisins, salt, sulphur, drugs, and horses are also exported, whilst the African territories export gums and drugs, ivory, tortoise-shell, rhinoceros horns, skins and hides, wax, cocoa-nut oil, rice, &c. The ruler, the hereditary title of whom is the Imaum, resides sometimes at M., sometimes at Zanzibar. The town of M. now contains about 60,000 inhabitants, an extraordinary mixture of Arabs, Persians, Afghans, Beloochees, Indians, Negroes, Jews, &c. The Banian merchants of India have frequented the coast of Arabia for a thousand years, and a dialect of Hindustani, much mingled with other languages, has become a sort of common medium of intercourse. M. was taken by Albuquerque in 1507, and remained in the hands of the Portuguese till 1648, when the Arabs recovered possession of it. M. owes its position and prosperity to the mild and wise measures of Said Seid, sultan of Oman and Imaum of M., who, at the age of 16, ascended the throne in 1803, and reigned till his death in 1856. His dominions after his death were divided among two of his sons, one of whom is established as an independent sovereign at Zanzibar, the other resides at M., and owns the sovereignty of the Asiatic provinces. See ZANZIBAR and WAHABIS.

MUSCATEL (Ital. *moscato*, musk), the name given to many kinds of sweet and strong French and Italian wines, whether white or red. Amongst the finest are the white Rivesalt and red Bagnol wines from Roussillon, and the Lunel from the Pyrenees, the Lacrymæ Christi and Carignano of Naples, &c.

MUSCATINE, a city of Iowa, U.S., is on the west bank of the Mississippi, 100 miles above Keokuk, and 32 south-east of Iowa city. It has a large trade by the river, and several railroads, three steam flour-mills, two steam saw-mills, planing-machines, &c. The export of timber amounts to 10,000,000 feet per annum. There are 16 churches, schools, newspapers, &c. Pop. (in 1860) 5324.

MUSCHELKALK (Ger. shell-lime), the middle member of the Triassic, or New Red Sandstone period, the beds of which are entirely absent from the British strata. Being typically developed in Germany, the foreign name has been universally adopted to designate them. They consist of (1st) a series of compact, grayish, regularly-bedded limestone, more than 300 feet thick; and (2d) alternations of limestone, dolomite, marl, gypsum, and rock-salt, nearly 300 feet thick. The limestone abounds in the remains of Mollusca. The paleozoic Goniatites are replaced by the Ceratites, a remarkable link between them and the Secondary Ammonites. Ceratites are distinguished by the few small denticulations of the inner lobes of the suture. The heads and stems of Lily crinoids (*Encrinurus*) are also abundant in these strata, and the remains of ganoid fish have also been met with.

MUSCI. See MOSSES.

MUSCICAPIDÆ, a family of birds of the order *Inscissores* and tribe *Dentirostres*, of which the greater number receive the popular name Fly-catcher (q. v.). The limits of the family are, however, very variously defined by different ornithologists. The M. are mostly inhabitants of the

warmer parts of the world, in which they are very widely diffused. The species are very numerous.

MUSCIDÆ, a family of dipterous insects, having a short, thick, membranous proboscis, geniculated at the base, entirely retractile so as to be concealed within the mouth, and terminated by two large lobes (see HOUSE-FLY); the antennæ three-jointed; the thorax with a transverse suture. The species are very numerous, and universally distributed. More than 800 are found in Britain, among which are the well-known House-fly, Blow-fly, &c. The larvæ are Maggots (q. v.). Although some of the M. are troublesome, none of them are so much so as species of some other allied families.

MUSCLE AND MUSCULAR TISSUE. Muscular tissue is specially distinguished by its contractile power, and is the instrument by which all the sensible movements of the animal body are performed. When examined under a high magnifying power, the fibres of which it is composed are found to exist under two forms, which can be distinguished from one another by the presence or absence of very close and minute transverse bars or stripes. The fibres of the *voluntary* muscles—or those whose movements can be influenced by the will—as well as the fibres of the heart, are *striped*; while those of the *involuntary* muscles—the muscular structures over which we have no control—as, for example, the muscular fibres of the intestinal canal, the uterus, and the bladder, are *unstriped*.

On examining an ordinary voluntary muscle with the naked eye (a muscle from one of the extremities of any animal, for example), we observe that it presents a fibrous appearance, and that the fibres are arranged with great regularity in the direction in which the muscle is to act or contract (for it is by their inherent power of contracting that muscles act). On closer examination, it is found that these fibres are arranged in *fasciculi*, or bundles of various sizes, enclosed in sheaths of areolar tissue, by which they are at the same time connected with and isolated from those adjoining them; and when the smallest *fasciculus*, visible to the naked eye, is examined with the microscope, it is seen to consist of a number of cylindrical fibres lying in a parallel direction, and closely bound together. These *primitive* (or, as some writers term them, the *ultimate*) fibres present two sets of markings or *stria*—viz., a longitudinal and a transverse set. The fibres, when separated from each other, frequently split longitudinally into *fibrillæ*, as is seen at one of the ends of fig. 1. Sometimes, however, when a fibre is extended,

Fig. 1.—A Fasciculus of Striped Muscular Fibres, shewing longitudinal cleavage: Magnified 300 diameters.

it separates in the direction of the transverse stria into a series of discs, as is shewn in fig. 2. Either cleavage is equally natural, but the latter is the least common. Hence, observes Mr Bowman, who has specially investigated the minute structure of voluntary muscle, 'it is as proper to say that the fibre is a pile of discs as that it is a bundle of fibrillæ; but, in fact, it is neither the one nor the other, but a mass in whose structure there is an

intimation of the existence of both, and a tendency to cleave in the two directions. If there were a general disintegration along all the lines in both

Fig. 2.—A Fasciculus, similarly magnified, shewing transverse cleavage:  
The longitudinal lines are scarcely visible:  
a and b, discs nearly detached; b', a detached disc, more highly magnified, shewing the sarcoeus elements.

directions, there would result a series of particles, which may be termed *primitive particles* or *sarcous elements*, the union of which constitutes the mass of the fibre. These elementary particles are arranged and united together in the two directions, and the resulting discs, as well as fibrilla, are equal to one another in size, and contain an equal number of particles. The same particles compose both. To detach an entire fibrilla is to abstract a particle of every disc, and *vice versa*. The fibres are supplied

Fig. 2 (bis).—Attachment of Tendon to Muscular Fibre in the Skate.

with vessels and nerves which lie in the intervals between them, and are attached by their extremities through the medium of tendon or aponeurosis to the parts which they are intended to move. Aggregated in parallel series, of greater or lesser size, and

Magnified 70 diameters.

A, from the frog; B, from the dog; a, a, sections of the injected capillaries, shewing the position they occupy among the fibres; a', a capillary seen longitudinally; b, b, section of elementary fibres, shewing their angular form and various size. These figures shew that the vascularity is greatest when the elementary fibres are smallest.

birds where it is most evanescent. Their average width in man is about  $\frac{1}{100}$ th of an inch, being about  $\frac{1}{50}$ th of an inch in the male and  $\frac{1}{100}$ th

of an inch in the female. The average distance between the striæ, or the size of the sarcous elements, in the human subject is  $\frac{1}{100}$ th of an inch, the extremes being  $\frac{1}{150}$ th and  $\frac{1}{75}$ th of an inch, according to the contraction or relaxation of the fibre. The form of the fibres is polygonal, their sides being flattened against those of the adjoining fibres. Each fibre is enclosed in a transparent, very delicate, but tough and elastic tubular sheath, which cannot always be readily seen, but is distinctly shewn stretching between the separated fragments of a fibre which has been broken within it, for its

Fig. 4.—Muscular Fibre broken across:  
Shewing the unbroken sarcolemma uniting the fragments.

toughness will often resist a force before which its brittle contents give way. This tubular sheath is known as the *sarcolemma* or *myolemma*—the former term being derived from the Greek words *sarx*, flesh, and *temna*, a skin or husk; and the latter, from the Greek words *mûs*, a muscle, and *lemma*.

It was for a long time believed that the contraction of a muscle was associated with a change in the direction of each fibre from a straight line to a sinuous or zigzag course. The investigations of Mr Bowman have, however, shewn that this view is erroneous. He has proved that in a state of contraction there is an approximation of the transverse striæ, and a general shortening with a simultaneous thickening of the fibre, but that it is never

Fig. 5.—Fragment of an Elementary Fibre (from the Eel) partially contracted in water:  
Magnified 300 diameters.

a, uncontracted part; b, contracted part, along the border of which the sarcolemma is raised from the surface by the water that has been absorbed, that has thereby caused the contraction, and by it has been expelled from the contractile mass.

thrown out of the straight line, except when it has ceased to contract, and its extremities are acted on by the contraction of adjacent fibres.

Muscles grow by an increase, not of the number, but of the bulk of their elementary fibres; and Mr Bowman believes 'that the number of fibres remains through life as it was in the fœtus, and that the spare or muscular build of the individual is determined by the mould in which his body was originally cast.'

The structure of the *involuntary* or *unstriped* muscles must now be considered. This form of muscular tissue most commonly occurs in the shape of flattened bands of considerable length, but of a width not exceeding  $\frac{1}{50}$ th or  $\frac{1}{100}$ th of an inch. These bands are translucent, and sometimes slightly granular, and are usually marked at intervals by elongated nuclei, which become much more apparent on the addition of acetic acid. Kölliker has shewn that every one of these bands or fibres is either a single elongated cell (a fibre-cell) or is a fasciculus of such cells. (They are represented in fig. 2, d, in the

article *CELLS*, under the title of *Contractile fibre cells*.) These fibres have not usually fixed points of attachment like the striated fibres, but form continuous

Fig. 6.—Fibres of Unstriated Muscle:

*a*, in their natural state; *b*, when treated with acetic acid, which reveals the existence of corpuscles; *c*, corpuscles or nuclei detached. This and the preceding diagrams are copied from Bowman.

investments around cavities within the body—such as the intestinal canal, the bladder, the uterus, the blood-vessels, &c.—or are dispersed through the substance of tissues, such as the skin, to which they impart a contractile property.

The chemical composition of ordinary (or voluntary) muscle is described in the article *FLESH*. It is only necessary to add that the fibrillæ, or the sarcois elements of which they are composed, consist of a substance termed *SYNTRONINE* (q. v.), which closely resembles the fibrinæ or coagulating constituent of the blood; and that the same syntonine is also the main constituent of the unstriated muscles, or at all events of their fibre-cells. Like the blood-fibrine, it exists in a fluid form in the living tissue, and only coagulates or solidifies after death.

Our limited space prevents even an allusion to the arrangement and distribution of blood-vessels, nerves, and areolar-tissue in muscular structures; and we therefore pass on to the consideration of the muscles and their functions.

Muscles vary extremely in their form. In the limbs they are usually of considerable length, surrounding the bones and forming an important protection to the joints; while in the trunk, they are flattened and broad, and contribute very essentially to form the walls of the cavities which they enclose. There is unfortunately no definite rule regarding the nomenclature of muscles. Muscles derive their names (1) from their situation—as the temporal, pectorals, glutæals, &c.; or (2) from their direction—as the rectus, obliquus, &c., of which there may be several pairs—as, for example, rectus femoris, rectus abdominalis, rectus capitis, &c.; or (3) from their uses—as the masseter, the various flexors, extensors; or (4) from their shape—as the deltoid, trapezius, rhomboid, &c.; or (5) from the number of their divisions—as the biceps and triceps; or (6) from their points of attachment—as the sterno-cleido-mastoid, the genio-hyo-glossus, the sterno-thyroid, &c. In the description of a muscle, we express its points of attachment by the words *origin* and *insertion*; the former being applied to the more fixed point or that towards which the motion is directed, while the latter is applied to the more movable point. The

application of these terms is, however, in many cases arbitrary, as many muscles pull equally towards both attachments. Muscles opposed in action are termed *antagonists*, this antagonism being in most cases required by the necessity that exists for an active moving power in opposite directions. Thus, by one set of muscles, the *flexors*, the limbs are bent; while by a contrary set, the *extensors*, they are straightened. One set, termed the muscles of mastication, closes the jaws, while another set opens them; and probably every muscle in the body has its antagonists in one or more other muscles.

The skeleton, which may be termed the locomotive framework, may be regarded as a series of levers, of which the fulcrum is, for the most part, in a joint—viz., at one extremity of a bone—the resistance (or weight) at the further end, and the force (or muscle) in the intermediate portion. In most cases, in order to preserve the necessary form of the body, muscles are applied at a great mechanical disadvantage as regards the exercise of their power; that is to say, a much larger force is employed than would suffice, if differently applied, to overcome the resistance. The two main sources of this disadvantage lie in the obliquity of the insertion, and consequently of the action of most muscles, and in the muscles being usually inserted very near the fulcrum. The first of these disadvantages is in many cases diminished by the enlargements of the bones at the joints. (See fig. 7, A.) The tendons (*t*) of the muscles (*m*) situated above the joint are usually inserted immediately below the bony enlargement, and thus reach the bone that is to be moved (*o*) in a

Fig. 7.

direction somewhat approaching the perpendicular. If this enlargement did not exist (as in fig. 7, B), the contraction of the muscle, instead of causing the lower bone to turn upon the upper one with comparatively little loss of power, would do little more than cause the two ends of the bones to press upon each other. The second mechanical disadvantage is compensated for by gain in the extent and velocity of movement, and by the avoidance of the great inconvenience of having the muscles extended in straight lines between the ends of jointed continuous levers. Thus the bones of the forearm (*b, c*) are bent upon the bone of the arm (*a*) by the biceps muscle (*d*),

Fig. 8.

which arises close to the head of the latter, and is inserted at *e*, at a short distance from the elbow-joint, which acts as the fulcrum of the lever *c*. By this arrangement, a contraction of a single inch in the muscle moves the hand (*f*), in the same time, through the extent of about 12 inches, but then the hand moves through every inch with only about

the twelfth part of the power exerted by the muscle. By the junction of two or more levers in one direction, as in the different segments of the extremities, the extent and velocity of their united actions are communicated to the extreme one. Thus a blow of the fist may be made to include the force of all the muscles engaged in extending the shoulder, elbow, and wrist.

The great and characteristic property of muscular tissue—that of shortening itself in a particular direction when stimulated—is called *contractility*. The stimulus may be direct irritation by mechanical means, or by galvanism, or by some chemical substance, but in the living body the muscular fibres are, in most cases, made to contract by the immediate influence of the nerves distributed among them, which are consequently termed *motor nerves* (see NERVOUS SYSTEM), and are under the influence of the will. By an exertion of volition, we can contract more or fewer muscles at once, and to any degree, within certain limits; and as a matter of fact, there is hardly any ordinary movement performed in which several muscles are not called in play. But every voluntary muscle is also subject to other influences more powerful in their operation than the will. The movement of the features under the impulses of passion and emotion are more or less involuntary, as is shewn by the very partial power the will has of restraining them, and the extreme difficulty of imitating them.

Many movements ensue involuntarily when certain impressions, which need not necessarily be attended with consciousness, are made on the surface of the body, or on any part of its interior, either by external or internal causes. Such movements are termed *reflex*, and are noticed in the article NERVOUS SYSTEM.

Our limited space precludes us from noticing the individual groups of muscles occurring in the human body. Several important groups are, however, noticed in the articles ARM, EYE, FOOT, HAND, LEG, &c.

MUSES, in the Classic Mythology, divinities originally included amongst the Nymphs, but afterwards regarded as quite distinct from them. To them was ascribed the power of inspiring song, and poets and musicians were therefore regarded as their pupils and favourites. They were first honoured amongst the Thracians, and as Pieria around Olympus was the original seat of that people, it came to be considered as the native country of the Muses, who were therefore called *Pierides*. In the earliest period their number was three, though Homer sometimes speaks of a single muse, and once, at least, alludes to nine. This last is the number given by Hesiod in his *Theogony*, who also mentions their names—Clio (q. v.), Euterpe (q. v.), Thaleia (q. v.), Melpomene (q. v.), Terpsichore (q. v.), Erato, Polyhymnia (q. v.), Urania (q. v.), and Calliope (q. v.). Their origin is differently given, but the most widely-spread account represented them as the daughters of Zeus and Mnemosyne. Homer speaks of them as the goddesses of song, and as dwelling on the summit of Olympus. They are also often represented as the companions of Apollo, and as singing while he played upon the lyre at the banquets of the Immortals. Various legends ascribed to them victories in musical competitions, particularly over the Sirens (q. v.). In the later classic times, particular provinces were assigned to them in connection with different departments of literature, science, and the fine arts; but the invocations addressed to them appear to have been, as in the case of modern writers, merely formal imitations of the early poets. Their worship amongst the Romans was a mere imitation of the Greeks, and never became truly national or popular. Among the places sacred to

them were the wells of Aganippe and Hippocrene on Mount Helicon, and the Castalian spring on Mount Parnassus.

MUSEUM (Gr. *mousetion*), originally the name given by the ancients to a temple of the Muses, and afterwards to a building devoted to science, learning, and the fine arts. The first museum of this kind was the celebrated Alexandrian Museum (see ACADEMY). After the revival of learning in Europe, the term museum was sometimes applied to the apartment in which any kind of philosophical apparatus was kept and used; but it has long been almost exclusively appropriated to collections of the monuments of antiquity and of other things interesting to the scholar and man of science. In this sense it began to be first used in Italy, and probably in the case of the famous Florentine Museum, founded by Cosmo de Medici, which soon became a great and most valuable collection of antiquities. Nothing analogous to the museums of modern times existed amongst the ancients, the greatest collections of statues and paintings which were made in the houses of wealthy Romans having been intended for splendour rather than for the promotion of art. The name soon ceased to be limited to collections of antiquities, and sculptures, and paintings; collections illustrative of natural history and other sciences now form a chief part of the treasures of many of the greatest museums, and there are museums devoted to particular branches of science. Of the museums of Britain, the British Museum (q. v.) is the greatest; that of Oxford, founded in 1679, is the oldest.—The museum of the Vatican, in Rome, contains immense treasures in sculptures and paintings, and also in books and manuscripts.—The museum of the Louvre in Paris, that of St Petersburg, and those of Dresden, Vienna, Munich, and Berlin, are amongst the greatest in the world. The usefulness of a museum depends not merely upon the amount of its treasures, but, perhaps, even in a greater degree upon their proper arrangement; and whilst great collections in the chief capitals of the world are of incalculable importance to science, its interests are also likely to be much promoted by those local museums, still unhappily not numerous, which are devoted to the illustration of all that belongs to particular and limited districts. Museums appropriated to the illustration of the industrial arts—their raw material, their machines, and their products—and of everything economically valuable, are of recent origin, but their importance is unquestionably very great. Pre-eminent among institutions of this kind in Britain are the South Kensington Museum and the Industrial Museum in Edinburgh.

MUSHROOM, or AGARIC (*Agaricus*), a genus of fungi, of the suborder *Hymenomyces*, having a *hymenium* of unequal plates or gills on the lower side of the *pileus*. The species are very numerous. Many of them are poisonous, many are edible, and some are among the most esteemed fungi. The species most esteemed in Britain is the COMMON M. (*A. campestris*), a native also of most of the temperate regions both of the northern and of the southern hemisphere, and of which a very large and fine variety occurs in Eastern Australia. It is found during summer and autumn (but chiefly in autumn) in pastures, orchards, vineyards, &c. Its *pileus* is regularly convex, becoming almost flat when old; fleshy, dry, white with a tinge of yellow or brown; of a silky smoothness on the upper surface, or somewhat scaly, but never warty; thickly set on the under side with very unequal gills, which in a young state are pink, and afterwards become dark brown. The *pileus* is attached by its centre

to the top of the stem. The stem is of a firm fleshy texture, and towards the top is surrounded by a more or less distinct white membranous ring, the remains of the curtain or veil (*indusium*), which in a young state extends to the pileus, and covers the gills. This *M.* is gathered for the table when young, being preferred when the veil is still unbroken, and the unexpanded pileus has the form of a ball or button; but both in this state, and afterwards, whilst it shews no symptoms of decay, it is used for making Ketchup (q. v.). It has a very pleasant smell and taste, and the flesh, when bruised, assumes a reddish-brown colour.—Very similar to it, and often sold instead of it in London and elsewhere, but rejected by all skilful housekeepers as unfit even for making ketchup, is the ST GEORGE'S AGARIC (*A. Georgii*), sometimes called *whitecaps*, frequent in moist pastures and near buildings in all parts of Britain. This species is easily distinguished by its larger size—the pileus being sometimes 18 inches broad—its coarser appearance, its rather disagreeable smell, the yellow colour which its flesh assumes when bruised, and the lighter colour of its gills.—Care must be taken not to confound the Common *M.* with the white variety of *Agaricus phalloides*, a species not uncommon in Britain, chiefly in woods and on the borders of woods, which is very poisonous. Perhaps it is the possibility of this mistake which has led to the prohibition of the Common *M.* in Rome, where many kinds of esculent fungi are brought in great abundance to the market, and

This *M.* is used for ketchup, and is also dried and powdered for use at table as a savoury addition to sauces and stews. It is constantly brought to market in England. It is liable, however, to be

Fig. 2.

where a special officer superintends the sale of them. *A. phalloides* is, however, easily distinguished by the ring at the bottom of the stem, the white colour of the gills, the warts on the upper surface of the pileus, and the powerful smell, which becomes extremely disagreeable as the *M.* grows old.—Another species of *M.* much in use for the table is the FAIRY-RING *M.* (*A. oreades*), sometimes called *Scotch Bonnets*—the *Champignon* of the French. It is common in pastures in Britain and most parts of Europe, often forming Fairy Rings (q. v.). It is much smaller than the Common *M.*, the pileus being seldom more than an inch broad, the stem taller in proportion. The stem is solid, fibrous, and tough, with no ring; the pileus smooth, fleshy, tough, convex, with a more or less distinct boss (*umbo*) in the centre, of a watery-brown colour; the flesh white. The odour is strong, but agreeable.

confounded with several poisonous species; but only one of them, *A. dealbatus*, forms fairy rings, and this may be readily distinguished by its disagreeable odour, by its becoming grayish-brown in zones when soaked in water, by the margin of the pileus being at first rolled inwards, and by its very fine dingy whitish gills.—The other edible species of *M.* or agaric are numerous, but they are chiefly used on the continent of Europe, and scarcely at all in Britain, although some of them are common British plants.—The ORANGE-MILKED AGARIC (*A. deliciosus*), which grows chiefly in fir-woods and among junipers, has a viscid pileus, four inches or more broad, at first orange, afterwards pale, the gills and juice orange, the gills running down the stem, the smell and taste agreeable.—The MOUSSERON (*A. prunulus*) is common in woods and pastures, particularly on sandy soils. It has a pileus about 2—4 inches broad, convex, yellowish-white when young, the gills at first white, and afterwards flesh-coloured. The odour is agreeable. It is much esteemed on the continent as an article of food.—The PARASOL AGARIC (*A. procerus*) is found in pastures, especially under trees. It loves sandy soils. It is remarkable for its long stem, 8—12 inches high, with a thick spongy ring. The pileus is 3—7 inches broad, at first obtusely conic, then bell-shaped, covered with brown scales. The taste and smell are pleasant.—The WHITE FIELD AGARIC (*A. virgineus*) is one of the most common of British species, growing in pastures, with viscid or satiny white or whitish convex pileus, fully an inch broad, stem nearly two inches long, and light chocolate-coloured distant gills, which run down the stem. It grows either singly or in groups.—The ANISE *M.*, or SWEET-SCENTED AGARIC (*A. odorus*), grows in shady woods and dells among moss and decaying leaves. It has a slightly convex pileus, about three inches broad, with pale gills. The odour is like that of anise.—The IVORY *M.* (*A. chryneus*) is found in woods, with pileus 2—3 inches broad, of a grayish-yellow colour, broad gills, and a rather long and somewhat scaly

stem.—The **SMOXY M.** (*A. fumosus*), with pileus smoke-gray above, the gills and stalk yellowish, is common in fir-woods.—All these are edible, and more or less pleasant and nutritious. Finer than most of them is the **IMPERIAL M.** (*A. cesarius*), the *Kaiserling* of the Germans, a species found in loamy soils in some parts of Europe, with orange pileus and lighter yellow stem and gills; but, unhappily, it is apt to be confounded with the very poisonous *Amanita* (q. v.) *muscaria*.

The **COMMON M.** is frequently cultivated both in the open garden and in houses or sheds. To grow it in the open garden, beds are prepared, generally of earth mixed with horse-dung, partly fresh and partly from old hotbeds, and are raised into ridges almost as high as broad. To grow it in houses, boxes are filled with alternate layers of half-rotten horse-dung and of straw, with a surface layer of fine mould. But of each of these methods there are many different modifications, none of which can here be detailed. In both, the production of mushrooms is sometimes left to the chance—often almost a certainty—of spawn (*mycelium*) or spores existing in the dung or earth; sometimes, to increase the probability of a speedy and abundant crop, earth is introduced into the bed or box from a pasture known to be rich in mushrooms, and *M.* spawn is also frequently planted, which is either collected where mushrooms grow, or produced by artificial means, often appearing and being propagated extensively without the development of the *M.* itself. The almost certain production of *M.* spawn in heaps of slightly-fermenting horse-dung, straw, and earth, has been often urged as an argument in favour of the equivocal generation of fungi, but the minuteness and multitude of the spores may more reasonably be urged on the opposite side.

**MUSIC** (Gr. *mousike*, from *mousa*, muse; Lat. *musica*), a combination or succession of sounds having the property of *pitch*, so arranged as to please the ear. The pleasure derived from music arises from its exciting agreeable sensations, and raising pleasing mental images and emotions. Apart from words, it expresses passion and sentiment, and linked to words, it loses its vagueness, and becomes a beautiful illustration of language.

The doctrine of musical sounds is based on the principles of Acoustics (q. v.). Sound is conveyed through elastic media by waves, not of alternate elevation and depression, but of alternate condensation and rarefaction, in which it is the form, the condition of the groups of particles that progresses, not each individual particle. When a series of vibrations recur on the ear at precisely equal intervals of time, following each other so closely that each cannot be separately distinguished, the result is a musical sound or note. The sound ceases to have a musical character when each pulsation is individually audible, as is the case when there are fewer than about sixteen beats in a second. The gravity or sharpness of the sound is called its *pitch*, and depends on the number of vibrations in a given time. A succession or progression of musical sounds following each other constitutes melody; the difference in pitch between any two of them is called an interval. Where two or more musical sounds, whose relative pitch is properly proportioned, are heard simultaneously, the result is a chord, and a succession of chords constitutes harmony.

When a vibration is communicated to a string stretched between two points, the result is a musical note, whose pitch is dependent on the length of the string and the degree of tension applied to it: the shorter the string, and the greater the tension, the higher is the pitch. If the string be divided in

the middle, the tension remaining the same, the note produced is twice as high in pitch, and is called the octave to the note produced by the whole string. Every vibration of the one corresponds to two of the other, and there is between a note and its octave a far closer relation than between any two other notes; they go together almost as one sound, and are considered to a great extent as one musical sound. In the diatonic scale, familiar to every correct ear, there are six notes, bearing certain harmonic relations to the fundamental note, interposed between it and its octave; and as we ascend, the notes arrange themselves in similar successions of sevens, each set an octave higher, or double the pitch of that which preceded it. The seven notes are designated by the names of the first seven letters of the alphabet, the same letter being used for any note and its octave. For another notation also in use, see **SOLMIZATION**. Taking C for the fundamental note, we have for our scale

Ć D E F G A B Ć D E F G A B Ć, &c.

The scale may be extended up or down indefinitely, so long as the sounds obtained continue to be musical. The satisfaction and sense of completeness which the diatonic scale gives the ear, arise from its being founded on correct harmonic principles. The quality called harmony is produced by a coincidence of vibrations: notes are more harmonious the oftener their waves coincide. Besides the octave, two of whose waves coincide with one of the fundamental, there are other intervals harmonious, though in a less degree. Dividing our string into three parts instead of two, we have a note higher than the octave, which may be lowered by an octave by making the string two-thirds of the original length, and produces a wave of which three coincide with two of the fundamental. Next to the octave, this note stands in the most intimate relation to the fundamental; it is called the dominant. Dividing the string by five, and lowering the note two octaves, another harmonic is got, called the mediant. In contradistinction from both these, the fundamental note (or any of its octaves) is called the tonic or key-note. C being taken as the key-note, E is the mediant, and G the dominant. These three notes, when struck simultaneously, form the harmonic triad, and stand to each other in the relation of 1,  $\frac{2}{3}$ ,  $\frac{3}{2}$  (numbers indicating the number of vibrations, which are inversely as the length of the string), or, reducing fractions to integers, in the relation of 4, 5, 6. When a musical string is vibrating, these sounds are heard on close observation more or less distinctly vibrating along with it, the cause being a spontaneous division of the string into aliquot parts, producing subordinate vibrations simultaneously with the principal vibrations. But the dominant may in its turn be the tonic from which another triad of tonic, mediant, and dominant is taken, forming a scale of triads extending indefinitely up and down, and it is from three such adjacent triads that the diatonic scale originates. Its elements are the triad of the tonic united with the triads which stand in the most intimate relation to it—viz., those immediately above and below it—

F A C, C E G, G B D.

F is the note whose dominant is C (the tonic), and therefore, in respect of C, it is called the subdominant. A is the mediant of the subdominant F, and therefore called the submediant. D is the dominant of the dominant, and is called the super-tonic. B, the mediant of the dominant, is called the leading note. We have seen that the notes of each triad stand to each other in the relation of 4, 5, 6.

Preserving this proportion, and multiplying to avoid fractions, we have

F A C E G B D  
as 16, 20, 24, 30, 36, 45, 54

We must multiply F and A by 2, and divide D by 2, to bring them within the compass of an octave, and then we have

C D E F G A B C  
as 24, 27, 30, 32, 36, 40, 45, 48

These are the degrees of the Diatonic Scale, which are indicated by the white keys of the pianoforte, as in the figure in the following column.

The interval CD is commonly called a second; CE, a third; CF, a fourth; CG, a fifth; CA, a sixth; and CB, a seventh; CC being, as already seen, an eighth or octave—names corresponding to the position of the notes on the key-board or in the diatonic scale, but having no relation to the proper proportional numbers already given. The intervals of the third, fifth, and sixth (counting from the key-note), owing to the more intimate harmonic relation of the notes between which they lie, afford more satisfaction to the ear than the others, or are, as it is called, the most perfectly consonant intervals. Intervals may be counted from any note as well as the tonic. DF is called a third as well as CE, although these intervals are unequal. We may have intervals beyond the octave; they are, however, substantially but repetitions of those below, CD, a ninth, being also a second, and so on.

It is often desirable in the course of a musical composition to change the key-note, which involves the formation of a diatonic scale on some other note than C, in which case we are said to modulate from one key into another. As the intervals CD, DE, EF, &c., are by no means all equal, the notes which we have already got will not do for a scale founded on any other tonic than C. The ratios of the intervals in the diatonic scale, expressed in numbers by logarithms, are:

|    |    |    |    |    |    |    |   |
|----|----|----|----|----|----|----|---|
| C  | D  | E  | F  | G  | A  | B  | C |
| 51 | 46 | 28 | 51 | 46 | 51 | 28 |   |

At first sight it would appear that in keyed instruments there must be a separate row of keys for each tonic, but practically this is found not to be necessary. If D instead of C be taken as key-note, E, G, and A are some approach to the correct second, fourth, and fifth, but F and C are greatly too low in pitch for a proper third and seventh. With some notes taken as key-note, the correspondence is greater, with others it is less. The difficulty is overcome by a system of compromises called

Temperament (q. v.). Roughly speaking, we have in the diatonic scale an alternation of two long intervals, a short interval, three long intervals and a short interval. The long intervals 51 and 46 are styled tones, and the short interval 28 a semitone. Were the tones all equal, and the semitone exactly half a tone, a note interposed in the middle of each tone, dividing the seven intervals into twelve, would make it immaterial where the scale began. A system founded on this supposition is the remedy actually adopted in most keyed instruments, and the inaccuracy produced by this compromise is not sufficiently great to offend

the ear. The interposed notes, indicated by the black keys of the pianoforte (see fig.), complete what is called the chromatic scale, consisting of twelve intervals approximately equal.

The notes of music are represented in ordinary notation on a series of five parallel lines, called the staff. On these lines, and in the four spaces between them, marks are placed indicating the notes, which are counted upwards, beginning with the lowest line. Every line or space is called a degree, the staff consisting of nine degrees.

When more than nine notes are required, the spaces below and above the staff are used, and the scale is extended by means of short added lines, called leger lines. The pitch of the notes on the scale is determined by a figure called a clef (*claris*, a key), placed at the beginning of the staff on a particular note, from which all the others are counted. The clefs most in use are the bass, tenor, and treble clefs, represented on the notes F, C, and G respectively (see CLEF). The treble and bass clefs only are used in music for keyed instruments, and when a staff is required for each hand, they are joined together by a brace, the upper staff for the right hand, the lower for the left. The ascending scale in these clefs is as follows:

C D E F G A B C D E F G A B C

Treble.

Bass.

C D E F G A B C D E F G A B C

These notes correspond with the white keys of the pianoforte or the diatonic scale when C is key-note, no allowance being made for the black keys, which, as we have seen, divide the tones into semitones. Those semitones which do not occur with C as key-note are represented by the signs  $\sharp$  (sharp) and  $\flat$  (flat). The sign  $\natural$  prefixed to a note,

elevates it a semitone in the scale, raising, for example, F to F sharp.  $\flat$  lowers the note by a semitone, depressing B to B flat. When a note which has been elevated by a sharp, or depressed by a flat, is to be restored to its original place, the character  $\natural$  (natural) is prefixed to it.

The names of the intervals correspond to the

MUSIC.

degrees of the staff, but it has been seen that intervals of the same name are not necessarily equal. If the sign of a flat or a sharp be prefixed to either note of an interval, it still preserves its name of a third, a fifth, &c.; but to distinguish intervals of the same degree, the qualifying epithets of major and minor, augmented and diminished, are used.

The different keys in music are best understood by reverting to the scale of triads, on which the diatonic scale is founded. Taking a series of triads, of which the dominant of each is the key-note of the next, we obtain the following scale, extended both upwards and downwards from C:

Each triad is composed of the key-note, its mediant, and dominant, and the scale of each key is composed of the triad of the key-note, with the triad immediately preceding and that immediately following it. Each key is succeeded by the key of its dominant, and if we begin with the key of C (in the middle of the scale), each key acquires an additional sharp till we reach the key of F# with six sharps. These are the sharp keys. If, beginning again with the key of C, we go back instead of forward in the scale of triads, we obtain the flat keys; each key has an additional flat to that above it, till we come down to the key of Gb with six flats. This key in instruments with temperament is exactly the same with

that of F# and on this account it is not generally found convenient to extend the keys beyond six, or at most seven, sharps or flats. G# with seven sharps is the same as Db with five flats, and Cb with seven flats is the same as B with five sharps. In music written in these keys, double sharps and double flats occur, which are indicated by the characters x and bb respectively. In writing music in any key with sharps or flats, it is usual, instead of prefixing the sharp or flat to each note when required, to place the sharps and flats belonging to the key together after the clef, on the degree to which they belong, and such collections of sharps or flats are called the signature.

SIGNATURES OF THE SHARP KEYS.

SIGNATURES OF THE FLAT KEYS.

A sharp or flat introduced in a composition which does not appear in the signature, is prefixed to the note, and called an accidental.

The diatonic scale and keys above described belong to what is called the major mode; there is also another mode in use called the minor mode. In the minor, as in the major mode, the diatonic scale and the keys are based on the scale of triads. Each of the triads already considered consists of two unequal intervals, called a major third and minor third. Supposing we begin with the minor instead of the major third, we have a succession of chords taking their minor third from one triad and their major third from another. These compound chords are called minor triads. Their proportion is as 10, 12, 15, and out of three such consecutive minor triads the scale of the minor mode is constructed.

D F A C E G B  
80, 96, 120, 144, 180, 216, 270

Multiplying D and F by 2, and dividing B by 2, to bring the whole within the compass of an octave, we have:

A B C D E F G A  
120, 135, 144, 160, 180, 192, 216, 240.

The scale here represented is what is known as the descending scale of the minor mode. When the seventh of the scale ascends to the eighth, it becomes sharp, as the proper leading note or sharp seventh to the tonic. This sharp is, however, always omitted from the signature, and placed accidentally before the seventh which it is to elevate. In order to avoid the harsh interval of the augmented second (from F to G#), it is usual in

MUSIC.

the ascending scale to make the sixth sharp also, in order to accommodate the seventh; thus the

ascending or accidental scale of the minor mode has two notes altered from the signature.

ASCENDING SCALE.

DESCENDING SCALE.

Each minor scale is called the relative minor to the major scale on its right hand in the scale of triads, with which it has the same signature: thus the relative minor scale to C major is that of A minor.

Each minor scale is also called the tonic minor to the major scale on the same key-note, from which it differs in flattening the third of its tonic, and in the descending scale also the third of its subdominant and dominant. The tonic minor scale to C major is C minor.

C major      F̣ A C̣ E G B Ḍ  
A minor     Ḍ F̣ Ạ C̣ E G Ḅ

C MAJOR.

C MINOR.

As the descending scale regulates the signature, each tonic minor has three flats more, or three

sharps less in its signature than its tonic major.

F MAJOR.

F MINOR.

A MAJOR.

A MINOR.

G MAJOR.

G MINOR.

In this last example, F<sup>##</sup>, B<sup>##</sup>, and E<sup>##</sup> are all considered sharps in contrast with F<sup>♯</sup>, B<sup>♯</sup>, and E<sup>♯</sup> of the minor scale.

*Rhythm.*—In musical notation, the relative duration of notes is indicated by their form. Notes may be open or close; they may consist of a head only, or of a head and stem. Where there is a stem, it may be turned up or down, according to convenience. The semibreve, the longest note in ordinary music, is open, and consists of a head only (S). The minim is an open note with a stem, half the length of a semibreve ; the crotchet is a close note with a stem, half the length of a minim ; the quaver is a close note with a stem and hook, half the length of a crotchet ; a quaver is further divided into two semiquavers with two hooks ; four demi-semiquavers with three hooks ; and

eight semi-demi-semiquavers with four hooks . In slow religious music, an open square note, called a breve , sometimes occurs. The semibreve is

equivalent in time to two minims, four crotchets, eight quavers, sixteen semiquavers, thirty-two demi-semiquavers, and sixty-four semi-demi-semiquavers. The notes formed with hooks may be grouped

together . In vocal

music this is not done except when a group is to be sung to one syllable. When a dot is placed after a note it is lengthened by one-half; when two dots, it is lengthened by three-fourths.

Every piece of music is divided into portions equal in time, called measures, which are separated from each other by vertical lines called bars. The term bar is often loosely used to denote the measure as well as the line. The exact length of the measure is indicated by a sign at the beginning of the movement. In common

time, indicated by the sign each measure includes a semibreve, or its equivalent made up in

slowness, quickness, and the character of execution. The most important of them are explained under separate articles—as are the various musical graces or embellishments known under the names of the *Appoggiatura*, *Beat*, *Shake*, and *Turn*. Among abbreviations in frequent use are a line drawn over or under a semibreve, or through the stem of a minim or crotchet, to divide it into quavers; or a double line, to divide it into semiquavers. Two minims may be connected to indicate their repetition as quavers. Thus—

Every key contains within itself two other triads besides that of the key-note—viz., those of the subdominant and dominant, which have the subdominant and dominant of the key-note respectively for their fundamental basses; and the feeling of satisfaction produced by the diatonic scale arises out of the fact, that its notes belong to a progression of chords formed on a fundamental bass suggested by the ear. This fundamental bass is here indicated on the lower staff—

The relative position of the notes of a chord, and consequently its intervals, may be altered by raising one or more of them an octave; and, on the whole, the nearer the intervals approach to their position in the harmonic scale, the purer is the harmony. Close, in contradistinction to dispersed harmony, is when the notes of a chord are so near that no component note could be placed between them. When the fundamental bass of a chord ceases to be its lowest note, the chord is said

**Harmony.**—We have mentioned that when a string is struck, its harmonics are more or less distinctly heard along with it. This arises from the string spontaneously dividing itself into aliquot parts—as one-half, one-third, one-fourth, one-fifth, one-sixth, one-seventh, &c., of the string. The numbers 2, 3, 4, 5, 6, 7, expressing the relative number of vibrations in a given time, are a measure of the pitch of the note, and placed proportionally to one another, or in the form of a fraction, they are a measure of the interval. The prime numbers 2, 3, 5, and 7, and their compounds, constitute the harmonics of a musical sound; no division by a higher prime number is tolerable to the ear along with the fundamental note, and no sound corresponding to such division is audible in the vibrations of a string—

The degrees of the harmonic scale consist of intervals decreasing in a geometrical ratio from the octave to the minor tone, viz.—

- |                    |                     |
|--------------------|---------------------|
| 1 : 2 Octave.      | 6 : 7 Grave third.  |
| 2 : 3 Fifth.       | 7 : 8 Tone maximus. |
| 3 : 4 Fourth.      | 8 : 9 Tone major.   |
| 4 : 5 Major third. | 9 : 10 Tone minor.  |
| 5 : 6 Minor third. |                     |

Other intervals more or less consonant are to be found in the harmonic scale, of which the most important is 4 : 7, the grave seventh. From this scale is derived the triad, which we have seen to be the foundation of the diatonic scale, and also the whole theory of chords.

The first five notes of the harmonic scale are the component parts of the major common chord, by far the most consonant chord that can be produced by five notes. Neglecting octaves, its essential notes are the major triad, C E G, or 4, 5, 6, which, as already seen, consists of a fifth divided harmonically into major third and minor third. The root on which a chord is formed, or the note by whose division into aliquot parts the notes of the chord are produced, is called its fundamental bass, and the fundamental bass of the triad C E G is C. The common chord is the triad with the addition of the octave of the root; its proportions are 4, 5, 6, 8,

to be inverted. Thus  and  are inversions of the common chord, but not , where the fundamental bass is still the lowest note.

The minor triad is, as we have seen, a compound chord, whose ratio is 20, 24, 30, taking its minor third from the triad below, and its major third from the triad above. Its fundamental bass is the key-note. The minor mode has, like the major, three triads in each key—those of the tonic, subdominant, and dominant; and the minor common chord admits of the same inversions as the major, by making the third or fifth the lowest note.

The first seven notes of the harmonic scale contain the chord next in consonance to the common chord, the chord of the seventh or dominant harmony. Rejecting octaves, it is the harmonic triad with the addition of the grave seventh, 4, 5, 6, 7, C E G B $\flat$ , or G B D F, and admits of three inversions, according as the third, fifth, or seventh is taken instead of the root as the lowest note. This chord belongs to the key of which its fundamental note is the dominant; and in order to satisfy the ear, it requires to be followed by a resolution into the common chord of the key, or one of its inversions, the major third rising a semitone to the key-note, and the seventh descending one degree—

The dominant seventh note is flatter by an interval of 63, 64 than the subdominant of the key, though the two are not distinguishable on keyed instruments. The chord of the dominant seventh is the same in the tonic minor as in the major mode, but differs in its resolution, in respect that it descends a tone instead of a semitone

The dominant harmony

affords numerous means of modulating from one key to another. For example, the addition of a dominant seventh to the common chord of a key, effects a modulation into the key of the sub-

dominant In modulat-

ing into the key of the dominant, the supertonic bears the dominant harmony, and becomes domi-

nant of the new key For

other modulations, we must refer to works on the theory of music.

The following more complex harmonies are also in general use—

1, the chord of the added ninth, consisting of the dominant harmony (its root generally omitted) with the fifth of the adjacent triad above. 2, 3, and 4, the different forms of the added sixth, or chord of the subdominant. 2 is the triad of the subdominant, with the third of the adjacent triad below, or rather its octave; 3 is the triad of the subdominant, minor mode, with the third of the adjacent triad below; and 4, the same triad with the third of the tonic major to the adjacent triad below. 5, the diminished seventh, a compound of the characteristic notes (B F) of the dominant harmony of the major mode with those (G# D) of the relative minor. 6, 7, and 8, the augmented sixths, all dominant harmonies, resolving into the major tonic. 6, called the Italian sixth (F A D#), is a compound of the characteristic notes (A D#) of the dominant harmony of the minor mode (B D# F A) inverted, with the dominant seventh note (F) of the major triad (C E G) below for a bass; 7, the French sixth (F A B D#), the same as the last, with the addition of the octave to the fundamental bass; 8, the German sixth (F A C D#), compounded of the characteristic notes of the dominant harmony of the minor mode inverted, with the dominant sevenths of the major triads below and above.

All classical harmonies can be reduced to the chords enumerated, varied by inversions, omissions, suspensions, and pedal basses. A pedal bass or organ-point is a bass note sustained through a progression of chords, to only the first and last of which it is the proper bass. The pedal bass of the tonic is often used with the chord of the dominant seventh, the added ninth, and the diminished seventh, and occasionally with other chords: sometimes the pedal harmonies are taken on the dominant instead of the tonic, and the holding note sometimes occupies an upper part instead of the bass—

A musical composition consists of a succession of notes or of chords subject to certain laws. Like discourse, music has its phrases, periods, and punctuation. When a piece of music continues in the same key, it is said to move by progression, a term used in contradistinction to modulation, where the key is changed. Progression in music of two parts is of three kinds—oblique, when one part repeats or holds on the same note, while the other moves up and down; direct, where both parts move in the same way; and contrary, where one moves up, and the other down. Consecutive chords should in general be connected, either as having some note in common, or as being the chords of closely connected keys. There are certain chords which require a special resolution—i. e., they must be followed by certain other chords; and there are certain progressions which, from harshness, are in ordinary cases to be avoided, more particularly consecutive fifths, and consecutive octaves, the latter, however, being admissible when used merely to strengthen a part. Modulation is generally effected by introducing the chords common to both keys, and the secret of good modulation consists in the skilful choice of intermediate chords. Every regular piece of music is composed in a particular key, in which it begins and ends, and which predominates over all the other keys into which it has modulated. The keys into which a key most readily modulates, are those most nearly related to it—viz., the dominant, the subdominant, and the relative and tonic major or minor. We have seen how modulation may take place by introducing the dominant harmony of the new key or one of its inversions, and in this way the entire harmonic circle of the keys can be made, either by ascending or descending fifths; but in order to effect this change, it will be necessary, on reaching the key of C# with seven sharps, to substitute, by what is called an Enharmonic (q. v.) change, D with five flats, or vice versa, which on instruments with temperament produces no real change on the pitch, but merely on the names of the notes.

The arrangement of chords which the ear naturally expects at the close of a strain is called a cadence; it corresponds in music to the period which closes a sentence in discourse. It is perfect when the harmony of the dominant precedes the harmony of the key-note, and imperfect when the harmony of the key-note precedes that of the dominant without its seventh.

The imperfect cadence is the most usual termination of a musical phrase, or short succession of measures containing no perfect musical idea. A portion of melody formed of two regular phrases, and containing a perfect musical idea, is called a section, and its regular termination is the perfect cadence.

Music is produced by the human voice, and by a variety of artificial instruments. For the application of the voice to musical purposes, see SINGING. Musical instruments are classified as stringed instruments, wind instruments, and instruments of percussion. In some stringed instruments, as the pianoforte, the sounds are produced by striking the strings by keys; in others, as the harp and guitar, by drawing them from the position of rest. In a third class, including the violin, viola, violoncello, and double bass, the strings are put into vibration with a bow. In wind instruments, the sound is produced by the agitation of an enclosed column of air; some, as the flute, clarinet, oboe, bassoon, flageolet—instruments of wood, and the trumpet, horn, cornet-a-piston, &c., of metal, are played by the breath; in others, as the organ, harmonium, and concertina, the wind is produced by other means. In the two last-named instruments, the sound is produced by the action of wind on free vibrating springs or reeds. Instruments of percussion are such as the drum, kettle-drum, cymbals, &c. The chief peculiarities of the more important musical instruments are noticed in special articles.

Musical compositions are either for the voice, with or without instrumental accompaniment, or for instruments only. Of vocal music, the principal forms may be classed as church music, chamber music, dramatic music, and popular or national music. The first includes plain song, faux-bourdon, the chorale, the anthem, the sacred cantata, the mass and requiem of the Roman Catholic Church, and the oratorio. Vocal chamber music includes cantatas, madrigals, and their modern successors, glees, as also recitatives, arias, duets, trios, quartets, choruses, and generally all forms, accompanied or unaccompanied, which are chiefly intended for small circles. Dramatic music comprehends music united with scenic representation in a variety of ways, in the ballet, the melodrama, the vaudeville, and the opera, in which last, music supplies the place of spoken dialogue. Instrumental music may be composed for one or for more instruments. The rondo, the concerto, the sonata, and the fantasia generally belong to the former class; to the latter, symphonies and overtures for an orchestra, and instrumental chamber music, including duets, trios, quartets, and other compositions for several instruments, where each takes the lead in turn, the other parts being accompaniments. These and other forms of composition will be found noticed separately.

*History of Music.*—A certain sort of music seems to have existed in all countries and at all times. Even instrumental music is of a very early date: representations of musical instruments occur on the Egyptian obelisks and tombs. The music of the Hebrews is supposed to have had a defined rhythm and melody. The Greeks numbered music among the sciences, and studied the mathematical proportions of sounds. Their music, however, was but poetry sung, a sort of musical recitation or intoning, in which the melodic part was a mere accessory. The Romans borrowed their music from the Etruscans and Greeks, and had both stringed instruments and wind instruments.

The music of modern Europe is a new art, with

which nothing analogous seems to have existed among the nations of antiquity. The early music of the Christian Church was probably in part of Greek, and in part of Hebrew origin. The chorale was at first sung in octaves and unisons. St Ambrose and Gregory the Great directed their attention to its improvement, and under them some sort of harmony or counterpoint seems to have found its way into the service of the church. Further advances were made by Guido of Arezzo, to whom notation by lines and spaces is due, but the ecclesiastical music had still an uncertain tonality and an uncertain rhythm. Franco of Cologne, in the 13th c., first indicated the duration of notes by diversity of form. The invention of the organ, and its use in accompanying the chorale, had a large share in the development of harmony. Along with the music of the church, and independently of it, a secular music was making gradual advances, guided more by the ear than by science; it seems to have had a more decided rhythm, though not indicated as yet by bars. The airs which have become national in different countries were developments of it, but it had its chief seat in Belgic Gaul; and the reconciliation of musical science with musical art begun in Flanders by Josquin Deprès in the 15th c., was completed in the 17th c. by Palestrina and his school at Rome, and reacted eventually on the ecclesiastical style. The opera, which appeared nearly contemporaneously with the Reformation and revival of letters, greatly enlarged the domain of music. Italy advanced in melody, and Germany in harmony. Instrumental music occupied a more and more prominent place. Corelli's compositions exalted the violin. Lulli and Rameau, with their ballet-like music, seized the characteristics of French taste, till the German Glück drove them out of the field. The scientific and majestic fugue reached its highest perfection under J. S. Bach. The changes introduced in ecclesiastical music in England at the Restoration gave birth to the school of Purcell; and a little later, England adopted the German Handel, who was the precursor of Haydn, Mozart, Beethoven, Spohr, and Mendelssohn. A school has recently sprung up in Germany, of which Wagner is the chief exponent, whose aim is to create a new style of music; but a number of the works of this school of 'music of the future' are only remarkable for purposeless modulation, and want of coherence.

For further information, reference is made to Pepsusch's *Treatise on Harmony*, Dr Caleott's *Musical Grammar*, Sir John Hawkins's and Dr Burney's *History of Music*, Dr Marx's *Allgemeine Schule der Musik*, and Brown's *Elements of Musical Science*.

**MUSK, or MUSK DEER** (*Moschus moschatus*), a ruminant quadruped, the type of the family *Moschidae*. This family differs from *Cervidae* (Deer) in the want of horns, and in the long canines of the males, projecting beyond the lips. The M. is an inhabitant of the elevated mountainous regions and table-lands of Central Asia. The habits of the M. are very similar to those of the Chamois. Its favourite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued

MUSK DUCK—MUSK OX.

by hunters on account of its odoriferous secretion, which has been known in Europe since the 8th c., and is much valued as a perfume. This secretion, *musk*, is produced in a glandular pouch situated in the hinder part of the abdomen of the males; and its natural use seems to be that of increasing sexual attractiveness. The musk-bag is formed by an infolding of a portion of the skin of the belly, within which a number of membranes are contained, and between these membranes are glands by which the musk is secreted. When newly taken from the animal, musk is soft and almost resembles an ointment; it is reddish-brown, and has an excessively powerful odour. Very little of it reaches Europe unadulterated.—Musk is usually imported either in the form of *grain-musk*, that is, the musk which has been collected chiefly from stones upon which it has been deposited by the animal, in which state it is a coarse powder of a dark-brown colour; or in the *pod*, that is, in the musk-sac, which is cut altogether from the animal, and dried with the musk inside. Of both kinds the annual importations are about 15,000 ounces per annum, chiefly from China and India. Small quantities are used in medicine, but the greater portion is employed by the perfumers. It is imported in small boxes or caddies, often covered with bright-coloured silk, and each containing 25 pods. The kinds generally known in trade are the Tonquin or Chinese, which is worth two guineas an ounce in the pod, or £3, 10s. per ounce in grain; and the Cabardine, Kabardine, or Siberian, which is always imported in pod, and is very inferior, being only worth about 15s. an ounce.

The flesh of the M. is sometimes eaten, but has a very strong flavour. The season of migration from the highest and coldest to more temperate regions, is that at which the M. is chiefly pursued.—No other animal of the family *Moschidae* yields the perfume called musk, or has more than a rudimentary musk-bag. The other species of *Moschidae* belong to the genus *Traquillus*, and receive the popular name *Chevrotaïn*. They have a very elongated muzzle; and the accessory hoofs assume the form of appressed conical claws. They inhabit the thick woody copses or jungles of the Indian islands, and are the smallest of ruminant quadrupeds. Some of them are not larger than a hare. Their tusks are not so long as those of the Musk. One of them, the *Napu* of Java and Sumatra, has the smallest blood corpuscles of any known animal.

MUSK DUCK (*Cairina moschata*), a species of

tubercle at the base of the bill, the edges of the mandibles sinuated, the face and lores covered with a bare tuberculated skin, the wings furnished with a knob or spur at the bend. The M. D., or Muscovy Duck—so called, however, through mistake, and receiving its name M. D. more appropriately from its musky smell—is a native of the warm parts of America. It is very plentiful in Guiana, in that part of the year when winter reigns in the north. It is a larger bird than the common duck, in its wild state almost black, with glosses of blue and green, and white wing-coverts, but varies considerably in domestication. It is often to be seen in poultry-yards in Britain, but is rather curious than profitable. It hybridises readily with the common duck, but the hybrid is sterile.—The M. D. of Australia is a very different species, belonging to the genus *Biziura*.

MUSK OX (*Bos moschatus*, or *Oribos moschatus*), an animal of the family *Bovidae*, regarded as a connecting-link between oxen and sheep. It inhabits the most northern parts of America, enduring the winter even of Melville Island and Banks' Land; but, like many other animals, it is partially migratory, some individuals or herds seeking more southern regions and better pastures on the approach of winter, whilst some remain in the furthest north.

Musk Ox (*Bos moschatus*).

It is not found in Greenland, Spitzbergen, or Siberia. The M. O. is scarcely equal in size to the smallest of Highland cattle, but appears larger from the profusion of long matted woollen hair with which it is covered, and which hangs almost to the ground. The head is covered with long hair as well as the body, the face alone having short hair. Beneath the long hair there is a thick coat of exquisitely fine wool. The head is large and broad; the forehead convex; the extremity of the muzzle hairy. The horns are very broad at the base, and in the male meet on the forehead; they do not rise but bend down on each side of the head, and curve outwards and upwards towards the tip, which tapers to a sharp point. They are about two feet long measured along the curvature; and about two feet in girth at the base; a pair of them sometimes weighing sixty pounds. The limbs are short, the legs have short hair. The tail is very short, and is covered with long hair, so that it is undistinguishable to the sight. The general colour is brown. The female is smaller than the male, has shorter hair on the chest and throat, and smaller horns. The frog of the hoof is short, and partially covered with hair; the foot-marks are very similar to those of the reindeer.

The M. O. feeds on grass, twigs, lichens, &c. It is fleet and active, very sure-footed on rocky ground, and ascends or descends very steep hills with great ease. It is gregarious; the herds generally number

Musk Duck (*Cairina moschata*), Male and Female.

duck, of the non-oceanic section of *Anatide* (see Duck); of a genus characterised by an elevated

MUSK PLANT—MUSKETRY.

thirty or forty. The powerful horns are excellent weapons of defence against wolves and bears, which are often not only repelled but killed. When musk oxen are assailed by firearms, however, they generally huddle more and more closely together, and do not even seek safety by flight, so long as the assailants are unseen. The flesh is much prized by the Esquimaux, but retains much of the strong musky odour which characterises the living animal. The horns are used for various purposes; particularly the wide base for vessels. The fine wool has been spun and woven into a fabric softer than silk. No attempt has yet been made to domesticate the M. O.; which, however, seems worthy of it, and suitable for all cold regions.

**MUSK PLANT, MUSK ROOT, MUSK TREE, MUSK WOOD.** Different parts of a number of plants smell more or less strongly of musk. Among these are the common little Musk Plant (see **MIMULUS**), the Musk-tree of Van Diemen's Land (see **ASTER**), and the Musk Ochro (see **HIBISCUS**).—The musk-tree of Jamaica (*Moschorhylum Swartzii*) belongs to the natural order *Melaceæ*. It emits from all parts a smell of musk. —All parts of *Guarea grandifolia*, another tree of the same order, a native of the West Indies, sometimes called musk wood, also smells strongly of musk, but particularly the bark, which is used in perfumery.—The drug called **MUSK ROOT** or **SAMBUL** is brought from the East, and is the root of a plant supposed to be of the natural order *Umbelliferae*; but the plant is unknown, nor is it certain whether its native country is Persia, or some more remote region of Central Asia. It has a pure musky odour, and is used as a substitute for musk.

**MUSK RAT, or DESMAN** (*Mygale* or *Calemys*), a genus of insectivorous quadrupeds of the Shrew (q. v.) family (*Sorexidae*), differing from the true Shrews (*Sorex*) in having two very small teeth between the two large incisors of the lower jaw, and the upper incisors flattened and triangular. Behind these incisors are six or seven small teeth (lateral incisors or false canine teeth) and four jagged molars. The muzzle is elongated into a small flexible proboscis, which is constantly in motion. The eyes are very small; there are no external ears; the fur is long, straight, and divergent; the tail long, scaly, and flattened at the sides. All the feet have five toes, fully webbed; and the animals are entirely aquatic, inhabiting lakes and rivers, and making holes in the banks with the entrance from beneath the surface of the water. Only two species are known, one (*M.* or *G. Pyrenaica*) about

the body. The Russian desman is blackish above whitish beneath; it has long silky hair, with a softer felt beneath, and its fur is held in some esteem. Desman skins, however, are chiefly valued on account of the musky odour which they long exhale, and which is derived from a fatty secretion produced by small follicles under the tail of the animal. The desman feeds on leeches, aquatic larvæ, &c., searching for them in the mud by means of its flexible proboscis. It seldom, if ever, voluntarily leaves the water, except in the interior of its burrows, which are sometimes twenty feet long.

**MUSK RAT** (*Sorex murinus*), an Indian species of Shrew (q. v.), in size about equal to the common brown rat, in form and colour much resembling the common shrew of Britain, but remarkable for the powerful musky odour of a secretion which proceeds from glands on its belly and flanks. This odour adheres most pertinaciously to any object with which the animal may come in contact, and provisions are often utterly spoiled by it. Even wine and beer are said to be spoiled by it, in spite of the glass and cork of the bottle; although the probability is much greater that it adheres to the outside of the bottle, and that the liquid is spoiled as it is poured out. One of the Indian names of this animal is *Sondeli*.

**MUSK RAT.** See **MUSQUASH**.

**MUSKET, or MUSQUET** (Fr. *mousquet*; from *mouchet*, a sparrow-hawk; in the same way that other shooting-implements were named *falcon*, *falconet*, &c.), the firearm for infantry soldiers, which succeeded the clumsy harquebuss, and has recently itself given way before the Rifle (q. v.). The first muskets were matchlocks; after which came wheellocks, snaphans or snaphance muskets; and lastly, percussion muskets, which were a vast improvement, both for accuracy and lightness, on all which had gone before. Compared, however, to the present rifle, the musket—familiarily known as *Brown Bess* (possibly a corruption of Ger. *Büchse*, a hollow tube or gun)—was a heavy, ugly, and ineffective weapon. The following is a table of the ranges attained, on an average, by the musket, the Enfield, and the Whitworth rifles:

|   | Musket. | Enfield Rifle. | Whitworth Rifle. |
|---|---------|----------------|------------------|
| Accurate fire, . . . . .                      | Yards.  | Yards.         | Yards.           |
| Effective against workmen, . . . . .          | 100     | 650            | 900              |
| Effective against troops in column, . . . . . | 150     | 800            | 1100             |
|   | 200     | 1000           | 1500             |

**MUSKETOO'N**, an obsolete weapon, was a short musket of very wide bore, carrying a ball of five ounces, and sometimes bell-mouthed like a blunderbuss.

**MUSKETRY, SCHOOLS OF.** When the introduction of the Minié rifle in the French service, and the subsequent arming of the British troops with the still more delicate Enfield rifle in 1851, brought the accuracy of a soldier's fire to be an important consideration in estimating his value (which with the old musket was not the case, as it was proverbial that the bullet never hit the point aimed at however carefully), the English government at once saw the necessity of providing instruction in the manipulation of the rifle. Accordingly, instructors of musketry were attached to the troops, one to each regiment; and to give further encouragement, a school was established at Hythe in 1854, under Colonel (now General) Hay, where lessons on the theory of the arm, and practice in its actual employment, were the sole occupation of the day. Officers and promising men were sent there as fast as the

Musk Rat, or Desman (*Mygale Pyrenaica*).

eight inches long, with tail as long as the body, a native of the streams of the Pyrenees; another larger species (*M.* or *G. moschata*), very plentiful in the Volga and other rivers and lakes of the south of Russia, nearly equal in size to the common hedgehog, with tail about three-fourths of the length of

accommodation permitted; and after a course of a few weeks were able to return to their corps, and become instructors to their comrades, so that in a comparatively short time the shooting of the whole army rose in a surprising degree. Whereas, before the establishment of this school, the English stood low in the scale of shooting, the competitions held during recent years at Wimbledon have demonstrated that no nation can now excel them as marksmen. The formation of the volunteer corps, in 1859, led to a greatly increased demand for musketry instruction, which the government met by forming a second school of musketry—on the same footing as that of Hythe—at Fleetwood, where, on the vast sands of Morecambe Bay, the troops and volunteers of Scotland, Ireland, and the northern English counties find the necessary teaching. The two schools are superintended by an inspector-general of musketry instruction, with subordinate instructors. The inspector-general is responsible also for the instruction throughout the regiments all over the world. Under him are the district inspectors, regimental instructors, and sergeant instructors.

The total cost of musketry instruction for 1864 amounts to £37,095.

**MUSLIN**, a cotton fabric of Oriental origin, is said to have derived its name from the town of Mosul, in Mesopotamia, where this material was at one time very largely manufactured. At present no such trade exists there; and for muslins, of the common kinds at least, the Indian market depends upon the manufactures of England and France. But no European manufacturer has ever been able to rival the wonderfully fine muslins of Dacca. This does not arise so much from the fineness of the yarn, although that too is very great, but from the marvellous fineness conjoined with a most delicate softness to the touch. The fineness of the yarn is so great, that until lately no machinery could produce anything like it; a piece of Dacca muslin, shewn in the International Exhibition (1862), was 31 feet in length by 3 feet in width, and contained in a square inch 104 warp threads and 100 weft threads, yet the entire piece weighed only 3½ ounces. A French manufacturer, M. Thivel Michon of Tavaré, has made a muslin of English yarn spun by the Messrs Houldsworth of Manchester, which surpassed the finest Dacca in the excessive thinness of the yarn, but it wanted its delicate softness. Muslin is much less compact in its texture than calico, indeed it more nearly resembles gauze in appearance; but it is woven plain, without any twisting of the weft threads with those of the warp. The manufacture of muslins in Great Britain and France is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico-printing. See **WEAVING**.

**MUSNUD**, a Persian throne of state.

**MUSOPHAGIDÆ**. See **PLANTAIN-EATER**.

**MUSQUASH**, **MUSK-RAT**, or **ONDATRA** (*Fiber zibethicus*), a rodent quadruped, a native of North America. It is the only known species of the genus to which it belongs, which is characterised by dentition similar to that of the voles; in some other characters more nearly agreeing with the beaver. The M. is in shape nearly similar to the brown rat; the head and body are about 15 inches in length, the tail ten inches. The whole body is covered with a short downy dark-brown fur, intermixed with longer and coarser hairs. It is common in almost all parts of North America, from lat. 30° to lat. 69°, except in the southern alluvial districts. It is a very aquatic animal, seldom wandering from the rivers, lakes, or marshes

in which it makes its abode. The fur is in demand, and forms an article of commerce—skins in large number being still exported from America to Britain and other European countries. The M. burrows in the banks of streams and ponds; the entrances

Musquash (*Fiber zibethicus*).

of its burrows being always under water, so that it must dive to reach them. In marshes, the M. builds a kind of hut, collecting coarse grasses and mud, and raising the fabric from two to four feet above the water. The flesh of the M., at those seasons when it is fat, is in some request among the American Indians, and is said to be not unpalatable.

**MUSSEL** (*Mytilus*), a genus of lamellibranchiate molluscs, the type of the family *Mytilidæ*, which, however, is much more restricted than the Linnean genus *Mytilus*. The *Mytilidæ* belong to the division of *Lamellibranchiata*, called by Lamarck *Dimyaria*, having two adductor muscles—muscles employed in closing the valves of the shell. The mantle has a distinct anal orifice; the foot is small; and there is a large *Byssus* (q. v.), which is divided into fibres to its base. The valves of the shell are equal; the hinge is destitute of teeth. Some, but few, of the species are found in fresh-water. See **DREISSENA**. Some (*Lithodomus*) burrow in stone. How they do it is utterly unknown, but they do burrow even in the hardest stone; and some small tropical species excavate for themselves holes in the shells of great limpets. The *Lithodomi* are sometimes called *Date-shells*. Some of them are very beautiful, which is the case also with the true mussels, after the epidermis is removed. Even the COMMON M. (*M. edulis*) then exhibits beautiful veins of blue. This species is very abundant on the British coasts, and is much used as bait by fishermen. It is gregarious, and is found in vast beds, closely crowded, adhering by the byssus to rocks, &c. These beds are usually uncovered at low-water. The shell is oblong; at its greatest size about three inches long, and an inch and a half broad. Mussels, when young, move about by means of the foot, with which they lay hold of objects and drag themselves along, until they find some suitable spot to anchor themselves by a byssus. If detached, they soon find another anchorage. In an aquarium they readily attach their byssus-threads even to the smooth glass, and the threads may be broken more easily than separated from the glass. An ingenious and important application of the strength of these threads has been made by the French, to render Cherbourg breakwater more secure by binding the

loose stones together, for which purpose it was planted with tons of mussels. The Common M. is much used as an article of food, and is generally found quite wholesome; yet it sometimes proves poisonous, particularly in spring and summer, either causing blotches, swellings, and an eruption, accompanied with asthma, or a kind of paralysis, and even sometimes producing delirium and death. Emetics and ether are the chief remedies in cases of this kind. Some places are famous for the excellent quality of their mussels, and particularly places in tidal estuaries. Mussels are sometimes brought from other parts of the coast to the mouths of rivers to fatten and improve in flavour before being sent to market.—Several other species of *M.* (*Mytilus* and closely allied genera) are found on the British shores.—The family abounds in most parts of the world.—A very large species of *M.* (*Mytilus chioros*), and of very fine quality, is found at Chiloe.—Some of the *Lithotomi* are highly esteemed as food; and means are taken in some places on the shores of the Mediterranean to promote the increase of their numbers.

**MUSSEL, FRESH-WATER.** See FRESH-WATER MUSSEL.

**MUSSELBURGH**, a small seaport and royal and parliamentary burgh of Scotland, in the county of Edinburgh, is situated at the mouth of the Esk, 6 miles east of Edinburgh. East of the burgh is the scene of the battle of Pinkie, in which the Scots were defeated by the English in 1547. On the west side of the Esk is the village of Fisherrow, a suburb of the burgh, where many of the inhabitants are engaged in fishing. Tanning, leather-dressing, and the manufacture of sailcloth, nets, and salt are carried on. The harbour at Fisherrow is frequented by coasting craft, and by small vessels from Holland and the Baltic. Timber, oil-cake, bark, seeds, and hides are imported; coal is the chief export. On the 'links,' a famous golfing-ground, the Edinburgh races take place annually. *M.* unites with Leith and Portobello in sending a member to parliament. Pop. (1861) 7423. (1871—7506.)

**MU'STANG.** See HORSE.

**MUSTARD** (*Sinapis*), a genus of plants of the natural order *Crucifere*, having yellow flowers, and linear or oblong pods, which terminate in a sword-shaped and compressed or 4-cornered beak, and contain one row of seeds. The seeds are globular, and their Cotyledons (q. v.) conduplicate.—The most important species is **BLACK M.** (*S. nigra*), an annual, which grows wild in fields and by waysides in the middle and south of Europe, and is not uncommon in the southern parts of Britain. Its pods are bluntly 4-angled, smooth, erect, and lie close to the stem, their valves 1-nerved; the leaves are smooth, the lower leaves lyrate, the upper leaves linear-lanceolate. The seeds are brownish black.—**WHITE M.** (*S. alba*), also a native of most parts of Europe, and of the southern parts of Britain, is an annual, having divergent pods covered with stiff hairs, the valves 5-nerved, the seeds yellowish, the leaves pinnatifid.—Both these species are cultivated in England and elsewhere, for their seeds, which are ground into powder and mixed with water, to make the well-known condiment called *Mustard*. The powder of the seeds is also much used in medicine as a rubefacient. The use of *M.* as a condiment is often found favourable to digestion. *M.* seeds depend for their pungency on a principle which, when water is added to Black M., forms *Volatile Oil of Mustard*. (See next article.) There is also in the seeds a bland fixed oil, *Oil of M.*, which is obtained from them by expression, and constitutes about 28 per cent. of their weight. The cake which remains

after the oil is expressed, is too acrid to be freely used for feeding cattle. It is Black M. which is chiefly cultivated, its seed being more pungent and powerful than that of White M.; but there is more difficulty in removing the skin of its seed than that of White M., which is therefore often preferred, but more in England than on the continent of Europe. *M.* requires a very rich soil. It is cultivated on the alluvial lands of the level eastern counties of England. Wisbeach, in Cambridgeshire, is the great M. market of England.—White M. is often sown in gardens and forced in hothouses, to be used in the seed-leaf as a small salad, having a pleasant pungency. It is also sometimes sown for feeding sheep, when turnip or rape has failed, being of very rapid growth, although inferior in quantity of crop.—**WILD M.**, or **CHARLOCK** (*S. arvensis*), which is distinguished by turgid and knotty pods with many angles and longer than the two-edged beak, is a most troublesome annual weed in cornfields in Britain, often making them yellow with its flowers in the beginning of summer. Its seeds are said to have yielded the original *Darham M.*, and are still gathered for mixing with those of the cultivated species. The bland oil of the seeds is used for lamps.—**PEKIN M.** (*S. Pokinensis*) is an annual, very extensively cultivated in China, its leaves being used as greens. It is quite hardy in the climate of Britain.—**INDIAN M.** (*S. ramosa*) is extensively cultivated in India for its seeds, which are used as a condiment; as are those of *S. dichotoma* and *S. glauca*, also cultivated in India. The oil of the seeds is much used throughout India for lamps.—**HILL M.** is a different genus, *Bunius* (q. v.).—The **M. TREE** of Scripture is supposed to be *Salvadora Persica*, a small tree of the natural order *Salten-doraceae*, a small order allied to *Mysinaceae*. It abounds in many parts of the East. The seed has an aromatic pungency, and is used like mustard. The fruit is a berry with a pungent taste.

*Manufacture.*—The manufacture of *M.* as it was originally used in this country, and as it still is on the continent, consisted in simply grinding the seed into a very fine meal. A false taste, however, arose for having an improved colour, and the flour of mustard was introduced, in which only the interior portion of the seed is used, the husk being separated, as the bran is from wheat flour. This causes a great loss of flavour, as the pungent oil, on which the flavour chiefly depends, exists in greatest abundance in the husk. Hence other materials, such as capsicum powder, and other very pungent matters, are added to bring up the flavour, and wheat flour and other substances are added to increase the bulk and the lightness of colour. Indeed, so many sophistications have been added, that the *M.* of the English tables can no longer be regarded in any other light than an elaborately compounded condiment, for which each manufacturer has his own particular recipe.

**MUSTARD, OIL OF.** The seeds both of the black and the white mustard yield by expression a large quantity of a bland fixed oil, but they do not contain any essential or volatile oil ready formed. It is only the black mustard which by distillation yields the compound usually known as the oil or essence of mustard, and which is in reality sulphocyanide of allyl (see **GARLIC, OIL OF**) contaminated with a little brown resinous matter, from which it may be freed by simple re-distillation.

When first obtained, it is a colourless fluid, which gradually becomes yellowish. It has a painfully pungent odour and acrid taste; and when applied to the skin, it speedily raises a blister. It is soluble in all proportions in alcohol, but dissolves very sparingly in water. In the article already

referred to, it has been shewn that this oil and oil of garlic are naturally convertible into one another; in combination with ammonia it forms a compound which is termed *thiosinamine*, and which combines directly with acids like a true organic base. Its mode of formation is explained by the equation—

Oil of Mustard. Ammonia. Thiosinamine.

By digesting oil of mustard with alkalis, or with hydrated oxide of lead, we also obtain a feeble base termed *sinapoline*, whose formula is  $\text{C}_7\text{H}_{12}\text{N}_2\text{O}_2$ .

The oil is formed in much the same way as the Volatile Oil of Almonds (q. v.). The black mustard contains the potash salt of a compound termed *myronic acid*, and a peculiar coagulable nitrogenous ferment, which, when the crushed seed is moistened with water, act upon each other, and develop the oil. It is the gradual formation of this oil, when powdered mustard and warm water are mixed, that occasions the special action of the common mustard poultice. The pungency of mustard as a condiment, of horse-radish, &c., is mainly due to the presence of this oil.

**MUSTELIDÆ**, a family of digitigrade Carnivora (q. v.), mostly forming the genus *Mustela* of Linæus; now divided into a number of genera,

Dentition of Mustelidæ.

in which are ranked the weasel, ermine or stoat, sable, marten, ferret, polecat, mink, skunk, &c. The *M.* are distinguished by the elongated form of the body, and the shortness of the limbs; also by having generally four or five molars on each side in the upper jaw, and five or six in the lower. On each side of both jaws there is a single tuberculative toe. The skull is much elongated behind the eyes. The *M.* display great litheness and suppleness of movement. They are very carnivorous. Otters are ranked among the mustelidæ.

**MUSTER** (It. *mostrare* from Lat. *monstrare*, to shew) is a calling over of the names of all the men composing a regiment or a ship's company. Each man present answers to his name, those not answering being returned as absent. The muster-roll from which the names are called is the paymaster's voucher for the pay he issues, and must be signed by the commanding officer, the adjutant, and himself. The crime of signing a false muster-roll, or of personating another individual at a muster, is held most severely punishable—by imprisonment and flogging for a common soldier, by immediate cashiering in the case of an officer. In regiments of the line, a muster is taken on the 24th of each month; in ships of war, weekly. The muster after a battle is a melancholy proceeding, intended to shew the casualties death has wrought. In early times, before the army was a standing force, and when each captain was a sort of contractor to the crown for so many men, the muster was most important, as the only security the sovereign had that he really obtained the services of the number of men for whom he paid. Accordingly, any fraud, as making a false return, or as mustering with his troop men not actually

serving in it, was by the Articles of War of Henry V. made punishable with death for the second offence, and by Charles I. with death 'without mercy' for even the first such crime; while any person abetting in any way in the fraud shared the penalty.

**MU'SULMÁN**, *Mosleman*, a Mohammedan (from Arab. *Salama*), equivalent to Moslem, of which word it is, properly speaking, the plural; used in Persian fashion for the singular. We need hardly add that this Arabic plural termination of 'án,' has nothing whatever to do with our word *man*, and that a further English plural in *men*, is both barbarous and absurd.

**MUTE**, a small instrument used to modify the sound of the violin or violoncello. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, a leg of it being interjected between every two strings. The use of the mute both softens the tone, and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. Its application is indicated by the letters *c. s.*, or *con sordino*, and its discontinuance by *s. s.*, or *senza sordino*. The mute is sometimes used for the cornet, being inserted into the bell of the instrument, thereby subduing the sound, and producing the effect of great distance.

**MUTINY**, if—as commonly supposed—derived from the Latin *mutio*, a muttering, would seem to have applied originally rather to seditious complaining and conspiring than to actual deeds of violence. However that may be, the term has long included behaviour either by word or deed subversive of discipline, or tending to undermine superior authority. Till lately, mutiny comprised speaking disrespectfully of the sovereign, royal family, or general commanding, quarrelling, and resisting arrest while quarrelling; but these offences have now been reduced to the lesser crime of 'mutinous conduct.' The acts now constituting mutiny proper are, exciting, causing, or joining in any mutiny or sedition; when present thereat, failing to use the utmost effort to suppress it; when, knowing of a mutiny or intended mutiny, failing to give notice of it to the commanding officer; striking a superior officer, or using or offering any violence against him, while in the execution of his duty; disobeying the lawful command of a superior officer. The punishment awarded by the Mutiny Act to these crimes is, if the culprit be an officer, death or such other punishment as a general court-martial shall award; if a soldier, death, penal servitude for not less than four years, or such other punishment as a general court-martial shall award. As the crime of mutiny has a tendency to immediately destroy all authority and all cohesion in the naval or military body, commanding officers have strong powers to stop it summarily. A drum-head court-martial may sentence an offender, and if the case be urgent, and the spread of the mutiny apprehended, the immediate execution of the mutineer may follow within a few minutes of the detection of his crime. It, however, behoves commanding officers to exercise this extraordinary power with great caution, as the use of so absolute an authority is narrowly and jealously watched. To prevent mutiny among men, the officers should be strict without harshness, kind without familiarity, attentive to all the just rights of their subordinates, and, above all things, most particular in the carrying out to the very letter of any promise they may have made.

**MUTINY ACT** is an Act of the British parliament, passed from year to year, investing the crown with large powers to regulate the good government of

the army and navy, and to frame the articles of war. By the Bill of Rights, the maintenance of a standing army in time of peace, unless by consent of parliament, was declared illegal, and from that time the number of troops to be maintained, and the cost of the different branches of the service, have been regulated by an annual vote of the House of Commons. But parliament possesses a further and very important source of control over the army. Soldiers, in time of war or rebellion, being subject to martial law, may be punished for mutiny or desertion; but the occurrence of a mutiny in certain Scotch regiments soon after the Revolution, raised the question, whether military discipline could be maintained in time of peace; and it was decided by the courts of law, that, in the absence of any statute to enforce discipline and punish military offences, a soldier was only amenable to the common law of the country: if he deserted, he was only liable for breach of contract, or if he struck his officer, to an indictment for assault. The authority of the legislature thus became indispensable to the maintenance of military discipline, and parliament has, since 1689, at the beginning of every session, conferred this and other powers in an act called the Mutiny Act, limited in its duration to a year. Although it is greatly changed from the form in which it first passed, 175 years ago, the annual alterations in this act are now very slight, and substantially it has a fixed form. The preamble starts with the above quoted declaration from the Bill of Rights, and adds, that it is judged necessary by the sovereign and parliament that a force of such a number should be continued, 'for the safety of the United Kingdom, the defence of the possessions of the crown, and the preservation of the balance of power in Europe;' while it gives authority to the sovereign to enact Articles of War for the control and government of the force granted. The act comprises 98 clauses, of which the first five specify the persons liable to its provisions—viz., all enlisted soldiers or commissioned officers on full pay, whether of the regular army, militia, or yeomanry. Clauses 6—14, treat of courts-martial, their procedure and powers. Clauses 15—28, relate to crimes and their punishment, the leading offences being mutiny, desertion, cowardice, treason, insubordination, for each of which death may be the penalty; frauds, embezzlement, &c., for which penal servitude is awarded. Clauses 29—33, provide for the government of military prisons, and for the reception of soldiers in civil jails, under the sentences of courts-martial. Clauses 34—37, enact rules to guide civil magistrates in apprehending deserters or persons suspected of desertion. Clause 38 refers to furlough; 39—41, on the privileges of soldiers, enact that officers may not be sheriffs or mayors; that no person acquitted or convicted by a civil magistrate or jury be tried by court-martial for the same offence; and that soldiers can only be taken out of the service for debts above £30, and for felony or misdemeanour. Clauses 42—59, have reference to Enlistment (q. v.); 60—73, to billets, carriages, and ferries, providing for the compulsory conveyance and entertainment of troops by innkeepers under certain eventualities at fixed charges. Clauses 74 and 75 relate to the discharge of soldiers; and the remaining 23 clauses advert to miscellaneous matters, and the penalties under the act on civil functionaries who neglect to comply with its requirements. The Mutiny Act has, with one exception, been annually renewed; it has, however, several times been allowed to expire for a few days before its successor has received the royal assent.

**MUTUAL INSTRUCTION.** See **MONITORIAL SYSTEM.**

**MUTULE**, a plain block under the corona of the cornice of the Doric style, similar in position to the modallio of the Corinthian order, and having a number of guttæ or drops worked on the under side. See **ENTABLATURE**.

**MUTUUM** is a term used in Scotch Law, borrowed from the Roman law, to denote a contract of loan of a certain kind of things, as corn, wine, money, which are consumed in the use, and as to which the borrower is bound to restore as much of the same kind at some future time.

**MUZA IBN NOSEYR**, the Arab conqueror of Spain, was born 610 A.D. He displayed great bravery and high military talents in the contests of that turbulent period, so much so that he was appointed by the calif general of the army which was raised for the conquest of Africa in 698—699. After an insignificant expedition into the interior of Africa, he set out in 707 for Mauritania, conquering the kindred tribes of Eastern Barbary, and enrolling their warriors under his standard; and by 709, the whole of Northern Africa, including the Gothic strongholds on the coast, acknowledged the authority of the calif. At this period the Gothic monarchy in Spain was in a state of complete disorganisation, and M., seizing the favourable opportunity thus presented, sent his lieutenant, Tarik Ibn Zeiad, in April 711 to make an incursion into Spain. Tarik landed at Gibraltar, marched inland to the banks of the Guadalete, where he was met by Roderic the Gothic king. In the battle which ensued, the Goths were decisively vanquished, their king perished in the waters of the Guadalete, and the whole of Southern Spain lay at the mercy of the victor. M., on hearing of these successes, sent orders to Tarik to halt for further instructions; but the lieutenant, flushed with success, pressed on to the very centre of Spain, and seized Toledo, the capital of the Gothic kingdom. M. immediately set out for Spain at the head of 18,000 men (June 712), took Seville, Carmona, Merida, and other towns, and then marched upon Toledo, where he joined Tarik, whom he caused to be bastinadoed and incarcerated, but afterwards reinstated in obedience to an order from the calif. M. then marched first north-west and then east, subduing the country as he went; he then crossed the Pyrenees into France, but soon after returned to Spain, where he and Tarik received messages from the calif, commanding their immediate presence at Damascus; Tarik immediately obeyed, but M. delayed till a second message was sent to him. On reaching Damascus, he was treated with neglect, and, on the accession of the Calif Suleiman, was cast into prison, and mulcted in 200,000 pieces of gold; his two sons were deprived of their governments of Kairwan and Tangier; and the third son, who governed Spain in his father's absence, was beheaded, and his head sent to Muza. M. died soon after in the greatest poverty, at Hedjaz, 717 A.D.

**MYCELIUM**, in Botany, a development of vegetable life peculiar to *Fungi*, but apparently common to all the species of that order. The *spawn* of mushrooms is the Mycelium. The M. appears to be a provision for the propagation of the plant where its spores may not reach, its extension in the soil or matrix in which it exists, and its preservation when circumstances are unfavourable to its further development. It consists of elongated filaments, simple or jointed, situated either within the matrix or upon its surface. It is often membranous or pulpy. The development of the fungus in its proper form seems to be ready to take place, in proper circumstances, from any part of the Mycelium. *Fungi* often remain long in the state of M., and many kinds

of *M.* have been described as distinct species and formed into genera. Fries has rendered great service to botany in investigating these spurious species and genera, and determining their true nature.—Liquors, in which the flocculent *M.* of a fungus is spreading, are said to be *mothery*.

**MYCENÆ**, a very ancient city in the north-eastern part of Argolis, in the Peloponnesus, built upon a craggy height, is said to have been founded by Perseus. It was the capital of Agamemnon's kingdom, and was at that time the principal city in Greece. About 468 B.C., it was destroyed by the inhabitants of Argos, and never rose again from its ruins to anything like its former prosperity. In Strabo's time its ruins only remained; these are still to be seen in the neighbourhood of Kharvati, and are specimens of Cyclopean architecture. The most celebrated is the 'Gate of Lions,' the chief entrance to the ancient Acropolis, and receiving its name from two immense lions sculptured upon a block of bluish limestone above the gate. See Colonel Mure's *Tour in Greece* (vol. ii. p. 324).

**MYELITIS** (*myelos*, marrow) is the term employed to signify inflammation of the substance of the spinal cord. It may be either acute or chronic, but the latter is by far the most common affection. The chronic form begins with a little uneasiness in the spine, somewhat disordered sensations in the extremities, and unusual fatigue after any slight exertion. After a short time paralytic symptoms appear, and slowly increase. The gait becomes uncertain and tottering, and at length the limbs fail to support the body. The paralysis finally attacks the bladder and rectum, and the evacuations are discharged involuntarily; and death takes place as the result of exhaustion, or occasionally of asphyxia if the paralysis involves the chest. In the acute form there is much pain (especially in the spinal region), which usually ceases when paralysis supervenes. The other symptoms are the same as those of the chronic form, but they occur more rapidly and with greater severity, and death sometimes takes place in a few days.

The most common causes of this disease are falls, blows, and strains from over-exertion; but sexual abuses and intemperate habits occasionally induce it. It may also result from other diseases of the spine (as caries), or may be propagated from inflammation of the corresponding tissue of the brain.

The treatment, which is much the same as that of inflammation elsewhere, must be confided entirely to the medical practitioner; and it is therefore unnecessary to enter into any details regarding it. When confirmed paralysis has set in, there is little to hope for, but in the early stage the disease is often checked by judicious remedies.

**MYGALÉ**, a genus of spiders, the type of a

Mygale.

family called *Mygalidæ*. They have four pulmonary sacs and spiracles, four spinnerets, eight eyes, and

hairy legs. They make silken nests in clefts of trees, rocks, &c., or in the ground, sometimes burrowing to a great depth, and very tortuously. To this genus belongs the bird-catching Spider (q. v.) of Surinam; but it seems now to be ascertained that several of the larger species frequently prey on small vertebrate animals. They do not take their prey by means of webs, but hunt for it and pounce upon it by surprise. They construct a silken dwelling for themselves in some sheltered retreat. Some of them make a curious lid to their nest or burrow. They envelop their eggs, which are numerous, in a kind of cocoon.

**MYLA'BRIS**, a genus of coleopterous insects, nearly allied to *Cantharis* (q. v.), and deserving of notice because of the use made of some of the species as blistering flies. *M. cichorii* is thus used in China and India; and *M. Fuesselini*, a native of the south of Europe, is supposed to have been the blistering fly of the ancients.

**MYLITTA** (? corresponding to Heb. *Meyaledeth*, Genitrix, who causes to bear), a female deity, apparently first worshipped among the Babylonians, who gradually spread her worship through Assyria and Persia. She is originally, like almost every other mythological deity, a cosmic symbol, and represents the female portion of the twofold principle through which all creation burst into existence, and which alone, by its united active and passive powers, upholds it. *M.* is to a certain degree the representative of Earth, the Mother, who conceives from the Sun, Bel or Baal. *M.* and Baal together are considered the type of the 'Good.' Procreation thus being the basis of *M.*'s office in nature, the act itself became a kind of worship to *M.*, and was hallowed through and for her. Thus it came to pass, that every Babylonian woman had once in her life to give herself up to a stranger, and thereby considered her person consecrated to the great goddess. The sacrifice itself seems, especially in the early stage of its introduction among the divine rites of the primitive Babylonians, to have had much less of the repulsiveness, which, in the eyes of highly-cultivated nations, must be attached to it; and it was only in later days that it gave rise to the proverbial Babylonian lewdness. Herodotus's account of this subject must, like almost all his other stories, be received with great caution.

**MYLLODON** (Gr. grinder-teeth), a genus of huge fossil sloths, whose remains are found in the Pleistocene deposits of South America, associated with the *Megatherium* and other allied genera. A complete skeleton, dug up at Buenos Ayres, measured 11 feet from the fore part of the skull to the end of the tail. Although like the modern sloth in general structure and dentition, its immense size forbids us to suppose that it could have had the same arboreal habits, and the modifications of its structure seem to have fitted it for the uprooting and prostrating of the trees, the foliage of which supplied it with food.

**MYNIAS**, more accurately *MINYAS*, was, in Greek mythology, the son of Chryses. He was king of Jolcos, and gave his name to the people called *Minyæ*. He built the city of Orchomenus, where rites (named after him) were celebrated in his honour. His three daughters Clymene, Iris, and Alcithoë, according to Ovid, but Leucotheë, Leucippe, and Alcithoë according to other authors, were changed into bats for having contemned the mysteries of Bacchus.

**MYOSOTIS**. See FORGET-ME-NOT.

**MYRCIA**, a genus of trees of the natural order *Myrtaceæ*, to which belongs the WILD CLOVE or

WILD CINNAMON of the West Indies (*M. acris*), a handsome tree of 20 or 30 feet high. Its timber is very hard, red, and heavy. Its leaves have an aromatic cinnamon-like smell, and an agreeable astringency, and are used in sauces. Its berries are round, and as large as peas, have an aromatic smell and taste, and are used for culinary purposes.—The leaves, berries, and flower-buds of *M. pimentaoides* have a hot taste and fragrant smell, and are also used for culinary purposes.

MYRIAPODA (Gr. myriad-footed), a class of *Articulata*, resembling *Annelida* in their lengthened form, and in the great number of equal, or nearly equal, segments of which the body is composed; but in most of their other characters more nearly agreeing with Insects, among which they were ranked by the earlier naturalists, and still are by some. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes: a few are destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others, similar to that of crustaceans. Respiration is carried on through minute pores or spiracles, placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air-tubes to all parts. In most parts of their internal organisation the M. resemble insects; although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is greater to insects in their larval than in their perfect state. The body of the M. is protected by a hard *chitinous* covering. The number of segments is various, seldom fewer than 24; although in some of the higher genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus* (q. v.), are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annelids as organs of locomotion, and the distinctly articulated legs of insects. In the higher M., as *Scolopendra*, the legs are much fewer, and articulated like those of insects. None of the M. have wings. Some of them feed on decaying organic matter, chiefly vegetable; those of higher organisation are carnivorous. The M. do not undergo changes so great as those of insects, but emerge from the egg more similar to what they are ultimately to become; although some of them are at first quite destitute of feet; and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached, the number of segments and of feet increasing.

The M. are divided into two orders: the lower, *Chilopoda* (*Julus*, &c.), having the body sub-cylindrical, the feet very numerous, the head rounded, the mandibles thick and strong; the higher, *Chilopoda* (*Scolopendra*, &c.), having the body flattened, the feet comparatively few, the head broad, the mandibles sharp and curved.

The M. are found in all parts of the world, in the ground, among moss, under stones, in the decaying bark of trees, in decaying roots, and in many similar situations. The largest species are tropical. They are all generally regarded with aversion. It is doubtful how far any of them are injurious to crops, although it is not improbable that they accelerate rotteness already begun; but some (*Centipedes*) have a venomous and painful bite.

MYRICA. See CANDLEBERRY.

MYRISTICA'CEÆ. See NUTMEG.

MYRISTIC ACID ( $C_{25}H_{37}O_4$ , HO) is a crystalline fatty acid, found in the seeds of the common nutmeg, *Myristica moschata*. It occurs in the form of a glyceride in the fat of the nutmeg, or nutmeg butter. It has recently been found in small quantity amongst the products of the saponification of spermaceti, and of the fatty matter of milk; and hence this organic acid must be ranked amongst those which are common both to the animal and vegetable kingdoms.

MYRMECOPIAGA. See ANT-EATER.

MYROBALANS, the astringent fruit of certain species of *Terminalia*, trees of the natural order *Combretaceæ*, natives of the mountains of India. The genus *Terminalia* has a deciduous bell-shaped calyx and no corolla; the fruit is a juiceless drupe. *T. Belerica*, a species with alternate elliptical entire leaves, on long stalks, produces great part of the M. of commerce; but the fruits of other species often appear under the same name. Tonic properties are ascribed to M.; but although once in great repute, they are now scarcely used in medicine. They are used, however, by tanners and by dyers, and have therefore become a very considerable article of importation from India. They give a durable yellow colour with alum, and, with the addition of iron, an excellent black.—*Emblia M.* are the fruit of *Emblia officinalis*, of the natural order *Euphorbiaceæ*, a native of India. They are used in India as a tonic and astringent; also in tanning and in the making of ink.—There is a kind of plum called the *Myrobalan Plum*. See PLUM.

MYRRH (Heb. *mur*), a gum resin produced by *Balsamodendron* (q. v.) *myrrha*, a tree of the natural order *Amyridaceæ*, growing in Arabia, and probably also in Abyssinia. The M. tree is small and scrubby, spiny, with whitish-gray bark, thinly-scattered small leaves, each consisting of three

Myrrh (*Balsamodendron myrrha*).

obovate obtusely toothletted leaflets, and the fruit a smooth brown ovate drupe, somewhat larger than a pea. M. exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the colour at the same time becoming darker. M. has been known and valued from the most ancient times; it is mentioned as an article of commerce in Gen. xxxvii. 25, and was amongst the presents which Jacob sent to the Egyptian ruler, and amongst those which the wise men from

the East brought to the infant Jesus. It was an ingredient in the 'holy anointing oil' of the Jews. *M.* appears in commerce either in tears and grains, or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle, and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. It is used in medicine as a tonic and stimulant, in disorders of the digestive organs, excessive secretions from the mucous membranes, &c., also to cleanse foul ulcers and promote their healing, and as a dentifrice, particularly in a spongy or ulcerated condition of the gums. It was much used by the ancient Egyptians in embalming. The best *M.* is known in commerce as *Turkey M.*, being brought from Turkish ports; as the name *East Indian M.* is also given to *M.* brought to Europe from the East Indies, although it is not produced there, but comes from Abyssinia. It is not yet certainly known whether the *M.* tree of Abyssinia is the same as that of Arabia, or an allied species.

**MYRSINACEÆ**, a natural order of exogenous plants, consisting of trees and shrubs, natives of warm climates, and having simple leathery leaves, destitute of stipules; hermaphrodite or unisexual flowers, generally small, but often in umbels, corymbs, or panicles; very similar in structure to the flowers of the *Primulacæ*; the fruit generally fleshy, with 1–4 seeds. The flowers are very often marked with sunken dots or glandular lines.—There are more than 300 known species. Many of them are beautiful evergreen shrubs, particularly the genus *Ardisia*. Some have peppery fruit, as *Embelia ribes*.

**MYRTACEÆ**, a natural order of exogenous plants, consisting of trees and shrubs, natives chiefly of warm, but partly also of temperate countries. The order, as defined by the greater number of botanists, includes several suborders, which are regarded by some as distinct orders, particularly **CIAMÆLAUCIACEÆ** (in which are contained about 50 known species, mostly beautiful little bushes, often with fragrant leaves, natives of New Holland), **BARRINGTONIACEÆ** (q. v.), and **LECYTHIDACEÆ** (q. v.). Even as restricted, by the separation of these, the order contains about 1300 known species. The leaves are entire, usually with pellucid dots, and a vein running parallel to and near their margin.—Some of the species are gigantic trees, as the *Eucalypti* or *Gum Trees* of New Holland, and different species of *Metrosideros*, of which one is found as far south as Lord Auckland's Islands, in lat. 50½°. The timber is generally compact.—Astringency seems to be rather a prevalent property in the order, and the leaves or other parts of some species are used in medicine as astringents and tonics. A fragrant or pungent volatile oil is often present in considerable quantity, of which *Oil of Cajuput* and *Oil of Cloves* are examples. *Cloves* and *Pimento* are amongst the best known products of the order. The berries of several species are occasionally used as spices in the same way as the true *Pimento*. A considerable number yield pleasant edible fruits, among which are the **POMEGRANATE**, the **GUAVA**, species of the genus *Eugenia*, and some species of myrtle.

**MYRTLE** (*Myrtus*), a genus of *Myrtaceæ*, having the limb of the calyx 4–5-parted, 4–5 petals, numerous free stamens, an almost globose germen, and a 2–3-celled berry, crowned with the limb of the calyx, and containing kidney-shaped seeds. The leaves are opposite and marked with pellucid dots; the flower-stalks are axillary, and generally one-flowered. The **COMMON M.** (*M. communis*) is well known as a beautiful evergreen shrub, or a tree of

moderate size, with white flowers. It is a native of all the countries around the Mediterranean Sea, and of the temperate parts of Asia, often forming thickets, which sometimes occur even within the reach of the sea-spray. The leaves are ovate or lanceolate, varying much in breadth. They are astringent and aromatic, containing a volatile oil, and were used in medicine by the ancients as a stimulant. The berries are also aromatic, and are used in medicine in

Myrtle (*Myrtus communis*):  
1, flower of Myrtle, cut vertically; 2, Myrtle in flower.

Greece and India. A *M.* wine, called *Myrtulanum*, is made in Tuscany. *M.* bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks, the *M.* was sacred to Venus, as the symbol of youth and beauty, was much used in festivals, and was, as it still is, often mentioned in poetry. The *M.* endures the winters of Britain only in the mildest situations in the south.—The **SMALL-LEAVED M.** of Peru (*M. microphylla*) has red berries of the size of a pea, of a pleasant flavour and sugary sweetness. Those of the **LUMA** (*M. luma*) are also palatable, and are eaten in Chili; as are those of the **DOWNY M.** (*M. tomentosa*), on the Neigherry Hills; and those of the **WHITE-BERRIED M.** (*M. leucocarpa*), by some regarded as a variety of the **Common M.**, in Greece and Syria. The berries of this species or variety are larger than those of the **Common M.**, and have a very pleasant taste and smell.—A very humble species of *M.* (*M. nummularia*) spreads over the ground in the Falkland Islands, as thyme does in Britain.

**MYRTLE-WAX.** See **WAX.**

**MY'SIS**, a genus of podophthalmous (stalk-eyed) crustaceans, of the order *Stomapoda*, much resembling the common shrimps in form, although differing from them in the external position of the gills. They are often called *Opossum Shrimps*, because the last two feet are furnished with an appendage, which in the female forms a large pouch, and in this the eggs are received after they leave the ovary, and are retained till the young acquire a form very similar to that of the parent, when the whole brood are at once set free into the ocean. Species of *M.* are found on the British shores, but they are far more abundant in the Arctic seas, where they form no small part of the food of whales, and of many fishes, particularly of different species of salmon.

**MYSORE**, or **MAISUR**, a raj or principality of Southern India, under the protection of the British

government, in lat.  $11^{\circ} 35'$ — $15^{\circ}$  N., and in long.  $74^{\circ} 45'$ — $78^{\circ} 45'$  E. It is bounded on the N. by the British collectorate of Dharwar, and otherwise surrounded by districts belonging to the Madras presidency. The area is 27,000 square miles; the pop. in 1859—1860 was 3,822,053, and its gross revenue during the same year amounted to £958,460. M. is an extensive table-land, with an average elevation of about 2000 feet, and with a slope principally toward the north and north-east. The chief rivers are the Cauvery, flowing south-east, and the Tungabhadro, the Hugri, and the Pennar flowing north and north-east. The climate of the higher districts is during a great portion of the year healthy and pleasant. Besides the common grains, the province produces cinnamon, pepper, cardamoms, coffee, raw silk, cotton, the betel-nut, and sago-palm. Since 1832, the control of the country has been entirely in the hands of the English, and the government is administered by a British commissioner. Chief town, Mysore. For the history of M., see articles HYDER ALI, TIPPOO SAHIB, and INDIA.

MYSORE, or MAISUR, a city of India, the seat of a British residency, capital of the territory, and of the subdivision of the same name, is situated amid picturesque scenery on a declivity formed by two parallel ranges of elevated ground running north and south, 245 miles west-south-west of Madras, lat.  $12^{\circ} 19'$  N., long.  $76^{\circ} 42'$  E. The houses are generally built of teak, and among the chief edifices are the British residency and church. The fort is quadrangular in form, three of its sides being 450 yards in length, and the remaining side longer. The rajah's palace, occupying three sides of the interior fort, contains a magnificent chair or throne of gold. The climate is mild, but not healthy; fevers are of frequent occurrence. Carpets are manufactured. Pop. 65,000.

MYSTAGOGUE (Gr. *mustes*, an initiated person, and *ago*, I lead), the name in the Greek religious system of the priest whose duty it was to direct the preparations of the candidates for initiation in the several mysteries, as well as to conduct the ceremonial of initiation. It was sometimes applied by a sort of analogy to the class of professional *ciceroni*, who in ancient, as still in modern times, undertook to shew to strangers newly arrived in a city the noteworthy objects which it contained; but the former meaning is its primitive one, and formed the ground of the application of the same name in the Christian church, to the catechists or other clergy who prepared candidates for the Christian *mysteries*, or sacraments, of baptism, confirmation, and the eucharist, especially the last. In this sense, the word is constantly used by the fathers of the 4th and 5th centuries; and in the well-known lectures of St Cyril of Jerusalem, although all were addressed to candidates for the mysteries, some for baptism, and some for the eucharist, it is only to the lectures addressed to the latter that the name *mystagogic* is applied. This distinction was connected with the well-known Discipline of the Secret; and it appears to have ceased with the abolition or gradual disuse of that discipline.

MYSTERIES (Gr. from *muo*, to close the lips or eyes), also called *Teletai*, *Orgia*, or, in Latin, *Initia*, designate certain rites and ceremonies in ancient, chiefly Greek and Roman religions, only known to, and practised by, congregations of certain initiated men and women, at appointed seasons, and in strict seclusion. The origin, as well as the real purport of these mysteries, which take no unimportant place among the religious festivals of the classical period,

and which, in their ever-changing nature, designate various phases of religious development in the antique world, is all but unknown. It does seem, indeed, as if the vague speculations of modern times on the subject were an echo of the manifold interpretations of the various acts of the mysteries given by the priests to the inquiring disciple—according to the lights of the former or the latter. Some investigators, themselves not entirely free from certain mystic influences (like Creuzer and others), have held them to have been a kind of misty orb around a kernel of pure light, the bright rays of which were too strong for the eyes of the multitude; that, in fact, they hid under an outward garb of mummery a certain portion of the real and eternal truth of religion, the knowledge of which had been derived from some primeval, or, perhaps, the Mosaic revelation; if it could not be traced to certain (or uncertain) Egyptian, Indian, or generally Eastern sources. To this kind of hazy talk, however (which we only mention because it is still repeated every now and then), the real and thorough investigations begun by Lobbeck, and still pursued by many competent scholars in our own day, have, or ought to have, put an end. There cannot be anything more alien to the whole spirit of Greek and Roman antiquity than a hiding of abstract truths and occult wisdom under rites and formulas, songs and dances; and, in fact, the mysteries were anything but exclusive, either with respect to sex, age, or rank, in point of initiation. It was only the speculative tendency of later times, when Polytheism was on the wane, that tried to symbolise and allegorise these obscure, and partly imported ceremonies, the bulk of which had undoubtedly sprung from the midst of the Pelasgian tribes themselves in prehistoric times, and which were intended to represent and to celebrate certain natural phenomena in the visible creation. There is certainly no reason to deny that some more refined minds may at a very early period have endeavoured to impart a higher sense to these wondrous performances; but these can only be considered as solitary instances. The very fact of their having to be put down in later days as public nuisances in Rome herself, speaks volumes against the occult wisdom inculcated in secret assemblies of men and women.

The mysteries, as such, consisted of purifications, sacrificial offerings, processions, songs, dances, dramatic performances, and the like. The mystic formulas (*Deiknumena*, *Dromena*, *Legomena*, the latter including the Liturgies, &c.) were held deep secrets, and could only be communicated to those who had passed the last stage of preparation in the mystagogue's hand. The hold which the nightly secrecy of these meetings, together with their extraordinary worship, must naturally have taken upon minds more fresh and childlike than our advanced ages can boast of, was increased by all the mechanical contrivances of the effects of light and sound which the priests could command. Mysterious voices were heard singing, whispering, and sighing all around, lights gleamed in manifold colours from above and below, figures appeared and disappeared; the mimic, the tonic, the plastic—all the arts, in fact, were taxed to their very utmost to make these performances (the nearest approach to which, in this country, is furnished by transformation-scenes, or sensation-dramas in general) as attractive and profitable (to the priests) as could be. As far as we have any knowledge of the plots of these Mysteries as scenic representations, they generally brought the stories of the special gods or goddesses before the spectator—their births, sufferings, deaths, and resurrections. Many were the outward symbols used, of which such as the Phallus,

the Thyrsus, Flower Baskets, Mystic Boxes, in connection with special deities, told more or less their own tale, although the meanings supplied by later ages, from the Neo-platonists to our own day, are various, and often very amazing. The most important Mysteries were, in historical times, those of Eleusis and the Thesmophorian, both representing—each from a different point of view—the rape of Proserpina, and Ceres's search for her: the Thesmophorian mysteries being also in a manner connected with the Dionysian worship. There were further those of Zeus of Crete—derived from a very remote period—of Bacchus himself, of Cybele, and Aphrodite—the two latter with reference to the Mystery of Propagation, but celebrated in diametrically opposed ways, the former culminating in the self-mutilation of the worshipper, the latter in prostitution. Further, the Mysteries of Orpheus, who in a certain degree was considered the founder of all mysteries. Nor were the other gods and goddesses forgotten: Hera, Minerva, Diana, Hecate, nay, foreign gods like Mithras (q. v.), and the like, had their due secret solemnities all over the classical soil, and whithersoever Greek (and partly Roman) colonists took their Lares and Penates all over the antique world. The beginning of the reaction in the minds of thinking men, against this mostly gross and degenerated kind of veneration of natural powers and instincts, is marked by the period of the Hesiodic poems; and when towards the end of the classical periods, the mysteries were no longer secret, but public orgies of the most shameless kind, their days were numbered. The most subtle metaphysicians, allegorise and symbolise as they might, failed in reviving them, and in restoring them to whatever primeval dignity there might have once been inherent in them.

MYSTERIES AND MIRACLE-PLAYS were dramas founded on the historical parts of the Old and New Testaments, and the lives of the saints, performed during the middle ages, first in churches, and afterwards in the streets on fixed or movable stages. Mysteries were properly taken from biblical and miracle-plays from legendary subjects, but this distinction in nomenclature was not always strictly adhered to. We have an extant specimen of the religious play of a date prior to the beginning of the middle ages in the *Christos Paschön*, assigned, somewhat questionably, to Gregory Nazianzen, and written in 4th c. Greek. Next come six Latin plays on subjects connected with the lives of the saints, by Roswitha, a nun of Gandersheim, in Saxony, which, though not very artistically constructed, possess considerable dramatic power and interest; they have been lately published at Paris, with a French translation. The performers were at first the clergy and chorists, afterwards any layman might participate. The earliest recorded performance of a miracle-play took place in England. Matthew Paris relates that Geoffroy, afterwards Abbot of St Albans, while a secular, exhibited at Dunstable the miracle-play of *St Catherine*, and borrowed copies from St Albans to dress his characters. This must have been at the end of the 11th or beginning of the 12th century. Fitzstephen, in his *Life of Thomas à Becket*, 1183 A. D., describes with approval the representation in London of the sufferings of the saints and miracles of the confessors. On the establishment of the Corpus Christi festival by Pope Urban IV. in 1264, miracle-plays became one of its adjuncts, and every considerable town had a fraternity for their performance. Throughout the 15th and following centuries, they continued in full force in England, and are mentioned, sometimes approvingly, sometimes disapprovingly, by contemporary writers. Designed at first as a means

of religious instruction for the people, they had long before the Reformation so far departed from their original character, as to be mixed up in many instances with buffoonery and irreverence, intentional or unintentional, and to be the means of inducing contempt rather than respect for the church and religion. Remarkable collections exist of English mysteries and miracles of the 15th c., known as the Chester, the Coventry, and the Townley plays. The first two have been published by the Shakspeare Society, and the other by the Surtees Society. The Townley mysteries are full of the burlesque element, and contain many curious illustrations of contemporary manners.

Out of the mysteries and miracle-plays sprang a third class of religious plays called *Moralities*, in which allegorical personifications of the Virtues and Vices were introduced as *dramatis personæ*. These personages at first only took part in the play along with the scriptural or legendary characters, but afterwards entirely superseded them. The oldest known English compositions of this kind are of the time of Henry VI.; they are more elaborate and less interesting than the miracle-plays. Moralities continued in fashion till the time of Elizabeth, and were the immediate precursors of the regular drama.

Miracles and mysteries were as popular in France, Germany, Spain, and Italy as in England. A piece of the kind yet extant, composed in France in the 11th c., is entitled the *Mystery of the Wise and Foolish Virgins*, and written partly in the Provençal dialect and partly in Latin. A celebrated fraternity, called the *Confrérie de la Passion*, founded in Paris in 1350, had a monopoly for the performance of mysteries and miracle-plays, which were of such a length, that the exhibition of each occupied several days. A large number of the French mysteries of the 14th c. are extant. In the alpine districts of Germany, miracle-plays were composed and acted by the peasants: these peasant-plays had less regularity in their dramatic form, were often interspersed with songs and processions; and in their union of simplicity with high-wrought feeling were most characteristic of a people in whom the religious and dramatic element are both so largely developed. In the early part of last century, they began to partake to a limited extent of the burlesque, which had brought miracle-plays into disrepute elsewhere.

It is a mistake to suppose that the hostility of the reformers was what suppressed these exhibitions. The fathers of the Reformation shewed no unfriendly feeling towards them. Luther is reported to have said that they often did more good and produced more impression than sermons. The most direct encouragement was given to them by the founders of the Swedish Protestant Church, and by the earlier Lutheran bishops, Swedish and Danish. The authorship of one drama of the kind is assigned to Grotius. In England, the greatest check they received was from the rise of the secular drama; yet they continued to be occasionally performed in the times of James I. and Charles I., and it is well known that the first sketch of Milton's *Paradise Lost* was a sacred drama, where the opening speech was Satan's Address to the Sun. A degenerate relic of the miracle-play may yet be traced in some remote districts of England, where the story of St George, the dragon, and Beelzebub, is rudely represented by the peasantry. Strange to say, it was in the Catholic south of Germany, where these miracle-plays and mysteries had preserved most of their old religious character, that the severest blow was levelled against them. Even there, they had begun to be tainted to a limited

extent with the burlesque element, which had brought them into disrepute elsewhere. In 1779, a manifesto was issued by the Prince-archbishop of Salzburg, condemning them, and prohibiting their performance, on the ground of their ludicrous mixture of the sacred and the profane, the frequent bad acting in the serious parts, the distraction of the lower orders from more edifying modes of instruction, and the scandal arising from the exposure of sacred subjects to the ridicule of freethinkers. This ecclesiastical denunciation was followed by vigorous measures on the part of the civil authorities in Austria and Bavaria. One exception was made to the general suppression. In 1633, the villagers of Oberammergau, in the Bavarian highlands, on the cessation of a plague which desolated the surrounding country, had vowed to perform every tenth year the Passion of Our Saviour, out of gratitude, and as a means of religious instruction; a vow which had ever since been regularly observed. The pleading of a deputation of Ammergau peasants with Max. Joseph of Bavaria saved their mystery from the general condemnation, on condition of everything that could offend good taste being expunged. It was then and afterwards somewhat remodelled, and is perhaps the only mystery or miracle-play which has survived to the present day. The last performance took place in 1860. The inhabitants of this secluded village, long noted for their skill in carving in wood and ivory, have a rare union of artistic cultivation with perfect simplicity. Their familiarity with sacred subjects is even beyond what is usual in the alpine part of Germany, and the spectacle seems still to be looked on with feelings much like those with which it was originally conceived. What would elsewhere appear impious, is to the alpine peasants devout and edifying. The personator of Christ considers his part an act of religious worship; he and the other principal performers are said to be selected for their holy life, and consecrated to their work with prayer. The players, about 500 in number, are exclusively the villagers, who, though they have no artistic instruction except from the parish priest, act their parts with no little dramatic power, and a delicate appreciation of character. The New Testament narrative is strictly adhered to, the only legendary addition to it being the St Veronica handkerchief. The acts alternate with *tableaux* from the Old Testament and choral odes. Many thousands of the peasantry are attracted by the spectacle from all parts of the Tyrol and Bavaria, among whom the same earnest and devout demeanour prevails as among the performers. Plays of a humbler description, from subjects in legendary or sacred history, are not unfrequently got up by the villagers around Innsbruck, which shew a certain rude dramatic talent, though not comparable to what is exhibited at Ammergau. Girls very generally represent both the male and female characters.

**MYSTICISM** (Gr. *mustikos*, mystical), a term used with considerable vagueness, but implying that general tendency in religion to higher and more intimate communication with the Divine, to which, in most religions, ancient and modern, certain individuals or classes have laid claim. In the Platonic philosophy, and in the Eastern systems, from which that philosophy is derived, the human soul being regarded as a portion of the divine nature, it is held to be the great end of life to free the soul from the embarrassment and mental darkness in which it is held by the material trammels of the body in which it is imprisoned. In the pursuit of this end, two very opposite courses were adopted: the first, that of spiritual purification, partly by repressing the natural appetites and weakening the sensual

impulses by corporeal austerities, partly by elevating the soul through intense contemplation and withdrawal from the outward objects of sense; the other, that of regarding the soul as superior to the body, independent of its animal impulses, incapable, from its higher origin, of being affected by its outward actions, or sullied by contact with the corruption in which its lower nature might love to wallow. A similar element of M., which, in truth, must form in some sense a constituent of every religious system, is traceable in the early doctrinal history of Christianity, and the career of Christian M. also divides itself into the same twofold course. Among the early sects external to the church, we trace the first in the system of Tatian and of the Eucratites, while the second finds its parallel in the Syrian Gnostics, in Carpocrates, Bardisanes, and in one form at least of the Nicolaitic heresy. Within the Christian church there never has been wanting a continuous manifestation of the mystical element. The language of St Paul in Gal. ii. 20, and in 2d Cor. xii. 2, and many expressions in the Apocalypse, may be taken as the exponents of Christian M., the highest aspiration of which has ever been towards that state in which the Christian 'no longer liveth, but Christ liveth in him.' And although no regular scheme of M. can be found in the early Fathers, yet the writings of Hermas the Shepherd, the Epistles of St Ignatius, the works of St Clement of Alexandria, the Expositions of Origen, and above all, the Confessions of St Augustine, abound with outpourings of the true spirit of Christian mysticism. It is curious that the first systematic exposition of its principles is said to be in the works of the pseudo-Dionysius the Areopagite; but it was not till the days of the Scholastics that it received its full development, when the mystic life was resolved into its three stages, viz., of Purification, of Illumination, and of Ecstatic Union with God and Absorption in Divine Contemplation. It was upon the explanation of this third stage that the great division of the medieval mystic schools mainly turned; some of them explaining the union with God in a pantheistic or semipantheistic sense, and thereby annihilating the individual will, and almost the personal action of man in the state of ecstasy; others, with St Bernard, fully preserving both the individuality and the freedom of man, even in the highest spiritual communication with his Creator. Of the former, many, as the Hesychasts (q. v.) in the Greek Church, and the Brethren of the Free Spirit (q. v.) and the Beghards in the Latin, drew from these mystical doctrines the most revolting moral consequences; in others, as Tauler, Ruysbroek, Ekkart, the error does not seem to have gone beyond the sphere of speculation. The writings of Thomas à Kempis (q. v.), of St Catherine of Siena, of St John of the Cross, and of St Teresa, may perhaps be taken as the most characteristic representations of the more modern form of the traditionary M. which has come down from the mystics of the middle ages.

The later history of M. in the Roman Catholic Church will be found under the heads of FENELOS, MADAME GUYON, MOLINOS, and QUIETISM. The most remarkable followers of the same or kindred doctrines in the Protestant communions are Jacob Bohmer of Gœrlitz, Emmanuel Swedenborg (q. v.), and the celebrated William Law (q. v.).

**MYTH AND MYTHOLOGY.** The word *myth* (Gr. *mythos*), originally signified *speech* or *discourse*, and was identical with the word *logos*. After the age of Pindar and Herodotus, however, it came to be synonymous with the Latin word *fabula*, *fable* or *legend*. According to the present use of our language, a myth is an idea or fancy presented in the historical form; and though, of course, any fiction at any time

in this shape might be called a myth, yet by usage the word is confined to those fictions made in the early periods of a people's existence, for the purpose of presenting their religious belief, and generally their oldest traditions, in an attractive form. The tendency to create myths in this way seems inherent in every people; certainly there is no people so sunk into the brute as to be without them. A myth is not to be confounded with an allegory; the one being an unconscious act of the popular mind at an early stage of society, the other a conscious act of the individual mind at any stage of social progress. The parables of the New Testament are allegorical; so are *Æsop's Fables*; no one mistakes them for realities; they are known to have been invented for a special didactic purpose, and so received. But the peculiarity of myths is, that they are not only conceived in the narrative form, but generally taken for real narrations by the people to whom they belong, so long at least as they do not pass a certain stage of intellectual culture. Even myths of which the allegorical significance is pretty plain, such as the well-known Greek myth of Prometheus and Epimetheus, were received as facts of early tradition by the Greeks. Myths may be divided into several classes, of which the first and most important is the theological and moral. The oldest theology of all nations is in the form of myths; hence the great importance of mythological study, now universally recognised; for it is not occupied merely or mainly with strange fancies and marvellous fictions, invented for the sake of amusement, but contains the fundamental ideas belonging to the moral and religious nature of man as they have been embodied by the imaginative faculty of the most favoured races. It is this dominance of the imagination, so characteristic of the early stages of society, which gives to myth its peculiar dramatic expression, and stamps the popular creed of all nations with the character of a poetry of nature, of man, and of God. From the very nature of the case, the myth-producing faculty exercises itself with exuberance only under the polytheistic form of religion; for there only does a sufficient number of celestial personages exist, whose attributes and actions may be exhibited in a narrative form; there is nothing, however, to prevent even a monotheistic people from exhibiting certain great ideas of their faith in a narrative form, so as by prosaic minds to be taken for literal historical facts. But besides strictly theological myths, there are physical myths, that is, fictions representing the most striking appearances and changes of external nature in the form of poetical history; in which view, the connection of legends about giants, chimeras, &c., with regions marked by peculiar volcanic phenomena, has been often remarked. It is difficult indeed, in polytheistic religions, to draw any strict line between physical and theological myths; as the divinity of all the operations of nature is the first postulate of polytheism, and every physical phenomenon becomes the manifestation of a god. Again, though it may appear a contradiction, there are historical myths; that is, marvellous legends about persons, who may with probability be supposed to have actually existed. So intermingled, indeed, is fact with fable in early times, that there must always be a kind of debatable land between plain theological myth and recognised historical fact. This land is occupied by what are called the heroic myths; that is, legends about heroes, concerning whom it may often be doubtful whether they are merely a sort of inferior, and more human-like gods, or only men of more than ordinary powers whom the popular imagination has elevated into demi-gods.

The scientific study of mythology commenced with

the ancient nations who produced it, specially with the acute and speculative Greeks. The great mass of the Greek people, indeed—of whom we have a characteristic type in the traveller Pausanias—accepted their oldest legends, in the mass, as divine and human facts; but so early as the time of Euripides, or even before his day in the case of the Sicilians, Epicharmus and Empedocles, we find that philosophers and poets had begun to identify Jove with the upper sky, Apollo with the sun, Juno with the nether atmosphere, and so forth; that is, they interpreted their mythology as a theology and poetry of nature. This, indeed, may be regarded as the prevalent view among all the more reflective and philosophical heathens (who were not, like Xenophon, orthodox believers) up from the age of Pericles, 450 B. C., to the establishment of Christianity. But there was an altogether opposite view, which arose at a later period, under less genial circumstances, and exercised no small influence both on Greek and Roman writers. This view was first prominently put forth by Euhemerus, a Messenian, in the time of the first Ptolemics, and consisted in the flat prosaic assertion, that the gods, equally with the heroes, were originally men, and all the tales about them only human facts sublimed and elevated by the imagination of pious devotees. This view seemed to derive strong support from the known stories about the birth and death of the gods, specially of Jove in Crete; and the growing sceptical tendencies of the scientific school at Alexandria, were of course favourable to the promulgation of such views. The work of Euhemerus accordingly obtained a wide circulation; and having been translated into Latin, went to nourish that crass form of religious scepticism which was one of the most notable symptoms of the decline of Roman genius at the time of the emperors. Historians, like Diodorus, gladly adopted an interpretation of the popular mythology which promised to swell their stores of reliable material; the myths accordingly were coolly emptied of the poetic soul which inspired them, and the early traditions of the heroic ages were set forth as plain history, with a grave sobriety equally opposed to sound criticism, natural piety, and good taste.

In modern times, the Greek mythology has again formed the basis of much speculation on the character of myths and the general laws of mythical interpretation. The first tendency of modern Christian scholars, following the track long before taken by the fathers, was to refer all Greek mythology to a corruption of Old Testament doctrine and history. Of this system of interpreting myths, we have examples in Vossius, in the learned and fanciful works of Bryant and Faber, and very recently, though with more pious and poetic feeling, in Gladstone. But the Germans, who have taken the lead here, as in other regions of combined research and speculation, have long ago given up this ground as untenable, and have introduced the rational method of interpreting every system of myths, in the first place, according to the peculiar laws traceable in its own genius and growth. Ground was broken in this department by Heyne, whose views have been tested, corrected, and enlarged by a great number of learned, ingenious, and philosophical writers among his own countrymen, specially by Buttman, Voss, Crenzer, Müller, Welcker, Gerhard, and Preller. The general tendency of the Germans is to start—as Wordsworth does in his *Excursion*, book iv.—from the position of a devout imaginative contemplation of nature, in which the myths originated, and to trace the working out of those ideas, in different places and at different times, with the most critical research, and the most vivid reconstruction. If in

this work they have given birth to a large mass of ingenious nonsense and brilliant guess-work, there has not been wanting among them abundance of sober judgment and sound sense to counteract such extravagances. It may be noticed however, as characteristic of their over-speculative intellect, that they have a tendency to bring the sway of theological and physical symbols down into a region of what appears to be plain historical fact; so that Achilles becomes a water-god, Peleus a mud-god, and the whole of the *Iliad*, according to Forchhammer, a poetical geology of Thessaly and the Troad! Going to the opposite extreme from Euhemerus, they have denied the existence even of deified heroes; all the heroes of Greek tradition, according to Uschold, are only degraded gods; and generally in German writers, a preference of transcendental to simple and obvious explanations of myths is noticeable. Creuzer, some of whose views had been anticipated by Blackwell, in Scotland, is especially remarkable for the high ground of religious and philosophical conception on which he has placed the interpretation of myths; and he was also the first who directed attention to the oriental element in Greek mythology—not, indeed, with sufficient discrimination in many cases, but to the great enrichment of mythological material, and the enlargement of philosophical survey. In the most

recent times, by uniting the excursive method of Creuzer with the correction supplied by the more critical method of O. Müller and his successors, the science of comparative mythology has been launched into existence; and specially the comparison of the earliest Greek mythology with the sacred legends of the Hindus, has been ably advocated by Max Müller in the *Oxford Essays* (1856). In France, the views of Euhemerus were propounded by Banier (1739); and generally the French scholars, such as Raoul Rochette and Petit Radet shew a distinct national tendency to recognise as much of the historical element as possible in mythology. By the British scholars, mythology is a field that has been very scantily cultivated. Besides those already named, Payne Knight, Mackay, Grote in the first volumes of his history, and Keightley are the only names of any note, and their works can in nowise compete in originality, extent of research, in discriminating criticism, or in largeness of view, with the productions of the German school. The best for common purposes is Keightley; the most original, Payne Knight. On the special mythologies of India, Rome, Greece, &c., information will be found under the heads of the respective countries to which they belong. The more important mythological personages are noticed under their own names; see BACCHUS, JUPITER, HERCULES, &c.

# N

THE fourteenth letter of the English alphabet, is one of the nasal liquids of the lingual class. See LETTERS. Its Hebrew (and Phœnician) name, *Nun*, signified a *fish*, which its original form was probably meant to represent. N is interchangeable with L (q. v.) and M, as in *collect*, *commingle*, *confer*; and in Ger. *boden*, compared with Eng. *bottom*.

In Latin, this letter had a faint, uncertain sound at the end of words and in some other positions, especially before *s*. This accounts for words in *on* having lost the *n* in the nominative case, though retaining it in the oblique cases, as *homo*, *hominis*; and for Greek names like *Platon* being written without the final *n* in Latin. The dull, muffled pronunciation of *n*, which is indicated by such words as *consul*, *cesor*, *testamento*, being frequently spelled *cosul*, *cesor*, *testameto*, was the first stage of the modern French nasal *n*. Before a guttural letter, *n* naturally assumes the sound of *ng*, as *bank*.

NAAS, a market and assize town of Kildare County, Ireland, 20½ miles south-west of Dublin. The population in 1861 was 2959, of whom 2655 were Catholics, 276 Protestants of the Established Church, and the rest Protestants of other denominations. The number of inhabited houses was 529. Having been anciently the seat of the kings of Leinster, N. was early occupied by the English. A parliament was held in it in 1419, and it obtained charters successively from Henry V., Elizabeth, and James I. At present, N. is a place of little trade, and is almost entirely without manufactures. It returned two members to the Irish parliament, but was disfranchised at the Union. It is the seat of a diocesan school, and of three national schools (one of which is attached to the Roman Catholic convent), containing (1861) 732 pupils, of whom 359 are boys, and 373 girls.

NA'BOB, or NABAB, a corruption of the word *Nawáb* (deputy), was the title belonging to the administrators, under the Mogul empire, of the separate provinces into which the district of a *Subahdar* (q. v.) was divided. The title was continued under the British rule, but it gradually came to be applied generally to natives who were men of wealth and consideration. In Europe, and especially in Britain, it is applied derisively to those who, having made great fortunes in the Indies, return to their native country, where they live in oriental splendour.

NABONA'SSAR, ERA OF, was the starting-point of Babylonian chronology, and was adopted by the Greeks of Alexandria, Berosus and others. It began with the accession of Nabonassar to the throne—an event calculated (from certain astronomical phenomena recorded by Ptolemy) to have taken place 26th February 747 B. c.

NÁBULU'S, or NÁBLU'S (a corruption of the Gr. *Neapolis*, New City, the name given to it in the reign

of Vespasian), anciently called SHECHEM or SICHEM, in the New Testament (John iv. 5), SYCHAR; is a town of Palestine, possessing, it is said, 'the only beautiful site from Dan to Beersheba.' It lies between Mount Ebal and Mount Gerizim, on the south side of the valley of Erd-Mákhna, and has a population variously estimated at from 8000 to 14,000, of whom about 500 are Christians, 150 Samaritans, and 50 Jews; the rest are Moham-medans, fierce, turbulent, and fanatical. The houses are pretty good, but the streets (as usual in the East) are narrow, gloomy, and filthy. The chief productions are soap, cotton, and oil—the soap-manufactories are large, and the oil is considered the best in Syria.—See Porter's *Handbook for Syria and Palestine*, and Stanley's *Palestine*.

NACRE. See MOTHER OF PEARL.

NADIR, an Arabic word signifying that point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and centre of the earth are in one straight line. The zenith and nadir form the poles of the Horizon (q. v.). See ZENITH.

NADIR SHAH, of Persia, belonged to the Afshars, a Turkish tribe, and was born near Kelat, in the centre of Khorassan, Persia, in 1688. When 17 years old, he was taken prisoner by the Usbeks, but escaped after four years of captivity; entered the service of the governor of Khorassan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offence, he betook himself to a lawless life, and for several years was the daring leader of a band of 3000 robbers, who levied contributions from almost the whole of Khorassan. An opportunity having occurred, N. seized the town of Kelat, and gradually extended his territorial authority. Persia was at this time ruled by Melek Ashraf, an Afghan of the tribe of Ghilji, whose grinding tyranny and cruelty produced in the mind of every Persian a deadly hatred of the very name Afghan, which exists to the present day. N. having avowed his intention of expelling the hated race from the country, and restoring the Saffavean dynasty, numbers flocked to his standard, and Meshed, Herat, and all Khorassan were speedily reduced. Ashraf, signally defeated in several engagements, fled before the avenger, who, with a celerity only equalled by its thoroughness, purged the provinces of Irak, Fars, and Kerman of even the semblance of Afghan domination. The assassination of Ashraf, during his retreat, terminated the war. The rightful heir, Tamasp, then ascended the throne, and N. received for his services the government of the provinces of Khorassan, Mazanderan, Seistan, and Kerman, assuming at the same time the title of Tamasp-kúli (the Slave of Tamasp), the title of khan being subsequently added. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which had been seized by the Turks in the preceding reign; but

his sovereign having in his absence engaged unsuccessfully the same enemy, N. caused him to be put in prison, and elevated his infant son, Abbas III., to the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of N. himself, who was crowned as *Nadir Shah*, February 26, 1736. He resumed the war with the Turks; and though totally defeated in the first two battles by the Grand Vizier Asman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also conquered Afghanistan, and drove back the invading Usbeks. His ambassador to the Great Mogul having been murdered along with all his suite at Jelalabad, and satisfaction having been refused, N. in revenge ravaged the North-west Provinces, and took Delhi, which he was, by the insane behaviour of the inhabitants, reduced to the necessity of pillaging. With booty to the amount of £20,000,000, including the Koh-i-nūr (q.v.) diamond, he returned to the west bank of the Indus. He next reduced Bokhara and Kharezm, restoring to Persia her limits under the golden reign of the Sassanides. From this period, his character underwent a sudden change: he was formerly open-hearted, liberal, and tolerant; he now became suspicious, avaricious, and tyrannical. The empire groaned under his extortions, and he was finally assassinated on the 20th June 1747. His only surviving son was carried to Constantinople, and thence to Vienna, where he was brought up as a Catholic, under the surveillance of the Empress Maria Theresa, and died a major in the Austrian service, under the title of Baron Semlin. N.'s tyranny has now been forgotten; and at the present day, he is regarded with pride and gratitude as the 'Wallace' of Persia.

NÆVIUS, Cn., one of the earliest Latin poets, was born, probably in Campania, in the first half of the 3d c. B.C. In his youth, he served in the first Punic war; but about the year 235 B.C., he made his appearance at Rome as a dramatic writer. Of his life, we know little; but of his character, rather more. He was very decidedly attached to the plebeian party; and in his plays, satirised and lampooned the Roman nobles with all the virulence and indiscretion of a hot-blooded impetuous Campanian—that Gascon of ancient Italy! His rashness ultimately caused his banishment to Utica in Africa, where he died, 204 or 202 B.C. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, *De Bello Punico*, in the old Saturnian metre. Of these, only a few very unimportant fragments are extant, which may be found in Bothe's *Poëtarum Latinorum Scenicorum Fragmenta* (Halberstadt, 1824); or Klunmann's collection of the same (Jena, 1843), enriched by a life of N., and an essay on his poetry. See also Sellars's *Poets of the Roman Republic* (Edin. 1863).

NÆVUS (known popularly as *mother-spot* or *mole*) is a congenital mark or growth on a part of the skin. Sometimes it is merely a dark discoloration of the surface as described in the article MACULE, in which case it is termed a mole and is perfectly harmless; but often it consists of a dense network of dilated blood-vessels, forming a reddish or livid tumour, more or less elevated above the surface of the surrounding skin. The most frequent situations of these vascular nævi are the skin and subcutaneous cellular tissue of the head; but they may occur elsewhere. The popular belief is, that they are caused by the longing of the mother during her pregnancy for a lobster, or strawberry or raspberry, or some other red-coloured article of food, and that the influence of her mind has impressed upon the

factus a more or less vivid image of the thing she longed for; and hence the name of *mother-spot*. Sometimes these tumours waste away spontaneously, and give no trouble; but frequently they increase rapidly, invade the adjacent tissues, and ulcerate or slough, and thus become dangerous to life by hæmorrhage. When these tumours do not shew a tendency to increase, no treatment is necessary. When they are obviously increasing in size, the continual application of cold (by means of freezing mixtures), with moderately firm pressure, is sometimes of service; but a more certain method is to employ means to produce such an amount of inflammation as to obliterate the vessels; for this purpose, the seton, the application of nitric acid, and vaccination of the tumour, have been successfully applied. The injection of strong astringents, with the view of coagulating the blood, has sometimes effected a cure. If all these means fail, extirpation, either with the ligature or knife, must be resorted to; the ligature being regarded as the safest and best method. For the various methods of applying the ligature, the reader is referred to any standard work on operative surgery. If the tumour is in an inaccessible spot, as in the orbit of the eye, and is increasing rapidly, the only course is to tie the large vascular trunk supplying it. The common carotid artery has in several instances been tied with success for vascular nævus in the orbit.

NÄTELS, a village of Switzerland, in the canton of Glarus, and five miles north of the town of that name, in a deep valley, is one of the most famous battle-fields in the country. Pop. 2000. Here, in 1388, 1500 men of Glarus, under Matthias an Buhl, overthrew an Austrian force of from 6000 to 8000 men. The event is still celebrated yearly.

NĀGA is, in Hindu Mythology, the name of deified serpents, which are represented as the sons of the Muni Kas'yapa and his wife Kadrū, whence they are also called Kādraveyas. Their king is S'esha, the sacred serpent of Vishnu.

NĀGAPATNAM, a seaport of British India, on the Coromandel coast, in the province of Tanjur, 15 miles south of Karikal. It was taken by the Dutch in 1660, but fell into the hands of the English in 1781. Its site is an open sandy plain, elevated only three or four feet above sea-level. The port is visited by small vessels, and carries on some trade with Ceylon. Pop. 10,000, many of whom are of Dutch descent.

NĀGĀRJUNA, or NĀGASENA, is the name of one of the most celebrated Buddhist teachers or patriarchs—the thirteenth—who, according to some, lived about 400 years, according to others, about 500 years, after the death of the Buddha Sākya-muni (i. e., 143 or 43 B.C.). He was the founder of the Mādhyamika school, and his principal disciples were Aryadeva and Budhapālita. According to the tradition of the Buddhists, he was born in the south of India, in a Brahmanical family. Even as a child, he studied all the four Vedas; later, he travelled through various countries, and became proficient in astronomy, geography, and magical arts. By means of the last, he had several amorous adventures, which ended in the death of three companions of his, but in his own repentance, and, with the assistance of a Buddhist mendicant, in his conversion to Buddhism. Many miracles are, of course, attributed to his career as propagator of this doctrine, especially in the south of India, and his life is said to have lasted 300 years.—See E. Burnouf, *Introduction à l'histoire du Bouddhisme Indien* (Paris, 1844); Spence Hardy, *A Manual of Buddhism* (Lond. 1853); W. Wassiljew, *Der*

*Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

NAGASAKI, or NANGASIKI, a city and port of Japan, opened to foreign commerce by the treaty of 1858, on the 1st July 1859, is situated in 32° 44' N. lat., and 129° 51' E. long., at the western extremity of the peninsula of Fizen, which forms the north-west portion of the island of Kiusiu. Previously to 1859, it was the only port in Japan open to foreigners. The harbour, which is one of the most beautiful in the world, is about six miles in width, and three or four in length. To a person inside, it appears completely land-locked, and it is surrounded by hills of about 1500 feet in height. These are broken into long ridges and deep valleys; while the more fertile spots are terraced and under cultivation. The town of N., which is about a mile in length, and three-quarters of a mile in width, lies on the north side of the bay; its population is estimated at 70,000. On the opposite side of the bay, the Japanese have a steam-factory, under the direction of Dutch officers. The climate of N. is genial. Towards the end of June, the thermometer ranges from 62° to 78°. Observations extending over the three hottest months of the year, from June 13 to September 13, 1859, shew that the thermometer ranged from 70° to 96° in the shade. During these three months, there were twenty-four days of constant rain, which was most excessive from the 24th of June to the end of July. The water at N. is bad, and there is more disease than at Hakodadi, where water is both good and plentiful. Cholera and typhus fever are sometimes virulent. At the end of the third year from the opening of the port, the foreign community consisted of thirty-nine persons. The trade of N. is inferior to that of Kanagawa. Sea-weed, salt-fish, and other articles are exported to China. The exports to Europe are mainly tea, vegetable wax, and copper. The total value of imports in the year 1861 amounted to 669,261 dollars, and the exports to 1,000,317 dollars, or about £140,000 and £203,000.—See Alcock's *Three Years' Residence in Japan*, vol. ii. p. 387 (Lond. 1862); *Yedo and Peking*, by Robert Fortune (Lond. 1863); Hodgson's *Residence at Nagasaki, &c.*, in 1859—1860 (Lond. 1861).

NAGELFLUE, the provincial name for a bed of conglomerate belonging to the Mollasse (q. v.), which forms a considerable portion of the strata in the central region of Switzerland, between the Alps and the Jura. It is said to attain the enormous thickness of 6000 and 8000 feet in the Rhigi near Lucerne, and in the Speer near Wesen.

NAGKESUR, the name under which the blossoms of the *Mesua ferrea* are sold in the bazaars of India. See GUTTIFERÆ.

NAGPUR, a city of British India, capital of the province of the same name, and situated near its north-west extremity, in an unhealthy swampy hollow, 430 miles in a direct line east-north-east of Bombay. Inclusive of its extensive suburbs, it is seven miles in circumference. It contains no important edifices. The great body of the inhabitants live in thatched mud-tents, interspersed with trees, which prevent the circulation of air, and secrete moisture, thus rendering the town unnecessarily unhealthy. The mean temperature of N. is estimated at about 80° F. Cotton cloths, coarse and fine chintzes, turbans, silks, brocades, blankets, woollens, tent-cloths, and articles in copper and brass, are manufactured. Here, on the 26th and 27th November 1817, a small British force of 1350 men, commanded by Colonel Scott, defeated a native army of 18,000 men. Pop. 115,000.

NÁGPUR, an extensive inland province of British India, belonging in its civil administration to the Bengal, and in its military to the Madras Presidency, extends immediately north-east of the Nizam's Dominions, in lat. 17° 15'—23° 5' N.; long. 78° 3'—83° 10'. Area, 76,432 square miles; pop. 4,650,000. The north part of the province is mountainous in character, being traversed by spurs of the great Vindhya range; the general slope of the surface is from north-west to south-east, and the Bay of Bengal receives the drainage of the country chiefly through the rivers Máhanadi and Wain Gangá—the latter a tributary of the Godávari. The climate is not healthy, and is especially insalubrious in the extensive tracts of low marshy land which abound in the province. The Gonds (see INDIA), supposed to be the aborigines, are the most remarkable class of the inhabitants. They rear fowls, swine, and buffaloes; but their country, forming the south-eastern tracts—about one-third of the whole—is covered with a dense jungle, swarming with tigers. In the more favoured districts, where the inhabitants are more industrious, rice, maize, oil, and other seeds, and vegetables are extensively cultivated. The rajahs of N., sometimes called the rajahs of Berar, ruled over a state formed out of a part of the great Mahratta kingdom. The dynasty, however, died out in 1853, and the territory came into the possession of the British. The province has five divisions—capital, Nágpur.

NAG'S HEAD CONSECRATION. This story, which was first circulated by the Roman Catholics forty years after the event, with respect to Archbishop Parker's consecration, was to the following effect. On the passing of the first Act of Uniformity in the first year of Queen Elizabeth, fourteen bishops vacated their sees, and all the other sees excepting that of Llandaff being vacant, there was a difficulty in maintaining the hitherto unbroken succession of bishops from apostolical times. Kitchin of Llandaff refused to officiate at Parker's consecration, and consequently the Protestant divines procured the help of Scory, a deprived bishop of the reign of Edward VI., and all having met at the Nag's Head Tavern in Cheapside, they knelt before Scory, who laid a Bible on their heads or shoulders, saying: 'Take thou authority to preach the word of God sincerely;' and they rose up bishops of the New Church of England! The story is discredited by the Roman Catholic historian Lingard, and is carefully refuted by Strype in his life of Parker. The facts of the case are, that the election took place in the chapter-house at Canterbury, the confirmation at St Mary le Bow's Church in Cheapside, and the consecration in the chapel of Lambeth Palace. Scory, then elected to the see of Hereford; Barlow, formerly Bishop of Wells, then elected to Chichester; Coverdale, formerly of Exeter, and never reappointed to any see; and Hodgkin, suffragan of Hereford, officiated at the consecration. The Nag's Head story probably arose from the company having possibly gone from Bow Church, after the confirmation, to take a dinner together at the tavern hard by, according to the prevailing custom. The due succession of bishops in the English Church has never been broken.

NAGY, a Hungarian word, meaning 'great.' It is prefixed to the names of many towns in Hungary and Transylvania. In the present work, many of the towns that take this prefix are given under the name that comes after it.

NAGY BANYA. See BANYA.

NAGY ENYED, a small town of Transylvania, on the Maros, 17 miles north-north-east of Karlsburg.

It contains a famous Calvinistic college. Pop. under 6000.

**NAIUM**, one of the twelve minor prophets, was a native either of Elkosh, in Galilee, or the son of a man named Elkosh. The identification of his birthplace with Capernaum (Nahum's Village) or a place called Elkosh, on the east side of the Tigris, not far from Nineveh, is the result of vague speculation. He was probably a contemporary of Isaiah, and flourished about 713—711 B.C. The burden of his 'vision' (in 3d chap.) is the destruction of Nineveh and the downfall of the Assyrian kingdom. His style is full of animation, fancy, and originality, and at the same time clear and rounded. His language throughout is classical, and in the purest Hebrew, belonging to the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem (2 Kings xix. 35, &c.). A commentary on N., with special reference to the Assyrian monuments lately discovered, has been written by O. Strass (Berlin, 1853).

**NA'IA.** See **ASP** and **COBRA**.

**NA'IADES**, **NAIADA'CEÆ**, or **POTAMEÆ**, a natural order of endogenous plants, divided by some botanists into several orders (*Juncagineæ*, *Zosteraceæ*, &c.), containing in all not quite 100 known species, all aquatic plants, some of them inhabiting the ocean, some found in lakes and ponds, some in streams. They are all of very cellular structure; the leaves have parallel veins, and the flowers are inconspicuous. To this order belongs the Pondweed (*Potamogeton*), of which a number of species abound in the still waters of Britain, and of which some are found as far north as Iceland. To this order also belongs the **GRASSWACK** (q. v.) of our shores, used for stuffing mattresses. The Lattice-leaf (q. v.) of Madagascar is one of the most interesting species, and one of the few which attract notice as in any way beautiful.

**NAIADS**, in Grecian Mythology, the nymphs of fresh-water lakes, rivers, and fountains. They were believed to possess the power of inspiration; hence, soothsayers and others are sometimes called *nympholeptoi* (seized by the nymph). They were represented as half-clothed maidens, and not unfrequently as companions of Pan, of Hercules, the patron of warm springs, or of the Sileni and the Satyrs, in whose jovial dances they join.

Naiaint.

**NAIANT**, or **NATANT** (Lat. *natare*, to swim), a heraldic term applied to a fish when borne horizontally across the shield in a swimming position.

**NAIGUE**, or **NAIK**, a native subaltern officer among Indian and Anglo-Asiatic troops, whose functions are somewhat analogous to those performed among European troops by the drill-sergeant.

**NAILS** are flattened, elastic, horny plates, which are placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a *root*, or part concealed within a fold of the skin; a *body*, or exposed part attached to the surface of the skin; and a free anterior extremity called the *edge*. The skin below the root and body of the nail is termed the *matrix*, from its being the part from which the nail is produced. This is thick, and covered with highly vascular papillæ, and its colour is seen through the transparent horny tissue. Near the root, the papillæ are smaller and less vascular; hence

the portion of nail corresponding to this part is of a whiter colour; from its form, this portion is termed the *lunula*. It is by the successive growth of new cells at the root and under the body of the nail that it advances forwards, and maintains a due thickness, whilst at the same time its growth in a proper direction is insured. The chemical composition of the nails is given in the article **HORNY TISSUES**, to which class of structures they belong. According to the observation of Beau, the finger-nails grow at the rate of about two-fifths of a line in a week, while the toe-nails only grow with about one-fourth of that rapidity. When a nail has been removed by violence, or has been thrown off in consequence of the formation of matter (*pus*) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail*. Its most usual seat is by the side of the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed by the use of tight shoes against its edge. These parts become swollen and inflamed; suppuration ensues, and an intensely sensitive ulcer is formed, in which the nail is embedded. Surgical advice should at once be resorted to in these cases, as there is no probability that the ulcer will heal spontaneously, especially if the patient continue to move about, and thus keep up irritation. In obstinate cases, it is not unfrequently necessary to remove a portion of the nail, an operation attended with much pain, although quickly performed.

**NAILS**, pointed pieces of metal, usually with flattened or rounded heads, used for driving into wood-work, for the purpose of holding the pieces together. A variety, in which the head is very large, and the spike portion small, used by shoemakers for protecting the soles of boots and shoes from wear, is called the *lob-nail*; another, which is made by cutting thin plate-iron into thin pointed pieces of various lengths, is called *brads*; these sometimes are without heads, but are usually made with a slight projection by way of a head. When made small, with flat heads, for attaching cloth or hangings in upholstery-work, they are called *tacks*; and when very large for heavy carpentry, *spikes*.

*Nail-making*.—Formerly, all nails were hand-made, by forging on an anvil; and in Britain and the north of Europe, vast quantities are still made in this manner, being preferable, for many kinds of carpenters' work, to those made by machinery. In France, the greater part of the nails used for light carpentry-work are made of soft iron wire, pointed with the hammer; and in order to head them, they are pinched in a toothed vice, which leaves the portion for the head projecting, and makes below it three or four grooves in the nail, which increase its hold on the wood when driven home. The head is beaten into a counter-sinking on the vice, which regulates the size.

The iron used for hand nail-making in Britain is sold in bundles, and is called *nail-rods*; it is either prepared by rolling the malleable iron into rods or small bars of the required thickness—which process is only employed for very fine qualities—or by cutting plate-iron into strips by means of rolling-shears: these shears consist of two powerful revolving shafts (*a, a*, fig.), upon which are fixed discs of hard steel with squared edges (*b, b*, fig.). The discs of one shaft alternate with those of the other; they are of the thickness of the plate to be cut, and the shafts are so placed, that a small portion of one set of the discs are inserted between those of the other set. When the shafts are revolving, a plate of iron is

pressed between the discs in the plane of the dotted line *c, c*, fig.; and it is forcibly drawn through, the steel discs cutting the plates into strips with

great rapidity. The quantity produced in this way is enormous, some mills turning out at the rate of ten miles per hour of nail-rods.

Several inventions, in which America took the lead, have been introduced, and are successfully worked, for making nails direct from plate-iron, either by cutting them out cold or hot; and a very large proportion of the nails in use are made in this way. Nail-making by machinery was originated in Massachusetts in 1810.

**NAIN DE TILLEMONT.** See TILLEMONT.

**NAIRN**, in the county of the same name, is a royal, parliamentary, and municipal burgh, and is 15 miles north-east by rail from Inverness. It is situated at the mouth of the river Nairn, on the west side, and for that reason was anciently called Inver-nairn. Lying on the southern shore of the Moray Firth, which is here about eight miles across, it commands a grand and extensive view of the coast of Ross-shire, including Cromarty Bay, nearly opposite. N. was regalsed by William the Lion. It has little historical interest, and few objects worthy of antiquarian attention. It is principally remarkable for the excellence of its sea-bathing and artificial baths, in which respect it is equal, if not superior, to any town in the north of Scotland, and on account of which it is a fashionable place of resort in the summer season. The temperature is mild and equable. The inhabitants enjoy a remarkable immunity from epidemic diseases. There is a commodious harbour. The town has a literary society, a museum, a newspaper, and three branch banks. Pop. in 1861, 3829; constituency in 1863, 131. N. unites with Inverness, Forbes, and Fortrose in sending a member to parliament.

**NAIRNSHIRE** is bounded on the N. by the Moray Firth, and on its other sides by the counties of Inverness and Moray, of the latter of which it anciently formed a part. It extends north and south 22 miles, and 15 miles from east to west. Its area is 215 square miles, or 137,500 acres. Pop. in 1861, 10,065, including the burgh of Nairn; constituency in 1863, 293. The rental, according to the valuation roll of 1863—1864, is £26,743, 16s. 5d., exclusive of the railway valuation. Nairn is the only royal burgh in the county, but there are the villages of Cawdor and Auldearn. The soil is for the most part light and sandy. There is, however, considerable agricultural activity, though the county is perhaps better known for its cattle-breeding. An important cattle 'tryst' is held at Cawdor once a month during the greater part of the year. The

climate of this county is distinguished for its salubrity, and the temperature is remarkably equable. The thermometer in the shade has not risen above 78° 3', or fallen below 11° 2', during the last twenty years. According to the latest observations, the yearly rainfall did not amount to more than 26 inches, the greatest fall being in October, and the least in April. At Brackla Distillery, which belongs to Robert Fraser, Esq., from 40,000 to 50,000 gallons of spirits are manufactured annually. The river Nairn runs through the county in a beautiful valley, which presents particularly attractive and romantic scenery in the neighbourhood of Cawdor Castle, one of the residences of the Earl of Cawdor. This castle is of uncertain antiquity, and is in an excellent state of preservation. It was the residence of the ancient Thanes of Cawdor, one of whom is mentioned in *Macbeth*. About the year 1510, the estates belonging to the earldom passed by marriage from the old family of Calder into the hands of a son of the Duke of Argyll, and are still in the possession of his descendants. Not a few other objects of antiquarian interest are to be found in the county of Nairn.

**NAISSANT**, a term applied in heraldic blazon to an animal depicted as coming forth out of the middle—not like *Issuant* (q. v.), out of the boundary line—of an ordinary.

Naissant.

**NAKHICHEVAN**, ON THE DON, a thriving town of South Russia, in the government of Ekaterinoslav, on the right bank of the Don, and near the mouth of that river, two miles east of Rostov. It was founded in 1779 by Armenian settlers from the Crimea, and has 13,200 inhabitants, mostly Armenians, belonging to the Greek-Armenian Church. There are several factories, chiefly for the manufacture of woollen goods, and an extensive trade is carried on.

**NAKSHATRA** (a Sanscrit word of doubtful etymology, but probably a compound of an obsolete base *naksha*, night, and *tra*, protecting, i. e., literally night-protecting) means properly star, and is used in this sense in the Vedas. At a later period, it was applied to the asterisms lying in the moon's path, or to the mansions in which the moon is supposed to rest in her, or rather, according to Hindu notions, *his* path. The number of these asterisms was reckoned originally at 27, later at 28; and mythology transformed them into as many daughters of the patriarch Daksha, who became the wives of the moon. See MOON. Biot, the distinguished French astronomer, endeavoured to shew that the Hindu system of the Nakshatras was derived from the Chinese *sien*; but his theory, though supported by very learned arguments, has been refuted by Professor Whitney, in his notes to Burgess's translation of the *Sārya-Siddhānta* (New Haven, United States, 1860), and by Professor Müller in his preface to the 4th volume of the *Rig-Veda* (Lond. 1862); for their arguments leave little doubt that the system of the Nakshatras originated from the Hindu mind.

**NALA** is a legendary king of ancient India—a king of Nishadha—whose love for Damayanti, the daughter of Bhīma, king of Vidarbha, and the adventures arising from, or connected with, it—the loss of his kingdom, the abandonment of his wife and children, and their ultimate restoration—have supplied several Hindu poets with the subject of their muse. The oldest poem relating to Nala and Damayanti is a celebrated episode of the *Mahābhārata* (q. v.), edited both in India and Europe, and translated

in Latin by Bopp; in German by Kosegarten, Bopp, Rückert, and Meier; and in English by Dean Milman. The two other renowned poems treating of the same legend, but with far less completeness, are the *Nalodaya* (q. v.) and the *Naiśhadhacharita* of Śrī-Harsha.

NALODAYA is the name of a Sanscrit poem which is highly prized by the modern Hindus. Its subject is the story of Nala (q. v.), but more concisely narrated than in the episode of the *Mahābhārata*, whence its contents are borrowed; and its reputed author is Kālidāsa (q. v.). Great doubts, however, must attach to the attribution of this authorship, if by Kālidāsa the author of *Sākuntala* is meant, and not some other poet bearing the same name; for the merits of this poem consist neither in elevation of thought nor in richness of fiction: they are sought for by the Hindus in its elaborate and artificial diction, and in its alliteration of every variety, which, to a European mind of culture and taste, would be no more than an intolerable jingle of sounds, devoid of all poetical worth. The text of the poem, with a modern commentary, has been edited (Berlin, 1830) by F. Benary, and (Calcutta, 1844) by W. Yates, who added to his edition a free metrical translation of the text, and an essay on Sanscrit Alliteration.

NAMAQUALAND, GREAT. The extensive region in South Africa north of the Cape Colony, extending from the Orange River, lat. 29° 30', to Walfish Bay, lat. 25°, and stretching inland from the west coast to the Kalihari Desert, comprehending an area of about 100,000 square miles, is known under the name of Great N., being principally inhabited by wandering tribes of Namaquas (q. v.). This region is drained principally by a large periodical water-course, called the Oup, Borradaile, or Great Fish River, which, running from north to south a distance of about 450 miles, joins the Orange River nearly at right angles, about 90 miles from its mouth. It is generally, except in its northern parts, where the country rises into extensive and lofty plateaus, a most sterile and barren region, and along a coast-line of upwards of 400 miles does not present a single running stream, much less a navigable river, although a few little bays along the coast, such as Angra Pequena, Sandwich Harbour, and Walfish Bay, afford safe anchorages. The valley of the Oup is bounded on each side by ranges of flat-topped barren mountains, which to the eastward die away into the waterless though waded flats of the Kalihari Desert, and coastwards stretch into vast sandy downs, against which the Southern Atlantic beats an unceasing surf, rendering landing very dangerous, and enveloping the coast in a perpetual mist. The chief productions of the region are cattle, for the rearing of which the country seems favourable. On the edge of the Kalihari, ivory and ostrich feathers are collected, and copper ore seems abundant in several localities. Guano is found at Ichaboc and many little islands on the coast, and considerable fisheries are carried on by Cape houses in many of the bays.

The lion, giraffe, rhinoceros, hippopotamus, and large game generally, are still found in N., although fast diminishing before the firearms of the Namaquas. The snakes are considered especially venomous. The gemsbok, eland, and other large antelopes, now almost unknown in the Cape Colony, are still numerous in the little-frequented wastes of this region. The climate is extreme, and though, on the whole, not unhealthy, is very trying to European constitutions. The water is generally brackish. The first English traveller in N. was Sir J. Alexander, who, in 1837, traversed it from north to

south. Charles John Andersson has also explored every part of it. Information on the region may be also found in the travels of Moffat, Campbell, and Le Vaillant. The native tribes, who may perhaps number about 50,000 souls, speak the Namaqua language, the purest type of the Hottentot.

NAMAQUALAND, LITTLE, is a division of Cape Colony south of the Orange River, formerly part of the district of Clanwilliam, and included with the country north of it under the general name of Namaqualand. It is a very barren region, covered with rugged volcanic-looking hills, through which the Gariep or Great Orange River appears, through some convulsion of nature, to have forced its way to the sea. Little N. has of late years afforded a very large supply of copper ore of excellent quality, but the mines, although not worked to any extent until within the last seven or eight years, were well known to the Dutch 200 years ago. The principal river is the Orange of the colonists, which divides the Cape Colony from Great Namaqualand; all the other streams are merely periodical torrents, often dry for years. The seat of magistracy is at Springbok Fontein, about 80 miles from the principal harbour, Hondeklip Bay, and where are situated the very rich mines of the Cape Copper Company. Many scattered tribes of Namaquas and Bastard Hottentots roam along the bank of the Orange River, and in the neighbourhood of the mines are numerous Dutch farmers and English settlers. All the larger mammalia, except a few gemsbok, are extirpated; but troops of ostriches are still numerous on the grassy flats of the Bushman country. The geological features of this region are peculiarly interesting, and have been thoroughly explored by A. Wylie, on behalf of the Cape government. The rocks are generally of granite or gneiss, intersected with numerous veins of cupreous indications, and near the Orange River, present many very curious features. The coast-line extends for 100 miles, with a few little bays, such as Port Naloth and Hondeklip, where there is tolerably safe anchorage, and generally presents a shore covered with low granite rocks. At Hondeklip Bay, a large boulder painted red forms a distinguishing landmark.

NAMAQUAS, the principal existing tribe of the race generally known under the name of Hottentot. They inhabit the region called Great Namaqualand, north of the Gariep or Orange River, and the country a few miles south of it, as far as the Kamiesbergen. They are a pastoral people of rather predatory habits, and live under the rule of their chiefs, whose powers, however, are of a very limited nature. Differing from the Bosjesmen Hottentots, the N. are a tall, well-made, active people, although presenting the usual peculiarities of the race, such as the light olive complexion, the oblique eye, and short tufted hair. They speak a dialect of the Hottentot language, which, however, differs considerably from that used by other tribes of that people. Mission stations of the Rheinisch and Wesleyan societies have been for many years established amongst them, and in a few localities, near the Cape Colony, with considerable success; and the New Testament and some elementary works have been translated into the Namaqua dialect. On the northern borders of the regions they inhabit, the N., under the chief Africaner, the descendant of a fugitive slave from Cape Colony, have for many years kept up a predatory and bloody war with the tribes of Orampos and Damaros, who live north of Walfish Bay. The total number of N. cannot exceed between 50,000 and 60,000 souls, scattered over a region of at least 150,000 square miles; and there is every prospect of the pure

Hottentot tribes soon becoming extinct, or at least absorbed, being gradually supplanted by the more energetic and civilised Bastard races, who, in point of civilisation and appearance, are very little inferior to the ordinary Dutch Boer of Cape Colony. Many of the southern N. possess wagons and oxen, and are employed in the transport of copper ore from the mines of Little Namaqualand to the shipping port at Hondeklip Bay.

A few of the peculiar customs of the Hottentot tribes, described by Kolben nearly 200 years ago, may be still traced amongst the more remote tribes of the N.; but contact with the Cape Colonists, and the efforts of the missionaries, have partially civilised this race, so that an ordinary Hottentot is quite as respectable a savage, or perhaps more so than his Betjouana or Amakosa brethren.

NAME (Sax. *nama*, Ger. *name*, Lat. *nomen*, Gr. *onoma*), the word by which a particular person or thing is signified in distinction from other persons or things. A name attached to a person is called a proper name. Names distinguishing one individual from another have been in use from the earliest ages of human society. Among the Jews, the name given to a child either originated in some circumstance of birth, or was an expression of religious sentiment. Old Testament names are almost all original—i. e., given in the first instance to the person bearing them; but the Jews, like other nations, after accumulating a considerable stock of names, began to repeat them, and we find few names in the New Testament which had not been used before. In Old Testament times, it was an occasional practice to adopt a change of name on the occasion of an important event in one's life.

The Greeks bore only one name, given on the tenth day after birth, which it was the right of the father to choose, and alter if he pleased. The earliest Greek names are generally expressive of some quality in high estimation, as valour, skill, wisdom, or gracefulness (Callimachus, excellent fighter; Pherocrates, strength bringer; Sophron, wise; Melanthus, black flower). In later times, when the faith in the gods was on the wane, names derived from Apollo and Athene, or indicative of the favour of Olympus (Apollodorus, gift of Apollo), came more into fashion. The eldest son generally bore the name of his paternal grandfather, and the confusion arising from the repetition of the same name was attempted to be obviated by appending the father's name (either simply, or turned into a patronymic), the occupation, the place of birth, or a nickname.

The Romans at a very early period bore two names, and afterwards every Roman citizen had three. The *prænomen*, like our Christian name, was personal to the individual—Caius, Marcus, Cneius; in writing, generally abbreviated to an initial or two letters, C., M., or Cn. It was given in early times on the attainment of puberty, and afterwards on the ninth day after birth. There were about thirty recognised *prænomina*. Women had no *prænomen* till marriage, when they took the feminine form of that borne by their husband. Every Roman citizen belonged both to a *gens* and to a *familia* included in that *gens*. The second name was the *nomen gentilitium*, generally ending in *-ius*, *-eius*, or *-aius*. The third name was the hereditary *cognomen* belonging to the familia. *Cognomina* were often derived from some bodily peculiarity, or event in the life of the founder of the family. A second cognomen, or *agnomen*, as it was called, was sometimes added by way of honorary distinction. In common intercourse, the *prænomen* and cognomen were used without the *nomen gentilitium*, as C. Cesar for C. Julius Cesar,

M. Cicero for M. Tullius Cicero. The Roman names were in their origin less dignified and aspiring than the Greek; some were derived from ordinary employments, as Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, Crassus (fat), Naso (long-nosed); a few from numerals, Sextus, Septimus.

The Celtic and Teutonic names, like the Jewish and Greek, had been originally very significant; but at an early period their exuberance became checked; people contented themselves with repeating the old stock. While the speech of Europe was undergoing a transformation, the names in use remained the same; belonging to an obsolete tongue, their signification by and by became unintelligible to the people using them. Many are derived from 'God,' as Gottfried, Godwin; some from an inferior class of gods known by the title *as* or *ans*, whence Anselm, Oscar, Esmond; others from elves or genii, Alfred, Alboin, Elfric (Elf King). Bertha is the name of a favourite feminine goddess and source of light, from the same root as the word 'bright;' the same word occurs as a compound in Albrecht, Bertram. To a large class of names indicating such qualities as personal prowess, wisdom, and nobility of birth, belong Hildebrand (war brand), Konrad (bold in counsel), Hlodwig (glorious warrior), called by us Clovis, and the original of Ludwig and Louis. The wolf, the bear, the eagle, the boar, and the lion entered into the composition of many proper names of men, as Adolf (noble wolf), Arnold (valiant eagle), Osborn (God bear). Respect for feminine prowess also appeared in such names as Mathilde (mighty amazon), Wolfhilde (wolf heroine). The spread of Christianity threw a number of the old names into comparative oblivion, and introduced new ones. The name selected at baptism was more frequently taken from the history of the Bible or the church than from the old traditional repertory, which, however, was never altogether disused. Many names, supposed to be local and very ancient, particularly in the Scottish Highlands, Wales, and Cornwall, are in reality but corruptions of names of Christian origin which are in use elsewhere. Owen, Evan, and Eoghan (the latter often Anglicised into Hector) seem all to be forms of Johann or John. A change of name was sometimes made at confirmation.

Periods of religious and political excitement have had a very powerful influence in modifying the fashion in names. The Puritans would only admit of two classes of names, those directly expressive of religious sentiment—Praise-God, Live-well—and names which occur in Scripture; these latter indiscriminately made use of, however obscure their meaning, or however indifferent the character of the original bearer of them. Old Testament names were used in preference to New, probably because they did not convey the notion of a patron saint. Old Testament names still prevail largely in America, where exists a medley of Christian names from all possible sources. At the French Revolution, names supposed to savour of either loyalty or religion were abandoned, and those of Greek and Roman heroes came into vogue instead. The Augustan period of English literature gave a temporary popularity to such feminine names as Narcissa, Celia, Sabina. In Germany, the names in use are particularly free from foreign admixture; they are almost all either of Teutonic origin, or connected with the early history of Christianity. In Britain, the number of names has, particularly since the Reformation, been more limited than in most other countries. In some families of distinction, unusual names have been handed down from father to son for centuries—e. g., Peregrine among the

Berties, and Sholto in the Douglas family. The accumulation of two or more Christian names only became common in the present century, and another practice which has gained ground in Britain is the use of surnames as Christian names. More recently, various old names, particularly feminine names, as Maud, Florence, Ethel, have been withdrawn from their obscurity, and resuscitated.

The use of fixed family *surnames* cannot be traced much further back than the latter part of the 10th century. They first came into use in France, and particularly in Normandy. At the Conquest, they were introduced into England by the Norman adventurers, and were general at the Domesday Valuation. Many of the followers of William had taken names from their paternal chateaux or villages on the other side of the Channel, names which were used with the French preposition *de* before them. Their younger sons and others applied the 'de' to estates awarded them as their portion of the conquered country, and called themselves De Hastings, De Winton, &c., a prefix probably never in vernacular use in England, and completely discarded with the disappearance of Norman-French, unless in a few cases where it was retained for the sake of euphony, or from coalescing with the initial vowel, as in De la Bèche, Danvers (d'Anvers), Dangerfield (d'Angerville). When English was used in place of Norman-French, the 'de' was always rendered into 'of.' The affectation of resuming it in recent times is as unwarrantable in theory as in taste. Such a designation as Lord De Tabley of Tabley House is an unmeaning tautology. The Scotch have a more expressive designation when they say Colquhoun of that Ilk. In France and Germany, a territorial surname (denoted by 'de' or 'von') came, when surnames spread to all classes, to be the mark of nobility, so much so that in later times, when any one was ennobled by the sovereign, the 'de' was prefixed to his previously plebeian and not territorial name. In Britain, the 'de' was never considered the test of nobility; the names of some of the most distinguished families were not territorial—e. g., Stewart, Butler, Spencer. In Scotland, surnames were hardly in use till the 12th c., and were for a long time very variable. The assumption of surnames by the common people is everywhere of much later date than their use by noble (gentle) families. As yet, they can hardly be said to be adopted by the people of the wilder districts of Wales.

There are many existing local surnames in Britain besides those derived from the names of the manors of the gentry or landholders. Farms, homesteads, the natural features of the country, all gave their names to those who resided at or near them; hence such names as Wood, Marsh, Dale. The preposition 'at' is in a few cases retained, as in Atwood, A'Court, Nash (atten-ash, i. e., at the ash). The travelling habits of the Scots account for such names as Inglis, Fleming, Welsh (the original of Wallace), applied to those who had visited foreign parts; and sometimes a Scotsman, wandering into England, returned with the acquired name of Scott.

A large class of surnames are patronymics, often formed by 'son,' or its equivalent in the language of the country, added to the Christian name of the father. Names of this sort often fluctuate from generation to generation. Alan Watterson had a son, Walter, who called himself Walter Alanson. The genitive case of the father's name sometimes served the same purpose, as Adams, Jones; and similarly in Italian, Dosso, Dossi. A fashion of using 'Fitz,' the equivalent of 'son,' before the ancestral name, as in Fitzherbert, prevailed temporarily in Normandy, whence it was imported into

England. In the Highlands of Scotland, the prefix 'Mac' (Macdonald) served the same purpose, which, however, fluctuated far longer than the patronymic surnames of England and the Lowlands; so also the 'O' (grandson of the Irish (O'Neil), and 'Ap' of the Welsh (Ap Rhys, otherwise Apreece). The 'de' of France had sometimes a similar origin, as in d'André, d'Hugues; and still more frequently the 'de,' 'dei,' or 'degli' of Italy—di Cola, di Giacomo.

Office, occupation, or condition, gives rise to surnames—e. g., Knight, Marshall, Page, Smith, Brewster, Shepherd; in Germany and Holland, Rauber and de Rogver (robber); and from such appellatives, patronymics may be again derived; thus, we have Smithson, de Maistre (master's son), M'Nab (son of the abbot), M'Pherson (son of the parson), del Sarto (son of the tailor), &c. So also personal qualities—Black, White, Strong, Stark, Lang (long), Littlejohn, Cruikshanks; and nick-names have not infrequently been perpetuated as surnames. We have also surnames derived from the signs and cognizances which were borne in the middle ages, not only by inns and shops, but by private houses. John at the Bell became John Bell; at Middleburg, in Holland, Simon, apothecary in the 'Drake,' or Dragon, became Simon Drake; hence, probably, the frequency of family names derived from animals, and also of those beginning with 'Saint,' though this last class may, perhaps, sometimes have had its origin in the first owner of the name dedicating himself to the service of the saint in question. In Scotland and Ireland, 'The' is a distinctive title borne by the heads of some old families—as 'The Chisholm,' 'The O'Connor Don,' in the Highlands of Scotland, the chief of a clan is usually addressed by the name alone in a marked manner: thus, 'Macleod' implies specially Macleod of Dunvegan, in Skye, head of the clan Macleod; 'Mackintosh,' in like manner, applies solely to Mackintosh of Moy, in Inverness-shire.

In England, the number of existing surnames approaches to 40,000, or about one to every five hundred individuals; in Scotland, there are far fewer surnames in proportion to the population. The remarkable predominance of certain surnames in certain localities—as Campbell, Cameron, Maclean in Argyshire, Macdonald in Inverness, Mackay in Sutherland, Gordon and Forbes in Aberdeenshire, and Scott, Ker, Elliot, Maxwell, and Johnstone on the borders—arises from the clansmen having made a practice of taking the name of their chiefs, considering themselves members of their family by adoption, if not otherwise. Elsewhere than in Scotland, vassals often adopted the names of their lords, and servants those of their masters. Two or more surnames are often borne by one individual, in which case the paternal surname is sometimes placed first, sometimes last; and, in recent times, it is by the name which occurs last that the bearer of the two surnames is most frequently known.

The wife, with us at least, changes her surname to that of her husband on marriage. In the continent, it is not unusual for the husband to append his wife's name to his own; and in Spain, the wife retains her own name, while the son is at liberty to use either paternal or maternal name as he pleases, the choice generally falling on the best family.

*Change of name.*—Prior to the Reformation, surnames were less fixed than they have since become. Occasionally, younger sons, instead of retaining their patronymic, adopted the name of their estate or place of residence. A great matrimonial alliance was a frequent cause for adopting the patronymic of the wife. With the clergy, ordination was a common occasion of a change of name, the personal surname being

exchanged for the name of the place of birth—thus, William Longe became William of Wykeham. In time of political troubles, a new name was often assumed for concealment; and in Scotland, the name of M'Gregor was proscribed in 1664 by an act of the privy council. In modern times, injunctions in settlements of land, and deeds of entail, are frequent grounds for a change of name, it being made a condition that the devisee or disponent shall assume a certain surname under penalty of forfeiture, a stipulation which the law recognises as valid. Such an obligation is often combined with one relative to arms. In a Scotch entail, it is a very frequent condition that each succeeding heir of entail, or husband of an heiress of entail, shall assume the entailor's name and arms, or his name and arms *exclusively*; in the former case, he may, if he pleases, continue to use his own surname along with the assumed one. The heir of entail is not held legally to take up any arms not otherwise his own, unless he have applied to the heraldic authorities for leave so to do. Where a Scotch entail contained an injunction to bear arms which had no existence in the official record of arms, the condition has not been held to be null; the heir of entail must apply to the Lord Lyon for a grant of arms bearing the designation of those disposed. In England, it used to be common to obtain a private act of parliament to authorise one to change his surname; and authority for such a proceeding has generally been given in later times by royal licence, which is granted only on a reasonable ground being established for the alteration, to the satisfaction of the kings-at-arms, to whom a remit is made. It has sometimes been supposed that this royal licence is necessary to legalise such a change, but the highest legal authorities have laid it down that there is nothing in the law of England to prevent any one, who may consider it for his interest so to do, to change his surname, or even his Christian name. The idea, lately prevalent to some extent, is equally erroneous, that an advertisement in a gazette or newspaper, or the execution of some deed, is a necessary form in order to effect a change of name. There are always great inconveniences in changing one's name, which sufficiently account for the general indisposition to do so, except from a questionable motive. As there is no law to prevent a person from changing his name, so there is, on the other hand, no law to compel third parties to use the new name, and disputes and annoyances arising from such a state of things are matters of course. The change tends to a certain extent to destroy the means of identification after the lapse of years, which may or may not be the object desired. Notwithstanding these difficulties and inconveniences, there are many examples of persons who have succeeded after a few years in being generally known under a new name, and of the public as well as his friends recognising it. The change of name, in general, produces no change whatever on the legal status. A party is equally punishable for swindling, larceny, and other cognate offences, whatever name he uses; and, on the other hand, if he is legatee, he is not prevented from establishing and receiving his legacy, whatever name he has adopted. It follows from what precedes that no person is punishable for using a new name, though it is sometimes an ingredient for a jury to take into consideration when they are required to infer a particular motive of conduct. The royal licence is practically required to be obtained by Englishmen (not Scotchmen) holding commissions in the army, as also when the change of name is to be accompanied by a change of arms, it being the practice of the English Heralds' College to refuse to

grant arms corresponding to such change, unless the royal licence have been obtained. In Scotland, a *bona fide* change of name requires neither royal, judicial, nor parliamentary authority, the sole exception being the case of members of the College of Justice, who require the permission of the Court of Session. A royal licence is not generally applied for by natives of Scotland, as it is not required to be produced to the Lord Lyon on applying for a corresponding change of arms. The arms will generally be granted when the Lord Lyon is satisfied that the change has been made on some reasonable ground, and not from a purely capricious motive; and the fact of the change of name, with the reason why it has been made, are narrated in the new patent of arms. When such change of surname and corresponding change of arms has been made by a Scotsman who is an officer in the army, the authorities of the War Office are in the habit of requiring a certificate from the Lyon Office to the effect that the change is recognised there.

*Names of places.*—These, like names of persons, belong, in a great measure, to the language of past races. All over Great Britain, a very large proportion are derived from the Celtic names for natural features of the country. From *Gwysg, afow, tam, tav, cluyd*—in the Celtic speeches equivalent to *water or river*—we have Esk, Avon, Wye, Thames, Tavy, Clyde. *Pen* or *Ben*, hill, gives rise to the names of hills in England and Wales (Penrhys, Penzance), and still more in Scotland (Ben Nevis). So, also, *coen, comb, valley*—as in Cumberland, land of valleys. The memory of the Roman invasion has been preserved in the termination *-chester* (derived from *castra*) in the names of towns, as Manchester. Though surnames often originated in local names, the reverse process also occurred; as where *vill, ton* or *ington, ham, or burgh*, has been appended to the name of the owner of the land, e.g., Charleville, Johnston, Wymondham, Edinburgh (i.e., Edwin's burgh).

See Wackernagel, 'Die Germanische Personennamen,' in the *Schweizerische Museum* (1837); Miss Yonge, *History of Christian Names* (Lond. 1863); Lower, *On English Surnames* (Lond. 1849); Professor Innes, *Concerning some Scotch Surnames* (Edin. 1860).

NAMUR, a province of Belgium, bounded on the N. by Brabant, E. by Luxembourg and Liege, W. by Hainault, and S. by France. Area about 1400 square miles. Pop. 301,397 (at the end of 1861). The principal rivers are the Meuse—which entirely intersects the province—the Sambre, and the Lesse. N. presents generally an alternation of fruitful valleys and low hilly tracts; but in some parts, where the heights constitute offshoots of the Ardennes, and are densely wooded, they attain a considerable elevation. With the exception of the land in the south-west, where there are large tracts of bog and heath, the soil is extremely rich, yielding abundant crops and fine pasture. The chief products of N. are wheat, oats, hops, oil yielding plants, and flax. Besides iron, copper, lead, and coal mines, N. has marble and slate quarries, and yields sulphur, alum, cadmium, alumina, flints, &c. It has good steel, iron, and smelting works, breweries, paper-mills, &c. N. is divided into the three arrondissements of Namur, Dinant, and Philippeville. At the close of the 12th c., N. was united to Luxembourg, after having existed as an independent countship for upwards of 150 years. Towards the middle of the 13th c., it passed by purchase to the House of Flanders, which retained possession of it till 1420; when, on the death of Count John III., without direct heirs, the countship, which was in a state of extreme financial embarrassment, was purchased for

132,000 gold ducats, by Philip the Good, Duke of Burgundy, and subsequently shared the fate of the other Burgundian states.

**NAMUR** (Flem. *Namen*), the chief town of the province of the same name, is situated at the confluence of the Sambre with the Meuse, and is a strongly fortified town and the seat of a bishop. Pop. 25,989 (at the beginning of 1862). Among its seventeen churches, the cathedral, or St Aubin's, which was consecrated in 1772, is one of the most beautiful churches of Belgium. N. has an academy of painting, a conservatoire for music, two public libraries, a museum; a theological seminary, and a college conducted by Jesuits. The present citadel was constructed in 1784, but the city has been fortified from the earliest period of its history; and in 1692, its defensive works were repaired and strengthened by Coehoorn, only, however, to be taken in the following year by Louis XIV. and Vauban, the latter of whom added considerably to its original strength. The reputation of its citadel made N. a prized stronghold in every war of later times; and after having been gallantly defended by its French conquerors, in 1815, against the Prussians under Pirch, it was finally restored to the Netherlands after the battle of Waterloo, and at once put into thorough repair. N. is noted for its cutlery, its leather-works, and its iron and brass foundries.

**NANCY**, one of the most beautiful towns of France, capital of the department of Meurthe, is situated on the left bank of the river of that name, at the foot of wooded and vine-clad hills, 220 miles east of Paris, on the Paris and Strasbourg Railway. Pop. 43,221. It is divided into the old and new towns (the former irregular and with narrow streets, the latter open and handsome), and comprises also two suburbs. It contains many handsome squares and imposing edifices, and owes much of its architectural ornamentation to Stanislaus Leezjinsky, who, after abdicating the crown of Poland in 1735, continued to reside here as Duke of Lorraine till his death, in 1766. His statue stands in the Place Royale, a fine square, surrounded by important public buildings, as the Hôtel de Ville, theatre, &c. The gates of N. look more like triumphal arches than the ordinary entrances of a town. Among the institutions are the university-academy, the normal school, the school of medicine, the lyceum, the public library, and numerous art and scientific societies. Cotton, woollen, and linen manufactures are carried on; but the principal branch of industry is the embroidering of cambric, muslin, and jaconet goods.

N. is known to have been in existence in the 11th century. Two centuries later, it became the capital of the Duchy of Lorraine (q. v.). Charles the Bold was killed while besieging the city in 1477.

**NANDU**, or **AMERICAN OSTRICH** (*Rhea*), a genus of South American birds allied to the ostrich, cassowary, and emu, and most nearly to the ostrich, from which it differs in having the feet three-toed, and each toe armed with a claw; also, in being more completely feathered on the head and neck; in having no tail; and in having the wings better developed and plumed, and terminated by a hooked spur. The wings are indeed better developed than in any other of the *Struthionidae*, although still unfit for flight. The neck has sixteen vertebrae. There are at least three species. The best known species (*R. Americana*) is considerably smaller than the ostrich, standing about five feet high. It is of uniform gray colour, except on the back, which has a brown tint. The male is larger and darker coloured than the female. The back and rump are furnished with long feathers, but of a more ordinary kind

than those of the ostrich. This bird inhabits the great grassy plains of South America, southward of the equator, abounding on the banks of the La Plata and its more southern tributaries, and as far south as lat. 42° or 43°. Its range does not extend across the Cordilleras. It is generally seen in small troops. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs in

Nandu (*Rhea Americana*).

a common nest, or drop them on the ground near the nest, to which the male rolls them. Contrary to the usual habit of birds, incubation is performed by the male. The N. is shy and wary, but is successfully hunted by the Indians, generally on horseback. The flesh of the young is not unpleasant. The N. is capable of being domesticated.—A smaller and more recently-discovered species (*R. Durrinii*) has light-brown plumage, each feather tipped with white. It inhabits Patagonia. A third species (*R. macrorhyncha*) is distinguished by its large bill.

**NANKEEN CLOTH**. Calico of the kind called 'nankeen,' or nankin, was formerly imported extensively from China to Europe, and said to be the manufacture of Nanking; the colour, a yellowish-buff, being a favourite one. It was supposed that the Chinese held a secret for dyeing this colour, which was found to be remarkably durable; but it became known that it was not an artificial colour at all, the cloth being made of a coloured variety of cotton, which was produced occasionally in China and India. Artificially dyed nankeen cloths now form a considerable export from England to China.

The colour of artificial nankeen cloth is produced by an elaborate process, in which the yarn or cloth is first dipped in a saturated solution of alum; then in a decoction of oak-bark; then in a bath of lime-water; and next in a bath of nitro-muriate of tin. Another, but less permanent, nankeen dye is produced by boiling annatto in a strong solution of pearl-ashes, and diluting with water to the required tint.

**NANKING**, capital of the province of Kiangsu, formerly the capital of China, on the Yangtse River, 90 miles from the beginning of its estuary, N. lat. 32° 40' 40", E. long. 118° 47'. Its name signifies the Southern Capital. Since the removal of the seat of government to Peking (Northern Capital), it has been called by the Chinese Kiangning-fu. The present city of N. is surrounded by a wall about fifty feet high, and has thirteen gates; it was about thirty-five miles in extent, with eighteen gates, when the city was the flourishing metropolis of the empire. According to Chinese accounts, the population of N. was once 4,000,000; but a more recent estimate

makes it 300,000. As the city has lately passed through so many vicissitudes, and is now the headquarters of the rebel forces, it is impossible to ascertain its present number of inhabitants. The gates differ somewhat from each other in their appearance and dimensions. Some of the finest are 30 or 40 feet high, by about 20 in width, and the arched gateways are 100 or more feet in length. In every provincial capital there is a Manchu garrison, or military colony, separated by a wall from that portion of the city which is occupied by the Chinese. Some of the finest streets of N. are to be found in the Tartar city; several being nearly 40 feet wide, having a space in the middle of about 8 feet in width, flagged with well-hewn blocks of blue and white marble, and on each side of this a brick pavement 14 feet or more wide. A deep canal or ditch runs from the river directly under the walls on the west, serving to strengthen the defences of the city on that side. The ancient palaces have all disappeared. The offices of the public functionaries are numerous, but, like the shops, present the general features common to all Chinese towns. The objects most worthy the inspection of the traveller are found, in ruins, outside the precincts of the modern city. Among these is the summer palace of the emperor Kienlung. It consisted of a number of one-story buildings, with spacious courts between, and flanked by smaller buildings on the sides. Enough still remains to show that the workmanship was of the most elaborate and unique character. When under cultivation, the spot must have been exceedingly beautiful. A road of hewn stone, varying from 4 to 6 feet in width, leads to the capital, a distance of about 20 miles. The tombs of the kings are remarkable for their sepulchral statues, which form an avenue leading up to the graves; they consist of gigantic figures, like warriors cased in a kind of armour, standing on either side of the road, across which, at intervals, large stone tablets are extended, supported by huge blocks of stone instead of pillars. Situated at some distance from these statues, are a number of rude colossal figures of horses, elephants, and other animals, placed without any distinct arrangement, whose purpose may have been originally to ornament particular tombs. Among the ruins must be included the far-famed Porcelain Tower. It was erected by the emperor Yungloh, to reward the kindness of his mother; the work was commenced in the 10th year of his reign (1413), at noon, on the 15th day of the moon, in the sixth month of the year, and was completed in nineteen years. The board of works was ordered, according to the plan of the emperor, to build a tower nine stories high, the bricks and tiles to be glazed, and of 'fine colours,' and it was to be superior to all others, in order to make widely known the virtues of his mother. Its height was to be 322 feet. The ball on its spire to be of brass, overlaid with gold, so that it might last for ever and never grow dim. From its eight hooks as many iron chains extend to the eight corners of its highest roof; and from each chain nine bells, suspended at equal distances apart; these, together with eight from the corners of each projecting roof, amounted to 144 bells. On the outer face of each story are 16 lanterns, 128 in all; which, with 12 in the inside, make 140. It requires 64 cattles of oil to fill them; their light illumines the 'thirty-three heavens, shining into the hearts of all men, good and bad, eternally removing human misery.' On the top of the highest roof are two brazen vessels, weighing together 1200 pounds, and a brazen bowl besides, weighing 600 pounds. Encircling the spire are nine iron rings, the largest being 63 feet in circumference, and the

smallest 24 feet, altogether weighing nearly 5000 pounds. In the bowl on the top are deposited one white shining pearl, one fire-averting pearl, one wind-averting pearl, one water-averting pearl, one dust-averting pearl, a lump of gold weighing 50 ounces, a box of tea-leaves, 1000 taels of silver, one lump of orpiment, altogether weighing 4000 pounds; one precious stone-gem, 1000 strings of copper coin, two pieces of yellow satin, and four copies of Buddhist classics. The brilliancy of the edifice, —the cost of which was 2,485,484 taels, a tael being about 6s. 8d.—will endure, according to the Chinese annalist, to hundreds of generations, a monument of recompensing kindness to myriads of years. Therefore it is named Pau-gan-sz, i. e., Recompensing Favour Pagoda. In the spring of 1853, N. was taken by the Taiping rebels, who put the entire Manchu population to the sword. Since that period, N. has been the capital of Tien Wang; and the city is styled by the Taipings, Tien-king, the Celestial Capital, the greater part of which they have wholly laid in ruins, including the beautiful Porcelain Tower, that magnificent monument of the gratitude of a son for his mother's love.—Dr Macgowan, *North China Herald*.

NANTES (anc. *Nannetes*, or *Nannetes*), an important seaport town of France, capital of the department of Loire-Inférieure, is situated on the right bank of the Loire, 30 miles from its mouth, and at the point of confluence with it of the Erdre and the Sèvre-Nantaise, both navigable streams. Besides railways, there is communication with the interior by steamers on the Loire. The natural beauties of the site have been much improved by art, and now, the noble river on which the town is placed, covered with craft of every size and description, the islands that stud its channel, the meadows that skirt its banks, and the bridges (upwards of 16 in number) that cross it and its tributaries here, combine to make the scene a highly picturesque one. N. contains numerous squares and churches. Several districts of the town, especially in the more modern quarter, are nearly equal to the finest districts of Paris in regularity and elegance. This town possesses numerous striking and beautiful buildings; among which the Cathedral of St Pierre, containing the splendid monument of Francis II., the last Duke of Bretagne, and of Marguerite his wife; and the old castle, the temporary residence of most of the kings of France since Charles VIII., and built in 938, are the chief. There is a public library containing 45,000 vols.; a museum of paintings; and a museum of natural history. The quays, lined on one side with houses, and in some cases planted with trees, afford an agreeable and interesting promenade of about two miles in length. The most beautiful promenade, however, formed by the Cours St Pierre and the Cours St André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. The harbour, 1968 yards in length, is capable of accommodating upwards of 200 vessels. Formerly, vessels of no more than 200 tons could reach the port, all vessels of greater burden unloading at Paimboeuf, at the mouth of the river; but within recent years, much has been done by dredging for the improvement of the river-bed, and large vessels can now reach the harbour. The chief manufactures of N. are varieties of linen and cotton fabrics, calicoes, flannels; musical, mathematical, and optical instruments; refined sugar and salt, chemical products, cordage, &c. It contains tanyards, copper foundries, brandy distilleries, &c., and numerous establishments engaged in the various manufactures to which a port gives rise, as

ship-building, the preparation of preserved meats, &c. In 1860, 2534 vessels, of 348,747 tons, entered and cleared the port. Trade with the West Indies is actively carried on here. Pop. (1862) 113,625.

**NANTES**, *EDICT OF*, the name given to the famous decree published in that city by Henri IV. of France, 13th April 1598, which secured to the Protestant portion of his subjects freedom of religion. Among its more important provisions were—liberty to celebrate worship wherever Protestant communities already existed; to establish new churches, except in Paris and the surrounding district, and in the royal residences; and to maintain universities, or theological colleges, of which they had four, those at Montauban, Saumur, Montpellier, and Sedan; adherents of the Reformed faith were also to be eligible to all civil offices and dignities; but, on the other hand, they were not allowed to print books on the tenets of their religion, except in those places where it existed; and they were obliged to outwardly celebrate the festivals of the Catholic Church, and to pay tithes to the Catholic priesthood. From this period, the Reformers or Huguenots (who then counted 760 churches) had a legal existence in France, but gradually their political strength was crushed by the mighty genius of Richelieu—who, however, never dreamed of interfering with their liberty of worship. Neither did his successors, Mazarin and Colbert; but under the influence of a ‘penitence,’ as corrupt and sensual as the sins which occasioned it, Louis XIV., after a series of detestable *Dragonnades* (q. v.), signed a decree for the revocation of the edict, 18th October 1685.—The result of this despotic act was that, rather than conform to the established religion, 400,000 Protestants—among the most industrious, the most intelligent, and the most religious of the nation—quitted France, and took refuge in Great Britain, Holland, Prussia, Switzerland, and America. The loss to France was immense; the gain to other countries, no less. Composed largely of merchants, manufacturers, and skilled artisans, they carried with them their knowledge, taste, and aptitude for business. From them England, in particular, learned the art of manufacturing silk, crystal glasses, and the more delicate kinds of jewellery.

**NANTUCKET**, an island and town upon it, on the south-east coast of Massachusetts. The island is 15 miles long and an average of 4 wide, with an area of 50 square miles. It was bought from the Indians by Thomas Macy, in 1659, for £30 and two beaver-hats. Since that time its inhabitants have been engaged in the whale fisheries. The town has a deep and secure harbour, a large amount of shipping in the fisheries, 7 factories of sperm oil, candles, &c., 9 churches, 2 newspapers, population of about 6000.

**NANTWICH**, a small market town of Cheshire, England, on the Weaver, 20 miles south-east of Chester. Many of its houses are interesting from their age and construction, being built in many cases of timber and plaster, and with overhanging upper stories. The parish church, one of the finest country churches in England, has recently been restored at great cost. It was famous in former times for its brine-springs and salt-works. Shoes, gloves, and cotton goods are manufactured, and malting is carried on. Pop. (1861) 6225.

**NA'OS** (Gr. a dwelling), the cell or enclosed chamber of a Greek temple.

**NAPHTHA** is derived from the Persian word *nafata*, to exude, and was originally applied to an inflammable liquid hydrocarbon (or rather a

mixture of several hydrocarbons) which exudes from the soil in certain parts of Persia. (According to Pelletier and Walter, it consists of three hydrocarbons—viz.,  $C_{11}H_{13}$ , which boils at  $190^{\circ}$ ;  $C_{16}H_{16}$ , which boils at  $239^{\circ}$ ; and  $C_{21}H_{22}$ , which boils at  $374^{\circ}$ .) The term is, however, now used not only to designate a similar and almost identical fluid, that issues from the ground in many parts of the world, and is known as petroleum, rock-oil, &c., but is also applied to other liquids which resemble true naphtha in little else than in their volatility and inflammability. Thus, wood-spirit or methylic alcohol, is often spoken of as *wood-naphtha*, and acetone is sometimes described as naphtha. Coal-tar yields by distillation a liquid which presents all the physical, and most of the chemical characters of naphtha, and which is usually distinguished as coal-naphtha. See GAS-TAR.

Crude Naphtha, whether occurring as a natural product, or as obtained from coal-tar, is purified by agitation with strong sulphuric acid; after which it must be well washed with water (in which it is quite insoluble), and finally distilled from quicklime. Pure naphtha is colourless, and of a peculiar taste and odour; it is soluble in about eight times its bulk of alcohol, and dissolves in all proportions in ether and in the essential oils. Hot naphtha dissolves phosphorus and sulphur, but deposits them on cooling. It is an excellent solvent for gutta-percha, caoutchouc, camphor, and fatty and resinous bodies generally; and hence it is extensively used in the arts for these purposes, and its employment as a source of artificial light is now becoming universal. In consequence of its containing no oxygen, it is employed by chemists for the preservation of potassium and other metals, which have a powerful affinity for oxygen. Owing to its volatility and inflammability, it must be handled with great caution, many fatal cases having arisen from its vapour catching fire on the approach of a candle.

The principal kinds of naphtha known in commerce are native naphtha, coal naphtha, Boghead naphtha (also called paraffin oil and photogen), shale naphtha, and naphtha from caoutchouc or caoutchine.

Native naphtha, petroleum, or rock-oil, is found in many parts of the world, as in Japan, Burmah, Persia, the shores of the Caspian Sea, Siberia, Italy, France, and North America. It is of various degrees of consistency, from a thin, light, colourless fluid found in Persia, with a specific gravity of about 0.750, to a substance as thick as butter, and nearly as heavy as water. But all the kinds when rectified have nearly the same constitution. They contain no oxygen, and consist of carbon and hydrogen compounds only. Bitumen and asphaltum are closely allied substances in a solid or semi-solid form. From a very early period in Persia and Japan, and at least since last century in Italy, native naphtha has been used to burn in lamps.

Coal naphtha is distilled from Gas-tar (q. v.), and both it and native naphtha, when purified, possess similar properties. Coal naphtha is, however, of a higher specific gravity, viz., from 0.860 to 0.900, and has a more disagreeable and penetrating odour.

Boghead naphtha, or paraffin oil, has become, of late years, so important a manufacture that a brief history of its origin cannot be uninteresting. In the year 1847, Mr James Young, now of the Bathgate Chemical Works, had his attention called to a petroleum spring at Alfreton, in Derbyshire, from which he distilled a light thin oil for burning in lamps, obtaining at the same time a thicker oil, which was used for lubricating machinery. After a year or two the supply began to fail, but Mr Young, noticing that petroleum was dropping

from the sandstone roof of a coal-mine, conjectured that it originated by the action of heat on the coal-seam, the vapour from which had condensed in the sandstone, and supposed from this that it might be produced artificially. Following up this idea, he tried a great many experiments, and ultimately succeeded, by distilling coal at a low red heat, in obtaining a substance resembling petroleum, which, when treated in the same way as the natural petroleum, yielded similar products. The obtaining of these oils and the solid substance paraffin from coal formed the subject of his now celebrated patent, dated October 17, 1850.

It is at present (March 1864) a matter of dispute in the courts of law how far Mr Young's process is a new invention. Many years ago, Reichenbach had, by distilling 100 lbs. of pit-coal, obtained nearly two ounces of an oily liquid exactly resembling natural naphtha; and various other chemical writers are appealed to as proving that methods, substantially the same as Mr Young's, were known and practised. One thing seems to be admitted, that previous to Mr Young's patent, no one, in this country at least, had succeeded in producing the oil on a commercial scale.

The processes by which the oil and paraffin are obtained are simple. The material best adapted for the purpose is the well-known Boghead coal, which is a very rich gas coal, occurring in a field of limited extent near Bathgate, in Linlithgowshire. But all cannel or gas coals give the same products, and some of them in nearly as large quantity. The coal is broken into fragments like road metal, and gradually heated to redness in cast-iron retorts, which are similar to those used for coal-gas (see GAS), except that they are generally placed in an upright instead of a horizontal position. The retorts are usually about 10 feet long and 14 inches in diameter at the bottom, tapering to 12 inches at the top, and built in sets of four, so that one fire may heat each set. The coal is fed by means of a hopper on the top of the retort, and after passing through it at a low red heat, is drawn out as coke at the bottom, where there is a water lute to prevent the escape of oil or gas. There is a spherical valve in the hopper, counterpoised with a weight, which closes the retort at the top. The volatile matters distilled from the coal are conducted by a pipe to the condensers (which are similar to those used for coal-gas), where they are condensed into a thick black oil, of a specific gravity of about 0.900, along with a little water. Steam is sometimes passed through the retorts to facilitate the passage of the oil into the condensing-pipes as quickly as possible. Great care is necessary to prevent the heat from becoming too high, because gas and gas-tar and not paraffin oil are obtained when coal is distilled at a high temperature. A ton of Boghead coal yields practically about 120 gallons of crude oil, although with great care as much as 140 or 150 might be obtained.

The crude oil from the first distillation is then distilled again, either in cast-iron or malleable iron stills. The former are frequently long wide cylinders, and the latter are usually very strong steam boilers. From this second distillation a 'green oil' is obtained, and the residue is removed as coke from the bottom of the still. This oil is then mixed with from 5 to 10 per cent. of sulphuric acid, and afterwards with about the same quantity of soda, the mixtures being made in circular tanks with revolving stirrers. Both the acid and the soda mix with impurities which fall to the bottom as heavy tarry matters, and are run off by a stop-cock, till only the clear supernatant oil remains. After being so far purified, the oil is distilled once

more in an iron still. From this final distillation, a small quantity of light naphtha is first obtained, which is used for dissolving caoutchouc, three-fourths of what is left being a light and nearly colourless oil used for burning in lamps, and the remainder a thicker oil containing paraffin. This latter portion is pressed in a hydraulic press, which squeezes out the greater portion of the paraffin, leaving an oil which, either alone or when mixed with about a fourth part of rape oil, is sold for lubricating machinery.

The crude paraffin, after being subjected to hydraulic pressure three or four times, is treated with sulphuric acid and naphtha to remove impurities and colouring matter. It is finally boiled on the top of water to remove smell, and is then an exquisitely beautiful substance resembling the purest white wax. It is largely manufactured into candles, which equal, or even excel in appearance those made from wax, and are only about half as costly.

Shale naphtha, or 'shale oil,' is a substance which has been manufactured, for several years, from bituminous shales both in this country and on the continent. When the shale contains nitrogen and sulphur, from the presence of organic remains, such as that obtained in Dorsetshire, the naphtha has a fetid smell, which it is difficult to get rid of. When it is removed, however, by repeated purifications, the naphtha resembles the Boghead oil. Within the last two or three years, a burning oil of the same kind as the Boghead has been manufactured pretty extensively in Scotland and Wales from the bituminous shales of the coal-measures, which had previously been turned to no account.

Naphtha from caoutchouc or caoutchine is obtained from caoutchouc by destructive distillation. It is a fluid hydrocarbon, whose true composition seems not yet to have been made out. Caoutchine has the reputation of being one of the best solvents known for India-rubber.

Of the native naphthas we have already named, the Burmese (Rangoon) petroleum or rock oil is one of the best known. It is obtained by sinking wells about sixty feet deep in the soil, from which the crude substance oozes out, and is removed when a sufficient quantity has accumulated. It is about the consistency of goose-grease, and consists of several fluid hydrocarbons, with about ten or eleven per cent. of the solid hydrocarbon paraffin. The lightest naphtha obtained from this substance, known in commerce under the name of 'Sherwoodole,' has a very pleasant odour, and is in consequence much used for removing greasy stains from silks and other fabrics. The heavier naphthas it contains are also highly prized, both as burning and lubricating oils, on account of their agreeable smell. About 400,000 hogsheds of crude naphtha are annually obtained at Rangoon. The naphtha which is found abundantly at Baku, on the shores of the Caspian Sea, closely resembles the Rangoon in its qualities. There are volcanoes here and on several islands in the Caspian which are said to terminate their eruptions with outpourings of naphtha. The Persian naphtha is frequently pure enough for burning without rectification.

On account of its cheapness and abundance, the burning oil obtained from the North American petroleum springs has now become by far the most important of the native naphthas. The quantity of this oil which is at present imported into Great Britain is quite extraordinary, considering that the trade was only begun in 1859. The principal supplies are procured from Pennsylvania, Virginia, and Ohio. A considerable quantity has also been obtained at Enniskillen, in Canada.

Much curiosity exists respecting the origin of these great natural sources of petroleum, but no satisfactory explanation has yet been given. The theory that it has been distilled from the coal beds by subterranean heat is disputed by some geologists, on the ground that most of the wells are sunk in the Devonian rocks, below the coal-measures, though some of them are in the latter. Both in the States and in Canada, the oil varies from a thin and light-coloured to a very thick and dark-coloured kind. It is purified by similar processes to those described for the Boghead oil, and yields the same products—viz., a burning oil, a lubricating oil, and paraffin. The thick kinds contain the most paraffin. The following are the exports of petroleum from New York for the last three years: 1861, 1,102,239 gallons; 1862, 6,846,392 gallons; 1863, 19,674,897 gallons. The exports from New York appear to be rather more than all the other American ports put together.

The rapid increase in the importations of petroleum oil, and some accidents which occurred with it, led to the passing of an act of parliament in 1862, making it unlawful to keep more than 40 gallons of petroleum within 50 yards of a dwelling-house, or of a building in which goods are stored, without a licence from some local authority. In this act, any product of petroleum is included, which gives off an inflammable vapour at a temperature of less than 100° F. The alarm taken by the insurance offices at the increasing trade in this oil, also led to the construction of special warehouses for its reception at the Victoria Docks, London, and at the Liverpool docks. Special ships are, likewise, being introduced for this trade.

Terrible accidents have now and then happened with some of the more inflammable American oils, by reason of their vapours exploding in the reservoirs of lamps. Most of these have, no doubt, taken place with oils whose vapours form an explosive mixture with air at a temperature below 100° F., but they can hardly be considered safe if their vapours will take fire on the approach of a light at less than 120° F. The vapour of the burning oil from Boghead coal will not form an explosive mixture below 140° F., and is therefore quite safe. Even the most dangerous of the American oils can easily be rendered safe by removing the lighter naphthas which they contain. Coal-tar naphtha is more inflammable than any of them, but its dangerous properties are better known, and guarded against.

A commission appointed by the Navy Department of the Northern States of America, have recently, after several months of experimenting, recommended the use of petroleum to burn for the generation of steam, on the grounds that it is more economical than coal, and that, weight for weight, it will maintain steam three times as long.

**NAPHTHALIC GROUP OR SERIES.** The starting-point of the group is *Naphthalin* ( $C_{20}H_{12}$ ), a substance of great interest in the history of organic chemistry, from its being that upon which Laurent chiefly founded his Theory of Substitutions. It may be obtained in various ways, but is most easily and abundantly produced from the last portions of the distillate of coal-tar, which become semi-solid on cooling. The liquid part of this mass is got rid of by pressure, and the naphthalin is then taken up by hot alcohol, from which it is obtained in a pure state by crystallisation and sublimation.

Naphthalin crystallises in large, thin, rhombic plates, which are unctuous to the touch, and have a pearly lustre. Exposed to light under a glass covering, it gradually sublimes at an ordinary temperature in splendid crystals. It has a somewhat tar-like odour, and a pungent and somewhat

aromatic taste. It fuses at 174°, and boils at 428°. Its specific gravity, in the solid state, is 1.15, and as a vapour, 4.528. It is not very inflammable, and when ignited, burns with a white smoky flame. It is insoluble in water, but dissolves readily in alcohol, ether, and the fixed and essential oils.

By acting on naphthalin with an excess of sulphuric acid, we obtain *sulpho-naphthalic acid* ( $C_{20}H_8S_2O_6 + 2Aq$ ), from which, by substitution processes, a large number of compounds are produced. With nitric acid, naphthalin yields nitro-naphthalin [ $C_{20}H_7(NO_2)$ ], binitro-naphthalin [ $C_{20}H_6(NO_2)_2$ ], and trinitro-naphthalin [ $C_{20}H_5(NO_2)_3$ ], the group ( $NO_2$ ), or its multiples, being substituted for one, two, and three equivalents of the hydrogen of the naphthalin. The final product of the prolonged action, of boiling nitric acid on naphthalin is a mixture of oxalic and *naphthalic* or *phthalic acid*; the re-action being shewn by the equation:

This acid is also obtained by the continued action of nitric acid upon alizarin, which is an important fact, since it indicates a connection between naphthalin and the colouring matter of madder.

Laurent has discovered a very numerous series of substitution compounds formed upon the type of naphthalin, into the composition of which chlorine enters. They are of little practical importance although their investigation has exerted a remarkable influence upon the progress of organic chemistry.

**NAPIER, JOHN, Laird of Merchiston,** was born at Merchiston Castle, near Edinburgh, in 1550, and died there on the 4th of April 1617. After attending the regular course in Arts at the university of St Andrews, he travelled for some time on the continent, and returned to his native country highly informed and cultivated for the age. Declining all civil employments, for which his many accomplishments eminently fitted him, he preferred the seclusion of a life devoted to literary and scientific study. From this time his history is a blank till 1593, when he published his *Plaine Discovery* (or 'Interpretation') of the whole Revelation of Saint John (Edin. 5th ed. 4to, 1645), a work displaying great acuteness and ingenuity, but, it is scarcely necessary to add, not in any sense a 'plaine discovery' of the apocalypse. In the dedication to King James VI., he gave his majesty some very plain advice regarding the propriety of reforming his 'house, family, and court;' and on republishing the work, he added a supplement, resolving 'certaine doubts moved by some well-affected brethren.' About this time he seems to have devoted much of his time to the invention of warlike machines, but these inventions were never perfected, probably from motives of humanity. Like other eminent men of the time, N., though a strict Presbyterian, seems to have been a believer in astrology and divination, but there is no satisfactory proof that he ever practised these arts. In 1596, he proposed the use of salt as a fertiliser of land, an idea which, though scouted at the time, is now generally received. Another large blank in his history here occurs, and terminates in 1614, at which date he first gave to the world his famous invention of Logarithms (q. v.), in a treatise entitled *Mirifici Logarithmorum Canonis Descriptio* (4to, Edin.). This was followed by another work, *Rabdologie, seu nomenclationis per Virgulas libri duo* (Edin. 1617), detailing an invention for simplifying and shortening the processes of multiplication and division. See **NAPIER'S BONES**. He also prepared a second work on Logarithms, shewing their mode of construction

and application, with an appendix containing several propositions of spherical trigonometry, and those formulæ which are now known by his name. This work was published after his death by his son Robert, under the title of *Mirifici Logarithmorum Canonis Constructio, &c., quibus accessere Propositiones ad Triangula spherica faciliore calculo resolvenda, &c.* (Edin. 1619), and occurs along with the *Canonis Descriptio*. The latter work is included in Baron Masere's extensive collection, the *Scriptores Logarithmici* (Lond. 1808). N.'s eldest son, Archibald, was raised to the peerage as the first Lord Napier by Charles I. in 1627, and his descendants still bear the title. Two lives of N. have been published, the one by the Earl of Buchan (1787), and the other by Mr Mark Napier (1834).

NAPIER, SIR CHARLES JAMES, G.C.B., English general, one of several brothers distinguished for their bravery, three of whom—Charles, William, and George—were known in the Peninsular War as 'Wellington's Colonels.' They were sons, by a second marriage, of Hon. Colonel George Napier, grandson of Francis, fifth Lord Napier, who was fifth in descent, but through two females in succession, from the inventor of Logarithms. Charles, the eldest, was born at Whitehall, Westminster, August 10, 1782. Before he had finished his twelfth year, young N. received a commission in the 22d Foot. His first service was in Ireland, where he assisted in putting down the rebellion. He commanded the 50th Foot during the retreat on Corunna; and at the fatal battle in which Sir J. Moore fell, he was wounded in five places and made prisoner. Marshal Ney dismissed him, with permission to go to England on parole. On his return, he engaged in literary works, and even wrote an historical romance. In 1811, he returned to the Peninsula. At Coa, where he fought as a volunteer, he had two horses shot under him. At Busaco, he was shot in the face, having his jaw broken and his eye injured. He recovered in time to be present at the battle of Fuentes d'Onoro and the second siege of Badajoz. After distinguishing himself in innumerable skirmishes, the daring soldier returned to England. He next took part in a fighting cruise off the Chesapeake, capturing American vessels, and making frequent descents upon the coasts. He did not return to Europe soon enough for Waterloo, but was engaged in the storming of Cambray, and accompanied the army to Paris. After the peace he was, in 1818, made governor of the island of Cephalonia, the affairs of which he administered with great energy and intelligence. Being, however, of an excessively combative disposition, he became embroiled with the authorities at home. In 1841, he was ordered to India to assume the command of the army at Bombay. This was the most splendid period of his career, resulting in the conquest of Scinde against terrible odds. His destruction of a fortification called Emanu Ghur in 1843, was described by the Duke of Wellington as one of the most remarkable military feats he had ever heard of. The fearful battle of Meance followed, where N., with 1600 English and sepoy, defeated near 30,000 Beloochees, strongly posted, with the loss of 6000 men. The Ameers surrendered, except Shere Mahomed, who brought 25,000 men into line of battle at Hydrabad. N. had only 5000 men, but in three hours his little army gained a decisive victory. A few days afterwards, N. was in the palace of the Ameers, and master of Scinde. He was fortunate in possessing the entire confidence of Lord Ellenborough, who made him governor of Scinde. His civil administration was scarcely less remarkable or less successful than his military operations. He

gained the respect and reverence of the inhabitants, but soon became engaged in an acrimonious war of despatches with the directors. In 1847, he returned to England. After attending a series of festivals in his honour, he lived in retirement until the disasters of the last Sikh war caused the eyes of his countrymen to be turned to the hero of Scinde as the deliverer of our Indian empire. He went to India, but found on his arrival that the Sikhs had been routed. He now turned his attention, as commander-in-chief of the army in India, to the subject of military reform. He bade a final adieu to the East in 1851, and returned to his native country, where he resided until his death, which took place at his seat, at Oaklands, near Portsmouth, August 29, 1853. He had then attained the rank of lieutenant-general, was G.C.B., and colonel of the 22d Foot. It must be remembered to his honour that he was the first English general who ever recorded in his despatches the names of private soldiers who had distinguished themselves, side by side with those of officers. Brave to rashness, ready alike with tongue, pen, and sword, quarrelsome with his superiors, but beloved by his soldiers, and, to crown all, of a strangely wild yet noble and striking appearance, N. was one of the most remarkable men of his time, and in losing him the country lost one of its brightest military ornaments. His statue has recently been erected in Trafalgar Square. The story of his *Conquest of Scinde* has been written by his brother, Lieutenant-General SIR WILLIAM FRANCIS PATRICK NAPIER, K.C.B., born 17th December 1785, who served in the Peninsular campaign, and was engaged from 1824 to 1840 in preparing his *History of the Peninsular War*, the greatest military history in the English language. He died February 12, 1860, at Scinde House, Clapham, and was followed in a few weeks to the tomb by his wife, Lady Napier, niece of the great C. J. Fox. Her extraordinary skill in translating French documents written in cypher, and her indefatigable labours as her husband's amanuensis, are touchingly commemorated in the preface to the edition of the *History of the Peninsular War*, published in 1851.

NAPIER, SIR CHARLES, K.C.B., English admiral, was cousin to the hero of Scinde and the historian of the Peninsular War. His father was the Hon. Captain Charles Napier, R.N., second son of Francis, fifth Lord Napier. He was born March 6, 1786, at the family seat, Merchistoun Hall, in the county of Stirling. At 13, he went to sea as a naval volunteer. In 1808, he received the command of the *Rocruit*, 18 guns, and had his thigh broken by a bullet while engaging within pistol-shot the *Diligente*, a French corvette of 22 guns. At the reduction of Martinique he took a principal fort, accompanied by only five men. He kept up a running fight, in his 18-gun brig, with the rearmost of three French line-of-battle-ships, the *D'Hautpout*, which escaped from Guadeloupe, and was thus instrumental in her capture. This obtained him a post-captaincy; but being thrown out of active service, he served ashore as a volunteer in the Peninsular army 'by way of amusement,' as he expressed it. 'Black Charley,' as he was called, was present at Busaco with his cousins, and received a wound in the battle. In 1811, he obtained the command of the *Thames*, 32 guns. He inflicted an incredible amount of damage upon the enemy in the Mediterranean, and put a stop to their attempts to construct a fleet. He also conducted several desperate land operations with such marked success, that a high authority has declared that his genius was essentially military. In 1814, he was ordered to America, and led the way in the hazardous

ascent and descent of the Potomac. He afterwards took an active part in the operations against Baltimore. After the war, he settled in Paris, where he established the first steamers on the Seine. In 1823, he received the command of the *Galatea*, a 42-gun frigate, and was employed 'on particular service' on the coast of Portugal and in the Azores. He thus became acquainted with the leaders of the Constitutional party, and accepted the command of the fleet of the young queen. He sailed in search of the Miguelite fleet, and, although vastly over-matched, did not hesitate to engage it. He ran his 32-gun frigate, the *Rainha*, alongside of the *Don John*, of 80 guns, and carried her by boarding. This action concluded the war, and placed Donna Maria on the throne. He was made admiral-in-chief of the Portuguese navy, and attempted to remodel it; but official and corrupt influence was too strong for him, and he returned to England. He was appointed to the *Powerful*, 84 guns, and when the war between the Porte and Mehemet Ali broke out, he was despatched to Beyrout. He organised a land force, with which he stormed Sidon, and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre, and did not hesitate to disregard the orders of his chief, Admiral Stopford, when he saw the way to bring the battle to a speedy termination. He next blockaded Alexandria, and concluded a convention with Mehemet Ali, which, although at first repudiated, was eventually adopted by the allied powers. In 1841, he was elected M.P. for Marylebone. In 1847, he received the command of the Channel fleet. When the Russian War broke out, he was sent out to command the Baltic fleet. The capture of Bomarsund failed to realise the high expectations formed of N.'s exploits. In 1855, he was returned to parliament as M.P. for Southwark, and, until his death, November 6, 1860, he laboured with success to reform our naval administration, and improve the condition of our seamen. He died at Merchiston Hall, Hiordean, Hants, and was at the time of his death a vice-admiral and a knight of several foreign orders.

NAPIER'S BONES, an invention of the celebrated Napier (q. v.) of Merchiston, for the purpose of performing mechanically the operations of multiplication and division. The 'bones' were narrow

Napier's Bones.

slips of bone, wood, ivory, or metal, about 3 inches long by 3-10ths of an inch in breadth, and divided by transverse lines into nine compartments; each of these compartments being divided into two portions

by a diagonal line running from the upper right hand to the lower left hand corners. The 'bones' were divided into sets, all those of one set having the same digit occupying the top compartment, and the several multiples of that digit occupying in order the eight lower compartments; when the multiple consisted of two figures, these were placed one on each side of the diagonal line. There was necessarily a set of bones for each digit. There was also another rod similarly divided into compartments, in which were placed the nine digits; this was called the *index-rod*. Multiplication was performed as follows; e.g., if 6795 is to be multiplied by 97834, four rods (see fig.) whose top digits were 6, 7, 9, 5 are selected, and arranged in the order of the figures in the multiplicand, and the index-rod placed alongside them, as in the figure; the several figures of the multiplier are then sought for on the index-rod, the two lines of figures opposite each figure on the index are then added together diagonally, and the five sums thus obtained are arranged as follows:

9 61155  
7 47565  
8 54360  
3 20385  
4 27180

664782030 = the product required.

Division is performed in an analogous manner. The contemporaneous invention of logarithms for the same purpose of converting multiplication and division into addition and subtraction, caused Napier's bones to be overlooked, and they are now scarcely ever used.

NAPLES (Ital. *Napoli*, anc. *Neapolis*), a city of Southern Italy, capital of the province of Naples, is built partly at the base, partly on the slopes of two crescent-shaped acclivities on the famous bay of the same name. Pop. (1862) 447,065. Lat. 40° 51' 8" N., long. 14° 15' 5" E. The wonderful beauty of the site and of the surrounding prospect, the delicious softness of the climate, and the clear atmosphere, make N. famed among the cities of the world. It is one of the chief centres of commerce and industry of Italy, possesses a very extensive mercantile shipping, and is one of the principal stations of Mediterranean steam-navigation.

The public buildings of Naples are numerous and grand, but are devoid of architectural symmetry in consequence of the antiquity of their origin and the irregularity of their site. Many of the old streets are paved with lava, and inconveniently narrow; the houses in these quarters are of great height, and appear to overhang the narrow tortuous causeways beneath. The modern streets, however, are spacious and splendid. The city is divided into the Old and the New Town, or the East and West Crescents, by a lesser range of heights—viz., the Capodemonte, the St Elmo, and the Pizzozalone, terminating in the rocky promontory called the Castel dell' Ovo. The eastern division of N. is the most ancient and the most densely peopled; it contains the principal public structures, and is intersected by the splendid Via or Street of Toledo. The western, or modern section, contains the famous Riviera di Chiaja, or the Quay, a fine road running along the bay in a curved course of three miles, flanked on the right by a row of palaces, and bordered on the left by the beautiful pleasure-grounds of the Villa Reale, which lie between it and the sea, and of which the natural beauty is heightened by the interspersing of temples, fountains, and statuary groups amidst the acacia, myrtle, and orange groves. The public squares, or *larghi*, of N. are adorned with fountains and obelisks; and within the precincts of the city,

there are several highly-prized springs both of fresh and mineral waters. The fortified castles are numerous. Amongst the principal are the Castel Nuovo, called the Bastille of Naples, somewhat similar to the Tower of London, and adorned with a fine triumphal arch, erected in honour of Alfonso of Aragon; the Castel dell'Ovo, so called from its oval or egg shape, standing on a promontory, and connected by a bridge with the mainland; the Castel Capuano, of Norman origin; the Castel Sant' Elmo, on the hill of the same name, commanding a magnificent view from its ramparts, and formerly reputed for its immense strength; and the dismantled Castel del Carmine. The churches are upwards of 300, and many of them are rich in architectural and archaeological interest. The cathedral dedicated to St Gennaro (Januarius; q. v.) contains the celebrated phials in which the liquefaction of St Gennaro's blood is alleged to take place on two annual festivals; it also contains the tombs of Charles of Anjou and of Pope Innocent IV., besides numerous fine paintings and statues. The educational institutions of N. embrace famous schools of surgery, law, and general science. The philanthropical establishments are on an immense scale, and are richly endowed. There are also several theatres in the city, of which that of *San Carlo* (devoted to the Opera) is one of the largest and most celebrated in Italy; but the characteristic theatre of N. is the *Teatro di San Carlino*, the head-quarters of *Pulcinella* ('the Italian Punch.'). There are four grand public libraries; and in the Museo Borbonico, N. contains an unrivalled collection of art, comprising frescoes, paintings, mosaics, sculptures, bronzes, antiquities, coins, medals, inscriptions, and the renowned collection of precious objects excavated from Herculaneum and Pompeii.

The environs of N., apart from their extreme beauty of scenery, are highly interesting. The locality which contains the tomb of Virgil, the disinterred towns of Herculaneum and Pompeii, the physical phenomena of Vesuvius, and the Roman remains of temples, villas, palaces, and tombs, must possess an inexhaustible source of interest for scientific, antiquarian, and classical investigators. The modern villas of N. are splendid and luxurious. One of the most striking features of N. is its unique population and the universal publicity in which life is passed. The inhabitants for ever swarm in the thoroughfares, where an incessant throng of vendors, purchasers, and idlers intermingle with asses, mules, hand-carts, and conveyances, dazzling the eye with their brilliant variety of costume, and the pantomimic expressiveness of their frantic gestures and attitudes; while the ear is stunned by the shrill conflicting cries of the ambulatory vendors of every conceivable commodity, by the piercing notes of the improvisatore's song, and the uproarious bilarity and high-pitched patois of the countless masses, whose sole abode appears to strangers to be the thronged public squares and streets. The popular language of N., which is a corrupt dialect of Italian and Spanish, is in prevalent use among all classes of society; it lends itself especially to the satirical and facetious squibs and compositions in which the Neapolitans excel. The popular Neapolitan songs in the native patois are exquisitely naive and expressive in sentiment, and are set to popular melodies which exert a maddening charm over this southern populace. The physical condition of the lower classes of N., and especially of the *lazzaroni* (q. v.), has of late years sensibly improved both as regards raiment and lodging.

The name Naples (Gr. *Neapolis*, new city) had reference to an older town in the neighbourhood,

called originally Parthenope, and, after the foundation of the new town, Palæopolis (old town), which was situated most probably on the ridge called Posilipo, that separates the Bay of Pozzuoli or Baia from that of Naples. Both towns were Greek settlements, apparently colonies from the neighbouring Cumæ, joined by immigrants direct from Greece. In 327 B.C., Palæopolis was besieged and taken by the Romans, and thenceforth disappears from history; Neapolis submitted without resistance, and became a favoured and faithful ally, or rather provincial city of Rome. It long, however, retained its purely Greek character and institutions; and there is evidence that the Greek language continued to be used, even in public documents, as late as the 2d c. of the Christian era. N. was a flourishing and populous city during the Roman empire; and, notwithstanding the vicissitudes of the Gothic conquest of Italy, and the reconquests by the Byzantine emperors, it continued to be one of the most important and opulent places in Italy. About the 8th c., it threw off allegiance to the Byzantine emperors, remained independent till it fell into the hands of the Normans in 1140 A.D., and became the capital of the kingdom of Naples. (1871—pop. 448,743.)

NAPLES, BAY OF, an indentation of the Mediterranean Sea on the south-west coast of Italy, opposite the city of Naples, is 20 miles wide from Cape Miseno on the north-west to Cape Campanella on the south-east, and from this line extends inland for about ten miles. The scenery is very beautiful. On the shores are many towns and villages; the prospect is bounded on the east by Mount Vesuvius, and on the outskirts of the bay are the islands of Ischia and Capri.

NAPLES. The Italian provinces (formerly kingdom) of N. and Sicily, or the Two Sicilies, occupy the south end of the Italian peninsula, and consist of the continental territory of N. and the insular dependency of Sicily. The distinctive physical features of N. and Sicily are noted under the names of the different provinces of Italy and in the article SICILY. They are favoured by nature with a salubrious and almost tropical climate, unbounded fertility, and teeming population; and they present natural features of rare attractiveness. The rural population are an acute, frugal, and laborious race, and form a strong contrast to their idle and debased brethren of the towns. For statistics of products, exports, and population, see ITALY and SICILY. N., in ancient times, was divided into numerous petty states independent of each other, and its inhabitants were of various races. Many of these states arose from Greek colonies, which had been founded in the country previous to the 7th c. B.C. The ancient historical importance of N. is attested by the splendor of its cities, and the warlike renown of its population. On its conquest by the Romans, the great Neapolitan cities severally adopted the municipal, federative, or colonist form of government, and gradually assimilated their laws and customs to those of their conquerors. After the downfall of the Western Empire, N. was seized by Odoacer, but soon afterwards (490 A.D.) it was subjected by the Goths, and in the following century by the Lombards, who established in it various independent duchies, as Benevento, Spoleto, Salerno, Capua, &c. Most of these were overthrown by invading bands of Arabs, Saracens, and Byzantines, who were in turn expelled, and the whole country subdued by the Normans in the 11th century. The Normans subsequently erected N. and Sicily into a kingdom, and established a new political, ecclesiastical, and military system. To the Norman

dynasty succeeded that of the Hohenstaufen, whose rule was marked by an immense intellectual and social advancement of the people; but the vindictive enmity with which the papal see regarded this dynasty, led to the invasion of N. by Charles of Anjou, who, notwithstanding the heroic resistance of King Manfred (q. v.), by the battle of Benevento (1266) annihilated the power of the Hohenstaufen. The ascendancy of Charles of Anjou was further effectually secured by the treacherous defeat and decapitation (1268) of Konradin (q. v.), the last male-heir to the throne. By the *Sicilian Vespers* (q. v.) the island of Sicily was, however, wrested in 1282 from his grasp, and became an appanage of the Spanish crown. The predominance of the Neapolitan Guelph or papal party during the glorious reign of Robert I., who was the patron of Dante and Boccaccio, the depraved libertinism of his heiress and granddaughter Joanna, the fearful ravages committed by predatory bands of German mercenaries and by the plague, the futile attempts of the Anjou sovereigns to recover Sicily, and the evenombed feuds of rival claimants to the throne, are the leading features of the history of N. during the rule of this dynasty, which expired with the profligate Joanna II. in 1435; and was followed by that of Aragon, which had ruled Sicily from the time of the Sicilian Vespers. During the tenure of the Aragon race, various unsuccessful attempts were made by the House of Anjou to recover their lost sovereignty; and the country, especially near the coast, was repeatedly ravaged by the Turks (1480). In fact, after the death of Alfonso, the first ruler of the Aragon dynasty, the country groaned under a load of misery. Wars, defensive and offensive, were incessant, the country was impoverished, and a conspiracy of the nobles to remedy the condition of affairs was productive of the most lamentable results, both to the conspirators themselves, and to the other influential Neapolitan families. In 1495, Charles VIII. invaded N., and though he was compelled to withdraw in the same year, his successor, Louis XII., with the treacherous assistance of Ferdinand (the Catholic) of Spain, succeeded in conquering the country in 1501. Two years afterwards, the Spaniards under Gonsalvo di Cordova (q. v.) drove out the French, and the country from this time became a province of Spain. Sicily had previously (1479) been annexed to the same kingdom. During the two centuries of Spanish rule in N., the parliaments which had existed from the time of the Normans fell into desuetude, the exercise of supreme authority devolved on viceroys, and to their ignorance, rapacity, and oppressive administration may be solely ascribed the unexampled misery and abasement of this period. In the words of Sismondi, 'no tax was imposed save with the apparent object of crushing commerce or destroying agriculture, and the viceregal palace and the tribunals of justice became public offices in which the highest dignities and most sacred interests of the state were openly bartered to the wealthiest bidder.' During the Spanish rule, a formidable rebellion took place in 1647, headed first by Masaniello (q. v.), and afterwards by Henry V., Duke of Guise; the whole population of the province renounced their allegiance to their Spanish sovereigns, but the arrival of a new viceroy, who was equal to the occasion, resulted in the capture of the Duke of Guise and the re-subjugation of the country. At length, during the war of the *Spanish Succession* (q. v.), N. was wrested from Spain by Austria in 1707, and Sicily in the following year; but while N. was secured to Austria by the treaties of Utrecht (1713) and Rastadt (1714), Sicily was handed over to Savoy by the former treaty. In 1720, however,

both Sicilies were reunited under the Austrian rule, and in 1735 were given to Don Carlos, third son of Philip V. of Spain, who ascended the throne as Charles I., and founded the Bourbon dynasty. His reign was marked by equity and moderation; great reforms were effected in the administration of public affairs, science and literature were encouraged, and splendid works of public utility were erected throughout the kingdom. It was during his reign that Pompeii and Herculaneum were discovered. His successor, Ferdinand IV., followed in the course of legislative reform; but on the proclamation of the French Republic (1789), his states were invaded by a French army, and the kingdom of N. was erected into the Parthenopean Republic (1799). Ferdinand retired with his court to Sicily, and for a brief period enjoyed the restoration of his sovereign rights in N.; but a second invasion by Napoleon (1806) ended in the proclamation of his brother, Joseph Bonaparte, as king of N.; and on this latter assuming the Spanish crown in 1808, that of N. was awarded to Joachim Murat, brother-in-law of Napoleon. On the defeat and execution of Murat in 1815, the Bourbon monarch, Ferdinand IV., was restored. The liberal insurrectionary movements in N. in 1821 and 1830 were the forerunners of the revolution of 1848; and in each case the party of progress was combated by the respective kings with ruthless severity, and perfidious concessions, to be cancelled and avenged with sanguinary fury when the disarmed and credulous patriots were at the mercy of the sovereigns. See article GARIBALDI for the ultimate overthrow of the Bourbon dynasty in the kingdom of N., and its subsequent annexation to the kingdom of Italy under King Victor Emmanuel; also articles FERDINAND II. and ITALY. For the history of Sicily previous to its annexation, and during its various separations from N., see SICILY.

**NAPLES-YELLOW** is a pigment used by artists. It consists of antimoniate of lead, and is obtained by the direct combination of antimonic acid and oxide of lead under the influence of heat.

**NAPOLEÓN BONAPARTE**, Emperor of the French, was born at Ajaccio, in the island of Corsica, 15th August 1769. (For an account of the family to which he belonged, see **BONAPARTE, FAMILY OF**.) At the age of ten, he entered the Military School at Brienne, as a king's pensioner. Here he remained five years and a half. During that period, he displayed a great aptitude and predilection for mathematics, history, and geography, and an indifference to merely verbal and literary studies. His manner was sombre and taciturn, but as Bourrienne (who was his schoolfellow) says, this arose chiefly from the circumstance that he was a foreigner, poor and unaccustomed to the use of French, which he first learned at Brienne. In October 1784, he proceeded to the Military School to complete his studies for the army, and in rather less than a year obtained his commission as sub-lieutenant in the artillery regiment *de la Père*. When the Revolution broke out, N. was in garrison at Valence. He took the popular side, but in a quiet and undemonstrative way, for he did not love the boisterous enthusiasm of unmanageable mobs. When the armed rabble of Paris poured out to the Tuileries on the famous 20th of June 1792, N., who was then in the city, followed the 'despicable wretches' (as he called them), along with his friend Bourrienne; he saw them force the poor king to stick the red cap on his head, and smile fatuously from the windows of his palace. 'It is all over henceforth with that man,' said the young officer, and returned to Paris graver and more thoughtful than Bourrienne had ever seen him. After the scenes of

the 10th August, he left for Corsica, where General Paoli held the chief command. The excesses of the Septembrists and Terrorists, however, induced Paoli to throw off his allegiance to the Convention, and to seek the assistance of England. N. was active but unsuccessful in his opposition to the designs of the general, and was obliged, along with his relatives, to flee from the island.

He now petitioned the Convention for employment, and was sent to assist in the reduction of Toulon, with the rank of lieutenant-colonel of artillery. The city was captured (19th December 1793) entirely through the strategic genius of N.; and in the following February he was raised to the rank of brigadier-general, and placed at the head of the artillery in the army of the south. Later in the year, he was sent to Genoa, to examine the state of the fortifications of the city, and to discover the political disposition of the inhabitants. In the beginning of 1795, he was again in Paris seeking active employment, and thinking, from sheer ennuï, of transferring his services to the Sultan of Turkey. The Convention was now in great peril, on account of the mutinous spirit of the arrondissements of the capital, and, on the suggestion of Barras, Carnot, Tallien, and others, N. was made commander of the troops provided for its defence. On the 13th Vendémiaire (4th October 1795), the national guard, 30,000 strong, attempted to force its way into the Tuileries, where the Convention was sitting, but was routed and dispersed by a terrible cannonade directed by the young artillery officer. N. was immediately appointed to the command of the army of the interior. About this time, he made the acquaintance of Josephine Beauharnais, whom he frequently met at the house of Madame Tallien. Captivated by her elegant manners and amiable disposition, he proposed marriage to the graceful widow, and was accepted. The ceremony took place 9th March 1796. A few days before, he had been appointed to the supreme command of the army of Italy, and he was obliged to leave his bride almost at the altar. On his arrival, he found the troops in a wretched condition. He had only 36,000 available men, and even these were half-starved, and only half-clothed, to oppose to an Austrian and Piedmontese force of 75,000. Yet he was not afraid to undertake the conquest of Upper Italy. Leaving Nice at the close of March, he won his first victory over the Austrians at Montenotte (11th April), which opened the Apennines for him; three days later, a second success at Millesimo separated the allied armies; and, finally, his victory at Mondovì (on the 22d) compelled Sardinia to implore peace. He now hoped to utterly crush the Austrian army under Beaulieu, and at the battle of Lodi (on the 10th May) nearly accomplished it. His opponent did not venture to defend the line of the Mincio, but hastily throwing a garrison into the city of Mantua, retreated into the Tyrol. N. immediately entered Milan, and took possession besides of all the principal cities of Lombardy. Now began that system of enormous and unscrupulous plunder in Northern and Central Italy which gives something of a barbaric character to the conquests of the French. The Directory gave orders that N. should levy contributions from all the states which he had gratuitously freed, and according to his own account, he sent to France not less than 50,000,000 francs. His officers and commissaries actually seized whatever they wished, provisions, horses, and all manner of stores; and because Pavia ventured to make some slight resistance to the shameful extortions of the Republicans, N. gave it up to havoc for 24 hours! A body of savans (including Monge, Berthollet, and others) were

despatched to Italy to superintend the spoliation of its artistic treasures; and both now and in the subsequent Italian campaigns, pictures, statues, vases, and MSS. were carried off in great numbers, to gratify the vanity of the Parisian sight-seers. In this way, Lombardy, Parma, Modena, Bologna, and the States of the Church were savagely harried before the end of June—Pope Pius VI., in particular, being forced to submit to conditions of extreme rigour.

Meanwhile, Austria had resolved to make another effort for the recovery of Lombardy. About the close of July, Marshal Wurmser advanced from Trent at the head of 60,000 men, forced Napoleon to raise the siege of Mantua, but was himself defeated, with the loss of all his cannon, near Castiglione (5th August), and again at Bassano (8th September), in consequence of which, he was driven to take refuge within the fortress of Mantua with some 16,000 troops—the shattered remains of his 60,000. Austria, however, was not disheartened. A third army was despatched in two divisions: 30,000 from Carinthia, under Marshal Alvinzi; and 20,000 from the Tyrol, under General Davidowich. This was a terrible campaign for N.; his veterans were exhausted, his new supports had not arrived; he himself was despondent, while the Austrians were fresh and hopeful. At first, the latter were completely successful; but the great victory of Arcole, won by N. (17th November) after three days' fierce fighting, in which he lost nearly all his general officers, decided the fate of the campaign. His dispatches to the Directory, penned about this period, shew how thoroughly he apprehended the state of parties in Italy, and also how utterly indifferent he was to any considerations beyond those that advanced the interests of France. In January 1797, a fourth campaign was commenced by Austria. At the head of 50,000 fresh troops, Alvinzi descended from the Tyrol, but was completely routed by N. at Rivoli, on the 14th of the month; while not long after, Wurmser was starved into surrender at Mantua. A fifth army was assembled on the Tagliamento, under the command of the Archduke Charles: but his troops were mainly raw recruits, while those of N. were inured to war, and flushed with innumerable triumphs. In consequence, he was forced to retreat, which, however, he did slowly and in good order, hoping to surround his opponent in the interior of the country. N.'s design was to march on Vienna, and he actually penetrated as far as Judenburg, in Upper Styria, only eight days' march from the capital. The Austrian government at length was seized with alarm, made overtures of peace; and finally, on the 17th October 1797, the famous treaty of Campo-formio was signed, by which Austria ceded the Netherlands, Lombardy, and some other smaller territories to France; while she herself obtained in return, through disgraceful treachery on the part of the victor, possession of the province of Venice. It is generally said that N.'s military genius was never more brilliantly displayed than in these early Italian campaigns. In ingenuity of plan, celerity of movement, audacity of assault, he far outshines all his adversaries; it is, moreover, but just to him to state further, that he made desperate efforts to stop the excesses of the most scoundrelly commissariat in Europe; and that while in the main he shewed no hesitation in carrying out the brigand-like orders of the Directory, he does not appear to have appropriated a single penny to himself. It was power, not gold, that he cared for.

In December 1797, N. returned to Paris, where he was received with the utmost enthusiasm. At this time, there was much talk, and probably

some vague design, on the part of the Directory, of invading England, and N. was appointed commander-in-chief of the invading army. It has been thought, however, that this was merely a feint to mask the real design of the Directory, viz., the invasion of Egypt, as perhaps a preliminary step to the conquest of British India. Be that as it may, an expedition against Egypt was resolved on by the Directory; and on the 19th of May 1798, N. sailed from Toulon, with a fleet containing 30,000 soldiers, and a body of savans to investigate the antiquities of the country. He reached Alexandria on the 29th of June. At this moment, France was at peace with Turkey; the invasion of Egypt, a Turkish dependency, was therefore an act utterly unjustifiable, and reminds us not of European warfare, but rather of the irruption of a horde of barbaric Tartars. N. having landed his troops, captured Alexandria, and marched on Cairo. The Mamelukes prepared resistance; but on the 21st July, at the battle of the Pyramids, they were completely defeated, and the French became, in a surface-way, masters of Egypt. N. now entered the capital, and immediately commenced to reorganise the civil and military administration of the country—for he took a great, but also an ostentatious pleasure in this sort of work. Meanwhile, on the 2d of August, Nelson had utterly destroyed the French fleet in Aboukir Bay, and so cut off N. from communication with Europe. A month later, the sultan declared war against him. This was followed by disturbances in Cairo, which were only suppressed by horrible massacres. It was obviously necessary that N. should go somewhere else. He resolved to meet the Turkish forces assembling in Syria; and in February 1799, crossed the desert at the head of 10,000 men, stormed Jaffa on the 7th March, after a heroic resistance on the part of the Turks; marched northwards by the coast, and reached Acre on the 17th. Here his career of victory was stopped. All his efforts to capture Acre were foiled through the desperate and obstinate valour of old Djezzar Pasha (q. v.), assisted by Sir Sidney Smith, with a small body of English sailors and marines. On the 21st of May, he commenced his retreat to Egypt, leaving the whole country on fire behind him, and re-entered Cairo on the 14th of June. It was during his absence that the savans made their valuable researches among the monuments of Upper Egypt. About the middle of July, the Sultan landed a force of 18,000 men at Aboukir, who were attacked by N. on the 25th, and routed with immense slaughter. But the position of the victor was far from comfortable, and he therefore resolved to return to France—especially as news had come to him of disasters in Italy and confusions in Paris. On the 23d of August, he sailed from Alexandria, leaving his army behind him, under the command of Kleber; and after narrowly escaping capture by the English fleet, landed near Frejus on the 9th October. He hastened to Paris, soon mastered the state of affairs, threw himself into the party of Sieyès, and overthrew the Directory (q. v.) on the famous 18th Brumaire. A new constitution was drawn up, chiefly by Sieyès, under which N. became First Consul, with the power of appointing to all public offices, of proposing all public measures in peace or war, and the entire command of all administrative affairs civil and military. In a word, he was ruler of France; and though far from satisfied with the clumsy machinery of Sieyès's plan, he could afford to wait the future. About the end of January 1800, he took up his residence in the Tuileries. The country was tired of revolutions, disorders, and confusions; it was proud of its young leader, who seemed inspired but

not enslaved by the ideas of his age, and who knew how to enforce obedience, as well as to panegyrisse principles. It therefore regarded his assumption of sovereign power with positive satisfaction. N. displayed extraordinary vigour as an administrator, recruited the national treasury, by various sagacious expedients, repealed the more violent laws passed during the Revolution, such as punishment for matters of opinion, reopened the churches, and terminated by policy the Vendean struggle. But he knew well that his genius was essentially military, and that his most dazzling and influential triumphs were those won on the battle-field. France was still at war with Austria, and he resolved to renew the glories of his first Italian campaigns. Leaving Moreau in command of the army of the Rhine, he assembled, with wonderful rapidity and secrecy, an army of 36,000 men on the shores of the Lake of Geneva, and on the 13th May (1800), began his magnificent and daring march across the Alps. Almost before the Austrian general, Melas, was aware, N. had entered Milan (2d June). Twelve days afterwards, was fought the fiercely contested yet decisive battle of Marengo, which compelled the Austrians to resign Piedmont with all its fortresses, and (for the second time) Lombardy to the French. Later in the year, hostilities were recommenced; but the Austrians, beaten by Moreau in Germany (at Hohenlinden, &c.), and by N. in Italy, were at last forced to make peace; and on the 9th February 1801, signed the treaty of Lunéville, which was mainly based on that of Campo-formio. In the course of the same year, France and England also made peace, but the treaty (known as that of Amiens) was not definitively signed till the 27th of March 1802. Not less important for the consolidation of affairs in France was the famous *Concordat* (q. v.) between N. and Pope Pius VII., also concluded in 1801. In January 1802, N. became President of the Cisalpine Republic; and on the 2d August following, was declared Consul for life by a decree of the French senate.

Meanwhile, N. was busy superintending the drawing up of a code of civil laws for France. He assembled the first lawyers in the nation, under the presidency of Cambacérès, and frequently took part in their deliberations; the results of their labours were the *Code Civil des Français*, *Code de Procédure*, *Code Penal*, and *Code d'Instruction Criminelle*, besides commercial and military codes, all of which often go loosely under the name of the *Code Napoléon*. The first of these is an admirable production, and is in force to the present day. Considerable attention was besides paid to such branches of education as were likely to promote efficiency in the public service. Mathematics, physical science in all its departments, engineering, &c., were as vigorously encouraged as philosophy, ethics, and political speculation were discouraged. But the best proof that N. wanted not an educated people, but only active and expert tools and agents, was the indifference that he manifested to primary and elementary education. In a population of 32,000,000, the number of pupils under ten years is given by Fourcroy at only 75,000! The internal government was the acme of despotic centralisation. N. appointed all prefects of departments, and all mayors of cities, so that not a vestige of provincial or municipal freedom remained. He ruled France as he ruled the army of France, and was already an emperor in almost everything but the name.

Peace between France and England did not last long. N.'s policy in Italy irritated the British government, and as remonstrances were ineffectual, war was declared against France, 18th May 1803. The English fleet scoured the seas, paralysing the

commerce of France; while N. threatened to invade England, and assembled a large army at Boulogne. So utterly did he misconceive the character and condition of Englishmen, that he felt sure (by his own statement) he should be welcomed as a liberator by the people! While these warlike preparations were going on, occurred the dangerous conspiracy of the Chouan chief, George Cadoudal (q. v.), Pichegru (q. v.), Moreau (q. v.), and others. Its discovery (February 1804) alarmed N. excessively, and led to what has been considered one of the blackest deeds in his career—the murder of the Duke d'Enghien (q. v.) on the 20th of March following. He now appears to have felt it necessary to assume the title of emperor. France, he alleged, wanted an empire as a symbol of permanent security. An appeal was made to the nation. Upwards of 3,000,000 votes were given in favour of the proposed change in the form of government; only 3000 or 4000 against it. But where there is no municipal freedom, one does not know what value to put on votes. On the 18th May, N. assumed the title of Emperor at St Cloud, and was crowned by, or rather in the presence of, the pope (for N. rudely crowned himself), on the 2d December. In the following summer (May 26), he was also crowned king of Italy, in the great cathedral of Milan; and Eugene Beauharnais, his step-son, was appointed to the office of Viceroy.

This policy of aggrandisement, which set at naught the conditions of the treaty of Lunéville, alarmed the other nations of Europe, especially Austria, who saw her Italian possessions seriously threatened. In 1805, a coalition was formed between England, Russia, Austria, and Sweden, mainly through the persevering policy of the first of these countries; and war again broke out in the month of September. N. acted with amazing celerity. Concentrating his widely-scattered forces at Mainz, he marched at once across Bavaria, compelled General Mack to capitulate at Uha with 20,000 men (17th October); and on the 13th of November entered the capital of Austria. France was electrified; the rest of Europe was thunder-struck. But a more glorious triumph was yet to come. The Russian army was already in Moravia, under the immediate command of the Emperor Alexander I., and was there being joined by the scattered Austrian troops. N. did not lose a moment. Hurrying north, he gave battle to the allies at Austerlitz, on the 2d of December. The contest was tremendous; but the victory was complete. N.'s opponents were utterly crushed; and next day the Austrian emperor sought an interview, and sued for peace. A treaty was signed at Presburg on the 26th December, by which Austria ceded to France all her Italian and Adriatic provinces; other changes effected by it were, the dissolution of the old German empire, and the formation of the *Confederation of the Rhine* (q. v.).

In February 1806, a French army conquered Naples, and the crown was conferred by N. on his brother Joseph; in the following June, another brother, Louis, was made king of Holland. Prussia, now, when it was too late, assumed a hostile attitude. She had hung off partly through fear and partly through selfishness, from the great anti-French coalition of the previous year, and now, when circumstances were almost hopelessly adverse, she madly rushed against her colossal enemy. Austria, with more magnanimity than prudence, lent her help, but the star of N. was still in the ascendant. The battle of Jena (October 16) absolutely annihilated the power of Prussia; five days later, N. entered Berlin, whence he issued (November 21) his celebrated 'Decrees' against British commerce, hoping to ruin her by shutting out her ships from

every harbour in Europe. His expectations, it need hardly be said, were disappointed. His policy well-nigh ruined the commerce of his own and other countries, but it only increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be got from the colonies save through her, and the merchants of the continent were obliged—in order to supply their customers as before—to let her carry on a vast contraband traffic. See **ORDERS IN COUNCIL.**

After the capture of Berlin, N. proceeded northwards to encounter the Russians, who were advancing to the help of Prussia. On his way, he summoned Poland to rise, but only with partial success. At Pultusk (December 28, 1806), and at Eylau (February 8, 1807), the French were beaten and driven back on the line of the Vistula; but after some months, he received heavy reinforcements, and on the 13th of June, fought and won the great battle of Friedland, which led to the treaty of Tilsit, signed on the 7th of July. By a secret article of this treaty, Russia promised to close her ports to British vessels. It is important to observe here, that, as the military triumphs of N. increased, the civil and political liberties of his subjects diminished. Consequent on the treaty of Tilsit, a decree of the imperial senate abolished the tribunate—the only political body in France that preserved the semblance of national self-government. In August, N. created his brother Jerome sovereign of Westphalia—having patched up a kingdom for him in his usual unscrupulous way—and soon after, entered on a war with Portugal—the beginning of the great Peninsular War. The occasion of the war was the refusal of the Prince-regent of Portugal to carry out the Berlin decree in regard to British shipping. In March 1808, occurred that extraordinary instance of trepanning at Bayonne, by which the whole royal family of Spain fell into the hands of N.; and in the following July, his 'dearly beloved brother' Joseph was ordered to exchange the throne of Naples for the 'crowns of Spain and the Indies.' His successor was the 'handsome swordsman' (*beau sabreur*), Joachim Murat. Spain rose in insurrection, and an English force, under Sir John Moore, was despatched to its assistance. N. invaded the country about the close of October, defeated the Spanish forces, and captured Madrid (4th December). But his presence was urgently needed elsewhere, and he was forced to let Soult and other generals conduct the war in the Peninsula. Austria, again irritated and alarmed at his aggressive policy, especially in Italy (where he had seized Tuscany and the States of the Church), once more prepared for war, which broke out in the spring of 1809. Her army of Germany, commanded by the Archduke Charles, was in splendid condition; but still fortune was adverse. N. hurried into Bavaria, routed the Archduke at Eckmühl (22d April), compelled him to retreat into Bohemia; and on the 12th of May, entered Vienna for the second time. But the struggle was not over. The Archduke rallied his scattered forces, worsted N. in the terrible conflicts of Aspern and Essling (21st and 22d May), and drove him to take refuge for a time on an island of the Danube. The battle of Wagram (6th July), however, once more prostrated, or at least intimidated Austria; and on the 14th of October, she signed the peace of Schönbrunn.

N. appears to have now come to the conclusion, that he could only put a stop to the hostile machinations of the old legitimate dynasties by intermarrying with some one of them. Besides, his wife Josephine had no children—and he was ambitious of perpetuating his power in his family. With that callousness to everything except his own interests,

which is a prominent feature of his character, he immediately proceeded to divorce her. The act of divorce was solemnly registered on the 16th December. Less than three months afterwards, he married Maria Louisa, Archduchess of Austria. He was now at the zenith of his power, and so, according to the old Greek belief, Nemesis was on his track. What caused his ruin was really that outrage on civilisation—the Berlin Decrees. Russia found it impossible to carry it out, without permanent injury to her great landowners; Sweden and other countries were in a similar predicament. This led to evasions of the decree, and these, again, involved Russia particularly in further complications, until finally, in May 1812, N. declared war against her; and in spite of the advice of his most prudent counsellors, resolved to invade the country. Every one knows the dreadful history of the Russian campaign. N., wringing contingents from all his allies—Germans, Austrians, Italians, Poles, and Swiss—concentrated between the Vistula and the Niemen an army of half a million of men. The vast horde crossed the latter river (24th and 25th June) in three divisions, captured Wilna (28th June), and ravaged Lithuania. The Russian generals retreated before the invading host, deliberately wasting the country, and carrying off the supplies, but avoiding, as far as possible, all engagements—their design being to surround N. in the heart of the country, and by the help of famine and the rigours of a northern winter, to annihilate him in his hour of weakness. N. followed up the retreating foe with reckless resolution. He risked everything upon the chance of striking some overwhelming blow. The horrors of his march—in Lithuania alone, 100,000 dropped off (dead, sick, or captured by the swarms of Cossacks that hung upon his flanks)—are too familiar to require description. When he reached Smolensk (16th August), the Russians had just left it—on fire! Three weeks or so later, he made up on the enemy at Borodino, where an obstinate and bloody battle was fought (7th September). The French remained in possession of the field, but of nothing else. A week after, N. entered Moscow, hoping to find rest for a time in the ancient metropolis of the country. But the city was deserted by its inhabitants; and on the 16th, a fire broke out, which raged till the 19th, and left Moscow a heap of ruins. After five weeks' stay, N. was obliged to commence his retreat (19th October). His army was reduced to 120,000 men. The winter set in much earlier than usual, and he had to return through the very districts which had been wasted on his advance. When he left Smolensk (14th November), he had only 40,000 fighting-men; when he crossed the Beresina (26th and 27th November), he had not more than 25,000. With the excuse—which was in itself no doubt true—that his presence was urgently needed in France, he now abandoned the miserable remains of his army; and, on the 5th of December, leaving Murat in command, set out in a sledge for Paris, where he arrived on the 15th of the same month. He instantly set about a fresh conscription; and in the spring of 1813, marched into Germany at the head of 350,000 men; but the Russian campaign had broken the spell of terror which his name had till then exercised. The spirit of all Europe was thoroughly roused. A conviction was—somewhat unconsciously—seizing every mind (at the close of the campaign of 1814, even France shared it), that the world had had 'enough of Bonaparte' (*assez de Bonaparte*). Prussia, in particular, was burning to wipe out the disgrace of Jena, and all the bitter humiliations to which she had been subsequently subjected. The victories of the British in Spain, the fame of which was spreading all over the continent, also proved to her that French

soldiers could be beaten, not once or twice only, but through whole campaigns. An alliance was formed between the king of Prussia and the Emperor Alexander. At first, Austria remained neutral, but afterwards she joined the coalition. N.'s military genius, it has been often remarked, never shewed to greater advantage than in this and the next campaign, which cost him his crown and his liberty. He was for some months successful in winning battles—at Lützen (2d May), Bautzen (21st May), and Dresden (24th, 25th, and 27th August); but the invincible temper of the allies, who knew that he was playing his last card, made these victories almost fruitless. They were convinced that one grand defeat would neutralise all his triumphs. This was inflicted, after several minor defeats, at Leipzig—the great *Battle of Nations*, as it has been called (16th, 18th, and 19th October). The result justified their expectations—N. was hopelessly ruined! He commenced his retreat towards France, followed by the allies. When he recrossed the Rhine, he had only 70,000 or 80,000 men left out of his 350,000. All the French garrisons in the Prussian towns were compelled to surrender. N. appeared at Paris 9th November; and though great discontent prevailed in the country, and a spirit of opposition shewed itself even in the legislative body, the senate decreed, at his bidding, another conscription of 300,000 men, with which N. began, in January 1814, to attempt to drive the allies out of France. The skill and energy which he displayed were extraordinary; but they only marked the intensity of his despair. On the 30th of March, the allied forces captured, after a severe engagement, the fortifications of Paris; next day, the Emperor Alexander and the king of Prussia entered the city *amid the shouts of the populace*; on the 4th of April, N. abdicated at Fontainebleau. He was allowed to retain the title of emperor, with the sovereignty of the island of Elba, and an income of 6,000,000 francs, to be paid by the French government. A British ship conveyed him to Elba, where he arrived on the 4th of May.

After a lapse of ten months, most of which was spent in intrigues, N. made his escape from the island, landed near Frejus on the 1st of March 1815, and appealed again to France. The army went over to him in a body, and several of his marshals, but the majority remained faithful to Louis XVIII. On the 20th of March, he reached Paris, reassumed the supreme power, promised a liberal constitution, and prepared once more to try the fortune of battle with the allies. At the head of 125,000 men, he marched (15th June) towards Charleroi, on the Flemish frontier, where the English and Prussian forces were assembling. The Duke of Wellington, who, the year before, had completed the deliverance of Spain, was appointed by the Congress of Vienna commander-in-chief of the armies of the Netherlands. The campaign lasted only a few days. On the 16th, N. defeated the Prussians, under Marshal Blücher, at Ligny, which compelled Wellington to fall back on Waterloo, where, on the 18th, was fought the most memorable and decisive battle of modern times. It resulted in the utter and irretrievable ruin of Napoleon. The despot, who knew what awaited him—for France had not recalled him from Elba; he came at the desire of a faction, whose interests were identical with his—returned to Paris. The House of Representatives fiercely insisted on his abdication. He did so (22d June) in favour of his son, Napoleon II.; they further demanded that he should leave the country for ever, and he retired to Rochefort, with the design of embarking for the United States. On the 7th July, the allies again entered Paris, and refused

to acknowledge the acts of the French provisional government. N., who saw that he could not escape either by sea or land, voluntarily surrendered (15th July) to Captain Maitland of the *Bellerophon*, claiming the protection of British laws! It was, however, resolved by the British government to confine him for life on the islet of St Helena, a lonely rock in the Southern Atlantic, 1000 miles from the coast of Africa. He was conveyed thither by Admiral Cockburn, and landed at St Helena, 16th October 1815. The remainder of his life was politically insignificant. His chronic quarrels with his governor—or *jailer*, as the French prefer it—Sir Hudson Lowe; his conversations with friends and visitors about his past career; his deliberate attempts to falsify history in his writings, are familiar to every one. After more than a year of bad health, he expired, 5th May 1821. He was buried with military honours. In 1840, his remains were removed to France, and deposited in the *Hôtel des Invalides*.

**NAPOLÉON**, or, in full, **NAPOLÉON JOSEPH CHARLES PAUL BONAPARTE**, a French prince and general of division, is the son of Jerome, king of Westphalia, and of Frederica, Princess of Würtemberg, and was born at Trieste, in Austria, 9th September 1822. When the insurrection broke out in the Romagna in 1831, he was staying in Rome with his grandmother, Madame Letitia Bonaparte, but was forced to leave the city on account of his cousins (see **LOUIS NAPOLÉON**) being implicated in the revolutionary disturbances. He was then taken to Florence, and afterwards placed at a boarding-school in Geneva, where he remained two years, 1833—1835. His studies were completed at the Military School of Ludwigsburg, in Würtemberg, in 1840, after which he travelled for five years in Germany, England, and Spain. In 1845, he obtained from the French minister, Guizot, permission to visit Paris under the name of the Comte de Montfort; but his relations with the democratic party, and his advanced political opinions, rendered him suspected by the government, who ordered him to quit the country. He, however, again made his appearance on the eve of the revolution of February 1848. After the fall of Louis-Philippe, he offered his services to the provisional government, and was elected by the Corsicans a member of the Constituent Assembly, where he voted with the moderate republicans. He held for a short time, in 1849, the office of minister-plenipotentiary at Madrid. After the *coup d'état*, he withdrew into private life; but on the restoration of the Empire he reappeared to share in the honours that now fell thickly on his family. By a decree of the senate, 23d December 1853, he was pronounced a French prince, with the right to a place in the Senate and the Council of State; at the same time, he received the insignia of the Grand Cross of the Legion of Honour, and—though he had not served—the rank of General of Division. In the Crimean war, he commanded a division of infantry-reserves at the battles of Alma and Inkermann, but soon after returned to France, on the plea of ill-health. N. was President of the Imperial Commission of the Paris Exhibition in 1855. In 1858, he was appointed head of the ministry for Algiers and the colonies, but held the office only for a short time. During the same year he married the Princess Clotilde, daughter of Victor Emmanuel, and in the Italian war of 1859, commanded the French army of reserve in the south of Italy, but was not engaged in actual hostility. In 1861, he made a speech in the senate, reflecting on the Orleans family, for which he was challenged by the Duc d'Aunale. The challenge was not accepted, much to the disgust of the French army. N. was President of the French Commission

representing France at the London Exhibition of 1862.

**NAPOLI DI ROMANIA.** See **NAUPLIA**.

**NARAKA** is the hell of the Hindus. Manu (q. v.) enumerates twenty-one hells or divisions of N., and gives a general description of the tortures which await the impious there. 'They will be mangled (in these hells) by ravens and owls; they will swallow cakes boiling hot, walk over burning sands, &c.' The Purānās, however, are more systematic. The Vish'nū-Purān'a, for instance, not only names twenty-eight such hells, but distinctly assigns each of them to a particular class of sinners. Thus, a man who bears false witness, or utters a falsehood, is condemned to the hell *Raurava* (i. e., Fearful); one who causes abortion, plunders a town, kills a cow, or strangles a man, goes to the hell *Rodha* (i. e., Obstruction); the murderer of a Brāhman, stealer of gold, or drinker of wine, goes to the hell *S'ākara* (i. e., Swine); and so on. Besides these twenty-eight hells, however, which the Purān'a knows by name, we are told of 'hundreds and thousands of others in which sinners pay the penalty of their crimes.'

**NARBONNE**, a town in the south of France, in the department of Aude, 55 miles south-west of Montpellier, on a branch (La Robine) of the Canal du Midi. It is the *Narbo Martius* of the Romans; but there is reason to believe that it was well known to the Greeks 500 years before the Christian era. It was colonised by the Romans 118 B. c. and probably got the designation Martius from Q. Marcus Rex, one of the consuls at the time. Situated only about 8 miles from the sea, on the direct road into Spain and into the basin of the Garonne, N. was in early times a place of great commercial prosperity. It was the second settlement founded in South Gallia by the Romans, and was considered by them an important acquisition, both for its strength and as the key to the road into Spain. Under Tiberius, it flourished greatly; the arts and sciences being cultivated with success, and its schools rivalling for a long time those of Rome. About 309 A. D., it became the capital of Gallia Narbonensis, and contained among other buildings a capitol, theatre, forum, aqueducts, triumphal arches, &c. It was taken in 719 by the Saracens, who planted here a Moslem colony, and destroyed the churches. In 859, it fell to the arms of the Northmen. During the 11th and 12th centuries, it was a flourishing manufacturing city, but subsequently it fell into comparative decay, and is now entirely destitute of any monument of its former splendour. A considerable number of architectural fragments—as capitals, marble slabs with inscriptions, friezes, &c.—have been found, and have been grouped into a collection of antiquities.

The present very dirty town contains one imposing building, the Cathedral of St Just, founded in 1271, but still unfinished. The honey of N. is the best in France, both for colour and flavour. Manufactures are carried on to some extent. Pop. about 12,000.

**NARCISSUS**, according to a Greek fable, was the son of the river god Cephissus and of the nymph Liriope or Liriassa of Thespie, in Bœotia. He was a youth of extraordinary beauty, of which he was excessively vain; and for this he was punished by Nemesis, by being made to fall in love with himself on seeing the reflection of his own face in a fountain. He died of this love-sickness; and on the place where he died, sprung up the flower which bears his name. The story of N., fluely narrated by Ovid, is of comparatively late origin.

**NARCISSUS**, a genus of plants of the natural order *Amaryllideæ*, having a perianth of six equal petal-like segments, and a bell-shaped corona of various magnitude. The species are natives of the south of Europe, the north of Africa, and the temperate parts of Asia. The Common Daffodil (q. v.) is the only one which can be regarded as

Narcissus Poeticus.

truly a native of Britain. Many are cultivated in gardens, for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of Daffodil (q. v.) and Jonquil (q. v.). The name *N.* is popularly restricted to those which have flat—not rush-like—leaves, and a short not bell-shaped corona. Of these, one of the best known is the Peet's *N.* (*N. poeticus*), with generally one-flowered scape, the flower white and fragrant, the corona with a deeply-coloured border; others, with one or two flowers on the scape, are in common cultivation.—The **POLYANTHUS NARCISSUS** (*N. Tazetta*) has a number of flowers on the scape. It grows

in stony places near the Mediterranean and eastwards to China. Many varieties of it are in cultivation. It is not only grown in gardens and green-houses, but in water-glasses, like the hyacinth. It is very common in gardens in India, where it is highly esteemed as a flower. The narcissi in general are propagated either by seed, or by offset bulbs. They succeed best in a rich light soil.

**NARCOTICS** (Gr. *narkē*, stupor) are remedies which, in moderate doses, lessen the action of the nervous system. Their full operation is sleep or coma. Opium is the type from which most descriptions of this class of medicines have been drawn; but although most narcotics more or less resemble opium in their action, almost every one presents some peculiarity in the way in which it affects the system. These medicines are primarily stinaulating, especially when given in small or moderate doses; but this stage of their action is comparatively short; and when the dose is large, the excitement is scarcely perceptible. Their power of inducing sleep has procured for them the names of Hypnotics and Soporifics; while many of them are termed Anodynes, from their possessing the property of alleviating pain. Next to opium, Henbane, Indian Hemp, and Aconite may be regarded as the most important narcotics. It has been already mentioned that there are differences in the mode of operation of the different members of this class. 'Some dilate, while others contract the pupil; some appear to concentrate their sedative action more particularly upon the functions of the encephalon, others upon the contractile power of the alimentary and bronchial tubes, while a strict distinction is to be drawn between those which occasion constipation and those which do not; all these things being of great practical importance.'—Ballard and Garrod's *Elements of Materia Medica*, p. 13.

Narcotics are usually administered either with

the view of inducing sleep or of alleviating pain or spasm. As, however, their action is much modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution; and as a general rule, only under competent advice. The various quack medicines for children which are known as *Carminatives*, *Soothing Syrups*, &c., contain some form of opium, and are a fertile cause of the great mortality that occurs in early life, especially among the poorer classes.

It is almost unnecessary to add, that all the narcotics when taken in excess are poisonous.

**NARCOTINE** ( $C_{46}H_{92}NO_{14} + 2Aq$ ) is one of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 or 8 per cent. It is nearly insoluble in water, but dissolves readily in alcohol, ether, and chloroform. Its ethereal solution, when submitted to spontaneous evaporation, yields it crystallised in colourless acicular groups or in rhombic prisms. A mixture of concentrated sulphuric and nitric acids produces a blood-red colour with narcotine and its compounds. Narcotine possesses very slight alkaline properties; its salts do not readily crystallise, and are even more bitter than those of morphia, although the substance itself is almost tasteless. When first discovered (in 1803), it was supposed to be the stimulant principle of opium; but in reality it possesses very little activity. It has been prescribed in gradually increased doses up to a scruple, without the least injury. Its sulphate has been used in India as a substitute for quinine; and nearly 200 cases of intermittent and remittent fevers, treated by it with success, have been published by Dr O'Shaughnessy.

**NARD AND NARDO'STACHIUS.** See SPIKE-NARD.

**NARDOO** (*Marsilea quadrifida*), a plant of the acotyledonous natural order *Marsileaceæ* (q. v.), the only plant of that order which is used in any way by man. It has but recently become known to botanists. It is found in Australia, and affords important supplies of food to the natives of some

Nardoo (*Marsilea quadrifida*).

regions; it has also been of great use to some recent exploring-parties. It grows in places occasionally covered with water; vegetating whilst moisture abounds, and then exhibiting abundance of green clover-like foliage, the leaves consisting of three leaflets at the top of a stalk some inches in length.

When the water dries up, the remains of the plants are often covered with dried mud. It is then that the spore-cases are gathered for food. They are oval, flattened, about an eighth of an inch in length, hard and horny, and requiring considerable force to pound them when dry, but becoming soft and mucilaginous when moistened. The spore-cases, pounded with their contents, are made into cakes like flour.

**NARDUS**, a genus of grasses, having a simple spike, spikelets all on one side, no glumes; each spikelet consisting of one floret, which has two

*Nardus stricta*.

paleæ, the outer ending in a long point. *N. stricta* is one of the most common of British grasses, growing in dry elevated situations, and very characteristic of them. It grows in tufts, and is often called **MAT-GRASS**. It is perennial, purplish, short, rigid, and very worthless, as almost no animal but the goat will eat it.

**NAREW**, a river of West Russia, an affluent of the Bug, rises in the government of Grodno, and flows west-south-west to the main stream, which it joins at Sierock, after a course of 294 miles. The waters of the N. are about as great in volume as those of the Bug. It is navigable to Tykoczin, 150 miles from its mouth.

**NARO**, a town of Sicily, in the province of Girgenti, and 14 miles east of the town of that name. It has 10,000 inhabitants, who trade in oil, wine, and sulphur. Numerous tombs, medals, and other antiquities have been found here.

**NARSES**, a celebrated statesman and general, and almost the last stay of the old Roman empire in Italy, was born towards the last quarter of the 5th century. The place of his birth is uncertain. His parentage was obscure, and he was probably sold as a slave in childhood, having, according to the barbarous usage of the period, been previously emasculated. From some menial office in the imperial household at Constantinople, he rose by successive steps to the post of *cubicularius*, or private chamberlain of the Emperor Justinian, and ultimately to that of keeper of the privy purse. In the difficult art of courtiership, N. long maintained a pre-eminence. More remarkable, however, considering

his condition, was the distinction which he attained in military affairs. In 538, he was sent to Italy in command of a body of troops, professedly to act in concert with Belisarius (q. v.); but in reality, it is conjectured, with a secret commission to observe and to control that general. After some successes, N., having disputed with Belisarius, assumed an independent authority; but his separate command was unfortunate, and he was recalled to Constantinople in 539. After some years, however, Belisarius was recalled, and N. was appointed to the chief command in Italy. His conduct of that expedition extorted the admiration even of his enemies. Not having the command of a sufficient number of transports, he marched his army along the whole circuit of the shore of the Adriatic, and while the enemy's fleet were still in possession of the sea, was enabled to encounter them in the plain of Sentaglio, near Tagina, where, after a desperate engagement, the Goths were totally defeated, and their king, Totila, slain. N. took possession of Rome, and after a series of successes both in Southern and Northern Italy, completely extinguished the Gothic power in that peninsula. Justinian appointed N. exarch of Italy in 553. He fixed his court at Ravenna, and continued, till the death of Justinian, to administer the affairs of Italy with a vigour and ability which did much to stay the progress of that decay which had long infected all its social, political, and military institutions. The only blot on the character of his administration is the avarice with which he is charged by his contemporaries. His exactions pressed heavily on the exhausted resources of the population; though their severity may be in some degree palliated by the splendour and utility of the public works on which he partly expended the public resources. On the death of Justinian, his ascendancy came to an end. The Romans, on the accession of Justin, complained to him of the exactions of N., and that emperor deprived him, in 565, of his office; a proceeding to which a special indignity was imparted by an insulting message from the empress, that it was time for him to 'leave arms to men, and to spin wool among the women of the palace.' To this bitter taunt (according to Paulus Diaconus, *De Gest. Long.* ii. 6), N. replied that he would 'spin for her a thread which she would find it hard to unravel;' and he is accused of secretly intriguing with Alboin, king of the Lombards, to incite a new invasion of Italy, at the same time submissively offering his services to the emperor for the purpose of repelling the invasion. This account, however, seems uncertain, and perhaps improbable; and as N. died at Rome in 568, just on the eve of the Lombard invasion, no light is thrown upon this story by the actual events of the war. His age at the time of his death is a subject of much curious controversy. According to the popular account, it was no less than 95 years; but this is doubted by most of the historians.

**NARTHEX**, a part of the early Christian churches separate from the rest by a railing or screen, and to which the catechumens and penitents were admitted.

**NARVA**, a Russian town, 95 miles west-south-west of St Petersburg, is situated on the Narova, ten miles from its mouth in the Gulf of Finland. It was founded in 1233 by Waldemar II., king of Denmark, and came into the possession of Russia in 1704. The navigation of the Narova is impeded by a waterfall near N., 14 feet high. In 1861, 465 vessels entered and cleared the port. About 7200 pounds of flax are exported annually, besides deals and timber. On the waterfall above the town,

there are saw-mills, and an extensive cotton-mill, which employs 1700 workmen. Though belonging to the government of St Petersburg, N. is ruled by the laws of the Baltic provinces. Here, in November 1700, Charles XII., with 8000 men, defeated a Russian army of 60,000 men, under Peter the Great and the Duke of Croy. Pop. 7255.

**NARVAEZ, DON RAMON MARIA**, Duke of Valencia, a Spanish general and statesman, was born at Loja, in Andalusia, 4th August 1805, and when very young, served in the war of Liberation against the French. He was an officer in 1820, when constitutional government was re-established in Spain, and in 1822, when a reactionary party of the royal guard took up arms to destroy the work of the revolution, N. ranged himself on the side of the liberals, and contributed by his courage to the repression of the mutiny. Shortly after, under the command of Mina, he made the campaign of Cataluna against the guerillas, who were assisted by the monks. The invasion of Spain by a French army in 1823 forced him to retire from active life. He withdrew to Loja, and lived there in obscurity until the death of Ferdinand VII. in 1832. In 1834, as captain of chasseurs, he maintained a hot struggle against the Carlists of the Basque provinces, and signalised himself in various engagements. In 1836, he commanded a division under the orders of Espartero, and in November of that year, completely routed the Carlist leader, Gomez, near Arcos. This was a decisive moment in his career. He now became immensely popular, aspired to the highest offices of the state, and was regarded as the rival of Espartero. In 1838, by acts of terrible severity, he cleared the district of La Mancha of brigands, and was appointed in 1840 captain-general of Old Castile, and general-in-chief of the army of reserve. When Espartero gave General Alaix a place in the ministry, N. resigned his command. He took part in the insurrection against Espartero that broke out at Seville in 1840, but that having failed, he was compelled to flee to France, where he was shortly after joined by Queen Christina (see MARIA CHRISTINA), and commenced those plots against the government of Espartero which, in 1843, effected its overthrow. In 1844, he was appointed president of council, and created Duke of Valencia. His ministry was thoroughly reactionary. He recalled Maria Christina, and revised the liberal constitution of 1837. The progressista party was dissatisfied, and petty insurrections broke out, which the rigorous soldier-statesman repressed with an iron hand. But his dictatorial manners finally alienated even his personal friends, and his ministry was overthrown (10th February 1846). After a brief exile as special ambassador at the French court, he returned to power in 1847, but soon afterwards quarrelled with Queen Christina, and found it necessary again to retire from office in 1851. The cause of the quarrel is said to have been the indifferent respect which N. shewed to the children of Queen Christina by her second marriage. In 1856, on the overthrow of O'Donnell's ministry, he again became president of council, and immediately commenced to strengthen the royal authority, and to restrict the liberty of the press. But some of his measures were distasteful to the conservative party, and in November 1857 his ministry was forced to make way for that of Armero-Mon. (He died April 23, 1863.)

**NARWHAL** (*Monodon* or *Narwhalus*), a genus of *Cetacea*, of the family *Delphinidae*, resembling *Beluga* (q. v.) in form and in the want of a dorsal fin, but remarkably characterised by having no teeth at all, except two in the upper jaw, supposed

to be canines, which sometimes remain quite rudimentary, even in the mature animal, as they are in the young, and are sometimes developed into great spirally twisted straight tusks, passing through the upper lip, and projecting like horns in front. Only one species is ascertained, *M. monoceros* or *N. vulgaris*; the other species which have been described by naturalists having been founded on exaggerations and untrustworthy observations. It inhabits the Arctic seas, and is very rarely found so far south as the Shetland Isles, although an accidental wanderer has reached the coast of England. Narwhals are often seen in great numbers among the ice-fields, and in the creeks and bays of the most northern coasts. They commonly

Narwhal (*Monodon monoceros*).

associate in small herds. The tusks are much more frequently developed in the male than in the female, but in the female also they sometimes attain a large size. It is but rarely that both tusks are largely developed, although they sometimes are so, and then diverge a little; one of them generally continues rudimentary, or attains a length only of a few inches, whilst the other becomes a great horn, projecting straight in front, from which the animal has received the name of SEA UNICORN. A mature N. is generally about 15 or 16 feet in length, without reckoning the tusk, which is from 6 to 10 feet long. The body is less thick than that of the Beluga; the head is small, the forehead rises abruptly, the muzzle is very obtuse, the upper jaw projects a little; the first half of the body is nearly cylindrical, the remainder to the tail fin is conical. The tusk is hollow nearly to the point. Its use is rather conjectured than known. It is probably a weapon of defence, but Scoresby has suggested that it may be also used for breaking thin ice in order to obtain opportunity for respiration; and for killing fish, as he found remains of skates and other flat-fish in the stomach of a N., which it is not easy to imagine how a toothless animal, with rather small mouth and lips, could capture and swallow, unless the formidable tusk were first employed. Cephalopodous molluscs, however, are believed to constitute a principal part of the food of narwhals. The N. is a very active animal, swimming with great rapidity, lively, and playful. A group of narwhals playing together, projecting their great horns from the sea, and crossing them in their sport, is a very interesting sight. The N. is pursued by the Greenlanders and other inhabitants of the north, for the

sake of its blubber, with which its whole body is invested to the thickness of about three inches, amounting to nearly half a ton in weight, and yielding a large proportion of excellent oil. The tusks are also valuable, being of an extremely compact white substance—denser, harder, and whiter than ivory—which is used as a substitute for ivory. The kings of Denmark have long possessed a magnificent throne of this material, which is preserved in the Castle of Rosenberg. The flesh of the N. is used by the Greenlanders as food. Great medicinal virtues were formerly ascribed to the tusks; but were merely imaginary.

**NASALIS**, or **PROBOSCIS MONKEY** (*Nasalis larvatus*), a monkey allied to the *Doucs* or *Semnopithec*i, but distinguished from all other monkeys by an extreme elongation of nose, that organ being nearly four inches in length in the mature animal. In the young, the nose is comparatively undeveloped. The nostrils are placed quite at the extremity of the nose, and are separated merely by a thin

Proboscis Monkey (*Nasalis larvatus*).

cartilage. Of what use the magnitude of its nose is to the animal, is unknown. The N. inhabits Borneo and neighbouring islands. It is gregarious. It is an animal of about three feet in height, if placed erect, a position it does not often assume. It can leap fifteen feet or more. Its fur is thick, not long, nor woolly; chestnut red, and in some parts golden yellow.

**NASCENT STATE**, in Chemistry. When an element or compound is liberated from some chemical combination in which it had previously existed, the element or compound so liberated is at the moment when it escapes said to be in a nascent state; and it is then often capable of exerting far more powerful combining action with other bodies than it can exhibit when brought in contact with them after it has been liberated. Arsenic and hydrogen will not directly combine if brought in contact with one another under ordinary circumstances, but the application of Marsh's test (see **ARSENIC**) depends upon the direct union of the nascent hydrogen (liberated by the decomposition of the water) with the arsenic, giving rise to arseniuretted hydrogen gas. Again, if hydrated protoxide of nickel ( $\text{NiO},\text{HO}$ ) be suspended in a solution of caustic potash ( $\text{KO},\text{HO}$ ), it will undergo no change if a current of oxygen gas be passed through the solution; but if a current of chlorine be substituted for the oxygen, the whole of the metallic protoxide will be converted into the brown sesquioxide

( $\text{Ni}_2\text{O}_3$ ), the resulting decomposition being shewn in the equation:

This change arises from the action of the chlorine upon the potash, during which chloride of potassium (KCl) is formed, while the nascent oxygen which is liberated from the potash combines with the oxide of nickel. Again, cyanogen ( $\text{C}_2\text{N}$ ) and chlorine do not enter directly into combination, but if cyanogen at the instant that it is liberated from one of its compounds (as, for example, cyanide of mercury) comes in contact with chlorine, the two combine; and many other examples of similar action might be adduced.

**NA'SEBY**, a parish and village of England, in the county of Northampton, 12 miles north of the town of that name. Pop. (1861) 811. The battle of N., between Charles I. and the parliamentary army under Fairfax and Cromwell, took place here, June 14, 1645. It resulted in the total defeat of the royalists, the king being compelled to flee, after losing his cannon and baggage, and nearly 5000 of his army as prisoners.

**NASH, RICHARD**, better known by the name of *Beau Nash*, a fashionable character of the last century, who attained to a very remarkable notoriety, was the son of a Welsh gentleman, and was born at Swansea, in Glamorganshire, October 18, 1674. After studying at Oxford, he held for some time a commission in the army, and subsequently took rooms in the Temple, but the dissipations of society had more attraction for him than the pursuits of law. He became a dicer-out, a frequenter of good society, and contrived to support himself by gambling. But the grand turning-point in his fortunes was his visit, in 1704, to Bath—then a favourite haunt of elegant invalids, and the scene of the gayest intrigues. N. undertook the management of the public balls, which he conducted with a splendour and decency never before witnessed. In this way he came to acquire an imperial influence in the fashionable society of the place. It appears that he was also distinguished by a species of sentimental benevolence. He played hard and successfully; yet if he heard an individual sighing behind his chair: 'Good Heavens! how happy would that money make me,' N. would thrust his own winnings into his hands, with theatrical generosity, and exclaim: 'Go, and be happy.' His own equipage at this period of his career was sumptuous. He used, we are told, to travel to Tunbridge in a post-chariot and six grays, with outriders, footmen, French-horns, and every other appendage of expensive parade. He is praised for the great care which he took of the morals of the young ladies who attended the Bath balls, always putting them on their guard against needy adventurers—like himself. In his old age, Beau N. sank into poverty, and often felt the want of that charity which he himself had never refused. He died at Bath, February 3, 1761, at the age of 87.

**NASH, JOHN**, an architect, was born in London in 1752. He underwent the usual course of training for his profession, but after practising for a few years, withdrew from it, and entered into various speculations by which he lost considerable sums. Returning to his profession, he met with great success, and in 1792 settled in London, where he speedily rose to eminence. On the strength of having obtained a patent in 1797 for improvements in the construction of the arches and piers of bridges, he was in the habit of claiming a great

part of the credit of introducing the use of cast-iron girders. A large part of his time was occupied in designing and constructing mansion-houses for the nobility and gentry in England and Ireland, but he is chiefly celebrated in connection with the great street improvements in London. From February 1815, when he was appointed 'architect, valuer, and agent to the Board of Woods and Forests,' down till near the end of his professional career, he was busily engaged in the planning of routes, grouping of buildings, and fixing of sites. Regent Street, Haymarket Theatre, Laugham Place Church, and the terraces in Regent's Park, are specimens of his designs. The Pavilion at Brighton was another of his works. He retired from his profession in 1834, and died May 13, 1835. N., notwithstanding his many defects, possessed great power of effective grouping, as is well shewn in his works. In the architecture of mansion-houses, the designing of 'interiors' was his forte.

NA'SHUA, a manufacturing city of New Hampshire, U. S., at the junction of the Merrimack and Nashua Rivers. The falls of the latter afford water-power to six large manufacturing companies, which have extensive cotton-mills, machine-shops, &c. It has 10 churches, 3 banks, 2 newspapers. Pop. (1860) 10,065.

NA'SHVILLE, a city, port of entry, and capital of Tennessee, U. S., on the Cumberland River, 200 miles above the Ohio, and a little north of the centre of the state. The river is navigable by steam-boats of 1500 tons fifty miles above Nashville. Five railways connect it with a vast and fertile country. It is a handsome, well-built city, with a state-house, which cost a million of dollars; court-house, university, hospital, custom-house, theatre, penitentiary, Free Academy, Protestant and Catholic orphan asylums, 27 churches, 5 daily papers, 8 weekly, and 8 monthlies. It has a large commerce, flour and planing mills, manufactories of engines and machinery, and the extensive book-publishing house of the Southern Methodists. Near the city are the State Lunatic Asylum, and the 'Hermitage,' once the residence of President Jackson. In the war of secession, N. was taken by the Federals under General Rosen-cranz, and occupied by a military governor. Pop. in 1860, 16,987. (1871—25,865.)

NA'SSAU, an independent duchy of Germany, lying between 49° 50' and 50° 50' N. lat., and 7° 30' and 8° 45' E. long., is bounded on the W. and S. by the Main and the Rhine, the Prussian-Rhenish provinces, and the grand duchy of Hesse; on the E. by the Hesse and Frankfurt territories; and on the N. by Westphalia. Area, 1795 square miles. Pop. 456,567, at the close of 1861. The duchy of N. is a compact state, possessing very great physical advantages. In its southern districts, nearly the whole of its area is occupied by the Taunus Mountains, whose highest point, the Great Feldberg, attains an elevation of about 2750 feet. This range includes within its boundaries the fertile valleys known as the Rheingau. The northern part of the duchy includes the barren highlands of the Westerwald, whose most considerable peak, the Salzburger Head, is nearly 2000 feet high. Besides the Rhine and the Main, which are the boundary-rivers, N. is traversed from east to west by the Lahn, which becomes navigable at Weilburg, and is augmented by the confluence of numerous other streams, as the Weil, Embs, Aar, Dill, and Elbe. The productiveness of the soil is proved by the excellent quality of the numerous vegetable products, which include corn, hemp, flax, tobacco, vegetables, and fruits, including grapes, which

yield some of the most highly esteemed Rhenish wines. The hills are well wooded, and abound with game of various kinds, and the rivers yield an abundance of fish and crustaceans. In the more mountainous districts, iron, lead, copper, and some silver is obtained, together with good building-stone, marble, and coal; the chief mineral wealth is, however, derived from the numerous springs, which, directly and indirectly, bring the government a clear annual gain of more than 100,000 gulden. The most noted of these springs, of which there are more than 100, are Wiesbaden, Weilbach, Langen-Schwalbach, Schlangenbad, Ems, Selters, and Geilnau, the majority of which are the property of the duke.

N., which is divided into 23 districts, has few towns of any commercial importance, but it boasts of many fashionable watering-places, which are annually crowded with visitors from every part of the world. Of these, the most considerable are Wiesbaden (q. v.), the capital of the duchy (pop. 16,000), Schwalbach, Schlangenbad, Fachingen, Selters, and Geilnau. Höchst, an active little place on the Main, is the only manufacturing town of the duchy, but a brisk trade is carried on at many small ports on the Rhine, Main, and Lahn, from whence the mineral waters, wines, and other natural products of the country are exported. The exports are wine—including some of the choicest kinds, as Hochheimer, Johannisberger, Rudesheimer, Marke-brunner, Asmannshäuser—mineral waters, corn, iron, manganese, cattle, &c.; while the imports embrace colonial products, manufactured goods, salt, jewelry, &c.

N. has a representative form of government, based on the constitution of 1814; and the duke, who is also a Count-Palatine of the Rhine, Count of Sayn, Königstein, Katzenelnbogen, and Dietz, &c., is assisted in the government by a council of state, presided over by a prime minister. The legislative assembly consists of an upper chamber, composed of 24 representatives, chosen for six years, and a second chamber, chosen annually. Nearly half the population belong to the Catholic Church, which is under the ecclesiastical jurisdiction of the Bishop of Limburg, who is assisted by a board of commissioners, located at Eltville, on the Rhine; and excepting about 8000 persons, who belong to the Jewish and other persuasions, the remainder of the people, including the reigning house, profess the 'evangelical' form of German Protestantism, and are comprehended in one episcopal see under the Bishop of Wiesbaden. Ample provisions are made in the duchy for popular education, in furtherance of which there are upwards of 700 elementary schools, with about 1000 teachers, 10 normal schools, a gymnasium, various training, theological, polytechnic, military, and other educational institutions. In accordance with a treaty with Hanover, Göttingen constitutes the university for arts for N., which has also a Roman Catholic theological faculty in conjunction with Hesse-Cassel at the university of Marburg. Wiesbaden, which is the principal seat for all national institutions of literature, science, and benevolence, has a good public library, containing 60,000 volumes, a museum, &c.

N. occupies, in conjunction with Brunswick, the thirteenth place in the limited council of the diet, but it has two votes in the *plenum*, or full council. It furnishes a contingent of 4273, with a reserve of 1833 men, to the federal army.

The receipts, according to the budget of 1862, were 3,633,967 florins derived from the crown domains and indirect taxes, and 301,400 florins from indirect taxation, while the expenditure was

estimated at 5,117,831 florins. The national debt at the close of 1861 represented a capital of 6,753,500 florins. The duke, who is in possession of very extensive domains, ranks as one of the richest princes of Germany.

In tracing the history of N. to its earliest origin, we find that the districts now known by that name were anciently occupied by the Alemanni, and on the subjugation of the latter people by the Franks, became incorporated first with the Frankish, and next with the German empire. Among the various chiefs who raised themselves to independent power in this portion of the Frankish territories, one of the most influential was Otto of Laurenburg, brother of King Conrad I., who became the founder of two distinct lines of princes. The heads of these lines were Walram and Otto, the sons of Count Henry I., who, in 1255, divided the land between them. Walram II., the elder, was the progenitor of the house of Laurenburg, which, towards the close of the 12th c., assumed its present name of N. from the name of its chief stronghold; while Otto, the younger, by his marriage with the heiress of Gelders, founded the line of Nassau-Gelders, whose last male representative died in 1423, but which still survives through a female branch, in the family now occupying the throne of the Netherlands. This junior branch of the house of Nassau, by inheritance from a collateral representative, acquired possession, in 1544, of the principality of Orange; and since that period, the representatives of the Otto line have been known as Princes of Orange (q. v.). The Walram line, which in 1292 gave an emperor to Germany, in the person of Adolf of N., was subdivided by the descendants of that prince into several branches, until, by the successive extinction of the other lines, the Nassau-Weilburg family, which at present reigns over the duchy, was left, in 1816, the sole heir and representative of the Walram dynasty in Germany. N. had been declared a duchy in 1806, and in 1817 the reigning Duke William granted a new constitution; but during the first sittings of the assembly, dissensions arose between the ducal government and the representatives, the former having attempted to establish the proposition that the ducal domains were the unconditional property of the royal house, and that all the expenses of the state would consequently have to be met by taxation.

This proved a fruitful source of dissension between the duke and his people, and the opposition and discontent to which it gave rise, were not finally allayed till 1834, when a more liberal ministry, under Count Walderdorff, succeeded the unpopular cabinet which had hitherto directed public affairs. Concessions were made by the ducal government, which met the requirements of the chambers, and a satisfactory compromise was effected in regard to the crown revenues. In 1836, N. joined the German *Zoll-Verein*, and subsequently to that period, it has continued to advance in material prosperity. The reigning Duke Adolphus William, who succeeded his father, Duke William, in 1839, shewed the same conservative tendencies as his predecessor. The revolutionary crisis of 1848 found the people, who had been harassed by over-government and by a jealous dread of liberal sentiments, ripe for insurrection. The peasantry rose *en masse* in the rural districts, and revenged themselves for the severity of the game-laws and other obnoxious restrictions, by perpetrating the most wanton destruction of game and wood in the forests belonging to the crown and nobility. These disorders were speedily put down by the aid of federal troops, but notwithstanding the concessions made by the government, the relations between the people and their ruler

continued for many years to be unsatisfactory. Of late years there has been more unanimity between the government and the people. (N. is now incorporated with Prussia. See GERMANY in SUPP.)

NASSAU, the capital of New Providence, the principal of the Bahamas (q. v.), is pleasantly situated on the face of a hill, in lat. 25° 5' N., long. 71° 21' W. Pop. 7000. The town is well laid out, has several handsome public buildings, and an excellent harbour, drawing from 12 to 15 feet of water. The climate is very salubrious, and N. is a great resort of invalids from the north. N. exports cotton, pimento, and salt. In 1860, 219 vessels of 15,649 tons entered, and 209 vessels of 16,553 tons cleared the port. Since the outbreak of the civil war in the United States, it has become notorious in connection with the blockade-runners.

NASTURTIUM. See CRESS and TROPÆOLUM.

NATAL. The region now forming the colony of Natal derives its name from its being discovered by the Portuguese on Christmas-day 1498. It was visited about 1822 by several white traders from the Cape, who found the country in possession of the Zulu chief Chaka, who ruled in a most sanguinary manner over all the tribes, from the Umzimculu to the St Lucia River. He was killed and succeeded by his brother Dingaan in 1838, but the latter having treacherously murdered a party of emigrant Dutch Boers, who had paid him a friendly visit by invitation to buy land, he was attacked and finally destroyed by the Boers, who at that time had emigrated from the Cape Colony in large numbers, and who made his brother Panda paramount chief in his stead, and then settled themselves down in the country as his lords and masters. The British government, however, now interfered, and after a severe struggle on the part of the Boers, the country was formally proclaimed a British colony on the 12th May 1843, since which time it has progressed very satisfactorily, and bids fair to become one of the most valuable dependencies of the British crown on the African continent.

The colony of Natal looks out on the Indian Ocean, being situated on the south-east coast of Africa, about 800 miles east-north-east of the Cape of Good Hope, between the 29 and 31 parallels of south latitude. Its north-eastern boundary is the Tugela or Buffalo River, which divides it from Zululand, and its south-western boundary is the Umzimculu, separating it from Kaffraria proper. A lofty and rugged range of mountains called the Quathlamba, or Drachenberg, divide it from the Free State and Basutoland, and it contains a well-defined area of about 25,000 square miles.

These mountains are composed of a confused mass of granite, gneiss, sandstone, basaltic veins, and shale, and present both the flat top and serrated summits of the chain, of which they are a continuation, so well known in the Cape Colony as the Sneeuwberg and Stormbergen. About lat. 28° 30', these mountains seem to reach their culminating-point, and probably attain a height of 10,000 feet, forming a summit line of watershed, from which flow to all points of the compass the waters of the Orange, Umzimvoobo, Vaal, Tugela, and other large South African streams. Towards the coast, these mountains present a scarp and almost inaccessible face; towards the interior, however, they gradually die away into the immense rolling plains of the Free State. Many offshoots from these mountains traverse the colony, dividing it into a series of steps or plateaux, gradually rising from the coast region to the foot of the mountains, and forming so many zones of natural productions.

The coast region, extending about 25 miles inland,

is highly fertile, and has a climate almost tropical, though perfectly healthy. Sugar, coffee, indigo, arrow-root, ginger, tobacco, and cotton thrive amazingly, and the pine-apple ripens in the open air with very little cultivation. The midland terrace is more fit for the cereals and usual European crops, while on the higher plateau, along the foot of the mountains, are immense tracts of the finest pasturage for cattle and sheep.

The climate is very salubrious; the thermometer ranges between 90° and 35°, but the heat, even in summer, is seldom oppressive. The mean temperature at Pietermaritzburg, the capital, is 3°·5 above that of Cape Town. The winter begins in April and ends in September; the average number of rainy days being 13. In the summer season the thunderstorms are very frequent and severe. The annual rainfall on the coast is about 32 inches. Inland, it varies a good deal in different districts, and is greatest in summer. The south-east is the prevailing wind here in the summer months, as in the Cape Colony. Occasionally the sirocco or hot wind from the north-west is felt, which generally terminates in a thunder-storm.

N. has but one great harbour on its coast, and that is D'Urban, or Port Natal, in lat. 29° 40'. It is completely landlocked, but a bar prevents vessels above a certain tonnage from entering. There is, however, generally a depth of water on it varying from 9 to 18 feet. There is secure holding-ground in the outer anchorage. The harbour of D'Urban is of great importance to N., as it is the only one worthy of the name on the south-east coast. Many important engineering operations are now carrying on, which, it is supposed, will considerably increase the depth of water at the entrance. The principal rivers are the Tugela or Buffalo, the Umeomanzi, Umgani, and Umzimiculu; like the majority of South African rivers, they are of no use for purposes of inland navigation; but their streams are permanent, and often available for irrigating purposes, thus giving N. in one very essential point a decided superiority over the Cape Colony.

Coal, copper-ore, iron, and other minerals are found in several places, and there is no doubt when the great mountain-range is properly explored, that it will be found very rich in mineral wealth. Large forests of valuable timber abound in the kloofs of all the mountain-ranges, and many tracts along the coast are also well wooded. N. is divided into the following counties: D'Urban and Victoria on the coast region; Pietermaritzburg, Umeomanzi, and Umooti, central; and Klip River and Weenen at foot of the mountains. The capital is Pietermaritzburg, with about 2000 inhabitants, on a tributary of the Umgani River, about 50 miles inland. It possesses three banks, a large military establishment, and many substantial public buildings. Its name is a compound of the Christian name of Pieter Rietief, and the surname of Gert Maritz, two celebrated leaders of the emigrant boers who were murdered by Dingaan. D'Urban, or Port Natal, is also a very flourishing town, having a railway connecting the landing-place at Point Natal with the town, and a population of about 1200. It has 2 newspapers, and several banks and other public institutions. Verulam, Weenen, and Ladysmith are also flourishing towns, and several other new villages have been recently formed.

N. is governed by a lieutenant-governor, nominally subordinate to, although actually independent of, the governor of the Cape, and has recently received a constitution somewhat similar to that of the Cape Colony. Municipal institutions have been granted to the principal towns. It forms the diocese of a colonial bishop, and many mission stations of the Wesleyan, American, Norwegian, and Berlin

missions exist. Education is receiving much attention, and schools are multiplying.

There are no practicable roads across the mountains except the Do Beer and Beruidenhout Passes, which lead by a very circuitous route across the Free States to the Cape Colony. The numerous rapid streams which run from the mountains render internal communication often very difficult, and few of them have as yet been bridged over.

The principal articles of export from N. are sugar and arrow-root; besides a large home and inland consumption, above 2000 tons of sugar have been exported during the last two years, worth more than £50,000 sterling. The total value of exports may be estimated at £120,000, and is annually increasing, and comprises horses, ivory, sugar, coffee, arrow-root, wool, hides, feathers, molasses, and rhinoceros' horns. The value of imports is about £355,000. The revenue of the colony may be estimated at £54,000, principally raised from custom-duties, transfer dues, and taxes on native huts, &c. In 1843, the value of imports was £11,712, that of exports £1261, while the revenue was only £12,000. N. productions were very respectably represented in the Great Exhibition of 1862, and formed one of the most interesting of all our colonial compartments. The population of N. consists of the original Dutch emigrant Boers, who remained in the country after it became a British colony; of English and German settlers; and the remains of the broken Zulu tribes, who originally possessed the country. They may be estimated at 10,000 white, of whom two-thirds are of English birth, and 120,000 natives, who are the most docile and industrious of all the Kafir races, and, when properly managed, make excellent servants. It is intended to introduce both Chinese and Coolie labour, for the purpose of extending the sugar-plantations in the coast region.

In 1861, 97 ships, of 18,000 tons burden, arrived at the port, and 100 ships left the same with cargoes of colonial produce.

The large animals are gradually disappearing, although elephants are still occasionally met with in the dense bush of the coast region. Lions, leopards, wolves, and hyenas still hang on the outskirts of civilisation. The smaller antelopes are plentiful, and alligators are met with in nearly all the rivers north-east of the Umzimiculu. N., besides several poisonous snakes, produces a small species of boa, which sometimes attains a length of 16 feet. The hippopotamus is still found near the mouths of the rivers on the eastern frontier.

The botany of this region resembles that of Kaffraria proper, although generally of a more tropical character. All the timber-trees of the Cape Colony are found here, besides many new ones. The climate of the coast region, however, is too warm for the grape, at least for the purpose of wine-making.

The distance overland from Cape Town to Pietermaritzburg is about 1200 miles. By sea, about 850 miles to Port Natal. The road between N. and the Cape Colony, along the coast, is very difficult to travel, owing to the great number of rivers to be crossed. The distance from King William's Town, in British Kaffraria, to D'Urban is about 300 miles, and has been ridden in six days.—Mann's *Natal*; Hall's *South African Geography*. (1871)—pop. 315,000, of whom one-seventh are Europeans.)

NATAL, or RIO GRANDE DO NORTE, a fortified seaport of Brazil, capital of the province of Rio Grande do Norte, and built on low lands about three miles from the mouth of the river of that name, 100 miles north of Parahiba. In the year 1859—1860, 52 vessels of 16,337 tons entered and cleared the port. Pop. estimated at 10,000.

**NATAL**, JOHN WILLIAM COLENSO, D.D., BISHOP of, a divine of the Church of England, was born in 1814, and educated at St John's College, Cambridge, where he graduated as Second Wrangler and Smith's Prizeman in 1836. From 1838 to 1842, he was one of the masters of Harrow School, and for the next four years, tutor of St John's College. In 1846, he was appointed rector of Farnett St Mary, in the county of Norfolk, and in 1854, first Bishop of N., South Africa. The works by which he was, until recently, most widely known were his two treatises on Algebra and Arithmetic. The treatise on Algebra was first published in 1849, and that on Arithmetic in 1853. They soon acquired great popularity, and have been adopted as text-books in many of the principal schools and colleges in Great Britain. He has also published other educational works. He first attracted public notice, however, by the dedication of a volume of Sermons to the Rev. Mr Maurice (q. v.), at the moment when that gentleman was in disgrace with the 'orthodox' section of the religious world. His affection and respect for Mr Maurice were further shewn by his edition of the *Communion Service, with Selections from Writings of the Rev. F. D. Maurice* (1855). In the same year appeared his *Ten Weeks in Natal*; in 1861, his *Translation of the Epistle to the Romans, commented on from a Missionary Point of View*; and *A Letter to his Grace the Archbishop of Canterbury, upon the Question of the Proper Treatment of Cases of Polygamy, as found already existing in Converts from Heathenism*, in which he recommends, on grounds both of reason and Scripture, that converts to Christianity, already possessing several wives, should not be forced to put them all away, except one. He admits that monogamy is most in harmony with the genius of Christianity, but would enforce it only in the case of those who married after their conversion. The outcry raised by his professional brethren against the *Letter* was sufficiently loud, but it was nothing to the tempest of disapprobation that burst forth in the following year (1862), when he published *The Pentateuch and Book of Joshua Critically Examined*, in which he endeavoured to prove that, as they stand, these books are not the products either of the age to which they are usually assigned, or of the authors whose names they bear; and that they are not entirely historical, but in many most important passages are overlaid with legendary, mythical, and symbolical incidents—the growth of ages, and the result of afterthought interpreting events and supplying wants. Replies and 'refutations' innumerable have made their appearance, in spite of which the bishop has announced his intention of critically examining the rest of the Bible. The second, third, and fourth parts of this remarkable work have since appeared, distinguished by precisely the same qualities as the first.

**NATANT**. See **NAIANT**.

**NATATO'RES** (Lat. swimmers), the name given by Illiger, and many other ornithologists, to the order of birds called *Palmipedes* (q. v.) by Cuvier.

**NATCHEZ**, a city and port of entry in Mississippi, U.S., on the east bank of the Mississippi River, 280 miles north of New Orleans. It is finely situated on the bluff, 150 feet high, which here forms the bank of the river. A portion of the town at the bottom of the bluff is called Natchez-under-the-Hill, and was formerly the resort of the river gamblers, pirates, and other desperate characters. The city has eight churches, a court-house, jail, United States Marine Hospital, and two daily papers. It is the shipping port of a large and fertile cotton district, and has steam-boat

connections with the whole Mississippi valley. N., which derives its name from a noted tribe of Indians, was settled by the French in 1716, and destroyed by the Indians in 1729, who were subsequently defeated, and banished to the West Indies. Pop. in 1860, 13,553.

**NATION** (Lat. *natio*, from *natus*, born), a word used in two distinct senses. 1. A state or independent society united by common political institutions; 2. An aggregate mass of persons connected by ties of blood and lineage, and sometimes of language. The modern dogma of nationalism, as maintained by a class of continental politicians, starts from an assumption that a nation in the latter sense ought necessarily to be also a nation in the former, and endeavours to assign limits to the several races of Europe, with the view of erecting each into a distinct state, separated from other states or nationalities. The extreme politicians of the national school seem to consider the supposed rights of nationalities as paramount even to the obligations of treaties, and the political conjunction of one nationality with another is looked on by them as an adequate ground for a revolt or separation, apart altogether from the question whether the nationality is well or ill governed. In point of fact, the different races in Europe are so commingled, that any reconstruction of the political map of Europe, on ethnological principles, would be impossible, even if desirable. The blood of nine-tenths of Europe has been mixed within the historical period. The test of language, on which nationality has sometimes been based, is a deceptive one, in so far as it is indefinite and perpetually fluctuating. The people on the frontier between two races, as in the South Tyrol, generally speak two languages. Then we have dialects, like the Walloon, the Grödnerisch of the Tyrol, and the Romansch of the Grisons—as also the Breton, Welsh, Gaelic, and Irish languages, which could hardly be made the basis of independent communities. The wellbeing of the people governed is properly the end of all government, and it has practically not been always found that a state is better governed when it consists of one race only, than when it includes an aggregate of races. Highly diversified nationalities may be united in one political system, provided only that the government respects and consults the peculiarities of the several races, and does not attempt to force the usages, habits, or language of one on the rest. See **ETHNOLOGY**.

**NATIONAL CONVENTION**, an assembly of deputies of the people, which assumed the whole government of France on the overthrow of the throne in 1792. When the National Assembly (see **ASSEMBLY, NATIONAL**) had decreed the suspension of the king, 10th August 1792, it appointed the election of the N. C., which commenced its sittings 21st September. Its first act was to declare France a republic, 25th September. Upon this followed the trial and condemnation of the king. Through the support of excited mobs, the extreme Jacobin party became predominant in the Convention; where, from the elevated seats on which its members sat, it received the name of the *Mountain* party. The *Revolutionary Tribunal* was established; the chief administration of affairs was intrusted to the *Committee of Public Safety*, which exercised the most despotic powers. The Girondists (q. v.), at first a powerful party in the Convention, were destroyed, many of them perishing by the guillotine; and a new constitution, thoroughly democratic, was adopted, 10th August 1793; but its operation was suspended until peace should be restored. Meanwhile, the actual rulers of the country displayed marvellous energy; almost a million of citizens being placed under arms, and

immense provision of all warlike stores made by means of requisitions. They also proceeded with merciless severity against their political opponents, dealing with them as traitors; hundreds of thousands were thrown into prison, and the number who died by the guillotine increased daily both in Paris and throughout France. The N. C. itself latterly became subject to the dictatorial power of Robespierre; many of its members were guillotined within a few weeks; and independent opinion was no longer expressed. The overthrow of Robespierre was followed by a great reaction; the Jacobins were suppressed; and finally, the N. C., after concluding peace with Prussia and Spain, dissolved itself 26th October 1795 (4th Brumaire of the year IV.), leaving to the nation a new constitution, which placed the government in the hands of a Directory (q. v.).

**NATIONAL COVENANT.** See COVENANT.

**NATIONAL DEBT.** See DEBT, NATIONAL.

**NATIONAL EDUCATION.** The general subject of Education has been already treated under that head. By the term 'National Education' is understood (1) the means taken by the body of any nation, either through the state or other organisations, for educating the people; (2) the objects which the nation ought to place before itself in its educational measures. These questions involve the whole inner and outer history of education, and are far too large and important to be capable of such treatment here as would convey accurate notions to the reader. All we can do is to glance slightly at the history of the two branches into which the subject divides itself. Among ancient nations, and among not a few nations now existing, education in any definite sense did not, and does not, exist for the masses of the people. The children grow up in reflective or unreflective imitation of their fathers. But at all times, nations which have quite emerged from the savage state, have had some more or less organised scheme of education for the leisured and governing classes. The purpose kept in view in such education has been to fit the pupils to discharge certain duties of war or government. In addition to this, the priesthood had the education which their traditional hymns, laws, and customs afforded. That man as such, apart from any special practical ends, should be educated, was an idea late of being recognised, and occurred first to the Greeks, to whom the world owes so much. But neither among them nor their imitators, the Romans, was the education of the masses of the people ever contemplated. Education, properly so called, was confined to a few. In the centuries which succeeded the introduction of Christianity, the church was the great educating body—training those intended for the service of the altar, not only in Christian doctrine, but in all the learning of the past. This, at least, was the general tendency of education in the church. But it was not till the Reformation in the 16th c. that learning, even to the limited extent of reading and writing, was considered a worthy object of pursuit by any save those who, in some form or other, were destined to be drawn within the clerical ranks. The Reformation introduced the idea of educating the masses of the people—the leaders of this movement being, no doubt, forced to this conclusion by the necessity which their view of man's personal religious obligations imposed on them. It was manifestly a corollary from the position they took up that every man's intellect should be so trained as to be able to read, and inquire, and think for itself. It was only very slowly that so large a conception of the sphere of education could be given

effect to. Gradually, however, popular schools arose in many parts of the continent of Europe, especially in Germany, and the number of gymnasia or grammar-schools was, during the same period, increased. In Scotland, so early as 1696, the government took up the matter, and ordained that there should be a school as well as a church in every parish, at the same time providing for their maintenance by a tax on land, and for their management by putting them under a certain number of those who paid the tax conjoined with the minister of the parish—all being subject to the presbyteries within whose bounds they were situated. The example of Scotland cannot be said to have been followed on anything like a national scale by any country till after the French Revolution had exhausted itself. Since 1815, the distinguishing idea of government administration may be said to be the necessity of educating *the people, and all the people*—even the outcast and the criminal. During the last fifty years, all the German states, and more especially Prussia and Saxony, have developed excellent national systems of education, and France has followed their example. Russia and the new Kingdom of Italy are also now organising primary instruction; and at the same time, as in all European countries, they are making provision for the instruction and professional training of the teachers in Normal Schools (q. v.). The schools for instructing the middle classes, and grammar-schools (French, *lycées*; German, *gymnasiums*), whose object is to prepare pupils for the universities, have received increased attention. Universities themselves, too, have been further developed, their curricula extended in range, their objects elevated, and their number increased.

To return to primary instruction. In England there is no national system, properly so called; but voluntary efforts are largely aided by the state in the form of Privy Council grants. These grants have also been extended to Scotland, as it became necessary to supplement the parochial schools there, owing to the increase of population. The principal conditions on which these grants are made are, that they are only to supplement local efforts, that the schools pass a satisfactory examination before a government inspector, and that the Bible be read in them. As much additional religious instruction may be given as the school-managers please, but no schools will be admitted to Privy Council aid from which the Bible is excluded. Under the stimulus afforded by these grants, the educational wants of England have, since 1839, been to a great extent supplied; but many districts are still unprovided with schools, and many more are very badly supplied. A national system—that is to say, a system which would insure that a school was brought within reach of every child—is what England is tending to, and must ultimately have. Meanwhile differences of opinion as to the management of schools supported, as the schools under a 'national system' must be supported, namely, by a compulsory tax, and as to the kind of religious instruction to be given, divide parties, and make an immediate settlement of this all-important question impracticable. In Scotland the same evils exist as in England; but, owing to its admirable and ancient Parochial School System, to a very much less extent. A very considerable party, both in England and Scotland, desire to cut the knot of the educational difficulty by uniting on the subject of secular instruction, and making separate provision for religious instruction by the various sects. This party is commonly called the Secular party. See also VOLUNTARIANISM.

In Ireland, a national system instituted and

maintained by the state exists, and one of its main features is the separation of the religious from the secular teaching—at least in theory. The extent to which this principle has been encroached upon in the course of working out the scheme, is not accurately known, but is worthy of special inquiry.

In the British colonies, as in the United States of America, adequate state systems of education have been provided on the basis of the secular principle.—Further details of the external history of primary education in England, will be found under PRIVY COUNCIL, COMMITTEE OF, ON EDUCATION.

**NATIONAL GUARD**, an armed organisation of the inhabitants of towns for local defence, differs from the British Militia and Volunteers, in that it is at the disposal of the respective municipalities rather than of the crown. From this circumstance, the National Guard has always been an eminently democratic force, dependent on the approbation of the multitude, powerful when aiding a revolt, but impotent against disturbers of tranquillity. Italy, Greece, and some other nations, have at times maintained this civic force: but the country where it arose, and whence it has derived its historic fame, is France. For a description of the celebrated French National Guard, see GARDES SUISSES.

**NATIVE**, a term much employed in Mineralogy to designate substances found as minerals, which are also, and most of them more abundantly, obtained from other minerals by chemical processes. Thus silver found pure, or nearly so, is called *Native Silver*, whilst almost all the silver used in the world is procured from ores in which it exists variously combined. The term native is more commonly applied to the metals than to any other substances.

**NA'TRON**, or **TRONA**, is a term which is employed in commerce to designate an impure sesquicarbonate of soda ( $2\text{NaO}, \text{HO}, 3\text{CO}_2 + 3\text{Aq}$ ), which always contains sulphate of soda and chloride of sodium. It is obtained from the margins of lakes in Egypt, Siberia, Tibet, &c., and from the borders of the Black and Caspian Seas.

**NATRON LAKES**. Natron was one of the substances employed, at an early period, by the ancient Egyptians for the embalming of the mummies. It was called *hesmen* by the ancient Egyptians, and, together with the lakes from whence it was derived, is mentioned in texts of the 12th dynasty, B.C. 1800 circa. These lakes are in the vicinity of Zakeek, a village lying west of the Damietta branch of the Nile, south of the Lake Mareotis and Alexandria. The lakes, eight in number, are below the level of the sea, and the natron is obtained by evaporation, the best called *saltance*, or royal, being crystallised almost pure. The locality is also renowned for four monasteries, Deyr Suriani, St Maiarius, Amba Bishoi, Deyr Baramoos, containing libraries of Arabic, Coptic, and Syriac MSS., many of which obtained by Archdeacon Tattam, and other travellers, have enriched the national collections with Syriac MSS. of great interest relating to theology and ecclesiastical history. Their present population is about 300, but in the time of St Pachomius, 5000 anchorites dwelt here.

Lepsius, *Todt. Taf. vii. c. 17, l. 17*; Wilkinson, *Mod. Egypt*, i. 382; Brugsch, *Wanderung nach Natron Klöstern* (12mo, Berl. 1855).

**NAT'TERJACK**. See **TOAD**.

**NATUNA ISLANDS**. THE, lie to the north-west of Borneo, between  $2^{\circ} 28'$  and  $4^{\circ} 56'$  N. lat., and  $107^{\circ} 57'$  and  $108^{\circ} 15'$  E. long. They are densely wooded and mountainous, Ranay, on Great Natuna, rising to a height of 3500 feet. The largest of the

islands is about 600 square miles. Pop. of the whole about 1300, who grow rice, maize, sago, coconuts, &c., and exchange the produce of their fishings, their sago and cocoa-nut oil, for rice, iron, and cottons, at the European settlements on the Strait of Malacca.

**NATURAL**, in Music, a note belonging to the diatonic scale of C, and neither elevated by a sharp nor depressed by a flat. When a note has been so elevated or depressed, the natural sign  $\natural$  prefixed to it on its recurrence restores it to its place on the scale. When music is written on a key with a signature of sharps or flats, it is the office of the natural sign to counteract the signature as regards the note to which it is prefixed.

**NATURAL HISTORY**, in the widest sense, includes all natural science, and has the whole of creation for its subject. In this sense the term was employed by the philosophers of antiquity. But it is now limited to those branches of science which relate to the crust of the earth and its productions. Of these, geology and mineralogy have for their subject inorganic portions of creation; botany and zoology, the various branches of which are often pursued as separate sciences, with physiology, have for their subject organised creatures. Natural history takes cognizance of the productions of nature, and of their relations to each other, with all the changes on the face of the earth, and all the phenomena of life, both animal and vegetable. It derives assistance from other sciences, particularly chemistry and natural philosophy; and some of the branches of chemistry may also be regarded as branches of natural history. When man himself is considered as a subject of scientific study, psychology must be added to the branches of natural history, but in the term as commonly employed this can scarcely be said to be included.

In every department of natural history, classification is of the utmost importance, and scarcely less important is a scientific nomenclature suited to the classification. The subjects of study are so incalculably numerous, that an arrangement of them in well-defined groups is necessary to any considerable attainment in the knowledge of them; and it is only by systems of classification which arrange smaller groups in larger, and these in larger and larger again, that natural history has been brought to its present state. The very division of natural history into different sciences is a result of such a classification, and implies a recognition of the largest and highest groups. It is not always in the establishment of these groups that the greatest difficulty is experienced. The primary distinction of all the subjects of natural history into organised and unorganised, or into those having life and those not having life, presents itself very readily to every mind. And equally natural and necessary is the distinction of organised beings into Plants and Animals, however difficult it has been found to draw the precise limit between the lowest of plants and the lowest of animals. Another distinction readily presents itself to the student of living beings, in the kinds which retain the same characters from one generation to another. But here arises one of the most important of all the questions of natural history, what a *species* is, and how it differs from a *variety*. For this we refer to the article **SPECIES**. But much difference of opinion as there is on this point, the common and long-prevalent notion may be assumed, as suitable enough for guidance in all that relates to classification, that those are distinct *species* which cannot by any change of circumstances—or, let it be said, by any ordinary change of circumstances, and within any moderate period of

time—be so modified as to be transmuted one into another, whilst those are only *varieties* of which the modification and transmutation can be thus effected. Thus, in botany, *Brassica oleracea* is a species, of which kale, cabbage, cauliflower, broccoli, Brussels sprouts, &c., are varieties. Species, grouped together, according to their natural affinities, form *genera*; but a *genus* does not necessarily consist of more species than one; for, whilst some contain hundreds of species, others, apparently very distinct, contain only one as yet known to naturalists. The distinctions by which genera are separated are of course arbitrary, and are admitted to be so by those who deny that the distinctions between species are arbitrary, or that there is any uncertainty about them but what arises from the imperfection of our knowledge; for, at present, it must be admitted on all hands, that the uncertainty is in innumerable instances very great, what are species and what are varieties. The great object, however, in the formation of *genera* is that they shall be accordant with the facts of nature; and so in regard to the larger or higher groups which are composed of associated genera, as tribes, families, orders, classes, &c. But in all this, the great difficulty is that affinities exist on many sides; and that groups cannot be satisfactorily arranged in the order of a series, but often rather as if they radiated from a common centre; whilst otherwise viewed, the same groups might seem to radiate very differently from another common centre. A *natural system* is one framed with the utmost possible regard to all these facts; an *artificial system* fixes on one class of facts and proceeds upon it, in disregard of all others. See **BOTANY**.—In the inorganic departments of nature, a *species* is of course something different from what it is in the organic. But classification still proceeds on the recognition of facts in nature itself, which it is sought to exhibit in the groups that are formed. See **MINERALOGY**.

The nomenclature of natural history, in so far as it relates to organic beings, continues essentially as it was established by Linnæus. See **GENUS**. The names have in many cases been changed, but not the mode of nomenclature.

**NATURAL OBLIGATION**, in Law, means an obligation which is supposed to be prescribed by the law of nature, as the obligation of a parent to maintain his child. In England, such an obligation is not recognised by the common law, and therefore it was necessary in the Poor-Law statutes to punish by a penalty parents who, being able, refused or declined to maintain their children. In Scotland, the natural obligation of a parent to maintain his child is, however, recognised by the common law, though it is also enforced by the Poor-Law statute.

**NATURAL PHILOSOPHY** is a term frequently employed in Great Britain to designate that branch of physical science which has for its subject those properties and phenomena of bodies which are unaccompanied by any essential change in the bodies themselves. It thus includes the various sciences which are classed under *Physics* (q. v.) in the limited sense of that term.

**NATURAL THEOLOGY** is the name given to that branch of moral science which concerns itself with the evidences for the existence of God, drawn from an inquiry into the constitution of the universe. It is believed by the majority of philosophical thinkers, that these evidences warrant the belief in a Being of infinite power, wisdom, benevolence, and justice. There are, however, philosophers of great eminence who deny that there is such a thing as Natural Theology, who say that nature, at the best, gives forth an uncertain sound regarding the

existence of a Supreme Being, and that a logical demonstration of such existence is impossible, and has always broken down. This view is held, for example, both by atheists like David Hume, and by the new Scots-Oxonian school of metaphysicians, of whom the principal representative is Mr Mansel. The standard English work on the subject has long been Paley's *Natural Theology* (Lond. 1802; new edition by Lord Brougham and Sir Charles Bell, 1836). The Bridgewater and Burnett Treatises are also contributions to this branch of science.

**NATURALISATION**, the act of placing an alien in the position, or investing him with the rights, of a natural-born citizen. The present arrangements with reference to naturalisation, by which the old rule that British allegiance is indelible, has been changed, are embodied in the Naturalisation Act (1870), 33 Vict. c. 14, and the Naturalisation Oath Act (1870), 33 and 34 Vict. c. 102. By the former of these statutes it is provided, that an alien who has resided in the United Kingdom for a term of not less than five years, or has been in the service of the crown for a term of not less than five years, and intends, when naturalised, either to reside in the United Kingdom or to serve under the crown, may apply to one of Her Majesty's Principal Secretaries of State for a certificate of naturalisation. The applicant is bound to adduce such evidence of his residence, or service, and intention to reside, or serve, as shall satisfy the Secretary of State, who may, with or without reason assigned, give or withhold a certificate. No appeal lies from his decision, but his certificate takes no effect until the applicant has taken the oath of allegiance. An alien, to whom a certificate of naturalisation has been granted, is entitled to all political and other rights, powers, and privileges; and subject to all obligations to which a natural-born subject is entitled or subject in the United Kingdom, with this qualification, that he, when within the limits of the foreign state of which he was previously a subject, is not deemed a British subject, unless he has ceased to be a subject of the foreign state by the laws thereof, or by a treaty to that effect. Such a certificate may be granted to any person with respect to whose British nationality a doubt exists; and a grant of such special certificate for the purpose of quieting doubts shall not be deemed an admission that the person to whom it was granted was not previously a British subject. Aliens previously naturalised may, on application, obtain certificates. A British subject who has become an alien, in pursuance of this act (see **ALIEN**), may apply for a certificate of readmission to British nationality on the same conditions as an alien by birth. The Secretary of State has, in this case, the same discretion; and an oath of allegiance is likewise required. The privilege of readmission, like that of admission to British nationality, requires that the recipient shall have ceased to be a subject of the foreign state. In the colonies, the powers of the Secretary of State are conferred on the governor. By the Oaths Naturalisation Act, 33 and 34 Vict. c. 132, any person making or subscribing a false declaration is declared to be guilty of a misdemeanour.

In France, 'La grande Naturalisation' confers political privileges; 'La petite Naturalisation' gives all the private rights of a French citizen, and it has been doubted whether even public rights are not included in it. In 1867, the term of residence was reduced from ten years to three. A subject of France loses his native character by naturalisation in a foreign country, or acceptance of office abroad without permission of the state, or even by establishing himself permanently out of his

country. He may recover his rights by renunciation of his foreign office or domicile.

In Prussia, the higher administrative authorities can naturalise any stranger who satisfies them as to his conduct and means of subsistence. Nomination to a public office confers naturalisation. Prussian nationality is lost—(a) by discharge upon the subject's request; (b) by sentence of the competent authority; (c) by living ten years in a foreign country; (d) by marriage of a female subject with a foreigner.

In Austria, the authorities may confer the rights of citizenship on a person, after ten years' residence within the empire, who has been allowed to exercise a profession. A public functionary becomes thereby invested with rights of citizenship; but admission into the army has not this effect.—In the kingdom of the Netherlands, the power of naturalising rests in the crown.—In Russia, naturalisation is effected by taking an oath of allegiance to the emperor.

In the American States, five years' residence, and a declaration of intention to become a citizen, emitted before a magistrate, is requisite to naturalisation. See *Report of Royal Commissioners on Naturalisation* (1869).

**NATURALISED.** In the language of botanists and zoologists, those plants and animals are said to be *naturalised* in any country, which, having been introduced into it by man, have established themselves so as to exist without his care. A plant or animal is never said to be naturalised so long as it exists merely in a state of cultivation or domestication, but is so when it becomes truly wild, and, unaided, competes successfully for a place among those which are indigenous to the country. Thus, the horse is not naturalised in Britain, or in most of the countries in which it is most highly valued; but both the horse and the ox may be said to be naturalised in South America. Many of the plants now most characteristic of Southern Europe, are sometimes said to have been originally introduced from the East; and some that are abundant in many parts of Britain were in all probability brought from the continent of Europe. Some of these almost evince their foreign origin by growing chiefly near ruins, or in places which have long been the seats of human habitation. Many plants now naturalised in Britain appear to have been originally brought for medicinal use, although now disregarded. In many cases, however, naturalisation has taken place without any attempt having ever been made by man to introduce the plant even for cultivation; and thus many European weeds are now common in America, the seeds having found their way thither with those of more valuable plants, or in some such accidental manner. The same thing has taken place as to animals. Thus, mice and rats find their way from one country to another; thus the bed-bug found its way at no remote date to Britain; other insects have been even more recently introduced with foreign productions of different kinds; and a mollusc (see *DREISSENA*), previously unknown, has established itself in some British rivers and canals. The pheasant may be mentioned as an instance of naturalisation in Britain, designed and successfully accomplished by man. An *Acclimatisation Society* has recently been formed in London, which has for its object the naturalising, rather than what may more strictly be called the acclimatising, of animals deemed suitable and desirable. It is unquestionable that much may be done by naturalisation of animals, not only to render rural scenes more attractive, but also to increase their economical productiveness. Perhaps nothing of this kind has received so little of the attention due to its importance as the naturalisation of fishes. See **PISCICULTURE**.

**NATURE-PRINTING.** This is a process by which engravings or plates answering thereto are produced by taking impressions of the objects themselves, and printing from them. There is some dispute as to the original inventor of this art; Denmark claims it for a native of Copenhagen, Peter Kyle, a goldsmith, who died about 1833, leaving the MS. description of his invention in the archives of the Royal Collection of Engravings in that capital. It is, however, admitted that no use was made of his invention. In 1853, Alois Auer, director of the State printing establishment of the Austrian empire, published his process, and also some very beautiful works illustrated by this art. About the same time, in this country, Mr G. W. Aitkin made known his discovery of an exactly similar process, and showed some very beautiful plates of feathers, ferns, &c. But whatever other claims may be advanced, it is certain that Alois Auer holds undisputed right to the title of original inventor and practical applier of the invention. The process is very simple, as practised by Auer; but it cannot be applied to any objects except those with tolerably flat surfaces, such as dried and pressed plants, embroidery and lace, and a very few animal productions. The object is placed between a plate of copper and another of lead, both worked smooth, and polished; they are drawn through a pair of rollers, under considerable pressure—M. Auer says forty to fifty tons; then, when the plates are separated, it is found that a most beautiful and perfect impression of the object has been made in the leaden plate. This may be used directly as an engraved plate, if only a very few impressions are wanted; but as it is too soft to resist the action of the press for practical purposes, a fac-simile of it is obtained in copper by the electrotype process, which is used as the printing-plate. The best practical use to which nature-printing has yet been applied is the multiplication of patterns of lace and other figured surfaces, either in textile materials or metals, for trade purposes. Lace-prints especially are so exactly like the originals, that the most fastidious can require nothing more; hence the cutting up of valuable pieces of lace for patterns has been saved. The late Mr Henry Bradbury, of the firm of Bradbury and Evans, London, made nature-printing his special study, and produced the exquisite works, *Nature-printed Ferns*, and *Nature-printed Sea-Weeds*, in two vols. each. London: Bradbury and Evans.

**NAUMA'CHIA**, a Greek word, signifying literally a naval battle, afterwards, among the Romans, a spectacle which consisted in the imitation of a naval battle. Julius Cesar was the first to introduce a naumachia into Rome, 46 B. C., causing a portion of the Campus Martius to be dug to form a lake, on which the 'spectacle' came off. Augustus made an artificial lake (*stagnum*) near the Tiber for the same purpose, which was afterwards frequently used for naumachie. Claudius also exhibited a splendid one on Lake Fucinus. Nero, Domitian, and others were likewise fond of such amusements. The combatants were termed *Naumacharii*; they were for the most part either captives or condemned criminals; and the rival fleets took their names from the famous maritime nations of antiquity: Tyrians and Egyptians, Rhodians and Sicilians, Persians and Athenians, Coreyreans and Corinthians, Athenians and Syraeusans. The magnificence of these spectacles may be estimated from the fact, that in the one exhibited on Lake Fucinus, 19,000 men were engaged. These *naumachie* were not *sham-fights*, any more than ordinary gladiatorial combats. Both sides fought on in real earnest for dear life until one was utterly

overpowered; and as a rule, multitudes were 'butchered to make a Roman holiday.'

NAUMBURG, a town of Prussian Saxony, in the government of Merseburg, situated 17 miles south-south-west of the town of that name, on the Saale, in the midst of a striking amphitheatre of vine-clad hills. Besides its cathedral—a noble Gothic structure, completed in 1249, with two choirs, and containing many beautiful sculptures—there are several other churches. The manufactures are cotton and woollen fabrics, leather, and chemical products. Wine is grown in the vicinity in considerable quantity—116,347 gallons yearly. During the Thirty Years' War, and in the campaigns of 1806 and 1813, N., in which the Prussian magazines were lodged, was a place of great importance. Five annual fairs are held here. Pop. 13,797.

NAUPLIA, a small fortified town and seaport in the Morea, Greece, at the northern extremity of the Gulf of Argos or Nauplia, and 7 miles south-east of the town of Argos. It is laid out in the manner of a European town. Its roadstead is one of the best in Greece. In the Church of St Spiridon, Capo d'Istria was assassinated in 1831. N. is of high antiquity. At an early period it was the port and arsenal of Argos. In the 13th c., it was occupied by the Venetians, and was taken by the Turks in 1540. From 1824 to 1835, it was the capital of Greece, and had a population of upwards of 12,000; but on the removal of the court to Athens, it fell into decay. Pop. about 4000.

NAU/SEA is a distressing sensation always referred to the stomach. It is unattended by pain, but is usually accompanied by a feeling of general languor or debility, a small and often irregular pulse, a pale, cool, and moist skin, general muscular relaxation, an increased flow of saliva, and a sensation that vomiting will supervene. It is most commonly a *direct* symptom of disease or disorder of the stomach, but sometimes it is a very important *indirect* symptom of disease of some part at a distance from the stomach—as, for example, the brain or the kidney. The nausea which is so troublesome to pregnant women is due to the irritation excited by the enlarged uterus being reflected by nervous agency to the stomach.

NAUTE, CAUPONES, &c. These words are the commencement of an edict in Roman law, which made shipmasters, innkeepers, and stablers liable for the safety of the goods brought into the ship, inn, or stable. The same doctrine is adopted by the common law of England and Scotland, subject to variations produced by the Carriers' Act, and Railway and Canal Traffic Act, so far as regards carriers and railway and canal companies.

NAUTICAL ALMANAC, a work projected for the special behoof of astronomers and navigators. See ALMANAC. It is chiefly valuable to the latter class from its containing tables of the 'lunar distances'—i. e., distances of the moon from a few (5 to 7) of the more prominent stars, given for every three hours throughout the year—by which, at the present day, longitudes (see LATITUDE AND LONGITUDE) are most conveniently and accurately determined. To the astronomer, the *Nautical Almanac* furnishes a great mass of important data; it gives the position of the moon in right ascension and declination for every hour, and the sun's latitude and longitude for every day in the year; it shews the obliquity of the ecliptic, the sun's and moon's parallax, aberration, &c., at different times; it supplies the necessary data for the determination of the real or apparent size, position, and motion of the planets and their satellites; it fixes accurately the places of about 150 fixed stars, and gives full

details concerning eclipses, occultations, transits, and other celestial phenomena occurring during the year. It is generally issued four years in advance for the sake of mariners going on long voyages.

NAUTILUS, a genus of *tetrabranchiate Cephalopoda* (q. v.), extremely interesting as the existing representatives of an order of molluscs now reduced to a very few species, but of which the fossil remains attest the great abundance in former geological periods. The species of this genus are found only in the seas of warm climates. One or more of them must have been known to Aristotle, as appears from his description, which, however, is not minute. Yet it is but recently that they came under the observation of modern naturalists; and they were very imperfectly known, till a specimen, obtained by Dr Bennett in a bay of the New Hebrides in 1829, was submitted to the examination of Professor Owen, and became the subject of a valuable memoir by him. The shell, indeed, has long been common enough in collections, being plentifully found, entire or in fragments, on many tropical shores; but from the shell alone, little could be learned concerning the animal to which it belonged. The shell is spiral, the spire not at all elevated; and thus, in external form, resembles the shells of many species of snail; but internally, it is *camerated*, or divided into chambers, by transverse curved partitions of shelly matter. In a very young state, this structure does not exist; but as the animal increases in size, it deserts its first habitation, which then becomes an empty chamber, and so proceeds from one to another still larger, occupying the outermost only, but retaining a connection with all by means of a membranous tube (*siphuncle*) which passes through the centre of each partition. The use of this connection is not known; but the most probable supposition is, that the animal is enabled, by throwing air or some kind of gas into the empty chambers of the shell, or by exhausting them of air, to change the total weight, so that it may rise or sink in the water at pleasure. It commonly inhabits the bottom of the sea, where it creeps about, probably like the gastropods, by means of a large muscular disc with which the head is furnished; but it sometimes rises to the surface, and is to be seen floating there. Dr Bennett states that the specimen which he fortunately captured, attracted his attention when thus floating, as an object resembling a dead tortoise-shell cat. The story of its spreading a sail is as fabulous as the similar story regarding the argonaut. The head and arms can be protruded from the shell, and can also be completely retracted within it. There are numerous arms attached to the head, nineteen in the best known species; there are also numerous other tentacles; but none of these organs are furnished with suckers, and they are feeble in comparison with the corresponding organs of many of the higher or dibranchiate cephalopods. The mouth is of the parrot's bill form, as in the other cephalopods; but the mandibles are not entirely composed of horny matter, their extremities being calcareous and of a hardness apparently adapted for breaking shells. Their edges are also notched, and shew an adaptation for crushing rather than for cutting. The tongue is large. The gizzard is muscular. The food appears to consist, at least in great part, of crustaceans.

Only three species of N. are known, of which the best known and apparently the most abundant, is the PEARLY N. (*N. pompilius*), which is found in the Indian and the Pacific Oceans. Its shell is beautifully nacreous within; and is externally porcelain-like, white, and streaked with reddish chestnut. The shell, being large, thick, and strong, is used for a variety of purposes by the natives

of the East Indies and South Sea Islands; it is also made into ornaments of various kinds in China and elsewhere. The animal is eaten by the Fijians and other South Sea islanders, and is much esteemed as an article of food. The Fijians capture it by means of a basket-trap, somewhat like those used for catching lobsters, baited with boiled crayfish.

The name PAPER N. has sometimes been given to the Argonaut (q. v.).

*Fossil Nautilus*.—About one hundred and fifty species of fossil shells have been referred to this genus. They occur in all the strata from the Upper Silurian to the most recent deposits. Numerous forms, however, which exhibit very wide differences, have been incongruously associated under this generic name. The palæozoic nautili are so remarkable, that they must certainly be referred to one or more separate genera: some of the carboniferous species have a square back, and the whorls either compact or open in the centre, while the last chamber is more or less disunited from the shell; and the Devonian *Clymenia* has angular sutures and an internal siphuncle. Until a careful revision of this section of the Cephalopoda is made, it will be better to consider the species as belonging to the family *Nautilidae*, and not to the genus *Nautilus*.

NAUVOO', a town in Illinois, United States of America, on the east bank of the Mississippi River, 220 miles above St Louis. It was built by the Mormons in 1840, and in 1846 contained a population of 15,000. Its principal feature was a great temple of polished marble, original in style, and imposing in appearance. After the murder of Joseph Smith, the Mormon prophet (see MORMONS), and the expulsion of his followers, the temple was burned. The town was afterwards bought and occupied by a French Socialist community, under the leadership of M. Cabet. This experiment having proved, like others, a failure, the once famous city has been reduced to an inconsiderable village.

NAVAL ARCHITECTURE. See SHIP-BUILDING.

NAVAL CADETS are the youths training for service as naval officers. Every admiral on hoisting his flag may nominate two, every captain one cadet. The boy must be over twelve and under fourteen years of age, and must prove that he has had a fair elementary education. After two years' service, he becomes eligible for Midshipman (q. v.). In time of peace, about 190 cadets are annually required for the navy.

NAVAL CROWN, in Heraldry, a rim of gold round which are placed alternately prows of galleys and square sails. The device is said to have originated with the Roman emperor Claudius, who, after the conquest of Britain, instituted it as a reward for maritime services. He who first boarded the enemy's ship, and was the occasion of its being captured, was entitled to a naval crown. A naval crown supporting the crest in place of a wreath, occurs in various grants of arms in the early part of the present century, to the naval heroes of the late war. The crest of the Earl of

Naval Crown.

St Vincent, bestowed on him after his victory over the Spanish fleet in 1797, is issuing out of a naval crown or, enwrapped by a wreath of laurel vert, a demi-pegasus argent maned and hooped of the first and winged azure, charged in the wing with a fleur-de-lis or.

NAVAL RESERVE, ROYAL, is a sort of militia, auxiliary to the royal navy. It is a force held in

high esteem by naval men; and is considered an extremely valuable reserve of trained men ready to man the fleet in case of emergency. The force was instituted in 1859, under the Act 22 and 23 Vict. c. 40. That act authorises the engagement of 30,000 men, each for a period of five years, and provides that each shall be trained, for 28 days in every year, to the use of arms and naval tactics, either in Her Majesty's ships or on shore. In case of national emergency, these men can, by royal proclamation, be called out for service in the navy in any part of the world, for periods not exceeding five years. While training and while called out for actual service, the men receive the same wages as corresponding ratings in the royal navy: in addition, they each receive, as retaining fee, a sum of six pounds for every year in which the regulated training has been completed. On actual service, after three years—whether of uninterrupted service, or at broken intervals—the volunteer becomes entitled to twopence extra per diem. The man can terminate his engagement at the end of five years, unless on actual service, when the Queen may require him to complete five years of such service before discharging him. During the continuance of his engagement, he must not embark on voyages which shall entail a longer absence from the United Kingdom than six months, unless with special permission of the Admiralty. The periods for training are made as far as practicable to suit the sailor's convenience: he may break the 28 days into shorter periods, none being less than seven days. He is drilled as near as practicable to his own home, the drilling being intrusted to the officers of the Coast-guard. While drilling, if on board a Queen's ship, he has the regulation victuals; if billeted on shore, while training for great-gun exercise in batteries, he is allowed 1s. 4d. a day for victuals. It is optional with the volunteer to renew his engagement from time to time, as the respective periods of five years expire; and at about the age of 45, he becomes entitled to a pension of £12 or upwards for the rest of his life, subject to the usual obligation of service in certain circumstances in the navy, which all pensioners are under. This pension may be commuted, if desired, into one of less amount, to last until the death of the longest liver of the volunteer and his wife.

To be eligible for the Royal Naval Reserve, a man must be a British subject, under 35 years of age, in good health, and, within the preceding ten years, must have served at least five years at sea, of which one year shall have been as able seaman. Soldiers, militiamen, and Coast Volunteers are ineligible, and subject to a penalty if they join; but a member of the last force may obtain his discharge therefrom for the purpose of joining the Naval Reserve. Penalties are enacted in case men fail to attend: and failure after proper notice to come up for actual service is held equivalent to desertion. While training or on duty, the men are liable to all the punishments, as they are entitled to all the rights and privileges of regular seamen. The men considered most desirable are (1) those having fixed residences, and personally known to the shipping-master or his deputies; and (2) men having regular employment in the coasting-trade, or in vessels the business of which brings them back to the same ports at frequent and known intervals. In 1864, about 16,000 men belonged to the Naval Reserve, and were in a state of great efficiency.

In 1861, the system of the Reserve was extended—by the Act 24 and 25 Vict. c. 129—to officers of the merchant-service, certificated masters and mates being respectively granted commissions in the Naval Reserve as lieutenants and sub-lieutenants. The

holders are required to train for 28 days annually on board Her Majesty's ships, and are liable to be called out for actual service when required. When training, or on actual service, lieutenants receive 10s., and sub-lieutenants 7s. a day, with all the privileges, pensions for wounds, pensions to widows, uniforms, &c., of naval officers of corresponding rank. The number of these officers allowed by regulation is 130 lieutenants, and 270 sub-lieutenants: of these, in 1864, commissions had been granted to 130 lieutenants and 90 sub-lieutenants. The total cost of the Naval Reserve, officers and men, for the year 1864—1865, is estimated at £204,430.

**NAVAN**, a market town of Meath County, Ireland, situated at the junction of the Boyne and Blackwater, 28 miles north-west of Dublin, with which city it is connected by the Dublin and Drogheda, and also by the Meath Railway. Pop. (1861) 3855, of whom 3679 were Catholics, 154 Protestants of the established church, and the rest Protestants of other denominations. N. is one of the most ancient boroughs of English foundation in Ireland, and previous to the Union, returned two members to the Irish parliament. It is a place of considerable inland trade, and possesses a flax-mill, several flour-mills, and two paper-mills, besides a tannery, a brewery, and two distilleries. There are also an endowed school, a Roman Catholic seminary (one of the first opened in Ireland after the repeal of the penal law), and three national schools, containing (1861) 944 pupils, of whom 309 were boys, and 635 girls. The girls' school is attached to the Roman Catholic convent.

**NAVARINO**, or Neo-Castro, a seaport and citadel on the south-west coast of the Morca in Greece, contains only 2000 inhabitants, but is of importance from its position, commanding the entrance of the Bay of Navarino, at the southern extremity of which it is situated. On the island of Sphagia or Sphaeria, which closes the bay's mouth, was formerly situated Pylus Messeniaca, the town of Nestor, in a spot where now stands Old Navarino or Paleocastron. The Bay of Navarino was the scene of a great sea-fight between the Athenians under Cleon, and the Spartans (425 B. C.), in which the latter were defeated; and on the 20th October 1827, it saw the annihilation of the Turkish and Egyptian navies by the combined British, French, and Russian fleets under Sir Edward Codrington.

**NAVARRÉ**, a province, and formerly a kingdom of Spain, is bounded on the N. by France, on the S. and E. by Aragon, and on the W. by the Biscays; and is situated in 42° 20'—43° 15' N. lat., and 0° 50'—2° 30' W. long. Area about 4000 square miles. Pop. 297,422 (in 1857). The country is mountainous, being bounded and traversed by the Pyrenees, spurs of which occupy almost the whole of the province in its northern and eastern parts. The highest peaks are Altovisear, Adi, Aleorrunz, and Ruña. N. is watered by the Bidassoa, the Anzo, and by the Ebro, together with its tributaries, the Ega and Aragon, on the level shores of which corn, wine, and oil of good quality are produced. Some of the valleys which intersect the mountain-ranges, as those of Roncesvalles, Lescon, Bastan, and Roncal, have a fruitful soil, and yield good crops; but in the mountain districts, husbandry is impracticable, and the inhabitants nearly all follow the chase, as much from necessity as inclination; and while a large number of the Navarrese are soldiers, a still larger proportion are smugglers—the proximity of the province to France, and the dangerous character of the almost inaccessible mountain

passes which alone connect the two countries, holding out many inducements and facilities in the way of smuggling. The mountain forests still harbour bears, wolves, wild-cats, goats, deer, and an abundance of game of every other kind. Iron and salt are the chief mineral products of the district, but these are obtained in sufficient quantities to be exported. The people of N. are a hardy, brave, and hospitable race, loyal to the sovereign, attentive observers of the forms of their religion, and, except in the matter of smuggling, honest and moral; but they are passionate and distrustful, prone to anger, and keen in avenging an insult, real or imaginary. Although not industrious, the people follow a few branches of industry, and manufacture glass, leather, soap, chocolate, &c., of good quality.

The Navarrese, with few exceptions, are members of the church of Rome, to whose tenets they cling with superstitious devotion. They have always intermarried chiefly among their own compatriots, and are a nearly pure Basque race. In the mountainous districts, Basque is still spoken, but in the plains, the modern Castilian form of Spanish is rapidly supplanting the ancient language of the country. The chief town is Pamplona (q. v.).

The territory known from an early period of Spanish history under the name of N., was occupied in ancient times by the Vascones, who were subdued by the Goths in the 5th century. After having become gradually amalgamated with their conquerors, the people continued to enjoy a species of turbulent independence under military leaders until the 8th c., when they were almost annihilated by the hordes of Arabs who were rapidly spreading their dominion to all parts of the peninsula. The Gothic Vascones of N., who had been converted to Christianity, offered a gallant resistance to their infidel invaders, and although repeatedly beaten, they were not wholly subdued. The remnant which escaped the sword of their Moslem enemies took refuge in the fastnesses of the mountains, and choosing a knight of their number, Garcia Ximenes, as their leader or king, they sallied forth, and by their gallant resistance, compelled the Arabs to leave them in the enjoyment of an independence greater than that of the neighbouring states. On the extinction of the race of Ximenes, in the middle of the 9th c., the Navarrese elected as their king Inigo Sanchez, Count of Bigorre, in whose family the succession remained till the marriage of Philip the Fair with Queen Joanna I. of N.: and the accession of the former to the throne of France in 1285, rendered N. an appanage of the crown of France. It continued a part of that kingdom during the successive reigns of Louis X., Philip V., and Charles the Fair; but on the death of this last in 1328, France fell to the family of Valois, and the daughter of Louis X., the rightful heir, succeeded to N. as Joanna II. The events of the kingdom present no features of interest during the next hundred years. The marriage of Blanche, daughter of Charles III. of N., with John II. of Aragon, in 1442, did not produce an annexation of N. to Aragon, as John suffered his wife to rule her own kingdom as she pleased, and even after her death and his subsequent re-marriage, he resigned the government entirely to his son by Blanche. This son, known as Charles, Prince of Viano, having attempted to remain neutral in his father's quarrels with Castile, John expelled him and his elder sister Blanche, who sided with him, from N., and conferred the kingdom on Leonora Countess de Foix, his younger daughter, by Blanche, whose misrule completed the disorganisation which these family quarrels had commenced. Her son, Francis, called Phœbus, from his beauty, succeeded in 1479, and his sister Catherine

in 1483. Ferdinand and Isabella sought to marry the young queen to their son and heir, the Prince of Asturias, but her mother, a French princess, married her to Jean d'Albret. Ferdinand, however, was not willing to let the prize escape him, and on some slight pretext he seized N. in 1512. After this act of spoliation, there remained nothing of ancient N. beyond a small territory on the northern side of the Pyrenees, which was subsequently united to the crown of France by Henri IV. of Bourbon, King of N., whose mother, Jeanne d'Albret, was granddaughter of Queen Catharine; and hence the history of N. ends with his accession to the French throne in 1589. The Navarrese were, however, permitted to retain many of their ancient municipal charters and constitutional privileges, after their incorporation with the other domains of the Spanish crown, and these prerogatives were not taken from them till the reign of the present queen, when the active aid which they had furnished to the Pretender, Don Carlos, drew upon them the ill-will of the government, and led, at the close of the Carlist war, to the abrogation of their *fueiros*, or national assemblies, and to the amalgamation of their nationality with that of the kingdom at large.

NAVE. See CHURCH.

NA'VEW (Fr. *Navette*), a garden vegetable, much cultivated in France and other parts of the continent of Europe, although little used in Britain. It is by some botanists regarded as a cultivated variety of *Brassica napus*, or Rape (q. v.), whilst others refer it to *B. campestris*, sometimes therefore called Wild N., the species which is also supposed to be the original of the Swedish Turnip (q. v.). The part used is the swollen root, as in the turnip, but it is rather like a carrot in shape. Its colour is white. Its flavour is much stronger than that of the turnip. It succeeds in any soil, but is of best quality in a dry light soil. The seed is sown in spring, and the plants thinned out to five inches apart.

NAVICULA (Lat. a little ship), a genus of *Diatomacea* (q. v.), receiving its name from the resemblance of its form to that of a boat. Some of the species are very common.

NAVICULAR DISEASE, in the Horse, consists in strain of the strong flexor tendon of the foot, at the point within the hollow of the fetlock, where it passes over the navicular bone. It is most common amongst the lighter sorts of horses, and especially where they have upright pasterns, out-turned toes, and early severe work on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, wasting of the muscles of the shoulder, and projecting or 'pointing' of the affected limb whilst standing. When early noticed, and in horses with well-formed legs, it is often curable; but when of several weeks' standing, it leads to so much inflammation and destruction of the tendon and adjoining parts, that soundness and fitness for fast work are again impossible. Rest should at once be given, the shoe removed, the toe shortened, and the foot placed in a large, soft, hot poultice, changed every few hours. Laxative medicine and bran mashes should be ordered, and a soft bed made with old short litter. After a few days, and when the heat and tenderness abate, cold applications should supersede the hot; and, after another week, a blister may be applied round the coronet, and the animal placed for two months in a good yard or in a grass field, if the ground be soft and moist; or, if sufficiently strong, at slow farm-work on soft land. Division of the nerve going to the foot removes sensation, and consequently lameness; and

hence is useful in relieving animals intended for breeding purposes or for slow work. The operation, however, is not to be recommended where fast work is required; for the animal, insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse.

NAVIES, ANCIENT AND MEDIEVAL. The ancient method of naval warfare consisted, in great part, in the driving of *beaked* vessels against each other; and therefore skill and celerity in manœuvring, so as to strike the enemy at the greatest disadvantage, were of the utmost importance. The victory thus usually remained with the best sailor. This mode of conflict has been attempted to be revived at the present time, and vessels called 'steam-rams' are specially constructed for this species of conflict. The earliest powers having efficient fleets appear to have been the Phœnicians, Carthaginians, Persians, and Greeks; the Greeks had fleets as early as the beginning of the 7th c. B. C.—the first sea-fight on record being that between the Corinthians and their colonists of Coreyra, 664 B. C. The earliest great battle in which tactics appear to have distinctly been opposed to superior force, and with success, was that of Salamis (480 B. C.), where Themistocles, taking advantage of the narrows, forced the Persian fleet of Xerxes to combat in such a manner, that their line of battle but little exceeded in length the line of the much inferior Athenian fleet. The Peloponnesian War, where 'Greek met Greek,' tended much to develop the art of naval warfare. But the destruction of the Athenian marine power in the Syracusan expedition of 414 B. C., left Carthage mistress of the Mediterranean. The Roman power, however, gradually asserted itself, and after two centuries, became omnipotent by the destruction of Carthage. For several following centuries, the only sea-fights were occasioned by the civil wars of the Romans. Towards the close of the empire, the system of fighting with pointed prows had been discontinued in favour of that which had always co-existed—viz., the running alongside, and boarding by armed men, with whom each vessel was overloaded. Onagers, balistæ, &c. were ultimately carried in the ships, and used as artillery; but they were little relied on, and it was usual, after a discharge of arrows and javelins, to come to close quarters. A sea-fight was therefore a hand-to-hand struggle on a floating base, in which the vanquished were almost certainly drowned or slain.

The northern invaders of the empire, and subsequently the Moors, seem to have introduced swift-sailing galleys, warring in small squadrons and singly, and ravaging all civilised coasts for plunder and slaves. This—the break-up of the empire—was the era of piracy, when every nation, which had more to win than lose by freebooting, sent out its cruisers. Foremost for daring and seamanship were the Norsemen, who penetrated in every direction from the Bosphorus to Newfoundland. Combination being the only security against these marauders, the medieval navies gradually sprang up; the most conspicuous being—in the Mediterranean, those of Venice, Genoa, Pisa, Aragon; on the Atlantic sea-board, England and France. In the Mediterranean, Venice, after a long struggle with the Genoese, and subsequently with the Turks, became the great naval power. The Aragonese fleet gradually developed into the Spanish navy, which, by the epoch of Columbus, had a rival in that of Portugal. Many struggles left, in the 16th and 17th centuries, the principal naval power in the hands of the English, French, Dutch, Spaniards, and Portuguese. The present state of these and other existing navies will be briefly given under NAVIES, MODERN.

NAVIES—NAVIGATION.

NAVIES, MODERN. Dating the modern navies of the world from the 16th c., we find the British navy rising from insignificance by the destruction of the Spanish Armada in 1588; a blow which Spain never recovered, and which the Dutch, whose naval force had acquired tremendous strength in their struggle for independence, increased the weight of, by their triumph in 1607, in the Bay of Gibraltar. At this time, there was no decisive superiority of the fleet of England over that of France; but each was inferior to the Dutch navy. The Commonwealth and reign of Charles II. were signalled by the struggle for mastery between the English and Dutch; when victory, after many alternations, finally sided with the former. Through the 18th c., the English and French were the principal fleets; but Louis XVI. gave a decided superiority to the navy of France; and at the period of the American War, the naval power of England was seriously threatened. Spain, Holland, and Russia (now for the first time a naval power) had meanwhile acquired considerable fleets; and the 'armed neutrality,' to which the northern powers gave their adherence, rendered the British position most critical. However, the slowly roused energy of her

government, the invincible courage of her seamen, and the genius of her admirals, brought Britain through all her trials. Camperdown broke the Dutch power; many battles weakened the French navy; and at Trafalgar, in 1805, it, with the Spanish power, was swept from the ocean. The United States had in the meantime augmented their fleet, and in the war of 1812—1814, maintained a glorious struggle; but their navy is distinguished rather for the power of its individual ships than for the number of vessels. The growth, in recent times, of the British navy will be found under NAVY, BRITISH. The Emperor Napoleon III. has greatly enlarged and improved the French navy, which is now not very inferior to that of England. During the American War of Secession, a vast fleet of gun-boats, 'monitors,' and iron-clad vessels of all classes, has been created; but the ships appear chiefly adapted for river and coast service.

The following table, shewing the principal naval statistics of the several countries, is compiled from the latest returns; but these returns are made in such varying forms, and are so incomplete in some cases, that comparison is difficult:

NAVIES OF THE WORLD, 1864.

| COUNTRY.                         | Armour-plated Vessels. |           | Effective Line of Battle Ships. |          | Effective Frigates. |          | Effective Smaller Vessels. |          | Total Guns. | Total Men. | Approximate Total Cost. |

NAVIGATION, HISTORY OF. In its widest sense, this subject is divisible into three sections—the history of the progressive improvement in the construction of ships, the history of the growth of naval powers, and the history of the gradual spread and increase of the science of navigation. Although these three sections are to some extent interwoven, the present article will be limited to a consideration of the last, the first two being sufficiently described under SHIP-BUILDING, and NAVIES.

The first use of ships, as distinguished from boats, appears to have been by the early Egyptians, who are believed to have reached the western coast of India, besides navigating the Mediterranean. Little, however, is known of their prowess on the waves; and, whatever it may have been, they were soon eclipsed by the citizens of Tyre, who, to make amends for the unproductiveness of their strip of territory, laid the seas under tribute, and made their city the great emporium of Eastern and European trade. They spread their merchant fleets throughout the Mediterranean, navigated Solomon's squadrons

to the Persian Gulf and Indian Ocean, and planted colonies everywhere. Principal among these colonies was Carthage, which soon outshone the parent state in its maritime daring. The Carthaginian fleets passed the Pillars of Hercules, and, with no better guide than the stars, are believed to have spread northward to the British Isles, and southward for some distance along the west coast of Africa. From the 6th to the 4th centuries B.C., the Greek states gradually developed the art of navigation, and at the time of the Peloponnesian war, the Athenians appear to have been skilful tacticians, capable of concerted manœuvres. The Greeks, however, were rather warlike than commercial in their nautical affairs. In the 4th c. B.C., Alexander destroyed the Tyrian power, transferring its commerce to Alexandria, which, having an admirable harbour, became the centre of trade for the ancient world, and far surpassed in the magnitude of its marine transactions any city which had yet existed. Rome next wrested from Carthage its naval power, and took its vast trade into the hands of the Italian

sailors. After the battle of Actium, Egypt became a Roman province, and Augustus was master of the enormous commerce both of the Roman and the Alexandrian merchants. During all this period, the size of the vessels had been continually increasing, but probably the form was that of the galley, still common in the Mediterranean, though a more clumsy craft than now. Sails were known, and some knowledge was evinced even of beating up against a foul wind; but oars were the great motive-power; speed was not thought of, a voyage from the Levant to Italy being the work of a season; and so little confidence had the sailors in their skill or in the stability of their ships (still steered by two oars projecting from the stern), that it was customary to haul the vessels up on shore when winter set in. During the empire, no great progress seems to have been made, except in the size of the vessels; but regular fleets were maintained, both in the Mediterranean and on the coast of Gaul, for the protection of commerce. Meanwhile the barbarian nations of the north were advancing in quite a different school. The Saxon, Jutish, and Norse prows began to roam the ocean in every direction; in small vessels, they trusted more to the winds than to oars, and, sailing singly, gradually acquired that hardihood and daring which ultimately rendered them masters of the sea. The Britons were no mean seamen, and when Carausius assumed the purple in their island, he was able, for several years, by his fleets alone to maintain his independence against all the power of Rome.

The art of navigation became almost extinct in the Mediterranean with the fall of the empire; but the barbarous conquerors soon perceived its value, and revived its practice with the addition of new inventions suggested by their own energy. The islanders of Venice, the Genoese, and the Pisans, were the carriers of that great inland sea. Their merchants traded to the furthest Indies, and their markets became the exchanges for the produce of the world. Vast fleets of merchant galleys from these flourishing republics dared the storm, while their constant rivalries gave occasion for the growth of naval tactics. So rich a commerce tempted piracy, and the Moorish corsairs penetrated everywhere on both sides of the straits of Gibraltar in quest of prey; evincing not less skill and nautical audacity than savage fury and inhuman cruelty. But the Atlantic powers, taught in stormy seas, were rearing a naval might that should outrival all other pretenders. The Norsemen extended their voyages to Iceland, Greenland, and Newfoundland, while they first ravaged and then colonised the coasts of Britain, France, and Sicily. The sea had no terrors for these hardy rovers; their exploits are imperishably recorded in the Icelandic Sagas, and in the numerous islands and promontories to which they have given names.

Early in the 15th c., the introduction of the mariner's compass rendered the seaman independent of sun and stars—an incalculable gain, as was soon shewn in the ocean-voyages of Columbus, Cabot, and others. In 1492, Columbus rendered navigation more secure by the discovery of the variation of the compass. Between that and 1514, the 'cross-staff' began to be used; a rude instrument for ascertaining the angle between the moon and a fixed star, with the consequent longitude. Early in the 16th c., tables of declination and ascension became common. In 1537, Nuñez (Nomiüs), a Portuguese, invented various methods of computing the rhumb-lines and sailing on the great circle. In 1545, the two first treatises on systematic navigation appeared in Spain, one by Pedro de Medina, the other by Martin Cortes. These works were speedily trans-

lated into French, Dutch, English, &c., and for many years served as the text-books of practical navigation. Towards the end of the century, Bourne in England, and Stevin in Holland, improved the astronomical portion of the art, while the introduction of time-pieces and the Log (q. v.) rendered the computation of distance more easy.

It would be tedious to enumerate the successive improvements by which the science of navigation has been brought to its present high perfection; but as conspicuous points in the history of the art, the following stand out: The invention of Mercator's chart in 1569; the formation by Wright of tables of meridional parts, 1597; Davis's quadrant, about 1600; the application of logarithms to nautical calculations, 1620, by Edmund Gunter; the introduction of middle-latitude sailing in 1623; the measure of a degree on the meridian, by Richard Norwood, in 1631. Hadley's quadrant, a century later, rendered observations easier and more accurate; while Harrison's chronometers (1764), rendered the computation of longitude a matter of comparatively small difficulty. Wright, Bond, and Norwood were the authors of scientific navigation, and their science is now made available in practice by means of the *Nautical Almanac*, published annually by the British Admiralty. The more important points of the science of navigation are noticed under such heads as DEAD-RECKONING, LATITUDE AND LONGITUDE, GREAT-CIRCLE SAILING, SAILINGS, &c.

NAVIGATION, LAWS AS TO. By the law of nature and of nations, the navigation of the open sea is free to all the world. The open sea means all the main seas, and oceans beyond three miles from land. The sea within three miles from land is called the territorial sea, and each state has a kind of property in such sea, and has a right to regulate the use thereof. Hence, it was natural that in early times, before the laws of commerce were properly understood, each state should endeavour to exclude foreigners from that part of the sea so as to secure to its own subjects the benefits of the carriage of goods in ships, which has always been an increasing source of wealth. In England, however, as in most countries, the first care seems to have been bestowed on the navy, as the great means of defending the realm against enemies, and trading-ships came to be first subject to statutory regulation only as being in some way ancillary to the interests of the navy. The laws of Oleron were the first code of maritime laws which obtained notice as well as general acceptance in Europe, in the time of Edward I., and the authorship of those laws is claimed by Selden and Blackstone for Edward I., though the point is disputed by the French writers. By a statute of Richard II., in order to augment the navy of England, it was ordained that none of the lieges should ship any merchandise out of the realm except in native ships, though the statute was soon varied and seldom followed. At length, in 1650, an act was passed with a view to stop the gainful trade of the Dutch. It prohibited all ships of foreign nations from trading with any English plantation without a licence from the Council of State. In 1651, the prohibition was extended to the mother-country, and no goods were suffered to be imported into England or any of its dependencies in any other than English bottoms, or in the ships of that European nation of which the merchandise was the genuine growth or manufacture. At the Restoration, these enactments were repeated and continued by the Navigation Act (12 Char. II. c. 18), with the further addition, that the master and three-fourths of the mariners should also be British subjects. The object of this act was to encourage British shipping, and was long believed to be wise and

salutary. Adam Smith, however, had the sagacity to see that the act was not favourable to foreign commerce or to opulence, and it was only on the ground that defence was more important than opulence, that he said it was 'perhaps the wisest of all the commercial regulations of England.' In 1826, the statute 4 Geo. IV. c. 41 repealed the Navigation Act, and established a new system of regulations, which were further varied by subsequent statutes, till, under the influence of the free-trade doctrines, new statutes were passed, which reversed the ancient policy. By the law, as now altered, foreign vessels are allowed free commercial intercourse and equality with the ships of this country and its dependencies, except as regards the coasting-trade of the British possessions in Asia, Africa, and America, for the coasting-trade of the United Kingdom is now entirely thrown open to all comers. The advantages of equality and free trade are, however, so far qualified, that in the case of the ships of those nations which do not concede to British ships like privileges, prohibitions and restrictions may be imposed by order in council.

As regards those laws of navigation which affect the property and management of ships, a complete code of regulations is contained in the Merchant Shipping Acts, which are 17 and 18 Vict. c. 104, 18 and 19 Vict. c. 91, 25 and 26 Vict. c. 63. It will be necessary only to indicate the leading divisions of this subject. 1. As to ownership, registration, and transfer of merchant-ships. No ship is deemed a British ship unless she belong wholly to natural-born subjects, denizens, naturalised persons, or bodies corporate, having a place of business in the United Kingdom or some British possession. Every British ship, with a few exceptions as to old ships and small vessels, must be registered, otherwise, it is not entitled to the protection of the British flag. The Commissioners of Customs indicate at what port in the United Kingdom ships may be registered by their officers, and when registered, the ship is held to belong to that port. The name of the ship and its owners must be stated; and as regards joint-ownership, a ship is capable only of being subdivided into sixty-four shares, and not more than thirty-two owners shall own one ship. These registered owners are deemed the legal owners, and so long as the register is unchanged, the ship is held still to belong to them. The only way of transferring the property is by a bill of sale under seal; or if a mortgage is made, it must be made in a particular form, and duly registered, and the priority of title as between several mortgagees is regulated by the date of the entry in the register. 2. As regards the laws concerning merchant seamen, there is established in every such seaport a superintendent, whose business it is to afford facilities for engaging seamen, by keeping registers of seamen and superintending the making and discharging of contracts. No person is allowed to be employed in a foreign-going ship as master, or as first, or second, or only mate, or in a home-trade passenger-ship as master, or first or only mate, unless he has a certificate of competency or a certificate of service, issued by the Board of Trade only to those who are deemed entitled thereto. The master of every ship above 80 tons burden shall enter into an agreement, of a certain form, with every seaman he carries from the United Kingdom, and in which the names of the seamen, wages, provisions, capacity of service, &c., are set forth. The seamen are not to lose their wages though no freight is earned, or the ship lost. The men are also to have a berth of a certain size, and the ship to be supplied with medicines, log-book, &c. In order to secure general information, every master of a foreign-going ship is bound, within 48 hours after

arriving at the final port of destination in the United Kingdom, to give in a list with full particulars to the local superintendent of the Mercantile Marine Office. 3. As regards the liability of ship-owners for loss or damage, it is provided by statute, that no owner of a sea-going ship shall be liable to make good any loss or damage occurring without his actual fault or privity, to goods or things on board, by reason of fire on board the ship; or to any gold, silver, diamonds, watches, jewels, or precious stones on board, by reason of robbery or embezzlement, unless the true nature and value of such articles have been inserted in the bill of lading. And in cases where loss to goods occurs without his actual fault or privity, the owner shall not be liable in damages to an aggregate amount exceeding £8 per ton of the ship's tonnage. In case of loss of life or personal injury caused by mismanagement of the ship, but without the actual fault or privity of the owners, they shall not be liable beyond £15 per ton. In case of accidents, whereby a large number of persons have been killed or injured, and to prevent a multiplicity of actions, the sheriff of the county is to empanel a jury, and inquire into the question of liability. If the owners are found liable, then £30 is to be assessed as the damages for each case of death or personal injury. In case of death, such sum is to be paid to the husband, wife, parent, or child of the deceased. If any person consider this is not sufficient damages, then, on returning such sum, he may commence an action; but unless he recover double that sum, he must pay the costs. See also PILOTS and LIGHT-HOUSES.

NAVIGATORS' or SAMO'AN ISLANDS, a group of nine islands, with some islets, in the Pacific Ocean, lying north of the Friendly Islands, in lat. 13° 30'—14° 30' S. and long. 168°—173° W. The four principal islands of the group are Mauna, Tutuila, Upolu, and Savaii. Of these, Savaii, 40 miles in length by 20 miles broad, and having a population of 20,000, is the largest. Area of the group estimated at 2650 square miles; population about 56,000. With the exception of one (Rose Island), the N. I. are all of volcanic origin. For the most part they are lofty, and broken and rugged in appearance, rising in some cases to upwards of 2500 feet in height, and covered with the richest vegetation. The soil, formed chiefly by the decomposition of volcanic rock, is rich, and the climate is moist. The forests, which include the bread-fruit, the cocoa-nut, banana and palm trees, are remarkably thick. The orange, lemon, tacea (from which a kind of sago is made), coffee, sweet potatoes, pine-apples, yams, nutmeg, wild sugar-cane, and many other important plants, grow luxuriantly. Until recently, when swine, horned cattle, and horses were introduced, there were no traces among these islands of any native mammalia except a species of bat. The natives are well formed (especially the males), ingenious, and affectionate. The women, who superintend the indoor work and manufacture mats, are held in high respect. There are English and American mission stations on the islands, as well as several Roman Catholic establishments, and many of the natives have embraced Christianity. The government is that of the hereditary chiefs; the supreme power resting in the hands of a certain body of chiefs, called the Molo, or 'conquering party.' Trade is carried on with Sydney.

NAVY, BRITISH. Owing to the insular position of Great Britain, her navy has long been considered a matter of vital importance, and is the service in which every inhabitant takes a peculiar pride. In

considering the history of the British navy, it is convenient to divide the subject into *matériel* and *personnel*. The latter had no distinct organisation till the time of Henry VIII.; but of the former, we recognise in the earliest times the germ of subsequent glories. Carausius, a Roman general who had thrown off his dependence on the empire, maintained himself in England for several years by his fleet, with which he prevented the imperial forces from reaching the island. The Saxons brought maritime prowess with them to the British shores, but appear soon to have lost it amid the rich provinces in which they settled. Some organisation for the defence of the coast was, however, maintained, and Alfred the Great availed himself of it to repulse the Danes; he at the same time raised the efficiency of his navy by increasing the size of his galleys, some being built which were capable of being rowed by thirty pair of oars. Under his successors, the number of vessels increased, and both Edward and Athelstan fought many naval battles with the Danes. Edgar aspired to be lord of all the northern seas, and had from three to five thousand galleys, divided into three fleets on the western, southern, and eastern coasts respectively; but the size of most of these ships was very insignificant, and the greater part were probably mere row-boats. Ethelred II. formed a sort of naval militia, enacting that every owner of 310 hydes of land should build and furnish one vessel for the service of his country.

William the Conqueror established the Cinque Ports, with important privileges, in return for which they were bound to have at the service of the crown for 15 days in any emergency, 52 ships carrying 24 men each. Richard I. took 100 large ships and 50 galleys to Palestine. John claimed the sovereignty of the seas, and required all foreigners to strike to the English flag; a pretension which has been the cause of some bloody battles, but which England proudly upheld in all dangers. (This honour was formally yielded by the Dutch in 1673, and the French in 1704; and, although not now exacted in its fulness, the remembrance of the right survives in requiring foreign vessels to salute *first*.) In the same king's reign, a great naval engagement with the French took place (1293) in mid-channel, when 250 French vessels were captured. The Edwards and the Henries maintained the glory of the British flag;

had 'grete shippes, carrakes, barges, and ballyngers; and at one time collected vessels enough to transport 25,000 men into Normandy. Henry VII. was the first monarch who maintained a fleet during peace; he built the *Great Harry*, which was the earliest war-vessel of any size, and which was burned at Woolwich in 1553.

To Henry VIII., however, belongs the honour of having laid the foundation of the British navy as a distinct service. Besides building several large vessels, of which the *Henry Grace de Dieu*, of 72 guns, 700 men, and probably about 1000 tons, was the most considerable, he constituted a permanent personnel, defining the pay of admirals, vice-admirals, captains, and seamen. He also established royal dockyards at Deptford, Woolwich, and Portsmouth; and for the government of the whole service, instituted an Admiralty and Navy Board, the latter being the forerunner of the present Trinity Board. When this king died, he left 50 ships of various sizes, manned by about 8000 hands.

Under Edward VI., the navy fell off, but was sufficiently important in the succeeding reign for the English admiral to exact the salute to his flag from Philip II. with a larger Spanish fleet, when the latter was on his way to espouse Queen Mary. Elizabeth had the struggle with the Spanish Armada to try her navy, and left 42 ships, of 17,000 tons in all, and 8346 men—15 of her ships being upwards of 600 tons. From this period the tonnage of the ships steadily increased. Under James I. and Charles I., Mr Phineas Pett, M.A., the first scientific naval architect, remodelled the navy, abolishing the lofty forecables and poops, which had made earlier ships resemble Chinese junks. In 1610, he laid down the *Prince-Royal*, a two-decker, carrying 64 large guns; and in 1637, from Woolwich, he launched the celebrated *Sovereign of the Seas*, the first three-decker, and certainly the largest ship hitherto constructed on modern principles. She was 232 feet in length, of 1637 tons, and carried at first 130 pieces of cannon; but being found unwieldy, was cut down, and then proved an excellent ship. She was burned in 1696.

Prince Rupert's devotion to the crown was had for the navy, for he carried off 25 large ships; and Cromwell, on acceding to power, had but 14 two-deckers. His energy, however, soon wrought a change, and in five years he had 150 ships, of which a third were of the line; his crews amounted to 20,000 men. During the Protectorate, Peter Pett, son of Phineas, built the *Constant Warwick*, the earliest British frigate, from a French design and pattern. Cromwell first laid navy estimates before parliament, and obtained £400,000 a year for the service. The Duke of York, afterwards James II., assisted by the indefatigable Mr Samuel Pepys, did much for the navy, establishing the system of Admiralty government much on its present footing. In his time, Sir Anthony Deane improved the model of ships of war, again after a French design. James left, in 1688, 108 ships of the line, and 65 other vessels; the total tonnage of the navy, 101,892 tons; the armament, 6930 guns; and the personnel, 42,000 men. William III. sedulously augmented the force, foreseeing its importance to his adopted country. When he died, there were 272 ships of 159,020 tons, and the annual charge for the navy had risen to £1,056,915. George II. paid much attention to his fleets, and greatly augmented the size of the ships; he left, in 1760, 412 ships of 321,104 tons. By 1782, the navy had risen to 617 sail of 500,000 tons; and by 1802, to 700 sail, of which 148 were of the line. In 1813, there were 1000 ships (256 of the line), measuring about 900,000 tons, and carrying 146,000 seamen and

The Great Harry.

Edward III., in person, with the Black Prince, at the battle of Sluis, in 1340, defeated a greatly superior French fleet, with 40,000 men on board. Henry V.

marines, at an annual charge of about £18,000,000. Since the peace in 1815, the number of vessels has been greatly diminished, although their power has vastly increased.

The progressive augmentation of size in vessels may be judged from the increase in first-rates. In 1677, the largest vessel was from 1500 to 1600 tons; by 1720, 1800 had been reached; by 1745, 2000 tons; 1780, 2200 tons; 1795, 2350 tons; 1800, 2500 tons; 1808, 2616 tons; 1853, 4000 tons. From 1811, a gradual substitution of steam for sailing vessels began, which was not completed, however, till 1859. Since 1860, another reconstruction is in

The Warrior Iron-clad Screw Steam War-ship.

course of taking effect, iron-sided or armour-plated frigates, impervious to ordinary shot, being substituted for timber-vessels. At the same time, three and two deckers are ceasing to be employed, enormous frigates replacing them of a tonnage far exceeding the largest three-deckers of former times; they mount fewer guns, but those they carry are of stupendous calibre, and of rifled bore. The *Northumberland*, one of the largest frigates of this new class, is of 6621 tons, 1350 horse-power, and 38 large guns.

On the 1st of February 1864, the effective vessels of the navy were as follows: 16 armour-plated frigates (6 building); 2 turret or cupola vessels (both building); 3 armour-plated corvettes

The Duke of Wellington Line of Battle Screw Steam-ship, 131 guns.

(1 building), and 4 sloops (3 building); floating-batteries, 7; 70 ships of the line (3 building, and 2 without steam); 67 frigates (4 building, and 12

without steam); 28 corvettes (2 building); 70 sloops (3 building, and 6 without steam); 69 smaller steamers (1 building); 270 gun and mortar vessels (11 building, and 65 without steam); with 16 transports and 6 yachts, giving a total of 628 vessels. In 1863, 155 vessels were at sea, 97 on harbour and home service; 75 were employed in the coast-guard, or as tenders and cruisers. The personnel of the navy amounts, for 1864, to 71,950 men, including 18,000 marines, but excluding artificers and labourers in dockyards; the armament being about 9500 guns, mostly of heavy calibre. The annual charge for the year 1864—1865 is estimated at £10,432,610, which may be thus broadly subdivided:

|  |            |
|--|------------|
| Wages, Victuals, and Clothing of Officers and Men, | £4,178,765 |
| Admiralty Office,                                  | 168,605    |
| Coast-guard, Coast Volunteers, and Naval Reserve,  | 300,718    |
| Scientific Branch (Surveying, Hydrography, &c.),   | 71,276     |
| Dockyards and Victualling Yards,                   | 1,574,761  |
| Stores for Building and Repairing Ships,           | 1,826,312  |
| Miscellaneous Services,                            | 615,968    |
| Half-pay and Pensions,                             | 1,331,974  |
| Conveyance of Troops,                              | 314,230    |

£10,432,610

Information on the various points of detail connected with the navy, will be found under the respective heads, as ADMIRAL, CAPTAIN, HALF-PAY, SHIP-BUILDING, SIGNALS, &c.

NA'XOS, the largest, most beautiful, and most fertile of the Cyclades, is situated in the Ægean, midway between the coasts of Greece and Asia Minor. Extreme length, about 20 miles; breadth, 15 miles. Pop. about 20,000. The shores are steep, and the island is traversed by a ridge of mountains, which rise in the highest summit, Dia, upwards of 3000 feet. The plains and valleys are well watered; the principal products and articles of export are wine, corn, oil, cotton, fruits, and emery. The wine of N. (the best variety of which is still called in the islands of the Ægean, *Bacchus-wine*) was famous in ancient as it is in modern times, and on this account the island was celebrated in the legends of Dionysius, and especially in those relating to Ariadne. Among its antiquities are a curious Hellenic tower, and an unfinished colossal figure, 34 feet long, still lying in an ancient marble quarry in the north of the island, and always called by the natives a figure of Apollo. It was ravaged by the Persians, 490 B.C., and after the conquest of Constantinople by the Latins, became the seat of a dukedom, founded by the Venetians. It now forms a portion of the kingdom of Greece (q. v.). Naxos, the capital, with a population of about 5000, is situated on the north-west coast, contains 16 Greek, and 4 Catholic churches, and 3 convents, and is the seat of a Greek and a Latin bishop. Its citadel was built by the Venetian duke, Marco Sanudo.

NAZARENE (Gr. *Nazarenos* and *Nazaraïos*, an 'inhabitant of Nazareth') was used by the Jews as one of the designations of our Lord, and afterwards became a common appellation of the early Christians in Judea. Although, originally, it is but a local appellation, there can be no doubt that as Nazareth was but a second-rate city of the despised province of Galilee, it was eventually applied to our Lord and his followers as a name of contempt (John xviii. 5, 7; Acts xxiv. 5).

NAZARETH, a small town or village of Palestine, anciently in the district of Galilee, and in the territory of the tribe of Zebulon, 21 miles south-east of Acre. It lies in a hilly tract of country, and is built partly on the sides of some rocky ridges, partly in some of the ravines by which they are seamed. It is celebrated as the scene of the Annunciation, and the place where the Saviour

spent the greater part of his life in obscure labour. Pop., according to Dr Robinson, 3120, of whom 1040 are Greeks, 520 Greek Catholics, 480 Latins, 400 Maronites, and 680 Mohammedans. Porter thinks 4000 a moderate estimate. In the earliest ages of Christianity, N. was quite overlooked by the church. It did not contain a single Christian resident before the time of Constantine, and the first Christian pilgrimage to it took place in the 6th century. The principal building is the Latin convent, reared, according to pious tradition, on the spot where the angel announced to the Virgin the birth of her Saviour-son; but the Greeks have also erected, in another part of N., a church on the scene of the Annunciation. Besides these rival edifices, the traveller is shewn a Latin chapel, affirmed to be built over the 'workshop of Joseph;' also the chapel of 'the Table of Christ' (*Mensa Christi*), a vaulted chamber, containing the veritable table at which our Lord and his disciples used to eat; the synagogue, out of which he was thrust by his townsmen; and 'the Mount of Precipitation,' down which he narrowly escaped being cast headlong. The women of the village have been long famous for their beauty.

NAZARITES (from Heb. *nazar*, to separate) denoted among the Jews those persons, male or female, who had consecrated themselves to God by certain acts of abstinence, which marked them off, or 'separated' them, from the rest of the community. In particular, they were prohibited from using wine or strong drink of any kind, grapes, whether moist or dry, or from shaving their heads. The law in regard to N. is laid down in the Book of Numbers (vi. 1—21). The only examples of the class recorded in Scripture are Samson, Samuel, and John the Baptist, who were devoted from birth to that condition, though the law appears to contemplate temporary and voluntary, rather than perpetual Nazaritiship.

NEAGH, LOUGH, the largest lake of the British Islands, is situated in the province of Ulster, Ireland, and is surrounded by the counties of Armagh, Tyrone, Londonderry, Antrim, and Down. It is 18 miles (English) in length, and 11 miles in breadth, contains 98,255 acres, is 120 feet in greatest depth, and is 48 feet above sea-level at low water. It receives the waters of numerous streams, of which the principal are the Upper Bann, the Blackwater, the Moyola, and the Main; and its surplus waters are carried off northward to the North Channel by the Lower Bann. Communication by means of canals subsists between the Lough and Belfast, Newry, and the Tyrone coal-field. In some portions of the Lough, the waters shew remarkable petrifying qualities, and petrified wood found in its waters is manufactured into hones. The southern shores of the Lough are low and marshy, and dreary in appearance. It is well stocked with fish, and its shores are frequented by the swan, heron, bittern, teal, and other water-fowl.

NEAL, DANIEL, a dissenting minister and author, was born in Loudon, December 14, 1678. He was educated first at Merchant Taylors' School, and afterwards at Utrecht and Leyden, in Holland, and in 1706 succeeded Dr Singleton as pastor of a congregation in his native city. N.'s first work was a *History of New England* (1720), which met with a very favourable reception in America. Two years afterwards, he published a tract, entitled *A Narrative of the Method and Success of Inoculating the Small-pox in New England by Mr Benjamin Colman*, which excited considerable attention; but the production on which his reputation rests is his *History of the Puritans* (4 vols. 1732—1738), a work

of great labour, and invaluable as a collection of facts and characteristics both to churchmen and dissenters, though, of course, written in the interest of the latter. It involved its author in several controversies, which failing health rendered it impossible for him to prosecute. N. died at Bath, April 4, 1743.

NEAL, JOHN, an American author and poet, of Scottish descent, was born at Falmouth, now Portland, Maine, August 25, 1793. His parents belonged to the Society of Friends, of which he was a member until disowned, at the age of 25, because he failed to live up to the rule of 'living peaceably with all men.' With the scanty education of a New-England common school, he became a shop-boy at the age of 12; but learned and then taught penmanship and drawing. At the age of 21, he entered a haberdashery trade, first in Boston, and then in New York; and a year after, became a wholesale jobber in this business at Baltimore, in partnership with another American literary and pulpit celebrity, John Pierpont. They failed in 1816, and N. turned his attention to the study of law. With the energy which acquired for him the sobriquet of 'Jehu O'Cataraet,' affixed to his poem, *The Battle of Niagara*, he went through the usual seven years' law-course in one, besides studying several languages, and writing for a subsistence. In 1817, he published *Keep Cool*, a novel; the next year, a volume of poems; in 1819, *Otho*, a five-act tragedy; and in 1823, four novels—*Seventy-six*, *Lojan*, *Randolph*, and *Errata*. These impetuous works were each written in from twenty-seven to thirty-nine days. In 1824, he came to England, where he became a contributor to *Blackwood's* and other magazines and reviews, and enjoyed the friendship and hospitality of Jeremy Bentham. On his return to America, he settled in his native town, practised law, wrote, edited newspapers, gave lectures, and occupied his leisure hours in teaching boxing, fencing, and gymnastics. Among his numerous works are *Brother Jonathan*, *Rachel Dyer*, *Bentham's Morals and Legislation*, *Authorship*, *Down-easters*, &c. After a long silence, devoted to professional business, he published, in 1854, *One Word More*; and in 1859, *True Womanhood*. The latter work, though a novel, embodies the more serious religious convictions of his later years. He is said to be now engaged upon an autobiography, and a revision of his voluminous writings, which, with glaring faults of haste and inexperience, are full of genius, fire, and nationality.

NEANDER, JOHANN AUGUST WILHELM, by far the greatest of ecclesiastical historians, was born at Göttingen, 16th January 1789, of Jewish parentage. His name prior to baptism was David Mendel. By the mother's side, he was related to the eminent philosopher and philanthropist Mendelssohn (q. v.). He received his early education at the Johanneum in Hamburg, and had for companions, Varnhagen von Ense, Chamisso the poet, Wilhelm Neumaun, Noodt, and Sieveking. Already the abstract, lofty, and pure genius of N. was beginning to shew itself. Plato and Plutarch were his favourite classics as a boy; and he was profoundly stirred by Schleiermacher's famous *Discourses on Religion* (1799). Finally, in 1806, he publicly renounced Judaism, and was baptized, adopting, in allusion to the religious change which he had experienced, the name of N. (Gr. *neos*, new; *aner*, a man), and taking his Christian names from several of his friends. His sisters and brothers, and later his mother also, followed his example. He now proceeded to Halle, where he studied theology with wonderful ardour and success under Schleiermacher,

and concluded his academic course at his native town of Göttingen, where Planck was then in the zenith of his reputation as a church historian. In 1811, he took up his residence at Heidelberg University as a privat-docent; in 1812, he was appointed there extraordinary professor of theology; and in the following year, was called to the newly established university of Berlin as Professor of Church History. Here he laboured till his death, July 14, 1850. N. enjoyed immense celebrity as a lecturer. Students flocked to him not only from all parts of Germany, but from the most distant Protestant countries. Many Roman Catholics, even, were among his auditors, and it is said that there is hardly a great preacher in Germany who is not more or less penetrated with his ideas. His character, religiously considered, is of so noble a Christian type that it calls for special notice. Ardently and profoundly devotional, sympathetic, glad-hearted, profusely benevolent, and without a shadow of selfishness resting on his soul, he inspired universal reverence, and was himself, by the mild and attractive sanctity of his life, a more powerful argument on behalf of Christianity than even his writings themselves. Perhaps no professor was ever so much loved by his students as Neander. He used to give the poorer ones tickets to his lectures, and to supply them with clothes and money. The greater portion of what he made by his books, he bestowed upon missionary, Bible, and other societies, and upon hospitals. As a Christian scholar and thinker, he ranks among the first names in modern times, and is believed to have contributed more than any other single individual to the overthrow, on the one side, of that anti-historical Rationalism, and on the other of that dead Lutheran formalism, from both of which the religious life of Germany had so long suffered. To the delineation of the development of historical Christianity, he brings one of the broadest, one of the most sagacious (in regard to religious matters), one of the most impartial yet generous and sympathetic intellects. His conception of church history as the record and portraiture of all forms of Christian thought and life, and the skill with which, by means of his sympathy with all of these, and his extraordinary erudition, he elicits, in his *Kirchen-geschichte*, the varied phenomena of a strictly Christian nature, have placed him far above any of his predecessors. N.'s works, in the order of time, are: *Ueber den Kaiser Julianus und sein Zeitalter* (Leip. 1812); *Der Heil. Bernhard und sein Zeitalter* (Berl. 1813); *Genetische Entwicklung der vornehmsten Gnostischen Systeme* (Berl. 1818); *Der Heil. Chrysostomus und die Kirche, besonders des Orients, in dessen Zeitalter* (2 vols. Berl. 1821—1822; 3d ed. 1849); *Denkwürdigkeiten aus der Geschichte des Christenthums und des Christlichen Lebens* (3 vols. Berl. 1822; 3d ed. 1845—1846); *Antignosticus, Geist des Tertullianus und Einleitung in dessen Schriften* (Berl. 1826); *Allgemeine Geschichte der Christlichen Religion und Kirche* (6 vols. Hamb. 1825—1852); *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel* (2 vols. Hamb. 1832—1833; 4th ed. 1847); *Das Leben Jesu Christi in seinem geschichtlichen Zusammenhange*, written as a reply to Strauss's work (Hamb. 1837; 5th ed. 1853); *Wissenschaftlichen Abhandlungen*, published by Jacobi (Berl. 1851); *Geschichte der Christlichen Dogmen*, also published by Jacobi (1856). The majority of these works, including the most important, have been translated into English, and form more than a dozen volumes of Bohn's 'Standard Library.'

NEAP-TIDES. See TIDES.

NEAR'CHUS, the commander of the fleet of Alexander the Great in his Indian expedition,

327—326 B. C., was the son of one Androtimus, and was born in Crete, but settled in Amphipolis. In 329 B. C., he joined Alexander in Bactria with a body of Greek mercenaries, and when the latter ordered a fleet to be built on the Hydaspes, N. received the command of it. He conducted it from the mouth of the Indus to the Persian Gulf, in spite of great obstacles, resulting partly from the weather and partly from the mutinous disposition of his crews. N. left the Indus on the 21st of September 325, and arrived at Susa, in Persia, in February 324, shortly after Alexander himself, who had marched overland. Fragments of his own narrative of his voyage have been preserved in the *Indica* of Arrian.—See Dr Vincent's *Commerce and Navigation of the Ancients in the Indian Seas* (vol. i. pp. 68—77, Lond. 1807), and Geier's *Alexandri Magni Historiarum Scriptores* (pp. 108—150).

NEATH, a parliamentary and municipal borough and river-port of the county of Glamorgan, South Wales, on a navigable river of the same name, seven miles north-east of Swansea. It is built on the site of the Roman station *Nidum*, and it contains the remains of an ancient castle, burned in 1231. In the immediate vicinity are the imposing ruins of Neath Abbey, described by Leland as 'the fairest abbey in all Wales,' but now sadly decayed and begrimed by the smoke and coal-dust of the public works of the district. There are at N. several extensive copper and tin works. Copper, spelter, iron and tin plates, and fine bricks are extensively exported, stones are quarried, and coal and culm are raised. The trade of the port has largely increased within late years. Pop. (1861) 6810.

NEB-NEB, or NIB-NIB, the dried pods of *Acacia Nilotica*, one of the species of *Acacia* (q. v.) which yield gum-arabic, and a native of Africa. These pods are much used in Egypt for tanning, and have been imported into Britain. They are two or three inches long.

NEBRA'SKA, a territory belonging to the United States of America, lying in lat. 40°—43° N., and long. 95°—110° W.; bounded N. by the territory of Dakota, from which it is partly separated by the Missouri River and its branch, the Niobrara; E. by Iowa and Missouri, from which it is separated by the Missouri River; S. by the state of Kansas, and the territories of Colorado and Utah; and W. by Utah and Washington territories; being about 540 miles from east to west, and from 130 to 200 from north to south, having an area estimated (*American Almanac*, 1863) at 100,000 square miles. The chief towns are Omaha City, the capital, and Nebraska City, both on the Missouri River, and each having about 2000 of a population. N. is a vast plain rising gradually toward the Rocky Mountains, with immense prairies, the haunts of vast herds of buffalo, and with fertile and well-timbered river-bottoms. The chief rivers are the Missouri in its eastern, and the Niobrara on the northern boundary, the Platte or Nebraska, and the Republican Fork of the Kansas, and their branches. The Platte Valley, running through the whole centre of the territory, is broad and fertile. There are quarries of sandstone, a soft limestone which hardens on exposure, and thin beds of coal. In the mountainous western region are mines of gold, silver, copper, and cinnabar. Between the fertile lands of the eastern and central portion and the mountains is a great desert valley of 30 by 90 miles, 300 feet deep, full of rocky pinnacles, and rich in fossil remains. The climate is dry and salubrious, with an abundance of clear sunny days. The country produces wheat, maize, hemp, tobacco, and fruits in abundance, while the rolling

prairies afford unequalled pasturage. The Omahas, Pawnees, Otoes, Sioux, and other wild tribes hunt over the unoccupied territories, but the immigration is progressing rapidly. Erected as a territory in 1854, it had, in 1860, a population of 28,836. (N. became a state in 1867. Pop. in 1870—123,000.)

**NEBRASKA**, or **PLATTE**, a river of Nebraska Territory, United States of America, rises in the Rocky Mountains, lat. 42° 30' N., long. 103° W., and flowing easterly 600 miles through the entire territory, watering its great valley, falls into the Missonri.

**NEBUCHADNEZZAR**. See **BABYLON**.

**NEBULÆ**, a name given to indistinct patches of light in the heavens, which were at one time supposed to proceed from aggregations of rarely distributed matter belonging to distant worlds in the course of formation. By the gradual improvement of telescopes in power and distinctness, these nebulae have, one after another, become resolved into clusters of distinct stars, and it is now generally supposed that such a resolution of all nebulae which have been observed is only limited by the power of the telescope. It is probable that the group of stars with which our system is immediately surrounded, and which forms to our eyes the galaxy which studs the firmament, would, if looked upon from the immeasurable distances at which these so-called nebulae are situated, itself assume the appearance of such a nebula; and that in the intervals there exist spaces as void of starry worlds as these are comparatively full of them. See **STARS**. Some nebulae are of a round form, presenting a gradual condensation towards the centre; others consist of one star surrounded by a nebulous haze; while a third class present just the same appearance as would be exhibited by the solar system, if seen from a point immensely distant. These and other phenomena suggested to Laplace the idea, afterwards developed into a theory, and known as the *nebular hypothesis*, that these nebulae were systems in process of formation; the first stage presenting an agglomeration of nebulous matter of uniform density, which, in the second stage, shewed a tendency to gradual condensation towards the centre; and, finally, the nebulous matter round the now-formed centre of the system, separated itself into distinct portions, each portion becoming condensed into a planet. The same opinion regarding the formation of planets from nebulae was put forward by Sir John Herschel in 1811; but the subsequent discoveries made by Lord Rosse have shewn the fallacy of this theory, by proving that the nebulae upon which the hypothesis was founded, were really clusters of stars like other nebulae.

**NEBULY**, one of the partition lines in Heraldry, which runs out and in, in a form supposed to represent the uneven edges of clouds.

Nebuly.

**NECESSARIES**. See **KIT**.

**NECESSITY**. This word occurs in connection with two different philosophical subjects, namely, the freedom of the will (see **FREE-WILL**), and the nature of our belief in fundamental truths, such as the axioms of mathematics, the law of causation, and the reality of a material world. It is alleged by some philosophers, that the truths held by us as most certain are the result of experience, and that the degree of certainty is but a measure of the universality of the experience. Others contend that such first principles as the axioms of mathematics are not only true, but *necessarily* true; we not only do believe them, but we *must* believe them. Such

necessity, it is argued, cannot come from mere experience, and therefore implies an innate or intuitive source. Hence the theory of necessary truth is only another name for the theory of instinctive or intuitive truth.

Necessity is a word too vague in its signification to serve as a leading term in philosophy. There are several meanings attaching to it, which should be clearly set forth before entering on the discussion of such questions as those above mentioned.

1. Necessity, in the first place, means that one fact or statement is *implied* in another. Thus, if we say that all the apostles were Jews, it follows necessarily that Peter was a Jew; this is not a new fact, but merely a re-assertion of a portion of the same fact. We are not at liberty to affirm a thing in one form, and then deny the same thing when expressed in a different form. If we say this room is hot, it is repeating the assertion in another way, to say that it is not cold. These truths follow by necessary inference. Hence the general axiom of the syllogism, that what is true of a whole class must be true of each individual, is a necessary truth in this sense. In affirming such a truth, we merely declare that we shall be consistent, and that when we have affirmed a proposition in company with other propositions, we are prepared to affirm it when taken apart from the others. This kind of necessity is sometimes called *Logical necessity*, and sometimes *Mathematical necessity*. We might call it *Deductive necessity*, or *necessity by Implication*.

2. A second meaning is *Inductive certainty*; or the certainty that arises from a well-grounded experience. That lead will sink in water; that animals need food and air in order to live; that warmth promotes vegetation; are truths that we call necessary, in the sense of being so certain that we may always count upon them. We presume with the highest confidence, that an unsupported body will fall to the ground, not because the fact of falling is implied in the fact of matter, but because nature has uniformly conjoined the two facts. We can speak even of moral necessity; by which we mean only uniform sequence and consequent certainty. When we declare that children, whose education has been neglected, must fall into evil courses, we declare what experience has shewn us will happen in relation to the human mind.

3. When necessity means neither deductive implication, nor inductive certainty, it refers us to a peculiar test supposed to apply to the truths in dispute—namely, the inconceivableness of their opposite. It is said that, not only can we not *believe* in the opposite of the axiom, that 'the sums of equals are equal,' but we cannot even *conceive*, *imagine*, or *picture* to ourselves the opposite of it. This impossibility of conceiving the contradiction of any statement, is regarded by many as a peculiarly cogent circumstance in its favour. It distinguishes the axiomatic first principles from the truths of inductive science, these having, it is said, an inferior order of certainty. To this it may be replied, however, that men's power of conceiving is so much affected by their education and habits, that many things, whose opposites were at one time inconceivable, have since been found to be false. For example, the notion that men could live at the antipodes was once reckoned inconceivable, and we now know it to be a fact. An unvarying association will often produce a disability to conceive anything different.

In commencing a discussion as to the necessary character of any truth, the disputants should agree beforehand which of the three meanings they intend. In the controversy on the Mathematical axioms, maintained between Dr Whewell on the one hand, and Sir John Herschel and Mr J. S. Mill on the

other, the third meaning is more particularly involved. The doctrine of Inconceivability, as the test of truth, has been put forward by Mr Herbert Spencer, under the title of the Universal Postulate (*Principles of Psychology*, Part I.).

NECHÉS, a river of Texas, U. S., rises in the central eastern portion of the state, and flows south by east, 200 miles, into Sabine Bay, where its waters, with those of the Sabine River, find their way, by Sabine Pass, into the Gulf of Mexico.

NECKAR, one of the largest tributaries of the Rhine, and the principal river of Württemberg, rises near to the source of the Danube, on the eastern declivity of the Black Forest, and close to the village of Schweningen. It has a winding course of 240 miles, first north-east to its junction with the Fils, then north to its junction with the Jaxt, and finally north-west to Mannheim, where it joins the Rhine. The principal places on its banks are Tübingen, Heilbronn, Heidelberg, and Mannheim. Its course, leading first through a deep and narrow dale, leads afterwards through a succession of wide and fertile tracts, enclosed by soft vine-clad hills. The scenery of its banks is, in general, very beautiful, and in many places highly romantic. From Cannstadt, about midway in its course, the N. is navigable; steamers ply regularly to Heidelberg. Good wines are grown on its banks. Chief affluents, on the left, the Enz; on the right, the Fils Rems, the Koehcr, and the Jaxt.

NECKER, JACQUES, a famous financier and minister of France, was born, 30th September 1732, at Geneva, where his father, a native of Brandenburg, but of Anglo-Irish descent, was professor of German law. He became a banker in Paris, and acquired a large fortune during the Seven Years' War. After retiring from business, he became the representative of his native city at the French court; and also acquired a high but not exactly a solid reputation by his publications on political economy and finance, particularly his *Essai sur la Législation et le Commerce de Grains* (Par. 1775). In this essay he appears as the opponent of the wise Turgot's liberal measures in regard to the traffic in grain, and claims for the state the right of fixing its price, and if it thinks it necessary, of prohibiting its exportation. On the removal of Turgot from office in June 1776, N. was called to assist in financial affairs, and after the brief administration of Clugny, he was made General Director of Finances in June 1777. N. could not conceal his elation. This was his weak point. He had all the vanity, egotism, and love of show that marked his brilliant but superficial daughter. Nevertheless, he succeeded not only in meeting the exigencies of the American war, but in restoring to some degree of order the general financial affairs of the country, though mainly by the perilous expedient of borrowing, which he was enabled to do to an almost unlimited extent, owing to the confidence reposed in his financial dexterity. Some years he borrowed as much as 490 millions of francs. His Protestantism, however, and some retrenchments which he made in the royal household, with his publication on the financial affairs of France (*Compte Rendu*, which produced an immense sensation), made him an object of great dislike to the queen and court, and on 12th May 1781 he was suddenly dismissed. He retired to Geneva, where he was visited, from motives of sympathy and respect, by the highest personages in the realm, the Prince of Condé, the Dukes of Orleans and Chartres, the Prince of Beauvau, the Duke of Luxembourg, Maréchal de Richelieu, the Archbishop of Paris, &c. but returned to Paris in 1787, from which he was soon

banished on account of an attack which he published on the financial management of the reckless and ignorant Calonne. In the financial and political crisis, however, which followed upon the financial administration of Loménie de Brienne, Louis XVI. found himself under the necessity of calling N. in November 1788 to the office of Comptroller General of Finances and Minister of State. N. recommended the calling of the States General, and thereby acquired the greatest popularity. He failed, however, in the difficulties which ensued, having no capacity for political affairs in other than their mere financial aspects. When the court, on 23d June 1789, determined upon nullifying the resolution of the third estate, N. hesitated, and the king therefore dismissed him on 11th July, and required him to leave the French dominions immediately. He obeyed, but the disturbances of the 12th, 13th, and 14th of July (on the last of which days the Bastille was taken) were the result of his dismissal, and the king was under the necessity of recalling him. He now allied himself with Mounier and other ministers for the introduction of a constitution like that of Britain, with two chambers or Houses of Parliament; but this caused a great diminution of his popularity, and he was unable to contend in debate with Mirabeau and other great leaders of the National Assembly. On the rejection by the assembly of his scheme of a loan, and the adoption instead of it of Mirabeau's scheme of assignats, he resigned his office in September 1790, and retired to his estate of Coppet, near Geneva, where he died, 9th April 1804. Besides the works already mentioned, he published several on political and on religious subjects, particularly a work on the French Revolution (4 vols. Par. 1796), which has been frequently reprinted. His daughter was the celebrated Madame de Staël.

NECK-MOULDING. A moulding at the junction of the capital and shaft of a column. The plain space between the astragal of the shaft and the mouldings of the cap of the Roman Doric order is called the neck.

NECROMANCY (Gr. *nekros*, dead, and *mantheia*, divination), a mode of divination by the conjuring up of the dead to question them concerning the future. It originated in the east, and in times of the most remote antiquity. It is condemned in the Old Testament; and the story of the witch of Endor affords a remarkable illustration of it, which has not a little perplexed interpreters of Scripture. The eleventh book of Homer's *Odyssey* bears the title of *Nekromanteia*, and in it the shade of Tiresias is represented as brought up and consulted by Ulysses. In most parts of Greece, necromancy was practised by priests or consecrated persons in the temples; in Thessaly, it was the profession of a distinct class of persons called Psychagogoi ('Evokers of Spirits'). The practice of it in that country was ultimately connected with many horrid rites, in which human blood, half-burned portions of bodies from funeral piles, the immature fetus cut out of the womb, &c., were employed, and sometimes human beings were slain, that their spirits might be consulted ere they finally passed into the lower world. The establishment of Christianity under Constantine caused necromancy to be placed under the ban of the church. There are evident traces of necromancy in some of the older Norse and Teutonic poems. The medieval belief in the evocation of spirits belongs rather to sorcery than to necromancy. See Peucer's *Commentarius de Principiis Divinationum Generibus* (Zerbst, 1591).

NECROPHILISM, an unnatural and revolting love or appetite for the dead which has manifested

itself in various ways. Consorting or living with the dead has been observed as a characteristic of melancholia. Individuals have inhabited graveyards, preferring the proximity and association of corpses with which they had no tie, to the cheerfulness and comforts of home; and there is recorded one notorious case, in which a gentleman, although on bad terms with his wife while alive, carried her body with him through India, scandalising the natives, and outraging the feelings of all, by placing the coffin under his bed. This hideous tendency may enter into certain developments of cannibalism, where the feast is celebrated in memory of a departed friend, rather than in triumph over a slain foe. It is affirmed that there were anthropophagous epidemics in 1436 and 1500; and the history of vampirism connects that delusion with the moral perversion now described. Patients in asylums, especially in continental asylums, are still often encountered who bemoan the crime of having devoured the dead, and violated charnel-houses. The most extraordinary exhibition of necrophilism is where individuals, not in fancy but in reality, have exhumed corpses, to see them, to kiss them, to carry them away to their own homes, or to mutilate and tear them to pieces. It is worthy of notice that, so far as such cases have been observed in this country, they have been confined to communities living in remote places, of rude and unenlightened character, and cherishing the superstitions of ages and states of society with which they have no other connection, and of which they have almost lost the recollection.—*Annales, Medico-Psychologiques*, t. viii. p. 472.

NECROPOLIS, a Greek term, meaning the city of the dead, and applied to the cemeteries in the vicinity of ancient cities. It occurs in classical antiquity only as applied to a suburb of Alexandria, lying to the west of that city, having many shops and gardens and places suitable for the reception of the dead. The corpses were received and embalmed in it. Here Cleopatra, the last of the Ptolemies, applied the asp to her breast, to avoid the ignominy of being led in triumph by Augustus. The site of the necropolis of ancient Alexandria seems to have been where are now the catacombs, consisting of galleries and tombs hollowed out of the soft calcareous stone of which the city is built, and lying at the extremity of the city. The term necropolis is now, however, used in a much more extended sense, and applied to all the cemeteries of the ancient world. These consisted either of tombs, constructed in the shape of houses and temples, and arranged in streets, like a city of the dead; or else of chambers hollowed in the rock, and ornamented with façades, to imitate houses and temples. Such cemeteries are to be distinguished from the *columbaria*, or subterranean chambers of the Romans, in which their urns were deposited; or the rows of tombs along the Via Appia; or the cemeteries of the Christians, whose bodies were deposited in the ground. The most remarkable necropolises are that of Thebes in Egypt, situated at a place called Gournah, on the left bank of the Nile, capable of holding 3000 persons, and which it is calculated must at least have contained 5000 mummies; those of El-Kab or Eileithyia; of Beni-Hassan, or the Speos Artemidos; and of Madfun or Abydos; of Siwah or the Oasis of Ammon. See OASIS. In Africa, the necropolis of Cyrene is also extensive; and those of Vulci, Corneto, Tarquinii, and Capua are distinguished for their painted tombs (see *TOMB*), and the numerous vases and other objects of ancient art which have been exhumed from them. Large necropolises have also been found in Lycia, Sicily, and elsewhere.

Strabo, xviii. p. 795—799; Plutarch, vit Anton; Letronne, *Journal des Savans*, 1828, p. 103; Dennis, *Cities and Cemeteries of Etruria*, i. 412, i. 276—358.

NECROSIS (Gr. *nēkros*, dead) is a term employed to denote the death or mortification of bone, but often restricted to the cases in which the shaft of a long bone dies, either directly from injury or from violent inflammation, and is enclosed by a layer of new bone; the death of a thin superficial layer, which is not enclosed in a shell of new bone, being usually termed *exfoliation*.

The bones of the lower extremity—the femur and tibia—are those which are most frequently affected by necrosis. The lower jaw is, however, extremely often affected by it, in persons engaged in making lucifer-matches; the disease being set up by the pernicious action of the vapour of phosphorus. The dead bone, known as the *sequestrum*, generally consists of the circumference of the shaft only, and not of the interior, and the inside of the dead portion presents a rough appearance, as if worm-eaten. If the membrane investing the bone (the periosteum) remain healthy, it deposits lymph, which speedily ossifies, forming a shell of healthy bone, which completely invests the dead portion.

The essential point in the treatment is the removal of the *sequestrum*, which is too purely a surgical operation to be described in these pages.

NECTAR, the name given by Homer, Hesiod, Pindar, and the Greek poets generally, and by the Romans, to the beverage of the gods, their food being called *Ambrosia* (q. v.). But Sappho and Aleman make nectar the food of the gods, and ambrosia their drink. Homer describes nectar as resembling red wine, and represents its continued use as causing immortality. By the later poets, nectar and ambrosia are represented as of most delicious odour; and sprinkling with nectar, or anointing with ambrosia, is spoken of as conferring perpetual youth, and they are assumed as the symbols of everything most delightful to the taste.

NECTARINE. See PEACH.

NECTARY, in Botany, an organ in the flowers of many phanerogamous plants, devoted either to the secretion or the reception of honey. Of the former kind are nectariferous glands, scales, and pores; of the latter, tubes, cavities, &c. But the term was for a long time very vaguely employed by botanists, and seemed to be found convenient for the designation of any part of a flower for which no other name was known. Thus amongst the parts called nectaries by the older botanists, may be found those now called *Disc* (q. v.), and that which bears the name of *Corona* (q. v.).

NEEDFIRE (Ger. *nothfeuer*; allied to Sw. *gnida*, to rub; Eng. *knead*), fire obtained by the friction of wood upon wood, or the friction of a rope on a stake of wood, to which a widespread superstition assigns peculiar virtues. With varieties of detail, the practice of raising needfire in cases of calamity, particularly of disease among cattle, has been found to exist among most nations of the Indo-European race. It has been supposed effectual to defeat the sorcery to which the disease is assigned. When the incantation is taking place, all the fires in the neighbourhood must be extinguished, and they have all to be relighted from the sacred spark. In various parts of the Scottish Highlands, the raising of needfire was practised not long ago, and it is perhaps still had recourse to in some very remote localities. The sacrifice of a heifer was thought necessary to insure its efficiency. The ways of obtaining fire from wood have been various; one is by an apparatus which has been called the 'fire-churn,' a cylinder turning on a pivot, and furnished

## NEEDLES.

with spokes, by means of which it is made to revolve very rapidly, and fire is generated by the friction. Fire struck from metal has been supposed not to possess the same virtue, and in some instances the persons who performed the ceremony were required to divest themselves of any metal which might be about them. In its origin, the fire-churn was considered a model of the apparatus by which the fires of heaven were daily rekindled. It is still in daily use in the temples of the Hindius. The same superstition was doubtless the origin of the story of Prometheus (q. v.). See Grimm's *Deutsche Mythologie*; Supplement to Jamieson's *Scottish Dictionary*.

**NEEDLES** are instruments of metal, or other material, for the purpose of carrying the thread in sewing, embroidery, knitting, netting, and other similar operations. They are generally made of metal, but bone, ivory, and wood are also used; for ordinary needle-work, called sewing, they are made of fine steel, and are too well known to need description; for other kinds of work, they are often much larger and differently formed, according to the requirements of the work to be done.

Needle-making is an important branch of industrial art, and it has of late years attained to extraordinary perfection. Small bars of steel, not thicker than a good-sized bristle, can be made perfectly round, pointed at one end with wonderful accuracy, pierced at the other end with an oval hole, the sides of which are so smoothly rounded that there is no friction upon the thread, and the whole of each instrument, not more than an inch in length, beautifully polished, and sold at less than a shilling per hundred, notwithstanding that a large part of the operations required in their manufacture are manual. The first operation, after the wire has been selected, and its thickness accurately gauged, is to cut it into eight-foot lengths; this is done by winding it in a coil of 16 feet circumference, and then cutting this coil into exact halves

Fig. 1.

with powerful cutting shears. The coiling of the wire is so managed, that there are 100 pieces in each half when cut; the bundles of 100 wires are again cut into the necessary lengths for two needles; and so well arranged are the cutting shears, that a man can easily cut enough for 1,000,000 needles in a day of 12 hours. The pieces cut from a coil, although now reduced to the length of two small needles, are nevertheless somewhat curved; they are therefore collected into bundles of about 6000, and placed in two iron rings, which hold them loosely together, as in fig. 1; they are then slightly softened

Fig. 2.

by firing, and are laid on an iron plate or bench, and are pressed with a small curved bar (fig. 2) in two or three positions, by which the operator manages to make them all perfectly straight. They are now taken to the grinder, who sits in front of his grindstone upon a seat which is hollow, and forms an air-shaft open towards the stone; through this a blast of air is forced when the wheel is in motion, which carries away from the grinder every particle of the subtle dust from the needle points and the stone. Before this humane invention, which has rendered the operation quite innocuous, the loss of life in this manufacture was more serious than in any other

industrial occupation. The operator, with great tact, holds about 25 of the wires, by means of his thumb, pressed against the inside of his fingers, the wires, which are held straight and applied to the grindstone, being dexterously turned round on the inside of the hand by means of the thumb, until they are ground sharp at one end; they are then reversed, and the other ends are similarly sharpened (fig. 3). They are next taken to the *impressing* machine, which in principle consists of a weight hanging to a block, which is raised by the hand and let fall at pleasure; the wires are placed in succession under this, so that the falling weight strikes each wire exactly in the middle, and there flattens it, as in fig. 4. The hardening of the flattened part by

Figs. 3, 4, 5, 6.

the blow is removed in the annealing oven, and the holes are next punched, two in each flattened portion, as in fig. 5. These are either done by hand-punches worked by children, who acquire great nicety in the operation, or by a machine on the same principle as the *impressing* machine; this not only punches the two holes, but also forms a small cross-cut between them (as seen in fig. 5), which is otherwise made by a file. At this cross-cut the wire is broken in two, and may now be regarded as two rudely-formed needles (fig. 6), each having a flattened and pierced head, as shewn in fig. 7. A number of these are now threaded (*spitted*) on a thin

Fig. 7.

Fig. 8.

wire, as in fig. 8, and are placed in a vice, which holds them firm and straight, so that the workman can file the heads on the top and sides, so as to remove all the burred edge outside the dotted lines in fig. 7. The next process is *oil tempering*, for which they are made hot, and immersed in sufficient oil to coat them thoroughly; the oil is then burned off, an operation which renders the needles brittle. They are then weighed out into lots of about 500,000 each, and after being shaken so that they lie side by side, they are laid on a square piece

Fig. 9.

of strong canvas, and a quantity of sand and emery-powder being mixed with them, they are corded up very securely into a long roll (fig. 9), from 18

inches to 2 feet in length. A number of these rolls or bundles are placed on a movable wooden slab, in the *scouring machine*, and over them is placed another heavily weighted slab. The action of the machine, of which these slabs form part, is to move them backwards and forwards in opposite directions, the bundles of needles acting as rollers, the pressure upon which works the enclosed needles, sand, &c. together, so that after eight to ten hours, which this operation occupies, instead of the blackened appearance they had when it commenced, they are white and silvery-looking. They are now removed to an exactly similar machine, where they are polished. Here they are separated from the sand and emery, and are removed to other canvas squares; and when mixed up with a paste of *putty-powder* and oil, are again corded up, and made to roll backwards and forwards under the weighted wooden slab of the *polishing machine* for four hours more. The next process is to remove them from the canvas, and agitate them in a vessel with soft-soap and water, to remove the oil and putty-powder, and next to dry them in ash-wood saw-dust. They are now highly polished and well tempered, but not all of exactly the same length, nor are the eyes perfect; they are therefore passed to a person who, by nice management of a small gauge, sorts them very quickly into certain lengths (*evening*), and arranges them all in one direction (*heading*). They then pass on to be drilled, an operation requiring great nicety, as the small oval holes have to be so polished all round, as not to cause any friction on the thread in sewing with them; a clever workman will drill and polish the holes of 70,000 needles per week. The needle is now practically finished, but many minor operations are considered necessary to produce high-finish; these we purposely omit, to avoid complicating our description. It is, however, worthy of remark, that this little instrument, which costs so much labour for its formation, has by these operations acquired immense value. The wire of which the ordinary-sized needles are made is so thin, that 5½ pounds go to form 74,000 needles. Of ordinarily sized needles, 2½ millions weigh 3 cwt., and are worth rather more than £200, although the steel wire of which they were made was only worth £14 at the commencement of the manufacture. English-made needles are the best in the world, and are chiefly made in Redditch and the neighbourhood, where, and in other parts of the county of Worcester, this manufacture employs a large number of persons.

NEERWINDEN, a small village of Belgium, in the north-west corner of the province of Liege, is celebrated in history for the great victory gained by the French under Luxembourg over the English under William III. (29th July 1693); and also for the defeat of the French under Dumouriez by the allies under the Prince of Coburg (18th March 1793).

NE EXEAT REGNO is the title of a writ issued by the Court of Chancery to prevent an individual leaving the kingdom, unless he gives security to abide a decree of that court. The writ was originally resorted to in cases of attempts against the safety of the state, but is now issued in cases where an equitable debt or demand is sought to be substantiated by a bill or proceeding in Chancery. The writ is only granted where the party usually resides within the jurisdiction. It resembles the process which is known in the common-law courts as arresting and holding to bail, and in Scotland as arresting a person *in meditatione fugæ*.

NEGATIVE, in Photography, is that kind of photographic picture in which the lights and shadows

of the natural object are transposed; the high lights being black, and the deep shadows transparent, or nearly so. Negatives are taken on glass and paper by various processes, and should indicate with extreme delicacy, and in reverse order, the various gradations of light and shade which occur in a landscape or portrait. A negative differs from a positive inasmuch as in the latter case it is required to produce a deposit of pure metallic silver to be viewed by *reflected light*; while in the latter, density to *transmitted light* is the chief desideratum; accordingly inorganic reducing and retarding agents are employed in the development of a positive, while those of organic origin are used in the production of a negative. Adopting the collodion process (which has almost completely replaced every other) as a type of the rest, the conditions best adapted for securing a good negative may be briefly indicated, leaving it to the reader to apply the principles involved to any process he may desire to practise.

The possession of a good lens and camera being taken for granted, and favourable conditions of well-directed light being secured, all that is necessary is to establish a proper and harmonious relation between the collodion bath, developer, and time of exposure. A recently-iodised collodion will generally be tolerably neutral, in which case, if the developer be at all strong, and the weather warm, the bath should be decidedly acid, or *fogging* will be the result. Should the collodion, however, be red with free iodine, a mere trace of acid in the bath will suffice, while the development may be much prolonged, even in warm weather, without fogging. If the simple fact be borne in mind that the presence of acid, either in the bath collodion or developer, retards the reducing action of the developer, it will suffice to guide the operator in many difficulties. The value of a negative consists in the power it gives of multiplying positive proofs. See POSITIVE PRINTING; also PHOTOGRAPHY.

NEGATIVE QUANTITIES are generally defined as quantities the opposite of 'positive' or 'numerical' quantities, and form the first and great point of difference between algebra as a separate science, and arithmetic. In the oldest treatises on algebra they are recognised as distinct modifications of quantity, and existing apart from, and independent of positive quantity. In later times, this opinion was vigorously combated by many mathematicians, among whom Vieta occupied a prominent place; but the more eminent analysts retained the old opinion. Newton and Euler distinctly assert the existence of negative quantities as quantities less than zero, and the latter supports his opinion by the well-known illustration of a man who has no property, and is £50 in debt, to whom £50 requires to be given in order that he may have nothing. After all, this discussion is little more than a verbal quibble, though interesting from the prominent position it for a long time held. It had its rise in the difficulty of satisfying the requirements of a constantly progressing science by the use of signs and forms retaining their original limited signification. It was soon felt that the limited interpretation must be given up; and accordingly an extension of signification was allowed to signs and modes of operation. + and -, which were formerly considered as merely symbols of the arithmetical operations of addition and subtraction, were now considered as 'general cumulative symbols, the reverse of each other,' and could signify gain and loss, upwards and downwards, right and left, same and opposite, to and from, &c. Applying this extended interpretation of signs to a quantity such as -4, we obtain at once a true idea of a negative quantity; for if +4 signifies 4 inches *above* a

certain level,  $-4$  signifies 4 inches *below* that level, and therefore, though a positive quantity in itself (a negative being, strictly speaking, an impossible existence), it may be fairly considered to be less than zero, as it expresses a quantity less by 4 than 0 inches above the level. Keeping this idea in view, it has been conventionally agreed to admit the existence of negative quantities as existing *per se*. The only errors which can flow from this arise from misinterpretation of results, for the four fundamental operations of addition, subtraction, multiplication, and division are unaffected by the extended interpretation of signs. The following is an illustration of the value of an extended interpretation of the negative sign, shewing at the same time how much more general are the ideas conveyed by algebraic expressions than by ordinary language: If at the present time a father is 50 years, and his son 20 years old, when will the father be three times as old as his son. This problem, when solved, gives  $-5$  as the number of years which must elapse before the father's age is three times the son's. Now, at first sight, this result appears to be absurd, but when we consider the terms of the problem, its explanation is easy. The question asked pointed to a number of years *to come*, and had the result turned out to be *positive*, such would have been the case, and the fact of its being negative directs us to look in a 'contrary' direction, or backwards to time *past*; and this is found to satisfy the problem, as 5 years 'ago' the father was 45 and his son 15.

Negative quantities arise out of the use of general symbols in subtraction, as in the formula  $a - b$ , where we may afterwards find that  $b$  is greater than  $a$ . See SUBTRACTION.

NEGRITOS, or NEGRILLOS (*Spanish*, diminutive of Negroes), is the name given by the Spaniards to certain Negro-like tribes inhabiting the interior of some of the Philippine Islands, and differing essentially both in features and manners from the Malay inhabitants of the Eastern Archipelago. They bear a very strong resemblance to the Negroes of Guinea, but are much smaller in size, averaging in height not more than four feet eight inches, whence their appellation of N., or little Negroes. They are also called by the Spaniards *Negrillos del Monte*, from their inhabiting the mountainous districts for the most part; and one of the islands where they are most numerous, bears the name of *Isla de los Negros*. These N. are also known by the names Aeta, Aigta, Ite, Inapta, and Igolote or Igorote. They are described as a short, small, but well-made and active people, the lower part of the face projecting like that of the African Negroes, the hair either woolly or frizzled, and the complexion exceedingly dark, if not quite so black as that of the Negroes. The Spaniards describe them as less black and less ugly than the Negroes—*Menos Negros y menos feos*. All writers concur in speaking of them as sunk in the lowest depths of savagedom, wandering in the woods and mountains, without any fixed dwellings, and with only a strip of bark to cover their nakedness. Their only weapons are the bow and arrow; and they live upon roots, wild fruits, and any sort of animals that they can surprise in their haunts, or conquer in the chase. By the Malays, they are despised and hated; and the buffalo-hunters in the woods, when they meet with them, do not scruple to shoot them down like wild beasts or game. 'It has not come to my knowledge,' says a Spanish writer, 'that a family of these Negroes ever took up their abode in a village. If the Mohammedan inhabitants make slaves of them, they will rather submit to be beaten to death than undergo any bodily fatigue; and it is impos-

sible, either by force or persuasion, to bring them to labour.' The same writer, an ecclesiastic, speaks of them as gentle and inoffensive in their manners, whenever he himself came in contact with them; and although informed that some of them were cannibals, he was not inclined to believe the report. Dr Carl Seherzer, the historian of the circumnavigation of the *Novara*, when at Manilla, had an opportunity of seeing a Negrita girl whom he thus describes: 'This was a girl of about twelve or fourteen years of age, of dwarf-like figure, with woolly hair, broad nostrils, but without the dark skin and wide everted lips which characterize the Negro type. This pleasing-looking, symmetrically-formed girl had been brought up in the house of a Spaniard, apparently with the pious object of rescuing her soul from heathenism. The poor little Negrilla hardly understood her own mother-tongue, besides a very little Tagal, so that we had considerable difficulty in understanding each other.'

According to Spanish statements, the N. are found only in five of the Philippine Islands—namely, Luzon, Mindoro, Panay, Negros, and Mindanão—and are estimated at about 25,000 souls. Remnants of them exist, however, in the interior of some of the other islands in the Eastern Archipelago; and they are scattered, also, though in small numbers, through certain islands of Polynesia. They are altogether an island people, and are hence treated of by Prichard under the designation of Pelagian Negroes. By Dr Pickering they are treated of as a distinct race, resembling the Papuan, but differing from it in the diminutive stature, the general absence of a beard, the projecting of the lower part of the face or the inclined profile, and the exaggerated Negro features. The hair, also, is more woolly than that of the Papuans, though far from equalling that of the Negroes in knotty closeness. By Latham, the N. are classified under the subdivision of 'Oceanic Mongoloidæ, C,' which subdivision is further modified by him into the designation of 'Amphinesians' and 'Kelenonesians.' The N. out of the Philippine Islands are found for the most part in the islands embraced under the latter designation, as New Guinea, New Ireland, Solomon's Isles, Louisiade, New Caledonia, and Tasmania or Van Diemen's Land. Except in the last-mentioned island, however, the N., strictly speaking—that is, the blackish people with woolly hair—do not preponderate over the other native tribes less strongly marked with Negro features; while in Tasmania itself, the race has almost entirely disappeared, amounting at present to not more than two or three dozen souls. Dr Pickering is of opinion, that the Negrito race 'once occupied more space than it does at this time, and that it has in many instances preceded the dissemination of other races.' We conclude with a description of a Negrito native of Erromango (the island where the missionary Williams was murdered), supplied to Dr Pickering by Horatio Hales, his associate in the United States exploring expedition. 'He was above five feet high,' says Mr Hales, 'slender and long limbed; he had close woolly hair, and retreating arched forehead, short and scanty eyebrows, and small snub nose, thick lips (especially the upper), a retreating chin, and that projection of the jaws and lower part of the face, which is one of the distinctive characteristics of the Negro race. . . . Pleased in a crowd of African blacks, there was nothing about him by which he could have been distinguished from the rest.' See PAPUANS and POLYNESIANS.

NEGRO, RIO. See RIO NEGRO.

NEGRO MINSTRELSY, a species of singing which originated among the negro slaves of the

United States, and is now popular at public entertainments. The sentiment of the earlier of these negro melodies was of the most simple kind, the words mostly broken English, and the harmonies confined chiefly to two chords—the tonic and dominant. How the airs were composed has been a matter of curious inquiry. Some of them are believed to be broken down and otherwise altered old psalm-tunes, which had been caught up by the more musical of the negro race. In some instances, the singing of the melodies is accompanied with grotesque gestures; the effect being to give the idea of good-nature and love of fun in the dark-skinned minstrels. Negro melodies may be said to have been made known by Mr D. Rice, who first in New York, in 1831, and afterwards in London, created a sensation by his singing of *Jim Crow*. Other songs followed, such as *Jim along Josey*, and *Buffalo Gals*; and from less to more, there was created a very characteristically national music, if the Americans will allow us to call it so. Becoming extensively popular, and addressed to fashionable audiences, this negro minstrelsy now comprehends a large variety of songs, with airs of a pleasing kind, the whole much in advance of the original negro compositions. For these improvements, the world is indebted, among others, to Mr E. P. Christy, who began as conductor of a band of minstrels at Buffalo in 1842, and who established himself in New York in 1846. At first, his troupe were called the 'Virginia Minstrels,' but afterwards they were known as the 'Christy Minstrels.' Mr Christy's great success in this species of entertainment brought other leaders and troupes into the field. In most cases, the members of the negro minstrel troupes are only negroes in name, with faces and hands blackened for the purpose. See *Christy's Minstrels' New Songs, with Music*, edited by J. Wade. London, 1859.

NEGROES (from the Spanish word *negro*, black; Lat. *niger*) is the name given to a considerable branch of the human family, possessing certain physical characteristics, which distinguish it in a very marked degree from the other branches or varieties of mankind—more especially the so-called whites or Europeans. In Blumenbach's fivefold division of mankind, the Negroes occupy the first place under the variety *Ethiopian*, which likewise embraces the Kafirs, Hottentots, Australians, Alfrians, and Oceanic Negroes. In Latham's threefold division, they are placed among the *Atlantida*, and form the primary subdivision of *Negro Atlantida* in that author's classification; while in Pickering's elevenfold division, they occupy the last place in his enumeration of the races of mankind.

Both Prichard and Latham strongly protest against the common error of looking upon the term Negro as synonymous with African. 'It ought to be remembered,' says the former, 'that the word Negro is not a national appellation, but denotes the ideal type constituted by the assemblage of certain physical characteristics, which is exemplified in the natives of Guinea in Western Africa, and in their descendants in America and the West Indies.' And Latham in like manner observes: 'No fact is more necessary to be remembered, than the difference between the Negro and African; a fact which is well verified by reference to the map. Here the true Negro area—the area occupied by men of the black skin, thick lip, depressed nose, and woolly hair—is exceedingly small; as small in proportion to the rest of the continent, as the area of the district of the stunted Hyperboreans is in Asia, or that of the Laps in Europe. Without going so far as to maintain that a dark complexion is the exception rather than the rule in Africa, it may safely be said that the

hue of the Arab, the Indian, and the Australian is the prevalent colour. To realise this we may ask, what are the true Negro districts? and what those other than Negro? To the former belong the valleys of the Senegal, the Gambia, the Niger, and the intermediate rivers of the coast, parts of Sudania, and parts about Sennaar, Kordofan, and Darfúr; to the latter, the whole coast of the Mediterranean, the Desert, the whole of the Kafir and Hottentot areas south of the line, Abyssinia, and the Middle and Lower Nile. This leaves but little for the typical Negro.' Bearing in mind this limitation of the primitive area of the Negro, we shall next proceed to speak of his prominent physical characteristics.

The Negro has a black skin, unctuous and soft; woolly hair; thick lips; the lower part of the face prognathic, or projecting like a muzzle; the skull long and narrow; and a low, retreating forehead. The skull of the Negro is remarkably solid and thick, so that in fighting they often butt against each other like rams, without much damage to either combatant; and it is likewise so flat that burdens are easily carried upon it. According to Camper's lateral admeasurement, the head of the Negro shews an angle of 70°, while that of the European shews one of 80°, on which difference of 10°, as he considered, depends the superior beauty of the latter. There is not much dependence, however, to be placed on such a mode of admeasurement; and the same may be said of Blumenbach's vertical method. According to this, a considerable difference would appear to exist between the skull of the Negro and that of the European. 'But,' says Dr Prichard, 'I have carefully examined the situation of the foramen magnum in many Negro skulls; in all of them its position may be accurately described as being exactly behind the transverse line bisecting the antero-posterior diameter of the basis cranii. This is precisely the place which Owen has pointed out as the general position of the occipital hole in the human skull. In those Negro skulls which have the alveolar process very protuberant, the anterior half of the line above described is lengthened in a slight degree by this circumstance. If allowance is made for it, no difference is perceptible. The difference is in all instances extremely slight; and it is equally perceptible in heads belonging to other races of men, if we examine crania which have prominent upper jaws. If a line is let fall from the summit of the head at right angles with the plane of the basis, the occipital foramen will be found to be situated immediately behind it; and this is precisely the case in Negro and in European heads.' There is, in fact, neither in this respect—the conformation of the Negro skull—nor in any other, solid ground for the opinion hazarded by some writers, and supported either through ignorance or from interested motives by many persons—that the Negro forms a connecting link between the higher order of apes and the rest of mankind. The difference is certainly considerable between the highest European and the typical Negro, but the gulf between them both and the highest of the Simiæ is so nearly of the same width, that the difference is scarcely distinguishable. But the skin, hair, skull, lips, maxillary profile, and general facial appearance of the Negro, are not the only features that distinguish him in a great degree from the European, and seem to stamp him as a distinct variety of the human race. 'In the Negro,' says Prichard, 'the bones of the leg are bent outwards. Soemmering and Lawrence have observed that the tibia and fibula in the Negro are more convex in front than in Europeans; the calves of the legs are very high, so as to encroach upon the hams; the

feet and hands, but particularly the former, are flat; and the os calcis, instead of being arched, is continued nearly in a straight line with the other bones of the foot, which is remarkably broad.' As to the supposed excessive length of the forearm in the Negro, a circumstance also dwelt upon as shewing an approach to the anthropoid apes, facts are altogether against the statement; there being no greater difference than is observable in individuals of any other variety of mankind. In stature, the Negro is very much on a par with the European, often reaching six feet, and rarely declining below five and a half. Into the discussion as to the cause of the blackness of the skin in the Negro we have not space to enter. It is generally supposed to depend upon the greater amount of pigment cells in the *Retæ Malpighii*, and in the greater number of cutaneous glands, as compared with the skin of Europeans. In the skin of the Negro there is much oily matter, and he perspires profusely, which serves to keep him in health, while it diffuses a smell far from agreeable to bystanders whose olfactory nerves are at all sensitive. Of the hair of the Negro, Dr Prichard remarks: 'I am convinced that the Negro has hair properly so-called, and not wool. One difference between the hair of a Negro and that of a European, consists in the more curled and frizzled condition of the former. This, however, is only a difference in the degree of crispation, some European hair being likewise very crisp. Another difference is the greater quantity of colouring matter or pigment in the hair of the Negro. It is very probable that this quality is connected with the former, and is its cause, though we cannot determine in what manner one depends upon another; but as these properties vary simultaneously, and are in proportion one to another, we may infer that they do not depend upon independent causes.'

The Negroes, in their native seat, comprise various independent tribes, which are thus classified and enumerated by Dr Latham: 1. *Western Negro Atlantida*, embracing the Woloffs, Sereres, Sarawollis, Mandingos, Felups, &c.; Fantis, &c.; the Ghá, the Whidah, Maha and Benin tribes, the Grebo, &c. 2. *Central Negro Atlantida*, embracing the Yarriba, the Tapua, Haussa, Fuhals, Cumbri, Sungai, Kissúr, Boruf, &c.; Begharmi, Mandara, Mobba, Furiars, Koldagi. 3. *Eastern Negro Atlantida*, embracing the Shillúk, &c.; Qámanyl, Dallas, &c.; Tibboo, Gongas. This list might, of course, be still further enlarged by reference to the works of Barth, Livingstone, Speke, and other travellers, whose researches have been published since the appearance of Dr Latham's *Varieties of Man*, in 1850.

While these several tribes have their distinctive peculiarities, they yet bear a strong general resemblance to each other, not only in their physical appearance, but in their intellectual capacities, moral instincts, customs, and manners. The Negro intellect is generally acknowledged to be inferior not only to the European, but to that of many primitive races not as yet brought within the pale of civilisation, while it is superior to that of the Australians, Bushmen, and Esquimaux. Some tribes are sunk in the lowest depths of barbarism, and are either ferocious savages, or stupid, sensual, and indolent. This is the case, for the most part, according to Prichard, where the exaggerated Negro type is discernible, as among the Bulloms, Papals, and other tribes on the coast of Western Guinea; also among the tribes near the slave coast, and in the Bight of Benin, where the slave-trade has been carried on to the greatest extent. In other parts they shew a capacity for practising the arts of life. They are ingenious in the construction of their dwellings, they have some knowledge of the working of iron

and other metals, they manufacture arms, dress and prepare the skins of animals, weave cloth, and fabricate numerous useful household utensils. Neither are they altogether deficient in a knowledge of agriculture. These marks of civilisation are, for the most part, apparent in the districts either wholly or partially converted to Mohammedanism. Mungo Park, in his account of Sego, the capital of Bambarra, describes it as a city of 30,000 inhabitants, with houses of two stories high, having flat roofs, mosques in every quarter, and ferries conveying men and horses over the Niger. 'The view of this extensive city,' he says, 'the numerous canoes upon the river, the crowded population, and the cultivated state of the surrounding country, formed altogether a prospect of civilisation and magnificence which I little expected to find in the bosom of Africa.' All tribes of Negroes appear to be passionately fond of music, and shew no little skill in the manufacture of musical instruments. They also express their hopes and fears in extemporary songs. Where Mohammedanism has not been introduced, the religion of the Negroes is nothing but a debased *fetish* worship. They make fetishes of serpents, elephants' teeth, tigers' claws, and other parts of animals, at the dictation of their *fetish man*, or priest. They also manufacture idols of wood and stone, which they worship; and yet, under all this, they have some idea of a Supreme Being. They believe in good and evil spirits, and are perpetually practising incantations to ward off the baneful influence of their spiritual enemies. Their religion, in fact, is one altogether of fear; and as this generally leads to cruelty, we find them for the most part indifferent to the sacrifice of human life. In some parts they even offer up human victims to propitiate their deities. They are cruel to their enemies and prisoners, and often shed blood for the mere savage delight they experience in seeing it flow from their victims. We need only allude to the inhuman *customs*, as they are called, of Dahomey, and the *Yam* and *Adai customs* of the Ashantees, as described by Bowdich, in support of this statement.

This same indifference to human suffering, coupled with the passion of avarice, has doubtless been the mainspring of the slave-trade carried on during so many centuries between the Negroes and European traders in the western coast of Africa. Begun by the Portuguese as early as 1503, when Negro slaves were first imported into the West Indies, sanctioned by Ferdinand of Aragon in 1511, and subsequently by Charles V., legalised in England under Elizabeth, and eventually practised by every maritime nation of Europe, this infamous trade flourished under the sanction of law as late as the year 1807, when it was happily abolished by act of parliament in Great Britain, and is now treated as piracy by almost every civilised nation. Even still, however, it is practised by lawless men, notwithstanding the humane efforts of Great Britain, France, and the United States to suppress it; and the encouragement which it has given to the petty chieftains on the slave coast, and the country behind it, to enrich themselves at the expense of their fellow-countrymen, has contributed more than anything else to retard the progress of civilisation in that part of Africa. 'The region mentioned,' says Prichard, 'has been the great seat of the exportation of Negro slaves, and the tribes on the coast have been reduced to the lowest state of physical and moral degradation by the calamities and vices attendant on that traffic. Throughout Negroland, and especially this part of it, the inhabitants of one district in the interior, the dwellers on one mountain, are ever on the watch to seize the wives and children

of the neighbouring clans, and to sell them to strangers; many sell their own. Every recess, and almost every retired corner of the land, has been the scene of hateful rapine and slaughter, not to be excused or palliated by the spirit of warfare, but perpetrated in cold blood, and for the love of gain.'

The custom of polygamy prevails among all the Negro tribes, and where these are constituted into nations or kingdoms, as in Dahomey, the sovereign has often as many as two or three thousand wives, whom he occasionally disposes of as presents to his chief officers and favourites.

The languages of the various nations and tribes of Negroes are very numerous. Vocabularies of nearly 200 languages have been brought from Africa by the Rev. Dr Koelle. 'A slight examination of these vocabularies,' says Mr Edwin Norris, 'seems to shew that there are among the Negro idioms a dozen or more classes of languages, differing from each other at least as much as the more remote Indo-Germanic languages do.' To these Negro idioms Dr Krapf has given the name of *Nigro-Hamitic Languages*. These may perhaps have affinities with some of the other African tongues, but not with any of the great well-defined families of languages. For further information upon this subject, we must content ourselves with referring to Dr Prichard's *Natural History of Man*, and especially to a learned note by Mr Edwin Norris, in vol. i. of that work, page 323.

Of the condition and prospects of the Negroes in the various countries into which they have been imported during the prevalence of the slave-trade, we have scarcely room to speak. They are found in all the West India Islands, to the number of about 3,000,000; in the United States, Brazil, Peru, and other parts of South America; also in the Cape de Verde Islands, Arabia, Morocco, &c. In the British West India Islands they were emancipated from slavery in 1834, and in those belonging to France in 1848. Indeed, slavery now exists nowhere in the West Indies, with the single exception of Cuba. In the United States, the Negroes amount to about 4,000,000. Many of these have been emancipated in the course of the civil war still (1864) raging, and all the Negroes of Secession masters have been declared emancipated by proclamation of President Lincoln and act of the Federal congress; at the same time that indemnities have been promised to such loyal states as of their own accord decree emancipation. So far Negro slavery, as an institution of the United States, has received more than one severe blow; neither can its total extinction, we think, be far distant, whatever may be the results politically of the present contest between Federals and Confederates.

NEGROPONT. See EURÆA.

NEGROS, ISLA DE. See PHILIPPINE ISLANDS.

NEGU'NDO, a genus of trees of the natural order *Acerææ* (see MAPLE), differing from the maples chiefly in the dioecious flowers being destitute of petals, and in the pinnated ash-like leaves. The COMMON N. or ASH-LEAVED MAPLE, is a native of North America, and now not unfrequent in Britain as an ornamental tree.

NEGUS, a compound of either port or sherry wine and hot water sweetened with sugar and flavoured with lemon-peel and spices. It is a favourite beverage in England, and derives its name from a Colonel Negus, who claimed to be the inventor.

NEHEMIAH, son of Hachaliah, probably of royal descent, is first mentioned in the Bible as cup-bearer to Artaxerxes Longimanus in his palace at Shushan about 444 B. C. Having learned the

sad fate of the returned colonists in Jerusalem, he prevailed upon the king to send him to his brethren there with full powers 'to seek their welfare.' For twelve years (444—432), he was untiringly engaged as 'Governor' in works for their safety from within and without: refortifying the city walls, notwithstanding the hindrances and dangers that beset him on all sides; inducing people from the country to take up their permanent abode in the city, thus promoting its prosperity; and finally, and above all, rekindling the flame of ancient piety and the enthusiasm for the observance of the Law in the hearts of the rough immigrants. He then returned to Persia, trusting to the new vitality which his reforms had, as he thought, infused into the Jewish commonwealth. But not long afterwards—within a period which it is extremely difficult now to fix—he had again to obtain leave from the king, for the purpose of abolishing the many abuses that had crept in during his brief absence from Jerusalem. His energies now were chiefly directed against the foreign elements mixed up with the people, both privately and publicly. He enforced the rigorous observance of Feast and Sabbath, and rearranged the Temple service in accordance with its primeval purity, procuring at the same time the means for its proper support by inducing the people to offer the tithes as of old. His second stay at Jerusalem seems to have lasted between ten and fifteen years; but the dates, as gathered from circumstantial evidence only, are exceedingly vague. He seems to have lived to an old age, but the place and year of his death are unknown. What was the part he took in the formation and redaction of the biblical canon, cannot be investigated in this place. But there can hardly be a doubt, that among the reformatory works undertaken by him, the collection, and perhaps the edition of some of the books of the Old Testament must be included.

The Book known under his name (in 13 chapters) is believed only partly his own work. Recent investigation ascribes to him only the first six chapters, part of the seventh, and the last chapter and half; the rest being a compilation by other hands. Its style and character are very simple, free from anything supernatural or prophetic. Its language resembles much that of Chronicles and Ezra, and is replete with Aramaisms and other foreign, partly Persian words. Originally considered a mere continuation of the Book of Ezra, it was by the Greeks and Latins at first called 'The Second Book of Ezra.' Gradually, however, it assumed its present independent position in the canon after Ezra. It is supposed to have been written or compiled towards the end of N.'s life.

NEILGHERRY (properly NILGIRI) HILLS (Skr. *nīla*, blue, and *giri*, mountain), a remarkable group of mountains in the south of Hindustan, entirely isolated, with the exception of a precipitous granite ridge, 15 miles in width, which connects it with the high table-land of Mairur on the north. Lat. 11° 10'—11° 38' N., long. 76° 30'—77° 10'. The shape of the group is that of a triangle, of which one side faces the district of Malabar on the west. Greatest length, about 40 miles; average breadth, about 15 miles. The base of the mountains is covered by a dense and unhealthy forest, swarming with wild animals, among which are the elephant and tiger; but in the higher regions of the Hills, wood is comparatively scanty. The surface of the group is undulating, rising, in the peak of Dodabetta, near the centre, to the height of 8760 feet, the greatest height, as yet ascertained, in India south of the Himalayas. The Hills for the most part consist of granite, covered often to the depth of

upwards of ten feet by a richly productive black soil. There are several morasses yielding peat, which is used for fuel. The higher lands form a fine open grass country, covered with the vegetation of the temperate zone, and inhabited by a most remarkable tribe, the *Tudas* or *Toruvans* (herdsmen). This tribe numbers only about 2000 persons. The men are tall and handsome, with Roman noses, fine teeth, and large expressive eyes; the women are singularly beautiful. Their religion is Theism; they have no idols. Owing to their great elevation, the N. H. have a delightfully cool climate, and are much resorted to on this account by invalided Europeans. The principal station, and the only place on the Hills that deserves the name of a town, is Utakamand, situated in the centre of the Hills, at an elevation of 7300 feet above sea-level. Its climate is cold and damp during the monsoon; at other times it is intensely dry, and the mean annual temperature is 58°.

**NEILGHERRY NETTLE** (*Girardinia Leschenaultii*), a plant of the natural order *Urticæ*, nearly allied to the true nettles, and possessing in a high degree the stinging power which is common in them. It is frequent on all the higher ranges of the Neilgherry Hills. The bark yields a valuable fibre, which the natives obtain by first boiling the whole plant, to destroy its stinging properties, and then peeling the stalks. The fibre is of great delicacy and strength, and is worth £200 a ton in England. The cultivation of the plant is therefore thought likely to be remunerative.—Markham's *Travels*.

**NEIRA.** See **MOLUCCAS**.

**NEISSÉ**, a town of Prussian Silesia, and a fortress of the second rank, is situated in a broad valley on the Neisse, an affluent of the Oder, 30 miles south-west of Oppeln. It consists of the town proper on the right bank, of the Friedrich's Town, and of the Preussen Fort on the left bank. It contains two great squares, has five Catholic and two Evangelical churches, a hospital, theatre, &c. It carries on manufactures of arms, chemical products, and tobacco, and establishments for spinning and weaving are in operation. Pop. 18,000, including a garrison of 5035 men. N., formerly the chief town of a principality of the same name, and the residence of a prince-bishop, has frequently been the scene of conflict.

**NEJIN**, an ancient town of Little Russia, in the government of Tchernigof, on the Oster, an affluent of the Dnieper, about 80 miles north-east of Kiev. It fell into the hands of the Lithuanians in 1320, and of the Poles in 1386, but was annexed to Russia in 1654. N. is an industrious town of 18,050 inhabitants, many of whom are Greek immigrants, who settled here during the reign of Catherine II. The principal branch of industry is the cultivation of tobacco. Great quantities of leaf-tobacco are sent hence to St Petersburg, Riga, and Mittau. The chief institutions are two monasteries, 25 churches, and a lyceum.

**NELSON, HORATIO**, the greatest of Britain's admirals, was born on the 29th September 1758, at Burnham Thorpe, Norfolk, of which place his father, Edmund Nelson, was rector. His mother's maiden name was Suckling, and through her he could claim a collateral kinship with the celebrated Sir Robert Walpole. As a child, he was feeble and sickly; and throughout life his small, frail, and attenuated frame seemed to consort but poorly with the daring and impetuous spirit which 'stirred and lifted him to high attempts.' At the age of 13, he entered the royal navy, commencing his career in the *Raisonnable*, 64 guns, commanded by his uncle, Captain

Suckling. Then, even more than now, promotion in the first stages of the profession was determined by Admiralty interest; and fortunately for him and for England, his uncle, shortly afterwards becoming comptroller of the navy, was able to facilitate his rise. His promotion was nearly as rapid as it could be, and before he was quite 21, he had attained the rank of post-captain, which fairly opened the way for him to the higher honours of the service. Up to this time, no opportunity had been afforded him of achieving any marked distinction, but to all who were brought into contact with him, he had already approved himself a bold and capable officer. Henceforward, for some years, he was nearly constantly employed in a variety of harassing services; and in all his conduct was such, that in no long time he had made for himself a brilliant reputation. His growing fame was as yet, however, chiefly confined to professional circles, no very signal exploit having brought his name prominently before the public. But with the advent of the war with revolutionary France, the time had come when he was to 'flame amazement' on the world by a series of noble deeds, in the lustre of which all other naval glory looks pale. In his obscurer years, he seems to have been cheered under what pained him as unmerited neglect by that prescience of a grand destiny, which has so often preluded to a career of exceptional splendour. Thus, on one occasion, he writes: 'They have not done me justice. But never mind. One day I'll have a gazette of my own.' And subsequently the same confidence is expressed with something like the depth of a religious conviction: 'One day or other I will have a long gazette to myself. I feel that such an opportunity will be given me. I cannot, if I am in the field of glory, be kept out of sight; wherever there is anything to be done, there Providence is sure to direct my steps.' In 1793, appointed to the *Agamemnon*, 64 guns, he took a distinguished part, among other services, in the sieges of Bastia and Calvi, in Corsica, losing an eye at the last of these; and in the celebrated action of Sir John Jervis off Cape St Vincent with the Spanish fleet, to a manœuvre of extreme and masterly daring, executed by Nelson in defiance of orders, that officer was mainly indebted for the splendid success obtained, and the peerage with which it was rewarded. Though in the interval an expedition which he commanded against Teneriffe had failed disastrously, with loss to himself of his right arm in the assault, it was on all hands admitted that everything was done on the occasion which skill and valour in their highest combination could effect, and N., on his return to England in 1797, was received with general acclamation. He was invested with the Order of the Bath, and a pension of £1000 a year was voted to him. Being next year intrusted with a fleet, he signalled this his first independent command of any magnitude by the stupendous victory of the Nile, memorable in naval annals as the completest annihilation of an enemy on record. See **ABOUKIR**. Finding the French fleet—to which his own was considerably inferior in force—skilfully moored so as to defy ordinary attack, he adopted the novel expedient of doubling on the enemy's ships, and was rewarded with success the most consummate. Of the French line of battle, two ships only escaped to be afterwards captured; and it was considered that solely to a wound in the head, which in the heat of the action prostrated N., did even these owe their temporary safety. Honours were now from all quarters showered upon him; and in particular the gratitude and enthusiasm of his countrymen were signified by the title bestowed

on him of Baron Nelson of the Nile, and a grant of £2000 a year for his own life, and the lives of his two immediate successors. For his services immediately subsequent, in effecting the expulsion of the French from Naples, the Neapolitan king rewarded him with the Dukedom of Bronte and a domain of £3000 a year. These last honours, however, were in one sense dearly purchased. The single suspicion of a blot on his public fame is in regard of his relations with the corrupt court of Naples, and of certain questionable acts into which by these he was led. The only flaw in his private character was his infatuated attachment to Lady Hamilton, the wife of the English ambassador, a woman of questionable antecedents, but perilous fascination, with whom he was here thrown in contact. The influence which she now obtained over him, she continued to the end to exercise. Early in life he had married, and married happily. If to the charms of an impure adventuress he sacrificed, on his return to England, the wife to whom before he had been tenderly devoted, it is not necessary to indulge in comment. Let us compassionate the one cruel frailty of a man in all else and in his proper nature, as gentle and generous as he was brave.

His next magnificent exploit was the battle of Copenhagen in 1801, in which, after a struggle of terrible severity, he shattered the naval power of Denmark, and along with it the dreaded coalition against England of the three northern kingdoms. Never were the characteristic and heroic qualities of the man more brilliantly displayed than on this most trying occasion. In the moral courage to accept responsibility at all hazards, no man ever surpassed him. In the heat of the battle, his chief, Sir Hyde Parker, in deadly anxiety as to the issue of what at a distance seemed to be a hopeless conflict, signalled him to discontinue action. 'Damn the signal!' said N., when this was reported to him. 'Keep mine for closer battle flying. That's the way I answer such signals. Nail mine to the mast.' And with the certainty of professional disgrace and ruin staring him in the face in case of failure, he worked out his grand triumph.

Had N.'s services here ceased, his fame would still have been assured as the greatest of England's naval heroes. But a crowning glory awaited him. In the earlier part of 1805, glowing with fierce ardour and impatience, he had chased half round the world a French fleet of nearly double the force of his own, scared by the very terror of his name; and on the morning of the memorable 21st October of that year, the desire of his eyes was satisfied, when in the Bay of Trafalgar he saw before him the combined navies of France and Spain moving to meet him in frank fight. Of the glorious consummation which followed, we need not speak in detail. Ere night, the power of France upon the seas was annihilated, and her threatened invasion of England had become an abortive dream. But N. was no more. He died as such men wish to die, amid the thunders of his mightiest victory.

The character of N. was, for a man of his greatness, unusually simple and transparent. A more absolute singleness of aim and aspiration than his, it is difficult even to conceive of. Literally on fire with that ardour and passion of enthusiasm, without some tincture of which scarce any man perhaps has ever yet achieved distinction, he was driven by it imperiously in one direction. The greatest of sailors—he was a sailor and little else. Of his genius for command, it would be idle at large to speak. In coolness, foresight, promptitude, instant intuitive decision, and a daring which, even when it seemed at times to touch temerity, was

yet regulated throughout by the nicest calculations of reason, he has perhaps never been quite equalled on the element. His nature was most noble and humane. His heart was as soft as a woman's, and overflowed with all liberal generousities. He had but to be known to be beloved; and of the tender chivalry of his relations with his gallant brethren in arms, it is touching to read.

NELUMBO (*Nelumbium*), a genus of aquatic plants similar to Water Lilies, and often included under that name, as well as by some botanists in the natural order *Nymphaeaceae* (q. v.); although by others constituted into a distinct order, *Nelumbiaceae*, differing in the want of albumen in the seed, and in the distinct carpels, which are one-seeded, and buried in the cavities of a large fleshy receptacle; which eventually becomes a broad hard bed, full of holes, with the large seeds half buried in them. The flowers and leaves are very similar to those of water-lilies. The species are few, and are found in the warm parts of Asia, in the north of Africa, and in North America. They are all distinguished by the beauty of their flowers. *N. speciosum* is the EGYPTIAN BEAN of Pythagoras,

Lotus (*Nelumbium speciosum*):

A, the ripe receptacle of *Nelumbium speciosum*; B, a seed; C, a seed, with the two cotyledons so separated as to show the large plumule which they enclose.

the Lotus (q. v.) of the Hindus, held sacred by them and by the people of Thibet. It is also much esteemed and cultivated in China, and elsewhere in the East, for its seeds, roots, leaf-stalks, and flower-stalks, all of which are eaten. It has been used as food by the Egyptians from remote antiquity. The seeds are in size and shape like acorns, with a taste more delicate than that of almonds. The root contains much starch, and *Chinese arrow-root* is said to be obtained from it. Slices of it are often served up at table in China. Great quantities are pickled with salt and vinegar, and eaten with rice. The powdered root makes excellent soup with water or milk. The flowers are generally rose-coloured, seldom white. The ancient Egyptian mode of sowing this plant, by enclosing each seed in a ball of clay, and throwing it into the water, is practised at the present day in India.—*N. luteum* is a North American species, extending almost as far north as Philadelphia; with yellow flowers. The seeds are sought after by children and by Indians, and the farinaceous roots are agreeable when boiled.

NEMAT/ELMIA (derived from the Gr. words *nema*, a thread, and *helmins*, an intestinal worm) is the term given by recent zoologists to a large and important class of the subdivision *Vermes* of the *Articulata*. The worms belonging to this class are

of a more or less elongated cylindrical form. Their skin is thick and strong, and is usually wrinkled in such a manner as to give the body an annulated appearance, which, however, disappears if the animal is placed in water. The nervous system in the higher forms (as the *Ascarida*) consists of two lateral ganglia at the anterior extremity, which are united by a slender nervous ring, and from which two lateral nervous trunks proceed to the posterior part of the body; while in the lower forms no distinct nervous system can be recognised. No special organs of the senses are met with; but a general sense of touch is probably present. The digestive organs are extremely simple. In one order (the *Acanthocephala*), no trace of an intestinal canal can be detected; in another order (the *Gordiaceæ*), there is a mouth, but no anus; while the higher forms are provided with mouth, intestinal canal, and anus. In the higher forms, a kind of vascular system is developed in the skin, in the shape of canals, in which the nutrient fluid is propelled by the movements of the body. No distinct respiratory organs can be detected; but in some genera there are glands whose object is not clearly known. These worms are unisexual; but the males are comparatively rarely found, and are always smaller than the females. With the exception of two families—the *Urolabea* and *Anguillulidæ*, or paste and vinegar eels—all the animals of this class are parasitic; indeed, Carnus, in his *Handbuch der Zoologie* (1863), vol. ii. p. 458, goes so far as to say that 'probably all the nematelmia live as parasites, either during their whole lives or during certain stages of their existence.'

The N. are sometimes termed *Round-worms*, just as the *Platyelmia* (tape-worms, flukes, &c.) are called *Flat-worms*. Most commonly, however, the term *round-worm* is restricted to the *Ascaris lumbricoides*, the most common of the human entozoa.

This class is divisible into three very distinct orders—viz., the *Acanthocephala*, which are destitute of an intestinal canal; the *Gordiaceæ*, which possess an intestinal canal, but no anus; and the *Nematoidæ*, which possess a perfect intestinal canal, provided with two orifices.

NEMATOIDEA constitute the highest order of the Nematelmia, and indeed of intestinal worms generally, inasmuch as they present a distinct nervous system, a complete intestine provided with mouth and anus, and distinct sexual organs. The history of their development is not fully known; but there is no reason to believe that these animals undergo any remarkable metamorphoses, although some perforate the intestinal walls, and become encysted in parenchymatous organs. The great majority of the N. are parasitic. The N. are divided by Carnus into twelve families, all the members of which are known only in a parasitic state of existence, excepting certain genera of the first and second family.

Although the intestinal canal is the most common residence of these worms, some, as *Trichina spiralis*, are found chiefly in the muscles; others, as *Filaria medinensis*, in the subcutaneous cellular tissue; and others in the kidneys, lungs, &c. See ENTOMOZOA. For further information regarding these worms, the reader is referred to Eberth's *Untersuchungen über Nematoden* (4to, 1863).

NEMĒA, anciently the name of a deep and well-watered valley of Argolis, in the Peloponnesus, between Cleonæ and Phlius. It lies north and south, and is from two to three miles long, and more than half a mile broad. It possessed a sacred grove, with a magnificent temple of Zeus, and was celebrated for the games called the *Nemean Games*,

which took place four times in two Olympiads in an adjacent woody valley. This was one of the great national festivals of the Greeks, and, according to one legend, was founded by the seven princes who were combined against Thebes; according to another, by Hercules after his victory over the Nemean Lion. The games consisted partly of exercises of bodily skill and strength—such as chariot-racing, quoit-throwing, wrestling, running in armour, horse-racing, boxing, throwing the spear, and archery, and partly of musical and poetical competitions. The prize was originally a crown of olive twigs, afterwards of parsley. We have eleven odes by Pindar in honour of victors in the Nemean Games.

NEMERTĒS, a genus of marine *Annelida*, the type of a family, *Nemertidæ*, remarkable for the prodigious length which some of the species attain, which, in their most extended state, is 30 or 40 feet. But the animal which stretches itself out to this length, is capable of suddenly contracting itself to three or four feet. The structure is similar to that of leeches, but there is no sucker. These annelids feed upon molluscs by sucking them out of their shells. They generally lurk in the mud or sand of the sea-coast, and are sometimes drawn up with the nets or lines of fishermen. They twine themselves into knots and coils, apparently inextricable, but without any real entanglement. The life-history of the *Nemertidæ* is curious. The embryo has at first a ciliated, non-contractile, oval body; from which there issues a small actively contractile worm, leaving behind it the oval skin, and this worm grows to the size already mentioned. The larval state, however, exhibits a cleft with raised edges, which becomes the mouth of the perfect animal.

NEMESIS, according to Hesiod, the daughter of Night, was originally the personification of the moral feeling of right and a just fear of criminal actions—in other words, of the conscience. Afterwards, when an enlarged experience convinced men that a Divine will found room for its activity amid the little occurrences of human life, N. came to be regarded as the power who constantly preserves or restores the moral equilibrium of earthly affairs—preventing mortals from reaching that excessive prosperity which would lead them to forget the reverence due to the immortal gods, or visiting them with wholesome calamities in the midst of their happiness. Hence originated the latest and loftiest conception of N., as the being to whom was intrusted the execution of the decrees of a strict retributive providence—the awful and mysterious avenger of wrong, who punishes and humbles haughty evildoers in particular. N. was thus regarded as allied to Atë (q. v.) and the Eumenides (q. v.). She was sometimes called Adrastæa and Rhamnusia, the latter designation being derived from Rhammus, a village of Attica, where she had a temple. She was represented in the older times as a young virgin, resembling Venus; in later times, as clothed with the tunic and peplos, sometimes with swords in her hands and a wheel at her foot, a griffin also having his right paw upon the wheel; sometimes in a chariot drawn by griffins. N. is a frequent figure on coins and gems.

NENAGH, a market town of Tipperary county, Ireland, distant 95 miles south-west from Dublin; pop. (1861) 6488, of whom 5898 were Roman Catholics, 530 Protestants of the Established Church, and the rest Protestants of other denominations. N. is the assize town of the North Riding of Tipperary, and is a place of more than ordinary pretensions, as well in its public buildings as in the general character of the houses. The ancient keep, called

Nenagh Round, is a striking object, and the court-house, jail, barrack, and union workhouse are imposing edifices. There is a free school, and three national schools, containing (1861) 1175 pupils, of whom 730 are females, and 445 boys. N. is almost entirely without manufactures, but is a place of considerable inland trade.

NEOPHYTE (Gr. *neophytos*, from *neos*, new, and *phito*, to grow), the name given in early ecclesiastical language to persons recently converted to Christianity. The word is used in this sense by St Paul (1 Tim. iii. 6), and is explained by St Gregory the Great as an allusion to 'their being newly planted in the faith' (Epp. b. v. ep. 51). It differed from Catechumen (q. v.), inasmuch as it supposed the person to have not only embraced the doctrines of the church, but also to have received baptism. St Paul, in the passage referred to, directs Timothy not to promote a neophyte to the episcopate; and this prohibition was generally maintained, although occasionally disregarded in very extraordinary circumstances, such as those of St Ambrose (q. v.). The duration of this exclusion was left for a time to the discretion of bishops; but several of the ancient synods legislated regarding it. The third council of Arles, 524, and the third of Orange in 538, fix a year as the least limit of probation. In the modern Roman Catholic Church the same discipline is observed, and extends to persons converted not alone from heathenism, but from any sect of Christians separated from the communion of Rome. The time, however, is left to be determined by circumstances. The name neophyte is also applied in Roman usage to *newly-ordained priests*, and sometimes, though more rarely, to the *novices* of a religious order.

NEO-PLATONISTS, the name given to an illustrious succession of ancient philosophers who claimed to found their doctrines and speculations on those of Plato. Strictly speaking, however, the Platonic philosophy—that is, in its original and genuine form—expired with Plato's immediate disciples, Speusippus and Xenocrates. Arcesilaus (q. v.), the founder of the New Academy, and at a later period Carneades (q. v.), introduced and diffused a sceptical *Probabilism*, which gradually destroyed that earnest and reverent spirit of intellectual inquiry so characteristic of the great pupil of Socrates. The course of political events in the ancient world also largely assisted in bringing about the same result. The triumphs of the Roman power had been accomplished at the expense of national liberties, and had issued in a general deterioration of moral character, both in the East and the West. Public men, especially, sought, above all things, material gratifications, and came to look upon philosophy itself as only a more exquisite kind of luxury. It was quite natural, therefore, that Scepticism and Eclecticism should become the prevalent forms of philosophy. Besides, the speculations of the older philosophers were felt to be unsatisfactory. When men began to review the long succession of contradictory or divergent systems that had prevailed since the time of Thales the Milesian, in the gray dawn of Greek history, a suspicion appears to have sprung up that reality, certainty, truth, was either not attainable, or could only be attained by selecting something from every system. Moreover, the immensely extended intercourse of nations, itself a result of Roman conquest, had brought into the closest proximity a crowd of conflicting opinions, beliefs, and practices, which could not help occasionally undergoing a confused amalgamation, and in this way presented to view a practical eclecticism, less refined and philosophical indeed than the speculative systems of the day, but

not essentially different from them. This tendency to amalgamation shewed itself most prominently in Alexandria. Placed at the junction of two continents, Asia and Africa, and close to the most cultivated and intellectual regions of Europe, that celebrated city naturally became a focus for the chief religions and philosophies of the ancient world. Here, the East and the West, Greek culture and Oriental enthusiasm, met and mingled; and here, too, Christianity sought a home, and strove to quell, by the liberality of its sympathies, the myriad discords of Paganism. 'Greek Scepticism,' says Mr Lewes, 'Judaism, Platonism, Christianity—all had their interpreters within a small distance of the temple of Serapis.' It is not wonderful, therefore, that a philosophy, which so distinctly combines the peculiar mental characteristics of the East and the West, as that promulgated by the Neo-Platonists, should have originated in Alexandria. Yet, at the same time, it is but right to notice, as does M. Matter in his *Histoire de l'École d'Alexandrie*, that it soon ceased to have any local connection with the city. Its most illustrious representatives were neither natives of Alexandria, nor members of the famous Museum, and they had their schools elsewhere—in Rome, in Athens, and in Asia.

It is not easy to say with whom *Neo-Platonism* commenced. Scholars differ as to how much should be included under that term. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy, 1st, of Philo-Judaus and of Numenius the Syrian; 2d, of the Christian Fathers (Clemens Alexandrinus, Origen, &c.); 3d, of the Gnostics; and 4th, of Ammonius Saccas and his successors. Others, again, would exclude the second of these (though the Alexandrian divines frequently Platonise); while a third party is disposed to restrict the application of the term to the fourth. The last of these modes of regarding Neo-Platonism is the one most current, and is perhaps the most convenient and definite; yet Bouterwek, Tenneumann, Lewes, &c., agree in considering Philo-Judaus (q. v.), an Alexandrian Jew, and (in part) contemporary of Jesus Christ, as the first of the Neo-Platonists—that is to say, as the first who endeavoured to unite the mysteries of Oriental belief with the dialectics and speculations of the Platonists. A similar course was at least partially pursued by the Christian fathers of Alexandria, partly from a predilection for the philosophy in which they had been reared, and partly from a desire to harmonise reason and faith, and to make their religion acceptable to thoughtful and educated pagans; hence, they too may, not without reason, be classed along with Philo, though their spirit and aim are distinctively and even strongly Christian. In Gnosticism, on the other hand, speaking generally, the lawless mysticism of the East predominated, and we see little either of the spirit or logic of Plato. They may therefore be dismissed from the category of Neo-Platonists. Regarding Philo-Judaus and the Alexandrian divines, it must be noticed that they wrote and taught in the interests of their own religion, and had no idea of defending or propagating a heathen philosophy. It is this which strikingly distinguishes them from the school founded by Ammonius Saccas, and also from an independent group of pagan teachers and authors who likewise flourished in the first and second centuries after Christ, and whose main object was to popularise and diffuse the ethics and religious-philosophic system of Plato, by allegorically explaining the ancient mysteries of the popular belief in harmony with the ideas of their master, but, at the

same time, blending with these many Pythagorean and Aristotelian notions. The best-known names of this group are Plutarch (q. v.) and Appuleius (q. v.). These men have a better claim to the title of Neo-Platonists than any of the others. They adhered far more closely to their great master, and were, in fact—to the best of their ability—simply popular expounders of his philosophy. Living at a time when paganism was in a moribund condition, they sought to revive, purify, and elevate the faith in which their fathers had lived. Christianity, a young, vigorous, and hostile system, was rooting itself in the hearts of men deeper and deeper every day, and these disciples of Plato—tenderly attached to their ancestral religion—felt that something must be done to preserve from going out the fires that were feebly burning on the altars of the ancient gods.

But these commentators and expositors of Plato were not remarkable for their philosophical power; a fresh stream of life was first poured into the old channels of Platonic speculation by Ammonius Saccas (q. v.) and Plotinus (q. v.), and it is this fact which gives the school which they established its best claim to the exclusive title of *Neo-Platonist*. 'In no species of grandeur was the Alexandrian school deficient,' as M. Saisset justly observes: 'genius, power, and duration have consecrated it. Re-animating during an epoch of decline the fecundity of an aged civilisation, it created a whole family of illustrious names. Plotinus, its real founder, resuscitated Plato; Proclus gave the world another Aristotle; and in the person of Julian the Apostate, it became master of the world. For three centuries it was a formidable rival to the greatest power that ever appeared on earth—the power of Christianity; and if it succumbed in the struggle, it only fell with the civilisation of which it had been the last rampart' (Lewes's *Biog. Hist. Phil.* p. 259). The essence of all the Alexandrian speculations, we have stated, consists in the blending of Platonic ideas with Oriental mysticism; the peculiarity of the *Neo-Platonists*, strictly so-called, lies simply in the novelty, audacity, and ingenuity of their reasonings. They aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the Highest, and the way in which they endeavoured to accomplish this was by assuming the existence of a capacity in man for passing beyond the limits of his personality, and acquiring an intuitive knowledge of the absolute, the true—that which is beyond and above the fluctuations and dubieties of 'opinion.' This impersonal faculty is called *Ecstasy*. By means of it, man—ceasing, however, it should be observed, to be individual man, i. e., *himself*—can identify himself with the Absolute (or Infinite). Plotinus, in fact, set out from the belief that 'philosophy' (i. e., 'Absolute Truth') is only possible through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. This intuitive grasp or 'vision' of the Absolute is not constant; we can neither force nor retain it by an effort of will; it springs from a divine inspiration and enthusiasm, higher and purer than that of poet or prophet, and is the choicest 'gift of God.'

The god of Plotinus and the other Alexandrians is a mystical Trinity, in the exposition of which they display a dialectical subtlety that even the most ingenious of the schoolmen never reached. The Divine Nature contains within it three Hypostases (Substances); its basis, if we may so speak, is called Unity, also poetically Primitive Light, &c. This Unity is not itself any *thing*, but the principle of all things; it is absolute good, absolute perfection; and though utterly incapable of being conceived by

the understanding, there is that in man that assures him that it—the incomprehensible, the ineffable, is. 'It has neither quantity nor quality; neither reason nor soul; it exists neither in motion nor repose; neither in space nor time; it is not a numeric unity nor a point; . . . it is pure Esse without Accident; . . . it is exempt from all want or dependency, as well as from all thought or will; it is not a thinking Being, but Thought itself—the principle and cause of all things.' To the sceptic this 'Primitive Light,' we are afraid, will not seem very luminous. From 'Unity,' as the primordial source of all things, emanates 'Pure Intelligence' (*Nous*—the *Vernunft* of modern German metaphysics); its reflection and image, that by which it is intuitively apprehended; from Pure Intelligence, in turn, emanates the 'Soul of the World' (*Psyche tou pantos*), whose creative activity produces the souls of men and animals, and 'Nature,' and finally, from Nature proceeds 'Matter,' which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness. Unity, Pure Intelligence, and the World-Soul thus constitute the Plotinian Triad, with which is connected, as we have seen, the doctrine of an eternal Emanation, the necessity of which he endeavours to demonstrate by the most stringent logic. Human souls, whose source is the Pure Intelligence, are—by some mysterious fate—imprisoned here in perishable bodies, and the higher sort are ever striving to reascend to their original home. So Plotinus, when in the agonies of death, said calmly to his friends: 'I am struggling to liberate the divinity within me.'

The most distinguished pupil of Plotinus was Porphyrius (q. v.), who mainly devoted himself to expounding and qualifying the philosophy of his master. In him we see, for the first time, the presence of a distinctively anti-Christian tendency. Neo-Platonism, which can only be properly understood when we regard it as an attempt to place Paganism on a philosophical basis—to make the Greek religion philosophical, and Greek philosophy religious—did not *consciously* set out as the antagonist of Christianity. Neither Ammonius Saccas nor Plotinus assailed the new faith; but as the latter continued to grow, and to attract many of the most powerful intellects of the age into its service, this latent antipathy began to shew itself. Porphyry wrote against it; Iamblichus (q. v.), the most noted of his pupils, did the same. The latter also introduced a theurgic or 'magical' element into Neo-Platonism, teaching, among other things, that certain mysterious practices and symbols exercised a supernatural influence over the divinities, and made them grant our desires. Magic is always popular, and it is therefore not wonderful that Iamblichus should have had numerous followers. Aedesius succeeded to his master's chair, and appears to have had also a considerable number of disciples. To the school of one of them the Emperor Julian belonged, whose patronage for a moment shed a gleam of splendour over Neo-Platonism, and seemed to promise it a universal victory. After a succession of able, but not always consistent teachers, we reach Proclus (q. v.), the last great Neo-Platonist, who belongs to the 5th c., a man of prodigious learning, and of an enthusiastic temperament, in whom the pagan-religious, and consequently anti-Christian, tendency of the Neo-Platonic philosophy culminated. His ontology was based on the Triad of Plotinus, but was considerably modified in detail; he exalted 'Faith' above 'Science' as a means of reaching the Absolute Unity; was a believer in Theurgy, and so naturally laid great stress upon the ancient Chaldean oracles, Orphic hymns, mysteries, &c., which

he regarded as divine revelations, and of which he considered himself—as, indeed, he was—the last great ‘interpreter.’ His hostility to the Christian religion was keen; in its success he saw only the triumph of a vulgar popular superstition over the refined and beautiful theories of philosophy; it was as if he beheld a horde of barbarians defacing the statues and records of the Pantheon. The disciples of Proclus were pretty numerous, but not remarkable for high talent. Perhaps the ablest of his successors was Damascius, in whose time the Emperor Justinian, by an arbitrary decree, closed the schools of the heathen philosophers. ‘The victims,’ says Cousin (*Cours d’Histoire de la Philosophie Moderne*), ‘of fierce retaliation, and of an obstinate persecution, these poor Alexandrians, after having sought an asylum in their dear East, at the court of Chosroes, returned to Europe (533 A.D.), were dispersed over the face of the earth, and the most part extinguished in the deserts of Egypt, which were converted for them into a philosophic Thebais.’ See Fichte, *De Philosophiæ Novæ Platonice Origine* (Berl. 1818); Bouterwek, *Philosophorum Alexandrinorum ac Neo-Platoniorum. recensio accuratio* (Gött. 1821); Matter, *Essai Historique sur l’Ecole d’Alexandrie* (2 vols. Par. 1820); Simon, *Histoire de l’Ecole d’Alexandrie* (2 vols. Par. 1843); Barthélemy St Hilaire, *De l’Ecole d’Alexandrie* (Par. 1845); Lewes, *Biographical History of Philosophy* (1857); and Tennemann’s *Manual of the History of Philosophy* (trans. by Morell; Bohm, 1852).

**NEOZOIC** (Gr. new life), a term introduced by Edward Forbes to include all the strata from the Trias to the most recent deposits. They are generally divided into the two great groups of Secondary and Tertiary Rocks. This division is, however, quite arbitrary—the chief point of difference depending on the occurrence in the Tertiary deposits of species supposed to be the same as some still living. There is no paleontological nor petrological break similar to that which exists between the Permian and Trias. Forbes, accordingly, suggested the obliteration of the division between the Secondary and Tertiary series, and the division of all geological time into two epochs—the Palæozoic and the Neozoic.

**NEPA AND NEPIDÆ.** See WATER-SCORPION.

**NEPAUL**, an independent kingdom of Hindustan, comprises a portion of the southern slope of the Himalayas, is bounded on the N. by Tibet, on the S. and W. by British India, and on the E. by Sikim, a protected state. Long. 80° 15′—88° 15′ E. It is 500 miles in length, by about 100 miles in average breadth. Area, 54,000 square miles; pop. estimated at 1,940,000. The kingdom is separated from the plains of India by the long narrow strip of land, resembling an English down, but unhealthy, called the Terai, which extends along the whole southern border. North of this, and running parallel with it, is the great forest of N., from 8 to 10 miles broad. North of this strip is a tract of hilly country, and above that are two tracts of greater elevation, the first of which may be called mountainous, while the second might appropriately be called Alpine, if it did not comprise among its mountains, peaks, which, like Mount Everest and Dhawalagiri, attain almost twice the elevation of Mont Blanc. The principal rivers are the Kurnali, the Rapti, the Gunduk with its great tributaries, and the Sun Kosi. The climate, most unhealthy in the Terai, is healthy and pleasant in the hilly and mountainous districts, suggesting that of Southern Europe. In the *Valley of N.*—the district surrounding the capital—the heat of Bengal, which is felt in

the hollows, may be exchanged for the cold of Russia by ascending the slopes of the hills which enclose it. The soil is extremely rich and fruitful. Barley, millet, rice, maize, wheat, cotton, tobacco, sugarcane, pine-apple, and various tropical fruits are cultivated. Gold has not been found, but iron and copper mines are worked. The inhabitants consist mainly of two tribes—the Ghurkas, whose chief occupation is war, and the Newars, who are principally artisans. The capital of the country is Khatmandu (q. v.).

**NEPENTHES**, the only known genus of a natural order of exogenous plants called *Nepenthaceæ*, consisting of herbaceous or half-shrubby plants with dioecious flowers, natives of swampy ground in India and China, chiefly remarkable for their leaves. Each leaf consists of a dilated foliaceous petiole, prolonged beyond its foliaceous part, as if it were the prolongation of the midrib of a leaf,

Pitcher Plant (*Nepenthes distillatoria*).

and terminating in a pitcher (*ascidium*), from which the name PITCHER PLANT has been very generally given to the species of this order. The pitcher is terminated by a lid, which is regarded as the true blade of the leaf. The fluid found in these pitchers is probably in some way useful for the nourishment of the plant, and is a secretion of the plant itself. It varies much in quantity. Insects often enter the pitcher, and are drowned in it. It contains binoxalate of potash. Pitcher plants (*N. distillatoria*) are not uncommon in our hot-houses.

**NEPHELIUM.** See LITCHI.

**NEPHRITE**, a mineral which is not unfrequently called Jade (q. v.), and of which Axestone (q. v.) is very generally considered a variety. It is composed of silica, magnesia, and lime; is compact, with a coarse splintery fracture, very tenacious, sometimes translucent, greasy to the touch, and of a green or greenish colour. It is found in granite, gneiss, greenstone, &c., in many parts of the world. Very fine specimens are brought from Persia, Siberia, and China, and are known as *Oriental Jade*. The kind called *Indian Jade* is olive green, and strikes fire with steel; that from China is whitish, and does not strike fire. N. is used for ornaments. The Turks make it into handles for sabres and daggers. Many imaginary virtues were once ascribed to it, such as the cure of epileptic fits and of nephritic (Gr. *nephros*, kidney) complaints; hence its name.

**NEPHRITIS** (Gr. *nephros*, kidney), inflammation of the Kidneys (q. v.).

**NEPOMUC.** See JOHN OF NEPOMUK.

**NEPOS**, CORNELIUS, a Roman historian, born in the 1st c. B. C., but the place and precise time of his birth are unknown. He was the friend of Cicero and Catullus. The only work of N.'s which has survived (if indeed it be his), is a series of twenty-five generally brief biographies of warriors and statesmen, mostly Greeks. These biographies are distinguished by the purity of their Latinity, the conciseness of their style, and their admirable exhibition of character, but sufficient care has not been exercised in the examination of authorities, nor is the relative importance of things duly regarded. Until the middle of the 16th c., these biographies, on the strength of the titles given in the various MSS., were generally ascribed to Æmilius Probus, a writer who lived in the latter part of the 4th c.; but in 1569, an edition was put out by the famous Dionysius Lambinus, who pronounced the so-called *Lives* of Æmilius Probus to be in reality the lost work of Cornelius Nepos, *De Viris Illustribus*. His weightiest argument is drawn from the excellence of the Latin, and the chastity of the style, so unlike the corrupt and florid language of the Decline. Many critics hold that these Lives ought to be regarded as an abbreviation of the work of N. by Probus. This hypothesis is not without its difficulties, but it is perhaps the least objectionable of any. There are many editions, among which may be mentioned those of Van Staveren (Leyd. 1773), of Tzschucke (Gott. 1804), and of Bremi (Zur. 1820); and the book is in general use as a school-book. It has been very frequently translated into English and other languages.

**NEPTUNE**, an ancient Italian god. It is doubtful whether he was originally a marine deity at all,

Neptune.

for the old Italians were the very opposite of a maritime people, yet his name is commonly connected with *nato*, to swim; hence at an earlier period he may have borne another designation, afterwards forgotten. When the Romans became a maritime power, and had grown acquainted with Grecian mythology, they, in accordance with their usual practice, identified him with the Greek god whom he most resembled. This was *Poseidon*, also *Poteidan* (connected with *potos*, a drink, *pontos*, the sea, and *potamos*, a river). *Poseidon* appears in his most primitive mythological form as the god of water in general, or the fluid element. He was the son of Cronos (Saturn) and Rhea, and a brother of Jupiter. On the partition of the universe amongst the sons of Cronos, he obtained the sea as his portion, in the depths of which he had his palace near *Æge*, in *Eubœa*. Here also he kept his brazen-hoofed and golden-maned steeds, in a chariot drawn by which

he rode over the waves, which grew calm at his approach, while the monsters of the deep, recognising their lord, made sportive homage round his watery path. But he sometimes presented himself at the assembly of the gods on Olympus, and in conjunction with Apollo, built the walls of Troy. In the Trojan war he sided with the Greeks; nevertheless he subsequently shewed himself inimical to the great sea-wanderer Ulysses, who had blinded his son Polyphemus. He was also believed to have created the horse, and taught men its use. The symbol of his power was a trident, with which he raised and stilled storms, broke rocks, &c. According to Herodotus, the name and worship of Poseidon came to the Greeks from Libya. He was worshipped in all parts of Greece and Southern Italy, especially in the seaport towns. The Isthmian games were held in his honour. Black and white bulls, boars, and rams were offered in sacrifice to him. N. was commonly represented with a trident, and with horses or dolphins, often along with Amphitrite, in a chariot drawn by dolphins, and surrounded by tritons and other sea-monsters. As befitted the fluctuating element over which he ruled, he is sometimes figured asleep or reposing, and sometimes in a state of violent agitation.

**NERCHUDDAH**, a river of Hindustan, rises in the Vindhya Mountains, at a height of from 3000 to 4000 feet above sea-level, in lat. 22° 40' N., long. 81° 52' E. It flows west, past Jabalpur (190 miles from its source), where the great depression between the Vindhya Mountains on the north and the Satpura Mountains on the south, known as the Valley of the N., begins. The other principal towns on its banks are Hoshangabad, Burwani, and Barneh. At Hoshangabad it is 900 yards wide, and from five to six feet in depth. At Barneh it begins to expand into a wide estuary, and after flowing 30 miles further, it falls into the Gulf of Cambay. Entire length about 800 miles, of which 90 miles are navigable for river-boats.

**NERCHINSK**, an important mining town of Russia, Eastern Siberia, in the Trans-Baikal Territory, on the Nercha, a tributary of the Shilka, in lat. 51° 58' N., long. 116° 35' E., 4707 miles from St Petersburg. It was founded in 1658, and has from 4000 to 5000 inhabitants. The district, of which N. is the centre, yields 2166 pounds of gold yearly, together with large quantities of silver, lead, and iron, and precious stones. The only tin-mines in the empire are worked here. The soil in the vicinity is fertile, and the climate mild and agreeable.

**NEREIS**, a genus, and **NEREIDÆ**, a family of *Annelida*, having a long slender body, a distinct head, with tentacles and eyes; the whole body

Nereis.

covered with tubercles, and the gills lobed and tufted. They are all marine, and generally hide under rocks or in the sand. They swim actively,

by rapid and undulating inflections of the body, and by the aid of numerous oars arranged along the sides; each formed of a stout footstalk, numerous bristles, and a flap. The proboscis is thick, strong, and armed with two jaws.

NEREITES, the name given to animals which have left their impress on the Silurian Rocks, and which exhibit a form similar to the modern Nereis. They occur on the surface of the laminae of fine shales, over which, when it was soft, the creature moved, leaving a long and tortuous trail, which is generally found to terminate in a more defined representation produced apparently by the body itself, although every trace of it has disappeared. See *ICHOLOGY*, fig. 2.

NERI, PHILIP DE, a saint of the Roman Catholic Church, and founder of the Congregation of the Oratory (q. v.), was born of a distinguished family in Florence, July 21, 1515. His character, even in boyhood, foreshadowed the career of piety and benevolence to which he was destined, and he was commonly known among his youthful companions by the name of 'good Philip.' On the death of his parents, he was adopted by a very wealthy uncle, with whom he lived for some time at San Germano, near Monte Cassino, and by whom he was recognised as his destined heir. But he relinquished all these prospects, for a life of piety and charity, and having come to Rome in 1534, he there completed his philosophical and theological studies, and won the esteem and reverence of all by his extraordinary piety, and his benevolence and activity in every good work whether of charity or of religion. Although he did not receive priest's orders till 1551, he had already been for years one of the most earnest and devoted in all the pious works of Rome for the instruction of the poor, the care of the sick, and the reclamation of the vicious; and in 1550, in unison with several of his friends, he established a confraternity for the care of poor pilgrims visiting Rome, and other houseless persons, as well as of the sick generally, which still subsists, and which has numbered among its associates many of the most distinguished members of the Roman Catholic Church. This confraternity, however, is chiefly noteworthy as having been the germ of the far more celebrated CONGREGATION OF THE ORATORY (q. v.), which was founded by St Philip in concert with his friends Baronius and Tarugio, both afterwards cardinals, Sabriati, and some others. Besides the general objects above indicated, and the spiritual duties designed for the personal sanctification of the members, the main object of this association was the moral instruction and religious training of the young and uneducated, who were assembled in chapels or oratories, for prayer and for religious and moral instruction. As a further means of withdrawing youth from dangerous amusements, sacred musical entertainments (thence called by the name of *oratorio*) were held in the oratory, at first consisting solely of hymns, but afterwards partaking of the nature of sacred operas or dramas, except that they did not admit the scenic or dramatic accompaniments of these more secular compositions. Religious and literary lectures also formed part of his plan, and it was in the lectures originally prepared for the Oratory that, at the instance of N., the gigantic *Church History* of Baronius had its origin. The personal character of N., the unselfish devotedness of his life, his unaffected piety, his genuine love of the poor, his kindly and cheerful disposition, and, perhaps, as much as any of the rest, a certain quaint humour, and a tinge of what may almost be called drollery which pervaded many of his sayings and doings, contributed to popularise his institute,

and to engage the public favour for himself and his fellow-labourers. He himself enjoyed the reputation of sanctity and of miracles among his fellow-religionists almost beyond any of the modern saints; and he may still be described as emphatically the popular saint of the Roman people. He lived to an extreme age in the full enjoyment of all his faculties, and in the active discharge to the last of all the charitable duties to which his life had been devoted. He died at the age of 80, May 26, 1595. He was canonised by Gregory XV. in 1622. His only literary remains are his *Letters* (Svo, Padua, 1751); the *Constitutions* of his congregation, printed in 1612; some short spiritual treatises, and a few sonnets which are printed in the collection of *Rime Oneste*.

NERIUM. See OLEANDER.

NERO, Roman emperor from 54 A.D. to 68 A.D., was born at Antium, on the coast of Latium, 15th December 37 A.D., and was the son of Cn. Domitius Ahenobarbus and of Agrippina, the daughter of Germanicus Caesar, and sister of Caligula. His mother becoming the wife of the Emperor Claudius, Claudius adopted him (50 A.D.), and his name, originally L. Domitius Ahenobarbus, was changed to Nero Claudius Caesar Drusus Germanicus. After the death of Claudius (54 A.D.), the Pretorian Guards, at the instigation of Afranius Burrhus, their prefect, declared him emperor, instead of Claudius's son Britannicus, and their choice was acknowledged both by the senate and the provinces. His reign began with the semblance of moderation and good promise, under the guidance of Burrhus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be treacherously poisoned at the age of 14, because he dreaded him as a rival, and afterwards (59 A.D.) caused his own mother Agrippina (with whom he was latterly on bad terms) to be assassinated, to please his mistress Poppæa Sabina (the wife of his principal boon-companion Otho, afterwards emperor), in order to marry whom he also divorced and afterwards put to death his wife Octavia (aged 20), the sister of Britannicus. The low servility into which the Roman senate had sunk at this time, may be estimated from the fact that it actually issued an address congratulating the hateful matricide on the death of Agrippina. N. himself, on the other hand, confessed that he was ever haunted by the ghost of his murdered mother. The affairs of the empire were at this time far from tranquil. In 61 A.D., an insurrection broke out in Britain under Queen Boadicea, which was, however, suppressed by Suetonius Paulinus. The following year saw an unsuccessful war against the Parthians in Armenia. At home, matters were not much better. The emperor was lampooned in verse; the senate and priesthood, alike venal, were also satirised by audacious malcontents; Burrhus, a valuable friend, died; and even Seneca, though not a great moralist, out of his books, thought it only decent to remove from court. In July 64, occurred a great conflagration in Rome, by which two-thirds of the city were reduced to ashes. N. himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance, reciting verses about the burning of Troy, but many scholars are doubtful whether he really had any hand in it. At all events he laid the blame on the Christians—that mysterious sect, who, like the Jews in the middle ages, were the cause of all otherwise inexplicable calamities, and persecuted them with great fury. Moreover, he rebuilt the

city with great magnificence, and reared for himself on the Palatine Hill a splendid palace, called, from the immense profusion of its golden ornaments, the *Aurea Domus*, or Golden House; and in order to provide for this expenditure, and for the gratification of the Roman populace by spectacles and distributions of corn, Italy and the provinces were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppæa, by kicking her when she was pregnant. He then proposed to Antonia, the daughter of Claudius, but was refused, whereupon he caused the too fastidious lady to be put to death, and married Statilia Messallina, after killing her husband. He also executed or banished many persons highly distinguished for integrity and virtue. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer, and he received sycophantic applauses, not only in Italy, but in Greece, to which, upon invitation of the Greek cities, he made a visit in 67. But in 68, the Gallic and Spanish legions, and after them the Praetorian Guards, rose against him to make Galba emperor, and N. fled from Rome to the house of a freedman, Phaon, about four miles distant. The senate, which had hitherto been most subservient, declared him an enemy of his country, and the tyrant ended his life by suicide, 11th June 68. One is sorry to learn that such a wretch had a taste for poetry, and was skilled in painting and modelling.

NERVA, M. COCCÆUS, a Roman emperor, elected by the senate after the murder of Domitian, 18th September 96. He was born 32 A.D., of a family belonging to Narnia, in Umbria, and twice held the honour of consulship before his election to the dignity of emperor. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; but finding himself, upon account of his advanced age, not vigorous enough to repress the insolence of the Praetorian Guards, he adopted M. Ulpius Trajanus, then at the head of the army of Germany, who succeeded him on his death, 27th January 98. After his decease, he obtained an apotheosis.

NERVOUS SYSTEM, THE, is composed in all vertebrated animals of two distinct portions or systems—viz., the *cerebro-spinal* and *sympathetic* or *ganglionic*.

The *cerebro-spinal system* includes the brain and spinal cord (which form the *cerebro-spinal axis*), and the cranial and spinal nerves. It was termed by Bichat the nervous system of animal life, and comprises all the nervous organs concerned in sensation, volition, and mental action.

The *sympathetic system* consists essentially of a chain of ganglia connected by nervous cords, extending from the cranium to the pelvis, along each side of the vertebral column, and from which nerves with large ganglionic masses proceed to the viscera and blood-vessels in the cavities of the chest, abdomen, and pelvis. It was termed by Bichat the nervous system of organic life, since it seems to regulate—almost or quite independently of the will—the due performance of the functions of the organs of respiration, circulation, and digestion.

The essential parts of the *cerebro-spinal axis* are described in the articles BRAIN, CEREBRUM and CEREBELLUM, and SPINAL CORD. The brain and spinal cord are covered and protected by three membranes or *meninges*, as they are frequently termed—viz., the *dura mater*, the *arachnoid*, and the *pia mater*. The *dura mater* is a strong fibrous membrane, which supplies the cranial bones with

blood in early life, and adheres firmly to their inner surface. It is less closely attached to the bony walls of the spinal canal. Inside the cranium it gives off processes (such as the *falc cerebri*, *tentorium cerebelli*, and *falc cerebelli*) which divide and support different parts of the brain; it gives a strong fibrous sheath to every nerve; and by splitting into two layers at certain points, it forms receptacles for venous blood, which are termed SINUSES (q. v.). The *arachnoid* (so called from its being supposed to be as thin as a spider's web) is a serous membrane, and, like all serous membranes, is a closed sac, consisting of a parietal and a visceral layer. The parietal layer adheres to the inner surface of the *dura mater*, to which it gives a smooth, polished appearance; while the visceral layer somewhat loosely invests the brain and spinal cord, from direct contact with which, however, it is separated by the intervention of the *pia mater* and some loose areolar tissue. In most regions there is an interval between the visceral layer of the *arachnoid* and the *pia mater*, which is called the *sub-arachnoid cavity*, and is filled during life by the *cerebro-spinal fluid*. This fluid, which varies in quantity from two to ten ounces, keeps the opposed surfaces of the *arachnoid* in close contact, and affords mechanical protection to the nervous centres which it surrounds, and guards them against external shocks. It is accumulated in considerable quantity at the base of the brain, where it serves for the protection of the large vessels and nerves situated there. In fracture of the base of the skull, the draining away of this fluid, often in very large quantity, through the external auditory meatus, is often one of the most significant symptoms. It is doubtless secreted by the *pia mater*, which is the immediate investing membrane of the brain and spinal cord. This membrane consists of minute blood-vessels, held together by an extremely fine areolar tissue. It dips down between the convolutions and fissures of the brain, and is prolonged into the interior, forming the *velum interpositum* and the choroid plexuses of the fourth ventricle. It is by means of this membrane that the blood-vessels are conveyed into the nervous substance.

We now proceed to notice the nerves connected with the cerebro-spinal centre or axis. These are usually described in two classes—the *spinal* and the *cranial* or *encephalic*. The former class consists of all those which arise from the spinal cord, and emerge from the spinal canal through the intervertebral foramina; while the latter includes those which arise from some part of the cerebro-spinal centre, and emerge through foramina in the cranium or skull.

The *Spinal Nerves* (exclusive of the spinal accessory nerve, which, from the fact that it emerges from the skull, is usually ranked among the cranial nerves) are thirty-one on either side, there being a pair for each pair of intervertebral foramina (whose formation is described in the article VERTEBRA AND VERTEBRAL COLUMN), and for the foramina between the atlas (the first or highest vertebra) and the occipital bone at the base of the skull. Every spinal nerve arises from the cord by two roots, an anterior and a posterior, of which the latter is distinctly the larger. Each root passes out of the spinal canal by a distinct opening in the *dura mater*. Immediately after its emergence, a ganglion is seen on the posterior root, and in the anterior surface of this ganglion the anterior root lies imbedded. Just beyond the ganglion, but not at all previously, the nervous fibres of both roots intermingle, and a compound nerve results. The trunk thus formed separates immediately after it has passed through the intervertebral canal into two divisions—the anterior and posterior—each of which contains

filaments from both roots, and possessing, as will be immediately shewn, perfectly different functions. These divisions, of which the anterior is considerably the larger, proceed to the anterior and posterior parts of the body respectively, and are

Fig. 1.—Roots of a Dorsal Spinal Nerve, and its union with the Sympathetic:

c, c', anterior fissure of the spinal cord; a, anterior root; p, posterior root with its ganglion; a', anterior division or branch; p', posterior branch; s, sympathetic; e, its double junction with the anterior branch of the spinal nerve by a white and a gray filament, the respective natures of which are subsequently described.—From Todd and Bowman.

distributed to the skin and the muscles. The anterior branch communicates with the sympathetic nerve, as is shewn in the figure. The mode of connection of the roots of the nerves with the cord is noticed in the article SPINAL CORD. These nerves are arranged in classes, according to the regions of the spine in which they originate, and we thus speak of eight cervical, twelve dorsal, five lumbar, and six sacral nerves on either side.

The discovery of the separate functions of the anterior and posterior roots of the spinal nerves, which has been characterised as the first important step towards a right understanding of the physiology of the nervous system, was made by our distinguished countryman Sir Charles Bell, although there is reason to believe that Magendie, without any knowledge of Bell's experiments, arrived at similar conclusions at nearly the same time. The original experiments consisted in laying open the spinal canal in rabbits, and irritating or dividing the roots of the spinal nerves. It was observed that irritation of the anterior roots caused muscular movement, and that the posterior roots might be irritated without giving rise to any muscular action; while division of the posterior roots did not impair the voluntary power over the muscles. Hence it was inferred that the anterior roots were motor (or conveyed motive power to muscles), and the posterior roots not motor; but it was not fully determined what degree of sensibility remained in parts supplied from the divided roots. Numerous physiologists arrived at similar results to those of Bell; but the most conclusive experiments are those of Müller, who operated on frogs, in which, from the great width of the lower part of the spinal canal, the roots of the nerves can be exposed with great facility. In these experiments, it was found that irritation of the anterior root always excited muscular contraction, while no such effect followed irritation of the posterior root; that section of the anterior root caused paralysis (or loss of power) of

motion, while section of the posterior root caused paralysis of sensation; and that when the anterior roots of the nerves going to the lower extremity were cut on one side, and the posterior roots on the other, voluntary power without sensation remained in the latter, and sensation without voluntary motion in the former. The obvious conclusion to be derived from these experiments is, that the anterior root of each spinal nerve is *motor*, and the posterior *sensitive*. (In place of the terms *sensitive* and *motor*, the terms *afferent* and *efferent* are now frequently used. The functions of the nerves being to establish a communication between the nervous centres and the various parts of the body, and *vice versa*; an *afferent* nerve communicates the impressions made upon the peripheral nervous ramifications to the centres, while an *efferent* nerve conducts the impulses of the nervous centres to the periphery.)

The *Cranial Nerves*, although twelve in number on either side, were arranged by Willis (*Cerebri Anatome; cui accessit Nervorum Descriptio et Usus*, 1664), whose system is still generally adopted, in nine pairs, which, taken from before backwards in the order in which they are transmitted through the foramina at the base of the skull, stand as follows: 1st, Olfactory; 2d, Optic; 3d, *Motores Oculorum*; 4th, *Pathetic*; 5th, *Trifacial*; 6th, *Abducentes*; 7th, *Portio Dura* or *Facial*, *Portio Mollis* or *Auditory*; 8th, *Glossopharyngeal*, *Par Vagum* or *Pneumogastric*, *Spinal Accessory*; 9th, *Hypoglossal*.

They may be subdivided into three groups, according to their functions—viz. *Nerves of Special Sense*—the Olfactory (see NOSE), Optic (see EYE), and Auditory (q. v.); *Nerves of Motion*, or *Efferent Nerves*—the *Motores Oculorum*, *Pathetic*, *Abducentes*, *Facial*, and *Hypoglossal*; and *Compound Nerves*—the *Trifacial*, *Glossopharyngeal*, *Pneumogastric*, and *Spinal Accessory*.

The reason why no nerve of Taste is included in the above arrangement amongst the nerves of special sense will be subsequently seen; and we proceed briefly to notice the functions of the motor cranial nerves.

The 3d, 4th, and 6th pairs—the *Motores Oculorum*, *Pathetic*, and *Abducentes*—together make up the apparatus by which the muscles of the orbit (the four Recti, the superior and inferior Oblique, and the Levator Palpebræ) are called into motion, and are sufficiently noticed in the article EYE.

The *Facial Nerve*, or the *Portio Dura* of the 7th pair, is divisible into three stages. The first stage is the *intercranial*, from its origin to its exit from the cranial cavity, in association with the *Portio Mollis*, or *Auditory Nerve* (q. v.), at the internal auditory meatus. The second stage is contained in the *Aqueduct of Fallopius*, a bony canal lying in the petrous portion of the temporal bone. In this stage it anastomises with other nerves, and thus *sensory* fibres are introduced into it from the 5th pair and other sources, which make irritation of some of its branches to cause pain. The third stage commences with the emergence of the nerve through the stylo-mastoid foramen. The nerve now lies in the parotid gland (which is not shewn in the figure), and after giving off the *posterior auricular*, and a few smaller branches, finally divides into the *temporal*, *facial*, and *cervical* branches (see 3, 5, and 9 in fig. 2). This diverging distribution of the nervous branches over the face forms the *pes anserinus* of the older anatomists, from the supposed resemblance to the expanded foot of a goose. Careful dissection of this nerve shews that the great majority of its fibres are distributed to muscles; and indeed, if we except the muscles of mastication, which receive their motor power from the 3d division of the 5th

pair, this may be regarded as the general motor nerve of the face. 'The muscles which are supplied by the facial nerve are chiefly those upon which

Fig. 2.—Distribution of the Facial Nerve and of the Branches of the Cervical Plexus :

1, the facial nerve at its emergence from the stylo-mastoid foramen; 3, temporal branches communicating with (4) the frontal branches of the fifth or trifacial nerve; 5, infra-orbital branches, communicating with (6) the infra-orbital branches of the fifth nerve; 7, maxillary branches communicating with (8) the mental branch of the fifth nerve; 9, cervico-facial branches; 15, the spinal accessory nerve giving off a branch to the trapezius muscle.

the aspect of the countenance and the balance of the features depend. The power of closing the eyelids depends upon this nerve, as it alone supplies the orbicularis palpebrarum; and likewise that of frowning, from its influence upon the corrugator supercilii. Anatomy indicates that this nerve is the motor nerve of the superficial muscles of the face and ear, and of the deep-seated muscles within the ear. This conclusion is abundantly confirmed by comparative anatomy. For wherever the superficial muscles of the face are well developed, and the play of the features is active, this nerve is large. In monkeys it is especially so. That extremely mobile instrument, the elephant's trunk, is provided with a large branch of the facial as its motor nerve. In birds, on the other hand, it is very small.—Todd and Bowman, *Physiological Anatomy and Physiology of Man*, vol. ii. p. 107.

Before Sir Charles Bell commenced his experiments on the functions of the nerves, it was believed that the facial was the nerve of sensibility of the face, and it was on several occasions divided with the view of relieving tic douloureux, of which it was supposed to be the seat. But the operation, of course, yielded no relief, and always inflicted a permanent injury, since it was succeeded by paralysis of the facial muscles, with total loss of control over the features and over the closing of the eye, on the side on which the operation was performed.

The treatment of facial palsy which is often, especially if it arises from cold, a very temporary affection, although usually a very alarming one to the patient and his friends, is described in the article PARALYSIS.

The *Hypoglossal Nerve* (derived from the Greek words *hypo*, under, and *glotta*, the tongue) escapes from the cavity of the skull by the anterior condyloid foramen, and passes outwards and forwards around

the pharynx to the interior surface of the tongue, where it breaks up into its terminal branches, which supply the muscular structure of that organ with motor power. This nerve communicates with the pneumogastric nerve, with the sympathetic (by branches derived from the superior cervical ganglion), and with the cervical plexus, soon after its emergence from the cranium; and subsequently, as it curves round the occipital artery (see fig. 3), it

Fig. 3.—This figure illustrates the Anatomy of the Side of the Neck, and shews, *inter alia*, the Nerves going to the Tongue :

1, portion of temporal bone, shewing the external auditory meatus and mastoid and styloid processes; 5, the tongue; 13, the common carotid artery; 14, the internal jugular vein; 15 and 16, the external and internal carotids; 17, the glossopharyngeal nerve; 20, the hypoglossal nerve; 21, the descending noni; 22, the pneumogastric nerve, lying between the carotid artery and the jugular vein; 25, the facial nerve.

gives off the long anastomosing branch known as the *Descendens noni*.

Experiments on living animals, comparative anatomy, and pathological investigations, alike indicate that this is the motor nerve of the tongue. In cases of paralysis of this nerve, the power of articulation is much injured or totally destroyed; and this is often one of the first symptoms which lead the physician to apprehend serious cerebral lesion.

We now proceed to the consideration of the *Compound Nerves*, beginning with the *Trifacial or Fifth Nerve*. This nerve, as was first pointed out by Sir Charles Bell, presents a remarkable resemblance to the spinal nerves in its mode of origin; for it arises by two roots, one large and the other small, and on its larger root, as on the posterior and larger root of the spinal nerves, is a distinct ganglion; the two roots being quite distinct until after the formation of the ganglion, when the lesser one coalesces with the lowest branch, which emerges from the ganglion to form the inferior maxillary nerve. This ganglion, which is known as the Gasserian Ganglion, and which is formed upon the larger root of the nerve, lies upon the upper surface of the petrous portion of the temporal bone, and is of a somewhat triangular form, with its base directed forwards and outwards. From this base there proceed three nerves—viz. the ophthalmic, on the inside; the superior maxillary, in the middle; and the inferior maxillary, externally. The first two of these nerves consist exclusively of fibres

from the ganglionic root, while the third—the inferior maxillary—is composed of fibres from both roots, and is therefore a compound nerve. From the mode of distribution, as well as from that of origin, it is inferred that the ophthalmic and superior maxillary are purely sensory, while the inferior maxillary is a motor and sensory nerve. (We have not inserted a special figure of this complicated nerve; the frontal branch of the ophthalmic division is, however, shewn in No. 4, fig. 2, while the infra-orbital branches of the superior maxillary division, and the mental branches of the inferior maxillary division, are shewn in Nos. 6 and 8 of the same figure; while the gustatory or lingual branch of the last-named division is shewn in No. 17, fig. 3. The nasal branches also shewn in one of the diagrams illustrating the article NOSE.) Experiments on living animals confirm the inference that have been drawn on anatomical grounds. Division of the ophthalmic or of the superior maxillary nerve, induces loss of sensibility without any serious impairment of muscular power; but when the inferior maxillary nerve, on either side, is divided, the power of mastication is destroyed on that side, and the sensibility of the tongue and of the lower part of the face on that side is lost.

The lingual or gustatory branch of the inferior maxillary is distributed to the mucous membrane and papillæ at the fore part and sides of the tongue, where it acts both as a nerve of common sensibility and of taste. (The consideration of the respective parts which this nerve and the glossopharyngeal play in the sense of taste, is considered in the articles TONGUE and SENSE OF TASTE.)

The trifacial nerve is the seat of the affection known as *tic-douloureux*, and described in the article NEURALGIA. It is in the dental branches of this nerve that toothache is situated; and in the process of teething in young children, the irritation of these branches, consequent upon the pressure of the teeth, often gives rise to convulsions, by being conveyed to the medulla oblongata, and exciting motor nerves by reflex action.

The *Glossopharyngeal Nerve* is principally an afferent or sensory nerve, but has a small motor root. It escapes from the cranium in association with the pneumogastric and spinal accessory nerves, through the same foramen as that through which the jugular vein emerges. It then descends by the side of the pharynx, and after anastomosing with the facial and pneumogastric nerves, and giving off a branch to the tympanum of the ear, terminates in branches to the mucous membrane of the base of the tongue, of the palate, tonsils, and pharynx, and in twigs to the digastric and stylopharyngeal muscles; so that its distribution is almost entirely to sentient surfaces (see fig. 3, No. 20). From a careful examination of the investigations of Dr John Reid and others regarding the functions of this nerve, Todd and Bowman arrive at the following conclusions: 1. 'It is the sensitive nerve of the mucous membrane of the fauces and of the root of the tongue, and in the latter situation it ministers to taste and touch, as well to common sensibility; and being the sensitive nerve of the fauces, it is probably concerned in the feeling of nausea, which may be so readily excited by stimulating the mucous membrane of this region.' 2. 'Such are its peripheral organisation and central connections, that stimulation of any part of the mucous membrane in which it ramifies, excites instantly to contraction all the facial muscles supplied by the pneumogastric and the facial nerves; and the permanent irritation of its peripheral ramifications, as in the case of sore throat, will affect other muscles supplied by the facial nerve likewise. It is therefore an excitor of

the movements necessary to pharyngeal deglutition.' —*Op. cit.* vol. ii. p. 119.

The *Pneumogastric Nerve*, or *Par Vagus*, is distributed to so many important organs (the larynx, heart, lungs, stomach, &c.), and is of such great physiological importance, that a special article is devoted to its consideration.

The *Spinal Accessory Nerve* is more remarkable for its peculiar course than in any other respect. It rises from the spinal cord at the level of the fifth or sixth cervical nerve, passes upwards between the anterior and posterior roots of the cervical nerves into the skull, and emerges from the cranial cavity with the two preceding nerves. It is chiefly distributed to the trapezius muscle. See Fig. 2, No. 15.

In the above remarks on the cranial nerves, we have omitted all notice of their points of origin, as that subject is sufficiently noticed in the article BRAIN.

We shall now briefly notice the mode in which the extremities receive their nerves. These nerves are derived from the spinal nerves, through the intervention of what is termed in anatomy a *plexus*. Four or five nerves proceed from the spinal cord for a certain distance, without any communication with each other. They then divide, and from the conjunction of the adjacent branches new nerves result, which again subdivide and interchange fibres. From the net-work or plexus thus formed nerves emerge, each of which is composed of fibres derived from several of the original branches. The most important of these plexuses are found in the regions of the neck, the axilla, the loins, and the sacrum, and are known as the cervical, brachial, lumbar, and sacral plexuses.

The *Brachial Plexus* is formed by communication

Fig. 4.—A diagram shewing the Brachial Plexus of Nerves of the left side, with its branches. Front view.

- 1, the brachial plexus; 2 and 3, the anterior and posterior thoracic nerves; 4, the phrenic nerves going to the diaphragm; 7 and 9, the external and internal cutaneous nerves; 10, the origin of the median nerve (which receives its name from taking a course along the middle of the forearm to the palm of the hand); 12 and 13, branches of this nerve; 14, the point at which it passes under the annular ligament, and divides into its terminal branches, which are distributed to the thumb and to all the fingers except the little finger and the outside of the ring-finger, which are supplied by 15) the ulnar nerve, whose terminal branches are shewn at 18; 19, the musculospiral nerve (the largest of the plexus); 23, 24, the radial nerve, one of the branches of the musculospiral.

between the anterior roots of the last four cervical nerves and the first dorsal nerve. These nerves are

nearly equal in size, and their mode of distribution is sufficiently explained by the diagram. The branches emerging from this plexus supply the shoulder and the arm; and the names of the most important of these branches are given in the description attached to the figure.

The *Lumbar and Sacral Plexuses*, with the nerves of the lower extremity, are shewn in fig. 5. The

Fig. 5.—A diagram shewing the Lumbar and Sacral Plexuses, with the Nerves of the lower extremity.

- 1, the first four lumbar nerves which, with the branch from the last dorsal, form the lumbar plexus; 2, the four upper sacral nerves, which, with the last lumbar, form the sacral plexus; 6, the anterior crural or femoral nerve; 7, 8, 9, 10, its branches; 11, its terminal branch, the long or internal saphenous; 13, the gluteal nerve; 15, the lesser ischiatic or sciatic nerve; 16, the greater ischiatic or sciatic nerve (the largest nerve in the body), dividing at about the lower third of the thigh, into 17, the popliteal nerve, and 18, the peroneal nerve; 19, muscular branches of the popliteal, given off in the posterior region of the knee; 20, the posterior tibial nerve, dividing, at 21, into the internal and external plantar nerves, which are distributed to the sides of the toes, in precisely the same manner as the median and ulnar nerves are distributed to the fingers; 22, the external saphenous nerve; 23 and 24, the two terminal branches of the peroneal nerve—viz. the anterior tibial and the musculo-cutaneous nerves.

description attached to the diagram sufficiently explains the mode of formation and the distribution of the branches of these plexuses.

The general arrangement of the *sympathetic system*, or, as it is sometimes termed, the *sympathetic nerve*, has been already noticed at the beginning of this article. Its cephalic portion consists of four ganglia on either side—viz., (1) the Ophthalmic, or Lenticular Ganglion; (2) the Spheno-palatine, or Meckel's Ganglion; (3) the Otic, or Arnold's Ganglion; and (4) the Submaxillary Ganglion. They are all closely connected with the branches of the trifacial nerve. The cervical portion contains three ganglia, the dorsal twelve, the lumbar four, the sacral five, and the coccygeal one, which, instead of lying on the side of the vertebral column, is placed in front of the coccyx, and forms a point of convergence for the two ganglionated cords which run from the cervical to the sacral region parallel to one another. Each ganglion may be regarded as a distinct nervous centre, from which branches pass off in various

directions. In addition to the cords of communication between the ganglia, certain sets of nerves may be usually traced—viz. (1) *visceral* nerves, which generally accompany branches of arteries to the viscera (the lungs, heart, kidneys, liver, spleen, and intestine, &c.); (2) *arterial* branches, distributed to arteries in the vicinity of the ganglia; and (3) branches of *communication* with the cerebral and spinal nerves, an example of which is shewn in fig. 1.

The distribution of the sympathetic nerve on the right side is shewn in fig. 6. The only nerve that our limited space will permit us to notice is the *great splanchnic*. This nerve arises by separate roots from the 5th, 6th, 7th, 8th, and 9th thoracic ganglia. These roots (see the figure) unite to form a large round cord, which passes obliquely downwards and forwards, and after entering the abdomen by piercing the diaphragm, ends in a large and complex ganglion, the *semilunar ganglion*, which lies upon the side and front of the aorta, at the origin of the celiac axis. The semilunar ganglia, with the nerves entering and emerging from them, combine to form the *solar plexus*, which, from the mass of nervous matter which it contains, has been termed the *abdominal brain*. It is in consequence of the existence of this great nervous centre, that a blow in the region in which it lies always inflicts a severe nervous shock, and not unfrequently causes death.

Experiments and clinical observations lead to the conclusion, that the sympathetic system supplies motor power to many of the internal viscera, especially the heart and the intestinal canal; that it also contains sensitive fibres, as is shewn by the sufferings of patients during the passage of a gall-stone or a renal calculus through a duct, whose sole nervous energy is derived from this system; that it presides over the process of secretion in the most important glands; and that it operates on the blood-vessels in causing them to contract, while the cerebro-spinal nerves produce the opposite effect.

On examining different parts of the nervous system under the microscope, we find that the nervous matter is distributed in two forms, the *vesicular* and the *fibrous*. The vesicular matter is gray in colour, and granular in texture, contains nucleated nerve cells, and is largely supplied with blood; it is immediately associated with mental actions, and is the seat in which the force manifested in nervous action originates. The fibrous matter is, in most parts, white and composed of tubular fibres, though in some parts it is gray and consists of solid fibres; it is less vascular than the former, and is simply the conductor of impressions made upon it. When these two kinds of matter are united together into a mass they form a *nervous centre*, such as the brain or spinal cord, while the *nerves* passing to and from them are composed of threads of fibrous matter. The nervous matter of both kinds is a soft, unctuous substance, with very slight tenacity; the softness being in a great measure due to the large quantity of water which it contains.

The *fibrous* form is the most extensively diffused throughout the body. It forms a large portion of the nervous centres, and is the main constituent of all the nerves. It occurs in two varieties—viz. as the *tubular fibre*, or the *nerve tube*, and the *gelatinous fibre*, the latter being of comparatively rare occurrence, and being found chiefly in the sympathetic system.

When a *tubular fibre* is viewed by reflected light, it presents a beautiful pearly lustre, and appears to be homogeneous. But if viewed by transmitted light, with a sufficient magnifying power, indications of structure become visible. Externally, there is the

tubular membrane (A d, d, fig. 7), a homogeneous and probably very delicate elastic tissue, according to Todd. Within the edge of the tubular membrane, on

intestines, liver, spleen, and pancreas being removed to bring it in view:

1, 2, 3, the superior, middle, and inferior cervical ganglia; 4, the two lines from this figure include the twelve dorsal ganglia; 5, include the four lumbar ganglia; 6, include the five sacral ganglia; 7, the ganglion impar; 8, cardiac plexus; 9, solar plexus; 10, aortic plexus; 11, hypogastric plexus; a, the larynx; b, the trachea; c, arch of the aorta; c', external carotid; c'', internal carotid; d, the heart; e, e, the diaphragm; f, the cardiac end of the esophagus; g, thoracic, and g', abdominal aorta; h, the kidney; i, the supra-renal capsule; k, the sacrum; l, the section of base of the skull; m, the bladder; n, the lower portion of the rectum.

either side are seen two thicker and darker lines (A c, c, b), which appear to mark the outer and inner limits of the structure known as the *white substance of Schwann*, which forms a tube within the tubular membrane; and within the white substance of Schwann is a transparent material occupying the axis of the nerve tube, and commonly known as the *axis cylinder* (A a). By the application of reagents, it is seen that the chemical composition of the white substance is different from that of the axis cylinder, and hence the functions of these two parts are doubtless different; the latter is in general soft and pulpy. The nerve-tubes are cylindrical in form, and lie parallel to one another, without any inosculation, if we except their frequent terminations in loops. Their average diameter is about  $\frac{1}{10000}$ th of an inch.

The *gelatinous fibres* are flattened, soft, and homogeneous in appearance, and contain numerous round or oval nuclei (see fig. 7, C). Their diameter is about  $\frac{1}{10000}$ th of an inch. In appearance they much resemble the fibres of unstriated muscle.

The *vesicular form* of nervous matter is of a dark reddish-gray colour, is found only in the nervous centres, is always well supplied with capillaries, and consists essentially of nucleated cells or vesicles, which are most commonly globular or ovoidal, but often present one or more tail-like processes, when they are termed *caudate* (see fig. 8). These caudate vesicles present great difference in shape and size. The processes are very delicate, and readily break off close to the vesicle. They probably either serve to connect distant vesicles, or else become continuous with the axis cylinders of the tubular fibres.

We may now consider the way in which the nerves and nervous centres are made up of these anatomical elements.

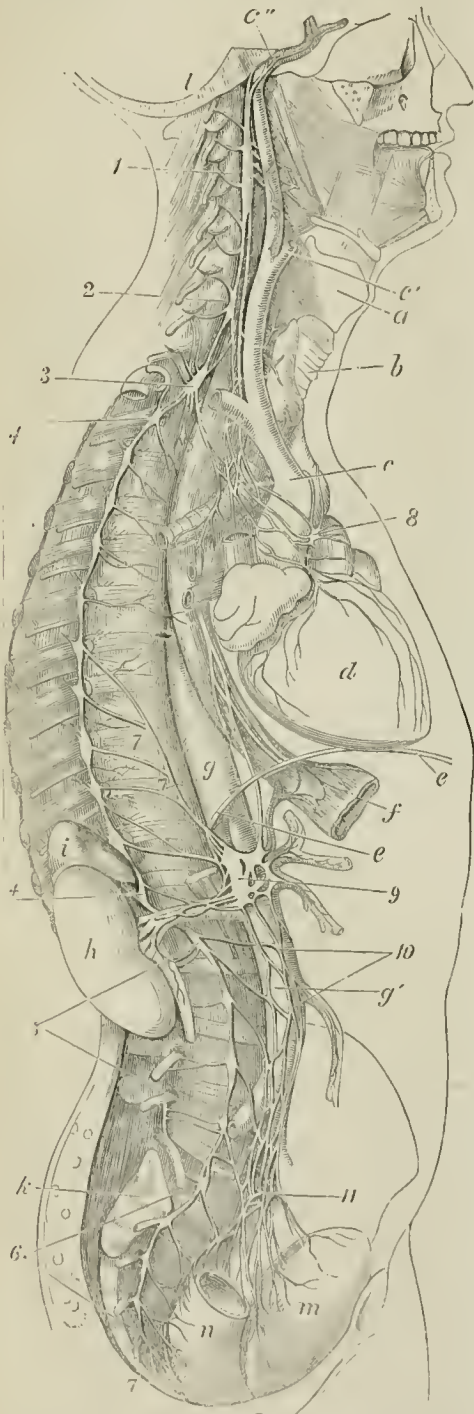

Fig. 6.—The Sympathetic Nerve; the right lateral walls of the chest and abdomen, and the stomach,

Fig. 7.

A, diagram of tubular fibre of a spinal nerve; a, axis cylinder; b, inner border of white substance; c, c, its outer border; d, d, tubular membrane; E, tubular fibres; e, in a natural state, shewing the parts as in A; f, the white substance and axis cylinder interrupted by pressure, while the tubular membrane remains; g, the same, with varicosities which are especially apt to be exhibited in the nerves of the special senses, and of young animals generally; C, gelatinous fibres from the solar plexus, treated with acetic acid to exhibit their cell-nuclei; B and C magnified 320 diameters; A on a considerably larger scale. —From Todd and Bowman.

A nerve is composed of a bundle of tubular fibres surrounded and connected by areolar tissue, which forms a sheath known as the *neurolemma*, whose

Fig. 8.

office is to protect the delicate tubes, and to support the capillaries from which they derive their nourishment.

The *nervous centres* exhibit a union of the vesicular and fibrous textures, which may be variously arranged. In the Brain (q. v.) the vesicular matter lies externally, forming the gray or encephalic substance; in the spinal cord, on the other hand, the vesicular or gray matter lies in the central portion,

Fig. 9.—A small piece of the Otic Ganglion of the Sheep, slightly compressed, shewing the interlacement of the nervous fibres and vesicular matter.

and the fibrous or white matter is external to it; while in the ganglia the two structures are more or less uniformly associated (see fig. 9).

From the observations which have been made in an earlier part of this article on the functions of individual nerves, it is sufficiently obvious that it is through the instrumentality of the nervous system that the mind influences the bodily organs, as when volition or emotion excites them to action; and that, conversely, impressions made on the organs of the body affect the mind, and excite mental perceptions through the same channel. 'In this way,' to quote the words of Dr Todd, 'the nervous system becomes

the main agent of what has been called the life of relation; for without some channel for the transmission of the mandates of the will to the organs of motion, or some provision for the reception of those impressions which external objects are capable of exciting, the mind, thus completely isolated, could hold no communion with the external world.' The nature of the connection between the mind and nervous matter is, and must ever be, the deepest mystery in physiology, and one into which the human intellect can never hope to penetrate. There are, however, many actions of the body in the production of which the mind has no share. Of this kind are the nervous actions, which are associated with the functions of organic life, such as digestion, respiration, and circulation. Again, there is another class of actions for which two nerves (an afferent or excitor, and a motor) and a nervous centre are necessary. These are the actions known as *reflex* or *excito-motory*, for the full investigation of which physiology is especially indebted to the labours of the late Dr Marshall Hall. For example, the movement of the œsophagus in propelling the food onwards to the stomach, is caused by the stimulus of the food acting on the excitor or afferent nerves, which, through the spinal cord, excite the motor or efferent nerves, and thus give rise to the necessary muscular action. When the edge of the eyelid is touched, the excitor nerve (a branch of the ophthalmic division of the fifth or trifacial nerve) conveys the impression of the stimulus to the nervous centre, and the eye is at once closed by the motor influence, which is transmitted by a branch of the facial nerve to the orbicular muscle. In such cases as these—and they form a very numerous class—the mind takes no part. In some of them it is conscious of the application of the stimulus, as well as of the muscular act which follows; but even in these cases no effort of the will could modify or interrupt the sequence of the phenomena.

It has been already shown that the stimuli, by which the action of nerves is commonly excited, are of two kinds, mental and physical, and the change which these stimuli produce in a nerve develops the power known to physiologists as the *vis nervosa*, or nervous force. 'The nervous force,' says Dr Sharpey, in his recent *Address on Physiology* (1862), 'has long been likened to electricity, but rather through a vague perception of analogy than from any rigorous comparison. It is true that electric force is developed in the nerves, and even exhibits modifications connected with different conditions of nervous action. Still, it must be borne in mind that the evolution of electricity is a common accompaniment of various processes involving chemical change, whether within the living body or in external nature; and the tendency of recent speculation is not towards the identification of the nerve force with electricity, but rather to suggest that the two stand related in the same way as electricity and other physical forces are related to each other—that is, as manifestations of a common force or energy, of which they, severally, are the special modifications.' The velocity with which impressions are transmitted by the nerves has been recently made the subject of investigation, but it is doubtful how far the observations are to be depended on, in consequence of the various sources of fallacy by which such experiments are beset. According to Hirsch, the velocity is 34 metres, or about 112 feet per second in man; while Helmholtz fixes it at 190 feet per second in the frog.

The description of the nervous system given in the foregoing pages is applicable, with slight modifications, to all the Vertebrates; the main differences

being in the degree of the development of the brain—a point which has been already noticed at the commencement of the article BRAIN. For a sufficient notice of the plan of the nervous system in the Invertebrate animals, the reader is referred to the articles ARTICULATED ANIMALS, MOLLUSCA, and RADIATA. It is only in the lowest subdivision of the Animal Kingdom, the PROTOZOA, that no traces of a nervous system can be detected.

For further information on the subject of this article, the reader is referred to Dr Carpenter's works on *Human and Comparative Physiology*, to Dr Todd's article on 'The Nervous System' in *The Cyclopædia of Anatomy and Physiology*, to Todd and Bowman's *Physiological Anatomy and Physiology of Man*, and to Funke's *Lehrbuch der Physiologie*.

NESS (identical with Eng. *nose*, A.-S. *nase*, Ger. *nase*, Ice. *nes*, Lat. *nasus*, Fr. *nez*), a geographical termination, signifying promontory. Names in *-ness* abound among the Orkney and Shetland Islands, and on the coast of Caithness; and they occur, though less frequently, along the east coast of Great Britain, as far as Dungeness in Kent. As the corresponding Scandinavian termination *-næs* prevails in the names of promontories in Norway, Sweden, and Denmark (e. g., Lindesnaes, in south of Norway), the existence of names in *-ness* in Britain is held as an evidence of Scandinavian and Danish colonisation. Grisez, on the north coast of France, points to the same source.

NESS, Loch, a long narrow lake in Inverness-shire, Scotland, extends north-east and south-west, and is 23 miles in length, and 1½ mile in average breadth. Its north-east extremity reaches a point 6 miles south-west of the town of Inverness. It receives the Morriston, the Oich, the Foyers, and other streams, and its surplus waters are carried off to the Moray Firth by the River Ness. It lies in the valley of Glenmore, and is enclosed by mountain masses averaging 1000 feet in height; but the scenery on its banks is not strikingly picturesque. In many places it is about 130 fathoms in depth, and owing to the length of time which this immense body of water takes to cool down to the freezing-point, ice never forms to any considerable extent.

NESSELRODE, KARL ROE., COUNT, one of the most eminent diplomatists of modern times, was born, 14th December 1780, at Lishon, where his father, a descendant of an ancient noble family on the Lower Rhine, was then Russian ambassador. He early devoted himself to a diplomatic career, gained in a high degree the esteem and confidence of the Emperor Alexander, and in 1813 was one of the representatives of Russia in the important negotiations which took place between the powers who combined against France. In 1814, he accompanied the Russian emperor to France, and on 1st March signed the treaty of the Quadruple Alliance at Chaumont. He was also one of those who concluded the treaty with Marshal Marmont for the surrender of Paris. He continued to take a principal part in all the negotiations which ended in the Peace of Paris; and was one of the most prominent and active of the plenipotentiaries in the Congress of Vienna. He was one of the most active diplomatists of the Holy Alliance, and accompanied the Emperor Alexander to the Congresses of Aix-la-Chapelle, Troppan, Laibach, and Verona. The Emperor Nicholas reposed in him the same confidence, and under his reign he conducted the Russian policy in the affairs of Greece and Turkey. Amidst the European convulsions of 1848 and 1849, Russia, under his guidance, refrained from interference, till opportunity occurred of dealing a deadly blow to the revolutionary cause in Hungary; and,

at the same time, of bringing Austria very much under Russian influence. Being one of the chiefs of the German or moderate party in Russia, N. is supposed to have exerted himself strenuously to preserve peace with the Western Powers; and after the war had broken out in 1854, and the ill success of Russia was manifest, he undoubtedly strove for the re-establishment of peace, and for the assembling of a congress to settle all disputes. After the accession of Alexander II. he retired from the direction of foreign affairs, and was succeeded in that department by Prince Alexander Gortchakov, but retained the dignity of chancellor of the empire, and a seat in the ministerial council. He died at St Petersburg, 23d March 1862.

NESTOR, according to ancient Grecian legend, the son of Neleus and Chloris, born in the Messenian Pylos, escaped destruction when Hercules slew all his brothers, being then a dweller among the Geronians, with whom he was brought up. He married Eurydice, by whom he became the father of a numerous family. In his youth he was distinguished for valour in wars with the Arcadians, Eleians, and the Centaurs, and in his advanced age for wisdom. Although he was an old man when the expedition against Troy was undertaken, he joined it with his Pylans in sixty ships. Homer makes him the great counsellor of the Grecian chiefs, and extols his eloquence as superior even to that of Ulysses. His authority was even considered equal to that of the immortal gods. N. returned in safety to his own dominions after the fall of Troy, along with Menelaus and Diomedes, and continued for long to rule over the people of Pylos.

NESTORIANS, a sect of the 5th c., so called from its founder NESTORIUS, under which head their distinctive doctrine, as well as their history up to the time of its condemnation, are sufficiently detailed. Of the later history it will be enough to say that, even after the Council of Ephesus, Nestorianism prevailed in Assyria and Persia, chiefly through the influence of the well-known school of Edessa. Although vigorously repressed in the Roman empire, it was protected, and probably the more on that account, by the Persians, and ultimately was established by King Pherozes as the national church, with a patriarch resident at Seleneia; its fundamental doctrine, as laid down in the synod of Seleneia in 496, being the existence of two distinct persons as Christ, united solely by a unity of will and affection. Under the rule of the califs, the N. enjoyed considerable protection, and throughout the countries of the East their community extended itself. Of their condition in Central Asia during the medieval period, some account will be found under the head of PRESTER JOHN. In the middle of the 12th c., their church reckoned no fewer than 90 bishops under regular metropolitans, together with 56 others, whose special dependencies are unknown; but in the destructive career of Tamerlane, they shared the common fate of all the representatives of the eastern civilisation. In the 16th c., a great schism took place in this body, of which a portion renounced their distinctive doctrine, and placed themselves under the jurisdiction of the Roman pontiff, to whom, under the title of Chaldean Christians, they have since remained faithful. The others still maintain their old creed and their ancient organisation. Their chief seat is in the mountain-ranges of Kurdistan. They are at present a poor and illiterate race, numbering about 140,000, and subject to a patriarch residing at Diz (who is always chosen from the same family, and takes invariably the name of Schamun, or Simon) and 18 bishops. All these are bound to observe

celibacy, but marriage is permitted to the priests and inferior clergy. Their liturgical books recognise seven sacraments, but confession is infrequent, if not altogether disused. Marriage is dissoluble by the sentence of the patriarch; communion is administered in both kinds; and although the language of the liturgy plainly implies the belief of transubstantiation, yet, according to Layard, that doctrine is not popularly held among them. The fasts are strict, and of very long duration, amounting to very nearly one half of the entire year. They pray for the dead, but are said to reject the notion of purgatory, and the only sacred image which they use or reverence is that of the cross. The N. of Kurdistan, like the Christians of the Lebanon, have suffered much from time to time through the fanaticism of the wild tribes among whom they reside. In a massacre in 1843, and again in 1846, many fell victims, and even still they owe much of their security to the influence exercised in their favour by the foreign representatives at the Turkish and Persian courts.

There is another body of N. who have existed in India from the period of the early migrations of the sect, and who are called by the name of Syrian Christians. Their chief seat is in Travancore, where they number about 100,000, and are subject to a patriarch. Among both bodies of N., European missionaries, Catholic and Protestant, have of late years endeavoured to effect an entrance, but the details would be out of place here. See *A Residence of Eight Years in Persia, among the Nestorian Christians*, by Rev. Justin Perkins, Andover, 1813.

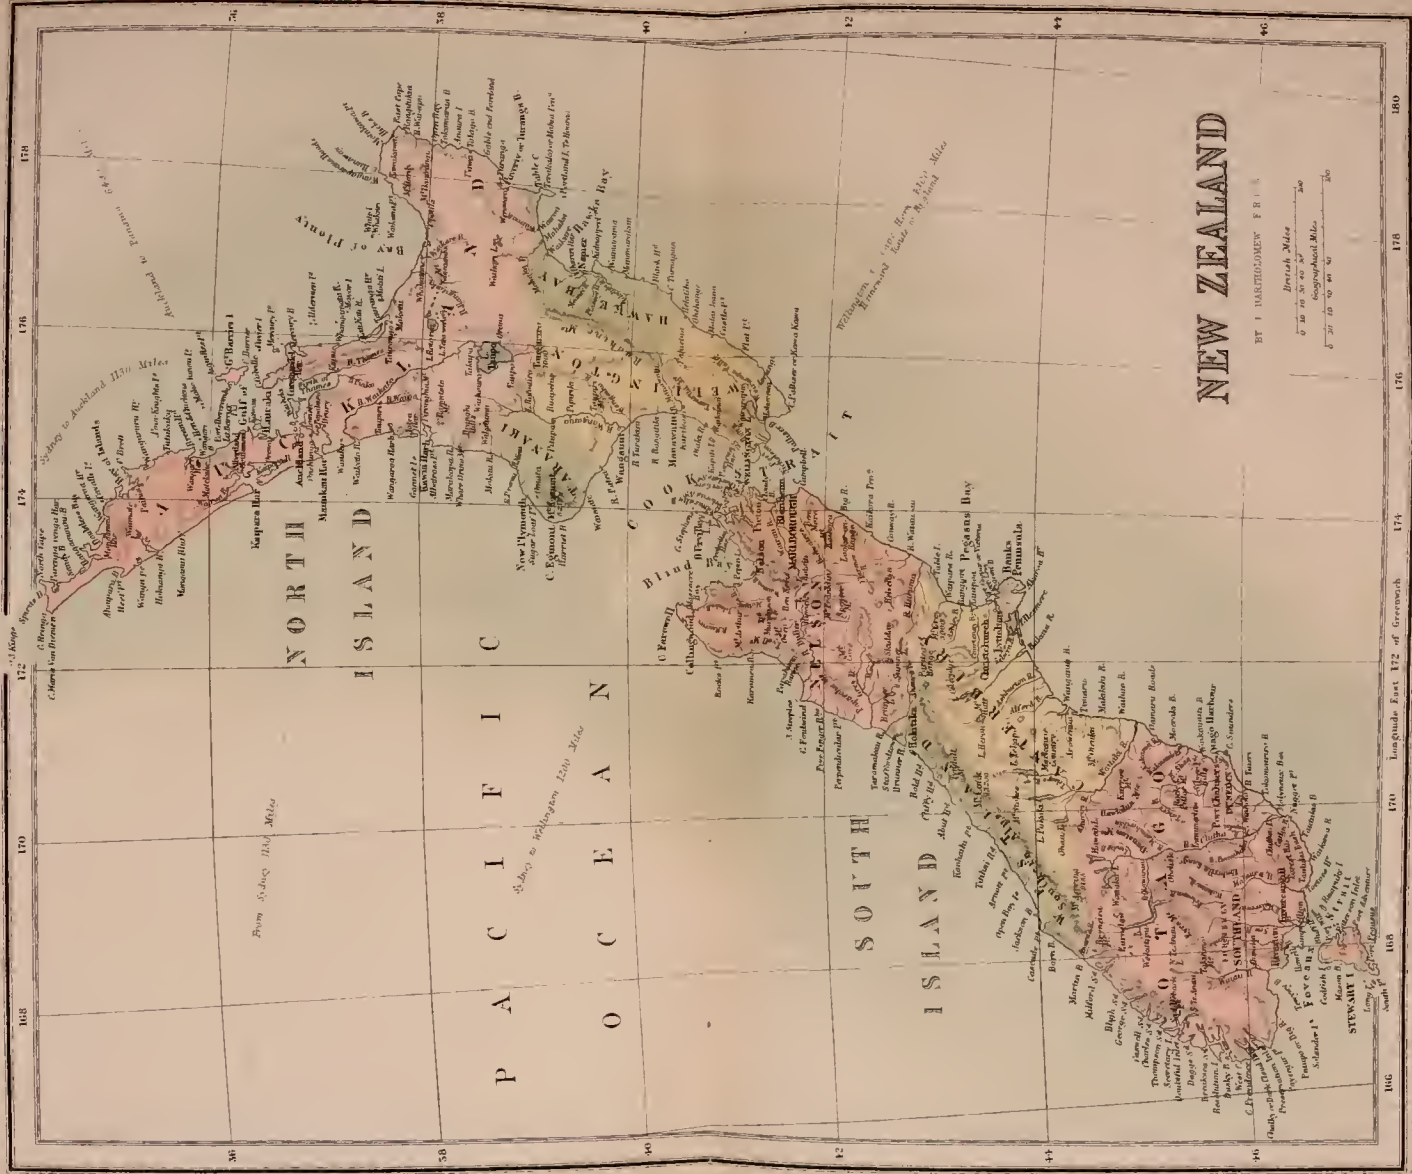

NESTORIUS, a native of Germanicia, a city of Northern Syria, in the patriarchate of Antioch, was probably a disciple of the celebrated Theodore of Mopsuestia; and having received priest's orders at Antioch, became so eminent for his fluency, if not eloquence, as a preacher, and for grave demeanour and exemplary life, that on occasion of a dispute about the election of a patriarch of Constantinople he was selected by the emperor, in 428 A.D., to fill the vacant see. Soon after his consecration, a controversy arose as to the divine and human natures of our Lord, in which N. took a leading part. One of the priests, who followed N. to Constantinople, Anastasius, having in a sermon, which was by some ascribed to N. himself, denied that the Virgin Mary could be truly called the 'Mother of God,' being only in truth the mother of the man Christ, N. warmly defended Anastasius, espoused this view, and elaborated it into the theory which has since been known by his name, and which equivalently, if not in formal terms, exaggerated the distinction of two natures in our Lord into a distinction of two persons—the human person of Christ and the Divine Person of the Word. An animated controversy ensued, which extended from Constantinople to the other patriarchates, and drew from Cyril, patriarch of Alexandria, a formal condemnation of the doctrine of N. in twelve anathemas still preserved, and a similar condemnation, accompanied by a threat of deposition and excommunication, from Celestine, bishop of Rome, unless he would withdraw the obnoxious doctrine. N. remaining firm in his opinions, a general council was convened at Ephesus in 431, at which Cyril took the most active and prominent part, and in which, notwithstanding the absence of the patriarch of Antioch and his bishops, N. was condemned and deposed. Considerable opposition was offered to this judgment for a time, but ultimately N. was confined in a monastery near Constantinople, whence, after four years, still persisting in his views, he was banished to the Greater Oasis in Upper Egypt, and after several changes of his place of confinement, died in exile. The

account given by Evageius, that his death was caused by a disease in which his tongue was eaten by worms, rests, according to Evageius himself, on a single and unnamed authority. The more probable narratives ascribe his death to the effects of a fall. The date of this event is uncertain. It was after 439, when Socrates wrote his history (*Hist. Ecc.* vii. 34), but there is little doubt that he was already dead in 450, when the Eutychian controversy first began to attract notice.

NESTS (Lat. *nidus*, Gael. *nead*; allied to Ger. *nähen*, Sax. *nestan*, Lat. *nectere*, to sew, bind, or tie) are the structures which animals prepare for the rearing of their young. They are very different, not only when the creatures which construct them belong to widely separated divisions of the animal kingdom, but often when the animals are of the same class, or even when they are nearly allied; and whilst some construct very simple nests, and those of others are very curious and elaborately framed, some make no nest at all. Among MAMMALS, the only nest-builders are certain rodents, as mice, dormice, squirrels, &c. The structures of some of the species are as artfully contrived and as beautiful as the nests of birds. It is among BIRDS that nest-making is most general; although there are not a few species which merely scrape a hole in the ground, and many sea-fowls lay their eggs on ledges of naked rock. The situations chosen by birds for their nests are very various, each species affecting some particular kind of situation, as each species also exhibits a uniformity in choice of materials and in form and mode of structure; these particulars, however, being all liable to modification—within certain limits—according to circumstances. Some birds' nests consist merely of a few straws or leaves collected together; some, of such materials as twigs, straws, moss, hair, &c., very nicely interwoven, and often with a lining finer than the framework; some, as those of swallows, are made of clay or other soft material, which hardens as it dries. Birds' nests are generally open at top, but some, as those of swallows, are so placed under a projection of rock or of a building, as to be covered, and have the opening at the side; whilst others are vaulted, and have the opening at the side. Some are situated in holes excavated in clayey, loamy, or sandy banks. The nests of tropicbirds, baltimore, weaver-birds, &c., are remarkable for the ingenious contrivance displayed in them; and a very singular nest is that of the tailor-bird, made by sewing together the edges of leaves. These are noticed in the articles on these birds. Many birds are as solitary as possible in their nidification; whilst others, as rooks and herons, congregate in large communities.—No REPTILES are known to construct nests; their utmost approach to it being to make a hole for their eggs in sand, or in some other suitable situation.—The nests of FISHES have recently attracted much attention of naturalists. It is supposed that the ancients were acquainted with the nest-building instinct of some fishes; but it was unknown to modern naturalists till 1838, when Mr Edwards discovered it in a species of Stickleback (q. v.). It now gives interest to many a fresh-water aquarium. Not many fishes are yet known as nest-builders. Among them are gobies and the goramy. Many are known not to construct nests. The salmon and others exhibit an approach to the nest-building habit, in making a place for their eggs in the sand or gravel which they choose for a spawning-bed.—Many INSECTS—a small proportion, however, of the whole number, and mostly *Hymenoptera*—construct nests, as bees, wasps, and ants. The nests of the social bees and wasps are also their ordinary habitations, but the nests of solitary bees are entirely

W. & A. Carter & Co. London

W & R CHAMBERS LONDON & EDINBURGH

NESTS—NETHERLANDS.

devoted to their young. A few insects, not hymenopterous, as some weevils, may also be said to make nests; but among insects provision for the wants of the young is usually made in very different ways. Certain spiders, amongst which may be named the water-spider, construct nests.—The instinct of nest-making, connected as it is with the instinctive care for their young which the Creator has made so important a part of the nature of so many animals, is by no means an index either of that care or of the affection with which, in many cases, it is conjoined; and some of the animals which construct no nest are among those in which affection for their young is exhibited in the highest degree.—The nest-making instincts of animals seem to be a very essential part of their constitution; and even in the most perfect domestication are still retained and exhibited; although the accommodation to circumstances which is also manifested shews something—and that not inconsiderable—of reason.

NESTS, EDIBLE, an important article of commerce between the Eastern Islands and China, and of luxury in China, are the nests of several species of Swallow (q. v.), of the genus *Collocalia*. The best known of these birds, *C. esculenta*, is about 4½ inches in length, 11 inches in expanse of wing, dusky black above, pale ash-colour beneath. The nest is shaped like that of the common swallow, and adheres to a rock; vast numbers being found together—often in absolute contiguity—in caves of the Eastern Archipelago; as those of the same and allied species are in other islands of the East Indies. The nests are formed of a gelatinous substance—the finest being transparent, or nearly so—with a somewhat fibrous structure, and are now believed to be made of sea-weeds of the genus *Gelidium* (q. v.). The nests are collected by means of ladders, and often by means of ropes, which

Chinese Swallow and Nest.

enable the gatherers to descend from the summit of a precipice, like the rock-fowlers of the North. The gathering of the nests takes place after the young are fledged. In the Chinese market the nests are sold for prices varying according to the quality, from £2 to £7 per pound, and they are of course used only by the most wealthy, chiefly for thickening rich soups. They are very wholesome and nourishing, but quite devoid of the peculiar properties which the Chinese ascribe to them.—The Dutch used to export from Batavia about 1000 peckuls of these nests annually, a peckul being about 25 pounds, and worth from 1000 to 1500 dollars. The greater part, however, were brought from more eastern islands. The nests weigh about half an ounce each.

NETHERLANDS, THE KINGDOM OF, lies between 50° 43' and 53° 36' N. lat., and 3° 22'

and 7° 16' E. long., is bounded on the N. by the North Sea, E. by Hanover and the western part of Prussia, S. by Liège, Belgian Limburg, Antwerp, East and West Flanders, W. by the North Sea. Its greatest length from north to south is 195 English miles, and its greatest breadth from the west, on the North Sea, to the extremity of Overysseel, on the east, 110 English miles. It contains 12,597 square miles. Pop., including the grand duchy of Luxemburg, 3,611,172. The following table gives the population, 1st January 1863, the area of the provinces, including the reclaimed Haarlem Lake, and the provincial capitals:

| Provinces.                  | Area in Sq. Miles. | Pop. 1863. | Provincial Capitals. |
|-----------------------------|--------------------|------------|----------------------|
| North Brabant,              | 1960               | 414,665    | 's Hertogenbosch.    |
| Gelderland, . .             | 1948               | 411,947    | Arnhem.              |
| South Holland,              | 1162               | 642,683    | The Hague.           |
| North Holland,              | 1050               | 554,221    | Haarlem.             |
| Zeeland, . . .              | 665                | 172,249    | Middelburg.          |
| Utrecht, . . .              | 532                | 165,681    | Utrecht.             |
| Friesland, . .              | 1253               | 279,154    | Leeuwarden.          |
| Overysseel, . .             | 1274               | 241,833    | Zwolle.              |
| Groningen, . .              | 895                | 214,425    | Groningen.           |
| Drenthe, . . .              | 1017               | 109,506    | Assen.               |
| Limburg, . . .              | 840                | 218,775    | Maastricht.          |
|                             | 12,597             | 3,416,144  |                      |
| Grand Duchy of Luxemburg, ) | 987                | 195,028 *  | Luxemburg.           |
| Total, . . .                | 13,584             | 3,611,172  |                      |

The population averages 271 to the square mile, but in Drenthe falls as low as 98, and in South and North Holland rises to 546 and 528; Utrecht, Limburg, and Zeeland being the next densely peopled. In 1861, the births amounted to 125,923, of which 5084 were illegitimate. In communities of more than 10,000, these were as 1 to 24.59, and in the others 1 to 37.64 of the total births, the average being 1 to 24.59. In the province of Utrecht, 1 to 19.32, the maximum; and in Friesland, 1 to 47.77, the minimum.

The leading mercantile places are Amsterdam, Rotterdam, Dordrecht, Alkmaar, Middelburg, Schiedam, Leyden, Delft, Gouda, Utrecht, Amersfort, Groningen, Meppel, Zwolle, Kampen, Deventer, Arnhem, Nymegen, Tiel, Gorinchem, 's Hertogenbosch, Tilburg, and Breda.

Physical Aspect.—The land is generally flat and low, much of it being below the level of the sea, rivers, and canals, especially in North and South Holland, Zeeland, the southern part of Gelderland, and Friesland. Along the west coast, the low lands are protected from the sea by a line of sand-hills or downs; and where that natural defence is wanting, strong dykes have been constructed, and are maintained at great expense, to keep back the waters. The greatest of these dykes are those of the Helder and of West Kapelle, on the east coast of Walcheren, (q. v.), which require, each, upwards of £6000 annually to keep them in order. Engineers, called the officers of the Waterstaat, take special charge of the dykes and great national hydraulic works, the expense of which is reckoned at about half a million sterling. A hilly district stretches from Prussia through Drenthe, Overysseel, the Veluwe or Arnhem district of Gelderland, the eastern part of Utrecht, into the Betuwe or country between the Maas and the Waal. This tract of country has many pretty spots, is of a light sandy soil, well watered, and when not cultivated, is covered with heath or oak-coppice. The greatest part of the N. is very fertile, the low lands and drained lakes, called Polders (q. v.), being adapted for pasturing cattle, and the light soils for cereals and fruits; but in some

\* Population in 1860.

NETHERLANDS.

districts there are sandy heath-clad plains, extensive peat-lands, and undrained morasses, which industry is rapidly bringing under cultivation.

*Islands, Rivers, Canals, &c.*—The islands may be divided into two groups, of which the southern, formed by the mouths of the Schelde and Maas, contains Walcheren, South and North Beveland, Schouwen, Duiveland, Tholen, St Philipsland, Goeree, Voorne, Putten, Beyerland, Ysselmonde, Rozenburg, and the island of Dordrecht. The northern group contains the islands at the entrance of the Zuider Zee and along the coasts of Groningen and Friesland, as Wieringen, Texel, Vlieland, Terschelling, Ameland, Schiermonnikoog, and Rottum. In the Zuider Zee are Marken, Urk, and Schokland.

The chief rivers are, the Rhine, Maas, and Schelde. Important branches of these are the Waal, Lek, Yssel, Roer, &c.

Water-ways are more numerous than in any other European country, the immense tracts of meadow-land and the fertile polders being girdled by large canals, and cut in all directions by smaller ones for drainage and communication. Those of most importance to the national trade are, the North Holland Canal, constructed 1819—1825, to connect the port of Amsterdam with the North Sea; the Voorne Canal, from the north side of Voorne to Hellevootsluis, which shortens the outlet from Rotterdam; the South Willemsvaart, through North Brabant, Dutch and Belgian Limburg, from 's Hertogenbosch to Maastricht, being 71½ English miles in length, and having 24 locks. Besides these, there are numerous important canals, connecting rivers, and cutting the kingdom into a net-work of water-courses. The North Holland Canal is 52 English miles long, 120 feet broad, 20 feet deep, and has 5 great locks, each 190 feet in length, and 24 in breadth. A new canal, which is not in any part to be less than 80 yards broad, and which will reduce the distance from Amsterdam to the North Sea from 52 to 15 English miles, has been planned, and a concession granted, the haven of which, on the North Sea, is to be near Wyk-aan-Zee, in about 52° 29' N. lat., and 4° 36' E. long., and the total expense, including the recovering of 15,000 acres of land from the Y, is reckoned at fully 1½ millions sterling.

Railways have been constructed to the extent of about 266 miles, forming lines of communication between the principal cities of the N., and with Prussia to the south-east, and Belgium to the south-west. The receipts of the three main lines in 1860 amounted to £351,150. In 1863, another main line was opened, and on the budget of that year stood an item of ten million guilders for railway-works.

*Climate, Agriculture, Produce, &c.*—The climate of the N. is variable, chilly colds often closely succeeding high temperatures, inducing various forms of fever and ague, and requiring peculiar care as to clothing, &c. In summer, the thermometer sometimes rises above 80°, and even to 90° F. in the shade, and a winter of great severity usually occurs every fifth year, when carriages and heavily-laden wagons cross the rivers and the Y on the ice, and thousands enjoy the national pastime of skating.

The farms are generally small and well cultivated, though the implements are old-fashioned and clumsy. Much progress is being made in reclaiming the sandy wastes, in Drenthe and Overijssel, by planting them with fir and oak, and sowing buckwheat, oats, and rye. The best implements are also being gradually introduced from England, and the steam-plough has, in 1862, been put in operation on the lands of the drained Haarlem Lake. The following table shews the

agricultural products, with their values, for 1858, according to government returns:

|                                 | Guilders    |
|---------------------------------|-------------|
| Wheat to the value of . . . . . | 16,392,825  |
| Rye, . . . . .                  | 29,314,859  |
| Barley, . . . . .               | 19,290,139  |
| Oats, . . . . .                 | 12,569,317  |
| Beans, . . . . .                | 4,685,646   |
| Pease, . . . . .                | 899,382     |
| Buckwheat, . . . . .            | 7,947,813   |
| Culza, . . . . .                | 4,406,897   |
| Potatoes, . . . . .             | 38,719,405  |
| Madder, . . . . .               | 4,072,370   |
| Chicory, . . . . .              | 481,581     |
| Flax, . . . . .                 | 5,644,747   |
| Hemp, . . . . .                 | 547,140     |
| Hops, . . . . .                 | 56,400      |
| Tobacco, . . . . .              | 1,053,720   |
| Various, . . . . .              | 1,466,325   |
| Total, . . . . .                | 139,977,639 |

or £11,513,101 sterling. In 1860, wheat occupied 201,080 acres; rye, 479,230 acres; barley, 104,951 acres; oats, 213,662 acres; potatoes, 250,688 acres; flax, 38,300 acres.

In 1860, the N. possessed 213,451 horses, 1,287,538 head of cattle, 865,728 sheep, 114,903 goats, and 270,586 pigs. The leading agricultural products of Zealand are wheat and madder; in South Holland, madder, hemp, butter, and cheese; in North Holland, butter and cheese are extensively made, and cattle, sheep, and pigs reared and exported. The horses of Friesland, Zealand, and Gelderland are of first-rate quality. The exportation of butter from Holland and Friesland, and of Edam, Leyden, Gouda, and Frisian cheese is large; in 1860, amounting to 1,973,506 Dutch pounds of cheese and 622,256 of butter. Fruit is abundant, and in several provinces, as Gelderland, Utrecht, and Drenthe, much attention is paid to bees. In Haarlem and neighbourhood, tulips and hyacinths are much cultivated, realising a large annual amount. In 1862, the parish of Bloemendaal, near Haarlem, sold of these bulbs to the value of £17,000. Wild ducks, snipes, plovers, and hares are plentiful; and there are also conies, partridges, pheasants, and deer—game forming an article of export.

*Geology, Mineralogy, &c.*—The N. are of recent formation, and consist of an alluvial deposit, chiefly of a deep, rich clayey soil, superimposed on banks of sand, marine shells, and beds of peat and clay. It appears that at some distant period there had been a depression of the land below its former level, enabling the sea to burst through its sand-banks, submerge the land, and form new deposits. The higher districts are composed of sand-drift mingled with fertile earths, and resting on a bed of clay. Coal is worked in Limburg; and a soft sandstone, which becomes fit for building purposes after having been some time exposed to the atmosphere, is quarried in the southern part of that province, which has also pipe and other clays. Valuable clays for pottery, tile and brick making, abound in the various provinces.

*Manufactures, Industries, &c.*—The chief manufactures are linen, woollen, cotton, and silk fabrics; paper, leather, glass, &c. Leyden and Tilburg are famed for woollen blankets, wool-dyed pilot, fine cloths, and friezes; 's Hertogenbosch for lincens and rich damasks; calicoes, shirtings, drills, table-cloths, striped dimities are made at Almelo, Amersfort, and in the leading towns of Overijssel. Good imitation Smyrna and Scotch carpets, and carpets of hair and wool, are manufactured at Deventer, Delft, Arnhem, Hilversum, Utrecht, and Breda; Turkey-red yarns, dyed silks, and silk stuffs at Roermond, Utrecht, Haarlem, &c.; leather, glass, firearms, at Maastricht and Delft; iron-founding, rolling and

hammering of lead and copper, cannon-founding are carried on at the Hague, &c.; and powder-mills at Muiden; Oudenkerk, Middelburg, 's Hertogenbosch, Amsterdam, Nymegen, &c., have important breweries, those of 's Hertogenbosch producing (1862) upwards of 1,250,000 bottles. Waalwyk, Heusden, and surrounding districts, manufacture boots and shoes, of which Heusden sent to North and South Holland 1,000,000 pairs in 1862. Gin is distilled at Schiedam, Delft, Rotterdam, and Weesp. Amsterdam has the largest diamond-cutting trade in the world, 10,000 souls depending on that branch of industry. Sugar-refining is largely carried on at Amsterdam, Rotterdam, and Dordrecht, from all of which sugar is exported to Russia, the Levant, and countries of Europe. Paper is chiefly made in Holland and Gelderland. The leading letter-type foundries are at Amsterdam and Haarlem. Manufactures of every kind are being rapidly increased in number, and adding to the material prosperity of the Netherlands. The chief motive power is the windmill, which forms a never-failing element in the scenery; but of late years, steam is becoming more general. In 1854, the steam-engines employed in factories were 464, with 7980 horse-power; and in 1857, they amounted to 662, of 11,139 horse-power.

Many people are employed in the immense inland shipping-trade which the canal net-work has fostered, there being, when the last census was taken, 6684 ships inhabited by families, or one inhabited ship to 81 houses. The houses were 542,295; families, 668,911. Fishing, not only in the inland waters, the coasts, and bays of the North Sea, but also on the coast of Scotland, is vigorously pursued. In 1861, the herring-fishing in the North Sea produced 29,260 barrels, valued at £46,920; on the N. coasts, to the value of £37,034; and in the Zuider Zee, additional, were taken 25,420,000 herrings. The anchovy take, almost exclusively in the Zuider Zee, amounted to 6992 ankers, valued at about £4903; and 3,065,000 oysters were obtained from the various oyster-beds, besides extensive fishings of cod, ling, turbot, flounders, soles, shrimps, haddock, &c.; and from the rivers, salmon, eels, perch, &c.

*Exports, Imports, Shipping, &c.*—The N. is peculiarly a mercantile as well as agricultural country; its merchants not only importing and exporting the products of their colonies and the surplus of their own country, but also those of other lands. The general imports (1861) amounted to a value of £39,873,752, of which from Great Britain were £11,457,495; the exports to £34,095,358, of which £6,981,560 were to Great Britain. The leading exports, in 1860, were:

|                           |   |
|---------------------------|---|
| Cheese, . . .             | 1,973,506 Dutch pounds of 17½ oz. avoird. |
| Butter, . . .             | 622,256 " " " "                           |
| Refined Sugar, 10,683,750 | " " " "                                   |
| Flax, . . .               | 3,615,676 " " " "                         |
| Madder, . . .             | 1,542,694 " " " "                         |
| Cattle, . . .             | 32,749 head.                              |
| Sheep, . . .              | 27,139 " "                                |
| Pigs, . . .               | 22,474 " "                                |
| Gin, . . .                | 48,214 barrels.                           |
| Garacine, . . .           | £130,458 sterling in value.               |

In 1861, the laden ships, which cleared in-bound, amounted to 8599, having a tonnage of 1,688,114; those in ballast being 470 ships of 66,237 tons. Of the in-bound ships, 3331 were N. and 2251 British. Cleared out-bound, laden, 4659 ships of 1,031,650 tonnage; in ballast, 4172 of 739,739 tons burden. Along the rivers were cleared, in-bound, 20,838 Belgian, Prussian, and Hanoverian laden ships, having a tonnage of 1,734,822, and 3583 empty of 223,177 tons; also 84 rafts of wood, of 12,966 tons weight. Outward bound along the rivers, 12,092 laden, amounting to 1,045,939 tons, and empty 10,081 ships of 852,961 tons.

*Religion, Language, Education, &c.*—About one-third of the population belong to the Roman Catholic Church; 67,000 are Jews, and the remainder Protestants, of whom 1,900,000 are Dutch Reformed. There are (1863) 1495 Dutch Reformed clergymen and 1612 Roman Catholic. For the Reformed religion, stands on the budget for the year the sum of £150,408, and for the Roman Catholic Church, £56,230.

There are five dialects spoken respectively in Groningen, Friesland, Gelderland, Holland, and Zeeland. These differ considerably from each other, and the Frisian is not at all understood by natives of the other provinces. The written language is the Dutch, that branch of the great Teutonic stock which preserves more of its original character than the rest of the same family. It possesses numerous words the same as Lowland Scotch, and bears a strong affinity to the Old Saxon English, as the following Dutch proverb shews:

Wen de wyn is in den man,  
Is de wysheid in de kan.

The kingdom of the N. has produced many great names in all branches of literature and science. Coster (q. v.), according to his countrymen, invented printing, Leeuwenhoek the microscope, and Huygens applied the pendulum. Out of a long list of distinguished names, may be mentioned those of Erasmus, Scaliger, Heinsius, Hugo de Groot (Grotius), Huygens, Leeuwenhoek, Vitringa, Boerhave, and the poets Hooft, Vondel, and Cats; whilst the writings of Van der Palm, Van Lennepe, Des Anorie van der Hoeven, Haafner, Stuart, Van Kampen, and those of the poets Bilderdyk, Da Costa, De Bull, Van den Berg, ter Haar, and Hofdyk, shew that literature is not waning. Exclusive of newspapers, there are 226 magazines and periodicals published in the N., of which 67 are religious, 42 on art, belles-lettres, and general literature, and 7 on antiquity, history, &c. Leading painters of the old Dutch school were Rembrandt, Gerrit (Gerard) Dou, Gabriel Metz, Jan Steen, Paul Potter, Ruysdaal, Van der Helst; and among those of the present century, Ary Scheffer, Koekkoek, Schelfhout, Pieneman, Kruseman, Van Os, Craeyvanger, ten Kate, Israels, Bles, Louis Meyer, Roeloff, Springer, &c., have distinguished themselves.

There are universities at Leyden, Utrecht, and Groningen; *atheneums* or colleges at Amsterdam, Deventer, and Maastricht, the students attending which must be examined for degrees at one of the universities. Latin schools are in all the leading towns. The universities and *atheneums* have faculties of theology, medicine, philosophy, law, and letters. There are also the Royal Military and Naval Academy at Breda, and that for engineers and the India civil service at Delft; seminaries in several places for the training of the Roman Catholic clergy; and others, especially in Amsterdam, for those of the smaller Protestant sects; and many literary, scientific, and agricultural institutes.

Each community or parish must have, at least, one elementary school, supported from the local public funds, in which reading, writing, arithmetic, history, geography, &c. are taught. A higher class of schools includes also foreign languages. All are under government inspectors, and the teachers must undergo stringent examinations on all the branches before obtaining permission to teach. Many society or subscription schools are being erected all over the land, with a normal school at Nymegen, not under government surveillance, and including religious instruction, which is excluded from the national public schools. The members of these

societies pay a yearly subscription and a small fee for each pupil sent by them to the school, a select number acting as managers. There are national normal schools at 's Hertogenbosch, Haarlem, and Groningen, the pupil-teachers boarding themselves, and receiving, at 's Hertogenbosch, £21 a year, and at Haarlem, £24. The attendance at school is about 1 to 8 of the population in winter, and 1 to 10 in summer. On 15th October 1862, there were in North Holland at school 63,333 children out of a population of 554,221, or about 1 to 8½. Of these, 33,914 were educated free of payment.

*Army, Navy, &c.*—The strength of the army, in time of peace, should be 60,000 men, but (1863) there is a deficiency of 10,000, even on paper. It is composed of volunteers, and of one man for every 500, drawn by lot for five years' service. There is also a local force, called the Schutterij, drawn by lot from those between 25 and 34 years of age, to assist in keeping order in peace, and in case of war, to act as a mobile corps, and do garrison duty. If attacked on the land-side, 90,000 men are required for the defences, and if by land and sea, 106,000. The first, or Maas line of defence, is formed by Maastricht, Venlo, Grave, 's Hertogenbosch, Woudrichem, Geertruidenberg, Willemstad, Breda, and Bergen-op-Zoom. The second line is formed by Nymegen, Forts St Andries and Lovestein and Gorinchem. The inner line of Utrecht is formed by various forts from Naarden, Utrecht to Gorinchem, which, by inundations, can make the provinces of North and South Holland into an island. There are many other forts, batteries, and strengths at the mouths of the rivers and along the leading ways.

The royal navy consists of 3 steam-frigates, 2 steam-corvettes, 38 screw steam-ships, 13 paddle do., 5 floating-batteries, 2 ships of the line, 7 frigates, 6 corvettes, 11 smaller vessels, 1 transport ship, 13 used for defences, and 35 gun-boats. There is also (1863) an armour-plated steam gun-boat building. The effective strength is 6291 men and 1850 guns. Prince Frederic, uncle of the king, is admiral, the Prince of Orange vice-admiral, and his majesty is commander-in-chief of the land and naval forces.

*Revenue, Expenditure, &c.*—The revenue of 1862 amounted to £8,396,912, and the expenditure to £8,259,631. The budget for 1863 was, revenue, £8,976,000; and expenditure, £8,330,000. Among items of revenue were, direct taxes, £1,750,310; excise, a million and a half sterling; indirect taxes, over a million; profit from the colonial produce, two millions sterling; &c. Among items of expenditure, a million and a quarter sterling for public works; over a million for emancipation of the West India slaves; £2,509,220 as interest of national debt, &c. The India revenue for 1861 amounted to £9,069,983, and the expenditure to £8,533,147 sterling.

From 1850 to and with 1862, there has been paid off £17,311,104 from the national debt, lessening the annual interest by the sum of £332,146. In 1863, the debt amounted to about 65½ millions sterling, and the interest payable to £2,500,080. The material prosperity of the N. is rapidly increasing, and a sum of probably not less than 300 million pounds is invested by N. capitalists in the funds of other nations.

The chief colonies are Java, Sumatra, Borneo, Celebes, the Spice Islands, and Papua or New Guinea, in the East; and Surinam, Curaçao, and its dependencies, in the West Indies, with factories on the coast of Guinea. Colonial pop. about 18 millions.

*Government, Franchise, &c.*—The government of the N. is a limited constitutional monarchy, heredi-

tary in the male line, and by default of that in the female. The crown-prince bears the title of Prince of Orange, and attains his majority at 18, when he takes his seat in the council of state. The executive is vested in the king, with a council of state composed of twelve members, nominated by his majesty, and the ministers of the Interior, Foreign Affairs, Finance, War, the Colonies, Marine, and Justice, the last-named taking charge of ecclesiastical affairs through two administrators, or under-secretaries of state, for the Protestant and Roman Catholic Churches. The legislative power is shared by the king and the two chambers of the States-general; the first chamber having 39 members, elected for nine years, by the provincial states, one-third of their number retiring every three years. The second chamber is composed of 72 members, chosen by electors above 23 years of age, who pay from £1, 14s. to £13, 12s. of direct taxes, according to the size and importance of the electoral district. These are elected for four years, one half of the chamber retiring every two years. For members of the town-councils, the electoral qualification is half the above sums. The members of both chambers must be 30 years of age before the day of election, and those eligible for the first chamber are the nobility. This exceedingly high franchise, which, in Amsterdam, is a higher direct tax than the rental qualification of Great Britain, makes an election a thing of no interest except to a few. In 1861, only 21·2 per cent. of the electors of Amsterdam gave their votes, and the maximum in any place was 46 per cent., in Assen, the capital of Drenthe.

The king nominates the governors of provinces, the burgoamesters of every city, town, or village, and a host of other officials. The cities, towns, and rural parishes are governed by a council, burgoamester (mayor or provost), and wetholders (aldermen or bailies). The council consists of from 7 to 39 members, according to the population, who are chosen for six years, one-third part retiring every two years. The council selects out of their number from 2 to 4 wetholders for six years, one-half retiring every third year. These, with the burgoamester, form the local executive. The law departments are the High Council, the provincial courts of justice, those of the arrondissements and cantons; appeal in many cases being open from the lower to the higher courts.

*History.*—Nothing is known regarding the original inhabitants of the N.; but about a century and a half before our era, the people known as the Batavi came out of Hesse, where they were living in hostility with their neighbours, and settled down between the Rhine and the Waal. At this time, the Frisians occupied the country north of the Rhine to the Elbe. The Batavi and Frisians differed little in appearance, manner of life, and religion. They clothed themselves with skins, lived by fishing, hunting, and pasturing cattle, possessing horses, cows, and sheep; were faithful, open-hearted, chaste, and hospitable. The songs of the bards composed their literature and history. Warlike and brave, they selected their leader for his courage and prowess, were armed with the bow and a short spear. They worshipped the sun and moon, and held their meetings in consecrated woods.

The Romans having subdued the Belgæ, next attacked the Frisians, who agreed to pay a tribute of ox-hides and horns, but continued restless and rebellious. The Batavi became allies of Rome, paying no tribute, but supplying a volunteer contingent, chiefly of cavalry, which decided the battle of Pharsalia in favour of Cesar, and formed a gallant band of the Roman armies in all parts of the

empire. About 70 A. D., Claudius Civilis, a Batavian, whose original name has not been preserved, made a bold effort to overthrow the Roman power in Rhenish or Germanic Gaul, but he was finally compelled to sue for peace. Towards the close of the 3d c. began the inroads of the Franks, followed by the Saxons and other races; and in the 5th c., the Batavi had ceased to exist as a distinct people. The Franks continued to spread, and with them the Christian religion, Dagobert I., one of their princes, erecting a church at Utrecht, which, 695, became the seat of a bishopric. The Frisians were opposed to, and the last to embrace, Christianity, to which they were forcibly converted by Charles Martel. At the end of the 8th c., all the Low Countries submitted to Charlemagne, who built a palace at Nymegen, on the Waal. The feudal system now began to develop itself and expand into dukedoms, counties, lordships, and bishoprics, which the dukes, counts, and bishops, especially the counts of Holland and bishops of Utrecht, endeavoured to enlarge and to rule over with as little submission to their superior as possible. The Crusades weakened the power and drained the resources of the nobles and priesthood, so that, during the middle ages, cities began to assume importance, strengthen themselves with walls, choose their own rulers, and appear in the state meetings. In 1384, the county of Flanders passed, through marriage, to the Duke of Burgundy, whose grandson, Philip the Good, made it his special life-effort to form the N. into a powerful kingdom. He bought Namur, inherited Brabant with Limburg, and compelled Jacoba of Bavaria to resign Holland and Zeeland. Charles V., as heir of the house of Burgundy, inherited and united the N. under his sceptre, and the country attained to prosperity, through the encouragements which he gave to commerce and shipping. Philip II., who succeeded his father, 1555, by his harsh government and persecution of the Reformers, excited the N. to rebellion, which, after a struggle of 80 years, resulted in the firm establishment of the Republic of the United Provinces. The founder of the independence of the N. was William of Nassau, Prince of Orange, called in history the Silent, who freely sacrificed his own property, and put forth every effort to unite the discordant states of the South with those of the North in resisting the Spanish yoke. Retiring to Holland, and banding together several provinces for mutual defence, by an agreement made at Utrecht, 1579, he perseveringly opposed the efforts of Spain; and in 1609, the independency of the United Provinces (the boundaries of which nearly coincided with those of the present kingdom of the N.), was virtually acknowledged by the Spanish king, an armistice for twelve years being signed at Antwerp, April 9 of that year. The struggle was renewed and carried on till 1648, when all the powers acknowledged the independence of the United Provinces by the treaty of Munster, while the Belgic provinces, divided among themselves, remained submissive to Spain and to the Roman Catholic Church.

Prince William the Silent did not live to see his efforts for freedom crowned with success. Excited by religious fanaticism, and the hope of a great reward, Balthazar Gerard or Guion, 1584, shot the prince in his house at Delft, from a narrow passage, as he was stepping from the dining-room to ascend an adjoining stair which led to the second floor. With the 17th c., the United Provinces began to advance in power and wealth, their ships visiting all parts of the world. Meanwhile, the contest between the Arminians and Calvinists broke out, and raged with fury for many years; Grotius and others fleeing to other lands, and the statesman

Oldenbarneveld suffering on the scaffold at the age of 72. The United Provinces were presided over by the Princes of Orange till the troubles at the end of the 18th c. began the long European war, which the battle of Waterloo brought to a close. The National Convention of France having declared war against Great Britain and the Stadtholder of Holland, 1793, French armies overran Belgium, 1794; and being welcomed by the so-called patriots of the United Provinces, William V. and his family, January 1795, were obliged to escape from Scheveningen to England in a fishing junk, and the French rule began. The United Provinces now became the Batavian Republic, paying eight and a half millions sterling for a French army of 25,000 men, besides giving up important parts of the country along the Belgian frontier. After several changes, Louis Bonaparte, 5th June 1806, was appointed king of Holland, but, four years later, was obliged to resign because he refused to be a mere tool in the hands of the French emperor. Holland was then added to the Empire, and formed seven departments. The fall of Napoleon I., and dismemberment of the French Empire, led to the recall of the Orange family, and the formation of the Southern and Northern Provinces into the ill-assorted Kingdom of the N., which in 1830 was broken up by the secession of Belgium. In 1839, peace was finally concluded with Belgium; but almost immediately after, national discontent with the government shewed itself, and William I., in 1840, abdicated in favour of his son. The N. being moved by the revolutionary fever of 1848, King William II. granted a new constitution, according to which new chambers were chosen, but had scarcely met when he died, March 1849, and the present king, William III., ascended the throne. The nation is prosperous, and the East India colonies, which were a burden in the earlier years of the kingdom, have long been a source of profit.

A bill for the emancipation of the slaves in the N. West India possessions passed both chambers, 8th August 1862, and received the royal assent. It decreed a compensation of 300 guilders for each slave, except those of the island of St Martin, who were to be compensated for at 30 guilders each. The freed negroes may choose the place to labour, but must be able to satisfy the government officers that they are employed somewhere. This surveillance to continue during ten years. The law came into force 1st July 1863, and in Surinam and all the other colonies the day passed quietly over. These, however, interested in agriculture have sent an address to the minister of the colonies, protesting against the high-wages tariff as hostile to the successful carrying on of their operations. The rate, however, is not higher than the planters in the neighbouring British colony of British Guiana are accustomed to pay. In the budget for 1863, provision was made for the extraordinary expenses connected with the emancipation to the amount of £1,065,366, of which £867,000 as compensation for the slaves of Surinam, and £21,250 as premiums for free labour. For Curaçao and its dependencies, £166,090 of compensation money, fully £12,000 being for various other outlays connected with the change. The number of slaves set free may be stated in round numbers to be 42,000, of whom 35,000 are in Dutch Guiana.

On 16th July 1863, a treaty was signed at Brussels by all the naval powers for the buying up of the toll levied, under treaty arrangements, by the king of the N., on vessels navigating the Schelde (q. v.), the king of Belgium binding himself also to reduce the harbour, pilot, and other charges on shipping within that kingdom.

NETHERLANDS TRADING COMPANY—NETLEY.

The N. have suffered much from floods, either caused by the breaking in of the sea, or by the descent of masses of water from Germany, while the rivers of the Rhine delta were blocked up with ice. The Zuider Zee (q. v.), which contains 1365 square miles, was of trifling extent till the flood of All Saints' Day, 1247, when the North Sea swallowed up a large tract of country. In 1277, the Dollart Gulf, in Groningen, was formed at the mouth of the Ems, by floods in the spring and autumn of that year, which destroyed 33 villages and 100,000 people. The immense waste of waters, known as the sunken South Holland Waarde, or Biesbosch, arose out of the breaking of one of the dykes, 1421, by which 72 villages were laid under water, only 34 of them reappearing. In modern times, great floods, but fortunately with only temporary results, have occurred in 1809, 1825, and 1855. That of 1855, which placed the town of Veenendaal, in Gelderland, and an extensive tract of country under water, was caused by a rapid thaw in the high lands of Germany pouring down torrents of water into the N. while the rivers were ice-locked after a winter of unusual severity.—See *Aardrijksbeschrijving Door, C. Beyer; Nederl. Geographisch-Historisch Overzicht Door, Luit. L. G. Beausar; Statistiek Jaarboek* (Witkamp, Amsterdam), an excellent book of reference, which is published yearly up to the present time; the Provincial Annual Reports, &c.

**NETHERLANDS TRADING COMPANY.** a chartered joint-stock association, with limited liability, formed to aid in developing the natural resources of Java. The Company possesses peculiar privileges, acting exclusively as the commission agents of the Netherlands government in all import and export transactions with the East India colonies, as well as doing a large private business as merchants. Private enterprise having failed to develop the trade of Java, after that island was restored to the Netherlands, King William I., in 1824, erected the Trading Company, with a capital of upwards of 3 millions sterling, not only becoming a large shareholder, but guaranteeing an interest of 4 per cent. on the paid-up capital. The early transactions were unprofitable, and in 1827 the king had to pay a part, and in 1830 the whole of the guaranteed interest. From that date, it has prospered and handed over, from the trade of Java (q. v.), large surplus balances into the national revenue. The head office of the directors is at Amsterdam, with agents at Rotterdam, Middelburg, Dordrecht, and Schiedam; the principal factory at Batavia, with agencies at the chief ports in Java and the other Netherlands possessions in the Eastern Archipelago. Immense quantities of goods suited for the colonial markets are bought, shipped from Holland and sold by the Company, for the account and at the risk of government; all the produce derived from the crown-lands being also placed in the factories, forwarded to Holland, arranged according to quality, and disposed of at the Company's periodical sales in Amsterdam, Rotterdam, &c. In 1857, one-third part of the calicoes, drills, and shirtings sent to Java was by the Trading Company, and the proportion of the trade from Java to the Netherlands which it enjoys, will appear from the following table:

SHIPPED FROM JAVA TO THE NETHERLANDS, IN 1857, BY

|                     | Trading Company. | Private Merchants. |
|---------------------|------------------|--------------------|
| Nutmegs, . . . . .  | 5,259            | 422 picols.        |
| Cinnamon, . . . . . | 1,169            | 1,070 "            |
| Indigo, . . . . .   | 947,375          | 326,111 lbs.       |
| Tobacco, . . . . .  | 439,290          | 29,295 "           |
| Sugar, . . . . .    | 892,848          | 478,073 picols.    |
| Coffee, . . . . .   | 95,848           | 16,802 "           |

The present capital of the Company is 31 million

guilders, and 5 millions of a reserve fund, or £3,150,000. The amount of commission paid by government is privately arranged according to circumstances. For many years the shares have been at a considerable premium, selling (1863) at 149, and the dividends average 10 per cent.

The success of the Trading Company depends mainly on the culture system, which was introduced into Java in 1830. Under the native rule, the land belonged to the princes, and the cultivators paid one-fifth of the produce, and one-fifth of their labour as ground-rent. The Dutch, by conquest, are now the proprietors of the greater part of the island, and exact the old produce rent, relaxing the labour to one-seventh, directing the holders of crown-lands to plant one-fifth of their cultivated fields with the crop best adapted for the soil and required for the European market. The government also has supplied, free of interest, enterprising young men with the capital necessary to erect and carry on works for the preparation of the raw materials, to be repaid in ten yearly instalments, beginning with the third year. The landholders of a certain district allotted to a sugar-mill were bound to supply a fixed quantity, receiving advances upon the crop to enable them to bring it forward. The rule of fixed quantity was relaxed in 1860, and has caused great discontentment among the contractors. The European residents and their assistants, the native princes, chiefs, and village head-men, receive a percentage according to the quantity which is manufactured from the produce delivered, so that all are interested in taking care that the lands are cultivated and the crops cared for. Sugar, tobacco, and tea are prepared by contractors; indigo, cochineal, coffee, cinnamon, and pepper by the natives under European surveillance, all passing into the Trading Company's factories for shipment to the Netherlands. The objections to the system are, that it does not leave the labour of the natives free, and that the passing of so much of the export and import trade through one favoured company injures the general merchant. On the other hand, it must be said that the Dutch government only carries out the old law, and it is therefore not regarded by the peasantry as an infringement of their rights; and the merchants and capitalists of the Netherlands did not of themselves put forth sufficient efforts to work out the natural capabilities of Java when it returned under Dutch rule.

**NETLEY, ROYAL VICTORIA HOSPITAL AT,** is a superb building, on the shore of Southampton Water, for the reception of invalids from the army on foreign service, and from among the troops serving in the adjoining military districts. In times of peace, it is only necessary to use a portion of the vast structure; but in the event of a European war, in which the British army should take part, the exigencies of the service would probably tax its accommodation to the utmost. There is provision for 1000 patients, with power to increase the number if necessary. The medical staff of course varies in proportion to the work to be done; but at present (1864) it consists of a governor, a paymaster, a captain of orderlies, an assistant-commandant, and 16 medical officers and purveyors of various ranks. The total cost of the construction of this hospital, which was commenced in 1855, has been about £350,000. Attached is the Medical School for candidates for the army medical department, the students having the best means of practical instruction in the wards of the hospital. N. is also the headquarters of the female nurses of the army, who are under the control of a lady stationed here as superintendent-general. Complete arrangements have been made for the landing of wounded men in front

of the hospital, and for conveying them thither with the least disturbance. There is no doubt as to the convenience of this great hospital for its purposes; but some questions have been raised, under high sanitary authority, as to the salubrity of the site, adjacent as it is to the wide banks of mud which Southampton Water uncovers at low tide.

NETS are fabrics in which the threads cross each other at right angles, leaving a comparatively large open space between them; the threads are also knotted at the intersections. In this respect, netting differs essentially from weaving, where the intersecting threads simply cross each other. The open spaces in nets are called *meshes*, and these correspond in size with an instrument used in net-making, consisting of a flat piece of wood or other hard substance, usually about the shape and size of a common paper-knife. In addition to this, a peculiar kind of needle (fig. 1) is used, upon which a large quantity of the thread is placed, by winding it from end to end between the forked extremities; the holes

Fig. 1.

are used to insert the end of the thread, to prevent it slipping off at the commencement of the winding. The art of net-making has been practised from the earliest times by the most savage as well as the most civilised nations. Even where the art of weaving was quite unknown, as in some of the South Sea Islands when first discovered, that of netting was well understood; and it is easy to see that the human race could not help learning the value of this art from seeing how frequently land and water animals get entangled in the shrubs and weeds through which they attempt to pass; hence we find amongst savage tribes, almost universally, nets are used not only for fishing, as with us, but also for entrapping land animals. We have ample illustrations of the uses of nets for both purposes in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt.

Until recently, nets have been always made by hand, and generally the thread has been a more or less thick twine of hemp or flax, the thickness of the twine and the size of the mesh depending upon the kind of fish for which it was made; recently, however, great improvements have been made in the manufacture of nets, and machinery of a most beautiful automatic kind has been introduced by Messrs Stuart of Musselburgh, whose manufactory is of vast extent. This establishment commences with the raw materials, which are hemp, flax, and cotton, the last having been extensively employed for herring and sprat nets of late years. Hemp, however, is the chief material for net-making; and in order to prepare it, it is first passed in long rolls through a machine consisting of two rollers with blunt ridges, the upper of which is kept down on the material by means of a hanging weight, consisting of a loaded box suspended to a chain from the axle of the roller. After the fibre has passed through this, it is much more supple than before, and is then *hackled*; this process is also done by machinery, which was first introduced into this manufactory for hemp-hackling, and succeeds admirably. It subsequently passes through the carding, roving, and spinning processes, as in all other kinds of yarn, and is finally twisted into threads or twines of the required thickness. Messrs Stuart have in one room 4000 spindles at work, besides the carding and twist machines. Of their patent loom they have 200 at work, the largest

of which makes nets 480 meshes in width. It would be useless to attempt to describe these ingenious looms, which are worked by hand, otherwise than by saying that their leading features are like the stocking-frames; a series of sinkers push forward, pull down, and pass in and out the thread, which is carried from one side of the web to the other by long iron needles, which act as shuttles passing not over-quickly from a long box on each side of the loom, as in fig. 2, which shews the box, *a*, with

Fig. 2.

shuttle-needle, *b*, protruded; *c* is the bobbin of twine which feeds the needle, and for this purpose must have a conical form, which is most ingeniously given it by a special contrivance, in the twisting-machine; *d, d, d* are small rings, through which the twine, *e*, passes, to prevent it being given off too quickly, or in knots or kinks. This simple yet most effective contrivance is worked by wheels and jointed rods, and might be advantageously applied to many other purposes. After the net comes from the loom, it goes to the finishers, who, by hand, make the addition of a kind of selvage, consisting of several thicknesses of twine, to give strength to the edges. The nets are then ready for use, and are sent in vast numbers to all parts of the world.

A great variety of nets are in use amongst fishermen, but the principal are the *seine*, *trawl*, and *drift nets*. The *seine* is a very long but not very wide net, one side of which is loaded with pieces of lead, and consequently sinks; the other, or upper, is buoyed with pieces of cork, and consequently is kept up to the surface. Seines are sometimes as much as 190 fathoms in length. When stretched out, they constitute walls of network in the water, and are made to enclose vast shoals of fish. The trawl is dragged along the bottom by the fishing-boat; and the drift-net is like the seine, but is not loaded with lead; it is usually employed for mackerel fishing.

Various kinds of nets are used in bird-catching, one of which is noticed in the article CLAP-NET. Nets are used in catching quadrupeds, chiefly for the purpose of enclosing spaces within which they are, but sometimes also for throwing upon them to confuse and entangle them.

Nets are used by gardeners to protect crops from birds; also to protect the blossoms of trees from frost, and it is wonderful how well this object is accomplished, even when the meshes are pretty wide, and the sun's rays have very free access.

NETTING, NAVAL. A *boarding-netting* is formed of strong rope, and stretched above the bulwarks of a ship, over the port-holes, &c., to a considerable height, for the purpose of preventing the entrance of boarders from hostile boats. In positions where boat attacks are feasible, ships are thus protected at night, and at other times when attempts at boarding are anticipated.

The *hammock-netting* is in the bulwarks of a ship, usually in the waist, and its purpose is to keep the hammocks of the crew when stowed there during the day; thus netted together, the hammocks form a valuable barrier against bullets.

*Hatchway-nettings* are of inch rope, and are placed

over the open hatchways during fine weather, to prevent persons from falling through.

NETTLE (*Urtica*), a genus of plants of the natural order *Urticeæ*, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4-parted perianth, and four stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an acheneum. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a N. is grasped in such a way as to press the hairs to the stem, no stinging ensues; but the slightest inadvertent touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *U. crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima*, the *Devil's Leaf* of Timor. Of British species, the most venomous, but the most rare, is the ROMAN N. (*U. pilulifera*); next to it is the SMALL N. (*U. urens*), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the GREAT N. (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woollen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* are used in some parts of Scotland and other countries as greens, and their peculiar flavour is much relished by some, although, in general, the use of them is confined to the poor; which, however, is probably the result of mere prejudice. Whatever it is that gives nettles their stinging power, is dissipated by boiling. The high value of nettles as food for swine, is well known to the peasantry of many countries; the Great N. is cultivated in Sweden for fodder of domestic animals; nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry; and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England, for the manufacture of a light kind of beer, called *N. beer*, which may be seen advertised at stalls, and in humble shops in Manchester and other towns. The *best* fibre of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fibre of *U. dioica* was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fibre, the plant is cut in the middle of summer, and treated like hemp. The names *N. Yarn* and *N. Cloth* are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics.—The fibre of *U. cannabina*, a native of the south of Siberia and other middle parts of Asia, is much used; and from that of *U. Whittlawi*, both fine lace and strong ropes can be manufactured. The fibre

of *U. Japonica* is much used in Japan, and that of *U. argentea* in the South Sea Islands; that of *U. Canadensis* is used in Canada.—The seeds and herbage of *U. membranacea* are used in Egypt as emmenagogue and aphrodisiac; and somewhat similar properties are ascribed to *U. dioica*.—*U. tuberosa* produces tubers, which are nutritious, and are eaten in India, raw, boiled, or roasted.—Australia produces a magnificent tree-nettle, *U. gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 feet high, but sometimes 120 or 140 feet, with trunk of great thickness, and very large green leaves, which, when young, sting violently. In some places, it forms *scrub* forests, and its stinging leaves form a great impediment to the traveller.

NETTLE-RASH, or URTICARIA (Lat. *urtica*, a nettle), is the term applied to a common form of eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular outline, and either white or red, or most commonly both red and white, there being a white centre with a red margin. The rash is accompanied with great heat, itching, and irritation; the appearance on the skin and the sensation being very much like the appearance and feeling produced by the stinging of nettles; and hence the origin of its names.

The disease may be either acute or chronic. In the acute form, feverishness usually precedes the rash by a few hours, although sometimes they commence together. The disorder is always connected with some derangement of the digestive organs, and it may often be traced to the imperfect digestion of special articles of food, such as oatmeal, the kernels of fruit, strawberries, cucumbers, mushrooms, and especially oysters, mussels, and crabs, which are eaten with perfect impunity by most persons. An hour or two after the offending substance has been swallowed, there is a feeling of nausea, with oppression about the pit of the stomach; the patient often complains of giddiness, and the face frequently swells; the skin then begins to tingle, and the eruption breaks forth; vomiting and diarrhoea often supervene, and act as a natural cure; but even when they do not occur, the violence of the rash usually subsides in a few hours, and the disorder altogether disappears in a day or two.

The chronic form is often very troublesome, and frequently comes on periodically in the evening. Cases are reported in which persons have been afflicted for ten years continuously by this form of the disease. Patients have left off all their customary articles of diet, one by one, without in all cases meeting with relief; and hence it may be inferred, that although the disease depends in all cases on a disordered condition of the digestive organs, it is not always the consequence of some special offending article having been swallowed.

The main treatment of the acute form consists in expelling the offending matter by an emetic and by purgatives, and the cure is thus usually completed. In the chronic form, the patient should, in the first place, determine whether the rash is caused by any particular article of diet, and if this seems not to be the case, an attempt must be made to improve the state of the digestive organs. A few grains of rhubarb taken daily, just before breakfast and before dinner, will sometimes effect a cure. If this simple remedy fails, Dr Watson recommends the trial of a draught composed of the infusion of serpentaria (about an ounce and a half), with a scruple each of the carbonates of magnesia and soda. He adds, that although external applications are usually of little avail, he has found that dusting the itching surface with flour sometimes affords temporary relief; and that a still more useful

application is a lotion composed of a drachm of the carbonate of ammonia, a drachm of the acetate of lead, half an ounce of laudanum, and eight ounces of rose-water.

**NETTLE-TREE** (*Cellis*), a genus of deciduous trees of the natural order *Ulmaceæ*, with simple and generally serrated leaves, considerably resembling those of the Common Nettle, but not stinging. The genus is distinguished chiefly by its fruit, which is a fleshy, globose, or sub-globose 1-celled drupe. The Common or European N. T. (*C. Australis*) is a native of the south of Europe, the west of Asia, and the north of Africa. It grows to the height of 30–40 feet, and is a very handsome tree, often planted along public walks in the south of France and north of Italy. The wood is very compact, very durable, and takes a high polish. It was formerly much imported into Britain for the use of coachmakers. It is used in Italy by musical-instrument makers for flutes and pipes. The flowers are inconspicuous, axillary, and solitary; the fruit black, resembling a small wild cherry, not eatable till after the first frosts, and then very sweet. The kernel yields a useful fixed oil. The tree succeeds well in the south of England.—*C. occidentalis* is a native of North America from Canada to Carolina, sometimes there called the N. T., sometimes the SUGAR BERRY. Its leaves are much broader than those of *C. Australis*, its fruit very similar. It is a much larger tree, attaining a height of 60–80 feet.—Another American species, *C. crassifolia*, often called HACKBERRY or HÄGBERRY, and HOOP ASH, is very abundant in the basin of the Ohio and westward of the Mississippi. It grows to a great height, but the trunk is not very thick. The wood is not much valued, but is said to make very fine charcoal. The fruit is black, and about the size of a pea.—The inner bark of *C. orientalis*, consisting of reticulated fibres, forms a kind of natural cloth, used by some tribes of India.—A number of other species are natives of the warm parts of America and of Asia.

**NEU-BRANDENBURG**, a town of Mecklenburg-Strelitz, and the largest and most beautiful in the duchy, is situated on Lake Tollens, 17 miles north-north-east of Neu-Strelitz. It is regularly built, contains two churches, a castle, &c., is the centre of a picturesque district, and the seat of considerable industry. Pop. 6766.—About half a league from N., on a rock overlooking Lake Tollens, stands the ducal pleasure-castle of Belvedere, commanding, it is said, the most beautiful prospect in Mecklenburg.

**NEUBURG**, an ancient town of Bavaria, is picturesquely situated on the right bank of the Danube, 29 miles north-north-east of Augsburg. It contains a handsome palace, the château of the Dukes of Bavaria of the line of Pfalz-Neuburg, who resided here from 1596 to 1742. The palace contains a collection of ancient armour. Brewing and distilling are carried on, and there is a considerable commercial trade on the Danube. Pop. 6769.

**NEUFCHATEL**, or **NEUCHATEL**, known also as *Neuenburg*, a canton in the west of Switzerland, between Lake Neuchatel and the French frontier, in lat. 46° 52'—47° 10' N., and long. 6° 26'—7° 5' E. Area, 304 square miles. Population, 87,369, at the close of 1860. N. lies in the midst of the Jura Mountains, four chains of which, running from north-east to south-west, traverse the canton, and are separated by elevated longitudinal valleys. The most easterly of these is a broken chain, running parallel to the lake of Neufchatel, on whose banks, and on the second and lower ranges beyond it, the vine is carefully cultivated. This second chain has five principal passes, the highest of

which, La Tourne, has an elevation of about 4000 feet. The third and fourth ranges, abutting on France, consist for the most part of barren hills, separated by elevated valleys; but here and there these high lands are well wooded and fruitful, producing corn, good pasture, fruits, &c. The greater number of the numerous streams which water the canton flow into the Rhine. Among these mountain torrents, the principal are the Reuse, the Seyon, and the Serriere, the two former of which, together with the rivers Orbe and Broie, are the feeders of the Lake of Neufchatel, known also as the Lake of Yverdun. The Thiele serves as its outlet, and carries its waters into the neighbouring lake of Biemme, and into the river Aar. The lake is 25 miles long, and from 3 to 5½ miles wide. Its level above the sea is 1420 feet, and it has a depth of 400 or 500 feet.

The natural products are iron ores, coal, asphalt, fruit, including grapes—from which good red and white wines are made—timber and corn, although the latter is not grown in sufficient quantity for the demands of the home consumption. The rearing of cattle constitutes an important branch of industry, and large quantities of cheese are exported; but the speciality of the canton is watch-making, which occupies from 18,000 to 20,000 persons, and is prosecuted in detail at the homes of the work-people, in the rural districts, where some families manufacture only special parts of the machinery, while others are engaged solely in putting together the separate portions that have been manufactured by others; and the watches thus prepared are exported in large quantities to every part of Europe and America. Muslin-printing employs upwards of 10,000 persons, and lace is extensively made by the country-women of the Val de Travers.

The climate of N. varies greatly with the locality; being temperate on the shores of the lake, cooler in the valleys, and severe on the mountain-sides. The population, with the exception of between 5000 and 6000 Catholics, belongs to various Protestant denominations.

The history of N. was identical with that of Burgundy, till the 11th c.; and after the principality had been for a time incorporated with the territories of the Counts of Chalons, to whom it had been granted in 1288, by Rudolph of Hapsburg, it passed to the House of Longueville. In 1707, on the extinction of the N. branch of the latter family, 15 claimants came forward to advance more or less valid pretensions to the N. territory. Frederick I. of Prussia, who based his claim to the principality of N. on the ground of his descent from the first Prince of Orange, a descendant of the House of Chalons, was the successful candidate; and from his time it continued associated with Prussia till 1806, when Napoleon bestowed it upon General Berthier; but in 1814, it was restored to the House of Brandenburg. This connection with the Prussian monarchy has been wholly dissolved since 1857, and N. is now a member of the Swiss Confederation.

**NEUFCHATEL** or **NEUENBURG**, the chief town of the canton (pop. 7727), occupies a magnificent site on the north-west shore of the Lake of Neufchatel, and is noted for its many charitable institutions, and for the beauty of its charmingly situated environs.

**NEUHAUS**, a town of Bohemia, on the Nescharka, about 70 miles south-south-east of Prague. Its palace, belonging to Count Czerny, is a splendid edifice. Cloth, paper, and chemical products are manufactured. Pop. 7600.

**NEUHAUSEL** (Hung. *Ersek-Ujvár*), a town of Hungary, on the right bank of the Neutra, 74 miles

north-west of Pesth, by the Vienna and Pesth Railway. It was formerly strongly fortified, and played an important part in the Turkish wars. No traces of its fortifications now remain. Pop. 7300, chiefly engaged in agriculture and the rearing of cattle.

**NEURALGIA** (Gr. *neuron*, a nerve; *algos*, pain) is a term employed to designate pain of a purely nervous character, usually unaccompanied by inflammation, fever, or any appreciable change of structure. The pain, which occurs in paroxysms, usually followed by complete remissions, is of every possible degree and character, being described in different cases as piercing, tearing, burning, &c. These paroxysms may occur at intervals of a few seconds only, or they may take place daily or on alternate days, or they may be separated by much longer intervals, which are often, but by no means always, of a regular length. With the pain, there is frequently spasmodic twitching of the adjacent muscles. The duration of the disease is very uncertain. The patient may have only a single attack, or he may be liable to recurring attacks for months, years, or even for his whole life; it is, however, very seldom that the disease occurs but once. Death scarcely ever results directly from this affection, but the pain may, by its severity and persistence, gradually undermine the constitution.

The disease may attack any part of the body where there are nerves; but in no part does it occur so frequently as in the face, when it is popularly known as *Tic Douloureux*; its seat being in the facial branches of the fifth pair of nerves (the trifacial nerves—see fig. 2 in NERVES). The following graphic description of the ordinary varieties of this form of neuralgia is borrowed from Dr Watson's *Lectures on the Principles and Practice of Physic*: 'When the uppermost branch of the trifacial nerve is the seat of the complaint, the pain generally shoots from the spot where the nerve issues through the superciliary hole; and it involves the parts adjacent, upon which the fibrils of the nerve are distributed—the forehead, the brow, the upper lid, sometimes the eyeball itself. The eye is usually closed during the paroxysm, and the skin of the forehead on that side corrugated. The neighbouring arteries throb, and a copious gush of tears takes place. In some instances, the eye becomes blood-shot at each attack; and when the attacks are frequently repeated, this injection of the conjunctiva may become permanent.'

'When the pain depends upon a morbid condition or morbid action of the middle branch of the nerve, it is sometimes quite sudden in its accession, and sometimes comes on rather more gradually; being preceded by a tickling or pricking sensation of the cheek, and by twitches of the lower eyelid. These symptoms are shortly followed by pain at the infra-orbital foramen, spreading in severe flashes (so to speak) over the cheek, affecting the lower eyelid, ala nasi, and upper lip, and often terminating abruptly at the mesial line of the face. Sometimes it extends to the teeth, the antrum, the hard and soft palate, and even to the base of the tongue, and induces spasmodic contractions of the neighbouring muscles.'

'When the pain is referrible to the inferior or maxillary branch of the fifth pair of nerves, it darts from the mental foramen, radiating to the lips, the alveolar processes, the teeth, the chin, and to the side of the tongue. It often stops exactly at the symphysis of the chin. Frequently it extends in the other direction, to the whole cheek and to the ear. During the paroxysm, the features are liable to be distorted by spasmodic action of the muscles of the jaw, amounting sometimes to tetanic rigidity, and holding the jaw fixed and immovable.'

'The paroxysms of suffering in this frightful disease are apt to be brought on by apparently trivial causes—by a slight touch, by a current of air blowing upon the face, by a sudden jar or shake of the bed on which the patient is lying, by a knock at the door, or even by directing the patient's attention to his malady, by speaking of it or asking him questions about it. The necessary movements of the face in speaking or eating are often sufficient to provoke or renew the paroxysm. At the same time, firm pressure made upon the painful part frequently gives relief, and causes a sense of numbness to take the place of the previous agony' (vol. i. pp. 723, 724).

*Tic douloureux* is the form of severe neuralgia which is by far the most commonly met with; the reason probably being, that the trifacial nerve, lying superficially, and being distributed over a part of the surface which is usually unprotected by any artificial covering, is very liable, for that reason, to be affected by exposure to atmospheric influences, which are undoubtedly to be included among the exciting causes of this disease. Amongst other seats of neuralgia may be mentioned the arm, especially the forearm, the spaces between the ribs, especially between the sixth and ninth, and the lower extremity, where it most frequently affects the sciatic nerve, giving rise to the affection known as **SCIATICA**, which, however, not always being pure neuralgia, will be noticed in a separate article.

The causes of neuralgia are various. Excluding inflammation of the nervous trunk or *neuritis*, the pain may be excited by a tumour pressing on the nerve, or originating in its substance; or by roughness of a bony surface with which the nerve may be in contact, as when it passes through a foramen; or it may be due to tumours within the cranium, or a morbid state of the spinal cord. Sometimes, again, irritation applied to *one* branch of a nerve will give rise to pain at the extremity of *another* branch of the same nerve, the sensation being reflected along the branch which is not directly exposed to the irritation. In this way we may explain the pain in the shoulder which often accompanies disease of the liver; the pain in the thigh, which is often associated with irritation of the kidney; the pain in the left arm, which is often coincident with disease of the heart, &c. Persons suffering from debility, anæmia, and a gouty or rheumatic constitution, are so especially liable to neuralgia, that these conditions—as also exposure to malarious influences—must be placed among the predisposing causes. Amongst the exciting causes, exposure to cold and wet, or to a cold dry east wind, is the most frequent; but fatigue, strong mental emotions, the abuse of tea, coffee, tobacco, and alcoholic drinks, a wound or bruise, the retrocession of gout, rheumatism, or cutaneous eruptions, &c., occasionally suffice to excite the disease.

The resources of the *materia medica* have been exhausted in searching for remedies for this cruel disease. Dr Elliotson believes that 'in all cases of neuralgia, whether exquisite or not, unaccompanied by inflammation, or evident existing cause, iron is the best remedy;' and there can be no doubt that when the disease is accompanied with debility and paleness, no remedy is likely to be so serviceable. If the digestive organs are out of order, the neuralgia may not unfrequently be removed or alleviated by correcting their unhealthy state. 'Dr Rigby tells us that having suffered in his own person an intense attack of *tic douloureux*, which opium did not assuage, he swallowed some carbonate of soda dissolved in water. The effect was almost immediate; carbonic acid was eructed, and the pain quickly abated. In this case, the pain depended upon the

mere presence of acid in the stomach. More often the cause of offence appears to lie in some part of the intestines; and purgatives do good. Sir Charles Bell achieved the cure of a patient upon whom much previous treatment had been expended in vain, by some pills composed of cathartic extract, croton oil, and galbanum. He mixed one or two drops of the croton oil with a drachm of the compound extract of colocynth; and gave five grains of this mass, with ten grains of the compound galbanum pill, at bedtime. Other cases have been since reported, both by Sir Charles and by others, in which the same prescription was followed by the same success.—Watson, *op. cit.* p. 727.

When the disease occurs in a rheumatic person, iodide of potassium (from three to five grains taken in solution three times a day before meals) sometimes gives great relief. When the paroxysms occur periodically—as, for example, with an interval of 24 or 48 hours—sulphate of quinine in doses of from 10 to 20 grains between the paroxysms, will usually effect a cure; and if the disease resist comparatively small doses, the quantity may be increased to half a drachm, or a drachm if necessary. Arsenic acts in the same manner as quinine in these cases, but usually less effectually.

The inhalation of chloroform will sometimes give permanent relief, and always gives temporary ease, and shortens the period of suffering.

The injection of a certain quantity of a solution of muriate of morphia, by means of a sharp-pointed syringe, into the cellular tissue beneath the skin over the painful spot, very often gives immediate relief. For the discovery of this mode of treating neuralgia, we are indebted to Dr Alexander Wood of Edinburgh. At one time—about half a century ago—it was a common practice to divide the trunk of the painful nerve, with the object of cutting off the communication between the painful spot and the brain; but in many instances the operation signally failed, and it is now never resorted to. A much simpler operation, namely, the extraction of a canine tooth, has often been found to give permanent relief in cases of facial neuralgia, and in such case a careful examination of the teeth should usually be made.

Local applications can be of no permanent service in cases where the pain results from organic change, or from general constitutional causes; they will, however, often give considerable temporary relief. Amongst the most important local applications may be mentioned laudanum, tincture of aconite (or aconitina ointment, in the proportion of one or two grains to a drachm of simple ointment or cerate), belladonna-plaster, and chloroform (which should be applied upon a piece of linen saturated with it, and covered with oiled silk, to prevent evaporation).

Lastly, neuralgia being a purely nervous affection, is often influenced by means calculated to make a strong impression on the mind of the patient; and hence it is that galvanic rings, electric chains, mesmeric passes, homeopathic globules, and other applications, which, like these, act more upon the mind than upon the body of the patient, occasionally effect a cure.

NEURITIS is the term applied to inflammation of the nerves. The disease is rare, and not very well defined. The symptoms closely resemble those of neuralgia. Rheumatism seems, in most cases, to be the cause of the disease, which must be treated by bleeding, leeching, purging, and low diet. Anodynes are also required for the relief of the pain; and of these, Dover's Powder, in tolerably full doses, is perhaps the best.

NEUROPTERA (Gr. nerve-winged), an order of

mandibulate insects, having four nearly equal and membranous wings, all adapted for flight, divided by their nervures into a delicate net-work of little spaces, and not covered with fine scales, as in the *Lepidoptera*. The wings are often extended horizontally when at rest, nearly as in flight; but the position is various. The form of the wing is generally somewhat elongated. The body is generally much elongated, particularly the abdomen. The head is often large, the compound eyes very large, and there are often also simple or stemmatic eyes. The habits are predaceous, at least in the larva state; often also in the pupa and perfect states, the food consisting of other insects, often caught on the wing. The power of flight is accordingly great in many. The larvæ and pupæ are often aquatic. The females have no sting, and only a few have an ovipositor. The metamorphosis is complete in some, incomplete in others. Dragon-flies, May-flies, scorpion-flies, ant-lions, and termites, or white ants, belong to this order.

NEUSATZ (also *Neoplanta* or *Uj-Videk*), a town of the Austrian empire, in the Servian Wojwodschaff, is situated on the left bank of the Danube, opposite Peterwardein. Its origin dates from the year 1700, and in the year 1849 it numbered nearly 20,000 inhabitants. A bridge, 840 feet in length, extends between N. and the town and fortress of Peterwardein. N. is the seat of the Greek non-unioned Bishop of Bács. On the 11th June 1849, it was taken from the Hungarian insurgents by the imperial troops, and was almost wholly destroyed. It appears, however, to be again reviving. It is a station for steamers on the Danube, and carries on an important and active trade. Pop. 10,000.

NEUSE, a river of North Carolina, United States of America, rises near the middle of the northern boundary of the state, and, after a south-easterly course of 250 miles, falls by a broad channel into Pamlico Sound, which communicates by several inlets with the Atlantic Ocean. It forms the harbour of Newbern.

NEUSIEDL, LAKE (Hung. *Ferto-tava*), a small lake on the north-west frontier of Hungary, 22 miles south-east of Vienna. It is 23 miles in length, and about 6 miles in average breadth, with a mean depth of 13 feet. Its waters are light-green in appearance, and are brackish in taste. The slopes of the Leitha Mountains in the vicinity produce excellent wine.

NEUSOHL (Hung. *Beszterce-Bánya*), a beautiful and thriving town of Hungary, the chief place of the richest mining district in the country, is situated in a hill-enclosed valley on the right bank of the Gran, about 85 miles north of Pesth. N., consisting of the town proper (pop. 6200) and five suburbs, contains a population, in all, of upwards of 10,000, who are employed in the copper and iron mines of the vicinity, in the smelting-houses, and in the manufacture of beet-root sugar, paper, colours, &c. It is the seat of a bishop, and contains a beautiful cathedral, a bishop's palace, and two evangelical churches, and several other handsome edifices.

NEUSS, a fortress and flourishing manufacturing town of Rhenish Prussia, near the left bank of the Rhine, with which it is connected by the river Erit, 4 miles south-west of Düsseldorf. Its church of St Quirinus, a beautiful edifice, and a notable specimen of the transition from the round to the pointed style, is supposed to have been built in 1209. N. is the principal grain-market of the province, and carries on manufactures of woollen and other cloths, ribbons, hats, vinegar, &c. It is supposed to be

the *Novesium* of the Romans, sacked by Attila in the year 451. Pop. 9776.

NEUSTADT (Polish, *Prudnitz*), a town of Prussian Silesia, 29 miles south-west of Oppeln. It is the seat of considerable manufacturing industry, woollen and linen fabrics being the staple goods manufactured. Damask-weaving alone employs 660 hands, and 380 looms. Pop. 7263.

NEUSTADT, or WIENER-NEUSTADT, one of the most beautiful towns of Lower Austria, called, from its loyalty, 'the ever-faithful town' (*ewig getreue Stadt*), is situated 28 miles south of Vienna, on the Vienna and Gloggnitz Railway, and is also connected with the capital by a canal. It is surrounded by a broad and deep ditch, and by a fortified wall pierced by four gates. The town is overlooked by the large old castle of the Dukes of Babenberg, now a military academy for the preparatory instruction of officers of the line. It accommodates from 400 to 500 pupils. The castle contains a fine Gothic chapel (date, 1460), rich in painted windows. It is the burial-place of the Emperor Maximilian. On the 14th September 1834, the whole town, with the exception of fourteen houses, was destroyed by a dreadful conflagration, which involved the loss of many lives. The new town has been laid out with great taste and regularity. The canal (40 miles in length) and the railway to Vienna, and the converging roads from Styria and Hungary, are the sources of the prosperity of the town. In N. machinery is extensively constructed; and sugar-refining and manufactures of silk, velvet, and cotton fabrics, fayence, leather, &c., are carried on. Pop. 13,700.

NEUSTADT AN DER HARDT, a small town of Rhenish Bavaria, charmingly situated on the Speyerbach, at the foot of the Hardt Mountains, 12 miles north of Landau. Its church, with several curious monuments of the Counts Palatine, and with some ancient fresco-paintings, was finished in the 14th century. It carries on some manufactures, together with the brewing of beer. Pop. 7600.

NEUSTADT-E-BERSWALDÉ, a town of Prussia, in the province of Brandenburg, in a pleasant district on the Finow Canal, 28 miles north-east of Berlin, on the Berlin and Stettin Railway. It is well known on account of its mineral springs, and carries on extensive manufactures in steel, iron, copper, brass, paper, and porcelain. Pop. 6153.

NEUSTADTL AN DER WAAG, a town near the north-west frontier of Hungary, 33 miles north-north-west of Neutra. Here excellent red wine is grown, and there is a good trade in grain, wool, sheep-skins, and wax. Pop. 6750, nearly half of whom are Jews.

NEU-STRELITZ, the capital and the residence of the court of the grand duchy of Mecklenburg-Strelitz, pleasantly situated in a hilly district, between two lakes, 60 miles north-north-west of Berlin. It was founded in 1733, is built in the form of an eight-rayed star, and contains the ducal palace, with a library of 70,000 vols., and having magnificent gardens attached. Pop. 7390, who are supported chiefly from the expenditure of the court, and by brewing and distilling. A mile south of the town is Alt-Strelitz, with the largest horse-market in the duchy.

NEUSTRIA, or WEST FRANCE (*Francia Occidentalis*), the name given in the times of the Merovingians and Carlovingians to the western portion of the Frank empire, after the quadruple division of it which took place in 511. N. contained three of these divisions. It extended originally from the mouth of the Scheldt to the Loire, and was

bounded by Aquitania on the S., and by Burgundy and Austrasia (*Francia Orientalis*) on the E. The principal cities were Soissons, Paris, Orleans, and Tours. Bretagne was always loosely attached to Neustria, of which the strength lay in the Duchy of France. After the cession of the territory afterwards called Normandy to the Normans in 912, the name Neustria soon fell into disuse.

NEUTITSCHHEIN, a small manufacturing town of Moravia, on the Titsch, 80 miles north-east of Brünn. It contains an old castle, and carries on manufactures of cloth and woollen goods, dyeing, and wagon-making. Pop. 8000.

NEUTRAL AXIS, the name given to an imaginary line through any body which is being subjected to a transverse strain; and separating the forces of extension from those of compression. If the ratio of the resistances to extension and compression were the same for all substances, and depended merely on the form of the body, then in all bodies of the same form the neutral axis would have a definite geometrical position; but it has been satisfactorily proved, by Mr Eaton Hodgkinson, that this ratio has a separate value for each substance. In wood, where the ratio is one of equality, the neutral axis in a beam supported at both ends, whose section is rectangular, passes lengthwise through the centre of the beam; while in cast-iron, in which the resistance to compression is greater than that to extension, it is a little above, and in wrought iron, in which the contrary is the case, it is a little below, the centre.

NEUTRAL SALTS. See SALTS.

NEUTRALS, nations who, when a war is being carried on, take no part in the contest, and evince no particular friendship for, or hostility to, any of the belligerents. As a general rule, neutrals should conduct themselves with perfect impartiality, and do nothing which can be considered as favouring one belligerent more than another.

The duties and obligations of neutrals at sea have given rise to many complicated questions. It is allowed on all hands that a neutral state forfeits her character of neutrality by furnishing to either belligerent any of the articles that come under the denomination of Contraband of War (q. v.). If she does so, the other belligerent is warranted in intercepting the succours, and confiscating them as lawful prize. Contraband of war, besides warlike stores, has sometimes been held to include various other articles, a supply of which is necessary for the prosecution of the war; and it has been doubted how far, in some circumstances, corn, hay, and coal may not come under that category.

An important question regarding the rights of neutrals is, whether enemies' goods not contraband of war may be lawfully conveyed in neutral bottoms. The principle that free ships make free goods, was long resisted by this and other maritime countries, and the general understanding has been, that belligerents have a right of visiting and searching neutral vessels for the purpose of ascertaining—1st, whether the ship is really neutral, as the hoisting of a neutral flag affords no absolute security that it is so; 2d, whether it has contraband of war or enemies' property on board. Neutral ships have therefore been held bound to provide themselves with passports from their government, and such papers as are necessary to prove the property of the ship and cargo, and it is their duty to heave to when summoned by the cruisers of either belligerent. It has been considered that a neutral ship which seeks to avoid search by crowding sail or by open force, may be captured and confiscated. When a merchant-ship is sailing under convoy of a vessel

of war, it has been said that the declaration of the officer in command of the convey that there is no contraband of war or belligerent property on board, is sufficient to bar the exercise of the right of search.

A declaration having important bearings on the rights of neutrals, was adopted by the plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in congress at Paris, on April 16, 1856. By its provisions, 1. Privateering is abolished. 2. A neutral flag covers enemies' goods, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag. 4. Blockades, in order to be binding, must be effective, that is, maintained by a force sufficient really to prevent access to the coast of the enemy.

It has sometimes been proposed to exempt private property at sea from attack during war—such a project, however, seems inexpedient. There may be a propriety in respecting the property of individuals on land, in a time of war, because its destruction, however injurious to the persons immediately concerned, can have little influence on the decision of the contest. But at sea, private property is destroyed because those from whom it is taken, being purveyors or carriers for the community at large, its loss must seriously affect the public, and have no small influence in bringing the contest to an end. See **BLOCKADE, PRIVATEER.**

**NEUWIED**, a town of Rhenish Prussia, on the right bank of the Rhine, 8 miles below Coblenz. It is the capital of the principality of Wied, now mediatised and attached to Prussia, and is the seat of the princes of Wied, with a beautiful castle. It was founded in the beginning of the 18th c. by Prince Alexander of Wied-Newweid, who, offering perfect toleration in religious matters, as an inducement, invited colonists of whatever persuasion to settle here. The town is well built, with wide, straight streets, running at right angles to each other, and contains the churches of Protestants, Catholics, Jews, Herrnhuters, &c. The inhabitants are well conditioned and industrious. Pop. 7240, who carry on manufactures of hosiery, woollen and cotton fabrics, iron-wares, leather, and tobacco.

**NEVA**, a river of Russia, in the government of St Petersburg, flows westward from the south-west corner of Lake Ladoga to the Bay of Cronstadt, in the Gulf of Finland. Its length, including windings, is about 40 miles, 9 miles of which are within the limits of the city of St Petersburg; and in some places it is 2100 feet broad, and about 56 feet deep; although at Schlussburg, where it issues from the lake, and at St Petersburg, where it enters the sea by several branches, it is shallow. From Cronstadt, goods are brought to St Petersburg in lighters or in small steamers. By the Ladoga Canal, the N. communicates with the vast water-system of the Volga, and thus it may be said to join the Baltic with the Caspian Sea. Its current is very rapid, and the volume of its waters is immense. It is covered by drift-ice for upwards of five months—from about the 25th November to the 27th April. An extensive traffic is carried on on its waters, both from the interior and from the Baltic.

**NEVA'DA TERRITORY**, in the west of the U. S. of America, is bounded on the W. by California—the boundary-line being the meridian of 116° W.—on the E. by Utah Territory, and on the N. by Oregon, and was organised in 1861. Its area is estimated at 80,000 square miles; and its pop. at 50,568, of whom 23,000 are Indians. The chief river is the

Humboldt, which flows west-south-west, and ends in the marsh called the Sink of the Humboldt. The principal lakes are the Mud Lakes, Pyramid Lakes, and the Walker and Carson Lakes. The country is traversed by mountains, in short ranges, rising to upwards of 6000 feet, and running from north to south. Of the 9 counties already formed, 7 have numerous mines either of gold or silver. The whole country is rich in mineral wealth. Besides gold and silver, quicksilver, lead, and antimony are found. The territorial capital is Carson City (pop. 2500), but the principal town is Virginia City (pop. 3000). In the autumn of 1862, the population was rapidly increasing, and the stocks of the mining companies were rising in value.

**NEVERS**, a town of France, capital of the department of Nièvre, and formerly the capital of the province of Nivernais, is built on a hill in the midst of fertile plains, at the confluence of the Loire and the Nièvre, 140 miles south-south-east of Paris. Highly picturesque, as seen from a distance, its interior shews steep, winding, and badly paved streets. It contains a beautiful cathedral of the 10th c., and a fine public garden; the large cavalry barrack, the fine bridge of 20 arches over the Loire, and the triumphal arch, erected in 1746, to commemorate the battle of Fontenoy, are also worthy of mention. N. is the see of a bishop, contains a public library, and has numerous educational, scientific, and benevolent institutions, and an arsenal. There is here an important cannon-foundry, and the principal manufactures are porcelain and earthenware, glass, brandy, iron cables and chains, and anvils. Pop. 16,082.

N., the *Noviodunum* of the Romans, existed prior to the invasion of Gaul by Julius Cæsar. It has been the seat of a bishop since the beginning of the 6th c., when it was called Nevirnum, became a county in the 10th c., and was erected into a duchy by Francis I. in 1538.

**NEVILLE'S CROSS.** See **BRUCE, DAVID.**

**NEVIS**, a small island of the West Indies, belonging to Great Britain, forms one of the group of the Lesser Antilles, and lies immediately south-east of St Christopher's, from which it is separated by a strait called the *Narrows*, two miles wide. It is circular in form, rises in a central peak to the height of about 2500 feet, and has an area of 20 square miles. Pop. (1861) 9822, of whom only 260 were white. Charlestown, a seaport, with a tolerable roadstead, situated on the south-west shore of the island, is the seat of government, consisting of a government council and general assembly. The soil is fertile, and the principal products are sugar, molasses, and rum. In 1860, sugar to the value of £36,123 was produced; molasses, £2790; and rum, £1740, the produce in the last article being for that year unusually small. In 1860, 433 vessels of 26,259 tons entered and cleared, and the value of the imports was £35,255, and of the exports, £40,666; the revenue, £5596; the expenditure, £5129. In 1860, there were 13 schools on the island, attended by 2108 scholars.

**NEW ALBANY**, a town in Indiana, U. S., on the north bank of the Ohio River, at the foot of the falls, opposite Portland, and two miles below Louisville, Kentucky; a finely situated, well-built town, having 22 miles of streets, 5 ship-yards, 3 foundries, 22 churches, and is the site of Asbury College and a collegiate institute. It has a large river-trade and railway connections with Indiana and Kentucky. Pop. (1860) 12,647.

**NEW BEDFORD**, a seaport city of Massachusetts, U. S., on Buzzard's Bay, 55 miles south of Boston. Since 1753, it has been the chief centre of

the American whale-fisheries, and is the richest town, in proportion to its population, in America. Of 547 vessels belonging to the port, 399 are whalers, which, in 1859, brought home 2,236,438 gallons of sperm-oil, 4,715,583 gallons of whale-oil, and 2,010,882 lbs. of whalebone. It has 13 oil and candle factories, 4 soap factories, several large cotton-mills, hoop-iron manufactories, barrel factories, 24 churches, 4 banks, 2 daily and 3 weekly newspapers, a public library of 13,000 volumes, city-hall, custom-house, alms-house, &c., with extensive railway and steam-boat connections. Pop. (1860) 22,300.

**NEW BRITAIN**, a manufacturing village in Connecticut, U. S., 10 miles south of Hartford, engaged in the production of stockinet goods, locks, jewellery, hooks and eyes, and various kinds of hardware. It has six churches. The water supply is from a reservoir of 175 acres, with a head of 200 feet, supplying public fountains with jets of 140 feet, and dispensing with fire-engines. Pop. (1860) 5212.

**NEW BRITAIN**, the name of one principal, and of several subsidiary islands in the Pacific Ocean, in lat. between 4°—6° 30' S., and long. between 148°—152° 30' E. The principal island, 300 miles in length, and having an area of 12,000 square miles, lies east of New Guinea, from which it is separated by Dampier's Straits. The surface is mountainous in the interior, with active volcanoes in the north, but along the coast are fertile plains. Forests abound in the island, and palms, sugar-cane, breadfruit, &c., are produced. The inhabitants, the number of whom is unknown, are described as a tribe of 'oriental negroes,' and are well formed, active, and of a very dark complexion. They are further advanced in civilisation than is usual among the Polynesians, have a formal religious worship, temples, and images of their deities. N. B. was first seen by Le Maire and Schouten in 1616, but Dampier, at a later date, was the first to land.

**NEW BRUNSWICK**, a city of New Jersey, U. S., is on the south bank of the Raritan River, at the head of navigation, 15 miles from its mouth, 30 miles south-west of New York, on the New Jersey Railway, and the Delaware and Raritan Canal. It has extensive manufactures of cotton, leather, india-rubber, paper-hangings, iron, and machinery, 16 churches, 2 banks, 2 daily and 3 weekly newspapers. It is the seat of Rutgers' College and Theological Seminary. Pop. (1860) 11,255.

**NEW BRUNSWICK**, a British colony, on the north-east coast of North America, is bounded on the N.W. by Canada and the Bay of Chaleur, on the N.E. by the Gulf of St Lawrence and the Strait of Northumberland, on the S. by Nova Scotia and the Bay of Fundy, and on the S.W. by the state of Maine. It has an area of 32,000 square miles, or 17,600,000 acres (rather more than the area of Scotland), and a population, in 1861, of 252,047. The coast-line is 500 miles in extent, and is indented by spacious bays, inlets, and harbours, which afford safe and commodious anchorage for shipping. The chief are Fundy, Chignecto, and Cumberland Bays, the two last being merely extensions of the first; Passamaquoddy Bay in the south; Verte, Shediac, Cocaigne, Richibucto, and Miramichi Bays on the north-east, and the Bay of Chaleur, 80 miles long by 27 broad, in the north-west. The province of N. B. abounds in rivers. The principal are the St John's and the St Croix, the former 450, and the latter 100 miles in length, and both falling into the Bay of Fundy; and of the rivers that flow eastward into the Gulf of St Lawrence, the Richibucto, the Miramichi, and

the Restigouche. The province contains numerous lakes, one of which, Grand Lake, is 100 square miles in area. Most of the others are much smaller. The surface is for the most part flat or undulating. With the exception of the district in the north-west bordering on Canada and the river Restigouche, no portion of N. B. is marked by any considerable elevation. Here, however, the country is beautifully diversified by hills of from 500 to 800 feet in height. These elevations, which form an extension of the Appalachian range, are interspersed with fertile valleys and table-lands, and are clothed almost to their summits with lofty forest-trees. In this district the scenery is remarkably beautiful. In the south of the colony the surface is broken up by great ravines, and the coast is bold and rocky. The shores on the east coast, and for twenty miles inland, are flat. The soil is deep and fertile. Of the whole acreage, 14,000,000 acres are set down as good land, and 3,600,000 acres as poor land. In 1851, 613,954, and in 1861, 835,108 acres were under cultivation. Timber is as yet the principal vegetable product, but wheat, oats, buckwheat, barley, rye, potatoes, and hay are raised. 206,635 bushels of wheat were raised in 1851, and 279,775 bushels in 1861. In 1851, 1,411,164 bushels of oats were raised, and in 1861, 2,656,883 bushels, or 10½ bushels for every inhabitant. N. B. contains a rich and extensive wheat-producing district; but the inhabitants, dividing their time between farming, lumbering, fishing, ship-building, and other pursuits, and following no regular system of tillage, have not much advanced the agricultural condition of the country for several years. The climate is remarkably healthy, and the autumn—and especially the season called the Indian summer—is particularly agreeable, and the severity of the winter has been already much mitigated by the clearing of the forests. In the interior, the heat in summer rises to 80°, and sometimes to 95°; and in winter, which lasts from the middle of December to the middle of March, the mercury sometimes falls as low as 40° below zero. At Fredericton, the capital, situated on St John's River, 65 miles from the south, and 130 miles from the north coast, the temperature ranges from 35° below to 95° above zero, and the mean is about 42°.

The northern districts of the province, from the Bay of Chaleur to the St John, are occupied by metamorphic slates. In the south, the carboniferous and new red sandstone systems (including deposits of red marl and gypsum, and extensive beds of coal) prevail. One-third of the surface of N. B. is covered by a bed of coal. Many of the coal-measures, however, are thin and impure; but the coal of Albert county is the most valuable deposit of bituminous matter on the American continent, and is apparently inexhaustible. It yields 100 gallons of crude oil per ton. From this deposit, 446,875 worth of coal was exported in 1859, and the stockholders were drawing 110 per cent. profit. Throughout the province, 2842 tons of coal were raised in 1851, and 18,244 tons in 1861; but mining has not yet become an important branch of industry. Gold and silver occur in N. B.; copper and iron ore of excellent quality abound; gypsum, plumbago, and limestone are very abundant, and the freestone of the province, unsurpassed for beauty and durability, commands a high price in the States. In 1861, 42,965 casks of lime, 42,476 grindstones, 14,089 tons of building stone, and 14,000 tons of gypsum were brought into the market. Wild animals abound in the province; the lakes and rivers are well-stocked with fish, and along the coasts cod, haddock, salmon, and other fish are caught in great plenty. In 1861, the total value of fish caught was £108,000, exclusive of the value of the fish consumed by the inhabitants. In

1860, 6707 vessels of 1,297,374 tons entered and cleared. The exports consisted of timber (in deals, boards, pine timber, &c., to the value of £621,455), fish, oil, and building and grindstones, amounting in all to £916,372. The imports consisted of manufactured fabrics, grain, hardware, tea, preserved meats, spirits, molasses, and sugar, and amounted to £1,446,740. In 1861, there were in the colony 92,025 cattle, 69,642 milch cows, 35,830 horses, 214,096 sheep, and 74,057 pigs. In 1861, there were 866 collegiate, grammar, and other schools, attended by nearly 20,000 pupils. In the same year the revenue amounted to £178,664, and the expenditure to £174,419. There were two lines of railway in operation in 1861—the line from St John's (at the mouth of the river of the same name) to Shediac, and that from St Andrew's to Woodstock. The length of both railway-lines is 190 miles, and there are also in the colony 450 miles of telegraph. Around the coasts and along the bank of the rivers there are excellent public and coach roads. Of the entire population, 55,238 are Catholics, 42,776 Episcopalians, 36,631 Presbyterians, and 57,730 Baptists. Chief towns, the city of St John (pop. 27,317), and Fredericton, the political capital (pop. 5652).

The province of N. B., together with that of Nova Scotia, originally formed one French colony, called Acadia, or New France. It was ceded to the English in 1713, and was first settled by British colonists in 1764. Twenty years subsequently, in 1784, it was separated from Nova Scotia, and erected into an independent colony.

**NEW CALEDONIA**, an island of the South Pacific Ocean, belonging to France, and lying about 720 miles east-north-east of the coast of Queensland, in Australia, in lat. 20°–22° 30' S., long. 164°–167° E. It is about 200 miles in length, 30 miles in breadth, and has a population estimated at 60,000. It is of volcanic origin, is traversed in the direction of its length, from north-west to south-east, by a range of mountains, which in some cases reach the height of about 8000 feet, and is surrounded by sand-banks and coral-reefs. There are secure harbours at Port Balade and Port St Vincent, the former on the north-east, the latter on the south-west part of the island. In the valleys the soil is fruitful, producing the cocoa-nut, banana, mango, breadfruit, &c. The sugar-cane is cultivated, and the vine grows wild. The coasts support considerable tracts of forest, but the mountains are barren. The inhabitants, who resemble the Papuan race, consist of different tribes, some of which are cannibals. N. C. was discovered by Captain Cook in 1774. In 1854 the French took official possession of it, and it is now comprised under the same government with Otaheite and the Marquesas Isles. Missionaries have been established on the island, and many of the natives are said to have embraced Christianity.

**NEW COLLEGE, OXFORD.** The College of St Mary of Winchester, in Oxford, commonly called New College, was founded by William of Wykeham, Bishop of Winchester and Lord High Chancellor in 1386. The buildings are magnificent, and the gardens of great beauty. The most remarkable peculiarity of New College is its connection with Winchester School, another noble foundation of Wykeham. After the kin of the founder (to whom a preference was always given), the fellows were to be taken from Winchester. The late practice was that 'two founders,' as they were called, were put at the head of the roll for Winchester, and two others at the head of the roll for New College. In 1851, the college consisted of a warden and 70 fellows (elected in this way

from Winchester), 10 chaplains, 3 clerks, and 16 choristers. By the ordinances under 17 and 18 Vict. c. 81, considerable changes were introduced, but the connection of the college with Winchester was in great measure preserved. The number of fellows was fixed at 30. Of these, 15 are open only to those who have been educated at Winchester, or who have been for 12 terms members of New College. The other 15 are open without restriction. The value of the fellowships is not to be more than £200 per annum, so long as their number is less than 40. There are also to be 30 scholarships, tenable for five years, of value not less than £50 per annum, inclusive of rooms, to be appointed by the warden and fellows of New College, by the election of boys receiving education at Winchester School. No conditions of birth are to be regarded in the election either of fellows or scholars. By a subsequent statute, the chaplains are made 3 in number, and from 8 to 10 choral scholars are added, to be upon an equality with the other scholars. This college presents to 37 benefices, and elects the warden of Winchester College.

**NEW ENGLAND**, a collective name given to the six eastern states of the United States of America—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut—including an area of 65,000 square miles. The people, distinctively known as Yankees, and mostly descended from an English Puritan and Scottish ancestry, are engaged in commerce, fisheries, and manufactures, and are celebrated for industry and enterprise. This region was granted by James I. to the Plymouth Company in 1606, under the title of North Virginia, and the coast was explored by Captain John Smith in 1614. See accounts of the several States.

**NEW FOREST**, the name of a district in Hampshire (q. v.), triangular in shape, and bounded on the W. by the river Avon, on the S. by the coast, and on the N.-E. by a line running from the borders of Wiltshire along the Southampton Water. Area about 64,000 acres. This triangle appears to have been a great wooded district from the earliest times, and its present name dates from the Norman Conquest, when it was regularly afforested. Since that period it has remained a possession of the crown, subject to rights of 'pannage,' vert (greenwood) and turf-cutting, claimed by various estates in or near the Forest. During the 'pannage' month, which commences at the end of September, and lasts for six weeks, the borderers drive in herds of swine to feed on the mast in the Forest, and this right they obtain by paying a small annual fee in the Stewarts Court at Lyndhurst, which is considered the capital of the Forest. Formerly, this district was the haunt of numerous 'squatters,' but their huts are now rarely to be seen. Gipsies, however, still congregate here in considerable numbers. In 1854, a commission was appointed to examine the extent and nature of the rights of pannage, &c., claimed by the foresters and borderers, and in a large majority of cases the claims were confirmed. The principal trees in the forest are the oak and beech, with large patches of holly as underwood. The oaks have been much used as timber for the British navy. Tracts of exquisite woodland scenery are everywhere to be met with. The afforestation of this district by the Conqueror, enforced by savagely severe Forest laws, was regarded as an act of the greatest cruelty, and the violent deaths met by both of his sons, Richard and William Rufus—both of whom were killed by accidental arrow-wounds in the Forest—were looked upon as special judgments of Providence. A small breed of pony lives wild under its shelter.

NEW GRANADA—NEW HAMPSHIRE.

NEW GRANADA (since 1858 the official designation has been *The Granadian Confederation*, and since 1862, *The United States of Colombia*), a republic in the north-west of South America, bounded on the N. by the Caribbean Sea; on the W. by Costa Rica, a republic of Central America, and by the Pacific; on the S. by Ecuador and Brazil; and on the E. by Venezuela. By the constitution of June 15, 1858—a constitution framed after the model of that of the United States of America—N. G. was divided into the following 8 'States': Panama, Bolivar, Cauca, Antioquia, Cundinamarca, Boyaca, Santander, and Magdalena. Entire area, 333,000 square miles; pop. about 2,263,000, of whom more than one-half are whites. The country is intersected by three great ranges of the Andes, which spread out like the rays of an open hand from the plateau of Pasto and Tuquerrez in the south (14,000 feet high), and are known as the Western, Central, and Eastern Cordillera. Between these chains lie the long and beautiful valleys of the Cauca and the Magdalena. The Central Cordillera is the highest chain, rising in Nevada de Tolima to a height of 18,020 feet, and from one of its peaks, near the frontiers of Ecuador, called Paramo de las Papas, descend the two principal rivers of N. G., the Magdalena and its tributary the Cauca, flowing north into the Caribbean Sea, besides several affluents of the Amazon in the east, and one or two streams flowing westward into the Pacific. The Eastern Cordillera is by far the largest chain, and consists of a series of vast table-lands, cool and healthy, where the white race flourishes as vigorously as in Europe. This temperate region is the most densely peopled portion of the Confederation, being, in some places, at the rate of 2600 to the square league. Bogota (q. v.) the present capital, is situated on one of these plateaux, at an elevation of 8694 feet. Eastward from this Cordillera stretch enormous plains as far as the Orinoco, the greater part of which belongs to N. G., and through which flow the Meta, the Guaviare, and other tributaries of the Orinoco. The geology of the country is very extraordinary. 'Everywhere,' we are told, 'are found traces of stupendous cataclysms, and a disarrangement and intermixture of primitive and sedimentary rocks, which seem to put all classification at defiance.' In the course of one day's journey, the traveller may experience in this country all the climates of the world. Perpetual snow covers the summits of the Cordilleras; while the rich vegetation of the tropics covers the valleys. With its great variety of levels and climates, N. G. yields naturally an equally great variety of productions: cattle, horses, wheat, and other European grains, maize, tobacco, coffee, plantains, cotton, cacao, sugar, cedar, mahogany, cinchona bark, ipecacuanha, gold, silver, copper, iron, and lead, coal, emeralds, pearls, and rock-salt. In 1858, according to official statements, the trade of the five ports, Panama, Santa Marta, Riohacha, Cartagena, and Savanilla, stood as follows:

|                | ARRIVED. |         | CLEARED. |         |
|----------------|----------|---------|----------|---------|
|                | Ships.   | Tons.   | Ships.   | Tons.   |
| British, . . . | 170      | 133,609 | 172      | 139,393 |
| Total, . . .   | 489      | 232,565 | 533      | 240,263 |

The total annual value of the exports of N. G. amounted in the same year to about 14,000,000 dollars. (1870—pop. 2,900,633.)

By the constitution, complete toleration in matters of religion and worship, the freedom of the press, a system of parish-schools, with gratuitous primary education, and many other important helps to civilisation and liberty have been established. The inhabitants rank first among the South Americans

in point of literary and scientific culture. There are at present about 800 public schools in the country, 60 seminaries and colleges for higher and professional instruction, 47 printing establishments, 40 periodicals, and numerous literary, scientific, and benevolent institutions.

The chief aborigines of the country, called *Chibchas* or *Muyscas*, held a high rank among the semi-civilised nations of the New World. They are said to have been frugal and industrious, with a well-organised government and a very passable religion—for heathens. They were conquered by Ximenes de Quesado (1536—1537), and their descendants are now 'Christians,' and speak the Spanish language. Several of the other tribes still maintain a savage mode of life; and some, as the Mesayos, are even said to be cannibals. In 1718, N. G. was erected into a vice-royalty by Spain. In 1819, it became independent, and then joined with Ecuador and Venezuela to form the republic of Colombia; but the union was dissolved in 1829—1830, and N. G. was organised as a separate republic in 1832. After several changes in the constitution (in 1843, 1851, 1853), a complete fundamental change was made in 1858, by which the separate 'provinces' were changed into 'states,' associated under a federal government like the 'United States' of North America, but self-governing in all internal affairs. In 1860, another revolution broke out, and for more than two years, the country was devastated by civil war. Finally, on the 29th September 1862, a convention was concluded between the Conservatives, or Federalists, and the 'Liberals,' which put an end to the strife. As the victory lay with the latter, certain changes have again been made in the constitution, and the country is now officially designated the 'United States of Colombia.' The first election of a president under the new form of the constitution was decreed to take place April 1, 1864.

NEW GUINEA. See PAPUA.

NEW HAMPSHIRE, one of the original thirteen United States of America, in lat. 42° 41'—45° 11' N., long. 70° 40'—72° 28' W., is 176 miles long, and on an average 45 miles wide, having an area of 9280 square miles, or 5,939,200 acres. It is bounded N. by Canada, E. by Maine and the Atlantic Ocean, S. by Massachusetts, and W. by Vermont, from which it is separated by the Connecticut River. It has ten counties; the chief towns are Manchester, Portsmouth, Dover, Nashua, Keene, and Concord, the capital. The population, except the recent influx of Irish in the manufacturing towns, is almost entirely descended from the original English and Scottish settlers. It has 18 miles of sea-coast, and one seaport, Portsmouth, at the mouth of the Piscataqua River, with a deep and commodious harbour. Its other chief rivers are the Connecticut and the Merrimaek. It is a state of mountains and lakes, much visited by tourists, and called 'The Granite State' and 'The Switzerland of America.' The White Mountains lie in the north central region. Their highest summits are Mount Washington, 6285 feet; and Mount Lafayette, 5500 feet. A notch in the White Mountains, 2 miles long, and in the narrowest part only 22 feet wide, affords passage to a road and mountain stream, and is much visited. The lakes and rivers of N. H. occupy in all about 110,000 acres. Lake Winnepiscogee is 25 miles long by 1 to 10 miles wide, with 360 islands, from a few yards to many acres in area, mostly covered with evergreens. The rocky strata consist of metamorphic rocks, mica and talcose slates, quartz, granular limestones, granite, gneiss, and contain magnetic and specular iron ores, beryls, tourmalins, mica, graphite, and staurolite or

soap-stone. The soil, except in the fertile valleys, is better adapted to pasturage than culture. The winters are long and cold, so that in the mountainous regions mercury sometimes freezes. In the forests are oak, maple, pine, hemlock, spruce, &c. The chief agricultural products are maize, rye, oats, apples, potatoes, and products of the dairy. Numerous waterfalls give motive-power to 44 cotton factories, 61 woollen, 29 iron, and many paper-mills, &c. The state has 621 miles of railway, 51 banks, 1 college (Dartmouth), 700 churches, 38 newspapers, an excellent system of free schools, and government and judiciary similar to all the American states. N. H. was settled in 1623 by colonists from Hampshire in England, who suffered during the colonial period from Indian wars and depredations. The state was organised in 1776. It has furnished a multitude of emigrants to the newer and more fertile western states. Pop. in 1810, 214,360; in 1840, 284,574; in 1860, 326,072. (1870—318,300.)

**NEW HARMONY**, a township of Indiana, first settled in 1815 by a German community of religious socialists, called Harmonists, under the leadership of George Rapp. In 1824, the village and domain was purchased by Robert Owen, for an experimental community on his system. After the speedy failure of this society, the property was bought by William Maclure for a School of Industry. It is now a flourishing western village, of about 700 inhabitants.

**NEW HAVEN**, the chief city, seaport, and semi-capital of Connecticut, U. S., at the head of a bay, 4 miles from Long Island Sound, 76 miles east-north-east of New York. Its broad streets are shaded with elms, and the public squares, parks, and gardens, with its handsome public and private edifices, make it one of the most beautiful of American cities. It is the seat of Yale College (q. v.), which has 8 large buildings and a Gothic library, 150 feet long. There are a handsome custom-house, state-house, hospital, 32 churches, academies and schools, 8 banks, 4 daily papers, and 3 ornamental cemeteries. There are large manufactories of carriages, clocks, and leather, iron and india-rubber works. A railway and steam-boats connect it with New York and the New England towns. Pop. (1860) 39,268. (1870—50,840.)

**NEW HEBRIDES**, a group of islands situated in the Pacific Ocean, to the north-east of New Caledonia, and to the west of the Fijis, extending in S. lat. between 14° and 20°, and in E. long. between 167° and 170°. Total area estimated at 2500 square miles. They are regarded as the most easterly point of the western division of Polynesia. The group embraces Espiritu Santo (65 miles long by 20 broad), Mallicollo (60 miles long by 28 broad), Vati Ambrym, Annatom, Erromango, Tanna, with an active volcano, and Aurora. Most of the group are hilly and well-wooded, some even mountainous. The most important woods are ebony and sandal; the principal edible products, yams, bananas, cucumbers, cocoa-nuts, and sweet potatoes; and the only animal of consequence, a diminutive species of hog, which, when full-grown, is no bigger than a rabbit. The inhabitants, who number about 200,000, are fierce, but excessively dirty and unintelligent. Erromango is a well-known name in missionary history, being the scene of the barbarous massacre of the Rev. John Williams—generally called the Martyr of Erromango.

**NEW HOLLAND**, the former name for Australia (q. v.).

**NEW INN HALL, OXFORD.** This Hall, with certain gardens adjoining, was presented to the warden and fellows of New College, by William of

Wykeham in 1392. The first principal on record occurs in 1438. During the Civil War it was used as a mint for Charles I. It was restored to the purposes of instruction by Dr Cramer, the late principal, who erected a handsome building for the use of the students.

**NEW IRELAND**, a long narrow island in the Pacific Ocean, lying to the north-east of New Britain (q. v.), from which it is separated by St George's Channel; lat. 2° 40'—4° 52' S., long. 150° 30'—152° 50' E. Length about 200 miles; average breadth, 12 miles. The hills rise to a height of from 1500 to 2000 feet, and are richly wooded. The principal trees are cocoa on the coast, and in the interior forests of areca-palm. The chief products are sugar-cane, bananas, yams, cocoa-nuts. Dogs, pigs, and turtles abound. The natives are apparently of the same race as the inhabitants of Australia; but our information about them is extremely scanty.

**NEW JERSEY**, one of the original thirteen U. S., in lat. 38° 55'—41° 21' N., and long. 73° 58'—75° 29' W., 167 miles long, with an irregular shape, and an extreme breadth of 96 miles, containing an area of 8320 square miles, or 5,324,800 acres; bounded N. by New York, E. by the Hudson River and the Atlantic Ocean, S. by the ocean and Delaware Bay, and W. by Delaware Bay and River, which separate it from Delaware and Pennsylvania. It has 21 counties. The chief towns are Trenton, the capital, Newark, Patterson, Jersey City, New Brunswick. Its coast-line is 120 miles, or, including bays, 540 miles. Besides its bordering rivers, the Hudson and Delaware, its principal streams are the Passaic, Hackensack, and Raritan. The northern portion of the state is hilly and mountainous. The Palisades, a wall of perpendicular trap-rocks, from 200 to 500 feet high, form the western bank of the Hudson River for fifteen miles, and one of the grandest features of its scenery. The central portion of the state is a rolling country, and the southern and eastern portion a sandy plain declining to the sea. Five geological belts cross the state, containing a sandy pine plain with bog iron ore, shelly marls used for manure, glass sand, green-sand or marl, plastic clay, used in making firebricks, metamorphic rocks, argillaceous red sandstone, copper ores, gneiss with specular and magnetic iron ores, red oxide of zinc, and Franklinite iron. Among the most attractive features in the scenery are the Falls of the Passaic, the Delaware Water Gap, and Schooley's Mountain. Atlantic City, a bathing-place on the sea-coast, connected by railway with Philadelphia, is a fashionable summer resort. The climate is mild, the soil north of the pine plains fertile, the country healthy, except the malarious river-bottoms. The state has 24,000 farms, producing wheat, maize, oats, common and sweet potatoes, apples, peaches, plums, grapes, melons, and garden vegetables for the great neighbouring markets of New York and Philadelphia. There are 21 cotton-factories, 41 woollen, 119 iron-works, with extensive manufactories of machinery, locomotives, carriages, glass, boots and shoes, &c. The state draws a large revenue from 611 miles of railway, and several important canals, connecting New York and the coal regions of Pennsylvania. There are 4 colleges, normal and free schools, 814 churches, 51 periodicals, including 6 daily papers. The government is similar to those of all the states.

N. J. was settled in 1620 by Dutch and Swedes. Taken by the English, it was ceded by Charles II. to the Duke of York; it was retaken by the Dutch in 1673, and afterwards bought by William Penn and other Friends, who have here numerous descendants. It was the scene of some of the most

important military movements of the War of Independence, and of the battles of Trenton, Princeton, Monmouth, and Germantown. Pop. in 1840, 373,306; in 1860, 672,031. (1870—906,096.)

**NEW JOHORE**, formerly *Tanjong Putri*, a Malay settlement on the southern extremity of the Malay peninsula. Here the rajah or *Tumunongong* of Johore, who is an independent sovereign, occasionally resides. The climate is healthy; large quantities of gambir and pepper are raised in the vicinity; saw-mills on an extensive scale are in operation. Vessels of the largest draught can approach close to the shore. The valuable timbers of these immense forests are yet scarcely known, but must find their way to the Indian, if not European markets, ere long. Population in the N. J. territory about 20,000, chiefly Chinese.

**NEW LONDON**, a city and port of entry, in Connecticut, U. S. of America, on the right bank of the river Thames, 3 miles from Long Island Sound, 50 miles east of New Haven. It is a rich and handsome town, with a custom-house, 10 churches, academy, 17 public schools, 2 daily and 4 weekly papers, 4 banks, several iron-foundries and steam saw-mills, a machine-manufacturing company, a deep secure harbour, protected by a fort of 80 guns, with 37,490 tons of shipping, much of it engaged in the whale fisheries, and railway and steam-boat communications. Pop. (1860) 10,115. It was settled in 1614, and in 1781 burned by General Arnold.

**NEW MALTON.** See **MALTON**.

**NEW MEXICO**, a territory belonging to the U. S., formerly a state of Mexico, in lat.  $31^{\circ} 10' - 38^{\circ}$  N., long.  $103^{\circ} - 117^{\circ} 9'$  W., 700 miles from east to west, and 350 to 400 from north to south, with an area of 243,063 square miles; bounded N. by the territories of Nevada, Utah, and Colorado; E. by the Indian territory and Texas; S. by Texas and Mexico; and W. by California. Its chief towns are Santa Fé, Taos, Socorro, and Mesilla. Its chief rivers are the Rio Grande, which crosses the territory from north to south; the Pecos, a branch of the Rio Grande; the Colorado, on the California boundary; the Gila, which rises in the Rocky Mountains, and flows westwards into the Colorado. These rivers and their branches water broad and fertile valleys, and supply the lack of rain by irrigation. Two great chains of the Rocky Mountains or Cordilleras pass through the eastern portion of the territory from north to south, and lesser mountain-ranges diversify the west, rising to elevations of 12,000 feet. The climate is cold in the elevated regions, hot in the plains, but everywhere dry and healthy. Heavy rains fall in July and August, but the rest of the year is dry. The productions are wheat, maize, fruits, and tobacco, with abundant pasturage. There are numerous mines of gold, silver, copper, iron, and salt. Merchandise is transported from St Louis and Texas in wagon or mule trains. The Indian population consists of 34,000 of the wild and predatory tribes of Navajoes, Apaches, Utahs, Comanches, &c., who possess large herds of horses, and make perpetual war upon the neighbouring settlements, and 10,000 semi-civilised or village tribes, who live by agriculture or the mines. This territory was explored by the Spaniards in 1537, who opened mines, established missions, and made some progress in civilising the natives. In 1846, Santa Fé, the capital, was taken by an American expedition under General Kearney. At the close of the war in 1848, N. M. was ceded to the United States, and erected into a territory in 1850. White pop. in 1860, 93,541.

**NEW ORLEANS**, a city and port of entry of Louisiana, U. S., on the left bank of the Mississippi

River, 100 miles from its mouth, lat.  $29^{\circ} 58'$  N., long.  $90^{\circ}$  W. The city is built on the alluvial banks of the river, on ground lower than the high-water level, protected from inundations by the levee or embankments, which extend for hundreds of miles on both banks of the river. The streets descend from the river bank to the swamps, and the drainage is by canals which open into Lake Pontchartrain, which is on a level with the Gulf of Mexico. The city is long and narrow, extending about six miles along the river, on an inner and outer curve, giving it the shape of the letter S. The older portion, extending around the outer curve, gave it the name of 'the Crescent City.' N. O. is the great port of transhipment for a large portion of the cotton crop of the southern American States, the sugar crop of Louisiana, and the produce of the vast region drained by the Mississippi and its tributaries. It commands 20,000 miles of steam-boat navigation, and is the natural entrepôt of one of the richest regions of the world. In 1860, its exports were 108,293,567 dollars; imports, 22,920,849 dollars. The receipts of cotton were 109,000,000 dollars; of all produce, 185,000,000 dollars, giving employment to more than 2000 ships and steamers. The custom-house is one of the largest buildings in America. The hotels, theatres, and public buildings are on a magnificent scale. There are a branch mint, several large hospitals, 6 orphan asylums, 2 medical colleges, the Jesuits college, Roman Catholic cathedral, 60 churches, 10 daily newspapers, extensive cotton-presses, cotton and sugar warehouses, 11 banks, and all the facilities for a vast commerce. Besides the great river, N. O. has railways connecting it with the north, east, and west. It is a beautiful, and, but for the very frequent visits of the yellow fever, a healthy city. This epidemic is chiefly fatal to unacclimated strangers, of whom it has sometimes carried off more than 8000 victims. The soil is full of water, so that no excavations can be made. The largest buildings have no cellars below the surface; and in the cemeteries there are no graves, but the dead are placed in tombs, or 'ovens,' above ground. N. O. was settled by the French in 1718; with Louisiana, it was transferred to Spain in 1763; soon after retransferred to France, and sold, with a vast territory drained by the Mississippi and Missouri, by Napoleon I. to the United States in 1803. In 1815 it was successfully defended against a British army, under General Packenham, by General, afterwards President Jackson. In 1860, Louisiana having seceded from the Union, N. O. became an important centre of commercial and military operations, and was closely blockaded by a Federal fleet. An expedition of gun-boats, under Commander Farragut, forced the defences near the mouth of the river, April 21, 1862; the city was compelled to surrender, and occupied by General Butler as military governor. In 1893, on its cession to the Union, the population was about 8000, mostly French and Spanish; in 1820, it had increased to 27,000; in 1860, to 168,823, and consisted of Americans, French creoles, Irish, &c. (1870—pop. 191,418.)

**NEW RED SANDSTONE.** A large series of reddish coloured loams, shales, and sandstones, occurring between the Carboniferous Rocks and the Lias, were grouped together under this name, in contradistinction to the Old Red Sandstone group, which lies below the Coal-measures, and has a similar mineral structure. Conybeare and Buckland proposed the title *Poikilitic* (Gr. variegated) for the same strata, because some of the most characteristic beds are variegated with spots and streaks of light-blue, green, and buff, on a red base. In the progress of geology, however, it was found that two very distinct periods were included under

these names; and the contained fossils of each group were found to be so remarkably different, that the one period was referred to the Palæozoic series under the name Permian (q. v.), while the other, known as the Trias (q. v.), was determined to belong to the Secondary series.

**NEW ROSS**, a seaport and parliamentary borough of Ireland, situated on the estuary of the Barrow, partly in the county of Kilkenny, but chiefly in that of Wexford, distant 84 miles south-south-west from Dublin. It is an ancient town, having been surrounded by walls about the middle of the 13th century. Before the union, it returned two members to parliament, of whom one was withdrawn by the Act of Union. It is now a place of considerable commerce, and the modern part of the town on the Wexford side is built with great regularity and taste. On the Kilkenny side is a straggling suburb called Rosbercon, connected with N. R. by a metal bridge, erected at a cost of £50,137, which has a swivel-pillar in the centre, to allow vessels to pass: formerly, the connection was by a wooden bridge, nearly 700 feet in length. The port is approachable at spring-tides by ships of 800 tons, and at all times by vessels of 600 tons; and there is a communication by river and canal with Dublin, and also with Limerick. The town is managed by a board of twenty-one commissioners. It possesses no manufactures of any importance. Pop. in 1871, 6813.

**NEW RUSSIA.** See **RUSSIA.**

**NEW SHOREHAM** See **SHOREHAM.**

**NEW SIBERIA**, a group of islands in the Arctic Ocean, lying north-north-east of the mouth of the River Lena, in Eastern Siberia. Lat. 73° 20'—76° 12' N., long. 135° 20'—150° 20' E.; area, 20,480 square miles. The principal are Kotelnoi (the largest), Liakov, Fadievskoi, and New Siberia. The coasts are in general rocky, and are covered all the year round with snow. The islands are very important, on account of the immense multitude of bones and teeth of mammoths, rhinoceroses, buffaloes, &c., which are found in the soil. They are now uninhabited, but there are traces of former inhabitants. Neither bush nor tree is to be seen anywhere.

**NEW SOUTH WALES**, a British colony in the south-east of Australia. It originally comprised all the Australian settlements east of the 135th meridian, but the formation, successively, of the separate colonies of South Australia (1836), Victoria (1851), and Queensland (1859), has reduced it to more moderate dimensions. It is now bounded on the N. by a line which, beginning at Point Danger, in lat. 28° S., follows several lines of heights across the Dividing Range till it meets the 29th parallel, which forms the rest of the boundary westward; on the W. by the 141st meridian; on the E. by the Pacific Ocean; and the line separating it from Victoria on the S. runs from Cape Howe, at the south-east of the island, north-west to the source of the Murray (q. v.), and then along that stream, in a direction west by north, to the western boundary of the two colonies. Area, 323,437 sq. m., or somewhat less than four times that of the island of Great Britain; pop. (1871) 503,981, of whom 275,531 were males, and 228,430 females. The more general physical character of the country is described under the head of **AUSTRALIA**. Within the colony of N. S. W. the mountain-range, which girdles nearly the whole island, is most continuous and elevated, and is known as the Dividing Range. The section of this mountain system on the southern boundary of the colony, called the Australian Alps, rises in Mount

Kosciusko to 7308 feet. From this the range extends northward, the water-shed being from 50 to 150 miles distant from the east coast, and thus divides the colony into two slopes, with two distinct water-systems. The rivers on the eastern side descend with great rapidity, and in oblique tortuous courses, their channels often forming deep ravines. Many of them are navigable in their lower course for sea-going steamers. The principal are the Richmond, Clarence, McLeay, Manning, Hunter, Hawkesbury, and Shoalhaven. The Hunter River, about 60 miles north of Sydney, opens up one of the most fertile and delightful districts in the country. The Dividing Range, which, opposite to Sydney, is called the Blue Mountains, being singularly abrupt and rugged, and full of frightful chasms, long presented an impenetrable barrier to the west, and kept the colonists shut in between it and the sea, and utterly ignorant of what lay beyond. At last, in 1813, when the cattle were likely to perish in one of those long droughts that appear to visit this country at intervals of a dozen years, three adventurous individuals scaled the formidable barrier, and discovered those downs on the western slope which now form the great sheep-ranges of Australia. A practicable line of road was immediately constructed by convict labour, and the tide of occupation entered on the new and limitless expanse. The numerous streams that rise on the west side of the water-shed within the colony, all converge and empty their waters into the sea through one channel within the colony of South Australia. The southern and main branch of this great river-system is the Murray. The other great trunks of the system are the Murrumbidgee, which is navigable; the Lachlan, at times reduced to a string of ponds; and the Darling. The Macquarie, passing through the rich district of Bathurst (q. v.), is a large tributary of the Darling, but it reaches it only in the rainy seasons. The coast-line from Cape Howe to Point Danger is upwards of 700 miles long, and presents numerous good harbours formed by the estuaries of the rivers. Owing to the great extent of the colony, stretching as it does over eleven degrees of latitude, the climate is very various. In the northern districts, which are the warmest, the climate is tropical, the summer heat occasionally rising in inland districts to 120°, while on the high table-lands, weeks of severe frost are sometimes experienced. At Sydney, the mean temperature of the year is about 65°. The mean heat of summer, which lasts here from the beginning of December to the end of February, is about 80°, but it is much modified on the coast by the refreshing sea-breeze. The annual fall of rain is about 50 inches. Rain sometimes descends in continuous torrents, and causes the rivers to rise to an extraordinary height. Sometimes the rains almost fall for two or three years in succession (see **AUSTRALIA**). The coast, for 300 m. from the northern boundary, is adapted for growing cotton, and in 1868, when a large quantity was grown, the average produce was 180 lbs. per acre; but cotton-planting seems now to be declining. Further south, the climate is more temperate, and is fitted to produce all the grain products of Europe. Immense tracts of land, admirably adapted for agriculture, occur in the south-western interior; while in the south-east coast districts, the soil is celebrated for its richness and fertility. In the north, the cotton and tobacco plants, the vine, and sugar-cane are grown, and pine-apples, bananas, guavas, lemons, citrons, and other tropical fruits are produced. In the cooler regions of the south, peaches, apricots, nectarines, oranges, grapes, pears, pomegranates, melons, and all the British fruits, are grown in perfection, and sometimes in such abundance that

the pigs are fed with them. Wheat, barley, oats, and all the cereals and vegetables of Europe, are also grown.

Agriculture is thus increasing in importance, though the predominating interest is still pastoral. In 1869, there were 27,720 persons holding land, and the land occupied, exclusive of pasture, was 7,857,469 acres, 482,324 acres being under cultivation. In 1870, there were 426,976 acres under crop. Of the land cultivated in 1869, 189,452 acres were wheat, 128,041 maize, 17,301 oats, 17,132 potatoes, the rest growing sugar, vines, green food for cattle, &c. Rice has also been grown in some quantity. Considerable attention has been bestowed on the cultivation of the vine and the manufacture of wine. The produce in 1862 was nearly 100,000 gallons of wine and 709 gallons of brandy, at the rate of about 160 gallons per acre.

The great produce of the colony is wool, the export from Sydney in 1870 being 57,399,707 lbs., valued at £3,268,274. Sheep-farming requires a large capital, together with skill and experience; and the sheep-farmers or squatters form the territorial aristocracy of the colony. All the best pasture-land has long been taken up and rented (for periods of 10—15 years) from the crown under certain conditions. Stations, or the right of grazing, with the stock on them, are continually advertised for sale; the price of a station is according to the number of cattle or sheep on it. The question of the rent that the 'squatters' should pay (which used to be about £10), and of the tenure by which the pasture-lands should be held, was long a source of agitation and bitterness in the colony. They now pay about a farthing a year for each sheep the run can support. According to the present regulations, arable lands are disposed of by two distinct systems of sale: one, to the highest bidder at auction in unlimited quantities; the other, at a fixed price in limited quantities. By this last, known in the colony as 'Free Selection before Survey,' the intending cultivator can first select for himself, and then secure in fee-simple a quantity not less than 40, and not more than 320 acres, at the rate of 20s. per acre, on condition of residing on his farm, improving a portion of it, and not subletting it.

The coal-fields of N. S. W. are extensive, and the seams of great thickness. In 1870, 868,564 tons, valued at £316,836, were raised. Iron, lead, copper, and oil-shale are abundant. Gold was discovered here in May 1851, and in that year gold was exported to the amount of £468,336. This amount was increased to £2,660,946 in 1852, but subsequently, owing to the discovery of the richer diggings of Victoria, gold-mining in this colony began to languish. Since 1857, however, the annual amounts found and exported have been steadily increasing; that for 1869 being 234,382 oz., valued at £886,749; and in 1870, £1,878,823. In 1870, there were in the colony 14,989,923 sheep, 1,795,904 cattle, and 280,304 horses. From statistical tables of the British colonies, presented to the Houses of Parliament in 1872, we find the revenue of N. S. W. for 1870 stated at £2,575,309, and the expenditure at £3,298,353. The exports in 1869 amounted to £9,933,442, comprising barley, oats, potatoes, live-stock, preserved meat, leather, wool, tallow, coal, gold-dust, and sovereigns: the imports, consisting largely of articles for food and clothing, &c., were £8,392,753. The Sydney branch of the Royal Mint was instituted in 1855, and issues large quantities of gold in sovereigns and half-sovereigns. From Sydney there are three lines of railway already open and in course of further extension, 403 m. being completed; and there is telegraphic communication with the capitals of the other colonies. N. S. W. is

self-governed, with a governor appointed by the Queen, a responsible ministry, a legislative council nominated by the crown, and a House of Assembly elected by permanent residents. As regards religion, all sects are on a footing of equality. There are in all 818 places of worship, of which 263 belong to the Church of England, and 158 to the Roman Catholic Church. The number of schools, classified as public, provisional, half-term, and denominational, under the Council of Education in 1870, was 846; besides these, there are about 500 private schools, and in all, 82,821 scholars. For the higher education, see SYDNEY. The capital is Sydney, with a population of 134,758; and the other chief towns are Paramatta, Bathurst (q. v.), Goulburn, Maitland, Newcastle, Grafton, Armidale, and Albury, with populations ranging from 3000 to 14,000.

N. S. W. took its origin in a penal establishment, formed by the British Government in 1788 at Port Jackson, near Botany Bay (latitude 34°). The prisoners, after their period of servitude, or on being pardoned, became settlers, and obtained grants of land; and these 'emancipists' and their descendants, together with free emigrants, constitute the present inhabitants. Transportation to N. S. W. ceased in 1840, and up to that date, the total number of convicts sent thither amounted to 60,700, of whom only 8700 were women. They were assigned as bond-servants to the free settlers, who were obliged to furnish them with a fixed allowance of clothing and food. In 1833, there were 23,000 free males and 13,500 free females, to 22,000 male and 2700 female convicts; and of the free population, above 16,000 were emancipists. The following table shews the recent rate of increase in the population:

|             | Males.  | Females. | Total.  |
|-------------|---------|----------|---------|
| 1850, . . . | 154,575 | 110,928  | 265,503 |
| 1861, . . . | 201,099 | 156,179  | 358,278 |
| 1870, . . . | 275,551 | 228,430  | 503,981 |

The increase of population in Sydney, within the past ten years, has been 19,105, or over 33.5 per cent.; and in the suburban districts 24,967, or over 59.5 per cent.

NEW STYLE. See CALENDAR, DATE.

NEW SWINDON. See SWINDON.

NEW-YEAR'S DAY, the first day of the year. The custom of celebrating by some religious observance, generally accompanied by festive rejoicing, the first day of the year, appears to have prevailed among most of the ancient nations. The Jews, the Egyptians, the Chinese, the Romans, and the Mohammedans, although differing as to the time from which they reckoned the commencement of the year, all regarded it as a day of special interest. In Rome, the year anciently began in March; and when Numa, according to the ancient legend, transferred it to the 1st of January, that day was held sacred to *Janus Bifrons*, who was thus supposed to turn at once back upon the old year and forward into the new. On the establishment of Christianity, the usage of a solemn inauguration of the New Year was retained; but considerable variety prevailed, both as to the time and as to the manner of its celebration. Christmas Day, the Annunciation (25th March), Easter Day, and 1st March, have all, at different times or places, shared with the 1st of January the honour of opening the New Year; nor was it till late in the 16th c., that the 1st of January was universally accepted as the first day of the New Year. The early fathers—Chrysostom, Ambrose, Augustine, Peter Chrysologus, and others—in reprobation of the immoral and superstitious observances of the pagan festival, prohibited in Christian use all

festive celebration; and, on the contrary, directed that the Christian year should be opened with a day of prayer, fasting, and humiliation. The mandate, however, was but partially observed. The festal character of the day, generally speaking, was pertinaciously preserved, but the day was also observed as a day of prayer; and this character was the more readily attached to it when the year began with the 1st of January, as that day, being the eighth after the nativity of our Lord, was held to be the commemoration of his circumcision (Luke ii. 21).

The social observances of the first day of the New Year appear to have been in substance the same in all ages. From the earliest recorded celebration, we find notice of feasting and the interchange of presents as usages of the day. Suetonius alludes to the bringing of presents to the capital; and Tacitus makes a similar reference to the practice of giving and receiving New-Year's gifts. This custom was continued by the Christian kingdoms into which the Western Empire was divided. In England we find many examples of it, even as a part of the public expenditure of the court, so far down as the reign of Charles II.; and, as all our antiquarian writers mention, the custom of interchanging presents was common in all classes of society. In France and England it still subsists, although eclipsed in the latter country by the still more popular practice of Christmas gifts. In many countries, the night of New-Year's Eve, 'St Sylvester's Eve,' was celebrated with great festivity, which was prolonged till after 12 o'clock, when the New Year was ushered in with congratulations, complimentary visits, and mutual wishes for a happy New Year. This is an ancient Scottish custom, which also prevails in many parts of Germany, where the form of wish—'Prosit (for the Lat. *prosit*)—Neu-jahr'—'May the New Year be happy'—sufficiently attests the antiquity of the custom. In many places the practice of tolling bells at midnight, and thus 'ringing in the New Year' is still observed. Many religious communions are wont to celebrate it with a special service. In the Roman Catholic Church, the *Te Deum* is still sung at the close of the old year; and New-Year's Day is a holiday of strict obligation.

NEW YORK, one of the thirteen original states of the United States of America, now the most important in population and wealth, occupies an irregular triangular area from the Atlantic Ocean to the great lakes, lat. 40° 29' 40"—45° 0' 42" N., long. 71° 51'—79° 47' 25" W. The state is 412 miles from east to west, 311 from north to south, with an area of 47,000 square miles, or 30,500,000 acres; bounded N. by Lake Erie, Lake Ontario, the river St Lawrence, and Canada; E. by Lake Champlain, and the states of Vermont, Massachusetts, and Connecticut, and by the Atlantic Ocean; S. by the ocean, New Jersey, and Pennsylvania; W. by Pennsylvania, the Niagara River, and the lakes which make its irregular north-western boundary. The state has 60 counties. Its chief towns are New York City, Albany (the capital), Buffalo, Rochester, Oswego, Troy, Hudson, Syracuse, Utica, &c. Pop. (1870) 4,373,068, of whom 1,000,000 are of foreign birth, 500,000 being Irish, and about 250,000 Germans. N. Y., though resting only one corner upon the Atlantic, has its sea-coast extended by Long Island, Staten Island, &c., to 246 miles; while it has a lake coast of 352 miles, and borders for 281 miles on navigable rivers. The Hudson, broad and deep, with tides flowing 150 miles, joins at Albany a system of canals, which connect New York City with the great western lakes and the river St Lawrence. The state is also traversed by railway-

lines in every direction. The centre is beautified by many picturesque lakes, and its north-eastern portion and the banks of the Hudson by fine mountain scenery. The Blue Ridge of the Alleghenies forms the Highlands, whose peaks rise 1500 feet from the Hudson; north of these, the Katskills rise to a height of 3800 feet, with a large hotel for summer visitors at an elevation of 2000 feet; while Mount Marcy and Mount Anthony, peaks of the Adirondacks, in the wild region west of Lake Champlain, are 5337 and 5000 feet high. The chief rivers, besides the Niagara and St Lawrence, are the Hudson, its chief branch the Mohawk, the Genesee, and the sources of the Delaware, Susquehanna, and Allegheny. Its geology presents a series of older rocks, from the Azoic to the lower members of the Carboniferous. Red sandstone of the Middle Secondary period is found on the borders of New Jersey; drift and boulders are found everywhere; the great Silurian belt passes along the eastern line, and granite with iron occurs in the north-east. There is no coal, but rich beds of marble near New York City; productive salt-springs in the centre of the state, which yielded, in 1869, 8,662,237 bushels; and petroleum and natural gas, enough in some cases to light large villages, in the west. Among the mineral springs, those of Saratoga and Ballston have a wide reputation. The climate, mild on the coast, is cold in the northern counties. The soil, particularly of the western and limestone regions, is very fertile, producing the finest wheat, maize, apples, peaches, melons, grapes, &c., in abundance. In 1860, N. Y. state produced 3,000,000 tons of hay, 9,000,000 bushels of wheat, 27,000,000 of oats, 19,000,000 of maize, 14,000,000 of apples, 5,000,000 lbs. maple-sugar, 40,000,000 lbs. cheese, 9,000,000 lbs. wool. Among the natural curiosities are the Falls of Niagara; of the Genesee, three cascades of 96, 25, and 84 feet in 2½ miles; of the Trenton, which falls 200 feet in 5 cascades; the Taghanic Falls, of 230 feet; and the oft-painted Falls of the Kaaterskill, 175 and 85 feet, in a gorge of the Katskill Mountains. In 1860, there were 24,833 manufacturing establishments, employing 215,000 persons, and a capital of \$317,000,000; and in 1869, 35 railways extending 4568 miles: the Erie Canal is 350 miles, and the New York canals together 855 miles; 351 banks of issue have a capital of \$124,589,000. In 1860, there were 5077 churches; in 1870, 11,705 public schools, attended by 1,029,955 pupils; private schools, attended by 120,000; 6 normal schools; 23 colleges, including the Cornell University at Ithaca, endowed in 1865, and the Vassar Female College at Poughkeepsie. In 1870, the expenditure for teachers and scholars was \$9,929,462. Of paupers, in 1860, 13,428 were in poorhouses, and 125,000 had outdoor relief, and 65,000 were foreigners. There were 2169 convicts in 4 state-prisons, who cost the state \$282,705, of which they earned \$238,627. There were 559 newspapers, and 112 other periodicals—73 daily, 401 weekly, 113 monthly, 16 quarterly; but a large number of these are published in the city of New York, and circulated over the Union. Thirty-two of these are daily newspapers, which issue annually upwards of 225,000,000, and the gross receipts of some of them exceed one million dollars annually.

The earliest explorations of New York by Europeans were in 1609 by Hendrick Hudson, who took possession of the country on the river which bears his name for the Dutch; and by Champlain, a Frenchman, who explored Lake Champlain from Canada. It was possessed by the Iroquois, or Five Nations, and the Algonquins. In 1621, the Dutch made a settlement on Manhattan Island,

which they bought for \$24, and founded New Amsterdam, now New York. In 1664, N. Y. was taken by the English. At this time it had more slaves than Virginia. The frontier settlement suffered in wars with the French and Indians. In the War of Independence (1776), Washington was driven from New York City, which was held by the British till the end of the war; but Westpoint was held, and Burgoyne, after two severe battles near Saratoga, compelled to surrender. The state constitution was adopted in 1777; in 1825, the opening of the Erie Canal gave a great impetus to the prosperity of the state. The population, in 1800, was 586,756; 1820, 1,372,812; 1860, 3,880,735; 1870, 4,382,759.

NEW YORK, the most important city and seaport of the U. S., and the third in the civilised world, is situated on the east side of the mouth of the Hudson River, at its confluence with a narrow strait called East River, which opens into Long Island Sound, in the state of New York, 18 miles from the ocean. Lat. 40° 42' 43" N., long. 74° 0' 3" W. The city comprises the island of Manhattan, formed by the Hudson River and the East River, and separated from the mainland by a narrow strait called Harlem River, on the east side, and on the west by Spuyten Duyvel Creek, and also includes several smaller islands, containing the fortifications in the harbour, and the public institutions in the East River. The island on which the city is built is 13½ miles long, and with an average breadth of 1½ths of a mile, comprising 22 square miles. A rocky ridge runs through the centre, rising at Washington Heights, 238 feet. The compactly built city extends five miles from the 'battery' at its southern point, and is laid out regularly into 141,486 lots. Avenues, 100 feet wide and 8 miles long, in straight lines, are crossed at right angles by streets from 80 to 120 feet wide, extending from river to river. The city is connected with the mainland of N. Y. by bridges across the Harlem River, and with New Jersey, Long Island, and Staten Island by twenty-two steam-ferris, which carried, in 1868, 82,321,274 passengers. Ten railways radiate from the city, while the finest passenger steam-boats in the world pass up the Hudson, Long Island Sound, and down the Narrows, through the lower bay. The harbour, formed by the upper and smaller bay, with its two arms, which almost enclose the city, is one of the finest in the world. There are 60 piers for shipping on the west, and 70 on the east side of the city. The harbour is defended by fourteen forts, mounting 1500 guns. The streets are traversed by many lines of city stages and horse railways, which carry millions of passengers annually.

The city is built of brick, brown sandstone, and white marble. Among its finest edifices are the City Hall, Custom-house, Trinity Church, Grace Church, two universities, cathedral, Academy of Music, Cooper Institute, and the numerous great hotels, several of which have accommodation for more than a thousand persons. Of 331 churches, 72 are Protestant Episcopal, 41 Roman Catholic, and the others of all denominations. There are 64 ward or grammar schools, 34 primary, 6 for coloured children, 12 corporate, 16 industrial schools, and a free academy, now the College of the City of New York. Besides, there are 35 Roman Catholic schools, and colleges and academies of the religious orders. Columbia College is one of the oldest in the country; the University of the City of New York has been more recently established. Each has departments of law and medicine, and there are two other medical colleges, several theological seminaries, and many private academics. The hospitals and institutions of charity are on a

liberal scale; and besides legal outdoor relief, the poor are visited and cared for by a public society, with agents in every district. Among the charities are asylums for insane, blind, deaf and dumb, magdalens, foundlings, &c. The Astor Free Library, founded by John Jacob Astor, has 140,000 carefully selected volumes; the Mercantile Library, 116,000 volumes, with a large reading-room; Society Library, 60,500; Historical Society, 50,600, with rich museums of antiquities; the Cooper Institute, a present to the city by Peter Cooper, has a free reading-room, picture-gallery, art-schools, &c. Annual art exhibitions are given by the National Academy of Design, Dusseldorf and International Galleries. The Academy of Music, or Opera-house, has seats for 4700 persons, and eight or ten theatres give nightly entertainment to 20,000. The Central Park, laid out in the finest style of landscape-gardening, is two and a half miles long by three-fifths of a mile wide. Eighteen smaller public parks are scattered over the city. The Croton Aqueduct brings a river of pure soft water from 40 miles distance, which is received in reservoirs of a capacity of 1,200,000,000 gallons, and distributed through 313 miles of pipes, with such a head as to supply public fountains of 60 and 80 feet jet, and the upper stories of most buildings. Eleven markets supply annually 140,000,000 lbs. beef, 25,000,000 lbs. mutton, 56,000,000 lbs. pork, and immense quantities of poultry, game, fish, oysters, fruits, and vegetables. The city government is composed of a mayor, boards of aldermen and councilmen, and bureaux of various departments. The police numbers about 2860, with salaries of \$800 to \$5500 a year. The stations are connected by telegraph, and have lodgings for destitute persons. A sanitary squad has charge of the public health. The Commissioners of Charity and Correction have direction of asylums, hospitals, and prisons. Commissioners of Emigration receive and attend to the wants of immigrants. A paid fire department exists, with 720 men, 45 steam fire-engines, and 84 telegraph stations, which has reduced the losses by fire to one-third of the former annual amount under the volunteer system. There are 97 fire, 39 life, and 10 marine insurance companies; 70 national and 32 savings banks; about 600 manufacturing and 200 mining companies; and 130 periodicals are published. N. Y. is the great centre of American finance and commerce. It receives 66 per cent. of all imports, and sends out 44 per cent. of all exports. It has many ship-yards, manufactories of steam-engines, sugar-refineries, &c. In June 1870, 4602 vessels belonged to the port, making 966,928 tons. In January 1870, 89 ocean steamers plied between N. Y. and European ports, and 15 to the West Indies, Brazil, &c. The exports of 1870 were \$195,219,625; the imports, \$305,962,185. The receipts into the Treasury of N. Y. in 1868-9 amounted to \$17,074,347; the expenditure to \$17,573,435. The state debt was \$34,848,035.

N. Y., the *Nieu Amsterdam* of the Dutch, was founded in 1621; in 1664 it was taken by the English. At the period of the revolution, it was smaller than Philadelphia or Boston; but increased in importance, especially after the completion of the Erie Canal had opened to it the commerce of the west. In 1789, 2086 persons died of yellow fever; in 1832, 3513 of cholera; in 1845, a fire destroyed a large portion of the business part of the city, with a loss of \$18,000,000. In 1741, in consequence of a supposed negro plot to burn the city, 13 negroes were burned at the stake, 20 hanged, and 78 transported. In 1863, in a riot caused by the conscription, the popular fury again turned against the negroes, and numbers were murdered. The

mortality of the city is 1 in 35; intramural interments are forbidden, and large cemeteries have been opened on Long Island. The population in 1870 was 922,531; but, if the neighbouring cities of Jersey and Brooklyn be included, exceeds 1,400,000.

**NEW ZEALAND**, a British colony in the South Pacific Ocean, consists of three islands, two large and one much smaller, and of a number of islets scattered round the coasts. These islands, named respectively North, Middle, and the small Stewart's Island, are situated about 6500 miles west from the coast of South America, and about 1200 miles south-east of Australia. The group is irregular in form, but may be said to extend from the south in a north-north-east direction, and, like the peninsula of Italy, resembles a boot in shape. North Island is 500 miles long, and 200 miles in greatest breadth from east to west; Middle Island is 550 miles long, and 210 miles in greatest breadth; South Island is triangular in shape, and has an area of about 900 square miles. Area of the three islands about 95,000 square miles. The North is separated from the Middle Island by Cook's Strait, which is 18 miles wide at its eastern and 90 miles wide at its western end; the Middle is separated from the South Island by Foveaux Strait, which averages about 20 miles in width. The group extends in lat. from 34° 15' to 47° 30' S., and in long. from 166° to 179° E.; being thus almost the antipodes of the British Isles.

**Coast Line.**—Of the entire coast line of about 4000 miles, nearly 1500 miles is formed by the shores of North Island, which are deeply indented, and contain many excellent harbours. Commencing from North Cape, and going south-east round the island, the chief harbours are Monganni, Wangaroa, the Bay of Islands, Auckland, Mercury, and Tauranga Bays, and the ports of Wellington, Manukau, and Hokianga. On the north and south coasts of Middle Island, which are much broken, the harbours are numerous and excellent; on the eastern coast, the principal harbours are Akaroa, Victoria, and Dunedin. On the coasts of South Island, there are also good ports.

**Surface.**—The New Zealand Islands are of volcanic origin, and a great portion of the entire area is occupied by mountains, among which are many extinct and a few active volcanoes. In North Island, Mount Ruapahu, the highest summit of the central range, is 9000 feet in height, and is capped with perpetual snow. In the same range is Tongariro, an active volcano, 6000 feet high. A continuous range of mountains runs along the western coast of Middle Island, and assumes the form of table-lands and isolated peaks toward the east. This range rises in Mount Cook to about 14,000 feet. In Southern Island, the greatest elevation is about 3000 feet. In North Island, the mountains are mostly clothed with evergreen forests of luxuriant growth, interspersed with fern-clad ranges, and occasionally with treeless grassy plains; extensive and rich valleys and sheltered dales abound; and in the east of Middle Island there are many expansive plains of rich meadow-land, admirably adapted either for agriculture or cattle-breeding. Water and water-power are found in great abundance in the colony, and the numerous rivers are subject to sudden floods from the melting of the mountain snows. As a rule, however, the streams are short, and are not navigable for more than 50 miles above their mouths. The chief is Waikato River, in North Island, which, issuing from the Taupo Lake (30 miles long by 20 broad), flows in a northern direction for 200 miles, and reaches the sea on the west coast. In Middle Island, the rivers Clutha, Mataura, and Waian, all flowing south, are

among the chief. Around Lakes Rotomahana and Rotorua are a number of grand and beautiful geysers, which throw up water heated to 2° above the boiling-point. The geology of N. Z. is remarkable in a high degree. The mountains, which are of every variety of outline, are chiefly composed of the lower slate-rocks, intersected with basalt, and mixed with primary sandstone and limestone. Beds of coal and lignite exist, and the former have been to some extent worked.

**Soil, Climate, and Productions.**—Of the whole surface-extent of N. Z. (nearly 70,000,000 acres, little short of the combined area of England and Wales, Scotland, and Ireland), one-fourth is estimated to consist of dense forest tracts, one-half of excellent soil, and the remainder of waste lands, scoria-hills, and rugged mountain regions. Nearly 40,000,000 acres are supposed to be more or less suitable for agriculture and cattle-breeding. The soil, although often clayey, has in the volcanic districts more than a medium fertility; but the luxuriant and semi-tropical vegetation is perhaps as much due to excellence of climate as to richness of soil. Owing to the prevalence of light and easily-worked soils, all agricultural processes are performed with unusual ease. The climate of N. Z. is one of the finest in the world. The country contains few physical sources of disease; the average temperature is remarkably even at all seasons of the year, and the atmosphere is continually agitated and freshened by winds that blow over an immense expanse of ocean. In a word, the climate much resembles that of England, with half the cold of the English winter; while the summer is longer and somewhat warmer, the atmosphere is more breezy and pure, and there are many more fine days throughout the year. In North Island, the mean annual temperature is 57°; in South Island, 52°. The mean temperature of the hottest month at Auckland is 68°, and at Otago 58°; of the coldest month, 51° and 40°. The air is very humid, and the fall of rain is greater than in England, but there are more dry days. All the native trees and plants are evergreens. Forests, shrubberies, and plains are clothed in green throughout the year, the results of which are, that cattle, as a rule, browse on the herbage and shrubs of the open country all the year round, thus saving great expense to the cattle-breeder; and that the operations of reclaiming and cultivating land can be carried on at all seasons. The seasons in N. Z. are the reverse of ours; January is their hottest month, and June the coldest. All the grains, grasses, fruits, and vegetables grown in England are cultivated in this country with perfect success, being excellent in quality and heavy in yield; while, besides these, the vine is cultivated in the open air, and maize, the taro, and the sweet-potato are cultivated to some extent in the sunny valleys of North Island. The entire acreage under crop in N. Z. in 1851 was 29,140; in 1858, it was 141,007; in 1872, 1,129,811; while in 1871 the total acreage fenced was 6,778,773. Of the crops, the principal were wheat, oats, barley, potatoes, and sown grass, which, under ordinary circumstances, are grown to great advantage in New Zealand. Besides a few harmless lizards, a small species of rat is the only indigenous four-footed animal found in either of the great islands. Hawks are numerous. The country is destitute of snakes, and possesses no insect so noxious as the English wasp. The pig, introduced by Cook, runs wild, and the red and fallow deer, the pheasant, partridge, quail, &c., and the commoner domestic animals introduced by colonists, thrive well. In February 1872, there were in the colony 81,028 horses, 436,592 cattle, 9,700,629 sheep, 151,460 pigs,

397 mules or asses, 12,434 goats, and 872,174 poultry. Coal in abundance, and of good quality, as well as iron, gold, silver, tin, copper, &c., are distributed over the colony. For statistics of the quantity of gold exported, see article OTAGO. Valuable timber is in great abundance. The number of inhabitants, in 1858, was 59,328; in 1861, 98,971; and in 1871, 236,260. In the same year, the revenue (of which the sources are principally customs, receipts, and sale of crown lands) amounted to £1,342,116; the debt of the general government to £8,496,016. The exports, consisting principally of gold, wool, ore, and timber, amounted, in 1871, to £5,282,084; the total exports of gold, from 1857 to 1871, being 6,272,878 oz., in value £24,352,999; of wool in 1871, £1,986,996; and the imports, consisting of British manufactures, tea, coffee, &c., imported for the most part direct from London, amounted to £4,078,193.

The colony is divided into the following eight provinces: Auckland, Taranaki, Wellington, Hawke's Bay, Nelson, Marlborough, Canterbury, and Otago, including Southland. The government is administered by a governor appointed by the crown, and a ministry, a Legislative Council nominated by the crown, and a House of Representatives elected by the people. Grammar and free schools, endowed from the public revenues of the various provinces, various colleges, and a university in Otago, are the principal educational institutions. A very large proportion of the population of European descent can read and write, more particularly in Otago. The principal churches are the Church of England, predominating in Canterbury; the Presbyterian Church, which predominates in Otago and Southland; the Wesleyan; and the Roman Catholic. In 1871, the immigrants into New Zealand amounted to 10,083 persons; the emigrants from it to 5297; of the excess of immigrants, by far the largest number 3106 remained to Otago, Auckland retaining only 638, and Wellington, 446.

The New Zealanders, or Maories (q. v.), estimated, in 1867, at 38,540, and in 1871, at 37,500, are mostly located in North Island.

N. Z. was discovered by Tasman in 1642, and was repeatedly visited by Captain Cook, who surveyed the coasts in 1770. After the settlement of Port Jackson, in New South Wales, the English and American ships engaged in the capture of the multitudes of whales that frequent those seas, had recourse to the coasts of N. Z. for provisions and shelter, especially in the excellent harbours of the Bay of Islands. N. Z. flax came also to be an article of traffic, and individual Englishmen began to settle on the coasts, and intermarry with the natives, and acquire land in right of their wives, or of purchase. Missionary enterprise began in 1814, favoured by various chiefs, who made grants of land to the missions. The missionaries not only laboured to convert the natives, but introduced improved culture among them, and did what they could to protect them from the injustice, fraud, and oppression of the Europeans that visited the islands, or had acquired settlements. More effectually to secure this object, a British resident or consul was appointed in 1833, but without any authority. In the meantime, a desultory colonisation, and the purchase of rights to land from the natives for a few hatchets or muskets, were going on; and to put an end to this state of anarchy, a lieutenant-governor was appointed, who, in 1840, concluded, at Waitangi, a treaty with the native chiefs, whereby the sovereignty of the islands was ceded to Britain, while the chiefs were guaranteed the full possession of their lands, forests, &c., so long as they desired to retain them: the right of pre-emption, however,

was reserved for the crown, if they wished to alienate any portion. Thus N. Z. became a regular colony, the seat of government of which was fixed on the Bay of Waitemata, and called Auckland. The previous year an association, called the New Zealand Company, had made a pretended purchase of tracts amounting to a third of the whole islands, and for a dozen years most of the colonisation of N. Z. was conducted under its auspices. The conduct of the company is considered to have been on the whole prejudicial to the prosperity of the colony; and after a long conflict with the government, they resigned, in 1852, all their claims—which the government had never confirmed—on condition of receiving £268,000 as compensation for their outlay. The unscrupulous way in which the Company and others often took possession of lands which the natives conceived themselves to have a right to, brought on, between 1843 and 1847, a series of perilous and bloody conflicts with those warlike tribes. They seemed, however, to have laid aside their hostility. But in 1861, the first of a series of intermittent outbreaks commenced, which were continued for several years, until, on the withdrawal of the imperial troops, the colonists, on whom fell the whole burden and conduct of the war, from their knowledge of bush life and intensified earnestness, lost no time in subduing the refractory natives, who are now turning their attention to agriculture and trade. Wellington is the present capital of N. Z.

**NEW ZEALAND FLAX.** See FLAX, NEW ZEALAND.

**NEWARK,** a municipal and parliamentary borough of England, in the county of Notts, on the Great Northern and Midland Railways, and on a navigable branch of the river Trent, sixteen miles south-west of Lincoln. The parish church, a large and elegant edifice, though often rebuilt, still shews traces of its original Norman character. N. is approached from the north by a causeway a mile and a half long, carried over the flat island formed by the Trent on the west and the Newark branch on the east. The castle of Newark, in which King John died in 1216, was built early in the 12th century. N. is said to be the greatest malting town in England; there are numerous flour-mills and breweries, and an extensive trade in corn, malt, flour, cattle, wool, and coal. It returns two members to parl. Pop. (1861) 11,515; (1871) 12,218.

**NEWARK,** a city and port of entry of New Jersey, U. S., on the west bank of the Passaic River, twelve miles from New York, on the New Jersey Railway. It is a handsome and industrious city; its principal street is two miles long, 120 feet wide, shaded by great elms, and bordering on three public parks. It contains a custom-house and post-office, 58 churches, 10 public schools, 7 banks, 4 newspapers, and extensive manufactories of leather, patent leather, enamelled cloth, carriages, saddles and harness, boots and shoes, clothing, hats, jewellery—547 establishments producing annually 25,000,000 dollars. It was settled in 1666 by a Puritan colony from Connecticut. N. has 92 vessels of 5941 tons. Pop. in 1870, 105,059.

**NEWBERN,** a city and port of entry of North Carolina, U. S., on the south bank of the Neuse River, at its confluence with the Trent, 30 miles from its mouth in Pamlico Sound. It exports tar, turpentine, naval stores, flour, and lumber. Pop. in 1860, 5434.

**NEWBURG,** a village of New York, U. S., on the west bank of the Hudson, 61 miles north of New York, amid the grand scenery of the highlands. Its handsome edifices, villas, and gardens,

on a gentle slope from the river, command a noble prospect. It contains a court-house, five foundries, a cotton factory, breweries, a railway carriage manufactory, 2 pianoforte manufactories, steam-boiler works, 5 soap factories, 41,000 tons of shipping, a large lumber trade, 23 churches, 5 banks, schools, and academies. It was Washington's headquarters during a critical portion of the War of Independence. Pop. in 1860, 15,198.

**NEWBURY**, a municipal borough and market-town of England, Berkshire, on both banks of the Kennet, seventeen miles west-south-west of Reading. The church, a venerable specimen of the Perpendicular style, was built in the reign of Henry VII.; but the tower was built by John Winchcombe, a clothier and famous citizen of N. in the reign of Henry VIII., and known then, and subsequently, as *Jack of Newbury*. N. is best known for two hard-fought battles between the Royalist and Parliamentary forces which took place here—the first in September 1643, the second in October 1644. In the former, the victory was undecided; in the latter, the advantage was on the side of the Parliamentarians. Pop. (1861) 6161. (1871—6602.)

**NEWBURYPORT**, a city and port of entry of Massachusetts, U. S., on the south bank of the Merrimack River, three miles from its mouth, 34 miles north-east of Boston. Lat. 42° 48' 30" N., long. 70° 52' 3" W. It is a pretty town, built on a swell of land rising 100 feet from the river. High Street, three miles long, shaded with trees, a beautiful Mall, and pond of six acres, are its chief ornaments. It has 16 churches, in one of which is the tomb of Whitefield, who died here (1770), 3 banks, 5 manufacturing companies, making 10,000,000 yards of cloth annually, several ship-yards, and manufactories of machinery, hats, clothing, &c.; two daily papers, one of which was established in 1786; a free high school, and a free library of 10,000 volumes. Pop. in 1870, 13,595.

**NEWCASTLE**, DUKE OF, THOMAS PELHAM HOLLES, minister of the first two Georges, born in 1692, and representative of the noble family of the Pelhams, played a prominent, but by no means illustrious part in the political history of his time. While a very young man, he succeeded to the family peerage by the death of his father, Lord Pelham, and George I. rewarded his attachment to the House of Brunswick by creating him first, Earl of Clare, and afterwards Duke of Newcastle. He was made Secretary of State when but thirty years old, although the king declared that he was not fit to be chamberlain to the smallest court in Germany. There was much of the absurd and grotesque in his character. Macaulay says of him, that 'his gait was a shuffling trot; his utterance a rapid stutter; he was always in a hurry; he was never in time; he abounded in fulsome caresses, and in hysterical tears.' Yet this man was during thirty years Secretary of State, and for near ten years First Lord of the Treasury! He served under Sir R. Walpole, retained his secretaryship in the 'broad-bottomed administration' in 1744, and in 1754 succeeded his brother, Mr Pelham, as head of the government. In 1757, he was compelled to take the first William Pitt (afterwards Earl of Chatham) into his ministry, and to give him the lead in the House of Commons, and the supreme direction of the war and of foreign affairs. A succession of brilliant victories followed—N. being only nominal head of the administration—and the great commoner had almost brought the war to a successful termination, when the accession of George III. led to the resignation of Mr Pitt, and the replacement of N., in May 1762, by Lord Bute, as head of the

ministry. N. declined a proffered pension, with the remark that if he could no longer serve he would not burden his country. In the Rockingham ministry, formed in 1765, N. filled the office of Privy Seal. He died November 17, 1768. His title descended to Henry, 9th Earl of Lincoln, whose great-grandson,

**HENRY PELHAM-CLINTON**, fifth Duke of Newcastle, and twelfth Earl of Lincoln, was born 1811, and educated at Christ-Church, Oxford. He represented South Notts in parliament from 1832 to 1846, when he was ousted by the influence of his father, the fourth duke, for supporting Sir R. Peel in his free-trade measures. He adopted politics as a profession; was a Lord of the Treasury in the brief Conservative administration of 1834—1835; and First Commissioner of Woods and Forests in the Peel administration, from 1841—1846. He was then made chief Secretary to the Lord-lieutenant of Ireland, but went out of office with his chief a few months afterwards. He succeeded to the dukedom in 1851, and returned to office in 1852, filling the post of Secretary of State for the Colonies (which formerly included the department of war) in the Aberdeen government. The war with Russia broke out, and in June 1854 it was found necessary to create a Secretary of State for War, and the new office was assigned to Newcastle. The 'horrible and heart-rending' sufferings of the British army before Sebastopol in the winter months of 1854 raised a storm of popular discontent, and when the House of Commons determined to inquire into the conduct of the war, the duke resigned. Yet, as is now acknowledged, no blame was attributable either to the Minister for War or his subordinate, Mr Sidney Herbert. They were called upon to administer a vicious system of military organisation, which broke down under the strain brought to bear upon it. N. was re-appointed Colonial Secretary in the second administration of Lord Palmerston, and held the seals with general approval from 1859 to the year of his death, 1864. In 1860, as Secretary of State for the Colonies, he accompanied the youthful Prince of Wales during a tour in Canada and a portion of the United States, and on his return received the Order of the Garter from the Queen. He died Oct. 1864.

**NEWCASTLE-UNDER-LYME**, a parliamentary and municipal borough of England, in the county of Stafford, 16 miles north-north-west of the town of that name. A branch-railway connects it with the North Staffordshire line, and a branch-canal with the Grand Trunk Navigation. One of its churches, rebuilt early in last century, has a very old square tower of red sandstone. The Free Grammar School has an income of about £100 a year, and was founded in 1602. Hats are the principal branch of manufacture, and silk, cotton, and paper-mills are in operation. N. is surrounded by famous potteries, and coal-mines are worked in the vicinity. Pop. (1871) 15,949.

**NEWCASTLE-UPON-TYNE** the chief town of Northumberland. Lat. 54° 58' 11.6" N., long. 1° 36' 36.5" W. It has the privileges of a county of itself. Gateshead, which stands upon the opposite side of the river, though in a different county, and having a separate jurisdiction, is virtually a part of Newcastle. According to the census of 1871, N. contained a population of 128,443, Gateshead, 48,627; making together, 177,070 inhabitants. N. sends two members to parliament.

The Romans had a stationary camp here, called Pons Ælii—one of the chain of forts by which the Wall of Hadrian was fortified. On the withdrawal of the Romans, the deserted camp became the

residence of a colony of monks, and the town was called Monkchester. Robert, Duke of Normandy, a son of the Conqueror, hastily built a castle here in the lifetime of his father. Hence the modern name of New Castle. William Rufus rebuilt his brother's castle, surrounded the town with a wall, and gave the inhabitants peculiar privileges. The present castle, which displays better than any other in England the genius of Norman military architecture, was erected by Henry II. between the years 1172 and 1177. N. being made the rendezvous of the vast armaments which the first three Edwards led into Scotland, it was in their time surrounded with new walls of unusual strength and magnitude; portions of them yet remain.

The town stands partly upon an elevated platform, and partly upon the north bank of the river, hence the streets in the lower part of the town are steep. The more ancient houses are chiefly built of timber; the upper stories project beyond the lower; dormer-windows and gable-ends appear in the roof. On the failure of timber, brick was resorted to; but the modern streets in the centre of the town have been built of stone, of which there is abundance in the neighbourhood. Chiefly through the instrumentality of one man of humble origin—Richard Grainger—N. has, in modern times, received the addition of many streets, squares, and public buildings, which in point of architectural effect are scarcely to be excelled by any in the kingdom. An extensive conflagration, in 1854, led the way to still more recent improvements. The river is crossed by two bridges. The High-level Bridge consists of a roadway and a railway above it. A temporary bridge has taken the place of the old Redheugh Bridge, which has been removed in order to construct a swing-bridge, to admit of the passage of ships. The railway bridge forms one of the engineering triumphs of Robert Stephenson; it consists of six cast-iron arches, supported upon piers of masonry. The length of the viaduct is 1337 feet, and the height of the railway above high-water mark, 112. Below the railway, this gigantic structure carries a carriage-way for ordinary traffic, by which the precipitous streets on both sides of the river are avoided.

There are 13 churches and chapels in the town connected with the Established Church, and about 28 belonging to other classes of worshippers. The mother-church (St Nicholas) is a noble edifice, chiefly in the Decorated style; its steeple, which is singularly light and bold, is early Perpendicular. Many of the new churches are structures of considerable elegance. In the Guild Hall, situated beside the river, an old and somewhat inconvenient building, the town assizes are held; in the Moot Hall, a modern and very handsome Grecian building, overlooking the Tyne bridge, the county courts assemble. A new and very spacious town-hall has recently been built on a block of ground facing St Nicholas Church; associated with it are a corn-market and offices for the transaction of the town business. The market for the sale of butcher-meat and vegetables is probably the most spacious and commodious in the kingdom. All the railways entering the town, terminate in a large station near its centre. Nearly 250 passenger trains arrive and depart daily. A commodious hotel is attached to the station. A building intended by Mr Grainger as an exchange, but now used as a news-room, is one of the most novel and elegant apartments used for that purpose in the kingdom. The jail, a heavy and costly mass of building, occupies a low and confined situation; it has been recently adapted to the carrying out of the separate system. The theatre is the great ornament of Grey Street, the handsomest street in

the town; it was designed after the Pantheon at Rome. The principal monuments in N. are a column, surmounted by a statue of Earl Grey, to commemorate the passing of the Reform Bill, and a bronze statue to George Stephenson.

In order to supply the wants of N. and its thickly-peopled neighbourhood, its markets are conducted on a large scale. The corn-market is held on Tuesday and Saturday; the hay-market and the cattle-market on Tuesday. During the year 1862, 54,936 fat cattle, 286,110 sheep and lambs, and 34,544 swine were sold in the cattle-market. A very large market is held every Thursday morning for the sale of butter, bacon, cheese, eggs, and other articles of country produce. Saturday is general market-day. N. is well supplied with water, derived from the streams and minor rivers to the north-west of the town.

The trade of N. consists chiefly in coal, and in those articles in the production of which great heat is required. The N. coal-trade had its origin in the reign of Henry III. This branch of industry is not now confined to N., but is spread over the greater part of the sea-board of Northumberland and the whole of Durham. Twenty-two millions of tons of coal are annually raised in the northern coal-field, giving direct employment to upwards of 60,000 persons. More than two and a half millions of tons of coke are annually manufactured. Until recently, very little iron was smelted on the Tyne; since the discovery of the Cleveland ironstone, the manufacture has prodigiously increased. The present make in the district of which N. is the centre, is about 600,000 tons yearly. There are annually produced on the Tyne 3000 tons of steel. Large quantities of lead, the produce of the mines of Alston Moor and Wardale, are brought to N. for shipment. Here, too, the silver is extracted, and the lead is rolled into sheets and pipes, or converted into shot, litharge, red and white lead. Copper, to the extent of £100,000 worth, is annually got from the copper pyrites used at the chemical works of the Tyne.

At N. the railway system had its origin. Here, as might be expected, locomotive and engineering establishments are found upon a great scale. The ordnance works of Sir William Armstrong at Elswick, a western suburb of N., are well known. Iron ship-building is carried on upon the Tyne to a great extent; vessels amounting to 51,236 tons were launched in 1863. N. occupies an important position in the manufacture of soda, bleaching-powder, vitriol, and other chemical products. There are decomposed in the district 100,000 tons of salt per annum. Earthenware is largely manufactured; window-glass and flint-glass have declined, but bottles are made to an enormous extent; impressed glass is largely manufactured, and plate-glass is made. Glass-staining has attained great perfection under Mr Wailes and Mr Baguley. The fire-brick trade is a new industry, which has already attained gigantic proportions. About 80,000,000 firebricks are annually made, besides gas-retorts and sanitary pipes, which are sent all over the world. About 100,000 grindstones leave the N. quarries annually. Portland, and other cements, are made to the extent of 11,000 tons in a year. About 500 persons are employed in the town in hat-making; they produce between 500 and 600 dozens of hats and caps every week. Some celebrated paper-mills and large tanning establishments are in the vicinity of Newcastle. Coach-building has largely increased of late years.

The river Tyne, from the sea to N., forms a natural dock for the accommodation of shipping. Two artificial docks have, however, been constructed, and a third is in contemplation. To the Tyne (divided

## NEWEL—NEWFOUNDLAND.

into the ports of N., North and South Shields) belongs a larger amount of shipping (393,321 tons) than to any single port in the kingdom, except Liverpool and London.

Of the benevolent institutions established in N., the most important are an infirmary, a dispensary, and asylums for the blind, the deaf and dumb. The Literary and Philosophical Society, the Society of Antiquaries, the Natural History Society, the Mechanics' Institution, and the Institute of Mining Engineers, successfully cultivate their several fields of labour.

Amongst the eminent natives of Newcastle may be named Lords Stowel, Eldon, and Collingwood, Mark Akenside, and Hutton, the mathematician. Intimately connected with it, though not born in it, were Thomas Bewick, the engraver, Robert Morrison, the Chinese scholar, and George and Robert Stephenson.

NEWEL, the central column or spindle formed by the ends of the steps of a circular staircase, and round which the stair winds. In turret-stairs, it is a plain roll; but in Elizabethan and old Scotch castles, there are frequent examples of handsome staircases of this kind with ornamental newels.

NEWFO'UNDLAND, an island and British colony of North America, lies in the Atlantic Ocean, at the mouth of the Gulf of St Lawrence, separated from Labrador on the north by the Straits of Belle Isle (about 12 miles broad), and extending in lat. from 46° 38' to 51° 37' N., and in long. from 52° 44' to 59° 30' W. In shape it resembles an equilateral triangle, of which Cape Bauld on the north, Cape Race on the south-east, and Cape Ray on the south-west, form the angles. It is 370 miles in length, 290 miles in breadth, about 1000 miles in circumference, and has an area of 40,200 square miles; pop. (1868) 146,536.

Of the entire acreage of the island, 3,000,000 acres are set down as *good*, and about 20,000,000 as *poor* land. The island, as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mountains, marshes, barrens, ponds, and lakes. The mountains in the Avalon Peninsula (stretching south-east from the main portion of the island, and connected with it by an isthmus of only about three miles in width) rise, in some cases, to 1400 feet above sea-level; while, both here and along the western shore, the height of 1000 feet is frequently reached. The number of the lakes and 'ponds' (the latter name being used indiscriminately for a large or a small lake) is remarkable, and it has been estimated, though, perhaps, with some exaggeration, that about one-third of the whole surface is covered with fresh water. The 'barrens' occupy the tops of hills. The coast-line is everywhere deeply indented with bays and estuaries, many of which are spacious enough to contain the whole British navy. Of these inlets, the principal, beginning from the northern extremity of the island, are Hare, White, Notre Dame, Bonavista, Trinity, Conception, St Mary's, Placentia, Fortune, St George's, and St John's Bays. These bays vary in length from 25 to 70 miles, are of great breadth, and are lined—as indeed the whole coast is—with excellent harbours. The rivers, none of which are navigable for any distance, communicate between the lakes of the interior and the shore, and are narrow and winding; occasionally, however, they are turned to account in driving machinery. The main streams are the Exploit, with its affluent the Great Rattling, and the Humber. The soil is sterile and unproductive, although there is considerable cultivation along the sea-board of the settled districts, which are limited principally to

the south-east coast; and a large portion of the land around St John's (q. v.) is under cultivation. The great body of the people are employed either in the fisheries or in establishments connected with them, and little attention has hitherto been paid to the culture of the soil; but there are now prospects of improvement in this respect. In 1861, 41,108 acres were under crops. In 1845, the only crops raised were oats and hay; but within recent years, large supplies of grain, vegetable, and garden seeds have been imported; and in 1861, 550,317 bushels of potatoes were produced, and turnips, hay, carrots, clover, barley, and oats were cultivated with success. The island is rich in useful minerals, among which are silver, copper, galena, marble, limestone, gypsum, roofing-slate, and coal—the last found only in small quantities. Lead, silver, and copper mines are worked, though mining is still in its infancy here. Trees, of which the chief are the fir, birch, willow, and mountain-ash, flourish and reach their natural size only in the low and fertile districts.

The fisheries are of two kinds—the 'Shore Fishery' and the 'Bank Fishery;' the former comprises the shores and bays of N.; the latter comprises a great tract known as the 'Banks' of N., from 500 to 600 miles in length, and about 200 miles in breadth. The Banks form the greatest submarine plateau known; the depth of the water is from 20 to 108 fathoms, and the most productive 'ground' is said to extend between lat. 42° and 46° N. Great variety of valuable fish is found in the waters around the colony, as the cod, salmon, herring, &c. The principal articles of export are fish—comprising dry cod, herring, and salmon—and cod-oil. Of dry cod, 970,176 quintals, value £810,943, were exported in 1870; 3593 tons of unrefined cod-oil, value £107,813; 404 of refined cod-oil, value £21,068; 4982 of seal-oil, value £176,472; and 265,189 seal-skins, value £55,248. The imports are chiefly provisions, as bread, butter, tea, &c.—cordage and cables, and manufactured goods. The imports and exports for 1870 amounted in value to £1,386,635 and £1,297,974 respectively. In 1857, 777 vessels, manned by 14,433 men, were engaged in the seal and other fisheries; the number of boats employed was 11,683, and the number of nets and seines, 2354. The total number of men (exclusive of French) employed in the fisheries of N., in 1861, was 24,000. The revenue in 1870 was £183,290; the expenditure, £147,844. In that year, the total tonnage of vessels that entered and cleared the ports was 320,506; 307,721 tons being tonnage of British vessels, and 12,785 of foreign vessels.

In 1861, there were in the island 260 educational institutions, attended by 12,230 pupils, and maintained at a cost of £11,187, of which government pays about a fourth part. Of the entire population of the island, 55,309 are Catholics, 42,638 Episcopalians, 20,144 Methodists, 822 Presbyterians, a small number of Baptists, Congregationalists, &c. There are no railways in the island, and its peculiar configuration renders even road-making a matter of great difficulty. There are no roads across the island; they are confined chiefly to the south-eastern and south-western sea-board. There is fortnightly communication in summer between St John's and Halifax by steamer. In the colony and connected with it, 400 miles of lines of telegraph have been constructed, 50 miles of which, from Cape Ray to Cape Breton, are submarine. The American terminus of the Atlantic Telegraph is in Newfoundland.

The early history of N. is involved in obscurity. It was discovered June 24, 1497, in the reign of Henry VII., by John Cabot; and the event is noticed by the following entry in the accounts of the privy-purse expenditure: '1497, Aug. 10. To

hym that found the New Isle, £10.' It was visited by the Portuguese navigator, Gaspar de Cortereal, in 1500; and within two years after that time, regular fisheries had been established on its shores by the Portuguese, Biscayans, and French. In 1578, 400 vessels, of which 50 were English, were engaged in the fishery. Sir Humphrey Gilbert, with his ill-fated expedition, arrived in St John's harbour, August 1583, and formally took possession of the island in the name of Queen Elizabeth. In the return voyage, the expedition was scattered by a storm, and the commander lost. In 1621, Sir George Calvert (afterwards Lord Baltimore) settled in the great peninsula in the south-east, and named it the *Province of Avalon*. The history of the island during the 17th and part of the 18th centuries, is little more than a record of rivalries and feuds between the English and French fishermen; but by the Treaty of Utrecht (1713), the island was ceded wholly to England; the French, however, retaining the privilege of fishing and drying their fish on certain portions of the coast. A governor was appointed in 1728. The present form of government, established in 1855, consists of the governor, a legislative council (appointed by the crown), and a general assembly (elected by the people). The coast of Labrador on the mainland, and the island of Anticosti, have been included, since 1809, within the jurisdiction of the governor of Newfoundland.

**NEWFOUNDLAND DOG**, one of the most sagacious and esteemed of the large kinds of dog. It is said to have been originally derived from Newfoundland, where it is used chiefly as a beast of draught, to convey light loads of wood or provisions, on sledges, over rugged tracks. Multitudes of these dogs, in St John's and elsewhere, are left to shift

Newfoundland Dog.

for themselves during the fishing season; and are again called to service when required by their masters. There are several varieties of N. D., particularly a smooth breed, with rather small head, white and spotted with black, which seems now to be extinct; a very large breed, with broad muzzle, head raised, noble expression, wavy or curly hair, very thick and bushy curled tail, black and white colour; and a smaller, almost black breed. Some of the breeds seem to be crossed with hounds and other dogs. The N. D. is remarkable for memory, and for patience and forbearance of temper. It is, however, apt to become irascible in confinement, and will then bite even its master. Some of the most interesting anecdotes of the affection and sagacity of the dog, relate to the Newfoundland Dog. No dog excels it as a water-dog. Its paws are half-webbed. Its power of endurance in swimming is very great.

**NEWGATE**, a celebrated London prison, stands at the western extremity of Newgate Street, opposite the Old Bailey. It is the chief criminal prison for the city and county. The exterior presents high dark stone walls, without windows, and with entrances from the side next the Old Bailey, in front of which public executions take place. The earliest prison here was in the portal of the *new gate* of the city, as early as 1218; and hence the name. About two centuries afterwards, it was rebuilt by the executors of Sir Richard Whittington, whose statue with a cat stood in a niche, till its destruction by the great fire of London in 1666. Shortly after, it was reconstructed, from which time, till 1780, the date of the erection of the present edifice, its condition was, in a sanitary point of view, horrible. Mr Akerman, one of the keepers, in his evidence before the House of Commons in 1770, stated, as a proof of this, that in the spring of 1750 the jail distemper, spreading to the adjoining Sessions House, caused the death of 'two of the judges, the lord mayor, and several of the jury and others, to the number of sixty persons and upwards.' The place, however, is now kept in the cleanest possible condition. The cells for condemned prisoners are at the north-east corner, next to Newgate Street. The *Newgate Calendar* contains biographical notices of the most notorious murderers, burglars, thieves, and forgers who have been confined within its walls.

**NEWMAN, JOHN HENRY, D.D.** was born in London, February 21, 1801, and educated at the school of Dr Nicholas, at Ealing, whence he passed, in 1816, to Trinity College, Oxford, of which college he became a scholar by competitive examination in 1818. Having graduated in 1820, he was elected Fellow of Oriel College in 1822, where he attracted the notice of Dr Whately, and was by him employed in the preparation for publication of his well-known *Treatise on Logic*, and introduced to the editor of the *Encyclopædia Metropolitana*, to which he became a contributor. He was ordained in 1824; and in the following year, his friend Dr Whately having been appointed head of St Alban's Hall, N. was by him selected as his vice-principal; but on being named tutor in his own college in 1827, as also public examiner, he resigned the vice-principalship. In 1828, he was presented to the vicarage of St Mary's, Oxford, in which church the sermons which he delivered at a late period had an extraordinary influence in forwarding the religious movement with which his name is permanently associated. At this period, N. was an earnest antagonist of the Roman Catholic Church. He was one of those who transferred their support from Sir Robert Peel to Sir Robert Inglis on occasion of the former's introducing the Roman Catholic Relief Bill; and he was one of the most active in commencing and carrying on the so-called Oxford movement—the great object of which was to counteract as well the Romanising as the dissenting tendencies of the time, by restoring and bringing into notice what N. and his friends believed to be the catholic character of the English Church. With this view, he commenced, in 1833, the series known as the *Oxford Tracts*, to which he was himself one of the chief contributors; and in 1838, he also became editor of the *British Critic*, which was an organ of the same views, and, in conjunction with Drs Pusey and Keble, of a *Library of Translations from the Greek and Latin Fathers*. He continued the publication of the Tracts up to the 90th Number, which was written by himself, and the tendency of which was so distasteful to the Anglican authorities, that the Heads of Houses at Oxford condemned the Tract, and the Bishop of Oxford called on N. to discontinue the publication—a request with which he at once complied.

The *British Critic* continued for some time longer to advocate the same opinions; but in 1843 that publication also was discontinued; and N., who had for some time resided at Littlemore, near Oxford, engaged, in company with some of his more youthful adherents, in study and ascetic exercises, thenceforward confined himself chiefly to his Littlemore residence, and eventually, in October 1845, was admitted into the Roman Catholic Church, a step which was immediately followed by the publication of a work on the *Development of Doctrine*, which was intended as an explanation of the process through which the writer's own mind had passed. Soon afterwards, N. repaired to Rome, where, after some preparation, he was admitted to orders in the Roman Catholic Church; and in 1848, on his return to England, he established a branch of the Congregation of the Oratory of St Philip Neri, of which he was himself appointed the superior. In 1852, he was appointed rector of the Catholic University established in Dublin, an office which he held for five years, afterwards returning to Birmingham, where he still resides, and in connection with which he has established a school of higher studies for the youth of the Roman Catholic religion. Dr N., in addition to the large share which he had in the publications already named, is the author of several very important works, written as well before as after his withdrawal from Anglicanism. Of the former period, are his *History of the Arians*, *Prophetical Office of the Church*, *The Church of the Fathers*, an *Essay on Miracles*, a *Translation of the Treatises of St Athanasius*, with many learned Dissertations, and several volumes of sermons. To the latter period belong the *Development of Christian Doctrine*, *Lectures on Catholicism in England*, *Apologia pro Vita Sua*, *Letter to Dr Pusey*, and an *Essay on Assent*. N. is also the author of two works of fiction, *Loss and Gain*, and *Callista*, a classical and Christian story of the 5th c.; and he was the editor, and in part compiler, of a series of *Lives of the English Saints*.

NEWMAN, FRANCIS WILLIAM, brother of the preceding, was born in London in 1805, and educated at the school of Ealing. Thence he passed to Worcester College, Oxford, where he obtained first-class honours in classics and mathematics in 1826, and, in the same year, a fellowship in Baliol College. This fellowship, however, he resigned; and he withdrew from the university in 1830, at the approach of the time for taking the degree of M.A., declining the subscription to the Thirty-nine Articles, which was required from candidates for the degree. After a lengthened tour in the East, he was appointed classical tutor in Bristol College, 1834. In 1840, he accepted a similar professorship in Manchester New College, and, in 1846, his great reputation for scholarship, and his general accomplishments, led to his being appointed to the chair of Latin, in University College, London, which he held till 1863. During all this time, he has not only been an active contributor to numerous literary and scientific periodicals, and to various branches of ancient and modern literature, but has also had a leading part in the controversies on religion, in which he has taken the line directly opposite to that chosen by his elder brother, being no less ardent as a disciple of the extreme rationalistic school than John Henry Newman of the dogmatical. These opinions, and the system founded upon them, form the subject of his well-known work, *Phases of Faith, or Passages from the History of my Creed* (1850); and of many essays in the *Westminster, Eclectic*, and other Reviews; but he is also the author of very many separate publications. Of these, several regard the controversy to which we

have referred—as, *Catholic Union; Essays Towards a Church of the Future* (1844); *A State Church not Defensible* (1846); *a History of the Hebrew Monarchy* (1847); *The Soul, its Sorrows and Aspirations* (1849). Others are on political or social topics—as, *Radical Reforms, Financial and Organic* (1848); *The Crimes of the House of Hapsburg* (1851); *Lectures on Political Economy* (1857); *Europe of the Near Future* (1871). A large number are devoted to historical, classical, and scientific subjects, the most important of which are *Contrasts of Ancient and Modern History* (1847); *Regal Rome* (1852); translations into 'unrhymed metre' of the *Odes of Horace* (1853), and the *Iliad of Homer* (1856); a treatise on *Difficulties of Elementary Geometry*; *Handbook of Arabic* (1866); *Orthoepy* (1869), &c.

NEWMARKET, a market-town of England, famous for its horse-races, is situated in a valley 13 miles east-north-east of Cambridge, and is partly in the county of that name and partly in Suffolk. It contains many well-built and elegant houses, the residences in many cases of gentlemen who are drawn hither from their interest in the *Turf*. The market-house and the famous Jockey Club are the chief edifices. Malt-making and brewing are carried on to some extent; but the town owes its prosperity to the horse-races, and nearly the half of the population are jockeys, grooms, trainers, or stablemen. The race-course of N., owned partly by the Jockey Club, and partly by the Duke of Rutland, is said to be the finest in the world, and the training-ground bears a similar character for excellence. There are seven race-meetings held here annually. See HORSE-RACING. Pop. (1861) 4069; (1871) 4534.

NEWPORT, a parliamentary and municipal borough, market-town, and river-port of England, chief town of the Isle of Wight, and situated near the centre of that island, on the Medina, which is navigable up to this point. St Thomas's Church, founded in 1554, on the site of an ancient structure built in the reign of Henry III., is a handsome edifice, and contains a monument erected by Her Majesty in memory of the Princess Elizabeth, daughter of Charles I., who died at Carisbrooke Castle, September 8, 1650. Among the educational establishments of N. is the Free Grammar School, in which frequent meetings and negotiations between Charles I. and the Parliamentary Commissioners took place. About a mile north of N. is Carisbrooke Castle, where the king was confined under the guardianship of Colonel Hammond for twelve months (1647—1648). There are several important institutions in the vicinity, as the Albany Barracks, the House of Industry, and the Parkhurst Prison for juvenile convicts. Manufactures of lace are carried on to some extent. Vessels of considerable tonnage can ascend to the quay at high tides. Pop. (1861) 7934. (1871—7976.)

NEWPORT, a thriving market-town, parliamentary and municipal borough, and river-port of England, in the county of Monmouth, and 24 miles south-south-west of the town of that name, on the Usk, and about four miles from the mouth of that river. It was anciently the port of the city of Caerleon, about three miles further up the river; but during the present century, it has become a shipping port of considerable importance, being the outlet of the produce of the extensive collieries, and iron and tin works of the neighbourhood. It possesses a number of recently-erected public buildings, has spacious docks, manufactures nails and spikes extensively, exports iron and coal largely, and carries on an excellent general trade. In 1862, 10,625 vessels, of 894,263 tons, entered and

cleared the port. N. unites with Monmouth and Usk in sending a member to parliament. The remains of Newport Castle are now used as a brewery. Pop. (1861) 23,249. (1871—26,957.)

**NEWPORT**, a city and port of entry, and semi-capital of Rhode Island, U. S., on the west shore of the island of Rhode Island in Narragansett Bay, 5 miles from the ocean. Lat. 41° 29' N., long. 71° 19' 12' W. It has a deep, excellent harbour, defended by Forts Adams and Wolcott. It has a state-house, custom-house, market, the Redwood Library, many large hotels, and elegant villas; is renowned for fine scenery and sea-bathing; and is one of the most fashionable watering-places in America. The town also contains cotton and other manufactures. It was settled, in 1638, by 17 adherents of Roger Williams, who followed him in his banishment from Massachusetts. It was occupied by 8000 British troops during the War of Independence, and was for a time the residence of Bishop Berkeley. Pop. in 1870, 12,552.

**NEWPORT**, a city of Kentucky, U. S., on the Ohio River, opposite Cincinnati, and on the east side of the mouth of the Licking River, opposite Covington. It contains a United States arsenal, and several iron foundries and rolling mills. Pop. in 1860, 10,046.

**NEWPORT-PAGNELL**, a small market-town of England, in Buckinghamshire, on the Ousel, 50 miles north-north-west of London. Lace is manufactured extensively, and there is a good trade in corn, coal, and timber. Pop. in 1871, 3655.

**NEWRY**, a seaport and parliamentary borough, situated partly in the county of Armagh, but principally in the county of Down, Ireland, distant from Dublin 63 miles north, and from Belfast 38 miles south-south-west, with both which places it is connected by a branch-railway communicating with the Dublin and Belfast Junction Railway. The town is nearly coeval with the English invasion, having grown up around a monastery founded in 1183, and a castle subsequently erected by De Courcey. This castle was the scene of several struggles; and in most of the civil wars of Ulster, N. suffered severely. It was incorporated as a borough, with a corporation and two members of parliament, by James I. Since the Union, it returns but one member, and the corporation having been abolished by the Irish Municipal Reform Act, the affairs of the town are now administered by 21 commissioners. It is traversed by a river of the same name, which falls into Carlingford Lough, and by a canal, by which the navigation is prolonged to Lough Neagh, a distance of 32 miles. A commission has been appointed for improving Carlingford Lough, and to remove the bar; the estimated cost being £80,000. The town is handsomely and compactly built. The quays are lined with spacious warehouses, and there are several mills, tanyards, coach and ear manufactories, and iron foundries. Extensive water-works have recently been constructed. Linen, cotton, and iron manufactures are carried on. The income of the port is £6000 yearly. Steam-vessels ply to Liverpool and Glasgow from Warrenpoint, a port five miles distant, on Carlingford Lough; and the Newry and Greenore Railway, connecting the Newry and Armagh line with Carlingford Lough, is in progress. Pop. (1871) 14,181.

**NEWSPAPER**, a periodical publication printed and distributed for the circulation of news. From the broadsheet relating the most meagre intelligence without comment or inference, the newspaper has gradually grown up into a powerful political, as well as social engine, diffusing information on all subjects of interest, circulating advertisements, and

acting on the public mind, in times of excitement, to an extent that has led it to be called a fourth estate of the realm.

The earliest approach to the newspaper is to be found in the *Acta Diurna*, or *Acta Publica*, of ancient Rome, an official gazette, which in the later times of the republic, and during the empire, appeared daily under sanction of the government. The contents of these *Acta* consisted of an enumeration of the births and deaths in Rome, an account of the money paid into the treasury, and everything relating to the supply of corn; extracts from the *Acta Forensica*, including the edicts of magistrates, the testaments of distinguished men, reports of trials, with the names of the acquitted and condemned, a list of the magistrates who were elected; extracts from the *Acta Senatus*, an account of public affairs and foreign wars, of the births, deaths, festivals, and movements of the imperial family; and generally, news relating to public buildings, funerals, games, fires, sacrifices, and miracles, as well as amatory stories. The *Acta* seem to have been drawn up under the superintendence of censors, quaestors, and other magistrates, by officers called *actuarii*, assisted by clerks and notaries; and their publication consisted in posting them in some public place in the city, where they could be read by any one who pleased. They continued to be issued until the downfall of the Western Empire, but there seems never to have been anything corresponding to them at Constantinople.

The beginnings of the newspaper of modern Europe are traceable to Germany and to Venice. Soon after the invention of printing, in the latter half of the 15th c., small news-sheets, called *Relationen* and the *Neue Zeitung*, appeared in Augsburg, Vienna, Ratisbon, and Nürnberg, generally in the form of a letter. The extant numbers contain, among other matters, accounts of the discovery of America, of the conquests of the Turks, of the French and Austrian war in Italy, with such local occurrences as executions, inundations, earthquakes, burnings of witches, and child-murders committed by the Jews. More important, perhaps, were the official *Notizie Scritte*, first issued by the Venetian government in the 16th c., containing accounts of the wars carried on by the Republic, and other events of general interest. At first they were not printed, but were to be seen in various public places on payment of a small coin, called a *Gazeta*, whence the name 'Gazette.' After they were allowed by the government to be printed, they obtained a wide circulation over the whole of Europe.

The earliest English newspapers, or news-letters, belong to the reign of James I., and were printed in the form of small quarto pamphlets. Some copies of a sheet, called the *English Mercury*, purporting to be published by authority of Queen Elizabeth in 1588, the period of the Spanish Armada, have been proved by Mr Watts of the British Museum to be literary forgeries, executed about 1766. The first English newspapers appeared at occasional and irregular intervals—the earliest of them, so far as ascertained, is entitled *News out of Holland*, and was published for M. Newbery in 1619. In 1622, these occasional pamphlets were converted into the first printed newspaper, entitled *The Certaine News of the Present Week*, edited by Nathaniel Butter. About the same time appeared the *London Weekly Courant*. A large number of publications, hardly deserving the name of newspapers, were circulated during the civil war, with such names as *England's Memorable Accidents*, *The Kingdom's Intelligencer*, *Mercurius Aulicus*, *The Scots Intelligencer*, *The Parliament's Scout*, *The Parliament's Scout's Discovery*, or *Certain Information*,

*The Scots Dove, The Parliament Kite, The Secret Owl, Mercurius Mastix, Mercurius Democritus, Mercurius Acheronticus, or News from Hell, &c.* The arrangement of the news is poor in the extreme, and what few comments there are, are of the most virulent description. The Long Parliament subjected the newspaper press to a censorship, which became more strict under Charles II. The first English newspaper which could properly be considered a vehicle of general information, was the *Public Intelligencer*, established by Sir Roger L'Estrange in 1663; it was dropped on the appearance of *The London Gazette*, the first number of which was published November 7, 1665, at Oxford, where the court was residing in consequence of the plague being then in London. A second paper, called *The Observer*, was afterwards started by L'Estrange, who, in 1680, exercised his authority as licencer of the press by issuing a proclamation 'for suppressing the printing and publishing of unlicensed news-books and pamphlets of news.' Small as was the sheet, a difficulty often arose how to fill it. One publisher was in the way of supplying the dearth of news by a passage from the Bible; another announced that 'blank space is left that any gentleman may write his own private business.'

Up to the reign of Queen Anne, few of the newspapers appeared oftener than once a week. From the interest excited by Marlborough's victories arose a demand for more frequent intelligence, and besides 17 newspapers published three times a week, the *Daily Courant*, established in 1709, was issued every day except Sunday. Of the more noted London newspapers, the *London Daily Post and General Advertiser* was established in 1726, and in 1752 became the *Public Advertiser*; a celebrity attaches to it from having been the medium in which 'Junius's Letters' first appeared. The *St James's Chronicle* arose from an amalgamation of two papers, the *St James's Post* and *St James's Evening Post*, both which began in 1715. The *North Briton*, edited by Wilkes, first appeared in 1762. The *Morning Chronicle*, discontinued in 1862, dates from 1770; the *Morning Post*, from 1772; the now defunct *Morning Herald*, from 1781; the *Times* first appeared in 1788, as a continuation of the *London Daily Universal Register*, established three years earlier.

During the reign of George III. prosecutions were rife against newspaper writers and editors; their result, generally, was to give a greatly increased currency to the doctrines assailed, and to confer a fictitious importance on the traders in politics, by whom many of the journals were conducted. The first attempt at parliamentary reporting was resented by the House of Commons as a breach of privilege, but the resolutions and the imprisonments of 1771 all ended in the tacit concession of publicity of discussion which has ever since prevailed.

The newspapers of Great Britain have, within the present century, greatly increased in size and improved in literary character. In both respects they are far in advance of the journals of any other country. Each number of the *Times* now consists in general of 16 pages, occasionally 24, and contains upwards of 5000 advertisements. The success of the *Times* is mainly due to the enterprise of its original promoter, Mr Walter, who first introduced various improvements in the art of printing, and made a strong effort to secure the best literary talent attainable in all departments of his journal. One of the most notable incidents in the history of the *Times*, was the exposure, through means of its Paris correspondent, of a gigantic scheme of forgery, planned in France in 1840—a scheme which contemplated the almost simultaneous presentation, at the chief

banking-houses of the continent, of forged Letters of Credit from Glyn and Co. The failure of the conspiracy was mainly due to the exertions made by the *Times*. One of the parties implicated, brought an action for libel against the printer, and obtained a verdict of one farthing damages. A public subscription was raised to defray the expenses incurred in defending the action; when the proprietors of the *Times*, declining personally to accept the sum subscribed, invested it in two *Times* scholarships in connection with Christ's Hospital and the City of London School, for the benefit of pupils proceeding thence to Oxford or Cambridge.

The editing of one of the leading London newspapers involves an immense daily expense, and the co-operation of a number of talented writers. The principal editor, as representative of the proprietors, has the whole oversight and responsibility intrusted to him. He occasionally furnishes the leading article, but it is more frequently composed by one of a staff of literary contributors, who are bound on the shortest notice to write on any subject which the editor may assign. The leader is in form a relic of the time when the newspaper was the news-letter; it is its professed object to analyse, condense, and explain public transactions, to scrutinise what is doubtful or suspicious in the conduct of public men, and to expose sophistry and imposture. Under the editor are various sub-editors, having the superintendence respectively of the London, the provincial, the foreign, the literary, the industrial, and other departments. The commercial article is furnished every evening by a contributor in the City. There are twelve to sixteen parliamentary short-hand reporters, who are continually relieving one another, besides reporters attached to the courts of law, and correspondents who furnish accounts of public meetings and local news of various kinds. The foreign intelligence, a most important department in the great London journals, is furnished by correspondents in all parts of the world, some of them, particularly those employed in time of war, being men of very high reputation in the literary world.

A stamp-duty on newspapers was imposed in 1713 by 10 Anne, c. 19, amounting to one halfpenny on 'half a sheet or less,' and one penny 'if larger than half a sheet, and not exceeding a whole sheet.' The duty was raised  $\frac{1}{4}d.$  by 30 Geo. II. c. 19; another halfpenny was added by 16 Geo. III. c. 34; still another by 29 Geo. III. c. 50; and a further addition of  $1\frac{1}{2}d.$  was made by 37 Geo. III. c. 90, amounting to 4d. in all. Act 6 and 7 Will. IV. c. 76, reduced the stamp-duty to 1d., with the addition of  $\frac{1}{2}d.$  or 1d. when the sheet contained upwards of 1550, or of 2295 square inches on each side. An additional  $\frac{1}{4}d.$  was chargeable on a Supplement. By 18 and 19 Viet. c. 27, passed in 1855, the newspaper stamp was abolished, a change which occasioned an immense increase in the number of newspapers, and diminution of their price, though many of the cheap papers then started were of very brief duration. The repeal of the paper-duty, which took effect on October 1, 1861, also added, though to a much less considerable extent, to the number and cheapness of newspapers. The number of stamps issued on British newspapers was  $7\frac{1}{2}$  millions in 1753, 16 millions in 1800, and 65,741,271 in 1850.

In 1843, the number of newspapers published in London was 79; in 1871, it was about 285. The increase in the circulation of the individual newspapers is, however, greatly more than the increase of newspapers. A few of the daily papers have attained a circulation of at least 100,000, and some of the weeklies a still larger circulation. The *Times*, which yields a far greater political influence

than any other paper, circulates considerably above 60,000 copies daily. Of the 22 London daily papers, 6 are published in the evening, but they are mere reprints of the morning paper, with what further news has been received during the day. Five are purely commercial. Of the remaining seventeen, four profess Conservative principles, and ten Liberal of various shades. The *Times* professes to be independent. One daily paper is printed in French. The price of the daily papers varies from  $\frac{1}{2}d.$  to  $3d.$  Of the 263 newspapers not daily, most are published once, some twice, some three times a week, and some once a fortnight. They comprise 8 agricultural, 9 sporting, 12 commercial, and 5 railway journals; 9 papers purely literary, or literary and scientific, 5 military, 4 musical, 2 theatrical, 4 photographic, 2 electrical, 4 chemical, 7 legal, and 4 medical. There is a *Court Express*, a *Court Circular*, and a *Court Journal*, a French, a German, an Anglo-American, and a Russian weekly paper. There are 6 pictorial, and 2 humorous papers. Of the remaining weekly papers, but a few possess strong political principles, most devote themselves to the spread of general intelligence. The bakers, drapers, grocers, and pawnbrokers have their respective journals; the builders and booksellers have each three; and there are many newspapers with a purely local circulation, some confined to the obscurer quarters of London. The price of the weekly papers varies from  $6d.$  to  $1d.$  or  $\frac{1}{2}d.$

The earliest English provincial newspaper is believed to be the *Norwich Postman*, published in 1706, at the price of a penny, but 'a halfpenny not refused.' It was followed, in 1714, by the *Norwich Courant*, or *Weekly Packet*. A *York Courant*, *Leeds Courant*, and *York Journal* were established about 1720; the *Manchester Gazette* in 1730, and the *Oxford Journal* in 1740. In 1843, 212 newspapers were published in provincial towns of England, and 8 in Wales. The provincial newspapers of England now number about 680, besides 37 belonging to Wales, and 14 to the Channel Islands. About a fifth of the number profess Conservative or Liberal-Conservative principles, a half Liberal, a small number perfect independence in politics, and the rest are avowedly neutral. More than half do not exceed  $1d.$  in price, and there are but a very few conducted with anything like ability. The news are for the most part taken from the London papers, and a characteristic feature of many second-class provincial papers is a column of gossip or scandal, entitled a letter 'From Our London Correspondent.'

The newspaper press of Scotland began during the civil wars of the 17th century. A party of Cromwell's troops, who arrived at Leith in 1652 to garrison the citadel, brought with them a printer named Christopher Higgs, to reprint the London paper, *Mercurius Politicus*. The first number was issued on the 26th October 1653, and in November 1654 the establishment was transferred to Edinburgh, where the reprinting went on till 1660. On the 31st December 1660, the first number was published of the *Mercurius Caledonius*, which professed to furnish information regarding the 'affairs in agitation in Scotland, with a survey of foreign intelligence.' It lived only three months, and was succeeded by *The Kingdom's Intelligence*. The *Edinburgh Gazette*, an official paper published by authority, was established in 1669 by James Watson, a printer of eminence and skill. In 1702, Watson also started the *Edinburgh Courant*, which attained its 215th number, and in 1706 the *Scots Courant*. In 1718, the town-council of Edinburgh gave a privilege to James M'Ewan to print the *Edinburgh Evening Courant* three times a week, on

condition that before publication he should give 'ane coppie of his print to the magistrates.' This paper is flourishing as the *Edinburgh Courant*, the principal Conservative journal in Scotland. The *Caledonian Mercury*, now defunct, was first published on the 23th of April 1720. The *Scotsman* came into existence in 1817, under the conduct of Mr Charles M'Laren, and, for a short time, of Mr J. R. M'Culloch, the political economist. The earliest Scottish provincial newspaper was the *Glasgow Courant*, established in 1715. The *Glasgow Herald*, established in 1803, and the *Scotsman*, in Edinburgh, are understood to have the largest circulation among Scottish daily newspapers. The *Aberdeen Journal* was founded in 1746 by Mr James Chalmers; the first number contained an account of the battle of Culloden. The number of newspapers published in Scotland in 1843 was 69; it is now 154, 15 of that number belonging to Edinburgh. A few of the leading newspapers of Scotland contain articles approaching in talent to those of the best English newspapers, and exercise considerable political influence, at least in matters relating to Scotland. 18 of the Scottish papers are regarded as Conservative, 91 Liberal, 14 Independent, and the rest neutral in politics. Of the 154, twelve only are daily papers, four of the twelve being published in Edinburgh, four in Glasgow, two in Dundee, one in Greenock, and one in Aberdeen. The price of the daily papers is  $1d.$ , that of the weeklies and bi-weeklies varies from  $\frac{1}{2}d.$  to  $4d.$

In Ireland, a news-sheet, called *Warranted Tidings from Ireland*, was printed during the rebellion of 1641; but the first Irish newspaper, properly so called, was the *Dublin Newsletter*, commenced in 1685. *Pue's Occurrences*, a Dublin daily paper, originated in 1700, was continued for half a century. It was followed, in 1728, by another daily paper *Faulkner's Journal*, established by George Faulkner, 'a man celebrated for the goodness of his heart, and the weakness of his head.' The oldest existing Dublin newspapers are *Saunders' (originally Esdaile's) Newsletter*, begun in 1746, and the *Evening Post*, instituted in 1725. The *Limerick Chronicle*, the oldest Irish provincial paper, dates from 1766. Ireland possessed 79 newspapers in 1843, and has now, in 1873, 140. Most of them are characterised by an energy of language, and a strength of political bias, unknown in the other parts of the United Kingdom. The *Irish Times* and the *Evening Mail*, published in Dublin, and the *Belfast News Letter*, are influential daily papers.

Of the 32 newspapers belonging to the British Isles, the Isle of Man supports 1 Conservative, 2 Liberal, and 1 neutral journal. Jersey has 9 journals, 4 printed in French and 5 in English; 4 are Liberal, 3 Conservative, and 2 Liberal-Conservative. Guernsey has an official gazette printed in French, which is Protestant and neutral, besides 2 Liberal and a Liberal-Conservative paper. These local papers are conducted with an amount of spirit and success which impresses us with a sense of the educative influence newspapers have evoked.

In the British colonies, newspapers are numerous, including some in India, printed in the Bengalee and other native languages. *Hicking's Gazette*, the first Anglo-Indian newspaper, appeared at Calcutta in 1781; it was followed, in 1784, by a small official sheet, the *Calcutta Gazette*, or *Oriental Advertiser*. The still surviving *Bengal Hurkuru* was established in 1795. In the earlier times of Indian newspapers, though there was no direct censorship, exemplary punishment was often inflicted on the authors of offensive paragraphs. In 1794, Mr Ducane, editor of the *World*, was transported to Europe for an inflammatory address to the army which appeared

in his paper; and a similar result followed, in 1798, to another editor, who made some severe observations on the official conduct of a local magistrate. A censorship, established by Lord Wellesley in 1799, was abolished by the Marquis of Hastings in 1818; but a licence, revocable at pleasure, was required to be taken out by every printer of a newspaper. In 1832, the Indian press consisted of 6 European and 5 native journals. The licensing system was done away with by Lord Metcalfe's law of 1835, a step disapproved of by the East India directors. Lord Metcalfe's law remained in force till the sepoy mutiny, since which event there has been a return to the system of licences. In 1855, from 55 to 60 newspapers were published in the native languages of India.—The first Australian paper was the *Sydney Gazette*, founded in 1803 by George Howe, a Creole of St Kitts. Hobart Town had its journal in 1804, and in 1824 newspapers began to multiply in the Australian colonies. The principal are now the *Sydney Herald*, the *Sydney Mail*, the *Argus* of Melbourne, and the *South Australian Register*. The materials for printing this last-named paper were carried out by the original South Australian colonists, the first number having been previously printed in England. A similar course was adopted by the first New Zealand colony in 1839 in founding their *New Zealand Gazette* and *New Zealand Advertiser*. Tahiti has, since 1844, had its *L'Océanie Française*. There is also the *Fiji Times*, the *Fiji Gazette*, and the *Central Polynesian*.

*France*.—The earliest French newspaper is said to have been established by Théophraste Renaudot, a physician, in the beginning of the 17th century. The first number of his *Gazette* appeared in 1631. In the following year, through interest of Cardinal Richelieu, he obtained a royal privilege for his *Gazette*; it was continued weekly up to 1762, and then began to appear twice in the week, and to combine advertisements with public news. Commercial intelligence was added in 1765, and in 1792, theatrical announcements. In 1650 was started the *Gazette Burlesque*, a journal in verse, edited by the poet Jean Loret, devoted in a great measure to the *Chronique Scandaleuse* of Paris; and in 1672, the *Mercur Galant*, a political and literary journal, which afterwards became the *Mercur de France*, and was continued during the Revolution, and down to 1815. The first French daily newspaper was the *Journal de Paris*, which began in 1777, and was discontinued in 1819. A large crop of journals sprang into being with the Revolution, organs respectively of Republicans, Jacobins, and Royalists, but most of them had a very brief existence. Under the first Napoleon the freedom of the press was much restricted. By one of his earliest ordinances as First Consul, all the newspapers were suppressed except 13, and under the Empire the tolerated journals were allowed to be little more than echoes of the official *Moniteur*. From the danger which attended the handling of political questions, arose the practice of filling a large portion of the sheet with the 'Feuilleton,' consisting of a sketch or tale by a popular writer, which has ever since been a characteristic of French journalism. During the Restoration period, the press being again less fettered, there was a large increase in the number of newspapers. In 1826, there were 127, and in 1829, 307 newspapers published in Paris. The July Revolution at first added still further to their number; but the restrictive measures of 1834, consisting in the imposition of a stamp-duty, and of an obligation to find security to the amount of 24,000 francs, led to the collapse of a large proportion of the then existing journals. The *Moniteur*, *Débats*, and *Presse* were in possession of the government,

and for a time also the *Constitutionnel*, and every shade of political opinion had its recognised organ. Emile de Girardin's scheme of widening the circulation of the government organ, the *Presse*, by bringing down the subscription price from 80 to 40 francs, had the result of reducing the price of the opposition journals also. Cheap newspapers being thus established, it soon appeared that with the class among whom they circulated most widely the feuilleton was regarded of more importance than the political article, and it thus became the policy of the journalists to pay enormous sums to the cleverest novelists of the day, in order to retain them in their service. 100,000 francs paid by Dr Véron of the *Constitutionnel* to Eugène Sue for his *Juif Errant*, turned out as profitable a speculation for the journalist as for the novelist.

The Revolution of 1848, like the revolutions that had gone before it, gave birth to a multitude of short-lived journals. There were 89 different political journals started into ephemeral existence in Paris during the late Commune, from March 19 to the 27th of May 1871. When the late Emperor Napoleon was president of the republic, a law was passed obliging the author of every newspaper article to affix his name to it. In February 1852, the press laws were incorporated, with increased stringency, into a *Décret organique sur la Presse*. Louis Napoleon, during the empire, relaxed the stringent a little. The republic holds newspapers in as great bondage as did its imperial predecessor. The most important daily papers published in Paris in 1873 are the *République Française*, *Pays*, *Siècle*, *Presse*, *Débats*, *Bien Public*, *France*, *Journal Officiel*, *Charivari*, and *Figaro*.

*Belgium*.—In the Low Countries an illustrated war gazette, called the *Nieuwtijdinghe*, was first published in 1605; it was the precursor of the *Gazette van Antwerpen*, which survived till 1805. During the Spanish and Austrian rule, each town had its privileged newspaper, but the press was considerably fettered in the expression of political opinion. Under the French rule, most of these journals disappeared or sunk into insignificance. The *Annales Politiques* was a political journal of considerable popularity during last century. Since the Revolution of 1830, the press has been subject to few restraints, the newspapers have been numerous, and some few of them well conducted. The *Indépendance Belge* has a large circulation, and exercises considerable political influence. It is the property of a company of bankers, and is conducted by a Frenchman of talent and liberal sentiments. The *Moniteur Belge* was instituted as the official organ of the ministry in 1830. The organ of the government is now the *Echo du Parlement*; it is in politics what is there called 'anti-Catholic,' that is, anti-ultramontane. A larger circulation is enjoyed by the *Journal de Bruxelles*, the *Emancipation*, and the *Etoile Belge*; all papers in the interest of the *parti prêtre*, and supplied with correspondence from Rome. The *Précurseur d'Anvers*, and the *Escaut* of Antwerp, have also a considerable circulation—the latter is at once ultramontane and ultra-democratic.

*Holland*.—The earlier newspapers of Holland were in some respects, particularly in the accuracy of their information, in advance of those of other countries, but gave far more prominence to commercial than to political intelligence. They all bore the name of *Courant* appended to the name of the town where they were published. Though subject to no censorship since 1815, it was not till 1830 that they began to comment on political occurrences. At present the principal Dutch journals are the *Allgemeene Handelsblad* of Amsterdam, and *Amsterdam Courant*; the *Harlemsche Courant*; and

the *Journal de la Haye*, *De Nederlandsche Stoompost*, and *Swatts Courant*—published at the Hague.

*Switzerland*.—Switzerland being a confederation of states, each with its own institutions, the Swiss newspapers have a very local character; but they are numerous, and some of them have of late years greatly improved in character. The *Swiss Times*, published in Geneva, and printed in both French and English, is now frequently quoted in all countries.

*Germany*.—Though in Germany the *Relationen*, above alluded to, were in some sort the precursors of newspapers, yet no serial newspaper, properly so called, seems to have existed till 1615. Frankfurt was the first town that possessed its journal; next followed Fulda, Hildesheim, and Herford. The earliest Leipzig newspaper was instituted in 1660. The first newspaper with a staff of foreign correspondents was the *Hamburgische Correspondent*; but no German newspaper can be said to have had any political weight till the institution of the *Allgemeine Zeitung*, founded by Cotta in 1798, which still takes rank as the first paper in Germany. It first appeared at Tübingen, and after changing its place of publication to Stuttgart and Ulm, eventually removed to Augsburg. During French ascendancy, the German papers were little more than echoes of the Parisian; but a number of journals of a more national character sprung up during the war of liberation. The abuse of the liberty of the press after 1830, led to the imposition by the diet of restrictions of a somewhat severe character on newspapers. The multitudinous journals of 1848 vanished very speedily; but within the last ten years there has been a decided advance in the character, literary and political, of the German newspapers, and more freedom of discussion has latterly been allowed. The advance has of late been most marked in the newspaper press of Austria. The leading papers of Vienna, the *Wiener Zeitung*, is, in a literary and political point of view, greatly improved. In Prussia, the *Berliner Privilegirte Zeitung*, the *Berlinische Nachrichten*, and the *Kölnische Zeitung*, the principal journal of the Rhenish provinces, are conducted with fair ability. The *Neue Preussische Zeitung* of Berlin, formerly known as the *Kreuz Zeitung*, is the most important organ of the reactionary party.

*Italy*.—We have mentioned the early *Notizie Scritte* or *Gazettes* of Venice. The news-sheets which followed them were in disfavour with the see of Rome; and a memorable bull denouncing them was issued by Gregory XIII. Up to 1847, the newspapers of Italy were small, politically insignificant, and subject to a strict censorship. With the accession of Pope Pius IX., a flood of political journals made their appearance, one or two of which only were conducted with any approach to talent, and few lasted above a year. In the Sardinian dominions there continued to be no fewer than 45 political papers published in 1852, 41 of which were printed in Italian and 4 in French. Of that number a great many soon afterwards collapsed. The removal of the former restrictions of the press in other parts of the Kingdom of Italy has started into life a number of newspapers. Seventeen political and ten partially political papers are now published in the dominions of Victor Emmanuel, besides 31 periodicals, many of which answer more or less to our ideas of a newspaper. Few of these newspapers are as yet of much promise. The leaders are poor, no great social or commercial questions are discussed, and each journal is the mere advocate of one or other of the political parties. The best of them, on the whole, is the *Journal de Florence*, which may be compared to some of the second-rate French papers. *L'Opinione* is the ministerial organ,

*L'Armonia* and *La Civiltà Cattolica* belong to the 'Neri' and 'Codini,' and *Il Diritto* and *L'Unità Italiana* to the party of progress. Humorous newspapers, after the model of our *Punch*, are abundant. The *Voce della Verità* is the paper which advocates the cause of the pope, and is published in Rome. *La Libertà* and *Il Fanfallo* are published in Rome; while Genoa issues its *Carrrière Mercantile*; and Milan, *La Perseveranza*.

*Spain*.—Sheets called *Relaciones*, giving accounts of important occurrences, used to appear in Spain at irregular intervals in the 17th c., occasionally in the form of romances; but no Spanish newspaper, properly so called, existed till last century, and fifty years ago Madrid possessed but one journal. The first approach to political journalism followed in the wake of the Peninsular War and the establishment of the Cortes. The gross licence with which many of the then established papers were conducted, led, in 1824, to the suppression of all except the *Diario* and *Gaceta* of Madrid, the *Gaceta de Bayona*, and a few which were purely commercial or scientific. At present, about 40 journals are published in Madrid, politically and in every other respect very unimportant; the most read is the *España*. The press of Portugal is as insignificant as that of Spain: the official organ is the *Diario do Governo*.

*Sweden and Norway*.—The earliest Swedish newspaper seems to have been the *Ordinarie Post Tidende*, established in 1643, and continued till 1680. It was followed by the *Relationes Curiosæ* in Latin (1682—1701). Two French papers, the *Gazette Française de Stockholm* and the *Mercure de Suède*, existed in Sweden in the second half of last century, but politically the newspaper press cannot be said to have had any influence until the establishment of the *Argus* by Johansen in 1820. For a number of years the principal journals of Sweden were the *Fäderneslandet*, the organ of the royalists, and the *Aftonbladet*, that of the reformers. The latter, on King Oscar's accession, ceased to be an opposition journal. The official paper is the *Post och Inrikes Tidningar*. Every provincial town has now its journal, and there are about 114 newspapers in all published in Sweden. Of the Norwegian papers, the oldest is the *Christiania Intelligentssædler*, founded in 1763. *Den Constitutionelle* is the government journal, and *Den Morgenblad* the organ of the opposition.

*Denmark*.—In Denmark journalism is still more recent. Up to 1830 only two newspapers were published in Copenhagen, both entirely made up of extracts from foreign journals. Since 1834, there has been an improvement in the character, and increase in the number of the Danish journals. They numbered 36 in 1849. The oldest newspaper now existing in Denmark is the semi-ministerial *Bertingske Tidende*, founded in 1749. The *Fädrelandet* is the journal of the Scandinavian popular party.

*Russia*.—The earliest newspapers in Russia were published under the personal surveillance of Peter the Great, first in Moscow and afterwards in Petersburg, to report the progress of the war with Sweden. Political journalism, properly so called, has, however, never flourished in Russia, and has, in fact, only been allowed in important political crises—as the French invasion of 1812, the Polish insurrection of 1830, and recently during the Crimean War, when the journalists were allowed to exercise their ingenuity in defending the government policy. The largest circulation was at that time attained by the *Sjéwernaja Ptsch'eta*, or 'Northern Bee,' which had its feuilleton. Generally speaking, the Russian newspapers occupy themselves with scientific and literary

subjects rather than public or political news. The *Journal de St Petersburg*, in French, is the organ of the court, and has considerable circulation out of Russia.

*Turkey*.—The first newspaper in Turkey was founded, in 1795, by M. Verminhae, envoy-extraordinary of the French government to the court of Selim III., and printed in French at Pera. A Frenchman of the name of Blacque established at Smyrna, in 1825, the *Spectateur de L'Orient*, afterwards the *Courrier de Smyrne*, which had considerable political influence during the Greek war. The same M. Blacque afterwards edited the official journal of the Porte, called the *Moniteur Ottoman*, which has, since 1832, been reprinted in Turkish under the name of the *Taqûmî Vaqâî*. The *Taqûmî* was till lately a very badly printed sheet, but it has much improved, and now issues weekly instead of monthly, sometimes containing very fair literary and political articles. But the most important Turkish paper is the *Djeridei Havadis*, founded in 1843 by Mr Alfred Churchill, an Englishman born in Turkey. It embraces a great variety of matter, a court gazette, official appointments, home and foreign news, advertisements, prices of stocks, and a feuilleton. There are besides in Constantinople two new and popular papers, called the *Terguman Ahalal*, or 'Interpreter of Events,' published three times a week, and the *Tus veeri Eskiâr*, or 'Mirror of Thoughts,' published twice a week. The latter has a scientific and literary repute. The Turkish papers have no leading articles, and from the constitution of political society in Turkey, there can be no avowed opposition to the policy of the government. The Turkish capital possesses also an Armeno-Turkish paper, printed in the Armenian character; an Arabic, and an Italian paper; as also the *Commerce de Constantinople* and *Courrier de Constantinople* in French.

*Greece*.—Various newspapers in modern Greece appeared at Paris and Vienna before Greece obtained her independence; but the first political journal published in Greece was the *Hellenikê Salpige*, founded in 1824, and soon followed by the *Hellenika Chronika* and *Hellenikos Telegraphos* in Missolonghi, the *Philos tou nomou* at Hydra, the *Ephemerides Athenaikai* at Athens, and the official *Genikê ephemeristês Hellados* published at Nauplia, with its opponent the *Apollôn*, which afterwards became the *Athina*. Most of these papers disappeared in 1833 on the system of sureties being introduced. The *Sotêr* was established as the government organ in 1833. From fifty to sixty newspapers are now published in Greece, the largest number in Athens, and several in the Ionian Islands. Generally speaking, the Greek papers make no endeavour to lead the parties in the state, but are rather distinguished by a blind subserviency to their passions and extravagances.

*United States*.—In America, the earliest newspaper was the *Boston Newsletter*, founded in 1704, insignificant in size and contents, and conducted by John Campbell, the postmaster of the town. A rival to it appeared, in 1719, in the *Boston Gazette*, 'published by authority.' The *Boston Newsletter*, however, thrived in spite of opposition. With the name changed to the *Massachusetts Gazette* and *Boston Newsletter*, it was the support of the British rule against the desire for independence, and ceased to appear when the British troops evacuated Boston. The *New England Courant*, established in 1721, was at first printed by James Franklin, and afterwards edited by his brother the famous statesman. It lasted but six years, but a subsequent newspaper, entitled the *Pennsylvania Gazette*, was started by

Benjamin Franklin in 1729, and continued weekly till 1765. *Elli's Boston Gazette*, begun in 1755, was for a long time the chief organ of the popular party, and conducted with considerable talent; in it appeared John Adams's 'Letters of Novanglus.' The *Massachusetts Spy* was another paper of note on the revolutionary side. After being temporarily removed from Boston to Worcester, and suspended for a couple of years, it was resumed, and is still in existence. At the revolution, the New England colonies possessed 13 newspapers; Pennsylvania, 7; New York, 3; and the middle and southern colonies, 10. All were published weekly. The development of the newspaper trade in 'the States' has kept pace with the advancing prosperity of the country. A daily paper is a prime necessity of life in that 'classic soil of newspapers.' In 1870, more than 5000 newspapers were issued in the United States, with an enormous, but unascertained, aggregate circulation: 43 of these, 24 in New York, and 19 in Philadelphia, send out at each issue 2,150,000 copies. Eighty-five newspapers have a circulation exceeding 20,000 copies each publication, of which 40 are in the city of New York, 13 in Boston, 10 in Philadelphia, 8 in Chicago, and 5 in Cincinnati. Some of the leading papers are conducted at an expense of half a million dollars annually, to secure in return gross receipts double the sum. The Germans publish 260; the Scandinavians, 12; Spaniards, 9; Italians, 4; Welsh, 3; while at San Francisco there is a newspaper printed in Chinese and English. About 275 periodicals, with a supposed aggregate circulation of 65,000,000 copies, are published in the United States. Among the leading newspapers of New York, the order of importance, both as to enterprise and circulation, is the *New York Herald*, the *Tribune*, and the *New York Times*.

The principal religious papers are the *New York Independent*, organ of the Congregationalists; the *New York Observer*, which props the Presbyterian cause; and the Rev. Henry Ward Beecher's *Christian Union*. The Methodists are supported by the *Christian Advocate*; and the Baptists by an *Examiner* and *Chronicle*.

All the other numerous journals of the American States are, compared with those of New York, accounted provincial. At the same time, it is not to be forgotten that, the United States being the region peculiarly affected by newspapers, they are all vigorously conducted. Each county, comprising, on an average, 360 square miles, has generally two or three papers—one being republican, another democratic, and if there is a third, it is probably the organ of some religious or other sect. These papers, sold at a very low price, are, in a great measure, filled with local and quack advertisements. The printer is, in most cases, the editor, and the village lawyer supplies leaders seasoned with coarse and personal invective. Some of them have been successfully started with no larger a capital than £100 of borrowed money.

There is an immense collection of newspapers in the British Museum, which belonged in part to the library of Sir Hans Sloane, in part to that of Dr Charles Burney. See Andrews's *History of British Journalism*, London, 1859.

NEWT, or EFT (*Triton*), a genus of batrachians of the family *Salamandridæ*, more aquatic in their habits than the salamander, to which, in form and characters, they are very similar, having an elongated body and tail, and four small weak limbs. The tail is vertically compressed, and a crest is often developed on the back and tail, but the crest is characteristic of the males in the breeding season, and the tail becomes rounded when the animals leave the water, as they often do, particularly in

the latter part of summer or in autumn; which, along with other variations apparently dependent on circumstances, have caused no little multiplication of specific names. The most abundant British species is the COMMON N., or SMOOTH N. (*T. punctatus*, *Lissotriton punctatus*, or *Lophinus punctatus*), which is from  $3\frac{1}{2}$  to 4 inches long, brownish gray above, yellowish beneath, spotted with black, with a soft, smooth skin, and two bands of pores on the head; a well-known inhabitant of stagnant pools and ditches, often found also under stones and in other damp situations. The WARTY N. (*T. palustris*, or *cristatus*), also pretty common, is 5 or 6 inches in length, blackish brown above with round spots of a darker tint, bright orange or orange-yellow with black spots on the under parts, the sides dotted with white, and the tail often exhibiting a white band, the skin rough or warty, and with many pores. The dorsal and caudal crests of the Warty N. are separate; those of the Common N. are united. Many other species occur in other parts of the world. They all feed on animal food, of which tadpoles and aquatic insects form the chief portions. They deposit their eggs on the leaves of aquatic plants, each egg separately, twisting or folding the leaf with their feet so as to conceal the egg, which is surrounded by a viscous substance, so that the leaf is retained in this form. The transformations of newts are noticed, and illustrations given, in the article BATRACHIA. They very frequently change their skin. They possess, in an extraordinary degree, the power of reproducing lost members—a limb, a tail, even an eye—in every respect perfect. Spallanzani, who made many observations on this subject, found that the same member could be reproduced a number of times successively. Newts are also capable of surviving, although long frozen up in ice, and return to activity when a thaw takes place. A strong and almost universal popular prejudice exists against them as most noxious animals, although they are not in the slightest degree venomous. They have recently, however, begun to be more favourably regarded in consequence of the frequency of aquaria, of which they are interesting inmates.—It is a curious fact that Linnæus, contrary to his usual discriminating penetration, confounded newts with lizards, which they resemble merely in form, differing widely in the most important characters. That they are often confounded by the unscientific is not wonderful.

NEWTON, SIR ISAAC, the most remarkable mathematician and natural philosopher of his own or perhaps of any other age, was born at Woolsthorpe, in Lincolnshire, in the year 1642. That year, remarkable in English history for the breaking out of the civil war between Charles I. and the parliament, is doubly remarkable in the history of science by the birth of N. and the death of Galileo. The circumstances with which the pursuit of truth, in scientific matters, was at this time surrounded in the respective countries of these great philosophers, were not more different than the characters of the philosophers themselves. Galileo died a prisoner, under the surveillance of the Inquisition, 'for thinking, in astronomy,' as Milton says, 'otherwise than the Franciscan and Dominican licensers thought.' In England, it had become the practice, and soon became the fashion, through the influence of Bacon and Descartes, to discard altogether the dictates of *authority* in matters of science. The dispositions of the two philosophers were happily suited to the situations in which they thus found themselves. Galileo's was a mind whose strength and determination grew by the opposition it encountered. The disposition of N., on the other hand, diffident of the value and interest of his own

labours, and shrinking from the encounter of even scientific controversy, might have allowed his most remarkable discoveries to remain in obscurity, had it not been for the constant and urgent solicitation of his friends that they should be published to the world.

N. received his early education at the grammar school of Grantham, in the neighbourhood of his home, at Woolsthorpe. On the 5th of June 1661, he left home for Cambridge, where he was admitted as subsizar at Trinity College. On the 8th of July following, he matriculated as sizar of the same college. He immediately applied himself to the mathematical studies of the place, and within a very few years must have not only made himself master of most of the works of any value on such subjects then existing, but had also begun to make some progress in the methods for extending the science. In the year 1663, he committed to writing his first discovery on fluxions; and it is said that in the same year, the fall of an apple, as he sat in his garden at Woolsthorpe, suggested the most magnificent of his subsequent discoveries—the law of universal gravitation. On his first attempt, however, by means of the law so suggested to his mind, to explain the lunar and planetary motions, he employed an estimate then in use of the radius of the earth, which was so erroneous as to produce a discrepancy between the real force of gravity and that required by theory to explain the motions, corresponding to the respective figures 16:1 and 13:9. He accordingly abandoned the hypothesis for other studies. These other pursuits to which he thus betook himself, consisted chiefly of investigations into the nature of light, and the construction of telescopes. By a variety of ingenious and interesting experiments upon sunlight refracted through a prism in a darkened apartment, he was led to the conclusion that rays of light which differ in colour, differ also in refrangibility. This discovery enabled him to explain an imperfection of the telescope, which had not till then been accounted for. The indistinctness of the image formed by the object-glass was not necessarily due to any imperfection of its form, but to the fact of the different coloured rays of light being brought to a focus at different distances. He concluded rightly that it was impossible for an object-glass consisting of a single lens to produce a distinct image. He went further, and too hastily concluding, from a single experiment, that the dispersive power of different substances was proportional to their refractive power, he pronounced it impossible to produce a perfect image by a combination of lenses. This conclusion—since proved erroneous by the discovery of the achromatic telescope by Mr Chester More Hall, of Mere Hall, in Essex, about 1729, and afterwards, independently, by Mr Dollond in 1751—turned N.'s attention to the construction of reflecting telescopes; and the form devised by him is the one which, at later periods, reached such perfection in the hands of Sir William Herschel and Lord Rosse.

It was on the 11th January 1671 that N. was elected a member of the Royal Society, having become known to that body from his reflecting telescopes. At what period he resumed his calculations about gravitation, employing the more correct measure of the earth obtained by Picard in 1670, does not clearly appear; but it was in the year 1684 that it became known to Halley that he was in possession of the whole theory and its demonstration. It was on the urgent solicitation of Halley that he was induced to commit to a systematic treatise these principles and their demonstrations. The principal results of his discoveries were set down in a treatise called *De Motu*

*Corporum*, and were afterwards more completely unfolded in the great work entitled *Philosophiæ Naturalis Principia Mathematica*, which was finally published about midsummer 1687.

Shortly before the *Principia* was given to the public, N. had been called to take an active part in defending the rights of the university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the Convention Parliament, in which he sat from January 1689 to its dissolution in 1690. In 1696, he was appointed Warden of the Mint, and was afterwards promoted to the office of Master of the Mint in 1699, an office which he held till the end of his life. He again took a seat in parliament, in the year 1701, as the representative of his university. Thus engaged in the public service, he had little time left for mere scientific studies—pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, N. shewed that he still retained the scientific power by which his great discoveries had been made. This was shewn in his solution of two celebrated problems proposed, in June 1696, by John Bernoulli, as a challenge to the mathematicians of Europe. A similar mathematical feat is recorded of him so late as 1716, in solving a problem proposed by Leibnitz, for the purpose, as he expressed it, of feeling the pulse of the English analysts. When in parliament, N. recommended the public encouragement of the invention of a method for determining the longitude—the first reward in consequence being gained by John Harrison for his chronometer. He was President of the Royal Society from 1703 till his death, a period of twenty-five years, being each year re-elected. In this position, and enjoying the confidence of Prince George of Denmark, he had much in his power towards the advancement of science; and one of his most important works during this time was the superintendence of the publication of Flamsteed's *Greenwich Observations*—a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer. The controversy between N. and Leibnitz, as to priority of discovery of the differential calculus, or the method of fluxions, was raised rather through the partisanship of jealous friends, than through the anxiety of the philosophers themselves, who were, however, induced to enter into and carry on the dispute with some degree of bitterness and mutual recrimination. The verdict of the impartial historian of science must be, that the methods were invented quite independently, and that, although N. was the first inventor, a greater debt is owing by later analysts to Leibnitz, on account of the superior facility and completeness of his method. The details of these controversies, with all other information of the life of this philosopher, will be found admirably collected in the *Life* by Sir D. Brewster, who writes with not only an intimate acquaintance with N.'s works, but in the possession of all the materials collected in the hands of his family. N. died on 20th March 1727, and his remains received a resting-place in Westminster Abbey, where a monument was erected to his memory in 1731. A magnificent full-length statue of the philosopher, executed by Roubilliac, was erected in 1753 in the antechapel of Trinity College, Cambridge. This work was assisted by a cast of the face taken after death, which is preserved in the university library at Cambridge. In 1699, N. had been elected a foreign associate of the Academy of Sciences, and in 1703, he received the honour of knighthood from Queen Anne. Among the best editions of N.'s principal works are the

quarto edition of the *Optics* (Lond. 1704), and the quarto edition of the *Principia*, published at Cambridge in 1713.

NEWTON, THOMAS, an English prelate of the 18th c., was born at Lichfield, January 1, 1704. He was educated at Westminster School, and afterwards at Trinity College, Cambridge, where he took the degree of M.A. in 1730, in which year also he was ordained priest. After holding several minor preferments, he was made Bishop of Bristol in 1761, and died 14th of February 1782. Without any remarkable merit, N. has, one cannot well say how, succeeded in obtaining a place in literary history. His two productions, whose fortunes have surpassed their deserts, are an edition of *Milton's Paradise Lost* (2 vols. 1749), with a memoir of the poet, and critical and explanatory notes; and *Dissertations on the Prophecies* (3 vols. 1754—1758). Besides these, he wrote occasional sermons, and a host of scriptural dissertations, the theology of which is reckoned not always 'orthodox.'

NEWTON, a township in Massachusetts, United States of America, on Charles River, eight miles west of Boston. It contains two villages, Upper Falls and Lower Falls, with five paper-mills, a cotton factory, a Baptist theological seminary, and 12 churches. Pop. (1860) 8382.

NEWTON-ABBOT, a market town of England, in the county of Devon, beautifully situated in a vale on the river Lemon, 15 miles south-south-west of Exeter. The portion of the town called Newton-Bushel is on the left side of the stream. It has been undergoing considerable improvements within recent years. William of Orange, after landing at Torbay, in 1688, made his first public declaration here. Pop. (1861) 5221.

NEWTON-IN-MAKERFIELD, a thriving manufacturing and market town of England, in Lancashire, 15 miles west of Manchester, on the Manchester and Liverpool Railway. Two large iron foundries, as well as printing, paper and sugar works, an oil-distillery, and a brick, tile, and pot manufactory are in full operation. There is a beautiful lake in the town, called Newton Mere, which is covered during the summer months with the pleasure-boats of the townspeople. Horse-races are held here in June, and horse and cattle fairs in May and August annually. The election of M.P.'s for South Lancashire takes place in Newton. Cotton and flour mills, iron foundries and glass-works are in operation; and bricks are made. Pop. (1861) 5909.

NEWTON-UPON-AYR, a burgh of barony and parish of Scotland, in the county of Ayr, on the north side of the river Ayr, and united with the town of that name by three bridges. See Ayr. Pop. of burgh, 4807. N. has ship-building docks, roperies, and iron and brass foundries. It exports 100,000 tons of coal annually.

NEWTON'S RINGS. In his investigations of the colours produced by thin plates of any material, solid, fluid, or gaseous, Sir Isaac Newton hit upon the following mode of exhibiting the colours produced by a film of air. He took two lenses, one convexo-plane, its convex side having a radius of 14 feet, the other equi-convex, with the radii of its surfaces 50 feet, and laid the first with its plane surface downwards on the top of the second, thus producing a thin film of air between the lenses; the film being thinnest near the centre, and becoming gradually thicker outwards. On slowly pressing the upper lens against the under one, a number of concentric coloured rings, having the point of contact of the lenses for their centre, appeared, and increased in size when the pressure was increased.

These rings, or more properly systems of rings, are seven in number, and each of them is composed of a number (ranging from eight in the first or smallest ring, to two in the outermost) of rings of different colours, the colours, though different in each of the systems of rings, preserving the same arrangement as the colours of the spectrum, of which they seem to be modifications; thus, in the second ring the inside colour is violet, and the outside scarlet red. The colours are very distinct in the first three systems of rings, but become gradually confused and dull towards the outside, till they almost fade away in the seventh system. The centre is deep black. The thickness of the air-film at the centre is about half a millionth of an inch, and increases gradually to nearly  $\frac{1}{130,000}$  of an inch, when the colours disappear.

**NEWTOWN**, a modern manufacturing town of North Wales, in the county of Montgomery, 8 miles south-west of the town of that name, on the right bank of the Severn, and on the Montgomery Canal, which connects it with the inland navigation of the country. It is the centre of the flannel manufactures of the county. It has 40 factories, employing in all 960 men. Pop. (1861) 5916.

**NEWTOWNSARDS**, a market town of the county Down, Ireland, 12 miles east from Belfast by railway. Pop. (1861) 9521, of whom 5855 are Presbyterians, 1765 Protestants of the Established Church, and 1139 Roman Catholics, and the rest Protestants of various denominations. It is a neat and well-built town, of considerable trade, and with extensive muslin, flax spinning, and weaving factories. Since the Union, it has ceased to be a parliamentary borough. The affairs of the town are administered by commissioners.

**NEWTOWN-LIMAVA'DY** (Ir. *Leim-a-madha*, 'The Dog's Leap'), a market town of the county of Londonderry, Ireland, and 16 miles east-north-east of the town of Londonderry. Pop., in 1861, 2734, of whom 931 are Presbyterians, 873 Catholics, 803 Protestants of the Established Church, and the rest Protestants of other denominations. N.-L., in the period anterior to the establishment of English rule, was the seat of the powerful sept of the O'Caahans, or O'Kanees; and during the wars of the Revolution, owing to its importance as a native stronghold, and its many historical associations, it was the scene of more than one struggle between the followers of James II. and those of William. Its chief importance at present is as a centre of the flax trade, once the staple of that district, and again rising in importance.

**NEXT FRIEND** is, in English Law, the name given to the person in whose name, or rather by whose agency, an infant—i. e., a person under the age of 21—sues in the courts of law and equity. The object is chiefly to have some party responsible for costs in case the infant fails in the action. In practice, the father, if alive, is usually the next friend, but any substantial person may be so. In the Court of Chancery, a married woman sues or appears by the intervention of a next friend, where she is personally interested.

**NEY, MICHEL**, a celebrated marshal of the first French empire, was the son of a cooper, and was born at Saarlouis, 10th January 1769. He was a non-commissioned officer in a hussar regiment when the Revolution began, and afterwards rapidly rose to high military rank. For the capture of Mannheim by a *coup de main*, he was made a general of division in 1799. He was interim commander of the army of the Rhine for a short time, during which he frustrated by a bold

diversion an important movement of the Archduke Charles against Massena and the army of Switzerland. After the peace of Lunéville, Bonaparte, anxious to win N., with other republicans, to his party, brought about his marriage with a young friend of Hortense Beauharnais, and appointed him inspector-general of cavalry. On the establishment of the empire, he was made a marshal. In 1805, he stormed the intrenchments of Elchingen, and was created Duke of Elchingen. He afterwards rendered important services in the Tyrol; contributed much to the French successes of 1806 and 1807; and served in Spain with great ability in 1808 and 1809, till he was dismissed by Massena, the commander-in-chief, on a dispute about the plan of the campaign. Chagrined by this, and dissatisfied with Napoleon's despotism, he remained for some time inactive; but in 1812 received the command of the third *corps d'armée*, and greatly distinguished himself at Smolensk and the Moskwa, in consequence of which he was created Prince of the Moskwa. He also displayed great abilities in the French retreat. He had a principal part in the campaigns of 1813 and 1814, but after the capture of Paris, he urged the emperor to abdicate, and submitted to Louis XVIII., who loaded him with favours. On Napoleon's return from Elba, N. assured the king of his fidelity, and was sent against Napoleon at the head of 4000 men; but finding the emperor to be received with general enthusiasm, and his own soldiers to be favourable to his cause, N. went over to his side. In the battle of Waterloo, he commanded the centre, and had five horses shot under him. After the capitulation of Paris, he yielded to the entreaties of his family to retire to Switzerland; but a costly Egyptian sabre, the gift of Napoleon, led to his being suspected by an official, and arrested. He was condemned to death for high treason, and was shot in the garden of the Luxembourg on 7th December 1815. He left three sons, who published his *Mémoires* (2 vols. Par. 1833).

**N'GAMI, LAKE**. The existence of lakes in the interior of Africa was vaguely known as far back as the days of Herodotus; and the earliest modern maps, shew at least half-a-dozen large and small, one of which is about the size, and very nearly in the position of that shallow reservoir of surface drainage which was discovered, or at least first visited by a European in 1849, when Dr Livingstone and Mr Oswell, who were aware of its existence from native report, reached its shores by a circuitous route from the Cape Colony. Although since ascertained to be of little importance in the physical geography of these regions, Lake N. was at first supposed to be in some way connected with the larger inland seas of Nyassa, Victoria Nyanza, and Taryanaka. It is situated between the 20th and 21st parallels of S. lat., and between the meridians 22° 10' and 23° 50' E. long., at a height of about 2500 feet above the level of the sea, and is connected by a series of sluggish anastomosing streams with the river-system of the Zambezi; its extent as well as depth varies with the fall of rain in the country to the north of it, but its average size may be taken at 70 miles long, by a breadth of 20 and a depth varying from 3 to 28 feet. In 1853, Lake N. was reached from the west coast near Walfish Bay by the traveller Andersson, and there is now a well-beaten route for traders between these two places, and a considerable quantity of ivory and ostrich feathers are annually collected in the neighbourhood of the lake. The principal characteristics of the region are rivers, with very sluggish current, and often flowing in different directions to and from the lake, large salt-pans and extensive

dry flats, covered with dense bush, the haunt of elephants and other large animals.

In 1855, the well-known sportsman and traveller, F. Green, ascended the River Tonka, which flows into the north-west angle of Lake N., as far north as the town of Lebebe, in 18° 11' lat., and then supposed that a communication existed with the waters of Cuanene, a river of the west coast. If such is the case, it would be a curious phenomenon in physical geography, communicating, as we know Lake N. also does, with the Zambezi, a river of the east coast.

NIA'GARA, a river of North America, which flows from Lake Erie northwards into Lake Ontario. It is about 36 miles in length, and its descent from the level of the one lake to that of the other is about 334 feet. On issuing from Lake Erie, it is three-quarters of a mile broad; but as it flows on, it becomes several miles wide, making room for a number of islands, the largest of which, Grand Island, is 12 miles long, and from 2 to 7 broad. At the foot of Grand Island, which reaches within 1½ mile of the Falls of N., the river is contracted to a breadth of 2½ miles, and grows narrower as it proceeds. By this, and by the descent in the channel, which is about 60 feet in the mile above the Falls, are produced the swift currents known as the Rapids, in which the river, notwithstanding its great depth, is perpetually white with foam. At the Falls, which are 22 miles from Lake Erie, the river is divided by an island containing about 75 acres, called Goat Island; but in consequence of a bend in the channel, by far the larger portion of the water is sent down by the Canadian side. On this side, therefore, is the grander cataract which has been named the *Horseshoe Fall*, but no longer bears the name appropriately, as the precipice has been worn from a curved into a somewhat angular shape. This process of wearing away goes on gradually still, a large projection on the Canadian bank, known as the Table Rock, having partly fallen off in 1863. The Horseshoe Fall is above 600 yards in breadth, and about 154 feet in height. The water is so deep that it retains its green colour for some distance below the brow of the precipice; and it rushes over with such force, that it is thrown about 50 feet from the foot of the cliff. One may thus, having donned an oil-skin dress, enter two or three yards behind the curved sheet of water; but the spray is so blinding, the din so deafening, and the current of air so strong, that it requires a tolerably calm nerve and firm foot. The separation caused by Goat Island leaves a large wall of rock between the Canadian and American Falls, the latter being again divided by an islet at a short distance from Goat Island. This fall is from eight to ten feet higher than the Horseshoe, but only about 220 yards broad. A little above the Fall, the channel is divided by Bath Island, which is connected by bridges with Goat Island, and the American shore. A small tower, approached from Goat Island, has been built on a rock over the brow of the Horseshoe Fall; and from this the finest view on the American side may be obtained, the Table Rock on the Canadian side giving the completest view of the entire cataract. The Falls can also be seen from below on both sides, and every facility is given for viewing them from all the best points, while magnificent hotels, Canadian and American, offer their inducements to the tourist to stay till he has received the full influence of the scenery. The river is crossed about 200 or 300 yards below the Falls, where it is 1200 yards broad. The current is lessened for about a mile, but increases again as the channel becomes narrower and the descent greater. Between three and four miles below the Falls, a

stratum of rock runs across the direct course of the river, which, after forming a vast circular basin, with an impassable whirlpool, is forced away at right angles to its old channel. The celebrated wire suspension-bridge for the Great Western Railway, with a road beneath for vehicles and foot-passengers, crosses the river 1½ mile below the Fall; it is 800 feet long, 40 broad, and 200 feet above the surface of the water.

NIA'GARA, chief town of Lincoln County, Canada West, is situated on Lake Ontario, at the mouth of the river Niagara, and is distant by water from Toronto 36 miles. Burned down in December 1813 by the American General McClure on his retreat, it was afterwards rebuilt, and promised to be a flourishing town; but its trade has fallen off within the last few years, and its population, which was once much larger, had decreased in 1861 to 2070.

NIA'S, an important island belonging to Holland, lies to the west of Sumatra, in 0° 18' 54"—1° 35' N. lat., and 97°—98° E. long., and has an area of about 1575 square miles. In 1857, when the Dutch took complete possession of the island, the population was reckoned at 170,000. There are several places where ships can anchor and take in provisions, water, &c. On the east coast is the village Nias, and on the west, Silorongang. Little islands and coral reefs lie here and there on the coast, which in some places is steep, while mountain-chains run from the south-east to the north-west. There is a greater breadth of excellent farming-grounds than the population, reduced by internal wars and the exportation of slaves, can properly cultivate. They grow rice, cocoa-nuts, bananas, tobacco, sugar-canes, &c., and annually about 110,000 lbs. of pepper. Cattle and horses have been imported, and they pay great attention to the raising of pigs and fowls. Formerly, about 500 Niassers were carried away annually as slaves to Batavia and other places, and though this traffic has been in a great measure suppressed, it is still to some extent carried on.

The Niassers are of the Malay race, but fairer than the Malays usually are. They are gentle, sober, and peaceful, remarkably ingenious in handicraft, ornamenting their houses with wood-carvings, forging arms, &c. The women labour in the fields, the children weave mats, while the men look after the live-stock, and hunt the deer and wild swine. They worship a superior deity, and fear a powerful one, who punishes them if they do evil. Polygamy is permitted, but is rare. The gift to the bride's family is from 60 to 500 dollars. Divorce is not allowed, and adultery is punished by the death of both parties. Dead bodies are placed in coffins above the ground, and creepers and flowering shrubs planted, which speedily grow up and cover them. Trade is on the increase.—See *Malayan Miscellanies*, vol. ii.; *Het Eiland Nias*, door H. J. Domis; Crawford's *Descriptive Dictionary* (London, 1856); *Tydschrift voor Ned. Indië*, 1854, 1860, &c.

NIBBY, ANTONIO, a Roman archaeologist of high celebrity, was born in 1792. He was one of those who, following in the footsteps of Winckelmann, made an elaborately minute investigation of the remains of antiquity their special study. The first work that made him known was his translation of Pausanias, with antiquarian and critical notes. In 1820, he was appointed Professor of Archaeology in the University of Rome. In the same year appeared his edition of Nardini's *Roma Antica*; and in 1837—1838, his learned and admirable *Analisi Storico-topografico-antiquaria della carta de Contorni di Roma*, to which was added (1838—1840) a description of the city of Rome itself. Among his other writings, may be mentioned his *Le Mura di Roma diseguate*

de W. Gall, and a large number of valuable treatises on the form and arrangement of the earliest Christian churches, the Circus of Caracalla, the Temple of Fortuna at Preneste, the graves of the Horatii and the Curiatii, &c. N. died 29th December 1839.

NIBELUNGENLIED, or '*Nibelunge Not*,' as the words are written in the oldest manuscripts, is one of the most finished specimens of the genuine epic of Germany belonging to the middle ages. There exist twenty more or less perfect manuscript copies of this curious poem, the earliest of which belong to the beginning of the 13th c., from which period till the middle of the 16th c. it enjoyed the greatest popularity among Germans of all classes. Nothing certain is known of the author or authors of the work beyond the fact, that it was put into its present form by a wandering minstrel in Austria about or prior to the year 1210, which is the date of the oldest accredited manuscript. According to W. Grimm and Laehmann's critical analysis of the poem, it is in itself a compilation of pre-existing songs and rhapsodies, strung together into one whole upon a plan remarkable for its grand simplicity, although less skill is shewn in some instances in the manner in which the several parts are connected. In the more authentic manuscripts the poem consists of only twenty parts, and it is conjectured that the latter portions of the epic, which are given only in some of the texts, as that of St Gall, are the composition of later compilers. The epic cycle embraced in the N. may be more specially regarded as the fusion of the history of the mythical people, called in the poem the Nibelungen, with five leading groups of myths, in which are incorporated the adventures of some of the most universally popular personages belonging to the semi-historic myths of medieval German folk-lore, as, for instance, the hero Siegfried with his mantle of invisibility, and the lovely Icelandic heroine Brunhilt; King Günther of Burgundy, and his fair sister, Kriemhilt, the wife of Siegfried; Haco of Norway, Dietrich (Theodoric the Great, king of the Ostrogoths) of Berne (Verona), and Etzel (Attila), king of the Huns. The loves and feuds, and the stormy lives and violent deaths of these national heroes and heroines, are skillfully intertwined in the N., and artistically made to centre round the mythical treasure of the Nibelungen, which, after the murder of Siegfried, who had brought it from the far north, is secretly buried by his murderer Haco beneath the Rhine, where it still remains. The poem, in its rude but strict versification, tells the tale of Kriemhilt's vengeance for her husband's death with a passionate earnestness that carries the sympathies of the reader with it, until the interest culminates in the catastrophe of the fierce battle between the Burgundians and Huns at the court of Etzel, whose hand Kriemhilt has accepted, the better to accomplish her purposes of revenge. The tale of horrors fitly closes with the murder of Kriemhilt herself, after she has satisfied her vengeance by slaying with Siegfried's sword his murderer Haco. This tale, which seemed to echo back the clash of arms and strife of passion which characterised the early periods of German history, kept a firm hold on the imaginations of the people till the taste for polemic writings, fostered, if not created at the period of the Reformation, caused this as well as many other treasures of folk-lore to be almost lost sight of and forgotten. Attention was, however, again drawn to it in the 18th c., by the publication of detached portions of the poem by Bodmer, *Christmülden-Rache* (Zurich, 1751), and by Müller in his *Sammlung deutscher Gedichte aus dem 12—14 Jahrh.* (Berl. 1782); but it was not till comparatively recent times that the value of the work

in an historical and philological point of view was recognised. Laehmann, who had submitted the poem to a critical examination, made known the result of his investigations in an edition published at Berlin, 1826, and again in his treatise *Zu den Nibelungen und zur Klage* (Berl. 1836). W. Grimm has also given a comprehensive analysis of the poem in his *Deutschen Heldensage* (Gött. 1829). Among the various translations into modern German, those of Simrock (Berl. 1827) and Pützer (Tüb. 1842) are the best. All the manuscripts of the N. comprise another poem under the title of *Die Klage*, which treats of the burial of the heroes who fell in the conflict at Etzel's court, and the laments which were composed in commemoration of that event. It is of greater antiquity than the N., and, like it, the work of an unknown author. A critical analysis of the N. will be found in Carlyle's *Miscellaneous Essays*.

NICARUA. See NICE.

NICARAGUA, a republic of Central America, bounded on the N. by the republic of Honduras, on the W. by the Caribbean Sea, on the S. by the republic of Costa Rica, and on the E. by the Pacific; lat. 10° 45'—15° N.; long. 83° 20'—87° 30'; area about 57,000 square miles; pop. estimated at 400,000, of whom about 30,000 are whites, 10,000 negroes, the rest Indians and Mestizoes. N. is traversed by two ranges of mountains—the western, which follows the direction of the coast-line, at a distance of from 10 to 20 miles from the Pacific; and the eastern (a part of the great range of the Cordilleras), which runs nearly parallel to it, and sends off several spurs towards the Caribbean Sea. The former is generally high and volcanic, but sinks at times almost to the level of the plains. Between the two ranges lies a great interior basin, containing the lakes of N. (q. v.) and Managua. The principal rivers are the Rio Coco, or Segovia, forming part of the boundary between Honduras and N.; the Escondido, or Blewfields; and the San Juan, all of which flow into the Caribbean Sea. The eastern coast of N. is called the Mosquito Coast. The country is in many places densely wooded—the most valuable trees being mahogany, logwood, Nicaragua wood, cedar, and Brazil wood. The pastures are splendid, and support vast herds of cattle. The chief products are sugar-cane (softer and juicier than the Asiatic variety), cacao, cotton, indigo, tobacco, maize, and rice, with nearly all the fruits and edibles of the tropics, plantains, bananas, tomatoes, bread-fruit, arrow-root, citrons, oranges, limes, lemons, pine-apples, guavas, &c. The chief vegetable exports are sarsaparilla, aloes, ipecacuanha, ginger, copal, gum-arabic, caoutchouc, &c. The northern part of N. is rich in minerals, gold, silver, copper, iron, and lead, but the mines are not so carefully worked now as under the Spaniards. The incessant political distractions of the country have notoriously all but destroyed the material prosperity of the country. The seat of government is Managua, with 10,000 inhabitants; but the largest town and former capital is St Leon, with a population of 35,000. N. is divided into the five 'departments' of Rivas or Meridional, Granada or Oriental, Leon or Occidental, Segovia or Septentrional, and Matagalpa.

N. was discovered in 1521 by Gil Gonzales de Avila, and conquered by Pedro Arias de Avila, the governor of Panama in 1522. In 1821—the great year of revolution in Central America—it threw off allegiance to Spain, and after a desperate and bloody struggle, secured its independence by the help of the 'liberals' of San Salvador. N. now became the second state in the federal republic of Central

America, but on the dissolution of the union in 1830, became an independent republic. In 1847—1848, a dispute broke out between N. and Great Britain about the Mosquito Coast, which led to some hostilities, and was only finally settled in 1860. Meanwhile, in 1855, a civil war had broken out between the so-called 'Conservatives' and 'Liberals,' which resulted in the victory of the latter, who were, however, obliged to call in the help of the since notorious Colonel William Walker (see FILLIBUSTERS).

By the constitution of 19th August 1858, the republic of N. is governed by a president, who is elected by universal suffrage, and holds office for four years. There are two legislative chambers—the Senate and the House of Representatives. Liberty of speech and of the press exists, but is not absolutely guaranteed. The Roman Catholic religion, however, is the only one *publicly* tolerated, but the services of other religious bodies may be privately performed.

NICARAGUA, LAKE (native, *Cocibolca*), a sheet of fresh-water in the republic of the same name, 110 miles long, and from 30 to 50 broad. Its elevation above the Pacific, from which it is separated by a low range of hills—at one point only 48 feet higher than the lake itself—is little more than 100 feet. The principal rivers flowing into it are the Mayales and Malacoloja on the north, and the Frio on the south; the only one flowing out is the San Juan (formerly *Usaquadero*), which unites it with the Caribbean Sea. Its islands are numerous, lying mostly in groups; the principal are Ometepe, Zapatero (uninhabited, but with extensive ruins and monolithic idols), Salentanami, and the Corales, a cluster of several hundred volcanic islets lying round the base of the volcano of Mombacho, in the north-west of the lake. The scenery is surpassingly beautiful, and even grand. Lake N. is also interesting on account of the facilities which it presents for water communication between the Atlantic and Pacific Oceans.

NICA'STRO, a town of Naples, province of Calabria Ultra II., is most beautifully situated west of the Apennines, on the margin of the coast plains, and commanding views of the sea, 24 miles south of Cosenza. It is the see of an archbishop. There are hot springs in the vicinity. Pop. stated at 7000 and 10,200.

NICCOLA PISANO, a distinguished sculptor of Pisa, to the influence of whose works the rise or restoration of sculpture in connection with Gothic architecture is mainly attributable. There is no record of the date of his birth, but from an inscription on a celebrated fountain in Perugia, designed by him and executed by his son Giovanni, it is evident that he was born at the beginning of the 13th century. His earliest work is supposed to be the 'Deposition' over one of the doors of the façade of the cathedral at Lucca, dated 1233. He worked on the principle of studying nature, modified or corrected by the ideal of antique sculpture; and it is said that he first adopted this principle from the sculpture on an ancient sarcophagus brought from Greece in the ships of Pisa; but though most of the finest specimens of Greek sculpture were not discovered till long after N.'s time, he must have had an opportunity of studying many important remains on the various classic ruins with which Italy abounds. This sculptor's reputation is supported by three important works, which remain and are still admired for their excellence—the pulpit of the baptistery at Pisa, the 'Arca' or shrine of St Dominic for the church of that saint at Bologna, and the pulpit of the cathedral at Siena. The first

of these was finished in 1260, and is reckoned the most elegant pulpit in Italy. It is of white marble, six-sided, supported by seven Corinthian columns, and adorned with five bas-reliefs of subjects from the New Testament. The second work, the 'Arca' of St Dominic, is one of even greater extent. It is composed of six large bas-reliefs, delineating the six principal events in the legend of St Dominic, and is ornamented with statues of our Saviour, the Virgin, and the four doctors of the church. The operulum or lid was added about 200 years afterwards. The subjects on the pulpit at Siena, the third of these works, are the same as those on that at Pisa, with the substitution of the 'Flight into Egypt' and the 'Massacre of the Innocents' for the 'Presentation,' and the enlargement of the concluding composition, the 'Last Judgment.' In these compositions there is great felicity of invention and grouping, truth of expression, and grace in the attitudes and draperies; and in that of the 'Last Judgment' the boldness displayed in the naked figures, twisted and contorted into every imaginable attitude, is wonderful, and evinces the skill with which N. drew on the antique and on nature. But it must be admitted that there is a degree of confusion or overfulness in the grouping, and that the heads of his figures are often large in proportion to the bodies; faults incidental to all early efforts. In this last work, it appears by the contract for its execution, that N. was assisted by his scholars Lapo and Arnolfo, and his son Giovanni; and this accounts for a certain feebleness that may be observed in portions of it. He died at Pisa, in 1276 or 1277, and was buried in the Campo Santo. N.'s influence on art extended widely; his pupils Arnolfo and Lapo executed numerous works at Rome, Siena, and other cities. His son and heir in reputation, though not his equal in talent, Giovanni Pisano, was constantly engaged on works of importance; in Pisa, where the Campo Santo (for he was also an architect) was erected from his designs; in Naples, which he visited on the invitation of Charles I. of Anjou; at Arezzo, where he executed the marble shrine of St Donato for the cathedral; at Orvieto, the bas-reliefs on the *facciata* of the Duomo, by many ascribed to N., being by him; at Pistoja, where he executed the pulpit, &c. The year of his death is not ascertained; it was probably about 1320. After Giovanni's death, the Pisan school split into two principal branches, Florence and Siena; that of Naples may also be reckoned a branch, from the influence exercised over it by Giovanni.—ANDREA PISANO, the ablest of Giovanni's pupils, was called to Florence to execute in marble the statues, bas-reliefs, &c., designed by Giotto in ornamenting the cathedral of S. Maria del Fiore, then in course of erection. The talent he displayed soon raised him to a high position and important employment. He executed numerous statues for the façade of the cathedral, and a bronze gate for the baptistery, of very great excellence. This gate still exists, along with the later and still more celebrated gates of Ghiberti. Under the influence of Giotto's genius, he became completely Giottesque in thought and style; and his works bear so distinctly the impress of that master-mind, that the design of many of them, and particularly the baptistery gate, are ascribed to Giotto. He died in 1345, aged 76. See Vasari; *Christian Art*, by Lord Lindsay; Agincourt, *Davia Memorie Istoriche*; Rosini, *Storia*, &c.; Cicognara (tom. i.), *Monumenti Sepolcrali della Toscana*.

NICCOLINI, GIOVANNI BATTISTA, a distinguished modern poet, was born in 1785, in the vicinity of Pisa, of a noble but impoverished family. N.'s first literary efforts were full of high promise of the classical and antique beauties which characterise

his finest compositions, and in 1810 he was crowned by the Crusca Academy. Through the influence of the queen of Etruria, he was appointed secretary of the Academy of Fine Arts, where he delivered to the young artists lectures on history and mythology; but on the fall of the Bonaparte sovereigns, this post was withdrawn from the poet. In 1805, the Grand Duke Ferdinand appointed him librarian in the Pitti Palace, an office he resigned in order to escape the servility of court dependence. By the death of a relative he acquired wealth and the power of exclusively devoting himself to literature, and published several much-admired essays and lectures; and in 1827 appeared his noble work, *Antonio Foscarini*. In 1841, N. published anonymously his best poem—*Arnolfo da Brescia*—and nothing finer has been written in modern Italian, whether it be viewed as a classical creation, full of life and poetry, or as a work of glowing patriotism. N. lived in the enjoyment of fame and honours to a ripe old age, and died at Florence in 1861.

NICE, or NICÆA, formerly a city of Bithynia, in Asia Minor, situated on the eastern shore of Lake Ascania. It was built, or rather rebuilt (for an older town had existed on its site), by Antigonus, the son of Philip (316 B.C.), and received the name of Antigonæia, which Lysimachus changed to Nicæa, in honour of his wife. It was a handsome town, and of great importance in the time of the Roman and Byzantine emperors; all the streets crossed each other at right angles, and from a magnificent monument in the centre the four gates of the city were visible. It is famous in ecclesiastical history for two Councils held in it, the First and Seventh Ecumenical Councils. The FIRST COUNCIL OF N. was held 325 A.D., and was convened by the Emperor Constantine, in concert, according to Roman Catholic historians, with the Roman pontiff, for the purpose of defining the questions raised in the Arian (q. v.) controversy. The details of the proceedings, so far as regards Arius, will be found in that article. The supporters of Arius at first are said to have numbered upwards of twenty; but ultimately the decree condemning him was subscribed by the whole body of the Council, the number of dissentients being, according to the highest computation, only five, while the most probable account reduces it to two. The NICENE CREED adopted in this Council forms the subject of a separate article. In addition to the Arian question, the Council of N. also deliberated on a schism, called the Meletian Schism, which at that time divided the church of Egypt, and the particulars of which have formed a subject of recent controversy. The decree of N. appears to have been founded on a compromise, but did not effectually suppress the schism. The decree of N. on the celebration of Easter was of wider application, and met with universal acceptance, the few recusants being thenceforward called Quarto-decimans (q. v.). This Council also enacted twenty canons of discipline. For a minute and picturesque description of this council, see Dean Stanley's *History of the Eastern Church*.—The SECOND COUNCIL OF N., called also the Seventh Ecumenical Council, was assembled under the Empress Irene (787), who was regent during the minority of her son Constantine, for the purpose of reconsidering the subject of Images. The tenor of the decree on Images is detailed under that head. In the West, the question of the acceptance of this council was the subject of considerable controversy, arising, in great measure, from a grossly erroneous Latin translation of the acts, which for a time obtained extensive circulation.

NICE (Ital. *Nizza*), chief town, since 1860, of the department of the Alpes Maritimes, France, is situated on both sides of the river Paglione, 100 miles south-south-west of Turin, in lat. 43° 42' N., and long. 7° 17' E. Pop. 36,800. It consists of three principal parts—the *Quartier de la Croix de Marbre*, or *New Town* (on the right bank of the Paglione), the *Old Town*, and the *Port*. The first of these is much frequented by foreigners, particularly English (whence its name of 'English town'). It is close upon the river, has a handsome quay filled with gay shops, and a splendid square called the *Jardin Public*. Two bridges over the Paglione connect it with the Old or Upper Town, which extends back to the foot of a hill called the *Castle Hill*. The Old Town is excessively dirty, and has narrow, stinking streets, with macaroni and confectionary shops, grocery establishments, slaughter-houses, &c. The Port, almost separated from it by the *Castle Hill*, is crowded with a seafaring population. The harbour admits vessels drawing fifteen feet of water, but is difficult of entrance. The *Castle Hill*, an isolated mass of limestone 800 feet high, receiving its name from having been formerly crowned by a strong castle, now in ruins, is laid out in public gardens, and affords an extensive and splendid prospect out to sea. There are some very fine buildings in the *Rue St François de Paule* and the *Corso*, where the theatre, the public library, and the principal cafés are situated. The *Place St Dominique* is the chief centre of business. The most attractive promenade in the Old Town is the *Terrace*, from 15 to 20 feet high, erected as a protection to the town against a stormy sea. But the most agreeable and fashionable drive and promenade is the *Promenade des Anglais*, extending for a mile along the shore from the right bank of the Paglione, and skirted on one side by elegant villas and hotels. Beggars are numerous, owing, doubtless, to the great influx of visitors. The climate of N. is extremely mild and salubrious in winter, and the town is, in consequence, a favourite residence of invalids from more northern regions. Not less than 5000 or 6000 English are constantly here in the hotels, boarding-houses, and private lodgings. The mean temperature of N., deduced from fifteen years' observation, has been found to be 60½° F.; the greatest heat (July and August), 88½°; the greatest cold (January), 27½°. Invalids should take care to lodge where they are sheltered from the currents of cold air that often come down the valleys like streams from the snow-clad Alps lying to the north.

The ancient Ligurian town of Nicæa, founded, it is said, by a colony of Phœnicians from Massalia (Marseille), became subject to Rome in the 2d c. B.C. It probably occupied the *Castle Hill*, rather than the site of the present city. Subsequently it passed into the hands of the Goths, Burgundians, Visigoths, kings and counts of Arles, the Angevine sovereigns of Naples, and the Dukes of Savoy (1388), in whose family it remained till 1860, when it was ceded to France. (1866—pop. 50,180.)

NICENE CREED, a detailed statement of doctrine, which forms part of the liturgy of the Roman, Oriental, and Anglican Churches, and is also received as a formulary by many of the other Protestant communions. It was drawn up principally by Hosius of Corduba, and is called by the name of the Council of Nice, although nearly one half of its present clauses formed no part of the original Nicene formulary; while, on the other hand, that document contained a series of anathemas condemnatory of specific statements of Arius, which find no place in the present so-called Nicene creed. The distinctive characteristic of the creed drawn up in the Council was the word

*Homoousios.* (See HOMOIOUSIAN.) Its clauses correspond (except in a few verbal details) with those of the modern formulary as far as the words 'I believe in the Holy Ghost,' after which follow the anathemas referred to above. The remaining clauses of the present creed, although they seem to have been in public use earlier, were formally added in the First Council of Constantinople (381), with the exception of the clause, 'And from the Son,' which was introduced in various churches of the West in the 5th and 6th centuries; and ultimately its formal embodiment in the creed, has continued a subject of controversy with the Greeks to the present day. See GREEK CHURCH. This creed appears to have been used in the public liturgy from the latter part of the 5th century. Its position in the liturgy varies in the different rites. In the Roman liturgy it is read on all Sundays, feasts of our Lord, of the blessed Virgin Mary, apostles' days, and all the principal festivals, but not on week-days, or the minor saints' days.

Several Arian creeds, in opposition to that of Nice, were drawn up at Sirmium and elsewhere (see LIBERTUS), but none of them met with general acceptance.

**NICHE**, a recess formed in a wall to contain a statue or some ornamental figure. In classic architecture, the niches are generally square recesses with canopies formed by small pediments. In Gothic architecture, the niche is one of the most frequent and characteristic features; the doorways, buttresses, and every part of the buildings being in many instances ornamented with niches and statues in endless variety.

**NICHOLAS**, the name of five among the Roman pontiffs, of whom the following alone appear to call for separate notice.—**N. I.** was born of a noble Roman family, and on the death of Benedict III., in 858, **N.** was elected to succeed him, and was consecrated in St Peter's Church, in the presence of Ludwig II., emperor of Germany. The earliest incident of importance of his pontificate is his conflict with Photius (q. v.), who had been intruded into the see of Constantinople after the deprivation of Ignatius. **N.** demanded from the emperor the restoration of Ignatius, as well as the withdrawal of certain attempted invasions of the jurisdiction of the West. On the refusal of his demands, **N.** excommunicated Photius (see GREEK CHURCH), and that patriarch, in return, assembled a council at Constantinople, and retorting upon his rival the same sentence, alleged that with the translation of the seat of civil sovereignty from Rome to Constantinople the ecclesiastical supremacy was likewise transferred. The Emperor Michael supporting Photius in his claim, **N.** failed to command submission to his sentence; nor was it till the following reign, that of Basil the Macedonian, that Photius was deposed, and Ignatius restored to his see. Meanwhile, however, **N.** had been embroiled with the Emperor Ludwig. The pope had been appealed to by the unjustly divorced wife of Ludwig's younger brother, Lothaire, king of Lorraine, and had appointed legates to inquire into and report upon the case; and the legates having exceeded their powers by giving a sentence in favour of Lothaire, the pope declared their sentence null, and excommunicated them. Ludwig espoused their cause, and marched his troops to Rome, in order to enforce satisfaction. After some hostile demonstrations, the emperor, terrified, it is said, by his own sudden illness, and some fatalities which befell his followers, desisted from the enterprise, and withdrew his troops. Lothaire was forced to make submission; the decree of **N.** was enforced, and Theutberga was formally reinstated in her

position as a wife and queen. **N.** died in 863.—**NICHOLAS V.** was originally called Thomas Parentucelli. Born at Pisa in 1398, he was educated at Florence and Bologna, and having fixed his residence in the latter city, he was eventually named bishop of that see by the pope, Eugenius IV. During the troubled period of the Councils of Basel and Florence, and in the difficult negotiations with the German and other churches which arose therefrom, he conducted himself with such ability and prudence, that on the death of Eugenius IV. he was chosen to succeed him on March 6, 1447. At this time, the anti-pope, Felix V., still maintained himself, although supported by a very small party; but **N.** prevailed on him to abdicate, and thus restored the peace of the church in 1449. In the judgment of the literary world, however, the great distinction of the pontificate of **N.** lies in the eminent service which he rendered to that revival of letters which dates from his age. The comparative repose in which he found the world at his accession, enabled him to employ, for the discovery and collection of the scattered master-pieces of ancient learning, measures which were practically beyond the resources of his predecessors. He despatched agents to all the great centres, both of the East and of the West, to purchase or to copy every important Greek and Latin manuscript. The number collected by him was above 5000. He enlarged and improved the Roman university. He remodelled, and may almost be said to have founded, the Vatican Library. He caused translations to be made into Latin of most of the important Greek classics, sacred and profane. He invited to Rome the most eminent scholars of the world, and extended his especial patronage to those Greeks whom the troubles of their native country drove to seek a new home in the West. Alarmed by the progress of the Turkish arms in Asia, he endeavoured to arouse the Christian princes of Europe to the duty of succouring their brethren of the East; but the age of enthusiasm was past, and he was forced to look on inactively at the fall of Constantinople in 1453. This event, by forcing a large number of learned Greeks to repair to Italy and other countries of the West, contributed powerfully to that progress of learning which **N.** had deeply at heart; but he scarcely lived to enjoy this result, having died two years later, in 1455, at the comparatively early age of 57. He must not be confounded with an anti-pope of the same name, Peter de Corbario, who was set up, in 1328, by Ludwig of Bavaria, in antagonism to John XXII. (q. v.).

**NICHOLAS I.**, more properly NIKOLAI PAULOVITCH, emperor of Russia, was the third son of Paul I., and was born at St Petersburg, 7th July 1796. He was very carefully educated under the eye of his mother, a princess of Wurtemberg, and subsequently devoted his attention to military studies and political economy, without, however, giving evidence of any natural capacity for these subjects. He visited England and other European countries in 1816, and in the same year made a tour through the Russian provinces. On 13th July 1817, he married Frederika-Louisa-Charlotte-Wilhelmina, the eldest daughter of Frederic William III. of Prussia, and lived in domestic retirement till the death of Alexander I. (December 1825), when, owing to the resignation of his elder brother Constantine, he succeeded to the throne of Russia. A long-prepared military conspiracy broke out immediately after his accession, which he suppressed with great vigour and cruelty. Capital punishment, which had been abolished by the Empress Elizabeth, was revived, for the purpose of inflicting it upon the leaders of the insurrection.

The rebels were hunted down with merciless energy, and in no case, even after the rebellion ceased to be in the least degree dangerous, was their punishment commuted. Instead of pursuing the course upon which Alexander had entered—cultivating the mind of the nation, so as to base his government upon education and intelligence—N., after a brief ebullition of reformatory zeal, reverted to the ancient policy of the Czars, absolute despotism, supported by mere military power. His first great measure, the codification of Russian law, was commenced in 1827, and completed in 1816.

Soon after his accession, a war with Persia commenced, but it was concluded on 28th February 1828, by the peace of Turkmanshai, which gave a considerable extent of territory to Russia. In the same year he entered upon a war with Turkey, in which victory, though at enormous cost, constantly attended his arms, and the peace of Adrianople (q. v.) obtained for Russia another increase of territory, the free navigation of the Danube, with the right of free passage between the Black and Mediterranean Seas. The political movements of 1830, in the west of Europe, were followed by a national rising of the Poles, which was suppressed after a desolating contest of nine months, in which the utmost efforts of the whole military resources of Russia were required. N. punished the rebellion by converting the kingdom of Poland into a mere Russian province, and strove to extinguish the Polish nationality. This policy, however, was viewed with great dissatisfaction throughout Europe, and the vanquished Poles were everywhere regarded with general sympathy. Russia, by N.'s mode of government, became more and more separated from the fellowship of the western nations. Intellectual activity was, as far as possible, restrained to things merely practical, education limited to preparation for the public service, the press was placed under the strictest censorship, and every means used to bring the whole mind of the nation under official guidance. His Slavism (q. v.) also prompted him to Russianise as much as possible all the inhabitants of the empire, and to convert Roman Catholics and Protestants to the Russian Greek Church, of which the Czar is the head. The independence of the mountaineers of the Caucasus was inconsistent with his schemes, and war was consequently waged against them with the greatest energy and perseverance, although with little success, and at the cost of immense sacrifices both of money and lives. The extension of British influence in Central Asia was also viewed by him with alarm, and was attempted to be counteracted by various means, amongst which was the expedition for the conquest of Khiva in 1839, which failed so signally (see KHIVA). Between 1844 and 1846, he visited England, Austria, and Italy. During the political storm of 1848—1849 he abstained from interference, watching, however, for an opportunity of doing so with advantage to Russian interests. The opportunity was at last found in the request of the emperor of Austria for his assistance to quell the Hungarian insurrection. This good service rendered Austria, as he thought, a faithful and firm ally. He succeeded at the same time in drawing closer the bonds of alliance between the Russian and Prussian monarchies, a proceeding fraught with the most mischievous consequences to the latter power. The re-establishment of the French empire still further tended to confirm these alliances, and led N. to think that the time had at length come for carrying into effect the hereditary Russian scheme for the absorption of Turkey; but the unexpected opposition of Britain and France, and his own

invincible repugnance to give up his long-planned scheme of conquest, brought on the Crimean War, during the course of which he died at St Petersburg, March 2, 1855, of atrophy of the lungs; but his death was undoubtedly hastened by chagrin at the repeated defeats which his arms sustained, and by over-anxiety and the excessive labour he underwent to repair his losses. He was remarkable for temperance, frugality, and patriotism, but equally so for vanity and ostentation. He was fanatically beloved by his Russian subjects, and was at the same time regarded by them with feelings of awe, a tribute to his lofty stature and imperial deportment, which gave him the most intense pleasure. In fact, this extreme vanity seems, to some extent, to have affected his mind, and to have been partly the cause of his political blundering towards the close of his reign.

NICIAS, a famous Athenian statesman and general during the Peloponnesian War, was the son of Niceratus, a very wealthy citizen, who had acquired his fortune by working the silver-mines at Laureium. N. belonged to the aristocratic party, and after the death of Pericles, presented himself as the opponent of Cleon, the great popular or demagogic leader. He was not a man of quick, brilliant, audacious genius, like Alcibiades; on the contrary, he was remarkably wary and cautious, even at times to timidity. Success generally accompanied his enterprises against the Spartans and their allies. In 427 B. C., he captured the island of Minoa; next year he ravaged the island of Melos and the coasts of Locris; the year following that, he obliged the Spartan force in Sphacteria to surrender, and also defeated the Corinthians. In 421 B. C., he made havoc of part of Laconia, captured the island of Cythera, and achieved several other successes. After the death of Cleon, he brought about a peace between the Spartans and Athenians, 421 B. C. Six years afterwards, the Athenians, at the instigation of Alcibiades, resolved on a great naval expedition against Sicily. N. was appointed one of the commanders, although he had strongly protested against the undertaking. In the autumn of 415 B. C., he laid siege to Syracuse, and was at first successful, but subsequently experienced a series of disasters; his fleet was destroyed, and his troops began a retreat towards the interior of Sicily. They were speedily forced to surrender, and N. was put to death 414 B. C. See Thirlwall's and Grote's *Histories of Greece*, and Plutarch's *Life of Nicias*.

NICKEL (symbol, Ni; equivalent, 29.5; specific gravity, 8.8) is a grayish-white glistening metal, capable of receiving a high polish, of about the same hardness as iron, and, like that metal, malleable and ductile. It has about the same fusibility as wrought iron, but is less readily oxidised than that metal, since it remains unchanged for a long time in a moist atmosphere, and is very little attacked by dilute acids. It is strongly magnetic, but loses this property when heated to 660°. It dissolves in hydrochloric and dilute sulphuric acid with a development of hydrogen gas, and is very readily oxidised in nitric acid.

N. only occurs in the native state in meteoric stones, in which it is always present in association with the iron which forms the principal part of those masses. It is found in tolerable abundance in Saxony, Westphalia, Hungary, Sweden, &c., where it occurs in the form of *kupfernickel* (so called from its yellowish-red colour), which is a combination of N. and arsenic. The metal is obtained on the large scale (for the purpose of making German silver (q. v.) and other alloys) either from this compound or *spets*, which is an impure arsenio-sulphide of N., formed

during the manufacture of *Small* (q. v.), by somewhat complicated chemical processes. In small quantities, it may be obtained by reducing one of its oxides by means of hydrogen at a high temperature, or by exposing the oxalate to a very high temperature in a crucible lined with charcoal.

N. forms two compounds with oxygen—viz., a protoxide, NiO, and a sesquioxide, Ni<sub>2</sub>O<sub>3</sub>, which is not basic, and may be passed over without further notice. The *protoxide* occurs as a greenish-gray powder, which exhibits no magnetic properties, and is insoluble in water. It is obtained by heating the carbonate or the *hydrated protoxide* in a closed crucible. The hydrated protoxide, NiO.HO, is obtained by precipitation from a solution of one of its salts by potash. The salts of the protoxide and their solutions are of a delicate, very characteristic green colour; but in the anhydrous state most of them are yellow. The neutral salts, soluble in water, slightly reddens litmus, have a sweetish astringent metallic taste, and when administered in moderate doses, excite vomiting. The most important of the salts is the sulphate (NiO.SO<sub>3</sub> + 7 Aq), which crystallises in beautiful green rhombic prisms. It is obtained by dissolving the metal or its oxide in dilute sulphuric acid; and is the source from which the other salts of N., the carbonate, oxalate, &c., are obtained. The principal use of N. is in the composition of various alloys, such as German Silver (q. v.).

The sulphate of N. has been prescribed successfully by Professor Simpson in cases of severe headache.

NICOBAR ISLANDS, a group of islands in the Indian Ocean, north-west of Sumatra, and forming, with the Andamans (q. v.), an extension of the great island chain of which Java and Sumatra are the principal links. Lat. 6° 40'—9° 20' N., long. 93°—94° E. They are divided by the Sombrero Channel into two groups, of which the principal members are the Great N. (area about 260 square miles), and the Little N. (area 86 square miles). Population in all, estimated at 6000, who are principally Malays. The cocoa-nut and banana grow everywhere on the shores. The soil is fertile, the mean annual temperature is 70° F., and the climate is so unhealthy, that the islands are quite unsuited for colonisation. The Danes claimed the islands in 1841, but abandoned their claim in 1848. The inhabitants are known in several instances to have seized vessels that have touched at the N. I., murdered the crews, and rifled and sunk the ships.

NICOLAI, CHRISTOPH. FRIEDR., a celebrated German author, bookseller, and publisher, was born 18th March 1733, at Berlin, where his father was also a bookseller. He devoted himself very earnestly to literary and philosophical studies, and early distinguished himself by his *Briefen über den jetzigen Zustand der schönen Wissenschaften* (Berl. 1756), in which he exposed the errors of both Gottsched and Bodmer, then carrying on a controversy which was agitating the literary world of Germany. He became the associate of Lessing and Moses Mendelssohn. Jointly with the latter, he edited for some time the admirable *Bibliothek der schönen Wissenschaften* (Leip. 1757—1758); and with Lessing, he gave to the world *Briefe, die neueste deutsche Literatur betreffend* (24 vols. Berl. 1759—1763). By this he was led to conceive the plan of the *Allgemeinen deutschen Bibliothek* (106 vols. 1765—1792), a periodical which he edited for many years, and which contributed much, particularly in the early period of its existence, to the progress of literature and improvement of taste in Germany, but was too frequently characterised by an undue acerbity of

tone. N.'s hostility to the new schools of literature and philosophy, which sprang up in Germany, exposed him to attacks from the pens of Herder, Goethe, Schiller, Lavater, and Fichte. His death took place 8th January 1811.

Among N.'s works may be mentioned his *Topographisch-historische Beschreibung von Berlin und Potsdam* (Berl. 1769, 3d edit. 1786); *Characteristischen Anekdoten von Friedrich II.* (Berl. 1788—1792), both of permanent value; some novels, as his *Leben und Meinungen des Magisters Selaldus Nothanker* (4th edit. Berl. 1799); *Geschichte eines dicken Mannes*, a sharply satirical performance (2 vols. Berl. 1794); *Beschreibung einer Reise durch Deutschland und die Schweiz* (Berl. 1781; 3d edit. 12 vols. 1788—1796); an autobiography, published in the *Bildnissen jetzt Lebender Berliner Gelehrten*; and a work entitled *Ueber meine gelehrte Bildung, über meine Kenntniß der Critischen Philosophie und meine Schriften dieselbe betreffend, und über die Herren Kant, J. B. Erhard, und Fichte* (Berl. 1799).

NICOLAS, Sr, a highly popular saint of the Roman Catholic Church, and revered with still greater devotion by the Russian Church, which regards him as a special patron, was one of the early bishops of Myra in Lycia. The precise date of his episcopate is a subject of much controversy. According to the popular account, he was a confessor of the faith in the last persecution under Maximian, and having survived until the Council of Nice, was one of the bishops who took part in that great assembly. This, however, seems highly improbable. His name does not occur among the signatures to the decrees, nor is he mentioned along with the other distinguished confessors of the faith who were present at the council, either by the historians, or what is more important, by St Athanasius. He may, with more probability, be referred to a later period; but he certainly lived prior to the reign of Justinian, in whose time several of the churches of Constantinople were dedicated to St Nicolas. Of his personal history hardly anything is certainly known, and the great popularity of the devotion to him rests mainly on the traditions, both in the West and in the East, of the many miracles wrought through his intercession. He is regarded, in Catholic countries, as the especial patron of the young, and particularly of scholars. In England, his feast was celebrated in ancient times with great solemnity in the public schools, Eton, Sarum Cathedral, and elsewhere; and a curious practice, founded upon this characteristic of St N., still subsists in some countries, especially in Germany. On the vigil of his feast, which is held on the 6th December, a person in the appearance and costume of a bishop assembles the children of a family or of a school, and distributes among them, to the good children, gilt nuts, sweetmeats, and other little presents, as the reward of good conduct; to the naughty ones, the redoubtable punishment of the 'Klaubauf.' The supposed relics of St N. were conveyed from the east to Bari, in the kingdom of Naples, towards the close of the 11th c.; and it is a curious fact that in the Russian Church the anniversary of this translation, 9th May, is still observed as a festival.

NICOMEDEIA, the capital of ancient Bithynia, was situated at the north-eastern angle of the Gulf of Astacus, in the Propontis, now called the Bay of Ismid, was built about 264 A. D. by Nicomedes I., who made it the capital of his kingdom, and it soon became one of the most magnificent and flourishing cities in the world, and some of the later Roman emperors, such as Diocletian and Constantine the Great, selected it for their temporary residence. It

suffered greatly both from earthquakes and the attacks of the Goths. Constantine died at a royal villa in the immediate vicinity. Hannibal committed suicide in a castle close by. It was the birthplace of the historian Arrian. The small town of Ismid or Isnikmid now occupies its site, and contains many relics of ancient Nicomedia.

**NICO'POLIS**, a Turkish city and fortress in Bulgaria, on the right bank of the Danube, occupies a line of limestone cliffs 56 miles west of Rusteluk. Although it occupies one of the most beautiful sites in the world, it is of little importance as a stronghold, as it is commanded by neighbouring heights. The city is divided into two portions; the fortress and Turkish town, defended on every side by batteries and ramparts, and the eastern quarter, comprising the dwellings of the Bulgarians, Wallachs, and Jews. N. is widely built, most of the houses being surrounded by gardens. It is an important market for Wallachian wares, but otherwise is not a great centre of trade. Wine is produced in the vicinity. Pop. 15,000.

N., the ancient *Nicomolis ad Istrum*, was founded by Trajan, and fragments of the old wall still remain. Here the Hungarians, under their king Sigismund, were defeated by the Sultan Bajazet I. in 1396. The city gives title to a Greek archbishop and to a Catholic bishop.

**NICOTIA'NA**. See TOBACCO.

**NICOTINE**, or **NICOTY'LIA** ( $C_{10}H_{14}N_2$ ), is one of the natural volatile oily bases destitute of oxygen, and constitutes the active principle of the tobacco plant, in the leaves, roots, and seeds of which it occurs in combination with malic and citric acids. It is likewise contained in the smoke of the burning leaves. It is a colourless, intensely poisonous liquid, of specific gravity 1.027 at 66°, which boils at 480°, evolves a very irritating odour of tobacco, especially on the application of heat, is very inflammable, and burns with a smoky flame. It is moderately soluble in water, and dissolves readily in alcohol and ether. If exposed to the air, it absorbs oxygen, and becomes brown, and ultimately solid. The quantity of N. contained in tobacco varies from 2 to 8 per cent.; the coarser kinds containing the larger quantity, while the best Havannah cigars seldom contain more than 2 per cent., and often less.

A remarkable case of poisoning by N.—that of the Count Bocarmé, who was tried and executed in Belgium for the murder of his brother-in-law—is recorded in the *Annales d'Hygiène* 1851, and was the occasion of Orfila's publishing his *Mémoire Sur la Nicotine*. A distinguished student of the College of Chemistry subsequently employed it for the purpose of suicide. The deaths that have taken place from the use of tobacco in the form of injection—of which several cases are on record—were doubtless due to the action of this substance.

**NIEBUHR, KARSTEN**, a distinguished geographer and traveller, was born in 1733, in the Hanoverian territory of Hadeln, on the confines of Holstein. Being early thrown on his own resources, he spent several years of his youth in the position of a day-labourer; but his natural energy having led him to apply himself to the study of geometry, and having acquired a small property, he went to Göttingen, where he attended the classes at the university until his resources were wholly exhausted. At this period he entered the Danish service, and in 1761 he joined the scientific expedition which King Frederick V. sent to explore certain portions of Arabia, with a view of illustrating some passages of the Old Testament. The expedition reached Cairo at the close of the year 1761, and after having carefully explored the pyramids, and crossed the desert to Mount

Sinai and Suez, proceeded to Arabia Felix. Here, however, the various members of the expedition, which included the eminent naturalist Forskål, all perished with the exception of N., who had himself suffered severely from fever. After the untimely death of his companions, he adopted the diet and dress of the natives—a measure to which he was probably indebted for the good health which he enjoyed during the rest of the travels, which he prosecuted with extraordinary resolution for more than six years. He proceeded as far as India, visiting also Persia and Asiatic Turkey, and continued the observations and researches of his late colleagues in addition to his own special geographical investigations. On his return to Denmark, in 1767, N. at once devoted himself to the task of publishing the results of his important mission, which appeared in German under the following titles, *Beschreibung von Arabien* (Copenh. 1772), and *Reisebeschreibung von Arabien und andern umliegenden Ländern* (Copenh. 1774—1778, 2 vols.); the publication of the third volume of this work was unfortunately delayed, in consequence of the pressure of numerous other engagements arising from his professional and official duties, and it was not till more than twenty years after his death that the book made its appearance under the supervision of N.'s daughter, and through the liberality of the eminent bookseller Perthes of Hamburg. In addition to these valuable observations, N. edited and published at his own cost the natural-history notes of his deceased friend and fellow-traveller, P. Forskål, which he arranged in two works, *Descriptions Animalium*, &c. (Copenh. 1775), and *Flora Egyptiaco-Arabica* (Copenh. 1776). The accuracy of detail, fidelity of delineation, and careful avoidance of all exaggeration, which characterise N.'s geographical and social descriptions of Arabia and other Asiatic countries, have made his works classical text-books for all who wish to study the subject. Although N. accepted, in 1778, a civil post, which fixed his residence in the remote provincial town of Meldorf, in the Ditmarsh district of Holstein, where he devoted himself during the rest of his life to the fulfilment of his official duties, he never relinquished his interest in scientific inquiry, and contributed several valuable papers on the geographical and political history of the nations of the east to the *Deutsche Museum*, and other periodicals. He died in 1815, leaving a character of being at once one of the most truthful and scientifically exact travellers of modern times.

**NIEBUHR, BARTHOLOMÆUS GEORG**, one of the most acute historians, critics, and philologists of modern times, was born August 27, 1776, at Copenhagen, where his father, Karsten Niebuhr (q. v.), then resided. The aptitude for learning which N. displayed almost from infancy, led him to be regarded as a juvenile prodigy, and unlike many other precocious children, his powers of acquiring knowledge kept pace with his advancing years. After a carefully conducted preliminary education, under the superintendance of his father, he spent a session at Göttingen studying law, and from thence proceeded in his 19th year to Edinburgh, where he devoted himself more especially to the natural sciences. On his return to Denmark, he became private secretary to the finance minister, Schimmelmann, and from that period till 1804 held several appointments under the Danish government, which, however, he was led to resign in consequence of his strongly pronounced political tendencies, which made him enter heart and soul into the feeling of hatred of Napoleon, which was at that time agitating the minds of Germans. In accordance with these views, N. entered the Prussian civil

service in 1806, and during the three succeeding years he shared in the vicissitudes which befell the government of his chief, Count Hardenberg, after the disastrous battle of Jena, and the consequent pressure of the Napoleonic influence on the management of the state. The opening of the university of Berlin in 1810 was a new era in the life of N., who, with the view of promoting the interests of the new institution, gave a course of lectures on Roman history, which, by making known the results of the new and critical theory which he had applied to the elucidation of obscure historical evidence, established his position as one of the most original and philosophical of modern historians. His appointment, in 1816, to the post of Prussian ambassador at the papal court, where he remained till 1823, gave him an opportunity of testing on the spot the accuracy of his conjectures in regard to many questions of local and social bearing. On his return from Rome, N. took up his residence at Bonn, where, by his admirable lectures and expositions, he contributed very materially to the development of classical and archaeological learning. He was thus employed when the revolution of 1830 roused him from the calm of his literary pursuits. N.'s sensitive nature, unstrung by physical debility, led him to take an exaggerated view of the consequences of this movement, and to anticipate a recurrence of all the horrors of the former French revolution, and the result was to bring about a state of mental depression and bodily prostration, which ended in his death in January 1831. N.'s attainments embraced a more extensive range than most men are capable of grasping, for he was alike distinguished as a shrewd man of business, an able diplomatist, an accurate scholar, and a man of original genius. He had mastered twenty languages before the age of thirty, while the mass of facts which his tenacious memory retained, and the intuitive sagacity that enabled him to sift true from false historic evidence, and often to supply by felicitous conjecture the link wanting in some imperfect chain of evidence, exhibit the extraordinary scope of his intellect. It is not to be denied, however, that he is often arbitrary and unhistorical in his conjectures, and the stricter sort of sceptical critics, like the late Sir George Cornewall Lewis, even go so far as to regard his effort to construct a continuous Roman history out of such legendary materials as we possess as, on the whole, a failure. Among the many important works with which he enriched the literature of his time, the following are some of the most noteworthy: *Römische Geschichte* (3 Bde. Berl. 1811—1832; 2d edit. 1827—1842; 1833; 1853), the first two volumes have been translated by J. C. Hare and C. Thirlwall, and the third by Dr W. Smith and Dr L. Schmitz; *Grundzüge für die Verfassung Niederlands* (Berl. 1832); *Griech. Heroengeschichte* (Hanbg. 1842), written for his son Marcus; the *Kleinen historischen und philologischen Schriften* (2 Bde. Bonn, 1828—1843), contain his introductory lectures on Roman history, and many of the essays which had appeared in the Transactions of the Berlin Academy. Besides these, and numerous other essays on philological, historical, and archaeological questions, N. co-operated with Bekker and other learned annotators in re-editing *Scriptores Historie Byzantine*; he also discovered hitherto unprinted fragments of classical authors, as, for instance, of Cicero's *Orations* and portions of Gaius, published the *Inscriptiones Nubienses* (Rome, 1821), and was a constant contributor to the *Rheinische Museum für Philologie*, and other literary journals and societies of Germany.

NIELLO-WORK, a method of ornamenting metal plates by engraving the surface, and rubbing

in a black or coloured composition, so as to fill up the incised lines, and give effect to the intaglio picture. It is by no means quite certain when this art was originated; Byzantine works of the 12th c. still exist to attest its early employment. The finest works of this kind belong to the former half of the 15th c., when remarkable excellence in drawing and grouping minute figures in these metal pictures was attained by Maso di Finiguerra, an eminent painter, and student of Ghiberti and Massacio. In his hands it gave rise to copper-plate engraving (see ENGRAVING), and hence much interest attaches to the art of niello-cutting. Genuine specimens of this art are rare, some of those by Finiguerra are very beautiful and effective, the black pigment in the lines giving a pleasing effect to the surface of the metal, which is usually silver. Those of his works best known are some elaborately beautiful pattines wrought by him for the church of San Giovanni at Florence, one of which is in the Uffizia, and some are in various private collections. In the collection of Ornamental Art at South Kensington, there are no less than 17 specimens of this art.

NIEMEN (called by the Germans *Memel*), a river in Prussia, rises a few miles south of the city of Minsk, flows westward to Grodno 180 miles, north and west along the frontiers of the Polish province of Augustowo, and west through East Prussia to the Kurische Hafl. Entire length, 640 miles. It is navigable for large craft at Grodno, 400 miles from its mouth, and is free of ice from March to November. Between Grodno and Kovno there are 55 rapids and shallows, and pilots are therefore required for the navigation of the river. At Winge, 8 miles below Tilsit, the N. divides into two branches, of which the northern, the Russ, reaches the Kurische Hafl by nine mouths; and the southern, the Gilge, by seven mouths. The delta is traversed by numerous canals. The N. is of considerable commercial importance. Large barges bring down the produce of Lithuania and of a portion of Poland to Königsberg and Memel. Corn, hemp, flax, hides, and bacon are the principal articles brought from the interior. Its principal affluent is the Vilia on the right.

NIEPCE DE ST VICTOR, CLAUDE-FELIX-ABEL, a French chemist and photographer, was born at Saint Cyr, near Chalon-sur-Saone, 26th July 1805. He served for some time in the army; but having made an important chemical discovery in connection with dyeing, he was permitted to exchange into the municipal guard of Paris, that he might pursue his scientific studies with more facility. This was in 1845, at which time his attention having been forcibly attracted to the important discoveries in photography which had been made by his uncle Nicéphore Niepce (see PHOTOGRAPHY), he resolved to devote his energies to this subject. He was led, in 1847, to the discovery of methods for obtaining images on glass, coated with albumen, starch, or gelatin, and for reproducing designs by the use of vapour of iodine. His investigations were for a time interrupted by the revolution of 1848, but he soon resumed them, directing his attention more especially to the obtaining of photographic images in colours; and before the close of 1852, he had succeeded in obtaining faithfully coloured images of flowers natural and artificial, coloured engravings, gold and silver lace, &c., upon silvered plates which had been sensitised by a chloride of copper. In obtaining these pictures, both photographic printing and the camera were employed; but to his intense disappointment, he found that

the colours soon began to fade, and after a time disappeared. This process he named 'Heliochrome.' His third and most important invention, that of the art of 'Heliography,' or the production of engraved steel-plates by photography, was first communicated to the Academy of Sciences in May 1833. He does not deserve the credit of having originated the idea; for his uncle, previous to 1839, had communicated an imperfect sketch of a similar invention to M. Arago; and Mr Talbot and others had succeeded by a similar process in obtaining images of simple objects on steel-plates; but to N. belongs the credit of having removed the almost insurmountable manipulative difficulties, and rendered the process of much more general application, thus making it practically serviceable. He has since been employed in improving and perfecting his various discoveries.

In 1855, he published the various memoirs in which he had at different times communicated his three great discoveries to the Academy of Sciences, under the title of *Recherches Photographiques*, which was followed, in 1856, by *Traité Pratique de Gravure sur Acier et sur Ferre*, and he has since presented to the Academy a number of memoirs on the action of light on a variety of substances, the last being *Sur l'Action de la Lumière et de l'Électricité* (February 1860). N.'s scientific studies have not interfered with his military promotion, as he was successively appointed chef-d'escadron, and (1854) commandant of the Louvre.

**NIERSTEIN**, a market village (pop. 2600) of Hessen-Darmstadt, in the province of Rhein-Hessen, and 9 miles south-south-east of Mayence, gives name to a well-known and highly-prized variety of Rhenish wine, which is produced in the neighbourhood.

**NIEUWVELDT MOUNTAINS**, a portion of the most northerly of the three ranges of mountains in Cape Colony, which at various distances from the southern coast all run parallel to it. Of these three ranges, the most northern attains the greatest altitude, having an average height of 7000 feet. The portion known as the N. M. extend in lat. 31° 40' to 32° 30' S., and are intersected by the meridian of 22° E. long. From their southern slopes, the Gamka or Lion River draws its head waters; and from their northern, the Gariep or Orange River obtains an important tributary in the Upper Zak.

**NIEVRE**, a central department of France, occupies a portion of the watershed between the Loire and the Seine, and is bounded on the west by the rivers Allier and Loire. Area, 1,684,469 acres; pop. (1862) 332,814. Mountains occupy the eastern border, and extend in a line of heights from south-east to north-west, dividing the department into two great declivities. The soil is generally rocky and sandy, cut up by ramifications, almost always wooded, of the mountains of Morvan. There are several plateaux more or less fertile, a number of hills covered with vines, and valleys productive in pastures; but the principal wealth of the department consists in its forests and minerals. The Nièvre, whence the name of the department, is an inconsiderable affluent of the Loire from the right. The three chief rivers—the Allier, Loire, and Yonne—are navigable, and the Yonne, which belongs to the system of the Seine, is connected with the Loire by a canal leading across the watershed. Of the entire area, 792,000 acres are (1864) in cultivable land, and more than a third of the whole surface is covered with forests, the timber from which, forming one of the principal sources of wealth, is conveyed by water in great quantities to Paris, &c.

About 6,000,000 gallons of wine are made yearly. From the mines of N. iron of good quality is obtained in abundance; lead, copper, and silver are also found; and there are coal mines, and quarries of marble and granite. Arrondissements, Nevers, Château-Chinon, Clamecy, and Cosne; capital, Nevers.

**NIFLHEIM** (from the same roots as Lat. *nebula*, cloud, and Eng. *home*), meaning the abode of clouds, was one of the nine separate abodes or homes, of which the old Scandinavians conceived the world as consisting in the beginning of time. It is the kingdom of cold and darkness, and is separated from Muspelsheim, the kingdom of light and heat, by a huge chasm (Ginungagap, yawning gap). Here flows the spring Hvergelmir, watched by the dragon Nidhugger; this spring sends out twelve ice-rivers, from the drops of which, thawed by sparks from Muspelsheim, sprang the chaotic giant Ymir and the cow Audhumbla. N. was also the abode of Hel (q. v.), the goddess of death, who here received all who died of sickness or old age.

**NIGELLA**, a genus of plants of the natural order *Ranunculaceæ*, having five coloured spreading sepals; five or ten small two-lipped petals, with tubular claw; the carpels more or less connected together, many-seeded; the leaves divided into

*Nigella sativa* :

a, top of stem, with leaves and flowers; b, fruit.

threadlike segments, the flowers solitary at the top of the stem or branches. They are annuals, natives chiefly of the countries near the Mediterranean and the warmer temperate parts of Asia. Some of them, occasionally seen in gardens in Britain, are vulgarly known by the names *Devil-in-a-bush* and *Devil-in-a-mist*. The seeds are aromatic, and somewhat peppery. Those of *N. sativa*, a species common in cornfields in the south of Europe, are supposed to be the **BLACK CUMMIN** of the ancients, and perhaps the **CUMMIN** of the Bible. The seeds of a species of *N.* are much used by the Afghans for flavouring curries. [The figure of *Nigella sativa* or Black Cummin is given by mistake instead of the true Cummin in the article **CUMMIN**.]

**NIGER**, the great river of Western Africa. Its name, according to Dr Barth, is a contracted form of one of the native names, *N-eghîr-râu*, which, as well as all the other names, *Dhiâlibâ* (*Joliba*), *Mâyo*, *Iša*, *Kwâra* (*Quorra*), and *Bâki-n-râwa*, means simply 'the river.' The principal head-water rises on the slopes of Mount Loma, a peak of the Kong Mountains, in a barren, desolate, and treeless region, in lat. 9° 25' N., long. 9° 45' W., about 1600 feet above sea-level. It flows north-east to Timbûktu,

where it bends eastward, and after flowing in that direction for about 250 miles, it curves toward the south, and proceeds in a general south-south-east course, until arriving at the head of its delta, in lat. about 5° 30' N., it separates into many branches, and enters the Gulf of Guinea, between the Bights of Benin and Biafra. It is called the Timbri for the first 70 miles of its course, after which it receives the name of the Joliba, or more correctly Dhiñlibá; and after passing Timbuktu, it is known principally as the Quorra. Little is known of its course until it reaches Sego (lat. 12° 30' N.), a distance of 350 miles from its source, but from that point it has been explored throughout nearly the whole of its course. From Sego to Timbuktu it flows through a fertile country, producing rice, maize, and vegetables, and abounding in good pasturage. In lat. 14° 10' N., the river separates into two branches; the western is called the Joliba or Mayo, the eastern the Bara-Isa. These, as they proceed, are known as the White and Black Rivers respectively; and they unite after enclosing the island of Jimballa, 220 miles in length, and from 2 to 20 miles in breadth. The river again bifurcates before arriving at Timbuktu, and after passing that town, the two branches, on one of which—the northern—Cabra, the port of Timbuktu is situated, again unite. In the district of union, in the south-west of Timbuktu, the country far and wide is intersected by numberless streams, forming a complicated network of water-courses. The river then flows east, sending off many creeks and branches to Bamba; its banks here are low and marshy, and during the rainy season are overflowed. In this region, rice, tobacco, wheat, and even barley are grown. The river then passes the town of Burrum, where it curves to the south-east, and from this point—called from the bend, the *Knee of Burrum*—it bears the name Kwara or Quorra until it reaches the delta. Immediately below *Burrum*, the N. does not present an imposing appearance. Its bed resembles a broad marshy valley, enclosed by ridges of rock or high dunes, thickly overgrown with reeds and sedges, and cut up by numberless streams and creeks. At the ferry of Burri (lat. 15° 55' N.), the breadth of the river is from 800 to 900 yards; and here the whole valley, about 10 miles broad, is fruitful, carefully cultivated, and well peopled. Further south, the towns of Garu and Sandu are passed, and here the bed is rocky and the navigation dangerous. At the town of Say, the N., after reaching a breadth of from 2500 to 3000 paces, is narrowed to a width of 1000 paces, flows at the rate of three miles an hour, and is enclosed by rocky banks. From Say to Wara, the course of the N. remains still unknown. From Wara, it flows east-south-east to Rabba; and from this town to its mouth, the course of the river is comparatively well known. In lat. between 8° and 7° 30' N., it flows round the eastern shoulder of the Kong Mountains (2000 to 3000 feet high), and here the banks of the N. are extraordinarily beautiful. In lat. 7° 40' N., it receives the Benne from the east. The delta consists of an immense mangrove forest, cut up into islands by the numerous branches (22 in number) of the river. The principal mouths are the Bonny, Mari, and Nun.

The existence of the N. seems to have been first made known in ancient times by travellers from the southern shores of the Mediterranean, who, crossing the great desert, came upon the upper course of a great river flowing toward the rising sun. This river Herodotus supposed to be a branch of the Egyptian Nile. Pliny speaks of the *Nigris* of Ethiopia, but he also thought that it flowed into the Nile. No definite notion of the river had

been formed until it was visited by Mungo Park in July 1796, when this traveller explored its banks for a distance of 160 miles. See *Park, Mungo*. Caillié explored the river from the town of Jennee to Timbuktu; and the English expedition of 1832, under Lander and Allen, proved that the Quorra was navigable from Boussa to the sea; information, however, which was obtained at an immense cost of human life from the unhealthiness of the climate. Subsequent expeditions have ended with similar results. In 1854, Dr Barth followed the course of the river from Timbuktu to Say, and much of what is now known about the N. is due to his labours. The entire length of the river is estimated at upwards of 2500 miles.—Barth's *Travels in Central Africa*.

**NIGHT-HAWK** (*Chordeiles Virginianus*), a bird of the Goatsucker family (*Caprimulgidae*), very common in America, from the Arctic islands to the West Indies. It is a bird of passage, visiting the north in summer. It is about nine inches in length, and 23 inches in expanse of wing. The gape is destitute of bristles. The tail is slightly forked. The general colour is brown, but it is much mottled and marked with white; and there is a white mark on the throat, in shape like the letter V. The N. is seen pursuing its insect

Night-hawk (*Chordeiles Virginianus*).

prey in the air, chiefly a little before sunset, and before dawn, and attracts attention by its rapid repetition of a sharp impatient cry, which has gained for it the name *Piramidig*. It produces also in its flight a remarkable hollow booming sound, 'like blowing into the bung-hole of a barrel,' in the moments of its perpendicular descent through the air. Its movements in the air are extremely beautiful and rapid. When fat and plump, as it usually is on its southward migration, it is esteemed for the table, and great numbers are shot.

**NIGHT HERON** (*Nycticorax*), a genus of *Ardeidae* (see *HERON*), intermediate in form between bitterns and herons, but with shorter and thicker bill than either, and legs shorter than in herons. The COMMON N. H. (*N. Gardeni* or *Europæus*) is found in Europe, Asia, Africa, and North America, chiefly in the warmer temperate regions. It is most abundant in America, and is partly a bird of passage. It is a very rare visitant of Britain. Its length, from the tip of the bill to the end of the short tail, is fully two feet. It weighs nearly two pounds. Its plumage is soft, the general colour ash-gray, passing into black on the neck and head, and into white on the breast and belly. The back of the head is adorned with three very long white feathers, which hang down on the neck. The nests are built in trees, and in general many together, forming a *heronry*. The N. H. feeds chiefly by twilight or at night; and is never seen standing

motionless, like herons, but walks about in search of prey, by the sides of ditches, ponds, &c.; its food consisting chiefly of fishes, frogs, and other aquatic

Night Heron (*Nycticorax Gardeni*).

animals. Its cry is very loud and hoarse.—Other species of *N. H.* are found in Africa and Australia.

**NIGHTINGALE, FLORENCE**, famed for her labours in reforming the sanitary condition of the British army, is the daughter of William Shore Nightingale of Embley Park, Hampshire, and Leigh Hurst, Derbyshire, and was born at Florence in 1823. Highly educated, and brilliantly accomplished, she early exhibited an intense devotion to the alleviation of suffering, which, in 1841, led her to give attention to the condition of hospitals. She visited and inspected civil and military hospitals all over Europe; studied with the Sisters of Charity in Paris; the system of nursing and management carried out in the hospitals of that city; and, in 1851, went into training as a nurse in the institution of Protestant Deaconesses at Kaiserswerth, on the Rhine. On her return to England, she put into thorough working order the Sanatorium for Governesses in connection with the London institution. Ten years was the term of apprenticeship thus served in preparation for the work of her life. In the spring of 1854, war was declared with Russia, and a British army of 25,000 men sailed to the East. Alma was fought on the 20th of September, and the wounded from the battle were sent down to the hospitals prepared for their reception on the banks of the Bosphorus. These hospitals were soon crowded with sick and wounded, and their unhealthy condition became apparent in a rate of mortality to which the casualties of the fiercest battle were as nothing. In this crisis, Miss N. offered to go out and organise a nursing department at Scutari. The late Lord Herbert, then at the war-office, gladly accepted, and within a week from the date of the offer—viz., on the 21st of October—she departed with her nurses. She arrived at Constantinople on the 4th of November, the eve of Inkermann—the beginning of the terrible winter campaign—in time to receive the wounded from that second battle into wards already filled with 2300 patients. Her devotion to the sufferers can never be forgotten. She has stood twenty hours at a stretch, in order to see them provided with accommodation and all the requisites of their condition. But she saw clearly in the bad sanitary arrangements of the hospitals the causes of their frightful mortality, and her incessant labour was devoted to the removal of these causes, as well as to the mitigation of their effects. In the spring of 1855, while in the Crimea organising the nursing-departments

of the camp-hospitals, she was prostrated with fever, the result of unintermitting toil and anxiety; yet she refused to leave her post, and on her recovery remained at Scutari till Turkey was evacuated by the British, July 28, 1856. She, to whom many a soldier owes life and health, had expended her own health in the physical and mental strain to which she had subjected herself. It is known that for years Miss N. has been an invalid. It is not so well known that her sick-room has been the scene of the most arduous and constant labour for the improvement of the health of the soldier. In 1857, she furnished the 'commissioners appointed to inquire into the regulations affecting the sanitary condition of the British army' with a paper of written evidence, in which she impresses, with the force and clearness which distinguish her mind, the great lesson of the Crimean War, which she characterises as a sanitary experiment on a colossal scale. Her experience in the Crimea, the results obtained by the labours of the sanitary commission, results accumulated under her own eyes, shewing that the rate of mortality among soldiers could be reduced to one-half of what it was in time of peace at home, turned the attention of Miss N. to the general question of army sanitary reform, and first to that of army hospitals. In 1858, she contributed two papers to the National Association for the Promotion of Social Science, on Hospital Construction and Arrangement, afterwards published, along with her evidence before the commissioners, by J. W. Parker and Son. The *Notes on Hospitals*, from their clearness of arrangement and minuteness of detail, are most valuable to the architect, the engineer, and the medical officer. In 1858, she published her *Notes on Nursing*, a little volume which is already among the treasured text-books of many a household. At the close of the Crimean War a fund was subscribed for the purpose of enabling her to form an institution for the training of nurses. The interest of the fund amounts to £1400 per annum; and though no separate institution has been formed, it is spent in training a superior order of nurses in connection with St Thomas's and King's College Hospitals. In the year 1863 was issued the Report of the Commission on the Sanitary Condition of the Army in India. The complete Report, with evidence, occupies two folio volumes of nearly 1000 pages each. The second of these huge folios is filled with reports from every station in India, occupied by British and native troops. These reports were sent in manuscript to Miss N., and at page 347 of vol. i. are inserted her observations upon this immense mass of evidence. In these observations, the facts are brought together in an order, and with an incisive force of statement, which render it one of the most remarkable public papers ever penned. That Report is likely to inaugurate a new era in the government of India; for the views of Miss N. extend not only to the sanitary reform of the British army, but to that of the towns of India. In 1871, Miss N. published *Notes on Lying-in-Institutions, together with a proposal for organising an Institution for training Midwives and Midwifery Nurses*. In the May number of *Fraser's Magazine*, 1873, she published an article entitled, 'A "Note" of Interrogation,' which attracted a good deal of attention, mainly on account of the way she handles religious beliefs and life.

**NIGHTINGALE (Phiomela)**, a genus of birds of the family *Sylviidae*, approaching in character to the *Merulidae*, the young having their first plumage mottled, as in the thrushes, and the legs being longer than in the fauveltes and other *Sylviidae*, with which they are commonly classed. The bill is straight, slender, not quite as long as the head; the wings do not much pass beyond the base of the tail;

the first quill is very short, the third is the longest; the tail is slightly rounded.—The Common N. (*P. luscinia*) is well known as the finest of songsters. It is rather larger than the hedge-sparrow, with about the same proportionate length of wings and tail. It is of a rich brown colour above, the rump and tail reddish, the lower parts grayish-white. The sexes are alike. It is a native of many parts of Europe and Asia, and of the north of Africa; and is a bird of passage, extending its summer migrations on the continent of Europe as far north as the south of Sweden, but in Britain it has scarcely ever been seen further north than Yorkshire. It is plentiful in some parts of the south and east of England, but does not extend to the western counties, and never appears in Ireland. It frequents thickets and hedges, and low damp meadows near streams. The extensive market-gardens near London are among its favourite haunts. It feeds very much on caterpillars and other larvæ. It arrives in England about

Nightingale (*Philomela luscinia*).

the middle of April, the males ten or fourteen days before the females. It is at this season, and before pairing has taken place, that bird-catchers generally procure nightingales for cage-birds, as they then become easily reconciled to confinement, whilst, if taken after pairing, they fret and pine till they die. The N. makes its nest generally on the ground, but sometimes on a low fork of a bush. The nest is loosely constructed of dead leaves, rushes, and stalks of grass, with a lining of fibrous roots. The eggs are four or five in number, of a uniform olive-brown. The song of the male ceases to be heard as soon as incubation is over. In captivity, however, it is often continued through a more considerable period. The N. usually begins its song in the evening, and sings with brief intervals throughout the night. The variety, loudness, and richness of its notes are equally extraordinary; and its long quivering strains are full of plaintiveness as well as of passionate ecstasy. The N. has been a favourite from most ancient times; and is often mentioned in the poetry of India and Persia, as well as of Greece and Rome. The loves of the N. and the rose are a fanciful theme in which eastern poets delight. The N. much resembles the redbreast in manners, and is equally pugnacious. It has been known to breed with the redbreast in captivity.—There is another, faintly mottled on the breast.

NIGHT-JAR. See GOATSUCKER.

NIGHTMARE (*Incubus*, *Ephialtes*) consists in a horrible dream, the terror being inspired by a sense of weight or oppression referred to the pressure of mountains, giants, hags, serpents, upon the

breast. It is attributed to acceleration or irregularity of the circulation in the chest or in the brain. It has been traced backwards to plethora, posture, heavy suppers; and forwards as a prognostic of heart disease or hydrothorax. It differs from ordinary dreams in possessing always the same characteristic of fear of some object in contact with the body, in a recognised inability to move or speak while there is a strong desire to do both, and in the presence of a semi-consciousness of the real source of the apprehension. The affection is recorded to have been epidemic; and modern instances have occurred where large communities have been agitated by night panics. A regiment of French soldiers, quartered in a ruined monastery, were awakened, at the same hour in two successive nights, by a black dog leaping on the breast of each. These veteran warriors, inured to danger, inaccessible to superstition, could not be prevailed upon to make a third trial. Such frightful impressions occur during the day, and during mere somnolency or drowsiness, but more generally at the moment of awakening during the night. The time, the distinct recollection retained of the circumstance, and the bodily perturbation which remained when consciousness was re-established, all conspired to convert these visions into the objective hobgoblins, the omens and supernatural revelations of past ages; and which still linger as matter of belief where the temperament or situation of the individual resemble those of our ancestors. In a very large number of instances such dreams represent, or are continuations of, the previous waking thoughts and emotions. They are so far voluntary that indigestible food or excess may induce them. Fuseli, for artistic purposes, created 'chimeras dire' in sleep by supping on pork chops.

NIGHTSHADE, the English name of certain plants of the natural order *Solanaceæ* (q. v.), possessing the narcotic properties frequently developed in that order. Among them are some species of *Solanum* (q. v.), particularly the COMMON N., or BLACK N. (*S. nigrum*), an annual or biennial, with

Common or Black Nightshade (*Solanum nigrum*).

erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers, and globose black berries; a frequent weed in waste places in England and in most parts of the world. Few

plants are more widely diffused. It is only slightly narcotic. The leaves, in a fresh state, are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries, although generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid *Solanine*, found also in the shoots of the potato.—For **WOODY N.**, see BITTERSWEET. For **DEADLY N.**, see BELLADONNA. For **ENCHANTER'S N.**, see CIRCEA.

**NIJMEGEN, NIMEGUEN**, the *Noviomagus* of the Romans (*magum* or *magen* being a Celtic word for a fixed dwelling), called by Tacitus *Bataworum oppidum*, in the middle ages *Numaga*, is the principal city of the district of Nijmegen, or the Betuwe, in the Netherlands province of Gelderland. Pop. 25,000, of whom three-fourths are Roman Catholic. It is pleasantly situated, 9 miles south of Arnhem, on several little hills, on the left bank of the Waal.—Several of the streets are steep and narrow, passing up the Hoenderberg (*Hunnerberg*, or Hill of the Huns), on which the Romans had a permanent camp in order to keep in subjection the country of the Batavians, which lay between the Rhine and the Waal; others are broad and well built. On a height stood, till 1797, when it was demolished by the French, the Castle of Valkenburg, said to have been built by Julius Cæsar. Here Charlemagne built a palace, and made the castle his residence. The site is now planted with trees, and forms a pleasant public walk overlooking the river and quay. On the brow of the hill there is a little sixteenth-sided chapel or baptistery, which some think was originally a heathen temple of the Batavians, and converted into a Christian church by Pope Leo III. in 799. On another eminence, where the chateau of the Duke of Alva once stood, is a modern tower called *Belvidere*, from the summit of which there is an extensive view, including the rivers which branch off at the delta of the Rhine—viz., the Rhine, the Waal, and the Yssel, with the Maas flowing in the south. N. is strongly fortified and well garrisoned. The town-house, founded in 1554, is beautifully and antiquesly fitted up within, and externally ornamented by several statues of emperors and kings of the Romans. St Stephen's, or the Great Church, standing on the highest part of the city, is a handsome Gothic edifice in the form of a Greek cross, and before the Reformation contained 30 altars. N. is a large market for cattle and agricultural produce, especially grain. Beer is extensively brewed, Eau de Cologne distilled, and there are factories for spinning and weaving linen, cotton, and silk. (1869—pop. 22,842.)

N. is celebrated for the great peace congress of the European powers which was held here, and, 10th August 1678, concluded a treaty between Spain and France; on the 17th September, between France and the United Netherlands; and between the German Empire and France, and the same empire and Sweden, 5th February 1679.

**NIJNI-NOVGOROD**, an important government in the east of Great Russia, between the governments of Vladimir on the west and Kazan and Simbirsk on the east. Area (according to the *Almanach de Gotha*, 1861) 19,390 square miles; pop. 1,259,606. The surface is divided into two distinct portions by the Volga with its tributary the Oka. On the left, the northern bank of the river, the surface is flat; on the right bank it is hilly. As the soil is not very fertile, and there are few rich meadow-lands, neither agriculture nor cattle-breeding is pursued extensively. The inhabitants are

principally engaged in manufactures. The chief rivers are the Volga, Oka, and their numerous tributaries. There is communication by water with 24 governments, and with the Baltic, the White, and the Caspian Seas. The northern districts of the government abound in forests, and here wooden utensils and tools are manufactured for the adjoining governments. There are several large iron-works, and the town of Gorbatof in the Sheffield of its district. Leather, especially that variety called Russian leather, is largely manufactured, and sheep and lamb skin dressing is a staple employment. On the right bank of the Oka are several ship-building and dock-yards. The towns and villages are filled with an industrious and thriving manufacturing population. Capital, Nijni-Novgorod (q. v.).

**NIJNI-NOVGOROD** (Lower Novgorod), a famous commercial and manufacturing town in the east of Great Russia, capital of the government of the same name, is situated at the confluence of the Oka with the Volga, in lat. 56° 20' N., long. 44° 1' E., 715 miles east-south-east of St Petersburg, with which, since 1862, it has been connected by railway. The fortified portion of the town occupies a hill overlooking the Volga, and is surrounded with a wall. It contains the Kreml or citadel, two cathedrals, the palaces of the governors, and an obelisk 76 feet high, in memory of Minin and Pojarsky, the deliverers of Moscow. The town possesses several rope-walks, dock-yards, ironworks for building steamers, three steel-cutlery works, &c. The commercial portion of N. is situated on a projecting point of land which forms the right bank of the Volga and the left bank of the Oka. It has an area of 350 acres, consists of 60 ranges of brick buildings, is surrounded by a canal, and contains 2520 shops, a Russian cathedral, an Armenian church, a mosque, a temporary branch of the state bank, counting-house, post-office, &c. Here the great annual fair is held; but the commerce of N. is not confined to this area. On the further side of the canal are ranges of wooden erections, containing 5000 shops, exclusive of taverns, baths, and other public establishments. The fair, which lasts over a month, is officially opened on the 27th July; but, owing to the tardy arrival of the Chinese and Siberian goods, a day or two generally intervenes before it actually commences. With the opening of the fair, the town becomes rapidly filled with merchants from every country and climate—Europeans, Bokharians, Khivans, Kirghizes, Tartars, Armenians, Persians, and even Chinese. The merchants are required to pay nothing in the way of taxes during their stay, except, indeed, the rent of the shops they occupy, and every one has the privilege of trading freely without any exaction from the crown. The fair of N. is of great commercial importance, especially with respect to the eastern and central provinces. The value of goods disposed of during the fair is great, and seems to be continually on the increase. In 1697, the value of the goods sold was £14,000; in 1741, £81,000; in 1790, £5,000,000; in 1857, £14,000,000; in 1861, £16,038,000; in 1863, £16,760,000. The articles gathered at the fair for sale may be divided into three groups as follows: 1. *Russian raw and manufactured goods*, consisting chiefly of cotton stuffs, linen and woollen goods, furs, metals, corn, drysalter's goods, chemicals, &c., the total value of which was 74,488,400 roubles. 2. *European and Colonial goods*, of which the manufactured goods amounted to 2,964,600 roubles; wines, 1,990,900 roubles; colonial goods, chemicals, &c., 6,294,800 roubles; total, 11,250,300 roubles. 3. *Asiatic goods*: Chinese (chiefly tea), 8,218,000 roubles; Bokharian and Khivan silks and cottons, 2,337,000 roubles;

Caucasian and Armenian, 4,199,200 roubles: total, 14,754,200 roubles. Grand total, 100,492,900 roubles.

N., an ancient town, was founded in 1221 by Prince Yury Vsevolodovitch as a stronghold against the invasions of the Bulgarians and the Mordva. It was devastated on several occasions by the Tartars; and in 1612, during the civil dissensions in Russia, when it was on the point of falling a prey to Poland, Minin, the famous butcher of N., collected an armed force here, which, under Prince Pojarsky, drove the invaders from the capital. See Moscow. The prosperity of this town dates from the year 1817, when the great fair was removed to N. from Makaricf, on account of the destructive fire which broke out in the latter place, and destroyed the greater portion of the stores and magazines. The normal population of the town is (1864) 36,350; but it is increased to upwards of 200,000 during the fair. N., so favourably situated for purposes of commerce, carries on a brisk trade during the whole season of navigation, and especially in spring during full water.

NIJNI-TAGILSK, a town of Russia, in the government of Perm, situated on the river Tagil, amid the Ural Mountains, 150 miles east of the city of Perm. It is one of the most important mining towns in Russia, or in the world. The soil in the immediate vicinity is everywhere rich in iron, copper, gold, and platina; not far off is the famous magnetic mountain Blagodot, 1422 feet high. Akimfi Demidoff (q. v.) established the first foundry here in 1725. The yield both of iron and copper is immensely large. Pop. 25,000.

NIKOLAEV, a town of South Russia, in the government of Kherson, and 40 miles north-west of the town of that name, stands 25 miles above the mouth of the Bug, and at the confluence of that river with the Ingul. It was founded in 1790, and its situation was found so convenient for ship-building purposes, that it soon became the centre of the naval administration of the Black Sea. It has broad straight streets, contains several barracks, a cathedral, schools for pilots, hospitals, an observatory, and an arsenal. During the period of its greatest prosperity (from the beginning to the middle of the present c.), 10,000 men were employed at N. in ship-building and other naval operations. Since the treaty of Paris in 1856, N. has lost much of its former importance. Pop. 33,500. (1867—67,972.)

NIKOLAEVSK, chief town of the Amur territory, in Eastern Siberia, situated on a well-wooded plateau on the left bank of the Amur, and 22 miles from its mouth, in lat. 53° 15' N., long. 140° 35' E., 6750 miles east from St Petersburg. It contains a wooden church with one large and five smaller steeples, the town residence of the governor, and the storhouse of the Amur Company. The approaches to the town are defended by four batteries, which command the upper as well as the lower part of the river. The Amur is here a mile and a quarter broad, but the landing-place is available only for small craft, all large vessels being compelled to lie in mid-stream. It was founded in 1851; in 1855, it consisted of 150 houses, and in 1858, of 249 houses. It is the seat of naval and civil administration, and the centre of the commercial activity of the district. Goods from the interior of Siberia and China are brought hither and shipped in foreign (chiefly American) vessels; and Siberian tradesmen now receive and despatch their goods by sea, as the land route formerly pursued was both tedious and expensive. Rich and extensive forests clothe the banks of the river, and the abundant pastures offer facilities for cattle-breeding. The chief hindrance to the rapid improvement of the

settlement is a want of hands and capital. A line of telegraph already extends from St Petersburg to beyond Irkutsk, and is in process of extension to Nikolaevsk. Mean temperature throughout the year, 39° 42'. Pop. (1858) 2552.

NIKOLSBURG, or MIKULOV, a town of Austria, in the south of Moravia, 27 miles south of Brunn, lies at the foot of the Pollaver Hills, famous for their rich red wines. The town belongs to the princely family of Dietrichstein. It has several steam-mills, and cotton and silk factories. In the middle of the town, upon a rock, stands the Castle of the Dietrichsteins, with a library of 20,000 volumes, and a vat in the cellars capable of containing 2000 eimers. Pop. 9400, of whom more than a half are Jews.

NIKO'POL, a thriving town of Southern Russia, in the government of Ekaterinoslav, on the right bank of the Dnieper, about 200 miles from its mouth, in lat. 47° 33' N. N. is the centre of an extensive agricultural district, the produce of which is here shipped to Odessa. Between N. and the port of Odessa, there is regular communication by steam-boat. The natural advantages of N. promise to make it one of the principal commercial centres on the Dnieper. Pop. 7260.

NILE (*Nilus*), called by the Egyptians, *Hapi Mu* (the genius of the waters), and by the Hebrews *Sihor* (the black), the river of North-eastern Africa formed by the union of the Bahr-el-Abiad (the White or True Nile) and the Bahr-el-Azrek (Blue Nile). The source of the first of these, the True Nile, or at least its great feeder, has at last been discovered by Captains Speke and Grant in the Victoria Nyanza Lake, which extends from about lat. 0° 20' N. to 2° 50' S., and from long. 31° 40' to 35° E., and is 3740 feet above the sea. The second has its source in Abyssinia, in lat. 10° 59' N., and long. 36° 55' E. From its outfall from Lake Victoria Nyanza at the 'Ripon Falls,' lat. 0° 20' N., long. 33° 30' E., the White Nile flows in a north-north-westerly direction as far as Gondokoro, which is in lat. 4° 55' N. and long. 31° 50' E., and 1900 feet above the sea. Several moderately-sized streams are supposed to flow out of the lake on each side of the main source. These are the Kafu and the Luajerré on the west, and the Asua on the east, the former joining the main stream in the Unyoro, the latter in the Madi country. After issuing from the lake, the Nile passes a range of sandstone hills, then rushes down due north with the beauty of a mountain torrent, running off at last into long flats, more like a lake than a river. In the Kidi country it is navigable as far as the Karuma Falls, where it rushes on with boisterous liveliness. In the Madi country the Nile has its well-known character of long flats and long rapids.

At the junction of the Asua River, in the Madi territory, lat. 4° 40' N., Captain Speke's discoveries terminated, for to this point the ivory-traders had ascended the Nile from Gondokoro. For about 500 miles after this, the river flows very tortuously, first in a north-westerly and then in a north-easterly direction, and is joined in about lat. 9° 15' N., long. 30° E., by its first great affluent, the Bahr-el-Gazal, which joins the Nile from the west with hardly any perceptible current. The second tributary is the Giraffe River, about one-third the volume of the Nile at its point of junction, long. 31° E. Its source is not known, but its character suggests the possibility of its coming from Lake Nyanza. From the Bahr-el-Gazal the Nile flows in a due easterly direction for about 80 miles, then south for 30 miles, when it is joined by its third tributary, the Sobat River, from the east.

The Sobat is full and navigable. Between this and the town of Khartoum, a distance of about 460 miles, the Nile runs in a northerly direction, with a width of from one to two miles, and is joined by several streams from the east side.

Khartoum, the capital of Nubia, is situated at the confluence of the Bahr-el-Azrek (Blue Nile) and the Bahr-el-Abiad (White Nile), 1188 feet above the sea-level, in lat. 15° 35' N. long., 32° 30' E. The Bahr-el-Azrek, long supposed to be the main branch of the True Nile, is formed by the junction of the Abai and the Blue River. The Abai has its source in Abyssinia, 50 miles from Lake Dembea, which it enters from the south-west; emerging on the south-east of the lake, it flows for about 90 miles in that direction, when it describes a semi-circle round the peninsula of Godjam, and continues north-westerly for about 150 miles. It is here joined by the Blue River from the south, and from this point the Blue Nile flows north-west to Khartoum, receiving from the east two large rivers running nearly parallel to each other, the Dender and the Rahad or Shinfa. From Khartoum, the united stream flows north for about 60 miles, passing the town of Halfaia and the ruins of Meroc to the first cataract, and thence north-east past Shendy (q. v.) to its junction with the Atbara, which enters the Nile at El Damer, lat. 17° 45' N., long. 34° E.

The Atbara, also called Bahr-el-Aswad, or Black River, because it carries down with it the greatest amount of the black mud and slime that manures and fertilises Egypt, is the last tributary received by the Nile. The Goang seems to be the direct source of the Atbara. It rises in the heights to the north of Lake Dembea. About 150 miles from its source it receives the Basalam River, and about 30 miles further on, the Takazze or Setit River, both from the east. The Takazze has a far greater volume of water than either of the preceding rivers. It rises in the Samen Mountains, round which it flows first easterly, then north, till in about lat. 13° 30' N., long. 35° 50' E. it turns north-west, and then almost due west, joining the Athara at right angles. It has many tributaries.

From its junction with the Atbara, the Nile continues to flow northerly through the populous and fertile district of Berber, full of villages, and then enters the desert. Turning westwards, in lat. 19° N., it forms the large island of Mograt, and makes a curve to the south-westward, known as the 'great bend,' in which there are two cataracts. Entering Nubia, the Nile resumes its north-westerly course, with narrow strips of cultivated land on each bank. Here it forms another cataract, and bends round to the north-east with a fifth cataract, in lat. 21° 40' N. After this the valley of the Nile narrows, and at Assouan, in lat. 24° 10' N., it forms the last cataract in descending.

From Assouan to the sea, the average fall of the Nile is two inches to a mile, and its mean velocity about three miles an hour. It waters and fertilises the whole length of the land of Egypt. The delta of the Nile extends from lat. 30° 10' N. to 31° 30' N., and has a base on the Mediterranean of about 150 miles. In it the Nile spreads out into numerous streams, the two principal being those of Rosetta and Damietta. The total length of the Nile, from its exit from the lake to the sea, is about 3300 miles, measured along its course, or 2200 miles direct distance.

A feature peculiar to the river of Egypt is, that from its junction with the Atbara, to its mouth, a distance of upwards of 1500 miles, it receives no affluent whatever, and yet it is able to contend with the burning sun, and scarcely less burning sands of Nubia. With the ancient Egyptians

the river was held sacred: the god Nilus was one of the lesser divinities. Its annual overflow is one of the greatest marvels in the physical geography of the globe, for it has risen to within a few hours of the same time, and to within a few inches of the same height, year after year for unknown ages. At Khartoum it begins to increase early in April, but in lower Egypt the inundation usually begins about the 25th of June, and attains its height in three months. It remains stationary about twelve days, and then subsides. The cultivable soil of Egypt is wholly dependent on the rise of the Nile, and its failure causes a dearth; for, virtually, the country has no rain. Continuous south-wind brings a good, and north-wind a bad year. During a good inundation, the rise is about 40 feet on the Tropic of Capricorn, 36 feet at Thebes, and 4 feet at the Damietta and Rosetta mouths in the Delta. If at Cairo the rise is only 18 or 20 feet, there is a scarcity; up to 24 feet, a deficiency; 25 to 27 feet is good: more than that causes a flood, and fosters plague and murrain. During the inundation, the whole valley is covered with water, from which the villages rise like islands, protected by dykes. Of late years the overflow has been greater than the average of many centuries. The rise and fall of the trunk stream of the lower Nile is owing to the periodicity of the rains on the mountains of Abyssinia and in the basin of Lake Nyanza, where, on the equator, it rains, more or less, all the year round, most copiously during the equinoxes. The banks of the Nile swarm with birds, among which are vultures, cormorants, geese, pelicans, quails, and the white ibis; and its sweet, soft waters teem with fish. The average amount of alluvium brought down by the river is estimated at a deposit of 4½ inches in a century—by some, it is made as high as 6 inches; the greater part of it is brought down by the Atbara.

The question of the source of the Nile is at once the oldest and the most recent of geography. It was a puzzle in the time of Moses, and long before his time. That the sources of a river, at whose mouth one of the earliest and most civilised peoples was established, should have been so long veiled in obscurity, is unparalleled in geographical research. The want of success in exploring the upper basin of the Nile may be attributed to the great length of the river, to the difficulties which beset the traveller in the physical nature of the countries he must pass through, the climate, and the jealousy, ignorance, and barbarism of the native tribes. This problem of centuries has now been in so far satisfactorily solved, for the question remains, whether there may not yet be found feeders of the White Nile carrying back its source to a still greater distance in the interior; a question which further research alone can answer. The journeys of Krapf and Rebmann to the foot of Kilimandjaro and the other snowy mountains in the east of Africa, believed by them to be the ancient and almost fabled 'Mountains of the Moon,' and the explorations of travellers up the White Nile, pointed to the conclusion that it was among these that the sources of the great Egyptian river would ultimately be discovered.

There was, however, another theory. Rumours gathered from the natives pointed to lakes in the regions south of the equator, as the true sources of the Nile. To explore this country, the distinguished traveller Captain Richard Burton, accompanied by Captain Speke, started from the Zanzibar coast in 1857. Their enterprise was so far successful that they discovered Lake Tanganyika, in lat. 5° S., long. 36° E., and a large crescent-shaped mass of mountains, overhanging the northern half of the lake, and 10,000 feet high, considered by Captain

Speke to be the true Mountains of the Moon. On the shores of Lake Tanganyika, Burton was laid up by illness, and his companion, after surveying the northern portion of the lake, left him there to recruit his health, while he (Speke) proceeded northwards to discover another huge 'nyanza' or lake, of the existence of which he was informed by the natives. This he accomplished on the 31 of August 1858, when he discovered the southern end

The Upper Course of the Nile.

of the Victoria Nyanza (q. v.). In his journal he says of this immense sheet of water: 'I no longer felt any doubt that the lake at my feet gave birth to that interesting river, the source of which has been the subject of so much speculation, and the object of so many explorers.' The idea of descending the Nile from the Nyanza seems at once to have struck him; but as at that time his preparations were quite insufficient, he was reluctantly compelled to return to Europe.

Judging that he was in a fair way to solve the great African problem, Captain Speke, taking with him Captain Grant, returned to the lake region in 1861. The expedition approached the Victoria Nyanza again from the coast of Zanzibar; and the first place from which they obtained a view of it during the second expedition, was the town of Mashonde on its western side. Thence they pursued their way along the shore northwards. The land above the lake was found to be composed of low sandstone hills, covered with gigantic grass of unsurpassed verdure, and by dells of trees as tall

and straight as the blue gums of Australia. Crossing the equator, they reached streams which are said to flow out of the lake, and further on, in the centre of its northern coast, the parent stream of the Nile, 150 yards in breadth, flowing over rocks of an igneous character, and forming falls 12 feet high, which Captain Speke christened the 'Ripon Falls,' in honour of the president of the Royal Geographical Society at the time of his starting on the expedition. It is from the west that the lake receives its largest supplies of water through the medium of smaller lakes. These derive their moisture from the so-called 'Mountains of the Moon,' which are situated in the middle of the rainy zone, where Captain Speke observed that no fewer than 233 days in the year were more or less wet days.

In the kingdom of Karagwé, Captain Speke found a very superior negro race, much better disposed to strangers than any of the tribes he had formerly passed through. The country occupied by this race, and that of Uganda, stretches along the Nyanza, and covers half of its western and northern shores, the Uganda being bounded on the east by the main stream of the Nile. The sultan of Uganda exercises an absolute power over his people. He (the sultan) had a knowledge of the navigation of the Nile by white men, and was desirous of establishing a commercial intercourse with Gondokoro, but was prevented by the hostility of the tribes to the north of his own. Speke was detained a prisoner for five months in this kingdom, but was treated with the greatest hospitality, though his movements were closely watched until he got into the neighbouring kingdom of Unyero.

North of Unyero, the dialects belonging to the language of South Africa, and which up to this point are used by the various tribes, suddenly cease, and give place to those of the language of North Africa.

With regard to the civilisation of these three kingdoms of Karagwé, Uganda, and Unyero, Speke does not hesitate to give the preference to the first, and represents the king, Rumanika, as an intelligent, honest man. Mtésa, the sovereign of Uganda, is an amiable youth, taking pleasure in field exercises; but one rule of his court requires that a human sacrifice be offered daily for the good of the state. The king of Unyero, Kamrasi by name, is represented as a harsh, suspicious, and pitiless creature, his principal occupation being the exercise of his unbridled authority.

The travellers spent a whole year in making their way through these three kingdoms, into which no white man had ever before penetrated, and only succeeded in getting away by making numerous presents, and still more numerous promises. Besides ascertaining the latitude and longitude of all the important points on the route, the travellers made numerous meteorological observations.

NILOMETER (the measurer of the Nile), the name of two buildings existing in Egypt, one in the island of Rhoda, opposite to Cairo, the other at Elephantine, close to Assouan, in 24° 5' 23" N. lat. The first consists of a square well, in which is placed a graduated pillar of marble, and is called a *mektias* or measure; the pillar contains 24 *deukhs* or cubits, each of which measure 21'386 inches, or according to Greaves, 1'824 feet, and contains 24 digits; but in its present state, it does not appear to have been intended to mark a rise of more than 16 cubits. This pillar is exceedingly slender. The building formerly had a dome, bearing a Cufic inscription, dated 847 A.D., and is said to have been erected by the Calif Mamun, or his successor Wathek Billáh. The first-mentioned monarch is said to have erected another nilometer at the village

of Banbenouda, in the Sæed, and to have repaired an old one at Ekhrmin. The Calif El Motawukkel built the present one. The mode of calculating the increase at the nilometer is rather complex, and to a certain extent arbitrary, political and financial reasons rendering the process a mystery even to the natives. At the present day the Nile is supposed to have risen to 18 cubits when the canals are cut; this is the height of the lowest inundation; 19 cubits are considered tolerable, 20 excellent, 21 adequate, and 22 complete, 24 are ruinous. In the time of Edrisi, however, 16 cubits were considered sufficient. The object of these nilometers was to measure the amount of taxation to be imposed on the country. The nilometer at Cairo is, however, much more recent than that existing at Elephantine, which consists of a staircase between two walls descending to the Nile. One of these walls has engraved on it a series of lines at proper intervals marking the different elevations to which the river rose under the Cæsars. The cubits here are divided into 14ths or double digits, and measure 1 foot 8·625 inches. This nilometer is described by Strabo. The probability is, that many nilometers existed in the days of the Pharaohs, probably one in each city. In the days of Mæris, 8 cubits were sufficient, but 15 or 16 were required in the time of Herodotus, 456 B.C., and this was the mean under the Romans. According to Pliny, if the inundation did not exceed 12 cubits it produced a famine, 13 starved the country, 14 rejoiced it, 15 was safety, and 16 delight, and this number is symbolically represented by the number of children playing round the river god on statues of the Roman period. The oldest nilometer appears to have been erected at Memphis, and it was transferred by Constantine to a church in the vicinity of the Serapeium; but Julian sent it back to this temple, where it remained till its destruction by Theodosius. At the present day, the rise is watched for with anxiety, and proclaimed by four criers.—Herodotus, ii. 13; Strabo, lib. xvii.; Wilkinson, *Topogr. of Thebes*, pp. 311—317. Hekekyan Bey, *Siriadic Monuments* (Lon. 1863), p. 145.

NIMBUS, in Art, especially in Sacred Art, is the name given to the disc or halo which encircles the head of the sacred personage who is represented. Its use is almost universal in those religions of which we possess any artistic remains—the Indian, the Egyptian, the Etruscan, the Greek, and the Roman. In the Hebrew scriptures, we trace, in the absence of representations, the same symbolised idea in the light which shone upon the face of Moses at his return from Sinai (Exod. xxxiv. 29—35), and in the light with which the Lord is clothed as with a garment. Ps. ciii. 1, Vulg. (eiv. 1, auth. vers.); and in the New Testament in the transfiguration of our Lord (Luke ix. 31), and in the 'crowns' of the just, to which allusion is so often made (2 Tim. iv. 8; 1 Peter v. 4; Apoc. iv. 4). Nevertheless, the nimbus, strictly so called, is comparatively recent in Christian art, appearing first towards the end of the 5th century. Later in Christian art, it became almost a necessary appendage of all representations of God or of the saints. Its ordinary form is the circular or semi-circular; a form, indeed, in which later symbolists discover an emblem of perfection, and of eternity; but the nimbus of the Eternal Father is often in the form of a triangle, and that of the Trinity an emanation of light, the rays of which form the three arms of a cross. The nimbus of the Virgin is sometimes a simple ring, and sometimes a crown or diadem; occasionally it is encircled by an ornamental border, on which twelve stars are sometimes represented. Her nimbus, as well as that of

the Divine Persons, is commonly of gold; but that of the Virgin Mary is occasionally in colours, as blue, red, purple, or white. The nimbus of the saints is ordinarily the semicircle or lunula. Dedron mentions the curious instance of a picture of the traitor Judas with a black nimbus! In later art, the nimbus became lighter and more aerial, melting, as it were, into the picture; and in Raphael's saints it occasionally fades into the very faintest indication of a golden tinge around the head. In connection with the nimbus may also be mentioned two analogous forms—the *Aureole* and the *Glory*. The former is an illumination surrounding, not the head only, but the entire figure. If the figure be upright, the aureole is commonly oval, when it is called the *vesica piscis*, and is supposed to contain an allusion to the *ichthys*. With a seated figure it becomes circular, and is occasionally divided by radiating bands, in the form of a wheel; sometimes it takes a quatrefoil form. It is commonly of gold, but occasionally also is in colours. The Glory is a combination of the nimbus and the aureole, and is chiefly seen in Byzantine pictures, and those of the early South German school.

NIMEGUEN. See NIJMEGEN.

NÎMES (anc. *Nemausus*), a town of France, capital of the department of Gard, stands in a fertile plain surrounded by vine-clad hills, 30 miles north-east of Montpellier, with which it is connected by railway. It consists of the town proper (ill built and dirty), and of three handsome suburbs. In the vicinity are the beautiful remains of the Roman aqueduct called the *Pont du Gard*. The chief of the modern edifices are the *Palais-de-Justice*, the theatre, and the hospitals. The *Grande Place* is embellished with one of the most magnificent fountains in France. N. contains numerous and variously-constituted educational institutions, an important public library, Maria Theresa's Museum (in the *Maison Carrée*), a museum of natural history, &c. It is the general entrepôt for the silks produced in the south of France, and its manufactures are principally silk and cotton fabrics. More than 10,000 looms are constantly in operation in the city, and about 6000 in the immediate vicinity. Shawls, handkerchiefs, lace, brandy, wines, &c., are made. Within the town are numerous and beautiful Roman remains, the chief of which are the amphitheatre; the *Maison Carrée* (Square House), a fine specimen of Corinthian architecture; a temple and fountain consecrated to Diana; *La Tour Magne* (Great Tower); the baths, and two Roman gates. See Menard's *Histoire des Antiquités de la Ville de N. et de ses Environs* (1838). Pop. 50,882.

Previously to the Roman invasion, N.—which is supposed to have been founded by a colony from Massilia (Marseille)—was the chief city of the Volce Arecomici. It flourished under the Romans, and was one of the great cities of Gaul. It surrendered to the rule of the Visigoths between 465 and 553, and afterwards to that of the Franks. Subsequently, it became a possession of Aragon; but was finally restored to France in 1259 by the treaty of Corbeil. The inhabitants adopted Calvinism in the 16th c., and on many occasions suffered severely for their religious principles. In 1791 and 1815, bloody religious and political reactions took place here.

NINIROD. See BABYLON.

NINEVEH, or NINUS, a very ancient and famous city, the capital of the great Assyrian empire, said in Scripture (Gen. x. 11) to have been founded by Ninus or Nimrod. It was situated on the east bank of the Tigris, opposite to the present

Mosul. According to the accounts of the classic writers, the city was of vast extent, 480 stadia, or more than 60 miles in circumference. Its walls were 100 feet high, broad enough for three chariots, and furnished with 1500 towers, each 200 feet in height. In the *Book of Jonah* it is described as an 'exceeding great city of three days' journey,' and one 'wherein are more than sixscore thousand persons that cannot discern between their right hand and their left hand' (children or infants are probably meant). After having been for many centuries the seat of empire, it was taken after a siege of several years and destroyed by the united armies of the Medes under Cyaxares, and the Babylonians under Nabopolassar, about 625 B. C. When Herodotus, not quite 200 years afterwards, and Xenophon visited the spot, there remained only ruins. Tradition continued to point pretty accurately to the site of N.; but it is only of late years that actual explorations have been made. For an account of these, see ASSYRIA.

NINGPO, a department in the province of Chekiang, China, comprising the city of that name, the Chusan group of islands, and the cities of Tsike, Fungwa, Chinhai, and Tsiangshan. The port of N. is situated at the confluence of two small streams, in lat. 29° 55' N., long. 121° 22' E., 12 miles from the sea, on an alluvial flat of extreme fertility, intersected by a net-work of rivulets and canals. Its walls are five miles in circumference, about 25 feet high, 22 feet wide at the base, and 15 at the top, with six double gates. As is the case with all the cities in this part of China, N. is permeated by canals communicating with a moat nearly surrounding the walls, and with the adjacent country. In one part of the city they expand into basins, and receive the name of lakes—the Sun Lake and Moon Lake. In the former, is an island devoted to temples, and accessible by bridges. These bridges—good specimens of those aerial stone edifices which adorn this part of China—are required to sustain little more than their own weight, as the roads here are all mere footpaths, and no wheeled vehicles are found. One of the rivers is crossed by a bridge of boats, 200 yards long. The entire city is well paved; the streets are wider than those of most Chinese cities, and the display of shops is indicative of wealth and luxury. Nowhere, save at Hanchau, are such extensive and beautiful temples to be found. The most elegant and costly of these is dedicated to the Queen of Heaven; the goddess being the daughter of a Fuhkien fisherman, the people of that maritime province are her more special votaries. Elaborate stone sculpture, exquisitely fine wood carving, and a profusion of gilt and tinsel, shew that no expense has been spared to honour the popular goddess.

The centre of the city is ornamented with an elegant seven-storied hexagonal tower—the heaven-bestowed pagoda, 160 feet in height. A spiral flight of steps within the walls of the tower lead to the summit, from which the gazer beholds a splendid scene; innumerable villages dot the plain, which is reticulated by silvery water-courses, replete with evidence of successful commerce and agriculture. The population of the city is about 300,000; that of the plain, about 2,000,000. On many of the hills which environ these cities, green tea is successfully cultivated; while the mulberry, the tallow-tree, and numerous other stimulants of industry abound. Two crops of rice are procured annually from the fields; while the fisheries of the rivers and adjacent coast give employment to a numerous class of the population. Ice-houses close to the river give the banks a picturesque appearance; the ice is used for curing fish. N. has an extensive coasting trade;

but no considerable foreign trade has been developed, owing mainly to portrages on the inland water-communications, and to the proximity of Shanghai, where no such obstructions exist. The district city of Chinhai, at the mouth of the Ningpo River, is also a port. A walled town, containing about 30,000 inhabitants, 10 miles to the east of Chinhai, is Kingtang, the nearest of the Chusan archipelago. Tinghai is the district city of the island of Chusan, which is 20 miles long, from 6 to 10 wide, and 51 in circumference. It is mountainous, with fertile valleys in a high state of cultivation. It has an excellent harbour. Tinghai was garrisoned several years by Her Majesty's forces from 1841, and was again temporarily occupied by the allied forces in 1860.—Dr Macgowan's *Lectures*.

NINIAN, St, the apostle of the Picts, lived in the latter half of the 4th and the beginning of the 5th century. Whether Christianity had been introduced among the Picts before the time of N. has been a subject of controversy; but although the details of the legendary account are uncertain, it seems, beyond all question, that some Christians were to be found, at least among the Southern Picts, in what is now known as the Lowlands of Scotland, from the end of the 2d century. Nevertheless, either their number was originally very small, or the rising church had fallen away under adverse circumstances; and it is certain that when N. appeared among them, the Picts were in the main a pagan people. He was a Briton, and of noble birth; but had been educated at Rome, and there ordained a bishop. The exact time of his preaching in Scotland is unknown. His labours appear to have commenced in Cumbria, and to have extended over the greater part of the district as far north as the Grampian Hills, his see being fixed at Candida Casa, or Whithorn in the modern Wigtonshire. His death is placed by the Bollandists in 432; his festival is the 16th September.

NINON DE LENCLOS, a celebrated French-woman, one of those characters that could have appeared only in the French Society of the 17th c., was born of good family at Paris in 1615. Her mother tried to imbue her mind with a love of the principles of religion and morality, but her father, more successfully, with a taste for pleasure. Even as a child she was remarkable for her beauty and the exquisite grace of her person. She was carefully educated, spoke several foreign languages, excelled in music and dancing, and had a great fund of sharp and lively wit. At the age of ten she read Montaigne's *Essays*. Six years later, she commenced her long career of licentious gallantry by an amour with Gaspard de Coligny, then Comte de Chatillon. To Coligny succeeded innumerable favourites, but never more than one at a time. Among N.'s lovers we may mention the Marquis de Villars, the Marquis de Sevigné, the Marquis de Gersay, the great Condé, the Duc de la Rochefoucauld, Marshal d'Albret, Marshal d'Estrées, the Abbé d'Effiat, Gourville, and La Châtre. She had two sons, but never shewed in regard to them the slightest instinct of maternity. The fate of one was horrible. Brought up in ignorance of his mother, he followed the rest of the world, and conceived a passion for her. When she informed him of the relation that subsisted between them, the unhappy youth was seized with horror, and blew out his brains in a frenzy of remorse. Even this calamity did not seriously affect N.; she was too well-bred to allow it to do that. N. was nearly as celebrated for her manners as for her beauty. The most respectable and virtuous women sent their

children to her house to acquire taste, style, politeness. So great was her reputation, that when Queen Christina of Sweden came to Paris, she said she wished particularly to visit the French Academy and Ninon de Lenclos. We may gather some idea of her wit and sense from the fact that La Rochefoucauld consulted her upon his maxims, Molière upon his comedies, and Scarron upon his romances. She died 17th October 1706, at the age of 90, having preserved some remains of her beauty almost to the last.—See Guyon de Sardière's *Vie de Ninon de Lenclos*; Saint-Eyremond's *Œuvres*; Douxmesnil's *Mémoires pour servir à l'Histoire de Mlle de Lenclos*.

**NINTH**, in Music, the next interval above the octave, being the same interval which an octave lower is termed the second. See **INTERVAL**.

**NIOBÉ**, in Greek mythology, the daughter of Tantalus and (according to the most popular version of the story) the sister of Pelops. She was the wife of Amphion, king of Thebes, and bore him six sons and six daughters. Proud of her children, she despised Leto or Latona, who had only two children, Apollo and Diana, and prevented the people from the worship of these divinities; whereupon Latona, enraged, moved her children to destroy all the children of N. with their arrows. They lay nine days in their blood unburied, when Jupiter changed them into stone, and on the tenth day they were buried by the gods themselves. N. wandered about in distress, and at last was changed into stone on Mount Sipylus, between Lydia and Phrygia, retaining, however, even as stone a sense of her woe. Such is the Homeric legend, which, however, was afterwards much varied and enlarged. N. was a favourite subject of the ancient artists. A group representing N. and her children was discovered at Rome in 1583, and is now in Florence. Some of the sculptures are very beautiful. Even the ancient Romans were in doubts whether the work proceeded from Scopas or Praxiteles.

**NIOBIUM** (symbol, Nb) is a rare metal discovered by H. Rose in the mineral *Tantalite*. It is obtained by reducing the double fluoride of niobium and potassium with sodium; and forms a black powder insoluble in nitric acid, but readily soluble in a mixture of nitric and hydrofluoric acids. With oxygen it forms two compounds, niobous acid, NbO, and niobic acid, NbO<sub>2</sub>; and chlorine, bromine, fluorine, and sulphur compounds corresponding to these acids have been prepared and examined. Neither the metal itself nor any of its compounds are of any practical importance.

**NIORT**, a town of France, capital of the department of Deux-Sèvres, on the Sèvre-Niortaise, is situated in an agreeable country, occupying the slope of two hills and the valley which intervenes, 110 miles north of Bordeaux. Its principal edifices are the Church of Notre-Dame, the town-hall, the theatre, and the old castle. Besides these, the beautiful Fountain du Vivier, the promenades, the library, and the college are worthy of notice. The dressing of chamois and the manufacture of gloves are the principal branches of industry. Dyeworks and tanneries are also in operation. Pop. 18,454.

N. is an ancient town. In the 14th c. it was taken by the English, and held by them for 18 years.

**NIPA**, a genus of endogenous plants referred by some botanists to the order *Pandanaceæ*, and by others to palms. *N. fruticans* is very common in the Eastern Archipelago, and northwards as far as the Mergui River, but becomes rare further north. It flourishes with the mangrove in places inundated when the tide rises. It abounds in saccharine sap, from which a kind of *Palm Wine* is made, and also

excellent sugar. The leaves are much employed for roofing houses, and large quantities are sent from the Tenasserim provinces northwards for this use.

**NIPADITES**, a genus of fossil palm fruits found in the Eocene clays of the island of Sheppey, in Kent. They are referred to *Nipa* as their nearest living ally, and are considered to have resembled in habit that genus, and to have grown on the banks of an immense river which flowed from the tropical regions of a continent lying to the southward, and entered the sea at Sheppey, where it deposited the fruits and leaves borne down with the current, by the side of the startishes and mollusca which inhabited the estuary. Some 13 different kinds have been described.

**NIPON**, or **NIPHON**, the largest by far of the group of islands forming the empire of Japan (q. v.). It is the mainland—the England and Wales—of Dai Nipon, or Great Nipon, the Japanese name for the empire as a whole. N. is included between 33° 30'—41° 30' N. lat., and 130° 50'—142° 20' E. long. The inland sea of Suonada separates it from the islands of Kiusiu and Sikopf, and the Strait of Matsumai on the north-east from the island of Yesso. On the N. it is bounded by the Sea of Japan, and on the S. and E. by the Pacific Ocean. The length of N. is 900 miles, and its breadth 240; and it has an estimated area of 42,000 square miles. Yeddo (q. v.), the capital of the empire, where the Tycoon holds his court, and Miaco, the residence of the Mikado, or spiritual emperor, are the chief cities of Nipon. Important meteorological observations, which give a good idea of the climate of the country generally, have recently been made by Dr Hepburn at Kanagawa. These are exhibited in a condensed form in the following table:

| 1860.              | Highest. | Lowest. | Rain in Inches. | Snow in Inches. | Number of Earthquakes. |
|--------------------|----------|---------|-----------------|-----------------|------------------------|
| January, . . . .   | 59° F.   | 18° F.  |                 |                 | 1                      |
| February, . . . .  | 58       | 19      |                 | 2               | 1                      |
| March, . . . . .   | 63       | 30      | 6½              | 1½              | 2                      |
| April, . . . . .   | 76       | 36      | 3½              |                 |                        |
| May, . . . . .     | 80       | 44      | 16½             |                 | 2                      |
| June, . . . . .    | 87       | 54      | 18½             |                 | 11                     |
| July, . . . . .    | 92       | 63      | 8½              |                 | 4                      |
| August, . . . . .  | 92       | 69      | 1 1/16th        |                 | 2                      |
| September, . . . . | 89       | 62      | 2½              |                 | 2                      |
| October, . . . . . | 81       | 50      | 7½              |                 | 2                      |
| November, . . . .  | 68       | 36      | 5               |                 | 4                      |
| December, . . . .  | 71       | 22      | 3½              | 1               | 1                      |

July and August are, therefore, the two hottest months in the year, while January and February are the coldest. Bracing sea-breezes make the heat of summer very endurable. The spring and autumn months are delightful. During the latter season, the sun for days, and even weeks together, runs his course in a sky undimmed by a cloud.—*Yeddo and Peking, a Narrative of a Journey to the Capitals of Japan and China*, by Robert Fortune (Lond. 1863, &c.).

**NIRUKTA**, or 'Explanation,' is the name of one of the six *Vedāngas* (see **VEDA**) which explains difficult Vedic words. That there have been several works engaged in such a task, even at a very remote period of Hindu antiquity, and that they bore the name of Nirukta is probable, for 'Nirukta authors' are quoted either generally or by name in several Sanskrit authors; but the work which is emphatically called *Nirukta*, and which, for the present, is the only surviving representative of this important Vedānga, is that of *Yaska*, who was a predecessor of Pānini (q. v.). His work consists of three parts—the *Naighantūka*, where, for the most part, synonymous words are taught; the *Naigama*, which contains

words that usually occur in the Vedas only; and the *Daivata*, which contains words chiefly relating to deities and sacrificial acts. A Commentary on this work has been composed by the same Yāska, and it likewise bears the name of Nirukta. In the latter, Vedic passages are quoted in illustration of the words to be explained, and the comment given by Yāska on these passages is the oldest instance, known at present to Sanskrit philology, of a Vedic gloss. Besides the great importance which Yāska's *Nirukta* thus possesses for a proper understanding of the Vedic texts, it is valuable also on account of several discussions which it raises on grammatical and other questions, and on account of the insight it affords us into the scientific and religious condition of its time.—Text and Commentary of *Yāska's Nirukta* have been edited by Professor R. Roth (Göttingen, 1852).

NIRVĀNA (from the Sanserit *nir*, out, and *vāna*, blown; hence, literally, that which is blown out or extinguished) is, in Buddhistic doctrine, the term denoting the final deliverance of the soul from transmigration. It implies, consequently, the last aim of Buddhistic existence, since transmigration is tantamount to a relapse into the evils or miseries of *Sansāra*, or the world. But as Hinduism, or the Brahmanical doctrine, professes to lead to the same end, the difference between *Nirvāna* and *Moksha*, *Apavarga*, or the other terms of Brahmaism designating eternal bliss, and consequent liberation from metempsychosis, rests on the difference of the ideas which both doctrines connect with the condition of the soul after that liberation. *Brahman*, according to the Brahmanical doctrine, being the existing and everlasting cause of the universe, eternal happiness is, to the Brahmanical Hindu, the absorption of the human soul into that cause whence it emanated, never to depart from it again. According to this doctrine, therefore, the liberation of the human soul from transmigration is equivalent to that state of felicity which religion and philosophy attribute to that Entity (see INDIA—Religion). As, however, the ultimate cause of the universe, according to Buddhism, is the Void or Non-entity, the deliverance from transmigration is, to the Buddhists, the return to non-entity, or the absolute extinction of the soul. However much, then, the pious phraseology of their oldest works may embellish the state of *Nirvāna*, and apparently deceive the believer on its real character, it cannot alter this fundamental idea inherent in it. We are told, for instance, that *Nirvāna* is quietude and identity, whereas *Sansāra* is turmoil and variety; that *Nirvāna* is freedom from all conditions of existence, whereas *Sansāra* is birth, disease, decrepitude and death, sin and pain, merit and demerit, virtue and vice; that *Nirvāna* is the shore of salvation for those who are in danger of being drowned in the sea of *Sansāra*; that it is the free port ready to receive those who have escaped the dungeon of existence, the medicine which cures all diseases, the water which quenches the thirst of all desires, &c.; but to the mind of the orthodox Buddhist, all these definitions convey but the one idea, that the blessings promised in the condition of *Nirvāna* are tantamount to the absolute 'extinction of the human soul,' after it has obeyed, in this life, all the injunctions of Buddhism, and become convinced of all its tenets on the nature of the world and the final destination of the soul.

Although this is the orthodox view of *Nirvāna*, according to the oldest Buddhistic doctrine, it is necessary to point out two categories of different views which have obscured the original idea of *Nirvāna*, and even induced some modern writers to believe that the final beatitude of the oldest

Buddhistic doctrine is not equivalent to the absolute annihilation of the soul.

The first category of these latter, or, as we may call them, heterodox views, is that which confounds with *Nirvāna* the preparatory labour of the mind to arrive at that end, and therefore assumes that *Nirvāna* is the extinction of thought, or the cessation, to thought, of all difference between subject and object, virtue and vice, &c., or certain speculations on a creative cause, the conditions of the universe, and so on. All these views the Buddha himself rejects, as appears from the work *Lankāvātara* (q. v.), where relating his discourse on the real meaning of *Nirvāna*, before the Bodhisattwa Mahāmāti. The erroneousness of those views is obviously based on the fact, that the mind, even though in a state of unconsciousness, as when ceasing to think, or when speculating, is still within the pale of existence. Thus, to obviate the mistaken notion that such a state is the real *Nirvāna*, Buddhistic works sometimes use the term *Nirupadhi'sesha Nirvāna*, or 'the *Nirvāna* without a remainder of substratum' (i. e., without a rest of existence), in contradistinction to the '*Nirvāna* with a remainder;' meaning by the latter expression that condition of a saint which, in consequence of his bodily and mental austerities, immediately precedes his real *Nirvāna*, but in which, nevertheless, he is still an occupant of the material world.

The second category of heterodox views on the *Nirvāna* is that which, though acknowledging in principle the original notion of Buddhistic salvation, represents, as it were, a compromise with the popular mind. It belongs to a later period of Buddhism, when this religion, in extending its conquests over Asia, had to encounter creeds which abhorred the idea of an absolute nihilism. This compromise coincides with the creation of a Buddhistic pantheon, and with the classification of Buddhist saints into three classes, each of which has its own *Nirvāna*; that of the two lower degrees consisting of a vast number of years, at the end of which, however, these saints are born again; while the absolute *Nirvāna* is reserved for the highest class of saints. Hence Buddhistic salvation is then spoken of, either simply as *Nirvāna*, or the lowest, or as *Parinirvāna*, the middle, or as *Mahāparinirvāna*, or the highest extinction of the soul; and as those who have not yet attained to the highest *Nirvāna* must live in the heavens of the two inferior classes of saints until they reappear in this world, their condition of *Nirvāna* is assimilated to that state of more or less material happiness which is also held out to the Brahmanical Hindu before he is completely absorbed into Brahman.

When, in its last stage, Buddhism is driven to the assumption of an *Adi*, or primitive, Buddha, as the creator of the universe, *Nirvāna*, then meaning the absorption into him, ceases to have any real affinity with the original Buddhistic term. See BUDDHISM and LAMAISM.

NISHAPUR, or NÜSHAPUR, a town of Persia, province of Khorassan, 53 miles west-south-west of Meshid, is situated in a most beautiful and fertile valley. Pop. about 8000. It is surrounded by a rampart and trench, and has a considerable trade in *turquoises*, which are obtained from mines in its vicinity.

NISI PRIUS is the name (borrowed from the first two words of the old writ which summoned juries) usually given in England to the sittings of juries in civil cases. Thus a judge sitting at *nisi prius*, means a judge presiding at a jury trial in a civil cause, and the *nisi prius* sittings are the jury sittings.

**NISIBIS**, the capital of ancient Mygdonia, the north-eastern part of Mesopotamia. It was situated in a fertile district, and was of importance, both as a place of strength and as an emporium of the trade between the east and west. N. was a city of very great antiquity, but of its remoter history nothing is known. In the time of the Macedonio-Syrian kings, it was also called *Antiochea Mygdonia*. It was twice taken by the Romans (under Lucullus and Trajan), and again given up by them to the Armenians; but being a third time taken by Lucius Verus, 165 A.D., it remained the chief bulwark of the Roman empire against the Persians, till it was surrendered to them by Jovian after the death of Julian in 363. The name *Nisibin* is retained by a small village in the Turkish ejalet of Diarbekr, round which are numerous remains of the ancient city.

**NITRATE OF POTASH.** See **NITRE**.

**NITRATE OF SODA.** See **NITRE**.

**NITRE**, or **SALTPETRE**, as it is frequently called, is the nitrate of potash ( $\text{KO},\text{NO}_3$ ). It usually occurs in long, colourless, striated, six-sided prisms; its taste is cooling, and very saline; it is soluble in seven times its weight of water at  $60^\circ$ , and in less than one-third of its weight of boiling water, but is insoluble in alcohol. When heated to about  $660^\circ$ , it fuses without decomposition into a thin liquid, which, when cast in moulds, solidifies into a white, fibrous, translucent mass, known as *sal prunelle*. At a higher temperature, part of the oxygen is evolved, and nitrate of potash is formed. Owing to the facility with which nitre parts with its oxygen, it is much employed as an oxidising agent. Mixtures of nitre and carbon, or of nitre and sulphur, or of nitre, carbon, and sulphur, deflagrate on the application of heat with great energy; and if nitre be thrown on glowing coals, it produces a brisk scintillation. *Touch-paper* is formed by dipping paper in a solution of nitre, and drying it.

Nitre occurs as a natural product in the East Indies, Egypt, Persia, where it is found sometimes as an efflorescence upon the soil, and sometimes disseminated through its upper stratum. The crude salt is obtained by lixiviating the soil, and allowing the solution to crystallise. A large quantity of nitre is artificially formed in many countries of Europe, by imitating the conditions under which it is naturally produced. The most essential of these conditions seem to be the presence of decaying organic matter whose nitrogen is oxidised by the action of the atmosphere into nitric acid, which combines with the bases (potash and lime) contained in the soil. The method employed in the artificial production of nitre consists in placing animal matters, mingled with ashes and lime rubbish, in loosely aggregated heaps, exposed to the air, but sheltered from rain. The heaps are watered from time to time with urine or stable runnings; at suitable intervals, the earth is lixiviated, and the salt crystallised. Three years usually elapse before the nitre bed is washed; after this interval, a cubic foot of the debris should yield between four and five ounces of nitre. As there is always a considerable quantity of the nitrates of lime and magnesia present, which will not crystallise, carbonate of potash, in the shape of wood-ashes, is added so long as any precipitate occurs. The nitrate of lime is decomposed, and the insoluble carbonate of lime separated:

Carbonate of Potash. Nitrate of Lime. Carbonate of Lime. Nitrate of Potash.

The clear liquor is then evaporated and crystallised. It has been found that the earth in which nitre has once been formed furnishes fresh nitre more

readily than on the first occasion. Care is taken that the *nitre plantations*, as they are termed, shall rest upon an impervious flooring of clay, so that the liquid which drains away from them may be collected and preserved.—Miller's *Elements of Chemistry*, 2d ed. vol. ii. p. 359.

Nitre does not occur in any living members of the animal kingdom, but it is found in the juices of various plants, amongst which may be named the sunflower, nettle, goose-foot, borage, tobacco, barley, &c.

All the nitre used in this country comes from the East Indies. The common varieties, which have a dirty yellowish appearance, are termed *rough* or *crude saltpetre*, while the purer kinds are called *East India refined*. The purification or refining of nitre is effected by dissolving it in water, boiling the solution, removing the scum, straining it while hot, and setting it aside to crystallise. The most common impurities are sulphate of potash, chlorides of sodium and potassium, and nitrate of lime. Chloride of barium will detect the first of these impurities, nitrate of silver the second, and oxalate of ammonia the third.

Nitric acid is employed in the manufacture of sulphuric acid, in the preparation of nitric acid, as an oxidising agent in numerous chemical processes, as an ingredient of fireworks, and especially in the manufacture of gunpowder. It is extensively used in medicine. In moderate doses (from ten grains to a scruple) it acts as a refrigerant, diuretic, and diaphoretic, and hence its use is indicated when we wish to diminish abnormal heat, and to reduce the action of the pulse, as in febrile disorders and hemorrhages. In acute rheumatism, it is given in large doses with great benefit. Some physicians prescribe as much as one, two, or three ounces, largely diluted with water, to be given in the course of twenty hours; but as in several cases a single ounce has proved fatal in a few hours, the effects of such large doses should be carefully watched. It is a popular remedy in sore throat, either in the form of nitre balls, or powdered and mixed with white sugar. In either case, the remedy should be retained in the mouth till it melts, and the saliva impregnated with it gently swallowed. The inhalation of the fumes produced by the ignition of *touch-paper* often gives speedy relief in cases of spasmodic asthma.

Nitrate of potash is sometimes called *Prismatic Nitre* or *Potash Saltpetre*, to distinguish it from nitrate of soda, which is known in commerce as *Cubic Nitre* or *Soda Saltpetre*.

*Cubic Nitre*, or *Nitrate of Soda* ( $\text{NaO},\text{NO}_3$ ), occurs abundantly on the surface of the soil in Chili and Peru. It derives its name from its crystallising in cube-like rhombohedrons. In most of its properties it resembles ordinary nitre, but in consequence of its greater deliquescence, it cannot be substituted for that salt in the preparation of gunpowder. Being considerably cheaper than the potash-salt, cubic nitre is often substituted for it in the manufacture of nitric and sulphuric acids; and it is used in agriculture as a top-dressing for wheat and oats. In several experiments it has been found that one cwt. per acre has produced an increase of twelve bushels in the wheat crop, and of four or five sacks in the oat crop.

**NITRIC ACID** is the most important of the five compounds which oxygen forms with Nitrogen (q. v.). Until 1849, it was only known in the hydrated form (the *aqua fortis* of the older chemists), but in that year Deville shewed that *Anhydrous Nitric Acid*, or *Nitric Anhydride* ( $\text{NO}_2$ ), might be obtained in transparent colourless crystals by the action of perfectly dry chlorine gas on well-dried

crystals of nitrate of silver, the reaction being exhibited in the equation :

It is a very unstable compound, and sometimes explodes spontaneously. It dissolves in water with evolution of much heat, and forms hydrated nitric acid.

*Hydrated Nitric Acid* (symb.  $\text{HO,NO}_5$ , equiv. 63, sp. gr. 1.521), when perfectly pure, is a colourless liquid, fuming, powerfully caustic fluid, possessing an intensely acid reaction, as shewn by its action on litmus. It boils at  $184^\circ$ , and freezes at about  $-40^\circ$ . It parts very readily with a portion of its oxygen to most of the metals, and hence is much used in the laboratory as an oxidising agent. Its mode of action on the metals requires a few remarks. In order that a metal should unite with nitric, or any other acid, it is necessary that it should be in the form of an oxide. This oxidation is, however, effected at the same time that the metal and nitric acid are brought in contact, by one portion of the latter becoming decomposed and converting the metal into an oxide, while the remaining portion combines with the oxide thus formed, to produce a nitrate. The exact nature of the decomposition varies in the case of different metals.

Nitric acid, whether in the concentrated or in a more dilute form, acts energetically on organic matters. As examples of such actions we may refer to its power of decolorising indigo; of staining the skin and all albuminous tissues of a bright-yellow colour; of coagulating fluid albumen; and of converting cotton fibre into an explosive substance. See GUN COTTON.

The monohydrated acid ( $\text{HO,NO}_5$ ) is by no means a stable compound. If it be exposed to the action of light it is decomposed into hyponitric acid ( $\text{NO}_2$ ) (the peroxide of nitrogen of Graham) and oxygen; and mere distillation produces a similar effect. When it is mixed with water it emits a sensible amount of heat, owing to the formation of a much more stable hydrate,  $\text{HO,NO}_5 + 3\text{Aq}$ , which distils at  $250^\circ$  without change, and is unaffected by exposure to light. Its specific gravity is 1.424; and it is found that a weaker acid when heated parts with its water, and a stronger acid with its acid, till each arrives at this density. The existence of this hydrate has, however, been recently called in question by Roseoe.

The so-called *Fuming Nitric Acid* is merely a mixture of the pure acid with hyponitric acid.

Nitric acid does not occur naturally in a free state; but it is found tolerably abundant in combination with potash, soda, lime, and magnesia; and after thunderstorms traces of it, in combination with ammonia, are found in rain water. It may be formed in small quantity by passing a series of electric sparks through a mixture of its component gases in the presence of water, which is a mere imitation, on a small scale, of the mode in which it is produced in the atmosphere by a storm. It is usually prepared in the laboratory by the application of heat to a mixture of equal weights of powdered nitre (nitrate of potash) and oil of vitriol (hydrated sulphuric acid) placed in a retort. A combination of sulphuric acid and potash remains in the retort, while the nitric acid distils over, and is condensed in the receiver, which is kept cool by the application of a wet cloth. The reaction is explained by the equation :

During distillation red fumes appear, arising from the decomposition of a portion of the nitric acid and

a formation of some of the lower oxides of nitrogen. In this operation *two* equivalents of oil of vitriol are taken for *one* of nitre, these being the proportions found by experience to be most suitable. If they are taken, equivalent for equivalent, a very impure red fuming acid is the result. In the manufacture of nitric acid on the large scale, the glass retort is replaced by a cast-iron cylinder coated with fire-clay, and the receiver by a series of earthen condensing vessels connected by tubes; and nitrate of soda, found native in Peru, is substituted for nitre, in consequence of its being a cheaper salt, and of its containing 9 per cent. more nitric acid.

Nitric acid combines with bases to form *nitrates*, some of which, as those of potash, soda, oxide of ammonium, silver, &c., are anhydrous, while others combine with a certain number (often six) equivalents of water of crystallisation. Most of them are soluble in water, crystallisable, and readily fusible by heat; and at an elevated temperature they are all decomposed, usually leaving only the oxide of the metal. If paper be soaked in a solution of a nitrate, allowed to dry, and ignited, it burns in the smouldering mode characteristic of *touch-paper*. This property is, however, shared by a few other salts.

The tests for this acid when it is present in small quantities are less satisfactory than those for the other ordinary mineral acids. All its compounds are so soluble that no *precipitant* for this acid is known. The best method for its detection is mixing the fluid to be tested with a little concentrated sulphuric acid, and then pouring a strong solution of protosulphate of iron upon it, so as to form a separate layer. If much nitric acid be present, a black colour is produced; if only a small quantity is present, the liquid becomes reddish-brown or purple; the dark colour being due to the formation of nitric oxide by the deoxidising action of a portion of the iron salt on the nitric acid.

The applications of this acid in the arts, in manufactures, and in chemical processes are very extensive.

**NITRIC ACID, THE MEDICINAL USES OF.** In the British pharmacopœia there is both a strong and a dilute acid. The strong acid has a specific gravity of 1.5, and is represented by the formula  $3\text{HO,2NO}_5$ , while the diluted acid is prepared by mixing two ounces of the former with thirteen of distilled water, and has a specific gravity of 1.101.

The dilute acid is used internally as a tonic in conjunction with bitter infusions. In many cases of chronic inflammation of the liver, and in syphilitic cases in which the employment of mercurials is inadmissible, it may be prescribed with great benefit, either alone or in conjunction with hydrochloric acid, externally as a bath or lotion, or internally in doses of about 20 minims properly diluted. The strong acid is useful as an escharotic; as to destroy warts, some kinds of polypi, the unhealthy tissue in sloughing ulcers, &c., and as an application to parts bitten by rabid or venomous animals. Largely diluted, as 50 or 60 drops of the strong acid to a pint or more of water, it forms an excellent stimulative application to torpid ulcers.

**NITRO-BENZOL, or NITRO-BENZIDE** ( $\text{C}_{12}\text{H}_5\text{NO}_3$ ), is a yellow oily fluid, of specific gravity 1.2, which may be distilled without decomposition, crystallises in needles at  $37^\circ$ , and boils at  $315^\circ$ . It has a sweet taste, is insoluble in water, but dissolves freely in alcohol and ether. Its odour is very similar to that of oil of bitter almonds, which has led to its use in perfumery, under the name of *Essence of Nirbane*. It is obtained by treating benzol ( $\text{C}_{12}\text{H}_6$ ) with warm fuming nitric acid, when

1 equivalent of the hydrogen is replaced by 1 of hyponitric acid, so that the benzol ( $C_{12}H_6$ ) becomes converted into nitro-benzol ( $C_{12}H_5NO_2$ ).

**NITROGEN** (symbol, N; equivalent, 14; specific gravity, 0.9713) derives its name from the Greek words *nitron*, nitre, and *gen.*, to produce, in consequence of its being an essential constituent of that salt. It is frequently termed *azote* (Gr. *a*, priv., *zoe*, life), especially by the French chemists, in consequence of its being a gas incapable of supporting life, and, for the same reason, the German chemists term it *stickstoff*, which may be translated *choking substance*. It was discovered by Rutherford in 1772; but for its name, nitrogen, we are indebted to Chaptal.

Nitrogen is a colourless, tasteless, inodorous, permanent gas, which in its appearance in no way differs from the atmospheric air, of which it is the main ingredient. It is somewhat lighter than atmospheric air, 100 cubic inches at 60° F., and barometer 30 inches, weighing 30.119 grains, while the same volume of air weighs 30.935 inches. It is characterised rather by negative than by positive properties. It is not combustible, nor is it a supporter of combustion (a lighted taper being immediately extinguished if immersed in this gas); it is not respirable, although it is not positively poisonous; for when it is mixed with respirable gases (as with oxygen in atmospheric air) it may be breathed without injury. It is very slightly soluble in water, and hence may be collected over that fluid. Its combining powers are very slight, and although it unites with oxygen, hydrogen, chlorine, and many other substances, the union is never effected by the direct action of the elements on one another, but only by complicated processes, and many of the resulting compounds are of an exceedingly unstable nature.

Nitrogen is one of the most widely diffused elementary substances. It forms about four-fifths of the bulk of the atmosphere; for air, after having been freed from the small quantities of carbonic acid and aqueous vapour which it contains, consists, according to the experiments of Dumas and Boussingault, of 20.81 per cent. of oxygen and 79.19 per cent. of nitrogen by volume, or 23.01 of oxygen and 76.99 of nitrogen by weight; the two gases in this case being uniformly mixed, but not in chemical combination with one another. It occurs, however, in combination with oxygen in the form of nitric acid ( $HO,NO_3$ ) in various nitrates, which are found as natural products in many parts of the globe. In combination with hydrogen, it is abundantly found as ammonia, and combined with oxygen, hydrogen, and carbon, and sometimes additionally with sulphur and phosphorus, it forms the most important constituents of the solids and fluids of the animal body, and occurs in many vegetable products, especially in the alkaloids, such as morphia, strychnia, quinia, &c.

The ordinary methods of preparing and exhibiting this gas, are based upon the removal of the oxygen from atmospheric air. This may be done (1) By setting fire to a small piece of phosphorus placed in a capsule, that floats on the water of the pneumatic trough, and by inverting a glass-receiver filled with air over it. The phosphorus combines with the oxygen of the air to form phosphoric acid, which dissolves in the water, while the nitrogen is left, and must be transferred to another vessel. (2) By placing a stick of phosphorus in a jar of air which is standing over water. In two or three days there will be the same results as in the former experiment—viz., phosphoric acid and nitrogen; (3) Or by passing air through a tube containing heated copper filings, which absorb the oxygen. In the above cases, a little carbonic acid is present, which may be removed by passing the gas through a

solution of potash. Pure nitrogen may be directly obtained by the action of chlorine gas on a solution of the nitrogenous substance, ammonia.

Nitrogen forms with oxygen no less than five distinct compounds, containing, respectively, 1, 2, 3, 4, and 5 equivalents of oxygen, with 1 equivalent of nitrogen. These compounds are thus named and constituted: Protoxide of Nitrogen (known also as Nitrous Oxide and Laughing Gas), NO; Bin oxide (or Dextoxide) of Nitrogen (known also as Nitric Oxide),  $NO_2$ ; Nitrous Acid,  $NO_3$ ; Hyponitric Acid (known also as Peroxide of Nitrogen),  $NO_4$ ; Nitric Acid,  $NO_5$ .

*Protoxide of Nitrogen* is a transparent, colourless gas, with a sweetish taste and smell. It is much more soluble in cold than in hot water, and therefore should be collected over the latter. Under a pressure of 50 atmospheres at 45° it is reduced to a colourless liquid, and it may be frozen into a transparent solid at about  $-150^\circ$ . This gas is about half as heavy again as atmospheric air, its specific gravity being 1.527. It supports the combustion of many bodies, such as carbon, sulphur, phosphorus, and iron, with a brilliancy similar to that which they exhibit in oxygen; and, like oxygen, when mixed with hydrogen, it forms a mixture which explodes on the application of a flame. The most remarkable property of the gas is its intoxicating power on the animal system. It may be respired for a short time if quite pure, or if only mixed with atmospheric air, without danger or serious inconvenience. The intoxication is frequently accompanied with an irresistible propensity to muscular exertion, and usually with uncontrollable bursts of laughter, and hence the gas has received the name of *laughing gas*. It is best obtained by heating solid nitrate of ammonia in a glass retort, when it is converted into protoxide of nitrogen and water. It has recently come into frequent use as an anæsthetic in dentistry and similar cases. It is less suited to protracted operations, as the effects are transient. It produces much less disturbance of the system than chloroform.

*Bin oxide of Nitrogen* is a colourless gas, very slightly soluble in water, and having a specific gravity of 1.039. Its taste and smell (if any) are unknown, since, in the presence of atmospheric air, it instantly becomes more highly oxidised, and forms yellowish-red fumes of hyponitric acid. As it is of little importance, it is unnecessary here to describe the mode of obtaining it.

*Nitrous Acid*, or *Nitrous Anhydride*, is a substance of which, in its uncombined state, very little is yet known further than that it is a dark-blue, very volatile fluid, which boils at  $32^\circ$ , and is then converted into an orange-red gas.

*Hyponitric Acid* presents a remarkable example of a body within comparatively small limits of temperature occurring in a solid, a fluid, and a gaseous form. At a temperature of  $-4^\circ$  it occurs in the form of colourless prismatic crystals, which are converted at about  $9^\circ$  into a fluid which, till the temperature reaches about  $30^\circ$ , is colourless; but at a higher temperature becomes yellow and orange, and at about  $82^\circ$  boils, and is converted into a brownish-red vapour. It is chiefly the vapour of hyponitric acid that forms the orange fumes that are produced when bin oxide of nitrogen comes in contact with the air. It possesses a very disagreeable suffocating odour, and a caustic action, and colours the skin yellow, like nitric acid. It does not enter into combination with bases, but is immediately decomposed by them into nitric and nitrous acids; and it is in consequence of its not possessing this essential character of an acid that Graham has given it the name of *peroxide of nitrogen*, a term that has since been adopted by Miller and other chemists.

*Nitric Acid* is described in a special article.

Nitrogen combines with hydrogen in four proportions, but none of these compounds can be formed by the direct union of the component elements, and only one of them, viz., ammonia, has been obtained in the isolated form. They are—*Imidogen* (NH), *Amidogen* (NH<sub>2</sub>), *Ammonia* (NH<sub>3</sub>), and *Ammonium* (NH<sub>4</sub>). Of these, the first two will be noticed in the article ORGANIC BASES, while the two last are sufficiently described in the article AMMONIA.

Nitrogen combines with chlorine, bromine, and iodine. The *chloride of nitrogen* is a heavy, oily, orange-coloured fluid, insoluble in water, and evolving a vapour of a highly irritating nature. It is one of the most dangerous compounds known in chemistry, as it explodes with extreme violence when brought in contact with phosphorus, arsenic, potash, ammonia, caoutchouc, numerous oily matters, &c., at ordinary temperatures, and spontaneously when heated to above 200°. It has occasioned so many serious accidents that we shall omit all details regarding its mode of preparation. Its exact formula is unknown. *Bromide of Nitrogen* is an oily-looking detonating liquid, resembling the chloride in appearance and properties. *Iodide of Nitrogen* occurs as a black powder, which when dry explodes upon the slightest touch, and often without any assignable cause.

Nitrogen enters into combination with various metals, as mercury, copper, titanium, molybdenum, and vanadium, forming a class of compounds to which the term *Nitrides* is applied. Their most marked characteristic is, that, like the preceding set of compounds, they are highly explosive, resolving themselves when struck, or at a high temperature, into their constituent elements.

**NITROUS ETHER, or NITRITE OF OXIDE OF ETHYL**, is represented by the formula C<sub>2</sub>H<sub>5</sub>O.NO<sub>2</sub>, or AeO.NO<sub>2</sub>, Ae being the symbol for ethyl (C<sub>2</sub>H<sub>5</sub>). It is a pale yellow fluid, having a specific gravity of 0.947, and evolving an agreeable odour of apples. On evaporation, it produces a great degree of cold, it boils at 62°, and it is very inflammable. It does not mix with water, but is readily miscible with alcohol. When kept in contact with water it soon decomposes, and an acid mixture of a very complicated character is formed. It may be obtained by mixing 1 part of starch and 10 of nitric acid in a capacious retort, which must be gently heated. The vapour of nitrous acid, which is evolved by the action of the starch on the nitric acid, is conducted into alcohol, mixed with half its weight of water, contained in a two-necked bottle, which is to be plunged into cold water. The second neck of this bottle is connected with a good cooling apparatus; and the vapour combining in its passage through the alcohol with the oxide of ethyl, forms nitrous ether, which distils in a continuous stream. This, which is known as Liebig's method, is the best process, but it is usually prepared by the direct action of nitric acid on alcohol, in which case the nitric acid is deoxidised by the hydrogen and carbon of the ethyl of part of the alcohol.

The *Spirit of Nitrous Ether, or Sweet Spirit of Nitre*, used in medicine, is a mixture of nitrous ether with about four times its volume of rectified spirit. Its specific gravity should not exceed 0.85. It is used, in conjunction with other medicines, as a diuretic, especially in the dropsy which follows scarlatina; and it is employed, in combination with acetate of ammonia and tartarised antimony, in febrile affections. The dose in febrile cases is from half a drachm to a couple of drachms, and if we wish it to act as a diuretic, two or three drachms should be given. It is a rather expensive medicine,

and consequently is extremely liable to adulteration. In the new British Pharmacopœia, it is recommended that this substance should be directly obtained by the distillation of nitrite of soda (five ounces), sulphuric acid (four fluid ounces), and rectified spirit (two pints)—a process open to many practical objections.

**NITZSCH, KARL IMMANUEL**, one of the most distinguished theologians that modern Germany has produced, was born September 21, 1787, at Borna. He studied for the church at Wittenberg, where he took his degree in 1810, and where, in 1813, he became parish minister. Here his religious opinions underwent a great modification, through the influence of Schleiermacher and Daub, and he awoke to a clearer perception of the essence of religion. From this time forward N. is to be regarded as one of that new school—of which Neander is the greatest representative—who endeavoured to reconcile faith and science, not by forced and unnatural methods, but by pointing out their distinctive spheres, and by exhibiting in their own spiritual life that union of reason and reverence for which they argued in their writings. In 1822, N. was called to Bonn as ordinary professor of theology and university preacher, where he laboured with great diligence for more than twenty years, not only in theology, but in all matters affecting the welfare of the Prussian church. In 1847, he succeeded Marheineke at Berlin, and as professor, university preacher, and upper consistorial councillor, he has exercised with prudence and moderation a wide ecclesiastical influence. In his political (perhaps also in his religious) views he may be classed with the late Chevalier Bunsen. The High Lutheran party having denounced liberal politics as irreligious, N. and Bunsen and others have vindicated them on the ground of Christianity, not without success. In theology, his position will be best understood when we say that he subordinates dogma to ethics, or rather that he believes the only dogmas which can hope to permanently maintain themselves are those that result from an ethical apprehension of Christianity. Besides numerous smaller treatises on Dogmatics, the History of Dogmas and Liturgies, three larger works call for special mention. These are his *System der Christlichen Lehre* (Bonn, 1829; 6th edit. 1851); his *Praktische Theologie* (Bonn, 1847—1848); and his *Predigten, or Sermons*, of which several collections have appeared, and which are remarkable for their extraordinary richness of thought.—**NITZSCH, GREGOR WILHELM** (born in 1790), brother of the preceding, has acquired a high reputation as a philologist, and is now professor of archeology at Leipsic. He is considered one of the ablest opponents of Wolf's Homeric theories. His chief work is *Die Sagenpoesie der Griechen* (Brunswick, 1852).

**NIVELLES** (Flem. *Nyvel*), a town of Belgium, in the province of South Brabant, 18 miles south of Brussels. It has a fine church, called the Church of St Gertrude (built in the Romanesque style of architecture, 1048 A.D.), which claims to contain the relics of St Gertrude, daughter of Pepin, Maire du Palais. They are deposited in a shrine placed over the high-altar. N. has manufactures of linen, cotton, lace, &c. Pop. 8000.

**NIVERNAIS**, formerly a province in the middle of France, nearly corresponding to the present department of Nièvre. It was divided into eight territorial districts, and its towns enjoyed municipal privileges at a very early period. The principal landowners were the counts, afterwards dukes, of Nevers, who held under their vassalage more than 1800 fiefs.

NIX, in the masculine, and *nixe* in the feminine (Old High Ger. *nihhus*; Anglo-Saxon, *nicor*; Dutch, *nikker*; Old Norse, *nikr*; Swed. *näk, nek*; Dan. *nök, nok*—whence our name for the devil, *Nick*, not as some absurdly suppose, from *Nicholas* Machiavelli), the common name for all water spirits in the Teutonic mythology. They are represented as of human form, or sometimes as passing into that of a fish or of a horse. They love music and dances, and possess the gift of prophecy, like the Greek Muses, Sirens, and other water gods. The nix taught, in return for a good gift, the art of playing on a stringed instrument; and often in the evening sunshine the nixes, combing their long hair, were wont to mingle in the dances of mortals; but their company was dangerous, for though sometimes wearing a mild appearance, they were more frequently cruel and malignant.—The *water-kelpie* of Scotland must be reckoned a member of the genus Nix, but in him the evil element alone exists. He generally, if not always, assumed the form of a water-horse; frequented fords and ferries, especially during storms; allured travellers to mount him, and then dashed furiously with them into the stream which he had flooded by his devilish power, and submerged them in the roaring currents.

NIZAM'S DOMINIONS, an extensive territory in the interior of Southern India, lying to the north-west of the Presidency of Madras, in lat. 15° 10'—21° 42' N., and long. 74° 40'—81° 32' E. Length from south-west to north-east, 480 miles; extreme breadth, 340 miles. Area, 95,000 square miles, and pop. estimated at upwards of 10,000,000. The surface is a slightly-elevated table-land. The principal rivers are the Godavari (Godavery), with its tributaries the Dudhna, Manjera, and Pranhita; and the Kistna (Krishna), with its tributaries the Bimah and Tungabhadro. The soil is naturally very fertile, but poorly cultivated; yet, wherever it receives moderate attention, it yields harvests all the year round. The products are rice, wheat, maize, mustard, castor-oil, sugar-cane, cotton, indigo, fruits (including grapes and melons), and all kinds of kitchen vegetables. The pasturages are extensive, and sheep and horned cattle are numerous. Marsh and jungle, however, occupy a great space, and originate fevers, agues, diseases of the spleen, &c., though the climate is quite healthy where these do not abound. The mean temperature of the capital, Hyderabad, in January is 74° 30', and in May 93°. The inhabitants manufacture for home use woollen and cotton fabrics, and export silk, dressed hides, dye-stuffs, gums, and resins. Good military roads traverse the territory. The revenue of the Nizam is reckoned at £1,550,000 yearly. The ruler is a Mohammedan, but his subjects are mostly Hindus.

In 1657, the territory, now known as the Nizam's Dominions, became a province of the Mogul empire; but in 1719, the governor or viceroy of the Deccan, Azof Jah, made himself independent, and took the title of *Nizam-ul-Mulk* (Regulator of the State). After his death, in 1748, two claimants appeared for the throne, his son Nazir Jung, and his grandson Mirzapha Jung. The cause of the former was espoused by the East India Company, and that of the latter by a body of French adventurers under General Dupleix. Then followed a period of strife and anarchy. In 1761, Nizam Ali obtained the supreme power, and after some vacillation signed a treaty of alliance with the English in 1768. He aided them in the war with Tippoo, sultan of Mysore, and at the termination of that war, in 1799, a new treaty was formed, by which, in return for certain territorial concessions, the East India

Company bound itself to maintain a subsidiary force of 8000 men for the defence of the Nizam's dominions. The present Nizam or ruler, *Azul-ul-Dowlah*, who succeeded to the government on the death of his father, May 19, 1857, remained faithful to the British during the mutiny of 1857—1858.

NOBILĒ OFFICIUM, the term used in the Law of Scotland to denote the high prerogative right of the Court of Session to exercise jurisdiction in certain cases—as, for example, to appoint a judicial factor to young children or to lunatics.

NOBILITY, that distinction of rank in civil society which raises a man above the condition of the mass of the people. Society has a tendency to inequality of condition, arising from the natural inequality, physical, moral, and intellectual, of those who compose it, aided by the diversity of external advantages, and of the principles and habits imbibed at an early age. This inequality is apt to increase; the son, inheriting the faculties of his father, is more favourably situated than his father was for making use of them; and hence, in almost every nation in even the very early stages of civilisation we find something like a hereditary nobility. Privileges originally acquired by wealth or political power, are secured to the family of the possessor of them; and the privileged class come to constitute an order, admission into which requires the consent of society or of the order itself.

The ancient Romans were divided into *nobiles* and *ignobiles*, a distinction at first corresponding to that of patricians and plebeians. A new nobility afterwards sprung out of the plebeian order, and obtained (336 B.C.) the right to rise to high offices in the state; and in course of time the descendants of those who had filled curule magistracies inherited the *ius imaginum*, or right of having images of their ancestors—a privilege which, like the coat-of-arms in later ages, was considered the criterion of nobility. The man entitled to have his own image was a *novus homo*, while the *ignobilis* could neither have his ancestor's image nor his own.

The origin of the feudal aristocracy of Europe is in part connected with the accidents which influenced the division of conquered lands among the leaders and warriors of the nations that overthrew the Roman empire. Those who had acquired a large share of territorial possession, and their posterity to whom it was transmitted, were naturally looked on as the fittest persons to occupy the great offices of state and wield political power. The Frankish kingdom in Gaul was divided into governments, each under the authority of a chieftain called a Count or *Comes*—a designation derived from the *comes* of the Roman empire—whose Teutonic equivalent was *Graf*. A higher dignity, and more extensive jurisdiction, was conferred on the *Dux* or Duke, a term also of Roman origin, and implying the duty of leading the armies of the country. In the Lombard Kingdom of Italy, the same term was applied to the great officers who were intrusted with the military and civil administration of cities and their surrounding provinces. The Marquises were guardians of the frontier marches. In the subinfeudations of the greater nobility originated a secondary sort of nobility, under the name of Vavasours, Castellans, and lesser barons; and a third order below them comprised vassals, whose tenure, by the military obligation known in England as knight's service, admitted them within the ranks of the aristocracy. In France, the allegiance of the lesser nobles to their intermediary lord now continued a reality; in England, on the other hand, William the Conqueror obliged not only his barons who held in chief of the crown, but their vassals also, to take an

oath of fealty to himself; and his successors altogether abolished subinfeudation.

The military tenant, who held but a portion of a knight's fee, participated in all the privileges of nobility, and an impassable barrier existed between his order and the common people. Over continental Europe in general, the nobles, greater and lesser, were in use, after the 10th c., to assume a territorial name from their castles or the principal town or village on their demesne; hence the prefix 'de,' or its German equivalent 'von,' still considered over a great part of the continent as the criterion of nobility or gentility. Britain was, to a great extent, an exception to this rule, many of the most distinguished family names of the aristocracy not having a territorial origin. See NAME.

Under the feeble successors of Charlemagne, the dukes, marquises, and counts of the empire encroached more and more on the royal authority; and in course of time, many of them openly asserted an independence and sovereignty with little more than a nominal reservation of superiority to the king. By the end of the 9th c., the Carolingian empire had been parcelled into separate and independent principalities, under the dominion of powerful nobles, against whom, in Germany, the crown never recovered its power. In France, however, the royal authority gradually revived under the Capetian race, the great fiefs of the higher nobility being one by one absorbed by the crown. In England, where the subjection of the feudal aristocracy to the crown always was, and continued to be a reality, the resistance of the nobles to the royal encroachments was the means of rearing the great fabric of constitutional liberty. All those who, after the Conquest, held *in capite* from William belonged to the nobility. Such of them as held by barony (the highest form of tenure) are enumerated in *Domesday*. Their dignity was territorial, not personal, having no existence apart from hereditary possession. The *comes* was a baron of superior dignity and greater estates; and these were in England the only names of dignity till the time of Henry III. The rest of the landholders, who held by other tenures than barony, also belonged to the nobility or gentry.

After the introduction of Heraldry, and its reduction to a system, the possession of a coat-of-arms was a recognised distinction between the noble and the plebeian. In the words of Sir James Lawrence (*Nobility of the British Gentry*): 'Any individual who distinguishes himself may be said to ennoble himself. A prince judging an individual worthy of notice, gave him patent letters of nobility. In these letters were blazoned the arms that were to distinguish his shield. By this shield he was to be known or *nobilis*. A plebeian had no blazonry on his shield, because he was *ignobilis*, or unworthy of notice. Hence arms are the criterion of nobility. Every nobleman must have a shield of arms. Whoever has a shield of arms is a nobleman. In every country of Europe without exception, a grant of arms, or letters of nobility, is conferred on all the descendants.' On the continent, the term noble is still generally used in this sense; in England, it is now more common to restrict the words noble and nobility to the five ranks of the peerage constituting the greater nobility, and to the head of the family, to whom alone the title belongs. Gentility, in its more strict sense, corresponds to the nobility of Sir J. Lawrence and of continental countries. This difference of usage is a frequent source of misapprehension on both sides of the Channel; at some of the minor German courts, the untitled member of an English family of ancient and distinguished blood and lineage has

sometimes been postponed to a recently-created baron or 'Herr von,' who has received that title, and the gentility accompanying it, along with his commission in the army. It has been taken for granted that the latter belongs to the 'Adel' or nobility, and not the former.

The original higher nobility of Germany consisted of the dynasty nobles, i. e., the electoral and princely houses of the realm, with those counts and barons who had a seat in the diet or estates of the realm. These last have, since 1815, all been elevated to higher titles; most of the counts, in recompense for their acquiescence in the abolition of the German empire, receiving the diploma of prince, a title to which our dukes, marquises, and earls have also an undoubted right. The lower German nobility, corresponding to our gentry, were the merely titular Counts and Barons (i. e., those who had no seat in the Diet), the Edel-herren and Banner-herren (something like our Bannerets), the Knights of the Holy Roman Empire, the 'Edlen von' (who now take the style of baron), and the common nobles distinguished only by the prefix 'von.' Throughout the middle ages, the lesser nobility of Britain preserved a position above that of most continental countries, being, unlike the corresponding class in Germany, allowed to intermarry with the high nobility, and even with the blood-royal of their country.

The higher nobility, or nobility in the exclusive sense, of England, consist of the five temporal ranks of the peerage—Duke, Marquis, Earl, Viscount, and Baron (in the restricted signification of the word), who are members of the Upper House of Parliament. Formerly, all the barons or tenants-in-chief of the sovereign were bound to attend his councils; but after the reign of Edward I., only a select number of them were summoned, the rest appeared by representatives—the former were considered the greater, the latter the lesser barons. See MINOR BARONS. In Scotland, the whole barons continued to sit in parliament till a much later period; and after the minor barons attended only by representatives from their body, these representatives sat in the same house with the greater nobility, and up to the Union, their votes were recorded as those of the 'small barrounis.' By the Act of Union between England and Scotland, the Scotch peers elect 16 of their number to represent their body in the House of Lords in each parliament. The peers of Ireland, in virtue of the Irish Act of Union, elect 28 of their number to sit in the House of Lords for life. The Act of Union with Scotland has been understood to debar the sovereign from creating any new Scotch peerages; all peers created in either England or Scotland between that date and the union with Ireland are peers of Great Britain; and peers created in any of the three kingdoms subsequently to the union with Ireland are peers of the United Kingdom, with this exception that one new peerage of Ireland may be created on the extinction of three existing peerages. When the Irish peers are reduced to 100, then, on the extinction of one peerage another may be created. All peers of Great Britain or of the United Kingdom have a seat in the House of Lords. A Scotch peer, though not one of the sixteen representative peers, is debarred from sitting in the House of Commons, a disability which does not attach to Irish peers. The peerage is, from time to time, recruited by new additions, the persons selected being in general peers of Scotland or Ireland; younger members of the families of peers; persons distinguished for naval, military, political, or diplomatic services; eminent lawyers promoted to high judicial appointments; persons of large property and ancient family,

noble in the more extended sense; and occasionally, but rarely, persons who have by commerce acquired large fortunes and social importance. At present, the peerage comprehends 548 individuals—the number of peerage titles being much greater, as several titles often merge in one person. Three royal dukes are included in this enumeration, as also 81 peers of Scotland, and 190 of Ireland. Only 25 of the present Scotch, and 87 Irish peers, are without seats in the House of Lords, in consequence of there being, besides the representative peers, 40 peers of Scotland, and 75 of Ireland, who are at the same time peers either of England, Great Britain, or of the United Kingdom. The privileges belonging to peers as members of parliament will be explained under PARLIAMENT; as peers, they also possess the following immunities: They can only be tried by their peers for felony, treason, or misprision of treason, when the whole members of the peerage are summoned, and the accused is acquitted or condemned by the voice of the majority, given not on oath, but 'on honour.' This privilege, which extends to peeresses, either in their own right or by marriage, is in Scotland further regulated by Act 6 Geo. IV. c. 66. A peer answers to bills in Chancery upon his honour, and not on oath; but when examined as a witness in civil or criminal cases, or in parliament, he must be sworn. He cannot be bound over to keep the peace elsewhere than in the Court of Queen's Bench or of Chancery. Scandal against a peer is '*scandalum magnatum*,' a more heinous offence than slander against another person, and subjects the offender by various English acts to statutory punishments. All the privileges belonging to the English peers, except the right of sitting in the House of Lords, were extended to the peers of Scotland by the Treaty of Union. A peer who has different titles in the peerage, takes in ordinary parlance his highest title, one of the inferior titles being given by courtesy to his eldest son. Certain Courtesy Titles (q.v.) belong also to the daughters and younger sons of a peer, but do not extend to their children.

In France, a limited body of the higher nobility, styled the peers, were in the enjoyment of privileges not possessed by the rest. The title of Duke was subject to strict rule, but many titles of Marquis and Count, believed to be pure assumptions, were recognised by the courtesy of society. The head of a noble family often assumed at his own hand the title of marquis; and if an estate was purchased which had belonged to a titled family, the purchaser was in the habit of transferring to himself the honours possessed by his predecessor—a practice to which Louis XV. put a stop. Immediately before the Revolution, 80,000 families claimed nobility, many of them of obscure station, and less than 3000 of ancient lineage. Nobles and clergy together possessed two-thirds of the land. Practically, the estimation in which a member of the French nobility was held depended not so much on the degree of his title as on its antiquity, and the distinction of those who had borne it. The higher titles of nobility were not borne by all members of a family; each son assumed a title from one of the family estates—a custom productive of no small confusion. Unlike 'roturier' lands, which divided among all the children equally, noble fiefs went to the eldest son. The Revolution overthrew all distinction of ranks. On 18th June 1790, the National Assembly decreed that hereditary nobility was an institution incompatible with a free state, and that titles, arms, and liveries should be abolished. Two years later, the records of the nobility were burned. A new nobility was created by the Emperor Napoleon I. in 1808, with titles descending to the eldest son. The

old nobility was again revived at the Restoration. All marquises and viscounts are of pre-revolution titles, none having been created in later times.

Commercial pursuits have more or less in different countries been considered incompatible with nobility. In England, this was less the case than in France and Germany, where for long a gentleman could not engage in any trade without losing his rank. A sort of commercial 'Bürger-Adel,' or half-gentleman class, was constituted out of the patrician families of some of the great German cities, particularly Augsburg, Nürnberg, and Frankfurt, on whom the emperors bestowed coats-of-arms. In semi-feudal Italy, there was on the whole less antagonism between nobility and trade than north of the Alps. The aristocracy of Venice had its origin in commerce; and though untitled, they were among the most distinguished class of nobles in Europe. On the other hand, in Florence, in the 14th c., under a constitution purely mercantile, nobility became a disqualification from holding any office of the state. In order to the enjoyment of civil right, the nobleman had to be struck off the rolls of nobility; and an unpopular plebeian was sometimes ennobled, in order to disfranchise him. A little later, there grew up, side by side with the old nobility, a race of plebeian nobles—as the Ricci, the Medici—whose pretensions were originally derived from wealth, and who eventually came to be regarded as aristocrats by the democratic party.

Italian nobility has this peculiarity, that it does not, for the most part, flow from the sovereign, but from the municipal authorities of the towns acting in entire independence of him. The municipalities can confer nobility on whom they please, by inscribing his name in their respective *Libri d'oro*. The registers of nobility of most of the Tuscan towns are deposited in the *Archivio della Nobiltà*, or Heralds' Office, at Florence—an institution created by the first sovereign of the House of Lorraine. The municipalities have, however, no power to confer titles, though at one time several persons, a few Englishmen included, on the strength of their names being in the *Libro d'oro* of Fiesole, assumed the titles of marquis, count, and baron—an abuse put a stop to by the late grand duke of Tuscany. In Rome, there is a small number of nobles—as the Colonnas, Caetanis, and Orsinis—who hold their fiefs as sovereign princes; the rest of the nobility, many of them of very ancient lineage, are municipal, the power of creation being vested in the senator, himself a nominee of the pontiff, and the *Conservatori*, chosen by lot from the Capitoline nobles. In last century, so many undistinguished persons had been added to the roll of nobility, that Pope Benedict XIV. found it necessary to prohibit by a bull the admission of any one whose ancestors had not filled certain high offices in the state. The same decree limited the number of noble families to 187, designed the *Patriziato Romano*, out of whom 60 of the oldest and most illustrious were chosen as *Nobili Conscritti*, otherwise called the Capitoline nobles, and restricted the admission to the patriziato for the future to persons who had rendered important services to the city, and whose names were approved by the *Congregazione araldica*, an exception being made in favour of members of the reigning pontiff's family. As the families of the *conscritti* became extinct, other patrician families, designated *Nobili Ascritti*, were added by the municipality to make up the number. The titles at present borne by the Roman nobility are: I. Prince or Duke, generally so called, but officially designated 'Barone Romano'—a title acquired by the Borghesi, Rospigliosi, and others from popes of their respective families; in the case of the

Colonnas, Dorias, Odescalchi, &c., from royal or imperial erection; and in other instances—as the Caetani and Massimi—from investiture by the pope as a temporal sovereign. 2. Marquis and Count; many of these are provincial nobles, with titles generally derived from small feudal tenures, of which, in some instances, it would be difficult to shew the diploma, or point out the period of creation. In some parts of the Papal States it is understood that every head of a noble house is a marquis; and in the March of Ancona, Sixtus V. conferred the right to bear the title of count on all who were of noble blood at the period. 3. Knights (*Cavalieri*), a designation given to all who wear a Roman order, to Knights of Malta, and generally to younger sons of the titled nobility. 4. Princes, who, with the sanction of the pope, have purchased honours along with ancient fiefs, that carried with them ducal or princely titles, most of them *novi homines*, as the Torlonias. Titles do not descend to the younger members of the family; it is the general usage for the head of the house to bear the most ancient title, while the eldest son, on his marriage, assumes the second in point of antiquity. The title is sometimes the family name, sometimes the name of a feudal possession. The proper designation of the younger branches of titled families is 'dei Principi,' 'dei Duchi,' 'dei Marchesi,' &c.

The nobility of Spain boasts of a special antiquity and purity of blood, a descent from warriors and conquerors alone, without the infusion of any of the elements derived from the church, law, and commerce that are to be found in other countries. 'Hidalgo' (*hijo d'algo*, son of somebody, not *filius nullius*) is a term which implies gentility or nobility. The hidalgo alone has in strictness a right to the title 'Don,' which, like 'Sir' of our knights and baronets, requires the adjunct of the Christian name. When the Christian name is omitted, the title 'Señor' instead is prefixed with the addition of 'de.' 'Don' has latterly been used by persons who have no proper claim to it about as extensively as 'Esquire' in England. Hidalgo, till recently, conferred important privileges and immunities. The higher nobility are styled *Grandees*; formerly, the title was 'rico ombria,' and the ceremonial of creation consisted in granting the right of assuming the pennon and caldron (*peñon y caldera*)—the one the rallying ensign of command, the other of maintenance of followers. In contradistinction from the grandees, the class of nobility below them are called 'los Titulados de Castilla.' Red blood is said to flow in the veins of the hidalgo, blue in that of the grandee. Formerly, there were three classes of grandees, whose mark of distinction was this—that a grandee of the first class was entitled to put on his hat in the royal presence before the king spoke to him; the second, after the king spoke to him; the third, after the king had spoken and he had replied. The second and third classes are now absorbed into the first. Of the grandees, some bear the title of duke, some of marquis, some of count; but it is the ambition of every grandee to unite in himself as many grandeeships, or have as many hats, as the phrase is, as he can. This is effected by the marriage of heiresses through whom *grandeza* descends, and whose names and titles are assumed by their husbands. An enormous accumulation of titles is sometimes found in the person of one grandee. Titles as well as estates go only to heirs of entail. The titulars of Castile are designed 'vuestra señoría;' in common parlance, 'noia.' The title of Baron is little used in Spain. Physically and mentally, the grandees have degenerated from their ancestors, and they have not the influence at court and in the country which lauded property

ought to give them. Most of them reside at Madrid, clinging to their nominal rank and real nullity, while they are practically excluded from all the functions of state.

In Russia, what nobility existed before Peter the Great was of a patriarchal not a feudal kind; but in his anxiety to assimilate everything to a western standard, the czar took the existing aristocracies of states quite differently situated as the model to which to approximate the fortunate of his own subjects. The Russian nobles have ever since been enlarging their privileges by encroachments on those under them. Before Moscow was burned, the mass of the nobles connected with the court lived there in great splendour, and along with their domestic serfs constituted half the population of that city.

The preservation of noble blood, untainted by plebeian intermixture, has often been reckoned a matter of much moment. In Spain most of all, this purity of lineage has been jealously guarded. In the German empire, no succession was allowed to feus holding immediately of the emperor, unless both parents belonged to the higher nobility. In France, the offspring of a gentleman by a plebeian mother was noble in a question of inheritance or exemption from tribute, but could not be received into any order of chivalry. Letters of nobility were sometimes granted to reinstate persons in this position. It is in Germany still important for many purposes to possess eight or sixteen quarterings, i. e., to be able to shew purity of blood for four or five generations, the father and mother, the two grandmothers, the four great-grandmothers; and also, in case of the sixteen quarterings, the eight great-great-grandmothers, having all been entitled to coat-armour. Among the higher grades of the peerage in England, a considerable number may be pointed out who do not possess this complete nobility. It is in Scotland more usual and more regarded, both among peers and untitled gentry, where the eight or sixteen quarterings are still in use to be displayed on the funeral escutcheon. At some of the minor German courts, the sixteen quarterings are not unfrequently an illusion, diplomas being granted in the absence of a full pedigree, to declare the parties as noble as if they had sixteen ancestors.

NO'CERA, or NOCERA DEI PAGA'NI, a small town of Naples, in the province of Principato Citeriore, eight miles north-west of Salerno, and on the highway from that town to Naples. It carries on important woollen manufactures. Pop. 7400.

NO'CTURN (Lat. *nocturnum*, recited 'by night'). Under the head BREVIARY (q. v.) has been explained the general order of the services of the canonical hours, in the Roman Catholic Church. The service of MATINS on Sundays and festivals is divided into three nocturns, each of which consists of three (or more) psalms and three *lessons*. The lessons are either from the Scriptures, from the life of a saint, or from a homily of some Father. The name is derived from the recitation of the service 'by night.'

NODAL POINTS, LINES, AND SECTIONS. When a string or metallic cord, under strong tension, is made to vibrate, we hear, besides the principal sound, several secondary and shriller sounds; these are denominated harmonic sounds, and are produced each by a certain portion of the chord which vibrates independently. Further investigation has shewn that every vibrating string is divided into a number of portions alternately vibrating in opposite directions, and that the points which separate these portions from each other are at rest. These points are

known as *nodal points*, and their situation may be found by placing small pieces of paper on an extended string, and causing it to vibrate; the points from which the pieces of paper have not been displaced are the nodal points. If a plate of glass or metal be held in the hand, and a well-resined fiddle-bow be drawn across the edge, particles of fine dust, previously placed on the plate, will arrange themselves in lines, shewing that along these lines no vibration has taken place; these lines are *nodal lines*, and are

Nodal Points.

found in most cases to group themselves together into geometrical figures, and occasionally to present the most beautiful designs. The wood-cut represents a few specimens. The arrangement of the nodal lines depends on the point by which the plate is held, and on the form of the plate itself. Similarly, if a column of air in a wholly or partially closed tube be acted upon by the force of the breath applied through a hole at any point in its length, the column will divide itself into cylindrical portions each in a state of vibration, and separated from one another by transverse sectional portions in which the air is at rest; these latter sections are known as *nodal sections*.

**NODDY** (*Megalopterus* or *Anous*), a genus of birds of the family *Laridae*, differing from terns in having the bill slightly angular, thus exhibiting an approach to gulls, and the tail not forked but somewhat wedge-shaped. Only one species is known (*M.* or *A.* *stolidus*), a bird widely diffused

Noddy (*Megalopterus stolidus*).

both in the northern and southern hemispheres, and familiar to sailors, not only as often seen skimming over the water in quest of fishes, but also as not unfrequently alighting on vessels, and, particularly during the night, suffering itself to be taken by the hand. At its breeding-places also, where not accustomed to the visits of man, it scarcely gets

out of the way, and the female sits undisturbed on the nest. Hence it commonly shares with the Booby the reputation of unusual stupidity. It is about fifteen or sixteen inches long, from the tip of the bill to the end of the tail, the general colour being a brownish-black. The N. is a rare visitant of the British shores, but is very abundant in warmer latitudes; and on some of the *keys* of the West Indies, and other islets of different parts of the world, it breeds in immense numbers. Particular islets seem to be specially selected as the breeding-places of noddies; and there their nests are sometimes so closely placed that it is not easy to walk among them. Each nest generally contains three eggs, about two inches long, which are very good to eat, and are in some places collected in great numbers.

**NODES**, in Astronomy, are the two points in which the orbit of a planet intersects the plane of the ecliptic, the one through which the planet passes from the south to the north side of the ecliptic being called the *ascending node* ( $\Omega$ ), and the other the *descending node* ( $\varpi$ ). As all the bodies of the solar system, whether planets or comets, move in orbits variously inclined to the ecliptic, the orbit of each possesses two nodes, and a line drawn joining these two points is called the *line of nodes* of each body. It is scarcely necessary to add, that as the earth moves in the plane of the ecliptic she has no nodes. The places of the nodes are not fixed points on the plane of the ecliptic, but are in a constant state of fluctuation, sometimes *advancing* (eastward), and at other times *receding* (moving westward). This motion is produced by the mutual attractions of the planets, which tend to draw each of them out of the plane of its orbit; and it depends upon the relative positions of the planets with respect to another planet whether that planet's nodes shall advance or recede. On the whole, however, the majority of possible 'relative positions,' or *configurations*, as they are called, is in favour of a retrograde motion; and we find by observation, that in an average of many revolutions round the sun a constant retrogradation of the node takes place. The determination of this retrogradation in the case of the planets is a most complicated problem, as the separate action of each on the others has to be taken into account; but in the case of the moon's nodes, the immensely preponderating attraction of the earth, and its great relative magnitude as compared with the moon, enable us to throw out of account any other disturbing influence, and at the same time to exhibit clearly the cause of this motion of the nodes. Suppose the moon to have attained her greatest north latitude, and to be descending towards the ecliptic, and the earth to be in longitude between her and her previous descending node, then the earth's attraction will tend to *depress* the moon's orbit, and cause her to descend to the plane of the ecliptic sooner than she would otherwise have done; in this case we have a retrogradation of the node. Again, supposing the moon placed as before, but the earth in advance of the line of nodes, then the earth's attraction will tend to draw the moon forward in her orbit so as to meet the ecliptic in a point beyond the previous descending node; in this case, the moon's node has advanced. As in the case of the planets, however, the retrograding tendency preponderates. The average annual retrogradation of the nodes is very small in the case of the planets, but considerable in that of the moon. See **MOON**. In calculating the courses of the planets, the 'length' of the ascending node, or its distance in longitude from the vernal equinox is a most important element. See **ORBIT**.

**NODES**, in Botany. See **STEM**.

**NODES** are swellings, most commonly of an oblong form, which occur on superficial bones, such as the tibia, ulna, clavicle, and frontal bone, and are due to a syphilitic taint, to serofula, or to rheumatism. Their immediate cause is the infiltration of lymph or serum into the periosteum, or between it and the bone. The treatment depends so essentially on the constitution of the patient, and the primary cause of the swelling, that it would be inexpedient to enter into any detail regarding it.

**NODIER, CHARLES E.**, an eminent French litterateur, was born at Besançon, 29th April 1783; other authorities give 1780 and 1781. His father was a distinguished lawyer, who warmly embraced the side of the revolution, and brought up his son in the same principles. At the age of 12, he was a member of the famous society of *Amis de la Constitution*, and hated tyranny with a most ideal and classical hatred; but he soon afterwards became a royalist; then, again under Napoleon, a republican; and indeed during his whole career shewed a want of that robust opinionativeness, without which it is impossible for a man to become a genuine politician. He died—after a life of the hardest literary work, in which time, and even admirable talents were wasted on inferior subjects—27th January 1844. Besides editions of the French classics, grammatical, lexicographical, and poetical works, he wrote numerous tales and memoirs. A portion of his writings was collected and published in 12 vols. at Paris, 1832—1834, under the incorrect title of *Œuvres Complètes*.

**NOETIANS.** See **PATRIPASSIANS**.

**NOGENT LE ROTROU**, a town of France, in the department of Eure-et-Loir, is situated in a pretty vale on the Huisne, 32 miles west-south-west of Chartres. It is a station on the Great Western Railway from Paris to Rennes in Brittany. Pop. (1861) 5877. N. is a long, well-built town, with a ruined castle in the Gothic style, the residence of the great Sully.

**NOGGING.** Brickwork built in the panels of a timber-framed house. Nogging-pieces are horizontal timbers, introduced to strengthen the brickwork.

**NOILS**, a technical term employed for the short and broken hairs which are removed from wool in the process of combing and preparing it for worsted manufactures. The *noils* are used for making inferior yarns, and are valuable for *felting* purposes, in which they are largely employed.

**NOLA**, an episcopal city of Italy, in the province of Terra di Lavoro, 16 miles east-north-east of Naples, is built on the site of one of the oldest cities of Campania. The ancient N. was founded by the Ausonians, and fell into the hands of the Romans in the Samnite war, 313 B.C. For its protection, Marcellus in the second Punic war fought in its vicinity the first battles in which the Romans were victorious over Hannibal. Augustus died at Nola, 14 A.D. The first bells for Christian churches are said to have been cast here in the 5th century. See **BELL**. Numerous coins, and beautiful vases made of a pale-yellow clay, with figures painted in crimson and maroon, and supposed to have been manufactured here by potters from Corinth, have been found in the vicinity. N. was a flourishing city in the middle ages, and has at present 9000 inhabitants.

**NOLI ME TANGERÉ**, a popular name for one form of the disease which has been already described under the term **LUPUS** (q. v.).

**NOLLÉ PROSEQUI**, a term used in English Law to denote that the plaintiff does not intend to

go further with the action, or part of the action, in which case he enters or files a memorandum, called a *nolle prosequi*, after which the action, or part of the action, is at an end on that point, and the defendant is entitled to his costs thereon.

**NOLLEKENS, JOSEPH**, was born in London in 1737. His father, who was from Antwerp, and by profession a painter, died when he was young, and his mother, a Frenchwoman, not remaining long a widow, he received but little education. Being placed in the studio of Scheemakers the sculptor, in Vine Street, Piccadilly, he worked hard, and made such progress, that, in 1759, the Society of Arts awarded him fifteen guineas for a group in clay; in 1760, thirty guineas for a *bas-relief*; and during the same year, ten guineas for a model in clay of a dancing faun. Soon after this, N. set out for Rome. He was then in his twenty-third year; his purse was light, he had no patron to support him; but he was independent in spirit, and had been trained to habits of economy. A *bas-relief* he carved in stone brought him ten guineas from England, and the Society of Arts voted him fifty guineas for his group in marble of Timoclea before Alexander. But one of the most important events for him, after settling in Rome, was his meeting Garrick in the Vatican, who immediately recognised his countryman as the young sculptor to whom the prizes had been awarded by the Society of Arts, sat to him for his bust, and paid him handsomely for it. This was the first bust he had been commissioned to model, and it gave him the opportunity of proving where his strength lay. He also executed in Rome a bust of Sterne in terra cotta, which added greatly to his reputation. After residing ten years in Rome, he returned to London, took a lease of extensive premises in Mortimer Street, where he set up his studio; and the reputation he had acquired in Rome was such, that he immediately had full employment, and within a year after (in 1771) was elected an Associate of the Academy, and a Royal Academician the following year. His forte was in modelling busts. Into these he infused much truth and character, and he has handed down the likenesses of most of the important personages who figured in this country in the end of the last and at the commencement of this c.—of Samuel Johnson, who was his friend and frequent visitor—of Fox, Pitt, and other political characters. George III. also sat to him; and his manner, which exhibited pretty strongly what is popularly set down as blunt and manly English character, made him a great favourite with the king. Besides busts, N. executed numerous commissions for public monuments and statues. He was selected by the Academy, with whom the choice lay, to execute the government commission of a monument to the three captains, Manners, Bayne, and Blair, who fell in Rodney's great battle of April 12, 1782; but in this he did not rise above the allegories of Neptune and his Sea-horse, and Britannia and her Lion. His statue of Pitt for Cambridge was much praised at the time. He also executed, either in the course of his studies, or to meet the views of those connoisseurs who advocate high art, a considerable number of classical and mythological statues and groups, a faun, a Bacchus, five Venuses, Cupid and Psyche, Pætus and Arria, &c. He died in London, 23d April 1823. His wife, to whom he had been long married, and who had brought him some fortune, died a few years before him. He had no children, and his great wealth, upwards of £200,000, was left to certain friends, burdened with some legacies and annuities to his old assistants and servants.—See *Cunningham's Lives of British Artists*, &c.

**NOMADS** (Gr. *nomain*, to tend or feed), the name given (originally by the Greeks) to those tribes which, depending chiefly on their flocks and herds, have no fixed habitation, but move about for convenience of pasture. The nomad tribes are of a higher grade of civilisation than those that live by hunting and fishing, but much inferior to those engaged in agriculture and manufactures. They are very generally addicted to robbery, and readily engage in aggressive war, so that they have frequently become conquerors of extensive cultivated countries, as in the instances of the Huns, Arabs, and Tartars. There are now few nomads in Europe, and these only in the steppes near the Black Sea, and the regions of the utmost north, where cultivation is impossible. Almost all the Finnish, Mongolian, and Turkish tribes, and the tribes formed by mixture of these races, in the steppes and deserts of Central and Northern Asia are nomads, also the Kurds and the Bedouins, many of the tribes of Africa, and the Ganchos and some of the other Indian tribes in North and South America.

**NO'MBRIL POINT**, in Heraldry. See ESCUTCHEON.

**NOME**, a term used in the ancient Greek music to denote any melody determined by inviolable rules.

**NOMINALISM**. This word refers to a celebrated controversy of the middle ages, respecting the nature of our general or abstract ideas. It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called Realism. Those that held the opposite view were called Nominalists, because they maintained that there is nothing general but *names*; the name 'circle' is applied to everything that is round, and is a general name; but no independent fact or property exists corresponding to the name. There is nothing in a general name, they say, but a declaration of resemblance among a number of things; all things that the name is applied to, resemble one another in some point, which point of resemblance the mind can consider apart from the points of difference; this act of isolated consideration being what is called the power of abstraction. We can be engaged in thinking of the smell of a rose, we can compare it with other sweet odours, and speculate as to the nature of the material that gives the odour, or as to the pleasure that we derive from it; all this is a process of abstract thinking, but it would not of itself suffice to prove that the odour has a separate existence. We might also confine our attention to the mere form, or outline of the rose, and compare it with other forms; but we should be still less able to affirm the independent existence of this particular form.

Realism must be traced back to Plato's system of Ideas, or the eternal and independent existence of general attributes, from which the concrete embodiments were derived. There existed in the Divine Mind, according to Plato, patterns, models, or archetypes, according to which individuals were formed. The archetype circle was the origin of all actual round things. Aristotle denied the separate existence of these general forms, and held that they existed only in connection with matter, or with objects in the concrete. The Stoics repudiated universals in both senses. The Aristotelian view constituted the Scholastic Realism, and prevailed until the 11th c., when a re-action took place in favour of the Stoical doctrine, headed by Roscelin of Compiègne and John the Sophist. This was the

commencement of Nominalism. The celebrated Abelard was a disciple of Roscelin, and induced large numbers to depart from the Realistic notions, which were identified at the time with religious orthodoxy. The controversy raged with great violence through the 12th century. Thomas Aquinas and Duns Scotus, in the following century, gave their powerful adhesion to Realism. In the 14th c., William Occam, an English Franciscan friar, and a pupil of Scotus, revived the advocacy of Nominalism, which was once more maintained by a number of eminent men, in spite of the hostility of the church, carried the length of persecution. The controversy subsided at the Reformation.

A middle view between Nominalism and Realism was held by a few persons when the contest was at its height; which was, that although general properties have no separate existence in nature, they can be conceived in the mind apart from any concrete embodiment. Thus we may form an idea of a circle, irrespective of any individual round body. This view is specious, and is tacitly implied in many opinions that have never ceased to be held. See GENERALISATION.

**NOMINATIVE**. See DECLENSION.

**NON-APPEARANCE**, the term used in the Law of England to denote that a party against whom an action or suit has been commenced has not entered an appearance, which is the way by which he comes before the court to defend his right. In many cases, if he does not appear, the suit will go on in his absence, provided he was duly served with the writ of summons or bill.

**NON-ASSUMPSIT**, is in English Law the usual plea or defence to an action for breach of a contract not by deed, and means that the defendant denies that he broke the contract, or that there was any contract.

**NON-COMMISSIONED OFFICERS**, in the British army, constitute a numerous and very important class in the regimental system between the commissioned officers and the men. As the former are not permitted to mix with the private soldiers, lest familiarity should diminish the sway of absolute discipline, it is necessary to have an intermediate class to overlook the men in their barracks and at all times when off the parade. None are so suited for this duty as the best conducted of the men themselves, who are promoted by selection to non-commissioned rank, and hold many privileges and powers unattainable by the privates. The non-commissioned officers comprise the serjeants-major, all the serjeants, the trumpeters, drummers, and buglers, and, in the Life Guards and Royal Horse Guards only, the corporals. They can be reduced to the ranks by sentence of a court-martial, or by their colonel-commandant; but not by a lieutenant-colonel nor by any junior officer. Non-commissioned officers are entitled to quarters for their wives, or lodging-money in lieu of quarters. Accustomed themselves to obey, the non-commissioned officers are admirable assistants in preserving discipline; veterans, to whom military life is a second nature, they are looked up to by their comrades as examples, to lead in battle or to teach in drill. The non-commissioned officers have a Mess (q. v.) to themselves. In a battalion of infantry, there at present are 81 non-commissioned officers to 800 rank and file; but the proportion varies, as the latter may be greatly augmented without affecting the number of the former; and in the whole British army (European) for the year 1864—1865, there are 19,363 non-commissioned officers. This intermediate rank is a necessity in all armies; in France, the non-commissioned

officers are termed *sous-officiers*; in Germany, *unter-offizieren*.

**NONCONFORMISTS**, a name sometimes given generally to all sectaries who, at any period in English history since the establishment of Protestantism, have refused to conform to the doctrine and practices of the Episcopal Church. It is, however, more frequently used in a restricted sense to denote the 2000 clergymen who in 1662—two years after the Restoration—left the Church of England, rather than submit to the conditions of the Act of Uniformity, which required of every beneficed minister, every fellow of a college, and even every schoolmaster, unfeigned assent to all and everything contained in the Book of Common Prayer. The ejected ministers swelled the ranks of the Presbyterians and Independents, the latter of whom are sometimes called Nonconformists.

**NON-EFFECTIVE** (Fr. *non-actif*), is the term applied to the portion of the personnel of the army or navy not on active service or in immediate readiness for active service. It thus comprises all officers on retired or half-pay, pensioners, and superannuated officers. In a force liable to frequent augmentations and reductions, the non-effective charge will necessarily be considerable; and the great French war, with the extensive reductions following it, bequeathed to the British an annual non-effective charge of several millions, which is only now beginning to be satisfactorily expunged. At present (1864—1865), the non-effective charges are £2,106,157 for the army, and £1,381,974 for the navy, being 13·8 per cent. on the gross cost of the two services.

**NON-ENTRY**, in the Law of Scotland, means that state of a feudal estate when the last vassal has died, and his successor has not been invested or seised of the land. On such an occasion, the superior is entitled to what is called a casualty of non-entry, which consists of the rent of the feu.

**NON EST INVENTUS**, a technical term used in that part of the law where, after judgment, the sheriff endeavours to arrest a party. If after a reasonable search he cannot find the debtor, he makes a return to the court that he has not been able to find the debtor, which is shortly called a return of *non est inventus*, and his duty is then discharged until a fresh writ is issued to him.

**NONE** (Lat. *nona*, 'ninth'), one of the lesser Canonical Hours (q. v.), so called from its recitation being primitively fixed at the ninth hour.

**NONES**. See CALEND.

**NONFEASANCE**, in certain parts of the Law of England, means the not doing what one is bound to do.

**NONJOINDER**, in English Law, is the omitting to join all the parties to the action or suit.

**NONJURORS**, the name given to that portion of the Episcopal clergy of England who at the coronation of William and Mary refused to take the oath of allegiance to these sovereigns, believing that they had unlawfully possessed themselves of the throne abdicated by James II. They were great champions of the doctrine of passive obedience on the part of subjects towards kings; and as the triumph of the Prince of Orange was obtained at the expense of that doctrine, it was impossible that they could, consistently with their antecedents, acknowledge him as their rightful king. The House of Commons allowed them six months longer than laymen to make up their minds, but declined to adopt the amendment of the Lords, viz., that the oath should not be imposed on the clergy. They refused, and were consequently deprived of their

sees and benefices. The nonjurors comprised Archbishop Sancroft, 8 bishops, and about 400 of the inferior clergy.

**NON-RESIDENCE**, the name given in Church Law to the offence of a person holding a Spiritual Benefice who absents himself without legal justification from the local parishes within which the duties attached to the benefice are prescribed to be performed. The obligation of residence follows clearly from every principle of law, and from the constant tendency to relaxation on the part of the clergy, has been an unfailing subject of legislation, ecclesiastical and civil, from the very earliest times. The Council of Nice in 325, of Antioch in 332, and of Carthage in 401; the constitutions of the popes from the earliest genuine document of that class, the novels of Justinian, the capitularies of Charlemagne—all speak the same language, and enforce it by the same penalties. During the mediæval period, and especially during the unhappy contests of the western schism, great abuses prevailed. The whole substance of the legislation of the Roman Church on the subject, however, is compressed in the decrees of the Council of Trent, which are mainly contained in the decrees of the XXII. and following sessions, 'On Reformation.' The decrees of the council regard all church dignitaries, and others charged with the cure of souls. Without entering into the details, it will suffice to say, that for all the penalty of absence without just cause, and due permission, consists in the forfeiture of revenues, in a proportion partly varying with the nature of the benefice, partly adjusted according to the duration of the absence. For each class, moreover, a certain time is fixed, beyond which, during twelve months, absence cannot be permitted. The duty is imposed on persons named in the law of reporting to the ecclesiastical superiors cases of prolonged absence. The same legislation has been confirmed by most of the recent concordats, and is enforced by the civil law of each country. In England, the penalties for non-residence are regulated by 1 and 2 Vict. c. 106. Under this act, an incumbent absenting himself without the bishop's licence for a period exceeding three, and not exceeding six months, forfeits one-third of the annual income; if the absence exceed six, and does not exceed eight months, one-half is forfeited; and if it be of the whole year, three-fourths of the income are forfeited. The persons excused from the obligation of residence by the canon law are sick persons, persons engaged in teaching the theological sciences in approved places of study, and canons in immediate attendance upon the bishop ('*canonici a latere*'), who ought not to exceed two in number. By the act 1 and 2 Vict. c. 106, heads of colleges at Oxford and Cambridge, the wardens of Durham University, and the head-masters of Eton, Westminster, and Winchester Schools are generally exempted, and temporary exemptions from residence are recognised in other cases, which it would be tedious to detail. In the Roman Catholic Church, besides the general legislation, most of the provincial and diocesan statutes contain special provisions on the subject of non-residence.

**NON-SUIT** is a legal term in England, which means, that where a plaintiff in a jury trial finds he will lose his case owing to some defect or accident, he is allowed to be non-suited, instead of allowing a verdict and judgment to go for the defendant. The consequence is, that the plaintiff has to pay the defendant's costs; but he can bring a fresh action, if he can get over the difficulty that rendered a non-suit necessary or expedient.

**NOOSSA**. See MOLUCCAS.

**NOOTKA DOG**, a large kind of dog, common in a domesticated state among the natives of the vicinity of Nootka Sound. It has erect, pointed ears. It is chiefly remarkable for the extreme abundance of its long woolly hair, which, when shorn off, holds together as a fleece, and is spun and woven into garments. The introduction of this wool-bearing dog into other countries has been suggested, but not yet attempted.

**NOOTKA SOUND**, an inlet on the west coast of Vancouver's Island, British North America, in lat. 49° 35' N., long. 126° 35' W. Its entrance is protected by an island of the same name, and the Sound can be entered on both sides of the island. It extends inland for 10 miles in a north-north-east direction; but the greatest breadth of water is not more than 500 yards. Numerous small coves and inlets are found around the rocky shores. It affords good anchorage.

**NORD**, the most northerly department in France (whence its name), corresponding with the former province of French Flanders, and bordering on Belgium and the Straits of Dover. Area, 1,420,000 acres; pop. (1861) 1,303,350. It is composed of two parts, or at least narrows near the middle at Armentières, on the Lys, almost to a line. It is watered by the Scheldt and the Sambre, with their affluents, and by numerous canals. It is the most densely peopled department in France. The soil is fertile, well cultivated, and yields more abundant harvests than any other part of the country. Of the whole area, 853,606 acres are arable land. The principal products are wheat, hemp, beet-root, vegetables, tobacco, and fruits. Manufactures of lace, cambric, linens, and beet-root sugar are extensively carried on. It has twice the average proportion of railways and roads, and four times that of canals, as well as the most important coal and iron mines. No other department has so many populous towns and strong fortresses; none adds so much to the national revenue; in none are the people so intelligent, so susceptible of culture, or so industrious. In respect of its educational and benevolent institutions, as well as of its learned societies, it ranks next to the department of the Seine. The arrondissements are Lille, Douai, Cambrai, Valenciennes, Avesnes, Hazebrouck, and Dunkerque. The chief town is Lille.

**NORDERNEY**, a small island belonging to the kingdom of Hanover, lies three miles off the coast of East Friesland, and forms one of a string of islands that line that coast. Area about 4 square miles; permanent pop. 800. It has enjoyed, since 1797, a great reputation as a place for sea-bathing, and in the summer season has from 1600 to 2000 visitors. The little village at the west end of the island has a very tastefully-built *Conversations-Haus*, 130 feet long. Trees do not grow here.

**NORDHAUSEN**, a flourishing town of Prussian Saxony, pleasantly situated at the southern base of the Harz Mountains, on the Zorge, 33 miles north-north-west of Erfurt. The surrounding country is very fertile in corn, and in the vicinity commences the *Goldene Aue* (Golden Plain), a fertile valley watered by the Helme. It contains a gymnasium, numerous churches, one of which, St Blasius, contains two pictures by Luke Cranach. It carries on a thriving general trade, is the dépôt from which the Harz Mountains are supplied with necessaries, and has most extensive distilleries and considerable manufactures of tobacco, sugarcy, chemicals, cloth, leather, &c. Its spirit distilleries, of which there are fifty in almost constant operation, produce annually for export from 60,000 to 70,000 hogsheads of 180 quarts each. Pop. 15,619.

**NÖRDLINGEN**, a town in the west of Bavaria, is situated on the river Eger, 44 miles north-west of Augsburg by the Munich and Nürnberg railway. It has a Gothic church, with a high tower and fine organ, and manufactures of Tyrolese carpets, linens, and woollens, besides a large trade in feathers. Pop. 6920. N. is historically interesting as the scene of several battles, the most famous of which was fought, 6th September 1634, between 24,000 Swedes, under Count Horn and Duke Bernhard of Saxe-Weimar, and 45,000 imperialists under King Ferdinand. The former were defeated with the loss of 12,000 killed and wounded, 300 banners and standards, 80 cannons, and several thousand prisoners, among whom was Horn himself.

**NORE** is a sand-bank in the estuary of the river Thames, 4 miles north-east of Sheerness, on which there is a floating light, called the Nore light, in lat. 51° 29' N., long. 0° 43' W. The name, however, is more commonly applied to the portion of the estuary in the vicinity of the Nore light and sand-bank.

**NORFOLK**, a large and important maritime county of England, bounded on the north and north-east by the North Sea, and on the south by the county of Suffolk. Area, 1,354,301 acres; pop. (1861) 434,798. Its coast-line, extending from Yarmouth, on the east, to the mouth of the Nen in the Wash, is about 100 miles in length. From Yarmouth to Happisburgh, the coast is low and sandy; from Happisburgh to Weybourne, it is skirted by low cliffs; and west of Weybourne to the entrance to the Wash, where the banks are in great part dry at low-water, and where a considerable extent of land has been reclaimed from the sea (see *WASH*), it is low, and covered with sand or shingle. The surface of the county is level, or nearly so, none of the rising-grounds being considered worthy of being called hills. The principal rivers are the Ouse, the Yare, with its affluents the Wensum and the Waveney, and the Bure. Communication is kept up by the navigable rivers, and by the Great Eastern Railway. The climate is affected in spring particularly by cold north-east winds, but the air is in general dry and healthy. The soil consists chiefly of light sands and loams, and comprises a great extent of land, which though naturally not fertile, has been made so by judicious management. The agriculture of the county is in an advanced condition, and all the usual crops are extensively grown; while that of barley is especially celebrated. Half the acreage is devoted to rearing food for cattle, and thus the necessary supply of manure is secured. Geese and turkeys are extensively reared for the London market. The county, which forms two divisions, East and West N., returns four members to the House of Commons. The capital is Norwich. (1871—pop. 438,511.)

**NORFOLK**, a city and port of entry of Virginia, U. S., 106 miles south-east of Richmond, and 32 miles from the ocean. The city is irregularly built on low ground, and contains a city hall, military academy, mechanics' hall, court-house, jail, custom-house, 3 banks, 14 churches. Its large deep harbour is defended by Fort Calhoun and Fortress Monroe, the largest fortress in America. A government navy yard, dry dock, and marine hospital are in the suburb of Gosport. N. was built in 1736; in 1776, it was burned by order of Lord Dunmore, the British colonial governor. In 1855, a large number of the inhabitants died of yellow fever; in 1861, at the secession of Virginia, the navy yard, attacked by the Confederate troops, was hastily set on fire and deserted by the Federals, who sunk and burned several of the largest vessels in the American navy. Pop. in 1860, 14,609.

**NORFOLK ISLAND** lies in the Pacific Ocean, 1100 miles east-north-east of Sydney in Australia, in lat. 29° 10' S., and long. 167° 58' E. Length, 5 miles; breadth, 2½ miles; area, 8960 acres. It is the largest of a small cluster of islands, comprising N., Nepean, and Philip Islands, together with several rocky islets. The coasts are high and steep, and the surface generally uneven, rising in Mount Pitt to upwards of 1000 feet in height. The soil is fertile and well watered, and the climate healthy. In 1825, N. I. was made a penal settlement by the British government for the worst class of convicts sent out to New South Wales; but the experiment was a failure, and the establishment was broken up in 1855. In 1856, the inhabitants of Pitcairn Island (q. v.)—194 in number, descendants of the mutineers of the *Bounty*—were transferred hither by the British government; but after a few years a part of them returned to their old abode.

**NORIC ALPS.** See **ALPS.**

**NORIUM** is the name assigned by Svanberg to a metal, whose earth (or oxide) is associated with zirconia in certain varieties of the mineral zircon. Its existence is not as yet definitely established.

**NORMAL SCHOOLS**, institutions where teachers are instructed in the principles of their profession and trained in the practice of it. The name of Normal School is of French origin (*École Normale*, from Lat. *norma*, a rule or model), and is that generally used in Scotland; such institutions, in England, are oftener called 'Training Colleges;' and in Germany 'Seminaries.' That in acquiring knowledge the mind follows certain processes, and that any one imparting knowledge should do so in harmony with these processes, are truths which seem sufficiently obvious. It is only recently, however, that they have secured much attention; and they are even at this day deliberately denied by some men of thought, and of the highest educational position. The recognition of these truths has, however, been sufficiently extensive to secure the institution, in Great Britain, America, France, Germany, and Switzerland, of schools in which the principles of teaching form the subject of study, and in which model specimens of the art are given. Italy, and even Russia, are following in the wake of the countries named. These schools also afford a thorough course of instruction in the subjects which are taught in elementary schools. The only normal school for training the higher class of teachers for colleges and academies exists in Paris.

One of the earliest, if not the earliest, normal school in Great Britain was the Sessional School of Edinburgh (1830), afterwards developed into the 'General Assembly's Normal Institution.' The first attempt of a similar kind in England was that of the Battersea Training College, instituted by Mr. now Sir J. P. Kay Shuttleworth, and Mr. Tuffnell. Sir J. P. K. Shuttleworth afterwards, acting as secretary to the Committee of Privy Council on Education, suggested measures which have resulted in the institution of 36 colleges for the training of teachers in Great Britain in connection with the Established and Dissenting Churches. These turn out hundreds of male and female teachers annually, who having, after a two years' course of training, received government certificates of merit, become teachers of elementary schools.

There has been for some years a reaction against the necessity of normal schools, and their maintenance at the public expense. But this reaction can only be temporary, and the great facts will survive, that every subject of instruction is best taught according to a certain method, and that all methods are based on the study of the human

mind. This is a position which it is impossible permanently to shake. The real founders of normal schools are those men who, with more or less clearness and width of view, have brought prominently forward these principles. Such were Plato and Quintilian, in ancient times; in more recent years, the most prominent names have been Comenius, Pestalozzi, Rousseau; and, in our own country, Ascham, Milton, Locke, Professor Pillans, and Dr Arnold.

**NORMAN ARCHITECTURE.** As its name implies, this style was originated and chiefly used by the Normans. Soon after their conquest of the north of France, they began to erect churches and cathedrals in memory of their victories. Their conquests supplied them with the means for making these large edifices. They were not contented with the small churches then common in France, but desired to erect monuments worthy of their great conquests. They accordingly expanded the dimensions, while to a great extent retaining the style of the buildings they found in France. They seem also to have borrowed some of their ideas from the Rhine. See **GOTHIC ARCHITECTURE.**

The leading characteristics of their style were size and massiveness. They adopted the old Latin plan (derived from the Basilica) of central and side aisles; and at the east end, they invariably placed a semicircular apse. They seized on the tower as a distinguishing feature, and developed it as their style progressed. The ornaments are simple and of great variety; but the most common and distinctive are the zigzag, billet, chevron, nail-head, &c. The windows and doors are simple, with semicircular arched heads—the former without tracery. The tympanum of the door-arch is occasionally filled with sculpture.

The nave arches are carried sometimes on single pillars, but more frequently, especially as the style advanced, on piers with shafts. The shafts are almost always recessed in nooks (or 'nook shafts'). Owing to the great size of the buildings, the architects were unable at first to vault the main aisle, which, accordingly, had usually a wooden roof, the side aisles only being vaulted.

The masonry is rude; the joints being large, and the stones generally unhewn. The style prevailed from about the beginning of the 10th c. till the death of William the Conqueror, near the end of the 11th century. There are many examples in Normandy, the churches at Caen being well-known buildings of the date of William.

This style of architecture was brought into England by the Normans at the Conquest, 1066. They there extended the scale of the buildings, as they had done in Normandy, preserving, however, many local peculiarities of the Saxon style, which they found in the country. The chapel in the White Tower of the Tower of London is the earliest example of pure Norman work in England. There are, however, many buildings, both in England and Scotland, which date from before the end of the 12th c., when the pointed style began to be used. Durham, Lindisfarne, Canterbury, Dunfermline are partially Norman, besides many other churches and castles. The Anglo-Norman is heavier than the French-Norman, the cylindrical nave piers of the above buildings being much more massive than those of French works. To relieve this heaviness, the chevron, spiral, and other groovings were cut in the piers. The mouldings and forms of doors, windows, &c., are the same as those of Normandy. There is one remarkable difference in the plans of the Early Norman churches in the two countries: in France, the apse at the east end is always semicircular; in England, this form was gradually given up; and

towards the end of the style, the square east end was universally adopted.

**NORMANDY** (Fr. *Normandie*), formerly a province in the north of France, bordering on the English Channel; now divided into the departments of Seine Inferieure, Eure, Orne, Calvados, and Manche. It is in general a very fertile, richly-cultivated land, resembling a garden in many districts. Its chief agricultural products are corn, flax, and fruits (from which cider is largely made); its fisheries and manufactures of great importance, and its horses the best in the kingdom. The inhabitants are for the most part descendants of the old Normans, and bear the stamp of their splendid ancestors. They are intelligent, strongly built, and of a noble and energetic character; warm-hearted and patriotic, they produce the boldest sailors, the most skilful fishermen, agriculturists, cattle-rearers, and gardeners in all France. In the north-eastern and more level part (formerly *Upper Normandy*), the principal towns are Rouen, Dieppe, Havre-de-Grace, Harfleur, Honfleur, Lisieux, Evreux, Yvetot; in the south-western and hilly part (*Lower Normandy*), the principal towns are Caen, Falaise, St-Lô, Bayeux, Coutances, Avranches, Balonne, Alençon, Cherbourg, and Mont-St-Michel.

In the time of the Romans, the country bore the name of *Gallia Lugdunensis II.* Under the Frankish monarchs it formed a part of Neustria, and was first called N. after Charles the Simple, in 912, had given it to Rolf or Rollo, the leader of a band of Norse rovers (see **NORMANS**), to be held by him and his posterity as a fief of the French crown. From Rolf (baptized into Christianity under the name of Robert) and Gisela, the daughter of Charles, sprung the later Dukes of N., of whom Richard I., grandson of Rolf, vigorously maintained his authority against his liege lords, Louis IV. and Lothaire. William II., son of Robert II., became Duke of N. in 1036; and in 1066, established a Norman dynasty on the throne of England (see **WILLIAM THE CONQUEROR**), thereby politically uniting N. with the latter country. In 1077, his eldest son, Robert, wrested N. from him, but it was again united to England under Henry I. in 1105. With this monarch, Rolf's male line became extinct. Henry II., the son of Henry I.'s daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the government of England and N.; but in the reign of his son, John Lackland, it was conquered by Philippe Auguste (1203—1204). It remained a portion of the French monarchy for more than 200 years; but after the battle of Agincourt (1415) it was reconquered by the English, who held it till 1449, when it was finally wrested from them by Charles VII. See Liquez's *Histoire de la Normandie* (2 vols. Paris, 1835).

**NORMANDY, CUSTOMARY LAW OF** (Fr. *Coutumier de Normandie*). The ancient provinces of France were governed principally by a system of laws called *Coutumes*, which had originated in local usages, and been in the course of time reduced to writing and formally sanctioned by the sovereign. *Coutume* was distinguished both from *loi*, which originated with the king, and from *us*, or usage not reduced to writing. Of the codes of customary law, one of the oldest and most famous was the *Coutumier de Normandie*. It was divided into the ancient and modern custom. The former was first reduced to a written form, in 1229, under St Louis; the latter was the ancient *coutumier*, modified and reformed in 1585 by commissioners appointed by Henry III., with the concurrence of the three estates of the nobility, clergy, and people of Normandy. The ancient *coutumier* treats principally

of the duties of the judicial officers, the proceedings in the different courts, and the rights and obligations of the kings of France, the Dukes of Normandy, the feudal lords, and the people. In the modern *coutumier* are minute regulations regarding the transmission of property by will and inheritance. Each of the twenty-two vicomtes, into which N. was divided, had a different mode of devising real property. The law by which the Channel Islands are still governed is based on the customary law of Normandy. The chief judge in Jersey, Guernsey, and Alderney retains the Norman name of *bailli* or *badiff*, and his authority is much the same as that officer possessed under the Norman law. One of the most remarkable remnants of the *coutumier* still subsisting in the Channel Islands is the *Clameur de Haro*. Any one who considers that his rights of property are infringed, protests in the presence of two witnesses, and calling out three times 'Haro' (said to be a way of invoking Duke Rollo, noted for his justice), summons the trespasser to desist. He then applies to the authorities, relating what he has done, and proceeds to the Record Office, where note is taken of the circumstances; all which ceremonial must be gone through before bringing an action of trespass. The decision is generally referred to *une vue de justice*, and the losing party is subjected to a fine, and liable in costs: he had formerly also to undergo *un regard de châteaur*, or twenty-four hours' imprisonment, for having implored the aid of the prince without cause.

**NORMANS** (i. e., Northmen), a name generally limited in its application to those sea rovers who established themselves in that part of France called after them, Normandy; but sometimes embracing also the early inhabitants of Norway. During the middle ages, the name Northmen, or Norsemen, was often used in a broader sense, to denote the entire population of Scandinavia, and still more frequently, perhaps, to designate the Danes and Norwegians, exclusive of the Swedes. The Germans and French called the piratical hordes who ravaged their shores Normans or Northmen; the Saxons, usually Danes or Eastmen. They were also distinguished by the latter as *Mark-* or *March-men* (from *Den-mark*), as *Ask-men* (i. e., men of the *ashen-ships*), and as the *Heathen*. The primary cause of the plundering expeditions southward and westward across the seas, undertaken by the Norse Vikings (*Vikingar*, meaning either 'warriors,' or more probably dwellers on the *vics*, i. e., bays or fiords), as they called themselves, under leaders who took the name of 'Sea-Kings,' was doubtless the over-population and consequent scarcity of food in their native homes; besides, the relish for a life of warlike adventure, conjoined with the hope of rich booty, strongly attracted them; while—at least as long as the old Scandinavian religion lasted (i. e., till about the end of the 10th c.)—death in battle was not a thing to be dreaded, for the slain hero passed into a region of eternal strife in the Walhalla of Odin. Finally, discontent with the ever-increasing power of the greater chiefs or kings, induced many of the nobles with their followers to seek new homes.

The first Danish Norsemen made their appearance on the eastern and southern coasts of England in 787. After 832, their invasions were repeated almost every year. To one of these belongs the legend of Ragnar Lodbrok (i. e., Ragnar of the 'Shaggy Brogues'), who is said to have been taken prisoner by Ella, king of Northumbria, and thrown into a dungeon filled with vipers, where, while expiring amid horrible torments, he sung with heroic exultation the story of his life. The very existence, however, of such a person as Ragnar Lodbrok is questioned by many Scandinavian

scholars. In 851, the Norsemen wintered for the first time in the island, and after 866 obtained firm footing there. The Anglo-Saxon Ethelred I. fell in battle against them in 871. His brother Alfred, known as Alfred the Great (q. v.), after a long and doubtful struggle, partially reduced them to subjection; nevertheless, he was compelled to leave them in possession of Northumbria and East Anglia; and had not only to defend himself against a new and fierce invasion led by the famous rover Hastings (q. v.), but like his immediate successors, to contend against the revolts of his Dano-Norman subjects. A period of external peace now ensued; but in 991 the invasions of the Danes and Norwegians began anew. The Saxon king, Ethelred II., at first sought to buy them off by paying a sort of tribute-money, called *Danegelt* (q. v.); but the massacre of the Danes living in England, by command of that monarch, 13th November 1002, was avenged by four expeditions under the Danish king, Swen, who frightfully wasted the country, and finally conquered it in 1013, dying the following year. His son Knut, or Canute (q. v.), after carrying on a struggle for the supreme power with Ethelred and his successor Edmund Ironside (q. v.), at length, on the death of the latter, became sole monarch of England, which now remained under Danish or Norse rulers till 1042. The government of the country then reverted into the Saxon hands of Edward the Confessor (q. v.), who was succeeded in 1066 by Harold II. (q. v.), son of the powerful Godwin, Earl of Wessex (q. v.); but in October of the same year, Harold lost his life and crown at the battle of Hastings, and William the Conqueror, a descendant of a Norwegian chief who had settled in Normandy, once more established a Norse dynasty on the throne of England, but one greatly refined and improved by long residence in a comparatively civilised region.

It was also Danish Norsemen, in particular, who ravaged the western coasts of the European mainland, from the Elbe to the Garonne. As early as 810, the Danish king, Gottfried, had overrun Friesland; but the power of the great Charlemagne was too much for these undisciplined barbarians, and they were overawed and subdued for a time. Soon after his death, however, they recommenced (*circa* 820) their piratical expeditions, and favoured by the weaknesses and dissensions of the Carolingian rulers, became, during the 9th c., the terror and scourge of North-western Germany and France. They plundered Hamburg several times, ravaged the coasts of the Frisians (which then extended as far as the Scheldt), and in 843 firmly planted themselves at the mouth of the Loire. But ere long they ceased to be satisfied with making descents and settlements on the coasts, and in their small piratical craft they swarmed up the great rivers into the interior of the country, which they devastated far and wide. Thus, in 845, they ascended the Seine and plundered Paris—an exploit which was frequently repeated. In 885, not less than 40,000 of these Vikings are said to have ascended the river from Roten under the leadership of one Siegfried in 700 vessels, and besieged the capital for ten months. It was only saved at the expense of Burgundy, which was abandoned to their ravages. In 881, Louis or Ludwig III., king of the West Franks, inflicted a severe defeat on the invaders at Vimeu, near Abbeville in Picardy, the memory of which has been preserved in a song still popular among the country-people; but neither that, nor the repulse which they sustained from the brave German monarch Arnulf, near Louvain in 891, could hinder them from making fresh irruptions. In 892, they appeared before Bonn, and tradition says that bands of Danish rovers penetrated even into Swit-

zerland, and established themselves in the canton of Schweiz and the vale of Hasli. From their settlements in Aquitania they proceeded at an early period to Spain, plundered the coasts of Galicia in 844, and subsequently landed in Andalusia, but were defeated near Seville by the Moorish prince Abd-ur-Rahman. During 859—860, they forced their way into the Mediterranean, wasted the shores of Spain, Africa, and the Balearic Isles, penetrated up the Rhone as far as Valence; then turning their piratical prow in the direction of Italy, entered the Tyrrhene Sea, burned Pisa and Lucca, and actually touched the distant isles of Greece before their passion for destruction was satiated, or before they dreamed of returning west.

Doubtless Norwegian rovers also took part in these so-called Danish expeditions. We know that as early as the beginning of the 9th c. they made voyages to the north of Ireland, Scotland, the Hebrides, the Orkney and Shetland Isles; and the increasing power of Harald Haarfager in the 9th and 10th centuries, exciting great discontent among the smaller chiefs, great emigrations took place, and these islands became the new homes of these Norwegian Vikings. About the same period, colonies were settled in the Færø Isles and Iceland, from which some Vikings proceeded westwards across the North Atlantic to Greenland in 982, and thence, in 1002, south to a region which they called *Vinland*, now universally believed to be the coast of New England, thus anticipating the discovery of America by Columbus by nearly 500 years. From Norway also issued the last and most important expedition against the coast of France. It was led by Rolf or Rollo, who had been banished by Harald Haarfager on account of his piracies. Rolf forced Charles the Simple to grant him possession of all the land in the valley of the Seine, from the Epte and Eure to the sea. By the time of Charles the Bald the invaders had firmly planted themselves in the country, which then went by the name of Normandy (q. v.). They and their descendants are, strictly speaking, the Normans of history—warlike, vigorous, and a most brilliant race. They rapidly adopted the more civilised form of life that prevailed in the Frankish kingdom—their religion, language, and manners, but inspired everything they borrowed with their own splendid vitality. At a later period (the 12th c.), they even developed a great school of narrative poetry, whose cultivators, the *Trouveurs*, or *Trouvères*, rivalled in celebrity the lyrical Troubadours of Southern France. Their conquest of England, in 1066, gave that country an energetic race of kings and nobles, on the whole well fit to rule a brave, sturdy, but somewhat torpid people like the Anglo-Saxons. But though the Normans had acquired comparatively settled habits in France, the old passion for adventure was still strong in their blood; and in the course of the 11th c., many nobles with their followers betook themselves to Southern Italy, where the strifes of the native princes, Greeks and Arabs, opened up a fine prospect for ambitious designs. In 1059, Robert Guiscard, one of the ten sons of the Norman count, Tancred de Hauteville, all of whom had gone thither, was recognised by Pope Nicholas II. as Duke of Apulia and Calabria, and in 1071 as lord of all Lower Italy. His brother and liegeman, Roger, conquered Sicily, 1060—1089. Roger II. of Sicily united the two dominions in 1127; but in the person of his grandson, William II., the Norman dynasty became extinct, and the kingdom passed into the hands of the Hohenstauffen family.

The Swedish Norsemen directed their expeditions chiefly against the eastern coasts of the Baltic—Courland, Esthonia, and Finland, where they made their appearance in the 9th c.—the very time when

their Danish and Norwegian brethren were roving over the North Sea, the English Channel, the Bay of Biscay, and were establishing themselves on the shores of England and France. According to the narrative of the Russian annalist, Nestor, they appear to have penetrated into the interior as far as Novgorod, whence they were quickly banished by the native Slavic and Finnish inhabitants, but were as quickly solicited to return and assume the reins of government. Hither, consequently, in 862, accompanied by other noted warriors, came three Swedish chiefs, Rurik, Sineus, and Travor, sons of the same father, and belonging to the tribe of *Ros* (whence *Russ* and *Russians*). Rurik founded one kingdom at Novgorod, which stretched northwards as far as the White Sea. His successor, Oleg, united with that a second established by other Swedish adventurers at Kiev, which town now became the capital of the wide-extended Russo-Swedish kingdom. See **RUSSIA**. For a long period these Norsemen, who, it appears, became completely identified with their Slavic-speaking subjects in the 10th c., were dangerous enemies of the Byzantine empire, whose coasts they reached by way of the Black Sea, and whose capital, Constantinople, they frequently menaced, as, for instance, in 941, when Igor is said to have appeared before the city with upwards of 1000 ships or boats. Earlier in the same century, these Swedo-Russian warriors had found their way into the Caspian Sea, and actually penetrated to the coasts of Tartary and Persia. Partly from them, and partly from native Scandinavians, came those soldiers who from the 9th to the 12th c. formed the body-guard of the Byzantine emperors.—See Deppings's *Histoire des Expéditions Maritimes des Normands et de leur Etablissement en France au 10<sup>me</sup> Siècle* (2 vols. 2d edit. 1843); Wheaton's *History of the Northmen from the Earliest Times to the Conquest of England* (Lond. 1831); and Worsaae's *Minder om de Danske og Normændene i England, Skotland, og Irland* (Copenh. 1851).

**NORNÆ**, the *Parææ* of the northern mythology. They were three young women, by name *Urd*, *Verdandi*, and *Skuld*—i. e., Past, Present, and Future. They sit by the *Urdar*-wells under the world-tree *Yggdrasil*, and there determine the fate both of gods and men. Every day they draw water from the spring, and with it and the clay that lies around the wells, sprinkle the ash-tree *Yggdrasil*, that its branches may not rot and wither away. Besides these three great norns, there are also many inferior ones, both good and bad; for, says the *Prose Edda*, when a man is born there is a norn to determine his fate; and the same authority tells us that the unequal destinies of men in the world are attributable to the different dispositions of the norns. These lesser norns corresponded to the *genii* of classic mythology. Women who possessed the power of prediction or magic also bore this name.

**NORRISTOWN**, a borough of Pennsylvania, U. S., on the north bank of the river Schuylkill, 16 miles north-west of Philadelphia, containing cotton and woollen factories, iron rolling-mills and foundries, machine-shops, court-house, jail, public library, bank, 13 churches, 3 academies, 1 German and 4 English newspapers, and about 10,000 inhabitants.

**NORRÖPING**, the first manufacturing town of Sweden after Stockholm, is the chief town of Linköping-Län, in East Gottland, and is situated at the junction of the Motala with the Gulf of Bravike, in 58° 30' N. lat., and 16° 15' E. long. Pop. in 1860, 19,950. It is a fine, well-built town, with broad streets, large squares, and numerous churches

and charitable institutions. The rapid river Motala, which is spanned by several substantial bridges and lined with commodious wharfs, affords very considerable water-power, by which numerous systems of machinery are worked. The manufactures are cloths, stockings, starch, tobacco, soap, &c., while in the neighbourhood are the extensive ironworks and cannon foundries of Finspång. N. is a good salmon station, and is the principal Swedish port for the importation of wines and foreign spirits.

**NORTH, FREDERIC, LORD**, English minister, was born April 13, 1732, and educated at Eton, and Trinity College, Oxford. His father, Baron Guilford, a descendant of Roger, Baron North (*temp.* Henry VIII.), was created an earl in 1752. N. entered the House of Commons at an early age, was made a Lord of the Treasury in 1763, and inherited the Tory politics which, in the days of Charles II., had placed his ancestor in the highest ranks of the law and the state. It was his boast in the House of Commons, that 'since he had had a seat there he had voted against all popular, and in favour of all unpopular measures.' On the death of Charles Townshend, in 1769, he was made Chancellor of the Exchequer and leader of the House of Commons, a post for which he was well qualified by his eloquence, good humour, wit, and readiness of resource. His folly was, however, one of the immediate causes of the American War. Earl Russell, in his *Life and Times of C. J. Fox*, says that 'for £100,000 a year of revenue George Grenville provoked America, and that for £16,000 a year of revenue Lord North lost America.' In 1770, he succeeded the Duke of Grafton as prime-minister. As a minister he was too ready to surrender his own judgment to that of George III., who, with a narrower understanding, had a stronger will, and was determined to subdue America. N. was called by Horace Walpole the ostensible minister; the real minister was the king. N. had to encounter an ardent and powerful opposition, led by C. J. Fox and supported by Burke. It has since been proved that N. 'so early as 1776 was of opinion that the system he was pursuing would end in ruin to the king and to the country.' In 1778, he renounced the right of taxing the colonies. In 1782, it being impossible to carry on the war with America any longer, N. resigned. 'A more amiable man never lived,' says Earl Russell; 'a worse minister never since the Revolution governed this country.' With N.'s retirement came to an end George III.'s scheme of governing the country by his own will, and ruling the House of Commons by court favour and thinly disguised corruption. N. was succeeded by the Marquis of Rockingham, on whose death Lord Shelburne became premier. Fox's dislike of the terms of peace with America led him to enter into a coalition with N., whom he had for so many years inveighed against as a minister without foresight, treacherous, vacillating, and incapable. N. and Fox took office under the Duke of Portland in 1783, but the coalition destroyed Fox's popularity, and the Portland administration only lasted a few months. N. was afflicted by blindness during the last five years of his life. He succeeded to the earldom of Guilford, in 1790, on the death of his father, and died in August 1792.

**NORTH-EAST AND NORTH-WEST PASSAGES.** The numerous and important discoveries made by the Portuguese and Spaniards in the southern latitudes of Asia, and the reports which, on their return, they spread of the fabulous wealth of those regions, excited the attention of the other

NORTH-EAST AND NORTH-WEST PASSAGES.

maritime nations of Europe, and prompted them to send out expeditions to the East Indies for the purpose of obtaining a share in the lucrative traffic of which Spain had hitherto possessed the monopoly. But the latter power, then at the height of her prosperity, was not disposed to admit other nations as sharers of her good-fortune, and dealt so summarily with all intruders, having at that time the complete command of the Atlantic and Indian Oceans, that her rivals were reluctantly compelled to abandon all thoughts of trading in those seas. Unwilling, however, to lay aside their designs of opening a trade with the far-famed India and Cathay (as China was then called), they resolved to attempt to reach those regions by some other route. Two plans appeared most feasible—the one to reach Eastern Asia by coasting along the north of Europe and Asia, the *North-East Passage*; the other by sailing westward across the Atlantic. The latter was first attempted by John Cabot in 1497, but he found his progress barred by the American continent, or, at least, those parts of it known as Newfoundland and Labrador. Three years afterwards, Gaspard Cortereal and his brother made three several voyages in the same direction; and on reaching Newfoundland, sailed northwards, but were stopped on the coast of Labrador, in lat. 60° N. Both brothers afterwards perished, with all their followers. Several voyages were soon after made to discover if a passage for ships existed to the north of America (the *North-West Passage*), but without success; and the hardships which navigators were subjected to in these inhospitable climes, caused the abandonment for the time of all further investigations in that direction.

*North-East Passage.*—The search for a North-East Passage was now vigorously prosecuted, and England had the honour of sending out the first expedition for this purpose in 1553. It consisted of three ships, commanded by Sir Hugh Willoughby, and was fitted out under the direction of the celebrated Sebastian Cabot; but on rounding the North Cape, one of the ships was separated from the others during a violent storm, and subsequently entered the White Sea, then unknown to western Europeans. The other two, under Willoughby, drifted hither and thither in the vast waste of water surrounding the pole, till the navigators sighted Nova Zembla. Being unable to land, they sailed back along the north of Russia, and took up their winter quarters on the coast of Russian Lapland, where they were subsequently found frozen to death. Several other expeditions were, at different times, sent out by the English and Dutch, but none of them ever succeeded in penetrating further than the east coast of Nova Zembla, though they rendered good service to geography by making accurate surveys of Northern Europe and the adjacent islands of Spitzbergen, Nova Zembla, Waygat, &c. It was for a long time believed that the promontory which forms the eastern boundary of the Gulf of Obi was the *Tabis* of Pliny, and formed the north-east corner of Asia; and this opinion, which received the assent of the celebrated Gerard Mercator, tended greatly to encourage renewed explorations, as, according to it, the eastern coast of Asia was not more than 400 miles from Nova Zembla. The following is a list of the chief expeditions for the discovery of the North-East Passage:

|                                       |          |           |
|---------------------------------------|----------|-----------|
| Willoughby and Chancellor,            | English, | 1553      |
| Burroughs,                            | "        | 1556      |
| Pet and Jackman,                      | "        | 1580      |
| Barentz, William (three expeditions), | Dutch,   | 1591—1596 |
| Hudson, Henry, (first expedition,     | English, | 1608      |
| second expedition,                    | Dutch,   | 1609      |
| Wood,                                 | "        | 1676      |

In his third expedition Barentz nearly reached Icy Cape, about long. 100° E., but was, with his crew, imprisoned by the ice, and died before the return of spring. Various important discoveries were made during this expedition, which proved that in favourable seasons a passage could be found to the eastward, but after the subsequent failures of Hudson and Wood, the attempt was abandoned in despair. The Russian government now took up the search, and both by overland expeditions, and by vessels starting from various points on the north and east coasts of Siberia, sought to discover a practicable passage. The chief of these expeditions were those of Behring in 1741, which started from Petropaulovski, and was stopped at the East Cape; of Shalaroff, who with his crew perished of starvation; and of Billings, which started from the mouth of the river Kolyma, in Siberia. A final attempt was made by the Russian government by means of sledge expeditions in 1820—1823, which resulted in establishing the impracticability of any passage through these seas, on account of the constant alternation of open sea with fields of ice.

*North-West Passage.*—As was formerly mentioned, Sebastian Cabot and the brothers Cortereal were the first who attempted to double the north coast of America; Cabot had reached as far north as lat. 67° 30', in the strait between Greenland and America, but the courage of his crew failing, he was compelled to return. Notwithstanding his urgent representations, he was unable to prevail upon the English monarch to send out another expedition, and it was not till after several unsuccessful attempts had been made to find a North-East Passage that investigations of the north coast of America were resumed. As these investigations were carried on till within the last few years solely by the English, their prosecution till a definite result was arrived at came to be looked upon as a point of national honour, and repeated expeditions were sent out long after it had been clearly shewn that a North-West Passage, when found, would be useless in a mercantile point of view. In all, more than 200 voyages were made in search of the North-West Passage, so that only the most important of them can be even mentioned. The first expedition, after that of Cabot, was sent out in 1576, under James Frobisher, who made a second and third voyage in the two following years, but without any important discovery. In 1585—1588, northern enterprise received an impetus from the successful expeditions of Captain John Davis. This navigator sailed up the strait which bears his name, as far as lat. 72° north, and reported open sea still further north; he then surveyed the east and west sides of the strait, but without further important results. Henry Hudson (q. v.), who had previously attempted the North-East Passage, followed in 1610, and discovered the Hudson Strait and Bay, believing the latter to be none other than an inlet of the Pacific Ocean, an opinion which was proved erroneous by the investigations of Button in 1612; the latter, however, disseminated on his return the equally erroneous opinion that the bay was closed in on all sides, with the exception of the two eastern entrances. Button's account was not universally credited, and accordingly in 1615, Captain Bylot, who had been one of Hudson's company, was sent out, accompanied by Baffin, the most skilful navigator and scientific observer of the time; but their first expedition, which was to Hudson's Bay, was devoid of results. In their next voyage (1616), they sailed up Davis' Strait, reaching lat. 78° N., and satisfying themselves by a very superficial investigation that there was no northern outlet, the bay (as it was then believed to be) was named in honour of its explorer Baffin's Bay. On their

return southwards, they coasted along the west side, and discovered an opening to the west which they named Lancaster Sound, but believing it to be only an inlet, did not explore further. On his return, Baffin gave it as his decided opinion that no outlet to the west existed from Baffin's Bay, and the attention of explorers was again directed to discover an outlet from Hudson's Bay. In 1619, the solitary attempt by foreign powers to aid in the search was undertaken by Jens Munk, a Dane, but he made no discoveries, and the attempt was not renewed. The expedition of Fox and James, in 1631, led to the partial exploration of the channel since known as the Fox Channel, which forms the northern outlet to Hudson's Bay, and from this time the spirit of discovery slumbered till 1741. Between this date and 1746, several expeditions were sent out to discover an outlet from the north-west corner of Hudson's Bay, but their united researches satisfactorily proved that no such outlet existed. Owing to these disappointments, the search for a North-West Passage was discontinued for more than half a century, notwithstanding the fact of the British parliament having promised a reward of £20,000 to the fortunate discoverer. In 1818, the Admiralty took up the search, and sent out Captain John Ross and Lieutenant Parry, who sailed up Davis' Strait, and ascended Lancaster Sound for thirty miles; here Captain Ross gave up the search, considering it to be hopeless. But this opinion was by no means coincided in by Parry, who was accordingly sent out in the following year, and succeeded in far outstripping all his predecessors in the career of northern discovery. He entered Lancaster Sound on 30th July, and a few days afterwards discovered a large inlet, thirty miles broad, which he named Prince Regent Inlet. After exploring this inlet for some distance, he returned, and continued his course westward, as the ice allowed him, passing through a strait which he named after Sir John Barrow, the promoter of the expedition. Continuing his westward course, he reached long. 110° W., in Melville Sound, where he was stopped by the ice; and after wintering here, and giving names to the numerous islands, seas, and straits he had discovered, returned to Britain, with the glory of having advanced 30' of longitude further west than any previous explorer. On his arrival, he was welcomed with the utmost enthusiasm, and his discoveries imparted renewed energy to the half-dormant maritime enterprise of the British. There was now no doubt in what direction the North-West Passage was to be sought, but Parry's second expedition (1821—1823) was for the purpose of determining whether the Fox Channel was connected with the Arctic Sea of his previous voyage; it was, however, unsuccessful. A little before this time, the coast-line of North America from Behring's Strait to Point Turnagain, in long. 109° W., had been fully traced, so that it only remained to find some navigable passage from Regent Inlet to this point, and the long-wished-for result would be attained. For this purpose, Captain John Ross was sent out with an expedition in 1829, and after a laborious and difficult voyage up Prince Regent Inlet, reached a point only 200 miles from Point Turnagain. It was during this voyage that he discovered the magnetic pole. Dease and Simpson, in 1838, extended the survey of the American coast from Point Turnagain to within 90 miles of the magnetic pole, but the hopes of a channel between these points were dashed by the discovery made by Dr John Rae, in 1847, that Boothia (the land which bounds Regent Inlet on the west) is a peninsula of the American continent. We now come to the unfortunate expedition of Sir John Franklin, which, it was fondly hoped, would settle the question of a

North-West Passage. It sailed from England, May 19, 1845, and was last seen in Baffin's Bay. Franklin is believed to have sailed through Lancaster Sound, and ascended Wellington Channel to lat. 77° N., and thence returned southwards, crossing Barrow Strait, and sailing down the channel (now called Franklin Channel) which separates North Somerset and Boothia Felix from Prince of Wales Island to the west, where, in lat. 70° N., long. 98° 30' W., his ships were beset with ice, 12th September 1846, and Franklin died 11th June 1847. The survivors abandoned the vessels 20 miles south-west of this point, and perished in the attempt to reach the American mainland. Many expeditions were sent out to search for the missing voyagers, and one of these expeditions, under Collinson and McClure, sailed from Plymouth, 20th January 1850, and reached Behring's Strait in August the same year. Sailing eastward the following spring, McClure's ship became fixed in the ice, about 60 miles west of Barrow Strait, and the crew were picked up by Sir Edward Belcher, who had been sent out in April 1852 to their assistance. Belcher, who had reached Melville Sound by the eastern passage through Lancaster Sound and Barrow Strait, returned the same way; and thus McClure and his company enjoyed the envied honour of being the only ship's crew who had ever penetrated from Behring's Strait to Baffin's Bay. To McClure, then, belongs the honour of having finally set at rest all doubts as to the existence of a North-West Passage. By the various English and American expeditions which were sent out to search for Sir John Franklin, the whole region to the north of the American mainland as far as lat. 77° N., and long. 106° W., has been thoroughly explored, and various channels of communication between Davis' and Behring's Straits have been discovered, such as the route by Hudson's Bay, Fox Channel, Fury and Hecla Strait and Bellot Strait, into Franklin Channel, and thence by either the McClintock or the Victoria Channel, or the routes by Lancaster Sound, and the McClintock Channel, Prince Regent Inlet, or Prince of Wales Strait, to the open sea north of Russian America, but all these routes are utterly useless in a mercantile point of view.

**NORTH SEA** (ancient *Germanicum Mare*; Ger. *Nord See*), that arm of the Atlantic Ocean which separates the British Islands on the west from the continent on the east. It is 700 miles in extreme length (from north to south), about 400 miles in greatest breadth, and has an area of not less than 140,000 square miles. The great commercial highways from the N. S. to the Atlantic are by the Pentland Firth and the Straits of Dover; while on the east it communicates with the Baltic by the Skagerrack, the Cattegat, Sound, and Great and Little Belts. Along its south-eastern and southern coasts the shores are low, and are skirted by sand-banks, formed by the sand deposits carried to the sea by the waters of the Elbe, Weser, Rhine, and Scheldt, which are the principal rivers that flow into this sea from the east. The shores of England, especially in the south, are also low, and here sand has also accumulated, though not nearly to the same extent as on the continental coasts. The chief British rivers that fall into the N. S. are the Thames, Ouse, Humber, Tyne, Tweed, Forth, and Tay. Besides the sand-banks on the coast already referred to, there are others extending to the middle of the sea-bed, similar in their origin to those on the coasts, and occupying altogether about three-fourths of the entire area. Of these, the principal are the bank running north-east from the mouth of the Firth of Forth for 110 miles; the one extending north-west from the mouth of the

Elbe for about the same distance; the Dogger-bank (q. v.), &c. These sand-banks, combined with the storms and fogs so common in the N. S., render its navigation unusually dangerous. Another peculiarity of the bed of this sea is, the number of extraordinary 'holes' which have been found in it. Of these the most remarkable are the Little Silver Pit off Holderness in Yorkshire, and the North-north-east Hole, 8 leagues further east. Little Silver Pit is 25 miles in length, and from half a mile to two miles in width. At its edges there is a depth of from 50 to 80 feet of water, but the 'hole' has a depth of 330 feet. In the north, along the Norwegian coasts, the shores are steep and rocky, and there is a depth of about 190 fathoms. The depth (31 fathoms on an average) increases from south to north. The currents of this ocean are extremely various, and demand the greatest caution on the part of the navigator. Owing to the prevalence of south-west winds, the currents shew a general tendency towards the north-east. On the south-western coast of Ireland, the great tidal wave of the Atlantic is broken into two portions, one of which, coursing up the Channel, passes through the Straits of Dover; while the other, sweeping north, passes round the north of Scotland, and then southward along the east coast of Britain, and meets the southern wave off the coast of Essex. The northern portion of the tidal wave spreads over the whole of the German Ocean, and though on its entrance into the N. S. it is only 12 feet in height, it rises in its progress southward, as the sea becomes narrower, in the same way as the *bore* (q. v.) is formed in a contracting estuary. In the estuary of the Humber it rises to the height of 20 feet. This sea yields immense quantities of fish, the most important kinds being cod, hake, ling, turbot, sole, mackerel, and herring, also lobsters. The fisheries employ many thousand people. On all available points of the coasts, light-houses have been erected, and there are numerous floating-light vessels moored to detached banks. The traffic on the N. S. is enormous. It is surrounded by countries whose inhabitants have from the earliest times been famous on the seas, and the enterprise and national bias that formerly covered the Scandinavian waters with conquering fleets, may now be traced in the vast commercial intercourse carried on on the North Sea.

**NORTH WALSHAM**, a small market-town of England, in the county of Norfolk, on an acclivity on the right bank of the Ant, 14 miles north-north-east of Norwich. Its market-cross, repaired after the great fire in 1600, by which the town was almost entirely burned down, dates from the reign of Edward III. Pop. (1861) 2896.

**NORTH-WEST PROVINCES**, a great political division of British India (see INDIA), between Kumaoon and Nepal on the north-east, and Rajpootana on the south-west, consisting of the following six subordinate divisions: Delhi, Meerut, Rohileund, Agra, Allahabad, and Benares. Each of these divisions comprises five districts, with the exception of Benares, which comprises six. They are treated separately. The area of the North-West Provinces is 116,493 square miles; and the pop. (1859—1860) 30,110,497.

**NORTHALLERTON**, capital of the North Riding of Yorkshire, a market-town and parliamentary borough, 250 miles north-north-west of London, and 30 miles north-north-west of York by railway. It stands near the left bank of the Wiske. It contains a large number of public schools and other institutions. Manufactures of linen and leather, brick-making, and malting are

carried on a limited scale. Pop. (1861) of parliamentary borough, 4755, who send a member to the House of Commons. The battle of the 'Standard,' so called from a huge standard erected on a car by the English, was fought here, August 22, 1138, between the English under the Earls of Albemarle and Ferrers, and the Scotch under King David. The latter were defeated, and forced to retreat with great loss. (1871—pop. 4961.)

**NORTHAMPTON**, a village of Massachusetts, U. S., 1 mile west of the Connecticut River, 95 miles west of Boston, on the Connecticut River Railway. It is celebrated for its beautiful scenery, Mounts Tom and Holyoke rising from a picturesque valley. It contains many elegant residences, the county buildings, 2 banks, several academies, 7 churches, 1 cotton factory, 2 silk factories, 3 paper-mills. A bridge, 1230 feet long, connects it with Hadley. Pop. (1860) 6788.

**NORTHAMPTON**, capital of the county of the same name, a market-town, and parliamentary and municipal borough, on a rising-ground on the left bank of the Nen, 67 miles north-west of London by railway. In the centre of the town is a spacious market-square. The principal edifices are the shire-hall, the new and handsome town-hall, the corn exchange, the numerous churches, several of which are unusually interesting, as St Peter's, a recently restored and beautiful specimen of enriched Norman, and St Sepulchre's, one of the very few round churches in the empire, and supposed to have been built in the 12th century. The hospitals of St John and St Thomas were religious houses prior to the Reformation. Boot and shoe-making, which affords employment to about 3000 persons, is the principal branch of trade carried on here. Leather is made, and hosiery and lace are manufactured. Iron and brass foundries are in operation, and brewing is carried on. Races, called the Pytchley Hunt Races, take place here every year in March. Pop. (1861) of municipal and parliamentary borough, 32,813, who return two members to parl. (1871—pop. of p. b., 44,871.)

**N.**, a very ancient town, was held by the Danes at the beginning of the 10th c., and was burned by them in 1010. After the Conquest, it was bestowed on Simon de St Liz. Its castle was besieged by the barons in 1215, during the civil wars of King John. It was the scene of a great battle fought (July 10, 1460) during the Wars of the Roses, between the rival houses, in which the Earls of March and Warwick defeated the Lancastrians.

**NORTHAMPTONSHIRE**, a central county of England, bounded on the W. by the counties of Warwick, Leicester, and Rutland, and on the S.-W. by Oxfordshire. Area, 630,358 acres; pop. (1861) 227,704. Its surface is marked by gently undulating hills, alternating with well-watered vales. The chief rivers are the Nen and the Welland, both of which flow north-east, and fall into the estuary of the Wash. The county is traversed by the London and North-Western, the Great Northern, the Eastern Counties, and other lines of railway, and communication by water is maintained by the Union, Grand Junction, and other canals, as well as by the rivers. The climate of the county is mild and healthy; the soil, a black mould in the fen districts in the north-east, and a brown loam on the uplands, is very productive. White and green crops are abundantly produced, and on the rich pastures cattle are extensively reared for the London market. Four members are returned to the House of Commons for the county. (1871—pop. 243,896.)

**NORTHUMBERLAND**, the most northern county of England, is bounded on the E. by the

North Sea, and on the N.-W. by the Scottish counties of Roxburgh and Berwick. Area, 1,249,299 statute acres; pop. (1861) 343,025. The surface of the county has a rugged, and especially in the west and south-west a naked and barren aspect. The Cheviots run along the western border of the county, and send out spurs toward the east, which, gradually declining, are separated by fertile valleys, that widen as they approach the coast. About one-third of the area of the county is occupied by moorland, and along the Cumberland border the broken and bleak-looking hills are valuable for their lead-mines. Allenheads, the centre of the lead mining district, is the highest inhabited spot in England, being 1400 feet above sea-level. The inclination of the surface toward the east is indicated by the direction of the rivers Alne, Coquet, and North Tyne, which with the Tyne and Till are the principal rivers of the county. The Tweed forms the boundary of the county on the north for about 5 miles, and the south boundary is formed in part by the Derwent and Tyne. The climate is cold, but is milder on the coast than amid the hills, which, however, produce sufficient herbage for the maintenance of large flocks of 'Cheviot' sheep. The principal agricultural tracts occur along the coast, and inland along the river valleys for several miles. In these districts, the soil, for the most part, is a strong fertile clayey loam, productive in wheat, barley, beans, and clover. Agriculture is pursued on the most improved methods, and cattle, chiefly short-horned, are extensively reared. The south-east portion of the county forms a part of the great Northumberland and Durham coal-field, which was estimated to have produced, in 1862, upwards of 20,000,000 tons. The county is traversed by the Newcastle and Carlisle, North-Eastern and Border Counties Railways. The county returns four members to the House of Commons; the county town is Alnwick (q. v.). (1871—pop. 386,959.)

NORTON, ANDREWS, REV., American scholar and theologian, was born at Hingham, Massachusetts, December 31, 1786. Having graduated at Harvard College in 1804, he was appointed, in 1809, a tutor of Bowdoin College, and in 1811 mathematical tutor at Harvard, and in 1813 librarian of the university, and succeeded Dr Channing as lecturer on biblical criticism and interpretation. In 1819, he was appointed Dexter Professor of Sacred Literature, which office he retained until failing health compelled his retirement in 1830. Dr Norton was, after Dr Channing, the most distinguished exponent of Unitarian theology, a clear and perspicuous lecturer, an able and conservative critic, and a voluminous writer. Rejecting the doctrine of the Trinity, and protesting against Calvinism, he also opposed the school of Theodore Parker and the naturalistic theology. Besides his contributions to the *General Repository* and *Review*, the *North American Review*, *Christian Examiner*, he published (1833) *A Statement of Reasons for not believing in the Doctrine of the Trinity*; (1837) *The Genuineness of the Gospels*; (1839) *On the Latest Forms of Infidelity*; and left some poems and a translation of the gospels. He died at Newport, Rhode Island, September 18, 1853.

NORTON, THE HON. CAROLINE ELIZABETH SARAH, a poetess and novelist of some reputation, the daughter of Thomas, and the granddaughter of Richard Brindsley Sheridan, was born in 1808. Her father died while she was still a child, and her education, which embraced an unusually varied course of studies, was superintended by her mother. In 1827, she married the Hon. George Chappell Norton. In 1831, she first met Lord Melbourne,

then prime-minister, and the intimacy which succeeded having given rise to some scandalous rumours, Mr Norton brought an action against Lord Melbourne, which, however, resulted in a verdict for the defendant. From her childhood, Mrs N. had practised the art of verse-making. Her principal works are *The Sorrows of Rosalie* (1829); *The Undying One* (1830); *The Child of the Islands* (1845); *Stuart of Dunleath*, a novel (1847); *English Laws for Women in the Nineteenth Century* (1854); *The Lady of Garaye* (1862); *Lost and Saved*, a novel (1863).

Her prose works, several of which depict the wrongs incident to the position of women, are written with considerable cleverness and vigour; and her verse, though overstrained and staid in sentiment, has numerous admirers, and manifests some degree of that brilliancy for which the Sheridans have been so famous.

NO'RWALK, a township of Connecticut, U. S., on both sides of the mouth of Norwalk River and Long Island Sound, on the New York and New Haven Railway, 45 miles north-east of New York, and 31 south-west of New Haven. It has manufactories of iron, machinery, hats, felt-cloth (of which two companies make 500,000 yards per annum), 9 churches, &c. Pop. (1860) 7382.

NORWAY (Norweg. *Norge*), the western portion of the Scandinavian peninsula, which, together with Sweden, forms one joint kingdom, is situated between 57° 58' and 71° 10' N. lat., and between 5° and 28° E. long. It is bounded to the E. by Sweden and Russia, and on every other side is surrounded by water, having the Skagerrak to the S., the German Ocean to the W., and the Arctic Sea to the N. Its length is about 1100 miles, and its greatest width about 250 miles; but between the lats. of 67° and 68°, it measures little more than 25 miles in breadth. The area is given as 121,779 square miles, and the population (in 1860) as 1,600,000. The whole of the Scandinavian peninsula consists of a connected mountain mass, which, in the southern and western parts of N., constitutes one continuous tract of rocky highlands, with steep declivities dipping into the sea, and only here and there broken by narrow tracts of arable land. South of Trondjem (63° N. lat.), the rocky ridge expands nearly the entire breadth of Norway. The northern portions of the range, known as the Kiöllen Fielle,\* occupy a space of about 25 miles in width, and form as far north as 69° the boundary-line between Sweden and Norway. In those high latitudes the range rises rapidly on the western side, forming elevations of 4000 feet, at a distance of only 4 or 5 miles inland. Of the numerous summits which lie along the watershed, and which rise above the line of perpetual snow, the highest, known as the Sulitelma, has an elevation of 6200 feet. The mean level of the range, which seldom rises more than 4000 feet above the sea, is occupied by extensive snow-fields, from which glaciers descend to the edge of the sea, while here and there the vast snow plain is broken by fjords (i. e., friths), some of which, as the Folden Fjord, penetrate upwards of 70 miles through the rocky masses. These inlets run, in many cases, through the middle of long and broad finely wooded valleys, enclosed by rocky walls, which are either quite bare, or covered with lichens and mosses or stunted brushwood, among which falls of water pour perpendicularly down the mountain-side. South of 63° N. lat., the range of the Scandinavian mountains is known as the Norska, or Dovre Fielle, although the latter name belongs properly only

\* *Fielle* is the plural of *fiel*, a mountain-side.

to the part immediately in contact with the Kiøllen. This range, about 360 miles in length, attains its greatest elevation at the Sogne Fjord, where it is known as the Hurrungerne. Here the highest summits are 8000 and 8400 feet above the sea, while the contiguous snow-fields of Justedal, the largest in Europe, and covering an area of 600 square miles, have probably an elevation of nearly 7000 feet. From these and other vast snow-fields, averaging more than 10 miles in width, vast glaciers descend to within 2000 feet above the sea, where they often terminate in deep lakes, some of which are very extensive. This range is famed for the beauty of its numerous fjords, fringed with lofty pines, which skirt the base of the rocky walls, whose rugged sides are washed by precipitous waterfalls, some of which, as the Keel Foss on the Sogne Fjord, are 2000 feet in height. The upper valleys of this range, although generally too high for cultivation, contain the best timber that is exported from N., and afford good pasturage in the height of the summer, when the flocks and herds are driven thither from the low lands near the entrance of the fjords. The general elevation of the Norska Fielle does not rise above the line of perpetual snow, whose average height in these latitudes is 5000 feet, but it ranges above that of the growth of trees, which may be stated to lie 1000 feet lower. The most northern part of the Norska Fielle, which is known as the Dovrefield, and includes Sneehøtten, nearly 7500 feet above the sea, presents a broken surface, rent with ravines and narrow valleys, which admit of cultivation, but are difficult of access from the configuration of the land around them. Only two carriage-roads traverse the Norska Fielle, the one connecting Christiania with Bergen, and the other with Trondjem. The Scandinavian range consists principally of primitive and transition rock, and exhibits almost everywhere the effect of glacial action, the glaciers and moraines presenting the same appearances as in the Swiss alpine district. The numerous islands which skirt the coast of N., and must be regarded as portions of the range, present the same characters as the continental mass. Some of these, as the islands of Alsten and Dnnnoe, rise perpendicularly from the sea with peaks penetrating beyond the snow-line, which lies here at an elevation of 4000 feet. N. abounds in lakes and streams; according to some topographers, there are upwards of 30,000 of the former, of which the majority are small, while none have an area exceeding 400 square miles. The chief rivers of N. are the Glommen, Lougen, Louven, Drammen, Otter, and Wormen. The first of these has a course of 400 miles, but the majority of the Norwegian streams, all of which rise at great elevations, have a comparatively short course, and are unfit for navigation, although they are extensively used to float down timber to the fjords, whence the wood is exported in native ships to foreign ports. These fjords, or inlets of the sea, which form so characteristic a feature of Norwegian scenery, and give with their various sinuosities a coast-line of upwards of 8000 miles, form the outlet to numerous rapid streams and waterfalls, which leap or trickle down the edges of the treeless fields or mountain flats above. The greatest number of fjords occur in the northern parts of the land near Trondjem, where the narrow Sogne Fjord penetrates through the Norska Fiellen to a length of 120 miles, while near this the Porsanger Fjord runs a sinuous course of 100 miles, with the exceptionally large width of 20 miles.

*Climate, Soil, &c.*—The peculiar physical character of N. necessarily gives rise to great varieties of climate in different parts of the country. The influence of the sea and of the Gulf Stream, and

the penetration into the interior of deep inlets, greatly modify the severity of the climate on the western shores, and render it far superior to that of the other Scandinavian countries in the same latitude. On the coast generally, rain and fogs prevail; while in the regions near the North Cape, storms are almost incessant, and rage with extraordinary violence. In the interior, the air is clear and dry. The longest day, which in the south is 18 hours, may be said to be nearly three months in the high latitudes of the northern districts, where the longest night lasts almost an equal length of time. In Norway Proper, the winters as a rule are long and cold, and the summers, which rapidly follow the melting of the snows in April and May, are warm and pleasant. On the islands, however, the heats of summer are often insufficient to ripen corn. The protracted winter of the northern regions follows almost suddenly on the disappearance of the sun, when the absence of solar light is compensated for by the frequent appearance of the aurora borealis, which shines with sufficient intensity to allow of the prosecution of ordinary occupations.

It is estimated that  $\frac{2}{3}$ th of the area of N. lies within the region of perpetual snow, while a large extent of the mountain districts yield no produce beyond scanty grasses, mosses, lichens, and a few hardy berry-yielding plants. Only birch and juniper grow north of 67°, which is the boundary of the pine. The Scotch Fir, *Pinus sylvestris* (Norwegian, *Furn*) and Spruce, *P. abies* (Norwegian, *Gran*) cover extensive tracts, and with birch, constitute the principal wealth of N.; the value of these articles of export amounting in some years to upwards of 10 million thalers. The hardier fruits, as strawberries, gooseberries, cherries, and raspberries, are abundant and excellent of their kind. Hemp, flax, rye, oats, and barley are grown as far north as 66°; but although agriculture has been more systematically pursued of late years, the crops are not always sufficient for home consumption, and hence it is found absolutely necessary annually to import considerable quantities of corn and potatoes. The frugal peasantry do not, however, rely wholly upon importation, but prepare a species of cake or bread from the bark of the pine when corn is scarce, and in plentiful years store away some of the produce of the harvest in the national corn-magazines, which are established in every part of N. by way of a provision for an unfavourable season. Agriculture is most successfully prosecuted in the amts or administrative districts of Jarlsberg and Laurvik, Akershuus, Budskerud, and in the south generally; while in the northern parts, in the upper valleys, the rearing of cattle constitutes an important branch of industry. The herds and flocks are driven from the distant farms to the pasture-lands in these high mountain valleys, known as Saeterdale, where they remain till the approach of cold weather obliges the herdsmen to return with their charges to the shelter of the farms. Although the cattle and horses are small, they are generally strong and capable of bearing much hard labour.

*Products, &c.*—The fisheries of N. are of great importance, and not only yield one of the most important articles of home consumption, but at the same time constitute one of the most profitable sources of foreign export. Fish is caught in almost every stream and lake of the interior, as well as in the fjords of the coast, and in the bays and channels which encircle the numerous islands skirting the long sea-line of Norway. Salmon, herring, and cod are of the greatest importance, the latter alone giving employment to some 16,000 or 18,000 men, who proceed in upwards of 3000 boats to the

Loffoden Islands, in whose waters they fish from February till May, and often obtain a return of 16 millions of fish, having an average value of more than a million and a quarter of dollars.\* In some years the herring fishery of the south-west coast is even more remunerative; from 500,000 to 600,000 tons of fish being not infrequently taken in the season, and hence the collective fisheries of N. may be estimated to bring an annual return of 3 or 4 million dollars.

The fauna of N. includes the bear, wolf, lynx, elk, otter, reindeer, red-deer, seal, the cider-duck, and many other kinds of sea-fowl, blackcock, capercaillie, and a great variety of small game.

The mineral products, which comprise silver, copper, cobalt, iron, chrome ironstone, &c., yield an annual return of nearly 800,000 dollars. The richest mines are situated in the south, and chiefly in the district of the Glommen, as the celebrated and ancient silver works of Kongensberg, the copper-mines of Røraas, and the numerous iron shafts on the southern declivities of the mountains between Kongensberg and the Glommen. Latterly, however, some productive copper-works have been opened in the northern districts of Kaafjord in Finnmark.

Ship-building in all its branches is almost the only industrial art that is extensively and actively prosecuted. In many parts of the country there are absolutely no special trades, the inhabitants of the small fishing-ports, no less than the inmates of the widely separated farms, employing their compulsory leisure during the long winter in weaving, spinning, and making the articles of clothing and the domestic implements required in their households.

*Trade, &c.*—The principal seats of trade are Christiania, Drammen, Bergen, Stavanger, and Trondjem. The merchant fleet numbered, in 1860, 5300 ships, with a tonnage of upwards of 260,000 lasts, and carrying nearly 33,000 men. The exports, which consist mainly of timber, fish, minerals, furs, feathers, and down, amounted in 1860 to 10,742,217 dollars; while the imports were valued in the same year at 15,597,750 dollars, and consisted not only of the ordinary colonial goods, and objects of luxury, but in a large proportion of the most necessary articles of consumption, as corn to the annual amount of 800,000 tons, salt in nearly half that quantity, fresh and salted meat, butter, soap, hemp and flax, sailcloth, tow, oil, wine, tobacco, and manufactured goods of all descriptions. The most important commercial relations of N. now centre in Hamburg, which of late years has supplied it with colonial, English, and French wares. Holland, Russia, and Denmark stand next in order as importers to N., while the Catholic countries of the Mediterranean are the principal purchasers of the smoked and dried Norwegian fish.

*Receipts, &c.*—According to the budget for 1860—1863, the receipts for the three inclusive years were 14,266,050 dollars; while the expenditure was estimated at about the same sum, which would give 4,755,350 dollars annually. Prior to 1848, a very great reduction had been effected in the amount of the national debt through the rigid economy of the Storting; but the expenses incurred by the equipment of troops to aid Denmark in the Slesvig-Holstein war of 1848 have again augmented the sum, and at the close of 1859 it amounted to 7,600,000 dollars. This sum includes, however, the old unliquidated debt remaining from the time of the union of N. with Denmark, and the various loans made for the construction of railways.

*Administration, &c.*—N. is divided into 17 Amts, or administrative circles—viz., Smaleneenes, Agerhuus, Hedemarken, Christians, Buskerud, Jarlsberg and Laurvigen, Bradsbergs, Nedenaes, Lister and Mandals, Stavanger, South Bergenhuus, North Bergenhuus, Romsdal, South Trondjem, North Trondjem, Nordland, Finnmarken. These circles are subdivided into 46 bailiwicks, each presided over by a rural magistrate. N. has a representative government, based on the constitution which was established in 1814, and ratified at Eidsvold. Once in three years the Storting, or legislative chamber, meets, and is composed of representatives who are elected by the freehold voters of their several districts. The number of city representatives depends upon that of the rural representatives, to whom they stand in the relation of 1 to 2. The Storting votes the taxes, which are collected by officers of the king of Sweden and N.; it proposes laws, which must be ratified by the king; but if they pass the Storting three times, they acquire validity even without the king's sanction. Although N. constitutes one joint kingdom with Sweden in regard to succession, external policy, and diplomacy, it is in all other respects an independent state, having its own government, legislative machinery, finances, army and navy. The king is indeed commander-in-chief of all the forces of the country, whether military or naval; but he can neither augment or decrease their number, nor proclaim peace or war, without the assent of the Norwegian Council of State, which must consist of natives of the country; nor, excepting in time of war, can he bring foreign soldiers within the frontiers, or send native troops out of Norway. He must visit N. once every year, and in his absence affairs are administered in the name of his representative, who may be a Swede, and who is entitled viceroy if he be of royal birth. In accordance with the constitution, no title can be conferred independently of the tenure of office, and no one can be raised to the rank of a noble, while with the death of the members of the fifteen still surviving noble families who were born before 1821, all personal honours, privileges, and distinctions belonging to nobility will cease. The constitution may therefore be regarded as purely democratic in its character. The Council of State constitutes the highest court of justice, under whose jurisdiction the provincial magistrates or 'amtmander' administer justice, in conjunction with the bailiffs and sorenskriver or advocates, who preside over petty rural courts. These lower courts are controlled by the *Stift-Oberrette*, or Diocesan Courts of Justice, while the latter are, in their turn, under the High Court of Appeal, or *Høieste Rett*, which is located at Christiania.

*Religion, &c.*—The Lutheran is the predominant, and almost the exclusive church, although freedom is allowed to all other Christian denominations. Jews are not tolerated. The church is under the administration of five bishops, whose sees are Christiania or Aggerhuus, Christiansand, Trondjem, Nordland and Finnmark conjoined, and Bergen. There are 341 parishes, some of which extend over enormous tracts of land, and include from 5000 to 10,000 parishioners scattered in widely-separated farmsteads. The clergy, who receive tithes, exercise considerable influence in remote country districts, where they frequently are called upon to settle disputes, and exercise various judicial functions. Much has been done of late years in N. for the diffusion of knowledge, and provision is now made to extend education to the inhabitants of the most inaccessible districts by means of itinerant teachers, a certain number of whom, corresponding to the

\* The specie dollar is worth about  $\frac{1}{2}$  *Gd.*

number of farms in each parish, are nominated to the office of schoolmaster. These men proceed from house to house, being supplied with a school-room, and fed and entertained by each householder in succession for the number of days at which the farm is mulcted. In 1853, there were 419 fixed schools in 263 parishes; and by the aid of these, and the system of itinerant teaching, education is so universally diffused that it is rare to meet with Norwegians who cannot read and write. The university of Christiania (q. v.), which was founded in 1811, is well attended, and numbers amongst its students the sons of many of the peasant land-owners, who receive a university education without intending to follow the learned professions.

*Army, &c.*—The army of N. is composed of regular troops and militia, the former numbered for 1860—1863, 19,511 men, and the latter 15,604, making a total of 35,115. There is, besides, a special arm, known as the Skielöbern, or Skaters, which consist of a company of light infantry, carrying muskets, and ice-poles eight feet long. The fleet numbers 146 vessels, including 15 steamers, and 125 gun-boats; and there are 46,000 seamen on the rolls. Horten, in Christianiafiord, is the principal naval port. The only fortified spots are Fredericksteen at Frederickshald, Frederickstad, Akershuus, Bergenhuus, Munholm, and Wardoehuus, near the Russian frontier.

The population of N. is chiefly rural, only about 11 per cent. living in towns. Christiania, the principal city, has not more than 40,000 inhabitants, while Bergen and Trondjem have respectively only 26,000 and 16,000. The physical character, and consequent climatic relations of N., leave a very small proportion (according to some writers, only about 2 per cent.) of the area capable of being cultivated; for it may be stated generally, that the valleys are the only habitable and agriculturally productive parts of the country, the mountain-ridges which separate the low-lying lands being covered with bare masses of gneiss and mica schists, in the fissures of which the only vegetation is juniper, fir, aspen, birch, and stunted beech trees. There are few villages, and the isolated farmsteads are often separated from one another by many miles. The cultivators of the land are in most instances also the proprietors, less than one-third of the whole number being tenants only. Allodial land, known as *Udal* or *Odel*, does not descend to the eldest son unconditionally, since all his relatives have a claim upon it, and if it should be sold, have the right of buying it back within the term of five years at the sale-price. The holders of allodial lands have in recent times adopted surnames, which are generally taken from their hereditary property, but the small proprietors, who cultivate their own land, and are known as *Bonder*, or peasants, still, for the most part, retain the old Scandinavian custom of merely affixing *son* and *datter* to the father's name; thus, for instance, the children of a man known as Hans Jorgenson, and who had been christened Jorgen and Kirsten, would become Jorgen Haoson and Kirsten Hansdatter, while the children of Hanson would in their turn assume his Christian name as their patronymic.

*Race—Language, &c.*—With the exception of some 20,000 Lapps and Finns, living in the most remote northern regions, the inhabitants of N. are generally a pure Scandinavian race, akin to the North Germanic nations of Aryan descent. The genuine Norwegians are of middle height, with strong, well-knit, muscular frames, of fair skin, with light flaxen or yellow hair, and blue eyes. In character, they may be said to be frank, yet cautious and reserved, honest, moderate, religious, and super-

stitious, more from an inveterate love of clinging to the forms, thoughts, and creed of their ancestors, than from fanaticism. Their love of country, and the irrepressible fondness for the sea, by the very anomaly which these apparently contradictory propensities exhibit, shew them to be the true descendants of the sea-roving Northmen of old. Of late years, emigration has continued steadily to increase at a rate which threatens to be a serious evil to so badly populated a country as N., but which is easily explained by the small portion of land capable of cultivation. The general diffusion of education, and the perfect equality and practical independence which they have known how to secure and retain for themselves, notwithstanding their nominal incorporation with the other Scandinavian kingdoms, give to the poorest Norwegians a sense of self-respect and self-reliance which distinguish them favourably from those of the same class in other countries. Want of cleanliness, too ready a use of oaths, and a liking for strong drinks, are the failings to which the people are said to be most inclined; it should be observed, however, that great diversities of character and habits are observable in different districts. The peasants, more especially in the amts remote from towns, retain their ancient provincial costumes, which are, for the most part, highly picturesque, consisting, among the women, of ample woollen skirts and brightly-coloured knit bodices, fastened and adorned with silver or brass clasps and buckles. Music is much cultivated by all classes of the people, and the national songs and melodies which are the favourites, are for the most part of a melancholy character.

Danish is the language in ordinary use both in writing and speaking, although dialects nearer akin to the old Norse are spoken by the dalesmen and mountaineers of special districts. Since the separation of the country from Denmark, a strongly national tendency has been manifested by some of the best Norwegian writers, and attempts have been made to reorganise these dialects into one general Norwegian language, and thus, in fact, to revive the ancient Norse, or Icelandic, which has been preserved in Iceland in almost perfect purity since its first introduction to the island in the 9th c. by colonists from the Scandinavian mother-lands. Among the most zealous cultivators of the ancient and modern literature and history of N., we may instance Professor P. A. Munch, whose able expositions of the laws and social conditions of his country have thrown new light on its history; Keyser, Unger, and Hohnboe, who have done much to elucidate the Norse tongue and literature; A. Munch and Mosen, successful cultivators of the national lyric; and J. Moe and Asbjörnson, the critical collectors and annotators of native sagas. In the more abstruse departments of mathematical and physical science, Norwegians have gained for themselves a foremost place, as is sufficiently testified by the mention of names such as N. H. Abel, renowned for his discoveries in definite integrals; C. Hansteen, the astronomer; and Keilhau, the geologist.

*History.*—The early history of N. is comprised in that of the other Scandinavian countries, and is, like theirs, for the most part fabulous. It is only towards the close of the 10th c., when Christianity was introduced under the rule of Olaf I., that the mythical obscurity in which the annals of the kingdom had been previously plunged begins to give place to the light of historical truth.

The introduction of Christianity, which was the result of the intercourse which the Norwegians had with the more civilised parts of Europe through their maritime expeditions, destroyed much of the old nationality of the people with the heathenism

which they had hitherto cherished, although the sanguinary feuds which had raged among the rival chiefs of the land can scarcely be said to have lost their ferocity under the sway of a milder religion. Olaf II., or the Saint (1015—1030), who zealously prosecuted the conversion of his countrymen, raised himself to supreme power in the land by the subjection of the small kings or chieftains, who in the times of heathenism had subdivided the kingdom among them. The war between Olaf and King Knut the Great of Denmark, which terminated in 1030 with the battle of Sticklestad, in which the former was slain, brought N. under the sway of the Danish conqueror; but at his death in 1036, Olaf's son, Magnus I., recovered possession of the throne, and thenceforth, till 1319, N. continued to be governed by native kings. The death in that year of Hakon VII. without male-heirs, threw the election of a new king into the hands of the national assembly, who, after many discussions, made choice of Magnus VIII. of Sweden, the son of Hakon's daughter. He was in turn succeeded by his son Hakon, and his grandson Olaf IV., who having been elected king of Denmark in 1376, became ruler of the sister Scandinavian kingdoms on the death of his father in 1380. This young king, who exercised only a nominal sway under the guidance of his mother Queen Margaret, the only child of Valdemar III. of Denmark, died without heirs in 1387. Margaret's love of power and capacity for government brought about her election to the triple throne of the Scandinavian lands, and from this period till 1814, N. continued united with Denmark; but while it shared in the general fortunes of the latter state, it retained its own constitutional mode of government, and exercised its right of electing to the throne, until, like the sister-kingdom, it agreed of its own free will to relinquish this privilege in favour of hereditary succession to the throne. See DENMARK, HISTORY OF. The Napoleonic crisis may be said to have severed this union, which had existed for more than 400 years, for Denmark, after having given unequivocal proofs of adhesion to the cause of Bonaparte, was compelled, after the disastrous war of 1813, to purchase peace at the cost of this long united partner of her state. Crippled in her resources, and almost a bankrupt, she saw herself constrained to sign the treaty of Kiel in 1814, by which it was stipulated by the allied powers that she should resign N. to Sweden, receiving in return, by way of indemnity, some portion of Swedish Pomerania and the island of Rügen, which were subsequently exchanged with Prussia for Lauburg on the payment by that state of two million rix-dollars. The Norwegians, having refused to admit the validity of the treaty of Kiel, nominated Prince Christian, the heir-presumptive to the throne of Denmark, regent and subsequently king of Norway. This nomination was made by the national diet, or Storting, which met at Eidsvold, where they drew up a constitution based on the French constitution of 1791. These measures found, however, neither supporters nor sympathisers among the other nations; and with the sanction of the great allied powers, Charles John Bernadotte, Crown-Prince of Sweden, led an army into N., and after taking Frederikstad and Frederikshald, threatened Christiania. Denmark being unable to support the cause of Prince Christian, and N. being utterly destitute of the means necessary for prosecuting a war, resistance was of no avail, and the Norwegians in this untoward conjuncture of affairs, were glad to accept the proposals made to them by the Swedish king for a union with Sweden, on the understanding that they should retain the newly promulgated constitution, and enjoy full

liberty and independence within their own boundaries. These conditions were agreed to, and strictly maintained; a few unimportant alterations in the constitution, necessitated by the altered conditions of the new union, being the only changes introduced in the machinery of government. Charles XIII. was declared joint king of Sweden and N. in 1818, and while the latter has become an almost independent state, it is questionable whether the former has found in its nominal acquisition an equivalent for the loss of Finland, which was the price exacted for it by the allied powers, and made over to Russia. Since the union, N. has firmly resisted every attempt on the part of the Swedish monarchs to infringe upon the constitutional prerogatives of the nation; and during the reign of the first of the Bernadotte dynasty, the relations between him and his Norwegian subjects were marked by jealousy and distrust on both sides, but since the accession of his son, Oscar I., in 1844, perfect harmony and good-will have existed, and N. has continued to make rapid progress towards a state of political security and material prosperity far greater than it ever enjoyed under the Danish dominion.—See T. Thorlak, *Historia rerum Norvegicarum* (Copenh. 1711); Schöningh, *Norges Riges Historie* (Soroc, 1771); Munch, *Det Norske Folk's Historie*, Bd. 1—6 (Christ. 1852—1859). (1865—pop. 1,701,736.)

## NORWAY HADDOCK. See BERGYLT.

NORWICH, a city of England, capital of the county of Norfolk, and a county in itself, on the Wensum, immediately above its confluence with the Yare, 20 miles west of Yarmouth, and 93 miles north-north-east of London. It covers an area about five miles in circumference, is skirted on its north and east sides by the river, and on the west and south it was formerly surrounded by walls, of which there are still remains. In the town and immediate vicinity there are as many as ten bridges. The market-place (600 feet long by 340 feet wide) and its vicinity contain many large shops and good houses. The castle, finely situated on an elevation near the centre of the town, originally covered, with its works, an area of about 23 acres. The bridge (150 feet long) over the ditch has one of the largest and most perfect Anglo-Norman arches remaining. The massive quadrangular Norman keep is now used as a prison. The cathedral, almost wholly Norman in plan, was founded in 1094 by Bishop Herbert Losinga. It is 411 feet long, 191 feet broad at the transepts, and is surmounted by a spire 315 feet high. Near the cathedral are a number of ancient and interesting structures now mere or less in ruins, among which may be mentioned St Ethelbert's and the Erpingham Gate, the former in Decorated English, the latter in late Perpendicular, and both valuable and rich specimens of their styles. Besides a large number of dissenting chapels and other places of worship, there are about 40 churches, of which St Peter's, Maneroft, a handsome cruciform edifice of the 15th c., with a remarkably fine peal of 12 bells; St Andrew's, St Clement's, St George's, St Giles, St Michael's, and others, are worthy of mention. The Free Grammar School, with an endowment of about £200 a year, was founded by Edward VI., and the other educational establishments are numerous and various in character. The public library contains 20,000 volumes, and the library of the Norwich Literary Institution, 15,000 volumes. N. is the seat of extensive and flourishing manufactures, the chief of which are bandanas, bombazines, shawls, crapes, gauzes, damasks, camlets, and muslins; shoemaking is extensively carried on; yarn and silk mills are in operation, and employ many hands. Iron-founding,

tanning, dyeing, malting, &c., and agricultural implement-making, are also carried on. The trade, which is facilitated by a canal and river system of communication with the sea, is chiefly in agricultural produce and coal. N. is the see of a bishop, and returns two members to parliament. Pop. of municipal and parliamentary borough in 1861, 74,891.

About three miles south of N. is Castor St Edmunds, which, prior to the Roman era, was called Caister, and under the Romans received the name of *Venta Icenorum*. N., which occupies a place in history from the time of the earlier Danish invasions, had its origin in the castle erected as a stronghold by the East Anglian kings, and resorted to as a place of safety by the inhabitants of *Venta Icenorum*, who gave it the name of North-wic, or northern station or town, on account of its relative position with respect to their own town. The bishopric of the East Angles was removed hither in 1094. About 4000 Flemings settled at N. in the reign of Elizabeth, and greatly increased the prosperity of the town by the branches of manufacture which they introduced. (1871—pop. 80,390.)

NORWICH, a city of Connecticut, U. S., at the head of navigation of the Thames River, 13 miles north of New London, and 38 south-east of Hartford. The town consists of three large villages, one composed of beautiful and finely-situated residences; the others of nearly 100 manufactories of cotton, wool, paper, &c., which are supplied with water-power by falls of 50 feet on the Yantic River. N. contains county buildings, 7 banks, 1 daily and 2 weekly papers, 19 churches, 40 public and 5 private schools, and a free academy. N. was settled in 1659, when 9 square miles were bought for £70 of Uncas, an Indian chief, whose grave is in the village. Pop. in 1860, 14,047; in 1870, 16,633.

NORWICH or MAMMALIFEROUS CRAG, a series of highly fossiliferous beds of sand, loam, and gravel, of Pleistocene age, occurring at several places within a few miles of Norwich, where they are popularly named 'Crag.' They contain a mixture of marine and fresh-water mollusca, with ichthyolites and bones of mammalia. They are evidently estuary beds, the most common shells being the very species now abundant in such situations around the coasts of Britain; but with them are associated a few extinct species. The beds rest on the white chalk, the surface of which is frequently perforated by *Pholas crispata*, the shell still remaining at the bottom of the cavity. The mammalian bones belong to species of elephant, horse, pig, deer, and field-mouse. With them are occasionally found the bones of *Mastodon angustidens* and some mollusca, which belong to the Red Crag. Their occurrence here is believed to have arisen from their having been washed out of the Red into this, the Norwich Crag.

NORWOOD, UPPER and LOWER, are two villages in Surrey, England, with a station on the London and Croydon Railway, 6 miles south of London. The public pleasure-ground, called the Beulah Spa, is prettily laid out around a mineral spring. The villages are worthy of mention, however, chiefly on account of their schools, among which are a district school for the pauper children of Lambeth parish, and a very large and important educational establishment for the pauper children of London. The district parish of N. had, in 1861, a population of 7462.

NOSE, AND THE SENSE OF SMELL. The nose is not only the organ of smell, but is likewise a part of the apparatus of respiration and voice. Considered anatomically, it may be divided into an

external part—the projecting portion, to which the term *nose* is popularly restricted; and an internal part, consisting of two chief cavities, or *nasal fossae*, separated from one another by a vertical septum, and subdivided by spongy or turbinated bones projecting from the outer wall into three passages or *meatuses*, with which various cells or *sinuses* in the ethmoid, sphenoid, frontal, and superior maxillary bones communicate by narrow apertures.

Fig. 1.—A Longitudinal Section of the Nasal Fossæ of the Left Side, the Central Septum being removed:

1, the frontal bone; 2, the nasal bone; 3, part of the ethmoid bone; 4, the sphenoidal sinus. *a*, the superior turbinated bone; *b*, the superior meatus; *c*, the middle turbinated bone; *dd*, the middle meatus; *e*, the inferior turbinated bone; *f*, the inferior meatus; *gg*, a probe passed into the nasal duct.

The external portion of this organ may be described as a triangular pyramid which projects from the centre of the face, immediately above the upper lip. Its summit or root is connected with the forehead by means of a narrow bridge, formed on either side by the nasal bone and the nasal process of the superior maxillary bone. Its lower part presents two horizontal elliptical openings, the *nostrils*, which overhang the mouth, and are separated from one another by a vertical septum. The margins of the nostrils are usually provided with a number of stiff hairs (*vibrissæ*), which project across the openings, and serve to arrest the passage of foreign substances, such as dust, small insects, &c., which might otherwise be drawn up with the current of air intended for respiration. The skeleton, or framework of the nose, is partly composed of the bones forming the top and sides of the bridge and partly of cartilages, there being on either side an upper lateral and a lower lateral cartilage, to the latter of which are attached three or four small cartilaginous plates, termed *sesamoid cartilages*; there is also the cartilage of the septum which separates the nostrils, and in association posteriorly with the perpendicular plate of the ethmoid, and with the vomer, forms a complete partition between the right and left nasal fossæ. It is the lower lateral, termed by some writers the *alar cartilage*, which by its flexibility and curved shape forms the dilatable chamber just within the nostril. The nasal cartilages are capable of being slightly moved, and the nostrils of being dilated or contracted by various small muscles, which it is unnecessary to describe. The integument of the nose is studded with the openings of sebaceous follicles, which are extremely large and abundant in this region. The oleaginous secretion of these follicles often becomes of a dark colour near the surface; and hence the spotted appearance which the tip and lower parts of the sides, or *ala*, of the nose frequently present. On firmly compressing or pinching the skin of these parts, the inspissated

secretion is forced out of the follicles in the form of minute white worms with black heads.

The *nasal fossae*, which constitute the internal part of the nose, are lofty, and of considerable depth. They open in front by the nostrils, and behind they terminate by a vertical slit on either side in the upper part of the pharynx, above the soft palate, and near the orifices of the eustachian tubes, which proceed to the tympanic cavity of the ear.

The mucous membrane lining the nose and its cavities is called *pituitary* (Lat. *pituita*, slime, rheum), from the nature of its secretion; or *Schneiderian*, from Schneider, the first anatomist who shewed that the secretion proceeded from the mucous membrane, and not, as was previously imagined, from the brain; it is continuous with the skin of the face at the nostrils, with the mucous covering of the eye through the lachrymal duct (see *EYE*), and with that of the pharynx and middle ear posteriorly. This membrane varies in its structure in different parts of the organ. On the septum and spongy bones bounding the direct passage from the nostrils to the throat, the lining membrane is comparatively thick, partly in consequence of a multitude of glands being disseminated beneath it, and opening upon it, but chiefly, perhaps, from the presence of ample and capacious submucous plexuses of both arteries and veins, of which the latter are by far the more large and tortuous. These plexuses, lying as they do in a region exposed more than any other to external cooling influences, appear to be designed to promote the warmth of the part, and to elevate the temperature of the air on its passage to the lungs. They also serve to explain the tendency to hemorrhage from the nose in cases of general or local plethora. In the vicinity of the nostrils, the mucous membrane exhibits papillæ and a scaly epithelium, like the corresponding parts of the skin. In the sinuses, and in all the lower region of the nose, the epithelium is of extreme delicacy, being of the columnar variety, and clothed with cilia. In the upper third of the nose—which, as the proper seat of the sense of smell, may be termed the *olfactory region*—the epithelium ceases to be ciliated, assumes a more or less rich sienna-brown tint, and increases remarkably in thickness, so that it forms an opaque soft pulp upon the surface. It is composed of an aggregation of nucleated particles, of nearly uniform appearance throughout, except that the lowest ones are of a darker colour than the rest, from their containing a brown pigment in their interior. Dr Todd and Mr Bowman remark, in their *Physiological Anatomy*, from which we have condensed the above account of the nasal mucous membrane, that the olfactory region abounds in glands, apparently identical with sweat glands, which dip down in the recesses of the submucous tissue among the ramifications of the olfactory nerve.

The nerves of the nose are the first pair or olfactory which are specially connected with the sense of smell, branches of the fifth pair which confer ordinary sensibility on its skin and mucous membrane, and motor filaments, from the facial nerve to the nasal muscles. The olfactory nerve on each side is connected with the inferior surface of the Brain (q.v.) by an external, a middle, and an internal root, which unite and form a flat band (or, more correctly, a prism), which, on reaching the cribriform plate of the ethmoid bone, expands into an oblong mass of grayish-white substance, the *olfactory bulb*. From the lower surface of this bulb are given off the *olfactory filaments*, fifteen or twenty in number, which pass through the cribriform foramina, and are distributed to the mucous membrane of the olfactory

region. These filaments differ essentially from the ordinary cerebral nerves. They contain no white substance of Schwann, are not divisible into

Fig. 2.—The Distribution of the Olfactory Nerve on the Septum of the Nose:

1, the frontal sinus; 2, the nasal bone; 3, the sphenoidal sinus of left side; 4, the posterior opening of the left nostril; 5, the opening of the Eustachian tube; 6, a section of the soft palate; 7, a section of the hard palate. *a*, the olfactory nerve; *b*, its three roots; *c*, its bulb, from which filaments proceed downwards through the cribriform plate of the ethmoid; *d*, the nasal branch from the ophthalmic division of the fifth nerve; *e*, the naso-palatine nerve from the sphenopalatine ganglion; *g*, *h*, its branches; *f*, the septum of the nose.

elementary fibrillæ, and resemble the gelatinous fibres in being nucleated, and of a finely granular texture. The branches of the fifth pair (or trifacial) given to the nose are the nasal nerve (derived from the ophthalmic division), which supplies the skin and mucous membrane in the vicinity of the nostrils, and the naso-palatine nerve (derived from Meckel's ganglion, which is connected with the superior maxillary division), which supplies the mucous membrane on the spongy bones and on the septum. The peculiar sensation that precedes sneezing is an affection of the nasal nerve, and the flow of tears that accompanies a severe fit of sneezing is explained by the common source of this and the lachrymal nerve; while the common sensibility of the nose, generally, is due to the branches of this and of the naso-palatine nerve.

The nature of odorous emanations is so little known, that it is impossible to give a definite account of the mode in which they produce sensory impressions. From the fact that most odorous substances are volatile, and *vice versa*, it may be presumed that they consist of particles of extreme minuteness dissolved in the air; yet the most delicate experiments have failed to discover any loss of weight in musk, and other strongly odorous substances, after they have been freely evolving their effluvia for several years. But whatever may be the nature of the odorous matter, it is necessary that it should be transmitted by a respiratory current through the nostrils to the true olfactory region, whose membrane must be in a healthy condition. If it is too dry, or if there is an inordinate excretion of fluid from its surface (both of which conditions occur in catarrh or cold in the head), smell is impaired or lost, in consequence of the necessary penetration of the stimulating odour to the nervous filaments being prevented.

The acuteness of the sense of smell is far greater

in many of the lower animals (dogs, for example) than in man, and they employ it in guiding them to their food, in warning them of approaching danger, and for other purposes. To civilised man its utility is comparatively small; but it is occasionally much increased when other senses are deficient. In the well-known case of James Mitchell, who was deaf and blind from his birth, it was the principal means of distinguishing persons, and enabled him at once to perceive the approach of a stranger. Amongst many savage tribes the sense is almost as acute as in many of the lower mammals. For example, the Peruvian Indians are able, according to Humboldt, to distinguish, in the middle of the night, whether an approaching stranger is a European, American Indian, or Negro.

Although all poisonous gases are not odorous, and all bad odours may not be positively deleterious to health, there can be no doubt that one of the principal objects for which the sense of smell is given to us is to enable us to detect atmospheric impurities, many of which are of a most noxious character, and give rise to the most serious forms of fever.

#### NOSE-RING. See RING.

**NOSING**, the projecting edge of a moulding, such as the bead or bottle used on the edge of steps, to which the term is most frequently applied.

**NOSOLOGY** (Gr. *nōsōs*, disease) is that branch of the science of medicine which treats of the distribution and arrangement of diseases into classes, orders, &c. Many systems of nosology have at different times been adopted; some of which have been based upon the nature of the ascertained causes of diseases; others on the pathological states or conditions which attend diseases; others on the differences between structural and functional diseases, &c. It is hard to say which is the most perfect method; but that of Dr Farr, one of the most distinguished living medical statisticians, is adopted by the Registrar-General in the Reports on the mortality of London and England, and is becoming more generally adopted than any other. It has the advantage over the antiquated but once popular system of Cullen (1792) of meeting the requirements of modern science, and (by illustrating great questions connected with public health) of shewing those causes that are injurious or fatal to life, and of thus contributing to the removal of those evils (bad drainage, imperfect ventilation, &c.) which tend to shorten human existence.

We append Dr Farr's system of nosology, which is arranged in four primary classes, each of which includes various orders:

**CLASS I. ZYMOTIC DISEASES** (Gr. *zymē*, a ferment).—Diseases that are either epidemic, endemic, or contagious, and that are induced by some specific body, or by want of food or by its bad quality. In this class there are four orders—viz., Order I. *Miasmatic Diseases* (Gr. *miasma*, a stain), such as small-pox, measles, scarlet-fever, diphtheria, typhus and typhoid fevers, cholera, ague, &c. Order II. *Enthetic Diseases* (Gr. *enthētos*, put in or implanted), such as syphilis, gonorrhœa, glanders, hydrophobia, malignant pustule, &c. Order III. *Dietic Diseases* (Gr. *dieta*, way of life or diet), such as famine, fever, scurvy, purpura, rickets, bronchoecle, delirium tremens, &c. Order IV. *Parasitic Diseases*, such as scabies (or itch), and worm disorders from animal parasites, and ring-worm, scald-head, &c., from vegetable parasites or fungi.

**CLASS II. CONSTITUTIONAL DISEASES**.—Diseases affecting several organs, in which new morbid products are often deposited; sometimes hereditary.

This class contains two orders. Order I. *Diathetic Diseases* (Gr. *diathēsis*, condition or constitution), including gout, anæmia, cancer, melanosis, lupus, &c. Order II. *Tubercular Diseases*, such as scrofula, phthisis, mesenteric disease, tubercular meningitis, &c.

**CLASS III. LOCAL DISEASES**.—Diseases in which the functions of particular organs or systems are disturbed or obliterated with or without inflammation; sometimes hereditary. This class includes eight orders. Order I. *Brain Diseases* (or more correctly, *Diseases of the Nervous System*), such as apoplexy, paralysis, epilepsy, chorea, hysteria, mania, &c. Order II. *Heart Diseases* (or more correctly, *Diseases of the Circulatory System*), such as pericarditis, endocarditis, aneurism, angina pectoris, atheroma, phlebitis, varicose veins, &c. Order III. *Lung Diseases* (or more correctly, *Diseases of the Respiratory System*), such as bronchitis, pneumonia, pleurisy, asthma, empyema, laryngitis, &c. Order IV. *Bowel Diseases* (or more correctly, *Diseases of the Digestive System*), such as stomatitis, gastritis, enteritis, peritonitis, jaundice, &c. Order V. *Kidney Diseases*, such as Bright's disease, nephritis, ischuria, diabetes, stone, gravel, &c. Order VI. *Genetic Diseases* (or *Diseases of the Generative System*), such as hydrocele, ovarian dropsy, &c. Order VII. *Bone and Muscle Diseases*, such as caries, necrosis, exostosis, synovitis, muscular atrophy, &c. Order VIII. *Skin Diseases*, such as urticaria, eczema, herpes, impetigo, acne, lichen, prurigo, &c.

**CLASS IV. DEVELOPMENTAL DISEASES**.—Special diseases, the incidental result of the formative, reproductive, and nutritive processes. It contains four orders. Order I. *Developmental Diseases of Children*, such as malformations, idiocy, teething, &c. Order II. *Developmental Diseases of Women*, such as amenorrhœa, childbirth, change of life, &c. Order III. *Developmental Diseases of Old People*, such as old age, and its concomitant affections. Order IV. *Diseases of Nutrition*, such as atrophy, debility, &c.

**NO'STOC**, a genus of plants of the natural order *Algae*, suborder *Confervaceæ*, found upon moist ground, rocks near streams, &c., and consisting of a somewhat gelatinous hollow tumid frond, filled with simple filaments resembling strings of beads. *N. commune* is frequent in Britain, springing up suddenly on gravel-walks and pasture-grounds after rain. It is a trembling gelatinous mass, often called **STAR JELLY**, and vulgarly regarded, owing to the suddenness with which it makes its appearance, as having fallen from the skies, and as possessed of important medicinal virtues. *N. adule* is employed in China as an article of food.

**NOSTRADAMUS**, a celebrated astrologer of the 16th c., born 14th December 1503, at St Remi, in Provence. His proper name was Michel Notre-Dame, and he was of Jewish descent. He studied first at the Collège d'Avignon, where he exhibited remarkable scientific powers, and subsequently attended the celebrated school of medicine at Montpellier. Here he first acquired distinction during an epidemic that desolated the south of France, by his humane attentions to those stricken by the pestilence. After taking his degree, he acted for some time as professor, but was induced by his friend J. C. Scaliger to settle in Agen as a medical practitioner. After travelling for some time, he finally settled at Salon, a little town situated in the environs of Aix, about 1544. Already he must have been reckoned a man of note, for in the following year, when an epidemic was raging at Lyon, he was solemnly invited thither by the civic authorities, and is said to have rendered immense services. He first fell upon his prophetic vein about the year

1547, but in what light he himself regarded his pretensions, it is now impossible to say. At anyrate, he commenced to write his famous predictions (*Prophecies*) which first appeared at Lyon in 1555. These predictions were in rhymed quatrains, divided into centuries, of which there were seven; the 2d ed., published in 1558, contained ten. Astrology was then the fashion, and these quatrains, expressed generally in obscure and enigmatical terms, had a great success. Some, indeed, regarded the author as a quack, but the great majority as a genuine seer or predictor of the future. He was, consequently, much sought after by all sorts of people, high and low. Catherine de Médicis invited him to visit her at Blois, to draw the horoscope of her sons, and on his departure loaded him with presents. The Duke and Duchess of Savoy went to Salon expressly to see him; and when Charles IX. became king, he appointed N. his physician-in-ordinary (1564). He died at Salon, 2d July 1566. N.'s predictions have been the subject of an immense amount of illustrative and controversial literature. He also wrote an Almanac, which served as the model of all subsequent ones, containing predictions about the weather.—See Jaubert's *Vie de M. Nostradamus, Apologie et Histoire* (Amst. 1656); Astruc's *Memoirs pour Servir à l'Histoire de la Faculté de Montpellier* (Paris, 1767); *Apologie pour les Grands Hommes Soupçonnés de Magie* (Paris, 1825); and E. Baresté's *Nostradamus* (Paris, 1842).

**NOSTRILS, DISEASES OF THE.** Acute inflammation of the nasal mucous membrane is a very common and well-known affection, which has been already described under the title of CATARRH (q. v.), or Cold in the Head; while the chronic form of inflammation is described in the article OZENA. Hemorrhage from the nostrils, or *Epistaxis* (Gr. a dropping), is by far the commonest form of bleeding from a mucous membrane. It may be produced (1) by direct injury, as by a blow on the nose, or a scratch in the interior of the nostrils; or (2) it may be an *active* hemorrhage, in which case it is often preceded by a feeling of tension and heat in the nostrils, pain in the forehead, giddiness, buzzing in the ears, and flushing of the face (these symptoms are, however, seldom all present in the same case, and not unfrequently the flow of blood is preceded by no apparent disorder); or (3) it may be of a *passive* character, and may be due either to a morbid condition of the blood, as in malignant scarlatina, typhoid and typhus fevers, scurvy, purpura, &c., or to obstruction of the circulation by disease of the liver and heart.

If the hemorrhage occur in a flushed plethoric subject, and is obviously of an active character, it may be regarded as a salutary effort of nature, and may be left alone till it ceases spontaneously; but if it continues so long as materially to weaken the patient, or if it be of the passive character, or if it arise from injury, then means should be taken to stop it with as little delay as possible. The patient should be placed in the sitting posture at an open window, with the head erect or slightly inclined backwards; and amongst the simpler means to be first tried, are compression of the nostrils by the fingers, the application of a key or other piece of cold metal to the back of the neck, and the occasional immersion of the face or whole head in cold water, especially if accompanied by a drawing-up of the water into the nostrils; or Dr Negrier's plan of causing the patient, in a standing position, suddenly to raise his arms straight upwards, and to retain them for a short time in this position—a remedy which he states to have always succeeded, even in very bad cases, when other means had failed. Should these means fail, recourse must be had to astringent

injections (for example, twenty grains of alum dissolved in an ounce of water) thrown up the nostrils by a syringe, or to astringent powders (as finely-powdered galls, kino, matico, alum, &c.) blown up the nostrils by means of a quill or other tube, or snuffed up by the patient. As a final resource, direct compression must be applied. Abernethy never failed in stopping the bleeding by winding a piece of moistened lint around a probe, so as to form a cylindrical plug, passing this along the floor of the nose for its entire length, then carefully withdrawing the probe, and allowing the lint to remain for three or four days. Cases occasionally occur in which it is necessary also to plug the posterior orifices of the nostrils by an operation, into the details of which it is not necessary to enter.

*Polypus*, which is an old term employed to signify any sort of pedunculated tumour firmly adhering (literally, 'by many feet') to a mucous surface, is of common occurrence in the nostrils; its most usual seat of attachment being one of the turbinated bones. The ordinary kind is of the consistence of jelly, yellowish, streaked with blood-vessels, and of a pear-shaped form. The patient has a constant feeling of fulness in the nostril (as if he had a cold in the head); he cannot effectually blow his nose; and his voice is sometimes rendered more or less thick and indistinct. If he force his breath strongly through the affected nostril, and at the same time compress the other, and close the mouth, the polypus may generally be brought in view. The best treatment is to seize the neck or pedicle with the forceps, and twist it off. The consequent hemorrhage may be readily checked by the means already described.

*Foreign bodies* are often inserted into the nostrils by children, and become impacted. They may usually be extracted by a small scoop or a bent probe. If they cannot be removed by these means, they must be pushed back into the throat through the posterior nares.

Children are occasionally born with imperforated nostrils. This congenital malformation may, however, usually be remedied by surgical assistance.

**NOT GUILTY** is the form of verdict in a criminal prosecution, and also in some civil actions, when the jury find in favour of the defendant or accused party. The verdict is conclusive, and the accused cannot, in criminal cases, be tried a second time.

**NOT PROVEN** is a form of verdict used in Scotland in criminal prosecutions when the jury think there is some foundation for the charge, but the evidence is not strong enough against the prisoner to warrant a verdict of guilty. In such a case, a verdict of 'Not Proven' is substantially a verdict of acquittal. The prisoner cannot be tried afterwards, even though new and conclusive evidence come to light after the verdict.

**NOTABLES**, the name formerly given in France to persons of distinction and political importance. As the States General were inconvenient to the despotism of the monarchy, the kings of the House of Valois adopted the expedient of calling in their stead *Assemblies of the Notables*, the time of calling them and the composition of them being entirely dependent on the pleasure of the crown, by which also their whole proceedings were guided, so that they generally consented at once to whatever was proposed to them. They shewed a particular readiness in granting subsidies, to which they themselves, as belonging to the privileged classes, were not to contribute. An Assembly of Notables, convened in Paris by Richelieu in 1626, and presided over by Gaston, brother of Louis XIII., consisted of only

35 members. For more than a century and a half even this poor acknowledgment of any other mind or will in the nation than that of the sovereign ceased to be made; but when the state of the finances brought the monarchy into difficulties and perils, Louis XVI., at the instigation of the minister Calonne, had recourse again to an Assembly of Notables, which met 22d February 1787, and was dissolved 25th May. It consisted of 137 members, among whom were 7 princes of the blood, 9 dukes and peers, 8 marshals, 11 archbishops, 22 nobles, 8 councillors of state, 4 masters of requests, 37 judges, 12 deputies of the Pays d'Etats, the civil lieutenant, and 25 persons belonging to the magistracy of different cities of the kingdom. Calonne's representations of the state of the finances induced the Notables to adopt many reforms in the matter of taxation; but no sooner was the assembly dissolved, than many of them joined the parliaments in opposition to resolutions adverse to their private interests, so that the king was compelled to determine upon assembling the States General. Necker, who had meanwhile been placed at the head of affairs, assembled the Notables again, 6th November 1788, to consult them concerning the form in which the States General should be convened, and particularly concerning the number of members of the third estate and the manner of voting. The Notables declared against every innovation, and so compelled the court to half measures, which helped to prepare the way for the Revolution.

**NOTARY-PUBLIC** is an officer of the law, whose chief function is to act as a witness of any solemn or formal act, and to give a certificate of the same; which certificate, if duly authenticated, is accepted all the world over as good evidence of the act done in his presence, and attested by him. The services of a N. are chiefly available where his evidence is to be used in a foreign country. Solicitors are sometimes notaries-public, but in England there are fewer notaries, comparatively, than in Scotland, where notarial acts and certificates are more largely used.

**NOTATION**, the method of representing numbers and quantities by marks or signs. The representation of numbers is known as 'arithmetical,' and that of quantities as 'symbolical' notation.

**I. ARITHMETICAL NOTATION.**—The invention of arithmetical notation must have been coeval with the earliest use of writing, whether hieroglyphic or otherwise, and must have come into use about the time when it was felt that a mound, pile of stones, or huge misshapen pillar, was insufficient as a record of great events, and required to be supplemented by some means which would suffice to hand down to posterity the requisite information. The most natural method undoubtedly was to signify 'unity' by one stroke, thus: |; 'two' by two strokes, ||; 'three' by three strokes, |||, &c.; and, as far as we know, this was the method adopted by most of those nations who invented systems of notation for themselves. It is shewn on the earliest Latin and Greek records, and is the basis of the Roman, Chinese, and other systems. We have thus a convenient division of the different notational systems into the *natural* and *artificial* groups, the latter including the systems of those nations who adopted distinct and separate symbols for at least each of the nine digits. The Roman and Chinese systems are the most important of the former, and the Hebrew, later Greek, and 'decimal' systems of the latter group.

**Roman System.**—The system adopted by the Romans was most probably borrowed at first from the Greeks, and was distinguished equally by its simplicity and its cumbronsness. The following

seems to be the most probable theory of its development. A simple series of strokes was the basis of the system; but the labour of writing and reading large numbers in this way would soon suggest methods of abbreviation. The first and most natural step was the division of the strokes into parcels of tens, thus,  a plan which produced great facility in the reading of numbers. The next step was to discard these parcels of ten strokes each, retaining only the two cross strokes, thus, X, as the symbol for 10. Continuing the same method as larger numbers came to be used, they invented a second new symbol for 100, thus, C (which was at first probably the cancelling stroke for ten X's in the same way as X was originally the cancelling stroke for ten units); and for the sake of facility in writing, subsequently employed the letter C, which resembled it, in its place. The circumstance that C was the initial letter of the word *centum*, 'a hundred,' was doubtless an additional reason for its substitution in place of the original symbol for 100. An extension of the same process produced M, the symbol for 1000, which was also written  $\Lambda$ ,  $\nabla$ , and very frequently CI $\cap$ . This symbol was probably suggested by the circumstance that M was the initial letter of the Latin word *mille*, signifying a thousand. The early Roman system went no higher. But though the invention of these three symbols had greatly facilitated the labour of writing down and reading off numbers, further improvements were urgently required. The plan of 'bisection of symbols' was now adopted; X was divided into two parts, and either half, V or  $\Lambda$ , used as the symbol for 5; C was similarly divided,  $\square$  or L standing for 50; and N, CI, or I $\cap$ , was obtained in the same manner, and made the representative of 500. The resemblance of these three new symbols to the letters V, L, and D, caused the substitution of the latter as the numerical symbols for 5, 50, and 500. A final improvement was the substitution of IV for 4 (in place of IIII), IX for 9 (in place of VIIII), XC for 90 (instead of LXXXIX), and similarly XL for 40, CD for 400, CM for 900, &c.; the smaller number, when in front, being always understood as subtractive from the larger one after it. This last improvement is the sole departure from the purely additional mode of expressing numbers; and if the symbols for 4, 9, 90, &c., be considered as single symbols, which they practically are, the deviation may be looked upon as merely one of form. In later times, the Roman notation was extended by a multiplication of the symbol for 1000, thus CCCI $\cap$  represented 10,000; CCCCI $\cap$  represented 100,000, &c.; and the bisection of these symbols gave them I $\cap$  $\cap$  and I $\cap$  $\cap$  $\cap$  as representative of 5000 and 50,000 respectively. This, in all probability, is the mode according to which the Roman system of notation was constructed. To found a system of arithmetic upon this notation would have been well-nigh impossible; and so little inventive were the Romans, that the attempt seems never to have been made. They performed what few calculations they required by the aid of the *Abacus* (q. v.).

**Chinese System.**—This system presents a strong resemblance to the former, but is, in facility of expression, much superior to it. Like the Roman, it retains the primitive symbols for the first three digits, and like it also expresses the last four by prefixing a new symbol to the symbols for the first four, and the analogy is continued up to 'twenty.' From this point onwards, the Chinese system departs from the 'additive' principle, as 20, 30, &c., are represented not as in the Roman system by a repetition of the symbol for 10, but by affixing to the symbol for 10, on its

left side, the symbols for 2, 3, &c., as multiples. The same method is adopted with the numbers 200, 300, &c.; and should the number contain units, they are annexed on the right-hand side. For small numbers up to 20, the Roman notation is more expeditious, on account of the greater simplicity of its characters; but for very large numbers, the Chinese is scarcely more cumbersome than our own. Some numbers which are expressed by the Chinese with 14 characters, require more than 100 symbols when expressed in the Roman notation.

Previous to the intercourse of the Western European nations with China, their notation was much more cumbersome than it is at present; but the changes since made have affected merely the form of the characters, without altering the principle of the system.

*Artificial Systems.*—The first of these, in point of date, is the Hebrew; but as the knowledge we possess of it is very meagre, and as its principle was adopted by the Greeks in the construction of their improved system, it will be sufficient to describe the latter.

*Greek System.*—The Greeks at first used a method similar to the Romans, though at the same time they appear to have employed the letters of the alphabet to denote the first 24 numbers. Such a cumbersome system was naturally distasteful to so fastidious a race, and they hit upon the happy expedient of dividing their alphabet into three portions—using the first to symbolise the 9 digits, the second the 9 tens, and the third the 9 hundreds. But as they possessed only 24 letters, they had to use three additional symbols; their list of symbols of notation then stood as follows:

| Units.                          | Tens.                        | Hundreds.                          |
|---------------------------------|------------------------------|------------------------------------|
| $\alpha$ represents 1           | $\iota$ represents . 10      | $\xi$ represents . 100             |
| $\beta$ . . . . . 2             | $\kappa$ . . . . . 20        | $\sigma$ . . . . . 200             |
| $\gamma$ . . . . . 3            | $\lambda$ . . . . . 30       | $\tau$ . . . . . 300               |
| $\delta$ . . . . . 4            | $\mu$ . . . . . 40           | $\upsilon$ . . . . . 400           |
| $\epsilon$ . . . . . 5          | $\nu$ . . . . . 50           | $\phi$ . . . . . 500               |
| $\zeta$ (introduced) 6          | $\xi$ . . . . . 60           | $\chi$ . . . . . 600               |
| $\eta$ . . . . . 7              | $\theta$ . . . . . 70        | $\psi$ . . . . . 700               |
| $\theta$ . . . . . 8            | $\tau$ . . . . . 80          | $\omega$ . . . . . 800             |
| $\theta$ or $\vartheta$ . . . 9 | 5 or $\zeta$ (introduced) 90 | $\Delta, \Lambda$ (introduced) 900 |

By these symbols, only numbers under 1000 could be expressed, but by putting a mark, called *iota*, under any symbol, its value was increased a thousandfold, thus  $\alpha = 1000$ ,  $\zeta = 20,000$ ; or by subscribing the letter M, the value of a symbol was raised ten-thousandfold, thus,  $\zeta_M = 80,000$ . For these two marks, single and double dots placed over the symbols were afterwards substituted. This improvement enabled them to express with facility all numbers as high as 9,990,000, a range amply sufficient for all ordinary purposes. Further improvements were made upon this system by Apollonius, who also by making 10,000 the root of the system, and thus dividing the symbols into tetrads, greatly simplified the expression of very large numbers. Both Apollonius and Archimedes had to a certain extent discovered and employed the principle of giving to symbols values depending on their position and multiplicative of their real value, but this principle was applied to tetrads or periods of four figures only, and the multitude of symbols seems to have stood in the way of further improvement. Had Apollonius, who was the chief improver of the system, discarded all but the first nine symbols, and applied the same principle to the single symbols which he applied to the 'tetrad' groups, he would have anticipated the decimal notation.

The Greek arithmetic, founded upon such a system of notation, was necessarily lengthy and complicated in its operations, each number in the multiplicand forming with each number in the multiplier a separate product (not as in our system, where one product blends with another by the process of 'carrying'), though by arranging these products in separate columns, according as they amounted to units, tens, hundreds, &c., the process was somewhat simplified. But when fractions formed part of the multiplier and multiplicand, the Greek arithmetic became almost unmanageable, till the invention of SEXAGESIMALS (q. v.) by Ptolemy superseded it. After Ptolemy's death, all improvement was arrested.

*Decimal System.*—The decimal system, which was introduced into Europe from the East (see NUMERALS), was first employed by the Spaniards, and was from them transmitted to the French and Germans, through whom its use was extended over Europe. The modern arithmetic was not practised in England till about the middle of the 16th c., and for a long time after its introduction was taught only in the universities. The decimal system, possessing only 9 symbols—viz., 1, 2, 3, 4, 5, 6, 7, 8, 9 (called the nine digits)—adopts the principle of giving to each symbol or 'figure' two values, one the absolute value, and the other a value depending upon its position. The numbers from 'one' to 'nine' inclusive are expressed by the nine digits; ten is expressed by writing a cipher or zero after 1 (10), thus throwing it into the second place, and giving it a positional value ten times its absolute value. From the principle that a figure thus moved one place to the left is held to be increased in value ten times, this method of notation is called *decimal notation* (Lat. *decem*, ten), and *ten* is said to be the 'radix' of the system. The numbers from 'eleven' to 'nineteen' inclusive are expressed by taking the symbol 10 and putting the digits from 'one' to 'nine' inclusive in place of the zero—e. g., twelve is written 12, 1 in position signifying ten units, and 2, two additional units. On the same principle, twenty is expressed by putting 2 in the second position (20), and so on to 99. To express a hundred, 1 is put in the third place (100), thus making its value ten times what it is in the second place, or ten times ten units; two hundred is similarly expressed by 200, &c.; and should a number of tens and units amounting to less than a hundred exist in the number, the symbols expressing them are substituted for the two zeros. This process can be similarly continued without limit.

There is another way of looking at this notation, which is perhaps simpler and clearer. In such a number, e. g., as 333, instead of attributing different values to the figure 3 in the different positions, we may consider it as symbolising the same number throughout, namely, *three*; but *three what?* In the first place, it signifies three ones or units (e. g., three single pounds or sovereigns); in the second place, it still signifies three, but now it is three 'tens' or decades (three parcels of ten sovereigns each); and in the third place, it still signifies three, but now three hundreds (three parcels of a hundred each). It is from this point of view that the first place to the right is called the *place of units*, or the *units' place*; the second, the *place of tens*, and so on. When such a number as 6473 is analysed on this principle, it is seen to mean  $6 \times 1000$  (6 times 1000) +  $4 \times 100$  +  $7 \times 10$  +  $3 \times 1$ ; and 6004 becomes  $6 \times 1000$  +  $4 \times 1$ . In this latter instance the peculiar importance of the figure 0 is seen (see NOTHING). Following out the method, the general formula for all numbers is  $a \times 10^n + b \times 10^{n-1} + c \times 10^{n-2} + \dots + m \times 10^3 + n \times 10^2 + p \times 10$

+  $q$ , where  $a, b, c, \dots, m, n, p, q$ , stand for any of the nine digits or zero.

The special advantages of such a system are manifold. It enables us to express small numbers with the greatest ease, and as the smaller numbers are those most commonly used, this is a great point in favour of the system. It also gives to computation a unity which could never under any circumstances have existed in the systems of notation above described, and the most ordinary, and at the same time effective, illustration of this is the process of 'carrying' in multiplication, whereby one product is blended with another, and much time and trouble in the subsequent addition is saved. This simplification, however, is chiefly due to the introduction of the symbol 0, which, supplying the place of an absent digit, preserves to those figures on the left of it their true positional value. Another advantage of this system is the ease with which computations involving fractions are performed (see FRACTIONS, DECIMAL). The use of the number 10 as *radix*, is universal in all systems of notation; but it has been often doubted, and in some respects with good reason, whether it is the number best fitted for this position, and many have proposed to substitute 12 for it. This question will be referred to under SCALES OF NOTATION.

2. SYMBOLICAL NOTATION, the general designation of those symbols which are used by mathematicians to express indefinite quantities. The symbols are generally taken from the English, Roman, and Greek alphabets, and are apportioned as follows: Algebraic quantities are expressed by the English alphabet; those which are known, by the earlier letters  $a, b, c, \dots$ , and those which are unknown, by the later ones,  $u, v, w, x, y, \dots$ . In Trigonometry, the letters  $a, b, c, \dots$  denote measures of length, and  $A, B, C, \dots$  are used to express angles. In Mechanics and Astronomy, the Greek letters are generally used to express angles. When different sets of quantities are similarly related among themselves, the sets are, for convenience, expressed by the same letters; and to prevent confusion, each set has a peculiar mark attached to each symbol, thus,  $a, b, c, \dots$  denote one class;  $a', b', c', \dots$  another class;  $a'', b'', c'', \dots$  a third class; and so on; or,  $a_1, b_1, c_1, \dots, a_2, b_2, c_2, \dots$  &c.

NOTE, in Music, a character which by the degree it occupies on the staff represents a sound, and by its form the period of time or duration of that sound. The notes commonly in use in modern music are the semibreve,  $\circ$ ; minim,  $\text{q}$ ; crotchet,

$\text{f}$ ; quaver,  $\text{f}$ ; semiquaver,  $\text{ff}$ ; demisemiquaver,  $\text{fff}$ ;

and semi-demisemiquaver,  $\text{ffff}$ . Taking the semibreve

as unity, the minim is  $\frac{1}{2}$  its duration, the crotchet  $\frac{1}{4}$ , the quaver  $\frac{1}{8}$ , the semiquaver  $\frac{1}{16}$ , the demisemiquaver  $\frac{1}{32}$ , and the semi-demisemiquaver  $\frac{1}{64}$ . Notes of greater length than the semibreve were formerly in use—viz., the breve, twice the duration of the semibreve; the long, four times; and the large, eight times the semibreve. Of these the breve,  $\text{b}$  or  $\text{S}$ , is still sometimes met with in ecclesiastical music.—The term note is often used as synonymous with musical sound.

NOTHING, in Mathematical language, denotes the total absence of quantity or number, as when equals are subtracted from equals, but it is often employed (see LIMITS) to indicate the limit to which a constantly decreasing positive quantity approaches. The absence of number or quantity could be equally well signified by the absence of

any symbol whatever, but the presence of '0' shows that in its place some number or quantity might, and under other circumstances would, exist.

In Physics, the symbol '0' is generally denominated *zero*, and has a different meaning. Like the former, it is the starting-point from which magnitude is reckoned; but while the starting-point in the former case was absolute, in this case it is conventional, and by no means denotes the absence of all quantity or magnitude. Thus the zero-point of the thermometer must not be interpreted to signify that when the mercury has fallen to this point atmospheric heat has totally vanished, but must be understood as a mere conventional starting-point for graduation, chosen for convenience, and not even necessarily representing any fixed natural degree of temperature.

NOTICE TO QUIT, is the formal notice given by a landlord to a tenant, or by a tenant to a landlord, that the tenant ought or intends to quit at a future day named. See LANDLORD AND TENANT.

NOTO, a town of Sicily, in the province of Syracuse, and 16 miles south-west of the city of that name, 3 miles from the sea. It is of the highest antiquity, was a place of great strength under the Saracens, and held out against the invading Northmen longer than any other town of Sicily. It is a very handsome town, contains rich churches, beautiful palaces, and broad and straight streets. Its academy has a library attached, and a collection of antiquities. A good trade is carried on in corn, wine, oil, and the other produce of the vicinity. Pop. 10,950. N. was destroyed by an earthquake in 1693, and rebuilt about  $4\frac{1}{2}$  miles from its former site.

NOTRE DAME, i. e., *Our Lady*; the old French appellation of the Virgin Mary, and therefore the name of a number of churches dedicated to the Virgin Mary in different parts of France, and particularly of the great cathedral of Paris.

NOTTINGHAM, a municipal and parliamentary borough of England, capital of the county of the same name, and a county in itself, on the Leen at its junction with the Trent, 130 miles north-north-west of London. It is built principally on the slope and at the foot of a rocky eminence, and in an architectural sense it has within recent years been much improved. The market-place is  $5\frac{1}{2}$  acres in extent, and is surrounded by lofty buildings. The Trent, which passes about a mile south of the town, and is here about 200 feet wide, is crossed by railway bridges, and by an ancient bridge of 19 arches. The exchange, the town and county halls, the House of Correction, St Mary's Church, and the Roman Catholic Chapel are edifices worthy of special mention. The Free Grammar School, with an income from endowment of about £1000 a year, was founded in 1513, and had about 100 scholars in 1863. There are numerous hospitals for the poor and infirm. Of the manufactures, which are various and important, the principal are bobbin-net and lace, and cotton and silk hosiery. Cotton, silk, and flax mills, machine-shops, bleaching-works, and wire, iron, and brass works are in operation. N., which sends two members to the House of Commons, is a station on the Derby and Lincoln Railway. Pop. (1861) 74,693. (1871—86,608.)

The original castle of N. was built by William the Conqueror; it was dismantled during the Protectorate, and replaced by the present edifice—a castle only in name.

NOTTINGHAM, an inland county of England, between Lincolnshire on the east, and Yorkshire and Derbyshire on the west. Area, 526,076 acres; pop. 293,867. It is 50 miles in length from north

to south, and 20 miles in average breadth. The meridian of 1° west falls along the middle of the county, and may be said to divide it into two nearly equal portions, of which the eastern, comprising the vale of the Trent, is level, and the western is occupied by hills of no great elevation. In the south of the county are the wolds, consisting of upland moors and pasture-lands, broken up by many fertile hollows. In the west are the remains of the royal forest of Sherwood, famous as the chief haunt of Robin Hood. The principal rivers are the Trent, and its tributaries the Erewash, Mann, and Idle. The Nottingham and Grantham Canal in the south connects the Trent with the Witham, and these two rivers are also connected by the Fosse Dyke Canal, which, running north-west from the city of Lincoln, joins the Trent on the north-eastern boundary of the county. By the rivers, canals, and the North Midland, Sheffield and Lincoln, and Great Northern Railways, there is direct communication in every direction. The climate, especially in the east, is remarkably dry. The soil is various; and, with regard to productiveness, the land is not above mediocrity. The usual crops are raised; there are many hop-plantations, and much land is laid out in market-gardens. Extensive tracts have been planted recently. Four members of parliament are returned for the county. (1871—pop. 319,956.)

**NOUKHA**, a town of Russia, in Trans-Caucasia, is built on the southern slope of the Caucasus Mountains, 80 miles south-west of Derbend, in lat. 41° 12' N., long. 47° 13' E. Pop. 21,113, consisting of native Tartars belonging to the Mohammedan creed, of Armenians, and a few Russians, chiefly officials. Breeding the silk-worm is the staple branch of industry. The native breed of silk-worms is somewhat coarse, and is now being supplanted by the Italian breed.

**NOUN** (Lat. *nomen*, a name), in Grammar, is the term applied to that class of words that 'name' or designate the persons and things spoken about. In a wide sense, such words as *rich*, *tall*, are nouns, as well as *John*, *man*, *tree*; for they are names applicable to all objects possessing these attributes. But as words like *John*, *man*, *tree*, suffice of themselves to mark out or designate an object or a definite class of objects, while words expressive of a single attribute, like *rich*, *tall*, can be used only in conjunction with such a word as *man* or *tree*, the one class are called Adjective Nouns, or simply Adjectives (q. v.), while the other are called Substantive Nouns, or simply Substantives or Nouns. Nouns or Names, in this narrower sense, may be divided into classes in a variety of ways, according to the ground we take for our division. One of the distinctions commonly made by grammarians is into Proper Nouns and Common Nouns. A proper noun is usually defined to be 'the name of any individual person, or place,' as *John*, *London*; while a common noun is applicable to every individual of a class of objects, as *prince*, *city*. But this definition fails to point out the real difference; for there are several Londons, and there are more Johns than princes; other things also have proper names, besides persons and places, as ships (the *Minotaur*), and bells (Big Ben). Providence, again, although applicable to only One Being in the universe, is not a proper noun. Wherein, then, lies the difference? In order to answer this question, we must advert to an important distinction made by logicians with regard to the import of names. A word is said to denote all the objects to which it is applicable as a name; thus, the word *man* is a name for all the objects known individually as James, John, Adam, Cæsar, &c., and therefore denotes the whole human race;

but while thus denoting or naming them, it also implies something concerning them; in the language of logic, it connotes that they possess certain attributes, namely (1) a certain corporeal form, known as the human form; (2) animal life; (3) rationality. All this, at least, is included in the meaning or connotation of the word 'man.' Now, if we consider any noun of the class called common, we find that while it denotes, or names, or points out a certain object, or class of objects, it also conveys or implies some qualities or facts concerning them; in other words, all such names are connotative, or have a meaning. Not so with proper nouns. To say that a man is called John Butler, informs us of no quality he possesses, or of any fact except that such is his name. The name itself conveys no meaning; it is non-connotative. And this is what really constitutes a proper name; it is affixed to an object, not to convey any fact concerning it, but merely to enable you to speak about it. Proper names, indeed, are often given at first on account of the object possessing certain attributes; but once given, they do not continue to connote those attributes. The first John Baker was probably so called because he exercised the trade of baking; but his ceasing to bake would not have made him lose the name; and his descendants were called Baker, regardless of their occupation.

Proper names are thus *meaningless marks*, to distinguish one individual from another; and the A, B, C, &c., which a geometrician affixes to the several angles of a figure, are as much proper names as Tom, Lawrie, &c., applied to the individual bells of a chime. The proper contrast, then, to a Proper Noun is not a Common Noun—meaning by that a name common to a class of objects—but a Significant Noun.

Of Significant Nouns, by far the greater number are General or Class Names; that is, they can be applied to any individual of a class of objects, implying that all these individuals have certain attributes in common—as *quadruped*, *book*. The quadruped spoken of may perhaps be a *horse*, and here we have another class-name, applicable to the same object, but of less generality than 'quadruped.' *Animal*, again, is more general than quadruped, being applicable to a far wider class. But it is important to observe, that as the number of objects that the terms are applied to, or denote, increases, the number of attributes they imply—in other words, the amount of their meaning—diminishes. To call an object an 'animal,' merely implies that it is organised and is alive (with that kind of life called animal life); to call it a 'quadruped,' implies all this and a number of attributes in addition; and to call it a 'horse,' implies a still further addition.

It is to this class of words that the term Common Nouns is properly applicable; and the contrast to them is not Proper Nouns, but what might be called Singular Nouns, such as 'God,' 'providence,' 'universe.'

*Collective Names* are such as *regiment*, *fleet*, *senate*, *shoal*. They form a subdivision of Class Names or Common Nouns; for *regiment* is applicable to all collections of men organised in a particular way.

*Names of Materials* are such as *iron*, *water*, *sugar*, *wheat*. These two classes appear in many cases to merge into each other. In both, the objects named consist of an aggregation; but in collective names, the parts forming the collection are thought of as individual objects; as the *soldiers* of a regiment, the *fishes* composing a shoal. Substances, again, like iron, gold, water, are not made up of definite individual parts (at least to our senses); and in such as wheat, sand, the name of the individual visible part (*grain of wheat*, *grain of sand*) is

derived from the name of the mass, shewing that the idea of the individual is swallowed up in that of the mass.

A convenient term for names of materials or substances is that used by German grammarians—*Stuff-nouns*. Sometimes the same word is used as a *stuff-noun*, and also as a *class-noun*. Thus: 'The cow eats *grass*' (*stuff-noun*); 'The botanist studies the *grasses*, and has found a new *grass*' (*class-noun*); 'They had *fish*' (*stuff-noun*) for dinner, and consumed four large *fishes*' (*class-noun*).

Names of materials are not, like collective nouns, a subdivision of common nouns; they belong to the contrasted class of singular nouns; and, when the substance is simple or invariable in composition, cannot be used in the plural; as *gold, water, beef*.

*Abstract Nouns*.—In the expression 'hard steel,' or 'the steel is hard,' the word *hard* implies a certain quality or attribute as belonging to the steel. This quality has no existence apart from steel or some other substance; but I can withdraw (*abstract*) my thoughts from the steel in other respects, and think of this quality as if it had an independent existence. The name of this imaginary existence or abstraction is *hardness*. All words expressive of the qualities, actions, or states of objects, have abstract nouns corresponding to them; as *brave—bravery; strike—stroke; well—health*. In opposition to abstract nouns, all others are *concrete nouns*—that is, the attributes implied in them are considered as embodied in (*concrete*, Lat. growing together) the actual existences named.

**NOUREDDIN-MAHMÛD, MALEK-AL-ADEL**, one of the most illustrious men of his time, and the scourge of the Christians who had settled in Syria and Palestine, was born at Damascus, 21st February 1116. His father, Omad-ed-din Zengui, originally governor of Mosul and Diarbekir on behalf of the Seljuk sultans, had established his independence, and extended his authority over Northern Syria, including Hems, Edessa, Hamah, and Aleppo. N. succeeded him in 1145, and the better to carry out his ambitious designs, changed the seat of government from Mosul to Aleppo. Count Joscelin of Edessa, thinking the accession of a young and inexperienced sovereign afforded him a favourable opportunity of regaining his territories, made an inroad at the head of a large force, but was signally discomfited under the walls of Edessa, his army, with the exception of 10,000 men, being completely annihilated. The report of N.'s success being conveyed to Western Europe, gave rise to the second Crusade. The Crusaders were, however, foiled by N. before Damascus, and being defeated in a number of partial conflicts, abandoned their enterprise in despair. N. next conquered Tripolis and Antioch, the prince of the latter territory being defeated and slain in a bloody conflict near Rugia (29th June 1149), and before 1151 all the Christian strongholds in Syria were in his possession. He next cast his eyes on Egypt, which was in a state of almost complete anarchy under the feeble sway of the now effeminate Fatimites, and, as a preliminary step, he took possession of Damascus (which till this time had been ruled by an independent Seljuk prince) in 1156; but a terrible earthquake which at this time devastated Syria, levelling large portions of Antioch, Tripolis, Hamah, Hems, and other towns, put a stop to his scheme for the present, and compelled him to devote all his energies to the removal of the traces of this destructive visitation. An illness which prostrated him in 1159, enabled the Christians to recover some of their lost territories, and N., in attempting their re-subjugation, was totally defeated near the Lake of Gennesareth by Baldwin III., king of Jerusalem;

but undismayed by this reverse, he resumed the offensive, defeated the Christian princes of Tripolis and Antioch, making prisoners of both, and again invaded Palestine. Meanwhile, he had obtained the sanction of the calif of Bagdad to his projects concerning Egypt, and the true believers flocking to his standard from all quarters, a large army was soon raised, which, under his lieutenant Shirkoh, speedily overran Egypt. Shirkoh dying soon after, was succeeded by his nephew, the celebrated Salah-ed-din (q. v.), who completed the conquest of the country. N., becoming jealous of his able young lieutenant, was preparing to march into Egypt in person, when he died at Damascus, 15th May 1174. N. is one of the great heroes of Moslem history. Brought up among warriors who were sworn to shed their blood for the cause of the Prophet, he retained in his exalted station all the austere simplicity of the first califs. He was not, like the majority of his co-religionists, a mere conqueror, but zealously promoted the cultivation of the sciences, arts, and literature, and established a strict administration of justice throughout his extensive dominions. He was revered by his subjects, both Moslem and Christian, for his moderation and clemency, and even his most bitter enemies among the Christian princes extolled his chivalrous heroism and good faith. He possessed in an eminent degree the faculty of impressing his own fiery zeal for the supremacy of Islam upon his subjects, and their descendants at the present day have faithfully preserved both his name and principles.

**NOVA SCOTIA**, a province of the Dominion of Canada, is bounded on the N.-W. by New Brunswick and the Bay of Fundy, on the N. by the Straits of Northumberland and the Gulf of St Lawrence, and on the other sides by the Atlantic Ocean. It consists of two portions, N. S. proper, a large peninsula connected with New Brunswick by an isthmus about 15 miles in width, and the island of Cape Breton (q. v.). The peninsula, about 280 miles in length, and from 50 to 100 miles broad, extends in an east-north-east and west-south-west direction. Cape Breton lies north-east of N. S. proper, separated from it by a narrow strait, called the Gut of Canso, 16 miles long, and from half a mile to 2 miles wide. Sable Island, which is 25 miles in length by 1½ in breadth, and is surrounded by a dangerous, widely-extended sand-bank, is situated about 90 miles from the nearest coast of N. S., in lat. 44° N., and long. 60° W. It is formed of sand-hills thrown up by the sea, some of them being about 80 feet in height. The island is covered with wild grasses, which support herds of wild horses, known as Sable Island ponies. It is in the track of vessels trading between America and Britain, and owing to the number of wrecks that take place on its shores, a superintendent and several men are stationed here for the purpose of rescuing and aiding shipwrecked mariners. The area of the province is 18,600 square miles; pop. (1871) 387,800. The coast-line is about 1000 miles in length, and the shores, which are much indented, abound in excellent bays and harbours, of which the chief are Chedabucto Bay, Halifax Harbour, St Margaret's, Mahon, and St Mary's Bays, Annapolis, Mines, and Chignecto Basins, and Pictou Harbour. There are numerous rivers, but few of them are over 50 miles in length; the most important are the Avon, the Annapolis, and the Shubenacadie. N. S. contains about 400 lakes, of which the Bras d'Or, in Cape Breton, covers an area of 500 square miles, or about one-sixth of the entire area of the island. Stretching along the Atlantic sea-board, and extending inland from it for about 20

miles, is a range of highlands, and about 60 miles from the Atlantic coast are the Cobequid Mountains, 1100 feet in height; which traverse the peninsula from the Bay of Fundy to the Straits of Canso. The soil in the valleys is rich and fertile, producing all the fruits of temperate climates; and, especially in the north, the uplands also are fertile. The climate is remarkably healthy, its rigour being modified by the insular character of the province, and by the influence of the Gulf Stream. The mean temperature for the year is 42.09° at Pictou, and 43.6° at Windsor. The extreme limits of the thermometer may be stated at -15° Fahr. in winter, and 95° in the shade in summer. The province abounds in mineral riches, including gold, coal, and iron. No official statement of the quantity of gold obtained in any given time has been published, but it is now notorious that large quantities of the precious metal are locked up in the geological strata of the island, chiefly in bands of quartz. Gold was first discovered in the colony in March 1861, on Tangier River, about 40 miles east of Halifax. The chief diggings are along the Atlantic coast, and gold has been found in nearly 100 different localities. An act of the legislature regulating the disposal of claims and the collection of revenue from the gold-fields was passed in March 1862. In 1860, 213,400 tons of coal were raised from certain specified mines of the province, while large quantities were also raised in other localities. In 1851, the quantity of iron smelted was 400 tons; in 1861, 1200 tons. Of the entire area of the colony, 10,000,000 acres are considered good land, and of these 1,028,032 acres were under cultivation. Three-fourths of the whole area are comprised in the peninsula of N. S., and the remainder in the island of Cape Breton. The principal agricultural products in 1861 were hay, wheat, barley, buckwheat, oats, rye, Indian corn, potatoes, and turnips. The waters around the colony abound in fish, as mackerel, shad, herring, salmon, &c., and the fisheries are pursued with ardour and with ever-increasing success. In 1860, 900 vessels, 8816 boats, and 14,322 men were employed in the fisheries, and the value of the fish exported in that year was 2,072,081 dollars. In 1871, the imports amounted to £2,224,696, the exports to £1,357,693; the revenue for 1866 to £307,477, the expenditure to £279,364. There are in the colony 1150 miles of telegraph, and 94 miles of railway. It is provided with 10 colleges and academies, and 1123 grammar, normal, and other schools.

N. S. is supposed to have been visited and 'discovered' by the Cabots in 1497. Its first colonists were a number of Frenchmen, who established themselves here in 1604, but were afterwards expelled by settlers from Virginia, who claimed the country by right of discovery. Under the French settlers it bore the name of Acadia (Acadie); but its name was changed for its present one in 1621, when a grant of the peninsula was obtained from James I. by Sir William Alexander, whose intention was to colonise the whole country. Having found, however, that the localities they had fixed upon as suitable for settlement were already occupied, the colonists returned to the mother-country. In 1654, the French, who had regained a footing in the colony, were subdued by a force sent out by Cromwell. By the treaty of Breda, the country was ceded to the French in 1667, but it was restored to the English in 1713. After the middle of the 18th c., strenuous efforts were made to advance the interests of the colony. Settlers were sent out at the expense of the British government. The French, who had joined the Indians in hostilities against the English, were either expelled or completely mastered, and Cape Breton, which at an earlier period had been

disunited from N. S., was reunited to it under the same provincial government in 1819. N. S. was incorporated with the Dominion of Canada in 1867, and is represented in the Canadian parliament by 12 senators and 19 members of the Lower House. It has also its own local legislature and lieutenant-governor; the legislature consisting of a council and a House of Assembly elected by the counties—which are 18 in number—and the cities, the chief of which are Halifax, Annapolis, Liverpool, and Pictou.

NOVA ZEMBLA (Russ. *Novaja Zemlja*, 'New Land'), the name given to a chain of islands lying in the Arctic Ocean (lat. between 70° 30' and 76° 30' N., and long. between 52° and 66° E.), and included within the government of Archangel. Length of the chain, 470 miles; average breadth, 56 miles. The most southern island is specially called Nova Zembla; of the others, the principal are Matthew's Land and Liitke's Land. They were discovered in 1553, and are wild, rocky, and desolate—the vegetation being chiefly moss, lichens, and a few shrubs. The highest point in the chain is 3475 feet above the level of the sea. Mean temperature in summer, at the southern extremity, 35.51°; in winter, 3.21°. N. Z. has no permanent inhabitants, but as the coasts swarm with whales and walruses, and the interior with bears, reindeers, and foxes, they are periodically frequented by fishermen and hunters.

NOVALIS. See HARDENBERG.

NOVARA, a town of Northern Italy, and capital of province of same name, is situated in a fertile district about 60 miles east-north-east of Turin. Pop. about 20,000. It commands fine Alpine views from its ancient dismantled fortifications, and contains several notable churches, especially the cathedral, with its fine frescoes and sculptures, and grand high-altar. On the 23d of March 1849, N. was the scene of a great battle between the Sardinian forces and an Austrian army commanded by Radetzky, which resulted in the complete defeat of the Italians, and ultimately led to the abdication of Charles Albert in favour of his son, Victor Emmanuel.

NOVATIAN, a priest of the Roman Church in the 3d c., and the leader of a sect called after his name. The place and time of his birth are not known with certainty. N. had been a stoic philosopher, but after his arrival in Rome was converted to Christianity, and being seized with sudden illness while still a catechumen, received what was called *clinical* baptism; that is, baptism administered on a sick-bed, and without the solemn ceremonial. Such baptism was, in ordinary circumstances, an impediment to holy orders. Notwithstanding this irregular baptism, N. was promoted to orders by Fabian the Roman bishop; and soon afterwards shewed his weakness by flying during a persecution. At this time a controversy arose about the manner of dealing with the lapsed; that is, those who fell away in persecution. N. at first inclined to the milder side, but on the election of Cornelius to the Roman bishopric to which N. had aspired, and on Cornelius taking the indulgent course towards the lapsed, N., together with Novatus and some other discontented priests of Carthage, opposed his authority, and eventually N. was chosen by a small party, and actually ordained bishop, in opposition to Cornelius. The party who espoused his cause was called by his name. They were confined mainly, in the first instance, to Rome and to Carthage, where a kindred conflict had arisen. They held that in the grievous crime of idolatry through fear of persecution, the church had no power to absolve the penitent; and therefore, although it does not appear that they

excluded such sinners from all hope of heaven, yet they denied the lawfulness of re-admitting them to the communion of the church. This doctrine they extended at a later period to all grievous sins, of whatever character. N. may thus be regarded as the first antipope. The churches throughout Italy, Africa, and the East adhered to Cornelius; but the N. party set up bishops and established churches not only at Carthage, but at Constantinople, Alexandria, Nicomedia, Phrygia, Gaul, Spain, and elsewhere. They claimed for themselves a character of especial purity, and assumed the appellation of Cathari (Puritans). The time and manner of the death of N. is uncertain. According to Socrates (*Hist. Ecc.* iv. 28; v. 21; vii. 5, 12, 25), he died a martyr in the persecution of Valerian, but this is improbable. He was a man of considerable learning, and the work recently discovered in one of the monasteries of Mount Athos, and published by Mr Miller at Oxford in 1851, under the title of *Origenis Philosophumena*, is by some ascribed to him. His sect survived long after his death. An unsuccessful effort was made in the council of Nice to re-unite them to the church; and traces of them are still discoverable in the end of the 6th century.

NOVELLÆ. See JUSTINIAN.

NOVELS. The novel and the so-called romance, inasmuch as they constantly merge in one another, and are only superficially distinguished by the preponderance in the one of ordinary and familiar incidents, in the other of incident more or less remote and marvellous, may conveniently be included here under the common definition of prose narrative fiction. Between the legendary epic, the drama into which portions of its available material from fluent become crystallised, and the wider prose fiction or novel, into which this again expands itself, there are obvious affinities, the distinctions being rather of form than of essence. It is of the later development, the novel, that we purpose to give here a historical sketch, omitting, however, any consideration of the remoter and but slightly known specimens produced in Hindustan and China.

1. *Ancient Classical Prose Fiction*.—The earliest Greek compositions of a fictitious character, of which we possess any knowledge, are the *Milesiaca*, or *Milesian Tales*, said to have been written chiefly by one Aristides. The Milesians were a colony of Ionic Greeks who settled in Asia Minor, and fell under the dominion of the Persians, 494 B. C. They were a voluptuous, brilliant, and inventive race, and are supposed to have caught from their eastern masters, whom they somewhat resembled, a liking for that particularly oriental species of literature—the imaginary story or narrative. None of the Milesian Tales are extant, either in the original Greek or in the Latin version made by Sisenna, the Roman historian, about the time of Marius and Sulla; but we have some forty stories by Parthenius Nixæas, which are considered to be to a certain extent adaptations from them. The collection of Parthenius is entitled *Peri Erotikôn Pathêmation*, and is dedicated to Cornelius Gallus, the Latin poet, and the contemporary and friend of Virgil. If we may judge from this later set of fictions, which are mainly concerned with the description of all sorts of seduction, of criminal and incestuous passions, and of deplorable terminations to wretched lives, we have little cause, either morally or aesthetically, to regret the loss of their more famous prototypes. In Greece Proper, nothing was done, so far as we know, in the way of novel or romance, until after the age of Alexander the Great. It has been conjectured, not improbably,

that his Eastern conquests had a potent effect in giving this new bent to the fancy of his countrymen. Clearchus, a disciple of Aristotle, wrote a history of fictitious love-adventures, and is thus, perhaps, to be considered the first European Greek novelist, and the first of the long series of *Erotikoi*, who reach down to the 13th c. after Christ. Not long after came Antonius Diogenes, whose romance, in 24 books, entitled *Ta hyper Thoulon Apista* (Of the Incredible Things beyond Thule), was founded on the wanderings, adventures, and loves of Dinius and Dercyllis. It appears to have been held in high esteem, and was at least useful as a store-house, whence later writers, such as Achilles Tatius, derived materials for their more artistic fictions. The work has not been preserved, but Photius gives an outline of its contents in his *Bibliotheca Cod.*

A long interval, embracing, indeed, several centuries, now elapses before we come upon another Greek novelist or romancist. Be the cause of this what it may, the ever-increasing luxury and depravity of the pagan imperial world, combined to develop and intensify that morbid craving for horrible, magical, and supernatural incidents, which in general fill the pages of the romancists of the empire. The first names that occur in the new series are Lucius of Patra (*Patrensis*) and Lucian (q. v.), who flourished in the 2d c. A. D., during the reign of Marcus Antoninus; but as the former simply collected accounts of magical transformations (*Metamorphoses*), he is perhaps not to be regarded as a novelist proper at all; while the latter was really a humorist, satirist, and moralist in the guise of a story-teller—in a word, a classic Rabelais and Heine, and as far as possible from being a member of the wonder-loving school of Erotics, with whom he has only an accidental connection by the external form of some of his writings. The first of the new series of romance writers, strictly so called, is properly Iamblichus (not the Neo-Platonic philosopher), whose *Babylonia* is, indeed, no longer extant; but we are able to form a pretty just estimate of it from the epitome of Photius. The next notable name is that of Heliodorus (q. v.), Bishop of Trikka, who flourished in the 4th c. A. D. This Christian writer, whose *Loves of Theagenes and Charicleia* is really the oldest extant erotic romance, has far excelled all his predecessors in everything that can render a story interesting or excellent, and his charming fiction obtained a great popularity among such as could read. Some imagine that they see in Heliodorus a resemblance to the minutely descriptive style of novel introduced into England by Richardson; but without adopting this rather extreme notion, it can at least be safely asserted, that Achilles Tatius and all the subsequent *Erotikoi* deliberately imitated his style and manner, while he was not less certainly used as a model by that once celebrated but dreadfully tedious school of heroic romance which flourished in France during the 17th c., and whose best-remembered representative is Mademoiselle de Scudéri. Tasso, Guarini, D'Urfé, and several other modern writers, have drawn many particulars—sometimes almost *verbatim*—from the stories in the *Theagenes and Charicleia*. Achilles Tatius (q. v.), probably belonging to the 5th c., ranks next to, but at some distance from, Heliodorus in point of merit. His romance, entitled *Ta kata Leukippen kai Kleitophonta*, and consisting of eight books, has supplied incidents to more than one Italian and French writer.

The next work that invites our attention in point of time, the *Daphnis and Chloe* of Longus, is of a totally different character. It is a simple and

picturesque prose-pastoral, with no poisonings, murders, magic, supernaturalism, and impossible exploits. Over the whole story rest a rural peace and a smile of cheerful sunshine; and, in spite of some singularly polluted passages, it was, for its time, a pure and wholesome fiction. *Daphnis and Chloe* is the only pastoral romance produced by any Byzantine author. Whether or not it exercised any influence on the development of the modern pastoral of Italy and France, cannot be proved, but it has been noticed that there is no slight resemblance between it and the story of the *Gentle Shepherd*, which we know was suggested to Allan Ramsay by a classical friend, who may have borrowed from the Greek the sketch which he gave to the poet. It has also been very closely imitated by Gessner in his idyll of *Daphnis*.

After Longus comes Chariton (flor. sometime between the 6th and 9th centuries), whose romance, in eight books, on the *Loves of Charceas and Callirhoë*, is not quite complete, but nearly so. It contains, like the other erotic fictions, plenty of stirring and startling adventures, but on the whole these are less improbable than what we encounter in the writings of his predecessors. Of three Xenophons, also noted among the *Erotikoi*, and of uncertain date, the best is Xenophon of Ephesus, whose romance, entitled *Ephesiaca*, or the *Loves of Anthia and Abrocomas*, is in ten books, and has all the sensational characteristics of the school to which it belongs. It is, however, perhaps worth mentioning, that in the romance of Xenophon we meet for the first time with the story of the love-potion, the pretended death, and the mock-entombment of the heroine, which forms the leading incident in Shakspeare's *Romeo and Juliet*, and which, it is thought, reached the great English dramatist at second or third hand, through the Italian novelist, Luigi da Porta.

Again, a long interval elapses before we meet with another love-fiction of the old pagan sort. During this period, however, a work made its appearance, which was essentially a romance, and was composed expressly for the purpose of recommending that form of Christian life which was the favourite in early times—the ascetic and recluse form. This was the *Barlaam and Josaphat* (q. v.), the author of which is unknown, but whose popularity, during the middle ages, may be estimated from the fact, that it was translated into every language of Christendom from Norway to Spain. In the 12th c., another erotic Eustathius or Eumathius, who was properly the last of the series, published his *Ismene and Ismenias*, in eleven books. This romance is, in truth, a feeble performance; the expiring flicker of a lamp whose oil is about done. It is puerile in its delineation of character, and full of plagiarisms; yet many of its details have been copied by later occidental writers, such as D'Urfé and Montemayor.

In all the erotic romances, the adventures, which in fact constitute the story, have certain common characteristics. The hero and heroine are generally carried off by robbers or pirates; or they flee from home, and are accidentally separated. They resolve to seek each other throughout the world, and in the course of their loving quest, they visit the remotest regions, encounter the most frightful perils, make hairbreadth escapes from tragic ends, meet again in most unexpected and miraculous ways, and generally close their career in happiness and splendid prosperity—often turning out to be the offspring of far greater people than they fancied. Copious use is made of poisons, love-potions, improbable tricks, magic instruments, &c.; and one can easily see that the stories were meant to tickle

and stimulate a languid, corrupt, sensual, and credulous people, such as the Greeks of the Lower Empire undoubtedly were.

Before touching on the medieval romance of Western Europe, we may in a few words notice such specimens of classical fiction as exist, or are known to have existed in Latin. We have already stated that the Milesian Tales were translated into that tongue by Sisenna, who derived his knowledge of them from the Sybarites, a Greek colony of Lower Italy. The taste for similar stories increased during the empire, but the writers in general cannot have displayed much genius in their compositions, if we may judge from the contemptuous language used by the Emperor Severus against Clodius Albinus, whose fictions he designates *Iudicia literaria*, and *anilia* (old wives' tales). But higher praise must be assigned to the work commonly attributed to Petronius Arbiter (q. v.), who flourished in the time of Nero, and whose *Satyricon*—incomplete—is a comic novel or romance, and (although the dirtiest work even in pagan literature) is executed with skill, vigour, and at times with beauty. In the 2d c. A. D., Appuleius (q. v.) wrote his *Ass* (called from its excellence the *Golden Ass*), which relates the adventures of a young man who had the misfortune to be accidentally metamorphosed into that animal, while sojourning in Thessaly, retaining, however, his human consciousness. The misery which he suffers at the hands of robbers, eunuchs, magistrates, and other persons into whose hands he falls, until the period when he is enabled to resume his former figure, are portrayed with a wit, humour, and fancy hardly inferior to Lucian. The work is also believed to have had, like the writings of his Greek contemporary, a moral and satirical aim. It was immensely popular in the middle ages, has supplied Boccaccio with some of his stories, and the author of *Gil Blas* with the picturesque incidents of the robbers' cave in the early part of his romance, and contains in the episode of *Cupid and Psyche* one of the loveliest allegories of classical antiquity.

2. *Romantic Fiction in Western Europe.*—The first thing to be clearly understood in connection with this branch of literature is, that it is not a continuation of the Græco-Byzantine or classical fiction, though, curiously enough, it began to spring up in the West just as the other was dying out in the East. It is a completely new growth, the product of new historical circumstances, which were but very slightly affected by Byzantine influences of any kind; and it transports us into a world of ideas, sentiments, beliefs, and actions, as different from what we find in the *Erotikoi* as could well be imagined. In the latter, the principal characters are mere lovers forced into adventures by the ministers of fate; in the former, they are real heroes, of the old Homeric type, and seek dangers greedily and joyously. When we read the *Erotikoi*, we are reminded in many ways that we are in the midst of a corrupt and decaying civilisation; when we turn to the romances of chivalry, in spite of certain superficial and barbarous vices, such as the prevalence of bastardy, and the indifference displayed to bloodshed, we feel that we are in the presence of a youthful, healthy, vigorous and growing social life. That these romances, generally from beginning to end, consist of a series of extraordinary and utterly impossible exploits, in which the magic, the mystery, and the enchantments of the *Arabian Nights* are rivalled or outshone, is unquestionable; but this proves no more than that the races of Western Europe, who slowly, during the dark ages, rose, by the help of the church, out of barbarism into feudalism—the first step towards the

civilisation of the modern world—were boundlessly ignorant, credulous, and wonder-loving. Their prodigious vigour and vehemence of character having no proper intellectual *pabulum*, was forced to supply its craving for a knowledge which was beyond its immediate attainment, by the exaggerations of a fancy that was without law or limit. We need not go so far as to assert that, in the mediæval romance, everything is of native or 'Gothic' origin; the fact is very much the reverse. This extreme theory, propounded by Mallet, and supported by Bishop Percy and other writers, is totally inadequate to account for all that is contained in these romances. Not less inadequate is another theory, first suggested by Salmasius, and afterwards elaborated by Warton, that the mediæval romance is mainly of Saracenic origin, and was probably introduced by the Moorish conquerors into Spain, and thence propagated into France and Britain; while a third theory, which has also found supporters, viz., that it was derived from the classical mythology of ancient Greece, is the most inadequate of all. The true explanation of the matter appears to be, that mediæval romance had its root and foundation in Chivalry (q. v.)—a genuine product of Western Europe—and although the machinery, so to speak, the exploits and the marvels, may have often been derived from the foreign sources we have mentioned, yet the spirit, scenery, sentiment, and life of the legends thoroughly reflect the characteristics of the earlier ages of feudalism. The notions of dragons, giants, magic rings, enchanted castles, are probably of Saracenic origin, and may have been introduced into Europe by the horde of pilgrims who visited the East in the time of the Crusades; such incidents as the detaining of a knight from his quest by the enchantments of a sorceress, may have been a tradition of the *Odyssey* of Homer; but the gallantry, the courtesy, the romantic valour, the tournaments, the noble friendships of brother-knights—all that distinguishes the romances of chivalry from Runic legends or the *Arabian Nights*, cannot be traced to any other source than the newborn chivalry of Europe.

The mediæval romances are divisible into three great series: 1. Those relating to Arthur and the Knights of the Round Table; 2. Those relating to Charlemagne and his Paladins; 3. Those relating to Amadis de Gaul and his descendants.

The Arthurian series is, in its essence, of Welsh and Armoric origin. Its genesis is as follows. First came the legendary chronicles composed in Wales or Brittany, such as the *De Excidio Britannie* of Gildas (q. v.); the chronicle of Nennius, belonging to the 9th c.; the Armoric collections of Walter Calenius or Gualtier, Archdeacon of Oxford; and the famous *Chronicon sive Historia Britonum* of Geoffrey of Monmouth (q. v.)—from these, and from the multitude of floating unrecorded traditions, sprung the *metrical*, which in turn gave birth to, and were ultimately superseded by, the *prose* romances. It is with the latter alone we have here to do. They, like the metrical romances, were composed by Anglo-Norman authors (whose names are unknown) during the 13th, 14th, and 15th centuries, who took all the more willingly to the old British legends, that in these the 'Saxons' were the objects of the authors' hatred and detestation. The principal romances of the Arthurian cycle are those of *Merlin* (q. v.), the enchanter; of *Arthur* (q. v.); of the Saugreal (see GRAAL); of *Perceval*; of *Lancelot du Lac*; of the princes of Lyonesse, *Meliadus* and his son *Tristan*; and of *Isaie le Triste*, the son of Tristan. They relate the marvellous adventures, exploits, loves, and gallantries of the Knights of the Round Table, and are probably in substance the

oldest of the mediæval prose romances. The scenes are generally laid in Wales, Cornwall, Brittany, Ireland, or Scotland; only in one or two of the series are we taken as far as Egypt or India; and though Arthur is slain by 'Saracens' who supported his nephew, Mordred, and a general eastern colouring is present in the cycle, yet it is 'Saxons' who are his principal foes.

The series of Charlemagne and his Paladins is of purely French origin, and originated in a somewhat similar fashion to the Arthurian cycle; that is to say, there was first a legendary chronicle (in verse, however), entitled *Historia de Vita Caroli Magni et Rolandi*, erroneously attributed to Turpin or Tilpin, Archbishop of Rheims, and contemporary of Charlemagne, but probably executed in the 11th or 12th c.; then came a series of metrical romances, strictly so called, which were gradually supplanted by their prose counterparts, the authors of which last, however, appear to have diverged more from the metrical originals, and to have been more free and fanciful than their predecessors of the Arthurian cycle. The principal are *Huon of Bordeaux* (the incidents of which are followed by Wieland in his *Oberon*), *Guerin de Monglave*, *Gaylen Rhetoré* (in which Charlemagne and his Paladins proceed *incognito* to the Holy Land), *Miles and Ames*, *Jourdain de Blaves*, *Doolin de Mayence*, *Ogier le Danois*, and *Maugis the Enchanter*. In these romances we are, in some respects, on totally different ground from that on which we find ourselves in the Arthurian series. We are transferred to the East—to Africa, Palestine, Arabia, Bagdad, Constantinople, India, Persia, the Caspian Sea, &c. We are introduced to the courts of Saracen 'princes,' 'sultans,' and 'emirs;' and see Mohammedan maidens of peerless beauty falling in love with Christian knights, and for their sakes abandoning, or even betraying father, mother, brethren, and kinsmen. Fairies, who figure but slightly in the Arthurian romances, play a frequent and an important part in these; demons, dervishes, apes, talismans, palaces with cupolas and gilded roofs, splendid jewels, diamonds, &c.—everything, in fact, shews the influence exercised on the imagination of Western Europe by the glowing scenery, the brilliant life, and the gorgeously fanciful superstitions of oriental lands.

The series relating to Amadis de Gaul and his descendants is sufficiently characterised under the head of AMADIS (q. v.). We may only observe, as a proof of the comparative lateness of their composition, that the 'Saracens' of the French romances here give place to 'Turks;' and as the eyes of Europe were turned towards the tottering Greek empire, many of the scenes of warfare are laid at Constantinople.

Besides the three distinct series of romance above mentioned, a fourth perhaps deserves mention, in which the heroes of antiquity are grotesquely tricked out in the costume of mediæval knights. The exact date of their composition cannot be ascertained, but they were probably later in general than any of the other three series; and, at any rate, were for the most part not published till the end of the 15th and the beginning of the 16th centuries. The principal are the romance of *Jason and Medea*, of *Hercules*, of *Edipus*, and of *Alexander*. They are all written in French, and the first two profess to be the work of a Raoul le Febvre. An attempt is made to adhere, in the general outline of the stories, to the ancient myths, but most marvellous embellishments are added, such as only the middle ages could have conceived; while the transformations that the classical personages undergo are exceedingly ludicrous. Jove becomes a 'king;' Mercury, his 'squire;' the

Fates, 'duennas,' Cerberus and the Sphinx, 'giants;' &c.

Before leaving this division of our subject, we would observe that, though the romances of chivalry may appear infinitely tedious and absurd to a modern reader, they were immensely relished and admired during the ages in which they were produced, were widely disseminated, in different forms, throughout all Christendom, and were highly popular with later poets. The influence which they exercised on Pulci, Boiardo, Tasso, Spenser, &c., shews the strong hold that they must have had on the imagination of Europe; but with the decline of chivalry, the spread of the more rational and artistic fictions of the Italian novelists, the revival of letters, and the general advancement in civilisation of Christendom, the taste for the romances of chivalry also declined, until finally Cervantes laughed them out of literature, and well-nigh out of memory, in the beginning of the 17th century.

3. *Development and Influence of Fiction in Italy.*—The Italians originated no romances of the kind described above. This resulted from various causes, the principal of which perhaps are: 1st, that they were really not a Gothic, but at least a semi-classic people; 2d, that they were more polished than the northern nations; and 3d, that instead of feudal chivalric institutions, the most characteristic political features of Italy, during the middle ages, were mercantile and lettered republics. There was what may be roughly called a *middle class*—of merchants—in Italy, when England and France, and Spain, contained really little more than nobles and serfs; and these were really the best instructed and the most enlightened portion of the community. Hence it is but natural that we should find a style of fiction mirroring to some extent this more civilised and sober form of social life. That the classical romances had some influence on the development of Italian fiction, is probable; several of the tales recorded in the love-letters of Aristenetus, and in the *Golden Ass* of Appuleius, are quite like what we read in Boccaccio and others. The fables of Pilpai or Bidpai (q. v.), translated into Latin as early as the 13th c., were also not without a certain effect; but it is to the Arabico-Indian book of the seven counsellors (better known as *The Tales of the Seven Wise Masters*), still more to the stories of Petrus Alphonsus (whose work is entitled *De Clericæ Disciplinæ*), and the *Gesta Romanorum* (q. v.), a grotesque jumble of classical stories, Arabian apologues, and monkish legends, in the disguise of romantic fiction; but most of all perhaps to the *Contes* and *Fabliaux* (q. v.) of the French poets, that we must look for the first sources of those almost innumerable *novellets* which mark the earlier literary history of Italy.

The earliest Italian work of this sort is the *Cento Novelle Antiche*, commonly called *Il Novellino*. It is a compilation by different hands—all unknown—of stories floating about, or taken with modifications from the sources above mentioned, with one or two of the more graceful episodes in the romances of chivalry, and was executed towards the close of the 13th century. It was followed in 1358 by the *Decameron* of Boccaccio (q. v.)—the finest, in point of humour, sentiment, and style, of the whole set, but not more original in the matter of story than *Il Novellino*. Its influence on early European literature was prodigious. Chaucer and Shakspeare in England have been in particular greatly indebted to it for incidents and plots; while in France—from whose Trouvères he had himself derived so much—Boccaccio had a number of distinguished imitators. In his own country, his influence was so overwhelming, that for some centuries Italian novelists could

do nothing more than attempt to copy him. The principal of these imitators are Franco Sacchetti (1335—1410), Ser Giovanni (who began to write his *novellets* in 1378, from which Molière got the plot of his *Ecole des Femmes*, and Shakspeare probably part of his story of the *Merchant of Venice*—though the story of the bond is far older, and is of Persian origin—Chancer is also indebted to this Italian); Massuccio di Salerno (flor. about 1470), more original than most of the post-Boccaccian novelists; Sabadino delli Arienti (flor. about 1483); Agnolo Firenzuolo; Luigi da Porta; Molza, and Giovanni Brevio (flor. at the close of the 15th, and in the first half of the 16th c.); Girolamo Parabosco (flor. 1550); Marco Cademoste da Lodi (1544); and Giovanni Giraldi Cinthio (died 1573), noted particularly for his extravagant employment of sanguinary incidents, and the introduction of scenes of incredible atrocity and accumulated horrors. The seventh of his third decade of stories contains the story of Othello, the Moor of Venice; the plot of *Measure for Measure* was also derived indirectly from him. Cinthio was, in fact, the greatest favourite of all the Italian novelists with the Elizabethan dramatists. Besides these, we may further mention Antonio Francesco Grazzini (died 1583); Straparolo (wrote 1554 *et seq.*), from whom Molière, and also the French writers of fairy tales, derived numerous hints; while the ludicrous incident embodied in the Scottish song of *The barrin' o' our door*, forms one of the stories of this writer; Bandello (died 1555), the most widely known and read (out of Italy) of all the Italian novelists next to Boccaccio, and in whom we find the original of Massinger's play of *The Picture*, and of Shakspeare's *Twelfth Night*; Granucci (published 1574); Malespini (published 1609); and Campeggi (early part of 17th century).—The best French imitations of these Italian tales are the *Cent Nouvelles Nouvelles* (printed 1456, and translated into English under the title of the *Hundredth Mery Tayles*, 1557). They are full of life, gaiety, and imagination, and are written in a most naive and agreeable manner; and the *Heptameron* of Margaret, Queen of Navarre, from which Shirley, the English dramatist, has taken the plots of two of his comedies.

A few words may also be devoted here in passing to a very different class of fiction—the *Spiritual Romance*. It originated, without doubt, in the bosom of the church, and from the desire to edify, by stories of religious knight-errantry, a rude and ignorant community, incapable of understanding or relishing abstract doctrines. The first of the series is *Barlaam and Josaphat*, already alluded to; but by far the greatest work of the kind produced during the middle ages is the *Legenda Aurea*, or *Golden Legend* (q. v.)—itself believed to be drawn from different and now partly forgotten sources. Besides these, may be mentioned a species of spiritual tale—the *Contes Dévots*, prevalent in France during the 12th and 13th centuries, and which were written by monks, probably with the view of counteracting the witty and licentious stories of the Trouvères; but curiously enough, in these pious fictions, the lives of monks and nuns are represented as far more immoral than in those of the secular satirists. The things, too, which the Virgin Mary is represented as doing are most astounding, and throw a strange but valuable light upon the religious notions of the age. In one story, she conceals the shame of a favourite nun; in another, she performs the part of a procuress; in a third, she officiates as midwife to an abbess who had been frail and imprudent; and in general, she

performs the most degrading offices for the most worthless characters.

*Romance of the 16th and 17th Centuries.*—During the middle ages, the universal sway of the church and the institutions of feudalism gave a certain character of uniformity to the modes of life, and thereby to the social literature of Western Europe; but after the epoch of the Reformation, and even earlier, this uniformity disappears, and we find in every direction a tendency to the opposite extreme of individualism. This tendency manifests itself especially in the fiction of the period, which, vastly increasing in quantity and varying in quality, becomes difficult to classify. We shall, however, endeavour to group the products of modern prose-fiction works under what appears to us a convenient chronological heading.

During the 16th and 17th centuries, four different kinds of romance or novel were cultivated—1. *The Comic Romance*; 2. *The Political Romance*; 3. *The Pastoral Romance*; 4. *The Heroic Romance*.

*Comic Romance* substantially begins in modern times with Rabelais (q. v.), styled by Sir William Temple the *Father of Ridicule*. Others, indeed, had preceded him in the same path, but they had acquired no celebrity. In him we see unmistakably one form of the modern spirit—its daring freedom of speculation, criticism, and satire, also that lack of reverence exhibited by those who, at the period of the Reformation, clearly discerned the abuses of the church, but had not faith in the possibility or efficacy of reforms. Thus, Rabelais, in his inimitable burlesque romance, scoffs (with the tone of a sceptic, however) at the vices of the clergy, the crooked ways of politicians, the jargon of philosophers, and the absurdities of the *contes dévots*, and of the medieval tales generally. The next remarkable romance of a comic nature is the *Vita di Bertoldo* of Julio Cesare Croce (flor. at the close of the 16th c.), a work recounting the humorous and successful exploits of a clever but ugly peasant, and regarding which we are told that for two centuries it was as popular in Italy as *Robinson Crusoe* or the *Pilgrim's Progress* in England. The substance of the story can be traced back to an oriental source. A few years later appeared *Don Quixote* (see CERVANTES), in which 'war to the knife' was proclaimed against the romances of chivalry, and in which, perhaps, we see, more distinctly than in any other fiction of the period, the new turn that the mind of Western Europe had taken. Almost contemporaneous with *Don Quixote* was another Spanish romance—Matteo Aleman's *Life of Guzman Alfarache*, successively beggar, swindler, pander, student, and galley-slave. In this work, as in others of the same sort, we find several indications of the influence of the Italian novelists. It has been supposed that *Guzman Alfarache* suggested to Le Sage the idea of *Gil Blas*, and there is some resemblance between the two; but, at anyrate, it gave birth to a host of Spanish romances with beggars and scamps for heroes, of which the best is the *Lazarillo de Tormes*, by Diego de Mendoza (1586). In the following century, France produced, among others, Scarron's *Roman Comique*, and Furetiere's *Roman Bourgeois*. England and Germany have nothing to shew in this department.

*Political Romance* was manifestly suggested partly by the great politico-ecclesiastical changes that took place in Europe in the first half of the 16th c., and partly by the immense increase in the knowledge of the manners and customs of remote nations, occasioned by geographical discoveries and mercantile adventure. The earliest of the series is the *Utopia* of Sir Thomas More; next comes the *Argenis* of Barclay, published in 1621; and to the

same class belong a variety of French romances produced about the close of the 17th and the beginning of the 18th c., of which by far the most famous is the *Télémaque* of Fénelon.

*Pastoral Romance.*—All through the middle ages, the fame of Virgil kept up a certain interest in compositions devoted to the delineation of rustic or shepherd life. We even find in the poems of the Troubadours several specimens of the erotic pastoral; and the *Ameto* of Boccaccio furnishes us with a prose illustration of the same. But it was after the revival of letters that this branch of fiction, so essentially classical, was most assiduously cultivated by men of scholarly genius; and though their works have not retained the popularity they originally enjoyed, they are still interesting and valuable from an historical point of view, and abound in descriptive passages of great beauty and sweetness. The pastoral life which they portray, however, never existed either in Greece or elsewhere. Their shepherds and shepherdesses are as unreal and unhistorical beings as the knights of mediæval romance. The first important work of the kind is the *Arcadia* of Sannazzaro, written in Italian, about the end of the 15th century. It was followed by the *Diana* of Montemayor, written in Spanish, about the middle of the 16th c., several of the episodes of which are borrowed from the Italian novelists; while Shakspeare has in turn directly taken from it the plot of the *Two Gentlemen of Verona*, copying occasionally the very language, as well as some of the most amusing incidents in his *Midsummer Night's Dream*. The *Diana* was imitated in French by Honore d'Urfé, whose *Astrée* (1610—1625) was for a long while held in the highest esteem, and is really, in spite of its tediousness, a work of great learning and considerable merit. Twenty years before the appearance of *Astrée*, Sir Philip Sidney wrote and published his *Arcadia*, as tiresome, and in its substance as unreal, as any production of the same school, but in stateliness and melody of language, in luxury of fancy, in nobility and purity of sentiment, far exceeding them all.

*Heroic Romance* owed its origin partly to the immediate antecedent pastoral romance, partly to an increased acquaintance with classic history, produced by the translation of such books as *Plutarch's Lives*, and partly to the interest excited in the Moors of Granada by a splendid romance in Spanish (professing, however, to be a *history*), entitled *The Dissensions of the Zegrís and the Abencerrages*, and was printed at Alcalá in 1604, and which soon became extremely popular, especially in France. It was in the latter country alone that the *Romans de Longue Haleine* (Long-winded Romances), as they have been happily nicknamed, were cultivated. The first of this heavy series was the *Polexandre* of Gomberville, published in 1632, in which the influence of the early Greek romances is visible. His successor, Calprenède, the best of a bad lot, wrote *Cleopatra*, *Cassandra*, and *Pharamond*. But the most prolific, and consequently the most intolerable of the school, is Madame de Scudéri, whose principal romances are *Ibrahim ou l'illustre Bassa*, *Clélie*, *Histoire Romaine*, *Artamenes ou le Grand Cyrus*, and *Almahide*. The pompous dignity, the hyper-polite address, the dreadful dullness, and the hollow ceremonialism of these ridiculous performances, admirably (if unintentionally) mirror the features of French court-life during the time of the *Grand Monarque*. The heroic romances did not long retain their meretricious reputation. Molière, and still more, Boileau in his satire *Les Héros de Roman*, *Dialogue*, ridiculed them to death, and in consequence, Madame de Scudéri had no successor.

NOVELS AND ROMANCES OF THE 18TH CENTURY.—The two European nations that most brilliantly distinguished themselves in the department of fiction during this century were England and France, and to these we shall chiefly confine our attention.

1. *English Prose Fiction*.—During the age of Elizabeth and her immediate successors, the imaginative genius of England, from various causes, had taken an almost exclusively poetical direction, and with the exception of Sidney's pastoral of *Arcadia*, and Bunyan's *Pilgrim's Progress*, we meet with nothing in the shape of a novel or a romance for a hundred years. The 17th c. has nothing to shew till it approaches its close. This is doubtless owing, in part at least, to the intensity of the great political struggle that agitated and rent England during the first half of that century, and gave an austere theological bias to society. The Puritans, in their day of triumph, would not tolerate either comic or heroic romances. They set their faces 'like flint' against all imaginative fiction, which they considered as little better than lying; and even to this day that class of people commonly described as 'the religious portion of the community,' in some sense the representatives of the Puritans, betray the legitimacy of their spiritual descent by their aversion to all sorts of secular tales. After the Restoration, however, an extraordinary change came over the English nation, or at least over the upper and wealthier classes. These rioted in the excess of a coarse and licentious reaction against the rigorous piety and fanaticism of the Commonwealth. This turbid viciousness by and by calmed down, but it left a certain taint of sensualism and materialism in the habits and life of the people, which, in the opinion of some competent critics, marks them to this day. It is certain that at the beginning of the 18th c. England was entering on the most prosaic, unimaginative, and unheroical period of her history. Its characteristics are faithfully reflected in most of her novels, which, as pictures of the gross dull life, the paltry thoughts, the low sentiments, the modish manners, and the loose morality that prevailed, possess a great historical value apart altogether from their literary merits. The first name that occurs is that of the notorious *Aphra Behn* (q. v.), the greater number of whose novels, of which *Oronoko* is the best known, appeared towards the close of the reign of Charles II., but are included here in the literature of the 18th c., as they belong to it by the nature of their contents, and not to the 17th c. types of fiction. She was imitated by Mrs Heywood (born 1696, died 1758), of whose *Love in Excess*, *The British Recluse*, and *The Injured Husband*, it has been remarked, that 'the male characters are in the highest degree licentious, and the females as impassioned as the Saracen princesses in the Spanish romances of chivalry.' A later work, however, *The History of Miss Betsy Thoughtless*, is of a higher stamp, and is supposed to have suggested the plan of Miss Burney's *Evelina*. But the first novelist of great genius belonging to the new era is Daniel De Foe (q. v.), the father of modern English prose fiction, in whose writings—*The Adventures of Captain Singleton*, *The Fortunes of Moll Flanders*, *The History of Colonel Jack*, &c.—the coarse, homely, unpoetical, but vigorous realism of the time is strikingly apparent. Perhaps the Spanish ragumufin romances may have furnished him with some hints. *Robinson Crusoe* is the finest and the most famous of all that class of fiction which was extensively cultivated both in France and England during the earlier part of the 18th c., and which received, in the former country, the name of *Voyages Imaginaires*. To the same class (outwardly at least) belong Swift's *Gulliver's Travels*,

though at bottom this is a satirical romance, like the works of Rabelais, and the *Gaudenzio di Lucca*, a sort of politico-geographical fiction, generally attributed to Bishop Berkeley. After De Foe comes Richardson (q. v.), very unlike any of the novelists of his age—to appearance! His *Muso* is a most decorous prude, and never utters anything rude, or vulgar, or licentious; but though she was inspired with the best intentions, her notions of how virtue should be rewarded indicate the coarseness of the time, hardly less than the debaucheries and seductions of Fielding and Smollett. The principal novels of Richardson are, *Pamela*, *Sir Charles Grandison*, and *Clarissa Harlowe*. Fielding (q. v.) thought Richardson untrue to nature, and wrote his first novel of *Joseph Andrews* as a burlesque on the style of his predecessor. Like his subsequent performances, *Tom Jones* and *Amelia*, it represents society as Fielding's sharper eyes saw it, on the whole, gross, vulgar, and impure. Smollett (q. v.), with a different style of genius, continues to paint in the same spirit. His chief works are, *Roderick Random*, *Peregrine Pickle*, *The Adventures of Ferdinand Count Fathom*, and *Humphry Clinker*. Sterne (q. v.), belonging to the same period, exhibits a genius so whimsical, peculiar, and original, that it is almost impossible to class him with any of his contemporaries. His *Tristram Shandy* is a work *sui generis*, but nowhere is the coarse impurity and indelicacy of the age more conspicuous. Four years later, appeared Goldsmith's *Vicar of Wakefield*, in which a change for the better, in a moral point of view, is first noticeable. With the exception of Richardson, all the novelists above mentioned are usually, and we may add correctly, described as *humorists*. Other qualities they have besides, but this is the most common and predominant. When this school was passing away about 1760—1770, another was on the eve of being born. The publication of Percy's *Reliques* had re-awakened an interest in the age of chivalry and romance. Readers had become tired of the long prevalence of prosaic fiction, in spite of the splendid genius devoted to its illustration. It had done its work, and could create no more. The first of the modern romantic school was Horace Walpole, whose *Castle of Otranto* appeared in 1769. It was followed by Clara Reeve, the authoress of the *Old English Baron*, a romance that every school-boy, we hope, remembers with the deepest gratitude; but the greatest genius in this line was undoubtedly Mrs Radcliffe (q. v.), whose *Mysteries of Udolpho* and other works, though now almost forgotten, were once greedily devoured and abundantly imitated. The ablest of her successors were Matthew Gregory Lewis, author of *The Monk* (1796), and Maturin, author of *Montorio* (1803). In all the romances of this school, the incidents are of the most startling, terrible, and often supernatural character, and the scenery is in keeping with the incidents. Fierce barons, mysterious bandits, persecuted maidens, gloomy castles, secret passages, deep forests, murders, ghosts, haunted chambers, &c.; everything that could charm, by way of contrast, and pleasantly horrify the languid, matter-of-fact, sceptical 18th c., is to be found in their exaggerated pages.

A few novelists remain to be mentioned who are incapable of particular classification. These are Dr John Moore (q. v.), author of *Zeluco*, &c.; Godwin (q. v.), author of *Caleb Williams*, *St Leon*, &c., in whom the free-thinking and revolutionary spirit that seized many minds after 1789 is conspicuous; Mrs Inchbald (*Nature and Art*, *A Simple Story*, &c.); Charlotte Smith (*Old Manor House*, &c.); Miss Austen (*Pride and Prejudice*, *Emma*, *Persuasion*); and Maria Edgeworth, whose sketches of Irish character first suggested to Walter Scott

the idea of attempting for Scotland a series of like illustrations.

2. *French Prose Fiction in the 18th Century.*—It is not easy—perhaps not possible—to trace the causes that led to the cultivation of the different kinds of fiction which flourished in France during this century, and particularly during the first half of it. The natural love of change—of novelty; the accidental influences of foreign literature; the disposition, so peculiarly French, to satirise prevalent follies and vices; the wish, on the other hand, to amuse the leisure moments of a luxurious, superstitious, and profligate society: all these and many other causes unquestionably assisted in determining its diverse development. Four kinds have been distinguished: 1. *Pseudo-historical Romance*, the literature in which department, although copious enough, neither deserves nor requires special notice; 2. *Romance in which the incidents, though natural, are purely imaginary*; 3. *Satirico-moral Romance*; 4. *Fairy Tales*, to which may be associated the imitations of *Oriental Tales*, and the *Voyages Imaginaires*.

2. *Romance in which the incidents, though natural, are purely imaginary.*—This class more nearly corresponds with the modern conception of the novel than any of its predecessors, and probably had its prototype in *La Princesse de Cleves* and *Zayde*, by Madame La Fayette, who flourished in the latter half of the 17th c.; but the first great name that adorns it is that of Marivaux (1688—1763), whose *Vie de Marianne* and *Paysan Parvenu* were long in high favour. They have this in common with the contemporary English fiction, that everything in them is produced by ordinary means, and the interest of the reader is sought to be awakened by the vivid and powerful portraiture of natural feelings, while the incidents, if often highly romantic, are always sufficiently probable to insure the credence of the imagination. Next to Marivaux comes the Abbé Prevot, q. v. (1697—1763), who first 'carried the terrors of tragedy into the novel.' He was a most voluminous writer, but the work by which he is now chiefly remembered is *Manon L'Escout*, recounting the adventures of a kept-mistress and swindler, the purpose of which appears to be similar to that of *La Dame aux Camelias* of Dumas fils—viz., to shew how noble, truc-hearted, and self-sacrificing a prostitute may be! Other writers belonging more or less strictly to the same division are Madame Riccobeni (flor. 1750) and Rousseau (q. v.), in whose *Heloise* we begin to see the dawn of that fierce natural impure passion, and that extravagant scorn of conventional life, that culminated in the sanguinary paroxysms of the Revolution.

3. *Humorous and Satirical Romance.*—By far the most celebrated specimens of this kind of fiction produced in France during the 18th c. are the *Gil Blas*, the *Diable Boiteux*, and *Le Bachelier de Salamanca* of Le Sage, q. v. (1668—1746), all of which were suggested by the prolific comic romancers of Spain, Juan de Luna, Quevedo, Cervantes, Espinel, from some of whom he has borrowed, with hardly any variation, whole scenes and stories, as well as from more ancient sources. The best parts, however, are his own, and the spirit of the work is thoroughly French in the gay and lightsoine vivacity of its humour. It is with some hesitation that we place the younger Crebillon (q. v.) in the same category, for the licentiousness of his *Egarements du Cœur et de l'Esprit*, and other novels, is far more apparent than their satire or humour. Bastide and Diderot (q. v.) hold an equally doubtful position as satirists or humorists; but Voltaire (q. v.) may fairly claim to rank among the former, in virtue

of his *Candide*, *Zadig*, *L'Ingénu*, *La Princesse de Babylone*, &c., most of which contain covert attacks on superstition and despotism, under the forms in which Voltaire best knew them. Voltaire, however, had not a rich imagination, and, in consequence, has been obliged to help himself liberally in the matter of incident from older writers.

4. *Fairy Tales, &c.*—A very careful inquiry might probably succeed in tracing back this kind of literature to the early intercourse of Christian and Moorish nations, but the first work in which we find definite examples of fairy tales is the *Nights* of the Italian novelist Straparola, translated into French in 1585. In this collection are found at least the outlines of some of the best-known stories of the sort, such as *Le Chat Botté* (Puss in Boots), *Prince Marcassin*, *Blanchebelle*, and *Fortunatus*. The immediate forerunner and prototype, however, of the French fairy tales was the *Pentamerone* of Signor Basile, written in the Neapolitan patois, and published in 1672. This work attracted and stimulated the fancy of M. Charles Perrault (q. v.), whose *Histoires ou Contes du Temps passé* appeared in 1697, and is incomparably the most naive and charming of all the collections of fairy tales. The titles of some of his *contes* will recall many a literary feast of our childhood—*La Barbe Bleue* (Bluebeard), *La Belle au Bois Dormant* (The Sleeping Beauty, to which, by the by, Tennyson has given a poetic immortality), *Le Chat Botté* (Puss in Boots), *Riquet à la Houppie* (Riquet with the Tuft), and *Le Petit Chaperon Rouge* (Little Red Riding Hood). The principal successors of Perrault were the Comtesse d'Aunoy (see AUNOY), Madame Murat, and Made-moiselle de la Force; but their stories are much more extravagant and forced than those of the illustrious academician. The same censure, however, is not applicable to *Les Contes Marins* (1740), by Madame Villeneuve, among which occurs the tale entitled *La Belle et la Bête* (Beauty and the Beast), perhaps the most beautiful creation in the whole circle of this fantastic form of fiction.

Meanwhile, the translation of the *Arabian Nights' Entertainments* (q. v.) by Galland, 1704—1717, and of numerous other Arabic and Persian works, the great encouragement extended to the literature of the East in the 17th and 18th centuries, the publication of the *Bibliothèque Orientale* of D'Herbelot, &c., created a taste for the brilliant exaggerations of oriental fiction, and a variety of works were soon in the field, swarming with necromancers, dervishes, califs, bashaws, viziers, cadis, eunuchs, slaves. The most notable of these are—*Les Mille et un Quart d'Heure*, *Contes Tartares*; *Les Contes Chinois, ou les Aventures Merveilleuses du Mandarin Fum-hoam*; and *Les Sultanes de Guzaratte*, *Contes Mongols*, of M. Gueulotte.—Of the class of fictions known as *Voyages Imaginaires*, the principal are the *Histoire Comique des Etats et Empires de la Lune*, and the *Estats et Empires du Soleil* of Cyrano Bergerac, which materially influenced the genius of Swift, who has, in fact, borrowed not a little from the first of these in his *Gulliver's Travels*, and which were themselves partly suggested by the Spanish romance of Dominico Gonzales, entitled *The Man in the Moon*. Such novels as the *Paul et Virginie* of Bernardin St Pierre, which appeared towards the end of the 18th c., do not come under any of the four heads, but may most conveniently be mentioned here.

*Prose Fiction of Germany during the 18th and 19th Centuries.*—The limits of our space will not permit us to do more than superficially indicate the development of this branch of literature in Germany, which, however, is the less to be regretted, as, during the greater part of the 18th c., it did not attain much distinction. Towards the close

of the century, however, writers became more numerous, and as the literary activity of many of them continued on till the first or second quarter of the 19th c., it will be most convenient and natural to treat both centuries together, as they, properly speaking, form only one era in the literary history of that nation.

The first eminent German novelist of this period was Wieland (q. v.), whose Greek romances, *Agathon*, *Aristippus*, *Socrates*, &c., are of that didactic and sceptical character which was beginning to mark the reflective genius of the continent, and which has since produced such immense changes in all departments of thought. Wieland was followed by a crowd of writers, in whose productions is more or less distinctly apparent the influence of the English novelists, particularly of Richardson and Fielding, who had been translated and carefully studied in Germany, where, however, the 'novel of manners,' whether serious or comic, dealt more largely in the representation of 'family life.' The principal names are August la Fontaine, Wetzel, Müller (whose *Siegfried von Lindenberg* is still remembered and read), Schulz, and Hippiel. Almost contemporary with these quiet and somewhat prosaic novelists, there flourished for a brief period (1780—1800) a school of an entirely opposite character, whose works, fiercely and outrageously romantic, had their poetic counterpart in Schiller's *Robbers*. They resemble, in their style of handling the feudal ages, the English romances of Mrs Radcliffe and others, which probably suggested them. The chief writers of this 'turbulent school of fiction,' as it has been called, are Cramer, Spiers, Schlenkert, and Veit Weber.

Alone, and far above all others in redundancy and originality of fancy, humour, and pathos, towers Jean Paul Richter (q. v.), who is incapable of classification, and to whom, therefore, his countrymen have affixed the epithet of *Der Einzige* (The Unique). Apart from all schools—in this respect, but in this only, like Richter—stands Johann Wolfgang Goethe (q. v.), whose novels, as well as his poems, are poetico-philosophic efforts to represent, perhaps to solve, the great facts and problems of human life and destiny.

The reaction from the materialism and irreligious levity of French thought, first shewed itself in Germany towards the close of the 18th c., in a certain earnest love and study of the old, simple, superstitious, and poetical beliefs of the middle ages. Hence originated the exquisite class of fictions called *Volksmärchen* (popular legends or tales), in which the Germans have never been equalled. The most illustrious cultivator of this species of fiction is Ludwig Tieck (q. v.), for Musæus (q. v.), though gifted with admirable powers of narration, is marked by a sceptical humour and irony, not altogether compatible with an imaginative conception of his subject. Other distinguished names are those of De la Motte Fouqué (q. v.), Chamisso (q. v.), Heinrich Steffens, Achim von Arnim (q. v.), Clemens Brentano (q. v.), Zschokke, and Hoffmann (q. v.). The most recent German novel of mark is *Sollen und Haben* (Debit and Credit), by Gustav Freytag (q. v.), in which the influence of Dickens is very conspicuous.

**NOVELS AND ROMANCES OF THE 19TH CENTURY.**—These have been produced in such overwhelming quantity, that volumes would be required merely to classify and characterise them. The vast and rapid increase in the material facilities of intercourse among European nations, which has taken place during the last forty years, has, among other results, tended to diffuse through each country the literary products of all the others, especially those of an

entertaining kind; and these have in turn more or less stimulated the imagination of native genius, so that at present there is hardly a people in Europe, not even excluding Turkey, which has not contributed something to the enormous stock of fiction belonging to the 19th century. It would be altogether out of the question to attempt, in a compendious work like the present, a notice, however brief, of the principal novels and romances of every European nation; we can only refer to the historical surveys of literature, to be found under such heads as BELGIUM, BOHEMIA, HUNGARY, NETHERLANDS, NORWAY, POLAND, SWEDEN, TURKEY, &c., and to individual biographies of eminent continental novelists. Even in regard to England and France, we can do little more than catalogue a few prominent names.

1. *English Fiction*.—Almost the first novelist that we encounter in the 19th c., Sir Walter Scott (q. v.), is probably the greatest that England, or even the world, has ever seen. Here, however, we have less to do with his personal rank in literature than with the kind of fiction that he cultivated. In a qualified sense, he may be regarded as a continuation of the romantic school, but it must be observed that he is free from all their monstrosities, spasms, tricks, and horrible machinery. Possessed at once of far greater antiquarian learning, imaginative genius, sound sense, and instinctive taste, than any of his 'romantic' predecessors, he knew precisely what to shun and what to choose; and though his Feudal Age, as depicted in *Ivanhoe*, *The Fair Maid of Perth*, &c., is a considerably idealised portrait of the rugged facts, it is a portrait, and not like Horace Walpole and Mrs Radcliffe's performances, a furious caricature. The political reaction that took place in Britain, after the sanguinary excesses of the French Revolution, assuming the form of a new and passionate attachment to venerable and time-honoured traditions, shewed itself in literature too, and Sir Walter Scott was its grandest representative. He strove to delineate the Past, as it seemed in the eyes of men who were dubious of the Present, and afraid of the Future—noble, stately, glittering, and gay, with the pulse of life ever beating to heroic measures. The overpowering genius of Scott necessarily but unhappily (for the comfort of readers) led to 'endless imitation,' but the only one of his followers that holds a tolerably decent position in literature is G. P. R. James (q. v.). Galt (q. v.) and Wilson (q. v.), the former with vulgarly comic humour, the latter with a highly sentimental and overdone yet withal poetical pathos, portrayed aspects of Scottish life which the author of *Warley* has passed over. Other novelists, such as Lockhart (q. v.), Miss Ferrier (q. v.), and Mrs Johnstone, do not call for special notice; neither does Hope (q. v.), though his *Memoirs of Anastasius* is a most brilliant and powerful book; nor Moore (q. v.), though his *Epicurean* has all the sparkling and superficial splendours of his verse. After Scott, the next novelist who distinctly marks a new stage in the development of fiction, is Sir Edward Bulwer Lytton (q. v.), in whose earlier works at least we find something like a reflection of the cold, sneering, selfish, and sensual spirit that marked the upper classes during the period of the Regency; but the versatile genius of this author, and the different fields in which he has won renown, would make it quite unfair to define him as a merely 'fashionable' novelist, though his first and least meritorious distinctions were acquired in that capacity, and students of *Sartor Resartus* are apt to so remember him. Of fashionable novelists, strictly so called, the best known are Mrs Gore (q. v.) and Theodore Hook (q. v.). This class was succeeded by another

infinitely worse than itself—the *Newgate novelists*, as they have been well termed, who sought for their heroes among highwaymen, thieves, desperadoes, and murderers, like Jack Sheppard, Blueskin, Dick Turpin, Claude Duval, &c., and, flagitiously indifferent alike to fact and morality, laboured with pernicious success to invest the lives of these scoundrels with a halo of romantic interest and dignity. The chief of this school, 'by merit raised to that bad eminence,' is William Harrison Ainsworth (q. v.). Its admirers are mainly to be found among the most ignorant sections of the community, and it is almost questionable if it even deserves mention in a literary point of view. During the last thirty years, novels have been multiplied to a degree which is almost alarming, and literally incalculable. The greatest names are unquestionably those of Dickens (q. v.), Thackeray (q. v.), and Miss Evans; but besides these might be mentioned a host of others, who have attained either celebrity or popularity, or both. Every mode of life, and every kind of opinion, social, artistic, scientific, philosophical, and religious, has sought to recommend itself by adopting this fascinating garb. We have the nautical novels of Marryat (q. v.), smelling, like Dildin's songs, of the briny deep; the political novels of Benjamin Disraeli (q. v.); the sporting and military novels of Lever (q. v.); the brilliant 'muscular Christian' novels of Kingsley (q. v.); the 'governess-novels,' as they have been aptly denominated, of Miss Brontë (q. v.); the 'school' novels of Hughes and Farrar; and the 'sensational' novels of Wilkie Collins, Miss Braddon, and others, the power of which last is undeniable, but the wholesomeness dubious. Other authors not less eminent, but not so easily classified, are Mrs Oliphant (q. v.) and Charles Reade (q. v.). The extraordinary increase of this potent, and therefore perilous branch of literature cannot fail to excite much curious reflection in thoughtful minds, but it is not within our province to 'moralise the theme.'

2. *French Fiction during the 19th Century.*—A few words are all that we can devote to this part of our subject, though it is far from uninteresting either in a literary or a moral point of view. The effect of the Revolution of 1789 on literature was not immediately beneficial, but the reverse, though it planted the germs of a multitude of new thoughts and aspirations in the mind of Christendom, which have since yielded, both in France and elsewhere, a prolific harvest of wheat and—tares. The iron despotism of Napoleon crushed nearly all literary expression whatever. His hatred of 'idealognes' is well known, but the novel was that species of idealogue composition that came least into collision with the principles of imperialism. Even *it*, however, could hardly be said to flourish; and the only tolerably gifted writer of fiction who figures during the First Empire is Le Brun, and he was reduced to the necessity of caricaturing the *bourgeoisie*, to which Napoleon had no particular objection, as they were by no means his warmest admirers. Chateaubriand (q. v.) and Madame de Staël (q. v.) are insignificant in this department, and Charles Nodier, though voluminous, was not an original novelist. After the return of the Bourbons, and especially after the revolution of 1830, France began to display a wonderful literary activity, and in particular, its long-repressed faculty of imagination burst into a sudden blossom of poetry and fiction. Even Napoleon, now that he was dead, received a peculiar homage from the class to whom he had never shewn favour or regard, of which the songs of Béranger and *Les Misérables* of Victor Hugo afford us specimens. Unhappily for the purity of its literature, the *régime* of the Resto-

ration, which followed the deliverance of France from a military despotism, was itself a base, corrupt, and profligate thing. The Bourbons came back only to re-enact the follies of their ancestors in the previous century, and the nation soon came to despise, detest, and disbelieve them, and the church which supported them. Hence, a certain reckless levity, and hollow mocking laughter, as of heartless scepticism, pervading those fictions which profess to delineate the realities of current life. The religious sanctions that give force and efficacy to moral obligations having disappeared, novelists have fallen back upon unassisted human nature, and have apparently justified all sorts of impruencies, indecencies, and even pollutions, in the lives of their heroes and heroines, on the ground of these springing from the excitements of a 'natural' passion. The sparkling wit, the sunny humour, the pathos, often exquisitely tender and refined, the delicate or deep delineation of character, the occasional fine flush of sentimental enthusiasm, and the poetic witchery of a religious mysticism, cannot blind us to the fact, that the substance of most of the recent French fictions is incurably immoral. Paul de Kock (q. v.), Balzac (q. v.), Dumas (q. v.), father and son, Sue (q. v.), Madame Dudevant (q. v.), though wholly dissimilar to each other in the quality of their genius, are woefully alike in the baser element of the national fiction. Victor Hugo (q. v.) and Lamartine (q. v.) are indeed morally far above the rest of their contemporaries, but they are perhaps the only great exceptions that can be mentioned. The 'Second Empire' has not improved the tone of the French novel, any more than it has improved the tone of society; but if it be true that when things have reached their worst they begin to mend, the country that has produced *La Dame aux Camélias* is perhaps, as regards the literature of fiction, in a hopeful condition.

The prose fiction of Spain and Italy during the 19th c. scarcely requires notice, as the former country has not produced a single work that has forced its way into the general European market, while the latter can boast of only one that has attained that dignity, the *Promessi Sposi* of Manzoni (q. v.); but in a comprehensive sketch like the present, it would be a blemish to omit at least the names of the more eminent Transatlantic novelists, as they have contributed not a little of late years to the stock of English prose fiction. The most notable are Brockden Brown (q. v.), the American Godwin; Fenimore Cooper (q. v.), from whom Europe has been content, on the whole not unwisely, to take its notions of the forests, the prairies, and the red men of the West; Washington Irving (q. v.), Edgar Allan Poe (q. v.), Nathaniel Hawthorne (q. v.), and Oliver Wendell Holmes (q. v.), in all of whose writings, except in the tales of Poe, is visible the influence of the life, traditions, scenery, and other salient characteristics of the New World. See Dunlop's *History of Fiction* (Lond. 1814).

NOVEMBER (Lat. *novem*, nine) was among the Romans the 9th month of the year, at the time when the year consisted of 10 months; and then contained 30 days. It subsequently was made to contain only 29, but Julius Cæsar gave it 31; and in the reign of Augustus the number was restored to 30, which number it has since retained. November was one of the most important months in connection with the religious ritual of the Romans, and continues in the same position, though for other reasons, in the Roman Catholic ritual. It was known among the Saxons as *Blot-month*, 'blood-month,' on account of the general slaughter of cattle at this time, for winter provision (known for a long time afterwards as *Martinmas beef*) and for sacrifice. This custom

was not confined to the Saxons, but prevailed in Northern Germany, and even as far south as Spain.

**NOVGOROD**, an important town of European Russia, capital of the government of the same name, is situated on the Volkhof, near where it issues from Lake Ilmen, 122 miles south-south-east of St Petersburg. It is the cradle of Russian history. In 862, the Norman prince Rurik, of the tribe of Variago-Ross (whence the name *Russia*), was invited hither by the neighbouring tribes, and from him begins the history of the country, and the line of its sovereigns. A monument, commemorative of this event, was erected here, with great pomp, in September 1862. In the 9th c., Oleg, the successor of Rurik, transported the capital to Kiev; but bestowed many privileges and liberties upon N., and from that time it began to prosper. The greatness of N. provoked the jealousy of the princes of Moscow, and in 1471, the czar Ivan III. nearly destroyed the town, bereft it of its liberties, and exiled the most influential citizens. During the time of its prosperity, the town was called Novgorod the Great; and had 400,000 inhabitants, and extended its sway to the White Sea and the river Petchora. Its government was a sort of republic, the prince being less a sovereign than the chief commander of the troops. Its greatness was due to its vast foreign trade alone, and when Archangel was opened for English trading vessels, but especially after the foundation of St Petersburg, its trade fell away, and the town rapidly declined. Of the existing ancient buildings, the most remarkable are the Church of St Sophia, founded in the 11th c., possessing a fine old library, as well as some remarkable paintings and tombs; and the Kreml, in the steeple of which hung the famous bell used to summon the citizens for the deliberation of state affairs. Pop. 18,768.

**NOVGORO'D**, a government of Great Russia, extends immediately south-east of the government of St Petersburg. Area, 48,780 square miles; pop. 975,200. The surface is gently undulating, with the Valdai Hills in the south, which rise to about 300 feet, and may be said to form the water-shed between the Baltic, Caspian, and White Seas. The government contains many lakes and rivers; of the former, the lakes Ilmen and Bieloe are the largest; and of the latter, the Wolchof, Msta, Szeksna, and Mologa are the most important. The rivers are connected by canals, which are of great service to trade. The soil, especially in the north-east, is not fertile, and the climate is severe; agriculture and cattle-rearing are carried on only to a limited extent. Forests and pasture-lands are numerous and extensive, and the timber and hay sent to the capital realise a considerable income. Quarries of the best stone for paving occur on the river Tosna, and near Stara-Russa there are mineral and saline springs.

**NOVI**, a town of northern Italy, in the division of Genoa, is a station on the railway from Turin to Genoa, and is 33 miles north-north-west of the latter city. It presents few attractions, with the exception of a number of picturesque old houses. It carries on a considerable transit-trade; and the silk produced in the vicinity is amongst the most celebrated in Italy. Pop. 10,800.

**NOVIBAZAR**, also **JENIBAZAR**, a town of Bosnia, European Turkey, situated on the river Rashka, an affluent of the Morava, 130 miles south-east of Bosna-Seral. Several of the great roads of the country cross each other here. N. has celebrated fairs, important trade, and considerable wealth, but the houses are mostly of mud. It is the chief point of communication between Bosnia and the rest of Turkey. Pop. 15,000.

**NOVITIATE**, the time of probation, as well as of preparatory training, which in all religious orders precedes the solemn **PROFESSION** (q. v.). Under the head of **MONACHISM** will be found the general principles by which the training for the 'religious' life is regulated. It will be enough to say here, that the novitiate in all orders must continue (Conc. Trid. Sess. xxv. c. 85, *De Regul. and Mon.*) at least one year. In most orders it is of two, and in several of three. Any attempt to solemnise the profession before the expiration of the novitiate, without a dispensation, is invalid. During the novitiate, the novices are immediately subject to a superior, called Master (or Mistress) of Novices. They are not permitted to engage in systematic study, their whole time being devoted to prayer, and to ascetic and liturgical training. During the novitiate, the novice continues free to withdraw, nor is he or she admitted to profession at the close of the novitiate, except after proof given of fitness, and of proper dispositions for the particular institute aspired to.

**NOVOARKHANGHEL'SK** (New Archangel), a seaport of Russian America, and centre of the administration of the Russo-American Company, situated on the island of Sitka, on the north-west coast of the American continent, in lat. 57° 3' N., long. about 135° W. It has a good port, and is the entrepôt of all the stores for the other Russo-American colonies, and of their produce, of which furs are the principal item. There are at N. only 66 clear days in the year. Mean temperature throughout the year 43° 45' F. Pop. 1000, mostly servants of the company.

**NOVOMOSKO'VSK**, an important market-town of South Russia, in the government of Ekaterinoslav, and 20 miles north-north-east of the town of that name, on the Samara, an affluent of the Dnieper. Three extensive fairs, chiefly for the sale of cattle and horses, are held here annually. The 'remounting' officers attend these fairs for the purpose of supplying their regiments with horses. Tanning and tallow-melting are carried on. Pop. 10,138.

**NOVOTCHERKA'SK**, a town of Southern Russia, capital of the territory of the Cossacks of the Don, on the Aksai, a tributary of the Don, at a distance of 12 miles from its right bank, and about 70 miles east-north-east of Taganrog. The central administration of the territory was transferred hither from Tcherkask in 1804 by Count Platof, commander-in-chief of the Cossacks. The choice was not a happy one, the distance of the town from the Don, the great commercial artery, being much felt. In 1855, a statue was erected in memory of Count Platof, who achieved an illustrious name by his military exploits from 1770 till 1816, and especially during the French invasion in 1812. Pop. 19,500, who carry on trade and manufactures, agriculture, cattle-breeding, fishing, and wine-growing.

**NOYADES** (i. e., 'Drownings,' from Fr. *noyer*, to drown), the execution of political offenders in great numbers at once by drowning them, one of the atrocities of the French Revolution, practised at Nantes by Carrier, the deputy of the Convention. See **CARRIER**. This mode of execution was also called, in cruel sport, *Vertical Deportation*.

**NOYAU**. See **LIQUEUR**.

**NOYON**, a town of France in the department of Oise, 78 miles north-north-east of Paris by the northern railway. It has a fine cathedral of the 12th and 13th centuries, in the Romanesque style of architecture; an episcopal palace, and some linen

and cotton manufactures. Pop. 5593. N. was a residence of Charlemagne, and the place where Hugo Capet was crowned king of France in 987. It is also noted as the birthplace of John Calvin.

NU'BIA, the modern appellation of a country subject to the pasha of Egypt, extending from Philae to the Sennaar, lat. 18° S., bounded on the E. by the Arabian Gulf, N. by Egypt, S. by Abyssinia, and on the W. by the Desert. It appears to have been anciently known as Ethiopia. The ancients gave the name of Ethiopia to the west bank of the Nile from Meroe to the bend of the river. The name seems to have been derived from the Egyptian and Coptic *Noub*, or Gold, a name still retained in *Wady Nouba*, which extends from the frontier of Dongola, north of the *Wady Seboua*, above Derri. The tract between Seboua and Assouan is called the Wady Kenous. Diocletian removed hither a Lybian tribe, called Nobatae, to the district above Syene to oppose the Blemmyes, who inhabited the western desert, now held by the Ababde and Bisharein Arabs. The dominion of the Pharaohs, when most extended, reached to the Isle of Argo, the last place where the monuments of the Egyptians have been found. Under these monarchs it was called Cush, and was governed by a royal scribe, entitled Prince of Cush or Ethiopia, till the twentieth dynasty, when it appears to have been recovered by a series of native rulers, who ultimately conquered Egypt; and although driven back, finally extended their rule from Meroe to Syene, the most southern city held by the Egyptian monarchs, the Ptolemies, and the Romans. These Ethiopians adopted the civilisation of the Egyptians, and the names of some of their monarchs have been preserved. The subsequent fortunes of this country will be seen under ETHIOPIA. The modern inhabitants consist principally of Arabs, who invaded the country after the rise of Mohammed, the principal tribes being the Djowabere and El Gharbye, who inhabit from Assouan to the Wady Halfa; the Kenous, Djaafere, and others, a branch of the Koreish, who occupied the land from Esne to Assouan. By the aid of Bosnian soldiers, the Djowabere were driven into Dongola in the reign of Selim, and their descendants still flourish at Ibrim, Assouan, and Sai. Lower down, inhabit a race called the Berbers or Barabras; south of Coesair are the Ababde. From Dongola and Sennaar, a negro state, the people are called Noubas, a hardy race, differing from the pure blacks; but the country throughout is inhabited by mixed races of Arabian and Nigritic blood. Another tribe, the Sheyyga, east of Dongola—a fine black race, addicted to horsemanship and war—are still more interesting. The Ababde Arabs are renowned as guides and camel drivers; the Bisharein are supposed by some to be the ancient Blemmyes, a tribe living on flesh and milk, but without the oriental jealousy of the Arabs; the Takas, supposed to be the ancient Bojals, dwell in the mountains. Three principal languages are spoken by these various tribes—the Nuba by the Berbers, who entered from the south-west; the Kungara, a Nigritic dialect, by the negroes of Dafur; and the Bisharie, said to exhibit Aryan affinities. The inhabitants, although less in stature than the Egyptians, are in the better parts of the country a fine muscular race; the women are pleasing, but not beautiful; and the climate is remarkably healthy. In their political government they were governed by their own chiefs, *maks* or *malechs*, till they were subdued by Ismael Pasha, in 1820, to the sway of Egypt, and the civil government is now administered by the Turks. The country is arid, in many places only cultivable at the

sides of the Nile, and consists of granite and sandstone. The soil raises durra, cotton, and date palms. It is traversed by the *Bahr el Azek*, or Blue Nile, and the *Bahr el Abiad*, or White Nile. The products are numerous, comprising maize, dates, tamarinds, gums, aloes, civet, musk, wax, myrrh, frankincense, senna, black wool, hides both of the elephant and rhinoceros, and their ivory, ostrich feathers, ebony, gold dust, saltpetre, salt, tobacco, coffee, cotton, which are carried by way of commerce to Egypt. The taxes are rated by the number of water-wheels for the irrigation of the land. There being no native currency, the coins of Egypt and Europe, especially the Spanish dollar, are received, but glass-beads, coral, cloth, *tobs* or shirts, and cloth (*samook*) also pass as money. In Kordofan, value is reckoned by cows. The most primitive modes of measurement are in use, maize being sold by the handful (*selga*), 18 of which go to a *moud*; and cloth being measured from the elbow to the fingers. Polygamy is general, and a wife at Kenous is purchased of her parents for 30 piastres; amongst the Arabs for 6 camels, 3 of which are returned to the bridegroom. Some of the tribes are jealous of their women, who are celebrated by travellers on account of their virtue. In their costume, they use turbans, linen, and woollen garments, and are armed with lance and shield, the latter made of the hide of the hippopotamus. No looms exist, but they plait neatly. Their chief musical instrument is a guitar of five strings, with sounding-board of a gazelle's hide. They are generally averse to commerce, eat little animal food, and are Mohammedans. Their houses are low huts of mud or stone. The chief attraction of this country to travellers is the numerous temples and other ancient remains of the Egyptians, extending from Philae to the island of Argo. These consist of the temple of Isis, in the isle of Philae, founded by Nectanebo I., and continued by the Ptolemies; the temple of Deboud, built in honour of Amen Ra, by Ataramen, and continued by the Romans; Tafa or Taphis, the modern Kalabshe, built by Rameses II.; the rock temple of Beit e Welly, recording the conquests of the same monarch; Wady Halfa, built by Osertesens I.; the rock temple of Ibsamboul, built by Rameses II.; Gebel Addeh, built by Horus of the eighteenth dynasty; Ibrim, built by Amenophes II.; Amada, founded by Thothmes III.; Ghersheh, Seboua, and Derri, built by Rameses II.; Dakkeh, the ancient Pselcis, built by Ergamenes; and the Colossus of the isle of Argo, the Pyramids of Meroe and Tanquassi.—Burckhardt, *Travels*; Champollion le Jeune, *Lettres Ecrites*, p. 107, and foll.; Lepsius, *Reise*, p. 107, and foll.).

NUCLEOBANCHIATA, or HETEROPODA, an order of gasteropods having the sexes distinct; the locomotive organ fin-like, single, and ventral; the gills packed in small compass along with the heart. They are all marine, and usually swim with the back downwards and the fin-shaped foot upwards. They adhere to sea-weeds by a small sucker placed on the fin. Some of them, as *Atlanta*, have a shell large enough to protect the body; some, as *Carinaria*, have a small shell covering the gills and heart only; and some, as *Firola*, have no shell at all.

NU'CLEUS. See CELLS.

NUDIBRANCHIATA (Naked-gilled), an order of gasteropods, hermaphrodite, destitute of shell, and having the gills exposed on the surface of the body. The gills are differently situated in different genera. The genus *Doris* (q. v.) is an example of this order.

NUECES, a river of Texas, United States of America, rises in South-western Texas, lat. 30°, long. 101° W., and after a south-easterly course of 300 miles, flows into Corpus Christi Bay, and through the Pass of the same name into the Gulf of Mexico.

NUISANCE is a legal term used to denote whatever is an annoyance to one's neighbours, or in a general sense to the public at large, in the exercise of their rights of property. The whole doctrine of nuisance is founded on the theory that every person is entitled to have the full use and enjoyment of his property, and of the right of passing to and fro on the highway without being interfered with or impeded by others, and whatever so impedes this full enjoyment of one's property and right of passage on the highway is a nuisance. Nuisances are thus capable of being divided into two kinds—private and public. Thus, if a neighbour leave a heap of rubbish emitting noxious smells close to A's windows, or make loud noises in his house, these may be said to be private nuisances, for they annoy A in the enjoyment of the fresh air and quiet which are part of his right of property. On the other hand, if something is put of the same kind on a public highway, or so as to annoy divers people equally and in the same manner, then it is called a public nuisance. One of the leading incidents of a nuisance is, that the party annoyed by it can in many cases, especially where the nuisance is injurious to health or life, take the law into his own hands and abate the nuisance without resorting to a court of law. The reason is, that the matter is of too urgent importance to await the slow progress of a suit at law, and mischief may be done in the meantime which would be often irreparable owing to the delay. Another important qualification of the right of abating a nuisance is, that the nuisance must be such that unless it is abated at once the party cannot exercise his legal rights; and hence if the nuisance is of such a kind that it does not directly interfere with the comfort or enjoyment of one's legal rights at the time, he has no right to abate it, but in that case is bound to resort to a court of law. This is best illustrated in the case of a nuisance on the highway, which is the class of cases in which the phrase a common nuisance is most familiarly known. Thus, if while A is riding or driving along the highway his progress is interrupted by a fence or gate which nobody has a legal right to put there, it is obvious that unless A can knock down or demolish at once this obstruction, he cannot proceed in the exercise of his legal right of using the highway. In such a case he has a right to demolish the gate and abate the nuisance, for it directly interferes with his own legal right. But if instead, a gate, a booth, or tent had been erected, not across the highway, but merely on one side of it, so as to leave room for passengers to pass, then though such tent or booth would be as undoubted a nuisance as in the other case, yet inasmuch as A can pass without direct interference, he has no right to abate the nuisance by destroying the tent. He must, in this latter case, resort to the legal remedy only. The same rule applies to all kinds of nuisances.

Another rule is, that in abating a nuisance the party is not to do unnecessary damage to property, i.e., more than simply abate the nuisance to such an extent as to enable himself to exercise his legal right, and no further. If he go beyond the immediate occasion, and cause unnecessary destruction to property, then he subjects himself to an action of damages. Hence it is often a difficult thing to know when one is justified in abating a nuisance and taking the law into his own hands.

Where the nuisance is sought to be removed by

legal means, then the remedy is in some cases twofold, and in some cases not so. Where the nuisance is of a private nature, an action of damages is in general the only remedy given by the common law. But where the nuisance is public, and affects all the public equally, or nearly so, then in general either an action may be brought, or an indictment will lie. Thus in case of a nuisance on a highway, as this affects all the lieges alike, an indictment is the proper remedy, though if an individual suffered special damage over and above what he suffers as one of the public, then he may bring an action. In Scotland, instead of an indictment, an action in the nature of a public action is raised, which is substantially similar in its results to an indictment.

As will be seen from what has preceded, the legal remedy in cases of nuisances has long been felt to be insufficient. To add to the other defects, there is great difficulty in determining whether a particular mode of using one's premises is in the nature of a nuisance or not; for if the line is drawn too narrowly, the rights of property and the natural freedom of the subject may be interfered with. On the other hand, things which formerly were considered no nuisances are now treated as such, owing to the spread of more enlightened views of public health and habits of cleanliness. These considerations recently induced the legislature to alter the common law in an important degree, and substitute a new code under the name of the Public Health and Nuisances Removal Acts, 11 and 12 Vict. c. 63; 18 and 19 Vict. c. 116; 23 and 24 Vict. c. 77. The general scheme of these acts is to enable districts to appoint local boards, with extensive powers of self-government, and to undertake and execute sanitary improvements, such as drainage and water-supply on a large scale, paying for the expense thereof by a local rate or assessment.

As regards the power of removing nuisances, a statute was passed in 1855 for England, called the Nuisances Removal Act, which has been amended by two subsequent acts. By these acts, some local board or local officers, and failing them the overseers of the parish, are appointed the local authority for carrying out the provisions of the act, and these are of an extensive kind. The act defines a nuisance to include any premises in such a state as to be a nuisance or injurious to health; any pool, ditch, gutter, water-course, privy, urinal, cess-pool, drain, or ashpit, so foul as to be a nuisance or injurious to health; any animal so kept as to be a nuisance, or injurious to health; and any accumulation or deposit which is a nuisance or injurious to health. The local authority is to appoint a sanitary inspector at a proper salary. Any person aggrieved may give notice to the local board, or the sanitary inspector may do so. The local board has extensive powers; it can authorise its inspector, on reasonable complaint, to demand an entrance into any private premises so as to inspect their condition, and may order the removal of nuisances found to exist there. The local board, on finding a nuisance exists, direct their officer to go before a justice of the peace and procure an order directing the private party to abate the nuisance. If he refuse to do so, the local board may remove the nuisance at the expense of the party on whose premises it exists, and sue him for such expenses. If any candle-house, melting-house, soap-house, slaughter-house, or place for boiling offal, blood, bones, &c., be certified by the medical officer, or any two medical practitioners, to be a nuisance, or injurious to the health of the inhabitants of the neighbourhood, the local board may cause the person carrying on such trade to appear before a justice of the peace, and if it is not satisfactorily

proved that he does not use the best practicable means for preventing or counteracting the effluvia, he is fined. So if houses are overcrowded, this may be stopped. Provisions are also enacted with a view to prevent the spread of diseases in times of epidemics, and to prevent common lodging-houses being kept in a foul state. Another important provision relates to the seizure of diseased meat and provisions exposed to sale, and the medical officer of health, or inspector of nuisances, has at all times power to inspect any animal, earcase, meat, poultry, game, flesh, fish, fruit, vegetables, corn, bread, or flour; and if found unfit for food, or diseased, or unsound, they may be carried away then and there and destroyed, and the shopkeeper fined. The local authority may also order owners of houses to supply proper water-closets, and to cleanse gutters and cess-pools which are foul. Besides the above provisions as to nuisances generally, there are separate statutes which prohibit smoke nuisance in the English metropolis and the river Thames. Thus all the furnaces in mills, factories, printing-houses, dye-houses, distilleries, glass-houses, bakehouses, &c., within the metropolis, must be so constructed as to consume their own smoke, and also any noxious or offensive effluvia arising from any trade is prohibited. These statutes are the 16 and 17 Vict. c. 128, and 19 and 20 Vict. c. 107.

In Scotland, a Nuisances Removal Statute was passed the year following the English act, viz., 19 and 20 Vict. c. 103. By that act the town council, or police commissioners of the place, were constituted the local authority for enforcing the act, and in other places the parochial board. Besides dealing with the same class of nuisances as the English act, the Scotch act provided for checking all trades and businesses offensive and injurious to the health of the neighbourhood. Similar powers were given to the local board to enter private houses and explore the causes of nuisances. Diseased and unwholesome meat and provisions may also be seized. Common lodging-houses were to be registered, and to be subject to rules and regulations to be made by the local authority. With regard to towns in Scotland, an extensive code of police laws was enacted in a general statute, the General Police and Improvement Scotland Act 1862, 25 and 26 Vict. c. 101. That act may be adopted by burghs; and villages above 700 of population may, by vote of householders, be converted into burghs for this purpose. A Smoke Nuisance Act for Scotland was passed applicable to all burghs, 20 and 21 Vict. c. 13; 24 Vict. c. 17.

The above is the usual legal acceptation of the term nuisance, but the word is sometimes used popularly to denote that class of nuisances, caused by disorderly houses or brothels, which are familiarly described as common nuisances. In the law of England those who keep a brothel are liable to be indicted for a misdemeanour, but as there was often a difficulty in setting the law in motion in such cases, a statute of 25 Geo. II. c. 36, enacted that if any two inhabitants should give notice to a constable of such a house being kept, it should then be the duty of the constable under a penalty, to go with such inhabitants before a justice and engage to prosecute the keeper, and their expenses are paid by the parish out of the poor-rates. The same act provided that whoever in point of fact acted as the master or mistress of the house, should be taken to be the keeper of the house. The punishment is fine and imprisonment. Of late an attempt has been made to convict a landlord under this statute when he knows of the character of his tenants, and refuses to give them notice to quit; but the courts have held that the mere fact of the

landlord refusing to give notice to quit, and so to eject such tenants, was not enough to make him liable in any criminal punishment. In Scotland, the offence of keeping a brothel is punishable in a similar manner. But apart from the keeping of a brothel, there is no criminal offence committed in this country by those who frequent such houses for the purposes of prostitution unless where the circumstances amount to Rape (q. v.) or Abduction (q. v.), or an aggravated assault.

NULLA BONA, a legal phrase in England, descriptive of the return made to a sheriff, who in executing process against a debtor finds he has no goods.

NUMA POMPILIUS, in the mythic history of Rome, was the successor of Romulus, the founder of the city. He was a native of Cures in the Sabine country, and was universally revered for his wisdom and piety. Unanimously elected king by the Roman people, he soon justified by his conduct the wisdom of their choice. After dividing the lands which Romulus had conquered, he proceeded, with the assistance of the sacred nymph Egeria, to draw up religious institutions for his subjects, and thus stands out in the primitive legend as the author of the Roman ceremonial law. His reign lasted for 39 years, and was a golden age of peace and happiness. The only feature in the myth of N. P. which we can regard as probably historical, is that which indicates the infusion of a Sabine religious element into Roman history at some remote period.

NUMA'NTIA, the chief town of the Celtiberian people called Arevaci in ancient Spain, was situated on the Douro (Durius), in the neighbourhood of the present Soria in Old Castile. The site is probably marked by the present Fuente de Gnarray. N. is celebrated for the heroic resistance which it made to the Romans, from 153 B.C., when its citizens first met a Roman army in battle, to 134 B.C., when it was taken and destroyed by Scipio the younger, after a siege of 15 months, in the course of which famine and the sword had left alive very few of its 8000 brave defenders. The besieging force under Scipio amounted to 60,000 men.

NUMBERS, THEORY OF, the most subtle and intricate, and at the same time one of the most extensive, branches of mathematical analysis. It treats primarily of the forms of numbers, and of the properties at once deducible from these forms; but its principal field is the theory of equations, in as far as equations are soluble in whole numbers or rational fractions, and more particularly that branch known as Indeterminate Equations. Closely allied to this branch are those problems which are usually grouped under the Diophantine Analysis (q. v.), a class of problems alike interesting and difficult; and of which the following are examples: 1. Find the numbers the sum of whose squares shall be a square number; a condition satisfied by 5 and 12, 8 and 15, 9 and 40, &c. 2. Find three square numbers in arithmetical progression; Answer, 1, 25, and 49; 4, 100, 196, &c.

Forms of Numbers are certain algebraic formulas, which, by assigning to the letters successive numerical values from 0 upwards, are capable of producing all numbers without exception, e.g., by giving to  $m$  the successive values 0, 1, 2, 3, &c., in any of the following groups of formulas:  $2m$ ,  $2m + 1$ ;  $3m$ ,  $3m + 1$ ,  $3m + 2$ ;  $4m$ ,  $4m + 1$ ,  $4m + 2$ ,  $4m + 3$ , we can produce the natural series of numbers. These formulas are based on the self-evident principle, that the remainder after division is less than the divisor, and that, consequently, every number can be represented in the form of the product of two factors + a number less than the smaller factor.

By means of these formulas, many properties of numbers can be demonstrated without difficulty. To give a few examples. (1.) *The product of two consecutive numbers is divisible by 2*: Let  $2m$  be one number, then the other is either  $2m + 1$  or  $2m - 1$ , and the product  $2m(2m \pm 1)$  contains 2 as a factor, and is thus divisible by 2. (2.) *The product of three consecutive numbers is divisible by 6*: Let  $3m$  be one of the numbers (as in every triad of consecutive numbers one must be a multiple of 3), then the others are either  $3m - 2, 3m - 1; 3m - 1, 3m + 1; 3m + 1, 3m + 2$ . In the first and third cases, the proposition is manifest, as  $(3m - 2)(3m - 1)$ , and  $(3m + 1)(3m + 2)$ , are each divisible by 2, and therefore their product into  $3m$  is divisible by 6 (= 1.2.3). In the second case the product is  $3m(3m - 1)(3m + 1)$ , or  $3m(9m^2 - 1)$ , where 3 is a factor, and it is necessary to show that  $m(9m^2 - 1)$  is divisible by 2; if  $m$  be even, the thing is proved; but if odd, then  $m^2$  is odd,  $9m^2$  is odd, and  $9m^2 - 1$  is even; hence, in this case also the proposition is true. It can similarly be proved that the product of four consecutive numbers is divisible by 24 (= 1.2.3.4), of 5 consecutive numbers by 120 (= 1.2.3.4.5), and so on generally. These propositions form the basis for proof of many properties of numbers, such as that the difference of the squares of any two odd numbers is divisible by 8. The difference between a number and its cube is the product of three consecutive numbers, and is consequently (see above) always divisible by 6. Any prime number which, when divided by 4, leaves a remainder unity, is the sum of two square numbers: thus,  $41 = 25 + 16 = 5^2 + 4^2$ ,  $233 = 169 + 64 = 13^2 + 8^2$ , &c.

Besides these, there are a great many interesting properties of numbers which defy classification; such as, that the sum of the odd numbers beginning with unity is a square number (the square of the number of terms added), i. e.,  $1 + 3 + 5 = 9 = 3^2$ ,  $1 + 3 + 5 + 7 + 9 = 25 = 5^2$ , &c.; and, the sum of the cubes of the natural numbers is the square of the sum of the numbers, i. e.,  $1^3 + 2^3 + 3^3 = 1 + 8 + 27 = 36 = (1 + 2 + 3)^2$ ,  $1^3 + 2^3 + 3^3 + 4^3 = 100 = (1 + 2 + 3 + 4)^2$ , &c.

We shall close this article with a few general remarks on numbers themselves. Numbers are divided into *prime* and *composite*—prime numbers being those which contain no factor greater than unity; composite numbers, those which are the product of two (not reckoning unity) or more factors. The number of primes is unlimited, and so consequently are the others. The product of any number of consecutive numbers is even, as also are the squares of all even numbers; while the product of two odd numbers, or the squares of odd numbers, are odd. Every composite number can be put under the form of a product of powers of numbers; thus,  $144 = 2^4 \times 3^2$ , or generally,  $n = a^p \cdot b^q \cdot c^r$ , where  $a, b$ , and  $c$  are prime numbers, and the number of the divisors of such a composite number is equal to the product  $(p + 1)(q + 1)(r + 1)$ , unity and the number itself being included. In the case of 144, the number of divisors would be  $(4 + 1)(2 + 1)$ , or  $5 \times 3$ , or 15, which we find by trial to be the case. *Perfect numbers* are those which are equal to the sum of their divisors (the number itself being of course excepted); thus,  $6 = 1 + 2 + 3$ ,  $28 = 1 + 2 + 4 + 7 + 14$ , and 496, are perfect numbers. *Amicable numbers* are pairs of numbers, either one of the pair being equal to the sum of the divisors of the other; thus,  $220 (= 1 + 2 + 4 + 5 + 10 + 11 + 20 + 22 + 44 + 55 + 110 = 284)$ , and  $284 (= 1 + 2 + 4 + 71 + 142 = 220)$ , are amicable numbers. For other series of numbers, see FIGURATE NUMBERS.

The most ancient writer on the theory of numbers was Diophantus, who flourished in the 3d c., and the subject received no further development till the time of Vieta and Fermat (the latter being the author of several celebrated theorems, a discussion of which, however, is quite unsuited to this work), who greatly extended it. Euler next added his quota, and was followed by Lagrange, Legendre, and Gauss, who in turn successfully applied themselves to the study of numbers, and brought the theory to its present state. Cauchy, Libri, and Gill (in America), have also devoted themselves to it with success. The chief authorities down to the present century are Barlow's *Theory of Numbers* (1811), Legendre's *Essai sur la Theorie des Nombres* (third ed. Paris, 1830), and Gauss's *Disquisitiones Arithmeticae* (Brunswick, 1801; Fr. translation, 1807); and for the latest discoveries, the transactions of the various learned societies may be consulted.

NUMBERS (LXX. *Arithmoi*; Heb. *Bamidbar*), the fourth book of the Pentateuch, consists of 36 chapters, embracing the history of the march of the Israelites through the Desert, together with the special laws given during this period as complementary to the Sinaitic legislation. Beginning with the census of the people (whence the name of the book), and the assigning of the special places to each tribe with reference to the sanctuary, the whole people is classified, and the tribe of Levi specially singled out. Ordinances on the purity to be maintained in the camp, the functions of the priests, and a description of the passover, follow. The second portion of the book describes the journey from Sinai to the borders of Canaan, the miraculous sustenance of the people, their dissatisfaction and consequent rejection, together with various special laws respecting sacrifices, &c., and the episode of Korah. The third part embraces the first ten months of the fortieth year of the wandering—an epoch hurried over with remarkable swiftness by the historian. In quick succession, the renewed strife of the people with their leaders, the message to the king of Moab, the death of Aaron, the defeat of the king of Arad, the punishment of the people by serpents, the march from Hor to Pisga, and the victorious battle against the kings of Sihon and Og, are recounted, and the extraordinary episode of Balaam follows. The further wiles employed by the alarmed Moabites and Midianites to avert the threatening invasion, and their result, together with the second census, are narrated. Moses is warned of his death, and the vital question of his succession is settled. Further laws and ordinances respecting sacrifices and vows, the conquest of the Midianites, and the partition of the country east of the Jordan among certain tribes, a recapitulation of the encampments in the Desert, a detailed specification of the manner in which the promised land should be divided after its conquest, and the final ordinance of the marriages of heiresses among their own tribe only, so as to preserve the integrity of landed property, make up the remainder of the book.

The Book of Numbers is, like the rest of the Pentateuch, supposed by the greater part of modern critics to consist of several documents written by *Elohists* and *Jehovists* respectively. See GENESIS, PENTATEUCH.

NUMERALS, the general name given to figures or symbols by means of which numbers are expressed (for Roman and Greek numerals, see NOTATION); the distinctive name of *Arabic Numerals* being given to the nine figures or digits and the zero, that are now in almost universal use among civilised nations for this purpose. Both the origin of

these figures, and the period at which they became known in Europe, have been made subjects of laborious investigation; and it seems to be now proved beyond a doubt that they are of Indian not Arabic origin, and were invented by the Brahmins some time B. C. But the more important inquiry as to the time of their introduction into Europe has hitherto baffled all research. The simple and convenient theory, that they were introduced into Spain by the conquering Arabs, and from that country, then a great seat of learning, a knowledge of them was disseminated throughout Europe, is contradicted by the fact that the eastern Arabs themselves had no knowledge of them previous to the time of the Calif Al-Mamun (813—833), while a knowledge of them existed in Europe from a considerably earlier date. The most probable theory is, that they were brought from India, probably by the Neo-Pythagoreans, and introduced into Italy, whence they became known to a few of the learned men of Eastern Europe. We have, however, every reason to suppose that the figures then known were totally different in form from those now used. These latter, called *Gobar* by the Arabs, may have been brought to Bagdad during the reign of Al-Mansor (760), or his immediate successors, and certainly not later than the time of Al-Mamun. During the latter reign we know the present system of arithmetic was introduced into Persia from India, and most probably a knowledge of the Gobar figures at the same time. Thence the system of arithmetic was brought to north-western Africa and Spain, and doubtless the figures along with it, about the end of the 10th or beginning of the 11th century, and from Spain a knowledge of both was speedily communicated to the rest of Europe, the Gobar figures superseding those forms of Eastern figures which had previously been employed. The knowledge of the figures however spread, as was natural, much more rapidly than the notation and arithmetic of which they were the foundation, and we consequently find in writings and inscriptions of the middle ages the Gobar figures partly substituted for, and mixed up with, the Roman numerals; as, for instance, XXX2, for 32; X4, for 14, &c.; and occasionally such expressions as 302, 303, for 32 and 33. The earliest work on modern arithmetic was published in Germany in 1390; it explained the decimal notation, and exemplified the elementary rules. The Arabic numerals were not generally introduced into England till the commencement of the 17th c., and it was long after that time before the decimal arithmetic became general. See a dissertation *Sur les Chiffres Indiens*, by M. Woepke, in the Asiatic journal.

NUMERATION, the reading off of numbers that are expressed by figures. As shewn in Notation (q. v.), the first figure on the right hand expresses units; the next, tens; the third, hundreds; and following the same nomenclature with the next three figures, we have the fourth expressing units of thousands; the fifth, tens of thousands; the sixth, hundreds of thousands. The seventh figure, in like manner, expresses units of millions; the eighth, tens of millions; and the ninth, hundreds of millions. When this method is consistently followed out, as is the case with French and other continental arithmeticians, the fourth period, or group of three figures, is denominated billions, the first figure of it

(the tenth from the extreme right) being, units of billions; the next, tens of billions; &c. Read in this way, the figures 56,084,763,204,504 express fifty-six trillions, eighty-four billions, seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units. In Britain, there is a slight variation in the mode, the only effect of which is to render it a little more complicated; thus, after units of millions, come tens and hundreds of millions, but then instead of billions we have, according to the current usage, thousands of millions; after this, tens of thousands of millions and hundreds of thousands of millions, and then billions, which occupy the 13th figure from the right, and are reckoned in the same way as millions, so that the next unit or *trillions* does not come in till the 19th figure. The above number, according to the British mode, would be read fifty-six billions, eighty-four-thousand-seven-hundred-and-sixty-three millions, two hundred-and-four thousands, five-hundred-and-four units. The first method is perfectly symmetrical, keeping throughout to divisions of three figures; the second only keeps to this division up to hundreds of millions, when it changes it for a division into parcels of six figures, which are named from units up to hundreds of thousands of units. The latter mode is, however, gradually falling into disuse.

NUMIDIA (Gr. *Nomadia*, the land of Nomads), the name given by the Romans to a part of the north coast of Africa, corresponding to some extent with the modern Algiers. It was bounded on the W. by the river Mulucha (now *Moluya*), which separated it from Mauritania; on the E. by the river Tusca (now *Wadi-el-Berber*), which separated it from the territory of Carthage, the *Africa Propria* of the Romans; on the south, it reached to the chains of Mount Atlas and the Lacus Tritonis, which separated it from the land of the Gactulians and Interior Libya. The chief rivers were the Rubricatus and the Ampsaga. The inhabitants of N., as of Mauritania, belonged to the race from which the modern Berber are descended. They were a warlike race, and excelled as horsemen; but, like most barbarians, were faithless and unscrupulous. Of their tribes, the *Massyli* in the east, and the *Massasylæ* in the west, were the most powerful. In the grand struggle between the Carthaginians and the Romans, they at first fought on the side of the former, but subsequently the king of the Eastern Numidians, Massinissa, joined the Romans, and rendered them effectual service in the war with Hannibal. Favoured by the conquerors, he united all N. under his sway. Of his successors in this kingdom, Jugurtha and Juba are the most famous. After the victory of Cæsar over Juba I., in the African war, N. became a Roman province (46 B. C.); but Augustus afterwards gave the western part—from the river Ampsaga, now Wadi-el-Kibbir—with Mauritania, to Juba II., and the name N. became limited to the eastern part; and when Mauritania became a Roman province, the western part was called Mauritania Cæsariensis. Among the Roman *coloniæ* were Hippo Regius, near the mouth of the river Rubricatus; Cirta (the residence of the Numidian kings), afterwards called Constantina, a name still preserved in Constantine; Sicca, and Rusicada. For the modern history of N. see ALGIERS.
