CONTENTS

VOLUME ONE

Preface	xi
About the Editors	xiii
About the Contributors	xv
PART I. THE DISCIPLINE OF COMMUNICATION	
1. Communication as an Idea and as an Ideal	3
<i>H. Dan O’Hair, University of Oklahoma</i>	
<i>William F. Eadie, San Diego State University</i>	
2. Communication as a Field and as a Discipline	12
<i>William F. Eadie, San Diego State University</i>	
3. The Speech Tradition	22
<i>William M. Keith, University of Wisconsin–Milwaukee</i>	
4. The Journalism Tradition	31
<i>John Nerone, University of Illinois at Urbana-Champaign</i>	
PART II. APPROACHES TO THE STUDY OF COMMUNICATION	
5. Philosophical Approaches to Communication	41
<i>James A. Anderson, University of Utah</i>	
6. Rhetorical and Textual Approaches to Communication	49
<i>Valerie R. Renegar and Jennifer A. Malkowski, San Diego State University</i>	
7. Quantitative Approaches to Communication Research	57
<i>Timothy R. Levine, Michigan State University</i>	
8. Qualitative, Ethnographic, and Performative Approaches to Communication	65
<i>Dean Scheibel, Loyola Marymount University</i>	
9. Critical/Cultural Approaches to Communication	74
<i>Kent A. Ono, University of Illinois at Urbana-Champaign</i>	
10. Feminist Approaches to Communication	82
<i>Bonnie J. Dow, Vanderbilt University</i>	
11. Queer Approaches to Communication	90
<i>John M. Sloop, Vanderbilt University</i>	

PART III. KEY PROCESSES OF COMMUNICATION

- | | |
|--|-----|
| 12. Message Construction and Editing | 101 |
| <i>Michael E. Roloff, Northwestern University</i>
<i>Courtney N. Wright, University of Tennessee, Knoxville</i> | |
| 13. Cognition and Information Processing | 110 |
| <i>John O. Greene and Melanie Morgan, Purdue University</i> | |
| 14. Perspective Taking, Adaptation, and Coordination | 119 |
| <i>Amy S. Ebesu Hubbard, University of Hawai'i at Mānoa</i> | |
| 15. Social Construction | 128 |
| <i>Mariaelena Bartesaghi and Kenneth N. Cissna, University of South Florida</i> | |
| 16. Listening, Understanding, and Misunderstanding | 137 |
| <i>Andrew D. Wolvin, University of Maryland, College Park</i> | |
| 17. Performance and Storytelling | 147 |
| <i>Eric E. Peterson, University of Maine</i> | |
| 18. Persuasion and Compliance Gaining | 156 |
| <i>Robert H. Gass, California State University, Fullerton</i>
<i>John S. Seiter, Utah State University, Logan</i> | |
| 19. Identity as Constituted in Communication | 165 |
| <i>Karla Mason Bergen, College of Saint Mary</i>
<i>Dawn O. Braithwaite, University of Nebraska–Lincoln</i> | |

PART IV. FORMS AND TYPES OF COMMUNICATION

- | | |
|---|-----|
| 20. Conversation, Dialogue, and Discourse | 177 |
| <i>Robert R. Agne, Auburn University</i>
<i>Karen Tracy, University of Colorado, Boulder</i> | |
| 21. Interviewing | 186 |
| <i>Charles J. Stewart, Purdue University</i> | |
| 22. Public Speaking | 194 |
| <i>Amy Slagell, Iowa State University</i> | |
| 23. Deliberation, Debate, and Decision Making | 202 |
| <i>James F. Klumpp, University of Maryland</i> | |
| 24. Conflict Management and Mediation | 211 |
| <i>Linda L. Putnam, University of California, Santa Barbara</i> | |
| 25. Visual Rhetoric | 220 |
| <i>Janis L. Edwards, University of Alabama</i> | |
| 26. Memorials and Other Forms of Collective Memory | 228 |
| <i>Peter Ehrenhaus, Pacific Lutheran University</i> | |

PART V. KEY CHARACTERISTICS OF MESSAGES

- | | |
|--|-----|
| 27. The Interplay of Verbal and Nonverbal Codes | 239 |
| <i>Laura K. Guerrero, Arizona State University</i>
<i>Lisa Farinelli, Augustana College</i> | |
| 28. Rhetorical Style | 249 |
| <i>Barry Brummett, University of Texas at Austin</i> | |
| 29. Genre | 257 |
| <i>Karlynn Kohrs Campbell, University of Minnesota</i> | |
| 30. Dramatic Elements in Messages | 266 |
| <i>Edward C. Appel, Lock Haven University</i> | |
| 31. Rhetorical Exigency, Strategy, and Argumentation | 275 |
| <i>Karyn Charles Rybacki and Donald Jay Rybacki, Northern Michigan University</i> | |
| 32. Social Support | 283 |
| <i>Erina L. MacGeorge, Purdue University</i> | |

PART VI. KEY COMMUNICATION RELATIONSHIPS

33. Spouses and Other Intimate Partnerships 295
Laura Stafford, University of Kentucky
34. Children, Parents, and Grandparents 303
Michelle Miller-Day and Jennifer A. Kam, Pennsylvania State University
35. Friends 313
Kristen Norwood and Steve Duck, University of Iowa
36. Dating and Romantic Partners 322
Jennifer A. Samp and Caren E. Palevitz, University of Georgia
37. Supervisors, Subordinates, and Coworkers 331
Patrice M. Buzzanell and Rebecca L. Dohrman, Purdue University
38. Social Groups, Workgroups, and Teams 340
J. Kevin Barge, Texas A&M University
39. Students and Teachers 349
Steven A. Beebe, Texas State University—San Marcos
Timothy P. Mottet, University of Texas—Pan American
40. Patients, Doctors, and Other Helping Relationships 358
Wayne A. Beach, San Diego State University

PART VII. FACTORS AFFECTING COMMUNICATION

41. Gender 371
Julia T. Wood, University of North Carolina, Chapel Hill
42. Ethnicity 380
Melbourne S. Cummings, Howard University
43. Sexual Orientation 387
Bettina Heinz, Royal Roads University
44. Culture 396
Fred E. Jandt, California State University, San Bernardino
45. Risk 405
Katherine E. Rowan, George Mason University
46. Freedom of Expression 415
Dale A. Herbeck, Boston College
47. Globalization 424
John M. Eger, San Diego State University

PART VIII. CHALLENGES AND OPPORTUNITIES FOR COMMUNICATION

48. Ethical and Unethical Communication 435
Josina M. Makau, California State University, Monterey Bay
49. Competent and Incompetent Communication 444
Sherwyn P. Morreale, University of Colorado, Colorado Springs
50. Unwanted Communication, Aggression, and Abuse 454
Brian H. Spitzberg, San Diego State University
William R. Cupach, Illinois State University
51. Sexual Harassment 463
Debbie S. Dougherty, University of Missouri
52. Deception 471
Timothy R. Levine, Michigan State University
53. Bias 479
Andrew Cline, Missouri State University

VOLUME TWO

PART IX. MEDIA AS COMMUNICATION

54. Traditional and New Media 489
Rayford L. Steele, Ball State University
55. Media Portrayals and Representations 497
James D. Robinson, University of Dayton
56. Media Uses and Gratifications 506
CarrieLynn D. Reinhard, Roskilde University
Brenda Dervin, Ohio State University
57. Agenda Setting and Framing 516
Salma I. Ghanem, University of Texas–Pan American
Maxwell McCombs, University of Texas at Austin
Gennadiy Chernov, University of Regina
58. Cultivation and Media Exposure 525
Nancy Signorielli, University of Delaware
59. Virtual Reality and Presence 534
Corey Bohil, Charles B. Owen, Eui Jun Jeong, Bradly Alicea,
and Frank Biocca, Michigan State University
60. Computer-Mediated Communication 543
Lara Lengel, Bowling Green State University
61. Group Decision Support Systems 550
Marshall Scott Poole, University of Illinois at Urbana-Champaign
Iftekhar Ahmed, Texas A&M University
62. Media Literacy 558
W. James Potter, University of California, Santa Barbara

PART X. COMMUNICATION AS A PROFESSION

63. Professional Communication Practices 571
Dale Cyphert, University of Northern Iowa

PART XI. JOURNALISM

64. The Idea of Journalism 583
John Steel, University of Sheffield

65. The Changing Nature of “News”	592
<i>Michele Weldon, Northwestern University</i>	
66. Reporting, Story Development, and Editing	600
<i>K. Tim Wulfemeyer, San Diego State University</i>	
67. Investigative Journalism	609
<i>Hugo de Burgh, University of Westminster</i>	
68. Magazine and Feature Writing	618
<i>Edward Jay Friedlander, University of South Florida</i>	
69. Photojournalism	626
<i>James E. McNay, Santa Barbara, California</i>	
70. Broadcast Journalism	635
<i>Mark Leff, Ohio University</i>	
71. New Media Journalism	643
<i>John V. Pavlik, Rutgers University</i>	
72. Media Law in the United States	652
<i>Sandra Davidson, University of Missouri</i>	
73. Journalism Ethics	661
<i>Clifford G. Christians, University of Illinois at Urbana-Champaign</i>	
74. International Journalism	670
<i>Sam Chege Mwangi, Kansas State University</i>	
75. The Business of Journalism	679
<i>Robert Dowling, Tsinghua University</i>	

PART XII. PUBLIC RELATIONS

76. History and Concepts of Public Relations	689
<i>Glen M. Broom, San Diego State University</i>	
77. Theories and Effects of Public Relations	698
<i>Carl Botan, George Mason University</i>	
78. Public Relations Research	706
<i>Don W. Stacks, University of Miami</i>	
<i>Marcia Watson DiStaso, Pennsylvania State University</i>	
79. Ethics in Public Relations	715
<i>Charles Marsh, University of Kansas</i>	
80. Issues Management	724
<i>Robert L. Heath, University of Houston</i>	
81. Campaign Design and Management	732
<i>Ronald D. Smith, State University of New York, Buffalo State College</i>	
82. Crisis Communication	741
<i>Kathleen Fearn-Banks, University of Washington</i>	
83. Political Communication	749
<i>Sharon E. Jarvis and Soo-Hye Han, University of Texas at Austin</i>	
84. International Public Relations	758
<i>Suman Lee, Iowa State University</i>	
85. The Business of Public Relations	767
<i>John D. Stone, James Madison University</i>	

PART XIII. ADVERTISING

86. History of Advertising	779
<i>Edd Applegate, Middle Tennessee State University</i>	
87. Research in Advertising Campaign Design	788
<i>Samuel D. Bradley, Texas Tech University</i>	
<i>Timothy C. Laubacher, B&a Advertising</i>	
88. Creative Development and Copywriting in Advertising Campaigns	797
<i>David Klowden, The Lambesis Agency</i>	
89. Media Planning for Advertising Campaigns	805
<i>Donald W. Jugenheimer, In-Telligence Inc.</i>	
90. Integrated Marketing Communication	815
<i>Michael Belch and George Belch, San Diego State University</i>	
91. Social Marketing Campaigns	822
<i>Timothy Edgar and Megan J. Palamé, Emerson College</i>	
92. International Advertising	830
<i>Barbara Mueller, San Diego State University</i>	
93. The Business of Advertising	840
<i>Edward W. Russell, Syracuse University</i>	

PART XIV. MEDIA MANAGEMENT

94. Media Economics and Ownership	851
<i>Fang Liu and Alan B. Albarran, University of North Texas</i>	
95. Media Policy and Regulation	859
<i>John Allen Hendricks, Southeastern Oklahoma State University</i>	
96. Radio and Television Programming	868
<i>Lynne Schafer Gross, California State University, Fullerton</i>	
97. Media Convergence	877
<i>Brad Mello, National Communication Association</i>	

Index	885
--------------	------------

PREFACE

The discipline of communication has grown in popularity from the time professors of journalism and speech decided, in the mid-1960s, that the term *communication* was an excellent general descriptor for the theory and research that each group aspired to create. Over time, the two groups grew closer together and began to recognize significant overlap in their theoretical and research interests, but there were also differences in their traditions that kept them apart. While both groups agreed that communication is a practical discipline, journalism professors focused a great deal of their attention on the education of media professionals. Speech professors, on the other hand, often were more oriented to the liberal arts and valued the fact that communication could be approached from a variety of traditions, including the arts, humanities, social sciences, and even the sciences.

A key term in 21st-century communication, however, is convergence. Not only are media and technology converging with each other to produce new means of communicating but also individuals are increasingly using both new and existing communication tools to create new forms of communication. And this convergence forces the various “camps” within the communication discipline to draw on each other’s theories and research methods to keep up with explaining the rapidly changing communication environment.

This convergence of ideas and theories provides a space to challenge conventional ways of thinking about the communication discipline, and that’s what I’ve attempted to do in these volumes. I wasn’t alone in my concerns: When I first accepted the assignment to serve as Editor, I immediately convened several informal groups of scholars at a professional meeting to discuss how I should approach this task. Uniformly, these scholars said, “The ways we talk about our discipline are tired—look for different ways to approach the material that needs to be covered in such a work.” And they said, “Even though we’ve relied on contexts of communication (interpersonal, group, organizational, public, and mass communication) to describe ourselves over the years, this contextual approach hasn’t served us very

well.” So I looked for another way, one that would not only honor the diversity of the study of communication but also integrate that diversity into a coherent form.

In the end, following the sections that introduce the discipline and a number of different approaches to studying communication phenomena, I divided communication study into four basic properties: (1) the different *processes* that people typically use to accomplish the task of communicating with each other (such as message creation, information processing, and identity construction); (2) the *forms and types* of communication (such as conversation, public speaking, interviewing, and decision making) that are commonly encountered in everyday life; (3) the *characteristics* (such as strategy, style, and the interplay of verbal and nonverbal codes) that a communicator must consider in creating messages; and (4) how communication changes depending on the nature of the *relationships* (such as familial, work, and romantic) that individuals build and maintain through these various processes, forms, and types and carefully or not so carefully constructed messages. To these, I added a number of factors that influence how we communicate (such as gender, ethnicity, sexual orientation, and globalization), as well as a number of topics that could be considered to be both challenges and opportunities for communicators (such as communication competence, sexual harassment, deception, and bias).

While media topics are not ignored in Volume 1, they are the centerpiece of Volume 2. The study of media has been somewhat more organized than has been the study of the communication process more generally, and there are a number of widely recognized theories of media as communication for which considerable knowledge has been generated through various research studies. The first section of Volume 2 presents a number of these theories and approaches (such as agenda setting, cultivation, uses, and gratifications), as well as topics related to how people use technology in the communication process.

The remainder of Volume 2 focuses on communication as a profession and the various professional courses of study in the communication discipline: journalism, public relations, advertising, and media management. The curricula for

these programs of study contain courses that are commonly taught across much of the United States, and so I tended to organize the topics in these areas around those common course titles. These sections are most in keeping with the Sage Publications editors' original concept for the *21st Century* reference work series, to have topics tied to course titles in the curriculum discussed in essays of approximately the same length (about 7,000 words per essay) and to have them provide comprehensive coverage of each topic, along with suggestions for further reading should the reader wish to pursue the topic in greater depth.

But because the communication discipline consists of diverse approaches, these chapters are written in diverse styles and from different points of view. I am extremely pleased both with the quality of the authors that I was fortunate to recruit to write for this work and with the quality of the work that those authors produced. I asked the author(s) of each chapter to cover the chapter's topic in a comprehensive manner, to write from that author's knowledge and experience with the topic, and to provide a perspective that readers (both students and their professors) might find to be unique. And the authors took advantage of that challenge, producing approaches that range from personal history to advice giving to vivid descriptions of research and, yes, essays resembling traditional reviews of literature. In many cases, authors sought to place the knowledge that they were discussing into new forms or to make new connections that might not have been made before. This work is no compendium of highlights from textbooks; rather, it reads more like a series of opening-day lectures, where the professor attempts to engage students with the course material. I see the differences in style and approach as both representing the diversity of the communication discipline and also pointing to the strength we obtain from gathering together such a variety of approaches and viewpoints.

Perhaps I have a somewhat unique perspective on this material. I was trained in the speech tradition of the field; my undergraduate degree is in speech, but my doctorate is in communication, from one of the first departments to call itself by that name. I have served not only in traditional professor roles but also as Associate Director of the National Communication Association, the largest of the communication scholarly societies, where I found myself working on projects to the benefit of the entire discipline and explaining our discipline to a variety of external audiences. And now I am serving as Professor of Journalism and Media Studies, and although my colleagues still think of me as "that speech guy," they also allow me from time to time to push them toward the convergence of ideas that I described above. We are a long

way from that convergence, but my, admittedly biased, hope is that our two traditions will continue to look for what unites us rather than what divides us.

No enterprise of this size and scope can be the product of one person. I appreciate very much the invitation from Sage Publications to edit this work, the vision of Jim Brace-Thompson of Sage's Reference Division in creating this series of works and seeing them to fruition. Sara Tauber served ably as Development Editor, even through a pregnancy and the early infancy of her child. Leticia Gutierrez and Laura Notton provided a multitude of behind-the-scenes technical assistance to me and to the authors. Kate Schroeder and her staff provided efficient and effective production services to make the completed work a reality.

I also would like to thank the individuals (too numerous to name, but you know who you are) who advised me on creating the structure for the work. Sherwyn Morreale, my former colleague from our days together at the National Communication Association, and Glen Broom, my present-day colleague, agreed to assist as associate editors, and they helped me refine the chapter structure and to generate ideas for the chapter authors. They also each wrote an excellent chapter for this work.

In fact, *21st Century Communication: A Reference Handbook* would not exist were it not for the generous and high-quality contributions of the many authors who agreed to participate in creating it. I frequently received comments that the idea behind this work was a wonderful and needed one, and when authors agreed to write they did so enthusiastically. That enthusiasm shows in their work.

I want to thank in particular my colleagues and the administration at San Diego State University. The administration recognized this project as being an important one and allowed me to work on it as a significant part of my scholarly duties. My colleagues across the campus, in the School of Journalism and Media Studies, the School of Communication, and the Department of Marketing, not only encouraged me, but many of those talented individuals also contributed chapters.

Finally, editing such a large project can become obsessive at times (maybe even most of the time). I am grateful to friends and family (and you, too, know who you are) for putting up with my obsession, for worrying about me at the times when the workload was at its peak, and for listening to me endlessly and supporting me all the same.

21st Century Communication has been a labor of love on the part of many people. I hope that the love and care that went into its creation comes through to its readers.

William F. Eadie

ABOUT THE EDITORS

Editor-in-Chief

William F. Eadie is Professor of Journalism and Media Studies at San Diego State University. His teaching and research interests include the development of theories of media and communication, the history of the communication discipline, and the role of media in social influence campaigns. He also served as director of San Diego State's School of Communication between 2001 and 2005. Prior to arriving at San Diego State, he was Associate Director of the National Communication Association (NCA) in Washington, D.C., where he worked with researchers and promoted communication research to a variety of audiences. His other faculty appointments have been at Ohio University and California State University, Northridge, and he has served as adjunct visiting faculty at the University of Minnesota; University of Maryland; University of California, Los Angeles; and California State University, Los Angeles. He served as the first editor of *Journal of Applied Communication Research* after it became an NCA publication, and he has been an advocate for the application of communication research in ways that affect the lives of ordinary people. He also has served as president of the Western States Communication Association and as president of its auxiliary, the Executives Club, and he is currently serving as editor of *WSCA News*, the association's e-newsletter. He has received the NCA Golden Anniversary Award for a journal article that was judged to be outstanding and NCA's Samuel J. Becker Award for Distinguished Service to the Communication Discipline, and he has been elected a member of the national honorary societies Phi Kappa Phi, Golden Key, and Phi Beta Delta. With Paul Nelson, he coedited two books for SAGE: *The Language of Conflict and Resolution* (2000) and *The Changing Conversation in America: Lectures From the Smithsonian* (2001). His next book project is tentatively titled *When Communication Became a Discipline*, and it will focus on the period from the mid-1960s through the mid-1970s, when both the journalism and the speech fields adopted the term *communication* to describe scholarly work in those

fields. He received his PhD in communication from Purdue University and his bachelor's and master's degrees in speech from the University of California, Los Angeles.

Associate Editor

Glen M. Broom, PhD, is Professor Emeritus, School of Journalism and Media Studies, San Diego State University (1979–2007) and Adjunct Professor, Queensland University of Technology, Brisbane, Australia (2003–present). He began his career in 1963 at the University of at Urbana-Champaign as Assistant Extension Editor in the Cooperative Extension Service. His work included an assignment as a radio consultant with the U.S. Agency for International Development in Amman, Jordan. He moved to Chicago in 1968, becoming the part owner, vice president, and director of public relations of the Chicago-based management consulting and training firm Applied Behavioral Science, Inc. He left the company to pursue his PhD in Mass Communication at the University of Wisconsin–Madison. He joined the UW–Madison faculty as the head of the public relations sequence (1975–1979). He also has been a visiting professor at the University of Texas at Austin and universities in Brisbane, Sydney, and Melbourne, Australia. He is a coauthor of *Effective Public Relations* (6th–9th eds., 1985–2006), author of *Cutlip and Center's Effective Public Relations* (10th ed., 2009), and coauthor of *Using Research in Public Relations* (1990). He also has written more than 50 scholarly journal articles, convention papers, and book chapters. He was awarded the Pathfinder Award (1986) by the Institute of Public Relations, named Outstanding Educator (1991) by the Public Relations Society of America, and presented the Jackson, Jackson and Wagner Behavioral Science Prize (1993) by the Public Relations Society of America Foundation. At San Diego State University, he was selected three times as the outstanding journalism/communication professor (1989, 1995, and 2006) and named outstanding professor and faculty commencement speaker for the College of Professional Studies and Fine

Arts (1993). The School of Communication selected him as faculty commencement speaker in 2003. He earned his BS and MS degrees from the University of Illinois at Urbana-Champaign.

Editorial Board

Sherwyn P. Morreale, PhD, is Director of Graduate Studies in Communication at the University of Colorado at Colorado Springs. For 8 years, she served as associate director of the National Communication Association (NCA), where she worked actively to promote communication pedagogy and research. She has authored or coauthored 20 refereed scholarly articles in national and regional journals, 13 books and monographs, and 14 book chapters. She has made 140 presentations at national and regional conventions and numerous workshops on communication assessment, curriculum development, and public speaking on campuses across the country. She has just completed a handbook for graduate students in communication, distributed nationally to all graduate programs, and *Pathways to Communication Careers in the 21st Century* (7th ed.),

intended for undergraduates. She also recently wrote two encyclopedia entries on the nature of communication competence and two articles for NCA's leading journal, *Communication Education*, one on the centrality of communication education and the other on the nature of the basic communication course. In the past year, she worked with NCA to produce new editions of three publications on communication assessment, including *Assessing Motivation to Communicate* (2nd ed.), *Large Scale Assessment of Oral Communication: K-12 and Higher Education* (3rd ed.), and *The Competent Speaker Speech Evaluation Program* (2nd ed.). She is presently working on two book projects, a public speaking textbook and a coauthored scholarly book on organizational trust, and on a major review of communication assessment for *Communication Education*, as well as several other research studies. In her capacity as Graduate Director at University of Colorado at Colorado Springs, she presently teaches Introduction to Graduate Study in Communication, Advanced Communication Theory, a seminar in Communication Competence, and a seminar in Organizational Communication with the campus chancellor, Dr. Pamela Shockley. She received her PhD from the University of Denver.

ABOUT THE CONTRIBUTORS

Robert R. Agne is Assistant Professor of Communication at Auburn University, Auburn, Alabama. His research interest is in the communicative challenges people face in various interactional settings. Much of his work has focused on the telephone negotiations between the Federal Bureau of Investigation and the Branch Davidians during the siege outside Waco, Texas, in 1993. Other studies have examined friendship interaction, mediation training, parasocial relationships through blog postings, 911 telephone calls, and social interaction among psychic readers. He received his PhD in 2003 from the University of Colorado, Boulder.

Alan B. Albarran is Professor and Director, Center for Spanish Language Media, University of North Texas. His research and teaching interests are in the management and economics of the communication industries. He served as editor of the *International Journal on Media Management* from 2006 to 2008 and editor of the *Journal of Media Economics* from 1997 to 2005. He is the author of seven books: *Handbook of Media Management and Economics*; *Management of Electronic Media*; *Media Economics: Understanding Markets, Industries and Concepts*; *Global Media Economics*; *Understanding the Web: Social, Political and Economic Dimensions of the Internet*; *The Radio Broadcasting Industry*; and *Time and Media Markets*. He has conducted workshops and given lectures in several countries, including Spain, Italy, Germany, France, Sweden, Finland, the United Kingdom, Switzerland, Mexico, Portugal, China, Taiwan, Russia, and Colombia. In 2008, he received the Award of Honor given by the *Journal of Media Economics* recognizing his lifetime achievement in the field. His professional experience includes work at six radio and two television stations, as well as industry consulting. He received his PhD from the Center for Spanish Language Media, MA from The Ohio State University, and BA from Marshall University.

Bradly Alicea is currently a research associate in the MIND Lab at Michigan State University. He earned his master's degree in anthropology and zoology from the University of Florida in 2002. He has done research in a number of areas,

including human-computer interaction, bioinformatics, and evolutionary biology. His PhD in media and information from Michigan State University is nearing completion.

James A. Anderson, Professor of Communication, University of Utah, is the author/coauthor/editor of 16 books, including *Communication Research: Issues and Methods* (1987), *Mediated Communication: A Social Action Perspective* (Sage, 1988), *Communication Theory: Epistemological Foundations* (1996), *The Organizational Self and Ethical Conduct* (2001), and *Media Violence and Aggression* (Sage, 2008). His 100-plus chapters, articles, and research monographs are in the areas of family studies, cultural studies, media literacy, organizational studies, communicative ethics, methodology, and epistemology. He is a fellow and past president of the International Communication Association. He has been the editor of *Communication Yearbook and Communication Theory*, associate editor of *Human Communication Research*, and guest editor of *Communication Studies and American Behavioral Scientist*, as well as a member of the editorial board of seven other journals. He is currently Executive Editor of the *Rocky Mountain Communication Review*. His forthcoming titles from Sage include works on mediated communication research methods and theory. He earned his PhD from the University of Iowa.

Edward C. Appel, Department of Communication and Philosophy, Lock Haven University, received his PhD in rhetoric and communication from Temple University (1984) and an MDiv from the Lancaster Theological Seminary (1985). He is the author of eight journal articles, all pertaining to Kenneth Burke and dramatism. He has served as associate editor of the *Quarterly Journal of Speech* and as conversation editor and associate editor of the *KB (Kenneth Burke) Journal.org*. In addition to teaching, he has had practical experience in public address as a Supply Preacher in the Presbyterian Church USA.

Edd Applegate is Professor of Advertising at Middle Tennessee State University. He has written several books on

advertising. He has contributed more than 75 articles and chapters to various books and encyclopedias. He has written more than 25 refereed articles for academic journals and proceedings. His research focuses on the history of advertising and journalism as well as the history of advertising education. He received his doctorate from Oklahoma State University.

J. Kevin Barge is Professor of Communication at Texas A&M University. His research interests center on developing a social constructionist approach to management and leadership, exploring the role of appreciative forms of communication to transform organizations, and articulating the relationship between dialogue and organizing in organizational and community contexts. His research has been published in the *Academy of Management Review*, *Management Communication Quarterly*, *Journal of Applied Communication Research*, *The OD Practitioner*, *Communication Theory*, and *Communication Monographs*. He received his MA and PhD degrees from the University of Kansas.

Mariaelena Bartesaghi is Assistant Professor of Communication at the University of South Florida. She has explored the impact of social construction in communication in *Communication Yearbook* (2008) and in a chapter of *Socially Constructing Communication* (2009), both coauthored with Theresa Castor. Her work in language and social interaction examines the therapeutic as discourse of authority that is continuously reconstructed in institutional talk and text. She received her PhD from the University of Pennsylvania.

Wayne A. Beach is a professor in the School of Communication, San Diego State University; adjunct professor in the Department of Surgery, School of Medicine; and member, Moores Cancer Center, University of California, San Diego. His research reveals a particular concern with health and illness, including long-term investigations of how family members talk through cancer on the telephone, medical interviewing in preventive and oncological care, and related illness dilemmas (e.g., bulimia, obesity, chest pain, cancer diagnosis, treatment, and prognosis). External funding for his research has been awarded from the National Cancer Institute (NCI), the American Cancer Society, and several philanthropic foundations in San Diego. His current work examines how patients make available and oncologists respond to fears, uncertainties, and hopes about cancer. Among other projects, he is also collaborating with professional theater groups in a production documenting how family members communicate about and manage cancer. Additional information is available at <http://advancement.sdsu.edu/marcomm/features/2008/cancer.html>. He earned his PhD in 1981 from the University of Utah.

Steven A. Beebe is Regents' Professor and Chair of the Department of Communication Studies and Associate

Dean of the College of Fine Arts and Communication at Texas State University–San Marcos. He is the author or coauthor of 12 widely used communication textbooks, most of which are in multiple editions. His research has appeared in *Communication Education*, *Human Communication*, *American Communication Journal*, *Communication Quarterly*, *Communication Research Reports*, and numerous other communication journals. He's received his university's highest awards for both research and service and was named Outstanding Communication Professor in America by the National Speaker's Association. He received his PhD in 1976 from the University of Missouri–Columbia.

George Belch is Professor of Marketing and Chair of the Marketing Department at San Diego State University, where he teaches strategic marketing planning, integrated marketing communications, and consumer/customer behavior. Prior to joining San Diego State, he was a member of the faculty in the Graduate School of Management, University of California, Irvine. He has been a visiting professor in the Graduate School of International Relations and Pacific Studies at the University of California, San Diego. Before entering academia, he was a marketing representative for the E.I. DuPont Company. He also worked as a research analyst for the DDB Worldwide advertising agency. He received his PhD in marketing from the University of California, Los Angeles.

Michael Belch has been Professor of Marketing at San Diego State University since 1976. Prior to obtaining his PhD, he was employed by the General Foods Corporation as a marketing representative. He received his BS degree from The Pennsylvania State University and his MBA from Drexel University. He obtained his PhD from the University of Pittsburgh with a major in consumer behavior and a minor in social psychology.

Karla Mason Bergen is Assistant Professor of Communication and Coordinator of Women's Studies at the College of Saint Mary in Omaha, Nebraska. Her research is focused on family communication and the social construction of identity, specifically how women communicatively negotiate unconventional identities. She has studied identity construction of female professors, lesbian families, and, most recently, women in commuter marriages and has published several articles and book chapters based on her research. She earned her PhD from the University of Nebraska–Lincoln.

Frank Biocca is the AT&T Chair of Telecommunication, Information, and Media. He directs the networked Media Interface and Network Design (MIND) Lab. He is interested in how mind and media can be coupled to extend human cognition and enhance human performance. His current projects include research on the psychology of presence in virtual environments, spatial cognition and information organization

in high-bandwidth and mobile system collaborative augmented-reality systems, and work on adapting interfaces to cognitive styles and subcultural differences. Among his books is the award-winning *Communication in the Age of Virtual Reality*. He has patents on augmented reality technology and more than 150 publications and has participated in the introduction of the first portable computer.

Corey Bohil is a cognitive psychologist with a background in classification and decision making, cognitive modeling, and human-computer interaction. He has worked on research projects exploring body-worn interfaces, augmented-reality navigation aids, and psychophysiological responses to virtual stimuli. His industry experience includes serving as a cognitive scientist for Perceptive Sciences Corporation in Austin, Texas, where he designed and implemented usability studies for numerous prominent software development companies. As the manager of the Michigan State University MIND Lab, he is involved in all phases of experimentation concerning uses of technology to augment cognitive/behavioral task performance, including spatial learning, embodied cognition, procedural and explicit learning, and telepresence.

Carl Botan has four decades of practice and academic research experience in public relations, strategic communication, and political campaigns. His current focus is on the use of strategic communication campaigns to address terrorism and other homeland security issues in both the United States and the developing world. In particular, he studies ways to ethically integrate strategic communication campaigns into domestic preparedness, training, and education efforts addressing both terrorism and natural disasters. He has won numerous awards, including designation as Australia's 1998 Outstanding Scholar-Practitioner in Public Relations, and the Outstanding Research Achievement Award and the Book of the Year Award, both from the public relations division of the National Communication Association. His best-known books are *Public Relations Theory*, *Public Relations Theory II* (both with Vincent Hazleton) and *Investigating Communication* (with Larry Frey and Gary Kreps).

Samuel D. Bradley is Assistant Professor of Advertising at Texas Tech University. He runs a psychophysiology lab designed to study attention, emotion, and memory in response to advertising and other mediated messages. He earned his PhD in mass communications and cognitive science at Indiana University in 2005.

Dawn O. Braithwaite is a Willa Cather Professor and Professor of Communication at the University of Nebraska–Lincoln. Her research focuses on how persons in personal and family relationships communicate during times of family transitions and challenges. She has published four books and 70 articles and chapters. She received the National Communication Association's Brommel Award for Family Communication and the University of Nebraska–Lincoln College of Arts and Sciences Award for

Outstanding Research and Creative Achievement in the Social Sciences. She is a past president of the Western States Communication Association and will be the National Communication Association's president in 2010. She received her PhD in 1988 from the University of Minnesota.

Barry Brummett is the Charles Sapp Centennial Professor in Communication and Department of Communication Studies Chair at the University of Texas–Austin. Among his publications are *A Rhetoric of Style* (Southern Illinois University) and *Rhetorical Homologies* (University of Alabama). He is a specialist in the rhetoric of popular culture and in the theories of Kenneth Burke. He earned his PhD in 1978 at the University of Minnesota.

Patrice M. Buzzanell is Professor and Redding Fellow in the Department of Communication. Her research interests coalesce around issues of gender in the workplace, with emphasis on career, leadership, and work-family processes. She received her PhD from Purdue University.

Karlynn Kohrs Campbell is Professor of Communication Studies at the University of Minnesota. She is the author of *Man Cannot Speak for Her: A Critical Study of Early Feminist Rhetoric* (2 vols., 1989) and coauthor of *Deeds Done in Words: Presidential Rhetoric and the Genres of Governance* (1990), *Presidents Creating the Presidency* (2008), *The Interplay of Influence: News, Advertising, Politics, and the Mass Media* (6th ed., 2006), *Critiques of Contemporary Rhetoric* (1997), and *The Rhetorical Act* (4th ed., 2008) and editor of *Women Public Speakers in the United States, 1800–1925* (1993) and *Women Public Speakers in the United States, 1925–Present* (1994). Her awards include a fellowship at the Shorenstein Center of the Kennedy School at Harvard, the National Communication Association Distinguished Scholar Award, the Woolbert Award for scholarship of exceptional originality and influence, and NCA's Golden Anniversary Monograph Award. She is the University of Minnesota 2002 Distinguished Woman Scholar in the Humanities and Social Sciences.

Gennadiy Chernov is an assistant professor in the School of Journalism, University of Regina. His research interests include mass communication theory, the psychological mechanisms of media effects, and agenda-setting theory. He received his PhD from the University of Oregon.

Clifford G. Christians is the Charles H. Sandage Distinguished Professor and Research Professor of Communications at the University of Illinois at Urbana-Champaign. He is Director of the Institute of Communications Research and holds joint appointments as Professor of Media Studies and Professor of Journalism. He has authored or coauthored numerous books and essays on communication ethics; his research specialty is universals in media ethics. He received his PhD in communications in 1974 from the University of at Urbana-Champaign.

Kenneth N. Cissna is a professor and chair of the Department of Communication at the University of South Florida, where he teaches undergraduate and graduate courses in interpersonal communication, group communication, and dialogue theory and practice. He has published scores of scholarly book chapters and journal articles and six books, including *Applied Communication in the 21st Century*, which received the 1995 Outstanding Book Award from the Applied Communication Division of the National Communication Association (NCA); *Moments of Meeting: Buber, Rogers, and the Potential for Public Dialogue* (with Rob Anderson); *Dialogue: Theorizing Difference in Communication Studies* (Sage, with Rob Anderson and Leslie A. Baxter), and, most recently, the *Handbook of Applied Communication Research* (with Lawrence Frey). He served as editor of the *Journal of Applied Communication Research* and of the *Southern Communication Journal*, and with Rob Anderson, he recently coedited a special issue of *Communication Theory* on “Fresh Perspectives in Dialogue Theory.” He is a past president of both the Florida Communication Association and the Southern States Communication Association (SSCA). His awards include SSCA’s 2007 T. Earle Johnson—Edwin Paget Distinguished Service Award and NCA’s 2008 Gerald M. Phillips Award for Distinguished Applied Communication Scholarship. He earned his PhD in 1975 from the University of Denver.

Andrew Cline is Assistant Professor of Journalism at Missouri State University. His fields of study are rhetoric and political science. His research focuses on the rhetorical aspects of the interaction of the news media and politics, including examining persuasive intention and bias. He earned his PhD in the interdisciplinary program at the University of Missouri—Kansas City.

William R. Cupach is a professor in the School of Communication at Illinois State University. His research pertains to problematic interactions in interpersonal relationships, including contexts such as embarrassing predicaments, relational transgressions, interpersonal conflict, and obsessive relational pursuit. He is a coauthor or coeditor of four scholarly books on “the dark side” of communication and relationships. He is a past president of the International Association for Relationship Research. He received his PhD in Communication Arts and Sciences from the University of Southern California.

Melbourne S. Cummings is graduate professor of Communication and Culture at Howard University in Washington, D.C. She received her PhD in Speech and Intercultural Communications from University of California, Los Angeles. She currently teaches and directs theses and dissertations in the areas of African American and intercultural communications. She has also written and published in these areas of rhetoric and culture as well as curriculum development in African American discourse. She serves as mentor to doctoral students interested in entering the professoriat and has served on the advisory

council of the National Communication Association’s Preparing Future Faculty, the Legislative Council, as well as Chair of the Affirmative Action Committee, and the Black Caucus. At the National Association’s conventions, she has been awarded two of their highest awards: The Robert Kibler Memorial Award for service to the organization and the MENTOR AWARD for her work with doctoral students and young African American faculty in the field of communications. Her publications appear in several refereed disciplinary journals and anthologies.

Dale Cyphert, PhD, is an associate professor in the Department of Management at the University of Northern Iowa. With degrees in speech, rhetoric and public relations, her career has included managerial positions in public relations, personnel, retail operations, and workplace training. Specializing in cross-cultural rhetorical theory, her research focuses primarily on variations in decision-making norms across differing socioeconomic groups. Current projects include the definition and development of communication competence in business organizations, methods of improving virtual team decision-making communication, the management of collaborative writing, and the use of communication to enforce or change a community’s decision-making norms.

Sandra Davidson, PhD, JD, is Associate Professor of Journalism and Adjunct Associate Professor of Law at the University of Missouri. She is the attorney for the *Columbia Missourian*. Her academic writings include “From Spam to Stern: Advertising Law and the Internet,” in *Advertising and the Internet: Theory and Research* (2007), and “Journalism: The Lifeblood of a Democracy” and “Journalism: Legal Situation,” published in *The International Encyclopedia of Communication*, edited by Wolfgang Donsbach (2008).

Hugo de Burgh is Professor of Journalism at the University of Westminster, Special Professor of Investigative Journalism at Tsinghua University (PRC 985 International Leading Scholar Programme Second Round/Specialist Plan for the Introduction of Key Knowledge and Talents), and Director of the China Media Centre, London. Among his recent books are *Investigative Journalism* (2nd ed., 2008), *China: Friend or Foe?* (2006), and *Making Journalists: Diverse Models, Global Issues* (2005) (the internationalization of journalism, including Latin America, the Arab World, Africa, Continental Europe, India, and the United States).

Brenda Dervin is a professor in The Ohio State University School of Communication and Joan N. Huber Fellow in Social and Behavior Sciences. Her research focuses on improving methodological approaches, particularly interviewing, for studying and understanding audiences and users. She formerly worked as a public information officer.

Marcia Watson DiStaso is Assistant Professor of Public Relations in the College of Communications at Pennsylvania State University. She serves as a board member of the International Public Relations Research

Conference, and her research focuses on investor relations as well as other issues important to public relations, such as research and new technologies. She received her PhD in communication from the University of Miami.

Rebecca L. Dohrman is a doctoral student in the Department of Communication who focuses on gender, alternative organizations, and entrepreneurship. She received her MA from Saint Louis University.

Debbie S. Dougherty is an associate professor in the Department of Communication at the University of Missouri. Her research interests focus on organizational power, particularly as it relates to sexual harassment and to emotions at work. She received her PhD in 2000 from the University of Nebraska–Lincoln.

Bonnie J. Dow is Associate Professor and Chair of Communication Studies and Associate Professor of Women's and Gender Studies at Vanderbilt University. She is the author of *Prime-Time Feminism: Television, Media Culture* and the *Women's Movement Since 1970* (1996) and a coeditor (with Julia T. Wood) of *The SAGE Handbook of Gender and Communication* (Sage, 2006). Her research interests include analysis of women's public address and feminist criticism of the mass media. She earned a doctorate in speech communication from the University of Minnesota in 1990.

Robert Dowling has been a reporter and editor for four decades and is a visiting professor at Tsinghua University in Beijing, where he helped launch a Global Business Journalism program for the School of Journalism and Communications. He is also the editorial adviser to *Caijing*, China's leading business magazine. Before his retirement from *Business Week* in 2007, he was the international managing editor of the magazine from 1991 to 2006 and assistant managing editor for ethics and training. He served as the magazine's European economic correspondent and Washington economic and monetary correspondent. He has been an editor and reporter for the *American Banker*, *Baltimore Sun*, and *The Hartford Times* and a reporter for UPI (United Press International). He is a board member of the Overseas Press Club (OPC) and serves on its Freedom of the Press Committee. During his editorship, *Business Week* won 16 awards for best economic, foreign affairs, and environmental coverage from the OPC. He is a frequent commentator on international economic and media trends.

Steve Duck is the Daniel and Amy Starch Distinguished Research Chair at the University of Iowa and the author or editor of more than 50 books, the latest being (with David McMahan) Sage's new hybrid text *Basics of Communication: A Relational Perspective*.

Amy S. Ebesu Hubbard is an associate professor in the Department of Speech at the University of Hawai'i at Mānoa. She earned her PhD in communication from the University of Arizona.

Timothy Edgar is an associate professor and director of the graduate program in health communication at Emerson College, where he teaches social marketing and behavioral and communication theory. He also has a secondary appointment as an associate adjunct clinical professor in the Department of Public Health and Family Medicine at the Tufts University School of Medicine. His career has been devoted to conducting research on the use of communication and social marketing strategies to motivate changes in health-related risk behaviors. Prior to joining the Emerson faculty, he was a senior study director at Westat in Rockville, Maryland for 9 years. While at Westat, he was an evaluator for the VERB™ campaign. He has a PhD from Purdue University.

Janis L. Edwards is Associate Professor of Communication Studies at the University of Alabama, where she teaches courses in rhetorical criticism, political communication, and visual communication. She has twice chaired the NCA Visual Communication Division, and her research on political cartoons and other visual artifacts has been published in a variety of journals and in the books *Defining Visual Rhetoric* and *Visual Rhetoric: A Reader in Communication and American Culture*. She is the author of *Political Cartoons in the 1988 Presidential Campaign: Image, Metaphor, and Narrative*. She received a PhD in 1993 from the University of Massachusetts.

John M. Eger is Van Deerlin Endowed Chair of Communication and Public Policy and Executive Director of the International Center for Communications at San Diego State University. He has taught media technology in a global environment, trends in technology and public policy, government telecommunications, and international communications for more than 16 years. A former advisor to two presidents and director of the White House Office of Telecommunications Policy (OTP), he helped spearhead the restructuring of America's telecommunications industry and initiated the development of an Asian Basin secretariat on telecommunications. This effort resulted in the formation of the Pacific Telecommunications Council. As the head of CBS Broadcasting International, he negotiated a groundbreaking agreement with China Central Television (CCTV) for commercial television. He was also responsible for the development of the prize-winning home video documentary series *World War II With Walter Cronkite*; the inauguration of live and tape-delayed, in-flight programming on domestic and international aircraft; and satellite delivery of *The CBS Evening News With Dan Rather* to Paris and Tokyo.

Peter Ehrenhaus is Professor and Chair in the Department of Communication and Theatre at Pacific Lutheran University, Tacoma, Washington. He has written extensively about the cultural legacies of the Vietnam War, through projects concerned with the Vietnam Veterans Memorial, the Tomb of the Unknown for the Vietnam War, and the uses of Holocaust memory and

American memory of the Second World War to circumvent “the Vietnam syndrome.” He is currently working on several projects concerned with memory of race lynching in America. He has a PhD from the University of Minnesota, Minneapolis.

Lisa Farinelli (PhD, Arizona State University, 2008) is an assistant professor of Speech Communication at Augustana College. Her research program emphasizes issues of emotional communication and conflict dynamics in personal relationships. Her most recent work has centered on the mental health context, with a focus on parents’ (a) care-giving practices and (b) verbal and non-verbal emotional expressions with children who have mental illnesses.

Kathleen Fearn-Banks, a tenured associate professor, joined the Department of Communication, University of Washington (Seattle) after more than 25 years in the communications professions—as a feature writer at the *Los Angeles Times*, a news writer/producer/reporter for KNXT-TV (now KCBS) in Los Angeles, and a publicist and media relations manager for NBC Television Network. She was Vice President of Development and Public Relations for The Neighbors of Watts, a nonprofit entertainment industry, which raised funds for day care centers in underprivileged areas. She is the author of three editions of *Crisis Communications: A Casebook Approach*, published first in 1996, with a fourth edition to be published in 2010. *The Historical Dictionary of African-American Television* was published in 2006.

Edward Jay Friedlander is Professor of Mass Communications at the University of South Florida. He is the coauthor of three journalism textbooks, including *Feature Writing for Newspapers and Magazines: The Pursuit of Excellence*. The textbooks have been used by students at more than 250 colleges and universities in the United States, including 25 large state universities and numerous private universities such as Harvard. The books also have been used by dozens of universities in Asia, Australia, Europe, North America, and South America. He has been a reporter for newspapers in Wyoming, Pennsylvania, Colorado, and Arkansas, and his freelance work has appeared in 40 other newspapers and a dozen national and regional magazines. He received his doctorate from the University of Northern Colorado, his master’s degree from the University of Denver, and his bachelor’s degree from the University of Wyoming.

Robert H. Gass received his PhD from the University of Kansas and is a professor of Human Communication Studies at California State University, Fullerton. His areas of expertise are argumentation, persuasion, social influence, and compliance gaining. He has published two texts (with co-author John Seiter) and over 70 scholarly articles, book chapters, conference proceedings, and professional papers. His recent research has focused on credibility in public diplomacy, visual persuasion, and interpersonal

influence. His textbook with John S. Seiter, *Persuasion, Social Influence, and Compliance Gaining*, is now in its third edition.

Salma I. Ghanem is Professor and Chair of the Department of Communication at the University of Texas–Pan American. Her research interests include first- and second-level agenda setting, coverage of the Middle East, and political communication. She has a PhD from the University of Texas at Austin.

John O. Greene is currently a professor in the Department of Communication at Purdue University. His research interests lie in interpersonal communication, nonverbal communication, and communication and aging. His approach to these areas of study is that of cognitive science. He is a past editor of *Human Communication Research*, a recipient of the National Communication Association’s Charles H. Woolbert Award, and a two-time winner of the Gerald R. Miller Book Award. He earned his PhD in communication from the University of Wisconsin–Madison.

Lynne Schafer Gross has taught radio-television production and theory courses at California State University, Fullerton (where she was the vice chair of the Communications Department), Pepperdine University, Loyola Marymount University, University of California, Los Angeles (UCLA), University of Southern California, and Long Beach City College. She is the author of 12 books and numerous journal and magazine articles, many of which deal with radio and TV programming. She is currently Associate Producer for the instructional video series *Journeys Below the Line* and in the past was Program Director for Valley Cable TV. She has served as producer for several hundred television programs, including the series *From Chant to Chance* for public television, *Effective Living* for KABC, and *Surveying the Universe* for KHJ-TV. Her consulting work includes projects for Children’s Broadcasting Corporation, RKO, KCET, CBS, the Olympics, Visa, and the Iowa State Board of Regents. It has also taken her to Malaysia, Swaziland, Estonia, Russia, Australia, and Guyana, where she has taught radio and television production and consulted on film planning and postproduction equipment. She is active in many professional organizations, serving as Governor of the Academy of Television Arts and Sciences and President of the Broadcast Education Association. The awards she has received include the Rosebud Award for Outstanding Media Arts Professor in the California State University System, the Frank Stanton Fellow for Distinguished Contribution to Electronic Media Education from the International Radio and Television Society, and the Distinguished Education Service Award from the BEA. She received her doctorate from UCLA.

Laura K. Guerrero is a professor in the Hugh Downs School of Human Communication at Arizona State University in Tempe. She has published extensively in the

areas of nonverbal and relational communication. Her work on nonverbal communication includes articles and chapters focusing on issues such as attachment, conflict, emotion, and intimacy. She has also published three books on nonverbal communication—*Nonverbal Communication in Relationships* (with Kory Floyd), *The Nonverbal Communication Reader* (with Michael Hecht), and *Nonverbal Communication* (with Judee Burgoon and Kory Floyd). She has a PhD from the University of Arizona.

Soo-Hye Han is a doctoral candidate in communication studies at the University of Texas at Austin. She is studying political language, campaign discourse, and media effects.

Robert L. Heath is Professor Emeritus at the University of Houston and Academic Consultant, University of Wollongong, Australia. He has published 14 books, including *Terrorism: Communication and Rhetorical Perspectives* (2008), *Today's Public Relations* (2006), *Encyclopedia of Public Relations* (2005), *Responding to Crisis: A Rhetorical Approach to Crisis Communication* (2004), and *Handbook of Public Relations* (2001). He also recently coedited *Communication and the Media* (2005), volume 3 of the series *Community Preparedness and Response to Terrorism*. He has contributed chapters and articles on issues management, public relations, crisis communication, risk communication, environmental communication, emergency management, rhetorical criticism, and communication theory. He is a coeditor of the forthcoming *Handbook of Crisis and Risk Communication* and coauthor of the forthcoming *Strategic Issues Management* (2nd ed.). He received his PhD in 1971 from the University of Illinois.

Bettina Heinz is an associate professor in the School of Communication and Culture and Associate Dean of the Faculty of Social and Applied Sciences at Royal Roads University in Victoria, British Columbia, Canada. Her scholarship focuses on culture and communication, with particular focus on language, gender identity, and sexual orientation. She is a past chair of the Caucus on Gay and Lesbian Concerns of the National Communication Association and a past member of the NCA L/G/B/T Division Committee on L/G/B/T Communication Scholarship. She obtained her PhD in communication studies from the University of Nebraska–Lincoln in 1998.

John Allen Hendricks is Professor of Communication and a former chairperson of the Department of Communication and Theatre at Southeastern Oklahoma State University. He has published numerous articles, chapters, and essays in journals, encyclopedias, and books on media policy, media regulation, media history, and political communication. He holds a PhD in mass communication from the University of Southern Mississippi.

Dale A. Herbeck is currently a professor in the Communication Department at Boston College, where he teaches courses in communication law, cyber law, and freedom of expression. He is a coauthor of *Freedom of Speech*

in the United States, a past editor of the *Free Speech Yearbook*, and a former chair of the Commission on Freedom of Expression of the National Communication Association. He holds a PhD in communication studies from the University of Iowa.

Fred E. Jandt is Professor of Communication and Dean, Palm Desert Campus, California State University, San Bernardino. He was formerly Professor of Communication and Director of Faculty Development and Research at State University of New York, College at Brockport. He has also been a visiting professor at Victoria University of Wellington in New Zealand. His areas of interest are intercultural and international communication, negotiation and mediation, and computer-mediated communication. His books include *Win-Win Negotiating* (1985), which has been translated into eight languages, and *An Introduction to Intercultural Communication: Identities in a Global Community*, now in its sixth edition (Sage, in press). He is also a coeditor, with Paul B. Pedersen, of the Sage book *Constructive Conflict Management: Asia-Pacific Cases*. He has a PhD from Bowling Green State University.

Sharon E. Jarvis is Associate Professor of Communication Studies and Government at the University of Texas at Austin, where she is also Associate Director for Research at the Annette Strauss Institute for Civic Participation. She has a PhD from the University of Texas at Austin.

Eui Jun Jeong is a PhD student in the Department of Telecommunication, Information Studies, and Media at Michigan State University. He was a senior researcher at the Korea Game Development and Promotion Institute from 2001 to 2004. His main interests are the educational effects of games on users and the applicability of interactive new media in education and health. His interests include education-applied technology, human-computer interaction, virtual reality, social network, and human cognition.

Donald W. Jugenheimer recently retired as Professor and Chair, Department of Advertising, Texas Tech University. He currently holds the position of principal and partner at In-Telligence Inc. He does research in advertising media, management, and the future of media. He has experience in advertising, media planning, and administration. He has a PhD in communications from the University of Illinois.

Jennifer A. Kam is currently a PhD candidate in the Communication Arts and Sciences Department at the Pennsylvania State University, where she has taught intercultural communication, interpersonal communication, and public speaking. Her areas of research comprise interpersonal communication, family and life span communication, and culturally grounded health promotion. She received her MA in 2004 from San Diego State University.

William M. Keith is Professor of Communication at the University of Wisconsin–Milwaukee. He is the author of *Democracy as Discussion* (2007) and was a coeditor, with

Alan Gross, of *Rhetorical Hermeneutics* (1998). He holds a PhD from the University of Texas at Austin.

David Klowden is Senior Copywriter at The Lambesis Agency. He has worked on campaigns for Hitachi, Skyy Vodka, Bebe, Campari, and The Natural Resources Defense Council. Prior to his career in advertising, he taught writing and cultural studies at the University of California, San Diego (UCSD), San Diego Mesa College, and Southwestern College. He is currently writing his second novel, which he hopes will be better than his first. He graduated Summa Cum Laude with a BA in creative writing from UCSD, where he also received his MA and CPhil in composition.

James F. Klumpp is Professor of Communication at the University of Maryland. He is a rhetorical critic with research interests in argumentation, political communication, and the history of American speaking. He was formerly Director of Debate and Forensics at the University of Minnesota, Wayne State University, and the University of Nebraska. He is a former president of the American Forensic Association, former editor of *Argumentation and Advocacy*, and former director of the National Communication Association/American Forensic Association Summer Conference on Argumentation. His publications include the coauthored *Public Policy Decision Making: Systems Analysis and Comparative Advantages Debate*. He earned his PhD in 1973 from the University of Minnesota.

Timothy C. Laubacher is a brand strategist for B&a, an advertising agency in Columbus, Ohio. His research while a student at Ohio State University focused on mass and interpersonal mediated communication. Specifically, his research attempted to measure the concept of presence using psychophysiological methods. Now, working in the advertising industry, he is responsible for keeping the customers' perspectives at the forefront of all advertising messaging through planning and conducting advertising research. He earned an MA in mass communication from Ohio State University in 2006.

Suman Lee is an assistant professor in the Greenlee School of Journalism and Communication at Iowa State University. His research focuses on international public relations, image/reputation building process, public diplomacy, and international newsworthiness. His articles appeared in *Public Relations Review*, *Corporate Reputation Review*, *International Communication Bulletin*, *Place Branding and Public Diplomacy*, *Journal of Intercultural Communication Research*, and *Public Relations Quarterly*. He served as an editorial assistant for *Communication Research* and has professional experience in public relations at Samsung, Seoul, Korea. He has a PhD from Syracuse University.

Mark Leff, 2008–2009 Fulbright Fellow at the Television and Journalism Studies School of the Communication University of China in Beijing, began teaching broadcast

news at Ohio University's E. W. Scripps School of Journalism in 2002, after working in radio and television news for more than 30 years. His career began in San Francisco radio news and also included on-air and producing work in Seattle, Washington, Columbus, Ohio, New York, London, Rome, and Atlanta, Georgia. At the national/international level, he worked for TVN, NBC News, and Visnews (now Reuters Television) and was one of the original employees at CNN, where he wrote, produced, and voiced the 365-part *This Day/This Century* series, which was aired throughout 1999. He worked with Shanghai Television and China Central Television at the 2001 APEC summit in Shanghai and has made award-winning documentaries in Georgia and Ohio.

Lara Lengel began her research on transnational communication and computer-mediated communication when she was a Fulbright Scholar in Tunisia (1993–1994). She is Chair and Associate Professor, Department of Interpersonal Communication, Bowling Green State University. Her books, including *Computer-Mediated Communication: Social Interaction on the Internet* (with C. Thurlow and A. Tomic, Sage), and numerous articles appearing in, among others, *Text and Performance Quarterly*, *Gender and History*, and *Convergence: The Journal of Research into New Media Technologies* address transnational and intercultural communication, and information technology in the Middle East and North Africa (MENA). She presented at the United Nations World Summit on the Information Society in Tunis and has codirected nearly \$500,000 of federal grant programs in the MENA on environmental communication and women, democracy, and media.

Timothy R. Levine is Professor of Communication at Michigan State University. He has published more than 70 original research articles on topics including deception, interpersonal communication, persuasion, and culture. His methodological papers focus on statistical analysis, measurement validation, and experimental research design. He is a founding coeditor of *Communication Methods and Measures*. He obtained his PhD from Michigan State University.

Fang Liu is an assistant professor at the University of North Texas. His research interests center on economics and management of the media and telecommunication industries. In particular, he is interested in the management implications of new media technologies for market structure and firm strategy. Some of his recent research projects include cable system diversification into high-speed Internet access and telephony, predictors of the video window and financial performance of motion pictures in the home video market, strategic alliances between broadcast television networks and Internet firms, and value chain analysis of cable-based Video-on-Demand. He earned his PhD from Michigan State University, MA from University of Florida, and BA from Tsinghua University.

Erina L. MacGeorge is Associate Professor of Communication at Purdue University (West Lafayette, Indiana). Her research focuses on the role of communication in coping with problems, including advice, comforting, and prayer. She obtained her PhD from the University of Illinois in 1999.

Josina M. Makau is a former arts and humanities dean. She is currently Professor of Philosophy and Communication and Co-Coordinator of the Program in Practical and Professional Ethics at California State University, Monterey Bay. She has published more than three dozen book chapters, articles, and reviews related to communication ethics, law, and moral reasoning. She is one of nine scholars selected for inclusion in *Exploring Communication Ethics: Interviews With Influential Scholars in the Field*. A past Communication Ethics Commission Chair and Editor of *Ethica*, her recognitions include Communication Ethics Conference Scholar-in-Residence; Duquesne University's Scholar Award for Excellence in Ethics Education for the Mind, Heart, and Soul; the H. A. Wichelns Award for Scholarship in Speech and Law; and Ohio State University's Alumni Teaching Award. She earned an MA in philosophy from the University of California, Los Angeles and MA and PhD in rhetoric from the University of California, Berkeley.

Jennifer A. Malkowski received her MA in communication in 2008 from the School of Communication at San Diego State University. Her research focuses on the intersection of rhetoric, political communication, health communication, and public policy in order to illuminate how public discourse influences everyday experiences. Her work has been presented on top paper panels at both national and regional conferences, and her political communication research has been recognized by a Dean's Award at San Diego State University for its cross-disciplinary appeal. She currently teaches at the University of San Diego and at Grossmont Community College.

Charles Marsh is an associate professor and William Allen White Foundation Professor at the School of Journalism and Mass Communications at the University of Kansas. His articles on classical rhetoric and public relations have appeared in *Public Relations Review*, *Journal of Mass Media Ethics*, and *Written Communication*. With David Guth and Bonnie Poovey Short, he is the coauthor of three textbooks: *Public Relations: A Values-Driven Approach*; *Adventures in Public Relations: Case Studies and Critical Thinking*; and *Strategic Writing: Multimedia Writing for Public Relations, Advertising and More*. He has a PhD from the University of Kansas.

Maxwell McCombs holds the Jesse H. Jones Centennial Chair in the School of Journalism at the University of Texas at Austin. A cofounder of agenda-setting theory, his research is focused on the explication of this theory and other aspects of political communication. He has a PhD from Stanford University.

James E. McNay is a California-based teacher and writer. At Brooks Institute, he was the founding program director

of the visual journalism program, where he taught for 7 years. Previously, he directed the photojournalism program at San Jose State University's School of Journalism. He was the first college instructor to receive the summer fellowship in the National Geographic photography department. As a journalist, he worked as a staff photographer for *The Houston Post* and *The Daily Iberian* in New Iberia, Los Angeles. He is a past president of the National Press Photographers Association (NPPA) and continues as a regular participant on the Black Team of the Eddie Adams Workshop. He writes regularly for the Sports Shooter Web site (www.sportsshooter.com) with the intention of helping emerging photographers break into the profession.

Brad Mello joined the National Communication Association (NCA) in July 2008, after 13 years of teaching at Trinity University, Washington, D.C. At NCA, he is responsible for supporting members as they strive to provide the highest quality instruction in communication. He assists efforts to develop and assess communication curricula. He works to encourage talented undergraduates to attend graduate school in many ways, including supporting the work of NCA student honoraries and clubs. Finally, he serves as an advocate for the discipline through outreach to other educational organizations in the District of Columbia area. He received his BA and MA from Penn State University and his PhD from the University of Oklahoma.

Michelle Miller-Day is Associate Professor of Communication Arts and Sciences at Pennsylvania State University, where she teaches family communication, mother-daughter communication, interpersonal communication, and qualitative research methods. Her current research interests include studying the ways in which communication in personal relationships affect health and well-being. Her work has been published in outlets such as *Journal of Applied Communication Research*, *Journal of Family Communication*, *Health Communication*, *Journal of Social and Personal Relationships*, and *Qualitative Inquiry*. She received her PhD in 1995 from Arizona State University.

Melanie Morgan is currently Associate Professor of Communication at Purdue University. Her primary research interest explores cognitive factors underlying communication skill development and message production. Her research has focused on the production of complex messages in a variety of areas, including aging, family, legal, and scientific contexts. Recent publications have appeared in the *Journal of Communication*, *Communication Studies* and the *Southern Journal of Communication*. She is the author of *Presentational Speaking: Theory and Practice* (5th ed.). She holds a PhD in communication studies from the University of Kansas.

Timothy P. Mottet is Professor and Henry W. and Margaret Hauser Endowed Chair in Communication at the University of Texas–Pan American, Department of Communication. Listed among the top 50 most published scholars in the

discipline between 1996 and 2001, his research appears in *Communication Education*, *Communication Quarterly*, *Communication Research Reports*, *Journal of Psychology*, and *Psychological Reports*. He is a coauthor or coeditor of three books. While a faculty member at Texas State University–San Marcos, he received two of the three highest awards the university presents to faculty members, including the Presidential Award for Excellence in Research (in 2005) and Service (in 2006). He received his EdD from West Virginia University in 1998.

Barbara Mueller is Professor of Advertising in the School of Journalism and Media Studies at San Diego State University. In addition to numerous book chapters and articles in professional journals, she is the author of *Communicating With the Multicultural Consumer: Theoretical and Practical Perspectives* (2008) and *Dynamics of International Advertising: Theoretical and Practical Perspectives* (2004) and coauthor (with Katherine Toland Frith) of *Advertising and Societies: Global Issues* (2003). She received her PhD from the University of Washington.

Sam Chege Mwangi is an assistant professor at the A. Q. Miller School of Journalism and Mass Communications at Kansas State University, where he teaches newswriting and international communication courses. He has served as a resident fellow at the Kettering Foundation researching international journalism and has also worked as a media consultant for UNESCO in the Caribbean. He earned his PhD in journalism and mass communications from the University of South Carolina.

John Nerone is Professor of Communications and Media Studies in the College of Media at the University of Illinois at Urbana-Champaign. He writes about media history, freedom of expression, and the public sphere, and is the author of four books and numerous articles, including *Violence Against the Press* (Oxford, 1994), *Last Rights* (Illinois, 1995), and, with Kevin Barnhurst, *The Form of News: A History* (Guilford, 2001).

Kristen Michelle Norwood is a doctoral candidate in the Department of Communication Studies at the University of Iowa. Her research centers on close personal relationships and gender and communication. She earned her MA in communication from the University of Arkansas in 2006.

H. Dan O’Hair is Professor in the Department of Communication at the University of Oklahoma. His teaching and research interests include organizational communication, health systems, risk communication, and patient care communication processes. He has published more than 80 research articles and scholarly book chapters in communication, health, management, and psychology journals and volumes and has authored and edited 16 books in the areas of communication, business, and health. He is one of the founding directors of the Southwest Program for Pancreatic Cancer at the University

of Oklahoma and was a cochair of the Pancreatic Cancer Progress Group at the National Cancer Institute. He has served on the editorial boards of more than 20 research journals and is a past editor of the *Journal of Applied Communication Research*, published by the National Communication Association. In 2006, he served as president of the National Communication Association.

Kent A. Ono is Professor of Communications and Asian American Studies at the University of Illinois at Urbana-Champaign. His written and edited work includes *Shifting Borders: Rhetoric, Immigration, and California’s Proposition 187* (with John M. Sloop, 2002), *Asian American Studies After Critical Mass* (2005), *A Companion to Asian American Studies* (2005), and *Asian Americans and the Media* (with Vincent Pham, 2008). He is a past chair of the Critical and Cultural Studies Division of the National Communication Association; a former director of the Cultural Studies Graduate Program at the University of California, Davis; and a coeditor of the “*Critical Cultural Communication*” book series.. He has a PhD from the University of Iowa.

Charles B. Owen is Director of the Media and Entertainment Technologies Lab and Associate Professor of Computer Science and Engineering at Michigan State University. His research focuses on solutions in computer gaming, augmented reality systems, and human-computer interaction. His work includes fundamental inventions in display calibration, system integration, and application design. He has more than 60 publications and has authored a book on multimedia stream correlation. He has also been the recipient of numerous awards for teaching excellence.

Megan J. Palamé is a graduate student in the MA Program in Health Communication at Emerson College. She has a BA from the University of Buffalo.

Caren E. Palevitz is pursuing her master’s degree at the University of Georgia. She is primarily interested in the intersection of relational communication and computer-mediated communication. Since beginning her master’s program, she has researched the interplay of compulsive Internet use and interpersonal relationships and looks forward to beginning work on social-networking sites and relationships. She completed her BA in 2007 at the University of Georgia.

John V. Pavlik is Professor and Chair of the Department of Journalism and Media Studies at the School of Communication, Information and Library Studies, Rutgers, the State University of New Jersey, where he is also Director of the Journalism Resources Institute. He is Chair of the editorial board for *Television Quarterly: The Journal of the National Academy of Television Arts and Sciences*. He was awarded the Fulbright Distinguished Chair in Media Studies at the Academy of Fine Arts Vienna (Austria), 2007–2008. His research focus is new media technology. His books include *Converging Media* (coauthored with Shawn McIntosh, 2004), *Journalism and New*

Media (2001), and *New Media Technology: Cultural and Commercial Perspectives* (1998). In collaboration with Steven Feiner, computer science professor at Columbia University, he developed the situated documentary, a new type of documentary using mobile-augmented reality technology. His PhD and MA in mass communication are from the University of Minnesota. He is a 1978 graduate of the School of Journalism and Mass Communication at the University of Wisconsin at Madison.

Eric E. Peterson is a professor at the University of Maine, where he teaches in the Department of Communication and Journalism. His research and teaching interests are in narrative performance, media consumption, and communication diversity and identity. He is best known in performance and storytelling for his work on theory and methodology and for his coauthored publications with Kristin M. Langellier on narrative performance, family storytelling, and personal narrative, including their book, *Storytelling in Daily Life: Performing Narrative* (2004). He earned his PhD in speech communication at Southern Illinois University in 1980.

Marshall Scott Poole is Professor of Communication and Senior Research Scientist at the National Center for Supercomputing Applications at the University of Illinois at Urbana-Champaign. His research interests include group and organizational communication, information systems, collaboration technologies, organizational innovation, and theory construction. He is the author of more than 125 articles and book chapters. His articles have appeared in *Communication Monographs*, *Human Communication Research*, *Quarterly Journal of Speech*, *Communication Research*, *Small Group Research*, *Management Science*, *Organization Science*, *Information Systems Research*, *MIS Quarterly*, and *Academy of Management Review*, among others. He has coauthored or edited 10 books, including *Theories of Small Groups: Interdisciplinary Perspectives*, *Organizational Change and Innovation Processes: Theory and Methods for Research*, and *The Handbook of Organizational Change and Innovation*. He has been named Fellow of the International Communication Association and Distinguished Scholar of the National Communication Association. He obtained his PhD from the University of Wisconsin–Madison in 1980.

W. James Potter is a professor in the Department of Communication at the University of California, Santa Barbara, where he teaches courses in media literacy, media content, and media effects. He has also taught at Western Michigan University; Florida State University; Indiana University; University of California, Los Angeles; and Stanford University. He is a former editor of the *Journal of Broadcasting and Electronic Media*. He is the author of numerous scholarly articles and book chapters and a dozen books, including the following Sage-published titles: *Media Literacy* (4th ed.), *On Media Violence*, *Theory of Media Literacy: A Cognitive Approach*, *How to Publish Your*

Communication Research (edited with Alison Alexander), and *The 11 Myths of Media Violence*. He holds a PhD in communication and another in instructional systems.

Linda L. Putnam is Professor in the Department of Communication at the University of California, Santa Barbara. Her research focuses on negotiation and organizational conflict, discourse and negotiation, and language analysis in organizations. She is a past president of the International Association for Conflict Management and former director of the Program on Conflict and Dispute Resolution at the George Bush School of Government and Public Service, Texas A&M University. She has a PhD from the University of Minnesota.

CarrieLynn D. Reinhard is a doctoral student in the final stages of her doctoral work at School of Communication, The Ohio State University–Columbus. Her research focuses on media audiences and users and their ways of and reasons for engaging with media. She formerly worked for an agency representing Hollywood writers and directors.

Valerie R. Renegar is an associate professor in the School of Communication at San Diego State University. Her recent research is focused on contemporary feminist rhetorical theory and the rhetoric of social change. She received her PhD from the University of Kansas in 2000.

James D. Robinson is a professor and director of graduate studies in the department of communication at the University of Dayton. He earned his PhD at Purdue (1982), MA at West Virginia University (1979), BA at University of the Pacific, and AA at West Valley College. He has published work in a number of journals including *Journal of Broadcasting*, *Health Communication*, *Journalism Quarterly*, *Progress in Transplantation*, *Women's Health Issues*, *Journal of Social and Personal Relationships*, *Sociology of Religion*, *Review of Religious Research*, *Communication Research Reports*, *Sex Roles*, *Mass Comm Review*, *Health Care Management Review*, and *Journal of Diabetes Technology and Science*.

Michael E. Roloff is Professor of Communication Studies at Northwestern University. Currently, he is a coeditor of *Communication Research* (with Pamela Shoemaker) and Senior Associate Editor of the *International Journal of Conflict Management*. His research has been published in a variety of journals, including *Human Communication Research* and *Communication Monographs*. He has a PhD from Michigan State University.

Katherine E. Rowan is Professor of Communication at George Mason University in Fairfax, Virginia. Her research on science and risk communication has appeared in journals such as *Health Communication*, *Risk Analysis*, *Communication Education*, and *Journal of Applied Communication Research* and in edited volumes such as *Communicating Uncertainty* by Sharon M. Friedman, Sharon Dunwoody, and Carol L. Rogers and the

Handbook of Communication and Social Interaction Skills by J. O. Greene and B. R. Burlinson. She examines science, health, and risk communication in a variety of contexts. Her most cited research explores ways in which to use research-tested communication strategies to explain complex science through mediated communication channels. Recent projects have included research with local emergency management officials throughout the nation, service on a National Academy of Science study committee assessing risk from low levels of ionizing radiation, and work for Health Canada, the National Library of Medicine, the National Cancer Institute, the U.S. Department of Agriculture, the U.S. Food and Drug Administration, and the U.S. Environmental Protection Agency. Prior to joining George Mason's faculty, she was a faculty member at Purdue University for 15 years. She teaches health, risk, and crisis communication for Mason's graduate program and serves as Associate Department Chair and Director of Undergraduate Studies in Communication. She received her PhD from Purdue University in 1985.

Edward W. Russell is Assistant Professor of Advertising at the S. I. Newhouse School of Public Communications at Syracuse University. Prior to entering academia, he spent 25 years in the advertising business in several of the world's largest and most successful advertising agencies, including Saatchi & Saatchi Worldwide, The Leo Burnett Company, and J. Walter Thompson. He has worked on major businesses in nearly every product category. He is responsible for introducing more than 60 new products throughout his career and ran one of Leo Burnett's most award-winning offices. A graduate of Ohio University and Northwestern University's Medill School of Journalism, he started his career at Saatchi & Saatchi Advertising, New York, in account management. In 1989, he relocated to Frankfurt, Germany, to run Saatchi & Saatchi's largest pan-European business. Six months after arriving, the Berlin Wall came down, and suddenly he was helping open new offices all over Eastern Europe. When the German posting was completed, he moved east to head Leo Burnett's office in Warsaw, Poland. Leo Burnett Warsaw was a stunning success; despite being in a country with no advertising business, it became one of the most award-winning advertising agencies in the world. He moved to Leo Burnett's Chicago headquarters, where he ran the agency's Procter & Gamble international business and authored their first international training program. Two full passports later, he joined academia as an advertising professor at the S. I. Newhouse School of Public Communications at Syracuse University.

Donald Jay Rybacki is Head of the Department of Communication and Performance Studies at Northern Michigan University. He received his PhD from the University of Nebraska–Lincoln. Karen and Donald Rybacki

are coauthors of *Advocacy and Opposition: An Introduction to Argumentation and Communication Criticism: Approaches & Genres*. Their work has been published in a variety of scholarly publications, ranging from *Journal of Collective Negotiation in the Public Sector* to *Southern Communication Journal* and *Public Relations Review*.

Karyn Charles Rybacki is a professor in the Department of Communication and Performance Studies at Northern Michigan University. She received her PhD from the University of Iowa.

Jennifer A. Samp is Associate Professor and Graduate Coordinator in the Department of Speech Communication at the University of Georgia. Her research focuses on how communicators' thoughts about themselves and their relationships influence what they say during conversations with close friends and romantic partners. Additionally, some of her current work examines how perceived and actual alcohol use affects decisions about relational problems and the behaviors enacted during discussions about those problems. She received her PhD from the University of Wisconsin–Madison in 1999.

Dean Scheibel is Professor of Communication Studies at Loyola Marymount University. His areas of research include interpretive, critical-interpretive, and dramatic approaches to organization and culture. He received his PhD from Arizona State University in 1991.

John S. Seiter is a professor in the Department of Languages, Philosophy, and Speech Communication at Utah State University, where he teaches courses in social influence, interpersonal communication, theories of communication, and intercultural communication. His published research includes articles investigating persuasion in applied contexts, perceptions of deceptive communication, and nonverbal behavior in political debates. He has received eight "Top Paper" awards for research presented at professional conferences. He was named his college's Researcher of the Year and his university's Professor of the Year. Together with Robert Gass, he wrote the book *Persuasion, Social Influence and Compliance Gaining* and edited the book *Perspective on Persuasion, Social Influence, and Compliance Gaining*. He received his PhD from the University of Southern California in 1993.

Nancy Signorelli is Professor of Communication and Director of the MA program in Communication at the University of Delaware. Beginning with her dissertation research, an in-depth methodological examination of television characters, she has conducted research on images in the media and how these images are related to people's conceptions of social reality (cultivation analysis) for the past 30 years. Her publications include one of the very first (and frequently cited) studies of characterizations on television ("Patterns in Prime Time," *Journal of Communication*, 1974). She continues to publish on gender roles,

television violence, and health-related images on television. She received her PhD from the University of Pennsylvania in 1974.

Amy Slagell heads the Speech Communication Program and directs the Fundamentals of Public Speaking course in the Department of English at Iowa State University. An active teacher of public speaking since 1983, when she began graduate work at the University of Wisconsin–Madison, she has also served as a public speaking consultant for the ISUComm initiative at Iowa State and as a speech trainer for national programs organized by the Center for Food Security and Public Health, housed at ISU’s Veterinary College. She has authored various articles on public speaking pedagogy for publications such as *Communication Education* and *Teaching Ideas for the Basic Course* and is the coeditor of “Let Something Good Be Said:” *Collected Speeches and Writings of Frances E. Willard*. She is currently serving as the vice chair of the Basic Course Division of the National Communication Association.

John M. Sloop is Professor of Communication Studies and Associate Dean of the College of Arts and Science at Vanderbilt University. He is the author and editor of several scholarly essays and books, including *Disciplining Gender: Rhetorics of Sex Identity in Contemporary U.S. Culture*, for which he was awarded the Winans-Wichelns Memorial Award for Distinguished Scholarship. He is currently the editor of *Communication and Critical/Cultural Studies*. His work investigates cultural “discussions” about matters of public interest, such as prisoners, immigration issues, and cases of gender transgression. He is currently working on a project involving the intersections of transportation, communication, and public regulation.

Ronald D. Smith, APR, is Professor of Public Communication and Chair of the Communication Department at Buffalo State College (State University of New York). He also is Project Director of the American Indian Policy and Media Initiative. He is the author or coauthor of several textbooks on media and public relations, coeditor of a book on media coverage of Native American issues, and author of several book chapters and research reports. He is a past president and past district chair of the Public Relations Society of America.

Brian H. Spitzberg is currently a professor in the School of Communication at San Diego State University. His research has been widely published, with books and articles in areas including interpersonal communication skills, communication assessment, conflict management, jealousy, infidelity, intimate-partner violence, sexual coercion, and stalking. He received his BA in 1978 in speech communication from the University of Texas at Arlington and his MA in 1980 and PhD in 1981 in communication arts and sciences at the University of Southern California.

Don W. Stacks is Professor and Director of the Public Relations Program at the University of Miami School of Communication. His work focuses on public relations research and evaluation. He is the author of *The Primer of Public Relations Research*. In addition, his focus is on crisis management and corporate communication. He received his PhD from the University of Florida in 1978.

Laura Stafford is Professor of Communication at the University of Kentucky. Her main interest is in relational communication. She specializes in relational maintenance and long-distance relationships. She is currently the Editor of the *Journal of Applied Communication Research* and has served as the chair of the Interpersonal Division of both the National Communication Association and the International Communication Association. She received her PhD in communication at the University of Texas at Austin.

John Steel teaches in the Department of Journalism Studies at the University of Sheffield, UK. He has recently published work on the future of newspapers in *Journalism Studies* (with M. Conboy), on censorship and the British Press in the *Journal for the Study of British Cultures*, and on the radical narrative of media history for the journal *Media History*. He is currently writing a book on *Journalism and Freedom of Speech*. He gained his PhD in the Department of Politics at the University of Sheffield in 2001.

Rayford L. Steele, PhD, is the founding director of the Center for Information and Communication Sciences at Ball State University, which he led for 22 years. He now serves as its first Distinguished Professor. He is the founder and executive director of the International Digital Media and Arts Association, a founding board member and past president and chairman of the Board of the United States Distance Learning Association, and the chair of Board Emeritus of the International Telecommunication Education and Research Association, which he helped found. He has consulted with Fortune 50 CEOs and educational and government organizations since 1972. He is a Frank Stanton Fellow with the International Television and Radio Society.

Charles J. Stewart is the Margaret Church Distinguished Professor of Communication at Purdue University. He is coauthor of *Interviewing: Principles and Practices* and *Persuasion and Social Movements*. His articles have appeared in the *Quarterly Journal of Speech*, *Communication Monographs*, *Communication Studies*, *Western Journal of Communication*, and *Southern Journal of Communication*. He has served as a consultant for Libby Company, the Internal Revenue Service, and American Electric Power Company. He is the recipient of the Murphy Award for Outstanding Undergraduate Teaching from Purdue University and the Ecroyd Award for Outstanding Teaching in Higher Education from the National Communication Association.

John D. Stone is Professor of Communication Studies at James Madison University. He is a graduate of Penn State

University and has taught at universities in Europe, Asia, and the Middle East. He is the author or coauthor of five textbooks in speech communication and public relations. His area of special concern is international public relations.

Karen Tracy is Professor of Communication at the University of Colorado, where she teaches courses in discourse analysis, language and identities, and the practices and problems of meetings. Her recent research, focusing on the practice of school board meetings, has appeared in *Communication Theory*, *Journal of Applied Communication Research*, and *Discourse and Communication*; she also is coeditor of the volume *The Prettier Doll: Rhetoric, Discourse, and Ordinary Democracy* and is finishing a book titled *Challenges of Ordinary Democracy: Discourse, Community, and Reasonable Hostility at a Local School Board*. She received her PhD from the University of Wisconsin in 1981.

Michele Weldon is an assistant professor at the Medill School of Journalism, Northwestern University. She has been teaching undergraduate and graduate journalism courses there since 1996. She is the author of three non-fiction books, including the most recent, *Everyman News: The Changing American Front Page* (2008). Her first book, *I Closed My Eyes*, was a creative nonfiction memoir, and her second book, *Writing to Save Your Life*, focused on expressive narrative writing. She has written for newspapers, magazines, Web sites, and radio for more than 25 years. She earned her BSJ and MSJ at Medill.

Andrew D. Wolvin is a professor in the Department of Communication at the University of Maryland, College Park. His research focus is listening behavior. In addition to numerous journal articles, he has authored *Listening in the Quality Organization* and coauthored (with Carolyn G. Coakley) the widely used text *Listening, and Listening Instruction, Experiential Listening and Perspectives on Listening*. He has a PhD from Purdue University.

Julia T. Wood is the Lineberger Distinguished Professor of Humanities and Professor of Communication Studies at the University of North Carolina at Chapel Hill. She has published more than 80 articles and chapters and 20 books, including *Gendered Lives: Communication, Gender and Culture*, now in its ninth edition. Her research and teaching focus on gender and communication, intimate-partner violence, and feminist theories. She obtained her PhD in 1975 from Pennsylvania State University.

Courtney N. Wright is an assistant professor in the School of Communication Studies at the University of Tennessee, Knoxville. She is interested in relational communication and its impact on well-being. She conducts research in the areas of conflict management and interpersonal communication, with special attention to communication behaviors that yield paradoxical effects. She examines teasing, grievance expression, social confrontation, and impression management. She has published in *Communication Reports* and teaches courses in communication theory, interpersonal communication, and interpersonal conflict. She has a PhD from Northwestern University.

K. Tim Wulfemeyer is a professor and coordinator of the Journalism Degree Program in the School of Journalism and Media Studies at San Diego State University. He has taught at Iowa State University, New Mexico State University, and the University of Hawai'i. He has worked as a radio and television journalist in California, Iowa, Texas, New Mexico, and Hawai'i. His research interests include the content of radio and television newscasts, ethics in journalism, sports journalism, and advertising aimed at children. He is the author or coauthor of 5 books, 4 book chapters, 35 journal articles, and 45 conference research papers. He has degrees from Fullerton College (AA), San Diego State University (BA), Iowa State University (MS), and the University of California, Los Angeles (EdD).

PART I

THE DISCIPLINE OF COMMUNICATION

1

COMMUNICATION AS AN IDEA AND AS AN IDEAL

H. DAN O’HAIR

University of Oklahoma

WILLIAM F. EADIE

San Diego State University

“What we’ve got here is failure to communicate.”

Cool Hand Luke, 1967

It is rather passé, if not overindulgent, to characterize communication as a ubiquitous phenomenon. As an ever-present process in our lives, not only is it convenient to take communicating with others for granted, but we are quick to blame communication maladies for many of the social ills confronting us. For some years, it was fashionable to refer to discussion about communication as meta-communication. Craig (2005) more recently referred to such deliberations as meta-discourse. Almost 50 years before the buildup of interpersonal communication as an academic specialty area, Watzlawick, Beavin, and Jackson (1967) promoted the idea that one “cannot not communicate.” That is, at any point when we develop reciprocal awareness of another, anything we do (or don’t do) is the act of communicating. We’re trapped—we can never *not* communicate. So instead we become obligated to a process that more often than not is judged uncharitably. Take most terms associated with the outcomes of communication. *Communication breakdown* is a popular one and generally refers to incompetent or indolent effort. The opening quote of this chapter, about a “failure” to

communicate, was popularized from the 1960s movie *Cool Hand Luke*. Communication failures are often associated with perceptual misalignment or cultural ignorance. Another perspective altogether is that engaging in *more* communication is a ready answer to many problems, whether they be personal, professional, or political.

Lest we appear sanguine about communication as an ideal, fodder for the canons of those who view communication as a panacea can be observed from substantial organizational entities. Communication was the focus of a study reported in the *MIT Sloan Management Review* where 50 former and current CEOs and CFOs were interviewed about their views on communication in organizations. To a person, these organizational leaders viewed the communication function as vital to their success. Their remarks can be summed up as follows:

- You cannot overcommunicate; use every mechanism (*The New York Times*).
- Speak in harmony—one story, one basic message (GlaxoSmithKline).

4 • THE DISCIPLINE OF COMMUNICATION

- You must modify your messages by constituency (Dell).
- Move from a “want-to-communicate” to a “have-to-communicate” strategy (Textron).
- I’m either communicating or thinking about it (FedEx).

Robert Craig (2005) once noted,

The idea that communication is important, the idea that human problems are caused by bad communication and can be solved by better communication, the idea that communication is a technical skill that can be improved by applying principles and techniques disseminated by communication experts, the idea, in short, that it is “good to talk”—these ideas are elements of a cultural pattern that has evolved in particular historical circumstances in close association with specific social practices and related cultural themes of human progress, modernization, and globalization. (p. 660)

Craig’s treatise was one of almost resignation blended with a dose of responsibility. Where do our responsibilities lie for the idea and ideals of communication?

We’ll first consider how some of our present ideas about this “thing” we call “communication” came about, and we’ll offer a rationale for why common ideas about communication are inadequate. We’ll summarize some of the current thinking about the idea of communication, and then we’ll offer a view of the idea of communication that can also serve as an ideal for communication study.

Communication as an Idea

The easiest way to think of communication is through its common meaning in several languages: as transportation, or a means of getting a message from one point to another. In fact, some of the earliest models of communication emphasized this mechanical means of moving a message. Harold Lasswell (1948) described communication simply as “Who? Says What? To Whom? With What Effect?” Claude Shannon and Warren Weaver (1949), in describing how the telephone works, indicated that a source encodes a message and that encoded signal is transmitted via a channel to a device that decodes the signal and makes it come out of a receiver in the form of the original message.

But these models are more complex and more of a problem than they might seem on the surface. Lasswell’s (1948) model, for example, assumes an entire psychology behind each of his people in the model (“Who?” and “To Whom?”). He assumes an entire social process behind the construction of the “Says What?” portion of his model, including the nature and meaning of language, the expectations of the situation, and cultural influences on what is said. And then, there’s the matter of the “With What Effect?” portion of the model. Lasswell clearly saw this as the central element of his model, because at the time so much attention was being paid to how both various media and various forms of persuasion influenced individuals—and there were considerable debates over the conditions

that would produce either strong or weak effects, both on individuals and on public opinion.

Shannon and Weaver’s (1949) model seems straightforward enough until you add in one factor: noise in the channel. As engineers, these authors were interested in noise in particular, because it interfered with telephone conversations, particularly long-distance connections. Noise was a technical problem that could be solved, in theory, by reducing the number of connecting points through which the signal had to travel in order to get from Point A to Point B (satellites proved to be wonderful ways of reducing those connections), but it was also a human problem, because people would try to guess the content of the message and in doing so would fill in the blanks that were left by the noise. So the model wasn’t as clean and elegant as, perhaps, its creators thought, because at each end of the encoder or receiver you not only had a piece of technology but also a human who was trying to make sense of the message that was sent or received.

How to make sense of the human piece? A popular approach of the same period as the models we just discussed involved looking at how people use language. The study of what was called *general semantics* was popular in the era immediately following World War II, and it was based on the idea that the world would be able to get along much better if we used language in a more precise fashion. As outlined by its founder, Alfred Korzybski, and popularized by scholars such as S. I. Hayakawa and Irving J. Lee, general semantics sought to explain how people use language by using the central metaphor of how maps fit with the territory being charted. The three metaphoric propositions about language were as follows:

1. *The map is not the territory.* Words are arbitrary, though agreed-on, symbols that usually have no correspondence to the things they are supposed to represent.
2. *The map is not all of the territory.* Words can never completely represent the things for which they stand; words are, to one degree or another, abstractions.
3. *The idea map would include a map of itself.* We have to use words to describe other words, and so abstraction is built upon abstraction.

General semanticists liked to come up with catchy slogans to make their points—for example, “Words don’t mean; people mean.” By this, the general semanticist meant that meanings of words were constantly changing, even though their meanings might appear to be stable. Hipsters, for example, tend to play with language, and at various times have described things they like as “bad” or “hot” or “cool.”

While these ideas about how we use language in communication are useful, the concrete suggestions that general semanticists make are good to remember but don’t solve the “problem” of communication. General semanticists remind us that we are most likely to be understood when we are using concrete, as opposed to abstract, words

when we remember that someone's use of a word at one time may not be the same at another time and when we recognize that we can never cover "all" of something with the language we use.

A more contemporary outgrowth of general semantics has been a focus on how we use language to "construct" the world around us. While general semanticists assumed that the world is material (the "territory") and words are but arbitrary descriptions of the material world (the "map"), those who use social construction as a perspective turn that notion on its head and contend that the world exists because people have constructed it, together, through the agreed-on use of symbols. So words become most important, rather than the things the words may be describing. The classic story about the three baseball umpires discussing their philosophies of working behind the plate illustrates this point. One umpire said, "Some's balls and some's strikes, and I calls 'em as they is." The second umpire said, "Some's balls and some's strikes, and I calls 'em as I sees 'em." And the third umpire, who took social construction to heart, said, "Some's balls and some's strikes, but they ain't nothin' until I calls 'em." There is a good deal more discussion on social construction and its implications for understanding communication in a different manner in "Social Construction and Meaning Creation" (Chapter 15).

In his landmark book *Speaking Into the Air: A History of the Idea of Communication*, John Durham Peters (1999) contended that our fascination with communication comes primarily from the use of technologies to disseminate messages to those who would be unreachable otherwise. These technologies need not be mechanical ones; they could be as simple as addressing a group of people face-to-face. Philosophers and ethicists have been well aware that using technologies to disseminate messages has the potential for mischief, and so our understanding of communication often arises out of the activities associated with communication that we wish to avoid, such as manipulation, deception, or lack of authenticity. Miscommunication is typically the problem; while "communication" is typically reified as an ideal state (we'll have more to say about this point in the second portion of this chapter).

Peters (1999) identified two basic forms of communication: dissemination and dialogue. Both have roots in ancient times. Dissemination is illustrated quite clearly in Jesus' parable of the mustard seed. This parable exists in various versions, but in each version Jesus uses the idea of something small that potentially can grow into something quite large to illustrate how his teachings would take root and spread.

Dialogue is the other basic form of communication. Here, Peters (1999) calls on *Phaedrus*, which was written by Plato, as an illustration. It is beyond the scope of this chapter to go into a detailed explanation of this philosophical exchange between Socrates, a renowned teacher, and Phaedrus, his student. Suffice it to say, though, that the conclusion reached by their philosophical conversation, according to Peters, is that the ultimate goal of human

interaction is authentic connection, with mutual love being the highest form of that bond. In such a view of communication, dissemination of information is relatively unimportant, except in how what we perceive we have in common serves to bring us together.

Dissemination and dialogue are not stand-ins for "mass communication" versus "interpersonal communication," however. Radio can be a very intimate medium, for example, creating at least the illusion that the host and listeners are having a personal exchange. On the other hand, much of our daily face-to-face interaction revolves around routine exchanges of information, creating almost no bond in the process. We surround ourselves with media and interpersonal environments that provide plenty of information, and yet each of us experiences loneliness and yearns for true connection. How to manage the dissemination and promote the connection is the central problem that all of us, as communicators, face, and it is the ultimate problem on which communication scholars focus their work.

Communication as an Ideal

Communication is thought of both as an ordinary action and as an extraordinary act. It is ordinary because it is a major human activity that we engage in each day, but it is extraordinary because communicating with others has the capacity to provide social support and comfort (see "Social Support," Chapter 32), engage others in deliberation and debate on important issues (see Chapter 18, "Persuasion and Compliance Gaining;" Chapter 23, "Deliberation, Debate, and Decision Making;" and Chapter 31, "Rhetorical Exigency, Strategy, and Argumentation,"), delight us with stories and performances (see Chapter 17, "Performance and Storytelling"), help us understand and manage who we are as people (see Chapter 19, "Identity as Constituted in Communication"), and manage or resolve conflicts (see Chapter 24, "Conflict Management and Mediation"). There are far more often calls for more (and better) communication than there are for less (or worse) communication, though there are often calls for moderation in the use of both pen and tongue. As Shakespeare's Hamlet put it,

Speak the speech, I pray you, as I pronounced it to you, trippingly on the tongue: but if you mouth it, as many of your players do, I had as lief the town-crier spoke my lines . . .

Be not too tame neither, but let your own discretion be your tutor: suit the action to the word, the word to the action. (Act 3, Scene 2)

In point of fact, we probably don't follow Hamlet's advice as often as we should. We assume that more (and better) communication will nearly always produce a more positive outcome than will less (or worse) communication.

Many times, such is the case, but not always. Let's consider, briefly, the kinds of problems that scholars were considering when the field of speech, one of the components of the communication discipline, was just beginning to establish itself as an area of scholarly study.

We usually assume that we are better off today than in earlier times, although it is wise to remember a comment from George Orwell—"Each generation imagines itself to be more intelligent than the one that went before it, and wiser than the one that comes after it." When considering the scholarship from the early years of our discipline, it is easy to observe that much of the work was pedagogically based. However, there were some pioneering intellectual thoughts given to the scientific study of communication. In 1915, in the first publication year of the *Quarterly Journal of Speech* (then known as the *Quarterly Journal of Public Speaking*), J. A. Winans argued for a more scientific and practically relevant study of the speech discipline:

Problems enough of every sort. Some are large, some small. . . . We shall not for some time be driven to the painful emendation of the text of Demosthenes or to studying the influence of Quintillion on Patrick Henry. We ought not to be led into dry-as-dust studies, and I do not fear that we shall be; we are too constantly confronted by the practical nature of our work. Our difficulty will be in getting into a sufficiently scientific frame of mind. Probably we shall do foolish things at first, as others have. We should begin humbly and grow. Each man of course can do but a small part of the work. We shall proceed, but slowly—all the more reason why we should begin soon. (p. 22)

In 90+ years, have we delivered on the idea and ideals of communication research so eloquently advanced by Professor Winans (1915)? Our goal is to comment on the virtues and vices entangled in thinking of communication as an idea or as an ideal. "It is always a perplexing challenge to resolve in one's own mind whether conditions lead us down paths of promises that excite us or promises that frustrate us. Sometimes these promises are one and the same" (O'Hair, 2006, p. 6). We all have ideas about what constitutes communication and its essence. In thinking through our history, we have identified three essential elements that capture our notions for communication as an ideal: (1) voice, (2) community, and (3) responsibility.

Voice

The communication field is quick to engage the metaphor of voice to represent the freedom and empowerment to participate and express oneself. Two common elements are often thought to constitute voice: access and agency. *Access* underlies the more basic of these phenomena and will be construed as a permissible entrée to the expression of ideas and opinions. *Agency* is a qualitatively different construct in that elements of empowerment stand ready to impose a privileging function in service of one's rights to expression and contribution.

Access

Access is more easily judged from a general perspective, although it is more elusive to assess from a local or contextual perspective. Most feel that access to participation is a worthwhile ideal. Perhaps the immigration debate stands as representative of that assumption. However, at a general level, too many of us offer lip service to the need for greater access to communication—including the challenge of the digital divide that we conveniently assumed was a temporary and embarrassing blip on our moral radar screens.

Access has captured our attention in more subtle ways through the lure of transformative communication technology. Instant messaging and cell phone use have reconceptualized how we communicatively relate with others in very strategic ways. More specifically, communication technologies have created an assumption of what Katz and Aakus (2002) describe as *perpetual contact*. In their book by the same name, these authors describe "how the internal psychological feeling of being accessible or having access changes social relationships" (p. xxi). Their position, situated among many others, is that cell phone use in particular is having a profound effect on normative communication patterns and that many of the unanticipated uses of this technology are proliferating.

We can first look to surveys as evidence of widespread use. In a poll conducted by BBDO Worldwide in 2005 (and reported by Peter Leo in the *Pittsburgh Gazette* on March 16, 2006), 75% of cell phone users reported that they had their devices turned on and within reach during waking hours, 59% would never loan their cell out, and 26% felt that it was more important to drive back home to get their cell phone than their wallet. Take, for example, the notion of *absent presence*. Kenneth Gergen (2002), a pioneer of the social construction approach, claims that, "at times our presence may go completely unacknowledged. We are present but simultaneously rendered absent; we have been erased by an absent presence" (p. 227).

James Rule (2002) illuminates a potential conundrum in understanding cell phone use. Rule wonders, "Does the demand for mobile phones . . . more closely resemble the need for an appendectomy or that for a drug fix? To what extent do the needs for which people use mobile phones appear to have pre-dated the technology?" And, as Rule points out, some needs are clearly important such as in emergencies; other needs more likely resemble an addiction model (p. 251).

Another issue of access focuses on the strategic management of interaction. For some, communication technologies offer opportunities for strategic communication. Text messaging in particular is preferred when users are motivated to reduce cues in order to avoid emotional expression. Teenagers suggest that text messaging friends about their plans on Saturday night can appear innocuous instead of desperate—"So what's going on tonight?"

Recipients can then strategically avoid the issue (“Not sure yet”) without implicating themselves and, at the same time, helping the friend save face—an essential strategy in teen life (O’Hair, 2006).

Strategic management of interaction also implicates less talk altogether. There is often an assumption that more communication is better. That is, we should always communicate to fix our problems. Communication scholars have frequently agreed that less talk is sometimes better. One of the hallmarks of conflict management techniques is avoidance in certain situations—cooling-off periods. In other instances of strategic interaction management, less talk and more action is a superior alternative. Walk the walk should not be discounted. Issues of access and responsible communication will continue to capture our attention.

Agency

Agency constitutes a fundamental issue in communication scholarship and will be no less important in advanced technologically embedded contexts. Broadly conceived agency starts with the rights to free speech and exhortation in the First Amendment to the U.S. Constitution. For its part, the National Communication Association (NCA) has dedicated itself to the ideals of free speech, with several of its policy resolutions contained in the NCA Policy Platform promoting uninhibited but responsible expression, including the following:

- Credo for Free and Responsible Communication in a Democratic Society
- Credo for Free and Responsible Use of Electronic Communication Networks
- Policy on Diversity
- Policy on the Digital Divide

The mere fact that a large professional communication association advances a number of statements on free expression suggests that free speech continues to be temporally affected and socially constructed. Communication agency has always been at risk of compromise due to the interpretative lenses of those who find it not as a pure ideal but as one that is managed in service of other ideals. The alternative is a position advanced by Daniel Gilbert, a psychologist from Harvard University, who remarked,

We live in a world in which people are beheaded, imprisoned, demoted, and censured simply because they have opened their mouths, flapped their lips, and vibrated some air. Yes, those vibrations can make us feel sad or stupid or alienated. Tough shit. That’s the price of admission to the marketplace of ideas. Hateful, blasphemous, prejudiced, vulgar, rude, or ignorant remarks are the music of a free society, and the relentless patter of idiots is how we know we’re in one. When all the words in our public conversation are fair, good, and true, it’s time to make a run for the fence. (Retrieved August 11, 2008, from www.edge.org/q2006/q06_8.html)

This standpoint harkens back to earlier contests over absolute free speech, and this perspective may not suit the tastes of those holding more moderate viewpoints—hence the notion of responsibility. How do we in the discipline of communication promote the ideal of free speech in a responsible manner? With the advancement of communication technologies, issues over free speech will come up ever more. With access and agency come two critical issues: maintaining a comfortable level of privacy and disentangling the relationships between communication and terrorism.

Privacy

For some, agency necessarily entails the right to privacy and anonymity. Take recent examples of college professors being videotaped during class and finding their performance published on *YouTube*. Predictably, many in the academy are disconcerted by such instances of privacy violations. The American Association of University Professors considers posting videos of professors a violation of intellectual property rights. In an online discussion of the issues, faculty weigh in from multiple perspectives, with some suggesting that video content can be digitally manipulated characterizing professors as bumbling fools (some do not need any editorial help in this regard); others suggest that the issue can be addressed by videotaping all lectures with a time stamp to be used as incontrovertible evidence of what actually happened in class.

Privacy issues extend to general society in meaningful ways as well. Consider the perspective of Kevin Kelly (2006), Editor-at-Large, *Wired* and the author of *New Rules for the New Economy*:

Fancy algorithms and cool technology make true anonymity in mediated environments more possible today than ever before. At the same time this techno-combo makes true anonymity in physical life much harder. For every step that masks us, we move two steps toward totally transparent unmasking. We have caller ID, but also caller ID Block, and then caller ID-only filters. Coming up: biometric monitoring and little place to hide. A world where everything about a person can be found and archived is a world with no privacy, and therefore many technologists are eager to maintain the option of easy anonymity as a refuge for the private.

How do we unpack the baggage that surrounds privacy as a form of communication agency? Is anonymity an essential characteristic of agency?

An additional issue worthy of consideration is the public-private dilemma that has recently caught up with high school students who post online content from home. With MySpace and Facebook reaching millions of high school students in increasing fashion, school administrators have entered the fray of what constitutes responsible communication agency. Note the following

incidents, which were reported in the October 26, 2006, edition of *USA TODAY*:

- A student was expelled at an Indianapolis-area school for posting sexually explicit remarks about a teacher on MySpace.
- A cheerleader in the Fort Worth area was dismissed from the squad for allowing someone else to post content regarding other cheerleaders on her blog.
- Pittsburgh school officials removed a student from the volleyball team for criticizing an art teacher on the Internet.

School officials argue that issues of First Amendment rights have less applicability based on the two issues raised earlier: temporal dynamics and socially constructed perspectives. To wit, Paul Houston, the executive director of the American Association of School Administrators contends that school safety issues, especially in light of recent instances of school violence, are enough to trump freedom of expression. “The context of the times obviously adds a dimension of concern.”

Communication and Terrorism

One last point is worth consideration. Access and agency, through technology, create opportunities for communication of all types—those that empower and those that intimidate (O’Hair, Ploeger, & Moore, in press). Thomas Friedman (2005), in his best-selling book *The World Is Flat*, makes salient the argument that a flat world is one where communication is handy, inexpensive, and limitless. He goes on to emphasize that it is important to understand that it is not only the computer geeks, elementary students, and grandmothers who become empowered with flat-world communication, it is “also al-Qaeda and other terrorists networks” (p. 8). Miller, Matusitz, O’Hair, and Eckstein (2008) remind us that crimes of terrorism are communication acts, marked processes where terrorists symbolize their views with the help of unwitting audiences. Miller and colleagues take up the issue of describing differently the relational partners involved in terrorism: the terrorist group, the media, and the audience. Miller and colleagues describe the relationship as

a more complex web involving terrorists groups, their symbolic messages, the codependency of media and the obligatory sense of the audience. Such a codependency phenomenon goes beyond a simple dyadic relationship between eager, gullible, naïve viewers and enthusiastic, greedy, corrupt media corporations. The codependency is, at minimum, triadic, for it must of course include the terrorists themselves. Terrorists must trust in the media to accomplish one of their primary objectives: the spreading of fear and terror. . . . The media provide a means for social integration and social empathy by allowing audiences to gain insight into the circumstances of others—identifying, empathizing, and sympathizing with them in efforts to gain a sense of belonging. The public may feel obligated—even compelled—in their need to

comprehend the destructiveness of a terrorist act or the impact it must have on its victims. (pp. 58–59)

Communication is indiscriminate in its ability to empower. It is always well to remember the ideals of our profession for supporting the promise of voice. With freedom of speech comes responsible expression. Communication scholarship must stand ready to offer insights into this conundrum.

Community

Community is a term employed by multiple disciplines with the intent of characterizing patterns of interaction. Community can be conceived in a geographic sense, as a composite of individuals who work, live, and play in close geographic proximity to one another, such as local communities. “However, geographic convenience does not itself create a sense of community. Another way of thinking about communities is from a perceptual sense where proximity may or may not influence how a community is constituted” (O’Hair, Heath, & Becker, 2005, p. 311).

The idea of communication is frequently found in communities. As O’Hair and colleagues (2005) commented,

We know about communities of scholars and communities of practice; even spiritual groups and softball leagues think of themselves as communities (*a sense of community*). Key to concepts of communities is how they are fashioned and sustained through communication processes and shared meaning. (p. 311)

Within this section, we will take up several issues that are emerging as staples of community communication. Marc Andreessen, the founder of Mosaic, later known as Netscape, captures some important thoughts about how communities form:

People have an innate urge to connect with one another. And when you give people a new way to connect with other people, they will punch through any technical barrier, they learn new languages—people are wired to want to connect with other people and they find it objectionable not to be able to. That is what Netscape unlocked. (Friedman, 2005, p. 63)

It is through community participation that we are able to confirm the democratic vision espoused by Thomas Jefferson. Most important, citizen involvement increases government accountability.

Families as Reemerging Communities

After decades of surveys and polls lamenting the decline of the family as an important social unit in people’s lives, perceiving families as communities is on the rise. In fact, some research suggests that families are enjoying resurgence as a place for communication and community.

Consider the following poll results, as reported in the May 22, 2006, issue of *Newsweek* and the October 30, 2006, issue of *Time*:

- 76% of parents claim that they are closer to their children than they were to their own parents, and 71% report more communication with their college offspring than with their parents at the same age.
- A generation ago, parents were seen as obstacles to social interaction, while today they are embraced as among their children's best friends.
- College surveys found that freshmen report more than 10 interactions per week with their parents using cell phones, e-mail, and text messaging. Most reported broad satisfaction with this level of contact, and 28% reported that they would like even more interactions with their fathers.
- Many college students fully expect to move back in with their parents regardless of their financial situation.

Compare these data with a survey conducted with 1,622 Americans by *USA Weekend* for its October 27–29, 2006, issue, which revealed that 67% of respondents think that “eating together as a family is a better way to instill good values in children than going to religious services regularly or volunteering regularly.” Or consider an extensive study conducted in 2005 by the Bureau of Labor Statistics reporting that parents now spend much more time with their children than in previous generations, with fathers reporting twice as much time communicating and caring for their children.

Are we experiencing a “cocooning” effect, alluded to by community scholars such as Robert Putnam (2000), whereby families wrap themselves in each other and fail to engage the members of other communities? As we examine other community effects, we may find that only communication research will be able to tell us how family communication influences wider community participation.

Virtual Communities

One of those communities is of the virtual type. Research investigating online communication has provided insights into how individuals interact in a virtual fashion for the purpose of sharing information and opinions and thus cooperating to form social systems (Jones, 1995). A rather poignant position was advanced by Katz, Rice, Acord, Dasgupta, and David (2004), which dismantled the arbitrary chasm between online and physical communities promulgated by others. Instead of insisting on distinctions, they argue for a bridging or progression of these communities, which serve humankind in similar ways. Take, for example, the phenomenon known as *smart mobs*. “Smart mobs consist of people who are able to act in concert even if they don’t know each other” (Rheingold, 2002, p. 63). Instantiations of this sort are

numerous, as evidenced by the following examples, taken from Rheingold (2002):

- The “People Power II” smart mobs in Manila that overthrew the presidency of President Estrada in 2001 organized demonstrations by forwarding text messages via cell phones.
- The Web site www.upoc.com enables fans to stalk their favorite celebrities in real time through Internet-organized mobile networks and provides similar channels for journalists to organize citizen-reporters on the fly.
- Cell phones relieve teens from temporal restrictions, allowing them to sustain communities without regard to time. “For teens, if you have a cell phone you can be late.”
- Muslim parents have become distraught at the idea that once disallowed social relationships between boys and girls now flourish through cellular technology. In Syria, community building among teenage girls has disrupted a once paternalistic and restrictive family structure.

Virtual communities should be examined from an opportunistic perspective, offering instances for understanding how people choose to form social bonds.

Community Resilience

Community involvement is not a new phenomenon; a National Research Council committee recommended that deliberative and participative community processes should be engaged to inform public policy choices (Stoto, Abel, & Dievler, 1997). The committee argued that these processes lead to a more informed public and more support for decisions. Even community members who do not directly participate in the planning and deliberating process have more positive views of policy decisions based on their perception that the process was fair and inclusive of community members’ viewpoints (Arvai, 2003).

Regardless of physical or virtual means, increasing community involvement and participation spawns positive civic and social effects often referred to as *resilience*. “Resilience is a community-building idea promulgated by Grotberg (2002). Resilient communities are those that enjoy strong relationships within and outside the family, understand the need for vibrant community services (such as education, health, social welfare), and are energetic in developing a community climate that is compassionate, empathic, respectful, and communicative. Building resilient socially networked communities, where stores of communication capital reside, offers greater comfort and security than disconnected communities” (O’Hair et al., 2005, p. 313).

Communities have offered up the promise of communication for centuries. Community is a convenient but essential element of how societies function. It is within communities that we find out what people are thinking and how they are relating to one another. Rebecca Townsend (2006), in a

recent review essay in the *Quarterly Journal of Speech*, wrote that it is within communities that we develop “an appreciation for how knowledge, identity and agency are related” (p. 214).

Responsibility

The third issue of communication as an idea or ideal involves responsibility. We have acknowledged earlier that communication is not the answer to all the maladies facing society. However, when conditions present themselves, communication scholars do have fundamental responsibilities in addressing the problems and missteps of humankind. This becomes apparent in the articles in communication journals that take a critical perspective to societal problems and the embrace of journals that are devoted to a critique of society and especially hegemonic institutions (e.g., *Critical Studies in Media Communication*). There are a number of viewpoints that could be privileged from this perspective, but we focus on two: responsibility to the human condition and advancing meaningful contributions.

Responsibility to the Human Condition

As Vitousek, Mooney, Lubchenco, and Melillo (1997) suggest, “We are changing Earth more rapidly than we are understanding it” (p. 494). Isn’t *understanding* an essential element of the “ideal of communication?” Our understanding of others must come not only from investigations, as we have been doing, but also from monitoring conditions and trends. The IBM Center for The Business of Government published a report titled *Six Trends Transforming Government* (Abramson, Breul, & Kamensky, 2006). The report identifies key drivers for change:

- The aging population
- The continued rapid development of technology
- Globalization of economies and services
- Lack of confidence in government
- External threats—terrorism, disasters, and so on

To these trends, we must add income inequality. The Economic Policy Institute reports data (in *The Economist*, December 29, 2004) that between 1979 and 2000, household income in the lowest fifth grew by 6.4%, while income from households in the highest fifth grew by 70%. Historically, we know that income disparity is a fundamental source of societal distrust and unrest. How do we in communication respond to these trends and challenges?

One answer for communication scholars lies in taking advantage of opportunities meant to address societal problems. Communication and related disciplines are now seen as integral to addressing a host of emerging practical problems. For example, disciplines such as communication are expected to play a key role in reforms in health care. Communication scholars are expected to make substantial contributions to homeland security initiatives ranging from

surveillance to interdiction, community preparation, and violence mitigation. Communication scholars will also be expected to contribute to the identification and communication of meteorological risks. These new initiatives reflect a shift in priorities to problem-based solutions. The idea of communication moving more toward a pragmatic enterprise for its research is a new idea that is contested as an ideal.

Advancing Meaningful Contributions

How will communication professionals respond to these and other challenges facing the human condition? Many in the academy consider communication to be an inherently applied discipline. It is ironic that many in the field of communication thought just the opposite—that the only practical or applied aspects of communication were instructional practices, pedagogy, and controlling communication apprehension. As O’Hair and colleagues (2009) wrote, applied communication research “has been graced with an ever-expanding exposure to methods. Post-positivists, humanists, interpretivists, and critical theorists find applied research an enterprise that more easily accommodates their ideas and questions” (see Chapters 5–11, this volume, for more details about these varying approaches). Moreover, communication scholars have made important contributions to our understanding of communication problems such as the following: severe weather warnings, pandemic flu campaigns, organ donation, food safety, gender equality, safe-sex messages, shelter-in-place (terrorism), direct-to-consumer drug advertising, terrorism, community building, cancer patient advocacy, and climate change.

The NCA has pursued practically relevant contributions for some time. Article II of the NCA constitution states, “The purpose of the association shall be to promote criticism, teaching, research, and *application* [italics added] of the artistic, humanistic, and scientific principles of communication.” NCA’s 2003 strategic plan specifically states, “NCA will engage in selected projects that extend and apply communication scholarship to other academic, professional, and civic communities.” A second stipulation states that “NCA will promote its publications to a wide audience of scholars and practitioners.”

Of course, as communication scholars, we hope to be in step with our colleagues who believe that theory should always play an indispensable role in applied research. We are mindful of Kurt Lewin’s famous statement, “There is nothing more practical than a good theory.” Theory and practice inform each other. Julia Wood (2000) perhaps said it best when she argued that “applied communication research is not bounded by domain. Its nature cannot be demarcated usefully by context . . . What defines and distinguishes applied communication research is its insistence on putting theory and research into the service of practice, and equally, of studying practices to refine theory in order to gain new understandings of how communication functions and how it might function differently, or better” (p. 189).

Communication as Both an Idea and an Ideal

In closing, we are persuaded by Martin E. P. Seligman (2002), a psychologist from the University of Pennsylvania and author of the best-selling book *Authentic Happiness*, who argues that the greatest achievements “occur in cultures that believe in absolute truth, beauty, and goodness.” We join with Thomas Friedman when he argues for promoting dreams instead of memories. The future of the communication discipline lies *not* only in celebrating our past but also in honoring our obligation and commitment to the human condition. In this sense, we embrace the idea of communication both as an intrinsic part of the human condition and as an ideal for making a difference in the lives of those who surround us, locally and globally.

COMMUNICATION AS A FIELD AND AS A DISCIPLINE

WILLIAM F. EADIE

San Diego State University

Is communication a “real” area of academic study? If so, how did it evolve as a discipline? In this chapter, I will trace the evolution of communication as a discipline, outline the reasons why I believe that it is a discipline, and discuss three means for describing the content of the discipline.

Communication is a topic that has fascinated both scholars and ordinary people from the earliest days of human civilization. Traces of writing on the subject can be found in most ancient civilizations around the world, but the most complete discourse on the topic came from ancient Greece, where rhetoric, or the art of persuasion, was an essential part of any discussion of how to be effective as a citizen in a democratic society. Writing on communication in the Greek era tended to focus either on how to be a more effective communicator or on the role of communication in society. A major debate erupted between the philosopher Plato and his student Aristotle on this topic. Plato contended that rhetoric was important for the pursuit of beauty and for entertainment purposes but its use should be ignored in society because rhetoric could lead people away from what was true and cause them to make bad decisions. Plato preferred a philosophical method he called dialectic, where individuals carefully searched for new truth based on what was already known. Aristotle, on the other hand, contended that the importance of rhetoric was to help those in society create probable truth out of what was known or could be deduced. Rhetoric, then, in Aristotle’s way of thinking,

was important to the substance of communication as well as to the style a communicator might use.

Rhetoric as a Key to Communication

Rhetoric was an important area of study for educated people throughout history, but how it was studied depended to at least some degree on the nature of the society where the study was taking place. In the days of ancient Roman democracy, for example, Cicero wrote a manual for structuring the content of public speaking that is still referenced in public speaking textbooks. But by the time the more autocratic rule of the Roman Empire was established, Quintilian, that era’s leading educator, defined rhetoric almost completely in terms of style when he wrote that rhetoric consisted of “a good man speaking well.”

The style side of rhetoric became dominant, to the point that good rhetoric was thought to be not just stylish but also stylized. Entire books were written on elocution, which purported to advise a speaker on the proper forms of speech, appropriate diction, and the ways in which the body should be positioned to convey particular emotions. Watch a play from the Restoration Era (from 1660 and into the 1700s), and you’ll observe the actors behaving in the very stylized manner that was an integral part of the success of those pieces of entertainment.

Rhetoric began to focus on substance again with the publication, in 1776, of George Campbell’s *The Philosophy*

of *Rhetoric*. Campbell emphasized that there were different purposes for speaking (to inform, to persuade, and to entertain), and each type required a different approach. The key to success, according to Campbell, lay in the quality of one's ideas. Ideas themselves had vivacity, Campbell argued, and thus, rhetoric need not be covered up with excesses of style. This approach proved to be very appealing to intellectuals in the newly formed United States of America, as they saw the pursuit of lively ideas as essential to building an effective democracy. So while professors of literature teaching at colleges and universities in the early days of the United States continued to examine how rhetorical style was used to create beautiful essays, stories, and poetry, debating societies focused on arguing about the best ideas for building a better democracy. Typically, these debating societies were not a formal part of the university curriculum, but eventually colleges and universities started hiring faculty who were adept in teaching students how to use rhetoric in order to communicate ideas effectively, both orally and in writing.

Technology and the Beginnings of Professional Journalism

The development of printing and the subsequent increase in literacy, the ability to read and write, among ordinary people also helped not only to preserve ideas but also to contribute to public debate on important issues. Printers began to report and publish the news as a means of having a steady income for their businesses, and these businessmen would train their apprentices to gather and write the news for distribution. The British parliamentarian Edmund Burke was credited with having dubbed the press "The Fourth Estate" (the other "estates" were the clergy, the nobility, and the citizenry) and with having acknowledged the press as being the most influential of them all. His term underscored the importance of journalism in a free society. The founders of the United States recognized that importance as well by including both freedom of expression and a free press in the Bill of Rights, the First Amendment to the U.S. Constitution.

Speech, Journalism, and the Democratizing of U.S. Higher Education

The advent of large public universities in the United States, especially those known as "land grant institutions," whose missions included the development of agriculture and technology in the regions they served, brought formal instruction in both oral rhetoric, or speech, and journalism into higher education. Land grant institutions reached out to educate talented students whose parents were not among the elite, and these students were not used to the

idea that they might use their education to become leaders in society. So speech education focused on developing and supporting one's ideas for oral presentation in a manner that would appeal to the particular audience that the speaker was planning to address. Journalism, on the other hand, made a transition from being taught as a craft to being taught as a profession. As members of the Fourth Estate, journalists needed to understand not only how to report and write accurately and clearly but also the context and the history of the issues on which they were reporting. Land grant universities valued democracy above most other ideals, and effective speech and a free press were the cornerstones of democracy.

At many colleges and universities, speech and journalism were taught in the English department. This arrangement made some sense, as English shared an interest in rhetoric with speech and an interest in writing with journalism. But it also produced tensions, as English professors treated rhetoric differently than did speech professors, and English professors regarded writing as a liberal art, while journalism professors regarded it as part of a profession. As a result, both journalism and speech professors began to break away from the English department and start separate programs. They also each formed professional organizations that were separate from the National Council of Teachers of English. In 1912, journalism faculty founded what today is called the Association for Education in Journalism and Mass Communication, while in 1914, speech professors founded what today is called the National Communication Association.

Both speech and journalism professors were focused on teaching rather than on scholarship. They recognized that universities were concentrating both on teaching and on scholarship that generated new knowledge, but they resisted becoming scholars. In the case of journalism faculty, many had professional experience as working journalists, and they wanted to maintain a professional identity as well as help prepare the next generation of journalists. In the case of speech faculty, most were focused on teaching students to be better oral communicators, and there was some disagreement regarding what would constitute appropriate scholarship. While speech faculty began publishing a scholarly journal almost immediately after forming their association, much of the scholarship that was published in that journal was related to the diagnosis and treatment of speech disorders, such as stuttering.

Communication as an Agent of Social Order and Change

Meanwhile, another new field of study, sociology, was taking root around the country, most notably at the University of Chicago. Sociology was a natural field of study at Chicago, as that university had been founded with

a mission not only to be a first-rate educational institution but also to study and improve the poor and working class neighborhoods of the city that surrounded it. Chicago's sociology program became one that was central to the university's mission, and it developed its own expertise or cultivated expertise in other disciplines that would help it accomplish its mission. The rise of various avenues of mass communication, including, in large cities, several competing newspapers, film screenings for entertainment, and, later, radio, led to the Chicago scholar Robert Park and others constructing the first theories of mass communication.

Chicago also was the home of the philosophers John Dewey and George Herbert Mead. Dewey and Mead arrived at Chicago together and were close friends. Even though Dewey left Chicago in 1904 to move to Columbia, Mead and Dewey stayed in contact. Both were interested in how people used symbols in thought and how they acquired and shared meaning through interactions with others. So Mead and Dewey can be thought of as early theorists of face-to-face communication, even though neither of them probably would have thought of himself in those terms. Nevertheless, both Mead and Dewey's ideas have continued to influence communication scholars to the present day. In addition, Chicago's sociology program was influenced by Mead in particular, and it became a champion of Mead's ideas about symbolic interaction and its role in creating societies. Formal communication scholarship may well have begun at Chicago, but communication there was more of a topic in a larger effort to determine how to define and improve communities, as well as the larger societies in which they were located.

Undoubtedly, the development of media technologies and the unsettled world conditions following World War I led to additional advances in communication scholarship. While the telegraph provided a means of reporting the news from distant places quickly, and films proved to be an excellent supplement to live entertainment, it was radio's immediacy and ability to provide information that was even more current than what was communicated by the telegraph that probably spurred scholars to begin to worry about how the media would affect politics and public opinion. The use of various forms of media for propaganda purposes during World War I, which was continued in Europe following the conclusion of that war, also concerned both scholars and policymakers.

A group of scholars, most of whom were working outside the mainstream of their academic fields of study, started to pursue these issues in various ways. Notable among these scholars were a group of European immigrants (e.g., Paul Lazarsfeld and Kurt Lewin) who were escaping persecution by fleeing to the United States. These scholars produced a number of insights about the nature of media effects and also contributed significantly to understanding how media content and presentation interacted with face-to-face communication to form and change public attitudes.

During World War II, a number of scholars and artists gathered in Washington, D.C., to put to use what had been learned about effective media use in producing and countering propaganda. This group worked at the Office of War Information; it included Wilbur Schramm, who had left his position as head of the famed Iowa Writers' Workshop to participate in the war effort. Schramm was fascinated by what his social science colleagues had learned, and following his stint in Washington, he wanted to put his newfound knowledge to work. He also wanted to return to the University of Iowa, where the only appropriate position open was as director of the School of Journalism. Schramm took up the position and used it to form a Bureau of Communication Research, as well as to begin a doctoral study in mass communication. Schramm's career would take him to the University of Illinois and to Stanford University before his retirement, and in each place, he would establish a distinguished communication program that focused primarily on mass communication research.

In a like manner, the social psychologist Carl Hovland, who was also among the scholars at the Office of War Information, returned to Yale and continued to do research on propaganda and mass communication. This research led him to study communication more broadly, focusing on social interaction and attitude change. Among Hovland's group at the Yale Program in Communication and Attitude Change were individuals who would become renowned figures in social psychology over the next generation.

Journalism and Speech Become Communication

Partly at Schramm's urging, scholars in journalism programs took up social science research in mass communication. Likewise, speech scholars began to do the same for face-to-face and group communication, led by Elwood Murray of the University of Denver, among others. Murray and a group of scholars established what is now called the International Communication Association. Though this group had decided to be interdisciplinary, it was dominated by speech scholars and served as a means for those individuals to become active in communication research.

A watershed mark for speech scholars occurred in 1960 with the publication of David K. Berlo's book, *The Process of Communication*. Berlo delineated a model of communication that, while not enormously different from those offered by other scholars, focused on face-to-face communication. The model outlined variables that might be studied to understand face-to-face communication better, and it introduced the word *process* to indicate that theorizing about communication could not simply focus on its individual parts but needed to take into account how those parts fit together.

By 1968, a group of speech scholars meeting in New Orleans had proposed to rewrite the definition of the academic study of speech to include the study of communication.

Over time, the use of *speech* waned and was replaced by *communication* in describing what was going on when people talked with one another. Likewise, the term *mass communication* waned over time and has been gradually replaced with *media studies*. And “communication” scholars stopped distinguishing between whether communication was mediated or face-to-face and started to use the term more generally to describe an area of study.

Communication as a Topic, Field, and Discipline

So communication progressed from being a *topic* of interest in disciplines such as sociology, social psychology, and political science to becoming a *field* of study within journalism and speech and then to becoming a *discipline* that encompassed and moved beyond the boundaries of both speech and journalism. Communication is still a topic of interest in sociology, social psychology, and political science, among other disciplines, and that interest has been substantial enough to prompt some scholars to contend that communication is an interdisciplinary field of study and not a true academic discipline.

The argument for communication as a field revolves around the fact that communication scholars have historically done research using theories and techniques developed by other disciplines and have coveted publication of research findings in other disciplines’ journals. But, primarily, this argument is based on the idea that communication scholarship is inferior to scholarship in other disciplines and that communication as an area of study lacks prestige. Evidence for this argument comes from the fact that publications in communication journals cite articles from other fields more often than publications in journals of other fields cite communication scholarship. Evidence is also drawn from the fact that communication is not well represented as an area of study in the elite universities of the United States and from the perception that communication scholars, and thus communication scholarship, are generally not well-known.

The argument for communication as a discipline acknowledges the evidence for the opposing argument but adds evidence that indicates that scholarly life in communication is changing. Such evidence includes the proliferation of journals in communication; the movement away from self-publication of these journals by the scholarly associations and toward publication by academic presses; and the continuing low rate of articles accepted for publication, despite the proliferation of scholarly journals devoted to some aspect of communication. The evidence also includes the upcoming first-time ranking of communication doctoral programs by the National Research Council; the classification of communication as a scholarly, as opposed to professional, discipline by the National Science Foundation; and the creation of categories of

funding for health communication research by the National Institutes of Health. And elite U.S. universities are starting to sponsor places where communication scholarship occurs in some form or another, even if they do not include communication as a formal academic department.

Communication’s Subfields of Study

A discipline has its own body of knowledge, its own set of theories and research methods associated with those theories, and a number of recognizable subfields of study. Communication’s body of knowledge is being developed by its substantial number of journals, including one devoted exclusively to publishing theoretical articles (*Communication Theory*). Its research methods may have been borrowed initially, but communication scholars have refined those methods to fit the type of scholarship being pursued. And there are recognizable subfields that are producing a stream of doctoral-level researchers. In 2004, the National Communication Association did a ranking study of communication doctoral programs focusing on subfields. The study identified nine subfields producing doctoral graduates in at least 15 of the 67 universities that responded. The subfields were communication and technology, critical/cultural studies of communication/media, health communication, intercultural/international communication, interpersonal/small-group communication, mass communication research, organizational communication, political communication, and rhetorical studies.

Many of these subfields describe the contexts in which communication occurs: one-on-one or in small groups, organizations, politics, and health care settings. Rhetorical studies and mass communication are familiar as topics of early study within the discipline. Two of the subfields, communication and technology and intercultural/international communication, deal with how individuals use and interact with various technologies and new media or with people from other nations or other cultures within the same nation. Finally, critical/cultural studies of communication/media concern how both face-to-face communication and the media reflect the power structures of the societies in which they occur and are an integral part of the construction of those power structures that greatly influence how we understand our cultures and how we interpret symbols within those cultures.

Three Approaches to Describing the Communication Discipline

There are at least three other approaches available for describing the discipline of communication that should be outlined in this chapter. One is an intellectual description of communication as a collection of scholarly “traditions.” The

second is the description of the communication discipline that the U.S. federal government's National Center for Educational Statistics developed for purposes of collecting and reporting data on instructional programs in higher education in the United States. And, third, the structure of this reference work also provides a means of understanding the content of the communication discipline.

Scholarly Traditions

Robert T. Craig (1999) of the University of Colorado, Boulder, has noted that communication scholarship is conducted in a number of different ways, and he has identified seven of these overarching approaches that he calls "traditions." These seven traditions are (1) rhetorical, (2) semiotic, (3) phenomenological, (4) cybernetic, (5) sociopsychological, (6) sociocultural, and (7) critical. I'll explain each one briefly in the paragraphs that follow.

The Rhetorical Tradition. Rhetoric should be a familiar topic by now. For Craig, the rhetorical tradition focuses on discourse, which can be expressed both face-to-face and via media. Rhetoric has always been conceived as an art rather than a science, and so the best way of examining it has been through the use of criticism—that is, examining the discourse itself and discovering how the creators of the discourse used various kinds of strategies to maximize the effects of that discourse. So whether examining the text of a speech, a newspaper editorial, or a film or television program, the critic is looking to get underneath the surface to see how language is being used for purposes of influence.

The Semiotic Tradition. Semiotics is the study of signs and symbols and how they are used. Scholars using the semiotic tradition look at how people cooperate to produce meaning and how meanings can be manipulated through the same process as they are created. The most common use of the semiotic tradition has been to examine media content to reveal how signs and symbols have been used to create artistic forms of meaning.

The Phenomenological Tradition. This tradition looks at the communication process from a philosophical standpoint. It treats effective communication as dialogue and values openness and authenticity in both speech and action. Scholars using this tradition analyze communication looking for misunderstandings and seeing how they can be corrected for the betterment of society as a whole.

The Cybernetic Tradition. Cybernetics deals with the control of systems. The most common example, using a mechanical system, is a thermostat, which controls when heating or air conditioning should be turned on and when it should be turned off to maintain a comfortable environment. Likewise, the primary cybernetic function in a communication system is feedback, with positive feedback encouraging the system to keep operating as is and negative

feedback indicating to the system that something needs to be changed. Scholars who use a cybernetic approach tend to study how communication systems are regulated and how they can be changed to make them more efficient and productive. The focus of scholarship in a cybernetic system is how information flows within the system.

The Sociopsychological Tradition. This tradition is the one that has generated the most amount of scholarship, historically, in communication. Scholars working within this tradition are typically interested in attitudes, behaviors, and patterns of interaction that can be isolated and studied as objects that exist in a real world rather than as something that is created. This sort of scholarship often isolates variables to study (e.g., do women speak differently than men?), and it often studies these variables using methods that can be quantified and analyzed statistically. This tradition is at the root of many theories of both interpersonal communication and media effects.

The Sociocultural Tradition. This tradition reaches into the sociological roots of the study of communication, but scholars who study communication from within this tradition typically eschew thinking in terms of "causes" and "effects." Rather, these scholars take the viewpoint that communication is constructed by the participants and that, in turn, those constructions influence our views of both society and culture. Communication both produces and reproduces those patterns that we recognized as societal or cultural.

The Critical Tradition. The critical tradition arises to a degree out of the sociocultural tradition. Scholars in this tradition also look at media and communication at the societal and cultural levels, but they focus on how communication helps create and re-create power structures within that society. In turn, these power structures seek to maintain themselves by becoming normalized through both talk and media content. Scholars working within this tradition regard the criticism of society as both a natural and a necessary part of their scholarship.

Craig's essay contended that communication scholars tend to gravitate toward one of these traditions, identify with it, and then pursue scholarship only from that tradition, though he acknowledged that some scholarship has been accomplished by generating findings from more than one tradition and then attempting to use those findings to produce a richer view of a particular communication topic than might otherwise be available. Craig found it encouraging that this sort of integration was going on, as doing so tended to break down the somewhat artificial differences among approaches. Rather than finding the discipline to be a hodgepodge of different approaches, however, Craig indicated that doing scholarship from these different traditions could actually strengthen the knowledge base of the discipline, assuming that scholars working from within

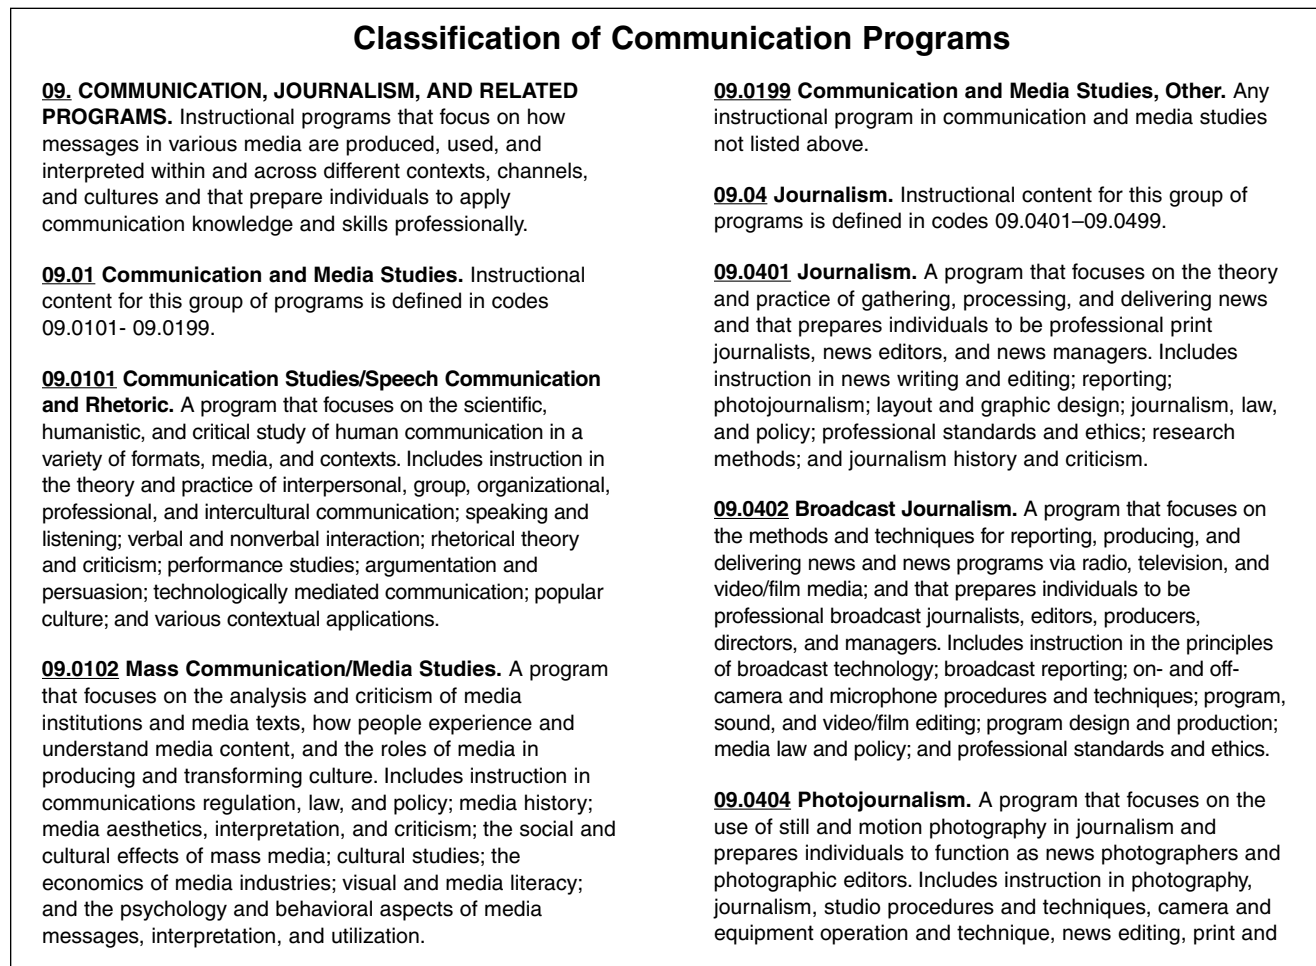

these different traditions were willing to integrate the scholarly insights coming from these traditions. Though there has been a period where the defenders of each tradition supported their own kind of scholarship at the expense of scholarship from the other traditions, such an argument seems now to be largely passé.

Communication as a Collection of Programs of Study

The second approach to describing the discipline focuses on what we teach, particularly what sorts of programs of study we offer to undergraduates. The U.S. federal government collects extensive data on programs of study in colleges and universities around the country, and to do so, it needs a category system for the data. This system is called the Classification of Instructional Programs (CIP), and it is maintained by the National Center for Educational Statistics. The “Communications” category within the CIP was originated in 1980 and featured mostly definitions of programs that

provided professional education in media fields. The 1980 system also contained a vaguely defined category called “Communications, General,” into which much of the scholarly work in the discipline was placed. There was also a category called “Speech and Rhetorical Studies,” which was included under the general heading of “English.” (See Figure 2.1.)

In the 2000 revision of the CIP, the “Communications” category dropped the “s” and therefore made the title more generic (*communications* generally refers only to the media). Professional programs of study were still an important component of the category, but the “General” section was eliminated, and in its place was added a section titled “Communication and Media Studies.” This section described the liberal arts programs in the discipline, where education focused on knowledge generated from theory development, instead of from research on professional practice. Unfortunately, the creators of the CIP retained the category of “Speech and Rhetorical Studies” under “English.” The word *speech* appearing as a subtopic of English is potentially confusing.

(Continued)

Figure 2.1 Classification of Communication Programs

(Continued)

film editing, news scene composition, subject surveillance, media law and policy, news team field operations, and professional standards and ethics.

09.0499 Journalism, Other. Any instructional program in journalism not listed above.

09.07 Radio, Television, and Digital Communication. Instructional content for this group of programs is defined in codes 09.0701–09.0799.

09.0701 Radio and Television. A program that focuses on the theories, methods, and techniques used to plan, produce, and distribute audio and video programs and messages and that prepares individuals to function as staff, producers, directors, and managers of radio and television shows and media organizations. Includes instruction in media aesthetics; planning, scheduling, and production; writing and editing; performing and directing; personnel and facilities management; marketing and distribution; media regulations, law, and policy; and principles of broadcast technology.

09.0702 Digital Communication and Media/Multimedia. A program that focuses on the development, use, and regulation of new electronic communication technologies using computer applications and that prepares individuals to function as developers and managers of digital communications media. Includes instruction in the principles of computers and telecommunications technologies and processes; design and development of digital communications; marketing and distribution; digital communications regulation, law, and policy; the study of human interaction with, and use of, digital media; and emerging trends and issues.

09.0799 Radio, Television, and Digital Communication, Other. Any instructional program in radio, television, and digital communications not listed above.

09.09 Public Relations, Advertising, and Applied Communication. Instructional content for this group of programs is defined in codes 09.0901–09.0999.

09.0901 Organizational Communication, General. A program that focuses on general communication processes and dynamics within organizations. Includes instruction in the development and maintenance of interpersonal group relations within organizations; decision-making and conflict management; the use of symbols to create and maintain organizational images, missions, and values; power and politics within organizations; human interaction with computer technology; and how communications socializes and supports employees and team members.

09.0902 Public Relations/Image Management. A program that focuses on the theories and methods for managing the media image of a business, organization, or individual and the communication process with stakeholders, constituencies, audiences, and the general public; and that prepares individuals to function as public relations assistants, technicians, and managers. Includes instruction in public relations theory; related principles of advertising, marketing, and journalism; message/image design; image management;

special event management; media relations; community relations; public affairs; and internal communications.

09.0903 Advertising. A program that focuses on the creation, execution, transmission, and evaluation of commercial messages in various media intended to promote and sell products, services, and brands; and that prepares individuals to function as advertising assistants, technicians, and managers. Includes instruction in advertising theory, marketing strategy, advertising design and production methods, campaign methods and techniques, media management, related principles of business management, and applicable technical and equipment skills.

09.0904 Political Communication. A program that focuses on human and media communication in the political process and that prepares individuals to function as members of political and public affairs organizations, political campaign staffs, and related government and media entities. Includes instruction in media effects, political speaking and debating, political advertising and marketing, image management, political journalism, opinion polling, and aspects of print and broadcast media related to the production and distribution of media messages in political settings.

09.0905 Health Communication. A program that focuses on how people, individually and collectively, understand and accommodate to health and illness and the role of communication and media in shaping professional health care messages and public acceptance of these messages. Includes instruction in the development and use of health-related and care-related messages and media; the goals and strategies of health care promotion; relationships, roles, situations, and social structures in the context of health maintenance and promotion; and applications to disease prevention, health advocacy, and communications concerning treatments.

09.0999 Public Relations, Advertising, and Applied Communication, Other. Any instructional program in organizational communication, public relations, and advertising not listed above.

09.10 Publishing. Instructional content is defined in code 09.1001.

09.1001 Publishing. A program that focuses on the process of managing the creation, publication, and distribution of print and electronic books and other text products and prepares individuals to manage the editorial, technical, and business aspects of publishing operations. Includes instruction in product planning and design, editing, author relations, business and copyright law, publishing industry operations, contracting and purchasing, product marketing, electronic publishing and commerce, history of publishing, and professional standards and ethics.

09.99 Communication, Journalism, and Related Programs, Other. Instructional content is defined in code 09.9999.

09.9999 Communication, Journalism, and Related Programs, Other. Any instructional program in communication, journalism, and related fields not listed above.

Or perhaps not. After all, there is a communication and media studies category titled “Communication Studies/Speech Communication and Rhetoric,” which uses *speech* as part of its name. Under this category are listed the following areas of study:

- Theory and practice of interpersonal, group, organizational, professional, and intercultural communication
- Speaking and listening
- Verbal and nonverbal interaction
- Rhetorical theory and criticism
- Performance studies
- Argumentation and persuasion
- Technologically mediated communication
- Popular culture

The first group of these areas of study is identified by the context in which communication occurs: two-person face-to-face (interpersonal), three or more people face-to-face (group), an organization where not everyone may interact face-to-face (organizational, professional), and face-to-face interaction that takes place between people of different cultures (intercultural). The second group of these areas describes aspects of the communication process (speaking and listening, verbal and nonverbal interaction). The final group describes topics of study within this aspect of the discipline: rhetorical theory and criticism (understanding and critiquing messages and communication situations designed to be persuasive); performance studies (understanding and appreciating how performers interpret texts for audiences); argumentation and persuasion (understanding the nature of arguments and how audiences are influenced by advocacy); technologically mediated communication (understanding how people use technology in communication); and popular culture (understanding the role communication plays in cultural trends).

The second category is titled “Mass Communication/Media Studies,” and under this category are listed the following areas of study:

- The analysis and criticism of media institutions and media texts
- How people experience and understand media content, and the role of media in producing and transforming culture
- Communications regulation, law, and policy
- Media history
- Media aesthetics, interpretation, and criticism (i.e., appreciating and evaluating media as art)
- The social and cultural effects of mass media
- Cultural studies (i.e., studying how the media influences our understanding of culture)
- The economics of media industries
- Visual and media literacy (i.e., understanding and evaluating how the techniques of media production and visualization affect how richly we can take apart media content)
- The psychology and behavioral aspects of media messages, interpretation, and utilization

The second major section in the CIP description of “Communication” is titled “Public Relations, Advertising, and Applied Communication.” This section includes courses of study that are primarily professional in orientation, as opposed to the liberal arts orientation of “Communication and Media Studies.” Courses with a professional orientation typically try to ground students in what we know about a given area, but they also focus on how to use what we know in some sort of occupation. Besides advertising and public relations, this section includes the following:

- Business communication, which focuses on the production of printed and Web-designed materials for business use
- Organizational communication, which, in this section, focuses on consulting skills for improving communication within organizations
- Political communication, which, in this section, focuses on the knowledge and skills required to manage political campaigns and the constituent and media relations of officeholders
- Health communication, which, in this section, focuses on the knowledge and skills required to improve communication in health care settings and between health providers and the public

Organizational, political, and health communication also have substantial bodies of theory associated with them, and so they are also topics of study in the “Communication and Media Studies” part of the discipline.

The third major part is titled “Journalism,” and it is also a section where professional education is the norm at the undergraduate level. The topics of study listed under journalism are likely to be found in most undergraduate programs in U.S. universities. Broadcast journalism is listed as a separate category under the “Journalism” rubric, but at most U.S. universities it is just as likely to be an area of specialization within a journalism program as it is to be a separate field of study.

The final major section is titled “Radio, Television, and Digital Communication.” This part focuses on how media content is produced, from a technical point of view. Included here are two major categories, radio and television production and digital media production (and several that describe related courses of study that are located in other fields, such as films or computer science). The “Radio and Television” category also includes a section on management, that is, understanding how broadcast media are programmed and how the entertainment needs and desires of audiences are assessed. This category is also likely to operate from a professional education perspective at most U.S. institutions of higher education. In fact, some of the practical courses in media production are offered as programs leading to professional or technical certification at 2-year institutions (i.e., community or technical colleges).

The Communication Discipline, as Represented in This Work

The third approach to describing the discipline will be my explanation of the topics I selected for inclusion in *21st Century Communication: A Reference Handbook*. When the Reference Division Editor at Sage Publications asked me to take on editing the two-volume work in which this essay is included, he described the project to me as “covering the discipline of communication in 100 topics.” As editor of the work, it was up to me to select the 100 topics for inclusion. I did a considerable amount of consulting with colleagues before making the decision.

Many of my consultants urged me not to use standard categories for describing the communication discipline. So I tried to think through what alternatives I would use. This approach worked much better for the liberal arts section of *21st Century Communication* than it did for the professional education section, so, in the end, a bit more than half the work reflects my own ideas about how to organize the discipline, while the rest represents descriptions that are more familiar and agreed on. The result was 100 chapters divided among 14 major parts. I’ll describe the contents of each major part briefly.

The first part focuses on the *discipline* itself. In it, I’ve included a chapter on the idea of communication but also on how “communication” has become a societal ideal; this chapter and the chapters on the history of the discipline form both the “speech” and the “journalism” perspectives.

The second part describes various *approaches* to the study of communication. This part includes methods used to generate research from many of Robert Craig’s seven traditions of study, which I described earlier in this chapter.

The third part looks at communication as a *process*. The eight chapters here reflect my thinking as to the major elements that contribute to our understanding of everyday communication. These are not necessarily traditional categories, but each does represent a significant area of scholarship within the discipline.

The fourth part considers a number of different *forms and types* of communication. These range from the most traditional forms from the speech tradition, such as public speaking and debate, to forms that have been pioneered by rhetorical and media scholars in more recent times, for example, visual rhetoric and examinations of forms of collective memory, such as public memorials.

The fifth part is devoted to the characteristics of *messages*, primarily, though not exclusively, from the standpoint of rhetorical scholars. Included are topics such as style, genre, and rhetorical strategy, but the part also features an examination of how messages are constructed to indicate social support.

The sixth part catalogs how communication affects the development of various kinds of *relationships* that are common in individuals’ lives. These relationships include ones involving family, friends, work colleagues, or people

who provide important functions, such as teachers and medical professionals. Although these chapters are written from the standpoint of a particular relationship, they include much of the information that might have been placed in the chapters on communication contexts, such as interpersonal, group, or organizational communication.

The seventh part explores how a variety of individual and societal *factors* affect communication. These factors are not the only ones that affect communication, but they represent ones where a considerable amount of scholarship has taken place. Included in this part are individual factors such as gender, ethnicity, and sexual orientation, as well as societal factors such as culture and globalization.

The first volume of this work closes by considering several areas of communication scholarship that reflect the different *challenges and opportunities* most of us face as communicators. Included here are topics such as ethics, communication competence, deception, and systemic media bias.

The second volume focuses primarily on media and the professional career opportunities that media industries provide. The topics in this volume are organized in a more traditional manner than are the ones in the first volume. The chapters in the first part of this volume cover many of the major research traditions on *media*, along with some of the research on how people interact with technology.

The rest of the second volume is devoted to topics common in *professional* education in journalism, public relations, advertising, and media management. The first part, titled “Communication as a Profession,” contains only one chapter, which provides an overview of the kinds of practices that are important to learn if one plans to become a communication professional.

Then, each of the following parts contains chapters on topics that are covered in individual courses that make up a typical curriculum in that professional area. So under *journalism*, there are topics on reporting, editing, and photojournalism practices, along with law, ethics, history, and various forms of journalism. I’ve also included chapters on international journalism and the business of journalism, though this last topic is not a typical part of most journalism programs.

Under *public relations*, I’ve included both basic concepts and more advanced topics such as issues management, crisis communication, and political communication. As journalism, I have included chapters on international public relations and the business of public relations.

The *advertising* part follows a similar pattern. I’ve included chapters on basic concepts and also on specialized topics such as social marketing, and integrated marketing communications. And, as in the previous two parts, I’ve included chapters on international advertising and the business of advertising.

The final part covers *management* topics relevant to media organizations. In this part, there are chapters on economics and ownership of media organizations, policy and

regulation, and media programming issues. The work concludes with reflections on media convergence, or how the boundaries among traditional media such as print and broadcast are being blurred by the widespread use of the Internet to deliver content and services that previously were the province of these older media.

Concluding Remarks

Communication is a multifaceted discipline that resists easy classification. I have attempted here to describe it by (a) tracing the history of the areas of study that led to what we now know as communication scholarship; (b) reviewing how communication can be considered a topic of inquiry in some fields of study but how it has emerged over time as its own field with identifiable subfields; and (c) discussing three approaches to conceiving of a communication discipline as (1) a set of scholarly traditions, (2) a collection of undergraduate programs of study, and (3) the contents of the reference work in which this essay is located. Even though all these descriptions are, in their own ways, reasonably accurate and complete, none of them is wholly so. The good thing about the communication discipline is that it is continually growing and changing, and the direction of that growth and change

relies on bright and committed individuals becoming fascinated enough with this thing we call “communication” so that they produce the scholarship that takes our field of study in new and interesting directions.

THE SPEECH TRADITION

WILLIAM M. KEITH

University of Wisconsin–Milwaukee

Where do disciplines and departments come from? We often speak as if they had always existed in the same form they do now, as if there were a natural set of categories for subjects and study. But just like everything else, disciplines and departments in the contemporary U.S. university have a history. What we think of as “communication” may be covered by two or three different departments, and all of them may have started out very different from their current form. We currently imagine communication as a universal process that happens in different media (television, radio, print, the Internet) and is attached to different professions (journalist, writer, producer, actor). The development of all these things proceeded by complex paths, however, and the bewildering diversity of communication departments reflects this. In some places, all kinds of communication are in the same department or college. In others, the communication professions (journalism, public relations, advertising) are in a separate department or even in the business school. In some cases, theater is contained within the communication department, while in others it is by itself or linked with other performing arts, such as music and dance. For the purposes of this article, we’ll take the core of university education in communication to be public speaking, debate, and the traditions that follow from them. In some places, the department in this tradition is called Speech Communication, though that term is increasingly disappearing in favor of Communication or Communication Studies.

To explain the general growth and direction of the communication discipline, we’ll first look at state universities 100 years ago and the received understanding of communication education. Then we’ll examine how public speaking

and debate became the core of a new kind of department, the Speech department, and unpacked the commitments of speech education to civic rhetoric and social improvement. The evolution of the field, lending it a humanistic and social science side, will be next, as we consider the unfolding research programs that grew out of the teaching interests of the Speech faculty. Finally, we’ll observe how current teaching and research in the field are organized.

Changing Universities

Before looking at the emergence of the field itself, let’s consider the background of higher education; the field of speech emerged out of changing teaching practices in U.S. higher education in the early 20th century. Between 1880 and 1920, many of the academic fields in the United States formed associations and university departments. Until that period, colleges had “faculties,” groups of people who taught a certain course. They usually didn’t have advanced degrees but were just university-educated men teaching various liberal arts subjects to students from prosperous families. Both the faculty and the students, however, were changing. University education, with the rise of the research university and the land grant schools, was becoming accessible to a larger and more diverse group of Americans. Higher education was outgrowing its traditional function of reproducing an elite class. In the 18th and early 19th centuries, college was mostly an exercise in self-improvement; its job preparation was limited to qualifying students for the “gentle professions” of the clergyman, the lawyer, and the politician, acceptable jobs for “gentlemen.” All these professions were

“public” (in the sense of public speaking) and reflected a civic approach that derived from a model of classical education focused on principles expounded by the Roman orator Cicero.

Where did communication fit into this model of education? Speech instruction had until this point been integrated into the general, liberal education of the private colleges, with students writing and speaking as part of the study of the classics and philosophy. But as the 19th century came to a close, speech instruction, focused mainly on delivery, became a separate course in the curriculum. Speaking as a performance art, the “platform entertainer,” had become lucrative and popular, and college instruction reflected that reality. People also expected that anyone with a college education could speak eloquently, with beauty and complexity and, at length, whenever the occasion demanded.

The resulting pedagogy, called *elocutionism*, focused heavily on the delivery and performance aspects of speaking and was perhaps more closely related to theater than to public address. Elocutionism harmonized with the middle-class culture of oral and musical performance but remained in tension with the civic traditions of public address. In 1890, the National Speech Arts Association (NSAA) was founded, with the intention of bringing together both private and university elocution teachers under the term *speech*, allowing them to include diverse activities involving the voice.

Speech as a Discipline and a Department

In U.S. universities, speech instruction was evolving from traditional patterns. A precursor to the field of speech was “Oral English,” which continued the elocutionist pattern by including courses (or sometimes parts of courses) that focused on students reading out loud or interpreting essays, stories, or poetry (either classic pieces or those written by the student); speaking was understood as a complement to writing instruction. This relationship to the dominant, literature-oriented part of English departments resulted in a kind of second-class status for those who taught speaking; they were paid less than others and typically were not eligible for promotion. Oral English itself was short-lived, as most of the people who taught these courses eventually moved to Speech departments when they were formed. The relationship between speech teachers and English departments was generally unstable, although some faculty made attempts at professional unity.

In 1910, the Eastern Public Speaking Conference became the primary organization for college teachers of speech. The idea of a conference for public speaking teachers in particular came from James Winans of Dartmouth College, later a renowned teacher at Cornell

University; Winans was concerned about the differences between NSAA teachers, who were sometimes more similar to today’s “motivational speakers,” and the emerging group of academic speech teachers and debate coaches. The journal of the conference was the *Public Speaking Review*, a mix of teaching tips, professional news, and reports from the conference. The conference and the journal met the needs of public speaking teachers to be able to talk to each other about teaching issues and professional issues. It was here, really, that the idea of speech as a distinct discipline was born.

But the *Review* was only part of the picture; overall, speaking instruction was flowering all across the country. At the national level, speaking teachers met as a section of the National Council of Teachers of English (NCTE), an organization that supplemented the research-oriented Modern Language Association (MLA) by focusing on teaching and including secondary school teachers. Due to the tension within English departments, the meetings of the NCTE and MLA became increasingly uncomfortable; James O’Neill of the University of Wisconsin, in particular, spoke out strongly about the need for speech teachers to organize themselves and to maintain the quality of both their teaching and their professional lives.

At the 1914 meeting of the public speaking section of the NCTE in Chicago, Illinois, O’Neill suggested a post-convention meeting of the speech teachers, and there, about 10 faculty members, mostly from the Midwest, decided to create a new association, the National Association of Academic Teachers of Public Speaking (NAATPS), along with a journal, the *Quarterly Journal of Public Speaking*. O’Neill would be president for the first 5 years, with Howard Woodward of Western Reserve University in Cleveland as the treasurer. The members took each part of their association’s name seriously. They wanted to be a *national*, not a regional, organization, similar to many other scholarly organizations formed in the previous 20 years. They were interested in the *academic* teaching of speech, which would be tied to research and scholarship; much elocution instruction happened in local, private academies, much the way private music schools still operate. The new organization saw itself as composed primarily of *teachers* who were brought together not so much by a common body of knowledge as by a common vision of instruction and skills.

Speech and the Civic Tradition

Most important, the founders of the field chose *public speaking* rather than “elocution” or “oratory” to designate their primary area of instruction. Oratory had been traditionally tied to the contexts of either elite speakers in the political arena (the Mayor, Governor, or President) or an aesthetically pleasing mode of speaking (what we would nowadays call “motivational speakers” were extremely

popular in the late 19th century). Public speaking represented a turn toward the practical. It included a variety of speakers, not just those in political power or entertainers. Public speaking also included a great many more contexts. Most of the communication professions we know today had recently appeared, in particular advertising and public relations, and people understood the emerging importance of what we would call “business and professional communication.” In addition, in a democratizing move, they envisioned almost all citizens as potential speakers. The widespread growth of civic organizations, from the Masons to the Lions Clubs, the Rotary, and innumerable other local organizations, would provide a platform for just about anybody to be a speaker. Public speaking was not only a broader category than oratory; it contained the possibility of an entire new field.

But in a larger sense, the new speech teachers did not give up on the civic mission of speech instruction; they simply realigned and reinterpreted it. They saw that the “public” in public speaking could have wide applicability without losing its civic meaning. Speaking to the Rotary on matters of public concern was just as civic, democratic, and political as a candidate’s campaign stump speech. The area where the civic dimension of speech was most hotly contested was intercollegiate debate, between teams of college debaters representing their schools. In “switch-side debate,” as it is called, a question is posed (for the whole season), and teams of two students (a school typically fielded several teams) debate other students through four or five rounds in a tournament. In each round, they switch to the opposite side of the question they are debating.

The first 10 years of the *Quarterly Journal of Speech* reveal a preoccupation with debates about debate. While public speaking instruction apparently wasn’t too controversial (except for the questions of standardization of grades and the role of speech correction), the proper organization and judging of debates provoked fierce quarrels, in which the political character of pedagogical choices became very clear. Several issues commanded the attention of those who cared about the fate of debate pedagogy. First, questions about the aims of debate emerged continually from the practical problems of conducting debate contests: What does debate do for students? So coaches argued over questions such as the following: (a) How much help should a coach give? (b) How much of a debate should be written and delivered as speech? (The impromptu rebuttal was an innovation around 1920.) (c) Should the judges be debate coaches and speech faculty, or eminent citizens of the community? (d) Do you let students debate both sides of the question?

The question provoking the angriest confrontations was the fourth one. A bright line emerged between the sides: If the debate is judged, then either we get technically better and more skillful arguers or slick and cynical sophists. If the question is judged, then either we’ll get better citizens

later on or we cheat students by having them stoop to local politics instead of learning excellent debating skills. Each side in this controversy saw significant values on the line. For those who wanted to judge the debate, led by James O’Neill, the president of the NAATPS, the professionalization of the speech profession was at stake; if you could bring in (say) Judge Smith or Rev. Jones to judge a debate, then there was nothing particularly professional or technical in teaching debate. For those who wanted to judge the question, led by Hugh Wells, a former judge then coaching at the University of Southern California, the civic context of speech instruction was at stake; if you didn’t mimic the form *and* content of civic occasions by holding students responsible to real audiences (i.e., members of the community), then debate became a game with no necessary connection to civic life. For many critics, the competitive nature of debate fundamentally undercut any civic ethos it might have; democracy, to be ethical and effective, must be much more than a game.

Dissatisfaction with debate has thus been around as long as debate has been an intercollegiate sport. In the 1930s, unhappiness with debate led to the introduction of a new course on *discussion*, which focused on deliberation and decision making in small groups. The discussion course brought together the various pedagogic threads we’ve seen. Discussion was collaborative and cooperative rather than competitive—group members work together to solve problems. Discussion represented an idealized form of civic communication. While many people identify democracy with voting, it could—and should—be more than that, since votes ought to be based on rational reflection about what to do. Discussion mimicked the deliberative aspects of democracy by bringing together diverse people and allowing them to engage each other rationally in decision making. Discussionists, including Alfred Sheffield, Craig Baird, and James McBurney, among many others, contrasted discussion sharply with debate and used John Dewey as their philosophical justification. Debate begins with a proposition (the “resolution”), and so when a debate begins, all the important decisions except one have been made. Discussion begins with a problem, which a group discusses until the participants feel that they have a common understanding of it. They then proceed to consider alternative solutions, asking of each one not only whether it solves the problem but also how its trade-offs compare with alternate solutions. Discussion isn’t mere talk; it is intended to be a framework for argument and reasoned speech that allows the focus to be problem solving rather than “winning the debate.” The important aspect of discussion is its “microdemocratic” character; at each stage, any member of the group could have input, challenging or modifying the characterization of the problem or the details of the solutions, whereas in a debate, once the resolution is proposed, the only choice is to vote it up or down. The discussion course evolved, during the 1960s, into the

“Small-Group Communication” or “Group Dynamics” course, though discussion was a competitive event in college forensics until the 1970s and remains one in some states’ high school forensic contests.

The Structure of Speech Departments

The first years of the NAATPS saw the widespread evolution from departments of Oratory and Elocution to departments of Speech; partly this was a change under way already, but the Association also encouraged members to form separate departments when they could. The new field quickly became more than public speaking. The most common pattern for Speech departments, sometimes called the “Midwestern” or “Illinois” model (after Charles Woolbert’s design for the department there), included every activity that involved human speech. Instead of courses that focused on a particular speaking situation (in the way the Oratory department focused on political and legal discourse), speech teachers expanded their domain into all the *uses* of speech. Courses thus included public speaking, debate, persuasion, physiology of the voice, diction and vocal expression, theater, and interpretation (of literature), the new name for what had been called “reading.” The early speech field did not view these as separate areas simply thrown into a department (as had been partly the case with speech in English departments) but as a unified course of study, beginning with the voice mechanism and proceeding to the various functions of human speech. Sometimes the “psychology” of speech was included as a unifying perspective, with each aspect of verbal communication depending on an underlying psychological mechanism. Sometimes classical rhetoric was invoked to provide a common thread, picturing a discipline that began with Aristotle and Cicero and was now moving into the 20th century. The Midwestern-style department would typically have four areas: (1) public speaking and debate, (2) theater and performance, (3) speech disorders, and (4) (with the advent of radio) some type of mass media.

This curriculum included some novel areas. Rhetoric became a standard part of the curriculum due to the many PhDs produced by the program at Cornell University; sometimes the focus was classical, sometimes on the emerging idea of “rhetorical criticism,” but most often, it was a study of British and American public address of the past 200 years. Speech pathology, pioneered by Smiley Blanton (who had an MD from Johns Hopkins) at the University of Wisconsin, became a staple of the field. Speech pathology (later called *speech pathology and audiology* and now most commonly called *communication sciences*) covered everything from nonstandard accents to cleft palate and stuttering to deafness and was a standard part of a general speech education right through the 1970s. Within 10 years of the founding of the field, radio had

become important enough so that universities offered courses in “radio speaking,” or training one’s voice for radio. At some schools, journalism was a part of the Speech department; at others, it grew out of news-writing courses and remained in the English department; and in others, it had its own department.

Consistent with the unified vision of the field, improvement of “speech” by addressing lisping or stuttering was of a piece with improving speech by “normalizing” a student’s accent or improving his or her interpersonal skills. This last function was often glossed as “social hygiene” or “speech hygiene.” By the late 1920s, teachers assumed that civil society was organic and that there was a normal, “healthy” function for individuals in social groups. Rather than a simple-minded conformity, they had in mind a kind of civic humanism inspired by John Dewey; the democratic functioning of groups both large and small required individuals who possessed the skills for both contributing their individual points of view and helping the group to function overall. In particular, Elwood Murray, in his classic work *The Speech Personality* (1937), not only launched the first serious use of social scientific methods in the field but also outlined the type of person that speech training was supposed to produce: someone “well-adjusted,” who could get along well enough with others to solve problems. This perspective was a considerable advance over the earlier skills approach, which had emphasized individual competence and success.

The NAATPS changed its name in 1920 to NATS, the National Association of Teachers of Speech, which conserved the pedagogic focus that defined the field previously while accommodating the move to teaching the full range of courses involving speech. In 1947, the name became the Speech Association of America, recognizing the growing research component of the field, demonstrated in the *Quarterly Journal of Speech and Speech Monographs* (now *Communication Monographs*), established in 1934. *The Speech Teacher* (now *Communication Education*) began in 1952 as a forum for teaching methods and later published mainly social scientific work on communication pedagogy. So, as it diversified, the field at this point has two branches, the humanistic (using the word *rhetoric*) and the social scientific (more closely identified with *speech* or *communication*). Let’s examine each of these in turn.

Rhetorical Studies

While working in Speech departments, humanistic scholars in communication increasingly identified themselves as “rhetoricians”—those who study rhetoric. With their discovery of Kenneth Burke’s work on rhetoric in the early 1950s, they merged a classical tradition of rhetoric with symbolic interactionism, developing a general approach to the human use of symbols. Through the 1960s, they expanded their notion of public discourse beyond speeches

by politicians to include pictorial and nonverbal rhetoric, protest rhetoric, and the rhetoric of social movements; in the 1980s and 1990s, literary theory and cultural studies decisively influenced the course of rhetorical theory and criticism.

Even though the term *rhetoric*, since the 18th century, had been a synonym for style instead of content and in the early 20th century was associated in the United States with composition courses (the “freshman rhetoric”), a more dignified and intellectually satisfying account of rhetoric has been natural to (Speech) Communication departments. From Henry Hudson’s “The Field of Rhetoric” to Donald Bryant’s “Rhetoric: Its Function and Scope” and the proceedings of the Wingspread Conference in 1970, scholars in this tradition sought to illuminate the social, cultural, and intellectual value in the study of persuasion.

In the 1930s, in part due to the efforts of Craig Baird at the University of Iowa, a rough consensus emerged about the outlines of rhetorical study. Humanists in Speech departments began with the idea that they would be studying “rhetorical history,” the historical elements (events, people, and words) that intersect at important political speeches in the American and British political tradition. But there could be very different emphases in studying speeches, as noted by Herbert Wichelns (1925/1993) in his landmark essay “The Literary Criticism of Oratory.” Wichelns points out that there are many different ways to understand the importance of a speech, and that some of them are not consistent with a rhetorical approach. He considers and rejects several options, most important a literary approach, where the speech is treated as a text just like a poem or a novel, and a biographical approach, where the emphasis is on trying to tie the personality or character of the speaker to specific features of the text. Wichelns argued that the approach that should be most characteristic of rhetoricians in Speech departments is a functional one: Speeches should not be evaluated on their aesthetic merit but on how well they achieved the speaker’s purposes in the situation. (Edwin Black would later contest this formulation in his 1965 book *Rhetorical Criticism*.) Craig Baird realized in the early 1930s both that Wichelns’ view didn’t exclude historical approaches (you might need to have a deep historical understanding to evaluate success) and that two things were needed for rhetorical criticism to become systematic. First, the field would need collections of speeches and need to collect important current speeches; Baird and his students William Brigrance, Maxfield Parrish, and Lester Thonssen got this project under way, and speech collections continue to be published to this day. Second, they needed a method of rhetorical criticism that would enable scholars to systematically analyze speeches. Thonssen and Baird intended their massive *Speech Criticism: The Development of Standards for Rhetorical Appraisal* (1948) to meet this need. The key features of this text were its comprehensiveness

and its vision of rhetorical criticism as a methodology. *Speech Criticism* tried to establish rhetorical criticism as a continuous tradition from the Greek and Roman rhetorical theorists to the present. It presents the problems of theory and methodology as part of a long tradition, which to an extent was an invention of the authors; the field that began as “speech” was focused on teaching public speaking, not the analysis of speeches and texts. Thonssen and Baird integrated some useful bits of literary methodology but by and large attempted to find an entirely rhetorical approach. But their focus was on speeches, and they hewed close to the functionalist approach outlined by Wichelns.

The Wingspread conference, held in Racine, Wisconsin, in 1970, was sponsored by the Speech Communication Association (as part of its National Developmental Project on Rhetoric) and organized by the faculty at the University of Wisconsin–Madison. An interdisciplinary group of scholars responded to the question “What is the essential outline of a conception of rhetoric useful in the second half of the 20th century?” In a superb set of essays and responses, participants outlined an expanded notion of rhetoric, which went far beyond the public address tradition. In light of the political unrest of the time, contributors noted that a starting point must be the inadequacy of traditional conceptions of political discourse as a foundation for rhetorical theory and criticism. In the publication of the Wingspread proceedings, in a volume called *The Prospect of Rhetoric* (Bitzer & Black, 1971), we can see some common threads connecting the “new” rhetorical scholarship. Rhetorical analyses are not empirical studies or theories about the effects of persuasion; those are left to social scientists, marketers, and mass communication researchers. Rhetorical theory and criticism must account for common speech as well as the speeches of politicians, low-brow discourse as well as high-brow, science as well as popular culture. Rhetoric is never merely technical, never just a set of means to an end; rhetoric is always both style and substance, ornament and argument. The moral dimension of rhetoric cannot be separated from its technical aspects, and rhetoric is not only a conveyer of knowledge but is also constitutive of knowledge.

Rhetoric, in short, is not only about much more than “just” speeches, it covers the whole canvas of human symbolic interaction. Much of the impetus for the newer versions of rhetoric came from the work of Kenneth Burke, a self-taught symbolic interactionist who adopted rhetoric as his favored theory. Nearly any part of culture or human life, from movies to music to clothes to food, can be understood as symbolic, and thus analyzed in terms of both the audiences that consume it and the audiences it creates, or constitutes. In the 1970s, scholars increasingly moved away from the public address paradigm, where the audience and, to an extent, the purpose are given, and toward a constitutive view of rhetoric, in which audience and speakers create a cultural and social reality through their talk. This

expanded (“global”) conception of rhetoric empowered rhetoricians to study increasingly diverse types of cultural artifacts and eventually paved the way for a version of rhetoric that overlaps with cultural studies. Cultural studies, which originated at the University of Birmingham (United Kingdom) in the 1960s, is a multidisciplinary movement that studies, from a generally Marxist point of view, the effects of the production and consumption of cultural artifacts, in particular how they do or don’t challenge the political status quo.

From Speech to Communication

To understand how the social science side of the field evolved, and thus the structure of the modern Communication Department, we have to see how Woolbert’s original picture of the field fared over the years. The Midwestern school had looked forward to a social scientific account of communication and sought scientific foundations for “speech,” from the physics of the human voice to the psychological means of persuasion. Woolbert’s 1916 article on “The Organization of Departments of Speech Science in Universities” outlined the Midwestern approach quite comprehensively. The organizing trope was “speech,” embodied (quite literally) in the use of the vocal mechanisms. Departments of Speech Science were to study and teach about the uses of the speaking voice (which obviously excludes singing) in all their functions and contexts. Woolbert listed 10 headings for the academic student of speech:

1. Phonology: Physiology of the voice, the physics of sound
2. The Technique of Expression: Vocal technique, bodily action, history of elocution
3. The Psychology of Expression: Adjustment of mind and voice—the psychology of meaning and thinking
4. Application of Laws of Expression: Reading, interpretation of literature
5. The Acting Drama
6. Extempore Speaking
7. Argumentation and Debate
8. Persuasion
9. The Pedagogy of Oral Expression
10. The Aesthetics of Speaking, Interpreting, and Acting

The disappearing relationship of speech to elocution is apparent here, since drama, oral interpretation, persuasion, and argument all find a place. To characterize speech disciplinarily, Woolbert (1916) provided a diagram that showed, through an overlapping set of circles, how the study of speech was related to virtually every other field.

Yet the point of disciplinarity is to emphasize difference over similarity, and Woolbert’s attempt to leverage speech into disciplinarity through its relation to other fields didn’t succeed at first. Throughout, Woolbert emphasized the “scientific” character this new discipline will have; for example, he discussed the laboratory practices that will soon, he hoped, be a standard feature of Speech departments. Research was the key, and so he noted,

The reason speech is backward as a subject has been its frequent lack of academic character . . . Speech science, if it is going to persist in our universities, must raise up for itself a corps of fully trained men and women. (p. 72)

Woolbert thought that the issue of disciplinarity was central, since social significance and curricular coherence would follow from a clear “scientific” research program that placed speech among the disciplines that have already made it. He was, however, wrong in the long run. Social scientific research was either borrowed from other fields or emerged out of concerns about the social relevance of knowledge about communication, as we have already seen in the case of Elwood Murray.

In the post–World War II era, the speech discipline began, slowly but steadily, to lose the integrated structure that had characterized its early years, in tandem with the growth of social science. First, and most obviously, the Midwestern model of the departments began to break up. As speech pathology became increasingly professionalized, it had less and less in common with Speech departments. Their focus was on research into the physiology of speech and hearing and the treatment of speech and hearing disorders, and on the production of accredited audiologists and speech pathologists for private practice and schools. Theater, in many cases, had more in common with other performing arts such as music and dance, sharing their need for performance spaces and having its faculty evaluated for their artistic output rather than publications. In departments with the components of mass media, radio, television, or film, the level of student interest and the increasing scholarly and professional profile of media scholars and practitioners led in many cases to the formation of a separate department where there wasn’t already one.

The loss of the integrated vision also happened on deeper levels, both methodological and epistemic. To an extent, speech scholars in the 1930s and 1940s had seen themselves as answering similar questions about speech/communication in different forms: sometimes questions about the historical context of speeches, sometimes about the causes of stuttering or the correlates of effective speaking. Increasingly, especially with the development of sophisticated experimental and statistical techniques, some Speech scholars began to emulate researchers in psychology and sociology and adopt a more clearly social scientific approach to communication research. The rift between humanistic and social science

research would continue to grow, and by the 1970s, debates on the relative merits of each approach were common.

Before then, however, researchers often borrowed methodologies and made them their own. Some borrowings turned out to be highly significant. Expanding on the Yale studies of persuasion, communication research, both in Speech and in Mass Communication departments, began to take a variable-centered approach to studying interpersonal and public influence. The Yale studies of the mid-1940s (conducted by psychologists from Yale, including Carl Hovland, Irving Janis, and Harold Kelley) began as assessments of the World War II motivational films in the *Why We Fight* series directed by Frank Capra. Rather than looking simply at the properties of the films (i.e., the arguments and visual images, or “appeals”), the U.S. military asked Hovland and his associates to systemically assess which aspects of the films actually changed the attitudes of soldiers about fighting; their methodology consisted in giving before-and-after measures of soldiers’ attitudes, to measure any change, and systematically varying the content of the films and the audience members to see which variables produced the most change in specific kinds of soldiers (older/younger, more/less educated, and so on).

In the late 1940s, a group of researchers at the Massachusetts Institute of Technology, led by the social psychologist Kurt Lewin, began to study group interaction (“group dynamics”) reflexively, by having group members simultaneously participate in and observe groups. They established a site in Bethel, Maine, the National Training Laboratory (NTL), for intensive summer studies of group process. They introduced many radical ideas, such as the reflexive study of groups (members both participate and watch themselves participate simultaneously) and the terminology of T-groups (therapy), C-groups (community groups), and X-groups (experimental groups). They brought new philosophies into communication research, from existentialism to Freud, and pushed the speech hygiene concept to its limit: Bad communicators are pathological and in need of therapy. They began to believe that a healthy psychological state and good communication were the same thing, since poor communication was caused by insecurity, defensiveness, failure of empathy, and so forth. As the NTL evolved, it began to move away from strictly group process and toward interpersonal communication more generally. This focus on personal relationships was actually somewhat novel. The speech scholars who attended the NTL summer sessions came away not only with a new framework for studying communication but also with a new ethic for communication. Some of them became part of what was sometimes called the human potential movement, an approach that sought to maximize the possibility of authentic and transparent communication. This approach represented an extension and transformation of social hygiene and was typified by textbooks such as Virginia Satir’s (1972) *Peoplemaking*.

During the 1960s, the standard contexts of communication we recognize today became parts of speech pedagogy and research, including professional communication and organizational communication. As more and diverse topics were included in the curriculum, the term *speech* began to seem restrictive, and the more general term *communication* seemed more appropriate, since it easily accommodated nonverbal communication, written and mediated communication, as well as the perspective that focused on human relationships generally rather than the parts of them conducted through speech. In 1968, a conference in New Orleans, Louisiana, was sponsored by the U.S. Office of Education and the Speech Association of America and resulted in the book *Conceptual Frontiers in Speech-Communication: Report of the New Orleans Conference on Research and Instructional Development* (Kibler & Barker, 1969). At this conference, the recommendation was made to change the name of the field to speech-communication, and this name, minus the hyphen, was adopted the next year, resulting in the Speech Communication Association (SCA).

The conference’s recommendations were made in recognition of the expanding understanding of the field, so that *communication*, a more general term that encompassed diverse channels, media, and modes of human interaction, was a more appropriate name for the field than *speech*, even though they adopted “spoken symbolic interaction” as the focus of study. They emphasized, echoing Woolbert without realizing it, that all areas of the field should “use scientific approaches to inquiry” (Kibler & Barker, 1969, p. 21). The report acknowledged some old themes: the field as essentially interdisciplinary, the importance of speech processes to democratic decision making, the necessity of speech instruction for people to become functioning members of society. But these themes developed a new urgency due to the recognition of the plight of the underprivileged in society; “The conference participants encourage speech-communication scholars to design and execute research dealing with the speech-communication dimensions of current social problems” (p. 25). This conference also marked the emergence of applied communication research, serving the needs of both society and (later) business.

Speech Communication as a field of undergraduate instruction underwent explosive growth in the 1970s (Craig & Carlone, 1998). Students wanted to study in the many “new” areas of communication: interpersonal, organizational, group, and others. In fact, the diversity began, gradually, to outgrow the bounds of the term *speech* and the term *communication*, as cultural studies and media studies became integrated into the field’s teaching and research. So, despite being shared by other departments, including Media and Speech Pathology, *communication* seemed increasingly a better fit. Another name change, based on the

results of a vote by the membership, created the current National Communication Association in 1997.

Structures, Functions, and Contexts

A helpful way to understand the current structure of the field is to take seriously its tradition of linking pedagogy to research and look at the general structure of department organizations. Of course, each department is different, but there are some overarching similarities in how coursework is divided up. Courses (and research programs) tend to reflect different ways of categorizing communication. If a kind of communication is distinguished by the literal (sometimes physical) arrangement of communicators, we'll call that *structural*. If a kind of communication is typified by what it is for, we'll call that a *function*. When different functions and structures differ only in the setting for communication, we can call that a *context* (or *communication context*).

A primary division among types of communication is structural. If we focus on the individual, that's often called *intrapersonal* communication, a study of psychological processes; if we leave out the linguistic dimension, we would be studying *nonverbal* communication. If two people communicate, we call that *interpersonal communication*; typically, the interpersonal relationships studied are romantic and heterosexual, though a growing body of research studies friendships (same or different gender) and romantic relationships of the same gender. Add from one to a dozen more people to an interpersonal setting, and it would be called *small-group* communication. If one person is speaking to many, we often call that *public communication* or *public speaking*. And if one person (or a group) communicates with an unknown audience (through books, radio, TV, etc.), it has typically been called *mass communication*, though that term is increasingly being replaced by *mediated communication*, for the following reasons.

Mass communication was typically understood as a kind of structural analog to public speaking: one person speaking to many over the radio or TV, one person writing to many through the newspaper or a book. It's easy to see how that view can be extended to situations where the "speaker" is a group or organization; movies and television shows would fall in that category. But the structural assumption of broadcast media, from one to many, is now only one technological option among many others. Thanks to the growth of the Internet and digital media generally, many new combinations are possible. Using e-mail or a message board, many people can communicate with a single person and possibly see each other's contributions. Two people who've never met in person can form a close interpersonal relationship, and small groups can have their meetings remotely or even asynchronously. Social networking sites such as Facebook or MySpace allow contact among people

who know each other only indirectly. These new ways of accomplishing, through technology, different forms of communication are rapidly being integrated into the communication curriculum, in the form of a single course (called something like "Technology and Communication") or a variety of courses.

Communication departments also study and offer courses in certain *functions* of communication. For historical reasons, the functions studied are only a subset of the possible ones. For example, the function of relationship development is treated typically within the course on interpersonal communication. However, it's common to have courses in persuasion, mediation, and conflict resolution, all of which are important functions of communication and to a certain extent cut across the social science/humanities boundary. In the context of the communication professions, other kinds of functions are possible: sales, public relations, and training are uses of communication sometimes taught and studied in a Communication department.

The biggest growth in the study and teaching of communication has occurred in the expansion of the *contexts* of communication. A context is, roughly, the setting in which a structure or function of communication occurs, where the setting influences the nature or kind of communication. A brief list of contexts might include the following:

- Organizational communication
- Business communication
- Health communication
- Global communication
- Intercultural communication
- Marital and family communication

Each of these contexts brings together knowledge from structures and functions and tries to address specific question or problems of communication in that context. In fact, much of the study and teaching about contexts focuses on specific problems within the context, investigating what goes wrong with communication and how it can be improved.

THE JOURNALISM TRADITION

JOHN NERONE

University of Illinois at Urbana-Champaign

This entry will discuss the history of journalism as a practice, the various approaches scholars have taken to studying journalism, and the impact of journalism studies on the larger field of communication studies. The journalism tradition has been formative. Communication as a discipline first took root in journalism programs (Donsbach, 2006; Rogers, 1994). Its engagement with journalism has nurtured a concern within communication studies for public life, the public sphere, and democratic self-government, the domain that provides journalism and journalists their ideological legitimacy. Concerns about the impact of news, news bias, and propaganda on public opinion drove thinking about media effects and the interaction of media and interpersonal communication. Normative ethical and policy discussions have also been defined by discourses about journalism ethics and freedom of the press.

Origins of Modern Journalism

Journalism and news are often used interchangeably, even by conscientious scholars, but it would be more appropriate to distinguish between them. Journalism is the ism that disciplines the media presentation of news. Every society in known history has had something we can recognize as news: information about current events having novelty and timeliness as values. Journalism, however, is relatively recent. The word itself appeared in Western languages only in the first half of the 19th century, referring then to the advocacy writing of partisans in national politics. Journalism was first the journalism of opinion. The word came to refer to news reporting only

later in the 19th century. It took its modern meaning as the expert or professional construction and explanation of current events in the first half of the 20th century.

Journalism as a discipline of news was an Anglo-American invention. Journalism grew at the intersection of the news market and the public sphere. Jean Chalaby (1998) argues that the invention of journalism followed the creation of a mass market for news and the media organizations that would supply it. The mass market appeared when large populations of ordinary readers were able to purchase newly available cheap newspapers, a development that occurred first in the United States (mainly because of the absence of a newspaper tax) in the 1830s and then in Britain in the 1850s. The cost of producing printed products dropped through the 19th century in most countries. Paper became cheaper due to improvements in supplies and the mechanization of production, presses became much quicker and produced far more copies as steam power was hooked up to cylindrical platens, and advertising revenue became far more plentiful as markets for consumer goods expanded. All these economic factors introduced economies of scale. The new, cheap media became mass media.

But the industrialization of the press disturbed the ecology of the public sphere. The founding forms of the newspaper had been rooted in a fantasy about a virtual national public engaging in the sorts of deliberation that would produce effective self-government (Barnhurst & Nerone, 2001). This early history of the public sphere has been most influentially outlined by Jürgen Habermas (1989).

Habermas (1989) argues that a public sphere appeared in specific European nations in the 18th century as “civil society” separated itself from the “state.” This kind of public

sphere was supposed to provide a space for political deliberation, a space in which private citizens might gather to discuss issues of common concern. The “bourgeois” model of the public sphere, as Habermas calls the 18th-century formation, was characterized by relatively free access to citizens and a broad and diverse representation of empowered voices, operating mainly through a newly political newspaper press. The people, observing the public arena, were supposed to be able to see their own concerns echoed there and to have confidence that the outcomes of public discussion would be reasonable. The public sphere became a key institution in the age of revolution. Activists took care to present reasoned arguments to the public at the same time as they mobilized actions on the ground. Much of this apparent debate was designed to conceal social conflict. And, of course, many were excluded, especially women, nonwhites, non-Christians, and the propertyless (Fraser, 1992; Warner, 1990). But in the age of small newspapers produced on hand-powered presses with circulations in the hundreds, it was possible to believe that expression was unrestricted (Tocqueville, 1835).

Industrialization of the media created an imbalance in the public sphere. New printing machinery, such as steam-powered presses; more abundant display advertising; and cheaper paper led to economies of scale for newspapers, turning them into big businesses and eventually turning daily newspaper markets into natural monopolies (Kaplan, 1995). Ordinary people as well as political leaders and activists believed that the owners of the wire services and the most successful newspapers had gained the power to shape public discourse and that they routinely abused this power (Blondheim, 1994; John, 2000; Lawson, 1993; Sinclair, 1919/2003). Public demands for restraints on media power gained traction (McChesney & Scott, 2004). In most Western countries, the development of a well-financed public service media sector mollified the public. In the United States, questions of media regulation repeatedly roiled politics. Movements for public ownership of the telegraph system arose throughout the period between the Civil War and World War I (Czitrom, 1982, chap. 2), and especially at the turn of the century, politicians raised the alarm at the growth of “yellow journalism,” as the sensational news of crime and sex in the cheap, mass-circulation press came to be called.

Media owners, editors, and reporters responded to public hostility by proposing ethical standards and claiming professional responsibility. They promised, in effect, to steward the public sphere. In some countries, journalists formed unions that afforded them the autonomy to elevate news standards. In the United States, media owners retained control. By the first decades of the 20th century, the public was well familiar with owners using chains of media properties to promote particular concerns—selflessly, as when E. W. Scripps used his chain as a mouthpiece for Woodrow Wilson’s administration during World War I (Zacher, 2008), or egomaniacally, as when William Randolph Hearst used his media empire to try to make

himself president (Nasaw, 2000). Such heavy-handed tactics produced a counterreaction. Owners were pressured to ensure the independence of their news operations by building a wall of separation between news/editorial departments and their business offices and to publicly commit their operations to fairness and balance, which came to be called objectivity. At the same time, traditional political and social elites, concerned with the state of public morality, pressured owners to resist market pressure for sensationalism and to respect the privacy of individuals.

The promise to steward the public sphere authorized a professionalization project for journalism. Media owners and working journalists together lobbied for college curricula in journalism and wrote codes of ethics, seeking to elevate the industry in respectability and public regard. In most developed countries, universities began offering journalism courses and degrees in the first decades of the 20th century.

Throughout the Western world, newswork underwent a reconfiguration as the professionalization project unfolded (Nerone & Barnhurst, 2003). The profession of journalism synthesized the tasks of the reporter with those of the correspondent. Reporting initially meant the faithful transcription of events and information. A reporter was someone who attended public meetings and transcribed what was said or who dropped by the markets and docks and gathered information about prices and arrivals. For a reporter, the world was filled with facts that could be collected and transmitted such as they were. Reporters were pieceworkers who were paid by the line. Correspondents, on the other hand, were letter writers. Stationed in distant locales, they constituted the eyes and ears of the public abroad. Unlike reporters, correspondents were supposed to be recognizable personae with opinions and voices.

The modern journalist combines these two subjectivities. The journalist is supposed to tell the truth about the world by giving expert explanation and context. The journalist has a name but not a voice; in fact, the journalist’s byline is not meant to promise a unique perspective but to assure the reader that any other journalist would have written the same story: It is a refutation of authorship. Citizens relied on journalists to explain the complexities of the modern world. Facts alone would lead to idiocy, while opinion could amount to propaganda. The stance of expert explanation, whether in the “objective” mode of U.S. journalism or the more engaged mode of European journalism, fit well within news media systems that were increasingly dominated by powerful national media that produced increasingly streamlined, modern accounts of the world.

Modern journalism had a predecessor in pictorial journalism. In the middle of the 19th century, shortly after the introduction of photography, “illustrated” newspapers appeared in each of the Western countries, beginning with Great Britain. Although similar in some ways to photojournalism, illustrated journalism relied on the artist’s traditional tools for incorporating narrative, commentary, and character analysis into pictures (Brown, 2003). Using

empirical traces in the form of photographs or sketches from roving sketch artists, illustrated newspapers provided middle-class readers with pictorial accounts of the nation's events, providing the visual repertoire that supported a national "imagined community," to borrow Benedict Anderson's (1991) term.

Origins of Journalism Studies

The academic study of journalism began against the background of World War I—era propaganda. It was then incorporated into the new schools of journalism, where it has sat uneasily beside the practical training of journalists.

In the United States, the founding text for journalism studies has been Walter Lippmann's *Public Opinion* (1922). Lippmann was a Harvard-educated journalist and an editorial writer of progressive temperament. During World War I, he experienced firsthand the propaganda campaigns of the Allied governments; after the war, he attended the peace negotiations at Versailles. These experiences left him troubled and disillusioned. He undertook a series of studies of news reporting during the war, which eventually led him to write *Public Opinion*, the work for which he is best known.

Taking his cue from the myth of the cave in Plato's *Republic*, Lippmann described the problem of public opinion as being rooted in the cognitive deficiencies of ordinary people, who think through personification, simplification, and stereotyping. Moreover, as their world becomes larger and more complex, ordinary people are forced to rely more and more on media than on personal experience. Media representations interact with personal interests and biases to produce the "pseudoenvironment," Lippmann's term for the "pictures in our heads" that intervene between ordinary people and the real environment. And media content is in turn distorted by market forces, which intensify the reliance on stereotyping.

For Lippmann, reliance on public opinion as a steering mechanism deeply compromised the effectiveness of democratic government. Instead, he proposed new institutions of expert opinion, "intelligence bureaus" that would provide sound information for decision making. He emphasized that the press was not an intelligence bureau because its work was always subservient to commercial motivations. Instead, he envisioned an array of think tanks (like the Brookings Institute) and bureaucratic agencies (like the Federal Reserve Board).

Lippmann's analysis of the vulnerabilities of public opinion did not go unanswered. Thinkers recognized much of his argument as common sense but considered his assessment of the situation too gloomy and his remedy too elitist. John Dewey's response was the most influential. In *The Public and Its Problems* (1927), Dewey acknowledged the vulnerabilities of public opinion but insisted that these problems were best addressed through a commitment to political education. Providing the spaces and institutions

for public engagement would encourage the development of more sophisticated and intelligent public information and public opinion.

The debate between Lippmann and Dewey produced an agenda for the study of news and public opinion. Lippmann himself produced a series of content analyses, beginning with *A Test of the News* (Lippmann & Merz, 1920), which analyzed 3 years of coverage of the Bolshevik Revolution by *The New York Times*. This study concluded that the coverage consistently distorted the prospects of the Bolsheviks to meet the expectations of a readership hostile to communism.

World War I also prompted the social-psychological study of propaganda. The most influential practitioner in this vein was Harold Lasswell (1927), whose book *Propaganda Technique in the World War* presented a systematic account of government-produced content and has been credited with offering a "hypodermic-needle" model of media effects, though Lasswell himself did not use that term. In Lasswell's account, the government "injects" propaganda into public consciousness, and the effects are predictable: Propaganda works to shape public opinion. This model fit the common sense of what had occurred during World War I. Throughout the 1920s and 1930s, propaganda was the most influential mode of studying media effects. Its influence peaked and began to wane with the 1937 founding of the Institute for Propaganda Analysis, a think tank that housed scholars such as Kirtley F. Mather and Alfred McClung Lee. The looming World War II made propaganda seem like an unpromising and even unpatriotic style of analysis, as it failed to distinguish between the propaganda efforts of actors such as Nazi Germany and the more palatable efforts of the Allied governments and the advertising industry (Sproule, 1997).

World War II and Its Aftermath

World War II and the Cold War that followed fundamentally changed the agenda for media and journalism studies. In the West, World War II produced an antitotalitarian consensus, leading to an urgency to explain why fascism should not arise in the liberal democracies and helping produce a settlement of the question of the relationship between media industries and the public sphere, which meant in turn a renegotiation of the responsibilities of the press.

During the war, the Allied nations pondered the growth and apparent success of fascist politics. Authoritarian systems seemed to be an effective way of organizing industrialized societies, perhaps even the natural way—this was one lesson of the rise of Hitler's Germany and Mussolini's Italy and, as the war gave way to the Cold War, Stalin's Soviet Union and Mao's China. One ideological goal of the Allies during the war and the Cold War was to explain why "totalitarian" systems were not natural, not efficient, and not inevitable.

In the United States, much scholarly energy went into showing that aspects of the American system or the American character provided a firewall against authoritarianism. At the same time, deflating apprehensions about homegrown fascism became the chief goal of communications research. This can be seen across a range of research traditions, from the normative innovations of the Commission on Freedom of the Press, or Hutchins Commission (1947), to the “limited-effects” and “two-step-flow” models of media effects found in the work of Katz and Lazarsfeld (1955).

The Hutchins Commission was a blue-ribbon panel of intellectuals funded primarily by Time-Life publisher Henry Luce to investigate the role of the mass media in a democratic society. The panel began with the recognition that the size and profit orientation of the agencies of mass communication posed a problem to traditional notions of a free press, which held that free and open competition among the media would allow for the voicing of a wide range of ideas: The media marketplace would represent the full spectrum of groups and opinions in society. But the industrialization of the media had closed off the media marketplace, while giving the surviving mass media tremendous power to define the range of debate. They had become, in effect, the “gatekeepers” of public discourse, to use D. M. White’s (1950) term. The gatekeeper metaphor accentuated the ability of the media, and especially journalism, to selectively grant public recognition to ideas and groups. The rise of media power and media monopoly imposed new responsibilities. The Commission tasked the media with providing a virtual “marketplace of ideas” as a substitute for the disappearing media marketplace. This meant the media must report the truth in context about society, provide a forum for comment and criticism, represent the groups and goals and values of society, and provide full access to the news of the day. Professional journalists were to play a key role in this function.

Such ideas about the responsibilities of media institutions were common in the West. In Great Britain, the first Royal Commission on the Press (1947–1949) came to similar conclusions. The notion that the media must serve the freedom of the people to express themselves, to acquire and impart information, and to communicate also permeated the early documents of the United Nations, such as the UNESCO Charter and the *Universal Declaration of Human Rights* (1947), though these did not necessarily envision professional journalism as the major instrument of popular communication. *Four Theories of the Press*, the most influential map of the terrain of normative press theory in the post–World War II era, called this constellation of ideas “social responsibility theory” (Siebert, Peterson, & Schramm, 1956, chap. 3).

While social responsibility theory expressed the new normative sense of the professional press, the limited-effects model seemed to describe the actual social functioning of mass communication. Katz and Lazarsfeld’s

influential book *Personal Influence* (1955) argued that primary groups and face-to-face communication offered a built-in resistance to top-down or mass-mediated messages, which reached the general public only through the mediation of local “opinion leaders.” This two-step flow countered the ominous influence of the increasingly concentrated media system and the mass society critique argued most memorably by C. Wright Mills in *The Power Elite* (1956). Mills had been an investigator on the primary research that had produced *Personal Influence*, by the way, and believed that the data showed strong media effects (Gitlin, 2006).

Both the limited-effects and the social-responsibility models can be seen as rooted in the Cold War. Both provided ideological assurance that totalitarianism was avoidable and unnatural. Both also addressed the problem of an apparently consolidated media system and its effects on the flow of public information, a situation that seemed to support the professionalization of journalism.

The High-Modern Moment

Dan Hallin (1994) refers to the Cold War era as the “high-modern moment” of U.S. journalism. At this moment, a relatively small number of national outlets—a handful of national newspapers, a couple of wire services, and a few national broadcast networks—offered an ideologically unified account of the news of the day in an apparently expert and nonpartisan fashion. Journalism in the United States has never fully professionalized and never can. The classic professions, such as medicine and law, exercise a monopoly on an occupational field through a licensing procedure that’s justified on the basis of some kind of arcane science: Doctors need to attend medical school and pass exams because medical science is recognized as crucial to sound practice. Journalism lacks anything like medical science, and the First Amendment prevents it from exercising a monopoly. But the bottlenecks in the media system that existed in the middle of the 20th century let it act like a profession. The owners and managers of these media had both an ideological and a business interest in maintaining professionalized standards.

In most Western countries, the media system was dominated by a handful of national partisan newspapers and by state-run broadcasting agencies. In Europe, Hallin and Mancini (2004) identified two other models beyond the North Atlantic’s market-based one: a northern European public service model, best exemplified by Scandinavian subsidies and state broadcast agencies; and a southern European model characterized by “political parallelism,” or media alignments with political parties. In these other systems, the inflection of professionalism differed, but in every developed system of mass communication, some form of professionalization took place, with “expert” journalists assuming a responsibility to explain the world to a more or less passive public.

Scholars tried to find ways to reconcile the evident power of journalism with the limited-effects model. One resolution, now common sense, was the “agenda-setting” approach (McCombs & Shaw, 1972). Agenda setting meant that even if the media don’t tell the people what to think, they do tell them what to think about. Media content provided the matter out of which public discussion could form, and media professionals, as gatekeepers, had the power to fix and stratify content and therefore establish the agenda for the public. The agenda-setting model has been tested dozens of times, and the parallelism between news content and surveys of public attitudes on issue relevance has been firmly established (McCombs & Shaw, 1993). But scholars disagree on where the agenda comes from in the first place. Some, including most news professionals, argue that it’s set by the world itself: The news agenda reflects current happenings. Others see the agenda set either by the ideology and sociology of news or by the maneuverings of empowered groups.

Studies of the sociology of the newsroom suggested that a number of contextualizing factors shaped the agenda. Tuchman (1978) and Gans (1979) argued that the routines of the newsroom and the ideological apparatus of the journalists themselves inflected news coverage. Herman and Chomsky (1988) took this notion to an extreme by arguing that the structure of the news media is built in a series of filters, such as reliance on official sources and on advertising income. After the five filters they identified had done their work, what was left, they argued, was propaganda. Although this “propaganda model” seems too mechanistic to many scholars of journalism, some studies have supported it (Kennis, 2003; Mermin, 1999).

One influential answer to the question of how the media agenda gets set is W. Lance Bennett’s “indexing” model. Bennett argues that news coverage is indexed to power. Where the powerful are in consensus about an issue—as, for instance, in the U.S. response to 9/11—news coverage will be either minimal or inattentive with regard to alternative positions. When the powerful are in disagreement, news coverage will offer a larger range of “legitimate” opinion. Bennett, Lawrence, and Livingston (2007) have found confirmation of the indexing model in news trends in the first decade of the 21st century, as consensus over 9/11 yielded to dissensus over the U.S. government’s Iraq policy in the wake of Abu Ghraib.

Another conception of the working of power through the press is “framing” (Entman, 1993). As in agenda setting, frame analysis holds that the media help set the terms of public discourse by defining the larger narratives and significations that give meaning to the news. During the Cold War, for instance, U.S. news media paid far more attention to international affairs than they did at the beginning of the 21st century. But all international news was “framed” by the competition between the West and the Soviet Bloc. This “Cold War frame” brought some events into visibility but left others marginalized or absent.

Elections that pitted pro-Soviet against pro-Western parties, for instance, received attention, whereas labor struggles in nonaligned or pro-Western nations did not. As in agenda setting, the framing hypothesis does not necessarily provide an explanation for how frames get made. It does seem to accurately represent what journalists do. They look for frames that will make a series of events meaningful and intelligible. It also explains the tactics of *parajournalists*, the term Michael Schudson (2003) applies to public relations professionals, public information officers, and others who try to influence the flow of news. Activists, politicians, and advocates of all varieties work hard to frame issues in a favorable way.

The cumulative weight of agenda setting, framing, indexing, newsroom sociology, and the propaganda model has made the limited-effects model of the 1950s and 1960s obsolete. Added together, these approaches to news culture in fact approximate an ideological analysis based on Gramscian notions of hegemony, in which apparently independent news professionals are led by the system of news production to reproduce dominant ideologies and representations of social groups stratified by race, class, and gender (Hall, Critcher, Jefferson, Clarke, & Robert, 1978; Reeves & Campbell, 1994). But one shouldn’t make too much of the eclipse of the limited-effects model. It was always opportunistically applied, inasmuch as non-Western media systems always appeared to scholars in the West as having powerful effects. And in the emerging interactive media environment, common sense is returning to the notion that readers or audiences are active in forming their own attitudes. The Internet, as it liberates users from the older mass media, appears to be a realm of limited effects.

Journalism Outside the West

The basic Western framework for understanding the world’s other journalisms received its classic expression in the book *Four Theories of the Press* (Siebert et al., 1956). This book told a story about a normative evolution from authoritarianism, with its distrust of the individual, reason, and free expression, to libertarianism, with its emphasis on limited government involvement and free competition. In addition to the authoritarian and libertarian theories, the book identified the social responsibility theory, described as a modification of libertarianism designed to accommodate the mass media, and the “Soviet Communist Theory,” which it treated as an extravagant version of authoritarianism. For much of the Cold War, deviations from the libertarian theory looked like authoritarianism to Western journalists and scholars.

But the 20th century saw a spectrum of noncapitalist and anticapitalist models of journalism. Even within the Soviet bloc and in Mao’s China, which are suitably called authoritarian systems, the notion of professionalism allowed for a range of autonomy under the rubric of “self-criticism.” Beyond these systems, a variety of “alternative,” “radical,”

and “development” media practices appeared, linked by a rejection of top-down flows of information and a resistance to North-to-South models of influence. Some called for journalism from the bottom up; some called for alternatives to the dominance of the North-based global wire services; and others criticized the news values that led coverage to obsess with “coups and earthquakes” (Rosenblum, 1979). Globally, these other journalisms gathered under the umbrella of resistance to “cultural imperialism” and advocacy of a New World Information and Communication Order (NWICO) (Nordenstreng & Schiller, 1979). The NWICO movement found a home in the UNESCO and was given its most influential expression in the report of the MacBride Commission (UNESCO, 1980), which invoked the UNESCO charter and the *Universal Declaration of Human Rights* in calling for a “right to communicate” and the “free and balanced” flow of information.

The NWICO movement crested in the early 1980s and then came under withering counterattack. Reagan’s United States and Thatcher’s United Kingdom withdrew from the UNESCO in protest in 1984, calling NWICO a movement to sanction censorship. The UNESCO distanced itself from the movement in response. With the fall of the Soviet bloc, the influence of the nonaligned nations, which had been the primary sponsors of the NWICO movement, seemed less salient. Issues of media and news influence and global flow migrated from the political arena to the economic sphere, where they were dealt with under the guise of tariffs and intellectual property agreements. Finally, regional media dynamism—Bollywood movies, Mexican telenovelas, Arabic-language news—made the international communication order seem less stratified.

The bulk of the world’s information economy remains highly concentrated, however. Beneath the apparent diversity and openness of the global media system is an increasingly concentrated core of vertically integrated transnational corporations. The same is true of national systems, where a proliferation of channels coexists with an even narrower set of controlling actors.

The End of the High-Modern Moment

At the beginning of the 21st century, the coherence of journalism came under strain. Among the factors contributing to this challenge to the hegemony of professional journalism were the rise of social heterogeneity, the eclipse of the ideological map of the Cold War era, and the decay of the media bottlenecks that gave the dominant channels of the 20th century their ability to set the boundaries of the news of the day. Professional journalists sensed the barbarians at the gate.

In the United States, journalism identified a “credibility crisis” in the early 1980s. After an ascendancy in the 1970s, in which the heroic journalism that had come of age during the Kennedy assassination (Zelizer, 1992) had congratulated itself (perhaps falsely) for toppling an administration

in the Watergate crisis (Epstein, 1975; Schudson, 1993) and helping to end the war in Vietnam (Hallin, 1986; Hammond, 1999), news professionals were surprised to find public resistance to their objections of exclusion from access to the invasion force in the attack on Grenada in 1983 (Nimkoff, 2008). The major news organizations, including the Gannett chain, came to the conclusion that public ignorance of the role of journalism in a democratic society had to be countered by programs of public education. They undertook both outreach programs to expand public knowledge and survey projects to measure it; over the next quarter-century they would find that their efforts produced little improvement in popular attitudes toward the news media (Mindich, 2004).

As an institution, 21st-century journalism will not be able to set the agenda or frame the terms of debate. It will be more vulnerable to influence from parajournalists and competition from new journalisms—tabloid journalism, for instance, or what Bill Kovach and Tom Rosenstiel (2006) call the “journalism of assertion” on cable television and the Internet. Professional journalists may also be freed from their demure captivity to objectivity and responsibility.

The end of the high-modern moment means a fundamental shift in journalism as the disciplined presentation of news. To alarmists, it means nothing less than the end of journalism. In all likelihood, journalism will adjust to its new circumstances and propose new elements of discipline. These will have to include a new humility about defining the world and a new frankness about the personhood of the journalists.

Three movements posed challenges to high-modern journalism at the beginning of the 21st century. First, “public journalism” expanded on the legacy of the Hutchins Commission and an awareness of the agenda-setting power of the press to argue that journalists should consciously align themselves with the public, deferring to public deliberation as the key agenda-setting function and dedicating themselves to making public life more engaging, more democratic, and more potent (Glasser, 1999; Rosen, 1999). The public journalism movement has waned in step with the monopoly power of media channels, particularly daily newspapers. Second, “citizen journalism” attracted attention with the rise of the Independent Media Center movement and made a spectacular contribution to the reporting of the protests against the World Trade Organization meetings in Seattle in 1999. It continued to grow with the rise of the blogosphere, but the blogosphere itself developed an ambiguous relationship with the mainstream media, relying on reporting from dominant institutions of journalism such as the BBC or *The Washington Post* for much of its raw material. Third, various movements for “media reform” proposed structural change in the form of ownership limits, public financing, and copyright restriction. Media reformers cover a wide spectrum of political positions and congeal around specific policy initiatives with significant success but have not yet managed to advance broader restructurings.

In much of the world, the old journalism of the West constituted the new journalism. This is particularly true in the former Soviet bloc, where new translations of *Four Theories of the Press* anchored the canon of new journalism education programs. Western models of professional journalism also made inroads in the commercializing media system of China, although Party ownership and state censorship of newspapers and broadcasting limited innovation.

The tribulations of journalism in the beginning of the 21st century are reflected in changes in journalism education and journalism studies. Journalism education has always searched with difficulty for intellectual grounding. Because journalism lacks the legitimating science that medicine and law enjoy, it has always been somewhat uncomfortable in the academy and somewhat insecure in the practical world. A successful career as a journalist does not, in most countries, require college-level education, and the most prestigious news organizations have often made a practice of recruiting journalists from other fields. Especially in specializations such as business news or science reporting, higher education in a field other than journalism is often considered more appropriate. In spite of this liminal situation, journalism schools and programs have continued to grow in numbers, journalism graduates have continued to increase their share of new hires, and Western journalism education has continued to colonize new areas of the globe.

Journalism Studies has been housed, for the most part, in journalism schools. The critical study of journalism and the social scientific study of news have never been entirely consistent with the practical training of professional journalists, and journalism schools have always seen scenes of competition between scholars and practitioners. Ironically, the strain on professional journalism and the rapidly changing media environment eased these strains. Scholars and practitioners found common ground in a concern for the declining news hole, a fear of corporate ownership and media monopoly, and a regard for the impact of the vulnerabilities of journalism on a challenged public culture. The new media environment encouraged journalists to think beyond objectivity and professionalism at the same time as intellectual challenges to scholarly detachment encouraged academics to be more open to civic engagement and entrepreneurial activity.

Conclusion

The journalism tradition has done much to set the agenda for communication studies and to place concerns for the health of public life at its center. Questions about the ability of ordinary people to govern themselves, fears about the impact of propaganda, and a concern for the vitality of the public sphere in an age of mass communication instigated communication scholarship in the first half of the 20th century, and models of media effects followed the

shifting landscape of journalism in its second half. As the field of communication research moved to address the new media environment in the beginning of the 21st century, the journalism tradition, with its emphasis on a discipline of verification as an indispensable element of public life, continued to generate questions and models. Inasmuch as communication studies embraces questions of citizenship and public life as foundational, the journalism tradition will continue to reside at its core.

PART II

APPROACHES TO THE STUDY OF COMMUNICATION

5

PHILOSOPHICAL APPROACHES TO COMMUNICATION

JAMES A. ANDERSON
University of Utah

The philosophical approaches in play in any field appear in the knowledge claims that mark the epistemological contribution of the field. For their part, these knowledge claims arise out of the theories that constitute the subject matter of the field. This entry, then, takes on the topic of communication theory. An entry on communication theory has three responsibilities: first, to define what theory is; second, to discuss the field of theory; and third, to explore what makes a theory a communication theory.

Theory

Theory is a way of thinking about something. It is a set of instructions that tells what and why things are (the way they are); how and why they function (the way they function); and the value it all represents. We find theory in every part of communication studies—in its empirical, critical, and analytical corners. We usually come into contact with theory in some discursive (speech or text) or symbolic (usually mathematical) form. This form may be as short as an equation or the few sentences of a proposition, each attributed to a single author, or may fill a library shelf with the work of several to hundreds of authors who produce a body of like-minded thought.

But for theory to be theory, it has to have certain characteristics and to accomplish certain goals. Theory has to have an object of explanation. It has to contain or connect to a method of analysis. In its objects and methods, it will

establish what counts as evidence as well as the warrants that justify the evidence while producing a characteristic explanation. It will have a set of boundaries that will set the scope of its performance and typical application. And it will have a consequence of value.

Explanatory Target

The point of theory is to explain something, to deepen our understanding of what's going on around us. The "something" that gets explained or better understood is the focal object or explanatory target of the theory. For example, the explanation provided by expectancy violation theory (Burgoon, 1978) operates in the domain of interpersonal relationships and offers an explanation for understanding what happens within a relationship when spatial or other nonverbal expectations derived from that relationship are violated. The explanatory power of the theory is not very high. It doesn't tell us very much about relationships, about how expectations are tied to different kinds of relationships, or even about the outcomes of a violation. But it does systematize what may have been just random observations about at whom we smile and nod or from whom we keep our distance. And that is plenty enough.

Method of Analysis

Theory's explanations operate in the abstract and at some level of generality greater than the individual case. At some point in its development, however, theory has to show

its value in understanding some set of specific conditions. The element of the theory that provides this understanding is its method of analysis. The method connects the constructs of the theory with the circumstances of the specific conditions in much the same way that methods of work connect a blueprint to a finished structure.

Every theory will have a preferred methodology or at least a methodology most commonly used. Methods can be classified as metric, interpretive, and analytical, as well as a host of hybrid forms that are some combination of these. Theories with their foundations in cognitive processes will most likely use metric measurement methods that use a logic of quantities (metric empiricism); theories based on action (rather than behavior) will use interpretive ethnographic methods that use a logic of narrative (hermeneutic empiricism); theories based on cultural texts will use interpretive/analytical methods based on close readings and critique and using syllogistic or enthymemic logic.

Contemporary discussions about the social construction of knowledge have complicated the relationship between the claims that theory makes and the understanding that we derive from those claims as to the specific case. The relationship comes down to the question as to whether the facts of the case are explained by the theory (facts and explanation are relatively independent) or the facts of the case are constituted in the theory (facts and explanation are both derived from the theory).

The answer to this question makes a difference if and only if the reality we are trying to explain is not itself a product of the social action that supports the theory in the first place. In our earthbound state, what happens when one steps off a curb is neither contentious nor subject to modification in social process. Our foot will fall to the street. We have a theoretical explanation for that circumstance—gravity. In the United States, we also have a factual certainty that over all full-time jobs, women will earn less than men. This fact is a different sort of fact from that of stepping off the curb because it is constructed in the data collection and analysis methodology in use by the U.S. Census Bureau and the subsequent interpretations applied to those data by other researchers. Change the methods as the Census Bureau did in 1993, and the facts change.

There is a fundamental ethical principle of equal pay for equal work, which is protected by the Equal Pay Act of 1963 and Title VII of the Civil Rights Act of 1964 in play here. Consequently, whatever the quality of the fact, if we generally agree that it is true, or fail to adequately challenge it, we then have to provide an explanation for the difference. The facticity of the difference is not by itself enough to warrant a claim of ethical and legal violation. We have to understand the nature of the fact; it has to be explained. There are a variety of theoretical positions from which we can develop that explanation. For example, we can use the economic theory of the market, or we might use any single or some combination of the critical issue theories of gender, class, or race.

If we choose economic theory, our method of analysis would undoubtedly be based on metric approaches with a heavy emphasis on quantitative data and statistical analysis (for an example, see the Government Accounting Office [2007] document “Women’s Earnings”). If we approached the problem from the critical issue theory of gender, or if the methods are narrational; we would create an argument as to how that wage gap should be understood as gender discrimination (for a practical—not scholarly—example, see the National Committee on Pay Equity Web site, www.pay-equity.org/about.html; accessed October 10, 2007).

So why would one see women’s earnings as a communication problem? It is a communication problem because regardless of the theory and its preferred method of analysis, the result will be an argument—a set of claims supported by evidence that makes sense inside some framework of warrants. It will not result in the of-course-it’s-true certainty of stepping off the curb. Furthermore, the issue cannot be resolved through epistemological force. It can be resolved only through political process, which means that both our understanding and the resolution of the inequity reside in communicative practices.

The argument character of the outcome or product of research is itself subject to argument. Objectivists (here played by the traditional science type) would contend that conclusions may be wrong but competent data are above contention just as the consequences of stepping off a curb are. Standpoint theorists (aka subjectivists, relativists) would argue that as long as the data are semiotic (based on language or action), the whole enterprise depends on the cultural moment of its production. The human condition (our ultimate explanatory target) is not transcendental but historical.

Evidence and Warrants

The preferred relationship between theory and some method develops out of the terms of the theory itself. If one is working from a cognitive theory that holds that internal cognitive states direct subsequent behavior and that these internal states are addressable through nonreactive linguistic measurements, why bother with the drudgery of field notes? In fact, under this theoretical structure, field notes would be considered insufficiently objective to count as adequate evidence for a subsequent claim. On the other hand, if one’s theory concerns the cultural hegemony embedded in the industrialized texts on relationships, objective measurements would be considered insufficiently nuanced to reach the complexity of the text, revealing only surface characteristics.

It is certainly true in the realm of theory production that the method can precede the theory. One exquisitely trained in ethnographic methods is unlikely to develop a cognitive theory of behavior. All of that researcher’s insight is based on the observable conditions of action. Researchers and theorists often resent this fall from Cartesian privilege, but knowledge production is a human activity.

Whatever its starting point, theory and its method of analysis establish the requirements of what will count as evidence by providing the foundational assumptions of the explanation itself. In the field of argumentation, these foundational assumptions are called warrants. These are the necessary prebeliefs that allow evidence and claim to be connected. If you are going to make a claim about the reliability of a scale, for example, you have to first believe that there is something independent of the scale to be measured (the scale is not simply responding to the interplay of language, for example). Furthermore, that something has to be stable enough to be measured accurately more than once. If you don't hold these warrants to be true, then a reliability coefficient cannot stand as evidence.

Warrants are the hidden game of theory. They are revealed by carefully addressing the question "What do I have to believe to be true for this theory to make sense?"—or in a less subjective modality, "What has to be true of the world for this theory to make sense?" Every theory has a nexus of warrants that are present but mostly unexpressed. This interconnected structure reaches some teleological or axiomatic point that may or may not be accepted. Depending on whether the axiom is accepted or not, the theory stands or fails, just as different geometries stand or fail on whether or not parallel lines meet at infinity. Espousing a theory entangles the spokesperson in the warrants of that theory. Without an adequate analysis of those warrants, we are ignorant of the implications of our theory beliefs.

The combination of theory, method, evidence, and warrants create the requirements of the explanation that can follow. A competent explanation has to be true to these requirements. It is also true that an explanation achieves competence by meeting these requirements. And there is more: The American Psychological Association (APA), for example, has a 400+ page manual innocuously titled as *A Handbook of Style*. It has rules for everything from the formatting of references to the parentheses in citations to spelling and punctuation. It also imposes a structure of argument and presumes the presence of certain kinds of evidence. Publication outlets that require the use of the APA style (or any single style sheet) impose a way of thinking on the writer. What we as readers see as the result in whatever scholarship we read, is a highly regimented argument, many elements of which can be there as much for these conventional requirements as for their epistemological force.

Scope of Performance and Application

Although we typically identify a theory by the author(s) whose formulation either captures the research community's interest at the time of presentation or is resurfaced at a later time, theory has to go well beyond the initial presentation and engage many other practitioners in order to be successful. (The whole issue of the

attribution of ideas to individuals is a cultural practice and is itself the subject of research.) Theory that is not picked up by others (and more meets that fate than not) is "dead" to the community, although resuscitations do occur. A theory "lives in a community of scholarship because it is productive—it generates hypotheses, research questions, frames arguments, and directs critical analysis in a way that the community finds valuable. In somewhat crass terms, works achieve publication, grants are secured, careers are advanced, and it might also have some lasting effect on our knowledge. This last marker of success is always in doubt. The Ptolemaic universe lasted from about AD 150 to Copernicus's heliocentric system of 1543, nearly 1,400 years. When we talk about the test of time, then, nothing in the social sciences comes close to meeting that standard.

The "test of time" is not just time, however. It is time that is needed to examine and refine the theory to find its areas of success and points of failure. This testing develops the theory's scope of performance and appropriate application. Every theory has a scope of performance and typical applications. Step off a curblike height in outer space and float away. The more mature and tested a theory is, the better defined are its scope of performance (circumstances where we gain knowledge) and its appropriate applications (the conditions under which it works as claimed). Determining the scope of performance and successful applications is a defined step in theory development. It involves a meta-analysis of the works that advance as well as those that critique the theory. A meta-analysis of a theory examines the primary research and scholarship that the theory has promoted to see if the set is coherent in its findings and claims. For example, Mares and Woodard (2005) examined 34 studies on the oft-neglected prosocial consequences of children's television viewing. They find about the same effect size for prosocial content as has been found for antisocial content. Mare and Woodward did not conduct any of the 34 studies they analyzed, but their meta-analysis allows us to see a developing preponderance of evidence that enlarges our understanding of television effects.

The appearance of meta-analysis is an important marker in the viability of a theory. It indicates that sufficient competent work has been done to allow the possibility of consilience. Consilience is the convergence of evidence that points to some conclusion—in our case, that the terms of the theory are supportable. Consilience is not evidence of validity (or truth). The convergence could be a convergence of error. The absence of consilience, however, is strong evidence of a failure to thrive within the community. Consequently, one should remain deeply skeptical of any theory until the meta-analyses start to show up in the literature.

One point that follows here is that theory is a work in progress. The theory of its initial formulation is rarely the theory of a mature meta-analysis. What a theory is, then, depends on when one engages it. The theory you learned in an undergraduate course is not the theory being used 10 years later. It is a process of continuing education.

Consequence of Value

Issues of value are always problematic in the discussion of theory. For some, theory is solely involved in the pursuit of truth, and questions of the good (value) are viewed separately across Hume's gap. This position is most easily held when the true is material and can be directly represented in theory. In this case, theory is a simple description and no more than a description of what is "out there." The position becomes untenable when the true is a social practice and represented in forms of discourse that load in preconception, hierarchy, and power relationships. In this case, something is true because it ought to be true—it benefits someone, some group, some class, some social structure. This sounds sinister, but the social construction of knowledge has to include the political processes endemic to the social.

But even if one holds to a 17th-century conception of the discovery of knowledge and the ultimate supremacy of truth over error, value inhabits theory. In the current battle of evolution and intelligent design creationism, there is much more on the line than which one is correct. There is identity, standing, voice, career, textbook market, and all the economic and political implications of the fight involved. To understand the intensity of the fight, one has to consider value. Individuals reap great benefits in the ascendancy of one theory over another.

There is a third framing of this issue that causes contention across materialists and social constructionists alike. This is the position that theory is an active form of advocacy. It is one thing to necessarily reproduce hegemonic social relations, as social constructionists believe, or to benefit from the success of a theory, as even materialists believe; it is quite another to say that theory is a deliberate form of advocacy. In this framing, theory is constructed to achieve its truth through its force of advocacy.

This position is justified as an extension of the social constructionist argument. If the realities of social life are created in social practice and if our knowledge of those social practices is itself a social practice, then a claim of knowledge reproduces and reinforces what is social practice. If, however, our knowledge claims disrupt ongoing social practices and change these practices to bring these practices in line with the claims, then the claims become true through advocacy. The advocacy forms of the critical issue theories of class, gender, and race are examples of this kind of theorizing.

Recapping

The effective engagement of theory in general and of a specific theory requires our attention to eight components: (1) target, (2) method, (3) evidence, (4) warrants, (5) explanatory form, (6) scope of performance, (7) typical application, and (8) value. For the nonpractitioner, communication theory is some discursive form. For the practitioner, however, a living theory is a way of thinking

that governs the scholarly practices of the members of that theory community. If it is only a discursive form, it is merely an artifact of some bygone scholarship. The eight components, then, can be summarized in the questions: What do I have to believe to be true about people and the world to accept this theory? And what are the scholarly practices that are enforced by these beliefs?

Levels of Theory

In more technical terms, we have been talking about the ontological (questions of existence), epistemological (questions of knowledge), praxeological (questions of action), and axiological (questions of value) issues to which every theory must explicitly or implicitly respond. How a theory in general responds depends on the prevailing preconditions of theory that are in play in the epistemological culture in which that theory is developed.

Theory doesn't just appear. It appears within a field of understanding. If, for example, you live in an era or cultural domain where all knowledge comes from authority, an empirical theory based on knowledge through experience would be marginalized and likely suppressed. In our current Euro-American epistemological culture, of course, empirical theories—theories connected to material evidence—are the norm. It was not always so, and in some areas of scholarship, it may never be.

At some grand level, these preconditions form the episteme. Our current Euro-American episteme has been called the Age of Enlightenment, and it puts a premium on the individual mind, rationality, and empiricism. Theory that develops in this era (which is now some 400 years old) will show these same characteristics (methodological individualism, deductive argument, and testable claims) or will spend resources in the struggle against them.

But of course there is more. As knowledge divides into domains of production, characteristic frameworks—generally called paradigms—develop. A paradigm establishes the norms, conventions, and warrants of the scholarship conducted within it. It is the ground on which the figure of the argument can appear. The paradigm provides for normalized scholarship. It allows us to evaluate the particular case to determine if it is good work and fits in with what we already know is true.

Paradigmatic theory has no single author, but rather it is the work of several to hundreds of authors who produce a body of like-minded work. Marxist theory, feminist theory, continental theory, cognitive theory, social action theory are all examples of paradigmatic theory. Theory at this level is an ongoing conversation of scholarly activity. This conversation creates a field of discourse, and while the boundaries of this field are both permeable and elastic—like those of a conversation, they do create real limits. If, for example, your characteristic explanations do not include the function of socioeconomic class, your theoretical position would be unlikely to be considered normal

Marxist scholarship. (On the other hand, one can address socioeconomic class from positions other than Marxist ones.) There are, therefore, rules of discursive membership. They are, however, dynamic not stable. The feminist theory of the 1980s is not the feminist theory of the first decade of the 21st century.

While there are many communities of scholarship in our discipline (collectively, our professional associations have more than 100 divisions and interest groups), paradigmatic communities ordinarily are not discipline specific but are distributed across many disciplines. In fact, one might consider that reach to be a mark of paradigmatic status. Paradigmatic theory would influence any field that addressed the issues that were the explanatory targets of the theory.

Kuhn's (1970) original formulation of the concept of paradigm referred to a way of thinking and scholarly practice that dominated a field of endeavor. In a field such as communication, which is widely understood as having no center to dominate, the term has come to mean any more or less organized community of practitioners who would recognize the same authorities, cite the same seminal works, produce common lines of argument, and use agreed-on protocols of evidence.

The social science of communication, for example, has been marked by the cognitivist paradigm for more than 50 years. Very briefly, cognitivism holds that physiological and psychological conditions lead to the formation of mental structures, which in turn direct behavior. If one can gain knowledge about or the ability to manipulate these mental structures, then one can predict and/or control behavior.

Cognitivists for their part want to predict and control behavior because prediction and control are hallmarks of the science to which they aspire. Consequently, when a cognitivist develops theory, the theory will be responsive to those requirements. Could one write theory that is independent of those requirements and not depend on mental structures or be directed toward prediction and control? Of course, but such a researcher would not be a cognitivist—he or she may be a radical cognitivist, postcognitivist, neocognitivist, or anticognitivist, but not a cognitivist.

We care about these constraints on theory because a paradigm refers as much to the political processes that control the appearance of new theory as to the epistemological principles that shape it. We know the stories of the true overcoming human ignorance—Galilean astronomy over Ptolemaic, oxygen over phlogiston, viruses over vapors, but we know little of the silenced desperation of those marginalized in opposition to normal scholarship. If one wants to claim the title of a social scientist in communication, the easiest route, today, is still through cognitivism. Paradigms are never secure even if long-lived, however.

The scholarly discourse within a theory field leaves an extensive record, far beyond what any one individual can access. Any one of us, then, can have only partial knowledge of a paradigm, and there may be as much variation within a paradigm as between paradigms. At this level, we create “versions” located in time, place, and authorship. Because this sort of theory is a constrained but unregulated mosaic of

different works, its specific terms and conditions depend on the way the works are compiled and analyzed. Consequently, the answer to the question “What is cognitive theory?” (or any other theory field) depends on the works that are chosen to represent it, the resolutions of the differences those works present, and the descriptive narrative the author constructs.

One might hope that as more of these meta-analytic compilations are developed, it is more likely that there will be convergence on some conventionalized sense of what the theory is, but there are tensions that seem to intervene. The compilations themselves are not neutral but rather have a point of view and often an agenda. The compilations of postmodern theory within the social sciences that appeared in the 1980s, for example, were mostly written by modernist authors. The postmodern theorists themselves were all too busy during that period writing the theory to step back and tell the rest of us what it was all about. As a result, many of the early meta-analyses were more about defending the turf of modernism than of illuminating the terms of postmodernism. All meta-analyses are purposeful.

Epistemologists such as myself are not very interested in the substantive content of theory—what their specific claims are. We are much more interested in the traces the theory leaves of the theorists' efforts to constitute the world for the pleasure of their theory and what the theory tells us about the knowledge production practices of that community of theorists. For us, theory and theories are just handy exemplars of what is really important. And of course, I write those lines from the vantage of a particular theory of knowledge from which I make sense of the practice of theorizing and to which I am beholden in my writing. Theory is everywhere. All this is a forewarning that what follows is at best incomplete and certainly written from the point of view of accomplishing this entry.

I have categorized the paradigmatic theory that appears most commonly in communication into five large classes and given exemplars (not a complete listing) of each. In the grand scheme of things, these five categories leave out as much theory as they include but not much that regularly appears in communication. The classes are (1) theories of human performance: behaviorism, cognitivism, developmental theory, sociobiology, evolutionary psychology, social action theory, performance theory; (2) psychoanalytic theory: Freudian, Jungian, Neo-Freudian, Lacanian, Deleuzean (Guattari); (3) critical issue theories: Marxism, feminism, critical race theory; (4) theories of discourse: semiotics, deconstructionism, postmodern discourse theory, critical discourse analysis, conversation analysis, Foucauldian theory; and (5) critical/cultural theory: critical theory, critical rhetoric, rhetorical theory, literary theory/theories of criticism, American/British/Continental studies, critical legal studies, disciplinary studies, media studies, popular culture, postcolonial studies, post-structuralism, queer studies, race studies, gender studies, women's studies, men's studies.

Theories of human performance have been most interested in why we humans do the things we do (the epistemology of performance). Most of the particular theories

arise out of the cognitivist paradigm. The bulk of research, on the other hand, has been interested in cataloguing what we do by collecting surveys on communicative behaviors (the ontology of performance). There has been very little effective ontological theory work. The field is still debating what communication is, what a message is, what a relationship is, what constitutes an organization and all the other nouns of the discipline, albeit definitions abound. The interpretive turn of the 1980s saw a reinstallation of an interest in how performances are enacted and constituted as action (the praxeology of performance). Most of this work has rested on social theory or social action theory. Finally, theories relating to the character (value) of human performance have been located in performance theory.

The language used in specific theories of human performance quickly locates the paradigm from which the theory emerges. Theories that talk about “acts and behavior” are most likely located in either—depending on the era of publication—the behaviorist (through the 1930s) paradigm or the cognitivist (from the 1940s to the present) paradigm. Theories that talk about action, interaction, or the semiotics (meaningfulness) of behavior rest on social/social action theory. Finally, when performance is the central term, the theory is part of the rapidly coalescing performance or critical ethnography paradigm.

Psychoanalytic theory considers the structure and performance of the conscious as a product of the disunity of the human mind. In very simple terms, for Freud, it was the struggle between the id and the superego; for Jung, it was the preconscious archetypes that shaped human understanding; for Lacan, the base is desire in the lack of self and other; and for Deleuze and Guattari, it is the schizophrenic character of capitalism that both liberates and represses the conscious. Freud and Jung attacked the “good man thinking well” conceptualization of human rationality, and Lacan and Deleuze and Guattari took the conscious out of the individual and into the political-economic system. In so doing, psychoanalytic theory undercuts the rationality and individual principles of the Enlightenment episteme by declaring that the thinking individual is not trustworthy (anti-Cartesian) and, consequently, is often held in disdain by U.S. and British empiricists.

Perhaps for that reason, until recent times, little of what communication theory textbooks consider as communication theory has been located in the psychoanalytic paradigm. Film theory has been the most likely member, although gender studies, particularly studies in masculinity, and cultural studies focusing on power and oppression have clear (if often unspoken) dependencies.

The critical issue paradigm generates theory that is initially universalist and utopian. Critical issue theories see the human condition as organized around their particular focus, whether it be economic class structure, power relationships, patriarchy, or race and ethnicity. In their early development, they tend toward monolithic villains and innocent victims instead of collusion and complicity. Throughout their development, they hold the promise of a

better world—at least for some—once their issue is resolved. As critical issue theories age, they develop greater complexity and less certainty, which in the eyes of this writer is much to their credit. Postmodern feminist theories and theories of resistance are two excellent examples. Both of these theoretical frameworks are making quite a presence in organizational communication.

Theoretical approaches based on the concept of discourse are also typically dependent on the principle of social constructionism. As with all ontological features of communication, discourse has a variety of definitions. The one to be used here is “language use that participates in social structures and relationships.” Social constructionism for its part holds that human practices constitute the features of human social reality. Discourse then is a player in the social structures and relationships in which it appears. For example, this writing is an exemplar of the discourse of scholarship. It is constrained by the rules of that writing; its appearance in turn validates and reinforces those constraints. It positions the author as knowing and the reader in a lower hierarchical position of learner. I write this because I know about discourse, and you read it because you want to find out, unless, of course, you are a critic/reviewer intent on enforcing the rules.

Most theories of discourse focus on the realities constituted in discourse, the structures of dominance and oppression it supports, and the power relationships that result. There are two notable exceptions: Semiotics can be a technical theory of language, a very broad investigation of significance, or a very focused analysis of meaning. Conversation analysis can range from a systematic theory of conversational structure to a broad argument concerning communicant relationships.

The critical/cultural paradigm is probably the most difficult to summarize because it covers widely diverse fields of theory such as critical theory, which comes out of 19th-century German intellectualism and radical hermeneutics, which is based on 20th-century American pragmatism. It is probably the least paradigmatic of the five, but it is, nonetheless, a location more likely to be called home by critical theorists and radical hermeneutists alike than any other. What makes it home is the common theme of social justice and the active pursuit of a redress of wrongs. There is also a common focus on texts, but the definition of text is expanded to include all meaningful construction of symbolic material. For some cultural and hermeneutic theorists, this definition includes the cultural performance of myths, rites, rituals, competitions, and the like. Cultural performances of this sort, of course, bring us back to performance theory and a connection to our first paradigmatic category. This connection underscores the premise that there are greater differences within a paradigm than between border occupants across paradigms.

Paradigmatic communities in communication tend to divide along two axes: empirical-analytical and foundational-reflexive. Empirical theories are ones that motivate the collection of data, whether those data are numerical values of a scale or the field notes of an ethnographer. Analytical theories

are those that put the focus on the argument. This distinction is a matter of balance as all theories begin with data on some sort of problem and have to construct some kind of argument. There is, however, a clear difference between a media effects theory that generates a survey and a media studies theory that generates a cultural argument.

Considering the second axis, foundational theories rest their validity on an unproblematic base that may be a set of universal, of-course-they're-true, principles or the unassailable evidence of experience. Reflexive theories rest their claims on more temporary standpoints that are themselves the product of the research and argument process. This axis cuts much more cleanly than the first. The cutting edge is the concept of the social construction of knowledge. This concept holds that human knowledge—particularly knowledge about social processes—has no independent source of validation but is always a product of the language, episteme, culture, scholarship, paradigm, theory, practice, and practitioners involved in its production. Reflexivity is the infinitely recursive practice of discovering how these sources provide for the claims that we make. Universal principles become much more local, their of-course-they're-true status appears because we create it, and our connection to experience is mitigated or constituted through language and culture.

Figure 5.1 presents a graphical image of the effect these axes have on communication scholarship. I have started the figure as a circle to indicate that while there are large differences among us, there is still a boundary that identifies our work as communication and separates us from other fields.

Some interesting interpretations of communication theory appear as one explores Figure 5.1. The left hemisphere contains much of the history of the scientific and critical

scholarship of the field. The right hemisphere represents the forces of change in communication theory, with the most action occurring in the lower right quadrant.

The upper hemisphere contains the qualitative-quantitative methodological divide. In this diagram, one can see that this divide is much more than methodological. The quantitative and qualitative methodologies typical of these quadrants connect to different ways of thinking about the world, our knowledge of it, and the purposes of scholarship. One can also see that foundational empiricism—the quadrant where metric approaches make sense—has a somewhat greater variety of theory than reflexive empiricism. There are good reasons for this difference that need not include the creativity of reflexive empiricists. Foundational empiricism in the social sciences developed along the well-trod epistemological trail of the physical sciences. The premise that the social reality in which we live is a product of our own practices is an entirely different pathway. The world history of the first half of the 20th century with its bevy of absolute dictators and two world wars greatly interrupted the scholarship of this field. One could go on: the conflation of Marxism with godless communism, the oppressions of the positivist regime, the control of science funding, the monolingual character of even the scholarly elite in the United States—all the juicy human practices that we often fail to discuss in most encyclopedias and textbooks.

There are, of course, other axes that we could use to divide the communication circle: Modern-postmodern, atomism-holism, propositional-narrational are three that come immediately to mind. Each would sort the theory list differently, and each would generate different explanations of the theory in our field. It's a never-ending story.

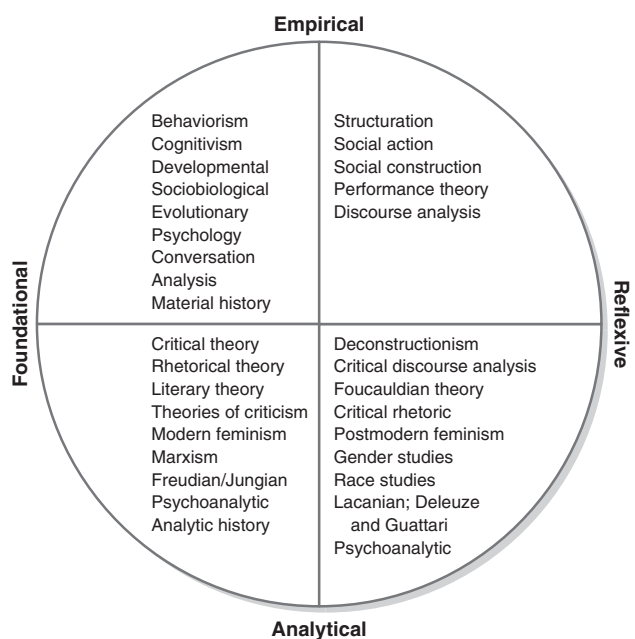

Figure 5.1 Location of Paradigmatic Theories on the Axes of Empirical–Analytical and Foundational–Reflexive

Communication Theory

Paradigmatic theories at the level we have been addressing them up to this point reach across a broad field of scholarship. The basic principles of discourse theory or of cognitivism or social action theory would easily reach across communication, sociology, psychology, and related fields. If we now have an idea of what theory is in its particular responsibilities and paradigmatic expressions, perhaps it is time to consider what makes a theory a communication theory.

The simplest and in many ways the best answer to that question is that a communication theory is whatever we claim as a communication theory. For example, Leon Festinger's (1957) cognitive dissonance theory is routinely included in the catalog of communication theories by our textbooks. Festinger was a social psychologist teaching at Stanford and developing his theory at a time when communication was still speech and journalism. The theory deals with the behavioral motivations of conflicting cognitions. It is centered in the heart of the cognitivist paradigm, connected as it is to Heider's (1946) balance theory. How does this theory become a *communication* theory? My reading of that is twofold. First, the experiments Festinger

conducted used messages to induce the conflicting cognitions and information seeking as the behavioral consequence. Messages and information seeking are clearly communication variables; consequently, the theory must be a communication theory. Not that simple, unfortunately, because cognitive dissonance does not depend on it being induced by messages—it could be induced by logical thinking—and information seeking is just a convenient behavior to measure. Nonetheless, it resonates as a communication theory, and consequently, we have appropriated it as a communication theory.

The second way it becomes a communication theory is that it has shown itself to be useful to the field. Communication scholars who take both a cognitivist and a message orientation have successfully used cognitive dissonance to explain the outcomes of competing messages or of messages competing with preexisting cognitive states. Sun and Scharrer (2004) used cognitive dissonance theory to explain the resistance of college students to critiques of the Disney studios' film *The Little Mermaid*. In their application of cognitive dissonance theory, Sun and Scharrer mostly use dissonance as a place holder for more appropriate cognitive balance theories (e.g., Feather, 1964)—a minor disconnection, one supposes.

In the Sun and Scharrer (2004) study, the cognition formed by the instruction in the “troubling ideologies of Disney” came into conflict with the preexisting admiration for Disney held by the students. Cognitive balance theory would predict four possible outcomes: rejection of the existing cognition (“I no longer admire Disney”), resistance to the new cognition (“Oh, it does not,” or even “I don’t care”), compartmentalization (“I’ll hold this belief in class and the other elsewhere”), or some synthesis of the two (“Disney films have troubling ideologies, and they provide clean entertainment for children”). The authors either found only resistance or used the theory to explain only the resistance they found. (A critique of their study would suggest the latter.)

If we return to our list of components of a theory (target, method, evidence and warrants, explanatory form, scope of performance, typical application, and value), one might assume that a *communication* theory would somehow target communication. Cognitive balance theories target the cognitive processes that work to maintain a desired balance of cognitions. What is the communication part of this theory? For some, the initiation of the cognitive processes to effect or preserve balance is seen as the consequence of communication. So in this case, resistance is seen as the effect of the course communication.

For others, it tells us something about cognitive processes but little about communication. The communication part of this study is held to be the construction of the instructional message that produced the dissonant cognition. The finding of resistance is evidence of that cognitive production (something of an ontological claim), but how and why the instructional message resulted in that production (the praxeological and epistemological claims) remain unknown.

Most communication epistemologists (Anderson, 1996; Craig, 1999; Peters, 1986) would argue that much of what we identify as communication theory is not truly *communication* theory. It is, rather, theory in which communication processes play some part. As a consequence, the field quickly fractionates into interpersonal communication, mediated communication, journalism, new media, organizational communication, cultural studies, and so on. Under this thinking, communication is an applied discipline. The real theoretical interest is in, say, the character and success of relationships; the formation and operation of organizations; the force of gender; the role of media in morality, violence, politics; and so on.

In the end, why does it matter? It matters because if our focal interest is in organizations, for example, and all we bring to the study of organizations and organizing is communication processes, we impoverish our theoretical efforts. At the same time, because communication processes are central to all social behavior, the study of these processes is centered in all interests in social behavior. Communication theory has made a strong contribution to our understanding of many social behaviors, not just a developed one in the social behavior of communication. Epistemologically, this puts us at risk because we have no secure intellectual center. It is an interesting, contentious, and unresolved issue.

RHETORICAL AND TEXTUAL APPROACHES TO COMMUNICATION

VALERIE R. RENEGAR AND JENNIFER A. MALKOWSKI

San Diego State University

The modern world is steeped in communication. In an average day, thousands of different messages are communicated via intrapersonal, interpersonal, public, and mediated channels. In fact, the world is so steeped in communication that much of the information that a person uses to become a member of their community is a result of communication (Mead, 1934). Scholars argue that humans come to understand the world and their communities as a result of communication. It comes as no surprise, then, that individual behavior can be shaped in important ways as a result of communication. Indeed, the way humans experience the world is filtered through communication so much so that rhetoric affects what we perceive, what we know to be true, how we understand our experiences, and how we conduct ourselves (Foss, Foss, & Trapp, 2002).

Rhetorical scholars engage in research that involves the close study of rhetorical texts or artifacts. This process is called rhetorical criticism, and it is the foundation of rhetorical and textual approaches to communication. Rhetorical critics analyze texts to learn more about how the process of communication works. Critics are interested in why some messages are compelling, but others fall flat, or why some movies, books, or television shows resonate with audiences, while others never seem to catch on. Rhetorical scholars, also called rhetorical critics, engage in systematic and sustained examination of texts. This sets them apart from popular critics who review books or movies and make determinations about

whether or not they liked it but who do not seek to understand how the text is working from a communication perspective.

In this chapter, the meaning of rhetoric is explored along with its characteristics. This is followed by an examination of rhetorical criticism, and finally the value of rhetorical and textual approaches to communication is discussed.

Rhetoric

The term *rhetoric* is often used in contemporary society to refer to meaningless talk or empty words. Politicians accuse their opponents of using rhetoric to persuade their audience. This implies that rhetoric is merely linguistic and has no force to shape social change. This perspective on rhetoric assumes that actions are more important than words and that actions can be understood apart from language.

This understanding of rhetoric is shortsighted and misinterprets the meaning of the term. Rhetoric has been an important part of civic life since the 5th century BCE (Foss et al., 2002) and has long been considered one of the most important liberal arts. Plato, the ancient Greek philosopher, believed that the art of persuading audiences should be reserved for the intellectual elite since this ability was too powerful for ordinary people. Aristotle, on the other hand, saw rhetoric as an important part of a democracy.

His book *Rhetoric* reads like a public speaking handbook instructing students on the best way to persuade audiences in myriad ways. Aristotle's definition of rhetoric, the ability to discern all the available means of persuasion in any given situation, is illuminating because it is focused on the critical skill of seeing the ways to persuade as opposed to actually making the most persuasive argument. Quintilian, an ancient Roman philosopher, defined rhetoric as the good man speaking well. This definition suggests that speaking skills are directly tied to particular individuals. Additionally, Quintilian believed that for persons to be "good," it was necessary that they have a well-rounded education as well as good intentions for their audience.

While most of the definitions of rhetoric are from ancient times, contemporary rhetorical theorists continue to study this form of communication. Kenneth Burke, one of the most prolific theorists of the 20th century, understood rhetoric as a process of creating identification with an audience. As speakers share their perspectives, audiences identify points of commonality that bring the two closer to agreement. An interesting aspect of Burke's definition is that he is not concerned with persuasion, or the ability of a speaker to change the mind of the audience. Instead, he focuses on the nature of communication as a vehicle for helping humans understand one another.

While there are a wide range of definitions for rhetoric, contemporary scholars tend to share the idea that rhetoric has some basic characteristics. Some scholars argue that for communication to be considered rhetoric, it must be intended to reach a particular outcome, while others have a wider definition that includes all kinds of communication, be it expressive or persuasive. Regardless of these differences, scholars agree that a great deal of communication is rhetorical in nature. The basic characteristics that tend to be shared across definitions are that rhetoric is the intentional or strategic use of symbols by humans in order to communicate. There are also a number of key terms that stem from the word rhetoric. *Rhetor* is the word used to refer to the creator of the rhetoric, while a *rhetorician* is a person who studies rhetoric, and *rhetorical criticism* is the process of making evaluations of rhetoric based on a systematic analysis of a rhetorical artifact.

The study of rhetoric is a study of human communication. Many scholars argue that one of the things that make humans unique is their ability to communicate. Although animals communicate, that communication falls outside the purview of rhetorical critics. Critics are interested in human-constructed intentional messages communicated through symbols.

Rhetoric is symbolic, meaning that symbols are the vehicle that humans use to communicate. Perhaps the most important symbol system that humans use is language, but there are many other forms of symbolic behavior that are also used to communicate, including nonverbal behavior, art, music, clothing, and architecture. A symbol is something that represents something else by virtue of a relationship or

association (Foss, 2004). Symbols are human constructions and have arbitrary meanings. The relationship between a symbol and what it describes are not based on some inherent quality. The relationship itself is arbitrary, and the relationship between a word and what it represents is something that individuals come to understand by means of communication. Another aspect of symbol use is that symbols are ambiguous. Because there is not an intrinsic relationship between the symbol and what it describes, there is often the need for the audiences of the message to interpret what the symbols mean. Language is not inherently clear and concise. This ambiguity allows for both the rhetor and the audience to participate in the creation of meaning. This is interesting to critics because no matter how clear a rhetor attempts to be, there is always the chance that an audience will interpret the message differently. While the intention of the rhetor is important, it is more important to the critic how the message itself can be read as a text. So, for example, a person may say something offensive without meaning to offend. The intent to offend is not as important as the fact that offense took place. It is not enough to say that the offensive language was unintentional, because the meaning of language is not the possession of the rhetor. Instead, the meaning of symbols is a product of both the rhetor and the audience.

Rhetoric is communication that is intentional. Thus, rhetoric is always a deliberate attempt to communicate. It is important to recognize that it is the attempt to communicate that is central to this idea, not whether or not that attempt was successful. A text can be considered rhetorical even if no one pays attention to it, and it can be considered rhetorical even if the audience interprets the rhetoric differently than the rhetor intended. The intention of the rhetor is relatively unimportant. Rhetoric is strategic because it is both intentionally created and deployed with intent. Rhetoric is usually aimed at a particular goal of persuading an audience or sharing something significant with an audience. Rhetoric does not just happen; it is the result of a deliberate process. Although the process is deliberate, it may not involve much thought. For example, someone may offer an opinion that has not been considered thoroughly, but it was still offered purposefully.

For critics, the strategic nature of rhetoric is intriguing because it reveals important information about how rhetors have chosen to construct messages. A critic may explore why one person may prefer confrontation and another uses a passive-aggressive communication style. A critic may choose to understand why individuals choose certain modes of communication. Many people may not think of these sorts of decisions as deliberate. They are just being themselves, and this is how they communicate. However, just because something has become a habit does not mean that it is not also a choice. Habits are the result of deliberate behavior and can be changed with other kinds of deliberate behaviors.

Individuals usually communicate with an end in mind. The goal may be to change someone's mind, it may be to have an audience buy a particular product, or the rhetor

may just want to get feelings about an issue out in the open for others to hear. Regardless of the goal, it is clear that rhetoric is designed with a particular goal in mind. For example, a person may talk to himself or herself in order to help him or her remember to do something or maybe to help figure out the parts of a problem. A person may communicate with someone else to share information or gain a new perspective. Even casual conversations have a goal and are, thus, often rhetorical.

Rhetorical Criticism

The process of carefully examining a text to discover how it works communicatively is called rhetorical criticism. Although a piece of criticism is centered on a particular rhetorical artifact, the goal of criticism more generally is to generate knowledge about how rhetoric works in order to persuade or to create some sort of identification with its audience. Thus, the careful examination of a text is used to generate more general knowledge of communication inductively.

Rhetorical Artifacts

Critics choose particular instances of rhetoric as the focus for their study. The rhetorical act itself is fleeting and can never be re-created in its entirety. Consequently, critics study rhetorical artifacts instead of the rhetorical acts themselves. An artifact is the tangible evidence of rhetoric. For example, when the president gives a speech, it is a rhetorical act. The artifact of that act would be a transcript and/or a recording of the speech. So while the speech itself has ended, the artifact is a tangible text that can be scrutinized over and over again. Rhetorical artifacts can take many forms, including written texts, books, video, paintings, recorded music, and films.

There are countless rhetorical artifacts available in our culture, so critics must choose their objects of study wisely. Critics usually look for some artifact that evokes a strong response. A book that has become a worldwide best seller and inspires millions of people might be an interesting object of study to discover what is so compelling about that text. Or a critic may choose to look at an artifact that has incited anger or disagreement. Critics might choose artifacts that were particularly effective or notably ineffective. There are myriad choices, but in general, critics are looking for something that is notable, important, influential, or unusual. Critics are also interested in satisfying their own curiosity, so they tend to select artifacts that are particularly interesting to them.

All rhetorical artifacts are a product of the particular time and place in which they were created. Rhetoric is often a response to some sort of problem that the rhetor seeks to redress with words. The term *exigencies* refers to the prevailing cultural conditions and constraints on the

particular rhetorical act. Critics must examine the exigencies that surround and constrain a rhetorical act to understand the choices the rhetor made. Bitzer (1968) describes the rhetorical situation as the sum of the exigencies surrounding any rhetorical act and urges critics to carefully consider the ways in which a particular situation demands a rhetorical response.

Rhetorical criticism seeks to understand the way rhetoric works, how messages are created, and why they have the impact that they do. Critics seek to reveal what the average person may not have noticed. A critic peels back the layers of a rhetorical artifact to discover and expose information about the rhetor, the intended audience, the rhetorical situation, the cultural assumptions of the rhetor and the audience, and how the rhetoric functions as a whole. Rhetorical critics formulate research questions concerned with how rhetoric works, why it works the way it does, and what kinds of rhetorical elements allow it to work in that way. Critics accomplish this by looking closely at rhetorical artifacts and researching the rhetorical situation that surrounds the artifact. Critics do not usually engage in interviewing or other forms of qualitative data collection. Instead, rhetoric critics focus their study on a particular text and seek to reveal what it can tell us about the communication.

Method

In rhetorical criticism, the method of inquiry is tied to a particular critical perspective. Critics make arguments about rhetoric based on the particular rhetorical perspective that is being employed. Instead of an established set of procedures that are used in some other forms of communication research, rhetorical criticism is a product of the application of a particular critical perspective to an artifact. There are countless critical perspectives that a critic can use, and increasingly, critics must develop a unique critical perspective to understand the artifact being studied.

A critical perspective acts as a lens. The critic looks at the artifact through the lens of the perspective. A perspective is informed by theory, and this in turn helps the critic develop a critical vocabulary. This critical vocabulary will help the critic discuss the artifact with a greater degree of precision. For example, if a critic was using a critical perspective that is based on the importance of metaphor, the critic would first research theories of metaphor to better understand what a metaphor is and how to identify its parts and effects within a text. Research into metaphor would reveal that metaphors have constituent parts called the vehicle and the tenor (Foss, 2004). So this critical vocabulary can now be used to better describe the metaphors in a particular text.

A critical perspective will allow the critic to better see some parts of the artifact but will obscure others. If critics are looking for metaphors, for example, they may not

notice gender-exclusive language or narrative elements. Different critical perspectives direct the critic's attention in different ways. Thus, the critic should endeavor to choose a critical perspective that will highlight what the critic finds most intriguing about the artifact. In contemporary criticism, critics often combine two or three critical perspectives to articulate their arguments more fully. It may not be enough to isolate and describe the metaphors in an artifact, so a critic may also add the critical perspective of ideology to discuss the ways the metaphors perpetuate a hegemonic ideological structure that supports, rather than challenges, the current societal power structure.

The choice of a critical perspective, much like the choice of an artifact, is an individual decision. Consequently, rhetorical criticism tends to be highly personal. Furthermore, two different critics could examine the same artifact from two different perspectives and make entirely different determinations about it. Different critical perspectives will yield different conclusions, but their evaluations can be equally valid. This means that there is little agreement about what kinds of criticism are best or which critical perspectives are the most illuminating. Rhetorical criticism should be supported by good arguments and based in the artifact being studied, but what makes one critical perspective better than the other is often a case of personal preference. Ultimately, rhetorical criticism should reveal new information about the rhetoric and contribute new understandings of rhetoric to the field of communication.

Examples of Critical Perspectives

There are some critical perspectives that have become common among critics. These critical perspectives provide a systematic approach to analyzing a rhetorical artifact in order to answer specific questions generated by that perspective. An artifact's form, pattern, assumptions, language uses, or structures may also direct a critic to a particular established critical perspective. Ideological criticism, feminist criticism, and narrative criticism are some examples of established critical perspectives. These traditional critical perspectives will be discussed to demonstrate the assumptions about the world and the qualities of a particular artifact that can be discerned with different perspectives. Established critical perspectives are a good place to begin to peel back the layers of an artifact.

Narrative Criticism

Narrative criticism begins with the assumption that humans are storytellers. Narratives are meant to give order to human experiences in order to establish common ways of living and common ways of explaining how to make choices and take action in society. Likewise, humans rely on narratives to explain the choices and actions of others (MacIntyre, 1981). Critics can better understand motive if

they can describe all the factors that led to a particular choice. There is a logic to storytelling, and critics seek to unpack and illuminate this logic.

Narration is a type of human interaction and the product of that interaction, the narrative, is something that is interactively created, understood, and shared with others. Narration is part of being human because it has become an ingrained method of reasoning on the personal and social levels. This perspective assumes that stories are used to explain and rationalize events, cultures, conduct, or character (Fisher, 1984). Indeed, humans rationalize their conduct through narratives. The narrative critical perspective recognizes a rhetor as a storyteller and, therefore, recognizes each rhetor's tendency to deliver a message through the use of a personal narrative or through aligning the message with a larger, widely accepted social narrative. These larger, widely accepted narratives are often called master narratives. The function of the narrative critical perspective is to understand the purpose of a rhetorical act. A narrative provides the structure for understanding the creation, adaptation, and reception of rhetoric. By understanding rhetoric as telling a story or aligning with a previously told story, a critic can begin to work inductively to understand how the larger narrative explains the logic behind the decisions made prior to, during, and following a rhetorical act.

Although narratives may not argue explicitly, narratives are intended to be persuasive. When a rhetor chooses to embed the message in a narrative, that message becomes persuasive because of the very nature of stories and of human's natural fondness for them. Narratives have the ability to disarm audiences because of the desire to hear an entertaining story. Narratives have the ability to awaken memories, experiences, and feelings in an audience that can become powerful motivators. And narratives tempt their audience with a sense of closure in two ways: First, audiences will want to stick around to hear the end of the story (the actual message), and second, audiences are prepared to receive a story's lesson that explains how a certain behavior will lead to a certain outcome. Each of these characteristics of narrative identifies the way rhetors structure their messages in persuasive ways.

The presence of a narrative in a rhetorical artifact assumes that each part of a message is functioning within a larger persuasive construct. In recognizing its presence, a critic can begin to evaluate the overall "lesson of the story" in order to understand the persuasive power behind a message. Critics can evaluate a message based on *narrative probability* and *narrative fidelity* (Fisher, 1984). Narrative probability refers to evaluating the actual qualities of the story being told in terms of a coherent story line, suspense, concern for the protagonist, a climax, a dramatic twist, vivid detail, and closure. Narrative fidelity refers to how well that story reflects the reality of a situation. In other words, narrative fidelity measures the reliability and truthfulness. A critic can measure the fidelity of a narrative by determining what information was available to the rhetor and how well the narrative represents that knowledge (Hart & Daughton, 2005).

Critics can also evaluate a particular message based on the narrative's origin and the narrative's intent. If a narrative is derived from a master narrative, a well-established overarching story that is recognized and respected across a culture, then that narrative taps into certain established set of rules. These established standards of conduct may persuade audience members to abide by a rhetor's message due to inherent loyalties to the overall master narrative. A critic can evaluate this rhetorical strategy in terms of narrative fidelity. Critics can also seek to uncover and evaluate a rhetor's intentions by observing what a given narrative is intended to reveal and what a given narrative is intended to conceal. These decisions reiterate traditional rhetorical decisions involved with the delivery of facts, definitions, and ideas. A narrative provides a vehicle to translate the parts of a message into a meaningful experience, and a narrative critic asks questions about that process of translation and the implications of simple stories.

Ideological Criticism

Ideological criticism is an umbrella term for any criticism that is primarily motivated by ethical or political concerns. As such, an ideology is a pattern of beliefs used to interpret some aspect of a society in order to evaluate that issue or topic and encourage a particular attitude or action toward it (Foss, 2004). The primary goal of the ideological critic becomes discovering and analyzing the dominant ideology or ideologies embedded in an artifact and those ideologies either negated or underrepresented. Understanding ideologies helps illuminate the motivations of the rhetor and the strategies used to persuade the audience. Ideological criticism not only acts as a lens to focus on the specific rhetorical strategies used by rhetors to persuade their audiences but also specifies the social or political goals of the rhetor. Ideological critics are concerned with exposing the power dimensions of rhetorical artifacts to expose and evaluate the purpose of rhetoric.

The purpose of ideological criticism is unique in that an ideological critic works to develop a standard to judge a particular rhetorical act or artifact (Hart & Daughton, 2005). Although other critical perspectives draw conclusions about the implications of their findings, often ideological critics make these judgments more explicitly. For example, Marxist criticism also seeks to undermine certain taken-for-granted power structures in society. However, Marxist criticism extends beyond an evaluation of linguistic strategies by situating and illuminating how a particular strategy relates to a larger context. Specifically, Marxist critics seek to undermine exploitive economic systems. Although economic exploitation may seem like a narrow goal, this specific standard of evaluation inspires critics to question how rhetorical acts and artifacts relate to societal structures that continually exploit the powerless members of society. Marxist criticism becomes activism because it identifies the specific strategies used to perpetually rationalize the exploitation and then publicly criticizes these

structures. Marxists view ideological criticism as a socially responsible activity whereby ideological evaluations need to extend beyond the artifact itself and draw conclusions about the political and social goals of larger systems of exploitation by exposing their spokespeople. To a Marxist, rhetors represent the ideologies of larger organizations, and these connections need to be exposed in order to hold these organizations accountable to higher moral standards.

Like Marxist criticism, postcolonialist critics believe in exposing systems of oppression; however, a postcolonialist critic also aims to resist these systems of oppression by actively privileging the voices of the oppressed. The term *postcolonialist* is derived from the term *colonialism*, which emphasizes a historical tendency for those in power to conquer and control another person's land (Sim, 1999). Here, a postcolonialist likens this definition to the contemporary conquest and control of a person's rights, ideas, freedoms, choices, and voices through the use of rhetorical acts and artifacts. Postcolonialist critics seek to expose the remnants of a seemingly dated method of control. This exposure seeks to evaluate the assumptions of rhetorical acts and artifacts against the assumptions of postcolonialist critics, which seek to respect *alterity* (the quality of the "other") through recovering the voices and perspectives of the *sub-altern* (those people who are oppressed due to gender, race, class, religion, or culture). Postcolonialist critics specify the strategies used in rhetorical acts and artifacts that naturalize, or make things seem normal, to expose how these strategies become embedded in larger ideologies and are then taken for granted. This taken-for-granted approach toward a rhetor's assumptions perpetuates systems of oppression. It becomes the work of the ideological critic to identify and evaluate these assumptions in order to expose their arbitrary relationship.

Feminist Criticism

Feminist criticism can be considered a form of ideological criticism in that many feminist critics also engage in rhetorical criticism to illuminate power inequities in everyday life (Hart & Daughton, 2005). Specifically, feminist critics focus on gender as a source of inequity and ask how rhetoric defines and promotes gendered behavior. Feminist critics focus on gender to evaluate larger structures that promote power at the expense of oppression and equality.

The terms power, oppression, and equality are central to understanding the motivation behind the critical feminist perspective. Feminism is a theory that advocates equal space for all voices in a society; thus, feminists strive to acknowledge the voices of the voiceless that have traditionally been silenced due to socially constructed power structures. Not all feminists are women, and not all women are feminists; instead, these key terms articulate the interests of a particular type of critic. Critics who consider the feminist perspective are usually asking questions about how a particular rhetorical act or artifact relates to the concepts of equality, oppression, and power.

Feminist critics assume that certain power structures perpetuate the marginalization of certain members in society. Ultimately, the function of these structures has been linked to the promotion of patriarchy—the rule of men in society—and a masculine view of the world (Hart & Daughton, 2005). Patriarchy is inherently oppressive because it ignores the unique experiences of people who lie outside the white, privileged male demographic. Feminists explore how factors such as gender, race, discourse, power, and organizing intersect to produce relations of dominance and resistance that work to perpetuate hierarchies of oppression (Ashcraft & Mumby, 2004). Feminist interpretations of hegemony emphasize the plurality of positions, identities, and interests and promote communication as a way to create, sustain, and challenge current social order (Clair, 1998).

Feminist critics expose the political nature of texts to actively engage in the political process. The feminist critical perspective identifies strategies that are implicit in rhetorical artifacts to actively challenge current social and political order. This political activism can be achieved through different methods of critique (Hart & Daughton, 2005). For example, policy critique seeks to illuminate how public policy has traditionally reflected a masculine worldview. This is achieved through the systematic observation and analysis of language and images used to define and promote certain public policy agendas within a given text. Similarly, performative critique assumes that gender is a socially constructed concept. This critique looks at how gender is enacted in a given text and then draws conclusions about how this enactment is related to things such as race and class. This approach assumes that rhetorical performances, occurring on stage or in everyday interactions, determine and inform the gender of a person (Hart & Daughton, 2005). This perspective is empowering because it uses rhetorical criticism to demonstrate the ways in which gender is socially constructed in order to counter historically patriarchal conceptions of what make a woman a woman or a man a man. Within the feminist critical perspective, there is an array of ways to approach rhetoric. However, most feminist approaches seek to promote the central feminist values of respect, equality, self-determination, and interconnection (Foss, Foss, & Griffin, 1999).

The trend in rhetorical criticism now is to develop individual methods that are suited to a particular artifact rather than applying one of the methods that have become standard in communication studies. This approach illuminates the understanding that a critic can only understand the significance of an artifact through personal interpretation and that meaning is derived from understanding the independent and unique ways texts stand in relation to one another.

The Critical Essay

Sharing rhetorical criticism via the critical essay is essential because it shows others how rhetoric is being deployed and how it functions in certain circumstances. Showing,

not telling, is an important part of what rhetorical critics accomplish. While analyzing a text and uncovering strategies, a critic inevitably reaches a “eureka” moment—a moment where the function of the artifact in a larger context becomes clear. The final step in the process of conducting rhetorical criticism is to share that “eureka” experience about communication with others.

A critical essay should include a description and context of the rhetoric/artifact, an explanation of the critical perspective that was applied to that artifact, an analysis of that artifact, and the conclusions and evaluations about rhetoric based on the analysis. Remember, although criticism focuses on a particular artifact, the goal of rhetorical criticism is to understand better how rhetoric works. Rhetorical criticism is an ongoing process, not a product. In other words, the exploration of an individual artifact functions as a case study. Its purpose is to reveal how a particular artifact means something in a larger context and how this new perspective can contribute to, extend, or modify current rhetorical theory.

The first step in sharing rhetorical criticism with others is to orient the reader and generate interest. This orientation is accomplished by providing a brief overview or summary of the actual artifact and a brief description of the context in which the artifact occurs. The critic then needs to provide the reader with enough information about a particular artifact to help a reader understand its historical, cultural, or social context, as well as its significance. Finally, the critic must explain why this critical perspective matters on a larger scale by illuminating what past studies have discovered and how this particular essay will change, improve, or modify our current understanding of the world.

The second step in sharing rhetorical criticism is an explanation of the critical method(s) used to analyze an artifact. A rhetorical essay needs to be self-sufficient. In other words, readers should not have to go elsewhere to understand the key concepts that are needed to understand the following analysis; however, they are not reading the essay to learn everything there is to know about the critical method that was used. Instead, readers need to understand just enough information about the critical method in order to follow connections made throughout the essay.

The third step in sharing rhetorical criticism is the analysis of the artifact itself. This is where critics get to tell the audience what was observed and then provide proof of their arguments by supporting each claim with direct evidence from the text. So instead of simply stating that a particular rhetor uses a particular kind of language, a critic must demonstrate this claim using direct quotes from the artifact in question. The primary standard of judging the validity of a given rhetorical essay is how well the arguments are justified with examples from the text. Because rhetorical critics examine artifacts through critical perspectives that are highly individual, there is no sense that the research is “right” or “wrong.” Instead, good criticism is interesting and well argued, while inferior research is

not supported with evidence from the text. Due to the personal nature of rhetorical criticism, it is important for rhetorical critics to showcase their own ideas and theoretical conclusions because their interpretation of the text is unique. In the analysis, other theories or concepts can be included to support or extend the critic's unique perspective, but the purpose of reading a rhetorical essay is to gain a new understanding of communication processes.

The final step in sharing rhetorical criticism is a clarification of the conclusions drawn from the analysis and the evaluation of these conclusions on a larger scale. Conclusions help juxtapose important findings that were previously explained in the analysis portion but were so compelling that they deserve another mention. An evaluation of these findings can be either implicit or explicit but must accomplish the goal of explaining the implications of this particular case study in terms of a larger scale. This is the portion of the essay dedicated to articulating how this particular case study contributes to current rhetorical theory.

Value of Rhetorical Criticism

Early rhetorical scholarship tended to be prescriptive. The authors were intent on providing tools for creating persuasion communication and using rhetoric most effectively. Conversely, contemporary rhetorical scholars tend to focus on analyzing rhetoric. This shift has much to do with understanding that words and symbols construct the social world and act as a filter for how an individual understands reality. While rhetoric has been seen historically as a skill to be mastered, contemporary rhetorical scholarship understands the personal nature of creating, receiving, and sharing messages with others and seeks to explore these unique sources of meaning. Rhetorical criticism assumes that the variation in perspectives reveals certain qualities about how the world operates on a larger scale and how people interact with each other in that world. This pursuit becomes significant because rhetorical criticism aims to produce better communicators and a more informed critical audience.

Rhetorical criticism is also valuable because it encourages people to be more thoughtful rhetors. Rhetorical criticism demonstrates ways to better communicate on a personal, professional, and political level by revealing how symbols are effectively used in the construction of meaning. Rhetorical criticism equips people with an understanding of successful and unsuccessful strategies for constructing messages and then encourages them to implement these strategies in their own lives. As a proactive tool for understanding how people communicate needs and motivations, rhetorical criticism enables the audience to hone their own communication skills.

Rhetorical criticism is also valuable because it encourages people to be more critical consumers of rhetoric. Rhetorical criticism creates a more sophisticated understanding of messages, which helps the audience to become more critical of the rhetoric they encounter. The level of

sophistication in published rhetorical criticism encourages audiences to recognize the persuasive strategies used to shape their behaviors and then encourages the audience to uncover the implicit strategies that may also be framing their options. Rhetorical criticism encourages society to always question simplicity by articulating how and why the world is not simple. A demonstration of how messages are more complex than what is initially perceived encourages audience members to question the intentions of every message. This critical posture enables audiences to attain a level of sophistication that can help them become more critically aware of the messages they encounter.

Rhetorical critics work to reveal information about how meaning is created to make visible information that was previously unnoticed. Along with encouraging people to become their own critical consumers, rhetorical critics demonstrate how this is done and the benefits of engaging in this type of questioning. Rhetorical criticism often exposes insidious structures in society that have worked to maintain the status quo or normalize certain practices or attitudes. By revealing these strategies, rhetorical criticism reveals the manufactured nature of these power structures or practices, and in doing so, it may expose their weakness. By providing information about how oppressive structures function, rhetorical critics may delineate ways to transcend entrenched structures, and in doing so, it may empower people to explore different options.

Rhetorical criticism promotes activism and is a valuable tool for improving our current situation. Some rhetorical critical perspectives develop standards by which certain rhetorical goals can be evaluated. Rhetorical criticism, then, can explicitly suggest ways in which current structures oppress or fail members of society. These evaluations often raise awareness about a particular situation and in doing so motivate people to change that reality. Similar to activism, rhetorical criticism offers insights into emotion and then identifies sites of possible improvement.

Rhetorical criticism is valuable because it illustrates the interconnectedness of our experience. Rhetorical criticism demonstrates the intertextuality of our existence by connecting disparate texts and juxtaposing them to reveal a new perspective. Likewise, rhetorical criticism demonstrates the interconnectedness of people by drawing conclusions and evaluations across time, borders, cultures, and societies. This perspective promotes tolerance of alternative methods of constructing meaning in order to encourage individuals to seek to understand why someone behaves in a certain way. This level of tolerance prevents immediate negative reactions to unfamiliar situations or ideas. Broad-minded citizens listen to and incorporate different perspectives to more fully understand and appreciate their shared experience with others. Rhetorical criticism teaches people how to listen to and look for different perspectives in order to ensure that this level of tolerance and appreciation is met.

Finally, rhetorical criticism is a valuable method for appreciating an art. Humans are users of symbols, and this quality sets us apart from all other creatures. Rhetorical

criticism becomes a valuable way to pay homage to this ability and to also highlight the responsibility assumed with this status. The more rhetoric is understood as an art, the more its role in everyday life can be appreciated and the more it will be respected as a powerful facet in the rhetorical construction of reality.

Conclusion

Rhetoric is one of the oldest and most revered areas of communication. Its roots can be traced back to ancient Greece, but it remains an important contemporary area of study. Communication scholars look critically at rhetorical texts to discover how rhetoric functions. This process, known as rhetorical criticism, is continually adding new information about the process of persuasion and identification to the discipline of communication. This chapter discussed the definition of rhetoric and the process of rhetorical criticism, provided examples of established rhetorical methods, and explained the importance of conducting criticism. As contemporary society continues to grow and evolve, new forms of rhetoric are constantly being generated. So while scholars in the early 20th century tended to focus on speeches, contemporary scholars may study emerging genres of artifacts such as Web sites or text messages. Rhetorical criticism will remain a vibrant method of inquiry because it is so closely tied to the artifacts that are produced by a culture. Indeed, critics are especially valuable in contemporary times because they have the ability to reveal the inner workings of the communicative messages that saturate our society.

QUANTITATIVE APPROACHES TO COMMUNICATION RESEARCH

TIMOTHY R. LEVINE

Michigan State University

Quantitative, social scientific communication research involves the application of a set of social scientific methods for testing defensible knowledge claims about human communication based on empirical data, statistical description, and statistical inference. As the name implies, quantitative approaches to communication research use numbers—more specifically, quantitative data—to draw conclusions about communicative phenomena. Various aspects of communication are quantified to assess their prevalence or to show systematic relationships between variables.

Common examples of quantitative communication research include survey research, content analysis, and experimental research. Quantitative methods are used to investigate all types and aspects of communication, and they are widely used in research on interpersonal communication, mass media, new technology, cross-cultural communication, and organization communication research, to name a few areas.

The term *quantitative approach* implies a contrast between quantitative research and qualitative research. The former seeks to quantify constructs of interest, whereas the latter does not. Qualitative research is sometimes portrayed as more exploratory, being useful in generating new ideas and understandings, while quantitative research is often seen as involving more formal hypothesis testing. Both quantitative and qualitative research, however, can serve either function. Generally, quantitative research is useful when the phenomena of interest can be classified either as present or absent or when the phenomena have measurable attributes that vary in degrees or amounts. If something can be measured or counted, a quantitative

approach can be used. A primary advantage of quantitative research is that statistical evidence can be used to enhance confidence in a knowledge claim. A second advantage is that many quantitative methodologies offer mechanisms to control nuisance variables, ruling out rival explanations and enhancing confidence in knowledge claims.

More useful than the quantitative/qualitative distinction, however, is a broader one between social scientific approaches and nonscience approaches such as rhetorical criticism, postmodern analysis, feminist scholarship, and critical scholarship. What makes an approach social scientific or not rests on issues other than whether or not numbers are involved. Science-based and nonscientific modes of research reflect very different understandings about the nature of knowledge, how knowledge is generated, what is useful to know, and how we can have confidence in what we know. The quantitative-qualitative distinction need not involve these deeper philosophical differences about the nature of knowledge and knowledge generation. Nevertheless, most social scientists find it useful to use quantitative methods at least some of the time, and the use of quantitative methods usually implies a social scientific approach to knowledge generation, whereas qualitative research may or may not be social scientific in character.

Philosophical Underpinnings

Most quantitative social scientific research adopts the philosophical approach of scientific realism (Pavitt, 2001, chap. 1). The presumption is that there is a real world that

exists beyond our perceptions that is potentially, and at least partially, knowable. The goal of research is to get our understanding more closely aligned with this objective reality. The word *verisimilitude* describes this idea of closeness to reality. In quantitative research, we want our theories and findings to have verisimilitude, and the extent to which we can make a case that our theories and findings have verisimilitude is the bottom line in quantitative communication science.

Sometimes quantitative social science approaches are mistakenly equated with logical positivism or operationalism, but these problematic philosophical perspectives have long been out of favor (Meehl, 1986) and never held much sway in quantitative communication research anyway (Miller & Berger, 1999). Logical positivism was a philosophical view that held that the only meaningful knowledge is what we prove either by objective observation or by logical proof. Operationalism is a view of measurement that equates attributes of things with their measures. For example, to an operationalist, communication apprehension is a score on a communication apprehension scale. The idea from Karl Popper (1959, chap. 1) that hypotheses and theories need to be falsifiable, however, is both useful and widely accepted. That is, for ideas to be scientifically useful, they must be testable.

Quantitative social scientific research is usually empirical, meaning that knowledge claims are based on data and the data stem from observation. Quantitative social scientific research also strives for objectivity. Complete objectivity is impossible to obtain, but methods are designed and evaluated by the extent to which the data are likely free from bias and the personal idiosyncrasies of the researcher. Finally, quantitative social scientific research strives to be self-correcting. Confidence in a finding or conclusion is enhanced through replication, and it is presumed that incorrect conclusions will ultimately be rejected because they fail to replicate. A replication is essentially a retest. If a finding has verisimilitude, other researchers should be able to produce the finding under conditions similar to the original research. For the social scientist, objective empirical observation, coupled with replication, provides the best path to verisimilitude over time.

Research predictions and knowledge claims in quantitative communication research are usually probabilistic in nature, general within some specified conditions, and contextualized to within those specified conditions. Knowledge claims are usually probabilistic in that they are often based on statistic inferences that provide estimates of how likely or unlikely the data are given some set of assumptions. Findings and conclusions are general in that they tell us what is usual or typical within a situation or context. For example, a finding might tell us that people tend to be truth biased and are more likely to believe other people whether or not the other people are actually honest (see Chapter 52, “Deception,” for a review of research on deception). Such a finding does not imply that people believe everything they hear or that they never think others

are lying; it is just that this tends to be the case on average. Finally, knowledge claims are contextualized in that they have boundary conditions—that is, conditions (specified or unknown) under which they apply and do apply. For example, truth bias is not expected to hold in situations where the person whose message is being judged has a strong motive to lie and that motive is known to the person doing the judging.

Types of Quantitative Research

Quantitative communication research can take many forms, and there are many ways to distinguish between different types of research. One common distinction is between basic and applied research. The main purpose of basic research is to advance knowledge and understanding. This knowledge may have practical implications, but that is of secondary concern. Rather, the primary purpose of basic research is to develop or test some theory or theories or to answer some question suggested by informed curiosity. The bottom line in basic research is learning something new and enhancing understanding. Applied research, in contrast, seeks to solve some real-world problems or test the utility of some real-world solutions. Applied research is often divided into formative research and evaluation research. Formative research is used to generate knowledge that will aid in developing an application, and evaluation research seeks to test the effectiveness of something. For example, in health communication campaigns, one might do formative research in developing the campaign and evaluation research after the campaign has been implemented to assess its impact in terms of effectiveness and unintended consequences.

Another distinction that is often made is between theoretical research and exploratory research. Truly theoretical research seeks to pit different theories against one another in order to test which one applies in some context, test hypotheses that are deduced from a theory, test the boundary conditions of a theory, or develop a theory. The primary advantages of theory include helping a researcher prioritize among variables and hypotheses and providing an avenue for generalization that cannot be achieved empirically.

Exploratory research, in contrast, is guided by informed curiosity rather than formal theory. Exploratory research simply tries to assess if there are reliable differences or associations. Although exploratory work is sometimes devalued relative to theoretical research, many important discoveries are stumbled on by accident.

Other ways to classify types of quantitative research rest on the type of methodology used. Typology formation studies and content analysis seek to classify communication phenomena and study frequency and prevalence. Mass survey research investigates public opinions using surveys given to random or representative samples. Paper-and-pencil questionnaire research often seeks to assess the correlations among communication concepts. Both experimental and quasi-experimental studies are common in

communication journals. Communication research sometimes involves physiological measurement, such as brain scans. Archival data can be analyzed with quantitative methods. In short, quantitative communication research is topically and methodologically diverse and can be applied to anything that can be quantified.

The Basic Elements of Quantitative Research

In this section, the basic elements of quantitative research are summarized. The basic elements include constructs, variables, variance, and how variables are related to one another.

Constructs and Variables

Quantitative research involves variables. Variables are symbols to which numerals or numbers are assigned. Variables are also observable things that vary or that can take on different values. In this sense, variables are contrasted with both constants and constructs. Constants are things whose values are fixed; they do not vary. Constructs are conceptual or theoretical entities that exist in the mind of researchers, whereas variables are observable. For example, the idea of communication apprehension is a construct, while the score on a communication apprehension scale is a variable.

Quantitative researchers are interested in constructs, usually how two or more constructs are related to each other. Constructs are ideas that are the topic of study. To research constructs, they must be measured and values must be assigned. The resulting values comprise variables, and relationships among variables can be tested, often with statistical analyses. When the variables are found to be statistically related in some manner, then it is inferred that the constructs are likewise related in a similar manner. Thus, constructs are (albeit imperfectly) measured, and when values are assigned to represent these constructs, we call the resulting collection of values a variable. Variables are tested for statistical association or relationship, and inferences are made about how constructs are related based on observed relationships among the corresponding variables.

When statistical analyses are used to test the relationships among variables and some variables are conceived of as predictors or causes of other variables, the variables that are the predictor or cause variables are called independent variables, while the variables that are predicted effects or outcomes are called dependent variables. Often, the notation x is used to refer to the independent variable and y to the dependent. When graphing the relationship between x and y , x is plotted on the horizontal axis and y on the vertical.

Independent variables can be further classified as active or measured variables. The values of an active independent variable are set by the researcher. That is, they are induced

or manipulated. This is not true for measured variables where the values are not under research control. Dependent variables are always measured and never active.

Variance

The extent to which a variable varies is called variance. The more scores differ from one another, the more they vary, and hence the greater the variance. Statistically, variance has a more precise meaning. Variance refers to the average squared amount by which scores differ from the average score.

Variance may be the single most important concept in quantitative research. Obviously, not all people are the same. Situations, too, differ from one another. And messages too vary. Quantitative research wants to know why, when, and how much things vary. This is often done by seeing if and how the variable we are interested in varies systematically with something else. That is, much, if not most, quantitative communication research seeks to predict and/or explain how some variable of interest is related to another variable or variables of interest. This involves demonstrating that the variance in a variable is systematically related to the variance in another variable. When variables are related, that is, one predicts, causes, or is associated with another according to some specified function, the variables are said to covary. If x is an independent variable and y a dependent variable, we can say that y is a function of x . Symbolically, $y = f(x)$. The trick, of course, is to know the function. Nevertheless, regardless of the specific function, it is a fundamental law of quantitative research that variance is required for covariance. That which does not vary cannot covary. In short, most quantitative research is about understanding variance (e.g., why people are different from other people in some way), and understanding variance requires having variance to observe.

The flip side of variance is constancy. Constants are also extremely important in quantitative research because they are central to the idea of control. Because that which does not vary cannot covary, constants cannot be related to anything. Hence, holding something constant is a surefire way to control its impact. What researchers try to do is to assess the variance and covariance of the variables of interest while holding constant as much else as possible. Because constants never affect other things, they provide the best mechanism for the “control” of nuisance variance in research. This is the best way to rule out rival explanations so we can understand what really leads to what.

These principles of constancy and covariance provide the conceptual basis for experimentation. If some variable x has a causal impact on some other variable y , then changes in x will systematically produce changes in y . In an experiment, the researcher systematically alters the values of x and observes values of y . If values of y systematically change when x is changed but y stays constant when x is constant, then evidence that x leads to y is obtained. Other potential causes of y are held constant so that they

cannot have an impact on y and so that the impact of x can be isolated. The tighter the control over nuisance variables, the stronger the inference that is obtained from observing y vary as a function of induced or created variance in x .

Constancy, variance, and covariance are also central in nonexperimental quantitative research. In nonexperimental research, variance is observed rather than created, and statistical analyses are used to document differences or association. Again, variance is essential because variance is required for covariance. Kerlinger and Lee (2000) offer a nice basic introduction to variables and variance in quantitative social science.

Relationships Among Variables

Variables can be related to each other in a variety of different ways. Given that the goal of quantitative communication research is usually to document and explain how variables are related, knowing about different types of relationships between variables is essential.

One possibility is that no relationship exists. That is, the variables are completely unrelated, and there is no covariance. Statistics cannot be used to prove the lack of a relationship, but statistical techniques such as meta-analysis or equivalence tests can show that a relationship is not strong or substantial (Levine, Weber, Park, & Hullett, 2008).

If variables are related, the simplest possibility is that variance in one variable causes variance in the other. This situation is called a direct causal relationship. Documenting a direct causal relationship requires showing that (a) the variables covary, (b) the cause variable precedes the effect variable in time, and (c) the effect is not explainable by some other variable called a spurious cause. If some other variable causes both the independent and dependent variables, then it will look like there is a direct relationship when there is not. The relationship is said to be spurious. A well-known example is that towns with more churches tend to have more bars. It would be a mistake, however, to conclude that churchgoing and alcohol consumption are causally related based on such an association. Obviously, both are related to population size. Larger towns tend to have more of everything. Cook and Campbell (1979) offer an excellent discussion of the concept of causation.

Sometimes direct causal relationships are strung together. So variable x may lead to variable y , and y , in turn, leads to z . This is called a mediated relationship, and y is said to mediate the relationship between x and z . Mediated relationships are sometimes confused with moderated relationships. A moderated relationship exists when the effect of an independent variable on a dependent variable varies as a function of a third variable. That is, the focal relationship of interest is variable. For example, if the relationship between self-disclosure and liking is stronger for women than men, then sex moderates the effects of self-disclosure and liking. Evidence for moderators is reflected to be a statistical interaction effect. In the example, there is a two-way interaction between self-disclosure

and liking on liking. Baron and Kelly (1986) is the most cited reference on mediated and moderated relationships.

Quantitative Research Design and Measurement

Research Design

Good research requires planning, and the research plan is called the research design or the method. Research designs can be classified into experimental, quasi-experimental, and nonexperimental designs. Experiments require (a) at least one active independent variable, (b) at least one comparison or control group, and (c) that participants are randomly assigned to experimental conditions. Designs that meet the first two conditions but lack random assignment are called quasi-experiments. Nonexperimental research includes only measured variables. A primary advantage of experimental designs is that they tend to provide better evidence of causal relationships. Because experiments and quasi-experiments involve active independent variables, time ordering is known. Also, the use of comparison and control groups helps control and rule out spurious nuisance variables. Finally, the random assignment that is required for true experiments offers an additional degree of control over nuisance variables.

The quality of a research design is typically assessed in terms of internal and external validity. Internal validity refers to how much confidence we have that variation in the dependent variable is really attributable to the independent variable and not some spurious, nuisance variable. External validity refers to the extent to which findings can be generalized to other people, situations, and times. Obviously, without internal validity, external validity is moot. Also, theory-based quantitative research is often aimed at testing generalizations rather than making generalizations (Mook, 1983). Campbell and Stanley (1963) is the classic work on design validity, and an updated treatment is offered by Cook and Campbell (1979). (See also Brewer, 2000; Smith, 2000.)

Measurement

To quantify a construct and enable observation, constructs must be measured. Measurement is the act of assigning numbers or numerals to represent attributes of people, objects, or events.

Measurement can be either categorical or continuous. The distinction between categorical and continuous measurements is important for determining both what type of statistical analyses make sense and how to interpret results. Sometimes measurement is discussed as forming four levels: nominal, ordinal, interval, and ratio.

Categorical measurement can be either binary, that is, present or absent, or involve placing things in categories. Content analysis often involves categorical measurement.

Categorical measurement is also called nominal measurement. In nominal measurement, everything that is the same gets the same value, and things that are different must get a different value, with each different category getting a different value. In nominal measurement, the values assigned to represent categories do not have number meaning, and the values do imply quantity or ordering.

In continuous measurement, scores reflect at least rank ordering. That is, values reflect more or less of something. Self-report scales are a common type of continuous measure.

Regardless of the type of measure, reliable and valid measurement is essential for good quantitative research. Measurement reliability has several meanings in quantitative research. Perhaps the most common is the extent to which a measure is free from random response error. When researchers report Chronbach's alpha, for example, the higher the value, the less random the response error. Researchers want random response error to be as small as possible because random errors create variance that cannot be explained by other variables, making the findings artificially small. This type of reliability is most often encountered when researchers are using multiple-item scales to measure a construct, and it is sometimes called internal consistency reliability.

Reliability also sometimes refers to repeatability. In this sense, a measurement is reliable to the extent to which it is stable over time. This is sometimes called test-retest reliability. Finally, there is intercoder reliability.

Intercoder reliability assesses the extent to which two or more coders or judges agree in rating or classifying something, adjusted for chance agreement. Cohen's kappa, Scott's pi, and Krippendorff's alpha are common measures of intercoding reliability. Intercoder reliability is often encountered in content analysis and observational research.

Measurement validity refers to how closely the values produced by a measure reflect the thing being measured. That is, a measure is valid to the extent that there is fidelity between scores and that which the scores are meant to represent. There are many subtypes of measurement validity. Researchers talk of face validity, content validity, construct validity, structural validity, convergent validity, and discriminant validity. Each of these reflects different ways of getting at the question "Are we really measuring what we think we are measuring?" Obviously, the results of research cannot be any more valid than the measures used to generate the findings. Thus, measurement validity is essential.

Nunnally and Bernstein (1994) and Pedhazur and Schelkin (1991) offer especially good treatments of measurement in social science research.

Statistical Analysis

Statistics play an essential role in quantitative communication research, and virtually all quantitative communication research uses some form of statistical analyses to help understand data. Statistical analyses can be divided into

descriptive statistics and inferential statistics. The goal of descriptive statistics is to characterize and summarize some existing data. Inferential statistics, on the other hand, is used to move beyond the results of a specific study and makes more general claims. Abelson (1995) offers a well-written and accessible treatment of statistical analysis in social science.

Descriptive Statistics

Common uses of descriptive statistics fall under at least five different categories. The first is raw counts and percentages, which are often used in conjunction with nominal data. These tell us about the frequency or prevalence of something and are very common in content analysis or public opinion survey work. For example, we might want to know about how much violence there is on television. This type of analysis can also be used to show relative frequency by breaking down percentages within different categories. For example, a researcher might report separate frequencies for children's shows and prime-time dramas.

A second common category of descriptive statistics conveys information about central tendency. Central tendency measures include the mean, the median, and the mode. The mean is an average obtained by summing scores and dividing by the number the scores. The median is the middle score when scores are ranked from highest to lowest. The mode is simply the most frequently occurring score(s). In highly skewed distributions, the median is usually preferred over the mean because the mean is sensitive to extreme scores. A skewed distribution is asymmetrical where extreme scores tend to be in one direction. An example is how often people lie per day. According to an unpublished national survey, the average lies told per day is about 1.6. Sixty percent of people, however, reported telling no lies at all. Because 4% of the people surveyed reported telling more than 10 lies per day, the mean of 1.6 lies per day departs from the median and mode, which were 0. In this case, the median and mode tell us more about the average person.

The third type of descriptive statistics is measures of dispersion. Measures of dispersion tell us about how much variability there is in the data, and the two most common ways to assess variability are the variance and the standard deviation. The variance was described earlier. The standard deviation is the square root of the variance and can be thought of as an approximation of the average amount that scores differ from the mean.

A fourth type of descriptive statistics conveys information about the shapes of distributions. When scores are lumped toward the low or high ends rather than being symmetrical, the data are said to be skewed. Kurtosis refers to the steepness or flatness of a distribution. Frequency distributions, histograms, and stem-and-leaf plots are common ways to show the shape of distributions of single variables. As the example about lying above demonstrated, describing the distribution of scores is often essential to

understanding what is going on with some data. When examining how two variables interrelate, a scatterplot is used to show how two variables covary. In a scatterplot, scores of the dependent variable are graphed on a vertical axis, and scores of the independent variable are plotted on the horizontal axis, and dots are used for each data point.

A final common category of descriptive statistics is called measures of effect size. Measures of effect size tell us how strongly two variables covary. The correlation, the squared correlation, the multiple correlation, d , and eta squared (η^2) are common measures of effect size.

Inferential Statistics

The other major type of statistics is inferential statistics. Inferential statistics are used to make claims that go beyond one's current data. They can be used to make inferences about a population based on sample data or to rule out chance factors as rival explanations for findings. The two most common types of inferential statistics in communication research are null hypothesis significance tests (significance testing for short) and confidence intervals.

By far, the most common use of inferential statistics in the social sciences and communication research is the null hypothesis significance test. The purpose of significance testing is to test a hypothesis against chance. It is called null hypothesis significance testing (NHST) because the researcher's hypothesis is pitted against its negation, called the null hypothesis. If the observed results differ from what is expected under the null hypothesis with some specified degree of confidence (usually 95%), then support for the researcher's hypothesis is inferred.

In conventional significance testing, there are two mutually exclusive and exhaustive statistical hypotheses, the null (H_0) and the alternative (H_1). The alternative hypothesis reflects a researcher's predictions and is usually stated in a research article. The null hypothesis is the negation of the alternative hypothesis. For example, if a researcher predicts a difference between two means, the alternative hypothesis is that the two means are different, and the null is that the means are exactly equal. The null hypothesis is seldom stated in research reports, but its existence is always implied in NHST. Usually, the null hypothesis is simply that there is no difference or no association.

A researcher selects a single arbitrary alpha level up front, usually the conventional $\alpha = .05$. The smaller this alpha level, the more confidence one can have in the result if it is "significant." With $\alpha = .05$, 95% confidence is claimed. Once data are collected, a test statistic (e.g., t , F , χ^2) from whichever type of statistic is used, and its corresponding p value is calculated, most often by computer. The p value indicates the probability of obtaining a value of the test statistic that deviates as extremely (or more extremely) as it does from the null hypothesis prediction if the null hypothesis were true for the population from which the data were sampled. If the p value is less than or equal to the chosen alpha, then the null hypothesis is

rejected on the grounds that the observed pattern of the data is sufficiently unlikely conditional on the null being true. That is, if the data are sufficiently improbable if the null were true, it is inferred that the null is likely false. Because the statistical null hypothesis and the statistical alternative hypothesis are written so that they are mutually exclusive and exhaustive, rejection of the null hypothesis provides the license to accept the alternative hypothesis reflecting the researcher's substantive prediction. If, however, the obtained p value is greater than alpha, the researcher fails to reject the null, and the data are considered inclusive. Null hypotheses are never accepted. Instead, one makes a binary decision to reject or to fail to reject the null hypothesis based on the probability of the test statistic conditional on the null being true.

In short, a statistically significant result is one that is unlikely to be obtained by chance if the null is true. So when research reports a finding that is "significant at $p < .05$," what that means is we can have 95% or better confidence that the finding is not exactly zero presuming that the test was done correctly.

Many people find the logic of significance testing confusing, and critics find much fault with the approach (Levine, Weber, Hullett, Park, & Lindsey, 2008). Nevertheless, significance testing is the statistical approach most often taught in research methods classes; it is the approach used by the major statistical software packages such as SPSS, and it is what most communication researchers use to test their hypotheses.

Statistical hypothesis testing in communication research most often takes one of two basic forms. One form tests for differences between two or more means or percentages, and the other tests for a linear association between two or more variables. Chi-square tests, t tests, and the analysis of variance (ANOVA) test for differences with correlation and regression test association. Which specific type of statistical test is used depends on whether a researcher is interested in documenting differences or association, the number of variables involved, and whether the variables are categorical or continuous. When testing for differences, if the variables are count data or percentages, chi-square can be used. To test the difference between two means, t tests are used. ANOVA is used to look for differences among three or more means or when there is more than one categorical independent variable and a single continuous dependent measure. Correlations test the association between two continuous variables. Multiple regression is used when there are two or more independent variables. When multiple dependent variables are tested, multivariate analyses such as MANOVA or canonical correlation are needed.

The second main approach to inferential statistics is the confidence interval. Confidence intervals are used to make inferences about a population based on sample data. A population is the entire collection of units under consideration, and a sample is some subset of that population. For example, all registered voters in the United States is a population

of interest, and we might study voter's opinions by taking a random sample of voters. Confidence intervals are used to estimate a range of values where the population value might fall given some sample data.

Readers are likely to be familiar with news coverage of opinion polls. In reporting polls, it will be reported that some percentage of people think such and such with some margin of error. For example, 24% ($\pm 2\%$) of Americans surveyed might think that Congress is doing a good job. That plus or minus or margin of error is the confidence interval. What that means is that it is 95% likely that if all Americans were surveyed, the percentage obtained would fall within that range.

The validity of confidence intervals rests directly on the quality of the sampling. Samples need to be representative of the population for good inference. As a consequence, survey research that aims to be informative about populations has developed sophisticated methods of sampling aimed at ensuring the representativeness of the sample. Nevertheless, it is important to keep in mind that the accuracy of confidence intervals in this context rests on the quality of sampling.

Other Statistical Analysis

A number of other types of statistical analyses are evident in quantitative communication research, and most researchers have a wide statistical repertoire. Readers of research are likely to encounter factor analysis, path analysis, structural equation modeling, network analysis, meta-analysis to name a few. Factor analysis is used to find patterns in correlations and is most often encountered in measurement validation research. Exploratory factor analysis and principle component analysis are used to see if variables can be collapsed into a more parsimonious set, while confirmatory factor analysis is used to test if items designed to measure a construct intercorrelate in the way intended. Path analysis and structural equation modeling are used to test causal models. Network analysis is used to assess linkages between people or other entities and is therefore very useful in communication research.

Another very useful analysis is meta-analysis. Meta-analysis is essentially a study of studies. It is a set of statistical analyses used to cumulate findings across studies. In meta-analysis, each study in a literature becomes a data point. So meta-analysis is very valuable in summarizing large literatures.

A Research Example

A research study that exemplifies many of the ideas presented here is McCornack and Levine's (1990) investigation of the effects of suspicion on deception detection accuracy among heterosexual dating couples in colleges. A previous study found that as relationship closeness increased, people became less accurate in detecting their

partners' lies because the trust in a relational partner tended to make the people believe their partners more often and, consequently, mistake lies for honest messages (McCornack & Parks, 1986). The McCornack and Levine (1990) experiment tested if induced suspicion might overcome this bias. It was predicted that suspicion would improve accuracy to a point but too much suspicion would be counterproductive. That is, it was anticipated that moderate levels of suspicion would yield higher accuracy than either low or high suspicion. The reasoning provided was that when people lack suspicion, they would miss the lies, but if they were too suspicious, they might mistake honesty for deception. Moderate suspicion might be just right.

The primary independent variable was state suspicion, which was conceptually defined as information from an outside source that another person might not be honest. The dependent variable was deception detection accuracy, which referred to the extent to which people were able to correctly distinguish truths from lies. In all, 107 dating couples were recruited to participate in the experiment. On arriving at the communication interaction lab, the couples were separated from their partners. One partner of each dating couple was interviewed on videotape. They had to answer 12 questions, and they were instructed to lie on 6 questions and give honest answers on the other 6 questions. The questions were about beliefs that the person held. The videotape was then shown to their respective partners, who made truth or lie judgments about each of the 12 answers their partner gave. Accuracy was calculated as the percentage of judgments that were correct. Thus, the actual percent correct score was the operational definition of accuracy.

State suspicion was experimentally varied by the instructions given, with one-third of the participants assigned at random to one of high-, moderate-, or low-suspicion conditions. Participants in the high-suspicion condition were told that their partner was definitely lying on some of the answers and that their job was to guess which ones were lies. In the moderate-suspicion condition, it was casually mentioned that their partner might not be completely honest. In the low-suspicion condition, no mention was made of lying, and the participants did not know that the study was about deception. Thus, the instructions served as the operational definition of state suspicion. Also, this study was a true experiment because state suspicion was an active independent variable under experimenter control; participants were randomly assigned to condition; and the low-, moderate-, and high-suspicion conditions provided a basis for comparison.

The results were tested with ANOVA and were consistent with the hypothesis. The highest accuracy was observed in the moderate-suspicion condition (64.6%), and this value was statistically greater than the accuracy in either the low-suspicion (53.2%) or the high-suspicion (57.2%) conditions. The differences were statistically significant at $p < .05$. However, these findings have not since been replicated, so we can have only limited confidence in these results. A replication of these findings, however, is under way.

Conclusion

Quantitative approaches to communication research use numbers to help us understand how people communicate. Quantitative communication research applies a set of social scientific methods for testing defensible knowledge claims about human communication based on empirical data, statistical description, and statistical inference.

Although quantitative approaches are usually contrasted with qualitative work, a more meaningful distinction is between science-based and nonscientific approaches to communication. Quantitative research almost always implies a scientific approach to understanding communication.

Quantitative research encompasses a diverse collection of topics and methods. Quantitative research can be applied to all topic areas in communication. It can be used in basic and applied research and in theoretical and exploratory research. Any aspect of communication that can be quantified can be studied with a quantitative approach.

The key skills for a quantitative researcher include research design, measurement, and statistical analysis. All three are essential. The goal of scientific research is to get our understanding closer to the truth of how things really are, and the quality of design, measurement, and analysis allow the quantitative communication research to make defensible knowledge claims and increase our collective understanding of how humans communicate.

QUALITATIVE, ETHNOGRAPHIC, AND PERFORMATIVE APPROACHES TO COMMUNICATION

DEAN SCHEIBEL

Loyola Marymount University

Chi Omega, Alpha Phi, Delta Zeta, Kappa Alpha Theta, Pi Beta Phi. You probably know that these are names of sororities, even if you aren't a member of the Greek world. You may have seen the Greek "letters" adorning sweatshirts on campus. But you may have little understanding of their colors, their secret practices, their risqué songs. Do you know about "bump-and-float groups"?

Researchers of a particular ilk use the terms of the title, *qualitative*, *ethnographic*, and *performative*, to study people and the communication that takes place in various contexts. There are significant areas where the approaches overlap with one another; and there are some differences as well. This chapter uses published studies about sororities to interweave a discussion of the substances of the "qualitative," "ethnographic," and "performative" approaches. This is appropriate in that one of the defining characteristics of the three approaches is to draw insights by closely interweaving the researcher's choice of theories and methods with the phenomena being studied, rather than presenting insights in a removed and distantly abstracted way.

All three of these research approaches embody things that we do every day: participating in relationships, organizations, and the world; making observations while we are engaged in activities, talking with people to find out information; and interpreting what people say and do to make sense of what's going on. By approaching how we do

these activities with more reflexive thought, we may become proficient and more adaptive at what we already do to survive. And all this will, in turn, make our lives more interesting and more meaningful. These approaches, are, as theorist Kenneth Burke says, *equipment for living*. Furthermore, you—*yes, you*—probably already *enjoy* these activities: meeting and talking with new people, learning new things, and being surprised. Sorry to tell you this, but there is a real possibility that you could be *having some fun* while you are doing research.

"Faking Identity in Clubland" and the Qualitative Approach

There is a long line of young women standing outside Edcel's Attic, a club in downtown Tempe, Arizona. The researcher recognizes many of the young women from the class he is teaching at Arizona State University. He knows that the young women are members of various sororities and are often the audience for a rock band named Ritual, which is comprised of four young men who are all members of fraternities. Observing the line of women attempting to enter the club, the researcher jots down notes on a pad, at first standing at a distance but later standing much closer, after making friends with the doormen whose job it is to examine the identification cards the women presented—typically a driver's license—to see if the ID card

is real or fake. Sometimes the doormen quiz a woman about the information on the card, hoping to catch her in a lie. Gradually, the researcher understands that when a doorman starts flirting with a woman, this is usually a signal that the doorman will ultimately let the young woman into the club (Scheibel, 1992). However, sometimes a woman gets caught “faking” her identity. In such cases, the ID card will be confiscated, and the woman will be denied entrance into the club. Such occasions are often accompanied by embarrassment, indignation, even outrage.

The researcher followed up the observations and taking field notes by conducting interviews with the doormen and a number of the young women who were in various sororities. The reason behind using a second technique for gathering data is because making observations and taking field notes are generally not sufficient to interpret the multifaceted and nuanced way individuals and groups do the things they do. Each technique has its own strengths and limitations. Consider the following narrative, in which a sorority woman discusses how she communicates with the doorman, as well as the inner conversation she holds with herself:

“You just try to remain calm. You watch your actions a lot, I think. You talk about other subjects . . . You keep talking, that’s what I do. I keep talking. I talk about it [the club] if I’ve been there before. ‘Oh, remember last time we were here.’ Usually in the . . . earshot of the person. I’ve noticed myself doing that . . . You try to remain focused on something other than what’s gonna happen right there. The conversation taking place. You initiate conversation, I think. And you get really nervous. I’m getting nervous right now, just talking about it . . . And you just tell yourself to remain calm. That you’ll get in. It’s not a problem. You’ve been here before. It’s hard. It’s so emotional just trying to go to a bar.” (Transcript 71, Lines 249–284; Scheibel, 1992, p. 168)

We might conclude from the transcript above that the qualitative approach adheres to some “basic assumptions” with which many scholars who use this approach would agree (see Van Maanen, Dabbs, & Faulkner, 1982).

First, the qualitative approach is interested in ordinary, *everyday behaviors* and communication phenomena, such as how underage sorority women strategically communicate to enter a bar. Most generically, qualitative approaches to the study of communication seek to describe, interpret, and understand what’s going on and how people are doing what they are doing.

Second, qualitative approaches typically conduct research as it occurs in *natural settings*—such as bars—in which the people are engaged in the activities that are important to the people being studied. The researcher enters the setting to directly observe and even participate in what he or she seeks to understand. Of course, the presence of the researcher may be dependent on negotiating *access* to the scene. In the setting above, the researcher was able to observe sorority women in a public place; thus, “getting

permission” was not a particularly problematic issue. Even here, however, the researcher needed permission to achieve even greater proximity to the scene. Thus, the researcher needed to *get along with* the doormen in order to observe the communication more closely. However, many places are not open but might be closed. For example, it is unlikely that the researcher—a middle-aged male—would be allowed to observe the sorority women in their cars as they “rehearsed” what they would say before going into the bar. The degree that a researcher is an “observer” or a “participant” may vary tremendously. If you are a 19-year-old member of a sorority and are doing a research project on sorority “rush,” you will be an observer but you will also be very much a participant, experiencing the very things you are researching and trying to understand.

Third, despite the use of specific techniques, it is the human researcher who is guiding this research, and it is through the interaction between the researcher and those the research seeks to understand that the data gathered are cocreated and negotiated. In other words, *you are the research instrument*.

Fourth, such research is based on inductive analysis, in which the researcher’s identification of patterns is based on the up-close-and-personal observations and the local understandings of individuals engaged in the scene. Thus, the researcher would not assume that what he found out about how sorority women did things in Tempe, Arizona, at a club called Edcel’s Attic would hold true for how women in Los Angeles did things at the Temple Bar. That is, research generalizations would only be tentatively offered.

Fifth, qualitative approaches make use of specific techniques such as participant observation and interviewing. Numerous discussions of the methodological issues inherent in the techniques attest to the complexities of doing such research and the often problematic things a researcher encounters when observing, interacting with, and interviewing people. Here are some considerations, questions, and issues related to the researcher making observations on the scene:

1. What are field notes? Are there different types? When might each type be used?
2. What should the researcher be trying to write down?
3. How are field notes written? How much detail should be written down?
4. How does the researcher know if the field notes are accurate?
5. For what duration (hours, days, weeks, months) should the researcher take field notes?
6. What happens if people observe the researcher taking field notes and get upset?
7. How is it possible for the researcher to write down conversations?

8. Is eavesdropping on conversations ethical?
9. Should the researcher write down his or her emotions to what is observed?
10. What does the researcher do with the field notes once they have been written?

These sorts of questions—and there are many more—are the types of questions about which a researcher may be concerned. Much has also been written on observation and also on interviewing.

1. Who should the researcher interview?
2. What types of interview questions are there?
3. How long should the interview last?
4. Should the interviewer take notes during the interview?
5. How many interviews should be conducted for the research project?
6. What kinds of information does the researcher want to get in the interview?
7. How does the researcher know if the interviewee is telling the truth?
8. What kinds of problems arise during interviews?
9. What sorts of problems are encountered when transcribing the interview?
10. What does the researcher do with the finished transcript?

All these questions are important, will concern the researcher, and may even be a source of some initial anxiety. However, such concerns typically fade away rather quickly, particularly when confronted with interesting—even *cool*—data. It is worth revisiting the piece of interview transcript presented above. The sorority woman elegantly discusses her outer strategies for dealing with the doorman while also pointing out her inner talk to control her nervousness and to present a calm exterior. The content of such data could not be directly observed, but it could be gathered through interviews.

However, there really isn't much about sororities in the study. In fact, sororities are largely absent. While the study focuses on sorority women, it does not deeply examine the things that go on within sororities. Rather, sororities serve largely as a *context* for studying the face-to-face behaviors of underage sorority women confronting the doormen while trying to enter the bar. There's nothing wrong with that; it is important in research to acknowledge the contextual factors that frame the central interest.

A qualitative approach to communication views phenomena as texts, apprehended through qualitative methods and ripe for interpretation. We are able to discover and isolate discrete communicative interactions, which we can study. Embedded in well-established gendered contexts, phenomena such as the construction and performance of

alternate identities become problems of interest. Teasing and flirting are strategies for establishing temporary identities that simultaneously reproduce the contexts in which such performances are embedded.

Despite commonalities, there are some differences between the *qualitative* and *ethnographic* approaches. One difference is that qualitative approaches often focus on a very small phenomenon in a particular setting, and they often do not even use participant observation. In contrast, ethnographic approaches are often concerned with interpreting the more comprehensive *culture* of a people, a group, or an organization (Lindlof & Taylor, 2002). Participant observation is a defining characteristic of the ethnographic approach. The emphasis on culture in the ethnographic approach comes from its disciplinary origins in anthropology. Conversely, the qualitative approach draws strongly from the discipline of sociology. In our discipline, a consistent area for research using the ethnographic approach is found in the area of organizational culture, which examines all sorts of symbolic activity, including rituals, storytelling, metaphors, and all manner of cultural practices (Pacanowsky & O'Donnell-Trujillo, 1982).

“Practicing Sorority Rush” and the Ethnographic Approach

Sorority rush—the process by which sororities recruit new members (aka “rushees”) to replace those who have graduated—is arguably the single most important cultural event for sororities. A sorority's status is largely dependent on how well the sorority recruits potential new members. So important is “rush” considered that officers are appointed and subcommittees are formed to regulate the learning of songs, for decorating rooms, and for escorting the rushees in and out of the parties. And weeks of rush rehearsal are conducted, during which sorority members are trained and retrained on things such as how to talk with rushees.

The researcher and roughly 135 sorority women sat in a large room in the campus. Sorority rush was still a week away, but the researcher was allowed to go “backstage” to observe and collect data at eight “rush rehearsals.” As many as 10 of the sorority women were carrying small audiotape recorders that the researcher had provided, so that the sorority women could record what was being said in different points of the room and also record the conversations they would soon be practicing.

Unlike the previous study, in which access was not very difficult, managing to get access to the backstage of sorority rush took, literally, years. Prior to the time this research project started, the researcher had served as a sorority's campus advisor for almost 8 years, during which time he had received a number of Greek awards. He had also supervised roughly 200 undergraduate thesis projects

dealing with various aspects of sorority life, most often sorority rush. Because the researcher had established some credibility and had developed good relationships, a number of sorority women in leadership positions were more than willing to allow the researcher access to the scene.

Here are some central ideas of the ethnographic approach:

- It incorporates qualitative research techniques, particularly participant observation and interviewing.
- It interprets how the meanings of things are socially constructed.
- It focuses not only on symbolic processes such as storytelling, metaphors, practices, rituals, as well as things such as values, ideology, power, but also on artifacts such as food, art, and dress.
- It situates research studies within contexts (e.g., historical, economic, political, legal) that are relevant to the research being undertaken.
- It expands and acknowledges the diversity of conceptual frameworks that might guide studies: interpretive, critical, feminist, postmodern.
- It provides greater reflexivity on the part of researchers in terms of their own ethical conduct while on the scene.
- It develops other areas for ethnographic research in addition to interpretive studies of organization and culture.
- It establishes the recent merging of ethnographic and performative approaches.
- It helps the growth of autoethnographic approaches that are literary, poetic, and artistic and shows the importance of the narrative “voices” created by researchers.

Rehearsing for the “Bad Rushee”

Sorority members know that during “rush” they will encounter “rushees” who, for any number of reasons, may not be interested in their particular sorority. Perhaps, the rushee has friends in a different sorority. Or the rushee, being aware of the preexisting reputations of the various sororities, wants to be a member of a “higher-status” sorority. What sororities dislike most is being confronted at rush party by a “bad rushee,” who is rude and disrespects the sorority. But sorority etiquette prohibits sorority members from responding in kind; rather, sorority members must maintain civility, which requires *restraint*, which is a form of mortification in the sense that the sorority is “punishing [it]self” (Brummett, 1981, p. 258). Thus, sororities develop strategies for addressing such situations.

In the large room, 135 sorority women are gathered to watch a demonstration or “skit” presented by two prominent Alpha Chi Theta sorority leaders, which mockingly depicts an encounter between a sorority member and a bad rushee. The researcher decided to focus on the rehearsing of organizational conversations as an important symbolic process as something of interest. In the skit, the sorority women use “mockery,” a form of *not serious impersonation*

of another person, to address a situation they know that they will confront during sorority rush:

Nicole: Krissy, you start with [being] the [rushee]. She’s [i.e., the rushee] not happy to be at an Alpha Chi Theta party, which *does* happen, and she says to you—I’ll be the rushee—and, say something. You pick me up.

Krissy: Hi, thanks for coming. Um, so good to see you. What year are you?

Nicole: (sullenly) I’m a freshman.

Krissy: So how did your first semester go? Did you like [our university]?

Nicole: (rolls eyes) Yeah. *Whatever*.

Audience laughs.

Nicole: (impatiently) So, um, how long does this party [go] for?

Krissy: I think this party is 30, 45 minutes.

Nicole: Okay.

Krissy: So, um, did you live in Desmond [a dormitory] or did you get a coed dorm?

Nicole: No. I live in Desmond and it’s a *shithole*.

Audience laughs.

Krissy: (quickly) Well I live in Doheny so I wouldn’t know anything about that. What’s your major?

Audience laughs. (Tape 21B, Counter 313–326; Scheibel, Gibson, & Anderson, 2002, p. 223)

The reasons the sorority performs the skit is twofold. First, the sorority understands that rush rehearsals *should be fun* in order to keep the entire sorority in an upbeat and positive frame of mind before they enter the intensity and frenzy of actually conducting rush, during a time when members are pulled between the demands of their courses as students while simultaneously conducting the work of sorority rush. Thus, the mockery of the rushee in the skit is consistent with the sorority’s *ideology of fun*, in the sense that the bad rushee is portrayed to be much worse than the sorority might expect to encounter. In an interview later, Krissy stated that “we were kind of making *fun of a really bad rushee*. And we knew that we would never have someone *that* horrible, but we do have really, obnoxious and annoying [rushees]” (Scheibel et al., 2002, p. 224). Less obviously, the skit is a cultural practice that lets the sorority acknowledge the situation while also allowing the sorority to think that they might be able to *overcome* the situation. Thus, an ethnographic approach to the sorority’s organizational culture looked at symbolic processes such as rehearsing rush conversations and the use of mockery as ways that create and maintain the sorority’s meanings of rush rehearsals and rushees.

In presenting the transcript of the skit, the researcher allowed *you, the reader*, to “hear” the two sorority women’s *performance* of the skit. And you may have felt some small glow of recognition, some sense of warmth that you were able to *imagine yourself* in the situation, listening in on the private backstage culture of sorority rush rehearsals. And yet, following the transcript of the skit and a bit of interview text, the researcher theoretically dissected the texts. Here is a segment of that dissection:

The “making *fun* of” is mockery that is also scapegoating, reflecting the various hierarchic divisions between sorority member and rushee. Thus, the guilt over judging those who, if accepted, would be their “sisters,” is put onto the rushee, who, by virtue of being “*that horrible*,” is deemed unworthy and may be dramatically denigrated. On two instances, Nicole’s conversation responses (“Whatever” and “shithole”) are outrageously inappropriate, and both are recognized as such and are met with audience laughter. The latter response (“shithole”) is particularly interesting, suggesting a “*consubstantial*” relationship between the rushee and her residence: the rushee is a “shithole” (Burke, 1969). For Burke, bodily analogies of pollution are necessary for catharsis and redemption; that is, “transcendence is not complete until the fecal motive has in some way been expressed and ‘redeemed’” (Burke, 1969, p. 309). Redemption occurs in the reestablishment of civility, the “*still moment following the fusion and release of a symbol-induced catharsis*” (Rueckert, 1982, p. 137; Scheibel et al., 2002, p. 224).

The dissection of the skit is part of a somewhat more *traditional* ethnographic approach, in which the interweaving of “data” with explanations using “theory” is guiding the research, and demonstrates not only the researcher’s interpretive skills but also his or her ability to apply and, it is hoped, *generate theory*. One of the most important assumptions about research is that it is being done to further the development of theory. One of the unfortunate byproducts of this assumption is that the actual thing being studied is of marginal consequence. There is a sense that it is not sororities that are important but, rather, the theory, and the researcher’s ability to apply and generate more theory, which is the “*really*” important objective. *The sorority could just as well have been an accountant’s office or an ice cream parlor*. But the odd thing is that many researchers are as interested in the context as they are in the theory; and it is the real world to which we bring our theories.

An ethnographic approach to communication provides a lens for glimpsing the performance of culture. The production and performance of dramatic “skits” create and maintain cultural meanings and expectations that guide sorority members’ interactions with “rushees.” Organizational phenomena, including rehearsing and mockery, allow organizational members to acknowledge and transcend the social tensions that are understood as potential problems for the

sorority. Thus, an ethnographic approach to the study of the performance of culture serves to extend our understanding of organizational maintenance.

The qualitative and ethnographic approaches are both increasingly identified as interpretive. Both are consistently—although not exclusively—identified with a theoretical orientation that believes that reality is a social construction. However, the limitations of the social construction orientation have led many to turn to a performative approach (see also Chapter 17, “Performance and Storytelling,” and Chapter 41, “Gender”). Again, the approaches not only have differences but also have many things in common.

“Sorority Rush as Lust” and the Performative Approach

In both of the studies previously discussed, *performance* has been a central feature. In the study “Faking Identity in Clubland,” sorority women’s identities were, in fact, *performed*. The “fake ID” cards were merely “props.” Their friends *rehearsed* the performance with them *backstage* before doing their *front-stage* performances. Likewise, in “Practicing Sorority Rush,” the sorority’s use of a “skit” is a performance of culture that both teaches and enculturates new members to the ways of sorority rush. The performance that scapegoats the “bad rushee” creates and maintains cultural meanings and expectations for behavior during rush.

Clearly, viewing the world as a *drama* has much in common with viewing culture as *performance*. Performance theorists have extended the ethnographic approach by shifting the emphasis from the “performance of culture” to “culture as performance” (Conquergood, 1989, p. 82). Moreover, the idea of performance is extended not only to those people or organizations being studied but to the researcher or ethnographer as well. Thus, performance becomes the method as well as the focus. Beyond this, however, ethnographic approaches have grown considerably, moving far beyond the traditional ethnographic models to those embracing the political and aesthetic nature of research (see Conquergood, 1991) while also expanding beyond the kinds of “realist tales” that ethnographers have traditionally told (Van Maanen, 1988); many ethnographers now use types of writing conventions that are typically found in literature and fiction and that could be thought of as being both performative and ethnographic. Thus, an organizational ethnographer such as Bud Goodall can write in the persona of a detective who is *on the case, finding clues, and living in the rock ‘n’ roll mystery*.

The “performative approach” is multifaceted, and research may include the literal oral performance of cultural scripts before an actual audience. Such research also often includes elements of the qualitative and ethnographic approaches. In one sense, however, the performance approach is a critique to the idea that culture is reducible

to texts that require the researcher to be there to turn observations into field notes or interviews into transcripts. The sorority women who were competent performers in faking their identities did not require the researcher's presence before they performed; thus, the performance approach seeks a more equitable balance, in which researchers and the people being studied may be viewed as coproducers.

However, the performative approach does not seek to do away with written texts, such as field notes or interview transcripts. Rather, the performative approach seeks to redefine and expand the nature of what it means to do ethnography. We see this in much ethnographic work on organizational cultural performances, such as the two previously discussed sorority studies.

The critiques of traditional research and their claims of "objectivity" became more problematic, and the "crisis" about how "reality" was represented became a voice with growing insistency within the communication studies discipline. The performative approach acknowledges the subjectivity of the researcher and examines the political and ethical choices of the researcher in the construction of both written and oral performances (Conquergood, 1991). In fact, some research projects in the performative approach might be categorized as "autoethnography," in the sense that the researcher is a member of the very culture being studied.

Some basic themes of the performative approach are as follows:

- Moving beyond a conception of the world as a socially constructed text
- A commitment to collaborative work *with* those being studied
- Recognition of critical and emancipatory possibilities in the work
- The politics of academic publishing
- The author's increased reflexivity and positionality within the work
- Consideration of the ethical implications of all aspects of performative work
- Greater legitimacy given to autoethnographic performances (even if written)
- Integration of artistic forms within the work produced, such as photographs and poems (e.g., Picart, 2002)

Consider the following, in which the middle-aged, male researcher has created a narrator voice that belongs to a 20-year-old sorority woman:

"A five-star girl, a major hottie named Dani Hunter, walks into a class I'm taking. She is tall and blond, with almond-shaped eyes, and bright even teeth. Her face is flawless, every pore and freckle perfectly placed. She's wearing an emerald-colored dress that fits her like the skin on a peach. She moves like a dancer, which we later find out she is. I love her and hate her all in the same moment. Along with the fifty other mortals sitting in the room, I am shocked silent listening to the sound of our collective sighs of resignation. Everyone

watches Dani as she snakes through the class, down an aisle, and sits in the second row. I'm watching as girls from Omega Zeta, Delta Phi, Theta Gamma, and the other sororities covet Dani and talk with their eyes. This is fever. This is lust." (Scheibel & Desmond, 2007, pp. 1–2)

This opening description, acknowledging the physical presence of a woman desired by the sorority, is in keeping with the new ethnography, which legitimates *the body* as a site of concern for ethnographers. To *show* lust, rather than *tell* about it, the sorority narrator waxes poetically about Dani Hunter, who is the object of her desire, discussing her eyes, her hair, her "flawless" face, the tightness of her dress, which "fits her like the skin on a peach," and how she moves. To the extent that lust prizes the body and physical beauty, describing the sorority woman in such a way is legitimate, particularly if we keep the idea in mind that what is being read—the text—is now possessed by *you, the reader*, not the researcher (Goodall, 2000, p. 134). And it is certainly more reasonable to have the narrator's voice being that of a sorority woman, since it is the *sorority's lust* that is being shown. Conversely, using the researcher's middle-aged white male voice as that of the narrator only suggests the metaphor of the researcher as organizational voyeur.

And yet old habits are hard to break. Consider the following footnote, which *tells* about lust in a traditional academic voice, suggesting that the researcher—historically produced from a long line of academic researchers—feels compelled to make his case in a way that is true to his own research roots:

The present Greek world of sororities is not so far removed from the ancient Greek world, where Epicurus linked death and lust. The "blind lust" with which "people pursue an immortality of reputation" is also an attempt to secure a "continued existence" and is an instantiation of the denial of death, which is linked to the fear of death. See Martha A. Nussbaum, *The Therapy of Desire: Theory and Practice in Hellenistic Ethics* (1994, p. 198). The "death of sororities is real; the sorority's membership dwindles, and the campus chapter of a sorority ceases to exist." Conversely, the fear of death in the Greek world is "also mixed with a sure and certain hope, the hope of reincarnation." See Jane Ellen Harrison, *Epilogomena to the Study of Greek Religion and Themis* (1962, p. 290). In this sense, each year of rush may be viewed as a reproductive reincarnation in which new members replace those who have left (Scheibel & Desmond, 2007, p. 5).

One might argue that the researcher's compulsion to cite sources and to incessantly document might also be considered a lust of sorts, for the fear of death in universities stalks not only sororities but also untenured professors. There is a political reality here, expressed in the axiom "*publish or perish*." Thus, there is a political dimension to the performative approach. What counts as knowledge, and who makes that decision? Who gets to perform the culture? What types of writing are valued in

university Communication departments? What types of writing will get a new professor tenured? These can be life-and-death questions in a new professor's career (see Conquergood, 1991).

By the time Dani Hunter was invented, the researcher had been researching sororities for almost 15 years, had observed rush backstage for hours at a time, had felt the boredom of the sorority women who were seniors and had been through rush several times, and could feel the anxiety and excitement of the sorority women who were new to "this side of rush." The backstage boredom of sorority rush had also been experienced by the researcher's tired body.

The article "Sorority Rush as Lust" was published in the journal *Liminalities: A Journal of Performance Studies*, a progressive electronic journal open to an array of styles of performative research and specializing in publishing manuscripts that would be difficult, if not impossible, to get published in the more traditional journals. While traditional communication journals periodically choose to publish scholarship that pushes the boundaries, such occurrences are few and far between.

The researcher's choice to use the "voice" of a sorority woman was based on several considerations. First, the researcher's knowledge of sororities and sorority rush was comprehensive. Second, the researcher was *not* portraying sorority rush in a way that sororities would consider negative. Consider the following two texts, the first of which is from the main body of the article and which is using the sorority narrator's voice:

"During all these parties, we engage the rushees in conversations, and try to get to know them, and also try to get them to know us. Obviously, the conversations we have with the rushees are *way* superficial. I mean, it's hard to get to know somebody on the basis of a few short conversations. 'Hi, what's your name?' 'What's your major, Dani?' 'What year are you?' 'Where do you live?' We're not talking deep here, but we do get a sense of the girl's character. Are the rushees just asking questions about drinking and guys? *Not a good sign.*"[†]

The following text is the corresponding footnote referred to by the "[†]" in the above text:

[†]Sororities often explicitly use these questions—often in a cluster—to characterize the superficiality of conversations between rushees and current members. However, sororities are very concerned about the nature of rush party conversations, and their respective "rush manuals" often include sections listing "conversational do's and don't's" (e.g., "DO listen not only with your ears, but with your eyes, heart and mind" and "DO NOT interrupt, gossip, lie, argue." (*Omega Zeta Rush Manual*, 2002, p. 12)

In reading these two texts, you might notice that in the first text, the voice of a first-person narrator's "character" strives for a candidness so that the reader might accept what "she" is saying, acknowledging the superficial nature of sorority members' typical conversations with rushees.

The narrator's use of "we" and "us" attempts to create the impression that the narrator is a woman among other women. The reader might notice that the narrator's emphasis on the word "*way*" is an attempt—albeit superficial—to give the narrator a smidgen of linguistic cool. In contrast, the second text—a footnote to the first text—reverts to traditional third-person voice, elaborating on the main text and providing and citing data (a sorority's rush manual), which is the standard way of supporting claims.

Sororities often explicitly use these questions—often in a cluster—to characterize the superficiality of conversations between rushees and current members. However, sororities are very concerned about the nature of rush party conversations, and their respective "rush manuals" often include sections listing "conversational do's and don't's" (e.g., "DO listen not only with your ears, but with your eyes, heart, and mind" and "DO NOT interrupt, gossip, lie, argue").

And in the discussion of these two texts, *this* researcher, that is, *me*, Dean Scheibel, is acknowledging the choices implicitly made while writing the original article. And it is this sort of thing, this arguably somewhat narcissistic (Taylor & Trujillo, 2001, p. 179) placing of *me, me, me* within what is being written, as it is being written, reflecting on the rhetorical choices that *I'm* making, that is one of the variants of the performance approach, and it becomes one of the writing conventions one may find within the newest autoethnographic trends.

The researcher—notice that "the researcher" has reverted to the traditional narrative voice—chose to work with a female coauthor on the manuscript, a young woman who had been instrumental in helping the researcher conduct research on sororities. Beyond the researcher feeling that he "owed" Megan for providing some editorial assistance (an "acknowledgment" in a footnote would have sufficed), the idea that the researcher is performing this research stuff *together and with members of the culture* suggests a debt of sorts. But even more, the researcher wanted her voice or, more specifically, wanted access to her knowledge of a sorority woman's voice. As it was noted in the original published manuscript, "In using this voice, I collaborated with a former student, Megan Desmond, who had been a member of a campus sorority; in editing my work, Megan provided a number of phrases, which I used *verbatim*" (Scheibel & Desmond, 2007). The researcher believed that Megan, as a woman, might be able to provide valuable suggestions and advice in creating a female voice; thus, the researcher and a former sorority member worked together to cocreate a narrating voice.

A performative approach to communication, informed by a heightened process of authorial reflexivity along with political and poetic enactments, allows for a widening of what may be considered scholarship and knowledge. Appropriating a sorority voice for a narrator creates an appreciative immediacy and a connection between author, reader, and "other," allowing the reader to experience the performance of the sorority in a manner typically not found

in traditional scholarship; thus, the reader was able to “lust” and “covet” Dani Hunter through the eyes and voice of a narrator that was not the voice of the authors. However, the performative approach’s use of literary conventions is not widely accepted in the discipline’s “important” journals but is more likely to be found in edited collections (e.g., Banks & Banks, 1998; Bochner & Ellis, 2002). Not surprisingly, the performative approach’s ability to inform scholarship is politically motivated not only to create a friendly context for studying relatively discrete communicative phenomena but also to transform the political allegiances of the communication discipline itself, with a particular interest in widening what is understood as “scholarship.”

In concluding this section on the performative approach, there seems to be some sort of expectation that the researcher acknowledges his or her *own* positionality with regard to these three approaches: My methods are generally qualitative and sometimes ethnographic. I favor doing analysis of naturally occurring conversations and of texts derived from ethnographic interviews. I often use the dramatic theories of Erving Goffman and Kenneth Burke, who view reality as drama, so maybe I have at least a big toe in the performative approach. But these acknowledgments are generally about as autoethnographic as I can get.

Conclusion

Qualitative, ethnographic, and performative approaches to communication are interrelated yet distinctive. The three approaches each have their own history, disciplinary origins, values and ways of doing things, revered texts, and practitioners. As a student who may have the opportunity to study something out in the world, the secret is to find a context that interests *you*—bars, museums, tattoo parlors, surf shops—and jump in and begin. You won’t be able to write about *everything*, but you’ll probably find something that holds your interest. Then you will find out what works for you and what you enjoy doing. Even more important, however, is that people are researchers, and the methods discussed in this chapter are the same things you do every day of your life: You participate in life; observe things around you; talk with people; and, if you’re lucky, get to write about—and perhaps perform—those things.

Qualitative, ethnographic, and performative approaches to communication, while having areas of convergence, can also be wildly dissimilar. My reading of these three areas narrowed the range among the approaches. A different reading likely would have made the areas of divergence among the approaches more noticeable, say, for example, by discussing a “conversation analysis” study under the heading of the qualitative approach. But even here, the “poetics of conversation” have been noted in speech errors (Hopper, 1992).

So it is worth dwelling on the areas of commonality among the approaches. Although the title of this article, “Qualitative, Ethnographic, and Performative Approaches to Communication” calls the three areas “approaches,” each can legitimately be called a “method” (see Frey, Botan, & Kreps, 2000). And each of the three “approaches” *is* a method, a manner, of studying communication phenomena; likely, it was in that sense that you interpreted the title when you read it. However, there is another definition of the word *approaches*, one that I prefer and that better summarizes the similarities among the three approaches. Thus, *approaches* suggests a drawing closer to or a coming nearer to. And I think it is this idea that the three approaches embody. Each allows us to get closer to and nearer to what we wish to understand: communication. And yet we are always approaching, never fully arriving, which, of course, provides us with humility and a good motive to continue doing what we are doing.

CRITICAL/CULTURAL APPROACHES TO COMMUNICATION

KENT A. ONO

University of Illinois at Urbana-Champaign

Fueled by technological innovations in media such as the Internet (with staging formats such as YouTube, Facebook, and MySpace), e-mail, wi-fi, cell phones, Blackberries and I-phones, DVRs,¹ and the much larger digital revolution (of which they are all a part)—as well as a rapidly increasing interest in social identities such as race, gender, sexuality, nationality, and ability—critical cultural communication (hereafter CCC) has become a central part of the contemporary field of communication.²

Given the recent focus of much CCC scholarship on new media and identity, newcomers to the field might imagine that because these concerns have been responsible for igniting interest in the field, they are definitive of this area of work. Certainly, recently published scholarship does suggest that research on the digital revolution and cultural identities is the main part of CCC. However, more significant to CCC are broader theoretical issues of discourse; social power relations; social inequities; political resistance; modern thought, politics, and institutions; social and political organizations, logics, and frameworks; and cultural difference. Furthermore, the study of CCC not only has strong historical roots but also aims to historicize social life and, therefore, while interested in social change and technology, is not interested only in the “new.”

This chapter is a brief introduction to CCC as a subfield of communication.³ The chapter begins by further defining CCC and then, by historicizing this important subfield,⁴ discussing how the terms—*critical* and *cultural*—are

interconnected. The chapter then addresses contemporary issues in the field before concluding with a gesture toward its future.

Defining CCC

Four approaches to defining CCC include defining CCC by its history, by its domain of study, by its interdisciplinarity, and by its transdisciplinarity. In thinking about the history of CCC studies, one might begin with Marxism. Arguably, the broader study of critical theory inside and outside the field of communication began with Karl Marx, with many of Marx’s central ideas continuing to resonate in critical scholarship. However, the modern emergence of critical and cultural studies more aptly begins with the Annales School in France and the Frankfurt School in Germany (some would also include the Chicago School of Sociology), beginning in the 1920s and 1930s, moving forward to the work of those associated with British cultural studies in the late 1950s and after, and then primarily after the 1960s to scholarship in the general areas of critical theory, postcolonial studies, poststructuralism, feminist studies, critical race studies, queer theory, and transnational and diaspora studies, each of which will be defined more fully later in the chapter.

Another way to define this area of research is by identifying its domain and by describing what CCC scholarship does. Among other things, CCC scholars tend to investigate discourses of power and knowledge; relationships

between global and local communities; cultural dominance and resistance; theory and its relationship to criticism; communication and its corresponding intersections with culture, performance, economics, social organizations, ethnography, the media (cyberspace, digital, and visual culture), and even academic disciplines themselves; as well as the broad issues of everyday life.

Yet another way to define CCC is by describing it as a discipline. But while CCC certainly sometimes looks and sounds like a discipline, because so many of its most important scholarly luminaries eschew disciplinarity or critique the modern 21st-century organization of knowledge and power of the academy into disciplines, it is more apt to describe CCC as interdisciplinary or, as I will suggest below, “transdisciplinary.” CCC is interdisciplinary or transdisciplinary because it cuts across fields and subfields such as performance studies, critical intercultural communication, critical organizational studies, critical rhetoric, and media studies. Critical cultural work includes both historical and contemporary topics that emphasize careful and creative theorization, interpretation, and evaluation of the communication phenomena of “everyday life.” Furthermore, CCC scholarship goes to great pains to engage and sometimes challenge and attempt to transform disciplinary questions in multiple fields. Indeed, one could further demarcate CCC as concerned with politics, historical context, theory, textual analysis, and self-reflexivity of methodology/purpose/approach, all issues that cut across wide-ranging fields such as political science, history, sociology, literature, and the humanities and social sciences more broadly.

However, while CCC functions interdisciplinarily by cutting across fields (e.g., studying sexuality or race may require studying genetics while at the same time studying gender and women’s studies and ethnic studies), it is important to argue that CCC is also transdisciplinary, meaning it creates its own set of questions both by asking questions that are not and cannot be answered within a given discipline and by forming its own, unique questions and answers germane to its study. Thus, CCC is very similar to the field of communication, itself, in that it borrows questions and findings from other fields while simultaneously setting its own scholarly agenda. CCC has its own unique scholarly approaches, positions, perspectives, and insights; breaks down boundaries among disciplines; and attends to theoretical and everyday life concerns. Additionally, it is defined more by the questions that are posed than by a specific theory or methodology.

“Critical” Versus “Cultural”

The combination of the terms *critical* and *cultural* into “critical cultural communication” is often a convenience, since they share many dimensions. However, there are also political and intellectual stakes, for both tend to

challenge political and intellectual orthodoxies; both challenge systems of governmentality; and both are interested, to some degree, in the social. Thus, the two terms *critical* and *cultural* come together in important ways—for example, in the name of the Critical and Cultural Studies Division of the National Communication Association and in the title of the journal *Communication and Critical/Cultural Studies*. The move to unite the critical and cultural might be described as an attempt to work across both areas, to call attention to their similarities versus their differences: In a sense, bringing the terms together is a linguistic and political “double gesture” to promote both and to imply their similarities rather than their differences.

Having defined CCC, it is now useful to draw distinctions between its two key terms *critical* and *cultural*, for while it makes sense for the two terms to be paired, at times there are crucial differences that require further explanation. Briefly, *critical* often conjures up for people critical theory and a Marxist intellectual tradition; whereas *cultural* brings to mind “cultural studies” and the British cultural studies tradition, as well as interdisciplinarity, identity politics, and literary and humanistic approaches to the study of popular culture, broadly defined. In its crudest, perhaps most stereotypical, way, the distinction between *critical* and *cultural* would boil down to critical theory versus cultural studies. In this way, one could conceive of critical theory as political economic work and cultural studies as identity politics. But this kind of distinction is far too crude to address adequately or accurately the complexity of critical and cultural studies and their relationship. Thus, next, I work to explicate some of the history of critical theory and cultural studies with an eye to how they are brought into a relationship in CCC.

In providing a history of critical theory, particularly as it pertains to communication, one might begin with the Frankfurt School, starting with the members who formed the original Institute for Social Research at the University of Frankfurt in the 1930s, such as Theodor Adorno, Max Horkheimer, and Walter Benjamin. Key works that are often referenced during this early period include Adorno and Horkheimer’s (1972) *Dialectic of Enlightenment* and Benjamin’s famous essay (1992) “The Work of Art in the Age of Mechanical Reproduction.” Building on their scholarship, Herbert Marcuse, in his *One Dimensional Man* (1972), suggested that the freedoms promised by capitalism were a ruse and that commodity capitalism in fact limits desire and possibilities for agency rather than expands them. Another key Frankfurt School figure was Jürgen Habermas (1989), known primarily for his book *The Structural Transformation of the Public Sphere*, first published in 1962, who theorized a public sphere as an ideal space in which communication can construct community and democracy. In it, Habermas, critical of bourgeois control of the mass media by private interests, laments the loss of space for public communication that

makes possible unencumbered public deliberation of democratic ideals. Until that point, CCC was, if not explicitly Marxist in orientation, then at least neo-Marxist, presupposing the significance and centrality of class and class critique, with an emphasis on political change and a critique of material inequality.⁵

While one definition of critical theory work is based in a Marxist tradition, another definition of critical theory is broader and has the potential to liaise well across both critical and cultural work. Such a definition of critical theory tends to be in opposition to, or to resist, hegemonic political and ideological formations. By hegemonic political and ideological formations, I mean the broad set of beliefs, forces, and attitudes that become ingrained within a society that make people, for example, immediately rise and put hand over heart before the national anthem is played, unquestioningly use gender-segregated bathrooms, or accept a link between biological identity markers and intelligence. Indeed, one of the principal ideologies against which many members of the Frankfurt School railed was fascism. The theories, critical methodologies, and even topics they examined were chosen so as to critique fascism and to imagine better ways of living. Thus, critical in this way is both the philosophical and the political stance taken in opposition to the reproduction of power relations in a multiplicity of forms.

Much work using this more expansive concept of critical theory includes Foucauldian and poststructural approaches that use theory as a tool for analysis. A Foucauldian position is one that draws on the work of the late Michel Foucault, a French scholar who thought carefully about shifts in public discourse around issues such as mental health, prisons, universities, and sexuality. Poststructural approaches have a tendency to seek explanations for how things are rather than assume that phenomena are easily explainable by already known methods and ways of viewing the world. Foundational scholars associated with a concept of critical theory that includes but builds beyond a Marxist foundation are Jacques Derrida, Michel Foucault, Jean Baudrillard, Hélène Cixous, Michel DeCerteau, Gilles Deleuze, and François Lyotard. The work of Mikhail Bakhtin and Fredric Jameson have also figured prominently, as has the work of Ernesto Laclau and Chantal Mouffe, especially their book *Hegemony and Socialist Strategy* (1985), and Judith Butler, Jacques Lacan, Roland Barthes, and more recently Slavoj Žižek.

Whereas critical work often traces its historical genealogy to Marxism and to critical theory, cultural studies has a different genealogical tradition. Early cultural studies work was associated with scholars who founded and then were part of the Centre for Contemporary Cultural Studies at the University of Birmingham, England. Early figures such as E. P. Thompson, Richard Hoggart, and Raymond Williams brought a class dimension to the study of culture and challenged the basic elitism of the academy and its relationship to society. However, such scholars typically found the Marxist scholarship that saw the political economy

as foundational, to which all questions of marginality must return, as too narrow. These early cultural studies scholars opened up possibilities for understanding marginality, oppression, and class discrimination from a multiplicity of sites; thus, critiques of dominance, which are critiques of the dominant social institutions and ideologies, could begin from points other than class alone. In a broad sense, these early cultural studies scholars took a Marxist argument about class and retheorized it in a way that allowed others to cross-apply an analysis of class to other social phenomena (not only economic ones), such as sexuality, race, gender, nation, age, and ability.

Following earlier cultural studies scholars, key figures such as Stuart Hall, Angela McRobbie, Meaghan Morris, Richard Dyer, Paul Gilroy, and Coco Fusco emerged, foregrounding an interest in youth activism, black British politics, queer studies, whiteness studies, feminism, transnationalism, cinema, visual, music, and performance studies.

Also important in the historical evolution of the field of cultural studies was the publication of two key volumes produced by University of Illinois, Urbana-Champaign (UIUC) faculty members, which created tremendous reverberations in the United States and abroad. The first, *Marxism and the Interpretation of Culture* (1988), affectionately known as the “big red book,” edited by Cary Nelson and Lawrence Grossberg, emerged out of a conference at Illinois and contained many key pieces that remain important touchstones in CCC work today. Following that volume was Grossberg, Nelson, and Paula Treichler’s *Cultural Studies*, an even weightier volume developing out of another conference on the UIUC campus. This volume included multiple-media formats and also focused on audience studies. Scholars in this book embraced cultural studies more than did those in *Marxism and the Interpretation of Culture*, where class critique figured much more pivotally. Important to the importation of a version of British cultural studies to the United States are Lawrence Grossberg and James Carey. The UIUC, in particular, was one site, the University of Iowa, where Carey also taught for a time, another, where a relationship between Marxist critical theory and British cultural studies took shape.

Those taking a cultural studies approach often define their practice based on the kinds of questions they ask. For instance, while many cultural studies scholars, especially in literary studies, conduct textual analyses, others emphasize ethnographic and audience reception research. While some focus primarily on resistance, others are more interested in cultural identity and activism. Still others emphasize critical analyses of, for instance, governmentality, the given governing structure that allows societies to be regulated and controlled. Governmentality is one emphasis of Foucault’s work that people such as Michael Hardt, Antonio Negri, and Nikolas Rose build on and discuss. Such scholars are interested not only in a given governmentality, which they might object to or oppose, but also

in plural governmentalities, which offer the possibility of having alternative rules and regulations within a society and emerge as a result of broad coalitions of social and political actors rather than, for instance, a narrower professional and bureaucratic group of leaders (such as U.S. senators, the World Trade Organization, or prime ministers or presidents).

As a whole, most cultural studies scholars examine multiple axes of power and oppression; emphasize interdisciplinarity and transdisciplinarity explicitly and seek knowledge produced out of transdisciplinarity rather than a hodgepodge combination of approaches from different disciplines; and consider culture to be a starting point for theory and analysis. Cultural studies emphasizes theories and methods that are relevant and useful to the research questions posed and studies designed, which often means using a multimethodological approach—that is, using more than one methodology at a time in combination. Cultural studies also tends to emphasize art, music, and theater as much as literature and film; and new media and visual culture, while foci in and of themselves, are often addressed transdisciplinarily.

It is important to suggest that, while Marxism, the Frankfurt School, critical theory, and cultural studies are all important aspects of CCC studies as practiced in the United States, many feel that the word *critical* is often used as a way to marginalize particular scholars and their brands of scholarship. Thus, *critical* is a contested term, one that can imply that one abides by a certain set of theoretical assumptions and obligations, such as a commitment to doing theory versus doing action. The use of *critical* as an exclusive term often is defended because those doing critical theory have struggled to gain hard-won positions in academia. However, *critical* is not “owned” by a given intellectual community; hence, varied and diverse communities describe their own work as critical. Thus, critical work not only exists within a Marxist framework or a European one (French and German, in particular) but also has bases within feminist, Third World (in film studies “third cinema”), and ethnic studies frameworks (see, e.g., Chabram-Dernersesian, 2006). In this vein, critical work also emerges out of the lived experiences of women, people of color, and LGBTQ (Lesbian/Gay/Bisexual/Transgender/Queer) communities, and it takes class seriously but not necessarily as the overarching, determining framework.

Understandably, at times, scholars of race, ethnicity, and culture have bristled when the word *critical* is used as a code for European critical (high) theory tradition. Such scholars challenge the word *critical* to refer to work done by white Europeans and Americans, especially work that uses a lot of theoretical jargon and is, if not exclusivist, elitist. In contrast, work done by people of color, LGBTQ scholars, and women is relegated, contra critical theory, to the dustbin of the cultural.

Perhaps the best exemplar of someone whose work often traverses across both critical and cultural dimensions and whose work is centrally focused on communication is

Stuart Hall, one of the significant leaders in Birmingham School history. Much of Hall’s work is used in scholarship on media and cultural studies. And some of his work (sometimes the very same work) is used in scholarship on race, ethnicity, transnationalism, postcolonialism, and diaspora. For instance, many read Stuart Hall’s (1980) essay about the dominant, negotiated, resistant reading positions available to consumers of media texts, while others draw more on his critical race essay about racial representations, “Whites of Their Eyes” (1985), and his work in Black diaspora studies. Thus, Hall traverses both more standard cultural studies and media studies, and race, ethnic, critical race studies realms, and his work gets taken up in both.

CCC work focusing on race, ethnicity, and critical race studies draws from numerous scholars, such as Audre Lorde, bell hooks, Angela Davis, Cherrie Moraga, the Combahee River Collective, Asian Women United of California, Homi Bhabha, Abdul JanMohamed, Henry Louis Gates, Nestor Canclini, Trinh T. Minh-ha, Michelle Wallace, Gayatri Spivak, Manuel Castells, Kuan-Hsing Chen, Rey Chow, Herman Gray, Chandra Mohanty, Lisa Lowe, Edward Said, Lauren Berlant, Michael Warner, Inderpal Grewal, Caren Kaplan, Wendy Brown, Patricia Hill Collins, Gloria Anzaldúa, Rosa Linda Fregoso, and the like. These scholars often study race, nation, ethnicity, transnationalism, and postcolonialism and are often simultaneously engaged in understanding multiple, overlapping, and intersectional aspects of social and cultural life, such as sexuality, gender, and class.

While all work in critical theory and cultural studies is interdisciplinary, at least to a degree, some of it has been more and some of it less useful to scholars in the field of communication, or at least with a foot in that field. Currently, because of the early work of Richard Dyer, David Roediger, Ruth Frankenberg, and George Lipsitz, scholarship exists that critically interrogates the concept of whiteness, which refers to the way representations of race have functioned, on the one hand, to render racial minorities hypervisible and, on the other hand, to render those identified as white as having either no racial identity at all or an identity that functions in unmarked ways. Such scholarship has blossomed within communication studies. Thomas Nakayama and Judith Martin’s (1999) edited book *Whiteness: The Communication of Social Identity* as well as an essay by Raka Shome, “Race and Popular Cinema: The Rhetorical Strategies of Whiteness in *City of Joy*” (1996), are good examples, as is the work of Lisa Flores, Dreama Moon, and Carrie Crenshaw, among others.

Traditions of feminist critical cultural work have long histories within a cultural studies framework. Scholars in this area assume that gender is socially constructed and explore its impact on women’s everyday lives. Most notable among the early scholars in this area are Meaghan Morris, Angela McRobbie, Paula Treichler, and Angharad Valdivia,

and more recent work, such as that by Barbara Biesecker, Carol Stabile, Raka Shome, Radha Hegde, and Aimee Carillo-Rowe, has also emerged. Perhaps because many of these scholars were trained by an earlier era of critical theory and cultural studies scholars, their work tends to be, from the outset, premised on multimethodological and multiple-identity research, as well as to cut clearly across critical and cultural divides. Queer studies work not only draws attention to the multiplicity of sexualities and genders that exist (well beyond heterosexuals and homosexuals and women and men) but also asks how a “queer perspective,” one that works outside the traditional social norms of societies traditionally dominated by heterosexual and patriarchal figures in power, can invigorate scholarship on all topics. Examples of key figures in communication include John Sloop, Katherine Sender, Larry Gross, Charles Morris, E. Patrick Johnson, Thomas Nakayama, and Fred Corey, who have been instrumental in moving critical questions of sexuality forward in the field. (See John Sloop, “Queer Approaches to Communication,” this volume, for a more detailed discussion of these issues.)

Work in transnational and postcolonial studies that draws on the work of Homi Bhabha, Gayatri Spivak, Ella Shohat, Robert Stam, and Edward Said, for instance, and within communication, the work of scholars such as Raka Shome, Radha Hegde, Marouf Hasian, and others have also been important. Much of this work gives not only new insight into the everyday but also new insights into the questions posed by scholars studying the everyday.

The Future of CCC

It is clear that CCC studies will continue to be a significant part of the field of communication for quite some time. Indeed, given the rapid centralization of this area in the field and change in globalization and media technologies, one can imagine vibrant new subareas within CCC work emerging for years to come. Exciting newer areas such as cyberspace and digital studies, new technologies, reality television, biotechnology and surveillance studies, cyber-cultural studies, and transnational globalization studies continue to reframe the field and require new methodologies and theories as well as new conceptualizations of communication. As new media technologies emerge and new international, social, and political stakes are discussed, new approaches using critical and cultural perspectives will be required.

The area of “neoliberalization” studies, which is the study of the way globalization and transnational capitalism work to eliminate constraints on markets (e.g., North Atlantic Free Trade Agreement or NAFTA) and expand inexpensive labor pools and material resources, while very much a part of CCC work, is in its early stages of development. Perhaps, there is some way to both make the study

of neoliberalism much more of a scholarly area or focus of CCC work and to deepen its theoretical significance. Moreover, perhaps there is a way to study neoliberalism in a way that specifically addresses issues of communication scholarship, hence rendering it useful for those rooted in the field.

An attempt to bring political economists together with cultural studies scholars rather than have a divide between them, emphasizing areas of common agreement and backgrounding the, at times rather minor, disagreements, would help strengthen scholarly work and allow future scholars to work across these two areas with more flexibility without the fear of reprisal. Bringing the critical and cultural together in studies of communication ultimately promises a much more fulfilling project, one that can enliven, excite, and stimulate the next generation of CCC scholarship to come.

Notes

1. Digital video recorders, such as TiVo.
2. Within the institutional and organizational framework of the field of communication, there has been a significant period of growth for CCC studies over the past 20 years or so. For example, one might think of the older Philosophy of Communication in the International Communication Association (which many recognize as an inaugural site for the development of cultural studies), the newer Critical and Cultural Studies Division in the National Communication Association, the *Communication and Critical/Cultural Studies* journal, and most recently in 2008 the International Communication Association journal *Communication, Culture, and Critique*. Nevertheless, job seekers still will not find many ads for academic jobs listing “critical theory” or “cultural studies” as preferred specialties, at least not in the United States.
3. Because of my particular focus and due to space limitations, while I draw on international scholarship, I center my discussion primarily on CCC as it has developed and is developing in the United States.
4. Throughout the essay, except when discussing particular works, when referencing scholars I list representative examples of their works in the bibliography.
5. One direction some critical scholars took was toward a political economic and public policy approach. Perhaps in the 1970s or 1980s, critical work in this more pragmatic vein stressed institutional analysis and policy change with less emphasis on theoretical questions of power, socialization, cultural conditions, and knowledge production.

FEMINIST APPROACHES TO COMMUNICATION

BONNIE J. DOW

Vanderbilt University

Feminist approaches to communication constitute a broad area of study that has developed over the past 30-plus years. We can trace the origin of feminist work in communication to the influence of the late-20th-century feminist movement, what historians have termed the *second wave* of U.S. feminism. Although the second wave of feminism, generally dated to a period between the late 1960s and the early 1980s (with the end date linked to the failure of the Equal Rights Amendment ratification campaign) was a movement with a variety of goals, factions, and ideologies, it brought issues such as gender discrimination, equal opportunity for women in education and employment, and the cultural influence of what were then called “sex role stereotypes” to the forefront of U.S. public consciousness.

Such issues were quickly taken up in academic work across fields of study, and communication researchers began to study what were then called “sex differences” in communication. Early research on sex differences promoted a deficiency model, within which characteristics of speech typical of men set the standard for competent interpersonal communication and characteristics of speech typical of women were judged negatively as a result. So, for instance, such research would report on women’s lack of assertiveness rather than men’s aggression and would note women’s lack of confidence rather than men’s overconfidence or arrogance in conversation. Importantly, such research stimulated by second-wave feminism had an implicit (and sometimes explicit) political dimension not only because of its origins in a movement dedicated to social and political change but because of its recognition that sex differences were linked to power; for example,

men’s communication style was perceived as more powerful and was thus more desirable.

By the late 1970s and early 1980s, however, feminist researchers were questioning the simplistic rooting of such differences in biology. Rather than understanding communication patterns as a “natural” outgrowth of biological sex, they began to ask questions about sex role socialization, about the relationship between power and gender in communication, and about the problems of using men’s behavior as the standard for “good” communication. They argued that different styles of communication had different strengths and weaknesses in different contexts (e.g., a less assertive style promoted empathy and turn taking) and should not be placed within a hierarchy. Moreover, they also contended that different communication styles were more linked to power and status in particular contexts (often themselves linked to gender roles) than to sex. Importantly, these developments heralded a move toward a perspective in which “gender,” a set of cultural constructions about expectations for men and women, replaced “sex,” a biological category, as a variable in understanding communication. Feminist researchers began to conceptualize gender as socially constituted through communication and performance and not reducible to biological sex. Some recent research in interpersonal communication has taken a more sophisticated approach to measuring gender identity independently of sex rather than simply assuming that biological sex equals gender (for more discussion of the research on gender and interpersonal communication, see Julia Wood, “Gender” this volume).¹

At the same time that interpersonal communication scholars were turning their attention to issues raised by the cultural

influence of the contemporary feminist movement, rhetorical scholars were doing so in an even more specific way: by studying feminism itself. Karlyn Kohrs Campbell's path-breaking essay, "The Rhetoric of Women's Liberation: An Oxymoron," published in 1973, not only drew attention to the rhetoric produced by second-wave feminists but also argued that such discourse deserved attention because of its differences from traditional (men's) public discourse. She explicated the rhetorical strategy of consciousness raising, which relied on personal examples, a peer tone, and an inductive structure, and she argued that it was a response to the unique situation in which women/feminist rhetors operated. Campbell's claim that such a context produced a kind of rhetoric that could not be understood using traditional rhetorical theories was a powerful feminist intervention into the study of public discourse, as it called into question the standards used to designate what was worthy of rhetorical study and why. Other studies of women's liberation rhetoric, as well as studies of specific feminist issues, such as the Equal Rights Amendment and abortion rights, continued to appear in the 1970s and early 1980s. Although this work did not necessarily announce itself as specifically feminist in perspective, it was an important foundation for the feminist work that would follow. First, it established that feminist rhetors and rhetoric were worthy of study, which was not an inconsequential thing in a field in which rhetoric produced by women had, to that point, rarely been studied because of its ostensible inferiority, a state of affairs that shows linkage to the deficiency model that prevailed in interpersonal communication scholarship. Second, scholarship about feminism circulated and analyzed feminist ideas and did so sympathetically. Finally, most evident in the case of Campbell's essay, this early work provided critical frameworks, such as the explication of consciousness raising, that would be useful to later feminist scholars.

The discourse of and around feminist social movements has continued to be a focus for feminist work. For example, the study of second-wave feminism has continued since the 1970s, although it is not as well developed an area of rhetorical study as is the rhetoric produced by women in 19th- and early-20th-century reform movements (commonly called the "first wave"), which I will discuss in the next section of this chapter. More recent studies of second-wave feminism have examined not only the rhetorical discourse of feminists but also the representations and rhetorical practices of second-wave feminism in the mass media. Moreover, feminist communication scholars also have recently turned their attention to the study of third-wave feminism, a movement that generally dates to the 1990s.

The Development of Feminist Approaches to Communication

Understanding the roots of feminist scholarship in relationship to the late-20th-century rebirth of feminism helps us understand that feminist approaches to communication are simply one manifestation of a larger and continuing social

and political movement targeted toward gender justice, which, as Celeste Condit and I have observed, "may include but can also go beyond the seeking of equality between men and women, to include understanding of the concept of gender itself as politically constructed" (Dow & Condit, 2005, p. 449). Despite differences in the varieties of feminism that I will discuss below, this broad definition recognizes that feminist work always understands gender as a political concept—that is, a concept that functions within, as well as functions to create, maintain, and challenge, power relations.

Much of the early work by feminist researchers in communication enacts an impulse toward equality in that it works toward righting an imbalance in the attention given to (and value ascribed to) men's communicative practices rather than women's. This impulse is characteristic of liberal feminism, a powerful strain of feminist thought since the first stirrings of feminist movement in the 19th century. Liberal feminism prizes equality of opportunity between men and women, although it tends to use men's experiences as the standard to which women aspire. For example, 19th-century feminist demands for opportunity in education and employment, at a time when women were denied access to higher education and the professions, assumed that equality would result when women had the same prospects in the public sphere as men. Liberal feminism, because it is the basis of visible feminist issues such as the Equal Rights Amendment, is often held to be the only, unitary, meaning of feminism.

Yet even within the liberal feminist project in communication, gestures toward other understandings of feminism have emerged, understandings that lead to the latter half of Condit's and my formulation of gender justice: an understanding of gender itself as politically constructed. For example, as I discuss in the following section on the "recovery project" in feminist rhetorical study, feminists' attention to women's rhetoric challenges the historical imbalance in the study of public discourse produced by men and also challenges the traditional ways of understanding rhetorical excellence that have worked to create that imbalance (Campbell's work on the rhetoric of women's liberation is an example of this dual effect). The latter challenges are consonant with a radical feminist orientation, which, following a meaning of radical as "going to the root," seeks not just to level the playing field but to question the layout of the field and the rules of the game as well. Thus, it is a liberal feminist impulse to insist that women's communication is as worthy of study as men's, but it is a radical feminist impulse to argue that we need to revise our standards for what makes some communication practices more worthy of study than others.

During the second wave, radical feminists went beyond decrying discrimination to interrogate the origins of cultural notions of sex differences and sex role stereotypes. They argued that public, legal remedies for sex/gender discrimination would not be enough and that a total transformation of social structures and practices

around gender—from sexuality to reproduction, to child rearing, to education, to work, to politics, and so on—would be necessary to achieve true freedom from sex/gender constraints for both men and women. In its insistence on challenging taken-for-granted assumptions around sex and gender, the radical feminism of the 1970s forecast the development of poststructuralist feminism in the 1980s, an academic theoretical movement that has deeply influenced the development of third-wave feminism outside the academy. Poststructuralist gender theory (which Wood discusses as “gender performativity” theory in “Gender,” this volume) holds that neither sex nor gender are natural categories but that the categories themselves, and their meaning in any given context, are created and sustained by discourse—speech, behavior, and social practices—of all kinds. In the simplest terms, then, working from a poststructuralist orientation means to move one’s focus from “How does this communicative practice *reflect* (an already assumed, preexisting) gender difference?” to “How does this communicative practice *create or constitute* a particular understanding of what gender difference means in a particular context?”

In the remainder of this chapter, I discuss three kinds, or phases, of feminist work in communication: recovery, representation, and reconceptualization. These are not entirely discrete categories, and they do not follow one another in a neat timeline—they simply constitute one schema (among many possible ones) for organizing feminist approaches to communication. They also do not neatly align with the varieties of feminist theory discussed above but, as I will note, show the influence of all of them at different times and in different ways. What I hope to demonstrate is that feminist approaches to communication have evolved incrementally over the past several decades and are driven by a variety of factors, including but not limited to sociopolitical changes outside the academy, theoretical developments within the academy, and changes in communication technologies and practices. However, they all share a commitment to the basic question that, implicitly or explicitly, motivates feminist approaches to communication: “How do understandings of gender, and their relationship to power, affect (and effect) communication practices?”

Feminist Approaches to Recovery

The recovery project in feminist communication studies has taken different forms, but it is generally characterized by a focus on asserting the importance of “recovering” communication practices that have been ignored or incompletely studied because previous scholarship has not accounted for the role of gender within them. Thus, a central concern of recovery scholarship is “correcting” or fleshing out the historical record so that it accounts more completely for the role of gender in understanding communication practices.

In feminist communication studies, the most visible recovery efforts have been in the area of public address; that is, the study of persuasive public discourse, traditionally oratory, in American history. Feminist scholars have argued that the rhetorical tradition has focused on the discourse of white men with national political power and/or status, such as presidents and social movement leaders, but that a complete understanding of American public address necessitates the study of women’s rhetoric. This is not simply because history has produced talented women orators worth studying, such as Elizabeth Cady Stanton or Sojourner Truth, but also because women rhetors have faced different rhetorical obstacles than have their male counterparts, making their discourse uniquely strategic and inventive. Studies of women’s historical rhetorical practices vary in the materials on which they focus and the degree to which they are presented as specifically feminist analyses. In general, recovery scholarship is understood as feminist because it grows from a commitment to recognizing the contributions of women to rhetorical history and because it operates from the premise that past scholarship has, wittingly or unwittingly, been sexist in its definitions of what counts as public discourse worth studying.

Although a few studies of women orators have existed since the mid-20th century, the publication of Karlyn Kohrs Campbell’s *Man Cannot Speak for Her: A Critical Study of Early Feminist Rhetoric* in 1989 rejuvenated this area of scholarship in contemporary rhetorical studies, serving as a foundational text and leading to a surge of research that continues today. *Man Cannot Speak for Her* appeared in two volumes: one that analyzed important rhetorical acts produced by women (such as Elizabeth Cady Stanton, Angelina Grimké, Sojourner Truth, and Susan B. Anthony) between the early 19th and early 20th centuries and another that included a collection of speeches by women during this same period. As Campbell’s work exemplifies, much of the work in the recovery project has focused not simply on women rhetors but on women rhetors who have argued for women’s rights. Women’s exclusion from the political system, because they were not granted suffrage (the right to vote) until 1920, means that, until the 20th century, women’s rhetoric tended to emerge from social movements challenging the status quo. Many of the rhetorical analyses of women’s rhetorical activities deal with their involvement in 19th- and early-20th-century reform movements focused on issues such as abolition of slavery, civil rights for African Americans, temperance (the prohibition of alcohol), woman suffrage, labor, and birth control.

In addition, such work has contributed new ways of understanding public discourse by arguing that the unique obstacles faced by women rhetors necessitated the development and deployment of specific strategies that addressed these obstacles. For example, in her 1989 book,

Campbell describes the concept of “feminine style” (similar in some ways to consciousness raising)—characterized by identification, inductive reasoning, personal tone, and treatment of the audience as peers, which, she argues, was effective in empowering traditionally passive 19th-century female audiences. Yet feminine style also has been usefully employed to illuminate contemporary women’s (and men’s) rhetoric, demonstrating its utility as a critical tool beyond a 19th-century context.

The influence of the recovery project has been wide-ranging. From the initial efforts to understand and elucidate the contributions of women’s oratory to rhetorical history, it has led to a range of scholarship that treats women’s rhetorical practices in a variety of time periods, social and political contexts, and discursive forms, as well as uses an array of rhetorical and feminist theories to elucidate them. So, for instance, there is a stream of scholarship focusing on the rhetorical strategies of women as participants in 20th- and 21st-century electoral politics, including as First Ladies. Moreover, feminist scholars have moved beyond a focus on oratory to study the rhetorical practices of women and feminists (and sometimes antifeminists) in other discursive forms such as books, newspapers, manifestos, letters, and petitions, as well as in nondiscursive forms including cartoons, postcards, and parades.

The work that has grown from the recovery project in women’s rhetoric and public address has used various theories and methods to analyze the rhetorical practices that it examines, and in many cases, these theories and methods cannot be categorized as specifically feminist. The primary difference that this scholarship presents is its emphasis on the role that gender plays in constituting the rhetorical situation and in influencing the form and function of the rhetorical strategies used by women rhetors. Importantly, gender has tended to be operationally defined as “women” in this stream of scholarship, leading to two problems: First, it treats gender as stable and as an unproblematic outgrowth of sex; second, it creates the impression that only women are gendered, just as uses of the term *race* often leave the impression that only those who are not white are “raced.” However, in recent years, scholars have begun to examine the role of masculinity in the discourse of and around male political candidates (and particularly U.S. presidents). For example, in an essay examining Elizabeth Dole’s truncated campaign for the Republican nomination for the U.S. presidency in 2000, Karrin Vasby Anderson concludes that the “ceremonial and symbolic role of the U.S. president is tied up with traditional masculinity,” but her study is one of only a few in public address that study masculinity from a feminist perspective. The feminist study of men and masculinity in public address is an area that needs growth, but other areas of critical scholarship, most notably media study and queer studies, have recently begun to emphasize the role of masculinity in their analyses. I discuss such work in

feminist media studies below, and John Sloop discusses the study of masculinity in queer studies of communication in the following chapter.

In much of the past work on women’s rhetoric, then, gender is understood as a stable identity rather than as something that is performed and constituted through rhetoric itself. However, recent work has demonstrated that “the import of feminist rhetorical study goes beyond the evaluation of the efficacy of rhetorical strategies in particular situations and provides insight into how gender and symbol use constitute, challenge, and constrain our identities and possibilities as political actors” (Dow & Condit, 2005, p. 451). Susan Zaeske’s (2003) book, *Signatures of Citizenship*, which studies the rhetoric of white women’s antislavery petitions in the early 19th century, is one example. It studies important nonoratorical texts produced over a number of years, offering a complex analysis of the ways in which the language of the petitions, and women’s choices to sign them, offers an insight into the development of a gendered, raced, and classed political identity, or citizenship, for a group of women who had no political power beyond the right to petition.

More recently, Angela Ray’s (2007) essay on women’s collective voting rituals between 1868 and 1875, “The Rhetorical Ritual of Citizenship,” is another example of the study of nonoratorical forms that emphasizes how rhetorical activities constitute particular gender identities rather than simply reflecting the assumed preexisting gender identity of a specific rhetor. As Ray explains, in the years after the Civil War, woman suffragists became energized by a new set of arguments that held that the Constitution should be interpreted as allowing women to vote simply because they were citizens. Across the country, dedicated suffragists attempted to assert their citizenship rights by going to the polls and demanding to be allowed to register and to vote at election time. Few were successful, but Ray’s central point is not about the efficacy of the strategy; rather, it is about how the performance of their attempts to do so, and the contemporaneous accounts of those attempts, highlights the ways citizenship was inescapably defined through gender (and race and class), despite the suffragists’ reliance on universalist arguments for the franchise. In work such as Zaeske’s and Ray’s, the use of poststructuralist feminist theory demonstrates the growing sophistication of research within the recovery project, as scholars investigate historical women’s rhetoric for its role in the constitution of gendered identities.

Thus, the recovery project, initially (and still) driven by a liberal feminist impulse to correct for the omission of women rhetors from the study of public address, has traveled in directions that focus on how public discourse functions as a grounding for the very meaning of gender. In this movement, from the study of women to the study of gender, the feminist recovery project in communication is aligned with the trajectory of feminist work across the academy.

Feminist Approaches to Representation

Early feminist studies of mass media representation were stimulated by the same liberal feminist motivations that characterize feminist work in other areas of communication research. In the late 1970s, quantitative researchers studied “sex roles” in mass media, which usually meant that they measured the level and types of representation of women on, for instance, television, arguing that women were represented less than men and that their roles (primarily as housewives, mothers, teachers, and nurses) were limited and stereotypical in comparison with men’s. A central concern of such early work was how well mass-mediated representation of gender reflected “real-world” conditions; for example, did the percentage of women characters on television match the percentage of women in the actual population? Thus, initial research in this area was driven by a belief that mass media were important forces of socialization, particularly for children, and that a critique of sex role stereotypes in mass media could lead to improvements in mass media representations and thus a lessening of the power of stereotypes in the larger culture.

As I will detail in this section, feminist analyses of media representation have grown and developed in many directions, but they are united by a concern with how mass media communicate ideology about women, gender, and feminism. In this work, ideology is generally understood as “common sense” or naturalized understandings of how the world works; for example, traditional gender ideology maintains that men are masculine and women are feminine and should be expected to perform as such. Over time, as the examples I discuss below will illustrate, feminist analysis of mass media has gone beyond the initial questions about how well mass media reflect conditions in the real world. Instead, akin to current work in the feminist recovery project, current feminist media research asks questions about how mass media work to create, challenge, and maintain cultural meanings of gender.

Contemporary studies of representation use a variety of methodological approaches. One strain of research uses quantitative (usually content analytical) measures of the amount, type, and effects of representations in media such as television entertainment, news, and advertising. Such work is feminist in that it often argues that the low level of female representation, as well as the quality of that representation (e.g., portraying women in music videos as highly sexualized), works against feminist goals of representing women as self-determining, competent, and multifaceted individuals. For example, in a study that treats the representation of feminism itself, Lind and Salo’s (2002) examination of 35,000 hours of television and radio news and public affairs programming between 1993 and 1996, reveals, among other findings, that feminists are rarely represented in the news, that

when they are they are likely to be demonized, and that they are depicted as different from ordinary women.

A second methodological approach in studies of representation, generally referred to as audience reception studies, uses ethnography, interviews, and sometimes online fan discourse to investigate how audiences process and interpret media messages. This work is feminist not only in its use of feminist theory but also in its emphasis on the ways women audience members use media products to understand—and sometimes to challenge—their place within patriarchal cultures. Such research has addressed a variety of media forms, including television, popular films, toys, and advertising. For example, in a 2003 essay, Yeidy Rivero interviews both Latin American and Puerto Rican women viewers of the popular Colombian *telenovela*, *Yo soy Betty la fea* (of which an American version, *Ugly Betty*, was produced in 2006 by NBC). She reports that the study’s participants did not take the program at face value, instead understanding the “ideologies of gendered ‘beauty’” (p. 78) in the *telenovela*’s narrative as social constructions that were constituted in relationship to dominant notions of femininity, class, and race and that were strongly influenced by beauty standards promoted by mass media.

Rivero’s essay is an example of a welcome trend in this research: the study of international media products and their interpretation by international audiences. It appeared in *Feminist Media Studies*, an academic journal founded in 2001 (indeed, the existence of such a specific journal demonstrates the maturation of this area of scholarship), which has become an especially rich outlet for international work. Although feminist research in communication studies, especially in rhetoric, tends to be overwhelmingly Americanist, feminist media studies are becoming more global in orientation, a shift no doubt influenced by the increasing globalization of mass media itself.

The third, and largest, area of feminist study of representation is critical/textual analyses, which includes much of the work with an international focus discussed above. In such studies, scholars use a variety of analytical techniques to examine the communication of gender ideology in a variety of media texts. Such work has become quite explicit in its feminist commitments since the 1990s and demonstrates growing theoretical sophistication by attending to the ways in which dominant notions of gender are constituted by media discourse.

Because feminist work on media representation represents such an enormous area of scholarship, it is difficult to characterize completely. In recent years, it has included work on a staggering array of media forms, including television entertainment, news, films, advertising, magazines, new media and the Internet, books, cartoons, and music, and this list is certainly not exhaustive. Generally, feminist studies of representation tend to emphasize the conservative function of media texts—that is, the ways they tend to

discipline “improper” gender performances (by, e.g., punishing and/or marginalizing assertive female characters), but there is also a strain of research that analyzes the ways in which some media texts can be read as offering progressive gender performances—that is, representing gender as fluid and foregrounding gender-transgressive characters in positive ways. Moreover, although studies of mass media reflect a dominant focus on whiteness that mass media itself perpetuates, a growing body of work examines representations of race and ethnicity in an American context.

In general, feminist research on mass media takes note of the polysemous nature of media texts—that is, their capacity for offering multiple meanings that can be “read” or understood in disparate ways by both media critics and media audiences. Some of the most interesting feminist work on media texts offers complex readings of the mixed messages that popular media present: messages that account for the ways feminism has changed cultural meanings and practices (by, e.g., including feminist issues in storylines or including powerful female characters) and yet undermine that progressive content at the same time. A recent example of such research is Lisa Cuklanz and Sujata Moorti’s (2006) analysis of television’s “new” feminism in the popular crime drama *Law & Order: Special Victims Unit (SVU)*. Cuklanz and Moorti argue that *SVU*, while generally relying on feminist understandings of violence against women in its narratives (e.g., by insisting that women do not bear responsibility for rape), simultaneously offers plotlines in which femininity is denigrated through characterizations of the program’s police officer protagonists as well as in its frequent use of female villains who represent the “monstrous maternal”—that is, women who fail in their maternal roles so grievously as to cause serious harm or even death to their children or others (p. 314).

In recent years, feminist media scholars have widened their purview beyond representations of women, femininity, and feminism, the traditional focus of earlier work, and have begun to produce feminist analyses of the role of masculinity in media texts. Recent noteworthy examples include Fahey’s (2007) analysis of the ways in which the 2004 presidential campaign coverage “emasculated” the Democratic candidate John Kerry by depicting him as “French and feminine,” and thus lacking the masculinity necessary to serve as president, and Johnson’s (2007) essay “The Subtleties of Blatant Sexism,” an analysis of the ways in which the overt sexism of *The Man Show* relies on accepting its constructs of masculinity as imperiled by an “imagined dominant female authority” (p. 166).

Current feminist work on mass media representation is diverse and wide-ranging, and it is by far the most eclectic body of work in feminist studies of communication. It is particularly noteworthy for its attention to the intersections of gender, race, class, nationality, and sexuality in media texts, as well as for its growing attention to the constitution of masculinity.

Feminist Approaches to Reconceptualization

In the sense that I use it here, reconceptualization refers to the ways in which feminist approaches to communication have functioned to question and revise received knowledge about how communication works as well as about how we produce knowledge about communication. At a basic level, the simple existence of feminist approaches to communication is a reconceptualization, because such approaches did not exist 30 years ago and because their presence asserts that the absence of attention to gender in the past rendered our understanding of communication incomplete.

One of the central ways in which feminist approaches have reconceptualized research in communication studies is through the demand for inclusivity. Initially, as I discussed in the recovery section, inclusivity took the form of arguing that women rhetors must be included in our understandings of rhetorical history, with the implication that such inclusion would fundamentally reconceptualize that history. At the same time, some feminist scholars have argued that the inclusion of women also requires that we revise our limits on what “counts” as communication and that we recognize nontraditional forms of communication, such as sewing, gardening, or fashion.

Over time, calls for inclusivity have expanded to include not just gender but also the ways in which gender intersects with other identity constructs, such as race, class, ethnicity, sexuality, and nationality. Just as men have too often been treated as though they represent all humans, feminist scholars have too often presented the experiences and behaviors of white women as though they represent those of all women, and feminist scholars continue to grapple with this issue. I noted in my section on representation that media studies is an arena of feminist study that has been especially attentive to issues of difference among women and feminisms, but the developing area of feminist intercultural and cross-cultural study of communication is an important source for this kind of work as well. Continued awareness about issues of difference across feminist work should lead to further reconceptualization of the feminist project in communication.

Feminist approaches to communication also have spurred reconceptualization in the area of theory. Although it is the case that feminist studies in communication have not produced a body of theory that can be specifically labeled as “feminist communication theory,” feminist scholars in different areas of the field have made various attempts to integrate theories from across the academy into frameworks compatible with the study of, for example, rhetoric, organizations, and communication practices across contexts, as is the case with feminist communication scholars’ engagement with standpoint theory. One of the central issues in feminist communication scholars’ engagement with feminist theories from elsewhere in the

academy has been the issue of essentialism—that is, the degree to which a particular theory or approach relies on an assumption of women’s or gender’s “essence” and implies that all women, or men, possess certain characteristics or behave in certain ways. Such assumptions are often labeled as “cultural feminism,” a variety of feminist thought that emerged in the 1970s and whose proponents argued that women were more likely to hold values such as pacifism, cooperation, and nurturance, which should be seen as superior to traditionally masculine values such as aggressiveness, competitiveness, and individualism. The debate over essentialism, however, has largely evaporated since the 1990s, as feminists have generally rejected the notion of a stable, universal gender identity that is unaffected by the issues of difference that we discussed above. In addition, the recent integration of feminist poststructuralist theory, especially work on gender performativity, into feminist work in communication has, as I have discussed at various points above, led to a profound reconceptualization of how we think about gender. Cutting-edge feminist work now tends to ask questions about how communication constitutes, maintains, and challenges gender identities rather than how communication reflects a preexisting, stable gender identity. As is evident from Sloop’s discussion of queer reconceptualizations in the following chapter, this poststructuralist emphasis on the instability of gender is a central theme that unites recent developments in the feminist and queer projects in communication.

As feminist approaches to communication continue to grow and develop, they will continue the process of reconceptualization, because it is generally the case that new insights arise from case studies of particular communication practices, a characteristic that feminist and queer studies in communication share, as John Sloop discusses in the following chapter on queer approaches to communication.

Conclusion

Feminist approaches to communication are somewhat unique because they developed from a political movement that began outside the academic realm (as Sloop discusses in the next chapter, the same is true for queer approaches), and the connection of feminist research to feminist politics continues to be important for communication scholars. Ultimately, feminism’s relationship to communication studies can be broadly understood in three overlapping ways. First, feminism itself, and the communicative practices emerging from its various manifestations, has been a focus of study for communication researchers. Second, feminism has produced a variety of theoretical perspectives for understanding the relationship of gender and power that have been influential in the study of all kinds of communicative practices, not just those emanating from feminist politics. Finally, feminist goals continue to operate in various ways across the

broad field of communication studies, such as through an insistence on the importance of studying gender in our research and in our classrooms, through continuing attempts to ensure gender parity among communication faculty, and through attention to feminist issues that are of concern to all academics, such as sexual harassment.

Note

1. Although I primarily discuss feminist work in rhetorical and media studies in the remainder of this chapter, largely because these are my areas of expertise, feminist work in organizational communication studies deserves mention as well. Much like interpersonal communication studies, the study of gender in organizations began in the 1970s with the “problem” of the entry of women managers into corporate life and emphasized strategies for assimilating women into male-dominated organizational cultures. However, as Ashcraft and Mumby’s (2003) *Reworking Gender: A Feminist Communicology of Organizations* exemplifies, the study of gender in organizations has evolved into a complex and dynamic area of study that understands gender as constitutive of organizations and that employs feminist and critical theory in sophisticated ways.

QUEER APPROACHES TO COMMUNICATION

JOHN M. SLOOP

Vanderbilt University

Queer approaches to communication share a common commitment to exploring the role(s) that gender and sexuality play in communication practices, theories, and analyses. While they certainly have some overlap with other areas of communication—notably feminist approaches—their political origins, their focus on sexuality, and their emphasis on nonnormative identities and behaviors make them distinct.

To begin, studies of gender and studies of sexuality are inextricably linked; contemporary feminist and queer scholars work from a perspective that holds that the socially “proper” performance of gender is tied strongly to the proper performance of sexuality and vice versa. In short, in a culture in which heterosexuality is seen as the norm and heterosexuality presumes binary notions of gender, the proper performance of both men and women is tied to stable forms of sexuality. This is why, for instance, a common stereotype of gay men is that they are feminine (“abnormal” sexuality is culturally linked to “abnormal” gender identity). As a result, any study of gender implies a study of sexuality, and any study of sexuality implies an investigation of gender.

In addition, it is important that I stress that queer approaches have a political dimension; that is, they are academic enterprises that grew from political movements and that support political goals derived from those movements. Beyond their origins in public, political movements, queer scholars see gender and sexuality as always inherently political because of their relationship to power; that is, struggles over gender and sexuality are always struggles over the power that accompanies (or is limited by) the “proper” or “improper” performance of gender and/or sexuality. Below, I discuss the origins of queer approaches to communication and then describe three broad themes—recovery, representation, and reconceptualization—that

characterize contemporary research using queer approaches to communication.

The Development of Queer Approaches to Communication

Queer approaches to communication can be traced to their roots in scholarship about gays and lesbians that developed in response to the public visibility of gay/lesbian social movements. From the 1970s to the early 1980s, a time period when the term *queer scholarship* would have sounded like a pejorative, a number of scholars were studying discourse about “gay rights” or discourse produced by gay and lesbian groups. For example, in 1979, Barry Brummett provided a Burkean analysis of the discourse of gay rights controversies, and in 1973, Chesebro, Cragan, and McCullough analyzed the discursive patterns of gay rights activism and gay consciousness raising. Other rhetorical analyses of the language of gay activism and the “gay community” include Joseph Hayes’s (1976) critique of the language employed by gays in community conversations; Bonnie Dow’s (1994) reading of the gay activist Larry Kramer’s important 1983 essay on AIDS, “1,112 and Counting”; and James Darsey’s (1991) “From ‘Gay Is Good’ to the Scourge of AIDS,” a summary of the changing language of the gay liberation movement. Although there was a simultaneous body of scholarship emerging that concerned the ways in which gays and lesbians were being represented in mass-mediated texts (which I will discuss below), much of this early work focused directly on political movements emerging from the political activism of gays and lesbians.

Beginning in 1995 with the publication of Anthony Slagle’s essay “In Defense of Queer Nation” (1995), a similar growth of scholarship emerged from (or studied) the

discourse of queer politics and queer social movements. If we take gay and lesbian social movement discourse broadly to assume that gays, lesbians, and bisexuals are stable identities and that gays, lesbians, and bisexuals deserve access to the social order based on their overall similarity to heterosexuals, then queer activism built political identity around differences and partial and fluid identities. Slagle's subtitle, "From Identity Politics to a Politics of Difference," laid out this transition rather directly.

While the terms *queer* and *queer theory* are wildly contested in academic literature and political discourse, I attempt here to provide some assumptions that are broadly shared. First, queer criticism operates on a logic that deconstructs the "gender/sex" binary discussed above. Growing in part from the work of Judith Butler's now classic 1990 book *Gender Trouble*, queer theory assumes that bodies are understood as sexed or gendered through the filter of cultural meanings that preexist in those bodies. Our understandings of gender and sexuality are maintained and challenged through performance, but the performance of gender or sexuality does not have a natural or necessary relationship to a particular kind of body. In short, queer criticism assumes that our ideas about the proper performance of masculinity and femininity are maintained by the expectations of heteronormative culture—including our behaviors toward each other in daily life and the representation of proper behavior in public discourse. Thus, the role of queer critique is not only understanding how dominant meanings attached to gender and sexuality are continually reproduced but also the "queering" (i.e., destabilizing) of such meanings and norms. Queer research is thus committed to opening up the possibility for resisting dominant meanings of gender and sexuality through performances that operate outside normative gender and sexuality "boxes."

Since Slagle's 1995 venture into queer activist logic, a number of scholars have used the tactics of activist queer groups to highlight the rhetoric of queer politics or general political lessons that can be drawn from queer tactics. For example, Charles Morris's and my essay (Morris & Sloop, 2006) used images produced by the queer activist group Gran Fury to think through the politics of queer male kissing in public spaces. Additionally, in a number of essays, the rhetorical critic Daniel Brouwer has looked at the ways in which people with AIDS have constituted counterpublics (i.e., marginalized individuals who form a group identity and group logic separate from mainstream or dominant logic) that have queered public understandings of the queer body. In "The Precarious Visibility Politics of Self-Stigmatization" (1998), for example, Brouwer investigates the use of HIV/AIDS tattoos as "self-stigmatization" and in "Counterpublicity and Corporeality in HIV/AIDS Zines" (2005), he focuses on the discourse of two zines produced by gay men with HIV/AIDS to investigate the rethinking of the "diseased" body in discourses that created counterpublics and new cultural logics.

From gay liberation to queer nation, then, the politics and discourse of the social movements themselves have been important resources for communication scholars. I want to stress, however, that the relation between social movements and criticism has been a complicated and robust one. While the discourse of social movements at times has served as a text for analysis by communication scholars, the unique politics emerging from these movements also have been used to help critics understand discourse and politics in other movements. And while rhetorical and cultural critics have used theory to illuminate gay/lesbian and queer movements, the politics of the movements also have altered the ways critics theorize discourse.

Queer Approaches to Recovery

As the result of a large number of factors, the queer "recovery" project is more abbreviated than the feminist one described in the previous chapter. First, because many historical gay/lesbian/queer speakers either did not identify themselves as such or did not speak out on gay/lesbian issues, they are somewhat invisible to any recovery process. Second, and this may be the more forceful reason, institutional/academic homophobia discouraged rhetorical critics from choosing to highlight gay/lesbian/queer speakers. As a result, just as early gay and lesbian research focused on gay/lesbian discourse or discourse about gays and lesbians often at an arm's length (i.e., without an obvious political agenda around gay and lesbian communities), it took even longer for queer recovery to emerge in communication studies.

While there were more overt recovery projects ongoing elsewhere in the academy, such as Jonathan Katz's (1992) *Gay American History*, communication studies as a discipline has moved somewhat slower in this regard. Nonetheless, the combination of the closeted nature of many historical queer orators and queer topics has set the stage for recent interesting queer scholarship. In "Keeping a Good Wo/man Down," for example, Robert Brookey (1998) provided a rereading of the female Revolutionary War soldier Deborah Sampson Gannett as transgendered, hence forcing a rereading of Gannett's feminist statements that had been studied by others. By providing a queered understanding of Gannett, Brookey not only "recovers" Gannett but also transforms the meaning of Gannett's feminist statements. Along these lines, in Charles Morris's recent edited volume, *Queering Public Address* (2007), I reread the story of Lucy Lobdell, a 19th-century woman who lived as a man, as a transgendered story, a case I will discuss more completely below. Such a reading forces a rethinking of the medical and psychiatric linguistic constraints that discouraged queered understandings.

Those who wish to see a stronger urge to rethink historical subjects in communication studies certainly owe a debt to Charles Morris. Not only has he offered fascinating

readings around the closeted queer stories of figures such as the 20th-century FBI director J. Edgar Hoover in “Pink Herring and the Fourth Persona” (Morris, 2002), but, in an essay in his edited collection *Queering Public Address*, he also has investigated the queer panic that occurred in academic journals over the very possibility of Abraham Lincoln’s recovery as a queer subject (Morris, 2007). In most of these cases, the “actual” sexuality of the subject is less important than a critique of the historical discourses that attempted to hold them in place as straight. *Queering Public Address* includes a number of essays that re-read historical figures in productive ways that force critics to understand the constraints on our historical understandings of gays and lesbians. Of particular note are Dana Cloud’s (2007) reading of the discourse concerning First Lady Eleanor Roosevelt, Lisbeth Lipari’s (2007) reading of the African American playwright Lorraine Hansberry, and Eric Watt’s (2007) critique of the queer facets of the Harlem Renaissance.

In short, while “queer recovery” work in communication studies has been slow coming and is certainly dwarfed by work on queer media representations, as I will discuss below, it is an area that is proving ripe for those interested in the history of gay/lesbian/queer orators as well as those interested in the constraints and possibilities allowed by shifting cultural meanings of gender and sexuality.

Queer Approaches to Representation

Like feminist studies of media representation, queer approaches to media representation assume that mass-mediated texts are powerful disseminators of ideology about sexuality. The intersection of media studies and gay/lesbian/queer representation has proven to be a highly productive area. If one traces out its path over time, one sees changes in popular culture as well as changes in the methods and perspectives of queer criticism. For instance, looking at work in the mid-1980s to early 1990s, we find a focus on either the invisibility of homosexual characters or the problematic ways in which homosexuality is made visible. Good examples of this type of research include Larry Gross’s (1991) “The Contested Closet,” a discussion of the ethics of mediated outing of public figures; Alfred Kielwasser’s and Michelle Wolf’s (1992) powerful critique of the symbolic annihilation of gay and lesbian adolescents; and Fred Fejes’s and Kevin Petrich’s (1993) overview of gay representation, “Invisibility, Homophobia, and Heterosexism.” In short, the criticism of this era focused on the lack of mainstream gay representation, offering insights into the reasons for this lack.

However, as gay, lesbian, and queer characters became more visible and more durable as characters throughout the tenure of different series (even becoming the lead characters in shows such as *Ellen* and *Will & Grace*), the focus slowly turned from critiques of invisibility to critiques of visibility. A great deal of such work is reviewed in my earlier essay “Critical Studies in Gender/Sexuality and

Media” (2006) in Bonnie Dow and Julia Wood’s edited volume *The SAGE Handbook of Gender and Communication*. In these critiques, we also find a tension at work between critics who focused on the ways gay and lesbian characters were disciplined into stereotypical “gay” behaviors and critics who found cause for celebration of gay/lesbian possibilities. In short, this body of work displays a tension between highlighting “progressive” changes and highlighting ideological constraint.

While the impulse toward the celebration of possibility or the critique of constraint remains at work, the number of texts to work with in mainstream media outlets—and hence the number of publications about them—continues to grow. Hence, while Katherine Sender (1999) was writing about the dual purpose of “gay window dressing” advertisements in the late 1990s in “Selling Sexual Subjectivities,” what Gust Yep (2003) refers to as “queer readings of the media” in his coedited volume *Queer Theory and Communication* are in full force in the first decade of the 21st century.

Most of these readings in the early part of the decade focused primarily on a discussion of the problematic ways in which gay/lesbian/queer characters were conformed to the gender/sexual ideology of mainstream culture. From Kathleen Battles and Windy Hilton-Morrow’s (2002) discussion of *Will & Grace* to Robert Brookey and Robert Westerfaulhaus’s (2002) critique of the disciplining of the homoeroticism of the film *Fight Club*, to my own (Sloop, 2000) and Brenda Cooper’s (2002) alternative readings of the story of the murdered transgendered teen Brandon Teena in “Disciplining the Transgendered” and “*Boys Don’t Cry* and Female Masculinity,” respectively, to, finally, Bonnie Dow’s (2001) essay “*Ellen*, Television, and the Politics of Gay and Lesbian Visibility,” communication critics have provided numerous accounts of the ways in which these representations constrained gay/lesbian subjectivity, with minor focus on the ways such representations encouraged a queered set of possibilities. Importantly, some of this work is noteworthy for its attention to masculinity and male privilege and its simultaneous engagement with feminist perspectives. For example, in Helene Shugart’s (2003) reading of gay man/straight woman pairings in popular film and television in an essay titled “Reinventing Privilege,” she argues that such couplings reinforce heteronormative norms as well as reinscribe male privilege for gay male characters.

There are relatively fewer recent discussions of representations of lesbians in mass-mediated discourse. The ones that have been written, however, generally take a more optimistic tone. For example, Jennifer Reed (2005) offers a critique of the discourse about Ellen DeGeneres and argues that DeGeneres’s outing has opened up positive representational spaces for other queer performers. Additionally, C. Lee Harrington (2003) offers a somewhat celebratory reading of audience reactions to the lesbian narrative line on *All My Children* in an essay titled “Lesbian(s) on Daytime Television,” and Didi Herman’s

(2003) “*Bad Girls Changed My Life*”—an analysis of a British drama set in a women’s prison—suggests that the show did not offer the expected read of lesbianism through the male gaze but rather presented lesbianism as normal, desirable, and possible.

Overall, attention to masculinity and male privilege in studies of these representations also sensitizes us to the imbalance—in both media representation and scholarship about it—between representations of gay men and representations of lesbians. Indeed, feminist scholars have repeatedly critiqued the ways in which queer scholarship often uses gay male experience as its foundation, ignoring the differing experiences and situations of lesbians and failing to account for the ways in which queer theory elides or runs counter to feminist concerns. Susan Fraiman’s (2003) *Cool Men and the Second Sex* is a strong example of work of this nature. Finally, two notable book-length projects emerged during this era—Larry Gross’s (2001) *Up From Invisibility* and Suzanna Danuta Walters’s (2001) *All the Rage*; each asks readers to be cautious before celebrating the recent growth of gay visibility, and each questions the particular contours of gay/lesbian/queer representations.

More recently, the critical readings have become richer as they have intersected with other forms of critical analysis, such as those interested in the political economy, media studies, and democratic theory. For example, emerging amidst the multiple academic readings of *Queer Eye for the Straight Guy* that focused on the heteronormative disciplining of the show’s titular queers, including E. Michelle Ramsey and G. Santiago’s (2004) “The Conflation of Homosexuality and Femininity” and Robert Westerfelhaus and Celeste Lacroix’s (2006) “Seeing Straight Through *Queer Eye*,” Katherine Sender’s (2006) “Queens for a Day” read the show through the lens of neoliberalism. She argued that the “queer men” on the show act in ways that reinforce neoliberal economic ideology while simultaneously offering a campy aesthetic that potentially undermines certain aspects of heteronormative sexual equations. In “Riding in Cars Between Men” (Sloop, 2005), I combine queer critique with media ecology, offering a reading of “gender trouble” in automobile sports that questions some of the oft-suggested liberating “effects” of technology. Jeffrey Bennett’s (2006b) essay “Seriality and Multicultural Dissent in the Same-Sex Marriage Debate” investigates the rhetorical dispute over same-sex marriage to understand how the value of difference in democratic politics—including differences in sexuality—can be productively understood as taking place in a process of “seriality” rather than being either essential or fluid. While sexuality is a strong focus of his work, it also serves to help the reader understand arguments over democratic processes.

Although there are other ways of mapping out the trajectory of the history of analyses of “queer” representation, the one I have drawn here highlights changes in mainstream representation of gays and lesbians and accompanying

changes in the critical project around representation. Hence, when there was a lack of viable queer representation in mainstream media (or solely negative representations), critics focused on this lack and its political outcomes. When queer representation and visibility proliferate, critics urge caution in the particular ways in which this representation takes shape, warning readers about the perils of too easily equating visibility with progress. Finally, as the representations have taken on a wider variety of hues, queer critics have been able to spend more energy articulating their concerns with a variety of other critical projects.

Queer Approaches to Reconceptualization

In many ways, attempting to identify a “reconceptualization” element of queer criticism is an impossible task. That is, if we take the move from gay/lesbian criticism to queer criticism to be a move that undermines the stability of both gay and straight identities, contesting any solid categories on the grounds of gender or sexuality/desire, then all queer criticism acts as a model of ongoing and permanent reconceptualization. That is, regardless of where we pinpoint the origins of “queer criticism,” it grew out of (and separates itself from) lesbian and gay projects and politics, working in part to undermine clear categories and reasons for holding onto systems and structures that maintain these categories. Hence, queer criticism always already functions as a tool for reconfiguring identity categories, with an ongoing expectation of these temporarily stable identities being undermined again.

In his summary of academic work in queer theory in *Queer Theory and Communication*, Gust Yep, Lovaas, and Elia (2003) noted the difficulty of talking about the purpose or overall project of “queer theory.” Given that it does not aspire to attain theoretical hegemony, given that it is an open system without a *telos*, or end goal, and given its refusal to be fixed to solid “reconceptualizations,” it is difficult to point to specific models. While gay and lesbian scholarship may have pointed to very particular politics or goals (e.g., the inclusion of homosexuals within particular social orders), queer theory to some degree is always troubling categories and meanings before they begin to solidify.

As a result, a queer take on reconceptualization has to queer “reconceptualization” itself, understanding that the reconceptualization is a temporary alignment to solve a particular problem while simultaneously acknowledging that this temporary solution conflicts with other shared political goals and all the while knowing that the new conceptualization itself must be destabilized. Hence, when Jeff Bennett (2006a) recently critiqued two television shows—*Boy Meets Boy* and *Playing It Straight*—in his “In Defense of Gaydar” essay, he is critical of the way in which “gaydar” was ultimately shown to work on the show, unearthing the “true” queers. In place of the reading provided by the show, Bennett offers us the opportunity to

confuse the sexuality of the characters on the show, hoping to undermine—without allowing a stopping point—the sexual and gender “boxes” of these characters.

A better example in terms of its effect on the reader may be Charles Morris’s (2002) “Pink Herring and the Fourth Persona,” a reading of the discourse surrounding J. Edgar Hoover and the way in which Hoover behaved publicly. Drawing on relatively recent claims that Hoover was a closeted gay man with a lifelong partner, Morris traces out the public actions taken by Hoover to close down the ways he was “publicly read” throughout his lifetime. Moreover, Morris illustrates the ways in which other biographers have argued over the meaning of Hoover’s sexuality—some refusing to consider him as homosexual, others opening the door to more fluid interpretations. However, by refusing to take a particular stance on Hoover’s sexuality, but instead illustrating discursive maneuvers to stabilize it, Morris ultimately leaves the reader with a stable understanding of how culture attempts to stabilize sexuality but an unstable understanding of sexuality itself.

While I see Morris’s entire *Queering Public Address* volume (2007) as a project intended to destabilize both the ways in which public address scholarship is carried out, as well as the categories we inherit from history, my chapter in that volume provides another example. In “Lucy Lobdell’s Queer Circumstances” (Sloop, 2007), I investigate the case of the first person to be named a “lesbian” in psychiatric discourse. By drawing on Lobdell’s case history, medical/psychiatric claims about her, and more contemporary readings of Lobdell, I strive to illustrate the ways in which Lobdell’s attempts to “live as a man” were ultimately read through a semiotic lens that could only read her as “homosexual.” By then employing language from queer and transgendered scholarship, I offer other ways in which Lobdell could be read and categorized now. The purpose in such an offering is not to come to a “final” conclusion about Lobdell’s identity but instead to point out the ways in which such an identity—in Lobdell’s lifetime and in the course of subsequent history—is always stabilized by existing discursive frames. A result of reading the chapter, it is hoped, is to recognize these constraints and to rethink the categories of the present based on a destabilizing of the past.

Ultimately, then, while it might be difficult to point to a unified project around which there is one ending point or goal, we can understand that current queer scholarship in communication studies has a task of revealing the fluidity of what seemed to be stable ideas and categories. Moreover, and as I pointed out in the section on representation, as such scholarship progresses, individual scholars are tying the queer project on sexuality into queer projects concerning media theory, political economy, neoliberalism, and so forth. Importantly, however, queer studies, especially in communication studies, have been very slow to take on questions of transglobalism or intersections with race. While there are a couple of remarkable explorations in the area of race and queerness—I would point to E. Patrick Johnson’s (2003)

Appropriating Blackness and Jennifer Brody’s (2003) “Queering Racial Reproduction,” for the most part, this remains an area that demands more focus. While opening attempts at transglobal queer studies have been made outside communication studies—Dennis Altman’s (2001) *Global Sex* is a good example, searches in our journals come up fairly empty. Seeing repeated calls for such work without a response should give us all cause for reflection.

Conclusion

Like the public arguments that parallel queer scholarship, the work in this area went from an era of relatively rare publications, most of which had an observational or “objective” tone, to a proliferation of work, much of it with a personal and political tone. Relatedly, the three themes I point to in this chapter—recovery, representation, and reconceptualization—have each seen strong growth in terms of the quantity, if not quality, of publication. Finally, one of the most exciting aspects of this area of work is that it is persistently reflexive about its own assumptions, its own project. As a result, the field of communication can expect to continue to see strong and complicated offerings in queer scholarship in the years to come.

References and Further Readings

- Altman, D. (2001). *Global sex*. Chicago: University of Chicago Press.
- Altman analyzes the ways in which globalization (via telecommunications, air travel, Internet capabilities) have altered sexual activities and sexual definitions across the globe. Altman illustrates that sex and sexuality have become articulated with global politics and economies, while continuing to differ according to their cultural contexts.
- Battles, K., & Hilton-Morrow, W. (2002). Gay characters in conventional spaces: *Will & Grace* and the situation comedy genre. *Critical Studies in Media Communication*, 19, 87–105.
- After reviewing the ways the homosexual characters on *Will & Grace* were celebrated in mass culture, Battles and Hilton-Morrow demonstrate that the show represents gay males as lacking masculinity, infantilizes subversive characters, and focuses on interpersonal relations rather than cultural politics. In such a way, the show ultimately reinforces heteronormativity.
- Bennett, J. A. (2006a). In defense of gaydar: Reality television and the politics of the glance. *Critical Studies in Media Communication*, 23, 426–444.
- Bennett investigates the ways in which the reality dating programs *Boy Meets Boy* and *Playing It Straight* were said to illustrate that sexual orientation has become difficult to read in a contemporary context. Bennett argues that the liberal democratic politics of the show encouraged this reading; he suggests that “gaydar” instead demands to be understood in individual contexts.

- Bennett, J. A. (2006b). Seriality and multicultural dissent in the same-sex marriage debate. *Communication and Critical/Cultural Studies*, 3, 141–161.
- Bennett uses U.S. public debates over same-sex marriage to highlight the usefulness of “seriality” as a way to rethink the contours of identity politics. Combined with rhetorical theory, Bennett attempts to think of sexual identity as neither completely fluid nor completely fixed and essential.
- Brody, J. D. (2003). Queering racial reproduction: “Unnatural acts” in Angelina Weld Grimke’s “The Closing Door.” *Text and Performance Quarterly*, 23, 205–223.
- Brody reads Grimke’s story as a performance that queers racial reproduction through its strategic use of the door as trope and its entanglement of the discourses of female homoeroticism, lynching, and infanticide.
- Brookey, R. A. (1998). Keeping a good wo/man down: Normalizing Deborah Sampson Gannett. *Communication Studies*, 49, 73–85.
- Brookey provides a reading of the public discourse that surrounded Deborah Sampson Gannett, a Revolutionary War soldier. By reading her as transgendered rather than as feminist, Brookey forces the reader to understand a different form of cultural politics and critical reading.
- Brookey, R. A., & Westerfelhaus, R. (2002). Hiding homoeroticism in plain view: The *Fight Club* DVD as digital closet. *Critical Studies in Media Communication*, 19, 21–43.
- Brookey and Westerfelhaus provide a critique of the film *Fight Club*, the public discourse about it, and the DVD extras included with the film. Ultimately, they argue that while the film could easily be read as homoerotic, the filmmakers went to a great deal of work on the DVD content to discipline the viewer’s understanding of the film, ultimately curtailing its homoerotic potential.
- Brouwer, D. (1998). The precarious visibility politics of self-stigmatization: The case of HIV/AIDS tattoos. *Text and Performance Quarterly*, 18, 114–136.
- Brouwer investigates the politics of HIV-positive tattoos being worn by some seropositive individuals. Brouwer suggests that the tattoos work in both positive and negative political ways, forcing the public to rethink assumptions about health while simultaneously encouraging surveillance.
- Brouwer, D. (2005). Counterpublicity and corporeality in HIV/AIDS zines. *Critical Studies in Media Communication*, 22, 351–371.
- Brouwer investigates two U.S. zines published in the 1990s for men with HIV/AIDS. He argues that the zines create counterpublics for these men and force a rethinking of the erotic/sexual and the grotesque.
- Brummett, B. (1979). A pentadic analysis of ideologies in two gay rights controversies. *Central States Speech Journal*, 20, 250–261.
- Brummett draws on Kenneth Burke’s pentad to illustrate the ways pro-gay rights and anti-gay rights groups focus on agency differently, with progay groups suggesting that people are born gay and antigay groups insisting that people actively choose their sexual activities.
- Butler, J. (1990). *Gender trouble: Feminism and the subversion of identity*. New York: Routledge.
- This is a classic text in queer studies and gender studies, in which Butler introduces the notion that gender (and its accompanying links to sex and sexuality) are performative. While one can alter and challenge cultural codings on gender and sexuality, Butler is also clear that bigenderism and heterosexuality are fairly firmly held in place.
- Chesebro, J. W., Cragan, J. F., & McCullough, P. (1973). The small group technique of the radical revolutionary: A synthetic study of consciousness. *Speech Monographs*, 40, 136–146.
- In a study of gay rights and gay activists, the authors analyze the ways the discourse of radical revolutionarism shapes the consciousness of members of the group.
- Cloud, D. L. (2007). The First Lady’s privates: Queering Eleanor Roosevelt for public address studies. In C. E. Morris (Ed.), *Queering public address: Sexualities in American historical discourse* (pp. 23–44). Columbia: University of South Carolina Press.
- Cooper, B. (2002). *Boys Don’t Cry* and female masculinity: Reclaiming a life and dismantling the politics of normative heterosexuality. *Critical Studies in Media Communication*, 19, 44–63.
- Cooper argues that the representation of the transgendered youth Brandon Teena in the film *Boys Don’t Cry* was a progressive one. Through a reading of the film text itself, Cooper argues that the film operated in part as a critique of heteronormative representations of gender and sexuality.
- Darsey, J. (1991). From “gay is good” to the scourge of AIDS: The evolution of gay liberation rhetoric, 1977–1990. *Communication Studies*, 42, 43–66.
- One part of a larger historical project, Darsey traces out changes in gay liberation rhetoric in the specific time period indicated by the title. Darsey situates these changes as a product both of group discourse and of material circumstances (e.g., HIV).
- Dow, B. J. (1994). AIDS, perspective by incongruity, and gay identity in Larry Kramer’s “1,112 and Counting.” *Communication Studies*, 45, 225–240.
- The gay activist Larry Kramer’s influential essay “1,112 and Counting,” published in New York City’s gay newspaper *The New York Native* in 1983, accused gay men, as well as public officials and health care professionals, of purposefully ignoring the spread of AIDS. Dow argues that Kramer’s confrontational rhetorical strategies worked to construct a new, politicized identity for gay men.
- Dow, B. J. (2001). *Ellen*, television, and the politics of gay and lesbian visibility. *Critical Studies in Media Communication*, 18, 123–140.
- Dow uses the discourse surrounding the coming-out of Ellen DeGeneres/Ellen Morgan to discuss the problematics of public outing stories. In contrast to the idea of “coming out” as liberation, Dow claims that Ellen’s story was one of confession that was ultimately productive of a regulatory discourse that constrained the implications of gay visibility by channeling it through the lens of psychological autonomy.

- Fejes, F., & Petrich, K. (1993). Invisibility, homophobia, and heterosexism: Lesbians, gays, and the media. *Critical Studies in Media Communication, 10*, 396–404.
- Although limited by the date of publication, this is an excellent overview of the treatment of gays and lesbians on all facets of mainstream television (i.e., drama, comedy, news). The authors lay out the ways in which homophobia and assumed heterosexuality make homosexuality invisible or disciplined.
- Fraiman, S. (2003). *Cool men and the second sex*. New York: Columbia University Press.
- Fraiman provides a fascinating read of male academics who she sees as seriously committed to social justice. Despite their political intents, they write using a “masculine” style and draw on examples and theories that either ignore feminism or work in problematic ways with it.
- Gross, L. (1991). The contested closet: The ethics and politics of outing. *Critical Studies in Media Communication, 8*, 352–388.
- Gross provides a thorough examination of the deliberate public outing of gays and lesbians. Gross balances the idea of outing as an invasion of privacy with outing as a politics of truth, investigating outing from numerous angles.
- Gross, L. (2001). *Up from invisibility: Lesbians, gay men, and the media in America*. New York: Columbia University Press.
- Gross investigates the representation of gays and lesbians in U.S. mass media over the past half-century, including coverage of the Stonewall riot, the AIDS crisis, the politics of outing, and the frenzy over Ellen DeGeneres. Gross highlights and balances both the benefits and the problems of the new visibility.
- Harrington, C. L. (2003). Lesbian(s) on daytime television: The Bianca narrative on *All My Children*. *Feminist Media Studies, 3*, 207–228.
- Using a number of “methods,” including production, reception and discourse analysis, Harrington focuses on the soap opera *All My Children* and a narrative involving lesbian identity. Harrington discusses some of the tensions that arrive when gayness is made visible on a seemingly conservative genre.
- Hayes, J. J. (1976). Gayspeak. *Quarterly Journal of Speech, 62*, 256–266.
- Hayes examines aspects of the language used by gay men in the United States, especially in terms of how this language influences the relationship between subculture and dominant culture. Hayes explores dialect use and the linguistic behavior of the gay community in a variety of settings.
- Herman, D. (2003). “*Bad Girls* changed my life”: Homonormativity in a women’s prison drama. *Critical Studies in Media Communication, 20*, 141–159.
- Herman argues that the British television show *Bad Girls*, set in a women’s prison, relies on a set of homonormative assumptions, unlike most other television. Simultaneously, however, the show reproduces dominant understandings of identities and relationships around race. The show illustrates a mix of progressive and conservative meanings.
- Johnson, E. P. (2003). *Appropriating blackness: Performance and the politics of authenticity*. Durham, NC: Duke University Press.
- Drawing from a number of theoretical perspectives and from his background as a teacher and performer, Johnson takes on a number of case studies—including gospel singers, memories of his grandmother, and classroom settings—to discuss the performance of race, as well as a number of other identities.
- Katz, J. (1992). *Gay American history: Lesbians and gay men in the U.S.A.* New York: Plume.
- As the title indicates, this manuscript pulled together a great deal of historical documentation to trace out the history of gays and lesbians in the United States. While on the one hand, it documents this history, on the other, it provides the grounds for analyzing the changing meanings of homosexuality.
- Kielwasser, A. P., & Wolf, M. A. (1992). Mainstream television, adolescent homosexuality, and significant silence. *Critical Studies in Mass Communication, 9*, 350–373.
- The authors argue that while television was beginning to show some images of adult homosexuals, it did not provide meaningful or useful representations of adolescents coming to understand themselves as gay or lesbian. The authors argue that this absence is damaging to gay adolescents in that it does not allow a cultural space for anything other than adult sexuality.
- Lipari, L. (2007). The rhetoric of intersectionality: Lorraine Hansberry’s 1957 letters to the *Ladder*. In C. E. Morris (Ed.), *Queering public address: Sexualities in American historical discourse* (pp. 220–248). Columbia: University of South Carolina Press.
- Morris, C. E. (2002). Pink herring and the fourth persona: J. Edgar Hoover’s sex crime panic. *Quarterly Journal of Speech, 88*, 228–244.
- Through an analysis of the discourse surrounding J. Edgar Hoover, specifically those claiming that he was gay, Morris discusses the ways in which a “textual wink” can operate in silence between members of a subculture of meanings. Morris investigates the “fourth persona,” or quietly acknowledged identities in texts and public discussions.
- Morris, C. E. (Ed.). (2007). *Queering public address: Sexualities in American historical discourse*. Columbia: University of South Carolina Press.
- This collection of essays provides a number of case studies of queer figures and queer stories in American history, including Harvey Milk, Eleanor Roosevelt, and Lucy Lobdell. The authors combine queer methodologies and queer theory in an attempt to expand both queer studies and public address studies.
- Morris, C. E., & Sloop, J. M. (2006). “What lips these lips have kissed”: Refiguring the politics of queer public kissing. *Communication and Critical/Cultural Studies, 3*, 1–26.
- The authors investigate the meaning of popular cultural displays of male-male kissing in an era that seems to celebrate gay visibility. Despite this celebration, the authors argue that the male-male public kiss remains highly political and problematic. They investigate progressive and regressive political possibilities.
- Ramsey, E. M., & Santiago, G. (2004). The conflation of male homosexuality and femininity in *Queer Eye for the Straight Guy*. *Feminist Media Studies, 3*, 353–355.
- The authors argue that male homosexuality and femininity are conflated in *Queer Eye*. While the bonding of gay and straight men over fashion and styling products may be

- uncommon, the representation does little to alter the meaning of gay masculinity.
- Reed, J. (2005). Ellen DeGeneres. *Feminist Media Studies*, 5, 23–36.
- Sender, K. (1999). Selling sexual subjectivities: Audiences respond to gay window advertising. *Critical Studies in Mass Communication*, 16, 172–196.
- Sender provides an analysis of the ways in which a variety of audiences respond to gay window advertising, or that advertising that is open to be read as concerning homosexual themes by gay and lesbian audiences and “straight” themes by heterosexual audiences. Sender’s reading groups, containing gay men, lesbians, and heterosexuals, provide a mixed evaluation of the progressive potential of such advertising.
- Sender, K. (2006). Queens for a day: *Queer Eye for the Straight Guy* and the neoliberal project. *Critical Studies in Media Communication*, 23, 131–151.
- Rather than focus on gay representations in *Queer Eye*, Sender focuses on the ways in which the show follows a logic of neoliberalism. Comparing it with *Queen for a Day*, Sender argues that we, as a mass culture, have moved from a logic of state welfare to a logic of neoliberalism in which tools are provided from which individuals can remake themselves to function in the new economy.
- Shugart, H. A. (2003). Reinventing privilege: The new (gay) man in contemporary popular media. *Critical Studies in Media Communication*, 20, 67–91.
- The author investigates the recent popularity of the gay male/heterosexual female coupling. Shugart argues that the coupling ultimately aligns the gay male with male privilege and reinscribes the male gaze, reasserting blatant sexism.
- Slagle, R. A. (1995). In defense of Queer Nation: From identity politics to a politics of difference. *Western Journal of Communication*, 59, 85–102.
- In the first work published in communication studies on Queer Nation and queer activism in general, Slagle not only provides a history of the transitions from gay rights discourses to queer politics, but he also outlines their different epistemological assumptions and influence.
- Sloop, J. M. (2000). Disciplining the transgendered: Brandon Teena, public representation, and normativity. *Western Journal of Communication*, 64, 165–189.
- Sloop investigates the news discourse surrounding the Brandon Teena case that gave rise to the film *Boys Don’t Cry*. Focusing on the case rather than the film, he argues that the news ultimately reinscribes heteronormative assumptions.
- Sloop, J. M. (2005). Riding in cars between men. *Communication and Critical/Cultural Studies*, 3, 191–213.
- Using the news reportage of two controversies concerning a regional female stock car racer, Sloop merges an investigation of the changing notion of the body as prosthetic with the gendered ideology of popular culture, investigating the ways in which the two inclinations are in conflict.
- Sloop, J. M. (2006). Critical studies in gender/sexuality and media. In B. J. Dow & J. T. Wood (Eds.), *The SAGE handbook of gender and communication* (pp. 319–333). Thousand Oaks, CA: Sage.
- This chapter reviews current research on the representation of gender and sexuality in mass media, dividing it into three areas: (1) studies focusing on ideological clawback in mass media, (2) studies dealing with the political ambivalence of mediated texts, and (3) studies that focus on politically progressive readings of mediated texts.
- Sloop, J. M. (2007). Lucy Lobdell’s queer circumstances. In C. E. Morris (Ed.), *Queering public address: Sexualities in American historical discourse* (pp. 149–173). Columbia: University of South Carolina Press.
- Walters, S. D. (2001). *All the rage: The story of gay visibility in America*. Chicago: University of Chicago Press.
- Walters provides an analysis of public discussions of gay men and women since the mid-1990s. Noting the explosion of gay visibility, Walters traces out the arguments that celebrate the visibility and the ones that see it as working counter to popular acceptance of gay populations. She observes that both tendencies are in play simultaneously and suggests the pitfalls of fully embracing either position.
- Watt, E. K. (2007). Queer Harlem: Exploring the rhetorical limits of a black gay “Utopia.” In C. E. Morris (Ed.), *Queering public address: Sexualities in American historical discourse* (pp. 174–194). Columbia: University of South Carolina Press.
- Westerfelhaus, R., & Lacroix, C. (2006). Seeing “straight” through *Queer Eye*: Exposing the strategic rhetoric of heteronormativity in a mediated ritual of gay rebellion. *Critical Studies in Media Communication*, 23, 426–444.
- Taking a queer perspective, the authors argue that while *Queer Eye* provides visibility for gay men, it does so by simultaneously domesticating queers, containing their sexuality, and recentering straight men. In such ways, it supports heteronormativity.
- Yep, G. A., Lovaas, K. E., & Elia, J. P. (Eds.). (2003). *Queer theory and communication*. Binghamton, NY: Haworth Press.
- The editors pulled together a strong set of essays that investigate the history of queer theory and its impact on communication studies. The breadth and depth of the analyses make this a strong assessment and review of the field.

PART III

KEY PROCESSES OF COMMUNICATION

MESSAGE CONSTRUCTION AND EDITING

MICHAEL E. ROLOFF

Northwestern University

COURTNEY N. WRIGHT

University of Tennessee, Knoxville

Individuals communicate to achieve a number of gratifications, including pleasure, affection, inclusion, escape, relaxation, and control (Rubin, Perse, & Barbato, 1988). Research examining the message features that most effectively produce these benefits has produced well-established literatures on communication effects such as persuasion (Dillard & Pfau, 2002), conflict management (Oetzel & Ting-Toomey, 2006), and group decision making (Hirokawa & Poole, 1996). Although the aforementioned scholarship provides useful insights, researchers have also studied the processes by which individuals construct messages intended to achieve these ends. These studies have focused on skills that might facilitate or hinder the construction of effective messages (e.g., Greene & Burlison, 2003). This chapter defines message construction and then examines the theory, methods, applications, and future directions associated with this important research area.

Defining Message Construction

Message construction is the process by which individuals compose and revise messages intended to accomplish their interaction goals. Although messages are enacted with nonverbal cues, message construction theory and research primarily focus on how the linguistic features of a message are produced. Hence, for much of the research conducted

in this area, a message constitutes linguistic elements (i.e., words) organized in some fashion (e.g., phrases, sentences, paragraphs) to achieve objectives. The length of a message may vary considerably, ranging from a single word to an elaborated tome, and may be presented via a variety of channels (i.e., face-to-face, written, electronic).

Although messages are composed of linguistic cues, not all researchers are interested in studying the specific elements in the message (e.g., verbs, nouns) but instead focus their attention on the features attributed to them. Hence, researchers may analyze the linguistic elements in a message so as to identify how they reflect ideas, topics, strategies, and arguments. Additionally, scholars may analyze these elements to examine how they embody stylistic features, such as the degree to which the message is listener adapted, direct, or face supportive/threatening.

Construction implies that individuals assemble linguistic elements into a message. In some cases, individuals create alternative message versions of which some may call for the revision, enactment, or even rejection of the message (Meyer, 1997). For example, individuals who want to tell a lie in response to a question may consider a truthful response as well as various forms of lies (Walczyk, Roper, Seemann, & Humphrey, 2003). In such cases, individuals may be quite strategic and mindful of how they are constructing the message and may even rehearse it mentally or out loud before delivery (Stutman & Newell, 1990). However, when a communication exchange begins, the

message construction process may be very short and occurs when individuals pause before responding to another's statement. During these nonresponsive periods, the ability to process information can be taxed as individuals attempt to make sense of what was just said, control their emotional reaction to it, reconsider and perhaps revise their interaction goals, and formulate an appropriate response. In effect, they monitor their own actions and make adjustments while listening to their partners to assess reactions (Clark & Krych, 2004).

Theory

Early research on message construction was primarily concerned with cataloging message types (e.g., Miller, Boster, Roloff, & Seibold, 1977; Shenck-Hamlin, Wiseman, & Georgacarakos, 1982) and refining methods to study them (e.g., Burleson et al., 1988). Limited theorizing occurred, with most research focused on the degree to which message features were related to individual-difference variables such as Machiavellianism (Roloff & Barnicott, 1978), cognitive complexity (Delia & Clark, 1977), and situational features (Cody & McLaughlin, 1980). With time, researchers started focusing more broadly on the cognitive processes associated with message construction.

Although there are many theories focused on aspects of message construction and each has its nuances, they share several principles. First, messages are constructed to achieve interaction goals. The objective is to induce some state in another (e.g., helpfulness, guilt, liking, respect, compliance). Interaction goals serve broader functions. For example, interpersonal influence is often motivated by a need to provide lifestyle advice, gain assistance, share activities, change another's political stance, give health advice, and change a relationship (Dillard, 1989). Social confrontations allow individuals to exert influence, reach catharsis, maintain their relationships, create understanding, and gain retribution (Stutman & Newell, 1990). Disclosing personal information to another may arise from a need for self-expression, self-clarification, social validation, relational development, or social control (Derlega & Grzelak, 1979).

Goals can be arranged hierarchically, and hence, to achieve a primary goal such as persuasion an individual may need to achieve subgoals, such as overcoming obstacles to compliance (Francik & Clark, 1985; Roloff & Janiszewski, 1989). Often individuals have a primary goal in mind that commits them to engaging another person. For example, a decision disclosure model developed by Omarzu (2000) posits that individuals go through several steps before deciding to self-disclose. These steps can include assessing whether their need to disclose requires action, whether an appropriate person is present to whom one might disclose, and whether disclosure would be appropriate in the situation and balancing the possible risks and benefits that may result from disclosure.

Furthermore, individual characteristics and situational features may prompt secondary goals to emerge that can affect the form of the message. When preparing for an argument, these secondary goals can be reflected in editing standards such as effectiveness, truth/honesty, self-image, other-image, and relational concerns (Hample, 2000; Hample & Dallinger, 1990). Influence messages can also be intended to reflect a person's true identity, create a positive conversation, maintain a valued relationship, and control arousal (Dillard, Segrin, & Harden, 1989). When planning for a confrontation, individuals report performance goals that include the desire to be argumentatively complete and to remain on the offensive (Stutman & Newell, 1990). On a basic level, these goals may reflect general conversational restraints (Kellermann, 2004) that require individuals to communicate in an efficient manner (e.g., express as few words as necessary) and to do so in a socially appropriate manner (e.g., do not impose on another's decision-making autonomy).

Although researchers have uncovered a variety of interaction goals, not all of them may be activated in a given encounter. Something must make them salient. However, activation does not necessarily mean that a person is aware of the goal. There is evidence that interpersonal goals can be nonconsciously activated by exposure to linguistic terms such as *family* or *friends* (Fitzsimons & Bargh, 2003). Furthermore, a secondary goal may be activated when the current situation is similar to other situations in which it has been previously pursued (Meyer, 2007).

Second, because messages are often designed to achieve multiple goals, individuals often find ways to incorporate several objectives into their message features. Hence, when rejecting a request from someone they like, individuals may include linguistic softeners such as apologies or explanations with their rejection and thereby preserve a positive relationship and maintain desirable social images. In some cases, multiple goals may promote sequences of messages that increase the likelihood of achieving a primary goal. So if uncertain about whether a person has the time to provide assistance, a communicator may first ask if the person is busy and, if the answer is no, then proceed to ask for help (Jordan & Roloff, 1990).

Third, message construction is influenced by information contained in memory. Several theories have been used to examine the role of memory in message construction. Kellermann (1997) focused on how conversational knowledge is organized in memory. She posits that individuals have conversation memory organization packets (MOPs) that are composed of scenes that contain generalized actions that lead to certain goals (e.g., complimenting someone stimulates liking). MOPs may focus on culturally shared information, such as physical settings in which a type of conversation takes place (e.g., it is more appropriate to confront someone about their negative behavior in private than in front of others) and the conversational elements that typically occur (e.g., when confronting someone, it is best to offer solutions for the problem). MOPs

may also reflect an individual's own personal experiences with this type of conversation (e.g., the last time I confronted my partner, she became angry). More than one type of MOP may be activated at the same time, and therefore, a person's message may be a composite of both cultural expectations and personal experience. Also, individuals may have a universal scene that indicates how individuals in communication roles should act in most situations (e.g., when talking to someone, one should establish rapport before turning to other topics). Hence, it is possible that individuals have a general understanding of how they should go about acquiring information and choose to follow this routine in most conversations, sometimes repeating these routines as new issues emerge within a given conversation.

Greene's action assembly theory (1984, 1997) provides another account of how memory influences a message. He argues that action assembly is guided by three types of information contained in memory. First, procedural records contain a symbolic representation of an action, outcomes associated with the action, and situations that are related to the action and outcome (e.g., polite requests typically gain compliance from strangers). Although procedural records are often independent, if they are frequently activated together, they may combine into a second type of informational structure called a unit assembly. Unit assemblies contain portions of more than one procedural record (e.g., complimenting others makes them feel good, and people are more likely to comply with a request when they are in a good mood). Finally, individuals possess outcome representations that specify the typical features of an action, the sequence in which the features are enacted, and their timing (e.g., when making a request of a stranger, one should wait until the person is not too busy, apologize for interrupting the person, and then make a request rather than a demand).

According to Greene, when formulating messages, individuals draw on information contained in memory about similar encounters. In doing so, they momentarily consider alternative conceptions of the event and the messages associated with them. After choosing one conception, the others may no longer be activated. The activated conception of the event will guide how the message features are organized (i.e., the grammar used), its content (i.e., the words), and how it will be spoken (i.e., paralinguistic cues). Moreover, the features of the conception are hierarchically organized such that those that are most abstract constrain the more concrete forms (e.g., in this situation, I must be polite, hence I should say, "I hate to interrupt, but I would be grateful if you could help me."). In situations in which a particular record has been frequently or recently activated and practiced, message construction may be quick, perhaps nonconscious, and the resulting behavior becomes a routine way of acting. When individuals encounter a situation of which they have no prior experience or knowledge, they often create plans that combine or adapt actions that they have used in the past.

Berger (1997, 2007) has proposed a theory of communication plans that has implications for message construction. Plans constitute mental representations of action sequences aimed at achieving goals. After deciding to pursue goals, individuals initially search their long-term memory for plans that have been effective in the past. On failing to find one, they create a new one that is a composite of older plans and information from the current situation. When strongly desiring to fulfill a goal, individuals create plans that are complex (i.e., they often have a number of specific steps, and they may include alternative sequences that may be enacted should an obstacle be encountered). In addition, to create complex plans, individuals must have a high degree of strategic knowledge about how to achieve a goal as well as knowledge about how to do so in the current situation.

Fourth, individuals construct messages that anticipate the goals, needs, and reactions of those with whom they communicate. To accomplish one's interaction goals, it is often useful to incorporate the views of another into one's message, or, in effect, engage in listener-adapted or person-centered communication. Hence, individuals take into consideration another's needs when constructing messages that comfort others (Burlison, 2003) and requests that overcome obstacles to compliance (Roloff & Janiszewski, 1989).

To facilitate understanding, speakers are thought to engage in audience design. In audience design, individuals access from memory the shared information they have with their intended target(s) and reference that information in their message (Clark & Marshall, 1981). The ability to access common ground varies with the prior history between a speaker and his or her partner (Horton & Gerrig, 2005). For example, when communicating with someone with whom they have a history, individuals may have a detailed set of experiences from which to access common ground, and their communications can be highly efficient (i.e., they do not have to fully explain details). However, when interacting with someone with whom they have little history, individuals have to create more detailed initial messages (Lau & Chiu, 2001), or they have to monitor and adapt their messages as they establish commonality during the interaction (Horton & Gerrig, 2005). In addition, time pressure to prepare a message may limit the ability to access common ground, and consequently, individuals have to correct for errors during the conversation (Horton & Keysar, 1996).

Fifth, when encountering resistance, individuals adapt their messages to overcome problems (e.g., Ifert & Roloff, 1996), and when unsuccessful, they disengage. Messages sometimes fail to accomplish the goals for which they were designed. Hence, individuals monitor and adapt their messages so as to accommodate the responses of others. For example, individuals who are trying to deceive another are sensitive to the degree to which the person is acting skeptical and then adjust their messages so as to increase their believability (Buller & Burgoon, 1996).

Berger (1997) posits that when encountering failure, individuals initially repeat their message but on further failure they alter their message elements without altering the higher-level interaction goal. For example, instead of abandoning a persuasive attempt, the person tries to clarify the basis for influence or uses a different argument. Regardless, failure can result in negative affect (e.g., frustration), which may cause individuals to choose to disengage from the conversation.

Sixth, messages that effectively achieve interaction goals are retained in memory and repeated. When such messages are shared within a community of speakers, they become conventionalized ways of speaking (Gibbs, 1986). Conventional speech allows people to recognize the intent of speech acts without having to understand the literal meaning of the words. Hence, conventional speech is a highly efficient way of communicating and can be used in a manner that is socially appropriate. For example, when making requests, individuals may be conversationally indirect (Blum-Kulka, 1989). Instead of using directives (e.g., "Pass the salt."), which can be impolite, they use hints (e.g., "This food needs salt."), indirect requests (e.g., "Could you pass the salt?"), or need statements (e.g., "I need the salt."), which are conventionally recognized as requests.

Method

Although ethnographic and conversational analytic methods have provided useful descriptions of discourse features and patterns, most researchers interested in message construction use variable analytic techniques. This approach requires them to measure their variables and to assess the degree to which they are correlated. To do so, they must measure message characteristics, assess the process by which messages are created, and observe variation.

Assessing Message Characteristics

Message characteristics are the final product of message construction. Although messages can have a variety of characteristics (e.g., length, organization, content), most researchers focus on only a few at a time. Several different methods have been used to measure these characters.

One of the earlier methods employed was labeled strategy selection (Burlinson et al., 1988). Typically, researchers provide research participants a hypothetical scenario and ask them how likely it is that they would use each strategy contained in a preselected list (e.g., Roloff & Barnicott, 1978). In some cases, the listed strategies were deduced from existing theories, and in other cases, they were inductively derived from actual descriptions of compliance-gaining attempts. The latter approach had the advantage of allowing researchers to test theories but, at the same time, overlooked some frequently used strategies unrecognized

by current theory. In some studies, the listed strategies were stated in broad terms (e.g., "I would threaten the person."), and in other studies, they were phrased in a specific manner (e.g., "I would tell the person that if he doesn't lend me the class notes I will never again talk to him."). The former allowed researchers to investigate categories of influence strategies but overlooked their linguistic nuances. The latter approach could not inform as to whether any results generalize to alternative ways of phrasing the same strategy. Perhaps the greatest weakness of the strategy selection approach stemmed from an item desirability bias. Individuals overreport the likelihood that they would use socially appropriate strategies while underreporting the likelihood they would use inappropriate ones (Burlinson et al., 1988).

As an alternative to strategy selection, some researchers use a message construction approach (Burlinson et al., 1988). Research participants are provided with a hypothetical scenario; then, they write what they would say, or in some cases, their message is audio recorded. The features of the messages are then categorized by trained coders. This approach produces actual discourse and is less biased by item desirability than is the strategy selection method (Burlinson et al., 1988). However, like the message selection method, the message construction method is not interactive. Typically, it assesses what individuals initially would do and provides little information about how messages might change as the conversation progresses.

Perhaps the most realistic method is to have individuals engage in an interaction. After being provided with instructions, their interaction is recorded. In some cases, the individuals may have an existing relationship (e.g., spouses), and in other cases, they are asked to adopt a specific role. In addition, one of the conversationalists may be a confederate in the study and is programmed to respond in a given fashion. Although yielding a rich variety of message characteristics, this method is formidable to use. Conversations can be messy. Individuals often interrupt and talk over each other. Grammatical rules are strained. Comments are often incomplete or change in focus before they are completed. Hence, researchers often struggle when deciding which behaviors to code and what categories to be used. Moreover, because conversationalists are influenced by each other's actions, there is dependency in the data, which complicates the statistical analysis. Statistics assume that all data points are independent observations, but because data from interactions are correlated (e.g., "How are you?" and "Not so well today," are related to each other), they are not entirely independent. So statistical tests that assume independence will be inaccurate to some degree when used to analyze messages. This inaccuracy may or may not be substantial enough to provide wrong answers to the questions the researchers are asking, so it is important to verify results in these studies through replication (i.e., Do the findings hold when the study is conducted with another group of people?).

Process Measures

Although measures of message characteristics are important, they only provide indirect information into the processes that occurred while they were constructed. To more directly gain insight into those processes, a number of approaches have been used.

First, some researchers access the process by testing for statistical mediation. This approach examines the degree to which the relationship between two variables arises from a third variable that reflects a process. Hence, when requesting assistance from another, intimates often create shorter messages than do strangers. This relationship is thought to be mediated by relational obligations that specify that intimates should volunteer to help in a time of need and, hence, require no explanations or incentives for helping. To assess this relationship, statistics are used to determine whether the intimacy influences message length through relational obligations (Roloff et al., 1988). Although this approach is useful, it does not provide detailed information about when and how obligations were used when forming the message. Rather, the approach merely indicates that intimates generate brief messages because they feel that they are obligated to help.

Second, other researchers have looked for behavioral indicators of message construction. One such assessment is response latency (see Monahan & Roskos-Ewoldsen, 2007). Response latency is the length of time it takes an individual to respond to another's statement. Presumably, the longer the response latency, the greater the amount of thinking that is going into constructing the response. One limitation to this measure is that it does not include detailed information about the content of the thoughts, nor does it inform as to other factors that may influence response latencies.

Finally, some researchers have used a "think-aloud" approach (e.g., Hample, 2000). This involves asking individuals to talk aloud while they are preparing a message for another or to review tapes of their interactions and describe what they are thinking at various points. Such an approach provides a direct description of the process. However, it is unclear as to the degree to which such a method might portray message construction as being more deliberative, rational, and focused than is actually the case when individuals are not accounting for their actions. Moreover, it is unclear whether post hoc (after the fact) analyses of thoughts actually reflect the processes occurring during the interaction.

Observing Variation

Variable analytic approaches observe variance in the constructs. Hence, a study that investigates how perspective taking influences message construction cannot be analyzed unless the study includes both individuals who vary in perspective taking and those whose messages vary in content. Researchers typically employ two methods of finding variance.

First, some researchers create variance through experimental methods. Often, research participants are given hypothetical scenarios and asked to select a strategy (i.e., Imagine that you want to go out on a date with someone; how likely is it that you would ask them to go out with you?), construct a message (i.e., Imagine that your friend is feeling bad and you want to make him or her feel better; write what you would say to him or her.), or enact a message (i.e., In the upcoming negotiation, you will play the role of a student who is selling a text, and your counterpart will play the role of a buyer.). These methods provide a great deal of control in that the researcher can focus the attention of participants primarily on key aspects of the study. However, such a strong focus may not generalize well to actual interactions. Moreover, the hypothetical nature of the stimuli may not create the same involvement as when interactions are natural rather than contrived.

An alternative method relies on capitalizing on existing variance. In this case, the researcher does not produce variance but seeks instances that may naturally vary. One method of doing this is to interview or survey individuals about actual instances when they constructed messages. Hence, a researcher may ask participants to describe what happened when they asked someone out on a date. This approach samples actual rather than contrived events. However, such recollections can suffer from a variety of selection biases. Individuals may have forgotten details of the event, may present them in a socially desirable fashion, or may select an atypical event (i.e., one that easily comes to mind). Moreover, rarely are both parties to an interaction interviewed or surveyed, and hence, it is not known if they would recall or report the event in a similar fashion.

Applications

As noted earlier, messages are a means of accomplishing one's goals, and hence, the study of message construction has pragmatic value. Several applications are paramount. First, research on message construction has provided insight into the development of effective communication skills (Berger, 2003). Indeed, some view message construction as a component of being a competent communicator (Wilson & Sabee, 2003). Considerable efforts have been made with regard to how to assess these skills (Spitzberg, 2003) and effectively provide instruction in them (e.g., Natalle, 2008).

Second, message construction research provides insight into the role of communication in determining a person's well-being. For example, individuals who suffer from chronic loneliness construct messages that include general or negative information about themselves that proves to be unattractive to others (Bell & Roloff, 1991; Berger & Bell, 1988). Some individuals who are highly sensitive to interpersonal rejection create a self-fulfilling prophecy by constructing negative messages that prompt others to reject

them (Downey, Freitas, Michaelis, & Khouri, 1998). Research also suggests that deficiency in skills may prompt individuals to construct messages that are counterproductive to their well-being. For example, depressed individuals often lack the social skills that would improve their mental state (Segrin, 1990, 2000), and verbally aggressive individuals often engage in counterproductive communication such as insults in part because they lack the ability to construct logical arguments (Infante & Rancer, 1996). Because of these patterns, clinical applications may be designed so as to improve communication and individual well-being (e.g., Segrin & Givertz, 2003).

Third, message construction also provides insight into relationship problems. Often, individuals in unhappy marriages construct messages that lead to counterproductive sequences such as demand-withdraw patterns, in which an individual demands that his partner change and the partner subsequently withdraws from the conversation (e.g., Caughlin, 2002). Additionally, an individual's criticism of a partner's behavior can stimulate a sequence of defensiveness, contempt, and stonewalling (Gottman, 1994). Both traditional and integrative behavioral therapies focus on helping couples construct positive messages and have been shown to be effective in treating marital problems (Christensen et al., 2004).

Fourth, some message construction researchers have conducted studies that have implications for communication in applied contexts. For example, there is a growing body of research focused on how health care providers and patients can communicate in a fashion that is informative, sensitive, and builds partnerships (e.g., Street, Krupat, Bell, Kravitz, & Haidet, 2003). In fact, some medical schools have begun incorporating such skills into their curriculum (Makoul, 2003) and continuing-education programs (e.g., Van Dulmen & Holl, 2000). Organizational researchers have focused on how superiors and subordinates can establish high-quality working relationships by providing constructive and supportive feedback (e.g., Mueller & Lee, 2002), and many MBA programs have incorporated communication training into their curriculum (Knight, 1999) as a result. Education and instructional communication research also focuses on the importance of constructive feedback. Communication research also informs as to student compliance-gaining attempts, even between students and instructors of different status levels (e.g., graduate teaching assistants and professors) (see Golish, 1999). The increasing use of online technologies in educational contexts via teacher-student e-mail exchanges, computerized discussion groups, and distance learning has made computer-mediated communication an area of particular interest as well. To this end, research informs as to a variety of issues, including the impact of teachers' e-mail strategies on students' willingness to communicate online (e.g., Waldeck, Klearney, & Plax, 2001).

Fifth, with the growing interest in and use of information technologies, some researchers have attempted to use the findings of message construction research to create

computer software that can communicate with humans. Given the tendencies of human beings to anthropomorphize (attribute human qualities to nonhumans), such software could allow for human-machine communication. For example, some research indicates that humans mindlessly use interaction norms such as politeness and reciprocity when communicating with computers (see Nass & Moon, 2000). Moreover, some researchers have created embodied conversational agents that are computer interfaces containing humanlike characters that can enact messages as well as integrate nonverbal cues with them (Cassell, Sullivan, Prevost, & Churchill, 2000). There is evidence that individuals can engage in rudimentary dialogue with these agents, and as they do so, they come to expect the agents to communicate like humans (Bickmore & Cassell, 2005).

Finally, with the increasing opportunities for members of different cultures to interact, researchers have been interested in identifying cross-cultural communication skills. Cross-cultural encounters can have a high degree of anxiety and uncertainty that, if not handled effectively, can create miscommunication (Gudykunst, 1993). Hence, individuals in intercultural settings must be aware of the messages they are sending, understand alternative ways by which they might be constructed, and verify how their messages are perceived. Hence, cross-cultural training programs are designed to include information about how to construct messages that allow individuals to initiate conversations, carry on meaningful discussions, and clear up misunderstandings (e.g., Eschbach, Parker, & Stoeberl, 2001).

Trends

Two trends are apparent in message production research. First, with the increasing use of communication technology, researchers are increasingly interested in the relationship between channel characteristics and message production. Several theories have developed that focus on channel characteristics associated with computer-mediated communication versus face-to-face conversation (e.g., Daft & Lengel, 1984) and how individuals choose media based on their interaction goals (Sheer & Chen, 2004) and conform their messages to norms associated with an Internet community (Lea & Spears, 1995; Wilkins, 1991) or adjust their messages to overcome channel characteristics (Walther, 1996). With the rapid advancements in information technologies, it is likely that new insights will emerge, and theory will need to be adjusted (Soukup, 2000).

Second, researchers continue to be interested in the degree to which the principles of message construction are universal or culturally bound. Although the concrete features of messages vary with cultures (e.g., different languages), some aspects of message production are thought to be universal. For example, identity implication theory assumes that regardless of culture, individuals want to gain approval and autonomy from others, realize that others

have the same needs, and, hence, act in ways that support the face needs of themselves as well as others (Wilson & Feng, 2007). Hence, individuals from different cultures share rules about the types of face attacks that may arise from a particular type of conversational move (e.g., a directive), but the likelihood that a face attack will occur in a given situation depends on cultural norms. Moreover, the influence of culture may vary with the context. Some psychologists argue that culture provides a shared cognitive tool or frame that can be used to guide behavior. However, these cultural cognitions are not always activated, and consequently, behaviors across cultures are sometimes similar (Hong & Chiu, 2001). Hence, cultural differences are most likely to be seen when individuals must act quickly or when culture has been primed, such as when communicating with others from the same culture. Indeed, individuals who are members of more than one culture (e.g., Asian Americans) may engage in cultural frame switching when they communicate with others from the different cultures to which they belong (Hong, Morris, Chiu, & Benet-Martinez, 2000).

Conclusion

Over the past three decades, message construction theory and research have grown in volume, methodological sophistication, and focus. Researchers have moved from descriptive studies often focused on identifying features and patterns of messages to more specific accounts of the cognitive process that influences message construction. Message construction research has implications for understanding both well-being and how humans are able to communicate with computers. Furthermore, there is increased recognition that new technologies may influence message construction, and with increasing globalization, researchers are investigating how culture influences message construction. The study of message construction is a multidisciplinary effort carried out by scholars from anthropology, communication, computer science, linguistics, psychology, and sociology. This pattern has produced models that span disciplinary boundaries and reflects a useful model of interdisciplinary approaches.

COGNITION AND INFORMATION PROCESSING

JOHN O. GREENE AND MELANIE MORGAN
Purdue University

A simple fact motivates this chapter: The mind makes human communication possible. Obviously, there are many extra-individual elements and processes, including symbol systems (e.g., language), culture, and so on, that play a role in shaping and constituting communication events. Cognitive processes, though, are the absolutely essential and ineluctable foundation of communication—without these processes (which will be examined in this chapter), communication (whether it be interpersonal communication, intercultural communication, mass communication, whatever) simply doesn't transpire.

“Cognition and information processing” is an umbrella term that encompasses all mental states and activities—those we are conscious of, those that take place outside of consciousness, and even consciousness itself. From the instant we encounter a stimulus to the time (a moment or years later) when we respond, cognitive processes are at work. Cognitive processes allow us to see, comprehend, move, and speak.

A Quick (and Selective) Survey of the Domain

To gain an appreciation of just how deeply intertwined cognitive processes and communication are, it is useful to consider some examples of the phenomena encompassed by “cognition and information processing.” To set the stage for that discussion, let us begin with a rudimentary scheme that partitions the mental realm into three components: the input-processing system, memory systems, and the output system.¹

Basic Frameworks of the Information-Processing System

The Input-Processing System

The input side of the information-processing system includes all those activities involved in taking in and making sense of the stimulus environment. The input-processing system thus includes processes such as *attention*, *perception*, and *comprehension*. The attentional subsystem functions to bring cognitive resources to bear in processing certain inputs, to the relative exclusion of others. In essence, attention is a selection system that serves as the “front door” to the rest of the information processing system: If you don't attend to what another person is saying, or a message in the mass media, those inputs are not likely to have an impact.

Perception refers to a set of cognitive operations by which we segment and categorize stimulus inputs into meaningful relationships and kinds. For example, the perceptual subsystem allows us to recognize that some objects in our visual field are farther away than others, to identify the letters printed on this page, to isolate the sound units that make up spoken language, and to recognize facial expressions of emotion. Our perceptual systems allow us to arrive at a coherent, “sensible” grasp of what's out there. Take away perceptual systems, and the world becomes a morass of unintelligible shapes, colors, movement, and sound.

Comprehension encompasses those processes by which we combine basic perceptual information with knowledge of causal relationships, rules of language, social regularities, and so on to construct a model of unfolding reality.

For example, it is comprehension processes that permit us to move from the perception of linguistic sound units to an understanding of the meaning of a phrase (e.g., “You look so handsome tonight.”); to link successive utterances, even when there is no stated connection between them (“And you must have been drinking.”); and to make sense of those phrases as elements of a larger discourse or story (“That’s it; I’m going home to mother!”).

The Memory System

The memory system can be partitioned in various ways, but doubtless the most fundamental distinction is between *long-term memory* (LTM) and *short-term*, or *working memory* (STM). As the label suggests, LTM is a repository that preserves information for an extended period—even years or decades. Moreover, the capacity of LTM is virtually unlimited—we don’t have to forget old information in order to make room for new facts. Again, there are different ways of subdividing the LTM system, but one common approach distinguishes between *declarative* and *procedural* memory. Declarative memory is memory for facts—the things you know about the world. It is in declarative memory that you have retained your mother’s middle name, the story line of *No Country for Old Men*, and the lyrics of your favorite songs. Procedural memory, on the other hand, contains information about how to do things: It is the basis of our skills. Because of procedural memory, people are able to drive a car, pronounce the words of their native language, or play a musical instrument.

While LTM preserves a vast store of information, most of that information isn’t available for use or processing at any particular time—cognitive scientists say that it isn’t “activated.” The STM system, then, is the site of information that is activated and available for further processing. You could think of LTM as a blackboard filled with written statements in a darkened room and STM as a small portion of that information illuminated by the beam of a flashlight. As the light beam moves across the board, information is lost from the STM as new facts enter. So, unlike LTM, where the storage capacity is virtually unlimited and where information is preserved perhaps for a lifetime, STM holds a very limited amount of information and for only a brief period. On the other hand, STM allows you to rehearse, manipulate, and elaborate its contents: You can, for example, rehearse a new acquaintance’s telephone number, add its digits, or even mentally traverse them in reverse.

The Output System

The output side of the information-processing system involves all those processes by which we formulate and execute behavioral responses. Essential components include, but aren’t limited to, activities such as those identified in the goals-plans-action (G-P-A) model (Dillard, 2008): *goal formation*, *response planning*, and

the *assembly and implementation* of overt behaviors. Scholars differ in their conception of the exact nature of “goals” (e.g., must they be conscious?), but the basic notion of what goals are is one we all intuitively grasp: Goals define what we’re trying to accomplish and constrain how we go about it (e.g., the car salesperson tries to make a sale without appearing to be too aggressive). Goal-formation processes, then, are those that give rise to these objectives and constraints. As the “drivers” of the output system, goals channel mental resources toward particular cognitive activities and thereby shape how and what we think, and what we do and how we go about it.

Planning involves formulating a behavior, or more likely a sequence of behaviors, for accomplishing one’s goal(s), and it entails several distinct subprocesses (see Berger, 1997). For example, one aspect of planning is the identification of subgoals—intermediate steps that must be taken to achieve the overarching objective (e.g., to accomplish the goal of serving dinner, one must procure the necessary ingredients, combine them properly, preheat the oven, etc.). Planning also involves identifying potential ways of accomplishing each goal or subgoal (e.g., given the goal of introducing himself to a stranger, a certain denizen of the jungle might consider saying “Hello, my name is Tarzan, and I am delighted to make your acquaintance” or, alternatively, “Me Tarzan.”). And yet a third component of planning is anticipating the likely outcomes of potential behaviors, that is, “engaging in Behavior X is likely to result in Outcome Y.”

Assembling and implementing behaviors involves those processes by which our plans are actually manifested as overt responses (see Greene, 2007). The content of plans is represented in relatively abstract mental formats—the sorts of symbolically based representational formats of which we are consciously aware and that we can even report or describe to others (so, e.g., you can tell your roommate what you’re planning to do over the weekend). On the other hand, overt behavior consists of the motor commands that allow us to speak and move. There is an intricate system that translates our conscious conceptions of what to do into actual behavior, and without this component of the output system, we might possibly still be thinkers (of a sort), but we couldn’t be doers.

A “Second Tier”: Building on a Basic Framework

The preceding section should make it pretty clear that the input-processing, memory, and output systems play an inescapable role in communication processes. But for communication scientists, the properties of these systems are typically not so much a primary focus as they are an essential foundation for exploring a vast array of phenomena that derive from and are shaped by the nature of these systems.² It is instructive, then, to consider a few examples of these “second-tier” phenomena.

Cognitive Load

Among the most common conceptions in cognitive science is the notion that the mind is a limited-capacity system in the sense that there is a finite pool of “processing resources” that restricts the number of mental activities we can carry out at any given time. If some activity makes heavy demands on our processing resources, we are said to be under a heavy “cognitive load,” and our ability to carry out other activities is curtailed. So, for example, if you are engrossed in text-messaging your roommate, you probably aren’t going to be able to process what your professor is saying about some complex topic. This idea of a limited-capacity system shows up in a variety of communication phenomena. For example, while it is not always true, everything else being equal, lying tends to be more cognitively demanding than telling the truth: The liar has to fabricate an account, keep his or her story straight, control nonverbal behaviors so as not to give himself or herself away, and so on. As a result, liars often exhibit behaviors indicative of heavy cognitive load (e.g., speech errors). A second example, often in the news these days, comes from studies that show that hands-free cell phones are no safer when driving than hand-held models. The reason, of course, is that it’s not having something in your hand that creates the problem; rather, the problem stems from having something other than monitoring the road on your mind.

Communication Skill Acquisition

It will come as no surprise to the readers of this volume that communication skills matter—skillful communicators simply fare better in the workplace and in their interpersonal relationships (e.g., marriages). But people aren’t born with communication skills; they are acquired over time, through practice. The process of skill acquisition is accompanied by a number of behavioral changes; for example, we get faster, we make fewer errors, and we experience less cognitive load. Cognitive science has made considerable strides in illuminating what happens in the mind as we acquire a skill and why these behavioral changes occur (see Greene, 2003). For example, recalling the declarative versus procedural memory distinction described above, one of the things thought to happen in skill acquisition is that one may learn a set of facts about what to do, and through practice, gradually convert this declarative knowledge into procedural form so that it is no longer necessary to keep the rules about what to do in mind.

There is another layer to the advances that have come from studies of skill acquisition. Because research has shed light on what happens in the mind as we acquire a skill, we can take that understanding and use it to design more effective training programs. For example, what are the most effective ways of *instructing* people about the skill, what conditions of *practice* are most effective, and what sorts of *feedback* are best for learning and skill transfer?

Creativity and Pattern

Human behavior is characterized by regularity and pattern. We readily recognize this in the behavior of others (and sometimes in ourselves). Our friends and loved ones have ways of speaking (e.g., favorite topics, vocabulary) and moving (e.g., facial expressions, mannerisms) that are just “them.” And the patterning of human behavior doesn’t just show up in individuals’ idiosyncratic ways of doing things. Members of groups (e.g., sorority members; church congregations), and even entire cultures, exhibit routines in their behavior that are common to all members of the group. We all know, for example, the basics of what to say and do when being introduced to someone.

Because this patterned, repetitive character of human behavior is so universal and so ubiquitous, failing to address it would leave some pretty big gaps in our understanding of communication processes. This is precisely one of the places, though, where cognitive science has made some important inroads. The fact that there is a repetitive element to our behavior implicates LTM. In other words, people must have preserved (in some form) the information used to produce the patterns they exhibit. Guided by this assumption, cognitive scientists have learned a lot about the nature of the LTM system(s), where knowledge of behavioral routines is represented, how that knowledge is acquired, and how it is used in shaping our actions (see Kellermann & Lim, 2008).

What is particularly fascinating in the context of a discussion of the patterned and repetitive nature of human behavior is that it is also simultaneously unique and creative. Sure, we exhibit idiosyncratic and shared ways of doing things, but we never do them in *exactly* the same way from one time to another. It turns out, for example, that even if you tried to repeat even a simple phrase three times in a row in exactly the same way, there would be variations in the vocal spectrograph of each repetition. Even more important, we have the capacity to think and say new things—to come up with ideas that we’ve never heard, seen, or thought before. This penchant for creation is the source of much of the best in human communication—our ability to tell a compelling story, to express an idea or feeling in just the right words, and even to come up with a great joke. As you might guess, studying and understanding the creative side of communication behavior is more difficult than coming to grips with the patterned aspects, but even here, theoretical and methodological advances have been made (see Greene, 2008).

Self and Self-Regulation

Like no other species, human beings have the ability to reflect on themselves—we are self-aware; we possess conceptions of who we “are” (and who we wish we were); and we think of ourselves and our actions in relation to others and their perceptions, actions, and purposes. These and

related self-relevant phenomena are central to social interaction. Such processes have been shown to be linked to social motivation (including concerns with self-presentation), social anxiety, marital satisfaction, and attitude—behavior relationships, to list just a few out of many.

Because they are mental phenomena, self-concept, self-regulation, and so on fall squarely in the domain of cognitive science, and considerable progress has been made in understanding their nature (see Baumeister, 1998). For example, one property of our experience of self is that it is relatively stable—we have a sense of unity and continuity concerning who we are. When I wake up in the morning, I feel that I am essentially the same person I was the day before. On the other hand, it turns out to be fairly easy to demonstrate that people’s conceptions of their abilities, attributes, and so on are often internally inconsistent and also malleable and subject to change. Models that describe the way self-relevant information is stored in and retrieved from LTM help explain how we can entertain inconsistent views of ourselves; how those perceptions of self can shift, sometimes pretty rapidly; and how even in the face of such inconsistency and change, we are able to maintain a coherent sense of self.

As a second example, while the self very often plays a role in motivating and shaping one’s behavior, this is not always true: There are times when we are not conscious of our selves (our thoughts, behavior, etc.). Models of self-awareness have shed light on those conditions under which aspects of the self are more or less likely to come into play, as well as on the behavioral consequences of self-awareness (see Baumeister, 1998).

Cognitive Changes Over the Life Span

Among the most intensively studied aspects of cognitive functioning are the various changes in mental processes that occur over the course of a person’s life. As we grow from infancy to childhood, adolescence, and beyond, numerous developments take place in the input-processing, memory, and output systems. For example, cognitive processes simply get faster over the course of childhood, we acquire the capacity to think in more abstract ways, and we develop the ability to monitor and regulate our own behavior.

Some of the cognitive changes accompanying development are particularly relevant to communication and social interaction. These include language acquisition, which typically commences with the production of single words around the end of the first year and rapidly progresses to multiple-word strings by about 18 months (see Clark, 2003). A second example of a socially relevant developmental change during childhood concerns what is termed the “theory of mind,” or the understanding that other people possess knowledge, beliefs, goals, and so on and that these may differ from one’s own mental states (see Premack & Premack, 2003). In the same vein, as children develop the

ability to take the perspective of others, they also begin to engage in strategic self-presentation in order to manipulate what others think of them (e.g., Aloise-Young, 1993).

The other end-of-the-life course is marked by cognitive changes as well. The efficiency of mental processing peaks as we reach early adulthood but begins a gradual decline shortly thereafter. An overall slowing of information processing begins in the early 20s. This decline becomes more pronounced as we age, ultimately affecting the ability to process language and text. Evidence of this decay is apparent in the communication patterns used by older adults, which can often be characterized as less complex (e.g., shorter, grammatically simpler constructions; fewer personal pronouns) than those exhibited by their younger counterparts (Kemper, 2006). As we age, we also experience deterioration in the efficiency of the attentional subsystem. We become less proficient in our ability to inhibit irrelevant stimuli (e.g., extraneous thoughts), making it more difficult to be attuned to important message features. Older adulthood affects memory as well. Decreases in STM begin in the 20s and become more pronounced with each passing decade—a deficit directly related to difficulty in sentence processing. With respect to the LTM system, declarative memory is negatively affected by age, but procedural memory is relatively impervious to the aging process. So while you may forget the name of your childhood best friend, you won’t forget how to play the piano.

A Second Pass at the “Second Tier”

The phenomena we’ve considered to this point, cognitive load, skill acquisition, creativity, the self, and life span changes, are simply examples, albeit fascinating examples, of what we’ve termed “second-tier” cognitive processes. There are many other such phenomena, and we should at least mention some of those that we could have as easily selected for inclusion here: cultural differences and similarities in information processing, the role of gender in thought and action, aesthetics and the perception of order and beauty, second-language acquisition, verbal and non-verbal message production (including understanding the link between the two), imagined interactions, person perception and impression formation, stereotyping and prejudice, attitudes (and the link between attitudes and behavior), self-deception, reasoning and decision making, consciousness, motivation, and emotion.

The Methods of Cognitive Science

The overview of the input-processing, memory, and output systems in the preceding section should make it obvious that no matter what communication phenomenon one sets out to understand, sooner or later, dedicated pursuit of that phenomenon leads to the realm of the mind. It is possible,

of course, to skirt the boundaries of the mental realm, assuming or ascribing properties (warranted or not) to the ultimate seat of message making and message processing (just as the early mapmakers designated the locations of “Atlantis” and “dragons”). Cognitivists, though, tend to be the sort of thinkers who want to know what’s there. And just as explorers during the Age of Discovery developed new tools and techniques for exploring the terrestrial realm (and those of our age, the celestial), cognitive scientists are able to draw on an array of innovative methods for understanding the nature of the mind. These techniques are both varied and numerous, but among the most important are verbal reports, memory assessments, temporal measures, and examination of performance errors.

Verbal Reports

Doubtless the most obvious and straightforward way of gaining insight into what and how people are thinking is to ask them. Under certain conditions, for example, people might reasonably be expected to be able, and willing, to tell you what they are trying to accomplish and how they are planning to go about it. Such verbal reports, however, can take numerous forms, and some are more or less reliable and valid than others (see Ericsson & Simon, 1996). For example, asking people to report on their activities and motivations is often problematic because they may censor or alter their accounts due to concerns associated with social appropriateness or out of considerations about what the investigator “wants to hear.” Even framing a verbal report as an instance of “communication” can shift the content of what is said from “that which one is thinking” to “that which would be sensible to the listener.”

In addition to the various *social* constraints on the content and quality of verbal reports, *cognitive* factors also pertain. For example, evidence suggests that people are more likely to give accurate reports of *current* thoughts and activities as opposed to *retrospective* accounts. Similarly, when people are asked about whether certain events or stimuli (e.g., an advertisement) may have influenced their behavior, they may quite easily answer the question not by relying on any specific or accurate memory of that influence but rather by *inferring* a plausible link (e.g., “I must have seen the ad, and I’m almost certain I bought the product, therefore I distinctly remember being influenced by that ad.”).

Finally, as a way of shedding light on cognitive processes, the usefulness of verbal reports is limited by the fact that many mental processes simply aren’t available to conscious awareness. You are aware, for example, of the words on this printed page, but not of the cognitive operations that allow you to perceive them; you apprehend the contents of your own consciousness at this instant, and maybe, if you direct your thoughts deeper, even of the environmental stimuli and remembered events that contribute to the thought(s) in your mind at this moment. But

chase as you will, you can only capture the content and residue of your thoughts and not the processes by which they came to be.

Memory Assessments

As noted in the first section of this chapter, the memory system holds a central place in science’s understanding of mental processes. It should be no surprise, then, that a great deal of effort has been devoted to exploring the nature of memory and various memory phenomena (see Tulving & Craik, 2000). In the main, studies of LTM involve either *recognition* or *recall* paradigms. Recognition studies typically involve two phases: In the first, people are presented with a series of stimuli (e.g., magazine ads), and in the second phase, the original stimuli are presented along with new stimuli of the same type. Participants, then, are asked to judge whether each item is “old” or “new.” Recall studies, in contrast, simply ask respondents to produce previously encountered information (e.g., “What is the capital of New York?”). The distinction between recognition and recall studies is exemplified in the difference between multiple-choice tests (which involve recognition) and short-answer or fill-in-the-blank exams (which require recall), and as you might expect, people tend to perform better on recognition tasks than on recall tasks. However, what is remarkable is that there are certain conditions under which that tendency is reversed, where people can actually recall information that they cannot recognize.

One of the key understandings to emerge from the research on memory processes is that memory is fundamentally a *constructive* process. In other words, memory doesn’t work like pulling up an intact document file stored on your computer. Instead (completely out of conscious awareness), multiple (incomplete) memory traces are retrieved, combined with current environmental stimuli, and laid over with sense-making cognitive processes to create a “recollection” of what transpired at some point in the past. Neath and Surprenant (2003) report an interesting example of this sort of memory construction involving a student who had fond childhood memories of a beloved family dog. As real as this memory was for this young woman, it turned out that the dog had died 2 years before she was born! This same sort of memory construction has been shown to apply in cases of eye-witness testimony, which is notoriously inaccurate, even under oath and, literally, with life-or-death decisions at stake (see Loftus, 1996). And that’s not the end of it: So pervasive is the constructive nature of recall that it occurs even to those “crystallized” moments that seem so indelibly etched in our minds that we would never forget them. For example, Talarico and Rubin (2003) found that in less than 1 year, people’s recollection of the events of September 11, 2001, were just as subject to loss and error as their memories of everyday occurrences.

Beyond our (in)ability to remember the events of our lives, other memory phenomena are equally compelling.

For example, one line of research has examined people's ability to remember *visual* versus *textual* information (see David, 2008). This work shows that we tend to have better memory for pictures than text, and this effect extends even to printed words that have visual referents (e.g., "mountain") versus those that are more abstract (e.g., "freedom"). Other studies have examined our ability to remember messages, both from face-to-face interactions and from the media (e.g., news reports, movies). Among the interesting findings of these studies is that we tend to have better memory for "what the other person said" in an interaction than what "we said" and that we are much better at recalling the "gist" of a conversation or story than the specific words that were used in its telling.

One final example of what we've learned about memory processes will resonate if you've ever observed that your ability to remember class material is worse on the final exam or your recall of jokes is better in bars. It turns out that our ability to retrieve information from memory is better when the conditions at the time of recall are similar to those at the time we originally acquired that information. So if your class meets in one room all semester and then you take the final in a different room, your ability to recall course material is reduced. And the same effect applies to your physiological state: If you study while drinking coffee, you'll have better recall with some caffeine in your system. Similarly, if you learn all your best jokes while drinking beer in campus bars, you're more likely to remember those jokes when you're in that same state and environment. This effect is so strong that people who are given the task of learning word lists underwater in scuba gear have better recall of those words when they're back underwater than when they're on dry land (see Neath & Surprenant, 2003).

Temporal Measures

Since the very inception of the scientific study of the mind almost 150 years ago, scholars have relied on measures of time to draw conclusions about the nature of mental processes. There are several, interrelated reasons that time is one of the most important tools of the cognitive scientist. Most simply, cognitive processes, like all other processes (e.g., boiling an egg, a solar eclipse) transpire over time, and for that reason, one of the key elements of understanding how a process works is to know how long it takes. By extension, assessing time allows one to determine whether a process takes longer under some conditions than others: If you have a good grasp of how something is operating, then you should be able to predict what factors will cause it to speed up or slow down (e.g., lowering the temperature will cause a chemical reaction to proceed more slowly). A third consideration is that examining the temporal characteristics of cognitive processes applies even to phenomena that occur outside of conscious awareness and thus are not available for verbal report. A final reason why temporal measures play such an important role in cognitive

science stems from the notion of "cognitive load" discussed previously. When mental activities make heavy demands on our finite pool of processing resources, our ability to carry out those activities is often slowed. For this reason, then, measures of response time can be used to draw conclusions about the cognitive demand that a person is experiencing.

Temporal assessments involve a variety of methodologies, depending on the specific aspect of the mental system that is under examination, but they typically involve measuring the time between presentation of some stimulus or task and initiation (or completion) of a subsequent response. The instructions can be as simple as pressing a button when a sound occurs or as complex as solving calculus problems. As a result of their versatility, temporal measures are commonly used to study each of the three major systems of the mind (input processing, memory, and output). In the input-processing realm, for example, studies indicate why some visual images take longer to be recognized than others (perception) and why it sometimes takes a while to comprehend a message (as when it takes us a few seconds to "get a joke"). With respect to memory, any number of experiments have shed light on conditions under which it takes us longer to retrieve information from LTM (the sort of occurrence that will resonate if you've ever "forgotten" your own phone number, experienced the "tip-of-the-tongue phenomenon," or momentarily blanked on the name of a person whom you know well).

One additional group of temporal measures merits special mention because they are directly tied to communication processes. Consider that verbal message production is characterized by various temporal parameters including speech rate (e.g., words per minute), speaker-turn latency (the period between when one person stops talking and another begins), and pause-phonation ratio (the duration of periods of silence divided by the duration of periods of talk during a person's speaking turn). These sorts of variables are particularly interesting because they lead "dual lives": On the one hand they have social significance because they are related to perceptions of credibility, social attractiveness, and so on, and on the other, they provide a window on the cognitive processes underlying speech production. Research on these temporal parameters shows that we speak more fluently (i.e., quickly, with less silent pausing) when we are familiar with our topic and when we've had an opportunity to plan what we're going to say in advance. Conversely, multiple-goal messages (e.g., trying to tell a friend that you didn't think much of her *American Idol* audition while also trying to be supportive) tend to slow us down.

Performance Errors

The final type of assessment in the cognitivist's toolkit actually goes hand in hand with those we've already covered. Studies that involve temporal measures also almost always examine errors in what a person says and does. This is because most tasks involve a speed-accuracy trade-off: The quicker we act, the more errors we tend to

make. (So you don't want to rush through an exam, and you really don't want your surgeon to be in too big a hurry!) Moreover, as we've alluded, in their verbal reports and in their memory performance, people make errors. What is particularly useful, though, is that when we do commit these errors, they are not random glitches—they emerge under certain conditions and not others; they are of certain types and not others. For example, people tend to “recall” events that never happened if those unseen occurrences are part of a “script,” or a familiar sequence of events. Similarly, we tend to “run off” well-practiced behavioral routines, even when they are not appropriate—and you have experienced this if you've ever called a new beau by the last one's name or, less embarrassingly, moved and found yourself dialing your old telephone number or even “driving home” to your old address! The key point is that because performance errors exhibit regularity rather than randomness, they provide an important window on the operation of the mind, not just when it “fails” but also when it is functioning normally.

The Special Allure of Cognitivism

The overarching theme of this chapter has been that cognitive processes lie at the very heart of human communication: The mind is the seat of message making and message comprehension. You can take away any other aspect of human existence (language, relationships, culture, cell phones, iPods, . . . —you fill in the blanks) and still have communication, but without the mind, you've got nothing. By extension, whatever other communication phenomenon one seeks to understand, sooner or later, pursuit of that issue will lead you to confront the nature of comprehension and action.

But the central and inescapable role of cognition in communication is only one of the reasons why cognitivism has come, here in the dawning years of the 21st century, to hold the position it does among all the various alternative approaches for studying communication processes. If the two of us, as your authors, have done any sort of creditable job to this point, a second contributing factor should be readily apparent: The phenomena in cognitivism's wheelhouse are inherently fascinating. As much as humans wonder at the complexity of the galaxies and the intricate nature of Earth's ecosystems, when God spoke these things into being, He was only getting warmed up, and He saved His best for last. The phenomena of the mind are intrinsically compelling: What is consciousness? How is it possible to think and do something new? What is the nature of dreams (and daydreaming)? How does what I think become manifested as speech and movement? How is it possible to know what to do, and to want to do it, and still do something else? How can I be so certain in my recollections—and so wrong? Why can't some people dance without looking at their feet?

Beyond the essential place of cognition in communication and the fascinating nature of the phenomena that it encompasses, there is yet a third reason (a whole cluster of reasons, actually) that gives cognitivism its particular appeal, and this is that it allows us to have our cake and eat it too. By this, we mean that people are sometimes led to think in terms of trade-offs and dichotomies (you can have one or the other), but the special nature of cognitivism allows one to work simultaneously at both “ends” of some commonly supposed continua. Let's consider three examples that illustrate this point.

Science and Aesthetics

One of the peculiar properties of human sense making is that we are so very prone to error and bias in what we perceive and suppose about the world. We see order, regularity, and association where it doesn't exist, and conversely, we fail to detect processes that really are at work. As an approach to understanding, science functions to minimize such error (see Haack, 1999). Rather than accept an assertion on faith or because someone in authority says it is so, science ultimately hinges on publicly available and replicable methods and data; it employs rigorous techniques to reduce the chances of illusion and the impact of wishing it were so.

At the same time that cognitivism affords the special advantages of science as a way of knowing, it also resonates with our aesthetic nature and our appreciation of order and beauty. And this is true in two distinct senses that are analogous to the ways in which a work of art can function aesthetically. A still life of a flower arrangement, for example, could reveal the beauty and structure of the blossoms, and at another level, that same painting can be appreciated for the artist's technique. In much the same way, the data and models of cognitive science reveal an elegance and order in human behavior that we might not apprehend otherwise. And at another level, the theories and models of cognitive science can, themselves, be a source of pleasure and satisfaction.

Theory and Practical Application

As we have just noted, thinking theoretically can be a source of genuine pleasure and excitement. People enjoy working on Sudoku and crossword puzzles, but building scientific theories is like working out newspaper puzzles on steroids. Theory construction is problem solving—finding ways of making sense of patterns of regularities and anomalies, and it requires imagination, intellectual discipline, and courage. And the appeal of thinking theoretically doesn't pertain just to building one's own theories; investing the effort to master the theories of others helps us to appreciate the “big picture” of how things fit together and why they work as they do, to understand how someone else went about trying to solve a problem, and even to think about things that person didn't see.

The sense of insight and satisfaction that comes from thinking theoretically is only half the story here because, even though cognitivism is fundamentally theory driven, the problems addressed by cognitive science are those that have very real applications and implications for people's lives. Just a few examples should be sufficient to illustrate the point: How can children with learning disabilities best acquire social skills; how can the cognitive changes that occur with advancing age be delayed or accommodated; and how can health campaign messages (e.g., don't drink during pregnancy). be designed to enhance the likelihood that people will attend, comprehend, and implement their recommendations? The overarching point is that if you want to make a difference in the quality of people's lives, it helps to understand how, and what, they think.

Universality and Difference

Cognitive science seeks to develop models of mental processes that are general in the sense that they apply to everyone. As an example, consider that people integrate sensory inputs with information in LTM in a way that allows them to understand the dialogue and follow the storyline of a movie. The cognitive theorist, then, sets out to develop an account of how this happens in a way that applies to all people (and all movies), not unlike the way physicists attempt to articulate the laws that govern the motion of all objects.

At the same time that cognitivism seeks to develop powerful, general accounts, it also seeks to understand the source and nature of differences in the way people process information and generate responses. Are there, for example, cultural differences in the content and structure of information in the LTM that are manifested in perception, comprehension, recall, and speech and action? At an individual level, why do experts in a particular domain perceive and interpret domain-relevant stimuli differently than do novices?

This striving after both universality and difference is illustrated in work that your authors have conducted on creativity in thought and behavior over the last half-dozen years. As we noted earlier in this chapter, human action is inherently creative—we all do it, and so part of our project has been to understand how it is possible for us to think and say new things (see Greene, 2008). On the other hand, some people just seem better at it than others: We all know people who just seem to be able to “think on their feet,” and we've been exploring what is at the root of this individual difference (see Morgan, Greene, Gill, & McCullough, in press).

Communication's Place in Cognitive Science: The Interplay of Minds

Cognitive science is an enormously broad interdisciplinary enterprise that spans a great many traditional fields of inquiry. Without any effort to formulate a comprehensive list, we can say that cognitive science draws on philosophy, neuroscience, anthropology, sociology, psychology, linguistics,

computer science, mathematics, . . . and communication. One of the great freedoms afforded by cognitivism is that of pursuing one's questions wherever they may lead. Rather than stopping or changing course because what one is doing is “not communication,” the cognitivist can go where he or she will.

At the same time, communication's emphasis on message behavior, code systems, social relationships, channel effects, and so on puts scholars in the field in a position to make unique contributions to cognitive science. A particularly interesting example involves the study of mutual influence processes—the ways in which the behaviors of interactants unfold in interdependent ways (see Burgoon, Stern, & Dillman, 1995). While much of the history of cognitivism has focused on studying the mind of the individual engaged in various tasks, there is a growing emphasis on exploring the interplay of minds (whether it be face to face, online, etc.). Communication scholars have much to contribute to that conversation.

Notes

1. You probably wouldn't want to push any general scheme for segmenting the realm of cognitive processes too far because, in point of fact, the mind functions as a system, and no matter where you draw lines for describing various subsystems and processes, those processes almost inevitably crop up as components of phenomena that have been partitioned into other subsystems. For example, even with the simple scheme introduced here (i.e., “input-processing system,” “memory systems,” “output system”), it should be readily apparent that memory plays a role in perception and comprehension and in behavioral production.

2. There are, of course, obvious exceptions such as attention processes to mass media and message memory.

PERSPECTIVE TAKING, ADAPTATION, AND COORDINATION

AMY S. EBESU HUBBARD

University of Hawai'i at Mānoa

Perspective taking is the sine qua non of communication. Implicitly and explicitly, communicators make assumptions and have expectations about others' knowledge, attitudes, and behaviors, and they act on those assumptions and expectations. "Think about it from her point of view." "How would you feel if you were in his shoes?" "The world does not revolve around only you." These exhortations proclaim the value of perspective taking. By considering another's vantage point, placing oneself in another's position, and acknowledging that there are other people in the world, with their own viewpoints, perspective taking can allow people to anticipate better the behaviors and reactions of others. In so doing, perspective taking can facilitate adaptation and coordination of interactions with others.

What is particularly interesting to communication scholars is how, when, and why the processes of perspective taking, adaptation, and coordination occur. In this chapter, the theoretical conceptualizations of perspective taking, adaptation, and coordination will be examined along with a discussion of the common methods used to study these fundamental processes. This will be followed by an appraisal of how these concepts have been and can be applied in various contexts, along with some of the key questions that are yet to be fully answered in these related areas of study.

Theoretical Conceptualizations

Perspective Taking

Although there is debate among developmental scholars about when children begin to be able to engage in perspective taking and what triggers this development (e.g., maturation processes and/or encounters with moral dilemmas), there is agreement that most adults do engage in perspective taking and know that other people can have different viewpoints from their own. Epley, Morewedge, and Keysar (2004) further argued that not only are adults less egocentric, but what allows adults to engage in perspective taking, as compared with children, is that adults can also correct for those egocentric tendencies.

Still, regardless of how this comes about, the concept of perspective taking remains an axiomatic element in communication. Researchers have typically defined perspective taking as the act of intellectually adopting the outlook or viewpoint of another person. Scholars have sometimes referred to this as a type of role taking and have further distinguished between affective and cognitive role taking. Thus, perspective taking or imaginatively taking another's perspective into account may entail considering both another person's feelings and thoughts.

Perspective taking also has been conceptualized as a form of empathy. In theoretical models of empathy, perspective taking is generally viewed in one of three ways. The first treats perspective taking as synonymous with empathy. The second considers perspective taking as one of several empathy dimensions or elements that have a separate influence on behavior (Davis & Oathout, 1987). Although the exact number of elements composing a multidimensional view of empathy (Davis, 1980, 1983; Eisenberg & Miller, 1987) is arguable, the most common ones, in addition to perspective taking, are emotion matching, empathic concern, personal distress, and fantasy. Briefly, emotion matching is feeling the same or very similar emotions to that of another person. For example, two people might both report that they are feeling happy. Empathic concern is feeling compassion and sympathy toward another person. People who show empathic concern do not feel the same emotion as another person (as with emotion matching) but have an emotional response to the situation of another person. This is other-focused. For instance, if a friend is feeling hurt because of a relationship breakup, you might feel sympathy for your friend. Personal distress is feeling anxiety, worry, and uneasiness in response to the situation of another person. This is self-focused. For example, if a classmate did poorly on an examination and is very upset about it, you might start to feel anxious and worried about your own grades. Fantasy is the tendency to identify with and become “involved” with fictional characters. For instance, you might respond to the plight of your favorite reality television star as if this was a real person in your life.

The third theoretical view of perspective taking treats perspective taking as a necessary antecedent, but not sufficient condition, to other empathy dimensions (Stiff, Dillard, Somera, Kim, & Sleight, 1988). This two-stage model places the cognitive forms of empathy (e.g., perspective taking) ahead of the affective forms of empathy (e.g., empathic concern). For example, after people are attentive to the views of another person, they feel compassion toward that person.

Adaptation and Coordination

The communication literature is full of a variety of terms that refer to various aspects of adaptation and coordination. Sometimes, the general area of study is referred to as accommodation or mutual adaptation. However, the multitude of terms can be confusing. In an attempt to provide a unifying rubric on these processes and to avoid confusion with specific theories and approaches (e.g., communication accommodation theory vs. accommodation processes) and methodological difficulties, Burgoon, Stern, and Dillman (1995) advocated the use of the term *adaptation*, or, more precisely, interpersonal adaptation, to refer to this literature. Similarly, taking a broader view of this phenomenon, Bernieri and Rosenthal (1991) referred to this literature as interpersonal coordination or “the degree to which the

behaviors in an interaction are nonrandom, patterned, or synchronized in both timing and form” (pp. 402–403). Thus, in this chapter, adaptation and coordination are considered synonymous with each other.

The typical patterns of adaptation and coordination in this area of study are often labeled as matching, complementarity, reciprocity, compensation, convergence, divergence, synchrony, and dissynchrony. Behavioral matching is exhibited when interactants have identical behaviors. For example, both interactants might display the same posture. The term, mirroring, is sometimes used when the identical behaviors are mirror images, or show reflection symmetry. They are essentially the same behavior, but in opposite directions. For instance, one person could cross his or her left leg over the right leg and the other person could cross his or her right leg over the left leg. Complementarity is exhibiting different or dissimilar behaviors.

Reciprocity refers to adjusting to the communication function of another’s behavior with behaviors that serve a similar communication function. If someone is showing anger by growling, then the other interactant could reciprocate by showing anger by glaring. Compensation, then, is responding to the communicative function of another’s behavior, but with an analogous behavior that fulfills the communicative function in the opposite direction. For example, instead of reciprocating with a glare, a person could compensate by showing pleasure through smiling.

Convergence is when one person moves toward a more similar pattern to that of another person. They become increasingly similar. Divergence is becoming increasingly dissimilar. For instance, if a person is behaving in a dominant manner, then another person could converge on that pattern by becoming more dominant over time as well or diverge by becoming less dominant over time.

Synchrony is the overall quality of interaction partners having the appearance of unity rather than separation or independence when communicating with each other. That is, the interactants’ behaviors are entrained to one another, with behaviors matching simultaneously or sequentially in an overall pattern. Synchrony, then, includes the qualities of interaction rhythm or tempo, simultaneous behavior or behavior changes that occur at the same time between interactants, and smooth meshing of behaviors. In a sense, synchrony is rhythmic reciprocity. Dissynchrony, on the other hand, is when the behavioral patterns of both interactants are out-of-sync or appear as if the interactants are operating autonomously from each other.

There have been a profuse number of theories offered to predict these various adaptation and coordination patterns. In an effort to provide more coherence to this literature, Burgoon and colleagues (1995) applied a communication-oriented organizational framework to the wide array of adaptation and coordination theories. They hierarchically arranged the theories along a dimension from automatic, nonarbitrary, or reactive to communicative, symbolic, or intentional and based their distinctions on the domain of

focus, ranging from individual to group to dyad. That is, there are biological approaches, arousal and affect approaches, social norm approaches, and communication and cognition approaches, respectively.

The biological models are grounded in innate, biological, and universal needs for survival, which often include concerns about safety, comfort, and connection with others, as well as building a foundation for more complex communication. Typically, the theorizing in this area examined interactional synchrony and dissynchrony, particularly between adults and children (e.g., when mother and infant vocalizations coordinate), and investigated instinctual forms of motor mimicry that occur when a person behaviorally responds to the situation of another when the situation is not actually happening to the person (e.g., when you observe someone about to be hit over the head and you duck your head) and mirroring behavior (e.g., Bernieri, Reznick, & Rosenthal, 1988; Condon & Sander, 1974; LaFrance, 1982; Lakin & Chartrand, 2003). One notable exception is Bavelas, Black, Chovil, Lemery, and Mullett's (1988) work on motor mimicry. In this case, Bavelas and her colleagues argued that motor mimicry, in the form of mirroring another person's behavior, goes beyond a biological basis and has a more communicative function of signalling similarity and rapport.

Arousal and affect models build on the foundations of biological needs and highlight the psychological needs of the individual. Some of the common theories in this area are affiliative conflict theory (a.k.a., equilibrium theory), arousal-labeling theory, discrepancy-arousal theory, and dialectical theory. For example, affiliative conflict theory is predicated on the idea that people try to balance their approach and avoidance needs to maintain psychological comfort in an interaction. When the equilibrium is disturbed, affiliative conflict theorists predict that behavioral changes will occur, primarily in the form of compensation (Argyle & Dean, 1965). For instance, if someone takes a step closer to you, you will step back to restore the interaction equilibrium.

Arousal-labeling theory explains both patterns of reciprocity and compensation (Patterson, 1976). From this theoretical standpoint, changes in the intimacy level in an interaction lead to arousal. When the arousal exceeds a certain threshold, that arousal is valenced positively or negatively and labeled as such by individuals. If the arousal is considered to be positive, then reciprocity is predicted. If the arousal is considered to be negative, then compensation is predicted. Continuing with the previous example, if someone steps close enough to you for the behavior to create sufficient arousal and you consider that arousal positive, then you will step forward. If you consider the arousal negative, then you will step back. Discrepancy arousal theorists (Cappella & Greene, 1982) downplay the cognitive emphasis that is present in arousal-labeling theory and posit a quicker process that generates reciprocity and compensation. That is, they theorize that people's behavior can be discrepant with their expectations and that discrepancies,

within a certain acceptable range, generate moderate arousal and are associated with positive affect. Discrepancies, outside a certain acceptable range, generate large arousal and are associated with negative affect.

Proponents of discrepancy-arousal theory generally predict that when two interactants want to approach each other, the discrepancy-arousal-affect chain will lead to reciprocity and when one interactant wants to approach and the other wants to avoid, then the discrepancy-arousal-affect chain will lead to compensation. Dialectical approaches also focus on psychological needs. However, according to dialectical theorists, people have competing and complementary needs that create dialectical tensions in relationships (Altman, Vinsel, & Brown, 1981; Baxter & Montgomery, 1997). To manage these tensions, people sometimes oscillate, fluctuate, or cycle between different needs. This leads to dyadic adaptation and coordination patterns of matching, complementarity, reciprocity, and compensation.

Rather than focusing closely on biological and psychological needs, social norm models emphasize the influence of social and cultural norms. The norms of reciprocity, social exchange, dyadic effect, Gottman's negative affect reciprocity, and communication accommodation are examples of theories in this area. For instance, the norm of reciprocity, as the name implies, predicts reciprocal patterns.

According to Gouldner (1960), reciprocity is a moral obligation to respond in kind through reciprocal patterns of people helping each other and avoiding injuring each other. Social exchange theorists similarly predict reciprocity and view the exchange of resources between people as fundamental to societal functioning. In communication research, social exchange principles are theorized to allow for exchanges of roughly equivalent resources and variable intervals of time when people can reciprocate behavior (Rolloff, 1987). For example, if a friend helps you move into your dorm room, you might help your friend move when he or she finds a new place to live or you might help your friend wash his or her car. Additionally, reciprocity of self-disclosures or personal information about the self, what Jourard (1959) refers to as the dyadic effect, was originally theorized to help develop personal relationships. For example, you tell your date your most embarrassing moment, and your date tells you the same. Analogously, Gottman's (1979) research on marital couples demonstrated that reciprocity of negative affect deteriorated personal relationships. For instance, a husband snipes at his wife, and the wife snaps back at her husband. Another theory that emphasizes norms is communication accommodation theory, originally known as speech accommodation theory (Giles, Coupland, & Coupland, 1991).

Generally, communication accommodation theorists focus on the patterns of convergence and divergence of communication behaviors, particularly as they relate to people's goals for social approval, communication efficiency, and identity. Depending on whether interactants are mutually accommodating or only one interactant is accommodating, the patterns of reciprocity and compensation are

also applicable. For instance, at a high school reunion, you see your good buddy from history class and your vocal patterns become more similar to each other. When you run into a disliked classmate from high school, your vocal pattern becomes more different from that classmate's.

While still retaining a basis in biological, psychological, and sociological orientations, communication and cognition models place more emphasis on the multiple functions of communication (e.g., message production and processing, relational management, social influence and control, identity and impression formation and management, and conversation management) and the meanings and interpretations of communicative behavior. Theories in this area include the sequential-functional model, expectancy violations theory, cognitive-valence theory, and interaction adaptation theory.

Patterson's (1983) sequential-functional model provides a broad framework for predicting reciprocity and compensation. According to Patterson, there are genetic and environmental determinants; personal, situational, and relationship antecedents; and preinteraction mediators, such as behavioral predispositions, arousal, and cognitive-affective expectancies, that influence interaction between people. When people interact, these factors and emergent features of the interaction are theorized to guide behavior. During an interaction, the interactants interpret the meaning and functions of each other's involvement level. This creates a change in arousal. When the arousal change is minimal, stable exchange and reciprocity are expected. When the arousal change is large, unstable exchange and compensation are expected.

Burgoon's (1978; Burgoon & Le Poire, 1993) expectancy violations theory is based on the idea that people have communication expectancies of others. During interactions, if these expectancies are violated, they are arousing and refocus attention to the features of the communication, the nature of the relationship between the interactants, and the nature and meaning of the violation. Communicative behavior that confirms expectancies has a valence ranging from positive to negative, and the interactant who violates expectancies has a communication reward valence ranging from positive to negative. Expectancy violation theorists generally predict that when communicative behaviors that confirm or violate expectancies have a positive valence and the communicator reward valence is positive, reciprocity results. When communicative behaviors that confirm or violate expectancies have a positive valence and the communicator reward valence is negative, reciprocity or compensation can result. When communicative behaviors that confirm or violate expectancies have a negative valence and the communicator reward valence is positive, compensation results. When communicative behaviors that confirm or violate expectancies have a negative valence and the communicator reward valence is negative, compensation results.

Andersen's (1999) cognitive-valence theory describes the communicative process of intimacy exchange between people, specifically increases in intimacy. This change in

intimacy is predicted to generate varying degrees of arousal. Proponents of this theory predict that adaptation occurs at moderate and large increases in arousal. For a moderate increase in arousal, an interactant's increase in intimacy behavior has a valence based on six types of cognitive schemata (i.e., cultural, self, interpersonal, relational, situational, and state schemata). If each of the six types of cognitive schemata has a positive valence, the overall valence is positive and reciprocity, in the form of an increase in intimacy behavior, is predicted. If any one of the six types of cognitive schemata has a negative valence, the overall valence is negative and compensation, in the form of a decrease in intimacy behavior, is predicted. For a large increase in arousal, compensation is predicted.

Finally, Burgoon and colleagues' (1995) interaction adaptation theory provides a comprehensive explanatory calculus for examining adaptation and coordination patterns in interaction. She parsimoniously integrated and built on past theories in this area. In so doing, interaction adaptation theory is based on five key concepts: required factors, expected factors, desired factors, interaction position, and actual behavior. When interacting with another person, interaction adaptation theorists posit that required, expected, and desired elements are arranged hierarchically and are interdependent. The most fundamental are required factors that are grounded in biological drives and basic human needs. Then, there are expected factors, which are based in social norms and cultural norms. Finally, there are desired factors that are personal and idiosyncratic to individuals' preferences and goals. People consider all three factors and develop an interaction position. This interaction position is basically a behavioral interaction pattern in a situation that is derived from the combination of what is required, expected, and desired by an individual. This individual could refer to the self or the partner. Actual behavior is a partner's enacted behavior. Both interaction positions and actual behaviors are valenced from positive to negative. Furthermore, people are anticipated to move toward more positively valenced behaviors, whether it is toward a more positively valenced interaction position or a more positively valenced actual behavior. Thus, the theory predicts that when interaction position and actual behavior are not discrepant, there is matching. When the interaction position is more positively valenced than the actual behavior, divergence, compensation, and maintenance (enacting the same behavior) are predicted. When the actual behavior is more positively valenced than the interaction position, convergence, matching, and reciprocity are predicted.

Methods

Operationalizing Perspective Taking

Researchers generally believe that perspective taking is dispositional, when people have overall tendencies to spontaneously think about the other person's perspective,

and situational, where people can be induced to think about another person's perspective. When studying perspective taking then, researchers often consider how to measure and manipulate perspective taking.

Perspective taking is typically measured either by asking people to report on their own perspective-taking skills in a survey or by inferring perspective-taking ability after examining how people respond to a variety of scenarios, vignettes, audio recordings, or role play instructions. Perspective taking is commonly manipulated through a set of instructions. The instructions ask people to imagine themselves or other people in a specified situation and imagine how they would think and feel if they were in another person's place and/or how another person is thinking and feeling.

Operationalizing Adaptation and Coordination

Burgoon and colleagues' (1995) review of adaptation patterns offers a useful set of criteria for distinguishing various forms of adaptation and coordination from each other and discusses the various ways these patterns can be and have been operationalized. To determine if and which forms of adaptation and coordination are occurring in interactions, Burgoon et al. indicated that the methods employed to study these phenomena must reasonably demonstrate or assess whether behavior was directed toward or was contingent on another person, whether there was a change in behavior, whether the influence was effected by one or more parties, whether the change was ordered or sequential, and whether behavior was strategic, as well as the direction and degree of the change and behaviors that are functionally equivalent.

Some methods that have been used to assess adaptation and coordination include directly asking people about their intentions in questionnaires, in diaries, or in video-cued recall sessions for various time intervals. This strategy provides information about whether people believe that their behavior was directed toward another person and whether their response was contingent on another.

Another method was to manipulate people's behavior by having them systematically change their behavior and observe any resulting changes in another person's behavior. This will help determine directionality, contingency, sequencing, and whether behavior change was lagged.

Researchers have also measured the magnitude and direction of behavioral change by comparing behavior with a baseline or control. The control could be a person's own behavior, in a within-individual or within-dyad design. Or the control could be a separate group, in a between-dyads design. In related fashion, social normative standards have been used as a baseline to infer behavioral change. In this case, an a priori list of behaviors that are consensually recognized as directed toward others is compared with the observed behavior.

Furthermore, adaptation and coordination can be inferred by using a variety of statistical techniques. For example,

directionality and contingency can be approximated by using a social relations analysis to assess actor, partner, and relationship effects and statistically partitioning the behavioral contribution of each effect or statistically examining conditional probabilities. Behavior change has been assessed using longitudinal designs with time as a factor in the statistical analyses. Sequencing and contingency have been surmised by comparing baseline correlations with correlations in different experimental conditions and using statistical techniques such as lag sequential analysis.

Burgoon and colleagues (1995) also noted that assessing directionality of change, magnitude of change, and functionally equivalent behaviors requires additional methodological considerations. For example, researchers might theoretically and empirically examine the range of changes and standard deviations. They might also need to use multiple behaviors, both verbal and nonverbal, that are substitutable to each other and/or look at functionally equivalent molar measures. They could look at behaviors, behavioral change, and interpretation of those changes using observer and participant perspectives. Moreover, investigators of behavioral adaptation and coordination would need to make a judgment about the degree to which the measures should be microscopic or macroscopic.

Applications

Understanding and engaging in perspective taking and the resultant adaptation and coordination are useful for mundane to critical communication events. These concepts and the theories about them are helpful both in the everyday type of communication with other people as well as during challenging or difficult exchanges with people. For example, when people engage in competitive and cooperative activities, consideration of how others will respond helps people to better adapt and coordinate actions. On a basketball team, for instance, a player might assist a teammate for an alley-oop to a slam-dunk. This not only requires precise passing and dunking skills, but it also requires teamwork and pinpoint timing. Players or audience members might also try to "psych out" the other team or taunt them during a game by choosing words or phrases that they believe will upset the other team or help them lose focus.

Perspective taking, adaptation, and coordination are equally applicable in a variety of other situations. People who are in the customer service field often need to make assessments of what other people want and then adjust to those desires. People who handle client complaints or irate clients can fruitfully use the ideas of perspective taking, adaptation, and coordination in deciding whether to strongly and forcefully state a position, with the hope that the client will back down, or calmly state a position, with the hope that the client will respond in kind.

When persuading someone, a common tenet of effective persuasion is the use of two-sided arguments. This means that persuaders must consider the arguments that

are consistent with their position and refute counterarguments by others. If a teenager wants to stay out past a curfew, then arguing for why he or she should be able to stay out later is only part of the process. The teenager should also consider what the parents' reasons are for wanting the teenager to come home on time. The teenager should refute those reasons as well as consider how to nonverbally present the information. Similarly, if an employee wants to ask the boss for a raise, the employee should consider the boss's viewpoint and state the employee's own case in a confident manner (in the hope that the boss will accept it) or in a submissive manner to show deference.

In public speaking, audience analysis is stressed. This means that information must be considered in light of the attributes of the audience and the audience's prior knowledge, attitudes, behaviors, and values, or basically, the perspective of the audience should be taken into account when planning a presentation. Additionally, after doing audience analysis, the public speaker must adapt his or her presentation to the information from that analysis. For example, if the audience is expected to be disinterested, then the speaker might be even more animated and enthusiastic, with the idea that the audience response will converge on the speaker's pattern, and the speaker might consider which factors will facilitate convergence.

In interpersonal interactions, perspective taking, adaptation, and coordination are valuable concepts that can be applied. For instance, if a friend has a problem, perhaps there was a death in the family; thinking about the situation from the friend's perspective would be helpful. If the friend is not talking about the problem, then a person could remain silent and hope that the friend will fill the void by compensating for the silence with talk, or the person could begin talking with the expectation that the friend might reciprocate the behavior. If a person is on a date with someone who is very attractive, the person might consider how receptive this attractive other would be to flirting. The person might think about whether to initiate flirting behaviors in the hope that the behavior will be matched or wait for the other person to initiate interest.

As is evident from this diverse array of examples, many communication activities can be analyzed through the ideas of perspective taking, adaptation, and coordination. What is also particularly clear is that adaptation and coordination often begin with perspective taking. Thus, the rest of this chapter will be devoted primarily to a discussion of perspective taking. The research on perspective taking indicates that perspective taking plays an important role in exhibiting communication competence, engaging in prosocial behaviors, and managing problematic events.

Exhibiting Communication Competence

Many have argued and found evidence to support the fact that perspective taking is significantly related to overall social skills, such as the ability to verbally and nonverbally encode, decode, and regulate messages and communication competence, or communicating effectively and appropriately (Redmon, 1989; Riggio, Tucker, & Coffaro, 1989).

Whenever people communicate with each other, perspective taking is applied as people take the other person's knowledge into account (Fussell & Krauss, 1992). Perspective taking is relevant when people adapt to diverse audiences, choose how to address someone, decide on the formality or informality of their language choices, engage in deception and deception detection, manage impressions, and regulate the flow and structure of their conversations. For example, Grice's (1975) conversational maxim approach hinges on perspective taking. That is, according to Grice, when people communicate with each other, they adhere to the cooperative principle by making appropriate inferences about the communicator's intentions when comprehending and responding to messages. This is how understanding indirect messages is possible. If someone says, "Can I ask you a question?" most will make sense of this question by thinking about the perspective of the person who said it and recognize that this question is a preamble to a question that is going to be asked subsequently and is not a signal of communicative incompetence (or a failure to recognize the apparent contradiction in that the person who asked to ask a question has already asked the question).

Engaging in Prosocial Behaviors

Research on perspective taking indicates that perspective taking directly or indirectly facilitates a variety of prosocial behaviors, such as being more fair and moral in actions; helping others; giving more resources to a disadvantaged other, even to the detriment of the collective good; forgiving others; and showing compassion toward others (e.g., Batson, 1987; Eisenberg & Miller, 1987). For instance, Batson and colleagues (2003) found that imagining the other person's position stimulated moral action and when people imagined the self in the other's position, they behaved more fairly toward the other person if that other person was relatively disadvantaged. Hodgson and Wertheim (2007) found that in situations when someone had committed a transgression or a hurtful action against another, those people who were better able to manage and regulate their emotions were associated with more dispositional perspective taking, and dispositional perspective taking was associated with an increase in instances of forgiveness of the transgressor or instigator of the hurt. Clearly, the relationship between perspective taking and prosocial behaviors has applications to persuasion. Whenever people are interested in convincing others to engage in prosocial types of behaviors, be it personally or through a media campaign, accounting for perspective taking might increase the success of the persuasive attempt.

Managing Problematic Events in Relationships

Research has also linked dispositional perspective taking with overall relationship satisfaction, happiness, and adjustment. The reason for this may be due to the effect

of perspective taking on the management of problematic events, such as being narrow minded, engaging in destructive forms of conflict, showing anger, and displaying aggressiveness in relationships.

For example, people who can take another person's perspective are more open-minded and flexible. They are less likely to stereotype other people, less likely to be prejudiced, less likely to commit attributional errors, and more likely to avoid dispositional attributions regarding others' behaviors (e.g., Galinsky, Ku, & Wang, 2005). Richardson, Hammock, Smith, Gardner, and Signo (1994) examined people's self reports of their conflict responses with friends and siblings. They found that dispositional perspective taking was positively associated with problem-solving responses and calm discussions without yelling.

Perspective taking was also negatively associated with aggression and aggressive tendencies, such as irritability, hitting, pushing, and sulking. When perspective taking was manipulated, Richardson and colleagues (1994) found that participants behaved less aggressively (set their partners to receive a lower level of electric shocks) at the start of the experiment, when they had not actually received shocks themselves. Additionally, they found that when the partners of the female participants engaged in offensive and insulting name-calling, those females who were high in dispositional perspective taking did not reciprocate the behavior, as compared with females who were low in dispositional perspective taking. When the partners of the male participants used relatively mild name calling, the males who were high in perspective taking reciprocated the less offensive name calling, as compared with the males who were low in perspective taking. Mohr, Howells, Gerace, Day, and Wharton (2007) also found that dispositional perspective taking was associated with lesser anger arousal and lesser inclination to express anger when provoked in interpersonal situations

Future Directions

Given the importance of this area of study, future research should continue to expand knowledge of these processes in communication. Some of the vital areas of focus that future investigations can concentrate on include examining when perspective taking can be used for darker purposes; how perspective taking can be triggered or activated in real life; and what the differences in perspective taking are between groups, partners, and judgments, or how types of groups, partners, and judgments can be compared.

Darker Side of Perspective Taking

Imagine an argument between a couple that ends with the statement "I knew you were going to say that." This statement is provocative to communication scholars because it reveals several issues about perspective taking and its role in communication that deserve additional

research attention. In the hypothetical scenario between the couple, perspective taking is used as a justification for actions. The literature on perspective taking, however, portrays a more optimistic view of perspective taking. That is, perspective taking is valuable and good, and we can better adapt to others' communication and coordinate our behaviors with increased perspective taking. Thus, future studies should also focus on the darker side of perspective taking. For example, research could examine how people might deliberately thwart another person's behavior, how people can use an assessment of the other person's perspective as a justification for inaction because the outcomes of the interaction were already anticipated, and how people might exploit each other's sensitive spots.

Future research could study the limits to perspective taking as well. Investigations could examine when perspective taking is applied and when it is withheld, perhaps even resisted. For instance, Frantz and Seburn (2003) examined argumentativeness and perspective taking and found that underlying motivations and preferences affected how people applied perspective taking. They found that when highly argumentative people had a preference for a particular viewpoint in a conflict situation, those individuals were less likely to see both sides of the argument than when they did not have a preference.

Further work could also focus on the negative consequences associated with perspective taking. Galinsky and colleagues (2005) reported that when people see more of themselves in others and more of others in themselves, they take on the attributes of others, both positive and negative. Research could investigate if adopting the perspective of an outgroup member leads to conflict with an ingroup member. For example, consider the case of a high school with a popular group and a socially isolated teenager. If a member of the popular group adopts the perspective of the teenager, members of the popular group might be upset with the perspective-taking popular group member. Future research could examine these dynamics.

Perspective-Taking Triggers

Additionally, if perspective taking is advantageous and can be situationally induced, then future work should investigate what triggers perspective taking. The content and form of a message to encourage perspective taking in the real world need to be investigated empirically. Research might also focus on other strategies for enabling people to think about others' viewpoints. Some worthwhile starting points include examining whether familiarity with a person, self-disclosure, and prior experience with a need might make people more inclined to take another person's perspective into account.

Analogously, research could investigate the ways in which perspective taking might be hindered or inhibited. Krcmar and Vieira (2005) argued, in their study of elementary-school-age children's television viewing of fantasy violence, that television fantasy violence portrays only one

predominant perspective (that of the perpetrator of the violent act), and this can hinder perspective taking. They found support that increases in viewing exposure to fantasy violence were related to decreases in perspective taking and decreases in perspective taking were related to decreases in moral reasoning (especially about a justified violent act).

Comparisons in Perspective Taking

The role of culture in perspective taking might be an important avenue for future work. Perspective taking might not be viewed similarly across cultures. Additionally, future research might investigate how people from collectivistic cultures think about perspective taking as compared with people from individualistic cultures. Initial evidence showed that Chinese people, with an interdependent self-construal, used perspective taking to focus more on others' knowledge and needs during a communication game than did Americans, with an independent self-construal (Wu & Keysar, 2007). If perspective taking is a part of overall social skills, then the role of perspective taking in reducing lack of coordination and awkwardness in intercultural communication interactions could also be examined.

Further research on perspective taking could also compare the effects of thinking about another's perspective when the other is a person or some other animate object. Servillano, Aragonés, and Schultz (2007) provided tentative evidence that concern for nonhuman animals could be induced through the use of perspective taking. Additional work could compare unidirectional and mutual perspective taking. Much of the research has been concentrated on how one person views another person. However, research has neglected to examine the dynamics involved when two people are adopting the perspectives of each other in their communication. Finally, further research could focus on whether accuracy in perspective taking is important and to what degree. Much of the current research on perspective taking did not assess the congruency between the perceptions of one person and the perceptions of another. Even so, Ickes's (1997) work on empathic accuracy draws further attention to the need to study the degree of congruency between people's perspectives, what facilitates that congruency, whether congruency is necessary for the various prosocial findings to remain robust, and when people are motivated to be inaccurate.

Conclusion

In this chapter, a variety of literatures were consulted to provide a sampling of the many theories about and research methods used to examine perspective taking, adaptation, and coordination. Although these three processes are significant aspects of communication, for the most part, perspective taking has remained an important but not explicitly identified component in adaptation and coordination theories. By discussing these processes

together, the reader can see how they are intimately and inextricably tied together and the multiple functions and applications they have. People live in a world of diverging and converging perspectives. In communication, a consistent failure to take into account others' perspectives and adapt and coordinate behaviors dooms people to a life buffered and isolated from others. Recognition, appreciation, and utilization of these critical processes in communication does not guarantee success in life, but it does mean that life will be enriched by complexity, offer unique challenges, and be ever changing.

SOCIAL CONSTRUCTION

MARIAELENA BARTESAGHI AND KENNETH N. CISSNA

University of South Florida

Social construction¹ is about asking questions (Bartesaghi & Castor, 2009). Before we explain what we mean by this, we will describe social construction as both a framework and a process in communication and illustrate its importance to your everyday ways of acting within social reality.

James Carey (1989) identifies two views of communication that are prevalent in our culture: transmission and ritual. According to the first, to communicate is to exchange information; so we speak of getting a point across, of mismatches between intentions and the actual messages received, of changing minds, and of message content. When we see communication as having to do with building relationships and *really* talking to each other (Katriel & Philipsen, 1981), with sharing stories about who we are as a culture, with gatherings as a way to keep us together, then we are thinking in terms of what Carey calls the ritual view.

Transmission and ritual views are not mutually exclusive; both are historically tied to the quest for travel and carrying messages across great distances and to the religious desire to pass on God's word. But in our culture, talking about communication in terms of transmission has become so natural that we cannot even tell that it is only *one* way of making meaning about and within communication (Krippendorff, 1993). According to the transmission way of thinking, language is merely a conduit for communication (Reddy, 1979), a way to transport meanings, feelings, and so-called contents that can be extracted at will at their destination. But if this is so, and if meaning is just a matter of transporting content, how can we explain the following conversation?

Driving back from a visit out of town, a married couple is chatting in the car, when the wife turns to the husband and says, "How about we stop for coffee?" "No, thanks," he responds and, as he is driving, does not stop the car. "Well, that's not very nice!" exclaims the wife, who proceeds to seethe for the rest of the drive home. The husband, seeing that his wife is upset, knows that he has done something wrong and wishes that he had stopped. Why, they both think, can't the other one just grow up and be a considerate, reasonable partner?²

And consider the role played by communication in our social world when we say that a person going through legal proceedings is *innocent until proven guilty*. This is not simply a matter of legal judgment but of speaking making it so. Before the jury is asked to pronounce the verdict, the life of someone standing trial hangs in the balance, his or her fate depending on the uttering of one word: *guilty* or *innocent*.

Inasmuch as these examples are about communication involving something other than messages being exchanged or information reaching a destination, the transmission metaphor so prevalent in our talk about communication is not an adequate construction for capturing what is occurring. The entailments of the transmission metaphor—where language is an empty vessel and there is one and only one message, independent of the relational word that creates and is created by it (Krippendorff, 1993; Lakoff & Johnson, 1980)—believe the experience of the married couple and the accused whose fate 12 peers must decide. The communication events in the two examples illustrate *communication as social construction*: continuously emergent

in relationships, constitutive of social reality, consequential to communicators, experienced through the bodily senses, and afforded by their material circumstances. Moreover, questioning the taken-for-granted transmission metaphor in communication, as we have done, is something encouraged by a social construction stance.

In the following sections, we first reconstruct communication by means of an intellectual collage of social construction as a framework for communication study and then present and discuss five propositions that illustrate a social construction position for communication. In the final section of this entry, we encourage reflection on what social construction has brought to the field of communication and the challenges that lie ahead.

Social Construction: An Intellectual Conversation

We invite you to conceive of social construction in communication (hereafter communication social construction, to distinguish it from social construction in other fields; see Bartesaghi & Castor, 2008, p. 5) as one voice in an intellectual conversation, itself carrying the overtones and timbre of many other voices. Social construction is not a form of knowledge but a way to think about and ask research questions in communication. It is a perspective, a possibility, itself made possible by a virtual joining of conversational threads among scholars in philosophy, sociology, psychology, and, of course, communication. Our account is by no means exhaustive, and we invite you to consult the list of further readings at the end of this chapter.

The phrase *social construction* comes from Berger and Luckmann's (1966) groundbreaking sociological treatise, *The Social Construction of Reality*. Central to its argument is that human beings, unlike any other species on earth, make their own environment real through "linguaging." Though we are born into a world of institutions that we experience as objectively there, Berger and Luckmann detail how our reality is (re)produced in social practices and everyday encounters, involving a circular, three-step process: externalization, objectification, and internalization. Together, these steps allow us to construct the social world (externalization), experience it not as a construction at all but as very much real (objectification), and then believe in it so much that we think it within ourselves (internalization).

Garfinkel (1967) brought Berger and Luckmann's (1966) theoretical ideas into the field with his *Studies in Ethnomethodology*. Conducting interviews and tape-recording conversation data from everyday and institutional encounters, Garfinkel and his student Harvey Sacks showed how individuals made sense of their own social worlds and each other in interaction. Sacks (1995) later developed Garfinkel's insights into conversation analysis, an approach within language and social interaction (Fitch

& Sanders, 2005) that reveals how social reality is both patterned and emergent, constructed in the utterance-by-utterance dynamic of the ongoing exchange.

The important move, shared by the various voices speaking within social construction and certainly by its most widely published scholar, the psychologist Kenneth Gergen (e.g., 1994, 1999), is what became known (in a phrase coined in anthropology) as a "crisis in representation," or the disavowal of the idea that language should serve, as the philosopher Rorty (1979) put it so well, as a "mirror of nature." In 1973, Gergen's paper "Social Psychology as History" made the case that there is no universal knowledge but only knowledge that is culturally and historically contextualized. By deconstructing knowledge, Gergen's argument reconstructed language as *making* knowledge rather than mirroring it. The critique of language as purely representational, something that could more or less accurately "reflect," "portray," or "transmit" reality, involved no less than a critique of traditional social science dictates that there is a truth out there and that it is the business of research to find it. Positivism was an important system of belief about the reality "out there" that alternative thinkers tackled in powerful ways.

Drawing from psychological theory and cybernetics, respectively, *constructivists* such as Rom Harré (1983) and Ernst von Glasersfeld (1988) focused on the individual's role in the construction of knowledge, for anything that is putatively "out there" must first be processed by the individual's sensory, emotional, and psychological makeup. In this respect, von Glasersfeld is particularly radical in his belief that "knowledge is not passively received either by the senses or by way of communication, but is actively built up by the cognizing subject" (p. 83). Inasmuch as they run counter to the idea of an objective reality that can be perceived in the "mind" through observation, constructivist accounts bolster social construction's critique of positivism. There is a big difference between constructivism and social construction, however, and that has to do with the role of social interaction, rather than the individual, as the locus of reality construction.

Discursive psychologists such as Edwards and Potter (1993) are a case in point; by tracking how we respond to each other in conversation, they aim to demonstrate that language does not represent but indeed constitutes the very objective truths that positivism seeks outside it. Edwards and Potter locate mental predicates such as "thinking," "remembering," and so on in everyday communication exchanges, arguing that their meaning is situated and contingent: It depends on what participants are trying to do. Discursive approaches such as discursive psychology, conversation analysis, and discourse analysis (e.g., Tracy, 2002) are all central to social construction arguments about the constitutive and performative nature of language and how social members *do* things with words (Austin, 1962).

By the 1960s, other voices joined the intellectual conversation that became the phenomenon we call social construction, as part of a movement known as postmodernism. These

were voices that the academy had marginalized or silenced for not speaking the language of traditional social science. Feminist voices provide one good example of this, such as Carol Gilligan in psychology (e.g., 1982) and Dorothy Smith in sociology (e.g., 1978). Gilligan's rewriting of psychology *In a Different Voice* (1982), for example, demonstrates how women's reality has been silenced by mainstream psychological theory, in favor of men's. By revoicing psychology, Gilligan (1982) demonstrates that one of its major theories of moral development is, in fact, based on faulty interpretation.

In communication, scholars broke away from empirical studies concerned with linear, causal relationships and favored social approaches (Leeds-Hurwitz, 1995). An important approach to communication social construction is Pearce and Cronen's (e.g., 1980) *coordinated management of meaning* theory, which foregrounds conversation and the ongoing negotiation of meaning (see Bartesaghi & Castor, 2008, pp. 9–10). The work of John Shotter (1984, 1993a, 1993b, 2000; Shotter & Gergen, 1994) in social accountability, joint action, and dialogical knowledge is also central to communication social construction. A unique and original thinker, Shotter developed the ideas of Wittgenstein, Bakhtin, and Garfinkel, among others, into relationally responsive social construction, where conversation is the key to understanding social life. In turn, Shotter (1993a) constructs conversation as a place for the unexpected, for unintended consequences and in-the-moment occurrences. Relationally responsive social construction understands communication as a moment-to-moment interaction in which participants continuously respond to the past, the present, and an anticipated future, and to each other.

Though social construction shook the taken-for-granted narratives of positivism, it may appear that it is itself taken for granted and may even be old news (Bartesaghi & Castor, 2008). We believe that this is just an appearance. In 2007, the Communication as Social Construction Division was added to the National Communication Association as a result of a summer institute on social construction that was held the previous year in Albuquerque, showing that the conversation is far from over and only just beginning. Indeed, two new books relevant to this chapter are available, *Socially Constructing Communication* (Leeds-Hurwitz & Galanes, 2009) and *The Handbook of Constructionist Research*, which includes a chapter on communication social construction by communication scholars Elissa Foster and Arthur Bochner (2008).

Social Construction in Communication: Five Propositions

As a response to the all-encompassing metanarrative of positivism, social construction is not a theory. Rather, it exists in the empirical dialogues among the proponents in

our discipline, as well as in the practices of those who apply it in their everyday activities. In the following five propositions, we outline the principal beliefs of *a social construction perspective in communication* (Bartesaghi & Castor, 2008; Bartesaghi & Castor, 2009).

1. Questions the Taken for Granted

This first proposition invites you to ask questions, think critically, and take nothing for granted. Once you adopt a social construction stance, you will find questioning a natural way to approach the world. We recommend three ways for you to ask questions. A good place to start is with definitions and classifications. Take gender, for instance. Most of us assume that the categories “male” and “female” are natural, assigned at birth, and have nothing to do with the social process. But hundreds of gender reassignment surgeries are performed each year in the United States alone, many of these on adults who wish to choose a different gender for themselves. This suggests that masculinity and femininity are bound up with gender (Burr, 2003, p. 3) and with how we talk it into embodied being (Bartesaghi & Castor, 2008, pp. 16–19).

A second way we encourage you to ask questions from a social construction perspective is in your own work. Our students often ask us whether they are allowed to write in the first person. As social construction scholars, we encourage students to do so because we do not treat research from an objectivist position, viewing the endeavor as a way of knowing the reality “out there.” Social construction thinkers recognize the researcher's role (and think of students as researchers) in shaping the context that we are studying (e.g., Briggs, 1986). How you write up your own work is crucial to this recognition, and writing styles that make explicit the role of the researcher in the research process are in direct contrast to the passive, third-person voice of traditional social science (e.g., Kondo, 1990). In communication, autoethnographic narratives (Ellis, 2004; Ellis & Bochner, 1996) that evoke emotions and reflection in the reader are fascinating ways to question the constraints of the organization and representational language of social science articles, which, by and large, purge narrative and first-person elements.

Finally, we invite you to see questioning as an interesting topic of study. A communication social construction thinker sees questions as connected to shaping identities (e.g., Antaki, 2001; Bilmes, 2001) and defining situations (e.g., Agne & Tracy, 1998). In political and news interactions, especially, questions are active and strategic attempts to control situations by defining social reality (Bilmes, 2001; Clayman & Heritage, 2002). Because they are powerful conversational acts (Sacks, 1995; Wang, 2006), and destabilize the taken for granted, questions are a great place to start to see social construction in action.

2. Positions Meaning in the Everyday Dynamic of Relationships

With this proposition, we resonate with Bakhtin's (1984) relational understanding of meaning making and his assertion that "truth is not to be found inside the head of an individual person [but] between people collectively searching for the truth, in the process of their dialogic interaction" (p. 110). To see truth, in the sense of knowledge and meaning, as a process of relationship is to challenge notions of knowledge as individual property as well as of mind and cognition (Antaki, 2006; Maynard, 2006). It is also to place social construction within the competencies of communication scholarship (Pearce, 1995).

As early as 1929, the philosopher John Dewey raised doubt about the individual as a psychological creation, a cognizing subject engaging in activities such as perception, memory, and information processing. For the "self-sufficing individual"—the same psychological creation that Edward Sampson (1977) addresses in terms of the "self-contained individual"—communication is no more than a mechanical connection between "inner" mental states and "outer" expression (Dewey, 1929/1958, p. 169; Radford, 1994). But as work in discourse studies has shown, the idea that meaning making is radically hidden (Shotter, 2000) within individual minds is no more than a picture that, as Wittgenstein would say, is holding us captive.

First, let us tackle the very idea of the mind and mental processes. Perhaps the most striking insight of the pioneering interaction scholar Harvey Sacks is how *thought is made visible in conversation*. By studying transcripts of tape recordings, the conversation analyst can *see* how thinking is constructed by the way conversants respond and orient to each other's contributions in the moment-by-moment shifts required by the exchange. In the turn-by-turn dynamic of talk-in-interaction, terms such as *think*, *remember*, and *know* become meaningful *relationally*, according to what the participants can *do* with them pragmatically within the conversation: argue a point, tell a story, or dispute one another's knowledge.

For example, consider Ochs and Capps's (1997) examination of how "I remember" functions as a device in the construction of a story (rather than as a verbal avowal of a cognitive process). Based on a transcribed exchange among family members, Ochs and Capps show how "I remember" is used as an assertion by both the parent and the child to engage in a tug-of-war with respect to who remembers best and, therefore, who is entitled to tell a particular family story. Authentic memory, the authors argue, is a narrative told or authored by the person who is granted author-ity to do so.

In another example, Antaki (2006) shows how cognition is visibly constructed in a relationship between two people engaged in everyday talk by analyzing a diagnostic interview between a (cognitively) disabled person and his institutional interviewer. By choosing which of the interviewee's answers actually counts as valid evidence of a cognition, the

interviewer not only *produces* cognition (in the sense that he constitutes it in interaction) but reproduces institutional order and the relational manifestations of that order.

What we particularly like about Antaki's (2006) essay is that it is a great empirical example of an aspect of Wittgenstein's (1953) philosophy. In his *Philosophical Investigations*, Wittgenstein wrote that

since everything lies open to view there is nothing to explain. For what is hidden, for example, is of no interest to us (p. 126). . . . How do sentences do it [manage to represent]? Don't you know? *For nothing is hidden* [italics added]. (p. 435)

Understanding meaning as a relational accomplishment, which is what Wittgenstein exhorts us to do, rather than as a hidden property to be extracted from individuals by cognitive measurements, frees us from (to borrow a phrase of Paul Ricoeur, 1970) a "hermeneutics of suspicion" (p. 33). Once we understand that we share in making memory, thought, and meaning, we need not suspect what others remember, think, and mean.

Scholars thinking about relationships in terms of communication social construction have developed Bakhtin's (1984) ideas on identity in dialogue into a notion of relational identity: "Through dialoguing with the other, we get a sense of who we are" (Sullivan & McCarthy, 2004, p. 307). The idea that identity is constructed in talk is now well entrenched (e.g., Tracy, 2002), and work in discourse approaches has endeavored to show how the concept of personhood can be an everyday relational accomplishment, as well as a topic of talk itself (Antaki & Widdicombe, 1998). We are all ongoing, emergent creations in the dynamic of claiming and being granted our identities, which, as Eisenberg (1998) tells us, exist in the ambiguity of the space between self and other.

In a communication social construction perspective, relational meaning making also comes with *relational responsibility* (McNamee & Gergen, 1999). This means resituating the burden of responsibility in the relationship *to the relationship* rather than the individual, who presently bears responsibility in our legal, educational, and psychiatric institutions, to name a few. What would that mean, exactly? How would we feel differently if we could see ourselves connected to and accountable for each other's actions rather than choosing psychological explanations that make others solely responsible for their thoughts and choices?

3. Realizes Communication as Constitutive and Consequential

Anderson (1997, p. 111) says it best: Each conversation is embedded within, will become a part of, will be influenced by, and will influence myriad other past and future conversations. By locating meaning in a dynamic of relationships, social construction makes us realize how the acts, and the choices we make within them, reflexively make the very relationships that we realize together. In

turn, this perspective is grounded in a view of communication as *constitutive*: something created in its very practices (Craig, 1999; Deetz, 1994). Because our participation makes it what it is, with our “past activities point[ing] in the direction of our present ones,” communication is both self-generating and self-specifying (Penman, 2000). In other words, your actions and words matter. They are not the isolated events of one individual but connected to relational and social matrices of actions and words that have the real power to reconstitute, or reconstruct, the events of your life and the world through communication.

We found a powerful example of communication as constitutive on the Web site of Rape Victim Advocates, a Chicago-based organization that mobilizes for those who have been targets of sexual assault. Their homepage reads as follows: “Through our presence in Chicago area emergency rooms, we provide nonjudgmental emotional support to *victims* of sexual violence, enabling them to *become survivors* [italics added]” (About RVA, n.d.).

In this excerpt, Rape Victim Advocates is distinguishing between what is constituted by the terms *victim* and *survivor* and is endeavoring to bring about a transformation from one state of being to the other for those who experienced rape. Realize that the terms *victim* and *survivor* refer to the same person but constitute and embody very different social realities. In altering the way the experience of rape is called, Rape Victim Advocates subscribes to a constitutive view of communication, proposing that the rape experience itself can be reconstructed in a different, more enabling way.

John Stewart’s *Language as Articulate Contact* (1995) exemplifies an eloquent theoretical argument on the constitutive nature of communication. Urging us to abandon the epistemological notion of communication encouraged by scholarship in fields such as semiotics, which focuses on representation (and, much like in the transmission view, constitutes communication in terms of signs, messages, and codes), Stewart encourages an ontological view of communication. For this purpose, he develops the ideas of the philosophers Heidegger (1962) and Gadamer (1989) and proposes communication as *dasein*, the human condition of everyday coping and being-in-the-world. According to the ontological view of communication, there is no need for language to bridge the gap between subject and object by means of representation (which can be more or less good). Language, in this sense, is not something we possess to represent, as in the epistemological view, but something we inhabit (Stewart, 1995). Language is experience, as the work of Rape Victim Advocates suggests.

Because communication constitutes our social world, it is also *consequential* to it (Sigman, 1995). Consider Krippendorff’s (1996) reflection on communication as a consequential activity among the scholars and teachers of our discipline:

Although social scientists communicate in numerous ways—interviewing their subjects, engaging discursively with colleagues, publishing their work [–] self-applications of

communication theories are surprisingly rare if not totally absent from the literature. It is as if the communicative involvements of scientists were immune to critical examination or so perfectly obvious as to be not worthy of attention. This schism easily leads to theories that people find hard to live by. I know of no communication scholar who could communicate by the protocols of the classical theories they tend to perfect with their colleagues, for example, of communication as attitude change, as information transmission, as prediction and control, as management of meanings, or as institutionalized mass-production of messages. (p. 311)

In this extract, Krippendorff (1996) underscores consequentiality. He takes communication scholars to task for the social realities implied by the theories they put forth and asks whether these are theories that you would choose to describe you and descriptions you would choose to abide by? And is it not interesting that Krippendorff chooses information transmission as one taken-for-granted theory in communication whose consequences we are unwittingly re-creating in our everyday communication?

4. Understands the World as Very Much Real for Those Who Live in It

We often find ourselves entangled in one of the great misunderstandings of social construction. This seemingly no-win quandary, also known as the realism-relativism debate, usually goes something like this: “So you believe that reality is socially constructed? This must mean that if you say that this dirty plastic bottle is actually a valuable treasure, then it must be so, right?” (Bartesaghi & Castor, 2009; Phillips & Jørgensen, 2002). Because social construction understands the world as very much real for those who live in it, this fourth proposition suggests how communication social construction thinkers may step out of this argument altogether.

The speaker in the example is committing two fallacies. The first is that he or she does not understand the very idea of *social* construction. Martin Buber (1965) put it this way: “We do not find meaning lying in things nor do we put it into things, but between us and things it can happen” (p. 36). In this case, it involves the way a community talks something into being, such as the value we place on something (and yes, it is possible that an empty plastic bottle could one day be sold on EBay for a good deal of money, if it were once the bottle of a rock star, right?). The second fallacy is misunderstanding social construction as representation rather than materiality and embodiment. Once experience and language are separated, the trouble starts. In a controversial and influential paper, Edwards, Ashmore, and Potter (1995) call this sort of trouble the “death and furniture” arguments. The material reality of tables (see this? *bang!*) and victims (what about Hurricane Katrina? and the bodies that come back from Iraq!) is brought up as evidence of how social construction is nothing more than a new recipe for relativism.

Because when you are trapped in a box the solution is to step out of it, we find the death and furniture arguments deceptive, for they position social construction *in opposition* to material realities, which social construction does not deny. In *The Social Construction of Reality*, Berger and Luckmann (1966) offered a solution. Tables and taxes acquire their ontological status through the circular process we described earlier, by which we, as social members, create together our social world through our coordinated work, and then we respond to them as objective truths: things that are there and that are part of our human experience. This is why we experience institutions as already “out there” material entities not of our own making. Reality may be a *relative* product of our interactional choices, but it is a very *real* experience once those choices have been made (Bartesaghi & Castor, 2009). But Berger and Luckmann (1966) can take us only so far in understanding social construction in material terms (Potter, 1996). They provide a phenomenological account, concerned with individual experiences and how they are internalized; thus, we need to seek further.

Edwards and colleagues (1995) offer their own counterproposition to realists who argue the brute physical reality of tables and the like. Just like anyone else, realists have to *make the argument*, for the argument cannot make itself: It has to be spoken by someone, from a particular position, and with a particular stake and entitlement. And relativists have a similar problem: “While realists shoot themselves in the foot as soon as they represent, relativists do so as soon as they argue. To argue for something is to care . . . which is immediately not relativist” (Edwards et al., 1995, p. 39). The social construction position sees both realist and relativist as ultimately trapped in a dilemma, and it does not side with either. To do so is to understand “reality” in objectivist terms (Pearce, 1995) as the opposite pole to “falsehood.” This means misusing *construction* to be synonymous with *made up* (as the challenger in the example of the plastic bottle was doing) or, as Burr (1998) notes, “*merely* [italics added] constructed” (p. 101).

Social construction’s view on reality is nothing if not realistic (Pearce, 1995; see also Bartesaghi & Castor, 2009). Once constituted, our social reality is very real and consequential to us. This is particularly visible in cases where a particular reality is selected as factual from an ambiguous set of differently interpretable acts. The construction of child abuse as a social problem is a good example (see Johnson, 1989). Child abuse, as we understand it today, is, in fact, a historical and social contingency, born of the large postwar child population, access to medical specialists with improved diagnostic techniques, and laws that required child beatings to be reported to the authorities. Before these historically traceable changes, beating children was not considered abuse. In addition to this, media reporting of horror stories in the 1960s to 1980s raised child abuse to the level of a social crisis. As Johnson (1989) explains, the media’s construction of child abuse as a social problem was based on, among other

things, linguistic presentation. Specifically, acts of child abuse were presented in the news as irrational and the acts of one individual; they provided no relational or social context, such as a family altercation, divorce, poverty, joblessness, or family strife. As such, the media (for ratings, readership, and a “good story”) constructed child abuse as pure evil against the innocent.

For another example, consider *The Construction of an LD Student* (Mehan, 1996), which explores how Shane, a fourth grader who sometimes stops in the middle of a math problem and says “no way” (but later completes it) ends up being declared learning disabled. Different parties are involved in defining Shane’s status as a learner: the mother (who does not think her child has special needs), the teacher, and the psychologist. By leading us through a transcription of the exchange among them, Mehan shows how the psychologist prevails over the others, by speaking in ways that are more authoritative and using complicated terms that the mother and teacher cannot challenge or question. Shane, who is not present, must, however, be subjected to the consequences of this meeting and of his newly constructed diagnosis. Mehan’s (1996) study, which is about how some have more say in defining what is real than others do, is also relevant to the following proposition that has to do with how power exists as a relationship, which we construct in communication.

5. Tackles Power as a Material and Embodied Relationship in Communication

With this final proposition, we argue that power is not something that exists “outside of” our talk, as institutions or abstract social structures. Rather, we propose that power is a material and embodied consequence of relationships, constituted in communication (Lannamann, 1998; Shotter & Lannamann, 2002).

Foucault (1980) has told us that power is everywhere around us. It is ironic, therefore, that in doing so, he abstracted it rather than materialized it (Krippendorff, 1995), for if it is everywhere, where exactly is it, and how do we know we have found it? Discourse scholars such as Thornborrow (2002) offer an empirical answer to Foucault by grounding power in everyday talk and linking talk to larger discursive frameworks. For example, by analyzing institutional talk, Thornborrow reveals how police work is accomplished in the everyday orderliness of conversational turn taking, showing how power is visibly co-constructed in the constantly shifting asymmetry between officers and a woman in a rape interview. Although the woman tells the two male officers that she has been raped, the officers’ questioning works to cast doubt not only on her story but also, gradually, on the woman’s moral fitness to tell it. As the exchange progresses, it is obvious that the woman has been placed, by a process of conversation, under police suspicion. As a result of the interview, the bodily experience of her rape is disclaimed by the male officers. The consequences of

this are very real: The woman will not receive the care and attention she needs; she is treated poorly; and, with their questioning, the officers officially categorize the woman as whom they believe her to be—someone who does not merit police protection. This is an embodied shift in her material circumstances, affected through a process of communication that is institutionally sanctioned. This is the social construction of power.

In her book *Talking Power* (1990), Robin Lakoff presents the following exchange between a therapist (T) and a client (C) as an example of a power imbalance. We invite you to consider how the therapist and the client engage in the construction of an asymmetrical relationship:

C: Why can't you see me on Monday?

T: That seems to disturb you, doesn't it? (p. 69)

As Lakoff (1990) points out, what is interesting about the therapist's response is what it tells us about the presuppositions it embeds about power distribution in therapy. There are, as we see it, three. The first is that the therapist is not bound by the same rules of conversation as the client (Bartesaghi, 2008) and may respond to a question with another question rather than give an answer. Second, the therapist constructs the client's question as information about the client's anxiety rather than as a genuine request for information (Lakoff, 1990, p. 69), thus claiming a relational reality in which words signify mental states. Finally, the conversation reflects on the tacit claim that therapy works by virtue of one person's ability to read the true meaning of the words of the other and to interpret that rather than what the other is actually saying. This ability is granted to therapists, and not clients, and in this brief exchange, we see this therapist claiming that right. That the exchange has to do with access to help (therapy) really brings home the fact that power is socially co-constructed in discourse, where one person is able to coordinate the material placement of the other's body (Lannamann, 1998).

Something remains to be said here: The client does have the option to respond to the therapist. As *joint action*, action that people intentionally engage in together but whose results are indeterminate and often unintentional (Shotter, 1993b), power in therapy (as elsewhere) is a relational accomplishment, a co-construction (Buttny, 1996). We do it together by claiming it and granting it. As such, through acts of communication and re-embodiment, it can also be undone (Krippendorff, 1995). The client could call the therapist's bluff, laugh, or find a new therapist. We are not suggesting that this is easy, as we do recognize that relationships are embedded in larger institutional and social frames. Rather, we are suggesting that power is locatable in our communication exchanges and that a social construction perspective allows us to see that it is not beyond our reach.

Conclusion

We have endeavored to offer a definition of social construction by reconstructing communication according to the perspective afforded to us as social construction communication thinkers. We have, first, questioned the very languaging of "communication" in transmission terms and instead positioned communication in the ongoing exchanges of our relational activities. Because social construction is not a unified theory but a response to theory's discontents, our second move was to offer a collage of thinkers and scholars who have contributed to our thinking and doing as communication scholars within the intellectual heritage of social construction. In the third section, we put forth five propositions for our readers to consider as key tenets for social construction scholarship in communication. We encourage you to use these propositions as starting points for your own conversations about communication and social construction; may they lead you to many more ideas than we ever thought possible.

Doing communication social construction work has its challenges. An important disciplinary challenge concerns the extent to which communication scholarship should involve critically, politically engaged work. Some scholars have convincingly argued for an ontological version of communication, where research can address material circumstances, illuminate issues of asymmetry, and make a difference in practice (Craig & Tracy, 1995). Inasmuch as communication social construction tackles power as material and embodied, working within its framework means that we cannot eschew doing critical work and work that may ask difficult questions (Phillips & Jørgensen, 2002).

Having come to the end of our chapter, we look forward to new beginnings, new conversations, and new thoughts about communication social construction: yours.

Notes

1. In his address to "Caught in the Act," a 2006 Summer Institute on social construction approaches to communication, John Stewart argued for dropping the suffix *ism* from *social construction*, to promote greater accessibility of social construction as a process in communication study rather than a theory in psychology, where it originated (see Stewart, 2009). We agree and drop the *ism* in our own writing (see also Bartesaghi & Castor, 2009).

2. We adapted this exchange from Tannen (1990).

LISTENING, UNDERSTANDING, AND MISUNDERSTANDING

ANDREW D. WOLVIN

University of Maryland, College Park

Listening has been identified as one of the most used and one of the most important communication skills in personal, academic, and professional settings alike (Wolvin & Coakley, 1996, pp. 13–25). The vital role of listening in communication begins with the recognition that listening is the first language skill to be acquired. The fetus listens as it develops in the mother’s womb; henceforth, this listening development plays a central role in one’s language acquisition. Auditory and visual discrimination also are central to the child’s early development of other (including survival, social, and intellectual) skills.

Studies of time spent communicating (Emanuel Adams, Baker, Daufin, Ellington, Fitts, et al., 2008) suggest that people listen for as much as 55% of their day. The primacy of listening is not just a matter of time on the task. Listening is a critical factor in academic success. Federal initiatives to strengthen educational outcomes for secondary school and post-secondary-school students underscore the need for listening proficiency. The U.S. Department of Labor established a commission to identify what critical skills are essential for high school graduates to function effectively in the workplace. The basic skills of mathematics, reading, writing, speaking, and *listening* were determined to be at the core of preparation for graduates to enter the workplace. In the workplace, listening ability consistently ranks in the top three skills that employers seek in hiring for entry-level positions. Effective listening is recognized as a key to organizational success, because poor listening can be costly.

The study of listening behavior in the field of communication is not a new focus. As early as 1948, Ralph G. Nichols, considered by many to be the “founder” of listening as a field of study, established some dimensions of what constitutes listening behavior, including inference making, listening for the main ideas, identifying the organizational plan, and concentration. Basic to any attempt to define listening, however, is a consideration of how listening is a unique behavior separate from other intellectual behaviors. Early listening research isolated a disparate listening comprehension factor, distinct from the students’ performance in areas such as reasoning, verbal comprehension, attention, auditory resistance, and memory.

The Listening Process

As a communicator, the listener engages in a sequence of behaviors that are generally accepted to characterize the decoding process: receiving; attending; perceiving; interpreting; and responding.

Receiving

The listener receives messages. During reception, the listener employs auditory and visual sensory receptors. While the listening process can include hearing sounds, listening and hearing are not the synonymous functions that many

individuals assume. The auditory reception of the message is itself a detailed process involving the intricate hearing mechanism. The sound must enter the middle ear, set into vibration the tympanic membrane, and be conducted through the inner ear to the brain. Problems with the hearing mechanism can compound the receptive process. Research at the National Institutes of Health suggests that as many as one out of every nine Americans has some type of hearing loss. Exposure to loud music, especially through headsets, has been identified as a major contributor to this situation.

While many researchers and practitioners have focused their definitions and models of listening on listening to auditory-only stimuli, listening also involves the visual channel when the source of the stimuli is in the presence of the listener. The visual channel is an influential communication media, and the other senses (smell, taste, touch) impact the listener as well.

Attending

After the message has been received through auditory and visual channels, it must be attended to in the working memory (Baddeley & Hitch, 1974). At this point, the listener is required to focus on the auditory and/or the visual stimuli and concentrate on the message received. While researchers differ as to how the short-term memory system receives and holds the information, they do agree that the attention span is quite limited. Cognitive psychologists recognize that attention is a limited resource of a fixed capacity of sensory systems and memory mechanisms combined.

The human attention span today undoubtedly has been limited further by the impact of the media. Many people raised in the television generation, for example, have come to expect a 7- to 10-minute program format with time out for a commercial break. This shortened attention span affects one's capacity to listen to lectures, to participate in conversation, and generally to function as a listener in all sorts of settings.

A listener's ability to attend to a message is influenced significantly by attention energy. Kahneman (1973) has determined that attention energy may be distributed according to (1) the difficulty of the mental task; (2) automatic, unconscious communication rules (such as focusing on the speaker who uses the listener's name); and (3) conscious decisions (such as focusing on one's supervisor's message rather than on that from a coworker).

Perceiving

Attention to the message is affected not only by the listener's energy in the short-term memory system but also by the listener's perceptual filter. The perceptual filter serves to screen the stimulus so that one's predispositions alter the message received. The listener's frame of reference—all of one's background, experience, roles,

and mental and physical states—makes up the perceptual filter. The frame of reference establishes the perceptual expectations that listeners bring to the communication so that, essentially, we see and hear what we want to see and hear. The listener who understands how the frame of reference shapes his or her listening behavior can function at a more sophisticated level. This understanding should extend to understanding the other communicator(s)—why they are responding as they do. Getting to this level of empathic perception affords the listener a solid frame of reference for interpreting the message.

Interpreting

Once the message has been received and perceived by the listener through the auditory, visual, and attention processors, the message must be interpreted by the listener. This stage of the listening process involves fitting the verbal and/or nonverbal messages into the proper linguistic categories stored in the brain and then interpreting the messages for their meanings. Lundsteen (1979) describes this representational process as one of internal speech. Decoding the verbal and nonverbal language varies according to each individual's perceptual filter and linguistic category system, so the original intent of a speaker's message may be misinterpreted, distorted, or even completely changed as the listener's meaning is assigned.

The assignment of meaning to the message is influenced not only by the linguistic category system but also by one's cognitive processing. This mental activity is framed by the hemispheric dominance of an individual; by his or her inductive, deductive, or intuitive orientation; and by the long-term memory. As the message is processed, it is analyzed, visualized, and associated according to the linguistic categories in the long-term memory store. As individuals are called on to handle a vast amount of information during the course of any given day, techniques to process and recall information become critical.

Some cognitive psychologists use schema theory to describe this complex task of decoding and interpreting messages. Schema theory posits that humans carry schemata—mental representations of knowledge—in their brains. These organized information structures consist of nodes (concepts, events, objects) and links (relationships of the nodes). New information that listeners receive is first run through existing schemata, or scripts, and then interpreted. Schemata represent the generic concepts that are stored in memory and relate persons or objects to attributes or relate actions to anticipated consequences. Smith (1982) suggests that schemata serve important listening functions in (1) telling us to what we should attend, (2) serving as the framework for interpreting incoming information, and (3) guiding the reconstruction of messages in memory. Cognitive responses to the message, thus, serve to frame the listener's interpretation of the information received.

Responding

After assigning one's own meaning to the message, the listener responds to it. This phase of the listening process involves moving the received, attended to, and interpreted message from the short-term memory into the long-term memory store for potential retrieval. As memory development specialists stress, retention requires strategy. Familiar techniques such as the use of mnemonic devices, linking, clustering, and chunking are considered by researchers studying the dynamics of short-term memory and recall.

The listener's response also is external, manifested in the feedback that the listener provides to the source of the message. Though listening constitutes an intricate internal process, attention to feedback is essential to good listening. Research by Leavitt and Mueller (1968) demonstrates that with increased feedback, both listener and speaker gain confidence that the message is communicated with accuracy and experience satisfaction with the communication. Other communicators in an interaction base their assessment of a listener's effectiveness on the feedback,

responses that might take the form of performance on a comprehension test, questions asked, attentive behaviors, or even compliance. Thus, while some listening scholars argue that feedback goes beyond listening and takes the listener back into a sender's role in the communication transaction, we rely on feedback, albeit unfairly at times, as an indicator of listening "accomplished."

The complex listening process, including reception, attention, perception, interpretation, and response, may be illustrated as a process model of overlapping circles (Figure 16.1). While the stages of listening occur in some sequence, in the listener's "real time," the dimensions probably occur in close simultaneity. At the core of the process are communication influencers—variables of the speaker, message, channel, environment, and individual listener—that affect the outcome at every stage of this process. It should be apparent, then, that listening behavior is one of the most complex of all human behaviors—and certainly extends far beyond the auditory processing that has been the focus of so many of the earlier listening scholars.

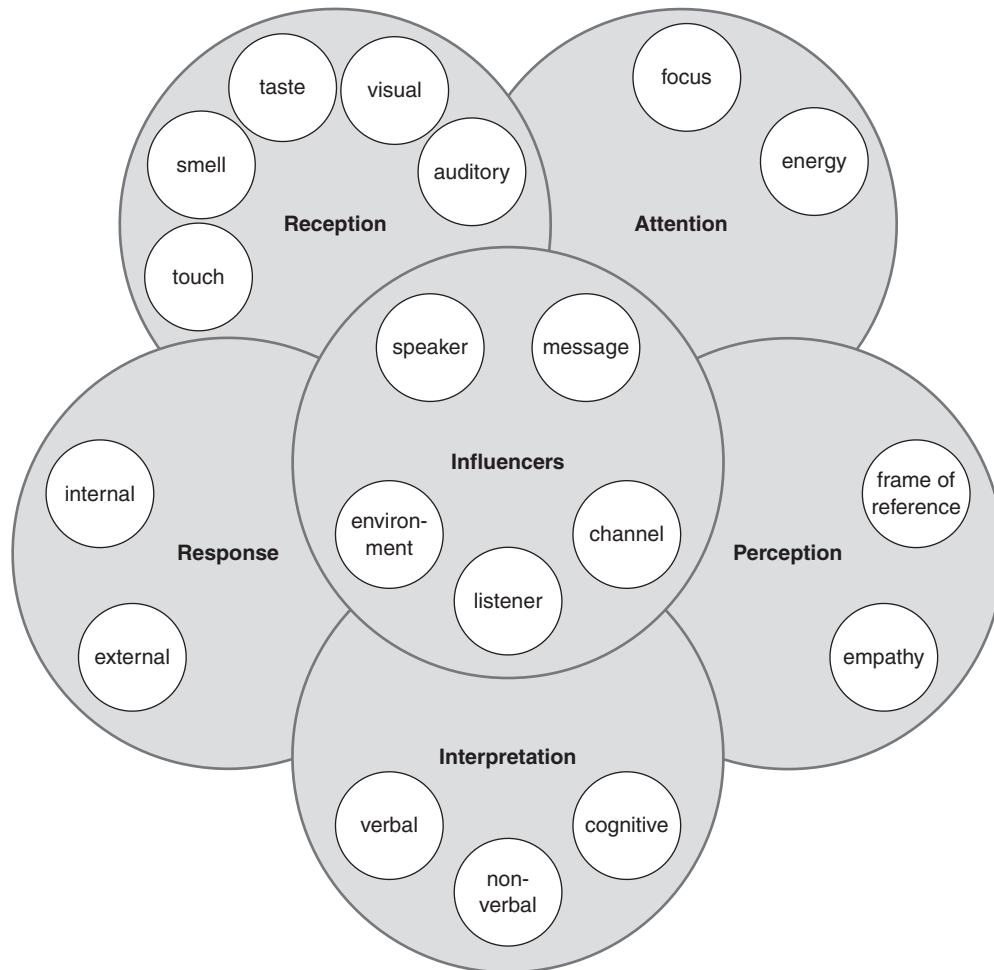

Figure 16.1 Listening Model

Listening Variables

As listeners receive, attend, perceive, interpret, and respond to messages, they are influenced by many variables that can enhance or impede effective listening. Listening researchers have focused on key physiological, social/psychological, and contextual influencers.

Physiological Influencers

Listening physiology certainly plays a major role in how listeners function. Sensory acuity, especially auditory and visual, is basic to listening. Age-related deterioration of sensory mechanisms can lead to loss of both the verbal content and the nonverbal dimensions of the communication. Additionally, the neurological makeup of the listener is a factor. Research on hemispheric specialization, for example, suggests that the left brain may be the more rational, objective, organizing processor, while the right brain is the more emotional, intuitive side.

Age also is an important listening variable. In a body of research on listening across the life span, my colleagues and I have determined that what may characterize competent or effective listening can change as one physiologically, sociologically, and/or communicatively ages (Halone, Cunconan, Coakley, & Wolvin, 1998). A listener acquires differential listening experiences and gains a wider array of general knowledge throughout his or her life span. Significantly, children, adolescents, young adults, older adults, and elders report different listening needs, different listening goals, and different listening strategies as they account for listening expectations and for listening experiences alike.

Just as age is a listening variable, so too is gender. One of the highly perpetuated American stereotypes is that listening is, essentially, “women’s work.” Brain imaging research (Phillips, Lowe, Lurito, Dziedzic, & Mathews, 2001) does demonstrate that men and women bring some very real differences in attention styles and cognitive processing styles to the communicative interaction. As these researchers explore more deeply the biological influence of the male/female genetic makeup, however, the social influence model continues to dominate our understanding of gender variables. Research reveals that men and women have been found to “learn to listen for different purposes and have different listening goals. The primary contrast appears in task versus interpersonal understanding: Males tend to hear facts, while females are more aware of the mood of the communication” (Booth-Butterfield, 1984, p. 39).

Psychological Influencers

In addition to the physiological influences on listening, listeners bring psychological variables to the communication. The listener’s attitudinal state may well be one of the most significant influences on that person’s listening behavior. A positive listening attitude, along with listening knowledge, is a critical ingredient of effective

listening. Positive attitudes give the listener a willingness to listen.

Positive attitudes that facilitate effective listening may be identified. Being interested is probably one of the most significant. Too frequently, listeners tune out with the excuse “Oh, this isn’t interesting.” A high level of interest combines with an active, responsible approach to listening. Unfortunately, Americans are conditioned to listening as a passive act. Good listeners recognize that they are partners in the communication and that they share in the responsibility for meeting the goals of the interaction. Effective listeners also remain open-minded, willing to listen to differing points of view and to speakers whose styles are not necessarily attractive or engaging.

Positive listening attitudes are not directed only at the other communicator. Positive listening attitudes also influence one’s self-concept as a listener. Sadly, listening is not a highly valued American communication skill; we seldom reward good listening. Rather, we reinforce negative listening behaviors in schools and families alike. “You’re not listening.” “You never listen to me.” “Be quiet and listen.” These admonishments are more prevalent in American speech than “Thanks for listening” or “You’re a good listener.”

Listeners, like speakers, also suffer communication apprehension. Wheelless (1975) has pioneered some study of receiver apprehension, “the fear of misinterpreting, inadequately processing, and/or not being able to adjust psychologically to messages sent by others” (p. 263).

Research on receiver apprehension suggests that listening anxiety stemming from stressful situations can lead to distorted messages and misunderstandings.

Additionally, there is evidence that receiver apprehension can result from inadequate information processing. McReynolds (1976) hypothesizes that the processing of material that is difficult to assimilate tends to accumulate (resulting in “cognitive backlog”) and to produce anxiety. Beatty (1981) has determined that receiver apprehension is a function of unassimilated information that results from processing difficulties because of the cognitive backlog.

The listener who suffers receiver apprehension and/or negative attitudes toward listening is not going to be an efficient listener. Indeed, an unreceptive listener may not be a listener at all. Wheelless, Frymier, and Thompson (1992) have looked at receptivity—being open to influence—as it relates to the listening behaviors of responsiveness and attentiveness. Extending this line of research, Roberts and Vinson (1998) determined that the importance of the topic is the crucial factor in establishing a listener’s willingness to listen.

A listener’s willingness to listen also depends on his or her listening preferences. Listeners choose different ways to listen, choices grounded in habitual responses that evolve over the course of one’s listening lifetime. Watson, Barker, and Weaver (1995) identified four listening styles: (1) a people-oriented style, which focuses on the emotional and relational aspects of a communication; (2) a content-oriented style, centered on processing complex information; (3) an action-oriented style, where the listener prefers

clear, efficient information; and (4) a time-oriented style, where the listener has a preference for short, limited messages. Undoubtedly, other listening factors, such as listening type (data driven, structure oriented, vision seeker, human dimension oriented), cognitive style (inductive, deductive, intuitive), introverted/extroverted personality style, conversational sensitivity, and channels, influence listening behavior in significant ways.

Contextual Influencers

While listeners bring significant physiological and psychological variables to their listening behavior, contextual influencers also play a central role in shaping the listening experience. Roles, culture, and time have received the attention of listening researchers.

The context of the communication frequently shapes the roles that communicators must assume in the interaction. We listen in many different communication relationships—personal, academic, professional—which require that we assume different roles as family members, friends, students, workers, or managers. It is noteworthy that listening effectiveness has been correlated with perceptions of good leadership. And listening enhances the sales relationship by creating a trusting climate.

Culture is understood as the set of customs, behaviors, beliefs, and language that distinguish a particular group of people and make up the background, experience, and perceptual filters of individuals within that group. The anthropologist Edward Hall (Hall & Hall, 1989) described how different cultures manage information in different ways. Low-context cultures, such as the United States and Canada, require communicators to give and receive a considerable amount of verbal information, while high-context cultures, such as Japan and Saudi Arabia, requires less extensive verbal messages. In high-context cultures, more information is contained in the communication setting and in the communicators themselves than in the words used.

As a result, people listen differently in different cultures. Kiewitz, Weaver, Brosius, and Weimann (1997), for example, compared the listening style preferences of young adults in three different cultures. They discovered that Germans preferred the action style, Israelis were more prone to the content style, while Americans were more oriented to the people and time styles of listening.

Like culture, time is a major variable in listening. Listening communicators are influenced continuously by various dimensions of time. Time is manifested in the aging process itself and how that process affects sensory acuity and the experience level of the listener. The time in which the communication occurs has an effect on listening, because people deal with information differently at different times of the day. Interestingly, verbal information presented in the afternoon may be retained longer than that offered in the morning.

Additionally, the time it takes to listen is a factor. It has been suggested that listeners can listen (and think) about

four times faster than the normal conversation rate, so we have a considerable “time gap” in the system for attention to wander and to lose focus. This gap between speech speed and thought speed may be one of the most significant factors.

With the advances in communication technology and information, many listeners today feel overwhelmed with messages. The average American worker confronts as many as 201 messages a day. As a result, we justifiably perceive that we are running out of time.

Listening Typologies

Listeners function in this complex, multidimensional process of listening with a variety of purposes. These purposes have been identified through several typologies by listening scholars. Lundsteen (1971, 1979), one of the first to analyze listening skills as a hierarchy, offered an instructional taxonomy of listening skills in general and of critical listening skills in particular. Lundsteen was concerned with building a listening curriculum, so she stressed the value of looking at levels of listening skills: Level A, the lowest level, is acuity or sound perception; Level B represents basic discrimination among sounds; and Level C is the comprehension of sounds. Skills at these levels may form a hierarchy, stresses Lundsteen (1979), “because persons who fail to discriminate sound differences with finesse probably also fail to symbolize much verbal meaning from those sounds” (p. 54).

Two other categories have been proposed by Barker and by Mills. Barker (1971) defined listening contexts as social and serious. These categories were explicated further as social listening, which includes appreciative, conversational, courteous listening and listening to indicate love or respect, while serious listening was classified as either selective or concentrated. Mills (1974) described listening targets as responsive listening (agreeing with the speaker), implicative listening (identifying what is not being said), critical listening (evaluating the message), and nondirective listening (providing a sounding board for the speaker).

Extending the previous work on the hierarchical nature of listening skills, Wolvin and Coakley (1979) developed a taxonomy of listening functions that correlate with five general purposes of listeners (aligned, of course, with the general purposes of speakers): discriminative, comprehensive, therapeutic, critical, and appreciative. Just as there are specific listening skills unique to each of these listening purposes, these skills operate in a hierarchical sequence—depending on what each listener’s intended objective or objectives for listening might be at any particular time. To listen to comprehend information, for example, the listener must use discriminative as well as comprehensive listening skills. Discriminative and comprehensive listening are the basic types in which listeners engage. At a higher order, then, listeners build on their discriminative and comprehensive listening skills to function as therapeutic, critical, or appreciative listeners.

It should be recognized that these listening purposes are not always discrete categories. There are times when an individual may listen for multiple purposes while receiving, attending, perceiving, interpreting, and responding to messages.

Discriminative Listening

Discriminative listening involves distinguishing the auditory and/or visual stimuli. Discriminative listening requires careful concentration on, and sensitivity to, the various stimuli to differentiate between/among them accurately. Effective discriminative listening demands sensitivity to the verbal and nonverbal cues offered by the communicator and a concerted effort to identify the auditory and the visual messages.

The importance of listening to discriminate is significant. Parents quickly learn discriminative listening skills when listening to the cries of their newborn infant. Auditory discrimination serves as the base for reading readiness programs for young children. Panhandlers are experts at visually discriminating an “easy mark” on the street. Auto mechanics rely on sound discrimination to understand the malfunctioning of a car. Musicians must discriminate sounds to perform at a professional level. And speech and hearing specialists work to distinguish speech sounds in order to assist clients in dealing with speech disorders.

Discriminative listening serves as the basis for all other purposes of listening behavior. The receptive stage in the process requires the listener to identify and interpret carefully the auditory and visual cues in order to deal effectively with the information being received.

Comprehensive Listening

Listening for comprehension extends from the discrimination of the stimulus to an understanding of the message. Comprehensive listeners listen to lectures, briefings, reports, conferences, television and film documentaries, telephone messages, traffic alerts in order to comprehend the information presented. Much of the educational process at all levels is based on comprehensive listening. Students are asked to listen carefully to lectures and class discussions in order to understand and retain vast amounts of information.

The effective comprehensive listener actively strives to understand and to retain the information in the message. Essentially, the listener is after listening fidelity, a concept identified by listening scholars as the “degree of congruence between the cognitions of a listener and the cognitions of a source following a communication event” (Mulanax & Powers, 2001, p. 70). To assign the meaning intended by the speaker instead of assigning his or her own meaning, the listener avoids critical judgment of the message, the speaker, the channel, or the language used. In addition to not being evaluative, the listener requires proficiency at listening for comprehension by having a

well-developed vocabulary, skill at making accuracy checks through questioning, and even note-taking strategies. Understanding and retaining the information presented requires the listener to develop memory skills—skills that enable the listener to initially hold the incoming information in the short-term memory, to rehearse the information in order to ensure that it is placed in the long-term memory store, and to draw on the long-term memory store to assign meaning. All these memory strategies depend on intense concentration, an essential key to effective listening comprehension. Given the fluctuating nature of attention, an effective comprehensive listener must work to refocus and maintain focus on the speaker’s message. Using internal summaries and identifying the speaker’s “signposts” may assist in this concentration process.

Therapeutic Listening

Therapeutic listening (also referred to more narrowly as “empathic” listening) requires that the listener serve as a “sounding board” to provide the speaker with the opportunity to talk through a problem, ideally to the speaker’s own solution to it. Effective therapeutic listening builds from discrimination and comprehension of the message for the listener to provide the necessary supportive behaviors and responses that enable the speaker to talk through the problem. While serious psychological problems must be handled by qualified therapists, an empathetic ear can be all the assistance required for many people to deal with daily concerns. An effective therapeutic listener must be careful not to evaluate or judge what is said. The therapeutic listener must operate from a high level of empathy—understanding why the speaker is responding as he or she does—to understand the speaker’s thoughts and feelings. By applying principles of nondirective listening, the listener offers just the necessary responses (verbalizations such as “uh huh” and nonverbalizations such as head nods) to keep the speaker communicating without directing him or her to any one particular solution.

Successful therapeutic listening demands a supportive communication climate in which the speaker feels free to express his or her feelings and thoughts without judgment. Likewise, the therapeutic listener must work to remain an empathetic listener without offering a great deal of advice. This is a difficult task, because many individuals will say, “What do you think I should do?” and we have a natural tendency to want to respond with “If I were you, I would . . .” Unfortunately, such advice then imposes *your* solution on another’s problem, and that may not be the most productive. People need help in solving their own problems.

Critical Listening

Unlike therapeutic listening, critical listening requires that a listener evaluate/judge what is being said. Once the critical listener has discriminated and comprehended the message, it

is necessary then to form judgments about the message in order to accept or reject the persuasive appeals. It is important to determine when critical listening is required. Unfortunately, too many listeners go to a critical evaluation prematurely or inappropriately, passing judgments on speakers and messages before comprehending them.

Listeners respond to persuasive messages at various levels. The credibility (trustworthiness, dynamics, and believability) of the speaker is influential. Furthermore, listeners respond to the structure and support of the speaker's arguments. Since effective persuasive communicators will use a variety of psychological appeals to get listeners to respond at the appropriate need levels, the conscientious critical listener must know what speakers are doing to develop persuasive messages and, consequently, how he or she is responding to them.

Critical listeners do well to train themselves in recognizing argument fallacies, particularly hasty generalizations drawn from too little or no evidence. And emotional language can distract listeners if they are not careful to recognize the "red flags" that lead to strong emotional responses. Furthermore, critical listeners should be able to assess the impact that the speaker may be having on their responses to the persuasive messages. Effective critical listening, thus, involves sound judgment and awareness of the persuasive strategies being used.

Appreciative Listening

Appreciative listening is listening to enjoy or to gain a sensory impression from the material. Listening to music, to environmental sounds, to a book on tape, or to a television presentation all represent forms of appreciative listening.

Although listening for appreciation also builds from discrimination and comprehension of appreciative experiences, it results from a very individual response. Listeners' tastes and standards for appreciation vary widely. Some specialists argue that awareness of the background and the style of the material may provide a more meaningful basis for appreciating that material. Thus, music appreciation courses, for example, frequently stress music history, form, and composition. Other specialists, however, encourage listeners to "go with the experience" and not be terribly concerned about analyzing the elements.

The effective listener, then, will make some determination as to what purpose for listening is appropriate in any given communication situation and adapt his or her listening responses accordingly. Although these categories are not discrete (a person may both appreciate and evaluate some material, for example), the taxonomy of listening purposes has been helpful to listeners in understanding their own listening behavior and in developing strategies for functioning more effectively with the different purposes.

While the taxonomy serves as a useful instructional frame, Arnold (1990) argues against this (or any) classification system by suggesting that "these distinctions do not hold up in practice and they provide little insight into

the processes of listening" (p. 3). As a result, he proposes to look at listening as a continuum from listening for information on the left side (of the continuum) to listening with empathy on the right side. However, as we have described the listening process, listening with empathy is integral to all forms of listening. For the listener to best interpret any message, he or she must bring a certain level of empathetic understanding to his or her perception of what the speaker is communicating.

Whether viewed as a continuum or as a taxonomy, listening is a complex communication behavior. The listener functions at different purposes depending on his or her objective as well as the speaker's goal in the communication. Because listening is such a complex human behavior, because as a covert behavior it is difficult to investigate, and because research on listening is still at a relatively exploratory stage, conceptualizing the process of listening continues to occupy the attention of many listening scholars.

Given the multidimensionality of listening, Fitch-Hauser and Hughes (1992) call for the establishment of some agreed-on operationalizations of listening. Yet most listening tests have focused only on the recall abilities of listeners who are aware that they are being tested.

Listening Competency

Traditionally, listening researchers and educators have focused on a skills-based approach to listening. Nichols's (1948) work on listening established 10 principles for good listening, which for decades became the benchmarks for skills in listening. These "ten commandments" for skilled listening formed a familiar base for much of the writing and teaching about listening:

1. Find an area of interest.
2. Judge content, not delivery.
3. Hold your fire (withhold evaluation until you comprehend the message).
4. Listen for ideas.
5. Be flexible in note taking.
6. Work at listening.
7. Resist distractions.
8. Exercise your mind (don't avoid difficult material).
9. Keep your mind open.
10. Capitalize on thought speed (productively use the gap between speech rate and listening/thinking rate).

Listening competence, however, has come to be understood as more than behavioral technique. Ridge (1984) concludes that "competence in listening is acquired by knowing and doing, and is evidenced by appropriate feedback or

response” (p. 4). Rhodes, Watson, and Barker (1990) articulate a similar view of listening competence: Competent listening cannot be defined as only possession of knowledge; effective, or competent, listening is a behavioral act, and like other behavioral acts, listening can be improved with practice and feedback” (p. 64).

Competence in listening, then, demands both knowing about listening and doing or engaging in appropriate listening behavior. Clearly, there are cognitive, behavioral, and affective dimensions to listening competency.

My colleagues and I have argued that listening competence must extend beyond knowledge and skills to the development of listening attitudes. The listeners’ motivation and willingness to participate in communication transactions are essential to all listening experiences. Bostrom (1990) supports the incorporation of attitude as a listening dimension, because willingness to listen is such an inherent part of the process. Given that listening is not a simple, passive communicative act, it becomes important that the listener engage as a fully functioning communicator in the communication process. Indeed, we argue that successful listeners must assume at least 50% (if not 51%) of the responsibility for the outcome of the communication.

The engaged listener is generally referred to as the “active” listener, the listener who does take his or her communication responsibilities seriously. Of necessity, accepting responsibility works into the attitudinal frame—being willing to listen. And the listener has to know what he or she is doing as a listener to understand how he or she is functioning in this complex process. The knowledgeable listener must understand not only the process itself but also the enhancers and the deterrents to functioning in this process at any given point—reception, attention, perception, interpretation, and response—while engaged in the act of listening.

Our research (Halone et al., 1998) provides an inventory of what listeners do. Individuals in different age groups across the life span, responding to open-ended questions about their listening, enabled us to develop a multidimensional profile of listening competency. We have established five listening dimensions: cognitive (what listeners know); affective (listeners’ attitudes); behavioral/verbal (listeners’ verbal responses); behavioral/nonverbal (listeners’ nonverbal responses); and behavioral/interactive (listeners’ relationship behaviors with speakers).

To expand our understanding of listening behaviors, Imhof (1998, p. 95) asked students in the Introduction to Psychology course at German universities to describe their listening strategies. The student self-reports enabled Imhof to design a profile of listening strategies before, during, and after listening. In further research, Imhof (2000) discovered that listeners who engage in strategic mental activities raise their motivation levels and their comprehension. The listeners’ mental strategies include intentionally monitoring interest in a topic, listing a set of questions before approaching a listening task, elaborating on the material

during listening, constructing a mental model of the orally presented text, and integrating the material into existing knowledge structures.

Another useful profile of the competent listener emerges from Stein’s (1999) research using the think-aloud protocol, in which students were asked to describe their thoughts and feelings as they were listening. After coding the listeners’ observations and the researchers’ observations of the listeners, Stein developed an inventory of what listeners do. Her inventory breaks out the cognitive, affective dimensions into a (similar to Imhof’s) prelistening (constructs goals and prepares to listen), listening (evaluates, expresses affective reactions, infers, interprets, monitors and activates comprehension repair strategies, selectively attends, integrates, and takes notes), and postlistening (evaluates retrospectively, notes goals’ relevance, asks questions, and retrospectively interprets, infers, monitors, integrates and expresses affective reactions) profile.

It is possible that Stein’s use of the think-aloud protocol and the resulting inventory will enable listening researchers to get closer to determining the cognitive, behavioral, and affective dimensions of listening so that listening assessment and listening training can be targeted more specifically to what listeners actually do when they listen. Just as reading researchers have used the protocol to determine what *expert* readers do, so too, it will be helpful to create a profile of how expert listeners function when they listen.

Listening Practice

Practice is crucial to listening proficiency. But that practice must be good practice. Listeners must be prepared to practice *correct* listening skills. And they must be prepared to practice listening skills throughout their communication life spans. Just as good speakers, writers, and readers practice and polish their communication skills across their lifetimes, so too do good listeners monitor, adapt, change, and polish their listening skills.

And good listening requires commitment. Americans assume far too passive a role as listeners. We expect speakers to do all the work. We don’t value listening as a leadership quality. Recent political campaigns are illustrative. Running for a U.S. Senate seat in New York, Hillary Clinton launched her successful campaign with a “listening tour” in the summer of 1999. While the vote may still be out on listening politicians, the information demands of the 21st century require that we take another look at listening skills. We live in a global economy, connected around the world by computers and cell phones. Information travels so fast and changes so fast that written documentation takes too much time. Organizations today rely on oral briefings with presentation graphic support as a primary means for managing information. Skilled oral briefers need skilled listeners.

Some institutions have recognized the importance of preparing skilled listeners for the 21st century. Alverno College in Milwaukee, for example, prepares all its students to listen and reinforces good listening competencies throughout its 4-year curriculum. As such listening training becomes more central to communication studies, it also becomes more sophisticated. Given the multidimensionality of listening competency, higher-order theory, and research about listening offer a substantial cognitive, affective, and behavioral frame for training listeners.

Listening Research

As should be apparent, the multidimensional, complex nature of listening makes this challenge even more complex from a research perspective. Research in listening has focused on the measurement of listening comprehension and on perceived listening effectiveness. The first major research study to do this, as has been noted, was the seminal study in 1948 by Nichols, in which he subjected University of Minnesota students to a battery of tests to develop a profile of how effective listeners do (and don't) behave while listening to lecture material. How listeners function has continued to receive the attention of quantitative scholars.

Expanding from Nichols's focus on listener behaviors, some empirical scholars have developed tests to assess listening skills. Bostrom and Waldhart (1983) developed the Kentucky Comprehensive Listening Skills Test, a measure of a listener's ability to comprehend audio messages. Watson and Barker (1984) designed a broader listening assessment (delivered via video) that taps into five dimensions: listening for message content; listening to dialogues/conversations; listening to lectures; listening for emotional meaning; and listening for directions and instructions. Steinbrecher and Wilmington (1993) published a video test that is designed to assess comprehensive, empathic, and critical listening skills.

Other empirical scholars have explored, from a qualitative research perspective, how listeners listen in different personal and professional contexts. Ross and Glenn (1996), for example, looked at how grown children and their parents listen to each other. Wolvin and Coakley (1993) used survey methods to profile the status of listening training in Fortune 500 corporations.

Empirical research in listening is drawing on more sophisticated models and methodologies today. Janusik (2005), for instance, explores how working memory influences listeners, expanding listening research beyond behaviors to cognitions. Consistent with communibiology theory, researchers (Phillips, Lowe, Lurito, Dzemidzic, & Mathews, 2001) are making use of brain imaging to determine how listeners respond to various stimuli.

Humanistic scholars also bring perspectives to critical interpretations of listening behaviors. Cornwell and Orbe (1999), for example, have used the concept of dialogic

listening to explicate the impact of hate speech on culturally diverse listeners. Wolvin (2005) has used a leadership model to analyze the effectiveness of Hillary Clinton's 1999 listening tour at the beginning of her U.S. Senate campaign.

The considerable body of research on listening enables scholars to better frame the pedagogy and practice of listening in the communication process. Bodie (2007) suggests that this research can be conceptualized as listening as a process (i.e., an information processing, cognition model) and listening as a product (i.e., a communicative function). Exploring the intersections of these two research perspectives and applying appropriate methodologies can expand the research agenda of listening scholars, who are found not only in the communication field but also in related disciplines such as psychology, religion, business management, education, and leadership.

Clearly, the study of listening offers interesting, challenging opportunities to better understand what listeners do cognitively and behaviorally and how those cognitions and behaviors are affected by a host of factors that influence the communicative outcome of the listening act. As scholars apply more sophisticated research and instructional strategies to understand this complex process, the significant role of listening in today's fast-paced communication world undoubtedly will be recognized and respected. Advances in technology and economic globalization have significantly altered the act of listening in the 21st century. "These changes are far reaching," observes Bentley (2000), "and have significant implications for how we will study and teach listening skills in the future" (p. 130).

PERFORMANCE AND STORYTELLING

ERIC E. PETERSON

University of Maine

Performance and storytelling are key processes in communication. These processes are understood in a variety of ways within the field of communication. Indeed, scholars regularly refer to performance as “an essentially contested concept” (e.g., Carlson, 1996; Strine, Long, & HopKins, 1990), in recognition of the different meanings, discourses, and traditions that accompany the term. This variety is evident in the many ways performance enters into daily conversation. Speakers talk of going to see a theatrical performance, of the recent performance of a popular singer, of performing a favor for a friend, and of enduring a performance review at work. In a similar way, storytelling is understood to draw on and encompass a variety of theories, approaches, and disciplinary orientations (e.g., Bamberg, 2007a). Speakers tell about what happened on the way to the store and about the life history of a politician; and they retell an urban legend posted on a weblog and recount atrocity stories from the newspaper. Both performance and storytelling are celebrated as generative concepts that revitalized research and academic disciplines at the end of the 20th century, to the point where scholars talk about “the performance turn” and “the narrative turn” in the human sciences. Performance and storytelling are described as interdisciplinary, transdisciplinary, and even antidisciplinary concepts.

Given the contested terrain within which performance and storytelling operate, any description of them as communication processes risks oversimplification and reduction. With this caution in mind, however, the approaches to understanding these processes can be organized into two predominate views. One view positions performance and storytelling as processes set apart from the ordinary or

everyday communication that surrounds them. Performance and storytelling *make* something of communication; they make it into play, verbal art, jokes, stories, drama, aesthetic expression, ritual, and poetic communication. A second view positions performance and storytelling as processes that are intrinsic to any communicative act. Performance and storytelling name the actual *doing* of communication; they refer to the exercise of linguistic and communicative competence, the practice of behavior and speech acts, the work of habit and discipline. Any particular approach, therefore, selects and combines aspects of these two views—making and doing—to theorize performance and storytelling.

Theorizing Performance and Storytelling

The theoretical description of performance and storytelling as making and doing has its clearest formulation in the classical Greek concepts of *poiesis* and *praxis*. *Poiesis* refers to the productive sciences of making things, such as making a good speech or a good poem. *Praxis*, on the other hand, refers to the practical sciences of doing things, such as the conduct of a good person or a good society. As Richard L. Lanigan (1992) summarizes, *poiesis* “brings into existence something distinct from the activity itself,” whereas *praxis* is “an activity that has a goal within itself” (pp. 211–212). The ambiguous combination of these views can be seen in early references to *mimesis*. These references involve a family of related terms that describe the expression, representation, or imitation of actions through

speech, dance, or song. These terms are used to describe the person who performs, the context of action, the act of doing a performance, and the result of the performed action. In the work of Plato and Aristotle, this ambiguity is reduced by emphasizing mimesis as a making, in particular as the capacity for making images, for making copies of concrete action, for representing ideas, and for imitating worthy models. Let us examine the work of two contemporary scholars who emphasize poesis, or making, with regard to performance and storytelling before turning to theories that emphasize praxis, or doing performance and storytelling.

Making Performance

The view of performance as the making of art, epitomized by Aristotle's discussion of tragedy in his *Poetics*, is not restricted to ancient Greece or even Western cultures. In his overview of performance studies, Marvin Carlson (1996) writes, "There has been general agreement that within every culture there can be discovered a certain kind of activity, set apart from other activities by space, time, attitude, or all three, that can be spoken of and analyzed as 'performance'" (p. 15). The communication process of making performance, across these various cultures, is not restricted to aesthetic venues such as theaters, concert halls, and festival tents. The anthropologist Victor Turner (1988) argues that "the basic stuff of social life is performance" (p. 81) and that humans are "self-performing animals," or *Homo performans*. Cultural performances, such as those found in theater and films, arise from and respond to performance in society, or what Turner calls social drama.

Social drama erupts from the fabric of ongoing social life and its normative customs and practices. Like Aristotle, Turner conceptualizes performance as a process bounded by a diachronic structure; that is, social dramas have a beginning, a middle or a sequence of distinct phases, and an end. In his book *Dramas, Fields, and Metaphors*, Turner (1974) identifies four phases of public action that constitute the diachronic structure of social drama. First, regular social relations and ongoing normative interactions are interrupted by a *breach*, which makes social conflict and antagonism visible. Second, this breach widens and extends into a mounting *crisis*, which cannot be ignored or re-absorbed into the existing social order. The crisis is liminal in the sense that it symbolizes a threshold or boundary that opens up a transgressive space within and against public life. Third, representatives of the social system respond through informal and formal means with *redressive action* to mediate, arbitrate, or ameliorate the crisis. In the final phase, the contesting parties move to closure through the *reintegration* of the disturbed social group or through the recognition of the legitimacy of the breach and the schism between the contesting parties. The symbolic transgression of social drama constitutes a

reflexive process whereby society can communicate about the communication system—a process that both makes and remakes the fabric of ordinary, customary, and norm-bound social life.

Making Storytelling

"Making storytelling" is an awkward expression; but it has the advantage of emphasizing the twofold sense of making that occurs in storytelling. Storytelling involves both the making of a story and the making of an event of telling. A person becomes a storyteller by making a story or a narrative out of the events of experience, both real and imaginary. And the storyteller makes that story into a communication event by telling it to and for an audience. Scholars from a variety of fields—such as folklore, anthropology, literature, linguistics, history, education, psychology, sociology—join communication scholars in exploring both these senses of "making storytelling" under the rubric of speech play, verbal art, narrative performance, folktales, and oral literature and traditions (for an overview, see Finnegan, 1992).

One example of this perspective on storytelling comes in Richard Bauman's study of storytelling as a way of speaking. For Bauman (1986), the essence of storytelling "resides in the assumption of responsibility to an audience for a display of communicative skill, highlighting the way in which communication is carried out, above and beyond its referential content" (p. 3). This display of skill in expression calls on the audience to go beyond appreciating the story to evaluating the ways in which the storyteller enhances experience. "Performance thus calls forth special attention to and heightened awareness of both the act of expression and the performer" (p. 3). Bauman follows Roman Jakobson (1960) here in his emphasis on the way storytelling enacts the poetic function of communication (see Peterson & Langellier, 2006, for further discussion of communication as storytelling). A storyteller is not valued by an audience simply for the information or message that the performance conveys. On the contrary, it is the storyteller's ability to make a report of events into something remarkable, memorable, and worthy of appreciation and response that draws the audience's interest. In storytelling, communication is productive; that is, storytelling makes something special, something poetic, out of what might otherwise be a prosaic or mundane message. As Bauman (1986) suggests, "Every performance will have a unique and emergent aspect" (p. 4) that sets it apart from the conventions and structures that make it possible. The audience and storyteller take up these existing resources to turn back and communicate about them.

Doing Performance

As the preceding description suggests, a view of performance and storytelling as making, or poesis, requires the repetition or mobilizing of meanings that are already socially

established. The making of performance and storytelling does not take place *ex nihilo*, outside of any social and cultural context and history. In social drama, performance draws on the reenactment of social relations that are easily recognized and commonly held by the participants. It is only possible to challenge the legitimacy of these socially established forms and conventions because they are so familiar. And these social forms and conventions must be deployed and enacted to be challenged. In brief, performance does them; performance is doing something, or praxis.

The view of performance as praxis draws on work by scholars on the philosophy of language and communication, especially as they incorporate the work of phenomenologists, semioticians, feminists, poststructuralists, and queer theorists. For these scholars, performance is an extension of bodily capability. Acting, like other operations of the body such as imitation and habit, is an existential operation, an embodied project of perception and expression. When one person imitates another by repeating something the other has just said in a mocking tone of voice, something regularly witnessed among children, that person is not putting together knowledge of what is seen (the visible muscular contractions the other uses to speak) with knowledge of what is felt (the bodily ability to produce similar sounds). Rather, one person mocks the other by responding to the particular situation with a conventional form of solution—the person gets into the form of, or per-forms, the other's action. Communication, from this perspective, is intersubjectively developed as a form or structure in time. One person can mock another, and vice versa, because together they constitute a system in which perception can become expression and expression can become perception. Just as a person can perform with the left hand a gesture just performed with the right, so too can one person perform what is performed by the other.

Judith Butler, in a 1988 essay that would prove to be highly influential among communication and performance studies scholars, develops this view of performance as doing in her exploration of how gender is constituted in performative acts. For Butler, gender identity is not something that is “given” but something that is done through what she describes as “a stylized repetition of acts.” Gender identity is a set of historical possibilities that must be continually realized in corporeal acts. These repetitive acts are both habitual and habituating. A person does not choose or select a particular identity so much as reproduce it by taking up and performing existing and conventional manners or styles of bodily acts. Such acts are regulatory and disciplinary practices in the sense that conventional performances are rewarded and unconventional performances punished. As a result, gender identity is a site of both pleasure and anxiety. The identity performed by these acts must be continually reinforced and stabilized. Because they are highly conventionalized, gender identities are open to modification just as other sedimented structures or habits of the body can be destabilized and changed.

Doing Storytelling

The performative aspects of doing storytelling are readily apparent in events where a skillful performer tells a highly polished narrative for a clearly demarcated audience. In this case, theorists highlight the communication practices employed by good performers, the elements that make up satisfying narratives, and the behaviors and responses of conventional audiences. The performative aspects of doing storytelling are less obvious, but no less important, in the mundane experiences of storytelling that emerge fleetingly in fragments, across diverse settings and in ambiguous circumstances, as told by multiple participants with varying interests and abilities. For example, think of how families tell stories around the dinner table. A story may be told by one person, as when a child tells a story of what happened in school. Or a story about something that happened last summer may be developed by multiple family members, where they compete, collaborate, cooperate, and contest with each other. The story may be more or less clearly identified as a story, it may be diligently developed through interruptions about the meal and comments on other matters, or it may be a fragment that someone only briefly mentions and then drops. Some family members may be willing and enthusiastic listeners and tellers, others may be reluctant and unwilling.

The focus on doing storytelling shifts the emphasis from the making of a good storyteller, or a good story or performance, to the pragmatics of communication and the strategic functions of those practices for embodied participants. Della Pollock's (1999) study of telling birth stories illustrates this theoretical shift to what she calls “talking understood as performance” (p. 8). The birth stories she describes function as discursive strategies, or “mobile cultural fragments” (p. 22), that circulate among a variety of listeners and tellers, who use these stories to make tentative and temporary connections with changing social conventions and meanings in unstable and transitory circumstances. The practice of telling birth stories undercuts and resists narrative norms that would prescribe a naturalized comic-heroic narrative where difficulties in pregnancy and delivery are resolved in the happy ending of a healthy birth. Pollock listens for the absences and silences, the constitutive differences and multiple performativities, that mark how the telling of birth stories transforms women into maternal subjects.

As communication processes, performance and storytelling function as both a making and a doing, as both poesis and praxis. The complexity of this combinatory relationship is revealed in their reflexivity and reversibility. Poesis and praxis are *reflexive* terms in their circular and overlapping reference: Theorists talk about performance and storytelling as “doing what is done” and as “making the best of what is made.” Poesis and praxis are *reversible* terms in how they refer to each other: Theorists talk about performance and storytelling as “a making do,” “making a

to do,” as well as “a do about making.” Theorizing performance and storytelling as communication processes provides a basis for their systematic study in applications of methodology.

Methodology

The turn to methodology poses the question of how we know what we know about, in, and through performance and storytelling. Methodology makes explicit the importance of the context in which performance and storytelling are located as objects of study. One way to approach the question of methodology is to assume that there is a stable and predictable relationship between an object, such as a performance or a story, and the research context. This approach draws on research traditions in the natural sciences and posits performance and storytelling as objects that are already constituted for researchers to find. Such methodologies emphasize the invention of “that which is *given* as evidence,” or *data* (Lanigan, 1992, p. 215). If researchers *know* what performance and storytelling is (invention), then they can find occurrences of it in a particular situation (according to the given evidence).

The experience of studying different cultures and subcultures, however, suggests that storytelling and performance are neither stable nor predictable objects of study. Researchers may “miss” hearing a story as a story because what constitutes a story in one culture or subculture may not in another. Or they may not “see” a performance as performance because the elements that constitute performance may not be the same in a different setting or at a different time. The potential to overlook performance and storytelling as objects of research is particularly evident when performance and storytelling are understood as praxis rather than poesis. Research methodologies for performance and storytelling, therefore, rely on alternative approaches that emphasize the participation of the researcher in locating what is to be known. These approaches draw on qualitative methodologies in the human sciences and emphasize the discovery of “that which is *taken* as evidence,” or *capta* (Lanigan, 1992, p. 215). As researchers participate in a particular context, they *come to know* (discovery) those features by which they locate (taken as evidence) performance and storytelling as objects of research.

There are several ways to organize or categorize the qualitative methodologies used in the study of performance and storytelling. Following Lanigan’s (1992) analysis, four types of qualitative methodologies used in existing research can be distinguished according to their object of analysis (how they answer the question “What is performance and storytelling?”) and the type of evidence they feature (how they answer the question “How do I know performance and storytelling?”). These four methodologies are semiology, ethnography, historiography, and

phenomenology. The following descriptions emphasize research exemplars and are meant to be suggestive rather than comprehensive accounts.

Semiology

The term *semiology* covers a wide range of applications in structuralism, poststructuralism, and textual and discourse analysis. As a methodology, semiology takes what is capable of occurring as its object of analysis. The researcher looks to substantial evidence to intuit or construct a narrative of what is problematic in performance and storytelling. The most common form of substantial evidence used in such research are signs (the material expressions of meanings) and their combination in texts: Everything from utterances, conversations, literature, meaningful action, and cultural practices to institutions can be taken as texts. The researcher then analyzes these texts to identify the codes that make them capable of occurring. Or, to use a distinction taken from linguistics, researchers specify the underlying competence that makes any particular performance possible.

Robert Scholes (1985) illustrates this type of methodology in his book on *Textual Power*. Scholes identifies three communication practices or skills that constitute textual competence: reading, interpretation, and criticism. To read and understand a story, we must deploy the basic elements of cultural and narrative coding gradually acquired from parents, teachers, and peers. Interpretation comes into play when a reader encounters unknown words, incomplete or excessive references, and ambiguous meanings. In this case, the reader looks to codes or “the rules of the game” of reading by locating repetitions, oppositions, regularities, and patterns to make sense of the text. In criticism, the reader examines how codes shape the text, how they normalize and naturalize it, and how they enact power and ideology. Methodologically, these three practices (praxis) of textualization are productive (poesis): “In *reading* we produce *text within text*; in *interpretation* we produce *text upon text*; and in *criticizing* we produce *text against text* [italics in the original]” (p. 24). Textualization produces substantial evidence for what is capable of occurring through the operation of codes.

Ethnography

Where semiology emphasizes the ideal operation of codes to specify what is capable of occurring, ethnography investigates what really occurred as its object of analysis. The researcher takes symbolic evidence to construct a narrative that thematizes performance and storytelling. Symbolic evidence can include the realities of human conduct, everyday activities, rituals, ceremonies, feasts, cultural events, as well as the realities of seeing, hearing, tasting, smelling, and touching in daily life. Ethnography uses participant observation and other forms of fieldwork

to immerse the researcher in cultural experiences. This methodology “privileges the body as a site of knowing,” as Dwight Conquergood (1991) summarizes in a key essay on performance ethnography.

Conquergood emphasizes boundaries and border crossings as the location for research—sites where difference makes a difference. The traditional boundary enacted in ethnography was one that defined the culture of the other as different from the culture of the researcher; one that distinguished the subject who writes from the subject who was written about. Postmodern and critical versions of ethnography challenge this thematization of unified cultures and detached observation. Rather than mark out a discrete and stable essence or possession, cultural identity is thematized as fluid and fragmentary, as a process or performance. Contemporary ethnographers focus on locating the diversity, displacement, and discontinuities in cultures rather than the continuity, coherence, and unity presupposed in more traditional ethnographies. Similarly, the process of writing ethnographic research is reconceptualized as a shift from monologue to dialogue, from objective description to intersubjective co-constitution. Conquergood discusses how boundaries of the self—and not just boundaries between cultures—bleed, leak, and wobble. His rethinking of ethnography highlights the importance of studying the borderlands of refugees, migrants, and exiles, where people “make do” within the changing contexts of postcolonial societies and global capitalism. But his work also paves the way for reconsideration of the boundaries of the self and the self as other, as taken up by work in autoethnography. Such research in ethnography constructs a narrative that thematizes the symbolic evidence of bodily knowledge to locate what occurred.

Historiography

In historiography, the researcher takes artifactual evidence to assert a narrative that observes performance and storytelling. In this case, what is actual or occurring constitutes the object of analysis. Traditionally, the artifacts taken as evidence include historical records and documents such as letters, diaries, oral interviews, newspapers, magazines, government records, maps, paintings, photographs, and all manner of texts. Such artifacts also may include material culture, such as clothing, household goods, furniture, artworks, machinery, and the built environment. Historians of performance and storytelling also look beyond the archive and the museum to document the bodily practices that are sedimented in gestures, habits, manners, and customs (for examples of this type of work, see the essays in Pollock, 1998).

The variety of artifacts considered by historians of performance and storytelling raises questions about the practices of observation, sometimes referred to as crises of representation and objectivity. For the meaning and significance of these artifacts, much less their actual existence, is not given or self-evident but must be constructed

or reconstructed and made visible or narrated. Rather than somehow remain separate and distinct from the artifacts they observe, historiographers participate in them by narrating and performing them. In this way, the work of “new historicists” echoes the concerns raised by the poststructuralists in semiology and critical ethnography. As Della Pollock (1998) observes,

The writing of history becomes the ultimate historical performance, making events meaningful by talking about them, by investing them with the cultural and political assumptions carried in language itself. What we can or want to call the truth thus becomes problematic. (p. 13)

Research in historiography “makes history go,” as Pollock suggests, by discomposing even as it composes a narrative that traverses the terrain of artifactual evidence.

Phenomenology

Where the emphasis in historiography is on observation, phenomenology focuses on understanding by interrogating formal evidence for what is factual or must occur. Edmund Husserl’s injunction “to the things themselves” underscores phenomenology’s methodological interest in constructing a narrative that locates the variant and invariant structures—the empirical and eidetic “forms” of performance, so to speak—of conscious experience. Phenomenological research progresses through a series of reductions or reflections. The first reduction is one that attends to the phenomenon as it is constituted in conscious experience. The researcher brackets common sense and scientific explanations, as well as taken-for-granted knowledge, to understand performance and storytelling. For example, many types of discourse are not recognized as stories because they do not employ the conventions that dominant ideologies would position as common sense. Stories that women or members of minority ethnic groups tell may be dismissed by researchers as poorly formed or poorly performed stories.

In the second reduction, the researcher takes up the description of the phenomenon to discover its typicality or structure. The researcher specifies the logic of similarities and differences in the experiences of performance and storytelling. Storytelling by women and minority ethnic group members, to continue with the previous example, are marked by regularities and patterns that can be located when normative conventions are bracketed. Not all storytelling variations function in a meaningful way for all participants. And the same storyteller may tell stories in different ways and use different conventions when the context changes. Phenomenology looks to articulate the logics that inform these variations, that make some possibilities occur rather than others.

In the final reduction, the researcher turns to a hermeneutic or interpretive analysis of the description and structural reductions. Analysis here does not create a

replica or representation of the phenomenon but an understanding that takes it up. The interpretive reduction specifies the possibilities for agency and effectivity in performance and storytelling that are inscribed by historical conditions and discourse conventions as well as those that are erased or marked over. For phenomenology, the doing and making of performance and storytelling are contextual facts of a particular situation: embodied by participants, situated in specific material conditions, ordered by discourse, and open to legitimation and critique (e.g., see Langellier & Peterson, 2004).

Applications

Performance and storytelling appear in a variety of contexts, including aesthetic, political, cultural, pedagogic, and therapeutic applications. Undoubtedly the most familiar application of performance and storytelling comes in the aesthetic realm. Whether in the form of traditional staged productions or storytelling festivals, performance and storytelling have a long history of varied application as works of art. What works are considered worthy of appreciation, however, shifts and transforms. At the end of the 20th century, for example, performers such as Laurie Anderson were incorporating storytelling, music, song, and images into multimedia stage performances; others, such as Spalding Gray, Tim Miller, Holly Hughes, and Karen Finley, were incorporating and reworking autobiographical material into monologues and solo performances; Anna Deveare Smith was going into local communities to conduct interviews, rework them into performances, and then return them to the community in staged productions.

The rise of solo performance, monologues, and autoethnography (such as Gingrich-Philbrook, 2000) demonstrates both the remaking of texts for aesthetic applications and the connections of storytelling and performance with political applications. Not surprisingly, many solo performance pieces arose out of social movements and identity politics organized around issues of race, class, gender, sexuality, age, and ability. In these cases, personal narratives and public demonstrations—performances designed to catch the attention of television and newspapers—were used to make identities visible and to persuade the public to remedy social inequities and injustices. The use of performance and storytelling to raise public awareness and mobilize action on HIV/AIDS illustrates one such political application (Kistenberg, 1995).

The rise of storytelling and performance also can be witnessed in the realm of popular culture. These cultural applications range from memoirs and celebrity biographies, talk shows and reality television programming, to homepages and weblogs. These popular applications highlight storytelling based on the presumed authority and authenticity of personal experience; and they emphasize performance grounded in the apparent spontaneous and

unadulterated action of personal presence and immediacy. Critics question the romantic individualism of these applications and how they naturalize specific storytelling and performance conventions. Other critics examine how stories and performances are rendered normal or normalized, such as in Jay Baglia's (2005) analysis of popular media accounts of Viagra and its relationship to the performance of masculinity.

Performance and storytelling have a range of applications in pedagogy. Histories of the teaching of expression and oral interpretation illustrate how performance and storytelling have been applied in classroom practices as a way to understand literature. More recently, these classroom practices have been expanded to include a focus on cultural performance and the practices of daily life. In this case, performance and storytelling serve to illuminate and enter into dialogue with "the other"—other persons, communities, and cultures. Such practices offer the possibility of opening up spaces where other stories can be heard and cultural performances reflected on (Stucky & Wimmer, 2002). As such, they can be applied in communities and not just classrooms, as witnessed by work in critical pedagogy. Drawing on the work of Paulo Friere and Augusto Boal, critical pedagogy emphasizes the performative character of storytelling and performance; that is, the embodiment of specific performances and stories is a way to enact, know, reflect, and potentially remake them in collaboration with other participants (for examples, see the essays on pedagogy in Madison & Hamera, 2006).

Therapeutic applications also emphasize the performative aspects of storytelling and performance. The very act of telling a story or performing is seen as a way to understand, come to terms with, or reframe that experience. Survivor stories, illness narratives, witness accounts, and personal testimonies are examples where performing or telling about lived experience constitutes the storyteller or performer as agents, as subjects of their own experience and not just as subjected to it. In some cases, these stories and performances recover and testify to cultural frames and forms that are excluded by dominant institutions and practices. For example, Rita Charon's (2006) advocacy of narrative medicine, juxtaposes the official medical chart with stories, drawings, and photographs that write into the record the embodied struggles with illness performed by patients and doctors. These varied applications make the case that performance and storytelling are as much about agency and efficacy as they are about appreciation, entertainment, and pleasure.

Comparison

The extent and variety of applications in performance and storytelling suggest that there is an inherently comparative aspect to them as communication processes. For some, this comparative aspect is based in the nature of the poetic and

the variability of aesthetic experience. Even in classical discussions of beauty, there is a concern to reconcile individual taste with the supposed universality of aesthetic judgment. How can individual speakers say that something is beautiful and be certain that their judgment is not idiosyncratic? What grounds do speakers have for going beyond the presumption that “there is no disputing about taste” (*de gustibus non est disputandum*)? Other thinkers locate the comparative aspect of performance and storytelling as a function of the variability of the practices that constitute them as communication processes. In this case, comparisons are made on the basis of locating what Jakobson calls “distinctive features,” or the differences that make a difference in language and communication.

To borrow a question posed by critical ethnographers, What are the differences that make a difference in performance and storytelling? As the work of Jakobson and the previous sections on theory and methodology suggest, differences can be located in the different contexts for performance and storytelling, the different forms that the poetic object or text can take, the different conventions and codes it puts into play, the different kinds of contact it enables among participants, the different expressive capabilities of performers and storytellers, and the different interpretive responses and responsibilities of audiences. In the past few decades, the importance of locating and understanding the operation of these differences has been greatly influenced by work in cultural studies, postcolonial studies, disability studies, critical race theory, feminist theory, and queer theory.

The simple sense of difference as a distinction between already constituted entities crops up in comparisons of this performance with that performance, of traditional storytelling with contemporary storytelling, of stories told by women with those told by men, and of coming-of-age rituals in this culture with rituals in that culture. A more complicated sense of difference asks how such entities are seen or constituted as different in the first place. Instead of taking the compared entities as natural or pre-given, this latter sense of difference asks how they came to be understood as something in and of their differences. This view of difference troubles the commonsense coherence and homogeneity implied in terms such as *the folk*, *tradition*, *ethnic culture*, or *a people*.

Consider the generative differences used to distinguish gender and sexuality. Feminist and queer theories reposition the normative constraints of “being a woman” or “being a man” by conceptualizing them as performative. Gender and sexuality, following the work of Butler (as discussed above), are socially reflexive and self-constituting practices for *doing* and not just something to be done. Positioning the identity and expression of gender and sexuality as performative avoids both a universalist essentialism (one is either a woman or a man, masculine or feminine, gay or straight), on the one hand, and a volunteerist individualism, on the other (one can consciously choose to be whatever one wants to be). The historical

realities of gender and sexual identities are continually performed in the embodied gestures, behaviors, habits, and institutions of daily life. In the field of communication, Kroløkke and Sørensen (2006) develop this view of gender and sexuality as performative.

Other authors have repositioned race and ethnicity as performative formations, as captured in the expressions “performing blackness” (Johnson, 2003) and “performing whiteness” (Warren, 2003). Petra Kupperts (2003) uses performativity to refigure the binary opposition of disabled and able-bodied identities. For writers such as José Esteban Muñoz (1999), such formations of identity are always already hybrid or “identities-in-difference.” By using this phrase, Muñoz argues that the subject is not created or posited in a linear process of identification that would present or re-present a uniform and consistent persona or self. He complicates identity formation by attending to the processes of disidentification, in which divergent, fragmentary, and contradictory practices work on, with, and against identification. Identities-in-difference are unstable, transitory, and discontinuous formations that function strategically; that is, they may deploy existing discourses of power and knowledge at one level and, at the same time, work to resist, oppose, and destabilize these same discourses at other levels.

Contemporary Issues and Future Directions

The postmodern movement of performance and storytelling outside the detached realm of aesthetic expression—as demonstrated by their varied applications and comparative dimensions—raises a series of issues that will shape the future direction of students, scholars, activists, audiences, and artists. Some of the first responses to this movement, not surprisingly, were reactions against an expansive understanding of what could be considered the appropriate subjects and texts of performance and storytelling. Attendees at the National Festival of Storytelling complained that their favorite storytellers were not performing the much loved folktales and classic cultural stories; instead, they were telling stories drawn from personal experience and daily life. The new performance studies scholarship, published in journals such as *Text and Performance Quarterly*, was criticized for taking up varied phenomena such as flight-attendant announcements, fake identification, office folklore, anorexia nervosa, and gay pornography instead of studies of great literature, great performers, and great performances.

The objections of critics to the new scholarship in performance and storytelling can be seen in part as a reactionary response to the domestic social movements of the time, a resistance to diversity and identity politics, an opposition to changes in the global flow of peoples and capital, and a rejection of postmodern art and aesthetics.

But such criticism also advances, and somewhat obscures, an important question regarding the nature of performance and storytelling. If performance and storytelling are no longer to be defined in modernist terms as the making of art and the art of making (poiesis), then what are the boundaries that define it as a communication practice (praxis)? In performance studies, Jon McKenzie (2006) tracks how performance has “gone global” and can be found not only in cultural forms but also in technological, organizational, governmental, economic, and environmental forms of power and knowledge. In narrative studies, Michael Bamberg (2007b) describes the shift from research on “big stories” and master narratives to an increasing emphasis on narrative practices and the “small stories” of what people do *in particular* when they talk and tell stories, on the situated and contextual nature of storytelling. But is everything performance and storytelling? Is performance and storytelling everything?

The boundary issues provoked by the new scholarship on performance and storytelling are recognized by scholars in a variety of ways. For example, the editors of a new journal posed the problem this way in their introduction to the inaugural issue:

Storytelling, Self, Society sets itself this task, among others: to steer between the dangerous shoals of fetishizing this particular medium (to the exclusion of the fertile channels that connect it with virtually any other) and of surrendering to the metonymic swoon in which the name *storytelling* can be bestowed on whatever one finds sufficiently uplifting. (Sobol, Gentile, & Sunwolf, 2004, p. 3)

This formulation evokes the dangerous shores trope that Wallace Bacon articulated more than four decades earlier on the need to navigate performance (in the guise of oral interpretation) between the shores of theatrical and literary study. Contemporary scholarship in performance and storytelling suggests that the future direction of theory and research is not to be found in opposition of different forms of study, exclusion of art from life or life from art, or the choice between poiesis and praxis but in charting their differential combinations.

Two contemporary issues in performance and storytelling research illustrate the difficulty of charting these differential combinations in ways that do not collapse into oppositional and exclusionary thinking. The first issue is the problem of representation and mimesis (e.g., see Diamond, 1997), or what might be described as the conjunction and combinatory logic of performance and performativity. Performativity names the repetition and citation of genres and conventions that, because they are materialized in performances, disappear in the act of doing them. Performance, to use phenomenological terms, has a horizon of retention and protention, where what is done trails off and fades away even as anticipations of what may happen begin to emerge in the act of doing what will soon be done. To continue performing requires that communication

research encompass both the performative repetitions and citations that make it possible and the transitory ephemerality of performance that opens it up to new horizons.

The second issue is the embodied ambiguity of the imaginary and the real. For example, in storytelling research, the analysis of storytelling practices—usually talked about as practices of showing and telling—constitutes and positions subjects with varying degrees of agency. At a minimum, these subject positions include the narrator in the story and the narrator of the story, the audience addressed by the narrator in the story and the audience addressed by the narrator of the story. Of course, any narrative can position the narrator as a character in the story and as a narrated subject by that character. Or, to move in the direction of the storytelling event, the narrator can be positioned as an audience to the audience addressed by the narrator, and so on ad infinitum. Furthermore, these various subject positions, both actual and imaginary, are now extended in computer and new media technologies, through sampling and remixing. The challenge for communication researchers is to account for the motility of embodied subjects that articulate or “mash up” the real and the imaginary in the changing terrain of storytelling.

Conclusion

Performance and storytelling are key processes that can be understood theoretically as a reflexive and reversible combination of making and doing communication. They can be studied through the human science methodologies of semiology, ethnography, historiography, and phenomenology. Performance and storytelling appear in applications that range across aesthetic, political, cultural, pedagogic, and therapeutic contexts. These applications highlight differences in contexts, messages, codes, and contact and differences within and among participants. These comparative differences lead scholars to question the boundaries that define performance and storytelling as communication processes. Rehearsing these arguments—putting performance and storytelling on stage, in other words—is a way to *make* what scholars *do*, their poiesis and praxis, explicit and open to critique and revision.

PERSUASION AND COMPLIANCE GAINING

ROBERT H. GASS

California State University, Fullerton

JOHN S. SEITER

Utah State University, Logan

Persuasion is both ancient and modern, an art and a science. It probably dates back 50,000 years or so, when hominids first developed language (Wade, 2006). If one counts nonverbal cues, then the practice of persuasion is even older. One can easily imagine a stone-age fellow, Lothar, grunting and gesturing to borrow his neighbor's flint to make a fire. Regardless of its date of origin, the study of persuasion in Western civilization dates back to at least 399 BCE, when Aristotle wrote *Rhetoric*. The advent of controlled laboratory experiments on persuasion dates back to the 1940s and 1950s. Much of the credit for research in this era goes to Carl Hovland and the Yale Attitude Change Program, a think tank devoted to the study of persuasion (Hovland, Janis, & Kelley, 1953).

The Vitality of Persuasion

The study of persuasion is fascinating. Part of the attraction is that persuasion is all around us. Estimates of the amount of advertising we're exposed to range from 300 to 3,000 messages per day. And that's just the tip of the iceberg. Most influence attempts take place in interpersonal

settings rather than advertising. Some of the allure is because so much remains to be learned about persuasion. As Henry Ford once remarked, "Half the money spent on advertising is wasted, but we don't know which half." A good deal is known about persuasion, but it is hardly an exact science.

Why learn about persuasion? First, persuasion is all around us and will persist in the "real world," whether studied as an academic discipline or not. Since a good deal of human communication is persuasive in nature, it is important to know how processes of social influence operate. Second, learning about persuasion can assist one in becoming a more effective persuader. Finally, a better knowledge of persuasion can make one a more discerning consumer of persuasive messages, especially unscrupulous forms of influence.

With this in mind, we provide an overview of research on persuasion. Our approach is social scientific in nature, which is to say we are interested in empirical, quantitative research. We cover both traditional and contemporary theories, concepts, principles, and processes. We also examine some newer, "cutting-edge" topics in persuasion. We try to touch the major bases, but because the field of persuasion is vast, we cannot include everything.

Macro Theories and Models of Persuasion

Persuasion scholars are interested in discovering how and why persuasion works. A variety of “umbrella” theories and models provide explanatory frameworks for how persuasion functions. We examine some of the best-known ones here.

The Elaboration Likelihood Model and the Heuristic-Systematic Model

The elaboration likelihood model (ELM; Petty & Cacioppo, 1986) and the heuristic-systematic model (HSM; Eagly & Chaiken, 1993) are dual-process models of persuasion. While the models are distinct in important ways, here we focus on their commonalities. Specifically, both models suggest that there are two basic modes by which people process persuasive messages. First, people might not put forth much thought or effort while processing a message. For instance, a consumer might rely on a name brand or celebrity endorser to make a decision. ELM calls this *peripheral processing*, while HSM calls it *heuristic processing*. Second, people might exert a lot of mental energy while processing a message, carefully analyzing evidence and scrutinizing message content. ELM calls this *central processing*, while HSM calls it *systematic processing*.

By way of example, let's say Loretta is pondering which brand of music player to buy. If she compares their features, looks up reviews on each brand, and reads about their warranties, she is using *central* or *systematic processing*. Suppose Luke also wants to buy a music player. Rather than agonizing over his decision, however, Luke buys the same brand as Loretta, because he trusts her judgment. Luke is using *peripheral* or *heuristic processing*.

Both the ELM and the HSM suggest that to use central/systematic processing, an individual must have the *motivation* and *ability* to do so. Motivation tends to be stronger if an issue affects a person directly. The person must also be able to understand and process the message. If a persuasive message were too technical, for example, a person might want to analyze the message but may be unable to do so.

The evidence suggests that persuasion that takes place via central/systematic processing is more lasting, whereas persuasion based on peripheral/heuristic processing is more temporary. Thinking about a message seems to cement it in the recipient's mind. Persuasion that occurs through central/systematic processing is also more resistant to change. Thus, a persuader who wants his or her message to stick should foster central/systematic processing of the message.

Both the ELM and the HSM are useful explanatory and predictive models of persuasion. Dozens of studies have been carried out using these two models, on a wide variety

of topics and issues, such as condom use, conservation, nuclear power, and vegetarianism. Neither theory is without its flaws, but both have held up well under testing.

The Theory of Reasoned Action and Planned Behavior

Two interrelated theories developed by Martin Fishbein and Icek Ajzen focus on behavioral intentions, or what a person plans to do, as the most effective means of predicting actual behavior (Ajzen, 1991; Ajzen & Fishbein, 1980). The theory of reasoned action (TRA) and the theory of planned behavior (TPB) presume that people are rational decision makers who make use of the information available to them. Behavioral intentions are based on three key elements. The first is a person's *attitudes toward the behavior* in question. The second is *subjective norms*, which depend on what the person perceives *others* think about the behavior. The third is *perceived behavioral control*, or whether the person thinks she or he has the ability to perform the behavior in question. Combining these three elements, suppose Naomi is contemplating whether to become a vegan. The first element would be her attitude toward a vegan diet and lifestyle. Does she believe that a vegan diet is healthier, kinder to animals, and better for the environment? The second element would be Naomi's beliefs about how others view veganism. Does she believe that other people look favorably on vegans, or think vegans are cool? The third element would be whether she believed she could adhere to a vegan diet and lifestyle. How hard would it be to eschew all meat and dairy products? Could she do without leather clothing? Taken together, these three elements would form Naomi's behavioral intention to become a vegan.

A few caveats regarding the TRA and TPB are in order. One is that the person's behavior must be volitional. In many persuasive situations, a person's choices are constrained by other factors, such as the cooperation of others. Another limitation is that the model focuses on rational information processing and, hence, cannot explain irrational thinking, such as phobias and prejudices. Nevertheless, this theory has held up well under testing on a variety of topics, including brand loyalty, cheating by students, condom use, breast cancer prevention, flu vaccinations, and seat belt use.

Attitude Change Theories

The study of how attitudes are formed and changed has fascinated persuasion researchers for over 50 years. Attitudes are important because they explain and predict behavior reasonably well. Because attitudes tend to correspond with behavior, changing a person's attitudes may also change the person's behavior. Attitudes can be measured as well, by using a variety of scales.

People's attitudes are often entrenched. Therefore, it is usually easier to align a persuasive message with an audience's existing attitudes than to change audience's attitudes, just as it is easier to tailor a suit to fit the customer than it is to change the customer's physique to fit the suit. It also is easier to nudge receivers' attitudes in a series of smaller steps than in one full swoop. As is the case with all persuasion, when attempting to change attitudes, a persuader may only achieve some of what she or he is after. Changes in attitudes also may be transitory.

Cognitive Consistency Theories

Attitudes don't exist in isolation, they occur in clusters. A person's attitudes toward gay adoption, for instance, would probably correlate with the person's attitudes toward gay marriage. Changes in one attitude tend to reverberate throughout related attitude structures. A variety of consistency theories, which we've melded into one general framework here, explain this process.

People tend to strive for consistency among their attitudes. If a person loves cats, it would be better if his or her significant other liked cats too. As such, the consistency principle can be used by persuaders quite effectively. A persuader might point out that a person holds conflicting attitudes by saying, "If you say you are against torture, then how can you be in favor of 'water-boarding'?" Even the UN condemns 'water-boarding' as a form of torture." A persuader might also point out that holding a particular attitude is inconsistent with another's behavior. For instance, one might say, "You claim to be opposed to illegal immigration, but your nanny has no green card. Why don't you practice what you preach?" A persuader can also try to demonstrate that attitudes held by another are not conflicting but rather consistent with each other. A person might argue, "Science and religion are not mutually exclusive. One can believe in science and god at the same time."

Cognitive Dissonance Theory

Cognitive dissonance theory focuses on the anxiety that accompanies decision making. The theory explains "buyer's remorse," or the angst associated with second-guessing an important decision (Festinger, 1957). We don't relish finding ourselves in a situation where someone says, "I told you so" or we think to ourselves, "I should have known better." To reduce dissonance, people engage in a variety of strategies, such as denial, bolstering, and rationalization. People also can change their behavior or try to change another's behavior. The *magnitude of dissonance* one experiences hinges on how much freedom one has in making a decision; the freer the choice, the greater the dissonance. The amount of time and effort that one puts into a decision also affects the severity of the dissonance; the greater the energy or sacrifice involved, the greater the dissonance.

Another intriguing feature of cognitive dissonance theory involves the role of *counter-attitudinal advocacy* (CAA). If a person voluntarily advocates a position contrary to his or her own personal views, the person will tend to experience dissonance. This causes the person's attitudes to shift, though not entirely, in the direction of the counter-attitudinal position. The person must freely choose to engage in CAA, however. If the person is bribed or coerced into doing so, little or no dissonance will be aroused.

Social Judgment Theory

Carolyn and Muzafer Sherif's social judgment theory (Sherif, Sherif, & Nebergall, 1965) explains that the more ego involved a person is in a topic, the more the person will tend to distort persuasive messages on that issue. The theory posits that on any given topic, there is a range of positions that can be advocated. The position a person finds most acceptable serves as an *anchor point* or benchmark by which other messages are judged. When exposed to a persuasive message, a person initially perceives the message as falling into his or her latitude of acceptance (LOA), latitude of rejection (LOR), or latitude of non-commitment (LNC).

A message that falls within the range of positions that a person judges as acceptable is within the person's LOA. A persuader who advocates such a message is "preaching to the choir." A message that falls outside the range of tolerable positions is in the person's LOR. A persuader who advocates such a message faces a hostile audience. Issues on which the person has no opinion fall within the person's (LNC). Importantly, the more ego involved a person is in an issue, the *narrower* his or her LOA and the *wider* his or her LOR are.

Social judgment theory maintains that persuasive messages tend to be distorted by receivers. Specifically, a message that falls within a receiver's LOA is distorted favorably and perceived as *closer* to the receiver's anchor position than it really is (*assimilation effect*). A message that falls inside a receiver's LOR is distorted negatively and perceived as farther from the receiver's anchor position than it really is (*contrast effect*).

A persuader is best advised *not* to advocate a position that falls within the receiver's LOR. Such a message will likely be rejected out of hand. Instead, a persuader should advocate a position that is discrepant from the receiver's anchor yet still close enough to the receiver's anchor to trigger the assimilation effect. This is where *message discrepancy* enters the picture. The greater the disparity between a persuader's position and the receiver's anchor, the more the attitude change that occurs, but—and this is important—only if the message does not cross the line and fall within the receiver's LOR (Siero & Jan Doosje, 1993). Effective persuasion, then, is rarely a one-shot effort. A person's attitudes must be "nudged" along via a series of

messages that are different from, but not too different from, the person's own position.

Traditional Research Foci

Traditional research on social influence focuses on several key components in the persuasion process. Notably, Berlo (1960) identified the source, the message itself, the channel by which the message is transmitted, and the receiver as primary components in communication and persuasive interactions. This section examines the role of each.

The Source

Source credibility, perhaps the most studied concept in the field of persuasion, refers to how believable audiences perceive a communicator to be. It would seem intuitive that the source of a message has a good deal to do with the message's persuasiveness. That is why companies pay handsomely for credible spokespersons to endorse their goods and services. Not any celebrity can sell any product, however. The *match-up hypothesis* (Kamins, 1990) suggests that the source and the brand must be a good fit.

Credibility Characteristics

Source credibility is a *perceptual phenomenon*. It exists in the eye of the beholder. Related to this is the recognition that credibility is also *situational*. A source might be regarded as credible in one persuasive context but not in another. Source credibility is also *dynamic*. It can change over time or even during the course of a single speech.

Researchers have argued for some time over what the fundamental dimensions of credibility are. There is now general agreement that there are three *primary dimensions*. These dimensions, identified by James McCroskey, are *expertise* (sometimes labeled competence), *trustworthiness* (sometimes called character), and *goodwill* (also known as perceived caring) (McCroskey & Teven, 1999). These dimensions almost always play a role in the evaluation of sources. If you had a serious medical condition, for example, you would want a physician who was highly knowledgeable about your condition (expertise). You would also want a doctor you could trust, one who wouldn't overbill you or recommend unnecessary treatment (trustworthiness). You would also want a doctor with a good "bedside manner," one who took an interest in your personal well-being (goodwill).

Credibility is almost always beneficial for a persuader. Since credibility is often a peripheral cue, receivers with low involvement are more likely to succumb to source influence than receivers with high involvement. Source credibility is not as great an asset if receivers use central processing. Credibility is not always a peripheral cue, however. There are occasions when receivers use central processing to scrutinize a source's credentials, knowledge,

and understanding of an issue. Evaluating the veracity of a witness's statements in a criminal trial, for example, would require jurors to use central processing.

The Message

Order Effects

Quintillian, the great Roman rhetorician, noted that just as generals must strategically place their troops on a battlefield, so too should persuaders strategically place their arguments within a speech (Corbett, 1971). This section provides a glimpse of other ways in which the order of messages affects persuasion.

First, imagine you are preparing a speech and have several arguments—some stronger, some weaker—that you plan to include in the speech. Where should you place them? Most research on this topic advises putting your best arguments either first (*anticlimax order*) or last (*climax order*) rather than sandwiching them in the middle (*pyramidal order*). Of course, this assumes that the audience is capable of distinguishing between strong and weak arguments. Unfortunately, this is not always the case. For example, a study by Petty and Cacioppo (1984) found that people who were not involved in a topic were more persuaded by the quantity of arguments (a peripheral cue) than by their quality (a central cue).

A second issue has to do with the order in which an audience is exposed to opposing messages. For example, if two people are arguing on different sides of an issue, who should speak first? The research results are mixed. Some studies suggest that the material presented first has more influence, a *primacy effect*, while other studies suggest that the material presented last has an advantage, a *recency effect*. Even so, the nature of the persuasive encounter can tip the scales one way or another. One condition, for example, is timing. Specifically, when people hear back-to-back messages and then wait some time before making a decision, the first message tends to be more influential. On the other hand, if people hear one message, wait some time before hearing the opposing message, and then decide immediately afterward, the second message tends to be more influential (see Miller & Campbell, 1959).

Inoculation

The material presented first has the additional advantage of facilitating *inoculation*. Inoculation theory is based on a biological metaphor (McGuire, 1964). In the same way that being exposed to a small dose of a virus defends you against subsequent exposure to the virus (think flu shots), being exposed to a small dose of a persuasive argument, made weak through refutation, defends you against the argument later on.

Two key components of inoculation are *threat* and *refutational preemption* (Pfau & Szabo, 2004). Threat, or warning people that existing attitudes are about to be challenged,

motivates them to strengthen their attitudes. Refutational preemption, the process of raising and refuting challenges, provides the ammunition required to bolster the attitudes against attack. By way of example, a parent might tell a child, “When other kids tell you that smoking is cool (threat), remember that cigarettes are a leading cause of cancer, which definitely isn’t cool (refutation).” Previous literature suggests that inoculation is not only robust under the proper conditions, it also enjoys widespread application to a number of persuasive contexts. What’s more, inoculating people against one set of arguments increases their resistance to other, different arguments on the same issue.

One-Sided Versus Two-Sided Messages

The importance of the refutational component of inoculation is underlined by a related area of research on *message sidedness*. Such research asks whether persuaders should present only their side of the argument or opposing arguments as well. The answer depends on the nature of the arguments that are presented. Specifically, *two-sided messages* (those including both supportive and opposing arguments) are more persuasive than *one-sided arguments* but *only if* the opposing arguments are refuted (Allen, 1998). When opposing arguments are raised but not refuted, then one-sided messages are more persuasive. Thus, the best bet is to use a two-sided, refutational approach.

Mere Exposure Effect

Up to this point, we have examined what happens when audiences are exposed to multiple arguments presented in some order. What happens, though, when audiences are presented with the same message repeatedly? According to the Mere Exposure Effect (Zajonc, 1968), the more we are exposed to an unfamiliar stimulus, the more favorably we evaluate it. Perhaps you’ve noticed that after hearing a song several times, you like it more than you did at first. The same is often true of TV commercials too.

One explanation for the Mere Exposure Effect is *perceptual fluency*, which posits that positive feelings are generated by the increasing ease with which a stimulus is processed. Of course, any message will wear out eventually, and some messages are annoying even at first exposure. Even so, research shows that incidental messages (banner ads, pop-ups) can be viewed up to 20 times before wear-out occurs (Fong, Singh, & Ahluwalia, 2007).

Narrative Versus Statistical Evidence

Earlier, we noted that when an audience has low involvement in an issue, the sheer quantity of arguments matters the most. When an audience is highly involved in an issue, the quality of arguments is what counts. A related concern has to do with *what form* of proof is the most effective, narrative or statistical evidence? *Narrative*

evidence is anecdotal evidence, told in narrative form, presented as a case study, or related as personal accounts. *Statistical evidence* consists of averages, percentages, and other numerical proof.

Numerous studies have compared the effectiveness of these two forms of proof. The most reliable generalization to date is that statistical proof has a slight edge over narrative proof (Preiss & Allen, 1998). Nevertheless, a well-crafted narrative can be quite compelling, and numbers don’t always speak for themselves. The best advice we can offer is to combine the two. Begin with a narrative example, then use statistics to demonstrate that the example is not an isolated case.

Fear and Other Motivational Appeals

When a coach gives a half-time locker room speech, she or he often employs motivational appeals to fire up the team. Motivational appeals are “external inducements, often of an emotional nature, that are designed to increase an individual’s drive to undertake some course of action” (Gass & Seiter, 2007, p. 271). A variety of motivational appeals have been studied, including fear appeals, guilt appeals, humorous appeals, patriotic appeals, pity ploys, and sex appeals. For brevity’s sake, we focus on fear appeals here.

Arousing fear in people depends on their level of *perceived vulnerability*. Vulnerability hinges on receivers’ perceptions of the probability, severity, and immediacy of the fearful consequences. Kim Witte has built on previous research to develop the extended parallel process model (EPPM), which explains how and when fear appeals are most likely to be effective (Cho & Witte, 2004). The EPPM is a dual-process model, which posits two methods of processing a fear-arousing message. The first, *danger control*, is a constructive response, which focuses on ways of avoiding or minimizing the danger. The second, *fear control*, is a counterproductive response, such as panic or freezing. To facilitate danger control, a fear appeal must provide specific recommendations that are perceived as efficacious or workable. Perceived efficacy includes *response efficacy*, which consists of identifying a practical, feasible remedy, and *self-efficacy*—whether a receiver believes she or he, personally, can undertake that course of action.

To illustrate, let’s say a physician is trying to convince an elderly patient to get an influenza vaccination. To increase perceived vulnerability, the doctor might mention the number of flu-related deaths annually and the susceptibility of seniors to the flu. To promote danger control, the doctor could emphasize that flu shots are safe and reasonably effective (response efficacy). To encourage self-efficacy, the doctor could say, “I can give you an inoculation today, you won’t need to reschedule a visit, and it’s covered by your health plan (self-efficacy).” Scaring the patient without providing a practical solution would likely result in fear control.

Considerable research has been conducted on fear appeals. The preponderance of research shows that they work quite well. To maximize their effectiveness, however, a persuader must concentrate on triggering danger control rather than fear control.

The Channel

The means by which a message is transmitted—whether spoken, printed, televised or, more recently, online—is an important consideration when studying persuasion. A good deal of work has examined the role of language and nonverbal communication in the persuasion process. This section highlights some of that work.

Language

Two important features of language are intensity and power. *Language intensity* refers to how emotional, metaphorical, opinionated, forceful, and evaluative language is. For example, saying “This corporation is emitting pollution” is less intense than saying “This corporation is raping the environment.” One theory that explains when and under what circumstances intense language is more effective is the language expectancy theory (LET) (see Burgoon & Siegel, 2004). LET argues that when persuaders use intense language, they violate our expectations about social norms regarding communication. If the source is perceived positively (e.g., the source is attractive or credible), intense language is more persuasive. If the source is perceived negatively, the reverse is true.

A second feature of language is the degree to which it is perceived as powerless. Among other mannerisms, *powerless language* is characterized by hesitations (e.g., “Uh,” “You know”), hedges (e.g., “I guess I sort of agree”), intensifiers (e.g., “I really agree very much”), and polite forms (e.g., “Excuse me. If you wouldn’t mind . . .”). In general, such tendencies decrease a source’s credibility and persuasiveness. A study by Johnson and Vinson (1990), for example revealed that even a few instances of powerless speech reduced the overall persuasiveness of a message.

Nonverbal Behavior

While it is common for people to think of words when they consider persuasion, nonverbal behavior has as much, if not more, persuasive impact. The direct effects model of immediacy (Andersen, 2004) asserts that nonverbal behavior is particularly persuasive when it communicates warmth and involvement with other people. *Immediacy behaviors* such as eye contact, appropriate touch, open body positions, smiling, and pleasant tone of voice are related to increased compliance in a variety of contexts. Nonverbal cues also can foster a *halo effect*, whereby people assume that one positive aspect of a person generalizes to other favorable qualities of the person. For instance, an attractive person also might be perceived as more intelligent or capable, which, in turn, aids her or him in gaining compliance.

Not all research, however, presents such a simple picture of the relationship between nonverbal behavior and persuasion. Earlier, we noted that intense language may violate people’s expectations and, as a result, can produce positive or negative effects depending on how the source is perceived. Expectancy violations theory (Burgoon, 1994) suggests that the same process takes place when a source violates people’s expectations for nonverbal behavior. Thus, a source who stands closer to a person than normally would be expected may be more or less persuasive depending on whether the violation is perceived positively or negatively. A high-credibility source can therefore get away with “bending the rules” better than a low-credibility source.

The Audience

Effective persuaders do not move the audience to the message; they move the message to the audience. This involves more than simply paying attention and adjusting to factors such as the age, educational level, intelligence, or size of the audience. Sometimes other audience characteristics come into play. The search for a single trait or characteristic that makes people persuadable has been unsuccessful. Nevertheless, a number of less global characteristics have been identified as important. In this section, we briefly touch on a few of them.

Gender

Although some early research suggested that females were more persuadable than males, later work showed no differences and, instead, tried to explain *when* gender differences could be expected. Some work, for instance, found support for a *cross-sex effect*, whereby people were more easily influenced by members of the opposite sex than by members of the same sex.

Culture

Cultural differences play a major role in the way people respond to influence attempts. Some cultures are *individualistic*, valuing independence and the goals of the individual over those of the group, while others are *collectivistic*, valuing harmony, conformity, and concern for others. As such, messages that appeal to personal benefits and success tend to be more effective in individualistic cultures, while those that emphasize family and group goals tend to be more effective in collectivistic cultures (Han & Shavitt, 1994).

Traits

A number of personality traits affect the way persuasive messages are processed. To illustrate, we briefly mention two. First, people high in the *need for cognition* enjoy effortful thinking more than those low in the need. Because they pay more attention, they tend to be persuaded by strong, compelling arguments while their counterparts are

more likely to be persuaded via peripheral cues (attractive source, brand loyalty). Second, *dogmatic/ authoritarian* people see the world in “black and white” and follow authoritative leaders blindly. As such, they tend to be rigid and difficult to persuade, *unless* the source happens to be a respected authority.

Compliance Gaining

While traditional persuasion research tends to focus on mass persuasion and attitude change, compliance-gaining research tends to focus on interpersonal influence in “face-to-face” contexts and, as its name implies, on actual behavioral compliance. This section examines research on message selection and production, the principles underlying why people comply with requests, and sequential persuasion tactics.

The Selection of Compliance-Gaining Messages

Early studies sought to identify what types of compliance-gaining strategies people are likely to select. A typical research design presented participants with hypothetical scenarios and asked them to report which strategies they were likely to employ. Depending on the study, some participants generated their own strategies, while others selected strategies from a predetermined list. Results of such studies yielded *typologies* of compliance-gaining tactics. For example, Marwell and Schmitt’s (1967) seminal study identified 16 different strategies (such as promise of reward, threat of punishment, liking, and debt). Despite the contributions of such research, it has been criticized for being atheoretical and for not reflecting the strategies people use in “real life.”

Goals and the Production of Compliance-Gaining Messages

More recent research has attempted to understand how goals influence the production of compliance-gaining messages. Two noteworthy examples are politeness theory (Brown & Levinson, 1987) and the goals-plans-action (G-P-A) model (Dillard, 2004). First, according to politeness theory, people seek approval (known as *positive face*) and try to avoid disapproval (known as *negative face*). Because compliance-gaining goals may differ in the degree to which they threaten face needs, such goals play an important role in shaping compliance-gaining behavior. For example, because asking a friend to help you paint your house may threaten face more than asking the friend to pay back \$20, when seeking help in painting, you may be less direct and provide more reasons for the imposition.

Similarly, the G-P-A model suggests that although people have the primary goal of gaining compliance, a number of secondary goals also influence their choice of strategies. For example, even if you thought that a threat might be effective at gaining compliance (primary goal), you might refrain from using it if you thought it might damage your relationship with the other person (secondary goal).

Principles Underlying Why People Comply With Requests

Based on his observations of successful, real-life persuaders (e.g., salespeople, fund-raisers, advertisers, recruiters), Robert Cialdini (2001) identified several principles explaining why people comply with requests. First, the principle of *reciprocity* suggests that people should return favors. A person who has received a favor is likely to feel indebted and, in turn, comply with a request for a return favor. Second, the principle of *scarcity* states that people value things that are in short supply. According to this principle, if shoppers believe that the items they are examining are limited, they would be more anxious to purchase the items. The third principle, *consistency/commitment*, suggests that once people become committed to some idea or cause, they are likely to behave consistently with it. For instance, a person who was committed to Mac computers would be unlikely to buy a PC. The fourth and fifth principles—*authority* and *similarity/liking*—suggest that we are more likely to comply with requests from credible sources who are likable and similar to us. The next principle, *contrast*, suggests that judgments are relative to one another. For instance, a \$3,000 diamond ring may seem expensive when compared with a \$100 ring but cheap when compared with a \$40,000 ring. Finally, the principle of *social proof* suggests that we are more likely to respond favorably to popular items (e.g., best-selling books) than to unpopular ones. We will discuss this notion in more detail later.

Sequential Persuasion

Although using a direct request is probably the most common approach to compliance gaining, compliance-gaining attempts are often more elaborate. A large body of research illustrates that successful compliance gaining often occurs in stages. In this section, we discuss four commonly studied sequential approaches to compliance gaining.

The two sequential approaches to seeking compliance that have probably received the most research attention are the *foot-in-the-door* (FITD) and the *door-in-the-face* (DITF) tactics, which are essentially mirror images of one another. Specifically, in the first (FITD), a persuader follows a small request, which must be agreed to, with a larger one; in the second (DITF), a persuader follows a large request, which is denied, with a smaller one. In both

cases, exposure to the initial request makes one much more likely to comply with a subsequent request. A common explanation for the FITD effect is that people who comply with the small request perceive themselves as being helpful, agreeable, or altruistic. To remain consistent, they go along with the second request. In contrast, the reciprocity and contrast principles are common explanations for the DITF effect. Specifically, if the larger, second request is perceived as a concession, persuadees may feel obligated to reciprocate by agreeing to the second request. On the other hand, people may comply with the follow-up request because, when contrasted with the initial request, it seems smaller than it normally would have.

Two additional sequential compliance-gaining tactics are the *lowball* and the *bait-and-switch*. Both of these ethically unsavory tactics work by first getting persuadees to commit to something that seems desirable but then changing the deal, ultimately getting them to agree to something that is less desirable. In the lowball procedure, once people agree to perform some behavior (e.g., buy a computer for \$1,000), they are asked to perform the same behavior at a higher cost (e.g., buy the same computer for \$2,000).

In the bait-and-switch procedure, once people agree to perform some behavior (e.g., buy a stereo for \$1,000), they are asked to perform a different, less desirable behavior (e.g., buy a different, inferior computer for \$1,000). A common explanation for both procedures is that once people agree to the initial request, they become psychologically committed and have difficulty altering their decision.

Buzz Marketing

Earlier, we mentioned the principle of social proof, which suggests that we use other people's behavior as evidence when making decisions about how we will behave. In other words, if other people have behaved in a certain way, we tend to follow suit. Although this idea is not new, recently it has become the basis of a common marketing strategy often referred to as "buzz marketing" or "viral marketing." In his best-selling book *The Tipping Point*, Gladwell (2002) explained that in the same way a contagious person can spread an epidemic, small groups of influential people can cause fashion trends or increase the popularity of a new product. Based on this assumption, companies hire people to create a buzz about their products. For example, attractive people might be hired as "poseurs" to hang out in trendy bars and clubs and say nice things about a particular brand of beer. These "undercover" consumers are trained to make the product seem exciting while adapting their communication to whoever they are persuading. This approach to persuasion is also well suited to the Internet. For example, personal blogs provide an opportunity for everyday persuaders to reach more potential consumers about new products. We predict that such approaches will be an important, fertile ground for new research on persuasion.

The Future of Persuasion Research

Persuasion research has a long and venerable history. Although it is difficult to know what the future holds, some educated guesses can be made about likely research avenues for the next decade or so. Just as the concept of tipping points influenced the past decade, the concept of *microtrends* may shape the next decade. Penn and Zalesne (2007) have stressed the importance of looking at distinctive niche groups to predict societal trends. These include "extreme commuters," "cougers," "vegan children," and "archery moms," among others. Even small trends, including countertrends, can have a powerful effect on society.

Persuasion on the Internet holds considerable promise as a topic of research. Studies on the impact of blogging and social networking sites such as MySpace and Facebook are already under way. And because people are increasingly reliant on cellphones (via voice, texting, and images) research on the nature and impact of "mobile persuasion" would seem fruitful.

Visual persuasion is becoming an important area of investigation as well. As more people view, rather than read, persuasion messages, visual influence is becoming a vital arena for research. A phenomenon dubbed the *Streisand Effect* has already sparked attention. Similar to the scarcity principle, when demands are made to remove videos or documents on the Web, hits for those materials increase dramatically. It seems a "forbidden fruit" is all the more attractive. The Streisand Effect is so named because the singer-actress filed a lawsuit, which was denied, against a photographer who took aerial photos of the Malibu coastline, including her estate.

Physiological measures of persuasion also may play a prominent role in future research. During the last Superbowl, researchers conducted brain scans of viewers watching Doritos and Emerald Nuts commercials. The Doritos spots elicited much more brain activity. Brain scans may become as popular as focus groups now are for marketing.

We believe that no matter what direction(s) the study of persuasion takes, it will remain a fascinating field of inquiry. A good deal is known about persuasion, but it is hardly an exact science. Many questions remain to be answered, and some important questions have to be asked.

IDENTITY AS CONSTITUTED IN COMMUNICATION

KARLA MASON BERGEN

College of Saint Mary

DAWN O. BRAITHWAITE

University of Nebraska–Lincoln

“**W**ho am I?” From ancient Greek philosophers who emphasized the importance of “know[ing] thyself” to well-known intellectuals in the 20th century, scholars have wrestled with theoretical, empirical, and practical questions about identity (Carbaugh, 1996; Eisenberg, 2001; Mead, 1934, 1936; Strauss, 1956). Questions about identity challenge each of us individually, in our web of social relationships with family and friends, and in our workplaces and communities. Scholars from communication studies have joined scholars from other disciplines including philosophy, sociology, and social psychology in studying identity.

A number of these scholars have engaged in ongoing conversations around the notion that the construction of individual, relational, and group identities is an ongoing process that occurs in social interaction. Our goal in this chapter is to explore how this scholarly conversation about identity as constructed in relationship with others has evolved over the past century and how identity construction is being studied as a communication phenomenon at the beginning of the 21st century. The conversation starts with comparing the idea of identity as constituted in communication with other perspectives of identity.

The Study of Identity

The psychological concept of identity has generally been synonymous with self-definition, or the question “Who am I?” (Baumeister, 1987; Eisenberg, 2001; Gergen, 1971; Holstein & Gubrium, 2000). Because persons in the Western world think of themselves as “individuals,” one’s identity is commonly thought to be located somewhere within one’s inner being or psyche. Baumeister (1987) described this “inner nature of selfhood” as being characteristic of “modern psychological thought” (p. 165). Carbaugh (1996) explained the psychologically based concept of identity as follows: “The individual has a ‘self’ or something inside of himself or herself that is special, unique, yet rather stable across scenes and times” (p. 28). Thus, an individual’s identity is not only characteristic of a unique person but is expected to be somewhat consistent over time, as illustrated by the Latin etymology for the word *identity*, meaning “sameness” (Halsey, 1983). Psychologically based perspectives on identity have had a great deal of influence on how the average American thinks about his or her own identity.

Carbaugh (1996) characterized the modern American search for identity as “the serious task of digging deeper into their own and others’ ‘core’ selves” (p. 194). Carbaugh

explained three popular “discourses of identity” in 20th-century American culture: (1) the discourse of biology, (2) the discourse of psychology, and (3) the discourse of cultural and social identity. The discourse of biology centers on identity as reflecting one’s biological makeup with regard to race, ethnicity, and/or sexuality. For example, your authors both identify as Anglo, heterosexual females. The discourse of psychology refers to identity in terms of a person’s internal psychological attributes or personality traits, characterizing ourselves and others as “outgoing,” “shy,” “intellectual,” or “having a great sense of humor.” The third discourse, of cultural and social identity, discusses individuals’ identities in relation to their membership in particular groups. For example, your authors would identify as “upper middle class” and “academics.” A common thread running through each of these three popular discourses of identity is their emphasis on identity as located within individuals, or, as Eisenberg (2001) characterized it, “the idea of an independent, fixed, unitary self” (p. 536).

An interaction that one of us had with a student in our undergraduate interpersonal communication classroom last semester illustrates this pervasive notion of identity as internal and individual. The student objected when presented with the idea of self being constructed in interaction with others. The student suggested that *mature* adult persons should not allow others to influence their self-concepts! When asked by the professor, “How do you know what you look like?” she initially responded with a puzzled expression. After a bit of thought, she responded, “Because we can look in a mirror and see ourselves.” Ah-ha. Just as we need a mirror to know what we look like physically, we need the mirror of other people’s reactions to us to gain insight into “who we are.” This example with the student highlights Herbert Cooley’s concept of the “looking glass self” (1902), perhaps one of the most well-known early-20th-century articulations of the social construction of self.

Over the course of the 20th century and into the 21st century, the perspective that our identities are constructed through our interactions and relationships with others has been further theorized, clarified, and refined. Our purpose in the remainder of this chapter is threefold: (1) to discuss the intellectual heritage of the idea that identities are constituted in communication; (2) to examine how communication theorists have integrated this foundational scholarship into communication approaches; and (3) to explore four different theoretical perspectives for studying identity, providing examples of how communication scholars have used each of these theories in empirical research. Finally, we end by briefly offering some suggestions for additional perspectives that might be profitably used by communication scholars studying issues of identity. We begin the following section by tracing the development of the idea that identity is located in social interaction through the process of communication.

Communication-Based Explanations of Identity

The notion that the identities of self and others are constructed through interaction has been addressed by scholars across several disciplines, including communication studies. The communication scholar Donal Carbaugh (1996) explained, “Social identities are not just inside a self, but *enacted* in scenes; communication is not just a revelation of self, but its *formative fashioning* [italics added]” (p. xiv). Three scholars in the first half of the 20th century who had primary roles in identifying communication as the way we construct identity were George Herbert Mead, Kenneth Burke, and Erving Goffman. Midcentury, Peter Berger and Thomas Luckmann based their theoretical perspective of the social construction of reality (including the construction of selves) on the foundations laid by these earlier scholars. Diverse contemporary communication theorists have built on these earlier intellectual traditions, as we shall see. We begin with Mead, who coherently articulated the relationship between communication and the construction of identity in the early part of the 20th century.

The Intellectual Heritage of Mead, Burke, and Goffman

The philosopher George Herbert Mead (1863–1931) tried to make sense of the relationship between individuals, their thought processes, and the broader social structure, leading to his book *Mind, Self, and Society* (1934). One of Mead’s important contributions was his conception of selves and society as being created in a continually evolving process.

Mead explained his thinking about identity in an essay titled “The Problem of Society: How We Become Selves” (1936). Mead’s answer to how the self comes into existence was summarized at the conclusion of that essay. “A self can arise only where there is a social process within which this self has had its initiation. It arises within that process. For that process, the communication and participation . . . is essential” (as cited in Strauss, 1956, p. 42). Mead (1934) believed that selves were created through the process of social interaction. Both one’s self (identity) and one’s mind (the ability to use language to symbolize thought) were acquired through communication with others (Mead, 1934; Meltzer, 1967). Because language is symbolic and requires social interaction with others, Mead’s theoretical perspective has become known as “Symbolic Interaction.” Because Mead’s theory of identity construction is based on the use of language and social interaction, he has been a significant influence on many communication scholars as well as those in sociology and psychology.

There is ample evidence that Kenneth Burke (1897–1993) was influenced by the ideas of Mead (McLemee, 2001). Burke was a rhetorician and has been influential for communication scholars. Burke grappled with issues of language, identity, and power. Burke's (1966) overarching concern with language is reflected in his well-known definition of [hu]man: "*Being bodies that learn language thereby becoming wordlings; humans are the symbol-making, symbol-using, symbol-misusing animal.*" Following Mead, Burke saw language as the way human beings interface with society and thus construct identities in an ongoing process. Burke's conceptualization of identity, like Mead's, hinged on the belief that individuals do not have identities apart from their interaction with others. Burke (1937) derided the idea that "an individual's 'identity' is something private, peculiar to himself" (p. 263). Burke believed that there was no such thing as a "core self" and that "the self, divorced from the social bases of experience which constitute identity, is a void" (Branaman, 1994).

Burke emphasized the importance of focusing attention on the language choices people make. In another oft-quoted statement, Burke (1966) pointed out that the language we *select* simultaneously *reflects* one portion of reality while it *deflects* another portion of reality (p. 45). The implications for identity are obvious: As we call attention to one aspect of our identity, we deflect attention away from other aspects of our identity. Burke saw language primarily as a rhetorical strategy for social change, and thus, his work has been central for rhetorical and critical scholars (Branaman, 1994). Burke's scholarship has been influential for others also, including Goffman.

Erving Goffman (1922–1982) was a sociologist who, like Mead and Burke, emphasized the essential role of social interaction in identity formation. The title of Goffman's well-known book *The Presentation of Self in Everyday Life* (1959) emphasized the performative perspective of identity, which he often referred to as "impression management." Goffman's thesis was that people are generally predisposed to present themselves in a positive manner consistent with their desired image. This "presentation" is done through communication in social interaction.

While Goffman (1959) used dramaturgical metaphors of the stage (e.g., "actors," "role," "performing"), he was clear that the "presentation of self" is not just an act for others' benefit. He cited Park (1950), who pointed out, "It is probably no historical accident that the word person, in its first meaning is a mask. It is rather recognition of the fact that everyone is always and everywhere, more or less consciously, playing a role" (p. 249). Goffman (1959) went on to say that "so far as this mask represents the conception we have formed of ourselves—the role we are striving to live up to—this mask *is* our truer self, *the self we would like to be* [italics added]" (p. 19). Goffman

emphasized that rather than being located within the individual, the self is located in interaction with others, the "product of a scene that comes off" and "something of collaborative manufacture" (pp. 252–253). Like both Mead and Burke before him, Goffman rejected the notion of a preexisting essential core self.

A particularly valuable contribution from Goffman was his contention that identities are not validated until they are recognized and supported by others. The identities we want to claim for ourselves, as well as how we behave, are influenced by our interactions with others. Individuals do not just get to be who they want to be; their desired identities must be accepted and supported by others (Carbaugh, 1996; Goffman, 1963). This is the basis for arguing that identities are *negotiated* in social interaction.

In the early part of the 20th century, Mead, Burke, and Goffman contributed to our foundational understandings of identity as constructed in social interaction with others, before the discipline's current focus on social science and communication theory became prominent. There was one other important contribution to this body of scholarship on the construction of identity that we should acknowledge—Berger and Luckmann.

Peter Berger and Thomas Luckmann (1966) were sociologists who were significantly influenced by Mead and the symbolic-interactionist approach, as well as by Goffman, Marx, Durkheim, Weber, and others. At the center of their classic book *The Social Construction of Reality* was the assertion that *all* human experience, including identity, is socially constructed as a subjective reality. Identity is "a phenomenon that emerges from the dialectic between individual and society" (p. 174). Like Mead, Goffman, and Burke, Berger and Luckmann contended that the concept of "self" is meaningless without social interaction. Berger and Luckmann emphasized the essential role of interaction with "significant others" in developing and maintaining personal identities, as well as the role of others in society.

Like the earlier scholars, Berger and Luckmann (1966) recognized that language—more specifically, face-to-face conversation—is the "vehicle" that maintains social reality and identity. "The reality of everyday life further presents itself to me as an intersubjective world, a world that I share with others . . . Indeed, I cannot exist in everyday life without continually interacting and communicating with others" (pp. 22–23). Like Goffman, Berger and Luckmann recognized that social processes and structures are also necessary for maintaining desired identities.

Berger and Luckmann's (1966) theoretical perspective has had great import for the study of identity by communication scholars for at least two reasons: First, these authors were able to synthesize and integrate much of the previous thinking on the essential role of communication and social interaction in identity processes. Second, by coining the

phrase “the social construction of reality,” they were able to give us a vocabulary with which to discuss identity issues.

In summary, the intellectual heritage of Mead, Burke, Goffman, and Berger and Luckmann rejected the idea of a preformed self coming into the social world. They all saw the answer to the question of identity (“Who am I?”) as being communicatively constructed in social interaction with others. As communication scholars started studying identity issues in social and personal relationships, they turned to this body of scholarship for theoretical grounding.

Communication Approaches to the Study of Identity

Early in the 20th century, what we now know as communication studies focused on the study of rhetoric and public speaking. In the second half of the century, the focus of the discipline broadened to include a social scientific, primarily logical-empirical research approach to communication issues (Braithwaite & Baxter, 2006). These scholars, particularly those in interpersonal communication, took up the study of identity based on the scholarship we discussed above. Three direct legacies of these earlier scholars were (1) rules-based approaches, (2) cultural communication approaches, and (3) postmodern approaches.

Rules-Based Approaches

Mead and Burke influenced the work of communication theorists such as Cushman, Pearce, and their colleagues in the 1970s and 1980s (Carbaugh, 1996). Cushman’s (1977) rules-based perspective on communication sprang from the premise that “interpersonal communication has as its principal goal the coordination of human activity in regard to the development, presentation, and validation of individual self-concepts” (p. 39). The coordinated management of meaning (CMM) theory (Pearce, 2004; Pearce & Cronen, 1980) provided a theoretical response to the question “What are they [people] making together?” Thus, the CMM theory asserted that *identities*, as well as episodes, relationships, and cultures, were created by the interaction between persons, a “process of co-construction, of being made by the joint action of multiple persons” (Pearce, 2004, p. 43). Although they acknowledged identities as being co-constructed through communication, researchers using the CMM and other rules-based theories have tended to focus on communicative outcomes such as the resolution of conflicts rather than identity issues per se, and the CMM theory has been used by organizational communication scholars more than those studying interpersonal communication (Baxter & Braithwaite, 2008). A second communication approach growing out of the earlier foundational work on identity was cultural communication.

Cultural Communication Approaches

The work of Carbaugh and Philipsen in the 1990s exemplifies the cultural communication approach growing out of the heritage of Mead, Burke, and Goffman. Carbaugh’s (1996) primary interest has been studying identity as communicatively constructed in specific sociocultural contexts. Carbaugh based his study of communication and social identity on the twin perspectives of identity constructed through communication and cultural ethnography. He articulated that identities are not only *socially constructed* through communication practices but are situated firmly in specific cultural and historical settings. Thus, individuals have not just “an identity” but rather multiple identities across situated social contexts, a notion that has been taken up by postmodern scholars (e.g., Eisenberg, 2001; Gergen, 2000).

Following Burke’s contention that individuals’ choices of words were important clues to their identities, Carbaugh theorized that communication researchers could investigate the construction of social identities by attending to the *symbols*, *forms*, and *meanings* in situated social interactions. For example, in his study of marital naming practices and women’s marital identities, Carbaugh (1996) found that women’s choices about their surnames after marriage reflected and constructed particular attitudes, values, and beliefs they had about themselves and their marital relationships.

Similarly influenced by Burke, Philipsen (1992) looked at particular ways of speaking in speech communities (such as his classic study of Teamsterville, a working-class industrial community in Chicago). Using a theoretical perspective he called the “ethnography of speaking,” Philipsen claimed that “personal identity, social reality, and social actions are constituted in—created, negotiated, and transformed, as well as reflected in—the communicative conduct of which speaking is a part” (p. 15). Operating from the assumptions that ways of speaking are structured, socially and culturally distinctive, and based in social life, Philipsen observed individuals’ use of language and analyzed these ways of speaking and their attendant meanings, premises, and rules to formulate *speech codes*. Philipsen’s main goal was to examine culturally situated language-in-use to discover the ways in which speech communities create and transmit cultural identities.

Cultural communication scholars such as Carbaugh and Philipsen have helped communication scholars to realize that to answer questions of identity we must not ask just “Who am I?” but “When, where, and how am I?” (Holstein & Gubrium, 2000). Postmodern communication approaches further extend the idea of identities as complex and shifting phenomena.

Postmodern Communication Approaches

Postmodern communication approaches view individuals as having multiple identities constituted in communication but also influenced by webs of relational, cultural,

biological, and environmental factors. The communication scholar Eric Eisenberg (2001) proposed a model of communication and identity that takes into account multiple factors that interact dynamically to construct identities. His model highlighted the interwoven nature of individuals' communication with others; their personal narratives and moods; along with the influences of society, culture, interpersonal relationships, biology, economics, and religion that construct multiple and ever-changing identities.

Both Eisenberg (2001) and Gergen (2000) have viewed identity as relational and dynamic; far from being a fixed core, identities are fluid and change with situated contexts. Eisenberg (2001) contended that we all have a "multiplicity of selves," and Gergen (2000) asserted, "One's identity is continuously emergent, re-formed, and redirected as one moves through the sea of everchanging relationships" (p. 139). Because the word *identity* seems to invoke the notion of an "independent, fixed, unitary self" (Eisenberg, 2001), thinking about individuals having "multiple identities" is an important linguistic move. Gergen (2000) called for a "new vocabulary of being" that "de-objectifies the individual self" (p. 242) and "recognize[s] the extent of our relational embeddedness" (p. 254). Communication scholars should certainly be at the fore in creating this new vocabulary of identity.

Leslie Baxter has talked about socially constructed identities as "constituted in communication." Baxter (2004b) described what it means to take a "constitutive" view of communication: "A constitutive approach to communication asks how communication defines, or constructs, the social world, including our selves and our personal relationships" (p. 3). Baxter's approach to viewing identities as "constituted in communication" calls attention to the unique contribution that communication scholars can make to research on identity, distinguishing it from work in other disciplines.

While Baxter (2004a, 2004b) positions her current work within Bakhtin's postmodern dialogic theory, there are commonalities between Baxter's perspective and the intellectual heritage of the other scholars discussed in this chapter. First, similar to Mead and Cooley, Baxter (2004b) described the way we come to know our "selves" as the result of interaction with others: "An individual knows self only from the outside, as he or she conceives others see him or her. The self, then, is invisible to itself and dependent for its existence on the other" (pp. 3–4). Second, Baxter rejects the notion of a "monadic self" in favor of a "dialogic self." Baxter (2004b) argued, "Self cannot be a unitary, monadic phenomenon, according to dialogism; instead it is a fluid and dynamic relation between self and other. Bakhtin's metaphor for this relation is a dialogue" (p. 4). Thus, when we are in dialogue with another, we are engaged in the process of identity construction—simultaneously constructing our identities as "selves" and our relational identities with others. Third, Baxter talks about the process of "selves *becoming*"—not unlike the ongoing process articulated by Mead, Burke,

and others. In Baxter's dialogic perspective, this process of selves becoming involves the relational pair negotiating integration and separation.

Baxter emphasizes that adopting a "dialogic perspective" does not mean simply dialogue between two relational partners with one-dimensional identities. Rather, dialogism is characterized by the dynamic interplay of the voices of multiple identities in the ongoing, "unfinalizable" conversation of social interaction. Bringing a dialogic perspective to the study of identity recognizes the ongoing creation of selves and relationships and the multiple identities created in interaction.

In summary, a number of communication theorists have refined and extended the earlier intellectual traditions. Although there are important differences in the way these theorists have approached the study of identity, all agree that identity is a relational phenomenon, constructed in social interaction. In the next section, we will look at several theoretical perspectives that have been frequently used by relational communication scholars to study identity.

Theoretical Perspectives in Communication and Identity Research

Contemporary communication scholars have used a number of theoretical perspectives to study identity issues. Each theory provides a different lens for the camera, allowing scholars to understand different aspects of communication and identity. Three theoretical perspectives that help us understand how communication constructs identity are symbolic interaction/social construction, facework, and relational dialectics/dialogism. We describe each theory briefly and provide selected examples of research on communication and identity based on each theory.

Symbolic Interaction/Social Construction

Symbolic interaction (Mead, 1934; Meltzer, 1967) and social construction (Berger & Luckmann, 1966) have similar premises; they both focus on how people create meaning of themselves and the world around them through social interaction (Braithwaite & Baxter, 2006). Scholars using both theoretical perspectives believe that identities and relationships are mutually constituted in communication with others (Carbaugh, 1996; Leeds-Hurwitz, 2006). Leeds-Hurwitz (2006) recognized the similarities and overlap between the two theoretical perspectives, explaining that they have "different intellectual histories and different emphases in practice" (p. 229). We do not find these distinctions of great import for our purposes here. While their vocabulary is somewhat different, the two perspectives share very similar views on the role of language and social interaction in the construction of identity. We summarize the main tenets of both perspectives, followed by examples of how communication scholars are using these theories to inform their research on identity.

Symbolic Interaction

Mead believed that both one's self (identity) and one's mind (the ability to use language to symbolize thought) are acquired through communication (Mead, 1934; Meltzer, 1967). The identities we want to claim for ourselves are created in interactions with others (Carbaugh, 1996; Goffman, 1963). Julia Wood (1994a, 1994b), for example, used the symbolic-interaction perspective to explain how persons construct gender identity. Wood (1994b) used symbolic interaction to explain the identity transformation of her own mother, who, as a married woman with two children, took great pride working as a stockbroker during the 1950s, when most middle-class women were stay-at-home mothers. When a family move forced Wood's mother to quit her career, she re-created herself as the epitome of the stereotypical housewife and mother, absorbing the expectations of both significant and generalized others and became what others around her expected her to be.

In research examining the nontraditional identity construction of commuting wives living apart from their husbands to pursue careers, Bergen (2006) found that these wives employed "accounts" to explain their commuting arrangement to others. Social network members often challenged commuter wives' identities by asking questions about their marital arrangement and expressing sympathy for their husbands and children. Commuter wives responded to these identity challenges by providing accounts. For example, one wife who reported being asked who prepared her husband's meals felt obligated to explain that her husband had always done much of the cooking during their marriage, as a way of responding to the unspoken suggestion that she was neglecting her wifely duties. Bergen's analysis of the stories of these women sheds light on how identities are negotiated in social interaction.

In their study of committed lesbian couples with children conceived by donor insemination, Bergen, Suter, and Daas (2006) also used symbolic interaction to investigate how co-mothers attempted to construct an identity of legitimate parenthood for the nonbiological mother. They found that co-mothers used address terms acknowledging motherhood for the nonbiological mother, hyphenated children's last names, and drafted legal documents including the nonbiological mother's name in efforts to persuade others to accept the nonbiological mother as a legitimate parent. These naming practices showed how symbols such as referents and address terms are an important part of constructing identity. Bergen and colleagues' study also illustrated that the desired identities are not always accepted by others and that validation by others is an essential part of the process.

Social Construction

Like symbolic interaction, social construction operates from the assumption that people make sense of the world and themselves through language (Braithwaite & Baxter, 2006). The construction metaphor suggests that relational functions such as repair, maintenance, and change are

carried out through the use of language (Leeds-Hurwitz, 2006); thus, studying identity from the lens of social construction mandates examining discourse in social contexts.

For example, in her study of how U.S. families with adopted children from China construct their familial identities, Elizabeth Suter (2008) used social construction along with Galvin's (2006) concept of discourse-dependent families. By focusing on the discursive processes of these families as they interacted with members of the extended family, social networks, and community institutions, Suter found that family identity was challenged by questions and comments that assumed that adoptive family relations are inferior to biological family ties and/or remarked on the visible dissimilarity between the parents and their adopted children. For example, people would ask Caucasian parents of a Chinese child, "Is he/she yours?" Suter discovered that adoptive parents used discursive strategies such as challenging comments, educating others, answering directly, or sharing something positive about their family to assert their family status to others. Suter's study illustrated how language in the form of discursive strategies can function as a resource in constructing and validating family identity. We now turn to a second major theoretical framework that has been used by communication scholars studying identity.

Facework (Face Theory)

Goffman (1959, 1971) suggested that individuals communicate with others to establish a desired identity. We seek to maintain this "face," or the public image that we present in social interaction, by expecting others to treat us in a manner consistent with our desired identity (Metts & Cupach, 2008). The communicative strategies used in making and maintaining these identity claims formed the basis for Goffman's theoretical perspective of "facework," or face theory. While Goffman was primarily concerned with public interactions, Cupach and Metts (1994) extended face theory by applying it to the study of interpersonal interactions in close relationships.

McBride (2003) contributed to the literature by studying facework in ongoing real-life situations. McBride interviewed participants who had broken up with their relational partner following a serious relational transgression (e.g., an affair or serious drug use) and later reconciled with the partner. McBride wanted to know how persons who had told family members about their partner's transgression communicatively managed the face needs of themselves, their partner, and their relationship, as well as the face needs of their family members. He found that participants often initially used strategies that protected the desired identities of all parties by managing *what* they told and *who* they told about their romantic relationship problems; they used strategies of keeping family members up-to-date (or not) on their ongoing contact with the former partner and providing accounts to (or avoiding telling) family members to manage the face threats that occurred after the reconciliation with the partner. McBride's

findings are an important addition to facework research because they illustrate the interplay of multiple persons' multiple identities within social networks and in ongoing personal relationships.

Other communication researchers have used facework to study how identity concerns are salient to interactions between teachers and students (e.g., Bergen, 2002; Kerssen-Griep, 2001). Bergen (2002) found that experienced female college instructors tended to use proactive facework strategies to establish and maintain their professional identities in the college classroom. She also found that instructors were reluctant to use face-threatening strategies in problematic situations and tried to allow students to maintain a positive image. Kerssen-Griep (2001) found that college students who had instructors sensitive to their face needs reported being more motivated to accept their instructors' authority, as well as more invested in their learning process. Metts and Cupach (2008) noted that in all social interactions, "a performance is designed, consciously or unconsciously, to create an impression for others of who we are—an idealized self that fits appropriately into the requirements of the context" (p. 205). The theoretical perspective of facework has enabled these communication scholars to learn more about the ways persons negotiate multiple identities within specific situated relational contexts. Next, we turn to a third theoretical lens that has been useful to communication scholars studying identity—relational dialectics.

Relational Dialectics/Dialogism

Over the past 20-plus years, Baxter has developed and used the theoretical perspective of relational dialectics (for a review, see Baxter 2004b; Baxter & Braithwaite, 2008). The core contention of relational dialectics is that all relationships involve a "dynamic interplay" between unified yet contradictory tensions. This dynamic interplay occurs in communication in everyday interaction. These tensions may be experienced *internally* between relational partners or *externally* between the relational dyad and their social network. Three recurring pairs of contradictory tensions found most often by researchers are integration-separation, expression-nonexpression, and stability-change. Baxter and her colleagues, however, have cautioned that these three categories are not exhaustive and each of these three major "unified opposites" has multiple-nuanced variations.

In her articulation of "second generation relational dialectics," Baxter (2004a) emphasized the *dialogic* nature of social life as "a process of contradictory discourses" (p. 182) and stressed that dialogue is not limited to two voices but rather should be thought of as multiple voices striving to be heard simultaneously. In this dialogic process, Baxter says, "selves and relationships are constituted in the jointly enacted communication events of the relationship parties" (p. 184). Thus, relational dialectics is a perspective tailor-made for examining identity as constituted in the communication between relational partners and has been used extensively by interpretive researchers who study communication and identity issues.

Baxter, Braithwaite, and various colleagues have used relational dialectics as a lens in different contexts. For example, they studied the changing personal and marital identities of elderly women whose spouses with dementia live in nursing homes. (Baxter, Braithwaite, Golish, & Olson, 2002). These women lived the altered identity of "married widows" as they negotiated the contradictions experienced in interacting with husbands who were present physically and absent cognitively and emotionally. They examined the ways these wives communicatively negotiated the web of contradictions as they redefined what it meant to have a marital relationship. Baxter and Braithwaite (1995) studied couples who participated in vow renewal ceremonies and how they discursively managed identity as a pair and as part of a larger social web.

Toller (2007) used relational dialectics to examine how parents negotiated changes in identity after the death of a child. She found that the death of a child affected spouses' personal identities, parental identities, and marital identities. One of the primary dialectical tensions that Toller found was presence-absence: "feeling like a parent/not having a child to parent" and "feeling like an outsider/feeling like an insider." Toller's research illustrates how multi-vocal variants of the primary dialectical tension of integration-separation come into play as parents reconstruct their personal, parental, and marital identities after the death of a child.

Marko (2006) investigated the dialectical tensions experienced by the parents of visibly different adopted children (children from different cultures) as they attempted to construct their familial, parental, and children's identities in interaction. For example, she found that parents negotiated the dialectic of similarity and difference by telling their adopted children, "We are a family like any other" and "We are unique and different." In examining the process of constructing identities, Marko (2006) illustrated Baxter's (2004b) recent "dialogic turn" by portraying the communicative construction of identity as a complex process that involves multiple, often contradictory meanings.

Future Research

We believe that there are several other theoretical perspectives that could enrich our understandings of how identities are constituted in communication. Thus, we base our suggestions for future researchers by calling on communication scholars to consider studying identity construction through the lenses of narrative, symbolic-convergence theory, and critical-feminist perspectives.

Narrative

Narrative scholars argue that narratives are the way in which human beings make sense of their lived experience and identities (e.g., Somers, 1994). While rhetoricians have long realized the link between narrative and identity (Burke, 1966, defined man as "the story-telling animal"), social

scientific communication researchers have only relatively recently begun to use varied narrative approaches to identity (Koenig Kellas, 2008). In spite of the great potential of narrative perspectives for studying how identities are socially constructed, to date, few communication researchers have used a narrative lens to guide their work (Koenig Kellas, 2008). One exception is Koenig Kellas (2005), who used a narrative perspective to study identity construction within relational and family contexts by examining family storytelling. A related perspective, Weick's "sensemaking" (1995), is being used by organizational and work-life communication scholars to study identity construction. For example, Buzzanell and colleagues (2005) used a sense-making lens to study managerial women's narratives in order to learn how they constructed identities as "good working mothers." We believe that narrative and sense making will be central to future identity research.

Symbolic-Convergence Theory

Another theoretical perspective that we believe holds more potential for relational communication scholars studying identity is Bormann's symbolic-convergence theory (Bormann, 1981; Braithwaite, Schrod, & Koenig Kellas, 2006). Through sharing stories, inside jokes, and other interactions out of the here and now, persons in relationships and collectives engage in shared fantasies and create a rhetorical vision of their identity and culture. For example, Golden (2002) used symbolic-convergence theory to study how couples interacted and created a shared parental identity and rhetorical vision of managing work and parenting.

Critical-Feminist Perspectives

Wood (1995) urged interpersonal communication scholars to integrate a critical-feminist perspective into their study of personal relationships. She contended that the communication processes in interpersonal relationships cannot be understood apart from the considerations of gender that influence interactions. Wood's own study of women and caregiving (1994) used such a critical-feminist perspective. Communication work-life literature has also incorporated recognition of gendered power dynamics both in and out of the workplace. Interpersonal communication research, however, has been slow to integrate critical-feminist perspectives (Braithwaite & Baxter, 2008).

Conclusion

In this chapter, we have maintained that rather than being a singular, unchanging phenomenon located within the individual, our identities are multiple, fluid, and created in interaction with others. As communication scholars, we owe our intellectual heritage of communication-based explanations of identity in large part to Mead, Burke, and Goffman. Over the past 30 years or so, communication

theorists have extended and refined the basic notion that identities are constituted in communication. While the perspectives used by communication scholars to study identity have provided theoretically rich frameworks to explore identity construction in social and personal relationships, we suggest that understanding of identity construction will be enriched even further by additional empirical research and the use of more diverse perspectives.

PART IV

FORMS AND TYPES OF COMMUNICATION

CONVERSATION, DIALOGUE, AND DISCOURSE

ROBERT R. AGNE

Auburn University

KAREN TRACY

University of Colorado, Boulder

Conversation, dialogue, discourse. Each of these terms names a form of communication in everyday life, yet each directs our attention in different ways. *Conversation*, ordinarily understood as informal, free-flowing talk, is what we do with friends, family, and coworkers when we have meals together, do joint tasks, or talk on the phone. Conversation is a descriptive term; it captures one kind of talking that is an alternative to others, such as interviewing, being in a meeting, or giving a speech.

Dialogue is both a descriptive term and an evaluative one. As a descriptive term, dialogue is a synonym for conversation. This descriptive meaning traces its roots to the scholarship of Mikhail Bakhtin, a Russian scholar who wrote in the first half of the 20th century. Every utterance, the basic and fundamental unit of talk, is dialogic: responding to what was said before and at the same time offering something new. By Bakhtin's definition, conversation is inherently dialogic. In communication studies, the more common meanings for dialogue are the evaluative ones that have been developed by Martin Buber, Carl Rogers, and others. As an evaluative term, dialogue is not just any stretch of conversation; it is a stretch in which people exhibit an openness to hear others, often on personal or difficult topics (Anderson, Baxter, & Cissna, 2004). Dialogues are communicative achievements, something only a small percentage of conversations deserve to be labeled as.

Discourse, the last term, is also descriptive. In contrast to conversation, it is much broader, including speeches, interrogations, and meetings, as well as conversation. Simply put, discourse is any type of *talk*. Drawing on discourse as the central term, this chapter addresses three issues. The chapter's first section describes several of the key units of discourse and their usual social functions. Then, the chapter overviews how discourse is made "study-able" and analyzed. The final sections focus on an especially significant function of talk—to build and maintain identities. After the process of "identity-work" is explained generally, the chapter examines two studies of law enforcement discourse to illustrate the subtleties with which discourse accomplishes identity-work.

Key Units of Discourse

Just as a "pizza" can be divided into slices or squares of different sizes or become a single big unit—a "calzone"—the unitizing possibilities for discourse are many and affected by an analyzer's purposes. Linguistics, a field also interested in discourse, and especially its written forms, treats discourse as an umbrella term to reference spoken or written units of language that are larger than a sentence. Language has semantic units (words such as *smile* and

word endings such as past-tense markers, as in “smiled”), phonemic units (the sounds that go with meaningful distinctions: *r* and *l* distinguish the word *rave* from *lave*), and syntactic rules (about how words may be ordered to make meaningful sentences). In linguistics, *discourse* refers to units that are bigger than sentences (e.g., paragraphs, stories) or the social and practical functions to which a stretch of language is put.

In the field of communication, the central interest is in spoken discourse and the purposes to which it is put. For this reason, unitizing begins with the utterance, which is the smallest unit of speech (e.g., “Hi,” “Sure, no problem”). A basic and important kind of utterance is the *speech act*. In the mid-20th century, the issue about speech to which scholars gave the most attention concerned how well a stretch of speech represented a state of affairs in the world. Speech that was not a true, accurate representation of what existed was asserted to be meaningless. The language philosopher John Austin (1962) regarded this view as missing what was crucial about speech in social life. Speech does not simply represent the world, he argued. It performs social actions. When people speak, their utterances compliment, warn, advise, promise, command, or perform any number of other actions.

John Searle (1969), a student of Austin’s, went on to distinguish among five categories of speech acts. Speech acts may be (1) directives—acts that suggest, guide, or direct a person to do something; (2) representatives—acts that assert what is taken to be true in the world; (3) commissives—acts that commit a speaker to a future course of action; (4) expressives—acts that make a speaker’s feelings visible; and (5) declaratives—speech that has the power to transform people from one state to another, as happens when a minister pronounces two people to be married. Not everyone agrees with Searle’s typology of speech acts, but his typology begins to make visible the varied purposes to which speech is actually put.

One type of speech act that has been extensively studied is the “account.” As Scott and Lyman (1968) defined it, an account is “a statement made by a social actor to explain unanticipated or untoward behavior” (p. 47). People offer accounts when they are late for a meeting, speak in a thoughtless fashion to a friend, or eat more than they think they should. They also offer accounts for highly consequential matters, such as when they violate a law (e.g., explaining to a police officer why they were speeding) or transgress a significant relational norm (e.g., sexual infidelity). Although people can offer accounts out of the blue, they more typically occur within a conversational sequence in which they are a response to an act of reproaching. Reproaches, as is the case with accounts, occur in different flavors. Just as accounts may justify why individuals did what they did or point to circumstances that made their action not entirely under their control, reproaches may range in tone from direct and hostile (“What the hell do you think you are doing?”) to indirect and subtle, which could be seen in sarcastic compliments or a speaker muttering a

comment under his or her breath that is hearable (“Hmmm, I wonder what’s going on here”).

Directives and apologies are two other speech acts that have received considerable attention (Blum-Kulka, House, & Kasper, 1989). Both of these acts are socially sensitive to perform and have relational repercussions. To direct another invariably raises the issue of who has the right to tell whom to do what. Similarly, speakers who apologize often want to accept that they did a wrong but minimize the wrong’s scope or elicit a counterapology.

A second unit of discourse is what Tracy (2002) referred to as *naming practices*. Naming practices include both the words and the phrases used to address particular others and the terms that are used to reference, label, and categorize people. Forms of address include first and last names, nicknames, titles (e.g., “Ms.,” “Professor”) and general terms of endearment (e.g., “babe”). Choosing among possible forms of address conveys what the speaker takes to be the formality or closeness of a relationship. To address a person using his or her title and last name (e.g., “Dr. Jones”) constructs a relationship as a distant one; in contrast, calling that person by a nickname, especially if it is an exclusive one known only by a select few, constructs two people as close. Speakers also combine forms to build relationships that mix respectful distance with friendliness, as seen in the rather common practice of children calling adults by their title and first name (e.g., “Dr. Joe,” “Miss Jane”).

Not only do speakers directly address others by a selected name, they also refer to others in relational terms (e.g. “My friend will be joining us” vs. “An acquaintance from work will be joining us) and by categories (group memberships, such as “Shriner” or “Catholic”; job categories, such as “librarian” or “office manager”; and race and ethnicity, such as “African American” or “black,” “Hispanic” or “Latino/a”). Debates about how to refer to people have become the focus of controversies in the larger society. One such debate that led to significant change in speaking and writing in the communication and other social science fields has been over the use of gender-neutral terms. On one side of the argument are people advocating that mixed-sex groups be referred to as “he and she” rather than the generic “he” and that forms such as “postal worker” or “police officer” should be preferred over “mailman” and “policeman” because the former terms are more inclusive of women. On the other side of the argument are people who regard these changes as unimportant, a matter of being “politically correct” (Aufderheide, 1992). In communication studies, there is consensus that, at least in its weak form, the Sapir-Whorf hypothesis captures a truth about meaning making. Edwin Sapir and his student Benjamin Whorf argued that the semantic and grammatical distinctions available in a particular language, whether the language be English, Hopi, or Portuguese, shape how people make sense and understand possibilities for action. Names matter. Although names do not determine what a person may think, they channel thought, making some interpretations and associations more (or less) likely.

Two more complicated units of discourse deserve mention. The first, *direct/indirect conversational style*, includes a large set of talk features, often going together, that speakers use to convey meanings either straightforwardly or through hints and subtle cues (Tracy, 2002). A relatively direct conversational style is one in which words convey a speaker's intended meaning straightforwardly; an indirect style requires a listener to arrive at a speaker's likely meaning by considering what was said in light of the topic and how it is viewed in society, the speech situation, and the relationship between conversational partners. Being direct involves saying what one thinks without softeners, bluntly and noneuphemistically. Being indirect involves using more words to convey a message; it is accomplished by hinting at what one might want, fishing for information, softening opinions, or avoiding certain expressions entirely.

A central way in which speakers vary their level of directness is through the use of politeness tokens (Brown & Levinson, 1987). Politeness is not just about saying "please" and "thank you"; it refers to language practices that soften potential threats to others. If a communicator wanted to borrow fifty dollars from a friend, the request could be made directly without regard for the other's desires ("Hey, can I borrow fifty dollars?"). The request could also be made less directly by attending to the other's need for social acceptance and approval, what Brown and Levinson call people's "positive face wants," using devices such as compliments and friendly forms of address (e.g., "Hey buddy, be a pal and loan me fifty dollars."). An even more indirect move, the negative-politeness strategy, would give attention to the partner's desire to be free from imposition and obligation (e.g., "I hate to be a burden by asking you this, but do you think you could loan me fifty dollars?"). Negative-politeness forms include verbal markers that mitigate the intensity of the speaker's request (e.g., "I was wondering," "Would it be at all possible"). The most indirect form, barring not making the request at all, would be for a speaker to hint at needing money in the hope that the other will offer it ("Oh gosh, looks like I'm going to be fifty dollars short for my rent"). In an extensive study of requests, Craig, Tracy, and Spisak (1986) found that people do not typically use only a single form but mix politeness strategies in skillful ways.

The directness style a communicator uses will have interpersonal consequences. The use of a relatively direct style can cue that a speaker is sincere and outspoken, a person who prefers to "get down to business." At the same time, the usage of a direct style may be interpreted as showing aggressiveness and insensitivity to others. Conversely, an indirect strategy could cue tactfulness and "people skills," but it also could seem indecisive, shifty, or untrustworthy. There are no simple positive/negative assessments that go with being indirect or direct. Most speakers use a mix of both styles, which vary with the kind of situation in which they find themselves. To complicate matters further, national and ethnic communities have sharply different notions about the most reasonable conversational style in particular situations.

Stance indicators is a second complex bundle of talk features to which people regularly attend in conversation. A speaker's stance—his or her in-the-moment attitude toward the topic of talk, the other, or the situation—is conveyed through linguistic, vocal, and gestural cues. In everyday life, people make judgments about whether their partner is an expert or novice on the subject, friendly or hostile toward them, and involved or bored with the situation. These "stances" are cued by sets of indicators. In Tannen's (2005) examination of conversations among friends, she found that when speakers talk loudly and fast, make large hand gestures, pause only briefly, and vary their pitch extensively, they will be assumed to be involved and interested in the topic.

A second example of a stance indicator has to do with belief and skepticism. When speakers respond to what another has said, they implicitly convey whether they believe or are skeptical of what their conversational partner said (Pomerantz, 1989/1990). When people believe a person, they will report it to others straightforwardly (e.g., "Arnie can't come to the party tonight because he hurt his back"). The stance indicators that cue skepticism include adding phrases such as "According to Arnie . . .," "Arnie claims that . . .," and "Arnie's story is that . . ." Thus, when speakers report what a person said, they not only provide a sense of the message's content, but they also reveal their stance to what the other has said.

These four discourse units—speech acts, naming practices, direct/indirect conversational style, and stance indicators—are but a small set of possible discourse units; there are many more. For instance, speech acts often occur in pairs (e.g., greeting-greeting, question-answer), creating demands for how the first part of a pair should be responded to or generating inferences about the respondent if that expected second part is not forthcoming. Not returning a greeting does happen, but when a return greeting is absent, marked inferences will be made (e.g., the spoken-to party is completely distracted, or the greeter is being snubbed by the spoken-to other). Units of discourse may also be quite large and include smaller interaction practices. An example is a story; stories usually include strings of speech acts and multiple reports of what various people in the story's social world have said—a discourse device referred to as "reported speech" (e.g., "Mary said, 'No, don't go.' And I said . . .") (Buttny, 2004). Jointly, these discourse units and others occur in scenes within social life and perform a variety of interpersonal functions. Before examining more closely the identity-work functions of talk, let us consider how discourse is studied to arrive at the claims that research forwards.

How Discourse Is Studied

The analysis of discourse began in earnest as audio- and video-recording technologies became commonplace and as the idea that ordinary exchanges between people in family

and work life deserved as much systematic attention as had previously only been given to “big” events such as a politician’s speech took root. It has been the work of the sociologist Harvey Sacks (1992) in the late 1960s, which strongly influenced a large range of distinct discourse analysis traditions. Working in a crisis call center in Los Angeles, he began taping, transcribing, and studying these telephone calls, as well as doing the same with phone calls between family members and friends. In disagreement with Noam Chomsky, an influential linguist of the time who thought that language was too messy to study in actual occasions of talk, Sacks argued for the value of looking closely at the social world and at conversational exchanges in particular. “From close looking at the world,” Sacks stated, “you can find things that we couldn’t by imagination assert were there: One wouldn’t know that they were typical, one might not know that they even happened” (p. 420).

Over time, conventions developed in communication as to the best way to represent features of spoken discourse in written form. The transcription system that is most often employed today is the one developed by Gail Jefferson, commonly referred to as the CA (conversation analysis) transcription system. Symbols in the CA system capture (a) the actual pronunciation and contractions of words (e.g., “y’know,” “got ’em goin’”), repetitions, and word cutoffs; (b) intonation patterns of utterances and word stress; and (c) utterance timing, including pauses and where one person’s speech overlaps another’s. Table 20.1 includes the most common meanings of the symbols used in transcripts.

An obvious question to pose is why bother with so much detail; is it useful for understanding discourse better? Communication scholars who analyze discourse, although they have disagreements with each other about the appropriate level of transcript detail, would all agree that a careful record of what has been said is an important first step to building interesting claims about communication.

An example of a CA transcript and how it led to an insightful understanding of communication is seen in Excerpt 1. This excerpt comes from a study by Staske (2002). Staske was interested in how romantic partners’ talk reflected and further solidified closeness in their relationships—something talk in intimate relationships was assumed to do, but how this was accomplished through talk was not well understood. Her study recorded romantic partners having conversations with each other, created transcripts of the exchanges, and then repeatedly looked at the transcripts while listening to the exchanges. Following this intense immersion with the discourse materials, she was able to name and describe a conversational practice that relational partners regularly used. It is a practice for doing intimacy. The practice, which Staske labeled “claims of intimate partner knowledge,” or CIPKs for short, tended to occur when partners were discussing relational problems.

.	(period) Falling intonation
?	(question mark) Rising intonation
,	(comma) Continuing intonation
-	(hyphen) Marks an abrupt cutoff
::	(colon[s]) Prolonging of sound
<u>never</u>	(underlining) Stressed syllable or word
WORD	(all caps) Loud speech
°word°	(degree symbols) Quiet speech
>word<	(more than and less than) Quicker speech
<word>	(less than more than) Slowed speech
hh	(series of <i>hs</i>) Aspiration or laughter
.hh	(<i>hs</i> preceded by dot) Inhalation
[]	(brackets) Simultaneous or overlapping speech
=	(equals sign) Contiguous utterances
(2.4)	(number in parentheses) Length of a silence
(.)	(period in parentheses) Micropause, 2/10 second or less
()	(empty parentheses) Nontranscribable segment of talk
(word)	(word or phrase in parentheses) Transcriptionist’s doubt
((gazing toward the ceiling))	(double parentheses) Description of nonspeech activity

Table 20.1 The Basic CA Transcription Symbols

Excerpt 1

- 1 M: Why does what affect us?
- 2 F: Our differences in our personalities. Do you
- 3 think this affects us? Do think it’s
- 4 [something that just [bothers us all the time
- 5 M: [Because [you: a
- 6 F: Listen to you. I knew you would say that. That
- 7 you’d say it was all my fault
- 8 M: No:: I’m not saying it’s your fault
- 9 F: Aren’t you admitting
- 10 M: I’m just saying you blew a lot of things way
- 11 outta proportion

Line 6 is an example of a CIPK. The vocal emphasis specifically on “knew” cues the speaker’s certainty about predicting what her partner would likely say at that moment. This is interesting because M’s utterance in Line 5 is broken and unfinished; nonetheless, F claims that she knows what M would say even though he barely said anything at all. In Line 8, M denies F’s CIPK, although his final comment (lines 10 and 11) frames F as not being completely off base. Stating that she “blows things way outta proportion” does imply blame. His utterance, then, partially confirms her CIPK. Claims that a speaker knows what the other will say is one discourse practice through which people enact themselves as close. This is true even if, as happens in Excerpt 1, the partner disputes the specific content of the claim.

The analysis of discourse is an inductive research enterprise. As Sacks formulated it so aptly, communication scholars doing discourse analysis are committed to discovering interesting features of social life by studying talk closely. One particularly interesting issue in social life that analysis of discourse has been used to further is the study of identity enactment.

Discourse and Identity-Work

When people talk, they present a version of self to others. The sociologist Erving Goffman (1959) used a dramaturgical metaphor to understand this presentation process. People in ordinary exchanges are “actors” and, as in the theater, they are expected to know their lines, have the right costume, and make their actions appropriate and believable to the role they are playing. Other communicators in a social situation, “the audience,” are expected to respond appropriately to the actor’s performance, applauding, laughing, and crying at appropriate moments. Because not all performances go smoothly, actors and audiences have practices they employ to respond to errors and glitches. Communicators in the actor role use “defensive practices,” such as when they have to “wing it” or “fake it.” Similarly, “protective practices,” such as listening or showing interest, are used by communicators in audience member roles to ratify that the actor has done a reasonable job.

Although the dramaturgical metaphor ably captures a part of what people experience as they meet, greet, and talk with others, it also introduces elements that are problematic. People do not change who they understand themselves to be (i.e., their identities) as quickly and easily as the theater metaphor implies; for that reason, we use the term *identity-work* to describe the work talk accomplishes during the presentation of self. A second advantage of identity-work as the key frame for understanding what discourse does is that it draws attention to another aspect of the discourse-identity process besides self-presentation. At the same time that a person’s talk is presenting a self, it is also altercasting.

Altercasting refers to the process through which talk casts the conversational partner in a particular role (Tracy, 2007).

Imagine a student stopping by a professor’s office to get help in understanding a theory (“the systems perspective”) that was presented during a lecture and requesting help in one of two ways:

Request A: Excuse me Dr. Trintash, I was wondering if you could go over the systems perspective with me again. I wasn’t feeling well in class the other day and didn’t listen as closely as I should have.

Request B: Hi Jean, how’s it goin? I was getting lost in class when you were talking about the systems perspective. Could you explain it to me one more time?

The person-referencing practices used in Request A, title and last name, imply a nonclose relationship in which the teacher has a higher status. In contrast Request B, by virtue of the first-name form of address, casts the teacher as an informal, friendly other. Request A also uses a more tentative, negative-politeness strategy (“I was wondering if . . .”) that treats the request for help as a favor rather than a matter-of-fact right to which the student is entitled. Part of the sense that B is treating the request as a right is cued by the account that the speaker gives for why she did not understand. Describing the reason for needing clarification as “I was getting lost” subtly justifies the student’s having trouble and makes relevant the possibility that the teacher did not give a clear explanation. In contrast, the student in Request A accounts for her request by saying that she “didn’t feel well” and she “didn’t listen closely,” suggesting that her inability to understand was a result of her own state rather than the teacher’s failure. In essence, Requests A and B altercast the teacher in markedly different ways. At the same time, the requests present the speaker differently. Request A portrays the student as a deferential person who sees self as responsible for mastering class material; Request B presents the speaker as a friendly, informal sort of student who sees self as entitled to receiving clear explanations of course ideas.

Another way to explain identity-work is with Goffman’s (1955) notion of face. Around the same time when Goffman was developing his dramaturgical view of social life, he introduced the idea of “face.” “Face may be defined as the positive social value a person effectively claims for himself by the line others assume he has taken during a particular contact. Face is an image of self delineated in terms of approved social attributes” (Goffman, 1967, p. 5). Face is the identity that a person desires in a particular social situation; it is not something over which a speaker has total control. Rather, face is granted by the people with whom a person interacts. The face that a speaker desires will always be situation specific. In work situations, people often want to be seen as “responsible,” “competent,” or “loyal.” In friendships, people may want to be seen as experts on a topic, “fun,” “funny,” or “trustworthy.” People also do work to avoid being seen in negative ways—for example as boring, incompetent, or autocratic. It is discourse practices that maintain face, ward off possible threats, or save face after it

is lost. Face is an umbrella term that references a large set of desired personal identities.

It is important to note that identities have many layers, some of which become more relevant than others in a particular situation. One layer of identity pertains to the broad social and cultural groups people belong to (such as race, nationality, age, gender, or religion). Another is the personality-style characteristics people possess (such as being friendly, rude, generous, or opinionated). A third kind of identity relates to the institutional roles that people hold at work and in families, and the last relates to the interactional style with which people act in workplace and intimate relationships (e.g., laidback vs. uptight teacher, close vs. distant friend). Stemming from the fact that people are usually considered to uphold multiple identities, they often work to give attention to more than one goal at a time. In making a request, for instance, the requestor can be seen as having the goals of (a) convincing the other person to comply with the request, (b) preserving the conversational partner's face, and (c) preserving the self's own face.

What makes communication difficult is that interactional goals may be incompatible with each other. Attending to one identity goal can endanger another one. For instance, a common practice in most academic departments is for graduate students and faculty to meet and discuss the research projects that a student or faculty member is working on (Tracy, 1997). In this kind of discussion group, which includes institutional members of different ranks (i.e., beginning and advanced graduate students, junior and senior faculty), presenting ideas and asking questions is likely to challenge multiple identities of the participants. Discussants, for instance, often desire to be seen as intellectually competent—accomplished through asking tough questions, and at the same time they desire to be judged supportive and tactful—accomplished through posing easily answerable questions. Participants typically recognize the importance of distinguishing among fellow members' expertise levels (i.e., a graduate student and a faculty member are not equally expert), but at the same time they believe that for the discussion to go well, it is important to minimize status differences and develop a climate of equality.

To summarize, identity-work is the simultaneous presentation of self and altercasting of others and is accomplished through discourse practices. As identity is multilayered and interaction goals can be in tension with each other, identity-work is a complicated and uncertain process.

Two Extended Examples of Identity-Work

The first example of identity-work to be examined occurred in a call a citizen made to the police/9-1-1. People call 9-1-1 for a variety of reasons, many of which are at odds with ordinary notions of "emergency." When people have troubles they want help solving and there is no obvious other person or agency to intervene, they will turn to the police. One

kind of situation in which this happens is when a person has problems with someone with whom there is a connection. If we seek to describe the likely face/identity wants that a person with this type of trouble would have, three are probable. First, we can expect that callers would like to get their trouble resolved, whether it is getting a piece of property back or getting another to stop engaging in harassing actions. Second, we would expect that callers would want to be perceived by the police agents with whom they talk as reasonable, or at least not unreasonable given the trouble they are experiencing. Third, in some cases, albeit not necessarily all, callers may want to accomplish the first two goals without strongly implying that the person with whom they have the trouble is so blameworthy that he or she should be arrested. Of note, these likely self-presentation and altercasting goals are in tension with each other.

Tracy and Anderson (1999) examined a small set of police calls in which citizens had these kinds of "connection-to-people-they-knew" troubles. One call involved a woman whose car had been taken. Consider how the caller initially describes her trouble.

Excerpt 2

- 1 CT1: Citywest Police?
- 2 C: Um, yeah, I need to file a complaint about my
- 3 car being taken?
- 4 CT1: (.) It was stolen?
- 5 C: Well .hhhhh a friend borrowed it and h- he
- 6 never brought it back.
- 7 CT1: How long's he had it?
- 8 C: Uh:m close to forty-eight hours.

By looking closely at these calls, Tracy and Anderson identified the discourse practices citizens use to manage conflicting identity goals. A first practice was for citizen callers to formulate a problem as agent-less. The caller does this in lines 2 and 3, where she identifies no agent who "took" the car. This agent-less formulation can be seen as attentive to not accusing a particular other and getting that person in trouble with the police. At the same time, it causes difficulty because it leads the call taker to infer that the caller has no knowledge of who took the car (line 4), thereby making relevant a police bulletin seeking to apprehend and arrest whoever was driving her car. As the caller knows the person who took her car, this agent-less formulation causes confusion.

As noted previously, naming practices reflect closeness and distance. A second strategy callers use to preserve their identity as reasonable people is to label an intimate sexual partner a "friend" and trade on the ambiguity of the term. "Friend," for instance, can be used as a polite term to refer to an acquaintance, or it can reference an ability to talk easily and openly with an intimate (My dad is one of my best friends). Most often, though, it is used as a contrast term

with intimate (“just a friend”). To refer to someone as a friend will typically be heard as distinguishing them from a sexual partner. Following a lengthy exchange, the first call taker refers the caller to auto fraud, and the following exchange occurs. Note how in lines 7 to 8 in Excerpt 3, the second call taker probes the meaning behind the caller’s description of the car taker as a “friend.”

Excerpt 3

- 1 C: Uhm yeah I don’t know what to do. A friend of
- 2 mine uhmm was using my car while I was in the
- 3 hospital? And he’s been gone now for, well, it’s
- 4 been, gosh, about 36 hours. And I haven’t been able
- 5 to get in touch with him. He doesn’t have a local
- 6 phone number, and I don’t know what to do.
- 7 CT2: Okay a friend of yours, meaning an acquaintance
- 8 friend? Or a friend, a boyfriend?
- 9 C: He’s staying with me.
- 10 CT2: Pardon? A boyfriend?
- 11 C: Yeah

With the call taker’s probing, the “friend” label looks like a downgrade from the close type of relationship the caller ends up admitting. What this exchange makes visible is the delicacy in police calls, and presumably other kinds of institutional encounters, in selecting forms of reference. Each form sets in motion different inferences about the caller and the kind of relationship he or she will be taken as having with the called-about person.

A second complex example of identity-work, also from a law enforcement context, illustrates how an FBI negotiator in a crisis situation failed to establish his superiority and his right to tell a law breaker what he should do (Excerpt 4; Agne & Tracy, 2001). Inequality is not necessarily preestablished, as it often is in parent/young-child relationships or in job interviews where the parent or the interviewer (respectively) is regarded as higher ranking before talk even begins. Talk often upholds the expected relational picture, but sometimes it reframes what would be situationally expected, turning nonequals into equals or making the superior the subordinate. Such a reframing is illustrated in the hostage negotiations that took place in 1993 between FBI agents and David Koresh, the leader of a religious group called the Branch Davidians, who were living in a compound outside Waco, Texas. The crisis situation started when the Bureau of Alcohol, Tobacco and Firearms tried to arrest David Koresh on charges of abusing the children of his followers and illegally stockpiling weapons. The attempted arrest led to gunfire and killing of several people on both sides; it was followed by a 51-day standoff between the FBI and the Davidians, in which FBI agents and Koresh and several other key Davidians spoke regularly on the telephone.

During the telephone negotiations, both sides worked to assume authority over the other. The FBI saw themselves as the enforcers of the law, expecting all citizens to abide by their directives regardless of a citizen’s religious affiliation. Koresh, in contrast, believed that he was the Lamb of God prophesized in the Book of Revelation to open the Seven Seals and usher in the Apocalypse and Judgment Day. As a result, Koresh saw himself as justified to resist “the government.” In the following exchange, the FBI negotiator (Sage) and Koresh construct an asymmetrical relationship. Using discourse practices, most likely out of conscious awareness, Sage altercasts Koresh as more knowledgeable (and hence superior). At the same time, Koresh constructs himself as an expert teacher and altercasts Sage as a novice student. Consider the discourse practices in a short exchange that contributed to these identities.

Excerpt 4

- 1 Sage: I’m not claiming to be anywhere near as well
- 2 versed in word and quotation as you are and I
- 3 respect that capability. But I find in that book
- 4 (.) that that book says the only person (.) the
- 5 only person (.) the only entity that can open
- 6 those Seven Seals is the Lamb of God.
- 7 Koresh: Exactly
- 8 (six lines omitted)
- 9 Sage: It’s garbage it’s a false hope and [you know that.
- 10 Koresh: [No it’s not,
- 11 on the contrary. These people remain here
- 12 because I have thoroughly opened to them
- 13 the Seven Seals see if you had [understood.
- 14 Sage: [Well then you
- 15 have a message that’s extremely valuable
- 16 that you need to share with the rest of
- 17 this world. The only way you can do that
- 18 David is if we can get this matter resolved
- 19 when when you come out you will be provided
- 20 with that opportunity and I’ll be in the front of
- 21 the line to listen to it
- 22 Koresh: That’s where you remain ignorant it’s not your
- 23 fault I do not hold you contemptible for that
- 24 but you remain ignorant to understand what is
- 25 actually being applied at this very time (.) see
- 26 (.) when it says in twenty two when I come
- 27 my reward is me it very clearly identifies that

28 when Christ comes the identifying mark will
29 be the knowledge of those Seven Seals.

There are several discourse practices that invoke a teacher identity for Koresh, therein establishing his expertise, and frame Sage as not so knowledgeable. First, the confirmation, “Exactly” in line 7 acknowledges some part of Sage’s statements (lines 1–6), whether it be that Sage is not “near as well versed,” that only the Lamb of God can open the Seven Seals, or both. “Exactly” is used much as a teacher does when validating a student’s response as correct; in fact, the remark has the flavor of a teacher giving a gold star for superlative work. Sage’s “garbage” comment in line 9 diffuses Koresh’s positive assessment, and in lines 10 to 13 Koresh straightforwardly disagrees with Sage (“No it’s not, on the contrary”) and explains why he is wrong (“I have thoroughly opened to them the Seven Seals”).

Koresh also sounds like a teacher in lines 22 to 29. By emphasizing Sage’s lack of understanding (“but you remain ignorant to understand . . .”) followed by a lesson on where in the Bible the identity of the one to open the Seven Seals is revealed, he underscores Sage’s limited knowledge. Saying, “in twenty-two” instead of “in Revelation, chapter twenty-two,” establishes Koresh as an expert who uses the biblical text so often that shorthand jargon is called for. In addition, when in line 27, the phrase “very clearly” is stressed, Koresh conveys his view that the lesson he is conveying is an easy one to comprehend. Notice, too, the very short but noticeable pauses between words (signaled by (.)). These micropauses before and after “see” cue that a speaker is about to say something that he has said many times before.

At the same time that Koresh is presenting himself as a teacher and altercasting Sage as a novice, Sage’s talk is confirming rather than resisting this relational identity. His disclaimer in lines 1 and 2 (“I’m not claiming to be anywhere near as well versed in word and quotation as you are”) positions himself as a novice; in addition, Sage saying that he “respects that capability” positions Koresh as the recognized expert. The FBI agent’s talk in this call was adhering to one kind of advice that negotiators are trained to consider in crisis negotiations: It gave attention to Koresh’s face wants to be seen as competent. In not adequately thinking through their complex interactional goals, however, the FBI did not give adequate attention to discursively building their rank as legitimately higher, with its attendant right to have their directives obeyed.

Negotiating equality and inequality is difficult not just because people struggle to attain one or the other in a given relationship but because the two are related in such a way that the pursuit of one necessarily involves the other. Tannen (1986) describes this as the paradox of power and solidarity in relationships. The desire to establish rapport or equal footing in a relationship is accomplished through discourse moves that if done only by one person (e.g., using first names, patting another on the shoulder) will enact an unequal

relationship. At the same time, refraining from doing friendly gestures to avoid the possibility of being seen as claiming a higher status identity could be taken as simple unfriendliness.

This chapter has described several of the basic units of discourse and the identity-work process, examined how discourse practices do identity-work, and considered how communication researchers interested in discourse arrive at claims about social life. In 2007, a new journal, *Discourse and Communication*, was launched. Its mission is to promote research that furthers connections between what Gee (1999) called Big-D and little-d discourse, that is, larger social and institutional issues and the specifics of talk and texts. The felt need for this new journal points to one rapidly growing discourse research arena: studies that investigate how talk is designed and structured to achieve or avoid certain ends in business contexts, media institutions, health care organizations, governance bodies, volunteer groups, and social-movement organizations. The audio and video recorders in these new institutional areas are rolling. It is now up to future scholars to transcribe, study carefully, and create insights into these previously unexamined stretches of conversational life.

INTERVIEWING

CHARLES J. STEWART

Purdue University

When we hear the word *interviewing*, we are likely to think of a journalist asking questions at the scene of an accident or a recruiter asking questions of an applicant. It is a simple one-way contact in which one person, usually a professional of some sort, asks questions and the other, usually a witness, sports fan, job applicant, or patient, answers them. This narrow and simplistic view of interviewing resulted historically in few interviewing courses in colleges, a handful of textbooks on interviewing, and little research beyond the study of recruiting and counseling interviews.

Fortunately, as times have changed and our understanding of human communication has become more sophisticated, interviewing courses have become commonplace, textbooks and articles treating many types or special types of interviews vie for our attention, and research has become abundant in areas such as health care, journalism, counseling, recruiting, performance review, and surveys. We have come to realize that interviews are the most common form of serious, purposeful, planned interpersonal communication that ranges from formal to informal, simple to intricate, minimally structured to highly structured, brief to lengthy.

This chapter begins with a definition of interviewing so that we can develop a firm understanding of what is and is not an interview. The definition is followed by a focus on the interview as a deceptively complex communication process. This leads to a discussion of the methods interviewers and interviewees employ in interviews, including approaches, questions and answers, and structure. The chapter closes with a discussion of growing areas of concern and focus, examining the increasing use of electronic means of interviewing (cell phones, the Internet, and videoconferencing), and a summary. Reading suggestions are offered to those

who wish to delve more deeply into the types and uses of interviews.

Interviewing Defined

Writers and researchers have defined interviewing in a variety of ways, but regardless of the specific wording, there are essential terms or concepts that distinguish the interview from other forms of communication. Let us start with perhaps the most important.

Each interview is a dyadic form of communication between *two parties*. Although one or both parties may consist of two or more people (two recruiters from an organization interviewing a college senior or one reporter interviewing three family members at the scene of an accident), there are two distinct parties, an interviewer party and an interviewee party. If three or more identifiable parties are present, they are taking part in *small-group* communication, not an interview.

The interview is *interactional* in nature, meaning that it is a process in which both parties are interdependent and communication is reciprocal. It is a mutual activity done with, not to, another party. If one party does all the talking and the other all the listening, a *speech* to an audience of one is taking place, not an interview. The parties both speak and listen from time to time; share feelings, beliefs, and attitudes; and exchange information and responsibilities. Each party brings something of importance to the interview and must be an active participant.

At least one of the two parties in each interview has a *pre-determined* and *serious purpose* other than mere enjoyment in the process and outcome. This characteristic denotes a

degree of seriousness, advance planning, and structure, which sets the interview apart from *social conversation*. At the same time, however, a good interview has many of the qualities of conversations, such as friendliness, sharing, listening, ease of speaking, and mutual satisfaction.

The use of *questions* is an integral, often dominant feature of most interviews. It would be difficult to imagine an interview without questions and answers. A question is any verbal or nonverbal expression that invites a verbal response and need not be an interrogatory and formally worded sentence. “Uh-huh,” “Um-hm,” “And?” or “Then?” may be effective questions that elicit important responses. A simple head nod or silence may encourage a party to continue with or modify an answer. Most interviews (particularly surveys, and recruiting and journalistic interviews) cannot exist without questions and overt responses. They are the tools both parties use to obtain information, check for accuracy, verify understanding, and provoke or challenge feelings and thoughts.

The interview is *relational* because both parties are connected interpersonally with varying degrees of interest in the outcome of the interview. They are interdependent because the interview is done with, not to, another party and neither can go it alone. John Stewart and Carole Logan (1998) and Stephen Littlejohn (1996) write that parties in interpersonal interactions have a relational history and memory created or re-created prior to, during, and following each interaction, which may be close or distant, formal or informal, casual or professional, friendly or hostile. Our relationships change over time and are essentially altered (created or re-created) in important ways each time we interact with one another. Important relational dimensions include perceived and real similarities between the parties; how much each desires to take part in an interaction; the degree of liking or affection; how the parties share control; and, perhaps most important, how much they trust one another, particularly at a specific time, during a specific situation, and in a specific setting. The degree of trust may determine if, when, where, and how an interview takes place and its outcome.

The Interview as a Communication Process

This definition of interviewing indicates that each interview is a deceptively complex communication process. As a *process*, the interview is a dynamic, ever-changing, continuing interaction of many variables, not merely asking and answering questions, giving or getting information. The word *process* also denotes a degree of structure and progression toward a chosen end or goal. Like processes, once an interview commences, it is impossible for the parties not to communicate as long as they are in sight and sound of one another.

Two Parties

John Stewart (2006) writes that interviewing is a process of “sending and receiving simultaneously” between two unique and complex parties. Members of each party are *unique products* and *sums* of their culture, environment, education, training, and experiences, and they adhere to specific beliefs, attitudes, and values. They have unique personalities and personas that they project in public arenas and are motivated by expectations, desires, needs, motives, and interests.

Somehow, these unique parties must *interact together* to bring about results that are satisfying to each: a filled vacancy and a position, an item for the evening news and an opportunity to tell one’s side of the story, helping and being helped in a counseling situation, selling and purchasing a computer. Both parties must be active participants from start to finish.

Exchanging Roles

Working together means *exchanging roles* of interviewer and interviewee during the interview when it is appropriate for the status and expertise of the parties, the interview in which they are taking part, and the atmosphere of the interaction. Although the setting—a journalist questioning an eyewitness, a physician giving information to a patient, a recruiter meeting with an applicant, a counselor discussing a problem with a student—may determine the primary role of interviewer or interviewee, the parties usually switch roles from time to time. They will speak and listen, question and answer, challenge and be challenged, motivate and be motivated. For instance, if a counselor asks a question and the counselee seeks clarification or objects to its wording, the counselee takes on the role of interviewer for the moment. When a recruiter invites the applicant to ask questions, the recruiter becomes the interviewee. How often and to what extent roles are exchanged depends on the interview type and setting. A survey taker may play the role of interviewer 90% of the time, while a physician may play the role of interviewer only half of the time. A job applicant may spend 70% of the time answering questions, while a person purchasing a suit may talk only 10% of the time.

Levels of Interactions

The nature and frequency of interactions are significantly affected by each party’s *perceptions* of self, the other, and the situation. How does each party see itself (self-concept) and value itself (self-esteem) and its possibility of success (self-confidence)? How does each party see itself in this situation as patient, subordinate, student, or client? Poor or exalted self-perceptions can do harm to or enhance the outcome of an interview. Perceptions of the other may be influenced by similar and different associations, cultures, genders, ages, ethnic groups, dress, and personal attractiveness. How

the parties view the situation (threatening or supportive, rewarding or punitive, constructive or destructive, safe or dangerous, pleasant or painful) will have a major impact on the communication interactions that take place.

Charles Stewart and William Cash (2006) identify interactions as *levels of communication* that take place during interviews. For instance, *Level 1* interactions tend to be safe, nonthreatening, socially acceptable, comfortable, and ambiguous, much like the following:

Interviewer: How are you doing?

Interviewee: Okay, thanks.

Level 1 interactions are common during the opening minutes of interviews, when both parties are sizing up one another, there is little relational history to serve as a guide, and the interview is between a superior and a subordinate.

Level 2 interactions tend to be half-safe and half-revealing because at least one party is willing to take some risk and the parties have a generally positive relational history. How an interview is arranged and by whom may determine if *Level 2* interactions take place. A *Level 2* interaction might go like this:

Interviewer: How's the project coming along?

Interviewee: Not bad, but we're a little behind schedule.

The interviewee is willing to disclose a little but not enough to pose serious risk, at least not yet.

Level 3 interactions are open, with full self-disclosure of feelings, attitudes, and perceptions. Trust is high, perhaps because of a strong and lengthy relational history between the parties, so the interviewee feels safe to interact openly. A *Level 3* interaction might go like this:

Interviewer: How are things at the Summerville facility?

Interviewee: Not very good at the moment. I'm having trouble between design and engineering on the new transmission and may have to make some difficult decisions about replacing some long-time supervisors.

Levels of interaction are critical to interviews. If an interview starts and remains at *Level 1*, the parties will share little information and few insights into attitudes, perceptions, problems, or solutions. It may be a pleasant but ineffective exchange of safe and ambiguous thoughts, feelings, and actions.

Both parties must strive to reach *Levels 2* and *3*, but their ability and willingness to do so may depend on their status in the interview (superior or subordinate), the climate of the interview (threatening or supportive), and their demographic makeup. For instance, women tend to disclose more than men, are better listeners, and are more responsive, particularly in woman-to-woman interactions. European Americans tend to disclose more about a wide range of topics, particularly about their careers, than do

those of Asian descent. Older Americans tend to be more reluctant to challenge authority and tend to respect status and place in the social or professional hierarchy. Disclosure is often difficult in the intimate interview because, as Laura Guerrero, Peter Andersen, and Walid Afifi (2005) write, "People face a constant struggle between wanting to do whatever they want . . . and wanting to do what makes them look good to others." (p. 35) Interviews tend to involve *our* actions, thoughts, feelings, careers, and futures.

Verbal Interactions

Verbal symbols, although merely arbitrary connections of letters into words, form questions, answers, and information exchange that enable both parties to identify, describe, and frame people, places, things, attitudes, ideas, and points of view. There can be no interview without them, but they often pose as many problems as solutions. For starters, many "English speakers" do not know the meaning of simple or apparently well-known words such as *impetus*, *lucid*, *advocate*, *overt*, *tumor*, and *brevity*.

Words tend to have *many meanings*. For instance, *to apologize* may mean to express sorrow or to defend oneself, *retreat* may mean to withdraw or a private place, and *silence* can mean the state of being reduced to silence or restraining from expression. Other words are *ambiguous* and allow us to assign different meanings according to our experiences and attitudes. An *adequate salary* to one may mean \$25,000 and to another \$250,000. *Middle-aged* may mean 35 to one person and 55 to another, depending on their ages and knowledge. A *small* high school may mean less than 100 students to one and less than 1,000 to another. Not only do identical words have many meanings, but they may confuse because they *sound alike*, such as *to* and *two*, *there* and *their*, and *be* and *bee*. Other words have positive and negative *connotations*. Years ago, many car dealers stopped using the word *used*, which connoted secondhand and wear and tear, and substituted *pre-owned*, which emphasized ownership and a like-new auto. What were known as "row houses" for decades became "town houses" in the 1970s and are now advertised as "town homes," with an emphasis on ownership and comfortable living. We are more disposed toward *inexpensive* products than *cheap* products. While the word *persuasion* has positive connotations, such as inspire and motivate, many see only negative connotations. For instance, some claim that persuasion connotes violence and should not be taught in colleges. A physician recently asked the author if his persuasion course taught "spin-doctoring."

Verbal symbols are often confusing because we create them for social, professional, and persuasive purposes. Nearly every profession creates *jargon* that only its members or "educated" others fully understand. For instance, "invasive procedure" means surgery, a "wood interdental stimulator" is a toothpick, a "vehicular control device" is a stoplight. *Slang* is a kind of unofficial jargon used to communicate primarily with the in-group. When a sportscaster excitedly proclaims that "Jones just hit a tater" or a basketball player was "dialed

in,” baseball and basketball fans may know exactly what the sportscaster means, while others think he is talking a foreign language. *Euphemisms* are better-sounding substitutions for common words, such as “powder room” for *toilet*, “gone to heaven” for *death*, “lifelike” Christmas tree for *artificial* Christmas tree, and “discomfort” for *pain*. *Naming* or *labeling* attempts to change the way we see reality. In our history books, we learn about the “Boston massacre,” not the Boston shooting or incident. In supermarkets, we see meat that is 85% lean, not 15% fat. We no longer speak of policemen but police officers, to signify that many members of police departments are now women.

Obviously, language can confuse as easily as communicate effectively. There are a number of ways to reduce language problems and enhance communication between interview parties. Each party should choose and adapt language carefully. The goal is to *communicate with* not *past* one another. Each should work at expanding vocabulary, including common euphemisms and slang, professional jargon, and connotations. Look for slight changes in words that change meanings and implications. Be aware of how those of different sex, age, race, culture, and ethnic group use and understand language. We may insult the other party and not know it.

Nonverbal Interactions

Most interviews take place face-to-face, with the parties only a few feet apart, so nonverbal communication is pervasive. Dress and appearance, touches, handshakes, silence, posture, and head nods may send intended or unintended messages. The extent of and changes in eye contact, facial expressions, gestures, and glances away or at another person in a party may alter the interactions between the parties and affect their relationship.

Be aware of the messages you may be sending nonverbally and how you can avoid unintended signals and misunderstandings. We often indicate positions of power or authority and who will direct and be in charge during an interview through our dress, physical appearance, the place we select for the interview, where and how we sit or stand, eye contact, body movements, and touch. Research indicates that nonverbal communication (how we say something) may be more important than verbal communication (what we say in words). If the verbal and nonverbal seem to conflict, we are likely to focus on the nonverbal as more accurate and honest. Often, of course, the two are so intricately bound to one another that it is nearly impossible to separate them.

When interpreting nonverbal communication with another, be aware of differences in how genders, races, ethnic groups, and cultures communicate. For example, women place more importance on facial expressions, pauses, and gestures than do men. The deeper voices of males tend to be seen as more credible than the higher-pitched voices of women. Black Americans tend to be more animated than white Americans. Africans are taught to avoid eye contact while listening to another. Japanese are taught to mask

negative feelings with smiles and laughter. Those living in Mediterranean countries encourage direct physical contact. Arabs tend to speak louder than do Westerners.

Feedback

Feedback is emphasized in all forms of communication, but it is often indirect or delayed, such as replies to e-mail messages, letters to the editor, applause or questions after a speech is completed, and written reports or evaluations. The proximity of interview parties means that feedback is magnified, immediate, two-way, direct, and continual in the form of questions, answers, stated agreements or disagreements, gestures, facial expressions, head movements, and sitting up straight or leaning forward. It is important to detect and assess feedback by observing and listening to verbal and nonverbal signals without allowing an overactive imagination to read what is not there. A person may fidget not because of boredom or disagreement but because of an uncomfortable seat or nervousness about events that are to take place following the interview. Poor eye contact may indicate shyness or deference to an authority figure rather than evasiveness or dishonesty.

Listening is critical in every interview, and there are several forms of listening from which to choose. *Listening for comprehension* is best when receiving, understanding, and remembering messages accurately and completely for future recall and use. It requires keen concentration on what, how, and why information, beliefs, and feelings are exchanged. Be patient, take notes, ask questions, and observe nonverbal cues.

Listening for empathy is best when trying to communicate concern, feelings, understanding, and involvement. Its traits are reassurance, comfort, warmth, and regard. It is expressing not merely sympathy but also true understanding. Express concern or empathy verbally and nonverbally, do not interrupt, be tactful, and avoid being judgmental. Empathic listening requires us to be comfortable with displays of anger, fear, sadness, and affection.

Listening for evaluation is best when it is necessary to evaluate, assess, or judge what is being said and how. If we are to evaluate accurately and fairly, however, it is essential that we comprehend “the what” and “the how” and be able to feel empathy for the other party. Listening for evaluation requires us to listen carefully and insightfully to every question and answer, observe nonverbal signals perceptively, ask for clarification, seek feedback, and try to avoid defensiveness or anger.

Listening for resolution, what John Stewart (2006) calls *dialogic listening*, is best when the intent of both interview parties is to resolve a mutual problem. Stewart likens it to adding clay to a mold to affect the shape and content of the end product, such as a production, group homework, sales, or a health care course of action or solution. Listening for resolution requires each party to encourage interchanges, trust in the competency of the other, focus on the present rather than the past, and focus on the problem rather than personalities or hierarchy.

Situational Variables

We have been focusing on the two parties in the interview, but they do not interact in a vacuum devoid of time and space. Every interview occurs at a specific time; on a specific date; in a specific place; and in proximity to immediate surroundings such as objects, pictures, decorations, furniture, and models. The time of the interview, such as morning, afternoon, or evening, may affect how each party communicates and their energy and motivational levels. For instance, few sales associates are happy to see customers just before closing time. An interview may commence at 7:30 a.m., with one party being a morning person and the other being an afternoon or late-night person. Dates such as early in a semester, just prior to spring break, or right after final examinations may affect interview focus, content, and motivation. Place brings in *territoriality*. On whose turf will the interview take place? Sarah Trenholm and Arthur Jensen (2004) use the term *personal space* to describe the “imaginary bubble” in which we operate and consider “almost as private as the body itself.” Pictures portraying tooth decay, neck or back models, and large charts showing the intricacies of the eye may interest or frighten a patient. Seating arrangement is a way to make a person feel at ease or comfortable, establish hierarchy and authority, and enhance communication.

Noise can disrupt an interview or make it very difficult for parties to hear, listen, or concentrate. At the very least, noise such as cell phones, foot and auto traffic, machinery, others talking, loud music, and doors closing can be distracting. Limit distractions by selecting private and quiet locations or turning off telephones, television sets, and CD players; closing doors and windows; and preventing interruptions by others. Avoid a physical or psychological kind of noise by not coming to an interview tired, angry, hungry, depressed, or focusing on the next interview or task.

Be aware that both parties may not see (perceive) the situation in the same way. Some supervisors may see their offices as safe, neutral locations, while their subordinates may see them as threatening, places where people are reprimanded and fired. One person may see Thanksgiving as a great family time, while a single or elderly person may see it as a lonely time or one that holds sad memories. Simple seating arrangements may signal superiority or equality, perhaps depending on which party is sitting in the big chair behind the big desk. Some individuals, such as recruiters, physicians, or police officers, may see a situation as routine (something they do every day), while others may see the same situation as a major event (one they do infrequently and with positive or negative consequences).

Interviewing Methods

Interview parties have a variety of methods at their disposal to make each interview a success, including approaches, questions, openings, closings, guides, schedules, and sequences.

The first decision concerns how much control each party will have over the interview.

Directive and Nondirective Approaches

After carefully analyzing self, the other party, the interview type, and the situation, the interviewer must determine whether to employ a directive, a nondirective, or a combination approach. A *directive approach* enables the interviewer to determine the purpose of the interview and its subject matter, structure, pace, interactions, and level of formality. The interviewee is mainly a respondent, provider of information, and reactant, with a modest amount of control. This approach is most appropriate for information giving, surveys and opinion polls, employee recruiting, and sales interviews, in which the interviewer must be in charge.

In a *nondirective approach*, the interviewer enables the interviewee to control the structure, topics, length of answers, formality, and pace of the interview. The interviewer listens, observes, and encourages. This approach is most appropriate for interviews such as information-getting interviews (journalistic interviews, oral history, and investigations), counseling, performance reviews, and problem-solving interviews.

In a *combination approach*, interviewers alternate directive and nondirective approaches when most appropriate for what is taking place during the interview. For instance, a recruiter may begin with questions, proceed to giving information about the position and organization, and then answer the applicant's questions. A counselor may begin with a nondirective approach to encourage the counselee to talk and reveal concerns and then move to a more directive approach when giving information or advice on courses of action.

Question Types and Uses

Questions are the tools of the trade for interview parties. Jamie McKenzie, an expert on the uses of technology, claims that “questions may be the most powerful technology we have ever created” because “they are tools that lead to insight and understanding” (Valenza, 2006). These question tools have names and perform unique and important functions for both interview parties.

There are a few fundamental types of questions. They may be *open-ended*, such as “Tell me about your trip to New Zealand,” or *closed-ended*, such as “When were you in New Zealand?” These are comparable to large and small screwdrivers or wrenches. Open questions encourage interviewees to talk, and their lengthy answers reveal what interviewees think is important and encourages them to volunteer information. They are also easier to answer and are less threatening. On the other hand, closed questions enable the interviewer to control the length of responses and lead to desired information. Interviewers can ask more questions, and interviewees expend little energy in providing short answers.

Questions may be *initial* or *follow-up*. Initial questions begin interviews, topics, issues, or concerns and can make sense when they stand alone, such as “What interests you in this position?” or “Tell me about the courses you are taking.” Questions may be follow-up in nature if they probe into a response and do not make sense out of context, such as “Why does that interest you?” or “Explain that to me in lay terms.” These questions may be lengthy or simple, such as “And?” or “Uh-huh?” Silence may provoke an interviewee into replying further or amending an answer. Follow-up questions probe deeper into areas of interest; encourage interviewees to elaborate on and explain answers that may be vague, superficial, or unclear; and elicit more meaningful answers from respondents who are reluctant or being purposely vague or obscure.

Questions may be *neutral*, in that the interviewer does not indicate the answer desired, such as “What did you think of the concert?” The intent is to avoid any influence on how the interviewee will answer. Or a question may be *leading*, suggesting the desired answer, such as “Don’t you think the concert dragged on too long?” Leading questions are most useful in persuasive interviews, in which the interviewer is more interested in obtaining agreement than in getting accurate, uninfluenced answers. The interviewer may want to see how a person answers under stress or how easily the person can be swayed by simple words or nonverbal cues. Counselors and others may use a strongly worded leading question, often called a *loaded question*, to reveal that all answers are acceptable, such as “Under what circumstances have you cheated on exams?” or “When was the last time you were legally drunk?”

There are a number of special types of questions, most of them follow-ups or probes, designed to fulfill specific purposes. For instance, a *clearinghouse* probe is designed to make sure all important information has been covered, such as “Is there anything else I need to know about the trip to Kenya?” *Informational* probes are designed to obtain further information or explanations, such as “And then what did you do?” A *restatement* probe basically repeats a question because an interviewee did not answer it directly or satisfactorily. A *reflective* probe reflects an answer and attempts to clarify or verify the information received, such as “Are you saying that you’re quitting as coach?” A *mirror* probe summarizes a series of answers to ensure accurate understanding between the parties. The ability to ask insightful and appropriate follow-up questions separates the skilled from the unskilled interviewer. Anyone can ask a series of initial questions and note the answers, but it takes skill to listen carefully and know when follow-up questions are needed and the most appropriate type to use.

Structure

Interviews, unlike conversations, must have a predetermined purpose and a degree of structure. The degree of structure will depend on interview type and purpose. For instance, a survey interview will be highly structured, a recruiting or journalistic interview moderately structured,

and a counseling interview minimally structured. Regardless of degree of structure, the opening is a critical first step in every interview.

Opening

The *opening* of interviews is critical, first, because it sets the tone and climate of the interview. It signals whether the interview will be serious or lighthearted, formal or informal, relaxed or tense, professional or nonprofessional, friendly or hostile, nonthreatening or threatening. What we say and do not say at the opening directly affects whether an interview will continue or end abruptly and the willingness of both parties to communicate beyond Level 1, superficial interactions. Small talk, humor, and compliments may help to establish a relationship or build on a relational history, but all three should be used in moderation. Too much, and they may “turn off” the other party, particularly if the talk, humor, and compliments seem forced or insincere. If a relationship is just beginning, beware of using the other party’s first name or nickname or touching beyond a handshake, particularly in a formal setting. Nonverbal actions such as voice, eye contact, facial expressions, handshaking, and dress may communicate the tone of the interview, while territoriality, seating arrangement, and physical setting may communicate the climate of the interview. Be aware of differences in the way sex, age, culture, and ethnicity may affect how the parties interact nonverbally. For instance, Lillian Glass has identified 105 “talk differences” between men and women in the United States, including touch, facial language, and voice patterns.

Second, the opening serves an *orientation function*, essential in motivating both parties to communicate freely and accurately. Orientation is critical when there is little relational history or the purpose and nature of the interview is unclear, particularly when interviews are taking place over the telephone. As interviewers, we might state our purposes; identify ourselves and who we represent; and indicate what we want, why we want it, and what will happen following the interview. We might explain the nature of a problem, how it was discovered, and both why and how we selected this interviewee at this time. An important goal of orientation is to reduce *relational uncertainty* so that interviewees come to understand their roles and purposes and to trust the interviewer to conduct a nonthreatening exchange and to use the information received for the stated purpose.

The opening must be a *dialogue* between two parties, not a *monologue* the interviewer recites. The less the other party is involved in this all-important stage, the less likely this party will be to communicate freely and accurately at Levels 2 and 3. Do not rush through the opening; be sure that the interviewee is ready to communicate. Some 90% of “cold calls” over the telephone fail because of a failed opening.

Closing

Too often, the closing is seen by both parties as merely a stopping point or way of saying goodbye, an unimportant

appendage to the interview. The closing, however, is as important as the opening. An abrupt, brief, seemingly uncaring closing may destroy the relationship established or enhanced during the interview and affect future interactions, assuming that there will be future interactions. An interviewee may feel unappreciated or used, only important until the interviewer obtains information, a sale, or help.

Both parties should know when the interview is coming to an end. Signals may be simple verbal cues such as “Well” or “Okay.” Mark Knapp and his colleagues cataloged a variety of nonverbal ways to communicate the closing of interviews. These include straightening up in our seats, leaning forward, breaking eye contact, standing up, or offering a handshake. Obviously, the interview parties must be aware of what each is saying and how each is acting to detect when a closing is commencing, but they must not read too much into simple nonverbal actions. For instance, a person may straighten up to become more comfortable, lean forward because of interest in what is being said, or break eye contact to think of a follow-up question or a carefully reasoned-out response.

The function of the closing is to end an interaction effectively while not precluding or harming future interactions. Be sincere in what you say, express appreciation, and be supportive. Like the opening, closings must be dialogues, not monologues. The interviewer might offer to answer questions, make personal or professional inquiries, or state satisfaction. If this interview is one in a series (a screening interview for a position, a performance review, a health care checkup), summarize agreements, explain the next step, and set a date.

The Body of the Interview

The body of the interview must be carefully structured and adapted to the purpose of the interview and the other party. It is tempting to begin preparation by jotting down a series of questions to ask, but we cannot prepare insightful questions if we have yet to determine what information, input, or reactions we want from *this* interaction. After all, it may be merely one of several planned contacts with this party. Many purposes are achieved only after several interactions between recruiters and applicants, physicians and patients, performance reviewers and employees, counselors and those with problems, sales representatives and clients.

With a clear purpose in mind, begin preparation by developing an *interview guide*, an outline of the information, data, and actions needed. First, list the major areas, then list subareas under each, and finally subareas under subareas. Draw on previous training in outlining to create a well-organized, logical list that will serve as a guide. Common patterns or sequences include topical, time, space, cause-to-effect, and problem-to-solution. The traditional journalistic guide will work for many interviews: who, what, when, where, how, and why.

If the interview is to be simple and brief, such as an exchange with a professor concerning a field project or internship, we may operate from a guide or *nonscheduled* interview. The major problem with this simple format is that

we will need to create every question on the spot, a difficult task for an inexperienced, emotionally involved, or nervous interviewer. A *moderately scheduled* format turns the major areas in a guide into carefully phrased questions and may include a few planned follow-up questions. A *highly scheduled* format turns all parts of a guide into questions and requires little deviation or instant creation of follow-up questions. A *highly scheduled standardized* format includes all questions, including planned follow-ups, and answer options for ease of recording answers. This format is used most often in surveys and polls, in which each interview must be identical to the previous one. Choose the format most suitable to purpose, skill level, situation, and interviewee.

Future Directions of Interviewing

Continuing theory, research, and practice in critical areas of the interviewing process focus, for instance, on the relational and interactional nature of interviewing and the sharing of roles. It is no longer acceptable to address only the interviewer. In the performance review interview, referred to not long ago as the “appraisal” interview, the emphasis is on interviewers as “coaches” who enable interviewees to succeed and reach their potentials by helping rather than evaluating or judging, focusing on the future rather than the past and on mutually agreed-on courses of action rather than problems. With the aging of American society and the emphasis on preventative medicine, the health care interview has become the focus of much study and research. Health care professionals and patients alike are addressing the need for effective interpersonal communication, including information gathering, information giving, and compliance with prescribed medications and regimens. “Behavior-based” interviewing, in which the questions require applicants to exhibit position-related skills and experiences, is dominating the literature on employment interviewing. There is a growing concern over ethics in all types of interviews, particularly in employment and persuasive interviews, in which there is growing evidence of dishonesty in resumes, answers by recruiters and applicants, and sales tactics.

While research continues to be done on the interviewing process and on specialized forms of interviewing such as opinion surveys, recruiting, performance review, counseling, and health care, important new research is focusing on electronic interviews via the telephone, cell phones, videoconferencing, and the Internet. Electronic devices may revolutionize the setting and the interactions in interviews.

Although the interview has traditionally indicated a face-to-face interaction with parties being in close proximity, the invention of the *telephone* more than a century ago made distance interviewing possible. The use of the telephone has become widespread, particularly in surveys, sales, and recruiting, because it is less expensive, is easy to use, saves time, reduces staffing needs, and covers long distances. But users of the telephone note the lack of presence of the parties and the limitation of critical nonverbal communication to voice. The interview becomes ear-to-ear

instead of face-to-face. Many interviewers do not like the impersonal nature of the telephone interview, while many interviewees do not trust interactions with someone they cannot see. Turn taking, so important in the interactive interview, is often difficult because the parties cannot see cues such as leaning forward, facial expressions, and gestures, which have traditionally aided turn taking. John Stewart (2006) calls turn taking “nexting” and claims that it may be the most important communication tool.

The advent of the *cell phone* has created a new world of possibilities for the telephone because interviews can take place anywhere at any time, including airports, classrooms, theaters, and restaurants. Interview parties are no longer tied to places such as the office, home, medical facility, or recruiting center. The cell phone also has video capabilities, which will add an important nonverbal dimension to telephone interviews. Privacy concerns will grow as parties carry on important interactions in public places, often where noise interrupts or interferes with hearing and listening. In fact, as we observe people walking down streets talking seemingly without pause, we wonder if it is not a one-way process rather than a true interaction.

Videoconferencing technology became widely available in the 1990s and is growing in use because multiple people in distant locations can both see and hear one another. It is particularly popular in recruiting, where several members of an organization can interview an applicant at the same time, and in problem-solving interviews, in which staff from around the country or globe can discuss a problem. Many of these interactions are small-group rather than interview interactions. While parties can see one another, the shots tend to be head, upper-body, or group shots, which are not nearly as helpful as face-to-face exchanges. Since there are fewer nonverbal cues, there tend to be fewer interruptions and less frequent turn taking. Research indicates that both parties prefer the traditional interview to the videoconference.

With the advent of the *Internet*, some interviews have gone from face-to-face or ear-to-ear to finger-to-finger. The electronic exchanging of messages can take place at any time of the day or night, can reach parties thousands of miles apart, and provides a record of messages sent and received. On the other hand, such “interviews” have no nonverbal element and are not interactions in real time. The Internet is no more interactive than e-mail or letters, and parties are unlikely to reply at length as they do easily in face-to-face interviews.

Conclusion

The interview is a dyadic form of communication between two distinct parties, at least one of whom has a predetermined and serious purpose. It is interactional in that both parties speak and listen from time to time and may share roles of interviewer and interviewee. It is relational because both parties are connected interpersonally and have varying degrees of interest in taking part and influencing the outcome of the interview. It typically involves questions

designed to elicit information; verify accuracy and understanding; heighten self-disclosure; and influence feelings, thoughts, and attitudes. It is a communication process that is a dynamic, ever-changing, and continuing interaction of many variables between two complex parties, often with differing backgrounds, motives, and goals. The close proximity of parties in interviews magnifies the verbal and nonverbal messages, sent and received, and enhances the importance of situational variables such as time, seating arrangement, physical surroundings, and noise.

PUBLIC SPEAKING

AMY SLAGELL

Iowa State University

In everyday language, *public speaking* refers to the communication practice of a speaker sharing ideas with an audience primarily through speech. The term encompasses a great many communication contexts, including events as different as delivering an oral report on company profits to a closed meeting of a board of trustees, addressing millions of listeners around the globe during a U.S. presidential inauguration ceremony, and giving a toast at a wedding. The fundamental notion underlying public speaking as a form of communication is that it is an embodied and oral act. Associated expectations that signal that a communication interaction is an example of public speaking are that the oral communication is shared with more than one listener and there is one person in the interaction who does most of the communicating. Like written communication, public speaking is complicated because sharing meanings with others through language is difficult. The challenges of public speaking are heightened, however, since the speaker shares meaning not only through words but also through body, voice, and visuals. Furthermore, the public-speaking experience, traditionally, is transitory; a speaker has only one opportunity to accomplish his or her goal—to be understood by the listeners. While readers can re-read documents until they understand the gist of the message, listeners, typically, cannot hear a speech again. Another challenge particular to the public-speaking experience is anxiety. In fact, 70% to 75% of the U.S. population report experiencing public-speaking anxiety (McCroskey, 2000; Richmond & McCroskey, 1998). Challenges such as these make public speaking a communication practice that continues to interest researchers and everyday practitioners and have made public-speaking classes a common requirement for undergraduate degrees

and public-speaking titles popular in the self-help sections of bookstores.

It is perhaps surprising that the demand for public speakers persists in our increasingly mediated age. While information can be shared through many other means and persuasive appeals are pervasive on television, billboards, and the Internet, there remains a significant role for public speaking as a means for sharing ideas and motivating others. Political speaking is particularly visible in U.S. culture as we watch candidates participate in debates and see legislators and citizens speak about civic affairs on news shows, C-Span, community access television, and Internet sites such as YouTube. Public speaking also happens at pep assemblies; in board rooms; during parents' night at public schools; in assembly halls and civic centers; at state fairs and trade shows; as part of award shows such as the Oscars; at commencements; at religious gatherings, inaugurations, and weddings; in classrooms, prisons, and legislatures; and even during meetings of 4-H or Rotary Clubs. U.S. culture is rife with contexts that call for public speaking.

Organizations such as the All American Speaker's Bureau arrange for celebrities and professional speakers to address audiences at corporate meetings, trade shows, conventions, and major community events. Though sometimes these appearances may include a chance to shake hands or get an autograph, their central purpose is to arrange to have someone with significant understanding of an issue, someone with a deep passion for a cause, or someone with a fascinating experience to share speak before an audience. The speakers' bureau understands the potential impact of this speaking situation for listeners and for the organization arranging the event and knows its market value. Groups will pay speaking fees ranging from around \$5,000, to hear, for

example, Amy Henry from NBC's *The Apprentice*, to more than \$200,000, to hear Donald Trump himself. Another organization, TED, originally devoted to sharing ideas about Technology, Entertainment, and Design, meets annually to showcase 50 speakers, who address a crowd of 1,000 for about 18 minutes each. These speakers share their exceptional ideas on topics ranging from open-source textbooks for college classrooms to innovations in wind power, to how the mind works, to the nature of romantic love. The 4-day conference regularly sells out a year in advance, but the speeches are digitally captured and the best are posted at www.ted.com. The organizers adopted the slogan "ideas worth spreading" and devote significant resources to their goal of "giving everyone on-demand access to the world's most inspiring voices." Such examples underscore the fact that public speaking remains a significant mode of communication in contemporary culture.

Public speaking has evolved as a form of communication, and it overlaps many of the other types of communication discussed in this handbook. Individuals engaged in the specific tasks of interviewing, deliberating, debating, mediating conflict, demonstrating, or communicating with visuals are likely to engage in public speaking as well. This chapter, therefore, will focus on the fundamental concepts of public speaking as a type of communication. While public-speaking theory and pedagogy are deeply rooted in the classical period, it is important to recognize how cultural developments, ways of understanding communicative processes, and even theories of language have revitalized and complicated the classical concepts. Even as U.S. cultural expectations have expanded such that today there is a belief that all citizens should be prepared to express themselves through public speaking, the ideas about how public speaking functions have grown increasingly complex. As a result, it has become clear that public speaking, like other complex skills, is one that can continue to develop across a lifetime. Though technological developments bring new challenges as well as opportunities, there are a handful of primary concepts that can guide public speakers to success in the 21st century.

Public-Speaking Goals

Public speaking is a form of communication that seeks an outcome; public speakers seek not simply to express themselves but to have an effect on their listeners. Humans have long sought to understand more about the ways language can shape circumstances and help them accomplish their goals. The first formal discussions on communication and public speaking in the Western tradition emerged in the 5th century BCE in Greece, though more ancient texts of Chinese and Jewish origin as well as the works of Homer indicate an even earlier interest in effective speech making. In Western cultures, public-speaking instructors were among the first people to be paid to share their knowledge with others. Early legal systems required citizens to speak

on their own behalf when presenting arguments on issues such as property ownership. Those who listened to these speeches and saw their varying levels of effectiveness began to codify the strategies that were most successful in particular situations. In Greece, ancient teachers of what was commonly known as "rhetoric" included well-known figures such as Gorgias and Aristotle in the 5th and 4th centuries BCE, respectively. In Rome, the first systematic rhetoric handbook, the *Ad Herennium*, dates to the 1st century BCE.

These early texts identify three central goals related to the different contexts for public speaking: to persuade judges to support your position in a court of law (known as forensic discourse, as in "I am not guilty of murder"); to persuade decision makers to support your position about what action should be taken by the community or state (known as deliberative discourse, as in "We should build a new wall for the city"); and to persuade people with arguments that a person or event is worthy of either praise or blame (known as epideictic discourse, as in "Helen of Troy's beauty is beyond all comparison"). These goals were related by their common goal or outcome: the persuasion of a listener.

According to Aristotle, the differences among these goals emerged in large part due to the specific context within which the speech took place and the role played by the audience during the exchange. Forensic discourse referred to the speeches given in legal settings where listeners would judge whether someone was guilty of a crime or whether a wrong was done in the past that required redress. Deliberative discourse was the discourse that took place in the senate, within bodies of decision makers for the state, who argued for certain policies, inviting listeners to judge whether such policies should be implemented in the future. Epideictic discourse took place in public spaces before popular audiences who made judgments about the object of praise or blame and also rendered judgments about the talents of the speakers. The situation within which speakers shared their ideas determined the kinds of materials, arguments, vocabulary, and delivery that were appropriate. For this reason, early rhetoric handbooks often divided their guidelines into chapters devoted to each different context.

In the 100 years preceding and following the beginning of the Common Era, debate about the goals of public speaking was vigorous. As the Roman theorist Quintilian summarized the issue in his landmark work the *Institutes of Oratory* (95 CE), which is the most detailed account of the education of a public speaker from the ancient world, what began as a debate about whether a speech of praise was significantly different from a speech of blame soon developed into claims that the goals of speaking were innumerable:

Indeed, if we distinguish praising and blaming in the third part of oratory, in what kind of oratory shall we be said to employ ourselves when we complain, console, appease, excite, alarm, encourage, direct, explain obscure expressions, narrate, entreat, offer thanks, congratulate, reproach, attack, describe, command, retract, express wishes or opinions, and speak in a thousand other ways? (Quintilian, 2006, Book 3, chap. 4, para. 1)

But if the goals of speakers were as numerous as the goals any individual speaker might set for himself or herself, there would be no way to generalize about the skills needed by a speaker, and it would become impossible to teach others to be successful in addressing audiences.

Some agreement about the genres of discourse became necessary as a way to identify what public speakers needed to know and what they needed to be able to do in order to be successful. The categories of forensic, deliberative, and epideictic speech remain salient today; but they fail to encompass other essential functions of public discourse within a culture. By the 5th century, rhetoric handbooks, such as Book IV of Augustine's (1958) *On Christian Doctrine*, encouraged teachers and students of rhetoric to accept a broad set of three goals for public speaking: to teach, to please, and to persuade. Today the majority of public speaking textbooks concentrate on the same three central goals of public speaking to inform, to entertain and to persuade an audience. Persuasive speaking is the most complex of the goals and remains an umbrella term for diverse discourses such as those aiming to change belief, to move to action, to inspire, to sell, to convert, and to motivate. In response to recent critiques of the fundamentally coercive nature of these kinds of persuasive speeches, whose aim is to change listeners, some theorists are exploring a new genre called "invitational speaking." This alternative goal for public speakers aims to initiate dialogues with listeners about issues and aims to share perspectives. The goal is to invite consideration of change rather than speaking with the intention of changing audience members (Foss & Griffin, 1995; Griffin, 2009).

Identifying the genre or the general goal of a speech within a particular situation helps a speaker understand a great deal about the strategies available to achieve the outcome for that kind of speaking situation. Informative speeches rely on clarity and thoroughness so that listeners can remember the information. Persuasive speeches are built on the speaker's credibility, the use of evidence and reasoning, as well as engaging the emotions of the audience to produce change. Invitational speeches aim to establish and sustain conditions of equality, value, and self-determination with listeners. Speeches to entertain rely on strategies that use humor to make their point. While these broadly defined goals govern the study of the discipline of public speaking, each speaker also needs to determine his particular goal within a particular speech situation. Those goals, like the long list developed by Quintilian, are innumerable, and identifying those goals requires careful consideration of many factors. While technology has expanded the potential impact of public speaking and added complications to the communicative process, the fundamental concerns and resources of the public speaker have remained remarkably consistent over time.

Fundamental Principles: The Dynamic Process of Public Speaking

Mid-20th-century efforts to visualize the components and processes of communication were dominated by what is called the transmission model (Shannon & Weaver, 1949). This was an information transfer model that seemed to suggest that communicators send information across some medium (such as telephone wires) to a receiver, who takes in the information as sent unless some kind of noise interferes to make the transmission problematic. This understanding of the public communication model has changed over time and is currently being influenced by postmodernists, who point out the indeterminacy of each of the parts of the model. Nevertheless, most teachers and public-speaking practitioners continue to find value in thinking about the distinct parts of the communication process to better accomplish their communicative goals. There are seven essential parts to the model: speaker, audience, message, channel, feedback, interference, and context.

Speaker

The speaker is perhaps the most obvious part of the public-speaking transaction, but there are complexities in the role that must not be overlooked. Communication begins within the mind of the speaker as he or she perceives and processes his or her own experiences and learning and makes decisions about the goal(s) of a speech and the strategies best suited to accomplishing those tasks. In fact, Aristotle does not define rhetoric as a product. It is not a speech or a specific strategy; it is not the outcome or effect a speaker has on an audience. Rhetoric, he says, is "the faculty of observing, in any given case, the available means of persuasion." Developing one's rhetorical skill, then, is about training the mind to see all the possibilities for persuasion or, in contemporary theory, to see all the possibilities for engaging audiences. Much of the work of a successful public-speaking interaction is the mental work of the speaker, who must sift through the possible goals, materials, information, and organizational and delivery strategies to select the best for a particular speaking context.

In addition, from the listener's point of view, the presence of the speaker is meaningful even before the speaker begins a presentation. The very fact that a presidential candidate chose to speak at a particular event conveys a message about the value of that event to that audience and to the listener as well as to those looking at the event from outside the immediate situation. The reputation of the speaker, his ethos or credibility, may also be known to the listener before the start of the speech. Announcements about the speech, the speech of introduction before a presentation or audience knowledge about earlier speeches, books or appearances by the speaker all serve to help listeners construct ideas about the speaker before the talk. These preexisting attitudes about the speaker can support or interfere with the speaker's goals depending on the listener.

Listener/Audience

The presence of an audience is essential to the public-speaking situation. Philosophers may debate the nature of “sound” when arguing about whether a tree falling in the forest makes a sound if no one is there to hear it, but theorists agree that the communicative act of public speaking requires the presence of a listener to be meaningful. Listeners bring their own experiences, languages, expectations, and ways of making meaning into the public-speaking interaction. The meanings taken away from a public-speaking presentation depend on the audience member’s work in creating them. The more researchers investigate the ways people learn, the more it becomes clear that complex biological and social processes are at work as audience members construct their own meanings in communication contexts. Public communication is a participatory process; a speaker cannot make himself or herself understood without the willing participation of the listener in the process. The complexities of the mental landscapes of audience members—individually and as groups—is part of what makes public speaking a creative challenge that is never fully mastered.

Message

A third complex feature of the public-speaking process is the message itself. By definition, the message is the meaning received and understood by the members of the audience. In general, the closer the message received is to the message intended by the speaker, the more effective the presentation. For this reason, public-speaking instruction is typically focused on the construction of the speaker’s message—such as the content, the structure, the word choices, but it is also the case that audience members are actively engaged in constructing their own sense of the message. The messages from which they construct meanings are intentional and unintentional, verbal and nonverbal. As individuals, listeners have varying degrees of attentiveness; still, the speaker must assume that audience members are constructing impressions of the speaker’s character, beliefs, age, class, race, gender, and even sexual orientation even before the speaker begins to address them orally. Contemporary public speakers are increasingly aware of this and work to manage these impressions to the best of their ability.

Channel

The intended and unintended messages projected by speakers come to listeners through some line of communication that we typically call a channel or medium. In the public-speaking context, air is the typical carrier of our verbal cues, and lines of sight carry nonverbal cues. These channels can be complicated by the presence of something that amplifies the sound, such as a microphone (as in a presidential state-of-the-union address) or a bull horn (as when President Bush stood in the rubble of the 9/11 attacks and

addressed the rescue workers). Even poor stage lighting or a podium too large for the speaker can make it more difficult to “read” the visual cues. In recent decades, public speeches have become increasingly mediated, such that one speech may be available through various channels. Today, not only are speech texts, such as the Gettysburg Address, available to new readers who are separated from the context by many years, but complete recordings of speeches are available to be viewed by individuals and groups around the globe. New technologies have also expanded the kinds of channels available to speakers to share their messages; whether using PowerPoint and embedding videos in presentations or publishing presentations via YouTube or blogs, today’s speakers have new challenges and opportunities when considering the media through which their messages are created and shared.

Feedback

Feedback is the element of the communication process that makes it a transactional experience. Rather than messages running only one way, from speaker to listener, theorists conceptualize public-speaking interactions as having a feedback loop. Parallel to the messages speakers communicate, feedback messages can be verbal and nonverbal, intentional and unintentional. Successful public speakers must be able to take in these messages and adapt to them. Audience members may communicate their enthusiasm or anger, the trouble they are having hearing or understanding, their agreement or disagreement, their willingness to give their attention or to ignore, and they may show their appreciation of the presentation with applause. Responding to feedback by restating, rephrasing, or elaborating a point; speaking up; slowing down; or even moving to an interactive moment of the speech to regain audience attention are all marks of the mature public speaker who is aware of the importance of audience feedback as a way to gauge whether an audience is continuing to work with the speaker to create shared meanings.

Within the immediate speaking situation, feedback is simultaneous with the delivery of the speaker’s message. However, in colloquial use, feedback also refers to information solicited by public speakers after public-speaking events. In classrooms, peers and instructors may offer feedback to a speaker about a presentation, asking questions or commenting on the public-speaking choices made. Mediated public messages, such as a speech posted on YouTube, will collect feedback by way of comments posted. Audience researchers can use new technologies to measure the feedback responses of listeners. During a presidential debate, focus groups may press triggers to indicate their level of agreement or how much they like a candidate at any particular moment in the debate. Processing such data helps political advisers and speech writers capture a glimpse of the meaning-making process at work within listeners so that later efforts to communicate similar messages can be made more successful.

Interference

When something prevents our messages from reaching those with whom we are communicating, interference is the culprit. In the transmission model of communication, this idea is typically conceived of as literal noise. For example, a public speaker's message might not get through to listeners if there was a baby crying in the room, a bus passing by the rally at the park, or a conversation being carried on among some members of the audience. This part of the model is based on the analogy that compares such noise with the kind of static that can interfere with a phone connection. Certainly such noise can make it hard for a speaker's message to be heard, thus, at a very fundamental level, preventing meanings from being shared with audiences.

As our conceptualization of speech making has shifted from the simplistic notion of transmitting sound from one person to an audience, so has the understanding of interference become much more complex. Hearing, listening, and understanding are different physiological and psychological tasks that we ask of audiences, and while public speakers are rightly concerned about being heard, they are also deeply concerned with being understood. An expanded notion of interference for the 21st-century speaker can include a wide range of possible distractions for audiences that can block, or make it harder for, messages to be understood. Today's speakers continue to be concerned about external distractions, such as noisy speaking venues or cell phone interruptions. In addition, new research about brain processing demonstrates the special challenges facing a speaker who is addressing listeners experiencing a sugar low or audience members who are present but are preoccupied with worries about needing to catch a plane, finish a project, or repair a relationship strained by an argument earlier that day. These internal distractions are usually outside the control of speakers, but the challenges they present to the success of a presentation are real and demand creative responses. Some points of internal interference in listeners can be unwittingly encouraged by speakers. Speakers who commit a faux pas, whether it be dressing inappropriately for the occasion, mispronouncing the name of the person who introduced them, or using terms unfamiliar to the audience, can send unintentional messages that interfere with the audience's ability or willingness to construct the meaning intended by the speakers. Similarly, speakers who incorporate poor visual aids, weak evidence, or a provocative word choice can invite listeners in whole or in part to disregard the rest of the presentation or to engage in a mental debate that interferes with their ability to understand what follows.

Context

In its most specific sense, context refers to the situation within which the public-speaking exchange occurs. This situation involves the reason the group constituting the audience is called together, whether it is a political convention where the room is filled with credentialed delegates, a

monthly meeting of the Rotary club, or a rally to protest a decision to cut funding for a university program. It also involves the actual setting for the speech—a comfortable, climate-controlled board room; an overheated, crowded schoolboard meeting running late into the night; or an outdoor rally where it is hoped that the audience will grow during the presentation. Within the setting, speakers also consider the size of the audience, the arrangement of space, the presence or absence of means of amplification, the visual aid support available, and even whether there will be other speakers at the event. Understanding the situation is paramount for the speaker to make decisions that will lead to a successful presentation.

Context issues, however, extend beyond the specifics of the particular speaking situation. Cultural and institutionalized differences will affect the norms of the speaker-audience relationship. U.S. senators know that their presentations on the floor of Congress will be listened to politely, though sometimes by only a handful of fellow senators. Members of the British Parliament, in contrast, can expect colleagues to make their agreement and disagreement clear throughout the speech with shouts, feet stomping, or hisses. The conventions governing delivery and language use vary widely among cultures and subcultures, complicating the challenge facing speakers as they aim to adapt to those norms. Professional speakers know that every new speaking situation requires some adjustment if their message is to be successful.

Public speaking is a radically situated communicative act. Delivered to a particular audience at a particular time in a particular space, speeches have been recognized as among the most transitory of the arts. Prior to the invention of recording technologies, a speech might persist as a written text, but that text represented a mere shadow of the experience of the speech as delivered. Though a speech can now experience an extended life span through recording, it remains, in the nature of public speaking, fundamentally linked to the context that called it into being, what Lloyd Bitzer (1968) called the rhetorical situation. Though listeners around the world continue to view Martin Luther King's "I Have a Dream" address, their understanding of the speech and the meanings they construct are not identical to those constructed by the listeners at the march or by people watching television coverage of the event. While some of the meanings of the speech persist over time and are shared by the millions of listeners who experience the speech today through various channels and in many different contexts, each listener lends his or her own life experiences and interpretive lenses to the meaning-making process. When listeners have the opportunity to add a deep understanding of the historical context within which the speech was given, their interpretive lenses change and new possible meanings of the text begin to emerge. Context persists as one of the most powerful influences on the public communication process, and our understanding of its significance continues to evolve.

Fundamental Principles: Effective Characteristics of Speakers

Speakers have various tools with which to respond to the dynamic complexities of the parts of the public-speaking interaction. Significantly, the skills required to respond effectively have not changed dramatically since the earliest theories of public speaking were being set forth. When today's students are asked what public speakers need to know in order to succeed, their responses are very similar to the ideas set forth in what communication educators call the Roman rhetorical canon. These five areas of instruction for public speakers have governed the topics studied in classrooms and mastered by remarkable speakers across the centuries. They include invention (creating the materials of the speech), arrangement (creating the order of the ideas in the speech), style (creating the expression of the ideas of the speech), delivery (embodying and speaking the ideas of the speech), and memory (strategies for recalling the ideas of the speech during delivery). In addition, today's students will often list more abstract concepts such as "confidence" as essential for the successful public speaker. Public-speaking instruction is typically founded on the assumption that mastery of the elements in the rhetorical canon added to experience will support the development of speaker confidence.

Invention, Arrangement, and Style Generate Ideas to Foster Connections With Audiences

While often treated as distinct areas of study, these first three parts of the rhetorical canon are coming to be understood as integrated because each of them lends generative power to the speaker. Invention includes tasks such as setting goals for a speech, identifying the major ideas the speaker hopes to convey, doing the research work necessary to select and develop those ideas, creating lines of thought and reasoning to powerfully attach the main ideas to the evidence at hand, considering ways to engage the particular audience to be addressed, and imagining points of opposition or confusion and ways to overcome those challenges. In other words, invention has long been recognized as the area of study concerned with creating and identifying the heart of the public speaker's message.

Arrangement, in contrast, has often been understood to involve the somewhat mechanical task of outlining the ideas and materials gathered and created in the inventional process. Distinct tasks such as structuring the main points; connecting the main ideas to one another; and understanding the conventions necessary to develop a good introduction, body, and conclusion for a particular situation are often taught as the fundamental aspects of this canon. In practice, the work of arrangement is dynamically linked with invention. For any particular speech topic, the consideration of strategies for organizing the speech to enhance its impact on listeners will lead to insights about engaging

those listeners, responding to objections, or refining the goal of the presentation. A speaker addressing recycling efforts in the community would produce a very different speech if he or she used a chronological structure (which would require addressing the steps in the process or offering a historical perspective) than if a topical structure was used (which might lead to an exploration of current options for local citizens or addressing the advantages and disadvantages of competing proposals). In this way, arrangement becomes more than putting together the pieces in the puzzle of a speech; it becomes a way to determine the very shape and look of the puzzle in its final form.

Similarly, current work at the intersection of linguistics, psychology, and communication identifies the deep impact that stylistic choices—speakers' ways of expressing themselves, or their use of style—are often constrained by habits of the mind and worldviews that have dramatic effects on the inventional process. Theorists such as Michael Osborn (1967) have identified the important ways in which metaphor functions not simply as a stylistic device that is used to clothe the thoughts of speakers but as a mode of thought that shapes our ideas and ways of thinking. Kenneth Burke (1966) explored the notion of terministic screens, arguing that a choice of terminology is "a selection of reality" and so, in some way, also functions to deflect us from some other perspective on reality (p. 45). Public speakers have long been aware that the connotations words carry have great power. The terms *prolife* and *antichoice* ostensibly refer to the same social movement, but the use of one term or the other offers an important insight into the attitudes of the speaker and may attract or repel listeners as a result. Linguists such as George Lakoff (2004) press the point further, arguing that connotations of words are not just suggestive but can constrain the ways in which we see the world. One example he offers is the phrase *tax relief*. When people hear the word *relief*, he argues, a mental frame is triggered. This frame, or way of understanding the world, sees relief as something good, something necessary for one to escape an affliction. When the frame of relief is brought together with the word *tax*, then that word is understood to be the source of the affliction and whoever can bring tax relief is understood to be a hero. Lakoff argues that discussions about tax policies would be significantly different if the term *tax* triggered a frame related to paying dues or to making an investment. Debates over the nature of language and its effects on the brain are ongoing, but successful public speakers of the 21st century must become increasingly aware of the power of language choices and the ways they influence not only audiences but the speakers' own ways of understanding the world.

Delivery and Memory Guide Nonverbal Connections With Audiences

The canons of delivery and memory address what, for many, are the most anxiety-provoking aspects of public speaking. The dynamic communication process relies on the speaker prompting the interaction by orally and visually

sharing the ideas generated through the processes of invention, arrangement, and stylistic considerations. Giving an embodied presence to these ideas is the only way public speakers have to initiate the meaning-making process with their audience, and it has an impact on the audience's ability and willingness to share in that process. Since a large part of the public speaker's success depends on the speaker's ability to use his or her voice and body and visual aids to project the message, teachers of public speaking have long invested energy in identifying and offering training in the factors that contribute to successful delivery. Eye contact, gesture, stance, facial expression, posture, appearance, volume, rate, pitch, and inflection all play significant roles in the delivery of the presentation and affect the success of the message. Indeed, if listeners cannot hear the message because the speaker is too soft or cannot understand the message because the speaker rushes, no appropriate meaning can be shared. Besides a few fundamental guidelines such as doing nothing that will prevent the audience from hearing and understanding the message, there are few delivery rules that enjoy universal application. Even direct eye contact between speaker and audience, which in mainstream U.S. culture is typically considered an essential feature of successful public speaking, would be considered inappropriate in some other cultures. Since there is no one-size-fits-all practice of delivery suitable for all speakers in all situations, wise speakers take constant note of the successful choices of the speakers they see and work to integrate those behaviors into their own repertoire, reinterpreting a choice to fit their own style and so expanding the possibilities for their delivery in future presentations.

Likewise, strategies for recall during delivery vary widely from speaker to speaker. While there has always been a tradition of impromptu speaking—training speakers to competently deliver ideas with little or no time for preparation, the classical tradition emphasized the need for the orator to develop a knack for memorizing speeches and reciting them as planned. In the United States, writing speeches and committing them to memory or delivering them from a manuscript remained a common practice well into the 20th century. While those kinds of preparation behaviors persist—most often supported by technology such as a teleprompter, other strategies such as outlining and focusing on key words and ideas have a strong following today. Current communication norms put a high premium on the authenticity of speakers. A conversational delivery style supported by brief notes, a rarely consulted outline, and, in some situations, a PowerPoint slide show that blends words and visuals is the most commonly implemented set of delivery and memory strategies.

Evolutions of Public Speaking in the 21st Century

Conceptualizations of public speaking have evolved over time. Today's speakers recognize that they do not simply transfer words and ideas to listeners but rather are engaged in

a complex process of attempting to share meanings among diverse members of an audience. This collaborative process means that public speakers must surrender the belief that they exercise entire control over the meanings constructed by audience members. The greatest challenge facing the contemporary public speaker is to adapt to the changing expectations and needs of their audiences. Emerging technologies are creating new opportunities for speakers to adapt to audiences, but they may also be changing the way audiences process information and create meanings.

The mental landscape of today's audience members has been shaped by regular interaction with a wide range of electronic technologies that may be altering their expectations of public speakers. In industrialized nations, a generation of multitaskers with fragmented attention spans that embrace distractions has come of age; it is also a generation accustomed to easy electronic information access and sophisticated visuals. This is a group whose members have constructed their own homepages and social networking pages with personalized links and in doing so have exercised great power in determining the information, communication styles, and worldviews they see. There is research to suggest that developing strong multitasking skills has both costs and benefits and that immersion in technology affects how people access and process information. For example, a recent study (Adam, Edmonds, & Quinn, 2007) looked at news-reading habits and discovered that today's consumers of online news read as much as the traditional newspaper reader, but they read very differently. The online readers gravitated to innovative structures of information; they were more apt to read a question-and-answer column or a set of bullet points; they also tended to jump from place to place on the screen and follow links. In this way, they created their own narratives from the information rather than taking in the narrative structures created by the reporters. These new habits of mind may mean that speakers need new organizational skills to adapt to listeners who want to, and who have learned to, process information less linearly.

Public speakers also need to develop new strategies for gaining and maintaining audience attention. Integrating more visual elements and more audience interaction into their presentations will help public speakers accomplish their goals. Instead of just talking about the structure of the pyramids of ancient Egypt, today's speakers can offer something like a guided tour to audiences by using a series of images along with oral descriptions. In his lectures on global warming, Al Gore doesn't use a long list of statistics to indicate the historical relationship between carbon in the atmosphere and temperature changes; instead, he illustrates a suggestive relationship with animated lines that are drawn on a screen before the very eyes of his listeners. Anyone with an MP3 player and speakers can incorporate sound to help an audience of naturalists learn to distinguish between the calls of the barred owl and the great horned owl. Asking for a show of hands, using call-and-response strategies, or having listeners participate in other ways will help speakers engage audiences, increasing the

likelihood that the message they are trying to share will be understood.

With so many avenues for gathering information and for communicating ideas open to the citizens of the 21st century, the central questions for an aspiring speaker must be “What is the added value of using public speaking as the means of communication for a particular message? What is it that public speaking can offer that would be absent from a documentary, a narrated PowerPoint slide show, an e-mail, or a blog or vlog posting?” The answer, of course, is the presence of the speaker. There is high demand for the opportunity to experience firsthand the ideas, voice, facial expressions, gestures, energy, and, in a sense, the character of a speaker through the public-speaking context. The physical presence of a speaker conveys a level of attention of the speaker for that particular audience, which is a gift every bit as desired as is the attention that audience is offering to the speaker. The possibility of an authentic connection continues to bring audiences together. In professional contexts, the possibility of interaction with the speaker, through comments or a question-and-answer session, adds value to the presentations of a sales or research team. In civic contexts, the transitory moment of public speaking, though changing somewhat with the advent of recordings and rebroadcasts, remains a real thing for the audience present in the room, who, by sharing the physical space with the speaker and other listeners at that moment, experience something that cannot be re-created. Live public speaking is no more likely to disappear than live music concerts or movie theaters. Despite YouTube, concert videos, DVDs, and home theater systems, the community-building exercise of sharing the experience of a speech, music, or a film is likely to persist.

Technology has and will continue to influence the choices of public speakers and the impact potential of public speaking in various ways. Whether using technology to engage audiences or eschewing it entirely to stand out as a different and still compelling presenter, speakers will continue to exercise a wide range of rhetorical choices. With audience research tools, demographic data, online surveys, and even opinion polling data all at the fingertips of the contemporary public speaker, there have never been more opportunities to “know” things about the audience a speaker intends to address. But making use of this information continues to depend both on training in the fundamental skills of the rhetorical canon and on developing what Aristotle called the faculty of mind that can see the various options for building bridges of meaning between speakers and listeners.

DELIBERATION, DEBATE, AND DECISION MAKING

JAMES F. KLUMPP

University of Maryland

Among the greatest powers of communication is the magnified wisdom and comfort of human choice that comes through disciplined rational interaction. The power to make decisions with others comes from many sources. There is the invoked influence of the rich disparity of experiences and perspectives brought to the communication. There is the variety of observation that comes from different eyes focused on a given moment. There is the variety of interests that makes our choices responsive to the values, wishes, and desires of others. But there are also qualities inherent in the processes that improve decisions: the testing of ideas, the challenging of faith, the exploration of alternatives, and the reaching of consensus. These rich advantages of choice through communication are the products of deliberation, debate, and decision making.

The three terms of this article's title are interrelated. The root of the term *deliberation* is a Latin verb meaning to weigh, to balance. It emphasizes the quality that comes from a systematic approach to choice. Deliberations are also deliberate; that is, they take time, and they proceed carefully. *Debate* emphasizes the testing that characterizes successful deliberation. Today's vernacular use of the term *debate* sometimes invokes a sense of combat, of stressful exchange, and indeed, the word's origin is in a medieval word for "to beat down." But fruitful meanings of the term are broader. They emphasize the responsibility of those engaged in debate to respectfully examine the intricacies of their own ideas and the ideas of others to refine individual experience into a communal product of greater worth. Debate, in this sense, is a productive art in which the ability to sift the quality of ideas is the hallmark of effective deliberation.

Deliberation by debate is also more structured, often with formal rules and often taking place within formal institutions such as Congress or at a monthly meeting of a civic organization. *Decision making* emphasizes the concluding of the process in choice. Decision making through a rich process of deliberation is the focus of this chapter.

The Historical Roots of Deliberation, Debate, and Decision Making

There seems little doubt that shortly after humans acquired the gift of speech, differences of opinion gave rise to choice and the disagreements that often precede it. But in the trail of human development, we mark the emergence of deliberation later. The best research in the Western tradition indicates that systematic study of deliberation emerged in the Greek city-state of Syracuse on the island of Sicily in the 5th century BCE. The citizens of Syracuse threw off a tyrant and founded an early republican form of government. They made deliberation an essential element of democracy. Citizens of Syracuse would gather together and address each other toward making decisions about their lives. They founded basic forms of what we today call courts of law, where issues such as land ownership could be resolved peacefully through a formal process of communication. This emergence of a communicative republican government then gave rise to the essential traditions for our purposes: the systemization or theory of our subject and the teaching of that subject. The theorist/teacher of Syracuse was Corax, who is credited as the first teacher of rhetoric.

Corax studied the process of decision making in Syracuse and advised his student-clients on how to further their and Syracuse's purposes in the assembly and the courts.

But the great systemitizer of decision making was the Greek philosopher Aristotle (384–322 BCE). Aristotle wrote a treatise, *Rhetoric*, that systematically described the role of language in successful human deliberation. Among his great contributions was a tripartite division of the arenas of speaking: the deliberative, the forensic, and the epideictic. The deliberative, Aristotle said, occurs in public assemblies and decides which action is best adopted. It is concerned with the future and addresses the desirability or undesirability of the action at issue. The forensic occurs most obviously in the law courts. It is concerned with the past and attacks or defends someone or seeks to establish the justice or injustice of some action. The epideictic, as Aristotle viewed it, is a ceremonial rhetoric and beyond this article's purview in studying deliberation, debate, and decision making. So powerful was Aristotle's overall view of rhetoric that it dominated the teaching of the subject into the 20th century.

Through the centuries following the classical age, rhetoric turned away from systems of decision making toward other problems. The resurrection of this interest came with the growth of democracy after the 17th century. At its core, democracy requires that communication among citizens be the mode through which society chooses action. Thus, deliberation is privileged, debate is framed within democratic institutions, and decision making is viewed as a public activity. The history outlined above maps this same rise of democracy from the overthrowing of the tyrant of Syracuse through the democracy of Athens. As democracy was reborn in the modern era, it is little surprise that many of the ideas about systematic decision making returned to the classical writings.

As democratic sensitivities spread, so did the prominence of deliberation. By the late 19th century, there was a great burgeoning of organizations in the United States. Civic organizations flourished in small towns and cities across the nation. Business organizations grew with corporate structure spreading throughout the economy. In such venues, meeting and deliberating to reach decisions became an important activity. As a result, interest in the techniques of discussion and debate grew. The first textbooks devoted to debating appeared during this time. Literary societies intensified their debating activities in American colleges.

By the early 20th century, deliberation was a focus of academic interest. John Dewey's (1910) book *How We Think* developed the process of deliberation as a natural human activity. By the 1920s and 1930s, the tradition of debating in literary societies had grown into interscholastic and intercollegiate competition. Debating became a central part of training for leadership. After World War II, deliberation in all its forms—discussion and debating, public and organizational—became an important focus in the study and teaching of communication. Like many subjects in communication, this activity stimulated both research and teaching, and the teaching was both theoretical and practical. Systems

for understanding deliberation and for conducting efficient and effective deliberation became central concerns. The goal of this article is to summarize contemporary ideas that are a product of this long history.

Principles of Democratic Deliberation

Deliberation is a pattern of communication tailored to provide a particular outcome: wise and accepted choice. For that pattern to yield its intended result, certain principles have been defined. Of course, deliberation does function short of full implementation of these principles, but the farther the process strays from their operation, the less satisfying the result. Thus, the principles provide benchmarks for satisfactory deliberation.

Contingent or Probable Choices. Deliberations do not operate with mathematical precision, nor are they appropriate when problems present but one solution. Deliberations occur when there is more than one option, with each option presenting some advantage over others or some probability of outcome that others do not have. In addition, deliberations are richer when different people have different opinions and knowledge relating to the subject at hand. Deliberations, in other words, happen in the presence of doubt or disagreement. Deliberation is a process of creative thinking and critical testing as well as a method for choosing alternatives.

Maximum Access to Participation. Several principles define the conditions of access to deliberation. Obviously, artificial barriers to participation that deprive the interaction of a variety of viewpoints are counterproductive. But in a more positive sense, deliberation is facilitated by the participation of people from varied backgrounds, with varied interests, and with varied experiences. In addition, except for a moderator or presiding officer, the authority of participants should be level to ensure open discussion of issues at hand.

Critical Respect and Cooperative Attitude. Those who participate in discussion on a regular basis know the advantages of comity. This requires respect for the process in which the participants engage and for the participants engaged in the process. Respect for the participants does not mean continual agreement. Indeed, respect requires recognition of the value of probative inquiry, and even disagreement, in the service of the deliberation's goals. Under conditions of comity, exchanges are richly textured with agreement and disagreement, with inquiry into ideas replacing personal sensitivities.

Assumption of Responsibilities in Deliberation. At the heart of deliberation lies a responsibility to critical inquiry. In turn, this critical inquiry necessitates participants assuming the burden of proof and the burden of rebuttal. The former

suggests that opinions expressed should be supplemented with reasons for those opinions. Where appropriate, deliberations should be based in facts relevant to the question at hand. Values and preferences underlying particular positions should be explained as well. The burden of rebuttal affirms that when satisfactory reasons are provided, there is a counterresponsibility to probe the reasons. Thus, the two burdens define the texture of exchange in deliberation.

Pooling of Judgment. Deliberations are defined by a commitment to an outcome shared by the participants. Participants may themselves have objectives in the deliberation; indeed, strenuous advocacy for a position often improves the likelihood of achieving the shared goal. But participants also recognize the primacy of a successful outcome to the purposes of deliberation.

In some cases, particularly in a structured debate, these principles may be formally instantiated into rules of conduct. But even when no formal rules dictate the following of these principles, acknowledgment of their influence on the quality of the deliberation marks the participation of discussants who contribute the most to successful deliberation.

A Vocabulary of Deliberation, Debate, and Decision Making

Deliberation, debate, and decision making are communicative patterns of everyday human experience. They are stylized accomplishments. That is, those who participate in deliberation do so in anticipated, coordinated patterns toward a specific end. To understand this process, perhaps the best avenue is to explore the specialized vocabulary that describes and structures the interaction.

Characterizing the Interaction

Deliberation. The term *deliberation* describes the process in which communicative exchange refines human understanding and leads to human choices. Deliberation is marked more by its goal than by its style. A wide range of specific behaviors contribute to accomplishing the goal.

Debate. Debate is a heavily structured style of deliberation. A strict set of rules defines the sequences and limits of interaction. Debates are often structured as a two-way pro-and-con deliberation over a defined proposition, in the debate context often called “the resolution.” The parties to the debate may be assigned responsibility for supporting or opposing the resolution that structures the debate. Typically, debaters take turns presenting arguments for or against the proposition. The speaker who is appropriately speaking at a given time in the debate is said to “have the floor.” The order of speaking may be decided or assigned and times designated for each speaker before the debate begins. Rules may or may not permit others to interrupt the

speaker who has the floor. There may also be opportunities structured into the format for the debaters and/or their audience to question other debaters. Often, debates will have a moderator or a chair, whose responsibility is to remain an unbiased enforcer of the rules.

There are different forums that are characterized by debate. One of the best known is governmental deliberative bodies such as Congress, state legislatures, or local councils. In these, debates typically revolve around a proposed law, policy, or resolution that the body is considering. Members may support or oppose adoption. Rules of procedure are well-defined, often beginning with general rules of parliamentary procedure, which are then supplemented or refined by the body itself. Whether there are time limits for having the floor and restrictions on the order of speaking depends on the rules of the assembly. Arguments in these debates are addressed to the chair, who presides and enforces the rules of the assembly. Only at the local level is interaction with nonmembers of the body permitted in the communicative exchange, and at that level, it is often limited. Following the debate, the members of the assembly cast votes on the policy or resolution before the body.

Another notable forum for debate is competitive academic debate. Such debates are conducted before a judge, who decides at the end of the exchange “who has done the better job of debating.” Speeches alternate between those supporting and those opposing the resolution. Sometimes debaters are permitted to question each other or are asked to address questions generated by their audience. Time limits are typically strictly applied. Speeches by the debaters may be separated into *constructive* speeches, in which the debaters present reasons for or against the resolution, and *rebuttal* speeches, in which no new arguments may be presented, only responses and challenges to the arguments of the opposing debaters and reestablishment of one’s own arguments.

Since 1960, with only three exceptions, candidates for president of the United States have engaged in debates. The practice has penetrated to lower governmental elections as well. These debates are highly structured affairs with rules established in negotiations between or among candidates, with varying imposition of the rules by members of a sponsoring organization. Often, commentators question whether these exchanges are debates at all. They typically pass from issue to issue in the course of the debate without having a single proposition at their center unless, of course, it is the tacit proposition that “[the candidate speaking] should be elected.” Candidates may address a moderator or those asking questions, but rules typically do not restrict speeches to the questions being asked. Debates often occur several times in the course of the campaign, and the deliberative judgment consequent to the debate is the election of one of the candidates to the office contested.

There are variations on all these forums. Often, a sponsoring group will organize a debate with pro and con speakers on their chosen topic simply for the benefit of public education. In 1993, for example, the television interviewer Larry

King organized a debate between Vice President Al Gore and the businessman and former presidential candidate H. Ross Perot. The Vice President supported and Perot opposed the proposed North American Free Trade Agreement (NAFTA). Such forums have public education as their primary purpose, although certainly the example given here had an indirect purpose of influencing congressional approval of the agreement.

Discussion. Discussion is a less structured style of deliberation. At its extreme, there are few rules beyond tacit understandings to hear out the opinions of others, and even those tacit understandings are sometimes violated. In many cases, discussions are spontaneous, without preliminary agreement on propositions or issues. Such loose discussions often lack focus, and their classification as deliberation may even be in doubt.

More formal discussions may be organized when understanding of some situation has not reached the clarity to formulate a specific policy for debate. For example, a parent-teacher association may gather to discuss the following: Are there behavioral problems in our school? And, if so, what should we do about them? Such a discussion may be carefully guided to sequentially consider the following: Is there a problem? If so, what is its nature? If so, what are some alternative approaches to address it? And which of these would be a better approach?

At some point, the ideas behind discussions and debates merge, with the defined focus and the extent of rule-governed procedure defining the frontier between them. The choice of term to apply to the deliberation may, in fact, be a response to the pejorative use of the term *debate*. Some proponents of deliberation seeking to open the process to better achieve some of the principles of deliberation employ *debate* as a counterpoint and prefer *discussion* as the term to describe the rules of interaction that they establish. Thus, the differentiated use of these terms may not be strictly descriptive of distinctions in the process of deliberation but may become part of a strategy for imposing particular rules for the exchange.

Decision and Decision Making. Typically, *decision* points to the achievement of the choice that is the objective of the deliberation process. “Decision making” fixes the character of the deliberation as a process with the decision as the product.

Defining the Responsibilities in Deliberation

Once the character of the deliberation is defined, additional terms help guide participants in understanding their responsibilities in such an exchange.

Advocacy. If deliberation is to be an expansive, encouraging, and critical environment for ideas, the participants in the interaction must engage fully. This responsibility to present and provide reasons for judgments and beliefs is advocacy. At times, this responsibility may be taken to an extreme—to

do whatever is necessary to achieve one’s own prejudged outcome—but a more satisfactory conceptualization recognizes that the responsibility is to the interaction and that the advocates’ responsibility is to maximize the values of the interaction, including fully engaged support for various positions by each advocate. Only with all advocates in a deliberation engaged are the advantages of deliberation sustained.

Burden of Proof. The responsibility entailed in the burden of proof is often stated as “he who asserts must prove”; that is, the responsibility of an advocate is not merely to offer claims and opinions about the subject but to provide reasons for those statements targeted to persuade others in the interaction. The burden of proof grows from the responsibilities of participation in full deliberation.

Burden of Rebuttal or Response. The responsibility entailed in the burden of rebuttal is the critical responsibility. Participants in the interaction share a responsibility to fully test and expand the positions introduced into the deliberation. Deliberations require engagement. This obligation extends beyond the responsibility to tell others when they are wrong. It demands more subtle exploration of probability and desirability to locate the nature and extent of an issue as fully as possible. Successful exercise of the burden of rebuttal then establishes a burden of response as the deliberation moves forward. Together, these burdens of proof, rebuttal, and response define the necessity for full engagement by participants in a deliberation.

Guiding the Structure of Deliberation

I have introduced some terms in the definitions above that provide productive as well as analytic value. When used in deliberation, such terms establish a process for productively structuring the *content* of deliberations.

Questions or Propositions. Deliberation operates most efficiently to achieve its goals when the process is focused. One way of defining that focus is by defining, as a first step, the question to be answered through the deliberation—for example, Is the evidence for global warming sufficient to require public attention? Often such a question is defined by those who organize the deliberation or by a subset of the deliberators. For example, typically legislative bodies have rules to restrict debate to the bill or resolution before the body. Another variation presents the question in the form of a *proposition*, a short unambiguous statement of fact, value, policy, or judgment to be tested through the deliberations—for example, Offshore drilling for oil on the continental shelf should be resumed. In contested academic debates, the limitations on debate are defined by a *resolution*: Resolved, that federal policy should encourage the development of alternative sources of energy. In all cases, the focus provides an orientation that limits deliberations to germane matters.

Once the question or proposition is defined, a typology of propositions helps guide the deliberation. A proposition of *fact* turns on an empirical dispute susceptible to resolution by collecting and testing pertinent evidence—for example, Carbon-based gases in the atmosphere are having a significant influence on the world's climate. To be advanced by deliberation, such propositions must have a complexity that requires more sophistication than mere sensory observation. The example benefits from careful consideration of various interpretations of climate and of the relationship of natural cycles and man-made effects and from different opinions about the tipping point of global warming. In short, contingency and probability are debated by informed participants to further understanding of the proposition.

A proposition of *definition* turns on a question of how words are to be used—for example, Pluto should not be considered a planet. These propositions recognize the ways in which vocabulary organizes various human activities—in our example, astronomy—and refines definitions that guide communication within those activities. This proposition was debated by the International Astronomical Union in 2006 to clarify how planets would be defined. In the end, this body clarified the definition of *planet* and reclassified Pluto from planet to dwarf planet.

A proposition of *value* turns on a question of the importance of principles of morality in a context—for example, A spirit of community enhances the quality of life. These propositions go to questions of right and wrong, the desirable and undesirable, the important and unimportant, and similar choices. Often, debates over questions of value attain their importance not from a final resolution of the propositional content but from the understanding and clarification they provide in the terms they explore. In the example, the debate may foster appreciation for the value of community or greater understanding of what quality of life represents.

A proposition of *policy* or *action* turns on whether following a particular policy or taking a particular action is beneficial—for example, The federal government should provide health insurance to all citizens regardless of employment status. Policy propositions are the most complex of propositions, entailing facts and values as part of the process of reason giving. In a debate, a well-formed proposition of policy usually names an actor and specifies the action to be taken. The terms *should* or *ought to* are signs of such propositions. Questions for discussion may focus more on problems and have less specified actors or actions than is typical in debate. For example, a discussion of food-vending policies in a school may not even begin with a presumption that there is a problem, although the fact that the discussion will occur indicates that someone believed so. But the discussion will take it up as an early issue whether or not there is, in fact, a problem. The purpose of such a discussion rests at the stage of developing and legitimating a public concern.

The types of propositions do not affect the function of the proposition—providing a focus for the discussion—but

do become important in identifying the issues that guide deliberations.

Issues. The term *issues* is a common vernacular term in disputes. The meaning in deliberation is no different from the everyday definition. The interaction between a proposition and its subject matter provides natural seams where deliberation develops. These are called *potential issues*. Such issues are potential because they may or may not be disputed in a particular deliberation. For example, a deliberation over the health insurance proposition cited above has the following among its potential issues: Are there citizens who do not now have insurance of some kind? Are their numbers significant? Is insurance the proper way to provide access to medical care? Should the federal government establish an insurance program or facilitate its provision through private sources? Can the federal government afford to provide such insurance? How will it do so? Will such a system significantly improve the nation's health? Note that the issues are posed in terms of questions that can be answered in deliberations. This is a common way of expressing issues.

One of the ways in which potential issues are identified is through a system known as *stock issues*. The use of stock issues begins by identifying the type of proposition at dispute: fact, definition, value, or policy. Then, a set of generally stated questions specific to that type are applied to the specific subject matter of the proposition to indicate potential issues. For example, one scheme of stock issues for policy propositions poses the following general questions: Is there a problem? Is the problem significant enough to deserve attention? Is there an action that will remedy the problem? How significantly will the action remedy the problem? Are there other reasons the remedy should not be followed? These stock issues generated the potential issues specified in the example of the health insurance proposition above.

Typically, deliberations do not exhaustively treat the issues on a proposition. Positions on some issues are easily agreed to by all in the deliberation. Other issues take on such importance that the time limits place a premium on those issues over others as the deliberation proceeds. The issues that, in fact, mark a deliberation are referred to as *actual issues*. Thus, actual issues are a subset of potential issues. The concept is central to the participants in the interaction because the actual issues define the topics that require attention in a particular deliberation. A useful classical term for these actual issues is *stasis*: the points of dispute on which the decision turns.

Issues function in several ways in managing deliberation. Perhaps most important, issues, like propositions, provide a focus to the deliberation. Where propositions help define its relevance, issues organize it by identifying points of focus to be tracked through the deliberation. The speakers participating in the deliberation typically identify the issue that they are addressing as they move through a presentation. Thus, issues become a kind of signpost for advocates to organize their presentations, which is particularly effective because

issues tie directly to the deciding factors in the deliberation. Within the texture of a deliberation, issues also assist in differentiating the importance of various arguments. In a sense, issues are the units within a deliberation on which questions of importance turn.

Issues also help organize a deliberation vertically. That is, we have not only issues but also *subissues* in a deliberation. The relationship between issues and subissues is the same as the relationship between propositions and issues: The outcome of issues turns on the subissues defined as potential or actual and is often determined by a scheme of stock issues.

Finally, issues are useful as a bridge between deliberation and decision making. They help bring the various arguments within a debate into an overall pattern that permits a decisive outcome. Except for the statement of the question or proposition, no element of a deliberation is as central to orderly and efficient deliberation as management of issues.

Terms Managing the Structure of an Argument

A final set of terms invoked in deliberation manages the presentation of ideas, the provision of reasons for supporting an idea, and the testing of those reasons.

Position. A position is a particular claim about an issue. Any particular issue may lend itself to one, two, or many different positions. Typically, a position is a declarative statement that articulates an advocate's belief or conclusion on the issue. Positions, in turn, define the actual issues in a deliberation. The impact of effective statements of position is to clarify the issues that differentiate the various possible outcomes.

Argument. The term *argument* has several vernacular meanings. One is a heated exchange among people—"having an argument." Full deliberation is, in fact, an argument among people. Orderly argument may lack the anger but not the intensity of this meaning. The other major meaning is to give reasons for something—"making an argument." It is this sense in which arguments are the basic unit of deliberation. Responsible advocates present arguments in the deliberation.

An argument consists of a claim and its explication. The *claim* is a succinct statement of the advocate's belief or judgment. The claim is what the advocate seeks to prove. Typically, a speaker opens presentation of an argument with a short, succinct statement of the claim. The *explication* follows. The explication is an appropriate combination of four different responses to the need to prove an argument. The *significance* of the argument explains why the argument is important to the issue at dispute. The *explanation* provides the elaboration of the ideas necessary to make the argument clear to those engaged in the deliberation. Explanations may illustrate, define terms, divide the question, or make other moves that help to clarify. The *proof* provides reasons for believing the claim. A well-constructed argument then ends with a statement of what has been established through the

presentation of the argument. This final step is often called the *clinch*. Consider the following example:

Our current system of health care leaves a large number of citizens without the advantages of health insurance. According to the Health Insurance Association of America, 43 million Americans now lack an insurance mechanism, through individual purchase, an employer, or a government program. Certainly so many of our fellow citizens, uninsured and forced in the face of health problems to choose care or some other consumer commodity, deserve our public concern.

This argument opens with a statement of the claim. The second sentence provides proof, in this case a combination of authority and statistical proof. The statement reporting the statistics ends with an explanation of the meaning of "without insurance," a recitation of the various ways citizens can acquire insurance. The final statement not only clinches the argument but also asserts the significance of the argument to the issues—indeed, to the proposition—by posing the choice faced by the uninsured.

Proof. The notion of proving one's assertion is so basic to deliberation that additional terminology governs exchanges over the sufficiency of proof. Those who study argumentation identify several characteristic ways to give reasons for, or prove, claims. Some of the most important are as follows:

Example. Examples have more impact as illustration than as proof. When Congress was deliberating health care, one common strategy was to provide an example of Americans who found themselves requiring treatment, not having insurance, and suffering long-term economic hardship in addition to their health difficulties. These narrative accounts often contained much emotion and stimulated empathy for the subject of the narrative, thus helping prove the reasons why health care was needed. As proof, examples are only as strong as the typicality of their content.

Analogy. An analogy is a comparison between two situations designed to carry the known qualities of one situation into another. Analogies between the Canadian and American health care systems, for example, may be called on to support or oppose government programs. As proof, analogies are only as strong as the degree and essentialness of similarity between the compared instances. Deliberations in which analogy is central often turn on the details of such similarities.

Authority. Authority relies for its power to prove on the expertness of the source of the information. The argument in the example above about the number of Americans without insurance relied on the authority of the Health Insurance Association of America. Proof by authority often evolves the issue under deliberation to the expertness of the source or the source's degree of knowledge of the situation.

Principle or Generalized Fact. This strategy of argument relies on reasoning from the general to the more specific.

For example, an argument in favor of banning smoking in restaurants may use the health risks of secondhand smoke as a reason for supporting the ban. The strength of such proof relies on the belief in the principle or generalized fact.

Evidence. Evidence is specific information brought into the deliberation and related to the claim in the process of giving reasons. In a sense, the various forms of proof listed above differ because they have different types of evidence at their root. The details of an example are the evidence for the argument from example; the details of an analogous situation for the argument by analogy; the statement of the expert for the argument by authority; the principle or generalization for the argument from principle or generalized fact. Thus, one scheme by which evidence is differentiated is the type of information employed in the argument.

There is a second important distinction in types of evidence: Direct evidence, sometimes called experiential or enthymatic evidence, has its power because the participants in the deliberation have experienced the fact personally. In a technical sense, such argument is not argument by authority, since the power of the argument turns on direct experience. Primary evidence is, however, an argument from the authority of the speaker. The evidence is primary when the speaker reports his or her own observations. Secondary evidence is an additional step removed, the speaker cites someone else as an authority for the proof. Generally, the closer the evidence is to those in the deliberation, the stronger it will be as proof, although this principle is modified by the relative authority of the sources.

One other type of evidence worthy of attention is statistical evidence. Typically, statistical evidence is coupled with authority proof, as it was in the example above, which combined a figure on the number of Americans without health insurance and the authority of the Health Insurance Association of America to provide proof. Statistics may be descriptive or inferential. Descriptive statistics merely describe the dimensions of a problem. Indicating that 43 million Americans lack health insurance is an example of descriptive statistics. Inferential statistics are a form of proof of relationships. For example, a report analyzing how exposure to secondhand smoke raises the incidence of cancer uses statistical procedures to support a link between the smoke and cancer.

The above terms provide a texture for describing and participating in deliberative processes. They are not merely terms useful for studying the phenomenon but are key strategic resources in shaping the deliberation toward the objective of a decision. They form a metalayer of the process, apart from the subject matter, that directs and organizes the activity. Thus, they are an essential component of deliberation.

Recent Research in Argumentation

In the late 20th century, few areas of communication research have been as active as argumentation. Argumentation studies

focus on the role of reason in human communication, and thus on the processes of deliberation, debate, and decision making. Several approaches interact in this research tradition.

Historical and Critical Studies of Public Deliberation. Historical studies investigate the origins of the positions and issues that have marked the turns of national and local history. Critical studies seek to enhance understanding of the role that deliberation plays in modern public issues. For example, since 2001, interest has been high in the role of argument in historical deliberations about war, with particular attention to the justification for the war in Iraq (see, e.g., essays in Riley, 2007).

Public-Sphere Studies. Jürgen Habermas's work in argument has stimulated research on the preconditions and processes for healthy public participation in governing society. Habermas's original work (1962/1989) located the central place of the public sphere in the emergence of democratic forms of government in post-Renaissance Europe. This work stimulated a number of critiques revolving around the exclusions that became a part of the history of democratic deliberation (see, e.g., essays in Calhoun, 1992). Feminist critiques (Fraser, 1992) and critiques of the exclusion of minorities (Black Public Sphere Collective, 1995) led to an understanding of how a political system is composed of multiple public spheres in which citizens acquire a voice that they take to deliberation. Meanwhile, Habermas's work turned toward a project to develop a normative theory of deliberation (1981/1987, 1988). He was interested in developing a mapping of the assumptions and procedures that define what has been called "emancipatory discourse." Habermas's normative theory seeks to connect the democratic goals of deliberation with the institutions of contemporary society.

Argumentation Theory. The late 20th century was a time of great flowering in the study of the ways in which people make arguments to prove claims and weave those arguments into a texture of everyday life. Spurred by seminal work by Stephen Toulmin (1958) and Chaim Perelman and Lucie Olbrechts-Tyteca (1958/1969), Aristotelian notions of argument gave way to more sophisticated understandings of argument throughout the institutions of society. Toulmin's work contrasted the understanding of formal logic with what he called "working logic." Toulmin worked on a theory of the latter, and by 2000, his model for argument, featuring the key terms of his layout of argument—data, warrant, and claim, dominated teaching in argumentation. Perelman and Olbrechts-Tyteca stressed the role of audience in argument. They portrayed argument as less a response to subject matters and more a response to those whom arguers seek to persuade. An important branch of argumentation theory has been informal logic, a branch of logical studies grounded in Toulmin's distinction of a working logic, thus

the logical moves with which humans craft arguments to influence others.

Pragma-Dialectics. European work on argumentation has been particularly influential in developing this branch of argumentation research. Pragma-dialectics stands out for its methods of study, seeking to develop a set of rules that, taken as a total system, describe the process of argumentation (Grootendorst & van Eemeren, 2003). In their search for normal modes of argument, pragma-dialectics share a perspective with Habermas's later work toward a normative theory of deliberative argument.

Social Scientific Study of Argument. In the United States, a growing circle of social scientists have been studying the modes and methods of the human accomplishment of argument. Their work approaches the problems of resolving conflict and achieving influence through argument as a human accomplishment to be understood in relationship to a theory of action. In many cases, they borrow concepts and ideas from traditional theories of argument and study the influence of those concepts on the argumentative texture of people's lives. In other cases, they begin their study in the performance of argument itself, seeking to understand how arguers conduct the natural process of making arguments. (For examples, see Riley, 2007.)

Pedagogic Studies in Debate Training. A final approach to argumentation works to map the direction of contemporary approaches to teaching deliberation and debate and to refine that process. For example, one recent work studied the influence of new technologies on the practices of academic debating (Voth, 2005).

The vitality of research in argumentation comes from the many strands of research that come together to focus on the processes of deliberation, debate, and decision making. The theory that has shaped our understanding of this practice comes under review not only to refine traditional approaches but also to question the basic approaches that have been instrumental in its development and seek new ways of understanding the process. The practice of deliberation, both historical and contemporary, comes under scrutiny to understand the process of rational decision making and also to map the ways in which deliberation has shaped political and social history. And the techniques with which we have sought to teach the skills of deliberation have come under scrutiny to understand their limitations and to suggest alternative methods for approaching the task of passing the skills of rational decision making to a new generation.

The Venues for Deliberation, Debate, and Decision Making

At the heart of the prominence of deliberation is a democratic spirit. The democratic ideal expresses faith in the

benefits of people coming together to pool their knowledge and judgment in the service of better and more accepted decisions. Obviously, then, one of the most prominent places where deliberation, discussion, and debate form a texture of decision making is in the public business of democratic government. In the idealized New England town meeting, citizens gather to make the decisions that govern their lives in a well-defined and historic institution. Representative bodies, from school boards to Congress, are more common venues for democratic governing. Nearly all such bodies are guided by rules that structure an open, democratic deliberative process. Even when supplemented by cloak room or executive sessions, there is a public dimension to such meetings.

But deliberation in a democracy extends beyond the formal venues of democratic bodies. Local schoolboards, planning boards, councils, commissions, and task forces conduct hearings where advocates present positions bearing on the question before the body. Parents may gather in a school auditorium to explore the behavioral problems at their school, the food served in the school cafeteria, or even the importance of sports or the arts to their children's education. Democracy spawns a large number of venues in which citizen input is structured through variations in the process of deliberation to ultimately influence governmental decision making.

But the spirit of democracy has infiltrated beyond formal governments. Deliberative processes are an important part of business organizations. Meetings are held every minute throughout business institutions in which the processes of deliberation are guiding the decision-making process. Even in instances where the decisions themselves are not democratic, where a leader assumes ultimate responsibility, wise leaders organize deliberation to inform their judgment. Public corporations ultimately report to stockholders' meetings, which, although often formalities, can on occasion become lively venues for deliberation. In between the small working group and the stockholders' meetings are layers of meetings with various degrees of openness in which deliberation proceeds and decisions are shaped.

Alexis de Tocqueville observed during his visit to the United States in the 1830s that Americans were joiners. A patchwork of voluntary organizations infiltrates all aspects of American life, from service organizations, such as the Lions or Kiwanis, to associations of bird watchers to nongovernmental advocacy groups, such as the Wilderness Society. Such groups deliberate throughout their processes and often hold deliberative programs to inform citizens of their issues as well as to urge citizen participation in effecting solutions to the common or complicated problems of life.

In short, deliberation, discussion, and debate are ubiquitous features of modern life. The public dimension of everyday life brings people into contact with others, communicating about mutual concerns with a wish to influence the course of their lives through the contact. This public dimension is enriched through participation in the opportunities for deliberation provided by the institutions of society.

CONFLICT MANAGEMENT AND MEDIATION

LINDA L. PUTNAM

University of California, Santa Barbara

Conflict is clearly a part of our everyday lives. Whether at home, school, or the office, people often differ with one another about what actions to take, how to implement them, or how to lead their lives. Conflict arises at the interpersonal level when two people have perceived incompatible goals, misunderstanding about their relationship, or different ways of assessing and behaving in situations. These disagreements arise in family settings, friendship interactions, and organizations. School and work settings have developed peer conflict management programs and workplace dispute resolution systems, respectively, to handle the personal and financial costs of escalating conflicts. Differences among groups in community problem solving also lead to ongoing conflicts in discussions about protecting the environment, urban development, and moral dilemmas over abortion and gay rights. At the national and international levels, differences in culture, religion, and territorial rights become sites of conflict amid constantly changing social, economic, and political conditions.

In general, people have a negative view of conflict and treat it as disrupting social and personal relationships. When individuals depict conflicts, they use negative images such as war, explosion, storms brewing, and struggles, as evident in statements such as “He *attacked* my point of view,” “We met in a *battle* of the minds,” “She *blew up* at me,” and “Her anger was like a *cyclone*.” These images cast conflict as abnormal and harmony as normal (Wilmot & Hocker, 2001). In actuality, conflict is not only inevitable but also normal and natural.

Other views of conflict treat it as a game in which people “bat ideas around” or engage in a “give-and-take exchange”

to make a deal. Although the game image presumes that conflict is inevitable, it does not treat it as beneficial to society. Descriptors such as *helpful*, *enriching*, and *growth promoting* rarely appear in individuals’ descriptions of conflict.

Conflict is clearly a natural and important element in society because it forms the grounds for change and collaboration. Conflict aids in relieving tensions, generating creativity, correcting injustices, and balancing power. Treating a conflict as a *dance* that entails *learning the moves* or as a *dialogue* that involves *talking it over* and *understanding the other person* are ways to drop the negative images and promote positive attitudes toward conflict management. These positive orientations to conflict are vital for developing effective communicative practices in conflict management.

Definition and Characteristics of Conflict

Conflict is a particular type of social interaction, characterized by opposite goals, interests, or values. For a conflict to exist, only one party has to see the situation as incompatible, even if the parties’ goals are not truly in opposition. Moreover, the conflicting parties need each other to achieve their goals, or they would leave the situation and go elsewhere. Their need for each other means that either party could block the other one from achieving his or her desires. For example, John and Mary want to spend their vacation together, but they want to go to different places on their holiday. If John believes that they

should vacation in the mountains and Mary wants to go to the beach, the couple may argue and decide not to take a vacation at all or to take their holiday separately. Both choices are unsatisfactory outcomes and block the achievement of spending their holiday together.

Since the two parties need each other to achieve their goals, they enter a conflict situation with a simultaneous mix of both cooperation and competition. John and Mary cooperate because they want to spend their vacation together; yet they compete in holding different, and presumably opposite, individual goals. Hence, to work through their conflict, they must simultaneously compete while cooperating. This mix of opposite motives contributes to the tensions that push and pull on the parties during a conflict and lead them to find a balance between the opposing poles. Too much competition may lead to escalation of the conflict, while too much cooperation may lead to giving in and feeling exploited by the other person.

Engaging in conflict then is a balancing act. Like walking on a tightrope, the parties want to balance in the middle rather than swing too far to the left or to the right and eventually fall off the rope. Like tacking a sailboat, the parties need to capture the force and energy of the wind and steer the boat in the right direction in order to avoid being blown out to sea or losing control. So parties balance cooperation and competition to avoid escalating a dispute and feeling exploited.

Disrupting this balance also shows how a conflict becomes destructive over time. When this occurs, the conflict increases in the number of issues, the number of participants, and the costs that disputants are willing to bear (Deutsch, 1973). Issues begin to multiply and blur together, and disputants involve other resources to defend their positions. As the conflict escalates, the parties becoming willing to sacrifice more, take more risks, and hold fast to their original positions. As disputants lose sight of their original goals, they engage in conflict interactions to win or to hurt the other party rather than to work through a problem; hence, destructive conflicts typically end in win-lose or lose-lose situations. In contrast, productive conflicts move in a direction of added flexibility, broadening learning and insights about each other, and increasing trust and respect. Productive conflicts focus on learning, growing, and developing new insights about complex situations.

Communication and Conflict Interaction

Another source of constructive and destructive conflict is the pattern of social interaction that stems from each person's response to the other party's moves and counter-moves. Social interaction refers to what the parties say to each other, the information they exchange, their nonverbal behaviors, the meanings and interpretations of the situation, and the nature of their communication system. In one sense, communication constructs conflict through the ways the parties develop patterns of interaction over time. These patterns form a set of messages in which one person initiates a

concern and the other person responds to this message. This message-response pattern develops into habitual and repetitive ways of interacting that can become automatic or instinctive over time.

One pattern or sequence of messages that leads to a destructive cycle is a conflict spiral. For example, if one party threatens the other person and this individual follows with a counterthreat, the interaction develops into a competitive spiral that grows in intensity. Even an avoidance response, followed by continual withdrawal, can result in a conflict spiral, if the parties continue to ignore important issues and yet must act on them. Moreover, a destructive spiral acquires a momentum of its own. Each time the parties enter into a conflict, they draw from their past patterns to shape future actions. Once involved in a conflict spiral, parties struggle to break it and to avoid returning to it in future interactions (Folger, Poole, & Stutman, 2005).

Just as social interaction shapes conflict, conflict patterns rooted in society influence communication. Since conflicts arise from our lived experiences, issues of race, class, gender, and culture shape the language that we use, the positions from which we talk, and the symbolic meanings of who we are and how we relate to others. Thus, societal conflicts impinge on communication and shape particular types of social interaction that can develop and perpetuate expressed struggles. Overall then, conflict and communication exist in a reciprocal relationship. Social interactions shape the nature of conflict, while conflict and tensions in social settings impinge on communication.

Goals of Conflict Management

Communication is also the foundation for managing conflict constructively and effectively. Thus, one goal of conflict management is to develop communication competence to engage in conflict situations in constructive ways. Specifically, being mindful of the process, knowing how to gain information from the situation, and making deliberate and conscious choices to avoid harming or exploiting others are important skills for managing conflict effectively. People who lack this competence to handle routine conflicts are more likely to rely on aggression than cooperation to attain their needs (Canary & Lakey, 2006). Individuals who are competent in addressing conflicts are flexible in their approaches, assess their situation accurately, and choose the behaviors that will help all parties in the situation. They follow appropriate rules and fulfill expectations, and they aim for win-win solutions or mutually acceptable settlements.

A win-win solution is one in which both parties get their needs met through the conflict management process. Each person sees the outcome as satisfactory and gets something out of the settlement; thus, the parties gain more from working together than if they resolve the problem individually. To apply this idea to the vacation example, John and Mary reach a win-win settlement if they decide to vacation at the beach this summer and go to the mountains for a vacation in the winter. This solution satisfies the needs of

both parties, and John and Mary get to spend their vacation together. This solution, however, is satisfactory but not optimal. To reach an optimal settlement, the parties would have their needs met at the same time rather than delayed. Optimal settlements typically result from learning that occurs through communicating effectively during the conflict. They probe to find out what they want from a vacation and why; they explore underlying needs that might not be evident on the surface of their requests. Trading off different seasons to go to the beach and the mountains asks one person to wait to meet his or her goal for relaxation or recreation. If the parties continued to talk, generate alternative solutions together, and think creatively about the problem, they might discover different options. An optimal solution in this case would be to find a vacation spot in which both the mountains and the beach are available to the couple. In this way, both parties could have their needs met simultaneously rather than in a delayed fashion.

Another goal for conflict management is helping parties transform or change their situations. Transformation refers to using conflict processes to change the ways parties see the conflict, how parties view their relationship, or how parties relate to each other. Transforming conflict differs from traditional goals in that it focuses on the underlying relational and identity concerns rather than on solving problems or reaching settlements. Transformation also makes use of different types of communication, those centered on dialogue, clarifying understandings, and reflecting on relationships. Dialogue aims at working through difficult issues, exposing and discussing deep-seated feelings, and developing new social realities and relationships. At the societal level of ethnic and social conflicts, transforming conflict entails recognizing the humanity of the other person or group, creating a new moral order between the parties, and basing relationships on mutually beneficial arrangements (Ellis, 2006).

Types of Conflict Management

The goals of developing competence, reaching satisfactory solutions, and transforming situations surface in three different types of conflict management: negotiation, mediation, and dialogue. The three types vary in definition, use, approaches for managing disputes, interaction patterns, and context issues pivotal to conflicts.

Negotiation and Communication

Negotiation refers to two or more people who work together to reach decisions, typically through exchanging proposals and counterproposals. A proposal refers to an offer that one party puts on the table as an option for reaching a settlement. The two parties exchange positions based on their estimates of the other party's behaviors and intentions; hence, negotiation is a strategic activity for making decisions about substantive issues in disagreements and disputes.

Negotiation Use

Initially commonplace in labor-management environments, negotiation was the primary way opposing parties settled issues such as wages, fringe benefits, and contractual relationships. It has been a widely used forum in international diplomacy and trade agreements. Efforts in the 1980s to reduce U.S. emphasis on litigation led to inclusion of negotiation training in the college curriculum in management schools, in public administration, and in law programs. With these changes, negotiation became an everyday organizational practice, one used in legal transactions, environmental and regulatory arrangements, buyer-seller activities, customer relations, and mergers and acquisitions.

Moreover, negotiation infuses everyday activities in the family, the workplace, and community life as individuals work out role assignments and routine endeavors. In environmental and governmental situations, it has become a way to develop general rules on proposed policies in advance of engaging in an actual conflict. Overall, negotiation is no longer limited to formal conflict management. Rather, it permeates everyday activities; hence, communication plays a vital role in shaping negotiation processes and outcomes.

Negotiation Approaches

Distributive and integrative bargaining are two approaches commonly used in negotiation. Derived from Walton and McKersie's (1965) classic research, distributive bargaining refers to the process of claiming value or dividing resources, particularly when the pool of resources is seen as fixed or limited to a specific amount. In distributive situations, parties try to maximize how much they will gain in a situation and minimize how much they will lose. Negotiators argue for the benefits of their positions, manage the other parties' impression of them, and avoid revealing any information that might make them look weak. Buying a used car provides an example of distributive bargaining. In this situation, both the buyer and the seller want to highlight their options, withhold their bottom line, and try to persuade the other side to give in. Some approaches to distributive negotiation, such as continuing to hold firm on a position, attacking the other party, and pushing too hard for concessions, result in unsatisfactory agreements or in no settlement.

Integrative negotiation, in contrast, focuses on creating value and expanding the resources available for a settlement. In integrative negotiation, parties strive for a mutually acceptable settlement that provides gain for both of them; hence, they focus on what they have in common and ways to meet each other's needs and interests. Engaging in problem solving, seeking information about priorities and needs, making concessions, and supporting the other party's ideas exemplify integrative processes. These processes are likely to yield benefits for both negotiators. For example, the management of a company that is losing money might propose to downsize a certain number of employees. The union, in

turn, might respond by recommending that the company reduce the salaries of upper-level managers. If the two sides engage in an integrative approach to negotiation, they might reach a mutually satisfactory solution through deciding to cut costs in production, proposing a program of early retirement, or requiring mandatory furloughs for everyone.

These integrative outcomes move away from both parties' original proposals. In the above situation, the parties share the common goal of company survival. As they discover this goal during the negotiation process, they realize that their original proposals would not be satisfactory to both sides, and they search for other options that would save money, help the company survive, and be mutually beneficial for both sides.

Interaction Patterns in Negotiation

Most negotiations are not purely distributive or completely integrative; rather, they entail a combination of both processes. Communication plays a vital role in defining how the two processes emerge and interrelate. Willingness to exchange information, especially about multiple issues and priorities of needs, is closely aligned with integrative processes, while arguing for one's position, asking for concessions, and debating the other side's options are typically aligned with distributive interactions. Both types of communication are necessary to attain individual needs and common goals and to avoid feeling exploited. Yet distributive tactics that turn into attacking the other side, locking firmly into position, or making excessive demands are likely to escalate the conflict and will result in no settlement.

Communication strategies, then, are also contingent on the ways negotiators respond to each other and on how their interactions develop over time. Specifically, in distributive processes, negotiators can avoid escalating a conflict by using strategies that complement rather than match the strategies of the other party. For example, if labor is arguing against management's position, then management might respond by defending their stance. This pattern of argument balances the communication and makes it easier to move to integrative negotiation. In marital conflicts, spouses who respond with submissiveness to their partner's dominant move or vice versa also balance each other.

In contrast, when negotiators match or reciprocate each other's aggressive or competitive tactics, they are more likely to escalate the conflict. Matching negative emotions such as anger or contempt, increases the likelihood of not reaching an agreement. When parties interrupt each other regularly or use deception, they strain their relationship and make it harder to negotiate an agreement. On the other hand, when both negotiators use first-person pronouns such as "I" and "You," give information about their priorities and needs, and talk in simple sentences, they signal a desire to move toward the other party and to work out their differences. Asking questions to make sure that parties understand each other is another way to break up a developing

conflict spiral and move the negotiation in a constructive direction. Hence, it is important for negotiators to know how to alter or shift unproductive interaction patterns into productive communication.

Context Issues and Negotiation

These observations about communication presume that the parties are from Western cultures. Negotiators from different countries often rely on and have different meanings for communication in conflict situations. Specifically, individuals from Asian countries rely on the context to interpret communication in conflict. They use facial expressions and body movements to convey messages about priorities, whereas negotiators from Western nations employ direct statements, reject offers overtly, and express their opinions openly. Thus, communication patterns in negotiation often differ across cultural contexts.

Another context feature that shapes communication in negotiation is the role of technology as a medium for negotiation. Advances in communication technology over the past 20 years have resulted in negotiation through e-mails, videoconferences, telephone conference calls, and other computer-mediated interactions. Comparisons among these different communication media reveal that face-to-face negotiators are more likely to cooperate than are individuals who use the computer or the telephone for their interactions. When parties rely on computers to engage in negotiations, they use fewer words, cluster too many arguments together in one message, and have trouble identifying when the other party is cooperating. So negotiating via computers is challenging and works best when supplemented with some face-to-face interaction.

To improve negotiations that rely on computer or telephone technology, parties should be very comfortable with the technology before they engage in conflict management. They should use multiple modes of communication to exchange information and to clarify issues. They should monitor the give-and-take process carefully and avoid using language that triggers negative emotions.

Mediation and Communication

When parties fail to manage conflict through their own negotiations, they often turn to another person for help. Unlike negotiation, mediation is a process in which a third party assists the disputants in working through a conflict. However, mediators do not make the decision for the parties; rather, they assist them with the process and help them move toward a settlement. In most situations, formal mediators are impartial and have no prior relationship with either of the disputants, but informal mediators might be friends, roommates, colleagues, or managers who embrace the best interests of both parties. Mediators typically ask questions, guide the interaction, paraphrase or summarize remarks, set the agenda, encourage parties to make concessions, and provide emotional support to both sides.

They differ in styles of interaction and the degree to which they exert control over the process.

Getting a third party to assist in managing conflict offers a number of benefits. Namely, it provides a cooling-off period for the disputants, helps them frame substantive issues, and redirects the interaction between them. Despite these benefits, though, overuse of mediation may encourage dependency on third parties instead of the disputing parties managing conflicts by themselves. For example, two coworkers who always go to their boss to manage conflicts between them may be less motivated to work out their problems on their own. Use of mediation, however, generally leads to high satisfaction with both the process and the outcomes of conflict (Donohue, 2006).

Mediation Use

Mediation programs have proliferated in the past two decades, especially in communities that have dispute resolution practices connected to the courts. Mediators help with divorce settlements, intervene in disputes between landlords and tenants, manage controversies among neighbors, and facilitate settlements of disagreements about zoning and community development. In addition to community conflict management centers, school systems have implemented programs in peer mediation to help students prevent violence and manage conflicts among classmates. Mediation is a common practice for dealing with labor disputes, but organizations have expanded the use of this approach to address salary grievances, personnel issues, and interdepartmental conflicts. Moreover, mediation continues to be a widely used approach in international diplomacy, peace-keeping, and brokering trade relationships. Overall, mediation has become a standard tool in a repertoire of conflict management approaches.

Mediation Approaches

Even though a wide array of approaches exists in mediation, they typically cluster into three types: (1) problem-solving models, (2) interaction management models, and (3) relational development approaches. The problem-solving approach, also known as assisted negotiation, focuses on addressing underlying interests and identifying common ground between the parties. In this approach, mediators often have a vision or a hypothesis for what would help the parties reach a settlement. They select their questions and strategies to search for common ground. For example, if a mediator thinks that poor communication underlies a problem, the third party directs questions to help the disputants diagnose their understandings. If the mediator uncovers common ground between the parties, the third party sometimes remains quiet and lets the disputants pursue their common interests. If the parties become contentious, however, the mediator may exert control through integrating the disputants' comments, charting an agenda, and making

requests for concessions. The overall goal in this approach is to reach a mutually satisfactory settlement.

Mediators who adopt the second approach, interaction management, aim to distinguish between productive and unproductive communication patterns and to intervene in a conflict to move parties in a productive direction. They focus on messages that signal trust and liking between the parties, unequal power relationships, and the priorities or importance of issues. Through the use of questions and summary statements, the mediator moves disputants away from competitive patterns. One particular destructive pattern that surfaces in close relationships is a competitive dilemma. In this dilemma, the parties signal closeness and dependence on each other while simultaneously conveying disapproval and negative emotions. This competitive dilemma is evident when a divorced husband and wife come close together to negotiate a child visitation issue while they simultaneously convey negative emotions and disapproval that signal rejection of each other. The mediator aims to break up this competitive pattern, help the parties redefine their interdependence, and help them work out a specific visitation program (Donohue, 2006). The interaction management approach focuses on unproductive communication and how to help parties change their patterns of talk to work out agreements.

The relational development approach differs from the other two models in treating a person's identity and relationship with the other party as the underlying concerns in the conflict. This approach aims to empower the parties to discover the key relational issues that underlie their problems and to transform how they see each other and their situation. Some mediators use stories that disputants tell to help them decipher the different views that each party holds about the conflict. Stories reveal the ways in which perceptions about the parties' roles as victims or offenders enter into narratives and how different plots and scenes play out over time. Mediators listen carefully to identify what is missing in the disputants' stories and to help parties use the missing elements to construct a new story, one that explores common issues and has the potential to bring the parties together.

Another option within the relational development approach is known as *transformative mediation*. In this approach, mediators help parties transform their relationships through improving their own empowerment and their recognition of the other party (Bush & Folger, 2005). Disputants typically enter into mediation with a focus on their own injuries or problems. They feel beaten down and victimized by the conflict and are often too paralyzed to act. Through granting them the capacity to take control and supporting them in this objective, mediators empower parties and help them develop the confidence needed to act on their own problems. Empowerment, then, opens the door to recognizing the other side's suffering. This mutual recognition builds compassion and empathy, which helps the parties listen and respond to each other. This approach purports that once parties address their

relational problems, they can discuss differences on substantive issues with renewed cooperation.

Interaction Patterns in Mediation

The three models of mediation differ in the ways in which communication helps parties reach agreements. In the problem-solving approach, mediators exert control over the process by setting rules for interaction, summarizing, redirecting comments, and calming the parties. They paraphrase comments to check for understanding, raise questions about options for settlements, and direct parties to evaluate the options that they have generated. Since the goal of the process is to uncover common-ground issues, they direct parties to their major concerns and urge them to set priorities for what is important.

In a similar way, the interaction management approach emphasizes mediator control of the interaction but focuses on redirecting parties away from unproductive communication. Mediators listen to topics, issues, and arguments to hear underlying messages about warmth, friendliness, and respect and about how each party is trying to control the other. They use questions, summaries, and comments to move parties away from competitive behaviors and to change their destructive communication patterns.

The relational development approach shifts to disputant control of the interaction. Mediators let disputants tell their own stories, use the stories as windows for uncovering the underlying concerns, and get parties to think about alternative narratives that might include elements that are missing in the original examples. In addition to seeking agreements, mediators strive to get the parties to own their conflict and to create a new story in which disputants can avoid blaming each other for their problems.

In the transformative mediation approach, mediators empower the disputants by letting them control the process, helping them achieve what they want from the interaction and recognize the suffering that both parties have experienced through the conflict. They follow the parties' lead and occasionally interject comments that reflect substantive and emotional concerns. Mediators might ask if each disputant wants to add something that might change each other's views. After the disputants begin to listen to each other and feel empowered to manage their own conflict, the mediator might offer a summary of what he or she thinks the parties are trying to get across. In the relational development approach, mediators see their role as helping the parties become equipped to manage disputes on their own, work through difficult issues, and recognize the suffering that each party has incurred.

Context Issues in Mediation

These three approaches to mediation are applied to a wide array of settings, including divorce mediation, labor-management conflicts, community and neighborhood disputes, and educational settings. Several contextual features,

however, influence the effectiveness of mediation. First, the nature of the conflict itself is critical to mediation success, especially in the problem-solving model. Conflicts that are highly intense or ones in which the parties are not motivated to find a settlement are hard to mediate and often lead to an impasse. The interaction management and relational development approaches are more effective in dealing with these intense conflicts.

A second contextual issue is the importance of mediator training. Training programs often emphasize one approach or a set of techniques and strategies. Mediators need to be trained regularly in the use of these approaches. They need to understand the principles and assumptions that underlie the different approaches to mediation and how to adapt the one they select to an array of conflict settings, including mediation with elders, workplace disputes, and court settings. Effective and continuous training aids in developing these skills. Finally, in some instances, mediation works most effectively when third parties are integrated into the community, exhibit the spiritual and moral values of the disputants' culture, and speak the native language of the disputants. Multiple mediators often work effectively in intercultural or gender-based conflicts in which diversity might be a central concern.

Dialogue and Communication

Although not as well-known as negotiation and mediation, dialogue typically involves third parties who act as facilitators in public conflicts. Dialogue emphasizes free and open expression of different points of view from multiple participants (Barge, 2006). It addresses conflict through creating new meanings for action that transform individuals and communities. By bringing oppositional groups together, facilitators help parties listen, begin to understand each other, and use critical thinking skills to develop courses of action.

Dialogue is particularly useful when parties hold fundamentally different values or moral positions (Pearce & Littlejohn, 1997). In most conflict situations, parties have difficulty addressing value disputes, and they rarely change their fundamental values; thus, dialogue provides a forum for engaging different value-based perspectives. The goal is to have parties move beyond polarizing other groups and to gain a richer understanding of complex issues and problems.

Uses of Dialogue

As a public process, dialogue resembles an old-fashioned town hall meeting in which parties voice their concerns about organizational, community, environmental, or international conflicts. Facilitators design a process that helps parties listen to multiple voices and creates opportunities to see their opponents in a new light. Then they generate new ideas, deliberate about the ones best for their collective needs, and strive to move forward in a common direction.

Problems that were initially treated as the domains of experts are now handled more effectively through dialogue and democratic participation. Specifically, land development concerns, planning and zoning controversies, community safety issues, and public school violence concerns are frequently addressed through participatory forums. In particular, dialogue provides prolife and prochoice advocates an opportunity to meet, develop common community concerns, work out options, and become engaged with policymakers (LeBaron & Carstarphen, 1997). Facilitators also employ dialogue to enable land developers, homeowners, regulators, environmentalists, and businesses reach a consensus in decisions about water and land use. Dialogue is also a type of conflict management employed in international circles, especially in problem-solving workshops that aim to foster mutual understanding in ethnic-political relations.

Dialogue Forums

A number of conflict management practices embrace dialogue as a forum. Two major approaches encompass an array of different dialogue practices. Public conversations entail programs such as the National Issues Forum, Study Circles Resource Center, Open Space, and the Public Conversations Project. These programs provide ways to structure dialogue, give participants timely and relevant information, enrich conversations, deliberate on the pros and cons of actions, and move toward solutions.

The National Issues Forum has citizens read booklets on the pros and cons of important social and community issues and then involves them in small-group dialogues to identify common-ground approaches to problems. Similarly, participants in the Study Circle Resource Center meet in small groups for several months and then in large community meetings to develop action items. In contrast, Open Space is a self-organizing, completely open process in which participants create their own agendas, work in breakout groups, come together in large groups, and then meet in different breakout groups. The Public Conversations Project is the most structured of the four programs in that it develops ground rules for conversation. Participants construct a contract, discuss their topics in small-group meetings, and enact follow-up reflections.

The second main approach to dialogue includes programs grounded in appreciative inquiry. Appreciative inquiry emphasizes the positive aspects of organizational and community life through focusing on assets and possibilities. It works from past and present strengths to identify moments of excellence. The belief that governs this approach is that positive interactions as opposed to negative deficiencies energize participants and offer them hope. Once parties have hope, it is easier to transform a conflict into opportunities for beneficial action.

Two examples of dialogue practices that highlight positive interactions are The Public Dialogue Consortium and the Appreciative Inquiry Summit. Grounded in deliberative democracy, the Public Dialogue Consortium focuses on

training participants to be facilitators, hearing voices from all stakeholders, framing issues in positive ways, and developing action steps. Facilitators report back to a large group, and then the process begins again with a new round of facilitators. Training participants to be facilitators instills an emphasis on strengths, positive outcomes, and possibilities for the future.

Interaction Patterns in Dialogue

These two approaches emphasize different interaction patterns for developing dialogue. In the public conversation programs, facilitators help participants listen actively, question each other, reflect on what was said, suspend judgment, and manage the tensions between advocacy and inquiry. To give everyone a voice, facilitators ask participants to share their stories and personal experiences before they deliberate about the pros and cons of alternatives. This approach also underscores the relational aspects of dialogue through urging participants to develop respect and to honor each other's comments.

The appreciative inquiry approach focuses on uncovering positive experiences and envisioning what might happen in the future. Facilitators typically conduct interviews with participants to discover the finest moments in the group's collective history and the core values of their community. Then, these positive moments are used to accent what is best and valued among community members. Next, participants address what should occur in light of the highly valued experiences gathered from the interviews. Communication consists of exchanging positive stories, reframing negative feelings into positive experiences, and drawing out visions of core values.

In both approaches, dialogue differs from the interaction patterns of persuasion, advocacy, and argument that characterize most conflicts. Dialogue privileges sharing and listening rather than arguing, admitting doubts and gray areas as opposed to setting forth airtight cases, asking questions out of genuine curiosity instead of trying to prove a point, and discovering deep-seated differences rather than presuming that parties understand each other. Dialogue is also fluid in that each comment simultaneously is a response to what happened previously and has potential to move the conversation in a different direction (Barge, 2006). Hence, dialogue is an emergent process, one that cannot be predicted from the participants' goals and intentions. It also builds collaboratively as parties respond to each other and create their situation together from what people say, how they say it, and how it develops over time.

Dialogue aims to transform individuals, relationships, and communities. Research on communication reveals three patterns that can lead to transforming of conflict situations: (1) labeling a problem differently, (2) using language that alters the levels of abstraction, and (3) developing new frames for understanding a situation. The ways in which parties label or name a problem relates to changing how they see a situation (Putnam, 2008). Each party typically enters a

conflict with different views of the situation and different labels for the problem. For example, public school teachers might name differential pay between men and women coaches as a problem of *discrimination*, but administrators might call it *paying for different job duties* or differences in the amount of time and work between male and female coaching jobs. If the two parties rename the problem as *deficiencies in women's sports*, they might change the number of games that women play or involve more women students in sporting activities. This renaming of the problem allows the parties to close the gaps between male and female salaries because the job duties have also changed.

A second interaction pattern that fosters transformation in dialogue is the use of language that shifts the levels of abstraction. Levels of abstraction refer to the way words function in categories. For example, two owners might talk about the health of a particular dog named Dusty. Other ways they could discuss this issue is to talk about diseases specific to a particular canine breed or to the problems that older dogs experience in general. Each time they shift from discussing the symptoms of a particular dog to talking about dogs in general, they move from specific to general issues at a more abstract level. This movement back and forth across levels of abstraction aids in redefining a conflict because the shift expands or narrows the boundaries and opens up new interpretations of the problem.

To illustrate, two people from different organizations engage in a conflict regarding who is taking advantage of whom and which company takes the most risk in their work relationship. If they move away from deliberating about particular revenue issues and begin talking more abstractly about what risk means for their respective businesses, they have the potential to transform the conflict by developing a new understanding of risk and seeing that they can take risk simultaneously rather than sequentially. This process leads to developing creative alternatives and producing a new form of collaboration.

A third way to transform a conflict through dialogue is to help the parties develop a new frame for making sense of the situation. In communication, a frame is like marking the boundaries or borders for a set of events. Similar to a picture frame, it is a way of marking ongoing streams of activity that cross time and space and bracketing specific interactions out for close examination. Parties usually come to the conflict with different ways of framing the ongoing events that produced their situation. Then, they try to develop a common frame to make sense of events by talking about what should be included or excluded in their frames, what should be in the figure as most important and what should be background, and how conflict elements should be moved to construct a shared picture of the events. To reframe the situation, the disputants might enlarge the meaning of an event, project actions into the future rather than in the past, or remove elements from consideration in analyzing the conflict. These changes shape the boundary and definition of a dispute and may lead to reframing and even transforming the conflict.

Context Issues in Dialogue

As a forum for managing conflict, dialogue depends on a number of contextual issues—namely, creating an atmosphere of safety, the inclusion of relevant parties, and the fairness and competence of the process. An atmosphere of safety results from communication that equalizes power differences among participants. Facilitators aim to build trust and empathy among parties through shaping understandings in small incremental steps. They treat parties equally regardless of status or position and emphasize participant involvement in all stages of the process.

Inclusiveness is critical to dialogue and deciding who should come to public meetings, which representatives are central to the problem, and what voices should be heard can make or break effective dialogue sessions. Finally, dialogue needs to be fair and competent. Fairness results from granting all parties a legitimate role in the decision-making processes, and competence depends on reaching the best alternative given the resources and opportunities to address the problem.

In summary, dialogue is a form of structured communication that emphasizes free and open expression of different points of view and using social interaction to transform conflicts. It is particularly effective for value-based, community conflicts in which parties hold stereotypic images of each other and feel alienated from decision makers. Two alternative approaches, public conversations and appreciative inquiry, focus on the communication skills of listening, questioning, reflecting, and deliberating. Public conversations also emphasize building common ground among participants, while appreciative inquiry works from positive achievements and strengths.

Both approaches draw on participants' stories and life experiences. Opportunities to transform conflict situations come from interactions that label or name problems differently and from those that discuss issues at both specific and general levels of abstraction. The factors that influence the effectiveness of dialogue include developing an atmosphere of safety, including all relevant groups and parties in the process, and attending to the fairness and competence of the process.

Changes and Future Directions in Conflict Management

The role of communication in conflict management has changed radically over the past three decades. Communication is not just a set of tactics that people use to address conflict, nor is it just a style or way of approaching conflict. Rather, communication is the way that parties construct and shape the very nature of conflict through forming productive interaction patterns, preventing conflict spirals, and transforming conflict situations. Hence, communication is not simply a tool to use in managing a conflict; it is a way of understanding how a conflict evolves.

The growth of mediation and public dialogue programs over the past several decades attests to the need to develop

procedures for managing conflicts outside the formal court system. Formal and informal mediation has grown in a wide array of arenas and is especially popular for managing custody and divorce settlements, neighborhood disputes, disagreements between landlords and tenants, and customer relations. Many corporations require human resource personnel to be trained in mediation or offer conflict management education for all employees. In a similar way, corporations have discovered that they can reduce lawsuits, eliminate workplace violence, and improve employee relationships by designing dispute systems. These systems have multiple points of entry to address problems, build in appeals for decisions, and emphasize open expression of concerns.

Managing conflict at the public level is beginning to shift from reliance on experts to employing a public participation process. Only recently have these processes turned to dialogue and facilitation as opposed to public hearings in which audience members make statements to decision makers. Public dialogue also struggles to involve all the relevant parties, work with large numbers of participants, and develop forums that both control interaction and allow for free and open expression. Forums that are too freewheeling or too constrained can reinforce stereotypes and prevent the development of trust and empathy.

VISUAL RHETORIC

JANIS L. EDWARDS

University of Alabama

Defining visual rhetoric can be a simple task, but its evolution as a research topic in the communication discipline is more complicated. At face value, the term *visual rhetoric* encompasses two meanings. First, visual rhetoric can be defined in artifactual terms, as rhetorical expression in visual form. To design an advertisement, create a protest sign, draw a political cartoon, practice photography as a commentary on social issues—all these examples of persuasive expression qualify as *visual rhetoric* in that they feature some visual image or form that functions to influence or convey meaning.

Some examples may include verbal elements, but in visual rhetoric the visual image is the central component of the message. A cartoon, for example, may include labels or dialogue, an advertisement is more likely than not to have some explanatory copy, and a photograph usually is accompanied by a caption or a story. But all these verbal elements are structured around a visual image, an image that conveys its own message and may prompt a response or reaction from the viewer. Sometimes the visual element stands alone. In these cases, the viewer may respond with an emotional reaction to the image, or the image may prompt specific associations. These examples of visually oriented messages fit the definition of rhetoric in that they are instrumental, public, intended for an audience, and situated; take symbolic form; and have potentially persuasive effects. Production courses in media or graphic design classes are concerned with the creation of visual rhetoric in much the same fashion as public-speaking courses teach students how to create effective verbal rhetoric.

But the communication discipline also treats rhetoric as a public message and process that constitutes meaning, meaning that may illuminate cultural and civic values as well as provide insight into historical and contemporary strategies of persuasion. In this framework, visual rhetoric incorporates an analytic pursuit rather than an applied, creative activity. The demands and functions of communication courses on rhetorical theory and criticism address this analytic perspective. Therefore, the term *visual rhetoric* also refers to the effort to understand and theorize rhetoric that occurs in visual form or involves the practice of visualization. In this sense, visual rhetoric has been said to operate as a mode of inquiry, a way of looking at images that is different from art history, aesthetics, or other ways of interpreting and assessing visual images and the processes of seeing. Visual rhetoric, as an analytic pursuit, guides us toward an understanding of the ways in which visual artifacts construct and create meaning. More recently, that pursuit also questions the effects of looking. In other words, rhetoricians are concerned with not only how images appear, or what implicit or explicit strategies of persuasion are invoked, but also how they are looked at.

To engage in the study of visual rhetoric is not only to exercise a particular mode of inquiry but also to implicitly argue for a definition of that mode—rhetoric—that goes beyond the traditional boundaries of *public address* and the spoken word and considers the force and potential generated by visual and material forms. Visual rhetoric broadens the definition of public discourse to include all variety of messages. Visual rhetoric invites us to consider not just the

speeches of presidents, for example, but also the social effects of their “photo opportunities.” Visual rhetoric invites us to think about the meanings generated by or reflected in political cartoons and photojournalism during a presidential campaign, not just the speeches and commentary by and about candidates on the campaign trail. Visual rhetoric invites us to consider how historical figures might be depicted in photographs—and how that might affect public memory of those figures—and not just analyze their appeals made in speeches. Visual rhetoric acknowledges that in a media-saturated age, our persuasive environment is as much about pictures as it is about words.

This duality between the practice of visual rhetoric and the analysis of visual rhetoric mirrors the history of the speech communication discipline, in which an initial concern with teaching the practice of public address as a development of skills was joined by a concern with the analysis of speeches. Today, although many courses in rhetorical theory and criticism taught within the communication discipline still focus on speeches, scholars are increasingly interested in the application of rhetorical principles to artifacts that have visual form or some sort of visual component or structure. The communication discipline is characterized by a wide range of pursuits that encompass both the development of practical skills and the liberal arts tradition of enhancing skills at critical thought.

In this essay, I provide a historical overview of the evolution of research in visual rhetoric that addresses and illuminates the second definition of visual rhetoric: the critical and theoretical examination of rhetoric that incorporates or exists as a visual form. The roots of visual rhetoric derive jointly from inquiries about the mass media and from a more general evolution of thought in the humanities. But both approaches had to overcome the long-standing bias toward language and against images in the communication discipline and in Western thought.

Theoretical Foundations in Visual Rhetoric

Speech Communication and Rhetoric

The analysis of visual rhetoric was initially explored as a subset of the larger arena of rhetorical studies. In their exploratory studies of visual images, scholars called on many of the theories and methodological tools we had developed for the study of language. To describe the study of visual rhetoric as an exact mirror of the traditional study of verbal oratory—as if images were “visual speeches”—has proved limiting, however, and does not entirely reflect the aims of current scholarship in the subject. The emergence of visual rhetoric as a scholarly concern has also occurred in a different academic context from the one that informed and developed the speech communication discipline early in the 20th century. The postmodern turn in more

recent rhetorical studies lends complexity and richness to the study of visual rhetoric. Since scholarly concern with visual rhetoric is relatively recent, current theory is positioned between applications of traditional rhetorical theories (which many scholars still find useful) and the development of emerging theories that attempt to address the particulars of visualizing practices.

While the study of speeches grew from a single critical perspective that had its roots in Aristotelian principles, and then generated additional theoretical and methodological perspectives that students learn today, the study of visual rhetoric has developed in the context of rhetoric’s rich theoretical developments of recent decades and at a time when academic thought reaches across, and is influenced by, other disciplines. Rhetorical study is also deeply influenced by the cross-disciplinary concerns of cultural studies. All these dynamics bring complexity to the study of visual rhetoric and also provide more workable tools than a traditional, Aristotelian approach might have provided.

Since serious and close analysis of the visual has a comparatively recent history within the communication discipline, compared with the study of oratory, relevant theory is still in a stage of development, and there are multiple views on how visual rhetoric should be studied or even defined. Although this situation can lead to controversy, it also creates exciting possibilities for study and learning. Students may consider themselves fortunate if they have teachers and classes that address this vital and contemporary subject in communication, and few areas of communication research offer as many connections to other disciplines as does the study of visual rhetoric and visual culture. In discussing visual rhetoric, we begin by charting the pioneering efforts at visual communication studies, the obstacles encountered by such studies, and how those studies have evolved in the short time we have benefited from rhetoric’s “visual turn.” In the next few sections, I will describe the development of visual rhetoric as overcoming obstacles in intellectual thought, its disciplinary roots in media studies that led to organized responses to visual communication, and the influence of the general humanities that has taken visual rhetoric beyond some of the constraints of using theories and methodologies adapted from the study of verbal rhetoric.

Antivisual Attitudes

That communication scholarship has only pursued the study of visual rhetoric in the past three decades is noteworthy, especially considering that visual images and visualization have been an important component of human activity for centuries. As David D. Perlmutter (1999), who has written extensively on news photography, observed, “We are *homo iconis* by our very nature, sight-driven animals that receive 90 percent of the data we collect and organize about the world through our eyes.” Humans are also the only animals who consciously and routinely create images to communicate with others.

When unknown Stone Age humans picked up pigments and tools to depict hunting and battle scenes on the walls of caves, they were engaging in the production of visual culture, which has increased with each new technological development that facilitates the circulation and reception of images. Paul Messaris, in his books on visual communication, describes how some aspects of our interpretation of images, especially the connections between camera angles and notions of power, stem from childhood experiences.

Postmodern thinkers also point to the importance of sight as a sense-making human activity, although some think of this phenomenon as more significant now than in the past. Martin Jay (1991) has used the term *ocularcentrism* to indicate the centrality of vision and visual images in contemporary society. In short, theorists have argued for the importance of images and imaging in human cognition and communication, and it remains fairly irrelevant whether ocularcentrism is limited to contemporary contexts or describes the historical human condition. Images are pervasive in our world as we live in it and as we have lived in it for some time. The invention of photography and the development of media technologies have only enhanced the appeal and power of images for us. But if images have always been with us, and their increase is tied to innovations in printing, film, television, and electronic communication, why has it taken so long for the communication discipline to embrace their study?

Part of the answer lies in long-standing cultural and historical attitudes that regard visual images with suspicion. Major religions warn against the dangers of idolatry or sacrilegious offense that attend the creation of images. As one example, violent protests ensued around the world when Muhammed, the spiritual leader of Muslims, was depicted in some provocative political cartoons published by a Danish newspaper in 2004. The issue continues to surface periodically in the tense political and cultural climate of our contemporary world. Although it didn't help matters that cartoon depictions are generally satiric and irreverent, any depiction of the holy figurehead of the Muslim religion is forbidden and considered offensive.

In ancient Greece, Plato cautioned about the divide between authentic experience and its visual simulation as shadowed images cast on a wall. During the 20th-century scholarship on visual images from thinkers as varied as Ernest Gombrich, Rudolph Arnheim, Walter Benjamin, and Roland Barthes began to influence and encourage work in the humanities on visual symbolism, semiotics, and iconology, as did the work of many critical writers on photography. Theoretical work in the larger field of the humanities would later shape contemporary studies in visual rhetoric. Within the communication field, the development of the study of visual rhetoric owes much to media scholars, who often voiced concern about the dominance of the visual in a public realm increasingly dominated by technological changes and a proliferation of mediated communication forms and channels.

Long after we accepted film and television images as major influences in the construction of social realities,

resistance to the place of the visual in this environment continued. The apparent dominance of the visual image as a tool of meaning making in society has continued to be met with skepticism about its adequacy and value in various social and cultural discourses.

This skeptical attitude is rooted in Aristotelian principles of rhetoric, which privilege logic and reasoning as the highest and best forms of public communication and persuasion. Logic and reasoning have been associated with the spoken word, while visual images are equated with emotional appeals. Emotional appeals are powerful rhetorical strategies that offer rhetors the ability to subvert the grounds of logic and rationality. In this manner of seeing images, they all too easily function as instruments of deception and propaganda, whether it's in the form of altered photographs circulated by totalitarian regimes or photo opportunities for U.S. presidents that seek to associate the politician with favorable images of masculine power to gain public acclaim. The pictorial images of public leaders projected by photography, films, and television are frequently interpreted as shallow, simplistic, and manipulative distractions from the complicated issues and policy questions of the political sphere, mere spectacles that entertain more than they inform. In this sense, appearance not only triumphs over reality, it becomes a new and false reality.

Because visual images are often seen as more manipulative than verbal speeches, many media and argumentation scholars initially regarded the visual realm with a negative view, claiming that the functions of visual images were limited and subordinate to the function of language. It is easy to dismiss images in politics and public discourse as mere spectacle, opportunities for entertainment rather than engagement, because visual images transfix us so readily. The question of whether a presidential candidate wears an American flag pin (sending a visual message of patriotic devotion) can triumph over real discussion of issues in today's public sphere. Similarly, politicians are at least as likely to employ managed photo opportunities to create an impression as they are to speak from the bully pulpit with facts, figures, and rational arguments. In heightening the value of the verbal over the visual, sometimes we forget that not all verbal messages are rational, as politicians and advocates also speak strategically with code terms, buzz words, and glittering generalities.

Besides treating the value of a visual message with skepticism, another common academic response to visual images was to regard them as merely ancillary to verbal texts or explanations. In other words, either visual messages were thought to overpower more rational thinking or they were considered to be inconsequential compared with written and spoken words. These responses may seem contradictory, but both are dismissive of the visual and have contributed to a historical lack of critical thought about visual images. At the same time, those who held concerns about the media's relationship with culture were motivated to call for instruction in "visual literacy" so that students would be better able to think critically about problematic

rhetorical artifacts. Thus, pedagogical tools such as *Killing Us Softly* (1979) and *Dreamworlds* (1990), two films that deconstruct the visual elements of advertising and music videos, respectively, responded to the concern over the assumed powers of visual persuasion. The relationship between visual images and formal argument was later explored in a special issue of the journal *Argumentation and Advocacy*, published in 1996.

The Prospect of Rhetoric Reconsidered

At its beginning, the study of visual rhetoric was initially rooted, in part, in the interests and concerns of media, advertising, and journalism scholars who were concerned about the social effects of visually oriented messages. Scholars of rhetoric shared some of these concerns about mediated visual messages but were also influenced by a shift in the 1960s over the appropriate practice of rhetorical scholarship from a task rooted in historical study to a task that should address and critique contemporary rhetorical discourse. The significant effects on society of social movements in the 1960s and 1970s lent a sense of urgency to expanding the scope of rhetorical studies beyond historical speeches to an embrace of more contemporary forms. Visual and mediated presentations were common elements of contemporary rhetoric, and television was making an enormous impact in the exchange of political messages. Rhetorical scholars realized that their analytic tools could aid in understanding many symbolic expressions besides speeches that were creating significant public meaning. The rhetorical actions spawned by social movements anchored the study of visual rhetoric to the visual or material artifact, both in form and in function.

One might argue that the visual has always potentially been an appropriate subject for rhetorical analysis, especially if we look to Aristotle's admonition to use the "available means of persuasion" in the inventional process. In the 20th century, Kenneth Burke's influential writings on rhetoric strongly suggested that visual forms qualified as symbolic action, a bedrock term that defined rhetorical expression in Burkean terms. But until a period of cultural unrest over the Civil Rights Movement, the Women's Movement, the Vietnam War, and other social change movements drew attention to widening modes of discourse, attention to the visual by rhetoric scholars was not evident.

A key turning point in the direction of rhetorical studies came in 1971, with a position statement that was part of an endeavor by the Speech Communication Association to reassess the field of rhetoric. The report called for a broadening of the scope of rhetorical criticism to include the many types of expression that were becoming common in the public dialogues on social change. Although visual expression was not specifically listed, it was clearly consistent with the "institutional and cultural symbols" that were hailed by the report's authors as the appropriate province of rhetorical study. Not only did the Wingspread Conference, as it was known, prompt initial publication of

scholarship on visual rhetoric, but other scholars such as Kathleen J. Turner and Cara Finnegan have, in reflective essays, more recently continued to affirm the value of the "visual turn" in rhetoric and public address studies.

Methods and Applications

Research in the 1970s and 1980s

The Wingspread Conference call for attention to new forms of rhetorical expression was met in the 1970s and 1980s with new critical analysis of various forms of visual texts from media and popular culture sources. Kathleen J. Turner (in 1977) and Michael DeSousa and Martin J. Medhurst (in 1982) published essays on comic strips and editorial cartoons in which they applied familiar rhetorical perspectives to graphic forms that mixed visual imagery with verbal elements. Medhurst joined with Thomas Benson to edit the seminal volume *Rhetorical Dimensions in Media* (1984). Both Medhurst and Benson had applied rhetorical concepts to films, and *Rhetorical Dimensions in Media*, in its three editions, discussed a range of media artifacts, most of them in visual form, although the book was not specifically labeled as an exploration of visual rhetoric. Similarly, Bruce E. Gronbeck explored the rhetoric of political advertising and documentary films, again taking a perspective that merged the visual and verbal elements of certain political artifacts into a cohesive message. Although these early studies varied in their specific attention to visual elements, the focus on visualized texts was new and important.

Because of their context in political discourse, editorial cartoons provided a compelling site in which to examine visual rhetoric. In addition to Medhurst and DeSousa, and the articles on political cartoons published in *Rhetorical Dimensions in Media*, Denise Bostdorff applied Burkean critical methodology to cartoons about a controversial U.S. Secretary of the Interior in an essay published in the *Quarterly Journal of Speech*. Bostdorff's analysis demonstrated that cartoons, in their combined visual and verbal manifestations that turned on irony and satire, operated from Burke's idea on perspective by incongruity. Lester C. Olsen addressed the visual, specifically, in his studies of artifacts of the American colonial period and posters that illustrated FDR's "Four Freedoms," identifying iconology as a central motivator in visual rhetoric. Each of these scholars drew in some way from existing critical methodologies and aesthetic theory and applied them to visual subjects. Along the way, artifacts such as posters and editorial cartoons were positioned as rhetorical texts, broadening the definition of rhetoric, which had been grounded in platform speeches.

Another important scholar who championed visual rhetoric at this time was Sonja K. Foss, whose interest in visual rhetoric pedagogy and inventive and informed investigations of a range of visual artifacts inspired emerging scholars to take up the visual as a critical subject. Foss

examined visual and material artifacts as disparate as works of art, furniture, architecture, and memorials. But in the course of making applications of critical methodologies, she also began to investigate how visual artifacts suggested new approaches and methodologies beyond those that had been developed in response to the study of speeches. Foss's analysis of the Vietnam Veterans Memorial (1986), along with the writings of others on the subject in the 1980s, also guided the discipline's subsequent, significant attention to the rhetorical and symbolic aspects of memorials as visual and material artifacts.

Organizing the Conversation on Visual Rhetoric

In the late 1980s, Sonja K. Foss, Marla Kanengieter, Raymie McKerrow, and several others who were interested in the intersections and applications of rhetoric to visual images formed a new unit of the National Communication Association (NCA) devoted to visual communication. Although this NCA division represents the full range of perspectives on visual communication studies, including media and visual literacy, visual rhetoric has occupied an important area of research within the NCA's Visual Communication Division.

Similarly, an informal group of scholars who have convened for a summer conference on visual communication, known as VIZCOM, for the past 22 years has included visual rhetoric as a subject focus, in addition to other perspectives on the study of images. While individual scholarship has helped shape and define the area of visual rhetoric, collaboration and conversation among scholars at conferences and within organizations have advanced visual studies significantly. Although, in some respects, visual rhetoric is still informed by the larger sphere of visual communication and visual studies—particularly photojournalism and media studies, the development of visual rhetoric in the discipline also owes something to developing theory in the humanities.

The Pictorial Turn in the Humanities

W. J. T. Mitchell, a professor of English and art history at the University of Chicago and editor of the noted interdisciplinary journal *Critical Inquiry*, addressed the question of visual images in a number of publications, notably the book *Picture Theory: Essays in Verbal and Visual Representation* (1995). Noting the burgeoning work of theorists addressing images that represent varying perspectives including philosophy, art history, cultural studies, photography studies, and semiotics, Mitchell proposed that these studies signaled a transforming “pictorial turn” in the humanities, a turn away from preoccupation with language to development of a range of concepts related to images and visuality.

One important aspect of Mitchell's argument has been that visual meaning is not predicated on language. Although this view is somewhat controversial, it opened the door to

broader assessments of meaning connected to visual form, not just grounded in verbal language, although we often use “language” as a conceptual metaphor to describe visual meaning.

Another important aspect of Mitchell's argument is identification of the rhetorical nature of the visual. In this respect, images (and their received meanings)—as well as human patterns or habits of seeing—are not defined as natural and universal. Rather, they are situated in historical, social, and cultural contexts and are deeply influenced by those contexts in their construction, uses, and interpretations. They are rhetorical texts in that they express and constitute cultural norms. The effects of images are thus highlighted, along with the strategies of image making. As one writer puts it, visual rhetoric “is concerned not only with how images look, but how they are looked at.”

The idea that images affect a viewer's response within a prescribed cultural mode was also famously argued by John Berger in this classic book *Ways of Seeing* (1972). It is worth noting that images, even when we see them as discrete texts, are often looked at in conjunction with other texts, both visual and verbal, expanding the possibilities of meaning. And yet, as elements of culture may dominate the social order, so too may visual images provide a prevailing cultural construction. This construction is called a *scopic regime*, an ordering of experience influenced by a hegemony expressed through visuality and socially ratified images. For example, the preponderance of female nudes in Western art and the relative absence of male nudes is regarded as a scopic regime that expresses a male-dominated culture that objectifies women.

For Walter Benjamin and Jean Baudrillard, a concern with images is complicated by their resemblance to “reality” and their capacity for reproduction. Baudrillard (1988), in particular, argues that we possess an inability to distinguish between what is real and not real and that all experience is now simulated (or *simulacra*) because we live in a scopic regime that encourages seeing the world as reflected and contained in images. Cultural critics, postmodern theorists, and other thinkers who shaped Mitchell's idea of the “pictorial turn” in the humanities continue to influence scholars engaged in visual rhetoric.

Studying Visual Rhetoric as Rhetoric

Although advances in the humanities have informed the study of visual rhetoric, its development in the communication discipline was initially and necessarily situated in the broader concerns of established rhetorical theories within the communication discipline. Extrapolating from research published in the 1970s and 1980s, we could say that the study of visual rhetoric closely resembled the study of oratory and public address, as scholars largely employed existing tools and methodologies to visual artifacts in the same way they had been applied to speeches. This strategy was understandable given that it was grounded in the traditions of rhetorical theory and criticism

and illuminated the places where visual and verbal forms shared rhetorical features. Moreover, as previously noted, visual images are rarely entirely separated from a context that may include a verbal aspect.

The application of standard rhetorical methods to visual artifacts continued in the 1980s and into the 1990s with the publication of additional work on political cartoons, as one example. Edward H. Sewell (1986) and Janis L. Edwards (in 1997) both examined cartoons as narratives. Taking an approach more closely tied to the visual elements of cartoons, Edwards and Winkler (1997) argued for certain political cartoons as representative forms that functioned as ideographs, a theory that had been previously applied to verbal terms in discourse. Edwards (1997) and Kaplan (1990) discussed visual metaphor in the contexts of cartoons and advertising, respectively. In the emerging research, no one method of analysis proved to be dominant. Instead, visual images seemed organized around many of the features that constructed spoken rhetoric. Existing methods of analysis proved applicable to images in ways that suggested that rhetorical theory could encompass visual as well as verbal expressions. Other scholars published early work that examined political advertising (another confluence of verbal and visual elements) and films.

In 1996, *Argumentation and Advocacy's* special issue on visual argument (was such a thing possible?), which set forth some theoretical assumptions about rhetoric in visual form, helped bring visual rhetoric further into the mainstream of rhetorical study.

Expanding the Range of Artifacts

The adaptability of rhetorical studies to the visual was also demonstrated by a growing interest in memorial architecture and material culture, combined with a cross-disciplinary focus on memory studies. Investigations of symbolic architecture and the Vietnam Veterans Memorial by Foss and others in the 1980s and the work by Carole Blair and associates on memorials as embodied rhetoric have inspired visual rhetoric scholars to extend their ideas of “the visual” beyond the concept of the image and join visual studies to other interdisciplinary concerns.

The 1990s brought critical attention to visual texts such as civil rights memorials, Gilded Age homes, patriotic medals, archival photographs, and photojournalism, a continuation of subjects with strong visual aspects that were appropriately defined and studied as visual rhetoric. The publication of Barbie Zelizer’s critical examination of Holocaust photography, *Remembering to Forget: Holocaust Memory Through the Camera’s Eye*, in 1998 was a critical moment that validated and inspired visual studies in rhetoric, especially as related to photography. Like Paul Messaris’s 1996 book on visual literacy and advertising, *Visual Persuasion: The Role of Images in Advertising*, Zelizer’s book won the NCA’s Diamond Anniversary Award for the outstanding book in the discipline.

Expanding the Scope of Visual Analysis

After nearly two decades of scholarly exploration in visual rhetoric, new courses in visual communication have been developed at any number of communication programs. Although not all these courses specifically address the visual from a rhetorical perspective, and emerging textbooks have explored visual images from a range of media and cultural studies perspectives, the larger context of “visual communication” assisted in the development of visual rhetoric as both a research and a pedagogical area.

At the same time, scholars began to reinvent the study of visual rhetoric. Most scholarship on visual rhetoric had approached images and material artifacts by using established critical tools and concepts to examine the strategic rhetorical choices evidenced *within* the image or structure. Subsequent scholarship, influenced by broader debates in the humanities and cultural studies, began to look at visual rhetoric in terms of its broader dynamics of production, circulation, and reception, reaching beyond the standard methods of rhetorical criticism to generate a more inductive approach to the visual.

For example, Rose (2001) argues that a methodological framework for the critical interpretation of images can address three sites of meaning: the site of production of the image, the site of the image itself, and the site of reception by audiences. Each of these sites is also governed by three modalities: technological, compositional, and social. Rose’s framework points to an accepted expansion of the traditional focus of rhetorical criticism on strategies evident *within* a text, but it also acknowledges the rhetorical tradition’s interest in history. Again, the 1995 publication of W. J. T. Mitchell’s book *Picture Theory: Essays in Verbal and Visual Representation*, along with other philosophic investigations of visibility as a societal construct, seemed to have ignited the new perspective on engagement with visual rhetoric. Among the scholarly endeavors taking up more holistic perspectives was Kevin DeLuca’s 1999 examination of the rhetoric of environmental organizations, *Image Politics: The New Rhetoric of Environmental Activism*, which argued for engagement with the contemporary visual dominance of the public sphere. Cara Finnegan, in *Picturing Poverty: Print Culture and FSA Photographs* (2003, also an NCA Diamond Anniversary Award winner), has influenced scholarship in visual rhetoric by highlighting circulation as a key critical issue in visibility and visual studies.

More recent research has incorporated a broader sense of visual rhetoric than singular or generic images, tapping into postmodern theories to study the practices and inducements of visualization. Circulation, appropriation, and rhetorical function provided themes for a series of studies by Robert Hariman and John Louis Lucaites on iconic examples of photojournalism. Image appropriation—where rhetors visually reference or reproduce existing images in new contexts—was discussed by Hariman and Lucaites (2007) in the book-length version of their studies in iconic photographs, *No Caption Needed: Iconic Photography, Public Culture, and Liberal Democracy*.

Edwards and Winkler (1997) earlier focused on image appropriation, examining how political cartoonists frequently employed Joe Rosenthal's iconic photograph of the flag-raising on Iwo Jima to comment on assorted military or political efforts. Lester Olson and James Kimble evaluated a familiar poster from World War II titled "We Can Do It!" which features a woman factory worker, her arm upraised and hand rolled into a fist. Not only has this image been appropriated in a wide range of artifacts that reference feminism, politics, and other topics, but Olson and Kimble note that viewers commonly incorrectly identify the image as an official illustration pertaining to "Rosie the Riveter," the popular designation for wartime female factory workers in that era. Familiar images thus become inventional resources that cartoonists, advertisers, and other media producers employ for rhetorical effect.

Hariman and Lucaites further located their discussions on the civic function served by familiar and frequently appropriated photographs that marked significant cultural moments. As of this writing, Hariman and Lucaites continue the conversation on the function of images within liberal democracy by maintaining a blog (with pictures) named after their book, *No Caption Needed*.

Much of the visual rhetoric research in the new millennium has followed a more integrated and holistic approach than the textual analysis that marked early efforts to analyze the visual. A number of scholars have, for instance, considered the iconology of visual aspects of commemorative works regarding World War II and other sites of national memory. Investigation of memorials as significant rhetorical artifacts of commemoration continues to engage communication scholars. Processes of production, circulation, and reception of images and artifacts have become part of the investigation of the visual, adding to the project of textual analysis.

Future Directions for Visual Rhetoric

Prospects

To speak of future directions for visual rhetoric is ironic because visual rhetoric has occupied the cutting edge of rhetorical studies in the three decades it has engaged scholars in communication research. Still, as we have seen, the path of studies in visual rhetoric has evolved as the defining characteristics of visual rhetoric have been redefined. Additionally, the evolution of thought on visual rhetoric mirrors the evolution of rhetorical studies into a cultural studies mode. The emphasis on memory studies and rhetoric is just the most evident feature of this stage of inquiry. Lawrence Prelli's important volume *The Rhetorics of Display* (2006) positioned both the visual and the verbal within the rhetorical notion of display.

Still, visual rhetoric looks ahead to new concerns. At the 2008 Kern Conference on Visual Rhetoric and Technology, each panelist who spoke on future directions

cited Internet imagery and its circulation as a growing area of visual rhetoric inquiry. Although attention to fixed images and more traditional technologies has not been exhausted, the imaging associated with new technologies is moving ahead as a scholarly concern.

This situation does not mean that textual analysis of images is passé. Application of existing rhetorical principles to images still potentially reveals much about the place of visual images in the context of rhetorical invention. The range of images in the public sphere presents many new avenues for study, and the developing ideas on cultural critical analysis offer the promise of additional insight into the visual, and the defining features of rhetoric. Some areas of communication research remain understudied in terms of images. For example, we consider images as a crucial component of political discourse today, yet studies of images in political contexts are few and are generally limited to televi-sual effects. While there has been some attention to political cartoons, political photography has been seriously neglected as an aspect of rhetorical investigation.

Visual rhetoric has proven to be a richly developing area of study within the communication discipline. Although the journals that deal specifically with the visual tend to fall outside the boundaries of rhetorical study, journals such as *Photographies*, *Visual Communication*, and *Visual Communication Quarterly* offer material on related research in media images, and rhetoric journals such as *Quarterly Journal of Speech* have demonstrated an openness to visual rhetoric. However, visual rhetoric still encounters obstacles to continued development in knowledge and understanding.

Problems

The rapid evolution of visual rhetoric scholarship is energizing, but also inhibiting, as theory and definition move forward rapidly, without adequate time to reflect on and refine research perspectives. Pedagogy also seems to lag behind research in this area, as spoken rhetoric dominates textbooks on public address and rhetorical theory and criticism. While many professors include discussions of the visual in their rhetoric courses, and relevant research is presented to students, this component of rhetoric is limited largely to faculty who have a special interest in the topic. As Olson (2007) noted, institutionalized concentrations on visual rhetoric are virtually absent, given the handful of interdisciplinary "visual culture" or "visual studies" institutional programs, discounting graduate and undergraduate study in the area and limiting collaboration.

Another factor that is both potentially enriching and inhibiting is the disjointed nature of visual studies within communication. Examination of the visual continues to be harbored in subareas of the discipline, such as rhetoric, media studies and production, and journalism. The multiple perspectives on visual communication bring diverse viewpoints and insights, but discussions of specific areas are not always seen as relevant to other areas. While visual rhetoric may borrow from or cross over to visual media

studies, the field of rhetoric still promotes concerns other than media, advertising, or visual intelligence studies, leading to “Balkanization” of visual studies within the communication discipline.

As Olson also noted, there is still resistance to rhetorical studies of the visual from traditionalists in the field. The focus on oratory as rhetorical study’s central concern is embedded in the discipline, particularly at specific institutions where, Olson maintains, such attitudes may influence future directions for rhetorical study by limiting attention to artifacts and dynamics other than historically significant speeches. While published research does not reflect this bias, it is evident in the pedagogical materials and structures of rhetorical study.

Visual rhetoric’s robust incursion into the communication discipline is demonstrated by the emerging collections of research, both original and republished, listed in the References and Further Readings section of this essay, as well as by scholarly interest in the topic. It is hoped that this interest will translate to greater pedagogical development as we move forward in a world where images dominate our public sphere and accompany much of our discourse. While some may still look with derision at the visual as an empty spectacle, it is important to understand how visual rhetoric acts on us and in our world to create, assist, and circulate meaning.

MEMORIALS AND OTHER FORMS OF COLLECTIVE MEMORY

PETER EHRENHAUS

Pacific Lutheran University

The decision to include a chapter on memorials and collective memory¹ in this handbook is noteworthy in its own right. Had this volume been published 25 years ago, it is difficult to imagine that these topics would have been considered of sufficient importance to represent communication studies. Prior to the mid-1980s, published scholarship in communication and rhetorical studies was silent on the topics of “memorials,” “monuments,” and “collective memory.”² At that time, memorials were studied primarily by art critics and historians, as well as by military historians. Similarly, the related topic of collective memory, and its implications for communal, cultural, or national identity, did not receive much attention in the communication discipline. Since that time, however, interest in these matters has blossomed. The same pattern holds for other disciplines and interdisciplinary arenas of study as well. In fact, *critical memory studies* has emerged as an important organizing term for the interdisciplinary study of collective memory and, thus, for memorials as well (see Zelizer, 1995). How can we explain the recent and rapid development of academic interest in questions of memory?

In this chapter, I first want to explore factors that have led communication and rhetorical scholars to the systematic study of memorials as *memory projects*—that is, to particular cases of memorializing that ostensibly speak on behalf of the community and affirm how some person, event, or moment in the past should be remembered. I suggest that the emergence of scholarly interest in memory projects reflects and reveals a crisis in contemporary cultural and political life that bears directly on our identity as members of our

national collectivity. Second, since memorials designate some person(s), event, or activity as worthy of remembrance, I examine several views of “memory” as they pertain to the study of memorials and collective memory. Finally, I offer a sampling of different types of memorial projects—studies that engage a range of objects that operate as memorials—so that readers can investigate further about the growing importance of critical memory studies in the field of communication and develop a more expansive view of “memorials” and memorial practices to include a broad range of material, visual, and performative texts. Throughout this chapter, I ask you, the reader, to keep in mind the importance of historical and cultural context for studying memory projects. Rich and thoughtful contextual development enables us to appreciate how sites of memory serve as traces of a particular moment in a community’s life, traces that can reveal the tenor, tensions, hopes, and concerns of that moment. And since material sites of memory tend to endure through time and unfolding historical and cultural conditions, memory projects enable us to see how collective memory persists, transforms, and is open to disputation and appropriation.

Why Memorials? Why Only Recently?

We might first consider why memorials, as material sites of memory, have only in recent years attracted serious scholarly attention in communication studies. Three factors, minimally, contribute to the answer: (1) a cultural crisis of memory, (2) the historic centrality of speech in

the communication discipline, and (3) paradigm shifts within the discipline. Together they provide an understanding of the catalysts that brought about contemporary scholarly interest in memorials, collective memory, and identity, particularly within the discipline of communication.

A Crisis of Memory

In 1989, the French historian Pierre Nora made this observation about a transformation taking place in the texture of everyday life. He wrote,

An increasingly rapid slippage of the present into a historical past that is gone for good, a general perception that anything and everything may disappear—these indicate *a rupture of equilibrium* [italics added]. . . . We speak so much of memory because there is so little of it left. (p. 7)

In this passage, Nora addresses what others have called the “fragmentation of contemporary culture” (see McGee, 1990), a general condition of life—called by some the postmodern condition—that is due to the advance of industrialization and modernization. Fragmentation is characterized by increasing compartmentalization of, and disconnection among, the “parts” of our lives; it reflects our loss of integration with the community itself, as we race about from work to school to family to other obligations, and our ever-increasing reliance on the mass and electronic media for connections to others. In the past, everyday life was characterized by the coherent integration of the entirety of our (ancestors’) lives within the rhythms of a community. And communities were “the real environments of memory” (Nora, 1989, p. 7), in which people shared stories and constructed the shared meanings of past events together.³ With the loss of these “real environments,” Nora argues, we hunger for “sites of memory.” In his view, community is local and situated in place rather than something more expansive. In fact, he distinguishes between history, as a narrative that belongs to no one in particular but to all of us in general, and memory, as communal narratives whose ownership is distinctly local and situated.

We can, however, take a broader view of this process of shared narrative construction and examine how we are constituted as members of a larger, imagined community based on the composite of stories that we inherit and retell about our past and that tell us who we are as a people. The unifying thread of these stories constitutes the “master narrative,” or the “grand metanarrative.” One frequent referent for this phrase is the entirety of Western thought and progress that gets labeled “modernity,” and it includes the centuries-long pursuit of human emancipation, the rise of individual liberties and self-governance, the advance of public education, the embrace of scientific knowledge and technology with its promise of security and plenty, and the belief in the preeminent human capacity for rational control of our individual and collective fates (see Harvey, 1989; Lyotard, 1984). Clearly, this is a hopeful and celebratory story, and equally

clearly, the dominant “story of America,” with its own master narrative, resonates comfortably with and within the grand narrative of modernity’s promise.

But what does this have to do with memorials? One important answer is this: When our sense of our collective identity becomes problematic, unstable, uncertain, and open to challenge, memorials—as sites of memory that claim to speak on behalf of the collectivity—become of crucial cultural importance. When our sense of who we are as members of a community is no longer clear or stable or certain, we engage the problem of collective memory itself.

The Vietnam era did much to destabilize and undermine Americans’ faith in their master narrative, from the discovery that their government had lied repeatedly to them as citizens, to the constitutional crisis precipitated by Watergate, to the massacre of Vietnamese at My Lai by American soldiers, to the racism that African American soldiers and those of other minority groups faced on return home (see Schudson, 1992; Turner, 1994). Moreover, the entirety of the Vietnam era was entangled with the challenges of the civil rights and women’s rights movements. In the wake of America’s Vietnam War and its destabilizing impact on the American ethos, it is no surprise that the Vietnam Veterans Memorial, dedicated on Veterans Day in 1982, quickly became the focal point of considerable attention by communication scholars (Blair, Jeppeson, & Pucci, 1991; Carlson & Hocking, 1988; Ehrenhaus, 1988a, 1988b, 1989; Foss, 1986; Haines, 1986). All these authors, in their own ways, engaged the problematic of what the war meant, of what (if anything) was served by the more than 58,000 American military deaths and the estimated 2.5 million Vietnamese dead, of what it meant to be an American.

America’s Vietnam experience was a significant catalyst for the emergence of memory studies and the examination of “public memory” and “the politics of the past,” as the historians John Bodnar (1992) and John Gillis (1994) remark in the introductions to their volumes. However, Vietnam is hardly the only experience or event to contribute to the rise of critical memory studies. There is much in our shared national story to call into question the meaning of national identity and the promise of the American master narrative. For example, against the claims of America as a beacon for decency and human rights stand the slaughter and subjugation of Native Americans and the torture and ritual humiliation of Iraqis in Abu Ghraib Prison. Against the promise of science and technology for human betterment stands the fact that only the United States has used nuclear weapons against human beings (see Linenthal, 1995; Linenthal & Englehardt, 1996; Prosis, 1998). Against the claims of human equality that are the foundation of Jeffersonian democracy stands the indisputable fact of American racial slavery and white supremacy, and the widespread resistance to seeing that as a part of the nation’s story rather than a violation of it (see Huggins, 1991).

In sum, when the texture of life is coherent and integrated and when the stories that bind us together as a

community “ring true” with narrative fidelity, then the pervasiveness of commemorative practices and sites assumes an unexceptional quality and blends into the texture of everyday life. However, in the face of cultural fragmentation and loss of faith in the narratives that ostensibly unify us, memorials become culturally significant sites to deliberate, argue, or affirm who we are as members of a community.

The Centrality of Speech in Communication Studies

A second explanation for the recent emergence of memorials as significant objects of study in the communication discipline is found in the discipline’s lineage and historic grounding in the study of speech—discursive rhetorical practice. This central focus on the spoken word, particularly in the context of public address, has long relegated nondiscursive symbolic practices to supporting roles at best. Consequently, memorials per se have been overlooked as important cultural and rhetorical artifacts, despite the fact that rhetorical scholars have a long history of valuing and studying significant commemorative discourse throughout Western history. The interest by communication scholars in commemorative discourse, as a form of ceremonial discourse more generally, can be traced to the discipline’s early reliance on a neo-Aristotelian model of criticism, with its organization of oratory into deliberative, forensic, and epideictic (see Wichelns, 1925)⁴ and, more recently, to the impact of genre criticism (see Campbell & Jamieson, 1978). Within the category of epideictic, the scope of critical interest in commemorative discourse spans the entire Western tradition, from Pericles’s Funeral Oration, delivered almost 2,500 years ago, to contemporary times. In the pantheon of American public address, Lincoln’s Gettysburg Address has long attracted scholarly analysis and adulation (see, e.g., Black, 1994). Interestingly, while the Gettysburg Address has received extensive scholarly attention, no investigation has been published in communication studies of how collective memory is constructed at the Gettysburg National Military Park through its museum, memorials, and monuments.⁵

Communication scholars who conduct close (verbal) textual analysis continue to make important intellectual contributions. The past quarter of a century clearly reveals that communication scholars are now far more open to investigating a wide variety of textual artifacts. In 1984, the study of memorials gained legitimacy when Hattenhauer argued, “Architecture not only communicates, but also communicates rhetorically” (p. 71) and then further suggested that perhaps “the clearest examples of what architectural signifiers connote is exemplified in ceremonial and monumental architecture” (p. 72). In 1994, Brummett offered a valuable distinction between “traditional” rhetorical texts as primarily verbal and expository and the texts of “popular culture” as primarily nonverbal and narrative or metonymic, noting the increasing importance of the latter category. A cursory examination of publications in recent issues of communication journals will bear out the fact that

traditional verbal texts now share scholars’ attention with texts such as architecture, films, photographs, and museums.

Paradigm Shifts

The third factor I wish to note concerns paradigm shifts in communication studies during the 1970s and 1980s. These shifts were influential for those who studied rhetorical texts as well as for those who studied communicative interaction practices and processes. It would be misleading to suggest that only rhetorical/communication critics can be interested in memorials as objects of study. The communication discipline comprises scholars drawn to various kinds of intellectual questions and objects of study and educated in a variety of modes of inquiry. As paradigms of inquiry shift, so too do the questions scholars ask and the phenomena that engage their attention.

One paradigm shift occurred with the “cultural” or “interpretive” turn in the study of human communicative interaction. Prominent in this alternative to traditional empirical social scientific inquiry was the “ethnography of communication,” an approach that theorized communication first and foremost as performed cultural practice (see Carbaugh, 1991; Philipsen, 1975, 1989). Ethnographic study seeks to describe how a culture’s communication practices enable people to construct shared meaning and conduct their lives meaningfully within a community with others. Certainly, memorials are amenable to ethnographic study, as they are both rhetorical products of the community and, frequently, sites of gathering for negotiating meanings of the community’s past. A noteworthy study of this negotiation process centered on a memorial site is Trujillo’s (1993) critical ethnography conducted on the 25th anniversary of the events at Dealey Plaza, the site of John F. Kennedy’s assassination. However, the primary focus in the “ethnography of communication” tends to center on the ritual quality of everyday communication practices rather than on more formalized public ritual practices (e.g., giving commemoration speeches) or public sites of commemoration (e.g., memorials). Consequently, memorials tend to take a supportive role in that particular ethnographic tradition.⁶ For example, in his study of the speech practices through which Vietnam veterans authenticated themselves to other veterans, Braithwaite (1997) examined how Vietnam veterans invoked the Vietnam Veterans Memorial as a valued resource for claiming their own experiential legitimacy. The Memorial played a secondary role in this study, but this is not to suggest that interpretive communication research, more generally, cannot make the study of memorials its central focus. Operating from a critical-interpretive approach, Ehrenhaus (1988a, 1988b) has examined the Vietnam Veterans Memorial as both text and context, investigating the various ways in which people craft the meaning of that site as they interact with the Memorial, with the written and visual artifacts left for public consumption, and with the others present at those moments of encounter.

Another paradigm shift was the “ideological” turn in criticism (see McKerrow, 1989; Wander, 1983, 1984b). This turn arose in response to the technically oriented political disengagement of much communication criticism during the political and cultural foment of America in the 1960s and 1970s (which I have addressed earlier). Particularly in view of an American foreign policy that was increasingly viewed as morally suspect, the central questions posed by the ideological turn were these: What are the responsibilities of the critic? Is the critic’s primary task to understand and explain how a particular discourse is constructed to achieve its desired ends? Or is the critic’s primary task to render a judgment about the moral grounds on which a text advances its claims? Should the critic subject to critical scrutiny the worldview that supports the text’s arguments?⁷ The impetus for the ideological turn was based on three related positions: first, the recognition that power and privilege are always present in communication practices and texts and that power and privilege have material consequences in the world that affect real human beings; second, that communication scholars tend to study texts in ways that ignore issues of power and privilege—that is, how a text privileges a certain voice, or ideological position, and silences or distorts or undermines other voices or positions; and third, that criticism is a mode of public engagement through rhetoric and that scholars of communication have a moral obligation to be a part of the culture’s debates through their criticism instead of residing safely apart from those debates and studying rhetorical texts with sophisticated, technical dispassion.⁸

Meanings of “Memory”

Central to the decision to study a memorial or to ask questions about memorializing is one’s choice about how to think about “memory.” The concept of “memory” has a long tradition in communication studies, originating in classical rhetorical theory with the five Roman canons of rhetoric—invention, arrangement, style, memory, and delivery. In his *Sourcebook on Rhetoric*, James Jasinski (2001) notes Corbett’s (1971) observation that of all the classical canons, rhetorical scholars have paid the least attention to memory (p. 355). The reason is not difficult to discern. Since antiquity, memory has been associated with memorizing speeches, and this locates (and hides) memory within the individual, apart from the more accessible and—for communication scholars—more interesting substantive, stylistic, and performative aspects of public discourse. This general assumption about memory as internal, individual, and hidden continues to be prominent today and resonates with contemporary cognitive psychology’s view of the individual as an information processor, retrieving stored information from memory. In fact, Bartlett’s (1932) classic psychological work on individual memory is often cited as a starting point for theorizing

“collective” memory (see Middleton & Edwards, 1990; Wertsch, 2002, chap. 3). In this view, even if collective memory is constructed in interaction with others, the basic resources for that social product must come from the private memory of each individual; moreover, that interactively constructed memory then returns to, and helps shape, the individual’s memory. Jasinski (2001) further notes a renewed interest in memory through two trends in communication studies. Both require rethinking this classic view of memory as essentially individual. The first trend is grounded in the now widely held assumption that reality is socially constructed through communication (see Berger & Luckmann, 1966; Mead, 1934). Building on this assumption, memory is conceptualized as a publicly accessible and socially constructed phenomenon; individual memory ceases to be the focus. Here, we find the basis for examining the relationship between memory as communally shared and memory as practices of commemoration, including the creation and use of memorials. The work of the sociologist Maurice Halbwachs (1992) prior to and during World War II is foundational to theorizing memory as socially and rhetorically constructed. Halbwachs proposed that we think about memory as a collective resource and that remembrance can be evoked by material objects—such as memorials—as well as by narrative recounting of events within the group. Moreover, the substance of collective memory is always selective, tied to groups’ experiences and life worlds. As a result, there can be a diversity of “collective memories” about the “same” event or person. As groups’ collective memories differ, so too do the meanings and significance of what is remembered. Ultimately, the choices and courses of action that we perceive available to us, and the actions that we ultimately undertake, depend on how we remember what we remember.

From this perspective, and consistent with the “cultural turn” in communication studies, a memorial could be studied by the ways in which that material object provokes, and evokes, a particular range of memories that are shared and negotiated by members of a community and that construct a collective identity. Or, more resonant with the training of text-based critics, one could read the signifiers that constitute a memorial as a coherent text for the meanings that it invites and encourages us to find; certainly, the text-context relationship would be crucial to enrich the critic’s insights, since the memorial’s meanings are shaped, in part, by the historical and cultural context in which the critic engages it. For this reason, and consistent with Halbwachs’s belief that there can be multiple collective memories of the same memorial, critical analysis of a memorial might help us understand how meanings of the “same” past differ among groups or transform across a community’s life. Meanings of the past are always contingent on the needs of the present (see Schwartz, 1982).

To explain the second trend, Jasinski (2001) draws on Cox (1990), who characterizes memory as a resource for disrupting prevailing relations of power in a society by bringing to public awareness evidence and an understanding of the past that has been hidden, silenced, or suppressed. In this view of memory, we encounter the ideological turn. More than just a social construction, memory is conceived here as a resource of invention and social critique—that is, a resource for thinking about the world, for arguing, and for revealing how powerful interests benefit by the hegemonic dominance of privileged viewpoints. Here, we find the theoretical move that underlies critical memory studies—scholarship that analyzes and “unpacks” the manner in which memory is rhetorically constructed to advance particular ideologically grounded viewpoints and agendas at the expense of other viewpoints and groups; that reveals how dominant constructions of memory “naturalize” present conditions through the selective process of remembering and forgetting; and that demonstrates how “forgetting” has been managed through silencing, absence, and suppression. Here, memory pertains to a reclamation process of recovering what has been lost or suppressed, to challenge the comfortable and comforting (for some) prevailing notions of “history”—how the world “is” and how the world “must” operate. In the arena of Holocaust studies, Irwin-Zarecka (1994) refers to the *possibility* of memory, which results from this reclamation work. Only when memory is recovered and made possible can a society deliberate about its obligations and responsibilities to (and not for) that past; this is the *necessity* of memory.

Operating from the agenda of this second trend, the study of memorials is motivated by a series of related questions about the *politics of memory*. First, implied by the phrase is the notion that memory is not a repository in which objective, factual, and stable content is stored away and from which “truth” can be retrieved; nor is it a location in which stored memories can fade if they are not properly tended. Rather, the “politics of memory” assumes that memory is constituted through our use of symbols and is manifested in *this* moment as we rhetorically construct memory through our communication practices. This assumption in no way requires us to abandon belief in “the past” or in “material fact” (i.e., that “things happened” or that “people committed particular acts,” as Holocaust deniers have attempted to claim). Rather, the politics of memory leads us to appreciate the contingent and positional nature of making meaning—that the significance or consequentiality of particular material events as well as their impact on human beings depend on *how* we value those events and those people. And this leads us back to memorials.

Second, because memory (and the meanings of memorials) is constructed through our communication practices, it is open to disputation by others who seek to frame the past differently in order to draw different lessons or guidance

from it. Taken together, the phrase *the politics of memory* leads us to conceive of memory as a *fluid* discursive field (i.e., an arena of public discourse) of contested meanings, a site of struggle that reveals diverse and competing interests in society.⁹ Viewed in this manner, we can begin to understand how the politics of memory, and thus memorials as material manifestations of memory, bears directly on our collective identity—that is, how we think about who we are as a people. Marita Sturken (1997) writes about the connection between memory and identity in *Tangled Memories*,

Memory forms the fabric of human life . . . [it] establishes life’s continuity; it gives meaning to the present, as each moment is constituted by the past. As the means by which we remember who we are, memory provides the very core of identity. (p. 1)

A compelling example of Sturken’s observation is evidenced in Savage’s (1997) study of the extensive program of monument construction after the Civil War. One of the projects that he focuses on is the Freedmen’s Memorial—a memorial to Lincoln funded entirely by contributions from free African Americans and completed in 1876, a year that also marks the end of the Reconstruction. Consider the possibilities for the design of such a memorial at a moment when the possibilities for redefining race relations to create an interracial society were prominent in the national conversation. As Savage writes, the plan for this memorial “was in itself a test of emancipation’s strength” (p. 89), and the project was “an enactment of the cultural change that the nation had to bring about” (p. 90). It is noteworthy that the entire project was under the control of the Western Sanitary Commission, a white-run agency providing war relief. The final result of the project was a memorial in which a freed African American slave is kneeling in gratitude at the feet of a standing Lincoln, whose hand is outstretched over the head of the supplicant. In this representation, we find the unequal master-slave relationship reproduced in the liberation of the black slave from bondage by the noble white man. That unequal and inequitable relation of power would remain in place for nearly another 100 years.

The questions that many communication scholars pose about memorials and memory reflect the assumption that memory (and thus collective identity) is not so much a stable condition as it is a dynamic and unstable site (i.e., a fluid field of shifting meanings) where competing and contesting points of view vie to be heard and to prevail. Consider questions such as the following (perhaps as they might have focused Savage’s work on the Freedmen’s Memorial): What merits remembrance? How ought we to remember what merits remembrance? What voices or “positions” are (or should be) invited into these cultural conversations? Who is authorized to extend these invitations? How does this memorial advance a particular

viewpoint of how the past should be remembered? Whose interests are represented by this viewpoint? What are (or have been) the consequences of this privileged viewpoint? What voices are suppressed or denied full legitimacy? What points of view ultimately prevail? And what are the implications of certain voices prevailing?

Haines's (1986) essay about the Vietnam Veterans Memorial is among the first studies of a memorial in the communication discipline and one centered expressly on the politics of memory. Haines draws on public addresses, news reports, and the poetry of Vietnam veterans to articulate the political struggle to control the Memorial's meanings, to examine "the mediated struggle now generating the meaning and memory of the Vietnam War" (p. 1). Like Foss (1986), who is drawn to the architectural "ambiguity" of the Memorial's physical design, Haines (1986) argues that this ambiguity permits administrative voices (of the Reagan administration) to appropriate the Memorial in their mediated, revisionist construction of the war's meaning and purpose. This appropriation, he argues, denies Vietnam veterans control over the Memorial's meanings as a place for therapeutic healing and creates for some a sense of personal despair so profound that some veterans see the Memorial as a potential site for suicide. His conclusion is particularly apt in view of contemporary American circumstances:

Maya Lin's Memorial design transforms Vietnam's grim statistics into an abstract image of sacrifice, generating rituals of remembrance and self-recognition within the context of Vietnam memory. . . . The administrative attempt at co-opting the Memorial for political purposes is clear, and is linked to the power strategies of future wars. . . . The Memorial's profound meaning is not so much in how the dead are remembered . . . but in how that remembrance is used by power to explain—to justify—future sacrifices in future Vietnams. (p. 17)

Memory Projects in Communication Studies

I end this chapter with a refrain of Nora's (1989) observation: "We speak so much of memory because there is so little of it left" (p. 7). In one sense, this is an odd comment, immersed as we are by material signs of memory, reminders that remembering the past matters. In another sense, Nora's observation is poignantly apt. In many cases, the public dialogue, argument, and anticipation that precede a memorial site's dedication often exceed the actual importance that the memorial site comes to acquire for the community; once the project is completed, it fades away from the public eye and becomes a familiar part of the landscape.

Carole Blair and Neil Michel (2007) observe that we are immersed in a contemporary "culture of public commemoration that began with the Vietnam Veterans Memorial" (p. 596) and that persists to this day; this is the "crisis of memory" cited earlier as a reason for the rise of the study of memorials and memory. The study of this crisis, manifested as a cultural preoccupation with public remembrance, has

been the focus of Blair's work since her original project on the Vietnam Veterans Memorial as postmodern architecture (see Blair et al., 1991). Sites of memory that Blair and Michel have studied include the Civil Rights Memorial (2000), the Astronauts Memorial (1998), and the AIDS Memorial Quilt (2007), as well as the Witches Trial Memorial in Massachusetts and commemorative efforts at Kent State University (Blair, 1999). Their essay on the AIDS Memorial Quilt is one of seven essays in a recent special issue of *Rhetoric and Public Affairs* (Winter, 2007) devoted to examining the rhetorical implications of the AIDS Memorial Quilt; among the questions raised and addressed are whether the Quilt should be viewed as a memorial or an archive (DeLuca, Harold, & Rufo, 2007) and its impact on negotiating the public's relationship with memory of the epidemic and homosexuality (Rand, 2007). And in his introductory essay in that collection, Morris (2007) notes the significance of Sturken's (1997) earlier cultural analysis of the entanglements of Vietnam memory with the AIDS crisis, in which she examined the Quilt as a site of cultural witnessing, of bearing witness to trauma.

Zelizer's (1998) *Remembering to Forget: Holocaust Memory Through the Camera's Eye* is a significant volume that concerns the global circulation of Holocaust photographs and its implications for witnessing. For a site of memory anchored in place, arguably the most important national memorial site for witnessing is the U.S. Holocaust Memorial Museum. In one study at that site, Crownshaw (2007) examines the capacity of photographic evidence to evoke a kind of trauma in contemporary audiences that bears upon the transmission of memory. In another, Hasian (2004) examines the museum's rhetorical dimensions and finds compelling evidence that the museum frames the Holocaust as an American affair. Using the film *Saving Private Ryan* as text, Ehrenhaus (2001) argues that Holocaust memory is embedded in the film's narrative as the underlying explanation for the American war effort. Biesecker (2002) draws on that film, as well as Brokaw's (1998) homage, *The Greatest Generation*, and analyses of the World War II Memorial and the Women in Military Service for America Memorial, to construct a text that together offers clear civic instruction to Americans on the celebration of their national identity. Implied in this civic lesson is the problematic that Owen (2002) identifies in her study of post-Vietnam films; the thematic development across these films articulates a falling away from the nation's foundational principles, issues a jeremiadic call back to those principles, and results in the reaffirmation of a unified national identity in (once again) *Saving Private Ryan*.

But the problematic of memory is not limited to bygone decades. Indeed, the challenges of collective memory are substantial in the wake of the attacks of September 11, 2001, and in the wake of American

responses to those attacks. Fried (2006) has studied the Smithsonian Institution's "September 11" exhibit and finds that the exhibit positions visitors as witnesses to trauma and avoids the "larger geopolitical contexts" that would problematize the meaning of the day's events; she concludes that this curatorial choice "impoverishes public knowledge and collective memory" (p. 387). Cohen and Willis (2004) direct their attention to National Public Radio's "Sonic Memorial" project, which uses "digital multimedia convergence to create a national aural memorial" of the 9/11 attacks at the World Trade Center. Despite the fact that the Sonic Memorial "bridge[s] radio and new media environments through the creation of a lasting memorial website" (p. 591), the politics of memory is a prominent concern for these authors, who conclude with observations about the privileging and silence of various voices. And in a study of the commemoration of the American military dead in Iraq and Afghanistan, Grider (2007) examines how the "information architecture of the internet" has fostered the development of online memorial Web sites that decontextualize "human loss at the expense of a coherent representation of a military" (p. 265) or political rationale for these deaths.

In conclusion, once we move beyond the idea of a memorial as a stable physical structure located in time and space, we acquire a much more expansive notion of memorials as memorial projects—as organized rhetorical efforts to shape communal understanding of some aspect of our shared experience and past, to manage and struggle over its meanings, and to stake out a claim on how we should (or should not) stand in relationship to that past. Particularly in view of the continuing challenges to the American nation and the meaning of our collective identity, we have every reason to expect that memorials and memory studies will continue to be an important focus of attention in communication studies.

Notes

1. For purposes of this chapter, I will use the phrase *collective memory* to designate an understanding of the past that is rhetorically constituted by and within a community through its various discourse practices. *Collective memory* is by no means a universally accepted or understood term, nor is there universal agreement about its formation, dynamics, or character. For some, the term suggests a stable, consensual understanding about past events, their meanings, and their implications for action (e.g., see Halbwachs, 1992); for others, "collective" memory is defined as a contested zone, a fluid, shifting field of meanings and ideological struggle (see Sturken, 1997).

2. An EBSCOhost search of the Communication and Mass Media Complete database identifies Hattenhauer's (1984) essay "The Rhetoric of Architecture: A Semiotic Approach" as the first publication in the communication discipline expressly concerned with memorials as rhetorical texts.

3. As the culture analyst Edward T. Hall explains, the richness of "slow" verbal messages that are possible in stable, situated communities has been supplanted by the "fast" messages—and message fragments—of contemporary life, which are made possible through technological innovations for mass communication and for instantaneous personal communication. (See Hall's *The Dance of Life*, 1983.)

4. Despite the fact that the original essay is neither available through EBSCOhost or JSTOR, it has been reprinted in a number of collections. See Burghardt's (2005) or Drummond's (1962) collection of essays, for example.

5. This finding is based on a search of the Communication and Mass Media Complete database in EBSCOhost. Several dissertations have been written in the discipline of history about Gettysburg and popular memory. Also, see Weeks (1998).

6. The ethnography of communication approach is not "critical" in the sense that it avoids offering a political interpretation or critique of the power relations that are a part of social and communicative relationships. Critical ethnography, in contrast, pursues the study of the everyday informed by issues of power and privilege.

7. Readers may track one key debate on these questions in Karlyn Campbell's rebuttal of Forbes Hill's (1972) essay on Nixon's "Vietnamization" speech in her *Critiques of Contemporary Rhetoric* (1972). Also, see Wander (1983, 1984a, 1984b).

8. I do not wish to suggest that as citizens, communication scholars were unaffected by or disengaged from the politics of the time. Rather, political engagement was generally viewed as outside the appropriate domain of professional, academic scholarship.

9. This notion of disputation has led scholars to use various terminology beyond *collective memory*, which tends to suggest a stable set of meanings shared by a group. Bodnar (1992) uses the term *public memory*, which he characterizes as "the intersection of official and vernacular cultural expressions" (p. 13). "Public memory is a body of beliefs and ideas about the past that help a public or society understand both its past, present, and by implication, its future" (p. 15). Sturken (1997), in contrast, employs *cultural memory* as her central term "to define memory that is shared outside the avenues of formal historical discourse yet is entangled with cultural products and imbued with cultural meaning" (p. 3). This term has enabled her "to examine how . . . popular culture has produced memories of the Vietnam War and how these film and television images have moved between cultural memory and history" (p. 3).

PART V

KEY CHARACTERISTICS OF MESSAGES

THE INTERPLAY OF VERBAL AND NONVERBAL CODES

LAURA K. GUERRERO

Arizona State University

LISA FARINELLI

Augustana College

Imagine listening to a computer-generated voice that pronounces each word perfectly but without any inflection or variety. Such a voice would be devoid of the rich sounds of nonverbal communication, which include pitch, volume, accent, and all the other qualities that characterize voices. Now, think about an e-mail exchange. Sometimes, the words people type are all that is needed. Other times, the words themselves are not enough, so people embellish them by adding bold typeface, italics, or extra punctuation marks such as ellipses or exclamation points. People also insert emoticons, which are symbols such as smiling or frowning faces, to add a nonverbal dimension to e-mail.

Conversely, it is difficult for humans to imagine a world that is completely nonverbal. When people visit foreign countries where they do not speak the language, they may try to use nonverbal communication such as pointing and facial expressions to get their message across, but without a common language to speak, interaction can be frustrating and counterproductive. As another example, think of the joy parents experience when their baby first starts to speak. Although children could previously communicate with their parents nonverbally, language opens up a whole new avenue of communication, allowing for more precise and intricate exchanges of information.

As these examples illustrate, verbal and nonverbal forms of communication are both essential parts of human interaction.

Although both forms of communication can be used alone, they are more frequently used together. In this chapter, the interplay between nonverbal and verbal communication is explored. First, a brief history of the emergence of nonverbal communication as an area of research is reviewed. Next, nonverbal and verbal forms of communication are conceptualized and distinguished from one another, followed by a discussion of what constitutes verbal and nonverbal codes. This chapter ends with a brief section on future directions for research.

History and Foundations

Various forms of nonverbal communication have been studied throughout the ages. The ancient Greeks and Romans studied how to use nonverbal behaviors to be more persuasive. During the 18th century, many Europeans were educated in the art of elocution—how to use gestures, posture, dress, and proper diction to make speeches more dramatic and emotional. The first social scientific perspectives on nonverbal communication emerged in the 19th century. Most notably, in his book *The Expression of Emotion in Man and Animals*, Charles Darwin (1872/1904) examined how nonverbal behaviors communicate emotion in socially adaptive ways. In the

latter half of the 20th century, psychologists and communication researchers began focusing more attention on nonverbal aspects of the communication process.

Ekman and Friesen's Early Contributions

Paul Ekman and Wallace Friesen were among the first to examine how nonverbal and verbal codes work together. They described five relationships between nonverbal and verbal communication: repetition, substitution, complementation, contradiction, and emphasis (Ekman & Friesen, 1969). Repetition occurs when the verbal and nonverbal message communicates the same thing. Saying "No" while shaking one's head or "Stop!" while putting one's hand out are examples of this. Substitution occurs when nonverbal behavior takes the place of a word or words. A nod may be used rather than the word "Yes," or a high-five may say "Congratulations!"

Complementation takes place when the nonverbal and verbal messages add to one another, sometimes to create a clearer meaning. For example, smiling while looking into a spouse's eyes and saying "I love you" communicates an especially high level of warmth and affection. Contradiction is at work when the verbal and nonverbal messages are at odds with one another, such as saying "I'm not mad" while looking away and making a surly face or being sarcastic, which occurs when speakers use vocal tone to indicate that they mean the opposite of what they are saying. Finally, emphasis involves using nonverbal communication to underscore what is being said. Yelling while saying "Watch out!" emphasizes the urgency of a dangerous situation, just as a hand gesture might indicate that a point someone is making is especially important.

Ekman and Friesen's (1969) early work also examined the following five types of kinesic behavior that help describe how body movement functions within the total communication process: emblems, illustrators, affect displays, adaptors, and regulators. Emblems refer to a set of body movements that "have a direct verbal translation" (Ekman & Friesen, 1969, p. 63). They can stand in for words entirely and often do so when verbal communication is difficult or inappropriate (Ekman & Friesen, 1969; see also Burgoon, Buller, & Woodall, 1996; Streek & Knapp, 1992). Therefore, they are often used strategically. Emblems have a common verbal meaning within a given culture or social group. For instance, in U.S. culture, there are emblems that mean "Good luck!" (crossing one's fingers), "Way to go!" (giving a thumbs up), and "Stop!" (putting one hand up with the palm facing away from the face). Emblems are typically so well understood within cultural or social groups that they "are virtually independent of linguistic context" (Bavelas & Chovil, 2006, p. 100). However, when used outside one's own cultural or social group, emblems are frequently misunderstood. Giving a thumbs up is translated as "Way to go!" or "Congratulations!" in the United States, but in many places around the world, including Iran, the thumbs up is a rude, offensive gesture.

Affect displays are body movements that transmit internal emotional states (Ekman & Friesen, 1969), such as clenching one's fists to display anger or smiling to exhibit happiness (see Andersen & Guerrero, 1998, for a review).

These body movements sometimes accompany speech and have the ability to replicate, say the opposite of, or qualify verbal communication (Ekman & Friesen, 1969). For example, a person might say, "I'm so angry with you," while displaying a furrowed eyebrow and showing his or her teeth (Shaver, Schwartz, Kirson, & O'Connor, 1987), whereas another person might say, "I'm not jealous," while displaying a cold look. Some facial expressions of emotion need to be interpreted within the context of accompanying speech (Mead, as cited in Jones & LeBaron, 2002). Speech, however, is not a necessary component for the communication of affect (Bavelas & Chovil, 2006; Burgoon et al., 1996). People recognize stereotypic, universal facial displays of sadness, such as frowning and downcast eyes, in the absence of verbal communication (Bavelas & Chovil, 2006). When affect displays become easily recognized without speech, they may be classified as emblems because they are so easily interpretable (Ekman & Friesen, 1969).

Illustrators help describe, clarify, or emphasize something. Examples include drawing a declining line in the air when talking about a dropping number of car sales, pretending to kick a ball, drawing the shape of an A-line skirt in the air when describing it, pointing to a star in the sky while saying "That star," and using hand gestures to indicate the speed of a song when conducting a symphony (Andersen, 2008). Sometimes emblematic behaviors function as illustrators. For instance, a person might make a circle around her or his ear to indicate that someone is crazy while saying "psycho" (Ekman & Friesen, 1969, 1972). In this case, the emblematic behavior emphasizes and clarifies the meaning of the term *psycho*.

As the above examples suggest, illustrators are "movements which are directly tied to speech" (Ekman & Friesen, 1969, p. 68). Although illustrators sometimes repeat verbal communication (Burgoon et al., 1996; Ekman & Friesen, 1969), as much as 80% of gestures in some research on face-to-face interaction involve "nonredundant information" (see Bavelas & Chovil, 2006, for a review). In fact, gestures that fall under the illustrator category may complement, emphasize, and sometimes even disagree with the spoken word (Burgoon et al., 1996; Ekman & Friesen, 1969). Some illustrators, such as batons and ideographs (Ekman & Friesen, 1969), are highly related to linguistic context, as "their meanings depend on the 'talk thus-far' and are worked out in the talk that succeeds them" (Streek & Knapp, 1992, p. 13; see also Bavelas & Chovil, 2006). For example, a person must rely on linguistic cues to determine the meaning of a raised eyebrow, which could be used to emphasize a word, show one's surprise or confusion, or flirt with someone, among other possibilities (Bavelas & Chovil, 2006).

Adaptors, or actions of the body used to "satisfy self or bodily needs," have no special connection to speech (Ekman & Friesen, 1969). Most adaptors are directed toward the self, such as moistening one's dry lips with a tongue, scratching one's arm, biting one's nails, twisting the ring on one's finger, or chewing on a pen. Some adaptors are directed at other people, such as tucking a strand of hair behind a friend's ear or wiping the dirt off a child's face. Adaptors are often enacted without intention or conscious

awareness, although object adaptors may be used to intentionally communicate. Self-directed adaptors are used most frequently when people are alone or do not think that others are watching them (Ekman & Friesen, 1972).

The last set of kinesic behaviors, regulators, are body movements that are connected to verbal communication in a distinct way. Although they “carry no message content in themselves,” they “convey information necessary to the pacing of the conversation” (Ekman & Friesen, 1969, p. 82). For example, a person may nod his or her head to encourage another person to continue speaking. Other regulators, such as eye contact or lack thereof, raising of an eyebrow, and shifts in posture, may indicate to a speaker to stop talking altogether, to repeat a message, and/or to let another person speak. Ekman and Friesen (1969) note that adaptors and affect displays can perform regulative functions in a conversation.

Watzlawick, Beavin, and Jackson’s Early Contributions

At around the same time that Ekman and Friesen’s classic work was published, Watzlawick, Beavin, and Jackson’s (1967) groundbreaking book, *Pragmatics of Human Communication*, brought nonverbal messages to the forefront of the communication field. Prior to the 1960s, communication scholars tended to examine verbal messages related to persuasion, self-disclosure, and power without considering nonverbal messages. Two propositions from Watzlawick and colleagues’ (1997) book changed this. Specifically, the authors advanced the famous propositions that one cannot not communicate and that every message has a content and relational level. According to the “one cannot not communicate” proposition, it is impossible for people to avoid communicating with others. Even when people do not speak, nonverbal behaviors such as posture, gestures, physical appearance, and facial expressions communicate messages.

In terms of the distinction between the content and relational level of messages, the content level refers to literal meaning, whereas the relational level refers to how a message is interpreted within a given context. On a relational level, a message is interpreted on the basis of the situation, the relationship people share, and the nonverbal behaviors people display. For example, imagine that Maria and Jake are sitting on opposite ends of a couch watching a movie. Maria says, “I’m cold.” Her statement has a literal meaning, but it also has several potential relational meanings. If Jake interprets Maria to mean “Do something so I’m not so cold,” he might rearrange the blanket on his lap so that it covers both of them or he might get up and switch the heat on. Perhaps Maria and Jake have been arguing and Maria’s comment means that she is feeling cold toward him. Or perhaps saying “I’m cold” is a signal that she wants Jake to put his arm around her so that they can make up. The way Jake determines the relational meaning behind Maria’s words would partially depend on her nonverbal communication. Did she smile

and sound wistful when she said “I’m cold,” or did she look away from Jake and sound tense? Understanding that every message has a content and relational level helps highlight how verbal and nonverbal communication work in concert to create meaning.

Distinguishing Nonverbal and Verbal Communication

To fully understand the interplay of nonverbal and verbal communication, it is essential to conceptualize these terms and distinguish them from one another, especially since there is controversy in the scholarly community regarding where the line between verbal and nonverbal falls. For early nonverbal scholars, the issue was fairly simple: Words constituted verbal communication, and everything other than words constituted nonverbal communication (Burgoon & Saine, 1978; Eisenberg & Smith, 1971; Knapp, 1978; Mehrabian, 1972). Since then, however, researchers have argued that this definition is too broad and that it does not help people understand the qualities that distinguish verbal and nonverbal communication. For instance, if nonverbal communication is everything but words, does it include body movements such as involuntary blinking, which no one pays attention to? Most contemporary researchers would say “No” and argue that involuntary displays of behavior should not be studied as communication (e.g., Bavelas, 1990; Burgoon et al., 1996; Guerrero, Hecht, & DeVito, 2008). What about sign language or Braille? In these cases, the channel is nonverbal (gestures or touch), but the message is made up of words.

Analogic Versus Digital Processing

A more contemporary conceptualization of the distinction between nonverbal and verbal communication rests on whether the message is processed digitally or analogically (Andersen, 2008; Gudykunst, Ting-Toomey, & Chua, 1988). When a message is processed analogically, people consider the whole message rather than dissecting it into smaller parts. In contrast, when a message is processed digitally, people make sense of it by looking at all the parts that make up the whole. Think about how children learn the alphabet. Often, they learn to sing their ABCs before they learn to say them. To a 3-year-old, “LMNOP” is usually a sound, not five distinct letters. This is because they have learned the ABCs by singing, which is an analogic activity. When they learn to say (and later write) each letter of the alphabet, they will be processing the information digitally. Analogic information, such as songs, artwork, facial expressions, and body movement, is processed primarily in the right side of the brain. Digital information, such as numbers, letters, and distinct words, is processed primarily in the left side of the brain (Andersen, 2008).

Some scholars have argued that communication is only nonverbal if it is processed analogically (Andersen, 2008). According to this view, nonverbal communication is continuous and holistic and as such is processed as a gestalt. This means that people see the “big picture” when processing

nonverbal communication, just as young children see “LMNOP” as something bigger than each individual letter. Verbal communication, on the other hand, involves linguistic information that is processed digitally (Andersen, 2008). Verbal information consists of discrete units that are highly notational and logical, such as the individual letters of the alphabet or individual words in a sentence. (See Table 27.1 for the key characteristics distinguishing verbal and nonverbal communication.)

Iconic Versus Symbolic Communication

Most verbal communication is symbolic and culturally specific. When communication is symbolic, there is an arbitrary relationship between the word (or behavior) and what it means. For example, in English, the word *tree* came to refer to something that grows up from the ground and has a trunk and (usually) branches. However, people could have easily chosen another word to represent tree (e.g., maybe “huckily”). Indeed, in other cultures, there are many different words for “tree.” These words do not resemble or relate to the trunk with the branches growing out of it in any real way; the association is arbitrary. People who do not know English would not connect the word *tree* to the image of the trunk with branches.

In contrast, many forms of nonverbal communication are iconic or intrinsic. Iconic messages resemble what they stand for. Examples of iconic messages include using one’s hands to show how big, tall, thin, or short someone is; pretending to kick a ball or swing a bat; or pointing to show direction. Intrinsic behaviors are actions that show a person’s internal state or constitute behavior in and of themselves. Examples include smiling, crying, hitting, and kissing. These types of behaviors tend to be understood across cultures, although there may be differences in the cultural rules that govern them. As a case in point, kissing is universally understood as an affectionate action, but the rules for kissing vary by culture (e.g., kissing both sides of the face to greet someone is more appropriate in some parts of the world than others).

<i>Nonverbal Communication</i>	<i>Verbal Communication</i>
Analogic	Digital
Usually iconic or intrinsic	Usually symbolic
Multimodal and variable	Unimodal and constant
More spontaneous	More strategic
Occurs in the here and now	Can refer to things removed in time and space (displacement)
Nonreflexive	Reflexive

Table 27.1 Key Distinguishing Features of Nonverbal and Verbal Communication

Although it is tempting to classify words as symbolic and behaviors other than words as iconic or intrinsic, the distinction is not quite so simple. Onomatopoeia words, such as “buzz,” “flush,” and “tap,” are iconic and may be understood across cultures. Similarly, although many body movements and vocalizations are iconic or intrinsic, others are symbolic. For instance, emblems can be translated into words and have various symbolic meanings in different cultures. Crossing one’s middle finger and forefinger have different referents depending on one’s culture. In the United States, this gesture commonly means “good luck” if held up in front of one’s face and “I’m lying” if held behind one’s back. In other cultures, this gesture is a sexual symbol, a symbol of friendship, or an obscene gesture. Although gestures such as the U.S. “good luck” gesture often have iconic roots (“I’m with you” in the case of the good luck meaning; “We’re close” in the case of the friendship gesture; one person on top of another in the case of the sexual symbol), they evolve so that they become synonymous with a particular meaning, thus functioning as a symbol.

Overall then, the relationships between most verbal communication and their referents are arbitrary and culturally specific. In contrast, a considerable portion of nonverbal communication is iconic or intrinsic and therefore understood (at least sometimes) across cultures. There is a gray area between these two positions. This gray area is occupied by onomatopoeia words and emblems. Some scholars consider emblems to be a form of nonverbal communication, and other scholars consider them to be a form of verbal communication. Those endorsing emblems as nonverbal communication cite their iconic roots (Guerrero & Floyd, 2006), whereas those endorsing emblems as verbal communication cite their verbal translation and constancy (Andersen, 2008).

Multimodal Versus Unimodal

In face-to-face contexts, one key distinction between nonverbal and verbal communication is that the former is multimodal or multichanneled whereas the latter is unimodal or unichanneled (Andersen, 2008; Burgoon, Guerrero, & Floyd, in press). This means that people can send various nonverbal messages at the same time. A person can simultaneously smile while leaning forward and gesturing, but a person can only say one word at a time.

The multimodal nature of nonverbal communication separates it from verbal communication while also making it an especially complex and sometimes ambiguous form of communication. If a person engages in multiple nonverbal cues at the same time, which behavior should a receiver focus on most? A receiver may not even pick up on all the different nonverbal cues that are occurring. This is why people often process nonverbal communication as a gestalt—in other words, they create a global image of the person’s behavior in their mind rather than trying to interpret each behavior separately (Andersen, 2008). Obviously, however, there is considerable room for misinterpretation,

especially if the receiver ignores or downplays some potentially meaningful behaviors. Although verbal communication can also be misinterpreted (and often is), the unimodal nature of verbal messages leaves less room for ambiguity.

Spontaneity Versus Intentionality

The term *communication* itself is defined differently by various scholars. Some scholars believe that for communication—either verbal or nonverbal—to occur, a sender must direct a message to another person or persons (Motley, 1990, 1991). Other scholars believe that communication occurs whenever a receiver attaches meaning to another person’s words or behavior (Andersen, 1991). Still others contend that communication occurs under either of these conditions (Guerrero & Floyd, 2006). The most common conceptualization of nonverbal communication is in line with the latter perspective, with nonverbal communication defined as nonlinguistic behaviors (body movement, vocal tone, facial expressions, etc.) that are either sent with intent or interpreted as meaningful by a receiver. This definition is appropriate for nonverbal communication because many forms of nonverbal communication occur spontaneously (Andersen, 1991). This is especially true of intrinsic nonverbal behaviors, such as crying, smiling, sighing, or speaking in a nervous voice. Such behaviors are often spontaneous expressions of a person’s internal feelings. People tend to trust spontaneous nonverbal cues more than they trust words (Burgoon et al., 1996).

Verbal communication, in contrast, tends to be sent with intent. Sometimes, verbal communication is highly strategic; people purposely say things a certain way to try to reach a particular goal. Other times, verbal communication is intentional insofar as it is directed toward another person (Motley, 1990). Although people can botch up what they mean to say, they still have a choice as to whether to utter the words or not. Some nonverbal behaviors are harder to control. People have difficulty controlling tears in their eyes, fleeting facial expressions of emotion, and vocal anxiety because such behaviors are highly spontaneous.

Of course, some nonverbal communication is strategic. A person might fake a yawn as an excuse to leave a social gathering early or smile as a means of trying to manipulate someone or create a good impression. To further complicate matters, the line between spontaneity and strategy can be blurry. Take the case of emblems. Emblems such as the hitchhiker’s thumb or the “OK” gesture are used like words and are therefore strategic. But many facial emblems (see Ekman & Friesen, 1969), such as a sad or a happy face, can be spontaneous or strategic, depending on the situation. In general, however, verbal communication tends to be more strategic, whereas nonverbal communication tends to be more spontaneous.

Displacement and Reflexivity

While nonverbal communication is unique in terms of its iconicity, multimodal nature, and spontaneity, verbal

communication has the unique qualities of displacement and reflexivity (Burgoon et al., 1996). Displacement refers to the ability to refer to things that are removed in time and space. For example, people can talk about how they felt last week compared with this week or how they would like things to change in the future. Nonverbal communication, in contrast, occurs in the here and now. Displacement is also related to being able to talk about things that are absent or nonexistent through the use of the negative. A daughter can tell her mother how she does not feel (“My throat doesn’t hurt”) as well as how she feels (“but my nose is really stuffed up”). It is more difficult to indicate negative states with nonverbal communication. The daughter could point to her throat and shake her head, but this could be interpreted in multiple ways (i.e., as indicating that her throat feels bad rather than that it does not hurt). Thus, verbal communication has a much greater ability for displacement than nonverbal communication.

Similarly, verbal communication has the special quality of reflexivity (Burgoon et al., 1996), which means that language can reflect on itself. A son might tell his father, “I didn’t mean to sound so sassy,” and his dad might reply, “I didn’t mean to sound so harsh.” People also make statements such as “I wish I hadn’t said that,” “I’m not doing a good job telling you how I feel,” “I think you misunderstood what I was trying to say,” and so forth. Words allow people to refine and reconstruct the meanings of other words that were previously uttered in a way that nonverbal communication cannot.

Nonverbal and Verbal Codes

Thus far, nonverbal communication has been conceptualized as analogic behavior that is multimodal, is usually iconic or intrinsic, and tends to be more universal and spontaneous than verbal communication. Verbal communication, in contrast, has been conceptualized as digital, symbolic, unimodal, and culturally specific. Displacement and reflexivity are two unique characteristics of verbal communication. Next, this chapter examines the various codes that constitute both nonverbal and verbal communication (see Table 27.2). A “code is a set of signals” that is associated with a unique message channel (Burgoon et al., 1996, p. 18). A channel is the mode of transmission, such as the voice, the body, or the environment. Within most channels, some messages are communicated nonverbally, whereas others are communicated verbally.

Contact Codes

Within the area of nonverbal communication, proxemics and haptics are both contact-related codes. Proxemics refers to messages communicated through the channel of space (Smeltzer, Waltman, & Leonard, 2008). For example, a nonverbal scholar studying proxemics might be interested in the fact that romantic partners

	<i>Nonverbal Communication</i>	<i>Verbal Communication</i>
Contact codes	Personal space	“Keep out” signs
	Conversational distance	“Welcome” signs
	Territory	Signs posting rules regarding territory usage
	Hugs, pats, slaps	
Kinesic codes	Posture	American Sign Language
	Facial expressions	Lipreading
	Expressive gestures	
	Eye contact, gaze aversion	
Appearance codes	Hair, eye, and skin color	T-shirts with slogans
	Height and body shape	Writing on team jackets or uniforms
	Facial features (e.g., nose shape)	Name labels
	Makeup	
	Clothing and accessories	
Voice codes	Vocal qualities (pitch, volume, warmth, animation, etc.)	Spoken words
	Singing, shouting, whispering	
	Pauses and silence	
Environmental and artificial codes	Architectural features	Signs identifying rooms, buildings, or streets
	Furniture arrangement	Room or house numbers
	Pictures, flowers	Plaques or diplomas containing information
	Temperature, noise, lighting	
Time codes	Pacing, wait time, punctuality	Clocks, calendars
	Perceptions of time as loose or exact	Verbal phrases related to time
Olfactory codes	Perfume, deodorant	
	Natural body odor	

Table 27.2 Nonverbal and Verbal Codes

NOTE: The types of communication listed here are meant to provide examples of verbal and nonverbal communication rather than a comprehensive list of codes.

generally sit closer to one another than friends (Guerrero, 1997) or that employees sometimes position their belongings in a particular way to show their cubicle space or their “territory” on the lunchroom table (Smeltzer et al., 2008). Haptics, or tactile communication, refers to messages communicated through human touch, which may span from intimate touch, such as hugging and holding hands, to nonintimate and even

aggressive touch, such as punching and kicking (Guerrero et al., 2008).

There are also verbal cues related to space and touch. For example, people regulate space using devices such as welcome signs, keep-out signs, and bumper stickers with sayings such as “If you can read this you’re too close” (Andersen, 2008). Public territory and traffic are also

governed by signs that tell people when and for how long they can park, when they can turn left or right, and whether a beach or park is public or private. At the haptic level, Braille is an excellent example of a tactile language that is processed digitally rather than analogically (Andersen, 2008). Braille is a language system complete with all the letters of the alphabet and punctuation necessary to string letters together to make words and to string words together to make sentences.

Kinesic Codes

When most people think about nonverbal communication, they think about body language. The formal name for body language is kinesics. Nonverbally, kinesic codes involve actions of the body that communicate signals without using touch or physical contact with another person (Burgoon et al., 1996). For example, posture, eye behavior, facial expressions, body movements (such as pointing or scratching one's arm), and most gestures fall under the nonverbal code of kinesics (Burgoon et al., in press; Guerrero et al., 2008). These types of kinesic cues can vary in terms of degree and intensity. A person can use demure eye contact to flirt or steady eye contact to intimidate. Similarly, a person's posture can vary from extremely relaxed to extremely tense.

Verbal kinesic cues, in contrast, tend to be more constant. In other words, there is much less variability in how people express verbal cues communicated through the kinesic channel. American Sign Language is a good example of a system of verbal communication that involves body movement. Like Braille, sign language includes behaviors that stand for words as well as letters that are strung together in logical ways that allow people to make sense of them. Similarly, lip reading is a form of verbal communication that involves being able to decode kinesic behaviors into words (Andersen, 2008).

While certain gestures, such as using one's hands to show how tall or short someone is, fall neatly into the category of nonverbal communication, others do not. Andersen (2008) argued that emblems such as the "good luck" gesture and "the finger" are actually forms of verbal communication because they are processed digitally like language and tend to be constant rather than variable. However, other scholars include emblems as a form of nonverbal communication (e.g., Burgoon et al., 1996; Knapp & Hall, 2006). Guerrero and Floyd (2006) considered emblems to be a form of nonverbal communication because such gestures nearly always share a resemblance to the words or ideas they communicate. Thus, their origins are iconic even though they become symbolic once they are universally understood within a given culture or social group. Moreover, gestural and vocal emblems (e.g., putting one's index finger over one's mouth and saying "shhh" to signal that someone should be quiet) tend to be used strategically, whereas facial emblems (e.g., smiling or rolling one's eyes) tend to be much more spontaneous.

Physical Appearance Codes

Fair or not, the way people look creates impressions. For instance, considerable research has demonstrated that there is often a halo effect for good-looking people. People assume that a person who is beautiful on the outside also has positive internal traits, such as being more sociable, honest, and socially skilled (Dion, 1986). There are numerous nonverbal cues related to physical appearance. Some of these cues involve signals sent from the way a person's body looks, such as hair color, skin color, size of body, and facial features. Other cues involve what a person wears, including clothing and accessories such as jewelry, ties, and scarves.

Although most physical appearances are nonverbal, some are verbal. People often wear T-shirts or jackets with slogans on them. In fact, some schools even have rules about what can and cannot be verbally represented on student clothing. Verbal cues on clothing can also show group membership. A baseball or dance team jacket, for example, might be emblazoned with both the individual's and the group's name.

Voice Codes

Many people think of the voice as part of the verbal code rather than the nonverbal code. Yet the way people say words communicates important messages. Within the area of nonverbal communication, the terms *vocalics* and *paralanguage* are used to describe the part of spoken language that is nonverbal. Vocalics includes all the signals other than the words themselves that are sent through a person's voice. These include voice qualities such as pitch, accent, speaking rate (i.e., how fast or slow someone speaks), volume, and level of expressiveness, among numerous qualities of the voice (Burgoon et al., in press). Vocalics also includes how people say words—are they singing, shouting, or whispering? Pauses and silence are also part of the vocalic code. For example, the amount of time it takes for someone to respond to another person's question is a silence that can send a message, as are the silences that convey a cozy level of comfort between two people or an angry grudge.

Verbally, spoken words are part of the voice code. The ability to speak and to construct sentences in ways that make sense to others who speak the same language are essential skills for being able to communicate verbally. Thus, the ability to speak is not enough, nor is the ability to say words. Famous case studies of children who were raised in isolation or with animals have shown that there is a developmental window for learning how to encode language (e.g., Rymer, 1994). Specifically, children need to be exposed to language before puberty if they hope to be able to acquire the language skills necessary to communicate. Although children who were isolated during their childhood often learn hundreds or thousands of words, they do not understand grammar or syntax, and they, therefore, cannot put discrete words together in ways that communicate broader messages.

Environmental and Artifactual Codes

Messages are also communicated via the environment and the objects within that environment. On the nonverbal side, there are myriad environmental cues, such as building design, color, furniture arrangement, noise, temperature, and artifacts (e.g., paintings, flowers). These types of environmental cues often frame communication by encouraging or discouraging social interaction (Guerrero et al., 2008). The objects people carry with them, such as purses, backpacks, briefcases, and cell phones, can also influence communication.

On the verbal side, signs that identify the names of buildings on college campuses, the office of the CEO, or the name of a street are all examples of verbal environmental cues. Room and house numbers can also be considered a form of verbal communication because numbers are processed digitally, as are letters and words. Some artifacts within environments also contain verbal communication. For example, some schools have a copy of the constitution posted on the wall. In museums and zoos, there are often placards that explain an exhibit or give facts about an animal. Personal artifacts, such as diplomas or awards hanging in one's office, contain verbal information that can enhance a person's credibility and status.

Time Codes

Researchers studying nonverbal communication use the term *chronemics* to refer to the ways people “use and perceive time” (Guerrero et al., 2008, p. 10). The way people use time is most closely related to communication. For example, being early or late communicates messages to others, as does the amount of time people are willing to wait for someone and the extent to which a person focuses on one versus multiple tasks at a time. Some people are oriented more toward the present, whereas others are focused on the future (Gonzales & Zimbardo, 2008). In the workplace, people are more likely to be satisfied with their jobs when they have a future time focus and less likely to be satisfied with their jobs when they feel pressured to work at a fast pace (Ballard, 2008). Nonverbal cues related to a fast-paced environment can contribute to feelings of pressure at work.

Time is also communicated through digital, verbal channels. The clock itself constitutes a highly digital mode of communication. In the United States, people frequently wear watches. Clocks are often on walls, computers, cell phones, and palm pilots. Verbally, people talk about “not having enough time to chat” or “having to go so I won't be late.” Thus, talk about time often serves to help people regulate their communication with others. As mentioned earlier, verbal communication is also unique in that people can refer to things in the present, past, and future by using language. Nonverbal communication only occurs in the present.

Interestingly, people from different cultures may vary in the extent to which they communicate about time using analogic versus digital cues. In some cultures, people view time precisely; in other cultures, people view time as loose and approximate (Hall, 1984). In the United States, people see time as fixed. When asked what time it is, people give the exact (or close to the exact) time. They also keep tight schedules and closely follow rules that regulate time. For individuals in this type of culture, digital forms of chronemic communication, such as watches and calendars, are especially important. In other cultures, such as Brazil and Southern Italy, time is treated more loosely; people are freer to be late or early for meetings; and analogic cues, such as how high the sun is in the sky and how dark it's getting, carry more meaning.

The Olfactive Code

In contrast to the other codes discussed so far, olfactics is a code that is almost exclusively nonverbal. Nonverbal researchers use the term *olfactics* to refer to the use and perception of smell as related to communication (Burgoon et al., in press). Although people can talk about something smelling good or bad (just as we can talk about the time), smells are almost always processed in a holistic fashion. The study of olfactics includes research on how people adorn themselves with smells such as perfume (Aune & Aune, 2008). In many places around the world, and particularly in the United States, people use perfume, soap, and body deodorant to convey a particular image to others or to cover up odor. Natural odors related to hormones and DNA structures are also part of the olfactive code (Furlow, 1996), as are smells within the environment.

Future Directions

Although scholars have made much progress in understanding the interplay between verbal and nonverbal codes of communication, much work remains to be done. One of the key issues relates to how much of the meaning associated with an interaction is derived from verbal versus nonverbal cues. Early estimates put the influence of nonverbal communication as high as 93%, but more recent studies suggest that nonverbal cues generally contribute about 65% of meaning, whereas verbal cues contribute about 35% (Burgoon et al., 1996). These percentages change depending on the task. When people are interpreting emotional cues, nonverbal communication is even more important. However, when people are trying to digest information, verbal communication is particularly critical. Future research should continue to explore how verbal and nonverbal cues contribute separately and in concert to create meaning.

Another important issue for future research is cultural differences. As discussed earlier in this chapter, some

codes of communication are more easily understood across cultures than others. Researchers have also uncovered a number of cultural differences in the way people communicate nonverbally (for reviews, see Andersen, 2008; Burgoon et al., in press). Yet little is known about the interplay of verbal and nonverbal cues across cultures. Scholars have determined that some countries, such as the United States and Germany, are characterized as low context, which means that people rely more on precise information from verbal communication (Hall, 1984). Other cultures, such as those in Asia, are characterized as high context, which means that people rely more on subtle information from contextual and nonverbal cues. For instance, the Chinese system of writing is filled with intricacies that are rich in meaning. Similarly, the meaning of some Vietnamese words change based on how they are said. In high-context cultures, analogic codes reflected in writing and speaking style appear to fuse with digital codes related to written and spoken words in ways that people in low-context cultures may not understand. There may well be other differences in how verbal and nonverbal codes relate to each other across various cultures, so this is an important area of future research.

Another recommendation for future research is to examine how verbal and nonverbal communication work together to create patterns of reciprocity and compensation. Reciprocity occurs when people display behaviors that have similar meanings (Burgoon et al., 1996). So one person might smile, and the other person might say “I love you.” Compensation occurs when people display behaviors that have opposite or very different meanings, such as one person looking away when another person stands too close to her or him. Thus far, most of the work on reciprocity and compensation has focused almost exclusively on nonverbal communication. Yet these codes could play off each other. For example, people might avert eye contact when conversation gets highly intimate or hug someone after receiving a compliment. Guerrero, Jones, and Burgoon (2000) demonstrated that people sometimes compensate verbally when their romantic partner acts avoidant (by saying things like “What’s wrong?”), even though they reciprocate nonverbally by showing more negative affect. A better understanding of these types of patterns will bring scholars one step closer to understanding the intricacies of the interplay between verbal and nonverbal codes.

RHETORICAL STYLE

BARRY BRUMMETT

University of Texas at Austin

Style is one of the most ancient concepts in communication and has long been regarded as a key component of messages. Its meaning and importance have not remained entirely consistent throughout history, however. This variability is a sign that it is an index of how communication works in cultures, for it changes as the role and nature of communication in society itself changes. Style has especially been associated with rhetoric, or the study, practice, and critique of persuasion. In important ways, what we think of style—whether we love it or hate it, think it is trivial or important—is what we think of rhetoric in general.

In this chapter, I argue that style has been understood within two main traditions: linguistic and performative. Both traditions have ancient roots, and both are alive and well today, but the linguistic understanding of style was relatively stronger in the past, whereas the performative understanding of style is gaining ground today. This shift of weight in the two traditions reflects a centuries-long cultural shift in the West from a concern with verbal ability to a concern with personal presentation in everyday life. Both traditions have generated a great deal of significant research, some of which I will review here. Although within and between the two traditions, the concept of style has varied greatly, I believe that a more or less consistent theme across all its manifestations has been aesthetics. By aesthetics I mean the sensory or artistic appreciation of objects and experiences (Brummett, 1999, 2004). Style may be understood as a kind of umbrella term for the aesthetic dimension of communication. I will proceed by explaining how style has been understood linguistically and then performatively. Finally, I will conclude by discussing the future of style

in the study of communication and why style in both traditions is key to effective rhetoric.

Linguistic Rhetorical Style

One understanding of style sees it as primarily or entirely the creative use of language in rhetorical appeals. The rhetorical theorist Roderick P. Hart (1990) explains this sense of style as “the sum total of language habits distinguishing one message from another” (p. 197). Whether attention to language is of central importance to persuasion or is mere decoration varies widely from one theorist and practitioner to another.

The understanding of style as linguistic, as the manipulation of language, is ancient. A number of theorists and teachers such as Isocrates, Plato, and Quintilian wrote on the subject. Here let us review a few of the ideas of just three of these ancient authorities: Aristotle, Marcus Tullius Cicero, and St. Augustine.

In his landmark, seminal work, *Rhetoric* (trans. 1954), Aristotle begins Book III with a discussion of style. Earlier in this work, he discussed how to come up with the substance of a speech, understood as arguments and emotional and personal appeals. Clearly, he intends a linguistic understanding of the concept of style: “For it is not enough to know what we ought to say; we must also say it as we ought; much help is thus afforded towards producing the right impression of a speech” (sec. 1403b). His work contains much practical good advice for the manipulation of language to create effective style—for instance, “Style to be good must be clear, as is proved by the fact that speech which fails to convey a plain meaning will fail to do just

what speech has to do” (1404b). He urges the reader to master figures of speech and turns of phrase so as to achieve clarity and to move an audience.

Classical rhetorical theory developed, over the course of centuries, what has come to be called “the canon” of rhetoric, which refers to the major parts of the preparation and presentation of a speech. These are the elements of effective public speaking to which the orator must pay attention. The great Roman theorist and orator Marcus Tullius Cicero (1977) offered a clear formulation of the canon:

And, since all the activity and ability of an orator falls into five divisions, I learned that he must first hit upon what to say; then manage and marshal his discoveries, not merely in orderly fashion, but with a discriminating eye for the exact weight as it were of each argument; next go on to array them in the adornments of style; after that keep them guarded in his memory; and in the end deliver them with effect and charm. (Book I, chap. xxxi, p. 142)

These “five divisions” have historically been summarized as invention (discovering what to say), organization, style, memory, and delivery. The historical tradition of rhetorical studies has focused more on style in the sense expressed by Cicero here, as linguistic manipulation, decoration, and adornment—as something added on to the substance of argument. But we will see below that ancient antecedents for the second, performative tradition of rhetorical style may be found in that canon of delivery as part of style as well. Let us just note in passing that this more “recent” performative dimension of style has ancient roots, even if it was not called style from the start.

In his great treatise *De Oratore*, Cicero discusses the linguistic dimension of style at length. “Every speech consists of matter and words,” he claims, “and the words cannot fall into place if you remove the matter, nor can the matter have clarity if you withdraw the words” (Book III, chap. v, p. 19). Different purposes in oratory are served by variations in linguistic style, he argues, for speakers “deserving of praise nevertheless achieve it in a variety of styles” (Book III, chap. vii, p. 26). As he explains later, “Important criminal cases need one style of language and civil actions and unimportant cases another; and different styles are required by deliberative speeches, panegyrics, lawsuits and lectures” (Book III, chap. liv, p. 211).

St. Augustine, writing in the 4th century CE, devotes Book IV of his work *On Christian Doctrine* (trans. 1978) to a discussion of how to preach to popular audiences. Following the concepts developed by Cicero, Augustine places great emphasis on linguistic style as adapted to the preacher’s purpose. He claims, “He who is eloquent should speak in such a way that he teaches, delights, and moves” (Book IV, chap. xii, p. 27). These three purposes of teaching, delighting, and moving (or persuading) are to be matched by subdued, moderate, and grand styles of

language, respectively (Book IV, chap. xix, p. 38). Augustine offers many examples of linguistic style from the Bible to illustrate these preferred dimensions of style as adapted to purpose.

Over the next centuries, theorists, teachers, and persuaders would continue to develop an understanding of style as linguistic manipulation. The study of figures of speech such as metaphor and irony developed tremendously, with works being written describing hundreds of such devices (see surveys by Corbett, 1998; Quinn & Quinn, 1995). People of the upper classes delighted in learning and using rhetorical style for entertainment and to impress others, especially as the Renaissance unfolded (Jeanneret, Whitely, & Hughes, 1991). From that, we are reminded that an important rhetorical function of style throughout the ages has been to define and separate different groups of people. It matters whether one has a “refined” or an “uncouth” style; one’s style bespeaks one’s class, geographic origin, and so forth.

During the late Renaissance, the French scholar Pierre de la Ramee, or Peter Ramus in Latin, wrote a work titled *Arguments in Rhetoric Against Quintilian* (trans. 1986) in the 16th century. Ramus is famous for equating rhetoric almost entirely with language style. He claimed that substantive argument was the property of logic, dialectic, or philosophy and that what we do when we argue is to demonstrate rational truths. All other influence is based on illogical—one might even say aesthetic—reactions to linguistic style, which Ramus equated with rhetoric. Since Ramus did not think highly of rhetoric as compared with logic, his equation of it with the mere decoration that is style shows us how the ways we think about style are often how we think about rhetoric as well. The Dutch scholar Desiderius Erasmus, also writing in the 16th century, based his educational system on rhetoric. A heavy emphasis of his method was extensive training in the manipulation of linguistic style. In his work *On Copia* (1963), he describes how students would be trained to reduce a sentence to its briefest possible expression as well as to expand a sentence fruitfully. The Englishman Hugh Blair, writing during the 18th century in what would be called the *Belles Lettres* or belletristic school of thought, emphasized the importance of refined, tasteful verbal style in both public and private speech and writing, in his book *Lectures on Rhetoric and Belles Lettres* (1860). A central theme throughout the early and middle history of the linguistic tradition of style has been to understand it aesthetically, to see it as a way to manipulate how we use, critique, and theorize the use of rhetorical language for artistic purposes.

In the 20th and 21st centuries, the linguistic study of style has continued vigorously. An aesthetic focus has remained, but with it has come increasing understanding that the aesthetic also has social and political consequences in that it can ground motivations. The ability of linguistic style to move audiences, whether the immediate audience of the public

speaker or the vast, mediated audiences of today's political struggles, has been explored in many scholarly studies.

An interest in studying language from many perspectives may be taken as a hallmark of the 19th and 20th centuries. Here, I want to call our attention only to a few scholars whose work in language focused significantly on style, on the aesthetic manipulation of language for effect. This scholarship is marked by concerns for aesthetic stylistic devices, principally metaphor; for the effects of word choices; and for the social effects of word choice in societies at large.

The English philosopher I. A. Richards (1936) had a largely stylistic understanding of rhetoric. Writing in the first half of the 20th century, he argued that metaphor was the underlying principle of all language and that therefore we cannot speak plainly and with total accuracy about the world and our experiences. Our language must always be expressed in one style or another, and it always occurs at some level of abstraction, Richards argued.

Writing throughout the 20th century, the eclectic and prolific theorist and critic Kenneth Burke advanced research into style more than anyone else. Burke believed that motives are shaped by the language that we use and that the way we stylize our language is vital in affecting how people think and act. In hundreds of critical essays, short and long, collected within his books, Burke showed the motivations created by expressing language in one style or another. In his book *Permanence and Change* (1965), for instance, written during the Great Depression, he argued that the way people chose to talk about the economy in the first quarter of the 20th century employed a style that actually led, through creating undesirable motivations, to the economic collapse. In his essay "The Rhetoric of Hitler's Battle" (1939), he showed that Hitler's motivations for war and genocide were perfectly apparent in his use of style in *Mein Kampf*.

Scholars in communication have pursued the study of linguistic style throughout the 20th century and into the 21st. "Don't Leave Your Language Alone," admonished Ernest Pulgram in 1952 to prospective orators and writers. Scholars such as Henry Ewbank developed schemes for studying the subject, as in his 1931 essay, "Four Approaches to the Study of Speech Style." Joseph DeVito also attempted to schematize "Style and Stylistics," in an essay published in 1967.

The aesthetic dimension of this focus on word choice is clear in an early essay by Horace Grant McKean (1916), "The Public Speaker as a Word-Artist," and again in Donald C. Bryant's 1950 work, "Aspects of the Rhetorical Tradition: Emotion, Style, and Literary Association," in which he explores links between oratorical and literary styles. Likewise, Carl E. Burklund (1955) focused on the aesthetic language of figures of speech and stylistic devices in his article "The Presentation of Figurative Language." The aesthetic dimension of imagination was linked to style in Donald Salper's "The Imaginative Component of Rhetoric,"

published in 1965, in which he largely refers to linguistic expression.

Jane Blankenship (1962) studied "oral and written style" to show the rhetorical effects of phrasing. Paul Newell Campbell (1973) used a well-known scheme of linguistic acts to develop a theory of how style has rhetorical and practical effects in usage. Usage or usefulness also informed an article from 1940 by Henry Alonzo Myers, "The Usefulness of Figurative Language," in which style was studied not merely as decorative but as having impact in the world.

Assessing such impact is often difficult. Linguistic style itself may be used to trace the wider effects of any rhetorical act, according to Richard A. Cherwitz. Cherwitz's (1980) study "The Contributory Effects of Rhetorical Discourse: A Study of Language-in-Use" argued that style is a tool for gauging the effectiveness of a writer or speaker. The critic may see whether a speaker's language choice is taken up by others and by public usage—Cherwitz argues that the chaining out of such usage is a sign of rhetorical success. In that vein of examining rhetorical word choices and their effects, a number of studies have examined the styles of specific great orators or types of speakers, as in J. H. Doyle's (1916) early-20th-century essay "The Style of Wendell Phillips." Thomas Lessl (1989) examined "The Priestly Voice" to identify common stylistic components of a particular linguistic stance that people, whether actual priests or other public leaders, take in public communication. Another study that casts its net broadly is Michael Osborn's (1967) "Archetypal Metaphor in Rhetoric: The Light-Dark Family," which looked at our culturewide use of metaphors based on light and dark to assess their rhetorical implications. Osborn identified consistent patterns in which metaphors based on light carry positive motivations, while metaphors based on dark urge audiences to oppose the object or concept to which the metaphor is applied.

More recent essays in communication continue this important tradition of the study of style as linguistic manipulation. Although not always identified as an issue of linguistic style, a recurring theme in research has been to study dominant metaphors in public use in order to explain the rhetorical implications of those stylistic choices. Jennifer R. Mercieca and James Arnt Aune (2005) study the style of an 18th-century text to distinguish between elite and vernacular language use, which of course is linguistic style. Robert L. Ivie (1980) has explored the effectiveness of metaphors for rallying public support for war. In a number of important essays, Ivie has identified key stylistic components of public foreign policy rhetoric, and he has shown ways in which language choices have furthered ideological choices. On a similar theme, Steven C. Combs (2000) argues that war itself is an effective metaphor for rhetoric, and he studies the style of some ancient texts to draw parallels between fighting and persuasion.

Another recent line of research into linguistic style has followed Michael Calvin McGee's (1980) concept of the "ideograph," which is a widely used term or phrase with important ideological, rhetorical consequences—such as "the people" or "equality." Dana L. Cloud's (2004) essay on U.S. press coverage of Afghan women is an example of a recent study using this theory; in her essay, she explores the implications of the phrase *clash of cultures* for how the United States understands other cultures through word choice in its war on terror.

Performative Rhetorical Style

My review of the linguistic tradition of style proceeded chronologically, from ancient times to the present. I will mix that order up a bit in presenting the performative tradition of style. I do so because scholars have more recently come to think of style as something not only linguistic but as also embodied in movement, gesture, facial expression—even in the clothes one wears, the cars one drives, the way we decorate our homes and choose our entertainment. This is style in the sense that we might say, "Oh, she has great style" or "He has no sense of style at all." It is a highly aesthetic way to think of style, based on the presentation of self in public. I will begin with some contemporary scholarship on the subject and then go back to ancient theorists. I will do this because scholars throughout history have studied style in this sense but have only recently begun to call it by that name. Yet I want to show that a concern for style as performative, as going beyond just linguistic aesthetics, has been part of the rhetorical tradition all along.

In *A Rhetoric of Style* (2008), I offer this definition of the performative sense of style:

Style is a complex system of actions, objects, and behaviors that is used to form messages that announce who we are, who we want to be, and who we want to be considered akin to. It is therefore also a system of communication with rhetorical influence on others. And as such, style is a means by which power and advantage is negotiated, distributed, and struggled over in society.

Style is certainly implicated not only in how we speak but also in how we present our whole beings in public, how we judge and construct relationships with both private friends and public figures.

Bradford Vivian (2002) complains that "for better or worse, then, modern rhetorical theory lacks a contemporary rationale and methodology for the study of style" (p. 223). Of course, he means style in the performative sense, and although this understanding of the concept is not as well developed as is the linguistic one, his own work has gone far toward developing such a rationale. The media scholar Stuart Ewen (1988) defines style as "a way that the human values, structures, and assumptions in a given society are aesthetically expressed and received" (p. 3).

His book traces the history of style in structuring society and politics since at least the start of the 25th century. The rhetorical theorist Robert Hariman's (1995) fine study of political style explores four commonly found kinds of style in political circumstances, and his work is highly performative in that it looks at the ways in which emperors and bureaucrats alike manage their images by the styles through which they present themselves in public.

The cultural critic Virginia Postrel (2003) argues that performative style has taken center stage as we have become a more "commodified" culture, obsessed with the aesthetic goods we use to construct our personal styles, and that style in this sense is coming to restructure consciousness around the world. Likewise, Michel Maffesoli (1996) argues, "In the strict meaning of the term, [style] becomes an all-encompassing form, a 'forming form' that gives birth to whole manners of being, to customs, representations, and the various fashions by which life in society is expressed" (p. 5). As we become preoccupied with self-presentation in everyday life, we come to think of rhetoric as a way to manage impressions beyond limited, particular occasions of speeches and essays (see also work on self-presentation by Erving Goffman, 1959).

A small but growing body of work has begun to study the styles of particular people or groups in order to identify the rhetorical impact of stylistic performances. This work may be found throughout the journal *Text and Performance Quarterly*. In my forthcoming book, I study the style of the "gun culture," and I argue that contradictions inherent in the essentially working-class style of that culture are key to understanding its social and political effects. Hariman's work, mentioned above, has been widely influential in helping us understand the rhetorical impact of four political styles in a wide range of applications: government, the corporate world, and international relationships, to name a few. Richard Majors and Janet Mancini Billson (1992) describe a particular style from the African American community, "cool pose," as performative and life structuring in this way, incorporating "unique patterns of speech, walk, and demeanor" (p. 2).

This exciting sense of style as performative will join linguistic style as the source of new and provocative research in the future. But as a concept, the idea of style as performative predates by centuries the application of the word *style* to these communication patterns. People have been studying performative style even when they did not call it *style*.

I noted earlier that the Greek rhetorical theorist and teacher Aristotle understood style as linguistic. However, he also discusses "delivery," which anticipates later, performative understandings of style. Aristotle sounds quite modern in saying, "The whole business of rhetoric being concerned with appearances, we must pay attention to the subject of delivery." We should note that Aristotle also calls the need to manipulate delivery as "unworthy" (sec. 1404a). Aristotle views delivery as unworthy because, like style, it is mere decoration added on to substantive appeals.

Nevertheless, being a pragmatist and acknowledging that people do respond to how a message is presented, he argues,

It is plain that delivery has just as much to do with oratory as with poetry. . . . It is, essentially, a matter of the right management of the voice to express the various emotions—of speaking loudly, softly, or between the two; of high, low, or intermediate pitch; of the various rhythms that suit various subjects. (sec. 1403b)

Although he does not call these considerations by the term *style*, he is clearly introducing ideas that today we might think of in terms of “a speaker’s style.” Aristotle restricts his understanding of such performance to the giving of speeches, however, rather than expanding it to style in everyday practices.

The Roman rhetorician and orator Cicero had a concept of style that went beyond just language to include performative dimensions. Cicero’s discussion of style is limited to public oratorical presentations and does not include the rhetorical effects of style in everyday life, but it is nevertheless perfectly consistent with today’s increasingly performative understanding of style. In his treatise *De Oratore* (1977), Cicero discussed the style of two orators whom he admires and noted the extent to which both language and physical performance are intertwined:

In present company, consider Sulpicius and Cotta, who stand almost on a level: what greater difference could there be between two orators, and yet what greater eminence in their respective styles? The one accurate and precise, unfolding the matter in language appropriate and suitable to it—he always sticks to his brief, and having discerned with supreme acumen the point that has to be proved to the court, he lays all other matters on one side and rivets his thoughts and utterances to this; Sulpicius on the other hand combines extreme boldness and energy, a very loud and resonant voice, and unrivalled vigor of bearing and dignity of gesture, with a weight and flow of language that make us think him Nature’s nonpareil of orators! (Book III, chap. viii, p. 31)

Later in that treatise, Cicero develops some principles of “delivery” that he does not call style per se but that clearly fall into the performative tradition of understanding style. By delivery, he means the physical, nonverbal means of public speaking, including gesture, clothing, expression, and so forth. He claims, “Delivery, I assert, is the dominant factor in oratory; without delivery the best speaker cannot be of any account at all, and a moderate speaker with a trained delivery can often outdo the best of them” (Book III, chap. iv, p. 213). Delivery is crucial for conveying emotion and tone,

for nature has assigned to every emotion a particular look and tone of voice and bearing of its own; and the whole of a person’s frame and every look on his face and utterance of his voice are like the strings of a harp, and sound according as they are struck by each successive emotion. (Book III, chap. lvii, p. 216)

We noted earlier St. Augustine’s assignment of three styles of language to three rhetorical purposes that a preacher might pursue. We also find a performative theme in Augustine’s rhetoric, even if he does not call it style. Writing for clergy at a time when many clergy were not as well educated or formally trained as might be desirable, Augustine stresses the importance of a performative style in conveying religious truths to audiences. The preacher should try to speak eloquently and wisely, he argues:

However, if he cannot do this, let him so order his life that he not only prepares a reward for himself, but also so that he offers an example to others, and his way of living may be, as it were, an eloquent speech. (Book IV, chap. xxix, p. 61)

This sense of a life lived in public with rhetorical effect that is not tied to language is quite consistent with later performative understandings of style. Augustine also notes the political and social consequences of style when it functions divisively in anchoring the judgments we make about other people’s worth and class.

As with the linguistic tradition of style, the performative tradition was developed over the centuries following the classical era, although not as strongly as the linguistic and not as clearly identified as style. In 16th-century Florence, the statesman and courtier Nicolo Machiavelli published his classic *The Prince* (1984), much of which is a study of the performative style necessary to gain and keep power. In the 18th century, the English man of letters Thomas Sheridan (father of the better-known playwright Richard Brinsley Sheridan) published his influential *A Course of Lectures on Elocution* (1968), a precursor of what would come to be known as the elocutionary movement. Sheridan echoed Cicero as he argued that nonverbal communication was at least as important as verbal communication, and in fact, he argued that it is a universal language since animals of all species including people may understand one another through gesture, vocal inflection, facial expression, and so forth. Sheridan therefore advocated paying attention in communication to one’s whole body, clearly a performative understanding of persuasion, although he did not specifically call it style. His countryman in the late 18th and early 19th centuries, Gilbert Austin, published *Chironomia* (1966), a remarkable work that organizes the space around the speaking body, assigning different areas to different emotions and emphases. Thus, there was a place to gesture for praise, a place to gesture if you wanted to place blame, a place to gesture to incite love, and so forth. Influential at the time, Austin’s work was of course too mechanical and simplistic to find much use in later centuries. But while it, too, does not use the word style, it belongs to a tradition that sees stance and movement as important elements of communication. We might also consider the 19th-century French teacher of dance and elocution, François Delsarte. Although not known for

prolific or influential publications, his theories and courses of instruction were widely important in the growing elocutionary movement presaged by Sheridan. Like both Sheridan and Austin, Delsarte taught that specific movements and vocal inflections were linked to the creation of predictable emotional reactions in the audience. The ideas of Sheridan, Austin, and Delsarte influenced not only public speaking but also how people carried themselves and spoke in all kinds of public appearances, even during everyday life, which is of course a performative way of thinking about style.

Modern scholars of communication from the start of the 20th century have studied the performative dimensions of style. A willingness to call this dimension by the term *style* has, as we saw at the start of this section, recently entered into this scholarly tradition. An early essay from 1915 by Gladys Borchers develops “An Approach to the Problem of Oral Style,” in which Borchers discusses the special dimensions of style that come from the person presenting herself in public before others—in other words, from performance. The importance of orality or the use of the spoken word is a dimension of style that moves toward the performative, since it goes beyond the purely linguistic. This is the theme of Robert T. Oliver’s 1943 article “Living Words.” A living word, as opposed to one on a page, is inherently performative. In performance, style tells us about the individual speaking, an idea developed early in the century by C. K. Rogers (1916) in “The Voice as a Revelation of the Individual.” That which is experienced orally is experienced in particular ways. An essay by Lionel Crocker (1928), “The Refrain in Oratorical Prose,” is an example of early 20th-century studies of such orality. An even earlier essay is F. H. Lane’s 1916 “Action and Emotion in Speaking,” which clearly addresses the performative dimension of delivery in public presentations: what one does, how one gestures, and so forth. A similar study from 1927 was Gaston Louis Malecot’s “A Note on Gesture and Language,” continuing Austin’s tradition of studying the ways in which gesture in performance conveys meaning. Likewise, T. Earle Pardoe explores “Language of the Body” in a 1923 essay. By 1970, W. Ross Winterrowd was referring to the nonverbal, performative dimensions of communication *as style* in his “Style: A Matter of Manner.”

Sheridan’s idea that a living voice may convey emotions nonverbally finds a more recent echo in Smiley Blanton’s 1989 study of “The Voice and the Emotions,” with its focus on the delivery and performance of public discourse. Wayland M. Parrish explored the kind of performed styles best suited to extemporaneous speaking in his 1923 essay “The Style of Extemporaneous Speech.” Floyd K. Riley studied parallels between conversation and certain styles of public address in 1928, in “The Conversational Basis of Public Address.” Marouf Hasian Jr. (2000) continues the performative tradition of style without explicitly calling it style in his study of

John Brown’s demeanor and self-presentation during his 19th-century trial.

Conclusion

The common thread linking the linguistic and performative traditions is aesthetics. However it is viewed, style has always been understood as an aesthetic dimension of communication. When a theorist has not thought aesthetics to be important, style has not been felt to be important. It is then regarded as mere decoration, as something extra to be added to a message or presentation after the main substance of argument and exposition has been developed. We saw above that linguistic style has sometimes been referred to as mere ornament or decoration. Performative style is often denigrated as mere “skin” or “surface,” a mask that one puts on just for today and that does not reflect one’s reality. Ewen (1988) describes that opinion as the feeling that “the ability to stylize anything . . . encourages a comprehension of the world that focuses on its easily manipulated surfaces, while other meanings vanish to all but the critical eyes” (p. 262). Those “other meanings” are often seen as the more important substance or inner core of who a person, speaker, or group really is. These doubts that are raised about both linguistic and performative style raise the question of whether style in either sense is important in effective communication. That is also to raise the question of whether attention to the aesthetic dimension of communication is necessary for rhetorical, communicative effectiveness.

It will not do to sneer at either sense of style in the 21st century or to believe that aesthetics are unimportant for effective communication. We are living in an age of aesthetics today. You can certainly find at least one show on television any time of the day or night that features aesthetics: how to cook, how to decorate, how to dress, how to be made over, how to overhaul your car, and so forth. Magazine racks in stores groan under the weight of slick glossies offering to show you how to make your self or your home more aesthetically appealing. If there are cultural reasons (e.g., the aesthetic is a more important value for us than it may have been for other eras) for this phenomenon, there are surely also commercial reasons: The world’s huge industrial overcapacity must be kept going by constant hyperconsumption on the part of the public, globally. We have to be induced to buy far more than we need, or the economy would come crashing down. One can never be persuaded to buy 20 pairs of jeans and 30 pairs of shoes for practical reasons alone. But if we can be persuaded that we have to have another pair of jeans in just that shade of indigo, if we can be taught that last season’s jacket is no longer socially acceptable, if we are led to believe that only this pair of shoes is appropriate for that big night out—in other words, if we can be taught to think in terms of style, then there is hardly any limit to what we may be persuaded to

buy. An aesthetic preoccupation is key to global capitalism, and if it is also central to today's popular culture, the link should not be surprising. Ewen (1988), argues that today's economy especially depends on style, since in the market "all manners of human expression and creativity are mined for their surfaces: their *look*, their *touch*, their *sound*, their *scent* [italics added]. This booty is then attached to the logic of the marketplace: mass produced and merchandised" (p. 52).

For both cultural and economic reasons, style and aesthetics are key to effective communication because they are key to how people live and think today. The political candidate with all kinds of good policy ideas who cannot express himself or herself in an exciting verbal style or cannot perform a likable personal style is simply not going to be elected. The business presentation couched in heavy jargon by someone in a rumpled suit and a slouching stance is not going to land the contract. And wouldn't that be unfortunate if the candidate were really the best person for the position and if the contract should by economic common sense go to that inept persuader? Style, linguistic and performative, is no longer decoration and adornment—it is increasingly the most important element of effective communication.

I think that given the power of the capitalist system and the market today, it is entirely understandable that style should increasingly take on a performative aspect. While the linguistic tradition is still with us, you can't sell the stuff for making good metaphors as easily as you can sell the stuff for making a good impression at the club tonight or at the job interview tomorrow. The linguistic tradition is a little disconnected from commodification, but commodification was made for the performative understanding of style and vice versa. For these reasons, the performative understanding of style will continue to gain strength as a major cultural preoccupation and dimension of communication.

A theme sounded throughout classical rhetoric is that one should study persuasion because it would be too bad to leave goodness and truth undefended while evil and falsehood win over audiences. Today, we may say that about the study of style. If it was important to know how to argue before audiences of the past, how to present facts and figures in the most logical fashion, today it is important to know how to reach audiences through style. Rather than regard style as inconsequential, communicators should accept its cultural and economic dominance and incorporate it into their rhetorical efforts in everyday life, in public presentations, and in mass communication.

GENRE

KARLYN KOHRS CAMPBELL

University of Minnesota

Genre is an alien term, hard to pronounce and difficult to define. Etymologically, *genre* comes from French, meaning “kind,” “category,” “sort,” or “gender,” and from the Latin *genus*, meaning “descent, family, type, or gender.” Genre and its close relative *form* are challenging terms because they are abstractions. No one has ever seen form or genre, only exemplars that we perceive as a particular form or genre. Accordingly, these concepts are malleable and are understood differently by literary and rhetorical critics, those who study communication through language, and those who study discourse communities and their regulation and constitution by rules and conventions.

The notion of categorizing works of literature and rhetoric by type has its roots in the thinking of Aristotle, the great categorizer, whose *Poetics* described the three broad literary genres of prose narrative, poetry, and drama (Connors, 1986) and whose *Art of Rhetoric* described three types of public discourse, the deliberative to enact expedient policies, the forensic as a means to do justice, and the ceremonial or epideictic to celebrate the values of the community and unify its members. Initially, such distinctions were descriptive, identifying basic symbolic processes. That is, to live peacefully in any community, there must be rules; hence, there must be deliberative discourse. If rules exist, some will break them, hence the need for forensic discourse. Because deliberative and forensic speeches involve disagreements, ceremonial discourse is needed to remind the community of its unifying values. Moreover, Aristotle did not treat these as mutually exclusive genres but noted points at which their elements merge or overlap, as in the deliberative implications of ceremonial discourse, illustrated by

the eulogies of Pericles for the Athenian dead and Lincoln’s address at Gettysburg.

What began as descriptions of public discourse soon migrated into pedagogy for fledgling orators. Training was based on imitation, which required students to analyze form (style, manner, arrangement) and content (themes or lines of argument). Students were expected to analyze a model, then imitate the form but supply new content or imitate the theme but present it in a new form. Exercises in imitation occurred on every level, beginning with exercises in vocabulary and grammar, and taught students to assess what precisely a given form did to create a given meaning or effect (Clark, 1959). Because the models used were outstanding examples from the rhetorical literature, the exercises were also training in invention. “In classical rhetoric, the doctrine of *imitatio* provided the most obvious intersection between the reading of texts and the production of persuasive arguments,” Michael Leff (1977) notes, and he emphasizes its central role in rhetorical invention: “*Imitatio* is not the mere repetition or mechanistic reproduction of something found in an existing text. It is a complex process that allows historical texts to serve as equipment for future rhetorical production” (p. 201). In the introduction to *Exemplum*, John Lyons (1989) links this pedagogy to the example:

Example is therefore based on the view that the apparently infinite number of possible events can be contained within a limited structure or repertory of rules. The occurrences or manifestations of a general rule will therefore be limitless, but the underlying rules will be finite,

an assumption underlying the practice of rhetoric, as described by Antonius in Cicero’s *De oratore*, that

all the possible subjects of debate are not founded on a countless host of human beings or an endless diversity of occasions, but on typical cases or character, and that the types are not merely limited in number but positively few. (Loeb Classical Library 34, in Lyons, 1989, p. 28)

Pedagogical exercises taught rhetorical theory by example:

Given the limitations of theoretical instruction, imitation played a vital role in rhetorical education, for it could show what the rules could not tell. In the first phase of this process, the reader would learn to identify strategies and forms as actually embodied in a historical text and to judge their significance relative to the construction of the text as a whole and its situated rhetorical purposes. (Leff, 1997, p. 202)

Subsequently, the strategies and forms identified would be incorporated into a new discourse addressing a different set of circumstances. As summarized by Rita Copeland,

the relationship between model and copy, like that of lineage, is predicated on the act of invention; the model or ancestor, discovers and posits the ground for future invention. Such an evolutionary pattern is enabled or sustained by the very interpretative continuity which it creates. Hence, to justify the imitative enterprise, the copy produces, not conspicuous likeness of the original, but rather what is understood and revalued in the original. (Copeland, 1991, p. 27, cited in Leff, 1997, p. 202)

Leff notes that this kind of imitation is a vehicle for what J. Robert Cox (1987) calls “the invention of usable traditions” (cited in Leff, 1997, p. 203) and constitutes what Leff defines as hermeneutical rhetoric.

As the field of speech emerged out of English departments at the beginning of the 20th century, genre played an important role in differentiating studies of rhetoric from studies of literature. In 1925, Herbert Wichelns responded to the need to define a distinctive mission for rhetorical scholarship. Like the founders of the new discipline, he defended the importance “of the study of the [oratorical] art” (p. 4). Literary analysis was unsuitable for such study because it presupposed “the absolute standard of a timeless world,” whereas oratory is “the art of influencing men in some concrete situation” (pp. 21–22). Rhetoric was not timeless literature; rhetorical acts were responses to particular situations, and orators were to be judged by their ability to adapt to and influence the immediate audience. Accordingly, rhetorical criticism “is not concerned with permanence, nor yet with beauty. It is concerned with effect” (p. 22). He wrote, however, that public discourse lies “at the boundary of politics (in the broadest sense) and literature; its atmosphere is that of the public life, its tools are those of literature, its concern is with the ideas of the people as influenced by their leaders” (p. 26). In other words, oratory was a kind of discourse importantly different from literature, although some of its tools were those of literature.

Early efforts in rhetorical criticism were collected in *History and Criticism of American Public Address* (Brigance,

1943, 2 vols.; Hochmuth, 1955, 1 vol.). Reflecting the distinction between literary and rhetorical scholarship, Brigance (1943) insisted that personal influence and social status, *not artistry*, guided his selection of speakers (Book I, chap. vii). The critical method outlined by Wichelns was systematized and detailed by Thonssen and Baird (1948).¹ Studies following these methods consisted primarily of historical-biographical studies of the situation in which a speech was given and of the man who delivered it. Based on analysis of the essays in the three volumes of *History and Criticism of American Public Address*, Edwin Black (1965) concluded that the standard methods of critical analysis consisted primarily of classifying speeches generically as deliberative/policy related, forensic/legal, or epideictic/ceremonial and analyzing them in terms of the modes of proof to identify argument, appeals, and credibility and the classical canons or arts in order to assess originality, structure, style, and delivery.

The urge to classify discourses, to order them by groups, has been a strong impulse in rhetorical criticism primarily because criticism rests on comparison and contrast, the processes by which we are able to perceive similarities and differences and to identify forms, strategies, and arguments. Comparison and contrast are not, however, of equal importance, primarily because differences are inevitable and endless. Every person, event, object, or situation differs in myriad ways. We cope with “blooming, buzzing confusion” by ignoring some differences to attend to and recognize recurring elements or patterns, which exist at many levels of abstraction and direct and frame the ways in which symbolic acts are to be interpreted. Attempting to understand phenomena by comparing them with other phenomena, similar and dissimilar, is a basic human conceptual activity.

Our ability to recognize any element of discursive practice relies on prior familiarity with other instances—of types of argument (e.g., a fortiori), kinds of structure (e.g., method of residues), issues (stasis), strategies (e.g., refutation, enactment), types of evidence (authority, testimony), tropes (metaphor, metonymy), and so on. Accordingly, all criticism is based on analogy, of perceived similarities among speeches, such as the eulogies for warriors by Pericles and Abraham Lincoln (Wills, 1992, pp. 41–62), Reagan’s ceremonial speeches at Bitburg and Bergen-Belsen compared with those at Omaha Beach and on D-Day (Jensen, 2007), or a comparison of Lincoln’s Cooper Union address with Barack Obama’s speech on race at Philadelphia (Wills, 2008), likenings that are the natural outcome of the comparative foundations of criticism. Evaluation is, likewise, based on comparison. We derive norms for judging immediate and long-term effects from familiarity with past successes and failures. We evaluate the artistry of rhetorical works by comparing them with those we consider models of excellence, of the ethical principles espoused in different works as options from which we might choose, and of the bases for judging truth and propriety through comparison with

outstanding exemplars. The challenge has been to avoid the pitfalls that genre invites—the sense that classifying speeches into types is all that is required of the critic, pitfalls of imposed regularity explored in the collection edited by Aram A. Aghazarian and Herbert W. Simons (Conley, 1986). As the editors note, any example of public discourse can be approached through many different frames so that a given work, such as Martin Luther King Jr.'s "Letter From Birmingham Jail," can be treated as protest rhetoric, an apostolic epistle, an apologia, Southern rhetoric, religious rhetoric, and so on (p. 11). Each frame is as apt as the extent to which it helps us understand the power of King's letter and the sources of its invention; criticism is not a contest to discover the best niche. Classification, however, courts the dangers of oversimplification and prescription. As critics quickly noted, generic analysis was as vulnerable to cookie-cutter applications as were the neo-Aristotelian methods it was designed to replace, and they argued forcefully that generic analysis was reductive and formulary (Conley, 1986; Patton, 1976). They were right; any critical procedure applied rigidly becomes just that.

As Aghazarian and Simons (1986) point out, "The amorphous nature of discourse continues to be a problem in genre studies," calling attention to the problems of interpretation. What, for instance, counts as "an invitation to contemplation, a call to action, a restatement of political principle, an appeal to unity" (p. 199) in an inaugural address? The essays on presidential inaugurals generally and on Reagan's 1981 inaugural in particular in that volume illustrate the insights of differing frames as well as the problems of interpretation (Joslyn, 1986).

There is no particular virtue to categorizing as such or to organizing discourses according to some principle, group of strategies, or motives (Benoit, 2000; Harrell & Linkugel, 1978; Ware & Linkugel, 1973). Identifying a form or a genre is useful only if that identification helps us understand how a particular discourse unfolds and appeals, how it functions. Comparison can be revealing. Looking at the apparently pointless discourse of the Yuppies of the 1960s through the lens of the diatribes of the ancient Cynics makes what is apparently nonsense intelligible (Windt, 1972). Through comparison, we can explore the role of enactment in the Democratic convention keynote addresses of Barbara Jordan (1976) and Barack Obama (2004). We can enlarge our understanding of enactment through analyzing Angelina Grimké's use of the mob's protests as proof in her 1838 speech in Pennsylvania hall, and we can discover another dimension of enactment by treating President Kennedy's repeated phrase, "Let them come to Berlin," in "Ich bin ein Berliner," as a call to enactment, asking us to do as he has done, to use Berlin as a test of the claims of the Communists (Campbell & Jamieson, 1978, pp. 18–19).

The possibilities for human symbolic action are infinite, yet our capacity to recognize and perceive such strategic

moves depends on frames of reference that enable us to discern a kind of argument, a strategy, a metaphor, or a genre. At this level, criticism is descriptive analysis, decoding and identifying the forms embedded in a complex message encrypted in a speech, a photograph, or a memorial. Equally, however, as Adena Rosmarin (1985) suggests, skillful critics create symbolic castles out of textual clues, drawing attention to Lincoln's control of time in the Cooper Union address (Leff, 1997), pointing to iconicity, the similarity between the form of a sign and its meaning (Leff & Sachs, 1990), such as the assonance in Kennedy's inaugural reference to "the steady spread of the deadly atom," noting Angelina Grimké's use of a prophetic persona and that of the biblical Esther (Japp, 1985), and tokens of ideology in political discourse (Black, 1970). As humans who communicate, we are all practicing critics whose interpretations are tested daily in conversation with our peers. Academic critics draw on their knowledge of rhetorical theory and literature to discern strategies at work that are likely to go unnoticed by most audiences. A disciplinary community of peers tests those claims to judge whether the claim is a mirage or the astute perception/recognition of an example of unusual symbolic architecture. In addition to Black's treatment of Chapman's speech as a morality play, other examples include the aforementioned comparison of the diatribe of the ancient Greek cynics with the rhetoric of the Yuppies (Windt, 1972), the post-9/11 rhetoric of George W. Bush as analogous to Puritan covenant renewal (Bostdorff, 2003), the rituals and performance of petitioning (Zaeske, 2003) and voting (Ray, 2007) as rhetorical action, treating Nixon's resignation speech as a farewell address in which he attempts to define his presidential legacy (Campbell & Jamieson, 1990, pp. 207–211), the explanatory power of a dramatic analysis of the processes by which a shooting in Maine was transformed to shift blame from the hunter to the victim (Tonn, Endress, & Diamond, 1993).

In 1965, Edwin Black offered an alternative to the traditional methods of rhetorical criticism based on language. Fundamental to his alternative were assumptions about linguistic practices. He wrote,

There will be a correspondence among the intentions of a communicator, the characteristics of his [*sic*] discourse, and the reactions of his auditors to that discourse. . . . to deny that is to deny the possibility of language as we ordinarily understand that term. (p. 16)

Thus, he concluded,

When we find three factors—strategies, situations, and effects—coinciding, this is a tolerably good reason for suspecting that the three factors . . . are really just three aspects of the same thing. Rhetorical strategies refer to characteristics of the discourse; rhetorical situations refer to extralinguistic influences on the audience; audience effects refer to responses to the strategies in the situations. (p. 134)

What he called the rhetorical transaction combined these three constituents (p. 135).

Two concepts underlying Black's approach to criticism are problematic. One is situation, a concept often reduced to a material reality (Bitzer, 1968). Situations, of course, are real, but only as the shared perceptions of a group. In some cases, these are widely shared perceptions and interpretations, but they are never uniform, illustrated dramatically by differing views among Americans of how to interpret the events of 9/11. They also are unreal, conceptual products of symbolic systems created by communities. Raymie McKerrow's (1989) call was for a critical rhetoric to attack the unreal but hegemonic rhetorical constructs that pervade our lives. Situation needs to be understood as a symbolic context grounded in community, a construct whose limits we recognize when our cultural knowledge is inadequate, as when Gerry Philipsen (1986) provides the background that enables us to understand Mayor Daley's council speech or when Lin-Lee Lee (1997) enables us to comprehend why Zhao Ziyang's speech to the students in Tiananmen Square persuaded them to end their hunger strike.

The other term is *genre*, the subject of this essay. Black (1965) defended his language-based approach to criticism and the importance of the intertextual connections that it emphasized this way: "The neo-Aristotelians ignore the impact of the discourse on rhetorical conventions, its capacity for disposing an audience to expect certain kinds of justifications in later discourses that they encounter, even on different subjects" (p. 35). In other words, discourses alter and shape community norms; their effects extend beyond responses in a given historical moment. Discursive practices are models. Genres emerge and evolve.

In the introduction to *Form and Genre: Shaping Rhetorical Action*, Campbell and Jamieson (1978) traced the history of generic approaches to rhetorical criticism. Subsequently, Campbell and Jamieson generically analyzed the rhetoric of the U.S. presidency. Their initial efforts focused on inaugural addresses (1986) and the speeches of ascendant vice presidents to identify the functions that these speeches performed (Jamieson & Campbell, 1982). As the analysis expanded to more kinds of presidential speeches, such as state of the union addresses, veto messages, war rhetoric, and farewells, this work became a study of the interaction between an institution and its rhetoric (Campbell & Jamieson, 1990, 2008). Jamieson's early work on the rhetoric of the papacy was especially helpful in moving us in this direction (1974, 1975). The approach taken was pragmatic: what are the ends of these discourses and what means are used to achieve them—that is, the relationship between form and function as a way to discover the knowledge created by the presidential practice of rhetoric.

In contrast to a conception of criticism as grounded in social practice, the literary critic Adena Rosmarin (1985) emphasizes the creative role of critics, whose *métier* is

claiming and expanding our rich symbolic inheritance. In *The Power of Genre*, she explores the key questions that face critics, who, she argues, "strive both to unfold the unique and unmediated particularity of a text or reading experience and to generalize this particularity, phrasing its explanation in terms not its own" (p. 6). She raises some of the most troubling questions:

Does genre constitute the particular or do the particulars constitute the genre? Are genres found in texts, in the reader's mind, in the author's, or in some combination thereof? Or are they not "found" at all but rather devised and used? . . . Can we "see" them or do they hover on the hermeneutic "horizon," always potentially but never actually in view? (p. 7)

She aligns herself with E. H. Gombrich's studies of the rhetoric of visual representation, who claims that every symbolic act is "intertextual—that each visual text, like each verbal text, is a rewriting of previous texts" (p. 19). Obviously, this claim echoes assumptions underlying Greco-Roman concepts of rhetorical invention. Rosmarin defines genre as "a kind of schema, a way of discussing a literary text in terms that link it with other texts and, finally, phrase it in terms of those texts" (p. 21). In other words, genre is

the critic's heuristic tool, his [*sic*] chosen or defined way of persuading his audience to see the literary text in all its . . . fullness and then to relate this text to those that are similar or, more precisely, to those that may be similarly explained,

and she adds that "explanatory power, like affective power, tends to be greatest when the affinities are surprising" (p. 25).

There are some similarities between Rosmarin's approach to genre in literature and Black's approach to rhetorical criticism based on linguistic practices. Generic analysis is not precisely a method but an interpretative frame based on the ways in which language works in human interaction. What might eventuate in a generic comparison begins with close readings of texts. Such works can be widely understood to be somehow importantly similar, such as eulogies, with the critic in a search of what key symbolic moves they share. On the other hand, a close textual analysis can lead to an unusual generic claim, as occurs in Black's analysis of Chapman's Coatesville Address. That speech has no surface similarities to classic morality plays such as *Everyman* or *Abraham and Isaac*, but Black works to persuade us to see what it does as symbolically similar to the transformations effected in and through morality plays. Once "seen" or interpreted in those terms, we can understand why and how that address is able to speak to subsequent audiences.

An alternative, social scientific approach to genre has grown out of psychological studies of cognition in everyday life (Nelson, 1969). What is sometimes referred to as activity theory, based on its Russian roots, looks at speaking and

writing as tools that mediate social practices by means of genres. Such genres are functional types, typified semiotic responses to recurring conditions that a group of people involved in some activity network share, and such genres mediate varied social practices in multilayered, multifaceted ways. Every modern profession carries out its activities through written genres, which evolve as conditions change, illustrated by changes produced by developments in law, medicine, and academic disciplines. This approach to genres is called sociohistorical because it traces the history of various genres within and among networks of social practice.

Whereas historically form and genre were preeminently pedagogical tools for honing the skills of fledgling orators, and then became part of the array of methods used by modern rhetorical critics, these concepts have become tools in efforts to understand discourse in postmodern culture. Genre has become less the study of affinities between speeches or symbolic acts and more the study of linguistic conventions and usages that constitute and regulate the practices of academic disciplines, professions, organizations, and institutions. The research studies of Carol Berkenkotter and Thomas N. Huckin (1995), Michael Bernard-Donals (1998), Cheryl Geisler (1994), and Charles Bazerman (1994), among others, illustrate this shift in focus. Its historical roots lie in the work of Lev S. Vygotsky in the late 1920s and 1930s, and it continued in the 1960s in the work of developmental psychologists. In the 1980s, that tradition was related to lines of research into cognition in everyday life (Nelson, 1969; Russell, 1996). Michael J. Shapiro (1986) traces the philosophical support for this shift, noting that

[Martin] Heidegger displaces the ego-subject, the subject of consciousness, from the center of knowledge and puts in its place a historical, changing subject constituted as a set of skills and/or practices, including (and especially) linguistic practices, which “house” human existence. (p. 160)

The shift is also related to Michel Foucault’s notion of

“discursive practice”—the combination of discursively engendered objects, concepts, enunciative modes, and themes—which creates privileged places for some subjects who are constituted as agents of knowledge while others are relegated to silence. (Shapiro, p. 162)

In other words, Foucault not only studies them but also seeks to undermine the power bequeathed by prevailing discursive practices (Shapiro, 1986, p. 165; see also McKerrow, 1989).

As an illustration of these dynamics of genres in a community, Charles Bazerman (1994) outlines the development of journalistic practices, including the interaction between discursive forms and technology:

The history of literate forms is a history of inventions, not just of literate forms themselves, but of their use in social circumstances and of the development of social circumstances through the incorporation of literate forms. The history of journalism

and the public taste for news includes material inventions, such as printing presses, steam presses, Linotype machines, radio, television, and satellites. But it also obviously includes the invention of kinds of periodicals. . . . Further, within these periodical types are embedded the inventions of thousands of changing genres, such as the sports story, the front-page analysis, the op-ed article, the advice to the lovelorn, and the gossip column. These literate forms appear within changing social structures created around the texts, such as changing distribution networks for the periodicals; the emergence of the profession of journalism; . . . the creation of a consumer advertising culture, and the idea of public opinion. (pp. 38–39)

Here, genres reflect the conditions of a field or profession, and as these change, so do the practices of those engaged in it.

As concepts, form and genre are rooted in the communicative functions of language. Humans are able to communicate as members of linguistic communities that share vocabulary, syntax, and established patterns of usage. It is impossible to communicate one’s distinctive personal experiences; vocabulary identifies only classes of objects (desks) or emotions (anger) that include widely varying instances or gradations of feeling. Northrop Frye (1957) links genres to “typical recurring images,” “associative clusters,” and “complex variables.” He compares them with the *topoi* of rhetorical commonplaces and calls them “communicable units” through which our experiences and feelings can be made intelligible to others (p. 99; see also pp. 95–115, 245). Forms and genres are conventions of usage that make it possible to interact with others and to articulate and express values, attitudes, and beliefs.

These concepts, which operate at different levels of abstraction, are discussed by Mikhail Bakhtin (1986) in his essay “The Problem of Speech Genres.” Bakhtin differentiates between primary and secondary speech genres. Primary genres are found in the local communicative activities of everyday life, such as greetings or asking a friend for a favor. Secondary genres, such as scholarly and scientific articles, written forms of organizational communication (Sharer, 2001; Yates & Orlikowski, 1992), legal summons, subpoenas, and patents, codify activity in situations occurring over time and in distant locales; accordingly, secondary speech genres are “complex” (Berkenkotter & Huckin, 1995, pp. 7–8). Bakhtin (1986) describes speech genres as boundless in their diversity because each sphere contains a whole repertoire of them. Secondary genres emerge “in more complex and highly developed and organized cultural communication” (p. 62), such as the artistic, scientific, or sociopolitical spheres that absorb and digest various primary or simple genres. According to Bakhtin,

Language is realized in the form of individual concrete utterances (oral and written) by participants in the various areas of human activity. . . . [T]hematic content, style, and compositional structure—are inseparably linked to the *whole* of the utterance and are equally determined by the specific nature of

the particular sphere of communication. Each separate utterance is individual, of course, but each sphere in which language is used develops its own *relatively stable types* of these utterances. These we may call *speech genres*. (p. 60)

Primary genres are embedded in the local, intimate milieu in which they occur; in contrast, secondary genres are more removed, distant. Bakhtin (1986) wrote,

Secondary (complex) speech genres—novels, dramas, all kinds of scientific research, major genres of commentary and so forth—arise in more complex and comparatively highly developed and organized cultural communication (primarily written) that is artistic, scientific, sociopolitical, and so on. (p. 62)

This approach is developed at length by Berkenkotter and Huckin (1995), who focus on the genres that develop and evolve in academic cultures. Their central claim is

that genres are inherently dynamic rhetorical structures that can be manipulated according to the conditions of use, and that genre knowledge is therefore best conceptualized as a form of situated cognition embedded in disciplinary activities. (p. 3)

Five principles constitute the theoretical framework for their work: first, that genres are dynamic rhetorical forms developed from responses to recurrent situations that stabilize experience and give it coherence and meaning; second, that knowledge of genres is derived from participation in the communicative activities of daily and professional life; third, that genre knowledge embraces both form and content, including a sense of what content is appropriate to a particular purpose in a particular situation at a particular moment; fourth, that in using genre rules we constitute social structures and, simultaneously, reproduce these structures; and, finally, that genre conventions signal a discourse community's norms, epistemology, ideology, and social ontology. They apply these principles to the scientific journal article; to scientific peer review correspondence; to the evolution of a scholarly forum; and to curricular, pedagogical, and classroom genres.

Carolyn R. Miller's groundbreaking 1984 essay "Genre as Social Action" responded to competing views of genre in rhetorical studies, and her analysis links the work of rhetorical critics and students of practices in discursive communities, such as academic fields. Her approach to genre is pragmatic, claiming that "a classification of discourse will be rhetorically sound if it contributes to an understanding of how discourse works—that is, if it reflects the rhetorical experience of the people who create and interpret the discourse" (p. 152). She proposes that "in rhetoric the term 'genre' be limited to . . . a classification based in rhetorical practice and consequently open rather than closed and organized around situated actions (that is, pragmatic, rather than syntactic or semantic)" (p. 155). She calls this approach ethnomethodological because "it seeks

to explicate the knowledge that practice creates" (p. 155).² Bazerman (1994) also links ethnomethodology to the study of genres:

It has been the project of ethnomethodology to uncover the everyday understanding of the world that is revealed in our everyday action; equally it has been the project of cognitive psychology to find how we code that everyday understanding of the world into structures of thought that then guide our continuing daily actions. Both . . . analyze how we bring to bear our sense of the world in our momentary actions. (pp. 175–176)

Consistent with her pragmatic approach, Miller (1984) argues that "a rhetorically sound definition of genre must be centered not on the substance or the form of discourse but on the action it is used to accomplish" (p. 151). Accordingly, genre "must involve situation and motive" (p. 152), "a point of connection between intention and effect, an aspect of social action" (p. 153). Because genres rely on the social practices of a community that grow and fade through time, they are "an open class, with new members evolving, old ones decaying" (p. 153). Although genres are responses to them, "situations" cannot be material or subjective. They cannot be material because, as objective phenomena, they are unique and cannot recur (Stebbins, 1967, p. 154, in Miller, 1984, p. 156); similarly, situations cannot be a subjective configuration or "perception" because these, too, are unique. Put differently, "Recurrence is an intersubjective phenomenon, a social occurrence"; thus, genres "are social constructs" (p. 156). Here, Miller turns to the work of Alfred Schutz, who argues that our "stock of knowledge" is based on types through which we interpret new situations, "types that are created and shared and evolve through communication and, hence, reside in language," and adds that "language can be construed as the sedimentation of typical experiential schemata which are typically relevant in a society" (Schutz, 1971, p. 234, in Miller, 1984, p. 157). In other words, "it is through the process of typification that we create recurrence, analogies, similarities" (p. 157). Here, Miller cites the work of M. A. K. Halliday, who comments that

the apparently infinite number of different possible situations represents in reality a very much smaller number of general *types* of situations, which we can describe in such terms as "players instructing novice in a game," "mother reading bedtime story to child," "customer ordering goods over the telephone," "teacher guiding pupils," "discussion of a poem," and the like. (Halliday, 1978, p. 29, in Miller, p. 157)

Although situations are infinite, their typifications are limited.

At issue, however, is how substantive, stylistic, and situational elements fuse in a genre. Kenneth Burke (1968) describes form as "an arousing and fulfillment of desire. A work has form in so far as one part of it leads a

reader to anticipate another part, to be gratified by the sequence” (p. 124). In other words, form shapes response to content by giving instruction about how to perceive and interpret, which disposes the audience to respond in a certain way. “Seen, thus, form becomes a kind of meta-information, with both semantic value (as information) and syntactic (or formal) value. Form and substance thus bear a hierarchical relationship to each other” (Miller, 1984, p. 159); thus, “we can think of form, substance and context as relative, not absolute; they occur at many levels on a hierarchy of meaning.” In other words, “form at one level becomes an aspect of substance at a higher level” (Miller, 1984, p. 160). As an illustration, she points to a hierarchic model developed by Thomas S. Frenz and Thomas B. Farrell (1976), which is composed of context, episodes, and symbolic acts. Context “specifies the criteria for interpreting both the meaningfulness and propriety of any communicative event.” Context has two hierarchic levels—form of life and encounters. “Form of life” refers to “cultural patterns, both linguistic and nonlinguistic, that give significance to actions, both linguistic and nonlinguistic.” Encounters “particularize form of life through rules of propriety” (Frenz & Farrell, 1976, p. 335). The second level of the hierarchy is the episode, a “rule-conforming sequence of symbolic acts generated by two or more actors who are collectively oriented toward emergent goals” (p. 336). The third and lowest level is the symbolic act, which comprises “verbal and/or non-verbal utterances which express intentionality” (p. 340) and is the “component” of the episode. Thus, what is form at one level becomes content at another, and at each level, form is a frame that instructs us about how to interpret content.

The complex relationships between form and content at different levels of abstraction are part of the ways in which we make meaning, ways in which we expand our rhetorical repertoire. Our ability to understand the form-content relationships created in communal practice are aspects of our social competence, but they also represent communicative potentials. Miller (1984) writes,

What we learn when we learn a genre is not just a pattern of forms. . . . We learn, more importantly, what ends we may have: that we may eulogize, apologize, recommend one person to another, instruct customers on behalf of a manufacturer, take on an official role, account for progress in achieving goals. We learn to understand better the situations in which we find ourselves and the potentials for failure and success in acting together. As a recurrent, significant action, a genre embodies an aspect of cultural rationality. (p. 165)

Miller’s conclusion emphasizes the ways in which social knowledge and language competence teach us how to adopt personae and perform appropriate symbolic acts and to recognize such action in others, which are essential elements in creating and interpreting the discourse that is a part of our daily life as communicators.

Genres are forms that exist in and are understood by members of communities. As such, they are affected by context, analogous to what Ludwig Wittgenstein referred to as language games, meanings that arise out of rule-governed usage, like the rules that create games such as bridge and soccer. Contexts, too, are hierarchical. What was form at one level becomes an aspect of substance at another level, echoing Bakhtin’s view of primary and secondary genres. In other words, “Conventions of form and substance combine according to constitutive rules to create the typified rhetorical action of the eulogy; in addition, the action is interpretable under regulative rules provided by larger contexts, like religion or public affairs” (Miller, 1984, p. 161). In other words, genres “exist” at different levels of abstraction.

Bakhtin (1986), too, emphasizes the fusion of form and content and the merging of generic elements, or what he refers to as *heteroglossia*, modes of speaking or writing that people learn to mimic, weave together, and manipulate, such as “formal letter” and “grocery list,” or “university lecture” and “personal anecdote” (see also Geertz, 1980). Samuel McCormick (2003) illustrates this process at work in a vernacular speech that reorganizes features of integrationist and nationalist ways of speaking drawn from two key strands in African American public discourse. This analysis is consistent with Bakhtin’s (2004) view that any language stratifies itself into many voices: “social dialects, characteristic group behavior, professional jargons, generic languages, languages of generations and age groups, tendentious languages, languages of the authorities, of various circles and of passing fashions” (p. 674). This diversity of voice, Bakhtin asserts, is the defining characteristic of the novel as a genre, but McCormick’s analysis illustrates similar processes at work in public address.

Although form and genre once were pedagogical tools for honing the skills of fledgling orators and then became methods used by modern rhetorical critics, at present these concepts have become tools in efforts to understand discourse in postmodern culture. Genre studies are now less concerned with identifying similarities among speeches or symbolic acts and more concerned with the linguistic conventions and usages that constitute and regulate the practices of academic disciplines, professions, organizations, and institutions.

Notes

1. In 1950, Harold Zyskind innovatively combined close textual analysis with generic criticism, using the Aristotelian genres as a basis for determining whether the Gettysburg Address was best understood as epideictic or deliberative rhetoric. He asserted an important principle, that the value of a generic approach could be tested by asking, “Are the meaning and purpose of the Address—in its uniqueness—in any way illuminated by an analysis of it as belonging to that genre?”

2. In *A Pragmatic Theory of Rhetoric*, Walter H. Beale (1987) writes that pragmatic theory “is concerned primarily with *what human beings do with discourse . . . with the act of discourse as a human action, in its typicality and in its uniqueness*” (p. 1).

DRAMATIC ELEMENTS IN MESSAGES

EDWARD C. APPEL

Lock Haven University

Picture this. Maybe, remember this! You're a child. You're playing in your backyard sandbox with your sibling. He or she throws sand in your face. You run to Mother to tattle. "Freddie threw sand at me again," you exclaim. "Yes, but you hit me first" is his reply. "But you called me a bad name, that's why," you retort. (You each "punctuate" your squabble differently, begin your narration of the event at some self-serving turn of events.)

Mom's had it with this scenario. She's heard it before. "You know the rules," she says for the fifth time: "No throwing sand, period! You don't go near the sandbox, the jungle gym, or the swings, neither of you, for a week! Now go do your homework." In a day or two, there're hugs and kisses and a milder tone of voice. You've learned your lesson—maybe.

That's drama.

Here's another, on a no-doubt-incomparable plane of importance. It's December 8, 1941. The day before, Japanese planes destroyed America's Pacific fleet at Pearl Harbor in Hawaii, except for aircraft carriers then at sea. President Franklin D. Roosevelt addresses a joint session of Congress to ask for a declaration of war. He details in general fashion the extent of the aggression on this U.S. territory, including heavy loss of military personnel. He lists Japanese attacks on Malaya, Hong Kong, Guam, the Philippines, and Wake and Midway islands as well, extending the scope of Japan's violation of the rules of international relationship. Using words such as "infamy," "dastardly," "sought to deceive," and "grave danger," Roosevelt identifies the bad guys against whom the "American people" will rise up "in their righteous might."

"The very life and safety of our nation" is at stake, Roosevelt says. "All measures [will] be taken for our

defense . . . no matter how long it may take us." "Unbounded determination" will energize this effort. In the end, "we . . . will make very certain that this form of treachery shall never endanger us again." "Absolute victory" is the goal. "We will gain the inevitable triumph—so help us God."

That's drama.

The Japanese would have "punctuated" this narrative differently, to be sure. References to an oil embargo, for example, might have preceded accounts of Nippon warships setting sail for Oahu.

Anyway, America did win that war. America sacrificed greatly at the front and at home to make it all happen. Contra the propaganda of the Japanese warlords, U.S. soldiers did not commit atrocities, postwar, on Japanese civilians. The United States made Japan's formerly dictatorial polity a model democracy, quite an improvement. It earned the privilege of buying Japanese cars, radios, TV sets, and cameras in exchange for dollars and raw materials. Or something like that!

Not to make light too offensively of that memorable era in American history, its moment of drama parallels, in rhetorical form and in the abstract, the messages exchanged between Mom and the kids perhaps in your kitchen several years ago. Both narratives fall under the heading of a most rudimentary definition of drama: moral conflict to set right a situation gone wrong or to keep right a situation that could go wrong.

To tease out the implications of that simple construction, if it's moral conflict, at least one human being has to be involved: if not woman against woman, Mom against the kids, or nation against nation, then man against nature. Or, alternatively, a morally sensitive being, namely a person,

has to be involved in the telling of the tale, at any rate. Only creatures with language possess morality.

If it's conflict, then there'll be finger pointing, blame laying, or guilt tripping, followed by punishment of some kind. Something's gone wrong. "You did it" and "Here's how you're going to have to pay" nicely serve as generic indictment and disciplinary announcement. There can't be conflict without talk like that, talk of crime or mistakenness. And the offended can't appropriately follow up on such an accusatory message by saying, "Fine, it's OK with us, go ahead, keep doing it, for all we care." A response won't be fully "dramatic" unless a person or persons intervene in some way, even if only to scold and suggest improvement. A verbal "slap on the wrist" fits with a charge of mistakenness. A long stint in prison or even a sentence of death, sad to say, still serves as penalty for crimes and evils in many parts of the world.

What about the "unbounded determination" and effort it's going to take to win through to "absolute victory," or whatever? There's a sense in which dramatic actors must punish themselves to bring it all to pass. Self-discipline, self-denial, "mortification," it's often called: In dramatic conflict, persons usually have to direct their acts of sacrifice inward as well as outward. Even Mom had to stop what she wanted to be doing, raise her voice, gin up her emotions, and role-play the scold to get you back on the straight and narrow. It wasn't fun for her, either.

How does one know that something has gone wrong in the first place? There must be "rules" of some kind, specific to a given culture, subculture, polity, or context, that the "bad guys or gals" have broken. Such rules of behavior and relationship might be written down, as in the legal codes of conduct the state imposes on its citizens through the actions of legislatures, the police, and courts of law. Or the rules of behavior and relationship might be unwritten, such as the ones that a culture or society imposes on its members in stealth fashion. Dress codes, dating practices, the forms that structure mannered conversations, the dramas enacted at ceremonies, parties, and other social gatherings—the "rules" that circumscribe the social butterflies active therein are not found in statute books, though they will often surface in the advice columns found in newspapers. Want to discover whether an unwritten "rule" is really a rule? Break it and see! The reaction to your social "crime" will be instructive, for sure.

What's still missing from this brief anatomy of drama? It's "moral conflict to set right a situation gone wrong." "No pain, no gain," the saying goes. After the pain, the punishment, the penalty, the suffering, what do you have, what's the gain? It's moral order restored, at least temporarily. That's usually the stated hope. You might have learned something in the "college of hard knocks." That, too, is a potential gain after the pain. Human relationships may feel right again, if the penalty fits the "crime." Isn't rehabilitation the ideal goal of a stint in prison, movement maybe to a halfway house or probation, and then restoration to complete citizenship? To borrow language from the highest orders of morality, dramas aim toward messages and

resolutions of "redemption": The United States atop the free world after 1945; Japan and Germany, now America's friends and allies, model democracies and powerhouse economies within two decades; Mom's embrace and, one would hope, reconciliation between sister and brother.

- A moral order of some kind, held together by rules of relationship applied by the "Moms" of the world, the "big shots" in authority
- Disorder by violation, through weakness, indifference, perversity, or commitment to a different social or political "order"
- Depending on who's telling the story, guilty bad guys who did the awful deed, opposed by the righteous good guys who act to set things aright
- Maybe a constructive or rebellious, charitable or hostile preparatory attitude that will energize or moderate the intended, corrective action, determine its degree or extent
- A sacrificial act or series of such actions, other directed in the form of punishment of one kind or another and/or self-directed in the form of mortifying, self-interfering efforts, all the way from the mild, muscular exertion of a gesticulating Mom to the martyrdom of an M. L. King, Jr.
- Morally corrective purposes and the means, steps, or stages by which to achieve them, a vision of redemption of some sort, restoration of order, things put back together again where they belong or, preferably, better conditions still!
- Risk, chance, maybe danger in the choice and pursuit of their purpose, as dramatic actors, by definition finite and uncertain human beings, reconnoiter resistances and calculate the odds of success in their quest to set right the moral wrong, improve their problematic situation, the stakes being enormous in declarations of war, high in marriage proposals, middling in negotiations at a car dealership, and likely minimal in the humane reproach of a sand thrower: Neither Moms nor presidents know for sure their selection of strategy will deliver, their gamble pay off

That's drama. Messages that contain these elements are dramatic indeed. Where do these features of discourse originate in talk on whatever level of social interaction—for example, the family/child level; the school/student level; the church, synagogue, mosque, temple/parishioner level; the society/member level; the company/employee level; the state/citizen level; the UN, international agreement/nation-state level; you name it? (Each level or dramatic arena will, of course, have its own particular rules and procedures for enforcement, and its own names for these generalized moments or stages of development.) Where, at bottom, do these elements of drama come from, and why is it important to know?

Drama as Rooted in the Content Parts of Speech

This chapter is titled "Dramatic Elements in Messages." Here's where the focus gets down to the atomic layer of

drama. Language users can't escape drama in their talk and thought. It is implicit—moral conflict and human struggles to overcome it or avoid it are implicit—in the words that make up the subjects and predicates of speech. What follows will seem ho-hum familiar to you. Its implications may not be.

A subject, the thing or idea a sentence makes a statement about, and a predicate, the sentence part that tells what the subject is, does, or has done to it, are put together in English with four building blocks. These four building blocks can be called the “content parts of speech,” since they make up the content, the “meat and potatoes” so to speak, of the spoken or written sentence. You know what they are. They are nouns, verbs, adjectives, and adverbs. Dictionaries, grammars, and books written by linguists give us the following meanings for these four building blocks of the subjects and predicates that make up sentences:

- Noun: a word, or group of words, that names a person, place, thing, or idea.
- Verb: a word, or group of words, that states an action that is taken or states what type of being a subject has, what it is.
- Adjective: a word, or group of words, that describes a noun, that is, describes a person, place, thing, or idea, offers a sharper picture of what it is, tells “what kind.”
- Adverb: a word, or group of words, that describes a verb, adjective, or other adverb, a word that indicates, for instance, why an action took place, how it was accomplished, when and where it happened, and the *manner* in which it was carried out.

Armed with these definitions of nouns, verbs, adjectives, and adverbs—the building blocks of the subjects and predicates that go together to make up sentences—the basic forms of thought the English language puts in the mind can now be stated. In terms of traditional grammar—the subject being the main idea and the predicate being what is said about that main idea—the following is clear:

In English discourse,

- A noun subject actor or receiver of action (the “agent” or the “patient,” to use the words linguists call them) performs or receives a verbal action (the who and the what)

or

- A noun subject is identified, classified, or given an attribute or sensation, if the verb is a linking verb, such as “is” or “feels” (the who and the what)
- For some usually adverbial purpose, end, or goal (the why)
- By way of some usually adverbial means or cause (the how)
- To some usually adverbial extent or degree or with some usually adverbial quality or attitude (the manner in which the action is prepared for and/or carried out)

- Within, in terms of, and in response to a usually adverbial, time-and-place scene, situation, or context (the when and the where of the action)
- The thought of the verb is often completed with what is called a “predicate complement” noun or adjective of some kind
- Noun subjects and objects are often modified by adjectives

These, then, in abbreviated summary, are the basic forms of thought expressed in statements about anything—humans, nonverbal animals, vegetables, inanimate materials, and ideas: noun subject actor or receiver of action (or noun subject identified, etc.), verbal act, typically adverbial purpose, means, manner, and scene.

The Implicitly Moral Nature of This General Pattern of Verbal Action

This anatomy of the most basic forms of thought expressed in English discourse may not seem very “dramatic” on its face. Nobody necessarily gets yelled at, verbally knocked around, when subjects and predicates are put together, especially when describing flowers growing in a garden, or planets circling the sun. If, however, one looks closely at the word *purpose* and follows through on its implications, one may think differently. An actor or “agent” performing an action for a purpose is at the center of language as drama. If not up to its ears, the word *purpose* is up to its knees in potential moral conflict. Consider the following.

The word *purpose*, first of all, names a “negative.” It names something that does not yet exist or something that does not yet exist in sufficient quantity, quality, or duration. If your purpose is to win a ballgame, you get in shape, practice hard, and cooperate with your teammates in drills that perfect the plays the coach has designed. The victory on the field or court though—the purpose or aim of your efforts—has not yet come to pass at the time you formulate or speak of your purpose. The victory, your purpose, is still in the future. And the future is a “negative” for the present. It has not happened yet.

The same holds true even for politicians whose purpose is merely to maintain things the way they are. They don't want anything new or different from the status quo, as it is labeled. All the laws and economic arrangements presently in place are just fine, they feel. These conservative statesmen and women or “reactionary” social-movement leaders oppose innovators and revolutionaries. Problem: The future isn't here yet. It is still a negative. What will it be filled with? The conservative status quo? Or revolutionary change and innovation? The purpose these resistance politicians or reactionary social-movement leaders will serve is one of lengthening the duration, enhancing the quantity and perhaps the quality, of the kind of

government and social system the nation currently has. Their purpose, like that of the ballplayers, points ahead in time to a set of conditions that do not yet exist, because the future does not yet exist.

Naming as it does a “not yet” or an “is not the case,” the notion of a “purpose” epitomizes language as verbal action, in contrast to language as a passive “mirror on nature.” “Purpose” points up how language can superimpose on the concrete natural conditions around us something that is “not there.” Just as your sought-after college diploma is “not yet” in your pocket, there’s probably “no” elephant stampeding through the room you’re in at this moment. “No elephant” is a concept you can bring to your present observations as you look to your left and your right. A chair might be materially there, along with a desk or table and a computer. But “no” playful pachyderm. “Purpose” and the negative destabilize a scientific or positivist view of language. They undermine an “objective” and therefore value-free notion of verbal description. Something is happening in language you can’t see, hear, feel, taste, or smell. Could it be—drama?

The social psychologist Abraham Maslow (1970) drew a famous diagram in the shape of a pyramid. He called it the hierarchy of human needs and motivations. He could have called the common human needs he lists in ascending order, lower to higher, a hierarchy of human purposes. Certainly, all persons pursue in their daily activities the ends and goals Maslow deems generally important for human life and success.

On the bottom tier of the pyramid, Maslow lists those physical needs humans directly share with nonverbal animals. They are those of food, drink, cover, shelter, reproduction, and elimination. Higher motivations include safety, belongingness, and esteem. At the pinnacle of the pyramid is the motive of self-actualization, self-fulfillment.

The moral drama that the word *purpose* conjures in the mind by way of hints and suggestions can be seen in a comparison and contrast between humans and other animals on Maslow’s lowest level of needs and motivations. The physical needs of humans Maslow cites are exactly the same, on some level of abstraction anyway, as those of insects and birds, squirrels, and chimpanzees. All animals, human and nonhuman, need and seek after, food, drink, shelter or habitat of some kind, reproduction, and so on. The difference is when nonhuman animals do not meet these needs, they get hungry, thirsty, vulnerable to danger and the elements, and deprived of offspring. When humans do not meet these needs, they get hungry, thirsty, vulnerable to danger and the elements, and deprived of offspring—and they get shamed! The poor themselves are deemed guilty for not properly providing for themselves and their dependents, a typical 19th-century approach to the problems of hunger and homelessness in a society. Or the social order that allows such deprivations to exist within it is blamed, a typical 20th- and 21st-century approach to the

problems of hunger and want. Somebody or some condition is blamed. Moral conflict transpires. Dramas of correction and redemption ensue.

The “higher” human needs and motives with a place in Maslow’s pyramid—safety, belongingness, esteem, and self-fulfillment—are no less burdened by moral judgment. Persons who neglect their safety needs and suffer for that neglect didn’t take proper “care,” their neighbors might say. A recluse who doesn’t “belong” anywhere or has no friends, is often stigmatized as a “loner” or social outcast. To a great extent, “esteem” is meted out according to our location on the “social ladder,” within our community of associates. One is deemed “estimable” or “not estimable” by way of that social standing. Men and women with talent who never use it to good advantage are sometimes labeled “failures” in life. In the pursuit of safety, belonging, esteem, and self-actualization, persons are no less open to ethical criticism and immersed in drama than in their search for food, clothing, and shelter.

That’s why Erving Goffman (1959, 1967), a sociologist, said that human beings in society are ritually vulnerable. By that he meant that humans are susceptible to moral judgment by those around them. Whether they fulfill their needs and purposes, lower or higher, is tinged with moral danger. “Face” is at stake. Men and women can hardly help thinking of “good” and “bad,” “valuable” and “worthless,” when they confront, contemplate, and employ the word *purpose*.

Not Only Whether but Also How

The word *purpose* connotes a rule-governed process of goal seeking, as well as a morally tenuous burden to meet one’s needs, to some extent at least, in the end. Potential moral censure goes not only with *whether* those fundamental human aims and resolves are fulfilled but also *how* they are fulfilled. All scenes, contexts, and hierarchies within which symbol users operate are circumscribed by rules (Cushman, 1977). Even behind closed doors, the “moral law” inside the human mind that inspired the philosopher Immanuel Kant with such “wonder” works its censorious will. The ultimate scene of human action, the literary scholar Tim Crusius (1990) says, is “language” and the intuition of the negative that suffuses it. And the negative, author of the *thou-shalt-nots*, judges persons omnipresently (Appel, 1993a, 1993b).

To wit: Unlike crows and coyotes, human beings do not descend on a farmer’s field to sate their hunger and take what vegetables or livestock they want, without fear of legal action. At the supermarket, they don’t stuff their shopping cart with goodies and wheel them out to the car, without stopping first at the checkout counter to pay. They hardly walk down a tree-lined suburban street, notice a beautiful home across a well-manicured lawn, and say to their spouse next to them, “That would be a great place to live! Let’s move in and make it our own

tonight.” They don’t pass a strange and gorgeous woman, or handsome man, on the street, and go up and say, “I’ve decided you and I are going to make a baby right now.” Symbolizing animals can’t “strike it rich” at banks and convenience stores with a pistol or an Uzi, without a likely and long vacation behind bars. How they strategize the pursuit of their purposes is even more fraught with potential moral conflict than whether they bring them to pass. Food, safety, friends, status—whatever it is they want, human animals have to conform to the *thou-shalt-nots* of society, or else!

Moral Women and Men, OK, but “Moral” Animals in Nature, Vegetables, and Minerals? Get Real!

An obvious issue is this one: If the notion of a morally tinged “purpose” is inherent and inescapable in messages about distinctively human actions, what about descriptions of the nonhuman world? Obviously, symbol users have to access these same parts of speech and forms of thought in their representations of anything and everything. Language offers no other content terms and meanings to work with. How does a claim of ubiquitous drama dovetail with talk about creatures and beings that have nothing to do with morality or ethics?

Consider these common turns of phrase and modes of thought that employ exactly the same terms for moral activity used to describe people:

- The stalking *action* of the lions went unnoticed by the wildebeests.
- The hydraulic *action* of the running water smoothed the edges of the rocks.
- Our car’s engine *acted up* on the trip last week.
- A chemical *agent* in the dish soap cut the grease on the silverware.
- The mother bird gathered twigs for the *purpose* of building a nest.

Lions, water, automobiles, detergents, and birds are not dramatic beings. None of them has anything at all to do with *moral* conflict. They are innocent of laws and rules. Not one experiences guilt or shame. Yet the same basic terms that express what they do also describe the legal *action* Sam took against George, the insurance *agent* who sells medical policies, and the spiritual *purposes* of the youth group on a religious retreat. Speakers and writers use these same basic descriptive concepts with respect to nonhuman beings without a sense of metaphor, without a sense of comparing two things that are essentially dissimilar. What gives?

What gives is that the subtleties of the drama inherent in language escape the modern “scientific” mind. Contemporary men and women aren’t quite as aware that they are investing rocks, plants, and nonhuman animals

with something akin to moral agency in such declarations as follows:

- The earth revolves around the sun once a year at a 23½-degree slant, generating the four seasons.
- The sun shone down on us, warming our bodies.
- Trees grow their branches toward the sunlight to facilitate photosynthesis and stay alive and healthy.
- A pack of African wild dogs ripped the baby zebra to shreds to satisfy their hunger.

Moral agent: a being that has a capacity for self-initiated action that can effect changes in its environment or in itself for good or ill, for benefit or harm. Each of the noun subject “actors” or “agents” in the sentences above are declared to be doing something to bring about changes in their environment for good or ill. The earth “revolves” on a slant to generate the four picturesque and productive seasons of the year. That’s the implication. The sun “shines” so as to bring warmth and life to the denizens of Planet Earth. That’s the implication. Trees “grow” their branches in a certain direction to make it possible for them to bear fruit to eat, provide shade and beauty for body and eyes, and furnish birds and other animals with a safe habitat. That’s the implication. African wild dogs “rip” a poor little baby zebra apart, live, to preserve themselves and their pups, yes, but they do so in such a vicious, cruel, and disgusting way, no one would want them around as house pets or team mascots. That’s the implication. These four “agents”—and that’s what the linguists call *any* subject in an active voice, action verb sentence, human or nonhuman—are represented as performing four “actions,” three of which do “good” and one does something “bad,” or at least morally ambiguous. True, African wild dogs have to live, but can’t they display better table manners?

Persons in primitive or archaic cultures would not have required such subtle analysis to understand that they were investing the nonhuman world of animals, plants, and inanimate objects with moral potencies via their speech. They did so openly, naturally, consciously. Following the cues intrinsic to language more naively than modern women and men, they revered, dreaded, even worshipped rocks and trees, rivers and storms as magical, living beings. Primitive peoples saw them as gods who could bring blessings or curses on themselves and their tribe. Their religion was “animism,” the anthropologists and theologians say. In animism, individual animals and plants, nonliving things and natural processes are seen to possess “souls” and supernatural powers by which to bring benefit or harm to the human realm. Nonhuman beings are conceived to be free moral agents, only more majestic than humans in their might and efficacy. The philosopher Ernst Cassirer (1946/1953) theorized that language began in this very way, via the projection of “momentary deities,” “momentary gods,” as he labeled humanity’s first words, on the sheer brute materials of the world as it is (pp. 17–18, 71).

The inherent thrust in language toward higher orders of abstraction led eventually to polytheism, where the

god of *this* river metamorphosed into the god of all rivers, and thence to monotheism, in which “acts” of nature have become the “acts” of one God. Read your insurance policies on hurricanes and floods, tornadoes and earthquakes, for particulars.

The philosopher of language most directly behind what’s been said to this point is Kenneth Burke. He’s certainly the most influential American rhetorician of the past 100 years. His name is the one, in the United States, most commonly associated with drama in discourse and life. Burke (1954) says, “Spontaneous speech is not a naming at all, but [rather] a system of attitudes, of implicit exhortations” (p. 177). Language “exhorts” to moral action, he asserts, or prompts an interpretation of phenomena, *all* phenomena, as in some way inscribed with moral action.

Burke (1954) adds, with respect to the parts of speech and their latent meanings,

[Jeremy] Bentham [a 19th-century British philosopher] detected a kind of organic flaw in the nature of speech, at least as regards the linguistic ideals which we now ask our vocabularies to embody [that is, the ideal of detached, “scientific,” value free reportage and description]. Speech takes its shape from the fact that it is used by people acting together. It is an adjunct of action. It thus tends naturally toward the use of implicit moral weightings, as the names for things and operations smuggle in connotations of *good* and *bad* [italics in original], a noun tending to carry with it a kind of invisible adjective, and a verb an invisible adverb. Our attempts at impersonality [read “objectivity”], as Bentham noted, are generally made by the use of question-begging words, which are impersonal only insofar as speaker and auditor share the same interests. (pp. 191–192)

Burke (1966) lays great stress on the ways the symbolizing animal, *Homo sapiens*, sees the “positives” of nature through the eyes of “moral negativity,” on the way “man [and woman] must perceive nature through the fog of symbol-ridden social structures that he [also she] has erected atop nature. Material things,” Burke says, “would thus be like outward manifestations of the forms which are imposed upon the intuiting of nature by language [necessarily infused and replete with moral action] and by the sociopolitical orders [i.e., rule-based moral hierarchies] that are interwoven with language.” Thus, “Nature, as perceived by the word-using animal, would be not just the less-than-verbal thing that we usually take it to be. Rather, as so conceived and perceived, it would be infused with the spirit of words, . . . full of gods, . . . a fantastic pageantry, a parade of masques and costumes and guild-like mysteries” (pp. 378–379; Burke, 1961/1970, pp. 17–23, 172–241).

The Dramatic Elements in Language and Life: A Reprise and Elaboration

What should be clear by now is this: The ultimate form or pattern of linguistic utterance that results from the trajectory

of implications begun by the general pattern of verbal action found in the definitions of nouns, verbs, adjectives, and adverbs (the content parts of speech), merely implicitly moral, is an explicitly moral pattern of verbal action found in discourse about distinctively human activity and in much discourse about nonhuman activity, namely, mythology, astrology, theology, and the “acts of God” clauses of insurance policies. Such moral drama, where scenes of action (the when and the where) are ethically charged; where featured actors and their opponents (the who) are good or bad, or some variation thereof; where the actions they take (the what) atone for wrongdoing sacrificially through victimizing punishments or mortifying self-denial; where purposes and the means to achieve those goals (the why and the how) are morally and redemptively corrective, the protagonist in the drama hopes anyway, though he or she cannot be sure ahead of time; and where attitudes (the manner or “incipient actions”) are pious or impious, repentant or rebellious, morally constructive or perverse—such components of moral conflict fashion the very lens through which symbol users are fated to interpret even the nonsymbolic motions of stars and electrons, whales and microbes.

Up to this point, *behavior* gone wrong has occupied center stage in this gambit in dramatic criticism. A more comprehensive question to ask with respect to the inception of drama in discourse and life is this one: What, in a given context, may one not *do* or not fail to do, yes, but also not *believe* or not fail to believe, not *accept* or not fail to accept, or else—what? Belief “gone wrong” is often just as censurable as behavior gone wrong in the religious, political, or social life of the being Burke calls *Homo loquax*.

Start again with the example of language used most thoroughly and transcendently: theology. In orthodox Protestant Christianity, for instance, the formula is “Scripture alone, grace alone, faith alone.” What a person does or does not *believe* answers most directly what Burke calls the defining question for self-identity. “What are you being a Christian *against*” [italics added] (1969a, p. 34) (substitute for “Christian” any label you wish). It was not—and is not mainly today—material conduct that separated Protestant from Catholic or Christian from non-Christian, to cite but one set of examples of religious drama. The Catholic English Queen “Bloody Mary” (1553–1558) killed Protestants, and Calvin and Zwingli’s Protestants killed Anabaptists, for what those “heretics” *didn’t believe*. In 1648, Europe’s Peace of Westphalia ended a century of violent conflict between Protestants and Catholics substantially over the question of religious faith.

Protestant and Catholic Christians have put such physical enmity behind them, even in Northern Ireland. Sunnis and Shiites in Iraq, however, exemplify, in the Muslim world, that the extremes of religious drama are still extant and problematic, even in the 21st century.

Look for the same “faith” dynamic, with far less bloodshed to be sure, on display in the ongoing dispute

between neo-Darwinian evolutionists and advocates of Intelligent Design that's come to verbal blows even in a court of law. Dover, Pennsylvania, was the venue, in 2005. Kansas has seen a similar confrontation. Strict orthodox evolutionists prescind from the fellowship of the righteous even those who believe in an élan vital or "emergent" or "creative" life force (Bergson, 1911; Chardin, 1959; Whitehead, 1929) that has complexified and "improved" living beings in the direction of heightened powers of adaptation. Biology, to Neo-Darwinians, is founded on principles of nonteleological mutation and "natural selection."

Creationists and defenders of Design say, no, life forms on earth are too wondrously complex and symmetrical in form for explanations founded on blind accident. A transcendental Power capable of intentional action must have planned it all, or even intervened at crucial moments, as in the generation of eyes.

The dramatic point is that Designers don't get published in mainstream scientific journals and neo-Darwinians are anathema at the pro-Design Discovery Institute. Beliefs, more so than physical actions, morally separate "good" scientists from "bad" scientists, "good guys" from "bad guys," on this seemingly persistent issue—depending on which direction you're coming from!

An Example of Dramatic Conflict, Actual or Potential, One Will Have Had to Experience to Get to College

Preschool children turn 5 or 6 and have to leave the rule-governed enclave called "family," at least for part of each weekday. They go to school. They go to kindergarten, then elementary school, then middle school, then high school. Maybe later, they go to college. Talk about tightly controlled, rule-governed environments!

Take, for instance, the drama of human relations at the high school level. Ideally, a student has to fulfill a set of stated requirements to pass a particular course, based on things such as homework, tests, compositions, and class participation. The student has to successfully complete a certain number of courses to advance to the grade above and/or perhaps achieve a cumulative grade point average established by the school directors, principals, and faculty, the big wheels, the rule makers, in this particular hierarchy/institution. Proceeding satisfactorily through all four grades—freshman, sophomore, junior, and senior years—the student graduates with pomp and circumstance, family hugs and kisses, and photographs proudly framed.

Assume that the general requirement for each course is a 60% average on work submitted and an overall 2.5 grade point average for one's entire schedule of subjects. That means, get an average of 70%, or a "C," on all your schoolwork and no less than a 60%, or "D," in any one course. Those are the rules. They establish a certain "moral order"

in school and community. Nobody gets a diploma from Jonesville High without producing work at this level of competence.

In high school, then, the curricular drama begins with posted "course and graduation requirements." Things begin to go wrong for students at Jonesville when their grades slip below 60% in one or more courses at the end of a marking period. "Failure notices" go out to parents. A guidance counselor requests an interview. Athletic coaches admonish about potential ineligibility for sports. Detention hall or extra in-school study time may loom. A period of "probation" might be officially invoked. The "finger of blame" points ever more directly and threateningly at these errant scholars. Overtly dramatic elements pervade their rhetorical context.

If low enough grades continue across two or three or more courses, "failing" students may have to "take the year over." They are "held back." Or they are forced to go to summer school when they'd rather be working and earning money, or vacationing at some camp for athletes or cheerleaders or other youth groups. They must "pay a price" for their academic missteps.

The "price having been paid," their "lesson having been learned," improvement having been shown, formerly "failing" students, students "at risk," often become successful students in the academic year(s) to follow. Their "suffering" has brought them new perspectives and understandings. They see things differently now, oftentimes anyway. They work harder and go on to better grades and ultimate graduation.

Course requirements, low grades, warning notices, and maybe academic probation, a failing effort across one's academic load of classes, being held back or suffering through summer school; then, one hopes, improvement and success and eventual graduation: These are the stages of moral drama as construed and applied in the theater of life called high school.

The word *potential* appearing in the heading above is implicit in drama in any sphere of human action, certainly including high school. Recall the featured definition in page 267 of this chapter. Drama: moral conflict to set right a situation gone wrong or *keep right, a situation that could go wrong*. Elements of drama are tacitly in play even in messages that seek to prevent the rule violations that inaugurate the "rising action" of moral conflict. Even when things are going fine for a person in an institution or other venue of drama—a family, a school, a corporation, or any large or small grouping—a threat hangs in the air. Children, students, employees, citizens, members of whatever organization or polity you can think of *might* break the rules. "Police" are on guard in the form of parents, teachers, hall monitors, foremen, gossips, tattletales, surveillance cameras, the cop on the beat, a standing army, you name it, to protect against just such a contingency.

Temptation is omnipresent. Humans can be morally weak, out of control, potentially ambivalent, subversive of

attitude, uncaring, or physically and mentally incompetent in the face of the rigors of rule-governed social life. When she called you at 6:15 a.m. to wake up, get up, get washed and dressed, and fed a bit of breakfast (the school bus comes in 1 hour!), Mom was summoning you to sacrifice, self-discipline, in the face of possible demerit. Proleptic guilt, as it were, tense anticipation of what might happen *if*, motivates as a deterrent to potential “crime” even before the fact. In the midst of moral order on the human plane, moral disorder hovers within and around as a menacing possibility.

Overlapping scenes of dramatic action complicate this picture yet further. Social expectations now stigmatize the high school “dropout.” A 100 years ago, an eighth-grade education was an acceptable norm. Not so today. It’s a high school diploma, then college or trade school or a job. Dropouts who then loiter and loaf are doubly targets of social censure.

Mom’s wake-up call summoned you to constructive moral action on multiple fronts.

Future Directions

An unresolved question, perhaps an unresolvable question, in the philosophy of language is this one: How creative is discourse in its relationship to the “real world” of rocks and trees, oceans and mountains, atoms and stars? What’s been called the “naïve verbal realism” of the 17th-century philosopher René Descartes may still be in fashion in scientific communities. Such a representationalist, empiricist, even positivist point of view is not, however, in general favor today among philosophers, rhetoricians, or literary and cultural critics. A “Postmodern” conception of language has been particularly influential from, say, 1970 to the early 21st century. In such a view, Richard Tarnas (1991) has argued, all “truth,” argument, and validity are “multiple, local, and temporal.” (pp. 397, 401). There are no universals. There are no foundations to knowledge. Indeterminacy reigns. “Reality” is socially constructed, via language, at a time and place. “All human understanding is interpretation, and no interpretation is final” (p. 397). Language, to the Postmodernists, the communication scholar Trevor Melia says, is something like an untethered balloon, ungrounded in the hard resistances of this universe.

Burke (1954) appears to take a middle position on this subject. All human understanding is interpretation, yes, and no interpretation is final—up to a point. That point is the ontological nature of symbolizing animals themselves, the “what they are” in partial contrast to “what they can know.” Humans are universally immersed in language and drama, Burke (1966) suggests. That’s a foundation of a kind, an ontological foundation. And the symbolic constructions that humans bring to their “reality,” though both interpretive and time and place bound, are disciplined by the “recalcitrance” of that material world, Burke (1954) maintains. Language necessarily superimposes dramatic

meanings on the world of objects, that’s true. In the process, however, it not only “selects” via abstraction and “deflects” by way of its inherent burden of tunnel vision, but it also “reflects” a portion of that reality, if not representing it in some Cartesian, “mirror-of-nature” manner or scheme (Burke, 1966). Symbolizing animals, maybe in fits and starts, adjust their symbolic actions to the counteractive motions of their animate and inanimate surroundings.

Drama in life, language, and interpretation is thus omnipresent but not likely insular or totally arbitrary.

What to Take Away

If discourse and human striving are infused with drama, and are, essentially, symbolic actions, those who dwell in the house of language ought to be on the lookout for two generic temptations: conflict and self-aggrandizement out of control. The “negative,” symbolic action in its purest form, tells why. What is “not there” never ends, is without number, and ultimately is without peer. Or what is “not there” goes on forever, extends to infinity, and puts to shame everything material and mundane. When other animals are sated, they stop eating, drinking, mating, aggrandizing, or whatever. Too often, humans can’t get enough. They seem goaded by that vision of the eternal and the infinite to make it immanent, struggle for ever more in the here and now. Keep up with the Joneses? A nice intermediate step, yes. Better still, *beat* the Joneses, surpass them, and grind them into the dust, if need be, so they never pose a threat again.

Symbolizing animals demonstrate way too often, Burke (1966) says, that they are “rotten with perfection.” Moderation, modulation, measured human endeavor, based on maximum self-consciousness, more humble self-awareness, is the key, Burke (1984) maintains, to personal and social well-being in the large.

“Comic” ambivalence, humility, and charitability, not “tragic” certainty, pride, and hostility, are the prescription. *In nuce*: This is the formula for the “purification of war” (Burke, 1969a, 1984).

RHETORICAL EXIGENCY, STRATEGY, AND ARGUMENTATION

KARYN CHARLES RYBACKI AND DONALD JAY RYBACKI

Northern Michigan University

Aristotle's concept of rhetoric as "the ability to find for any subject, the available means of persuasion" (Hill, 2003, p. 63) focuses on a process of discovery. His *Rhetoric* cataloged means by which elements of the speaker's character (*ethos*), emotional appeals (*pathos*), and logical arguments (*logos*) could be brought to bear for persuasive effect. A person thoroughly examines the issue being confronted and selects those means of persuasion that are best able to move an audience to accept his or her way of thinking.

Life presents us with numerous opportunities and challenges. This chapter focuses on one way in which communication can be used to engage others in helping us respond to them. Argumentation relies on Aristotle's *logos* to achieve its persuasive effect, but the body of knowledge surrounding argumentation has expanded well beyond the *Rhetoric*, and provides insight into how to appeal to the rational side of human nature. From the rhetorical tradition, the concept of strategy helps us find appeals. Strategy is a process of analyzing the situation we find ourselves in, and the circumstances that produced it, so we can make choices about what and how to communicate that maximize our chances of successfully engaging others. The rhetorical exigency precipitates strategic thinking.

Rhetorical Exigency

If we think of an exigency as the difference between what is and what ought to be, that exigency becomes

rhetorical when communication is the means we use to reach the desired state. Kenneth Burke's (1966) concept of the motion-action dichotomy illustrates the point. Motion occurs in nature, and Mother Nature doesn't use symbols to change the physical world. She just sends Hurricane Katrina to devastate New Orleans and other areas on the Gulf Coast. For Burke, action was the human counterforce to motion. We are part of the natural realm, but we use action to try to overcome nature and respond to events such as natural disasters. Standing on your porch as a hurricane approaches and commanding it to spare your property would be not only ineffectual but also suicidal. However, an appeal for government assistance, volunteers, and donations to assist communities devastated by a hurricane in recovering from the effects of the storm can produce results. It would be incorrect to assume that an exigency can only be the product of motion, because Burke noted that we also act in response to the actions of our fellow humans.

Lloyd Bitzer (1968, 1980) provided a comprehensive discussion of exigency and noted that it is the product not only of events but of people and relationships as well. An exigency is not just something we notice but something perceived to be salient; something that is or should be a matter of concern; something that requires a response because it is a pressing problem. We respond by communicating with others if we think doing so can help resolve the situation, which implies three beliefs about the audience. First, by communicating with others we cast them

in the role of agents of change and assume that they are actually capable of doing something about the problem. Second, we hope they share our perception of the problem but need to realize that they may have their own, decidedly different perceptions. Third, we assume that they are capable of being influenced by our message to come around to our way of thinking and doing something about the problem.

Suppose you've been offered a summer internship in the promotions department of a major league baseball team, your dream job. Unfortunately, it's an unpaid internship. You have to figure out not only a way to cover your living expenses while interning in a major metropolitan area but also how to pay for next year's tuition, room, and board since you won't be able to take the summer job you've had since you were a freshman in high school. You face an exigency. Maybe your family could help with expenses, except that the summer job is in your family's seasonal amusement park business. If you aren't there, they'll have to train someone to replace you, an experienced employee who they dream will graduate from running the merry-go-round to running the business one day.

This illustrates that there may be multiple exigencies in a situation, and perception of which one is most salient can depend on who you are and where you stand (Hunsaker & Smith, 1976). For you, the need to do the internship is salient, but your family may view the question of "who is going to run the merry-go-round" as most pressing. Donald C. Bryant's (1973) concept that the central function of rhetoric is "adjusting ideas to people and people to ideas" (p. 19) focuses on the transaction between the creator of the message and its audience. Since ideas must be modified so what the audience is asked to accept is reasonable to them, we should not attempt persuasion without thinking about our audience. That is certainly an important strategic consideration but not the only one.

Strategy

The choices made in deciding what to do or say in response to an exigency are strategic in nature. In discussing Aristotle's definition of rhetoric, we noted that he cataloged all the ways in which a speaker could persuade an audience by playing on their emotions, appealing to their reason, or trading on what they knew about his character. Once the speaker discovered all the ways he or she *could* persuade his or her listeners, only those most appropriate to the audience and situation *would* be used, a strategic choice. If your prior reputation with your family includes incidents of irresponsibility or not thinking through the consequences of your actions, using arguments based on your *ethos* to persuade them to help support your internship opportunity financially would be a poor strategic choice.

In describing the rhetorical situation, a model that communication critics use to explain why speakers were successful or unsuccessful in responding to an exigency, Bitzer (1968, 1980) called attention to the presence of what he called *constraints* and the impact they have on shaping strategic choices. A constraint is something that confines, restricts, forces, or compels choices about what to say on the speaker's part. Constraints can work to the speaker's advantage or disadvantage. They arise from practically anything: the characteristics of the speaker, the audience, or the environment in which communication takes place.

We have already touched on the role a speaker's *ethos* can play. It should be noted that an individual's social status, knowledge of the issue, and beliefs and attitudes are all potential constraints. Someone with high status may be able to successfully bluff his or her way through a situation where he or she has little knowledge of an issue, where a person with lesser status or whose status is unknown to the audience may not. Think of the frequency with which you see celebrities endorsing products or actors in white lab coats, which imply technical or scientific expertise, pitching products.

How an audience processes a message plays a role in making strategic choices. The elaboration likelihood model (Petty & Cacioppo, 1986) posits that we process persuasive messages along one of two routes: the central or the peripheral. A message has to hold some relevance for us to process it in the first place. If we have a high degree of involvement with its subject, are willing to take the time to think about it, and perhaps supply some of our own knowledge and experience in creating meaning for it, we are processing along the central route. If a message seems less relevant and we don't want to take a great deal of time thinking about how we will respond, we rely on simple cues such as the messenger's credibility as the basis for our involvement and process along the peripheral route. Taking this kind of mental shortcut is a matter of efficiency, given the number of messages we must respond to, and the cue we rely on can come from anything in the message, context, or situation. Since the existence of multiple, competing exigencies concerning your internship opportunity probably means that if your family processes the issue along the peripheral route, you face another summer of running the merry-go-round; you need to think about how to get them on the central route with you.

Audience knowledge, attitudes, and beliefs are important as well. If the audience is aware of and shares an interest in responding to the exigency, as was the case when stories of hurricane victims stranded on roof tops or huddled at the Louisiana Super Dome were all over the media, all that may be needed is a very specific appeal directing audience members how to volunteer or where to send their donations. If the audience is aware of the exigency but doesn't share an interest in responding to it, the people assume that the government is taking care of the problem and they pay taxes, so

they have done their part. Consciousness-raising communication about the limitations of what government can and is doing must precede the call for individual action.

The environment in which communication takes place can also act as a constraint, and it is one that the speaker may have little or no control over. Communication environments impose time, place, and manner restrictions on our behavior. This is most easily seen in circumstances where speakers are forced to use channels of mass communication such as television to reach their audience, as is the case when the president addresses the nation after a natural disaster has occurred or advertisers try to sell us cars and toothpaste.

The president's access to the airwaves in such circumstances is free of charge because of the newsworthiness of the event, and the length of his presentation is constrained largely by how long it will take to get his point across. Once the president chooses where to speak from, television shapes the performance. If the location is the Oval Office, the lighting will be artificial; he will be seated behind his desk, restricted in his ability to move, speaking directly to the camera, which continually focuses on him. If he is speaking from the scene of a disaster, the lighting will be natural; he will be standing behind or holding a microphone, much freer to move and gesture, speaking to a live audience that the camera may cut away to. While the decision to wear a business suit in the office and more casual garb in the field may seem normal, it is part of the theatricality of "appearing presidential" that television creates and presidents exploit. At the height of the energy crisis of the 1970s, President Carter addressed the nation from the White House wearing a sweater, seated in a rocking chair next to a fireplace, and encouraged the American people to turn down their thermostats.

Advertisers, on the other hand, pay a steep price for air time depending on the size and composition of the audience they seek to reach. Since the amount of time available for advertising at various times is limited by Federal Communications Commission regulations, their messages must be brief. This goes a long way toward explaining the presence of those celebrity endorsers and lab-coated actors who encourage peripheral route processing in deciding what make of car or brand of toothpaste to buy and indicates how various constraints that shape strategic choices can be interrelated.

Families also have communication rules that may impose time, place, and manner restrictions on behavior. Since the internship opportunity is something you need to discuss with your family, is there a right time or place to bring it up? More important, is there a wrong time and place? If your family's custom is to eat some of their meals together rather than grabbing something as they are headed out the door to another activity, is the dinner table someplace where conversation is free to range over a variety of subjects of world and personal importance, is conversation restricted to praising the pot roast

and complimenting the cook, or do you eat in silence while watching television? Is this the kind of issue that must be discussed face-to-face, or would a phone call or e-mail conversation be an appropriate manner of communication?

A communication strategy emerges from the choices made to maximize the probability of accomplishing a specific objective, be it marshalling support to aid the victims of a natural disaster or getting your family to help you live out your dream of interning with a major league baseball team. A successful communication strategy results in the creation of what Bitzer (1968, 1980) referred to as a fitting response. A fitting response is one that is appropriate to the rhetorical situation: exigency, audience, and constraints.

Argumentation

Arguments arise between people when there is a difference of opinion, such as whether or not your desire for a summer internship is a good idea, and can turn into a contest between those holding opposing points of view, in which one wins and the other loses. Happily that does not always have to be the case, since the process of argumentation can also function as a means of decision making and achieving consensus, a method of collaborating to work out differences of opinion (Walton, 1992). We define argumentation as "a form of instrumental communication relying on reasoning and proof to influence belief or behavior through the use of spoken or written messages" (Rybacki & Rybacki, 2008, p. 3).

Because they seek to influence belief and behavior, practitioners of the art of argumentation are persuaders, but that does not mean that argumentation and persuasion are the same. Argumentation relies on proof and reasoning, logical appeals to the rational side of human nature to influence audience belief and behavior. While persuasive messages can include logical appeals, they can also include emotional appeals, and some messages rely solely on eliciting an emotional response from the audience to achieve their suasive purpose.

Moreover, argumentation relies on the audience following the central route in the elaboration likelihood model when they process the information they read or hear. This requires a significant time commitment on their part, attending carefully to messages, supplying some of their own experiences to supplement the information supplied by the arguers, and thinking critically about these messages. There is also a significant time commitment required of those who create arguments. Choosing to engage in argumentation commits you to becoming thoroughly knowledgeable about the subject so that not only can you offer the best proof and reasoning in your own arguments, but you are also able to think critically about and respond to the arguments offered by those you are arguing with. The nature of the controversies that people argue about are usually

sufficiently important to them and their audiences to warrant the level of involvement necessary to cause people to follow the central route.

A distinction between persuasion as a whole and its subset argumentation is that while argumentation always follows the central processing route, many persuasive messages rely on the peripheral route. Persuasive messages based solely on pressing some hot-button emotional issue for the audience encourages peripheral route processing. If we thought critically along the central route about the proof and reasoning these messages offer, if there is any, we may not be as likely to buy what they are selling. To understand the relationship between argumentation and persuasion, think of persuasion as the term used to describe a universe of messages designed to alter belief and behavior, in which is included a constellation of messages using the techniques of argumentation to achieve that end.

If you think about your family's initial reaction to your request that they provide the financial support that will enable you to accept a summer internship and return to school next year, it's likely to be negative. While you may feel that their reaction is rooted in emotion, which it may be, realize that they believe or behave as they do for a reason. Argumentation is rooted in the idea that as rational creatures we are capable of changing our beliefs or behavior but will only do so if we are given good reasons. What are good reasons for them to support your plans?

Fields of Argument

Argumentation is rule-governed behavior that takes place in a specific context. Like other forms of communication, some rules are specific to the context, while other rules are universal and transcend contexts. To be successful in argumentation, you have to know the rules. Stephen Toulmin (1958) uses the term *field* instead of context, and it's a useful metaphor. We can think of a field like a playing field, a figurative ground in which arguers and audiences function. We can also think of a field in the professional sense, such as the field of law, medicine, education, or politics, or in the sense of a context, such as the family, service organizations, or social groups we belong to.

This latter category of fields produces rules of argument that are *field dependent*. The most obvious difference between various professional fields is the unique jargon each has developed. You've seen this in your undergraduate career as you've taken courses in different academic disciplines and realized that to make sense out of lectures and textbooks you had to learn how to solve the linguistic puzzles they contained. While members of a profession have no problem using this jargon, you need to be sure that you've mastered it and can use it correctly if you are addressing arguments to an audience comprising members of the profession. Families, groups, and organizations can also develop their own unique linguistic style. Beyond

their unique language, argumentation in professional and social fields is often shaped by field-dependent rules of engagement, the degree of precision they demand in arguments, and the mode of resolution used to settle disputes (Toulmin, Rieke, & Janik, 1984).

Law is a field with very clearly specified *rules of engagement*, and if those rules are not followed, a breach of proper legal procedure could result in a mistrial or be the basis for an appeal that might overturn a conviction. In a criminal case, after opening statements by both sides, the prosecution presents its witnesses and evidence and the defense has the opportunity to cross-examine. Following the presentation of the defense's witnesses and evidence, which are cross-examined by the prosecution, the trial proceeds to closing statements by both sides and the judge's instructions to the jury. The appropriateness of any question or the admissibility of any piece of evidence can be challenged, with the judge ruling on the objection before things proceed any farther. Compare legal rules of engagement with what happens in a typical academic dispute.

When Lloyd Bitzer published his initial article on the rhetorical situation in 1968 in a peer-reviewed academic journal, some in the discipline were concerned by its modernist, Aristotelian underpinnings. They published their critiques in similarly peer-reviewed journals. Bitzer's rejoinder appeared in an anthology published in 1980 and produced additional commentary into the 1990s. The rules of engagement for most academic controversies historically involved presentations at professional meetings or publishing in scholarly journals, although e-mail and listservs now speed up the discussion among those who elect to participate.

Fields also differ in the *degree of precision* they demand in arguments. This is especially true in the degree of rigor they apply in determining what constitutes acceptable evidence. When the medical profession tests drugs for their efficacy and side effects in the process of seeking Food and Drug Administration (FDA) approval, it imposes extensive controls. Some subjects get the drug, some get a placebo, and another similar group may get nothing at all. Subjects receiving the drug or the placebo are not informed whether what they are receiving contains active or inert ingredients. If the study is double-blind, even the persons dispensing the drugs are unaware of which is which. That way, differences between the groups can be ascribed to whether or not they received the drug.

The FDA is a federal regulatory agency which, among other things, has attempted to find out whether direct-to-consumer drug advertising encourages people to consult their physicians about a medical condition. They have concluded that it does on the basis of surveys sent to doctors asking them to report the frequency of patient contacts. The problem is that drug advertising is so ubiquitous that it is impossible to have a control group who are unexposed to advertising and see how their behavior compares. While the FDA is comfortable with the data showing that millions of people exposed to advertising for prescription

drugs consult their physicians about what they have seen advertised, the medical profession wouldn't accept the FDA's evidence as valid proof.

The rhetorical exigency, which gives rise to argumentation frequently, represents a controversy or significant problem that needs to be resolved. The leisurely manner in which we suggested academic disputes unfold is not the case when the issue is a really serious one, such as a charge of plagiarism or faking data. In the field of politics, the *mode of resolution* is voting, although what is voted on may have been amended to represent a compromise that a majority can agree to. In the field of labor management relations, negotiation, mediation, or arbitration may be used to resolve a controversy.

A family may not have formal rules of engagement; a sense of the degree of precision they expect in arguments; or a method for resolving disputes other than the kind of time, place, and manner restrictions we discussed previously. However, families that have experienced some kind of professional intervention, such as marriage or family counseling, may have procedures as elaborate as the field-dependent rules of any profession that need to be observed. Regardless of the field-dependent rules that are in play, there are other rules all arguers need to observe.

If something does not change from field to field, it is said to be *field invariant*. Learning the field-invariant rules of argumentation means that when you move from field to field, when you move between home, work, and social engagements, the only thing that needs to change in the way you practice argumentation is the field-dependent rules you follow. Field-invariant rules of argumentation deal with the way people think and how they decide what information they can rely on to aid their thinking. Since our definition of argumentation indicates that it employs reasoning and proof, this should come as no surprise.

People employ reasoning to make sense out of their world, and the forms of reasoning that humans use are limited in number. While what people reason about may vary from field to field, the forms of reasoning are constant across all fields. Generalization is a form of reasoning in which you look at a number of similar individuals, objects, or events and reach a conclusion about the universe of individuals, objects, or events they represent. If you've ever decided whether or not to buy a bunch of grapes by popping one or two into your mouth to see if they were juicy and tasted good, you were generalizing (as well as aggravating the manager of the produce department). You don't have to eat the whole bunch to make a conclusion; if those grapes were alright, so are the rest.

The medical profession may scoff at FDA studies of the effect of direct-to-consumer drug advertising, but both the medical profession and the FDA employ generalization as their method of reasoning. Medical researchers use test groups representative of all those with a particular medical condition to determine if the drug they are testing is an effective treatment. The FDA surveyed a representative

sample of physicians to find out if patients asked them about drugs promoted in advertising campaigns. Based on what they learned from their respective samples, both the medical researchers and the FDA generalized that what was true of the individuals in their samples would probably be true of all individuals in the target group. This illustrates the first field-invariant process—people in different fields of argument use the same patterns of reasoning to reach conclusions.

The second field-invariant process is that people in different fields of argument use the same means to determine if the evidence used in reasoning is sufficient to produce a sound conclusion. The means that medical researchers and the FDA use to decide if their evidence was adequate to support a generalization are the same. For a generalization to be valid, it must be based on a sufficient number of instances or cases that are representative of the group they are randomly drawn from. If any instances or cases point to a different conclusion, they must be explained. Medical professionals think that the FDA's evidence is inadequate because of a field-dependent rule of epidemiological research—an adequate research design must include a control group—not because the FDA lacked a sufficient number of cases on which to base its generalization.

You've been making a list of good reasons that you hope will influence your family to support your summer internship aspirations. Now you realize that there is going to be more involved than asserting "It will help me get a job after I graduate." Your family is probably going to want more than your word on this and may look critically at whatever evidence you offer. You need to be sure that your proof is something you and they can rely on. You also have to be sure that the connection between this information and the point you are trying to make follows logically, that it uses one of the patterns of thinking, such as cause, sign, generalization, parallel case, analogy, or dilemma (Rybacki & Rybacki, 2008), that people use to make sense of the world. Your family is likely to think of your proposal in terms of the dilemma it poses: If they let you do the internship, it's going to cost them money; if they don't let you do the internship, it's going to cost them relational currency with you.

Presumption

The concept of a field of argument has uses beyond helping us identify the field-dependent and field-invariant rules we need to follow. We can also think of the concept of field in terms of a playing field, a piece of figurative ground. To get off to a good start in argumentation, you need to identify the beliefs or behaviors that occupy the figurative ground and would continue to occupy it if no good reasons were offered to change things. Since the ground is the space in which arguers and their audiences function, ask yourself who possesses the figurative ground, who has the home court advantage. Doing this enables you to determine where presumption lies.

The Anglican Archbishop Richard Whatley (1828/1963) contributed greatly to our knowledge of presumption. Using the analogy of a group of soldiers inside a fortified position, he asked whether it was more sensible for them to remain where they were behind thick stone walls or abandon their position and engage the enemy on an open battlefield. Should they trade the safety and comfort of what they know for the uncertainty of what they don't? Should they leave things the way they are or opt for change?

Natural presumption favors that which presently exists, and we can find sources of natural presumption by examining institutions, traditions, documents, and practices. Suppose one of the reasons you want to do an internship is that it is a graduation requirement in your program of study. Because this requirement has been around for a while, presumption favors it. You may never have thought to question it, assuming that there must be a good reason for its existence, such as "It'll help me get a job after I graduate," and not given it much more thought. Most, but not all, fields of argument employ natural presumption, and it can be used as a tool for audience analysis to discover what knowledge, beliefs, and practices the audience likely accepts at face value.

Artificial presumption is used in the legal field. The presumption of innocence is artificial and means that the accused goes unpunished if the prosecution cannot offer good reasons to believe that he or she is guilty. The prosecution gets to present its case first, because if it does not offer good reasons, the defense can ask the judge to dismiss the charges against the accused without offering its own good reasons to believe that he or she is innocent. Thus, an additional value of understanding presumption, both artificial and natural, is that it can serve as a decision rule: We should continue to rely on presumption unless good reasons exist to do otherwise.

Artificial presumption is also used in hypothesis testing, "where there is an issue or question that is open in the sense that the relevant, available evidence does not resolve the issue one way or another with sufficient weight to close discussion of the issue" (Walton, 1992, p. 42). The reason for testing the efficacy of drugs and studying the effect of direct-to-consumer drug advertising is to resolve such open questions. Researchers typically start with what is called a null hypothesis—there is no effect—and attempt to discover whether sufficient evidence exists to reject the artificial presumption it articulates.

Natural presumption suggests that your family believes that you should not do the summer internship since you've been working at the family amusement park since your freshman year in high school. You are going to have to overcome that presumption with good reasons. Unlike the prosecutor trying to overcome artificial presumption and convince an impartial judge and jury of the accused's guilt, you face the challenge faced by many who challenge natural presumptions: You need to convince your

audience to give up beliefs and behaviors they are comfortable with and venture into the realm of the unknown.

Burden of Proof

The burden of proof is the logical opposite of presumption. If presumption weighs in on one side of the issue, the burden of proof counterbalances it. The weight of proof and reasoning must be sufficient to allow the audience to be comfortable with the decision to shift its allegiance from what presumption favors to the change being proposed (Walton, 1988).

However, unlike presumption, which is static and consistently favors one side of an issue, the burden of proof is dynamic and a responsibility of all parties to the controversy. If those who challenge presumption uphold their burden of proof and shift audience sentiment away from it, those who oppose the change that would result must accept their own burden of proof since they can no longer rely on presumption. After the prosecution has presented its case, the defense cannot just say "Presumption of innocence, my client goes free" and expect to prevail. The defense must present good reasons either for the judge to dismiss the charges or the jury to find the accused not guilty. A basic rule of argumentation is "Those who assert must prove."

The scope of the burden of proof is specified in some fields of argument, such as the legal field. If the charge is theft, the prosecution must prove that something was stolen and the accused did it. Testimony by the store owner and police pictures of the crime scene would prove the former, while circumstantial evidence, the accused's fingerprints at the scene of the crime, and direct evidence, the discovery of the stolen merchandise in the trunk of the accused's car, would prove the latter. This would constitute a *prima facie* case of the accused's guilt, one that "on the face of it" is sufficient to suspend reliance on presumption at least temporarily until the defense has had its say. Evidence that the accused has unpaid parking tickets, overdue library books, or poor oral hygiene would be irrelevant.

In fields where the scope of the burden of proof is unspecified, audience analysis can provide some guidance. An audience inclined to favor change will require less convincing than an audience inclined to oppose it. An audience that already knows something about the issue needs to have less information provided to them than an audience that knows nothing, unless what they know causes them to oppose change, in which case you will need to provide them with a lot more. While one audience will differ from another in many ways, one way in which they are similar is with regard to the kind of questions they want answered in deciding whether to embrace or reject change. Although the subject of these

questions will vary, their substance will not. These questions are the stock issues in argumentation.

Stock Issues

The concept of stock issues is field invariant in argumentation. The prosecutor does not have to search for what to argue in bringing a charge of theft against the accused, and the defense attorney is not in the dark either. You do not have to search for what to argue, since stock issues exist that don't change from field to field. That is true because, while the subject matter may change from field to field, people basically argue about four things: (1) how something should be classified (definition), (2) what is probably true about something (fact), (3) how something should be judged (value), and (4) what should be done about something (policy).

Your internship aspirations come down to a policy issue: My family should provide the financial support necessary for me to do a summer internship with a major league baseball team. There are three stock issues concerning policy: (1) What is the reason for change? (2) What is entailed in the proposal for change? (3) What are the consequences of change? Because your family is also your audience, it is important to remember that the focus needs to be on why they should support you, not just why you want to do this.

While there might be many reasons for doing this internship (it satisfies a graduation requirement, it would be fun, it would be prestigious, an internship can lead to a job, what you learn could be used to enhance the family business), you should limit yourself to the strongest reasons. The strength of arguments is a function of both what you are best able to prove and what your audience will find most compelling. If you think that your family fears your loss of interest in taking over the business, the "enhance the family business" argument might allay that fear, but you need to be careful. Arguers, like other communicators, have an ethical responsibility not to deceive their listeners, and if you don't plan on staying on at the amusement park following graduation, you don't want to create the opposite impression.

Thinking about the issue from the other side's perspective is important because it can help you anticipate objections and avoid problems. From spring training through the World Series, the baseball season stretches from mid-February to late October. Why does the internship have to be in summer, when we'd have to find someone else to run the merry-go-round, might be an objection your family would raise. You should certainly be prepared to respond to it and may decide to preempt the question by bringing it up yourself. Choosing to preempt the other side's arguments gives you the advantage of framing them from your perspective but runs the risk of causing problems by introducing issues that might never have been raised and creating the impression that you are acting defensively because your position is weak.

It is absolutely imperative that your position be consistent, without even the hint of contradiction. There is nothing more devastating and embarrassing than having something you've said turned against you. You anticipate that your family's concern about finding someone to replace you at the amusement park if you do a summer internship could be a barrier to winning their assent. You decide to address that in part of your proposal for change. You have a replacement lined up, a classmate, who thinks you've got the greatest summer job in the world. He'd love to run the merry-go-round, is a quick learner whom you could train in a couple of days, and will work dirt cheap because he can get internship credit for working at the park.

If that doesn't prompt your family to inquire why you can't get internship credit for the same thing, it's only because they aren't listening. Perhaps you can't get credit because your school requires an "arm's-length" relationship between intern and site supervisor so that evaluation of the intern is unbiased. Telling your family that at the outset as part of an argument about internships being required for graduation makes you seem knowledgeable and forthright. Offering it as an explanation when questioned may cause suspicion that you're making things up as you go along.

Alternative Perspectives

Our discussion of the manner in which argumentative message are created represents "conceptions of knowledge and truth that are accepted and articulated today [that] have been shaped throughout history by the male-dominated culture" (Belenky, Clinchy, Goldberger, & Traule, 1986, p. 5). Feminists argue that theories of argument generated by this culture lead to simplistic conclusions, monocausal position statements, and tests of knowledge. Women "tend to fuse ideas and opinions rather than claiming one opinion is true and all others must therefore be false," they are "connected knowers" (Rybacki & Rybacki, 2002, p. 210). According to feminist theory, the sexes are conditioned by culture to use argumentation and reasoning in different ways.

While we have focused on the use of argumentation to resolve differences of opinion, achieve consensus, and make decisions, it can also be employed to discover knowledge (Rowland, 1987). *Pragma-dialectics*, developed by Frans van Eemeren and Rob Grootendort (1992), can be employed in the production of knowledge. Pragmatics (*pragma*) is the study of how the language we use changes belief and behavior. *Dialectic* is concerned with the way people interact, a normative model of rules concerning what arguers can and must do in the case of pragma-dialectics. For example, you *can* ask someone to clarify their argument. You *must* clarify your argument if asked to do so. The rules of pragma-dialectics can also be used to evaluate encounters to determine why they failed to produce results.

Conclusion

Argumentation is rule-governed behavior used to produce reasoned discourse. It requires its practitioners to invest the time necessary to become thoroughly knowledgeable about their subject and carefully craft reasoned messages about it. Like all forms of communication, it is most effective in achieving its purpose when the interests of the other parties to the conversation are taken into account. This requires strategic thinking on your part. In the end, it is well worth it since argumentation can be an effective way of responding to a rhetorical exigency, enlisting the support of others to solve a problem or take advantage of an opportunity.

SOCIAL SUPPORT

ERINA L. MACGEORGE

Purdue University

If you have a situation that's upsetting you, you might have a friend who listens attentively and makes you feel better by conveying understanding and sympathy. If you have a problem and can't figure out how to solve it, a coworker might offer some advice that enables you to improve the situation. And if your car has broken down and you need help getting places until it's fixed, a family member might offer to drive you around. Communication scholars would describe the friends, coworkers, and family members in these scenarios as providing you with *social support*, where this term refers to assistance provided by family, friends, or acquaintances rather than professionals (e.g., counselors or therapists). Most of us not only appreciate but come to rely on social support and are providers of support in return. As the Beatles put it, we "get by with a little help from our friends."

Communication researchers were not the first to focus attention on social support; that distinction belongs to scholars in sociology and epidemiology. (For a historical overview, see Burlison & MacGeorge, 2002.) Since the pioneering research in the early 1970s, social support has been defined and studied in a variety of ways, depending in part on the academic disciplines in which different scholars are trained. Sociologists, for example, tend to conceptualize social support as *social integration*—that is, the extent to which individuals are embedded in relationships and groups, participate in social activities, or experience a sense of community and belonging. Sociological research has demonstrated that people with greater social integration tend to be healthier and live longer. Psychologists have typically taken a somewhat different approach by focusing on *perceived support availability*—that is, the individual's perception that caring behavior from others will be accessible if the need arises. Psychological research on social support has shown that high levels of

perceived support availability can "buffer" or prevent some of the negative influences that stress can have on health.

Not surprisingly, when communication scholars began to study social support in the 1980s, they introduced a unique perspective in which social support was conceptualized as *supportive communication*. In a seminal book that defined this emergent perspective, Burlison, Albrecht, Goldsmith, and Sarason (1994) argued that "social support should be studied as communication because it is ultimately conveyed through messages directed by one individual to another in the context of a relationship that is created and sustained through interaction" (p. xviii). Correspondingly, communication scholars have focused much of their research on "verbal and nonverbal behaviors intended to provide or seek help" (Burlison & MacGeorge, 2002, p. 384). These scholars have a special interest in identifying what kinds of supportive communication have a more (or less) positive effect on recipients; why certain behaviors are more effective than others, either in general or for specific types of people, problems, relationships, or situations; and why some people are more (or less) likely to provide others with high-quality supportive communication. In contrast to sociological and psychological perspectives on social support, communication scholars are not content with knowing that social relationships are beneficial (the sociological perspective) or that feeling loved and cared for is good for you (the psychological perspective); they want to know about the details of supportive behavior—that is, what works best and why, and who provides the best support.

This chapter provides an overview of theory and research on supportive communication. It begins by discussing different types of supportive communication and what is known about the features that make comforting and

advice giving more or less effective. This is followed by an overview of theory that helps explain how and why social support can produce positive outcomes for recipients. Subsequent sections address the question of who provides effective support and how researchers study supportive communication. The concluding section considers the future of research on supportive communication.

What Makes Supportive Communication Effective?

Types of Supportive Communication

As suggested by the opening paragraph in this chapter, social support scholars frequently distinguish between different types of supportive communication. Perhaps the broadest distinction that can be made is between communication that is intended to be supportive and communication that is not. Most people have had the unpleasant experience of seeking support from another person and receiving a response that conveyed overt rejection or disinterest. This type of communication is most probably not intended to provide support, nor is it likely to be perceived as supportive by its recipient. However, it is important to note that there can be consequential differences between the intentions of support providers and the perceptions of recipients. For example, support providers sometimes say things that downplay or minimize the importance or seriousness of a problem, perhaps with the intention of making the other person feel better (“It’s not that bad. Life will go on.”). In many cases, these minimizing behaviors are viewed negatively by support recipients even when they recognize the supportive intention behind the message (Burlleson & MacGeorge, 2002).

Another distinction is often made between *emotional support* and *instrumental support*, with the former understood to be focused on relieving a recipient’s emotional distress and the latter focused on improving a recipient’s problem-solving abilities. This is both an important difference and an oversimplification of how supportive communication really looks and functions. Support providers often attempt to provide both types of support, even in the course of a single message or interaction (MacGeorge, Graves, Feng, Gillihan, & Burlleson, 2004). Furthermore, we can distinguish different types of emotional and instrumental support. For example, some scholars have found it useful to classify messages of caring, concern, and sympathy (emotional support) separately from those that convey affection and respect (esteem support), while others may group these types of support together under the heading of emotional support. Again, the effect of a particular type of support may be different from what is intended. For example, advice about what to do could help someone feel better without having any real effect on resolving the problem.

Considering the broad categories of emotional and informational support, research suggests some generalizations about the effects of these support types. Overall, recipients often respond more positively to support providers’ emotional-support efforts than to instrumental-support efforts, perhaps because emotional support is relevant to a broader range of circumstances. For example, instrumental support is often perceived as less applicable to problems that cannot be solved (e.g., bereavement; see Servaty-Seib & Burlleson, 2007). However, as you may have experienced for yourself, there is considerable variation in the quality of support, whether emotional or instrumental. Some support providers in some situations say things that do an outstanding job of helping reduce distress, promote coping, and resolve problems, whereas others’ support efforts have little or no impact and may even make things worse. Correspondingly, supportive-communication researchers have focused considerable attention on the features or characteristics of emotional-support messages that lead to more (and fewer) positive responses and outcomes for recipients. A smaller but growing area of research has examined the same issues with respect to instrumental support, especially advice giving.

Communication of Emotional Support

In the supportive-communication literature, the communication of emotional support is often referred to as *comforting*. Comforting can take a variety of forms, as evidenced by the comforting efforts of toddlers, who may direct simple behaviors (hugging, offering a toy, saying “I’m sorry”) toward peers who are distressed. As children mature into adulthood, comforting retains important non-verbal elements but becomes increasingly verbal (Clark, MacGeorge, & Robinson, 2008).

The most influential research on the effects of comforting communication has been conducted by Brant Burlleson and colleagues, including Wendy Samter and Suzanne Jones. In this paradigm, comforting messages are described as varying in *person centeredness*, defined as the extent to which messages reflect “an awareness of and an adaptation to the subjective, affective, and relational aspects of communicative contexts” (Burlleson & Caplan, 1998, p. 249). Comforting messages low in person centeredness deny another person’s feelings and perspective by criticizing the feelings, challenging their legitimacy, or telling the other how he or she should act or feel. Comforting messages moderate in person centeredness implicitly recognize another’s feelings by attempting to distract the other’s attention from the distressing situation, offering expressions of sympathy, or presenting explanations of the situation that might function to reduce distress. Comforting messages high in person centeredness explicitly acknowledge and legitimate another’s feelings by helping articulate those feelings, elaborating on reasons why the other might feel that

way, and trying to place the feelings within a broader perspective. Overall, highly person-centered messages tend to be the most listener centered, emotion focused, and non-evaluative, with moderate- and low-person-centered messages exhibiting fewer of these qualities (see Burleson, 1994, for more details on the distinctions between different levels of person centeredness).

A very substantial body of research indicates that comforting messages high in person-centeredness are perceived as highest in quality (e.g., more sensitive and effective); messages of moderate person centeredness are rated somewhat lower and messages low in person centeredness, considerably lower (Burleson, 2003). Furthermore, recipients of highly person-centered messages (as opposed to moderate- or low-person-centered messages) actually experience greater improvement in their emotional states (Jones & Guerrero, 2001). Consistent with these effects of highly person-centered comforting, research also indicates that individuals who use this type of comforting are seen as more likable and attractive and are more accepted by their peers (Burleson, 2003).

The effects of person-centered messages are highly consistent across studies, but this research also indicates that effects vary somewhat as a function of certain demographic, cognitive, and situational factors. Some of the variables that appear to influence responses to person centeredness in comforting are gender, ethnicity, and cognitive complexity (Burleson, 2003); degree of distress has also become a recent focus of attention (Burleson, in press). Studies examining gender effects indicate that women evaluate highly person-centered comforting somewhat more positively than men, whereas men evaluate comforting messages low in person centeredness somewhat more positively than do women (MacGeorge, Graves, et al., 2004). Studies examining the influence of ethnicity or culture have found that Asian Americans, African Americans, and Chinese Americans distinguish somewhat less strongly between messages low, moderate, and high in person centeredness than do European Americans (Burleson & Mortenson, 2003; Samter, Whaley, Mortenson, & Burleson, 1997). Research on interpersonal cognitive complexity, which refers to the sophistication of cognitive schema for thinking about people and social situations, indicates that individuals with higher cognitive complexity evaluate highly person-centered messages as higher in quality (and messages that are low in person centeredness as lower in quality) than do individuals who are lower in cognitive complexity (Burleson, in press). Finally, a moderate level of distress appears to produce more discriminating evaluations of comforting messages than either low or high levels of distress, with moderately distressed individuals rating messages high in person centeredness more favorably (and messages low in person centeredness less favorably) than people with low or high levels of distress (Burleson, in press).

All this research indicates that the effectiveness of highly person-centered messages is moderated by features of persons and contexts. Recently, Burleson and colleagues have advanced a theory to provide a comprehensive explanation for much of the variation in comforting-message evaluation that is linked to these individual and contextual variables (Bodie & Burleson, 2008; Burleson, in press). This theory, labeled a *dual-process approach*, argues that responses to supportive communication depend to some extent on how much the recipient attends to and thinks about (i.e., “processes”) the actual content of a supportive message. Imagine two support recipients with very different levels of message processing: one who pays very little attention to what a support provider actually says and one who carefully thinks about every word. In this case, Burleson and colleagues argue that the first recipient will perceive less of a distinction between comforting messages representing different levels of person centeredness and be less affected by this aspect of the message. In contrast, the second recipient will discriminate carefully between messages with different levels of person centeredness and will be substantially affected by whether the message is high, moderate, or low in person centeredness. According to this theory, factors such as the level of distress help determine how much processing recipients give to comforting messages and thus influence their evaluations and responses to those messages. For example, having a moderate level of distress should increase both the ability and the motivation to process compared with a high level of distress (which decreases ability) or a low level of distress (which decreases motivation).

A fuller explication of dual-process theory is beyond the scope of this chapter, but recent studies have provided support for many of the theoretical claims (Burleson, in press). Thus, it may soon be possible to explain the hodgepodge of effects due to diverse demographic, cognitive, and situational factors through a more cohesive model. Despite the significance of this theoretical development, it is also important to emphasize that the influence of factors such as gender and distress on the evaluation of comforting messages is generally moderate; overall, research evidence indicates that highly person-centered messages produce superior outcomes across people and situations.

Communication of Advice

Instrumental support has been given less research attention to date than emotional support or comforting. Some research has indicated that instrumental support is not as generally beneficial as emotional support and also runs a higher risk of negative effects, perhaps because information or advice is more likely to be unnecessary, unwanted, or poorly matched to a recipient’s needs (MacGeorge, Feng, & Thompson, 2008). However, there is an increasing body of research on advice, motivated in part by studies

indicating that advice may be the most commonly offered form of support (MacGeorge, Graves, et al., 2004) and in part by an interest in identifying the characteristics of advice messages that cause them to be viewed more or less positively.

Focused research on advice as a form of instrumental support was initiated by Daena Goldsmith (1994), who observed that advice has the potential to threaten the *face* or public self-image of the recipient. Specifically, because advice tells or recommends what another person should do, think, or say (MacGeorge et al., 2008), it may be in conflict with the recipient's sense of independence or feelings of competence. However, as Goldsmith argued, advice givers can alter the manner or style in which the advice is given and thereby potentially reduce face threat. For example, a recipient's sense of independence might be better preserved if the advised action is presented as a suggestion ("Maybe you could . . .") or, even more indirectly, in a story about what the advice giver did when dealing with a similar problem. Of course, face threat could also be increased by the style in which advice is given; advice can come across as patronizing, critical, or even rejecting of the recipient ("Well, duh. Isn't it obvious that you should . . ."). Research by Goldsmith and others indicates that face threat is a salient issue for advice recipients: When advice is perceived as more face threatening, it is viewed as lower in quality and does less to facilitate the recipient's ability to cope with the problem; advice with a higher degree of perceived face threat is also less likely to be implemented (Goldsmith & MacGeorge, 2000; MacGeorge, Feng, Butler, & Budarz, 2004). The research findings are less clear about the specific linguistic strategies that do the best job of reducing face threat. Some work suggests that strategies may be best when used in combination (MacGeorge, Lichtman, & Pressey, 2002). For example, "I know you will get this worked out. I only have one little suggestion . . ." contains language that conveys respect for the recipient's competence *and* independence.

Erina MacGeorge, Bo Feng, and colleagues (2004) noted that advice recipients were likely to be influenced by the *content* of the advice message as well as its style and have undertaken research focused on recipients' perceptions of advice content (i.e., what they think about the action being advised). Advice recipients are strongly influenced by what is termed *response efficacy*—that is, the perceived likelihood that the advised action will actually help resolve the problem (Feng & Burleson, 2008). Specifically, when response efficacy is perceived to be high, advice recipients rate the advice more favorably, feel better able to cope, and are more likely to implement the action. Other content factors that also influence advice recipients include the perceived feasibility of the advised action ("Can I do it?") and the potential limitations or drawbacks of the action ("Will doing this create more problems?") (MacGeorge, Feng, et al., 2004). Research on advice content also shows that advice givers

can influence recipients' perceptions of advice content, such as response efficacy or limitations. In one recent study, advice messages that contained arguments that supported response efficacy (e.g., "You should do [advised action]. *I know this will help you because I did this when I had the problem with . . .*") caused advice recipients to perceive more response efficacy and rate the advised action more positively than messages that stated the advised action but did not make any further argument in its favor (Feng & Burleson, 2008).

A handful of studies have examined whether demographic or situational factors influence how advice recipients respond. Gender appears to have relatively little influence, with men and women liking advice to about the same degree and being affected to the same extent by style and content factors (MacGeorge, Graves, et al., 2004). Other factors appear to be more powerful influences: A collection of studies show that advice is evaluated more favorably when it comes from advice givers who are seen as experts, who evince confidence in their opinions, and who are in closer relationships with the recipients (MacGeorge et al., 2008). In addition, several studies indicate that the interactional sequencing of advice can have important influences on its outcome. Two studies have indicated that advice is viewed as less face threatening when it is requested, directly or indirectly, than when it is given without being requested (Goldsmith, 2000; Goldsmith & Fitch, 1997). In addition, advice is preferred when it is presented subsequent to efforts at emotional support and problem analysis, indicating that there are complex relationships between comforting, advice, and discussion of the problem (Feng, 2009).

There is relatively little focused research on supportive communication that is not classifiable as either comforting or advice; the study just mentioned (Feng, in press) is one exception. Another exception is Goldsmith (1994), who noted that offers of tangible help (e.g., "Can I help you study for the next exam?") can create many of the same face concerns as advice. However, offers have not received much attention as a type of support. Given that many supportive interactions include behaviors apart from comforting or advice, additional research is needed to understand what features cause these behaviors to have a positive or negative impact on recipients.

How and Why Does Supportive Communication Help?

As may be evident from the prior section, research on supportive communication has been strongly focused on determining "what works" when people engage in supportive communication. In the process of answering this question, scholars have drawn on a potpourri of theoretical perspectives, and it is probably fair to say that the questions of "how" and "why" have often been placed backstage.

Nonetheless, as the study of supportive communication has matured, the importance of theory has become increasingly evident. Without theory to explain how supportive messages affect recipients or why some supportive messages have better or different outcomes than others, it is difficult to build a comprehensive understanding of supportive interactions, or to help people become better support providers.

Short-Term and Long-Term Effects of Social Support

To address the question of *how* social support is helpful (or unhelpful), it is useful to make a general distinction between short-term and long-term, or *proximal* and *distal*, effects (Burlleson & MacGeorge, 2002). Supportive communication can—and does—have effects that occur either immediately or within a relatively short time after interacting with a support provider. These effects can include improvement in emotional state, increased capacity for coping, an intention to undertake an advised behavior, and feeling respected. Other short-term effects may include conversational satisfaction, a liking for and attraction to the support provider, and satisfaction with the relationship. Of course, short-term effects are not necessarily positive; to the extent that supportive communication is insensitive and ineffective, there can easily be increased distress, diminished capacity for coping, negative perceptions of the support provider, and similar undesirable consequences (Burlleson & MacGeorge, 2002).

In research on supportive communication, these short-term personal and relationship outcomes have typically been emphasized. In fact, the recognition that supportive behavior has important, and relatively immediate, consequences is one of the distinguishing characteristics of the communication perspective on social support (Burlleson & MacGeorge, 2002).

In contrast, psychologists, sociologists, and others who study social support have typically emphasized longer-term outcomes of social support, such as physical and psychological health (Cohen, Gottlieb, & Underwood, 2000). This emphasis is quite consistent with conceptualizing social support as social integration or perceived support availability. People tend to have relatively consistent levels of social integration and perceptions of support availability over time (unless significantly disrupted by life transitions or crises), so that it makes sense to examine how different levels of social integration or perceived support availability might affect physical or psychological health over time. In contrast, any single supportive message or interaction is probably less likely to have a detectable influence on health—though one can imagine exceptions, such as advice that prompts someone to immediately stop an unhealthy behavior. It is more likely that the quality of supportive communication could have a *cumulative* long-term effect on psychological or physical health such that those who receive high-quality supportive messages across time (perhaps from multiple individuals) are healthier than

those who receive lower-quality messages. Research is needed to examine this (and similar) possibilities.

Explaining the Benefits of Social Support

The distinction between the short-term and long-term effects of social support continues to be important when considering *why* social support has positive (or negative) effects because different kinds of theoretical explanations are relevant to these different kinds of effects. To explain the differences in the short-term effects of supportive communication, theorists have offered a variety of explanations, including (a) perceived supportive intent, (b) change in face (i.e., public self-image), (c) information and motivation, and (d) reappraisal (Burlleson & MacGeorge, 2002).

One explanation for why supportive communication succeeds or fails at improving affect, coping, and so forth is that it expresses the *supportive intention* of the provider. To the extent that a support recipient recognizes a provider as communicating with the intention to be supportive, the recipient is probably more likely to feel cared for, liked, and valued than if this perception is absent. These feelings should, in turn, affect their emotional state and capacity to cope. In some cases, support recipients may recognize and benefit from the supportive intention even when the communication itself is less than ideal. On the other hand, the perceived supportive intention may not “override” the impact of a poorly conceived message.

A second explanation for the differing outcomes of supportive communication draws from the *theory of face*, which has informed much work on advice. Having a problem or needing assistance prevents a person from presenting a public self-image of complete independence or competence; thus, it is potentially face threatening. In addition, many provider behaviors can themselves threaten face, even when the supportive intention is strong (Goldsmith, 1994). Asking questions about the problem can invade privacy, offering advice can come across as critical, and offering emotional support can suggest that the recipient is (overly) dependent on others (Burlleson & MacGeorge, 2002). Perceptions of face threat are closely tied to negative feelings such as embarrassment, shame, guilt, and anger. Thus, supportive communication may benefit recipients to the extent that it “rebuilds” any damage to face that occurs, either from the original problem or as a result of the support provider’s actions.

A third explanation for why supportive communication does (or does not) help has to do with the *informative content* of support messages. This idea is easy to illustrate with respect to advice because the information being given is about some action that the recipient could take to resolve the problem: To the extent that an advised action is perceived as efficacious or feasible and is implemented by the recipient, the information may affect the recipient’s outcomes. In addition, the information in advice messages may affect self-efficacy or motivation. Information can

also come from other kinds of support messages: Even comforting messages contain certain kinds of information, such as ideas about the normality or legitimacy of the feelings being experienced by the recipient. These feelings could affect recipients' perceptions of their problems and their subsequent actions (Burlison & MacGeorge, 2002).

A fourth explanation, based on the idea of *reappraisal*, has been given the most formal presentation as a theory. Burlison and Goldsmith (1998) advanced the idea that supportive communication works to reduce emotional distress when it encourages recipients to produce detailed, emotion-focused narratives about their problems. Doing this, in turn, helps recipients make sense of their problems and their feelings and, ultimately, helps them "reappraise" the situation in a way that reduces emotional distress. Burlison and Goldsmith argued that this reappraisal process is most likely to result from highly person-centered messages, which legitimate and encourage emotional expression. However, they also connected reappraisal with a larger conversational process that incorporates problem analysis and advice giving.

Although these theoretical ideas are all consistent with at least some existing research evidence, there has been little direct testing. One recent exception is a study testing Burlison and Goldsmith's reappraisal theory (1998). In this study, Jones & Wirtz (2006) asked research participants to disclose actual problems and to participate in interactions with confederates (research assistants pretending to be other participants). The confederates were trained to provide responses that were high, moderate, or low in person centeredness. In this study, participants who received highly person-centered comforting used the most "emotion words" to describe their experiences (i.e., words such as *sad*, *angry*, or *frustrated*) during the interaction and showed more improvement in their emotional states and a greater change in perspective on the problem (i.e., reappraisal) after the interaction. In addition, there was evidence that these variables formed a causal chain that begins with receiving highly person-centered comforting, continues with the use of emotion words, leads to reappraisal, and then results in emotional change.

Not surprisingly, theory about the long-term effects of social support has developed primarily within the psychological and sociological traditions and, consequently, has focused on social support as social integration or perceived support availability rather than supportive communication. In these traditions, theories of support effects can be loosely classified into *main-effect* models and *buffering-effect* models (Cohen et al., 2000). In main-effect models, increased social support is theorized to have a positive, direct impact on health regardless of stress. Research support for these models has come primarily from studies in which social support is conceptualized and measured as social integration. Thus, it appears that being more fully integrated in a network of social relationships and activities leads to health benefits, perhaps because tangible support, information, and social influence combine to produce

healthier behavior. In buffering-effect models, increased social support is theorized to "buffer" or prevent the deleterious effects of stress on health, such that when stressors occur, those who feel that they have more social support available are less likely to experience negative health effects (or they experience fewer negative health effects) than those who have less social support. This is thought to occur because perceived availability of support influences how people view or "appraise" their problems, so that those who have greater availability of support see their problems as more manageable, experience less stress, and consequently suffer fewer of the physical and emotional consequences of stress.

Theory on the short-term effects of supportive communication and theory on the longer-term effects of social integration or perceived support availability are yet to be systematically integrated. However, it is not difficult to see how integration of this type could proceed, especially with respect to buffering effects. It is possible, for example, that high-quality supportive communication, provided in the wake of a stressful event or a series of stressful events, leads to stronger perceptions of support availability (among other effects), which in turn, cause these recipients to be less susceptible to the noxious effects of stress on health when subsequent events arise. Efforts to develop theories that provide integrated accounts of the short-term and long-term effects of supportive communication are likely to emerge as a particularly important research area.

Who Provides Effective Supportive Communication, and Why?

For most people, supportive communication is exchanged in the context of close relationships, such as marriage, dating relationships, friendships, and family relationships. Support provision also occurs between work associates, though this is probably more likely when there is a friendship that extends beyond work-based roles. Less frequently, supportive communication may come from what sociologists call "weak ties," including acquaintances and people engaged in service roles that bring about consistent contact with clients (e.g., hairdressers or restaurant employees with their "regulars"). Although it is also possible to conceive of social support coming from medical and mental health professionals (e.g., doctors or psychologists), most research on social support focuses on non-professional helpers.

From both theoretical and practical perspectives, the question of who provides support is probably less important than discovering who provides *good* support. Answering this question has been an important part of the research on supportive communication, though virtually all the studies have focused on predictors of the person centeredness of comforting, leaving the question largely unaddressed with respect to advice. The most-studied predictors of skill at person-centered comforting are age, sex, and cognitive

complexity. In general, the person centeredness of comforting increases with age through adolescence, reflecting developments in the cognitive, emotional, and communicative capabilities necessary to support sophisticated verbal comforting efforts (Burlson, 2003). Gender appears to be a significant predictor of comforting quality throughout the life span, with ample and consistent evidence that girls and women, on average, provide comforting with a higher level of person centeredness than do boys and men (MacGeorge, Graves, et al., 2004). Cultural or social factors probably explain much of this difference: In most cultures and societies, women's gender roles include the expectation of nurturing and comforting others, and the traditional activities of girls and women (e.g., child care) provide greater opportunity for practice at comforting.

Complementing this research on demographic factors are studies that have examined cognitive complexity as an influence on comforting behavior. As previously discussed, cognitive complexity refers to the sophistication of cognitive schema for thinking about people and social situations (Burlson & Caplan, 1998). Several studies indicate that individuals who are higher in cognitive complexity typically produce comforting messages that are higher in person-centeredness. Furthermore, these studies indicate that differences in cognitive complexity help explain the previously reviewed differences in person-centeredness due to age and gender. Specifically, there is evidence of a causal chain in which being female (vs. male) predicts higher cognitive complexity, which in turn, predicts the use of comforting messages with greater person-centeredness. The same is true for age, though only between early childhood to adolescence. Thus, cognitive complexity not only predicts the person-centeredness of comforting but also helps explain the effects of the other variables.

How Is Supportive Communication Studied?

Researchers have used a variety of methods to conduct research on supportive communication. Most research methods can be classified into one of four types or "paradigms": (1) naturalistic, (2) interaction analysis, (3) message perception, and (4) experimental (Burlson & MacGeorge, 2002). Each of these has contributed to the current understanding of supportive communication, and each has strengths and weaknesses that are complemented by the other paradigms.

The *naturalistic* paradigm includes research studies with participants who have actually experienced a specific kind of stressful event, either chronic (e.g., an ongoing medical condition) or acute (e.g., the loss of a job). Through interviews or questionnaires, these participants provide reports regarding "helpful" and "unhelpful" communication (and other behaviors) they have received from others. A classic study in this paradigm was conducted by

Lehman, Ellard, and Wortman (1986), who interviewed bereaved spouses and parents to determine the types of support they had received, who provided the support, and how these types of support were evaluated. The primary strength of this paradigm is what is termed *ecological validity*—that is, it examines supportive communication in the "real world," as actually experienced by people experiencing problems. However, there are important limitations to this paradigm as well. People are not especially good at remembering what others actually say to them, especially when weeks or months have passed, so that participants in these studies often provide general descriptions of intentions and outcomes ("She really tried to be helpful; she made me feel cared about") rather than the details of what was actually said. This can make it very difficult to determine what would be helpful or unhelpful for other support providers to say in the same or similar situations.

The *interaction analysis* paradigm includes studies with pairs of participants in a laboratory context; their interactions are audio or video recorded and subsequently transcribed. The transcriptions are then coded (i.e., classified) for different types of supportive communication (e.g., emotional or instrumental) so that the frequency of these support behaviors can be used to predict outcomes of interest (e.g., reduced distress, improved coping, conversational satisfaction). For example, the author of this chapter is currently conducting a study in which college students talk with friends about a current personal problem; the conversations are both videotaped and audiotaped. One obvious advantage of this paradigm is that the actual supportive behaviors are "captured" for subsequent analysis. In addition, researchers have the opportunity to measure (usually via a questionnaire) multiple outcomes of the interaction as well as predictors of what happens during the interactions. In the author's study, for example, questionnaires are used to measure variables such as the closeness of the relationship between the friends and the intention to implement any advice that was offered during the interaction. The major disadvantage of this paradigm is that participants may react to the laboratory setting by, for example, providing or responding to supportive communication in ways they ordinarily wouldn't. The quality of studies in this paradigm also depends significantly on what the researchers choose to code; in general, large-scale classification of behavior (e.g., emotional vs. instrumental) does not yield as much useful information as more fine-grained classification (e.g., coding messages for person-centeredness).

In the *message perception* paradigm, researchers present participants with sets of supportive messages designed or selected to represent features of theoretical interest (e.g., person centeredness or different types of facework). Such messages may be presented as lists or in scripted conversations, on paper or video, or, more recently, via computer. Participants evaluate these messages as third-party observers (e.g., "What do you think of what Jack said to Jane?") or as hypothetical recipients (e.g., "What would you think if someone said this to you?"). Such evaluations are

made on whatever dimensions are of interest to the researcher but typically include one or more factors such as supportiveness, helpfulness, effectiveness, and so on. A recent example of research in this paradigm tested the influence of “argument explicitness” (Feng & Burleson, 2008). In this study, research participants read and evaluated advice messages that either did or did not contain various kinds of arguments in support of the advised action. Because this paradigm allows researchers to focus directly on message qualities of theoretical interest and can be easily carried out with large numbers of participants, it is a particularly popular choice. However, there are obvious differences between actually experiencing a supportive message and making judgments about a message directed at others or imagining oneself as the target of a message in a hypothetical situation. There is also a difference between evaluating a message (e.g., for supportiveness or helpfulness) and assessing its predicted outcome (e.g., reduction in distress), though researchers using this paradigm are increasingly doing both or the latter (MacGeorge, Feng, et al., 2004).

The *experimental* paradigm encompasses studies in which researchers induce stress or upset (usually mild) in participants and then expose them to supportive messages generated by the researcher or by experimental confederates (i.e., people who are pretending to be ordinary participants but are actually trained by the researcher to do and say specific things). After reading or hearing the messages, participants provide assessments of relevant message evaluations (e.g., helpfulness or sensitivity) and outcomes (e.g., reduction of distress). An important example of work in this paradigm, conducted by Suzanne Jones (Jones & Wirtz, 2006), was described previously as a test of Burleson and Goldsmith’s reappraisal theory. The experimental paradigm brings together the strengths of the interaction analysis and message perception paradigms, permitting the systematic manipulation of specific message features and the evaluation of multiple message effects and outcomes. One obvious challenge in using this paradigm arises from the ethical concerns inherent in inducing upset or stress in research participants; participants cannot be unduly upset, and they must be carefully debriefed (i.e., counseled by the researcher) so that little or no distress remains when the experiment is over. In addition, this research method is typically expensive in terms of time and resources. For this reason, the experimental paradigm is the least used, though its use is on the rise as supportive-communication researchers devise skillful ways to manage ethical issues and train confederates (Jones & Guerrero, 2001).

Collectively, each of these paradigms has been demonstrated to be useful toward building a base of knowledge and will continue to be used as their methods prove relevant to questions being addressed by researchers. To illustrate, although the naturalistic paradigm may seem the most limited, it is often an important starting point for understanding supportive communication in specialized populations, especially if there is reason to believe that the

experience or evaluation of support may be somewhat different in those populations than in the general population. Other research methods are also beginning to show promise (Burleson & MacGeorge, 2002).

The Future of Supportive Communication Research and Theory

Although scholarly interest in supportive communication does not have the lengthy history of some other areas in the communication discipline (e.g., persuasion), the past two decades have seen considerable development in theory and research and an increasing numbers of scholars who focus their work in this area. Many, if not all, are motivated by the practical nature of research on social support: Findings have high potential for translation into ways of improving support processes and thereby the lives of all who give and receive support.

As research on supportive communication continues to develop, there are at least three areas that are likely to (and should) receive special attention. First, as discussed in the section on how and why supportive communication is effective, there is a need to move beyond identifying what works to explaining why it works. Part of this endeavor will include making further links between psychological, sociological, and communication perspectives on social support. Second, more research needs to be focused on supportive communication in particularly difficult contexts, such as bereavement (Servaty-Seib & Burleson, 2007), and with specific populations, such as those experiencing major health issues (Goldsmith, 2004). Third, work is needed in the area of training in supportive-communication skills. With all the practical knowledge that is now available about how to provide effective comfort and advice, communication scholars and practitioners need to do considerably more to develop, implement, and evaluate ways of helping people acquire better skills in this area (Burleson, 2003).

PART VI

KEY COMMUNICATION RELATIONSHIPS

SPOUSES AND OTHER INTIMATE PARTNERSHIPS

LAURA STAFFORD

University of Kentucky

Communication and the quality of romantic relationships are strongly related. Generally, people think that bad communication leads to bad relationships and good communication leads to good relationships. Unfortunately, it is not that simple. There is little agreement on what constitutes good communication. For some people, hashing out every minute detail of their thoughts is critical, while others prefer to keep to themselves. Similarly, perceptions vary widely on the elements that make up a good relationship. One person's dream relationship may well be another's nightmare. Nonetheless, my goal in this chapter is to present some ideas as to how spouses and other intimate partners communicate in effective and not so effective ways.

Our beliefs influence our behavior, so I begin by presenting some commonly held irrational and dysfunctional beliefs surrounding relational communication. This is followed by a discussion of both communication skills and different types of couples. In addition, I will outline research findings concerning communication processes, in the context of intimate relationships, such as self-disclosure, conflict, support, sexual communication, and small talk. I consider an area of research known as relational maintenance, and I close by offering some practical suggestions for improving communication in intimate relationships.

Dysfunctional and Irrational Beliefs Concerning Communication Skills

Numerous dysfunctional or irrational beliefs surround communication in intimate romantic relationships. Holding such beliefs is linked to problematic relationships. Here are a few such beliefs regarding relational communication:

- Poor communication is the number one problem in relationships.
- Poor communication is the primary cause of bad relationships.
- Increasing communication improves relationships.
- Partners should be completely honest with each other.
- Gender differences in communication cause relational difficulties.

Poor communication is widely viewed as the major problem in relationships. The idea that bad communication is the root of all (or most) evil in relationships is deeply entrenched in our culture. When poor communication is seen as the problem, then improving or increasing communication is typically seen as the solution. Indeed, improving communication (learning better communication skills) is the number one prescription offered by pop psychologists for

troubled couples. However, communication itself is seldom the real problem. Rather, fundamental conflicts in values or beliefs are the major cause for most relational problems. Improved communication might help individuals understand the problems better and perhaps provide a means for tackling them. Yet even then, understanding a problem and agreeing on the solution are not the same. Many problems in relationships occur because of disagreements as to how to spend money, different standpoints on religion, dissimilar views of the roles of women and men in marriage, and many other ingrained values or beliefs. Consider a situation in which one partner desires children and the other does not. The couple can talk until they are blue in the face, with great skill; nonetheless, no amount of good communication will resolve this basic difference in desires. This is not to say that the way you communicate is unrelated to the quality of your relationship. We just must be cautious in the belief that communication is some magic panacea for relationships. Otherwise, real problems remain hidden.

Though communication skill training is frequently prescribed for multiple problems, usually communication skill training can only fix *communication* problems. Let us consider the following scenario. A wife feels as though her husband is not paying attention to her, though in actuality, he is; the husband just does not display the nonverbal cues that the wife finds consistent with being heard and understood. Communication skills training could teach the husband to use more eye contact and offer some “huh huhs” to help the wife feel that she is being listened to. On the other hand, if the husband simply does not want to pay attention to his wife or doesn’t care if she feels listened to or not, that is, if he has little motivation, there is little to be gained from skills courses that “teach” him to use eye contact and offer feedback.

If bad communication is believed to be the problem in relationships, this logically leads to the next belief that *bad communication causes bad relationships*. Though labeled as a dysfunctional belief, poor communication *can* actually lead to poor relationships. The belief is dysfunctional if we fail to recognize that bad communication is unlikely to be the primary problem. It is also dysfunctional when we believe that poor communication skills always precede a bad relationship. We can just as easily turn this idea around. That is, studies that suggest having a distressed relationship leads to poor communication. Often, both partners are highly skilled communicators when talking with people other than their partner. Such skills simply disappear when interacting with their own partner. This indicates that due to dissatisfaction with the relationship, one partner or both no longer bother to try to communicate successfully. They let ill feelings impede their motivation to try to use their skills.

Perception plays a part in these circumstances. If you and I are in a relationship, and I perceive our relationship to be on the rocks or have decided I do not care for you anymore (regardless of the reason), these negative feelings lead to negative perceptions. This makes it quite difficult for me to see your communication as positive or even neutral

because I am expecting negative communication. Consider the simple comment, “You got a haircut.” If this comment comes from someone with whom I have a positive relationship, I am likely to interpret this as a compliment. If it comes from someone with whom I have a bad relationship, I am more likely to see it as a criticism. In other words, troubled couples are more likely to interpret everyday remarks or simple observations as criticism and thus become defensive. This leads to worse communication and a worse relationship. This, in turn, leads to even worse communication. The couple is in a downward spiral. Alternatively, an everyday neutral comment between satisfied partners can be misperceived as a positive statement, such as a compliment, and rather than a negative cycle, a positive one occurs.

In short, when it comes to good and bad communication and good and bad relationships, we have a question of the chicken and the egg: Which came first? We do have evidence that poor communication can lead to relational troubles. Still, this is not the case nearly as often as most people think it is. The reverse is just as, if not more, likely: A bad relationship or negative perception of one’s partner leads to poor communication and even to seeing negative communication when it is not there. The probable case is that bad communication (or perceptions of bad communication) is not the heart of the problem. Rather, such communication and perceptions are symptoms of the problem, symptoms that cannot be ignored. If we can improve our relationship and our perception of our partner, better communication skills can follow without necessarily trying to improve our communication.

Still, the belief holds that communication is the problem and two people simply need to communicate more. As a culture, we tend to believe that increasing communication helps relationships. Many pop psychologists and self-help books reinforce this belief. Yet when people say they wish they could communicate more, they might want to remember the adage about being careful what you wish for. Increasing communication incurs the risk of increased negative communication. If we consider that poor relationships might lead to poor communication, increasing communication could simply lead to increased poor communication, leading us further along a downward spiral.

Partners should be completely honest with each other. As foreshadowed in the previous paragraph, this thinking is also flawed. In the 1960s, slogans such as “Tell it like it is” became mainstream. With this generation, came the belief that relational partners should be completely open and honest with each other. Partners should not live a lie, and if a relationship was not strong enough for the full truth, it was not a relationship worth having. Such views radically changed the way people thought about communication. An overemphasis on complete disclosure and complete honesty led us toward a belief system that still surrounds today’s relationships. Research has clearly documented that many messages can be honest but hurtful, and more often than not, such messages result in negative consequences for the individual and for the relationship.

The final irrational belief presented here, a bit different from the others, is that *the sexes communicate differently*. This is the idea that women and men differ in their communication in such fundamental ways that communication problems are inevitable. If this were true, by this logic, homosexual relationships should be conflict-free, whereas heterosexual relationships should be much more distressed. Research has found, however, that neither homosexual nor heterosexual partnerships are better than the other at communication within their romantic relationships. Yet among heterosexual couples, the way females and males communicate has taken much of the heat for relational problems. Though some strongly believe that there are gender differences in communication and that such gender differences can cause harm, many social scientists argue that gender differences in communication (and ways of thinking and acting) are minimal. Numerous meta-analyses (studies of studies) have found gender differences in communication to be small and largely inconsequential.

Why then do so many people think that such differences are prevalent? Perception, again, plays a role. We see differences, even when they are not there, because we expect them. A woman who talks little during a discussion of intimate topics is more likely to be seen as shy, whereas the same behavior in a man is attributed to males' dislike of discussing intimate topics.

The belief that women and men communicate differently is problematic because it often causes relational harm by obscuring or escalating the real problems. Why try to talk about an issue or work on a problem if that is just the way women and men are? I might be dissatisfied if my male husband does not open up to me, even if I assume that this is normal for a guy. I could completely miss the fact that he *wants* to talk with me but is shy. If I am too entrenched in my belief, I do not even notice his desire to talk or do not offer him the opportunity to talk then despite his desire. Therefore, he does not talk more, and I continue being dissatisfied that he does not.

People are more likely to interact in a manner similar to their partner than in a way predicted by gender. People tend to reciprocate behavior. If I attack you in conversation, you are likely to attack me, regardless of our genders. If I disclose to you, you are likely to disclose to me. In other words, how your partner argues or manages conflict is much more predictive of how you argue than is your gender.

Communication Skills

The idea of good communication is central to dysfunctional beliefs. Yet there is a difference between good communication (or good communication skills) and good communication within a relationship. The communication scholar Brant Burleson (2003) considers communication *motivation* as the desire and intention to achieve a certain goal, whereas communication *skill* is the ability to achieve the desired goal. Sometimes, when people think a problem is a lack of skills, the problem could well be a lack of motivation.

We also confuse communication behavior with skill. Communication *behavior* is the nonverbal and verbal activity individuals engage in. Communication is behavior and can be observed, unlike motivations and skills (abilities), which cannot be empirically examined. Whether or not a particular communication behavior is skillful can only be determined if indeed the person achieves the desired goal. This, too, relates to our idea that skill training is not helpful for many relationships. Just because someone has excellent communication skills, it does not necessarily mean the skills will be used to enhance the relationship. If my intent is to hurt or belittle my partner and I have the "good" communication skills to do so and use those skills to cause harm, I am not using my abilities to sustain or build a satisfying relationship. Skillful communicators can inflict much damage on each other and their relationship.

In sum, clearly communication skills are important and are linked to satisfying and stable marriages and intimate relationships. However, we simply cannot assume that poor communication is the problem in bad relationships. Many other problems from many other sources are more likely. If we focus only on improving or increasing communication, we miss the possibility that the problem is lack of motivation or even the inability to use or see positive communication with our partner because of some deeper issue. The deeper issue might be the source of the bad relationship and that bad relationship the source of worse and worse communication. We also cannot assume that a skillful communicator will choose or even have the ability to use those skills in a given relationship. Skillful communicators can intentionally hurt a partner. In addition, sometimes hurt is caused by what we think is supposed to bring us closer (e.g., complete openness and expecting certain types of communication based on gender). The point here is not to devalue communication. The point is to lead us beyond naïve, simplistic, and dysfunctional views of communication that are often propagated in self-help literature and by pop psychology. That being said, of course, some types of communication are generally more or less helpful for relationships.

Communication Processes and Typologies of Relationships

Communication Processes

Let us attend directly to specific communication processes that occur between spouses and other intimate partners. Some of these include self-disclosure, conflict, social support, sexual communication, and small talk. I will conclude this section by presenting two typologies of relationships.

Self-disclosure is credited as the ultimate means of relationship development. It has also been considered necessary for relational satisfaction and continuation. Self-disclosure does not always live up to individuals'

expectations for it. Self-disclosure does not equal satisfaction or stability. Sometimes we engage in self-disclosure to hurt the other person. Sometimes that is not our intent; nonetheless, the disclosure is still hurtful. Sometimes we engage in self-disclosure to get something off our chest without thinking about the ramifications of placing this burden of knowledge on the other person. Often times we choose not to self-disclose because we feel that the information is too private or personal or reflects too negatively on ourselves. Some satisfied couples limit their self-disclosure more than other satisfied couples do. Marital workshops wherein individuals are virtually forced to self-disclose have been known to do as much harm for certain marriages as they provide help for others. Within a marriage, an agreement as to the nature of self-disclosure or the need to self-disclose is more significant than the amount.

Social support is often overlooked as a vital aspect of spousal interaction. One scholar defined social support as “responsiveness to another’s needs and more specifically as acts that communicate caring: that validate the other’s worth, feelings, or actions: or that facilitate adaptive coping with problems through the provision of information, assistance, or tangible resources” (Cutrona, 1996, p. 10). Over the course of a relationship, numerous stressors occur at the individual level and at the couple level. Often, we expect our partners to provide emotional or physical support when we face life’s stressors. We might need our spouse to listen to us, to cheer us on, or simply to be there. We also need our spouse to do things for us (instrumental support) or to know that our spouse could if needed.

Problematically, not everything that is offered as social support by one person is accepted as such by the other. A well-intentioned “supportive” statement or action, such as “Let me help you with that,” can be viewed as patronizing. Attempts to cheer the other up, “Come on, it can’t be that bad,” might be seen as not taking the problem seriously. Though vital to strong relationships, offering, accepting, and agreeing as to what constitutes social support can be difficult for some couples.

Sexual communication is related to relational satisfaction. Oddly, in a society seemingly obsessed with sex, communication about sex has not been studied as much as many other communication processes. Often times, individuals seem to be able to engage in sexual activity more readily than they can talk about it. Many types of sexual communication occur. Given concerns with AIDS and other sexually transmitted infections, research has concentrated on safer-sex communication among relatively new partners. Within a monogamous marriage or otherwise committed intimate relationship, sexual communication refers to each person’s ability to negotiate sexual activity (initiation and refusal) and to talk about likes and dislikes. Individuals need to know how to initiate sexual interaction in a manner acceptable to their partner. One person’s direct and overt statement of desire might be either welcomed or considered crass and offensive by the other. Sexual initiations can be verbally direct, verbally indirect, physical,

nonverbal glances, touching, and the like. Whatever the case, the ability for either partner to initiate and each partner to be able to recognize and appreciate the invitation of the other is essential for sexual satisfaction.

Equally important is the ability to communicate a refusal or rejection of the offer and the recognition of such a refusal by the other. Not all partners want to have sex at the same time, and seldom is the frequency of sexual activity agreed on. Instances of refusal are going to happen. Partners in a solid relationship recognize the refusal and realize that the rejection of a sexual advance is not a rejection of the partner.

Sexual communication does not stop with the ability to negotiate the when or if of sex. In addition, sexual communication entails the couple’s abilities to express likes, dislikes, and desires outside of or during sexual activities. Talking about sex is somewhat of a taboo topic, even within marriage. Individuals frequently find it quite difficult and feel it risky to express likes and dislikes. Furthermore, such expressions must be met with acceptance not defensiveness or feelings of inadequacy. It can be difficult to hear what we might feel is negative feedback about our performance, but not providing (and accepting) such feedback makes it extremely difficult for a couple to continue to develop a satisfactory sex life. Of course, such feedback does not necessarily have to be verbal as long as partners develop some manner of expressing (and accepting) each other’s preferences.

To make talk more comfortable, couples often develop their own “idioms” (nicknames) for the initiation or refusal of sexual activity or various sexual acts. Jointly created “code” can be less threatening, and perhaps even fun, for both members of the couple.

Satisfaction with sexual communication, sexual activities, and the relationship are all associated with each other. Improvement in any one of these areas should result in improvement of the other two.

Conflict

Perhaps more research has been devoted to conflict within marriages than to any other single communication process. This is because many scholars believe that the way couples manage their disagreements is a major predictor of the success of the relationship. Many different ways of handling conflict can be successful if both partners agree as to how conflict should be managed.

John Gottman (1994b) has gathered the strongest evidence to date for what are clearly positive and negative communication patterns between romantic partners whether married, cohabiting, engaged, homosexual, or heterosexual. He calls the four negative styles of interacting the “Four Horsemen of the Apocalypse.” If left unchecked, these will almost certainly trample any relationship. These negative communication tactics are *criticisms*, *contempt*, *defensiveness*, and *stonewalling*. The next section explains each of these and offers Gottman’s advice for countering or correcting them.

Criticisms focus on the character or nature of an individual. Specific complaints about individual behaviors do not carry the same negative weight. Consider the difference between the messages “You are a slob” and “I wish you would pick up your socks,” or “You are so inconsiderate” and “You didn’t call me when you were going to be late getting home.” Offering a valid complaint about a specific behavior is more likely to lead to less defensiveness and have a higher chance of resolving the issue. Such a complaint is probably more truthful as well.

Among dissatisfied couples, criticisms and even valid complaints are often met with defensiveness leading to a counterattack. For example, I say, “I wish you would pick up your dirty laundry,” and you might respond with “Who are you to talk? You are such a slob.” Satisfied couples are less likely to respond to either a criticism or a complaint with a negative reaction. However, the use of specific complaints instead of general criticisms or character assassination, makes it easier not to be negative in return.

When offered a complaint, our best course of action is to stay focused on the specific complaint and consider whether the complaint is valid rather than to become defensive. Do you leave your socks on the floor? Do you fail to call? Take responsibility for your role and make amends rather than engaging in a counterattack of your own. Using complaints instead of criticisms does not give us a license to hurl numerous complaints at our partners. No matter how gently worded, an abundance of even legitimate complaints about another’s actions will eventually take its toll. Gottman has proposed that every negative comment within a relationship has to be offset by at least five to eight positive ones.

Contempt is pure poison. Contempt belittles the other person. It is shown through behaviors such as rolling one’s eyes or sneering, offering sarcastic comments, hurtful humor, mocking, name-calling, and the like. Such behavior shows no respect and no willingness to listen or understand. Contempt ultimately indicates disgust with the other person. Contemptuous remarks lead to further contempt or criticisms and do nothing to resolve any issues. It should go without saying that the use of contemptuous behaviors is unhealthy.

Defensiveness often comes on the heels of criticism and contempt. When it comes to conflict, it seems that many people believe that the best defense is a good offense. Rather than responding appropriately, individuals defend themselves by being critical, contemptuous, or failing to take responsibility for their own actions.

Most individuals tend to reciprocate behavior. In other words, they tend to give back what they are given. This is truest for unhappy couples. Satisfied and dissatisfied couples are likely to return a positive remark with a positive remark. A major difference between satisfied and dissatisfied couples emerges when a negative comment is offered. Only individuals in a satisfied partnership seem to be capable of meeting a negative remark (e.g., a criticism) without becoming defensive. Satisfied couples are able to stop a negative spiral rather than fuel it.

Stonewalling shuts the other person out. It sometimes occurs later in a relationship than the other behaviors. It might develop after several months or years of criticism, contempt, or defensiveness. Stonewalling can involve physically leaving the room or home with no explanation, simply storming out or walking away. Stonewalling can also occur in the other’s presence through the silent treatment.

Sometimes when an issue becomes too heated or feelings are being hurt, a timeout can be helpful. There is a vast difference between informing the other you are too upset to talk right now, that you need to take a walk and calm down, compared with simply storming out and slamming the door or remaining an impassive stone.

Chronic use of criticism, contempt, defensiveness, and stonewalling indicates little concern for what the other has to say. Though such negative communication is most readily evidenced in conflict situations, the same types of negative communication can also occur during nonconflict situations. Couples who use such communication tactics will likely end their relationships. Of course, if partners change the way they interact, the relationship prognosis changes.

Everyday Talk

We seem to be preoccupied with examining conflict and self-disclosure. However, most couples spend much more of their talk time in rather routine or mundane conversations. Moreover, such mundane conversation is vital. Indeed, the relational scholar Steve Duck (1995) argues that such talk is the stuff of which relationships are made. The day-to-day talk about the ordinary creates, sustains, and re-creates the relationship between people. According to Duck, relationships are never stagnant. They are always changing; they are “unfinished business.” Most scholars do share the view that relationships are constantly evolving. Duck argues that this occurs through the most mundane of discourse. Through such talk we reveal who we are, what we think, and what we think about our relationship, and we learn such things about our partner. In satisfactory relationships, most of our conversation with our partners is likely both mundane and satisfying. Similarly, other scholars have noted that much of our talk involves joking around, gossiping, catching up, covering logistics, and other such types of talk considered to be extremely ordinary.

Communicating to Maintain Relationships

Though the study of marital satisfaction and stability is long-standing, the area of research labeled *relationship maintenance* is comparatively new. The study of relationship maintenance has largely been concerned with the communication behaviors associated with relational stability, satisfaction, or other desired relational qualities, such as trust and commitment. Of course, scholars define *maintenance* in slightly different ways. Similarly, various scholars have

identified several means of communication linked to relational stability and quality. Most, if not all, of the communication behaviors discussed earlier could be considered maintenance behaviors. The broad study of relationship maintenance is much more recent than research on any one particular communication process, such as conflict or self-disclosure. The study of relationship maintenance attempts to tie these separate communication processes together and go beyond them. As a whole, relationship maintenance research considers not only the communicative processes between the members of the couple but also the role of social networks (e.g., family and friends) and perceptions and cognitions in maintaining relationships. For example, spouses' perceptions of their partners' use of maintenance behaviors (e.g., being positive) is related to their own satisfaction. Also, merely thinking about fond memories of your partner is related to maintenance.

Different types of couples use different types of maintenance behaviors. Maintenance behaviors also vary depending on the current state of the relationship. For example, a newly dating couple might use more openness, whereas a married couple of several years is likely to offer more reassurances. Maintenance activities are also varied based on a couple's circumstances. Couples in long-distance relationships must rely more on mediated means (e.g., telephone, e-mail) than those who are close. Cognitions (e.g., remembering past interactions and looking forward to future ones) appear to be a maintenance mechanism for couples who are physically away from each other. Furthermore, different maintenance behaviors are linked to differing relational characteristics. Assurances are strongly related to commitment, whereas being positive is strongly related to liking.

Though this brief presentation barely scratches the surface of relationship maintenance, it emphasizes the idea that there is no one type of communication that is right for differing types of relationships or even different points in time for the same relationship. Furthermore, research on maintenance reminds us that communication is not the only means of creating or solving problems in relationships. Our networks and our thoughts play a part. Many scholars who study relationship maintenance appear to view successful maintenance as the result of the maintenance activities. However, returning to our question of the chicken and the egg, it is not clear whether maintenance behaviors lead to positive relationships or whether they are reflections of positive relationships. In all probability, they are both. Such a comprehensive approach to relational success is likely to continue to help scholars further understand the connections between communication and successful relationships in the hope that advice that is more specific can be offered to couples.

Typologies

Research has shown there is no one right way to communicate or one good type of relationship. Different couples use different styles of communication and nevertheless are satisfied. Evidence comes from some researchers, such as Mary

Anne Fitzpatrick and John Gottman, who have identified general types of married and other intimate couples.

Mary Anne Fitzpatrick's (1988) typology of couples is based on their patterns of communication and their ideologies about marriage. She identifies three primary types of couples, which she calls traditional, independent, and separate. *Traditional* couples value interdependence over autonomy. They hold conventional views of marriage. For example, they tend to follow traditional gender roles and are more likely to see the man as the head of the family. They are intertwined and share time, space, and leisure activities together. They do not engage in frequent conflict or self-disclosure in many arenas, but they do engage in conflict and self-disclosure over issues they believe to be important.

Independent couples place importance on both connection and individuality. They have less conventional values about marriage. For example, they do not necessarily follow traditional gender roles, and they engage in more negotiation about who does what within the marriage. They are more likely than traditional couples to participate in separate leisure activities and to share less time together. Still, they are interdependent. They engage in high levels of self-disclosure and conflict over both relatively minor and major issues.

Separate couples hold conventional beliefs about marriage although they place little importance on interdependence. These couples spend less time together than either of the previously discussed couple types. They tend to avoid both self-disclosure and conflict.

Research indicates that about 60% of couples fall into one of these three types. All three of these can have satisfying and stable relationships. This leaves 40% of couples where the partners are of two different types. The probability of satisfaction is higher for individuals who share the same orientation than for those in mixed relationships.

Another typology of couples was developed by John Gottman (1994b). Gottman is interested in identifying satisfying and stable couples primarily based on how they handle conflict. He classified couples into one of five types, three of which are functional, whereas the other two are likely to terminate their relationships. The three stable types are the avoiders, volatile couples, and validators.

First are the *avoiders*. As their name suggests, these couples attempt to avoid conflict. They are more likely to agree to disagree than to confront the issue. They tend to minimize the importance of an issue, nevertheless they do accept the other person and listen to the other person's views. *Volatile* couples privilege independence. They seem to thrive on conflict and willingly engage in conflict. They are passionate and offer a great deal of both positive and negative affect. Finally, some couples are *validators*. These couples avoid many arguments except over issues they consider vital. During interaction, there is a great deal of verbal and nonverbal acknowledgment, indicating that each is paying attention and wants to hear the other.

Gottman has identified two additional couple types as dysfunctional and likely to end their relationships: the hostile-engaged and the hostile-detached. The *hostile-engaged* couple exhibits a pattern of complaining and criticizing

by one partner followed by defensiveness by the other. They seem to have little understanding of each other's points of view. The *hostile-detached* couple live relatively detached and separate lives. When they do encounter conflict, it is generally short and intense and consists of attacking and defensiveness, disinterest, or contempt.

Conclusion

When invited to write this chapter, I was asked to suggest how the knowledge included could help students with their own communication. In this conclusion, I offer some suggestions.

The generalities offered must be read with caution; it is important to remember that it is impossible to define "good" communication. One-size-fits-all prescriptions for good communication simply do not exist as no two relationships are the same. Though there are clearly some wrong ways to communicate, there is no one right way to communicate. That said, I attempt to offer general but, nonetheless, what I believe to be worthy pieces of advice.

First, I would challenge you to examine your beliefs about relationships, including those that are potentially dysfunctional. Do you strongly hold many dysfunctional views? Maybe, as an adult, it is time to revisit your views of relationships.

Similarly, think about what you consider good communication. Not everyone wants the same type of communication. Some of us thrive on conflict and disclosure and some of us prefer to avoid conflict and keep things more to ourselves. Some people believe that all issues and irritations have to be aired to have a true connection; others are quite happy with agreeing to disagree. The probability of a successful relationship increases when partners are similar not only in their values and beliefs but also in their communication preferences. Do not assume that your relationship is in trouble just because your partner seems to need to argue about everything. Similarly, do not assume that your partner does not want to be close to you just because she or he does not disclose as much private information as you might like. Before making a commitment, pay attention to your similarities and differences in communication preferences. A conflict avoider and a conflict engager will face the difficulty of not only resolving the issue but also resolving whether to engage in conflict. Last, within the realms of both sexual communication and social support, there is a need to recognize how sensitive and tricky negotiating the same meanings can be. It can require work to find ways of talking about sexual activity in a manner that is comfortable for both you and your partner or being able to offer support in a way that is not viewed as patronizing.

Next, I raise two issues that have not been addressed previously in this chapter. Little has been directly stated about amount or timing. I have mentioned that it is best if people agree on the amount of conflict or disclosure. There are other ways amount should be considered. For example, we generally do want positivity and reassurances from our

partner, yet someone who is constantly positive will probably get on our nerves. Perhaps we begin to wonder what is wrong, if our partner verbally reassures us of their love for us too many times a day. There might be a point at which we receive too much "good" communication.

The setting and the timing also factor into consideration. When and where one chooses to engage in conflict or self-disclosure, to offer social support, or even to attempt small talk can have major ramifications. Discussion of the same issue in private versus in front of friends or family members will affect the conversation. Or what might be taken as supportive communication or appropriate sexual communication in private might cause you to feel uncomfortable in public.

Raising an issue you desire to discuss when your partner is exhausted or stressed does not provide a great chance for either of you to use your best communication skills and successfully address the issue. Even small talk can be ill timed. It is not wise to attempt to engage in pillow talk as your partner is just on the edge of sleep. Your partner might not desire to be roused just to talk, and you might feel ignored.

We might not think about the where and when to engage in different types of talk with our partner, but a little consideration of such factors can go a long way toward setting up a situation that more readily lends itself to good communication. Some of us are rather selfish about our needs and want to talk about "it" (whatever "it" is) right then and there, without considering our partner's state or desire. We need to monitor our partner, and ourselves, and ask if this is indeed the right time or place. When either partner is overly exhausted, stressed, or emotional, even the best communicators are less likely to be motivated, or able, to use those skills in a positive manner.

Finally, I close with pieces of advice that I offer with the most confidence. Do not automatically assume that communication is the problem in a relationship; keep an eye out for the real issue. Keep in mind that problematic relationships *cause* problematic communication as well as *result from* problematic communication. As most problems are not communication problems, decide if the area of discontent is something you can live with or be willing to dig deep into real issues. If the problem is your communication, decide to work actively on your communication skills.

Do not reciprocate negative behaviors. Remember that most of us, including marital and other intimate partners, tend to give back what we are given. In a healthy relationship, partners are better able to counter negative behaviors with positive ones. Responding to a negative remark with a positive one can turn a downward spiral back upward.

Pay as much attention to your perceptions and attitudes about your partner and your relationship as to your communication within the relationship. If you are in a satisfying relationship, keep thinking positively about your partner and your relationship. Feed those fond feelings. If in a troubled relationship, keep in mind that you might see negative communication when it is not there and that you are probably not motivated to use your best

communication skills either. Rediscover the person you fell in love with and the great relationship you used to have. Maintaining a positive relationship or turning a distressed relationship back into a positive one, could just lead to good communication.

CHILDREN, PARENTS, AND GRANDPARENTS

MICHELLE MILLER-DAY AND JENNIFER A. KAM

Pennsylvania State University

Did you know?

In the year 2000 ...

U.S. Population Census, 2000

- Children under the age of 18 represented 26% of the population of the United States, and 90% (64.7 million) of those children live with at least one parent.
- Multigenerational households make up nearly 4% of all U.S. households.
- 2.4 million (42%) grandparents living in multigenerational households also had primary responsibility for caring for their grandchildren younger than 18.
- 43% women and 56% men ages 18–24 lived at home with a parent.

Families with children form a substantial number of households in the United States. In the best of times, families can be complicated, and the complex nature of families is not restricted to their structure (e.g., two-parent, single-parent, or multigenerational families). Unlike sociologists, whose main interests tend to be focused on family structures and the changing nature of families in the United States, communication researchers tend to be interested in the complexities of how families are created by both structure *and* interaction. That is, they tend to focus more on the private nature of interactions among family members than only on family structure itself. This is the purview of most 21st-century research in family communication: to study family interactions and the meanings that arise from them. This chapter does not undertake the complex task of presenting an exhaustive compilation of

research published in the field of family communication in general; numerous books and chapters have already completed that task with care (e.g., Braithwaite & Baxter, 2006a; Vangelisti, 2004). Rather, this chapter provides an overview of some history, theorizing, and research conducted on intergenerational communication by those identifying themselves primarily as communication researchers.

Brief History

Intergenerational communication refers generally to communication that occurs between individuals from different generations (e.g., parent-child, grandparent-grandchild). The study of communication among family members has a

long tradition. Research over the past 20 years has revealed to both clinicians and scholars that family communication is consequential to personal development and relational satisfaction. Family members are interdependent; that is, they influence and are influenced by each other, and family life is constituted through this social interaction. It is through communication that family members come to know family roles, rules, and expectations; how they form and maintain their relationships with one another; and how they learn to interact with others. The family is our first communication classroom. But, despite the centrality of communication in family functioning, it wasn't until the turn of this century that the field of communication supported a professional journal for the publication of original research on family communication.

Until the late 20th century, study of communication between and among parents, children, and grandparents perpetuated the trend across disciplines to focus almost exclusively on (Caucasian) mother-child communication. Historically, parenting was conceptualized as the domain of mothers, and the mother-child relationship was viewed as the primary intergenerational relationship in the family. It has been only recently that fathers, grandparents, and the role of culture and ethnicity have begun to play a significant role in family communication research. At the crossroads of the 20th and 21st centuries, communication research is now assuming a greater focus on the larger family system, on the complex nature of the family itself, and on understudied family relationships. The study of intergenerational communication is complex due to life span issues (e.g., from infancy to elder years), different family relationships (e.g., mother-daughter, father-son, grandmother-granddaughter), and family structure (e.g., single parent, two parent, biological parent, stepparent, multigenerational), along with a host of other complicating variables such as culture, ethnicity, and socioeconomics. Indeed, there is no one kind of family. There is no universal theory of families and no single recipe for effective communication. Families are diverse and have unique past experiences of communicating that carry into the present and have implications for the future. This makes the study of intergenerational communication such a challenge (and so much fun).

Communication Theories

Theories are important because they provide a lens through which we can describe and explain findings, and they provide direction for future research and understanding. Thus, to understand intergenerational communication research, it is necessary to become familiar with the theories that have been used to explain it. There is a long list of theories that have been employed to explain communication processes relevant to families; however, many of these theories originated outside the field of communication studies. Theories such as systems theory, attachment theory, and social learning

theory have historically been effectively applied to explain family functioning and communication interaction in family contexts. Nevertheless, until the latter part of the 20th century, there were few indigenous theories developed by communication scholars. As we enter the 21st century, this is changing. Braithwaite and Baxter (2006a) pointed out that several theories have been developed by communication researchers, and these theories have a presence in current research efforts to advance our knowledge and understanding of communication between and among parents, children, and grandparents. Communication-based theories of families and intergenerational relationships are guided by several assumptions explicated in the following sections. Whitchurch and Dickson (1999) argued that several assumptions describe how family communication tends to be conceptualized and that these assumptions imply a direction for intergenerational communication research efforts.

Assumption: Family Relationships Are Constructed Through Interaction

This assumption includes the belief that family relationships are constituted through verbal and nonverbal interaction, including the sharing and withholding of messages. There are four communication theories that serve to enhance understandings of intergenerational communication through a focus on the meanings that arise from that interaction: (1) communication privacy management (CPM), (2) family communication patterns (FCP), (3) necessary convergence communication theory (NCC), and (4) communication accommodation theory (CAT).

Communication Privacy Management Theory

Communication privacy management theory (CPM) (Petronio, 2007) maintains that people have a sense of ownership over their personal information; thus, they feel entitled to decide when to reveal personal information and to whom. In addition, people use privacy rules to control their personal information. When people share this information, the recipient is expected to abide by the privacy rules, which often means keeping the information secret. Yet people may, at times, break the rules and breach privacy boundaries. Revealing information to another person entails a degree of risk as that person may disclose the information to others. In deciding to share private information, people may regulate their privacy more rigidly for one person than another. Thus, privacy rules control who receives the personal information, the amount of information disclosed, the type of information disclosed, and the reasons for revealing the information (Caughlin et al., 2000).

CPM and Communication Among Parents, Children, and Grandparents. Privacy rules in families can be complex. Decisions to reveal or conceal information are predicated on the relationship of the communicators, the family role

(child/parent/grandparent), and a host of situational factors. In families, people form privacy boundaries around themselves, themselves and others in the family (e.g., sibling groups, parent-child), and around the family system as a whole. Establishing privacy boundaries is a rite of passage in adolescence. Adolescents often avoid certain topics with their parents in their quest for developing an independent, autonomous identity. In fact, research suggests that keeping some information from their parents can be a useful way for adolescents to establish their own autonomy. Yet topic avoidance becomes complicated in stepfamily systems. Afifi and colleagues (Afifi, 2003; Golish & Caughlin, 2002) reported that older adolescents were often frustrated with the tensions between revealing and concealing information among custodial parents, non-custodial parents, and stepparents. Moreover, developments such as changes in family structure and transitions from adolescence to adulthood require the renegotiation of privacy management rules. Research in this area often addresses issues of privacy rules, privacy boundaries, and boundary turbulence.

As with many of the other theories discussed here, grandparents are largely absent from the research on privacy. An exception is work conducted by Barker (2007) focusing on painful and personal self-disclosures by grandparents to their young-adult grandchildren. He discovered that maternal grandmothers made more disclosures compared with maternal grandfathers. Moreover, this study found that some grandparents shared private information to enhance their connection with a grandchild, but they also shared private information for control purposes. Likewise, family members may share or withhold information from elderly grandparents to protect or control. For example, in one ethnographic study of grandmothers, their adult children, and their grandchildren, certain truths were often kept from elderly grandmothers “for their own good” (Miller-Day, 2004). In this study, one of the grandmothers became ill and was diagnosed with intestinal cancer. Her daughter and grandchildren conspired and “decided not to tell her she had cancer.” Despite these studies, we know very little about privacy management across generations in families.

Family Communication Patterns

Family communication patterns (FCP) describe a “family’s tendency to develop fairly stable and thus predictable ways of communicating with one another” (Koerner & Fitzpatrick, 2004, p. 180). These patterns include a conversation orientation and a conformity orientation, which help scholars define four different family types and predict family processes, such as how members coordinate meanings in communicative interaction. A *conversation orientation* refers to the degree of openness in family interactions and emphasizes individuality and individual contribution, whereas a *conformity orientation* refers to the degree of conformity required by the family and emphasizes compliance with common family ideals and values.

Using high and low discriminations on the two orientations, four family environment types have been identified: (1) *laissez-faire*, (2) *consensual*, (3) *pluralistic*, and (4) *protective* families (Fitzpatrick & Ritchie, 1994). Because both dimensions of conversational and conformity orientations interact continually with one another, both dimensions need to be investigated together. *Laissez-faire* families are low on conversation and conformity orientations, not really encouraging individuality nor requiring compliance. These families are characterized by low engagement with each other, and offspring are predicted to be more influenced by external influences (e.g., peers) than by family members. In direct contrast are *consensual* families, which are high in both conversation and conformity orientations. Consensual families are open to discussing ideas and expressing opinions but are expected to ultimately agree with the opinion of those in positions of power, such as parents. *Pluralistic* families are high on conversation orientation but low on conformity orientation. In these families, open discussion of ideas is encouraged with little pressure to conform to other members’ perspectives. Finally, *protective* families are low on conversation orientation but high on conformity orientation. These families emphasize obedience and compliance with expectations, providing little opportunity for dissent or autonomous thinking.

FCP and Communication Among Parents, Children, and Grandparents. FCP research has almost exclusively addressed communication in individual households among intact families of parents and children with almost no inclusion of grandparents or multigenerational families. Research discoveries include descriptions of families at the high end of the conformity orientation dimension who tend to emphasize obedience. Findings suggest that children in these families may be more susceptible to peer pressure, be less willing to test new ideas, be less able to take the perspective of others or empathize, tend to engage in conflict avoidance, and be less likely to develop psychological and social competence. Conversely, findings suggest that families at the low end of the conformity orientation dimension tend to emphasize individual autonomy and are more apt to be tolerant of divergent opinions and ideas and more experienced in decision making. Families at the high end of the conversational orientation dimension highlight open discussion, and research has suggested that children from these environments value cooperative conflict resolution and are competent in expressing their ideas and feelings. Conversely, children from families at the low end of the conversational orientation dimension tend to be less comfortable sharing personal feelings or thoughts, and this seems to predict some future distress in personal relationships.

Necessary Convergence Communication

Necessary convergence communication (NCC) theory is a relatively new theory that enhances and extends work

in the area of family communication patterns. NCC is one of the few theories grounded in multigenerational research including three generations of family members. Originating from research with grandmothers, mothers, and adult daughters (Miller, 1995; Miller-Day, 2004), this theory explains how co-orientation between two individuals toward the sharing of a common reality (to attain agreement, accuracy, and congruence of both partner's cognitions) can become coercive in family relationships.

NCC is a type of communication "script"—an interaction routine—that is played out when conformity is required. In family environments that are high in conformity, children feel compelled to interpret the world around them in ways consistent with the parent (or grandparent), often altering their own opinions, beliefs, or attitudes to conform to their parent's perspective, and this may, in time, inhibit the children's thinking for themselves. In NCC, conformity to the parent's perception is perceived as required, as *necessary* to maintain the relationship. NCC argues that most of us defer to others to a certain degree, but chronically high levels of submission—across time and different domains—can predict negative outcomes for children.

NCC and Communication Among Parents, Children, and Grandparents. Studies of grandparents, parents, and grandchildren suggest that convergence communication patterns may be perpetuated across the life span, with elderly parents enacting the script across time with their adult children. Moreover, this research suggests that convergence communication patterns might be transmitted intergenerationally, that is, learned and habituated in one generation, then passed down to the next. Other research reports that convergence communication, when sustained into adult parent-child relationships, may be linked to relational dissatisfaction and may place adult children at risk for depression and eating and identity disorders. This theory holds promise for understanding the actual communication interactions that are performed under conditions of high conformity orientation, but little is known about how these patterns are perpetuated across time and transmitted across generations.

Communication Accommodation Theory

Communication accommodation theory (CAT) posits that when people interact they often attempt to meet the other person's needs and abilities by altering their communication (Coupland & Giles, 1988). The communication predicament model extends CAT with the assumption that people's perceptions of the other's needs and abilities may be based on stereotypes and attitudes toward that person, particularly when the communicators are from different groups (e.g., grandparents, parents, or children). People may accommodate by adapting their behaviors to meet their conversational partner's needs. Yet being aware of what another person needs may be a difficult endeavor, resulting in overaccommodation or underaccommodation.

People overaccommodate when they excessively change their communication, surpassing the other's needs. Several examples include increasing volume or slowing down speech when their conversational partner does not require such adjustments. Underaccommodation occurs when people do not alter their behaviors to meet their conversational partner's abilities. Examples include not slowing down speech or increasing volume when the partner requires these modifications. CAT, then, elucidates the process wherein people alter their communication, either successfully or unsuccessfully, based on their perceptions, stereotypes, and attitudes regarding the other person as being a member of another group.

CAT and Communication Among Parents, Children, and Grandparents. CAT and the communication predicament model have most extensively been examined focusing on communication between grandparents and young-adult grandchildren. For instance, CAT research would suggest that when young-adult grandchildren interact with one of their grandparents, they may do the following: (1) encounter their grandparent, (2) identify the grandparent's old age by his/her physical features, (3) draw on their stereotypes and expectations of older adults, and (4) alter their communication toward their grandparent by either over-, under-, or appropriate accommodating (Williams & Nussbaum, 2001).

As CAT research tends to consider young-adult grandchildren stereotyping their grandparents and other older adults, it is important to acknowledge that grandparents and older adults in general may also stereotype, overaccommodate, and underaccommodate when interacting with their grandchildren and other younger cohorts. Research by Harwood and colleagues (e.g., Soliz & Harwood, 2003, 2006) along with Hummert and colleagues (e.g., Hummert, Garstka, Ryan, & Bonnesen, 2004) has focused on the ways that older and younger adults overaccommodate or underaccommodate to one another in interaction. For instance, painful self-disclosures (e.g., health problems, loneliness) by older adults are perceived as underaccommodating by younger adults. Likewise, patronizing communication (e.g., talking down to the younger person) is perceived as an overaccommodative behavior. Similarly, communicating in a "baby talk" style to older adults may be perceived by older adults as overaccommodation. Thus, CAT has been shown to be applicable to numerous types of interactions, ages, and relationships.

Assumption: Families Are Constantly Managing Dialectical Tensions and Transitions Across the Life Span

Dialectical Theory

The theory of relationship dialectics provides a dualistic perspective of communication and relational processes by explaining how people manage contradictions that

stimulate certain types of communication in their relationships (Braithwaite & Baxter, 2006b). Contradictions are defined as unified oppositions, consisting of two concepts that are connected but are on opposite ends of a continuum. Although a vast number of contradictions or dialectical tensions exist, communication researchers tend to reference the following three: (1) autonomy-closeness, (2) openness-closedness, and (3) predictability-novelty. People attempt to balance their desire for independence from parents or grandparents while also maintaining some degree of intimacy. During their relational history, the involved parties also exhibit openness by divulging personal information and allowing for affective vulnerability, yet they also attempt to protect themselves by intentionally withholding other types of personal information. Finally, predictability reflects people's feelings of certainty and consistency; however, at times, people desire novelty, excitement, and change (Graham, 2003). As the contradicting concepts form a dialectical tension, both concepts are essential to the relationship (LePoire, 2006). When people experience dialectical tensions, such contradictions stimulate change in the relationship as people balance between the opposite ends of the continuum.

Dialectical Theory and Communication Among Parents, Children, and Grandparents. Dialectical theory helps us to understand how family relationships evolve over time and how they experience transitions. Similar tensions are negotiated in parent-child and grandparent-grandchild relationships; however, some research suggests that the management and negotiation of these tensions are more of a challenge with parents and children due to identity entrenchment. In fact, the personal-positional tension is one that is managed across the life span in these relationships. There are competing views of the other person as a unique person and the view of her as the daughter, mother, or grandmother. Developmentally, young-adult children begin to look beyond the family role a person plays to the unique characteristics of the person, such as his or her ambitions, desires, and faults. Research on mother-adult daughter relationships suggests that viewing mothers as sexual beings and "seeing the person behind the role" is one of the more difficult tensions for daughters to manage as they enter adulthood (Fisher & Miller-Day, 2006).

The following dialectics, however, have also emerged specifically in parent-child communication research: real and ideal (the ideal image of a mother in contradiction to the mother I have) and powerful and powerless (among stepfamily systems, the tension between new and old). Parents, children, and grandparents negotiate and communicatively manage these dialectics across the life span. Yet studying family relationships in different family structures at different developmental stages and experiencing different life transitions (e.g., adopting a caregiver role to an aging grandmother) can provide us with possible strategies for management of these tensions across a variety of contexts.

Turning Points

As dialectical theory introduces contradictions as stimuli for relational change, turning points further capture the ebb and flow in relationships. Turning points refer to events, incidents, or experiences that are associated with change in the relationship (Baxter & Bullis, 1986). In the past, communication researchers conceptualized relationship development as occurring in a linear manner such that people establish greater intimacy as they exchange information over time. Yet turning points capture a more dynamic pattern of communication and relationship management across people's life spans. Because turning points are defined as events that alter a relationship, researchers have a number of ways to consider how a relationship changes over time. For instance, a child may go away to college, thereby decreasing or increasing the communication, emotional closeness, or relational satisfaction with his/her parent(s) and grandparent(s). Thus, as turning points are associated with changes in a relationship, the challenge is to identify patterns of changes unique to different relationships.

Turning Points and Communication Among Parents, Children, and Grandparents. Although there is little research on turning points in children's relationships with their fathers, research reveals several common turning points in mother-daughter relationships. With the exception of any childhood illness, the first significant transitional experience in the mother-daughter relationship is when the daughter enters adolescence with the accompanying distance and struggle for autonomy. Throughout the life span, other common turning points include changes in proximity (when one person moves out of the household, e.g., to college or to establish a separate household), a daughter's own pregnancy and childbirth, the transition from a positional orientation to a personal orientation (seeing your mother as a woman, a person, and not just in her role of mother), and the transition to caregiving of the other due to age or infirmity. Mothers often admit that daughters define them, at least partly, as women and that turning points in the mother-daughter relationship are difficult to navigate because of the reflection of those changes on a mother's own identity.

To date, a limited number of studies exist that have explored the possible turning points that grandparents and grandchildren experience across their relational history. Investigating the turning points for this dyad is necessary, given that some researchers suggest the emotional closeness between grandparents and grandchildren decreases over time. Holladay and colleagues (1998) conducted a study with young-adult granddaughters who reported changes in their emotional closeness with their maternal grandmother when they experienced a particular life event. Among the types of turning points that Holladay and colleagues found, were engaging in shared activities, decreases in geographic distance, transition to college, and maturity. Thus, the study revealed that emotional closeness

within the dyad is better represented as a mountainous terrain than a single slope. Granddaughters experienced increased and decreased closeness at multiple times throughout their relational life span, thereby indicating that the relationship does not continuously decrease over time.

The next step in turning-point research may be for communication scholars to determine the messages exchanged during and after turning points to determine how grandparents and grandchildren communicatively react to these life events. Additionally, fathers seem to be absent from the turning-points literature; there is much to be learned about how fathers and grandfathers negotiate transitions in their relationships with their children and grandchildren.

This chapter has discussed several theories that have guided research in the area of communication among parents, children, and grandchildren. Yet to fully understand this information, it is important to recognize the methods that researchers tend to use to collect and analyze the information they gather about this communication.

Methods

Entering the 21st century, there are two dominant discourses in communication research on parents, children, and grandparents: logical-empirical and interpretive. *Logical-empirical* research seeks to discover universal covering laws. A researcher poses predictions based on a theory and then determines if the predictions were supported by the observations of the study and can be generalized to a select population. The tools used to achieve this are often the administration of questionnaires, experiments, and measuring or rating observations of interactions. Conversely, *interpretive* research does not seek to discover universal truths but seeks to make transparent how social worlds are experienced subjectively and how understandings are mutually coordinated, understood, and maintained in relationships. In family research, this often means revealing how family members negotiate daily routines communicatively or uncovering patterns of experience within and across families. The tools used to conduct interpretive work are often in-depth interviews, direct observations of daily behaviors, focus groups, and participant journaling of experiences.

Although the logical-empirical discourse represents the majority of research in family communication (Braithwaite & Baxter, 2006a), there is currently a resurgent interest in interpretive work. A 2007 professional discussion about methodological approaches to studying families conducted as a panel at the National Communication Association's annual convention resulted in four overarching recommendations for scholars: (1) conduct more case studies with families, examining the daily communication routines of families and exploring family communication dynamics within the household environment; (2) conduct longitudinal research to track families during

times of transition and development; (3) conduct more research in the laboratory, collecting physiological data; and, finally, (4) become proficient in new techniques for statistically managing the complexity of family data. Moving into this century, there are a variety of new statistical techniques available that will allow the next generation of researchers to examine the entire family as a system and not just dyadic pairings or subsystems within the family. Furthermore, mixed-methods research is increasingly important in communication research—mixing tools, such as observation and questionnaires, as well as mixing quantitative approaches (e.g., questionnaires) and qualitative approaches (e.g., in-depth interviews). These mixed approaches allow researchers to survey the terrain of communication experience in families (quantitative) while mining the depths of that experience (qualitative). Given the professional discussion and the range of new techniques now available to social scientists, we suspect that the 21st-century approach to research on families will honor the integrity and strengths of both quantitative and qualitative approaches to data collection and analysis.

Promising Areas of Research

In reviewing the communication theories that are employed to guide research in the area of parents, children, and grandparents, it is apparent that there is a lack of coherent multigenerational research, that is, intergenerational research focusing on relationships within and across multiple generations of a family. The majority of the research focuses on parent-child communication, with some focusing on grandparent-grandchild communication; however, substantially less research attention is paid to family communication across three generations. This is important because, due to the increase in the older population and increasing longevity, the grandparent-grandchild relationship can last for decades: more younger children and adults have living grandparents today than at any time in history (Mares, 1995).

In a recent review of the presence of children in communication research, Miller-Day, Pezalla, and Voigt (2008) discovered a marked absence of children in communication research. Among the 16 leading communication journals, from 2000 to 2007 only 5% of the published studies addressed communication with youth under the age of 18, and only 11% of those occurred in the *Journal of Family Communication*. Due to a variety of factors, including constraints imposed by university review boards, the inclusion of youth under the age of 18 is severely restricted; thus the representations and voices of youth are inhibited. This also impedes efforts to examine communication across multiple generations. This review revealed that when parent-child communication was represented in the research literature, the focus was most often on college students as children, thus privileging knowledge of parent-emerging adult child

relationships and almost completely denying families with young children.

Since 2000, there has been an impressive increase in the research attention to communication between grandparents and grandchildren, with most studies undertaken by Drs. Jake Harwood, Jordan Soliz, and colleagues. This work has addressed the effects of grandparent-grandchild communication on ageist attitudes and the age identity of older adults and has examined the role of communication satisfaction in grandparent-grandchild relational closeness. The results of these studies indicate that relational closeness between grandparents and grandchildren is influenced by having a parent to support the grandparent-grandchild relationship as well as to provide opportunities for the grandchild to interact with the grandparent in ways in which they can reciprocate self-disclosure and support. In turn, grandparents—particularly grandmothers—may provide a buffer for grandchildren during times of parent-child stress and conflict (Miller-Day, 2004).

Yet, as Williams and Nussbaum (2001) pointed out, “to understand intergenerational communication, a much greater effort on the part of scholars needs to be directed towards the communication behavior found within the grandparent-grandchild relationship” (p. 183). As can be seen in this chapter review, there is an incomplete picture of grandparent-grandchild communication in the field of family communication. To address this gap, additional research is necessary. While certainly not exhaustive, the following discussion offers some promising areas of research for family communication scholars who wish to address these research gaps and learn more about communication among parents, children, and grandparents. These promising directions for research efforts include examining multigenerational households, intergenerational transmission of communication behaviors, conversations between grandparents and grandchildren, children as language brokers, young children as caregivers, adult children and adult grandchildren as caregivers, genetic communication, and communication and technology.

Multigenerational Households

Custodial Grandparents. In the United States, the number of grandparents who become primary caregivers or substitute parents of a grandchild continues to increase. When parents cannot care for their child, grandparents often adopt the role of caregiver by raising their grandchild. The term *custodial grandparents* identifies those grandparents who are the head of the household and the primary caregiver of a grandchild. Being a surrogate parent adds great responsibilities. Many custodial grandparents report increased stress, financial struggles, family conflict, and health problems (see, e.g., Hayslip & Kaminski, 2005). Familial conflict and managing grandchildren’s behavioral problems appear particularly prominent. To address these problems, communication researchers should investigate

how custodial grandparents and the involved parties can manage these conflicts and behavioral problems. Determining more effective and appropriate forms of communication may help custodial grandparents and their grandchildren resolve conflicts and problem behaviors, which is likely to alleviate some of the psychological burden that custodial grandparents experience.

Three-Generation Households. Although three-generation households are increasing in the United States for various reasons (see, e.g., Jayson, 2005), few social scientific studies address multigenerational households. Moreover, even fewer studies exist on three-generation households in the communication field, thereby ignoring the communication processes that transpire between grandparents, parents, and children who co-reside. Although some three-generation households may provide support for a child, co-resident grandparents and parents may experience role conflicts. Moreover, for those three-generation households consisting of a parent(s), who cares for his or her own children along with an aging parent, the experience can also be stressful in a number of ways, affecting communication processes, family satisfaction, and mental health (see, e.g., Halpern, 1994). Communication researchers have the opportunity to investigate the communication processes and adjustments that occur when grandparents co-reside with parents and children in the same household.

Intergenerational Transmission of Communication Behaviors

Even when grandparents do not reside in the same household as adult children and grandchildren, it is clear from early work in psychology that patterns of interaction in one generation may recur across generations. In disciplines other than communication, ample support exists for the intergenerational transmission hypothesis, which posits that parents’ family-of-origin interactions with their own parents will influence how they interact with their own children and that families carry their problems with them from one generation to the next (Bowen, 1978). The communication researcher Miller-Day (2004) discovered unique family communication patterns and a “tradition” of suicide attempts across four generations of women in several families, and Diane Doumas and Steve Wilson both do research on the intergenerational effects of interpersonal violence and verbal aggressiveness on offspring (see, e.g., Doumas, Margolin, & John, 1994; Wilson, Hayes, & Bylund, 2006). All these scholars argue that communication patterns and processes are pivotal to understanding the dynamics of intergenerational transmission. The argument of many contemporary scholars is that our past experiences interacting and communicating with others (family members) shape how we interpret, understand, and guide our present communicative interactions.

Children as Language Brokers

For some families who immigrate to the United States, adjusting to a new environment with a different language and cultural practices may lead parents and other family members to rely on their children to help them adjust. Because children experience adaptation and language acquisition at a faster rate than do adults, children in immigrant families often act as language brokers. In particular, *language brokers* refer to people who act as cultural and linguistic mediators between two or more parties (Tse, 1995). These language-brokering children often interpret for their parents and grandparents at medical visits, stores, banks, and school. As language-brokering children take on adult responsibilities, some researchers suggest that parentification occurs. *Parentification* is defined as a person, typically of authoritative status, relying on a child for functional or emotional assistance, often at the risk of hindering the child's natural and appropriate developmental process (Castro, Jones, & Mirsalimi, 2004). Several studies indicate that language-brokering children experience parentification and, in turn, experience stress and resentment. Other studies suggest that these children develop confidence, self-esteem, and pride. Thus, research on language brokering is mixed, which makes investigating this process essential for communication researchers to establish more concrete results. Conducting further research to determine how language brokering affects children is essential, given that it may have substantial consequences for their well-being.

Young Children as Caregivers

In the United States, at least 1.4 million children who are between the ages of 8 and 18 are caregivers, where 72% are primary caregivers to a parent or a grandparent (Hunt, Levine, & Naiditch, 2005). Children may take on the role of caregiver for a number of reasons, some of which have been a parent's or a grandparent's medical condition. When children are responsible for preparing meals, bathing, dressing, transporting, or shopping for a parent or grandparent, such tasks may interfere with the children's social life, education, and well-being. Thus, it is not surprising that research on young caregivers shows a positive relationship between caregiving and stress, anxiety, depression, and school dropout (Amend, 2006). Because caregiving can have a negative effect on children's well-being, communication researchers must determine what makes certain young caregivers more resilient than others and how certain coping strategies may be more effective than others. Some young caregivers are able to successfully handle the responsibilities and pressures. Some report positive experiences from caregiving. Yet other children have difficulty carrying out activities that are usually expected of adults, thereby warranting greater attention to this unique and significant phenomenon.

Adult Children and Adult Grandchildren as Caregivers

One context of caregiving that appears to gain the most attention is that which occurs among adult children or adult grandchildren who assist a parent or a grandparent. These familial caregivers constitute the largest percentage of informal caregivers. Similar to young children who are caregivers, becoming a caregiver for a parent or grandparent later in life may also be difficult. Although most of these caregivers want the best for their parent or grandparent, studies reveal that caregivers may actually become too controlling over their parents' or grandparents' life. Too much control, however, can negatively affect the relationship and the care recipient's well-being. In response, the parent or grandparent who is receiving care may withhold information regarding a health problem, for example, to regain some control. Such findings have implications for privacy management, as was discussed earlier in the chapter with Petronio's communication privacy management theory. Consequently, communication researchers must consider more effective ways for families to communicate in the caregiving context, allowing parents and grandparents to maintain some sense of control over their lives while encouraging them to discuss their health problems and other needs with their family members.

Genetic Communication

While some research suggests that media exposure to information about human genetics is related to increased family discussions of genetics research (Weiner, Silk, & Parrott, 2005), there is little evidence that individuals are talking with friends or family members about genetic health. Weiner and colleagues reported that 84.7% of their sample reported that they had *never* talked about genetic health with family members, and among those who had exchanged some information, prenatal testing was the most discussed topic. This situation offers unique challenges to the medical community because existing research suggests that more patients with genetic disorders learn about their disorder from family members than from genetic counselors (Mellon, 2002). Indeed, family members are perceived to have a moral imperative to communicate genetic information to other family members. But do they? Genetic communication may be an area in which communication researchers can learn more about intergenerational sharing of health and medical information. While research literature in the area of family communication about genetics and health suggests that parents are responsible for disseminating information to their children, there is little evidence to suggest that they actually perform such a function and even less that uncovers the process of the information dissemination (see, e.g., Gaff et al., 2007).

Technology

As technological advancements provide new and faster ways of communicating, which transcend physical distance, communication researchers should take advantage of these new forms of media to determine how they change grandparents, parents, and children's communication and relationships. Life events, such as attending college and obtaining a job, may spread families further apart geographically, leading them to rely on e-mail, text messaging, telephones, and video phones to maintain their communication and relationship. Soliz, Lin, Anderson, and Harwood (2006) suspect that with the baby boomer generation—a computer-literate cohort—reaching older adulthood (65+ years), that cohort will be increasingly dependent on the Internet to maintain relationships with their children and grandchildren. Consequently, several issues to consider are how different forms of media influence the communication between grandparents, parents, and children and whether certain types of media encourage greater disclosure and intimacy.

Conclusion

As researchers commence the 21st century in the study of communication among grandparents, parents, and children, it is important to remember the relative youth of this area of study within the discipline of communication. It really wasn't until the turn of the 21st century that family communication became its own area of communication study. Subsequently, the study of communication within family systems has been hampered by a lack of indigenous theories, an overemphasis on dyadic relationships, statistical methods unable to capture the complexity of family interaction, and a neglect of both young children and older adults. Yet as the first decade of the 21st century comes to a close, there is considerable promise for the future. The field is witnessing a growth in homegrown theories, an increased understanding of how multimethod approaches can enhance understanding, and an increase in research focused on grandparenting.

In this time of rapid family change—when more younger children and adults have living grandparents today than at any time in history and more adult children are living at home with a parent—it has become increasingly important to understand the processes of intergenerational communication and how that communication affects family members across the life span. Undeniably, communication is both the whole cloth from which our family relationships are carved and the velvet thread that binds us together.

FRIENDS

KRISTEN NORWOOD AND STEVE DUCK

University of Iowa

Without friends, no one would want to live, even if he had all other goods.

—Aristotle

The modern study of friendships has roots in social psychology, sociology, and communication, with influence from rhetorical studies and interpersonal communication. This chapter can only briefly overview this vast literature. We begin by tracing ideas of friendship through history and then discuss its nature and functions. This is followed by an overview of theories of friendship development, maintenance, and dissolution. Also included is a brief discussion of methods used to research friendships.

Friendship in Time

Early Ideas About Friendship

Friendship is something we all know a little about, via “common sense,” and may not seem deserving of the philosophical contemplation or rigorous research it has received in the past 2000 years. However, Aristotle recognized the complexities of friendship, and even Homer (900 BCE) commented on a similar notion that translates to *comrade*. Aristotle still gets credit for first analyzing friendship in a systematic manner, devoting chapters in his *Nicomachean Ethics* and *Eudemian Ethics* to the nature of friendship, types of friendships, and the place of friendship in the Greek *polis* (city state).

Aristotle’s ideas on friendship are still relevant and ring true compared with lay perceptions. First, he believed that friendship should reflect the relationship one should have with oneself (self-love), and he described a friend as *another self*. Though this notion of loving oneself may seem egotistic, Aristotle’s concept of self-love is based on ethics and goodwill rather than narcissism. He believed that a person will typically strive to do what is in his or her own best interest, and so friends should behave toward each other in the ways that are in each other’s best interests: in other words, “Do unto others as you would have them do unto you.”

Aristotle discussed three types of friendship. Friendship grounded in virtue, or *character friendship*, is the purest type of friendship, where individuals are friends simply because they recognize each other’s good character. The truest friends are those who do not seek personal gain from the relationship, other than keeping the company of another whose virtuous nature they appreciate. A friend such as this wishes good for the Other simply for the Other’s sake. Aristotle believed that for this or any type of friendship to exist, the sentiments must be reciprocated. One person can have feelings of respect, appreciation, and liking for another, but unless those feelings are reciprocated no friendship exists. In this definition, friendship is something that exists between two people and is not something that one person can possess alone.

Aristotle is more skeptical about the other types of friendships. Friendships grounded in *pleasure* or *utility* exist because of some advantage gained. If friendship is a means to personal reward then it is not what Aristotle would deem a *perfect* friendship. However, friendships of utility were as common in Aristotle's time as the many relationships today where "politics" and economics are the basis of interaction (e.g., relationships with the boss or with classmates in school). In Aristotle's city, it was necessary to base relationships on some sort of social or economic reciprocity. Aristotle nevertheless saw these types as imperfect forms of friendship.

The Roman orator and philosopher Cicero continued the philosophical discussion of friendship in his treatise *Laelius: de Amicitia* ("On Friendship"). Like Aristotle, Cicero allows for different types of friendship but reveres friendship based on love and good feeling as the purest form. He maintained that such friendship does not fade with absence or death. Cicero does, however, disagree with Aristotle's claim of friendship being akin to self-love. He posited that we may sometimes hope less for ourselves than we should hope for a friend. So, in a way, Cicero believed that friends should actually be held in higher esteem than oneself.

Cicero goes further to discuss the nature of communication between friends. He suggests that honesty is better than flattery between friends because criticism is communicated without spite or personal attack. Friends also should accept honest communication/critique without feelings of bitterness. In addition to being honest and direct, friends should put their friends' well-being before their own reputations and even lives, if necessary. Clearly, Cicero expected much of his friends!

Aristotle and Cicero based their views of friendship in their own historical times and beliefs, but so do we. Any notion of friendship—even our own—is historically situated.

Temporal Aspects of Friendship

Alberta Contarello and Chiara Volpato (1991) conducted an analysis of literary texts looking for accounts of friendship as it has been depicted through the ages. They examined five French texts (spanning eight centuries) for descriptions of friendship. They noted that the kinds of relationships counted as friendships changed over history. In classical times, friendship was seen as distinct from kinship, but in medieval times, it was *based* on kin, describing solidarity between family members as well as lovers. With the progression of feudal systems, friendship blended with patronage relationships or those based on the inequality of relational partners, where one benefited the other, much like Aristotle's friendship of utility. Later still, the term reflected a concept closer to that of our modern idea of friendship.

Other interesting observations concerned a change in the nature of the relational dynamics with friends in later

times more directly expressing emotion, tolerating relational conflict, and seeking to resolve it rather than merely ending the friendship. Furthermore, throughout the texts, there was almost no mention of female-female friendships. It is likely that female friendships did exist but were just not represented, perhaps because of women's social status at the time.

Therefore, we can reasonably conclude that the concept of friendship is dynamic and has experienced changes through time and historical context. So, then, what is the nature of friendship in our own historical context?

The Nature of Friendship

We use the term *friend* to refer to many different kinds of people: best friend, close friends, and good friends; someone may be *just* a friend or *more than* a friend; siblings or parents may be not just family members but also friends; our significant others may also be our best friends. We may even differentiate our friends based on context by labeling different groups, such as friends from high school, friends from college, or friends from work, or differentiate friends based on sex by labeling guy friends as separate from girlfriends. For the many ways we think and talk about friends, though, there is at least one common element, namely, free choice: A true friend is someone you freely choose and who chooses you back.

The voluntary nature of friendship is stressed in research. Robert Hays (1988) offered this definition of friendship: "Voluntary interdependence between two persons over time, that is intended to facilitate social-emotional goals of the participants and may involve varying types and degrees of companionship, intimacy, affection, and mutual assistance" (p. 395). This voluntary element of friendship requires that the relationship exists by the free choice of both parties, not by the felt obligation to maintain a relationship, for example, at work or in class. This is the feature of friendship that separates it as a relational type from others, such as familial or work-related relationships, which are not typically voluntary or not usually perceived as such.

Keith Davis and Michael Todd (1982) developed a paradigm case of friendship—characteristics that are typical of friendship and differentiate friendship from other relationships. They found that in friendship, two people participate in a mutually reciprocal relationship as equals; enjoy each other's company; have mutual trust that each will protect the other's interests, will provide support in times of need, and accept the other person "as is"; respect each other's judgment; feel free to "be themselves"; have an understanding of the other's thought process; and are close through shared experience and intimate disclosure. Friendship comes with very hefty expectations!

Friendship is different from other types of relationships because no formal bond, contract, or ceremony exists to

mark its beginning or permanence (e.g., we do not send friendship anniversary cards as we do for romances or marriages). There are usually no factors that serve as obligatory pressures to keep friendships from ending, as in marriages where children, religious beliefs, or concerns over money might prevent two people ending an unsatisfying relationship. Another way friendships differ from romantic relationships is nonexclusivity. Typically, people are involved in only one romantic relationship at a time (at least, as prescribed by social norms). However, an individual can have several friends at a time. It is acceptable and even encouraged for a person to be on the lookout for new friends at any given point.

So if friendship is a voluntary and somewhat costly relationship in terms of time and effort, why do most people choose to have friends? While some definitions of *friendship* align with Aristotle's idea that one should be a friend simply for the sake of that person, most modern relational scholars emphasize self-referent rewards (benefits for oneself) or good feelings that friends give us about ourselves. If we got nothing from these voluntary relationships, why would we feel the need to have them in the first place? It seems Aristotle's idea of true friendship is missing something. Even if we do selflessly value the good character of another, we also want to profit from good friendship.

Functions of Friendship

Friendships fulfill various emotional, psychological, and physical needs. Individuals who are denied relationships or who choose to separate themselves from others, such as hermits, are not psychologically or even physically as healthy as those involved in close relationships. There's a reason we consider solitary confinement or even exile among the harshest of punishments. To take away an individual's connections to others is to take away a much needed system of support.

Robert Weiss (1974) offered a list of "provisions" of friendship—the good things that friendships provide for us—such as positive emotion, support, and shared communication and activity. Friends provide a sense of *inclusion and belonging*. Though family members may serve a similar function, it is the voluntary choice of a friend that makes such inclusion special. A friend provides a *reliable alliance* or a sense that someone is *there* if needed—emotionally, physically, or otherwise. A friend provides this support not out of obligation but for the sake of the other person and the friendship.

Besides offering inclusion, friends serve as measurement tools to help us gauge the propriety of emotions and the validity of opinions. They are sounding boards, confirming or disconfirming our actions and beliefs. They let us know where we stand, whether in the right or wrong. Because of this, friends are important to our *emotional integration* and *stability*. They help construct and reconstruct

our emotional framework when we are in doubt; for example, you may have asked a friend's opinion as to whether you acted correctly in a given situation.

In addition to emotional support, friends supply us with *physical support and assistance*, helping with everyday tasks, such as picking new clothes, preparing food, or studying. They bring us soup when we are ill, give us rides when our cars malfunction, and give us gifts on special occasions—and we do the same for them.

A simple but vital function of friendship is that it gives us *opportunities for communication*. With friends we have opportunities to communicate about everything and nothing, meaning the range of topics one discusses with friends typically has few limitations. We talk with friends about ourselves, other relationships, the weather, tragic or exciting events, future plans, present situations, and past mistakes. We share secrets, make small talk, and gossip about others. Talk about topics that may seem trivial is just as important as talk about life-changing events. It is both kinds of talk that constitute friendships in the first place. Friendships exist because of and through communication.

Furthermore, friends develop ways of communicating specific to the relationship (personal idioms). Friends share private jokes, understandings, private languages—such as nicknames for other people, activities—such as going to a favorite bar or restaurant, and references to common history. This phenomenon serves to demonstrate the relationship, as well as to exclude those outside the relationship who do not share the joke or the private language.

Friends also build and maintain each other's self-esteem in two main ways: by complimenting us directly and by relaying compliments from others. Friends help us see positive ways others perceive us. Another way friends increase levels of self-esteem is by making us feel valued. By choosing to spend time with us, listening to what we say, asking for our opinions, and soliciting our help in emotional and physical ways, friends give a sense of utility and worth. We feel good about our ability to do things for others, and without friends we would lose many such opportunities. In fact, most people resent it when others will not let them help or repay them for help.

Last, a provision of friendship that seems to incorporate most others is that of identity confirmation or personality support. All the provisions discussed above—inclusion, emotional and physical support, communication, and self-esteem—serve to support one's identity. Personalities consist of thoughts, emotions, behaviors, attitudes, doubts, and beliefs, among other things, none of which mean much unless performed and validated. We desire confirmation of who we are to be successful *being* who we are. Along the way, friends help us construct our personalities and spot holes that need fixing or parts that need rearranging. Those whom we trust to do this are likely to be those who share our ways of thinking. Friends typically have *psychological commonality* because they share similar thought-worlds or

systems of thinking and understanding. For this reason, perception of similarity is important in the development of friendships.

Theories of Attraction and Relationships

Attraction and Information Seeking

Why do we choose the friends we do? The motivation to make friends and keep them differs over the life span, and young people are more motivated to develop new friendships than middle-aged adults. Also, opportunities for meeting people must exist for friendship to develop. Research shows that physical proximity stimulates friendship development. We are more likely to become friends with those we encounter frequently, whether in class, at work, or in our neighborhoods (the Field of Availables), from whom we then make specific selections (the Field of Desirables) (Kerckhoff, 1974). Furthermore, we are more likely to become friends with those with whom we have enjoyable encounters.

Research has shown that similarity is important in some ways and at certain points in friendship development but less important at others. We tend to think that friends have much in common and are already similar in many ways, but in what ways do friends *need* to be similar for relationships to commence and develop successfully? Friends are usually more similar to each other than nonfriends in age, sex, race, interests, intelligence, and economic status. It was originally thought that attitude similarity was a specific condition for friendship, but research has shown that similarity in *behavioral preference* is actually more highly associated with friendship. We are fine having small differences of opinion with friends but are less likely to maintain friendship with those who engage in different sorts of behaviors or tend to make different behavioral choices than we do.

Similarity between friends is not a fixed thing. Steve Duck and Gordon Craig (1975) studied changes in similarity between friends over time: Broad value similarity is associated with early attraction, but by the time 8 months have passed, there has already been some filtering out, and the main feature of those who remain friends is a deeper psychological similarity. So in the beginning of friendships, it seems important for friends to value similar things, but sharing similar ways of thinking and processing experiences assumes greater importance for lasting friendship in daily life. Perhaps these different types of similarity come to light at different times because surface value systems are easier to discover during the first stages of interaction, while deep-thought processes or behavioral styles and patterns may take time to uncover.

In addition, perceptions of physical attractiveness, competence, and immediacy (or liking behavior) will cause us to feel connections to certain people. So, then, what happens after the initial attraction, after we realize the

possibility of friendship exists? There are many theories that explain how two individuals get from Point A (attraction) to Point B (friendship).

Charles Berger and Richard Calabrese (1975) developed the uncertainty reduction theory to explain what happens during the first stage of interaction between two people. The theory posits that when strangers first meet, their primary concern is information gathering in an attempt to reduce uncertainty and increase predictability about the behavior of another person. Individuals experience greater certainty when they can accurately predict another person's behaviors, and these predictions guide their own interaction behaviors. Levels of uncertainty affect perceptions and behaviors. The more certain an individual becomes about another, the more readily he or she perceives similarities and differences between self and the other person. The interaction may cease or progress accordingly.

Steve Duck (1991) proposed a model to explain the development from acquaintanceship to friendship based on factors other than simple personality similarity. Duck's model posits that strangers gather information about each other from different sources, such as physical appearance, communication style, and perceived attitude similarity, to construct an idea of the other person's deeper personality. In the beginning stages of interaction, we do not have much more to go on other than what we see and hear. We gather this type of information until more becomes available, usually through disclosures and shared experiences. Essentially, this model proposes that not all initial attraction leads to a developed friendship, because people get weeded out along the way. Those friendships that develop fully are based on successive passings through finer filters that cut other people out.

New information refines our ideas about the other person. New information helps us "figure them out" in such a way that we feel we can more easily describe, interpret, and predict behavior. One assumption of this model and others like it is that this progression runs smoothly and leads to a close relationship. Experience tells us that such is not always the case. With every potential relationship, the two parties must decide whether or not to engage in the activities that serve to develop relationships. So, then, how do we decide whether or not to move forward or at least to a different place?

Many social psychologists, including Donn Byrne, Gerald Clore, and Bernice and Albert Lott, have applied *reinforcement theories* to the study of attraction. They maintain that we are attracted to people who offer us rewards or are simply present when something positive happens to us. We associate positive outcomes with those people and so want to spend time with them. These rewards can come in many forms, from immediacy behaviors (closeness) to compliments to agreement with opinions. We can be conditioned by rewards to have a positive reaction to reward givers, and furthermore, a high frequency of rewards will usually cause positive feelings to increase.

Irwin Altman and Dalmas Taylor (1973) developed the social penetration theory to explain how relational development is based on changes in communication between people. During the initial stages of interaction, communication is somewhat superficial and is focused on a narrow range of topics, such as TV shows, general interests, and local events. As two people interact more frequently (and in a positive and rewarding manner), the communication becomes more intimate and covers a broader range of topics. Here, individuals begin to feel more comfortable self-disclosing about family members, personal problems, or past relationships. This progression can happen quickly or more slowly depending on the individuals involved or the context of the friendship development. In fact, self-disclosure can be used strategically to speed up or slow down the process of relational development.

Mark Knapp (1984) extended the work of Altman and Taylor to focus on the communicative dimensions of self-disclosure and how difference in these dimensions can delineate relational type. Knapp's results revealed three factors important in distinguishing communication between close relational partners and more distant acquaintances: personalized communication, synchronized communication, and difficult communication. *Personalized communication* is signified by unique and flexible communication, as well as by the depth of self-disclosure (personal information about oneself). *Synchronized communication* refers to the smoothness, coordination, and ease of communication between two people. Last, *difficult communication* is marked by strained and awkward interactions and the perception of communication barriers. Knapp showed that friendships were characterized more often by the first two factors than were acquaintanceships, and acquaintanceships were more often characterized by difficult communications than were friendships.

George Levinger and J. Diederick Snoek (1972) developed a model of the different levels of pair relatedness to explain the progression of interaction between two individuals. Their four levels of pair relatedness are: (1) zero contact, (2) unilateral awareness, (3) surface contact, and (4) mutuality. When two individuals are at *zero contact*, they are not even aware of one another. At *unilateral awareness*, one person is aware of the other, but there is no interaction. If this one-sided awareness leads to attraction of some kind, then the aware individual might make an effort to interact with the other. This might lead to *surface contact*, where the two individuals interact using small talk or superficial communication.

Based on this narrow sample of communication, the individuals assess the possible rewards of continued interaction. If things look positive, then the two may progress to mutuality. *Mutuality* involves intimate interaction where self-disclosure becomes deeper, and the partners clearly intersect in an integrative relationship.

These theories of initial interaction give us different perspectives on how two people might begin to gauge the possibility of a relationship. During the initial stages and

beyond, relationships take awareness and effort to form and transform. Steve Duck (1991) offered four skills needed for *relationshiping*, or the doing of relationships. Essential to the acquisition of friendship is the ability to recognize opportunities for friendship and the ability to make sound judgments of others. Second, one needs to be equipped with a relational tool belt complete with strategies and techniques for enticing likable people into relationships and showing them the potential rewards of such a relationship. Third, one should possess knowledge about the way successful relationships develop and use that knowledge to ensure timely and successful progression. Last, one must have skills for relationship maintenance and repair since relationships require looking after if they are to thrive.

Dynamics of Relationships

Moving past the initial attraction, some theorists have developed ideas about the choices we make once we are involved in relationships and must decide whether or not to stay in them. Among these theories are social exchange theories, based on economic models of not only the rewards in relationships but also the costs and, more important, the balance or imbalance of the two. Relational costs include investments of emotion, time, money, and energy. According to social exchange theories, relationships are satisfying and will continue when the rewards outweigh the costs, taken as a whole and in the long term.

John Thibaut and Harold Kelley (1959) took social exchange theory a step further in writing that relational partners not only weigh the cost-benefit ratio of the relationship to evaluate its worth but also compare relational outcomes to those of other relationships. People compare relationships with those they have experienced, those they anticipate, and those of others around them. In this way, relational partners not only evaluate the present relationship on its own terms but also compare its costs and benefits with those of other relationships. Kelley (1979) later proposed that as relationships develop, the motivations of those involved transform, shifting focus from individual costs-benefits to the *relational* rewards, or the rewards of the partner.

Stage Models of Relationships

Relational scholars have explained the dynamics of relationships with stage models of different phases relationships go through during development and dissolution. For example, Levinger extended his and Snoek's (1972) model of attraction stages to cover deterioration and dissolution of relationships. His ABCDE model stands for Acquaintanceship, *Buildup*, *Continuation*, *Deterioration*, and *Ending*. Mark Knapp and Anita Vangelisti (1992) developed a similar model, called the relational development model, claiming that relationships progress through stages of development: *initiation* (individuals form initial

assumptions and opinions of each other); *experimentation* (individuals collect and disclose information about themselves to get to know each other); *intensifying* (individuals begin to disclose more personal information, begin to develop informal and particular ways of communicating, and use labels such as “close friends”); *integrating* (two people fuse together and are seen as a pair, often merging social networks and creating a joint identity); and *bonding* (two people denote their relationship publicly—with marriage or some other social ritual; bonding doesn’t seem to apply to friendships since there is no formal ritual involved, for example, when two friends become roommates).

Knapp and Vangelisti (1992) also outlined stages for relational breakdown: *differentiating* (partners begin to disengage the joint identity); *circumscribing* (partners no longer communicate frequently or about personal matters); *stagnating* (interaction is at a standstill); *avoiding* (partners avoid face-to-face communication or physical copresence altogether); and *terminating* (the bond between partners is broken and the relationship dissolves).

Stephanie Rollie and Steve Duck (2006) critiqued stage models, claiming that though stage model approaches are appealing in their simple representations of changes in relationships, their utility cannot encompass the complex processes of relational development, maintenance, or dissolution. Stage models serve only as general maps for the often unpredictable dynamics of relationships. They are useful in delineating general principles of relational dynamics but are limited in that they characterize relationships as moving from one point to another with relatively little wavering.

Doing and Maintaining Friendships

Much of the early work on relationships conceptualized relationships as fixed states and so missed the fact that relationships are not simply emotions but manifest dynamics and performance of behaviors. For one thing, the two people involved in a friendship may have different conceptions of the relationship. Even more central to understanding friendships is what brings relationships into being, keeps them alive, and even dissolves them, namely, communication. Most social psychological work on relationships positions communication as a secondary phenomenon used only for transmitting information about emotions rather than doing something active.

Friendships are not only developed by communicating, they are carried out through everyday talk, shared activity, and talk about shared activity—much of it routine and pedestrian. Female-female friendship dyads emphasize personal topics and confiding in one another, whereas male-male friendship dyads emphasize talk about external topics and shared activities. Friends engage in talking not merely as an activity to fill time and transmit information but to accomplish relational tasks such as expressing emotions and opinions, establishing relational rules and boundaries, and actually changing the nature of the relationship. Furthermore, talk can be seen as rhetorical, as

can relationships. That is to say, talk and relationships serve as persuasive tools. For example, how often have you responded positively to a request or done a favor for someone just because the person was a friend? Steve Duck and Walter Carl (2004) offered a conception of talk and relationships as inherent in interpersonal influence, bringing together the rhetorical and interpersonal aspects of relating. They claimed, “Such talk is inherently rhetorical in that it implicitly offers a persuasive account of a view and hence is an effort to attempt to persuade others to support said view of the world or of self” (p. 7). We not only do things with words, but, very significantly if unconsciously, we do things with and for relationships. Relationships are persuasive in that we tend to make exceptions for and perform tasks for a friend rather than a stranger simply because we have a relationship with the friend.

Talk differs with relational type. The research of Sally Planalp and Anne Benson (1992) showed us that third-party observers can distinguish acquaintances from friends simply by listening to their talk. Friends were more relaxed, more intimate, and more informal in their interaction. Friends shared talk time equally but interrupted each other more than acquaintances. Furthermore, friends drew heavily on mutual knowledge when conversing, often leaving out information that was thought to be understood by both parties.

Now we know that talk between friends is vital to the relationship, but there is another kind of talk that has a great effect on friendship, to wit talk from the social network. We learn the rules and expectations of relating from our social networks, namely family members and friends. Moreover, social network members are active in giving advice, gossiping, and commenting about relationships and how they “should” be done. In this way, there are never only two people in any relationship since relationships exist within larger social contexts and their influence is ever present (e.g., “Whatever would the neighbors think?”).

One theory important to understanding these more complex processes of relationship is relational dialectics theory (RDT), developed by Leslie Baxter (1988), Barbara Montgomery, and Dawn Braithwaite. This theory focuses not on the progression from attraction to intimacy but instead on the management of everyday tensions that arise for existing relational partners. RDT assumes that relationships are not linear, that they are characterized by change, that contradiction is a fundamental fact of relationships, and that communication is central to managing contradiction. Baxter and Montgomery (1996) initially discussed three dialectical tensions: (1) *autonomy-connection*, where partners struggle to maintain some individual independence while still sustaining their togetherness; (2) *openness-closedness*, where partners feel pulled between the desires to reveal and to conceal information about the self and the relationship; and (3) *novelty-predictability*, where partners are caught between a desire for predictable stability and a desire for lively spontaneity in the relationship.

RDT also offers several strategies for managing these contradictions. A few of these strategies will be discussed

here. *Cyclic alternation* refers to managing different poles of contradictions over time. For example, lifelong friends may be very connected when they are young, may become more independent as young adults, and may return to closeness as middle-aged adults. *Neutralizing* refers to a compromise of the opposite poles of a dialectical tension. An example would be friends deciding to spend only two weekends together during a month instead of all four or none at all. This way, they could maintain a balance between independence and integration. Another example of a management strategy is *reframing*, which refers to reconstructing the dialectic so that the two poles are no longer positioned in opposition. If two friends see their ability to be spontaneous as part of their relational stability, then they have reframed the novelty-predictability dialectic. Whatever the strategy used, managing dialectical tensions is key in relational satisfaction.

All relationships require effort to ensure functionality and success. Many scholars, including Kathryn Dindia, Leslie Baxter, Dan Canary, and Laura Stafford, have uncovered strategies for maintaining relationships, though most of these strategies are used more by romantic partners and family members than by friends. Again, since the friendship is a voluntary, nonformalized relationship, fewer active maintenance strategies are used. However, relational maintenance strategies that might be used in friendships include *prosocial behaviors*, which are cooperative behaviors prompting discussion of the relationship (e.g., helping, doing favors); *antisocial behaviors*, which are coercive in nature (e.g., threats, tantrums); *positivity*, the use of optimistic or cheerful behaviors to make the other person feel valued and enjoyed; *openness*, direct discussion or disclosure of one's personal confidential thoughts; *assurances*, statements that directly indicate or imply a relational future; *social networks*, the use of mutual associations for relational preservation; and *sharing tasks*, fulfillment of responsibilities.

Sometimes, though, relational maintenance strategies are not enough to save a relationship from breaking down. Friends face difficulties like any relational partners, and there may be difficulties particular to the nature of friendship.

Difficulty and Dissolution

Since relationships are processes and are not fixed, they change and are vulnerable to all the other difficulties of human life. A successful relationship of any kind requires maintenance and repair—and perhaps especially friendships, since, as discussed earlier, there are no formalities or obligations binding friends together. Friendships require effort, or they will dissolve.

Jacqueline Wiseman (1986) conducted research to examine the nature of the *bond* between friends and the difficulties friends face (*binds*). She discussed the *unwritten contract* present in friendships that represents the implicit expectations of support, reciprocity, and responsibility, which can be a bind. Needs for support and rules for giving

and receiving are not always explicit, which can cause problems: for instance, one person gives until his or her source “runs dry,” one person gives support that is not needed, one person stops giving support while it is still needed, or one person might need support but will expect the other friend to give it without explicitly asking for it.

Wiseman (1986) showed that physical support is a common site for contention between friends, whether it is the absence of giving physical support or the excessive eliciting of it. Physical resources seem to have limitations for friends, though they are rarely discussed as such explicitly. Other causes of discontent are reduction of time spent together, failure to heed advice, failure to understand controversial actions, criticism “behind the back,” failure to reciprocate support, and competing loyalties between the friendship and partners' romantic relationship(s).

Such problems can lead to the breakdown of the friendship. Just as relational development tends to go through transformative stages, relational dissolution seems to work in similar ways. Though most relational stage models and theories are based on breakups in romantic relationships, some can be applied to friendships. Rollie and Duck (2006) recently offered six phases as a model for dissolution of relationships: (1) breakdown processes, (2) intrapsychic processes, (3) dyadic processes, (4) social processes, (5) grave dressing processes, and (6) resurrection.

During *breakdown*, one or both partners become dissatisfied with the relationship. If one person reaches the point where the discontent is unbearable, that person enters the *intrapsychic process*. Here, the individual ruminates about the relational partner's behavior, role performance, the relationship itself, the costs of “getting out,” and the potential rewards of alternative relationships. Also, the individual contemplates expressing—but does not actually express—dissatisfaction to the relational partner and more likely represses any such feelings. Eventually, the person may reach another threshold where that individual feels justified in ending the relationship.

If this threshold is breached, the dyad may begin *dyadic processes* and the dilemma of confronting the partner or avoiding the issue. Conflict, or at least negotiation, may occur during talks about the relationship. This is the point where relationship repair can happen if it is possible to “save” the relationship. Still, if the interaction progresses negatively, one or both parties may reach another threshold and decide on dissolution. Then, the dyad moves into *social processes*, where third parties are informed of the relationship problems. Typically, each partner seeks out a confidant who knows both partners so that the confidant can first act as a liaison between the partners and later can be persuaded to take sides. If the dissolution progresses from here, the dyad enters *grave dressing processes*, and the parties engage in adjustment behaviors. Here, both individuals make attributions about relational issues and retell the story of the relationship, giving separate versions of the breakup story. Finally, the *resurrection process* is where the person reemerges as a new being ready for a different kind of relational life.

Baxter (1984) noted that friendships are often just allowed to wither on the vine—calls are not returned, visits are not fixed up, availability for meetings is restricted, and so on until the Other “gets it” that the relationship is over. But there are also more complex processes of relational disengagement, represented by a flow chart of relational trajectories that incorporates what Baxter describes as the critical features of the relational dissolution process: the gradual versus sudden onset of relational problems; the unilateral versus bilateral desire to exit the relationship; the use of direct versus indirect actions to accomplish the dissolution; the rapid versus protracted nature of the disengagement negotiation; the presence versus absence of relationship repair attempts; and the final outcome of relationship termination versus relationship continuation.

Research Methods

Researching friendships has proven to be a challenging endeavor for several reasons. Traditional scientific methods, involving experimental techniques and laboratory conditions or questionnaires, have been only partially informative and are not always useful for finding answers to the most interesting questions about relationships. Even with qualitative methods, such as in-depth interviews, problems exist. The nature of relationships themselves creates difficulty. There are two individuals involved in every friendship, and getting both parties to agree to participate in a research study is challenging in itself. Even if a researcher succeeds in this task, each relational partner comes with his or her own vision of the relationship and a unique way of describing it.

Early work in attraction and relationships was situated in social psychology. As a result, much research was conducted using traditional scientific approaches, where relationships between variables were assessed with statistical tests. This method presented problems in what to count as the unit of analysis. If only one partner of a relationship was involved in a study, then only a one-sided account of the relationship was elicited. If both relational partners were involved in the study, there was a problem of counting two individuals as units of analysis when the relationship between them was really of interest. Furthermore, much early research occurred in laboratory settings where strangers were assessed on attraction by means of attitude similarity and other related variables. Laboratory research on relationships often revealed limited and mundane findings.

Observational methods have been used in a variety of disciplines where researchers collect data about “naturally occurring” behaviors, usually through the use of videotapes, audiotapes, and ethnographic methods. These methods are subject to validity issues, such as researcher involvement and subjectivity. One very common method used in relational research, and one that has been popular in the discipline of communication, is that of self-report data. Using self-report data, researchers can elicit the thoughts and feelings of an

individual in a relationship as well as his or her perceptions of the other partner’s thoughts and feelings.

Self-report data can be gathered through the use of surveys, interviews, or diaries. Problems with self-report data come from “social desirability”: Participants may answer according to what they think they *should* say or what they think their partners might say. Furthermore, researchers have the task of trying to deduce relational dynamics from two separate accounts of a relationship. One way that researchers have attempted to learn more about the ongoing processes of friendships is by using longitudinal studies. Longitudinal research involves studying the same sample of relational dyads over a period of time and identifying how the relationships develop, transform, and possibly even dissolve.

Applications

The study of friendships is still very much alive across disciplines but for the most part is situated within interpersonal communication. Communication scholars have recently produced work in areas of relational dynamics by focusing on the meaning and development of friendship across the life span, the rituals engaged in by adult friendship dyads, the face maintenance strategies used by friends, and the turning points that friends experience during progression and during termination. Research has also looked at differences in friendship types, such as long-distance friendships and intra- and intercultural friendships.

Additionally, much research has examined possible sites for difficulty in friendships. Specific studies have focused on topic avoidance between friends, the management of disputes among adult friends, the tensions between friends and their romantic partners, and jealousy in close relationships. A very recent and intriguing site for examining the dynamics and complexities of friendship is the study of friends with romantic intent or even the “friends-with-benefits” relationship. There are endless research frontiers for the study of friendship in the discipline of communication.

Conclusions

So Aristotle got it right: Friendship is both a bit obvious and extremely hard to understand. Our familiarity with it in our daily experience blinds us to the difficulties faced by researchers seeking the best methods to understand how it actually works. The fact that we deal with human subjects makes the topic very hard to study. Although friendship is based on the emotions of liking that can explain how people are attracted to one another initially, those same people actually have to make a friendship work and so have to behave together (i.e., talk and perform or enact their behavior of relationships) in ways that both they and society recognizes as “friendship.” Communication researchers have a major role to play in the furtherance of our understanding of friendship because they now have

developed some excellent techniques for finding out what is really going on in the dynamic performance of friendship in daily life—something over and above the emotions that bring friends together in the first place.

DATING AND ROMANTIC PARTNERS

JENNIFER A. SAMP AND CAREN E. PALEVITZ

University of Georgia

Romance is often considered to be an essential part of the human experience. For many, the idea of a “dating” and/or a “romantic relationship” is tied to the hope of a lifelong partnership, or at least the “magic” described in popular movies such as *Sleepless in Seattle* or the fantasy depicted in children’s movies such as *Cinderella*. For others, dating is a “challenge,” or a “game,” as depicted in the fictionalized trials of the characters in *Sex and the City* and *Nip/Tuck* or in “reality” shows such as *The Bachelor* and *The Flavor of Love*. The highs and lows of romance are prominently featured in songs from yesterday and today, and bookstores are overflowing with self-help manuals about how to attract yourself to others or how to find “the love you really want.” In these and other examples, dating and romance are often idealized as the intimate pairing for people who are “more” than just friends.

The dynamics of dating and romantic relationships are complex, diffuse, and multifaceted. While a full review of the nuances of such pairings is beyond the scope of this chapter, our purpose here is to highlight some of the basic processes and communication behaviors relevant to dating and romantic relationships and to sketch how these dynamics play out in the modern age.

Defining Romantic Relationships and Dating: Yesterday and Today

Historical Views on Dating

While few discount the importance of dating as a relational process, the idea of what it means to be dating in the United States has varied throughout time. In the 1800s,

dating was referred to as “courtship” and involved an act—bland by today’s standards—whereby a male paid a female a visit in her home, at a church social, or at a local dance. A woman’s parents supervised their daughter’s visits with a potential suitor and even exerted control over when courtship turned to marriage by determining when land would be turned over to the couple or when the male would be allowed to work for his new family (see Cate & Lloyd, 1992). Courtships were intended to determine whether a man could support his wife and whether the man and woman were of similar social standing. Love was assumed to blossom after marriage. But “love” was not tied to passion or romance; it reflected an openness, sincerity, and connection that would stand the test of time (Rothman, 1984).

The loosening of kinship ties and the migration to new homesteads soon weakened parental influences on courtship. While such changes led to a growing norm of unchaperoned interactions between males and females, as the 19th century evolved, women were encouraged to remain “pure” and to fend off the “wild” desires of men. Courtship served as a time to “tame” a man and to prepare a woman for household management. Into the early 20th century, the forces of romantic love were recognized to act like a magnet that pushed a couple together, making it difficult to pull them apart (Rothman, 1984). Nonetheless, it was expected that “proper” women avoided sexual contact, which could have social or biological consequences.

The rise in urban environments also brought dating out of the home and into unchaperoned spaces. The need to entertain a potential partner outside of the home introduced economic considerations into the process of courtship, with the male expected to provide the necessary

funds (Bailey, 1988). Herein emerged a dynamic to dating that was not defined by “love” or “compatibility” but rather by the degree to which a partner could “provide.” A woman’s conception of romance was now confounded with a male’s ability to pay for fancy dinners, flowers, chocolate, entertainment, and all other luxuries. Furthermore, the rise of the automobile allowed for those men with their own transportation to facilitate private dating behaviors, such as petting and more intimate behaviors.

During the early 1960s, dating was defined by a combined concern of finding a mate who was financially viable, attractive, and would commit to a relationship. To be dating was to be going “steady.” Yet by the 1970s, the counterculture message of defying traditional expectations resulted in a dominant cultural message that men and women were equal (Coontz, 1988). It was recognized that women had an equal voice in the selection of a dating partner and the behaviors by which a dating relationship is defined. Furthermore, a growing awareness of sex as an important part of relationships for both men and women emerged and became part of the process of dating. However, as reflective of a rather oscillatory pattern that we have depicted in our discussion of past years, the later part of the 20th century was marked by a decrease in sexual intimacy. A growing awareness of the implications of unprotected sex, the rise of AIDS, and a higher rate of divorce seemed to dampen the ideal of unbridled sensuality as part of dating. Individuals were more cautious and pessimistic about the idea of—and the risks associated with—dating and romantic relationships.

Dating in the Here and Now

In the 21st century, the definition of dating has broadened again; yet such definitions are arguably confounded with research interests and practical desires. For example, couples have been considered to be dating after they have had a first date (Jobe & Williams White, 2007), when they become short-term partners (Garcia & Markey, 2007), when they have redefined their “buddy” relationship to something more intense (Raley, Crissey, & Muller, 2007), when they are involved in a long-term romantic relationship, or when they designate each other as “boyfriend” or “girlfriend” (Quintero Gonzalez & Koestner, 2006). The changes in the concept of dating reflect a broader trend of changes in the conception of intimacy. For example, cohabitation is no longer confined to marriage. It is now often treated as a stage in a relationship where two people are “dating,” “committed,” or “invested” in one another (Surra, Boettcher-Burke, Cottle, West, & Gray, 2007). Sexual behavior now figures as a part of even casual dating (Mongeau, Seriwicz, & Therrien, 2004). However, sex is sometimes *not* an indicator of dating or romance, as seen in cases where couples have sex as a “hookup” (Paul, McManus, & Hayes, 2000) or in cases of “friends with benefits” (Hughes, Morrison, & Asada, 2005). While the trend toward casual

sex might indicate a more liberal sexual climate, there is also a small countertrend toward reclaiming premarital abstinence. Sprecher and Regan (1996) discuss how some adults and adolescents are going through a “retroevolution” that rejects a casual conception of sexual intimacy in favor of practicing abstinence until marriage. These decisions are made for a number of reasons, including ideology, fear of pregnancy or disease, and more traditional notions of what it means to be in love.

As definitions of dating have evolved, it is important to note that these changes are focused primarily on norms for heterosexual relationships. The limited amount of research devoted to the romantic relationships of same-sex partners generally finds that there are few differences between the relationships of same-sex and opposite-sex couples. The similarities, noted by Lannutti and Cameron (2002), span a breadth of dating concerns, including closeness, commitment, jealousy, love levels, maintenance, sexuality, and satisfaction. However, gays, lesbians, and transgendered individuals face the additional strain of not always having support from institutional agents, such as governments or religious bodies, and sometimes not even from their own social networks, offering few references for these couples in terms of relational role models and relational normalcy (Kurdek, 2007). Lannutti and Cameron (2002) suggested, however, that this lack of an institutionalized network may enable same-sex partners to become less dependent on outside sources of support and depend more on the interactions that occur within the dyad.

Initiating and Developing Relationships

Dating and romantic relationships typically initiate when one person is attracted to another based on one of three needs: (1) *physical*, as reflective of a desire to be with an attractive other; (2) *social*, as defined by the need to be in a relationship; or (3) *instrumental*, or the degree to which the other will help accomplish a task (McCroskey & McCain, 1974). While attraction may result from each or from a combination of these three needs, physical appearance is a dominant predictor of attraction in the early stages of a potential relationship. For example, features such as height are noticed quickly by a woman meeting a man for the first time and dramatically influence whether a potential romantic relationship is explored. Studies generally find that women find very short men unattractive (Pierce, 1996). Women across cultures are attracted to men with a strong jaw line, broad shoulders, and a narrowing of the waist. These indicators of male attractiveness also hold for judgments made by gay men (Klinkenberg & Rose, 1994). While height is not as much of a defining feature of attractiveness judgments for women, men consider a soft jaw line and an hourglass figure more attractive than the contrary (Buss, 1994). And across gender and sexuality, body symmetry and body proportionality are considered to

be attractive (Langlois et al., 2000). Research has found that people associate physical attractiveness with a host of other positive qualities, including intelligence, success, and competence, such that more attractive individuals are assumed to be generally more positive and capable than their less attractive counterparts.

While initial forces of attraction may be sparked by physical attributes, how a person communicates during an interaction also plays a substantial role in attraction. For example, tests of interaction appearance theory indicate that individuals rate people more physically attractive when they have warm, positive interactions with them, compared with interactions with more distant others (Albada, Knapp, & Theune, 2002). Warmth is typically communicated verbally through expressions of a positive attitude and a concern for others (Folkes & Sears, 1977) and nonverbally through smiling, eye contact, and showing interest (Guerrero & Floyd, 2006). In addition, the perceived ease with which a person engages in conversation is tied to attractiveness ratings: People appearing more composed and less nervous rate as more attractive (Vangelisti, Knapp, & Daly, 1990).

Self-Disclosure

Beyond physical attraction, what is verbally communicated to another about typically “hidden” attitudes and beliefs affects our judgments of attractiveness and contributes to relationship formation. Social penetration theory (Altman & Taylor, 1973) is one of the most well-known explanations for how self-disclosure defines relationships. Altman and Taylor suggested that self-disclosure can be conceptualized along three dimensions: (1) *depth*, which reflects how personal the disclosure is; (2) *breadth*, which refers to the number of topics discussed; and (3) *frequency*, or how often the disclosure occurs. Using the metaphor of an onion, Altman and Taylor (1973) suggested that there are three layers of self-disclosure: (1) a superficial layer that is easy to penetrate; (2) a social or personal layer that is easy for most friends; and (3) a very intimate layer, or core, that is seldom revealed, and then only to people we trust completely. The individuals who reach the “core” are assumed to be few and defined as those who are “intimate.” Research generally finds that the mere process of someone else disclosing to us increases our affection for the discloser (Collins & Miller, 1994). Furthermore, we are even more attracted to those who reveal that they are similar to us. According to Byrne’s reinforcement theory (Byrne, 1971), we are attracted to similar others because they reinforce our own attitudes and beliefs. Burleson (1998) found that we even prefer people who communicate in a similar manner to us. However, it is important to note that in romantic pairings, similarity is not necessarily linked to relational longevity. Amodio and Showers (2005) found that similarity was particularly important for individuals who wanted to keep their romantic relationships together; those who reported being highly committed to their relationship benefited from a similarity in attitudes

over time. Yet for those who reported having low relationship commitment, the longevity of their relationship was actually harmed by that similarity.

Models of Relationship Development

Several theories have sought to provide a nuanced account of how relationships are defined by distinct communication behaviors at various stages of relational development. Some perspectives assume that that we possess socially defined and cognitively embedded schemas and scripts about what “should happen” in a dating or romantic relationship, as well as how we should communicate in such pairings (Planalp, 1985). *Schemas* act as functional guides that we use to navigate relationships, and are defined by our own relationship experiences as well as the relationships we observe among others. The relationships that contribute to our schemas can be face-to-face, mediated, or in written form. Research suggests that schemas can function at a broad level to inform behavior in the absence of our own experiences. For example, Klinkenberg and Rose (1994) argued that although gays and lesbians have had few experiences in their youth that speak to their desires for a same-sex relationship, examples drawn from movies, counterculture publications, and close friends have contributed to their cognitive representations concerning what their relationships should be like and inform them how to act in their own relationships. Other scholars have focused on the universal expectations about what happens at a particular event in a relationship, such as a first date. For example, Rose and Frieze (1989) analyzed the types of behaviors enacted during a first date. Participants listed every activity from preparation for the date to the date’s end, ranging from “worry about or change appearance” to “kissing your date goodnight.” The researchers found that traditional stereotypes for men and women were exhibited in first-date behavior choices, with women listing more behaviors, such as waiting to be asked for a date, being more concerned about physical appearance, and having to resist sexual contact. Men were more likely to exhibit date-planning behaviors as well as initiating physical contact during a date. More recently, Mongeau and colleagues (2004) observed that first-date expectations ranged from having fun and investigating romantic potential to engaging in sexual activity. Despite subtle differences, the expectations for what counts as a date are relatively stable across sexes. In addition, relationship schemas influence what we are inclined to remember about our relationships (Samp & Humphreys, 2007).

Other models of relationship development focus on those communicative behaviors that define particular degrees of relationship commitment and intensity. For example, Knapp (see Knapp & Vangelisti, 2005) proposed a five-stage model: (1) In the *initiating* stage, people attempt to make a positive impression on another. Communication is therefore polite, friendly, and superficial. (2) In the *experimenting* stage, impression management needs are still salient, but

individuals have a growing interest in making an active effort to “feel” out another person by identifying his or her likes or dislikes, beliefs, and attitudes. (3) In the *intensifying* stage, the breadth and depth of disclosure intensifies, as do displays of affection. A tentative use of the term *we* and/or statements of affection, such as “I love you,” follow in this stage. (4) In the *integrating* stage, two individuals have decided that they are a couple or a “unified team.” They are able to anticipate each other’s attitudes and opinions, and they engage in joint activities, such as adopting a pet together. (5) In the final stage of *bonding*, partners formally declare their relationship via a socially accepted public form of “relational commitment.” In the United States, such a statement is usually made by a marriage or commitment ceremony. Whatever the particular event, a formalized effort is made to declare to all that “we are together forever.”

Technological Influences on Relationship Initiation and Development

The process of dating has been redefined in this modern age to be much more efficient yet impersonal. Take, for example, the current trend of “speed-dating,” where individuals looking to meet potential romantic partners attend an event where they go on a series of 3- to 10-minute “dates” with other attendees. After the event, participants have the opportunity to indicate whether they would like to see any of their dates again. If two speed-daters both wish to see one another again, they are given the means to contact each other for a future, presumably more traditional, date (Finkel, Eastwick, & Matthews, 2007). Although speed-dating contains elements of traditional face to face interactions, the process is mediated and presupposes a notion that romance may involve a quick, “gut” judgment, unlike many of the courtship processes of the past.

More substantially, the rise of Internet-based dating and social networking now offers users a highly selective way to find the perfect mate (Merkle & Richardson, 2000). The Internet has become an appealing option because it is an efficient and convenient means by which to meet many people. Furthermore, the Internet allows for more control of the impression management process, allowing individuals to exhibit the positive aspects of themselves that they believe will attract potential mates (Samp, Wittenberg, & Gillette, 2003; Walther, Van Der Heide, Kim, Westerman, & Tong, 2008). Online dating sites, such as Match.com and eHarmony, have been endorsed by socially defined “experts,” such as Dr. Phil, and psychologists. They have become a socially acceptable means by which to find a romantic partner. Users have the opportunity to pragmatically search for their soul mate and to limit their search based on common attraction criteria, such as religious views and sexual preference. Additionally, such sites allow the users to screen partners based on their preferred level of relational commitment—a feature often difficult to discern in traditional face-to-face interactions.

Apart from online dating sites, another popular way to meet people online and to stay in contact with “friends” is through social-networking sites, such as Facebook.com and MySpace.com. These sites allow users to set up personal profiles for which they can upload personal information and then communicate with friends and contacts via different kinds of messaging through the site. Whereas sites such as Facebook.com were originally created for college students to keep in contact with classmates, these sites have now taken on other uses and connotations. There are a wide range of reasons why people use these sites, including rekindling old friendships and relationships, starting new relationships, maintaining existing relationships (Ellison, Steinfield, & Lampe, 2007), or finding people for sexual “hook-ups” (Stern & Taylor, 2007).

Social-networking sites have also become an important step for users in declaring their relationship status. Making a relationship “Facebook official” has become an important public declaration of one’s relationship analogous to some public rituals in Knapp’s bonding stage. Just as these sites serve as the messengers of good relational news, they are also the bearers of relationships gone bad. Just as one becomes “Facebook official” with a partner, taking down this status is an official signal to the public that the relationship is over. Furthermore, these sites can even create conflict within the relationship, serving as a way to break up with a partner and even a way for partners to make their mates jealous (Stern & Taylor, 2007).

While social-networking sites can be useful communication tools, the lack of physicality of the Internet requires individuals to rely purely on written text, pictures, or avatars to interpret messages from potential or existing dating partners. Stern and Taylor (2007) found that students use these sites for information about whether or not their partners are being faithful. Commonly called “Facebook stalking,” curious mates have the opportunity to browse their partner’s walls and pictures, as well as other users’ pictures of their mates. For couples just starting to date, this information seeking aspect is also appealing as a way to monitor a potential partner’s profiles to see the activities and associations in which he or she is involved.

Dating and Romantic Relationship Maintenance: The Good and the Bad

While forces of attraction bring people together, a variety of forces keep a pair in a relationship. These include *commitment*, which reflects how attached and dedicated a person is to remaining in a relationship (Rusbult, Johnson, & Morrow, 1986); *obligation*, which refers to the extent to which a person feels that he or she owes something to a partner (Guerrero, Andersen, & Afifi, 2007); and *investments*, which are resources that have been put into the relationship that would be lost were it to end (Rusbult, Drigotas, & Verette, 1994). Perceptions of

commitment, obligation, and investments often work together to keep people in their relationships and frequently influence the way in which people communicate to keep their relationships together (Samp & Solomon, 2001; Solomon & Samp, 1998).

According to the dialectics theory (Baxter, 1993), relationships are in a constant state of flux. Keeping a relationship together requires managing this instability. A dialectical tension is a push-and-pull between two seemingly contradictory needs. Baxter (1993) proposed three major dialectical tensions: (1) integration-separation, (2) stability-change, and (3) expression-privacy. Each of these dialectical tensions has an internal and external manifestation. Internal manifestations refer to the tensions experienced between relational partners, while external manifestations refer to the tensions between a couple and outsiders, such as other dyads or society. Baxter (1993) identified several means by which to manage dialectical tensions, of which the dominant strategies are (a) *selection*, which involves favoring each side of the dialectic at different times; (b) *neutralization*, whereby couples avoid fully engaging either side of the dialectic; and (c) *reframing*, in which a couple adjusts their perceptions of a given dialectic such that it is viewed as complementary rather than contradictory.

Maintenance Through Communication

In a similar way to how objects such as cars and homes require regular maintenance to keep them in working order, so, too, do relationships. Actions that function to reinforce a certain level of intimacy, closeness, and stability between partners have been labeled examples of relational maintenance behaviors. Maintenance can involve engaging in specific behaviors that show a dating partner and others that the relationship is important. Individuals may do so verbally, through self-disclosure, comforting, or overt expressions about the relationship (Canary & Stafford, 1994), or nonverbally, by acting upbeat and positive, showing affection, and conveying warmth (Dindia, 2000).

The Internet is also a substantial resource for relationship management in the modern age. The popular press is full of articles telling the stories of soldiers who are able to keep in constant contact with their partners through e-mail, a development that has cast the most current military conflicts in a new light compared with previous military conflicts. Ramirez, Shuangyue, McGrew, and Shu-Fang (2007) suggested that instant messaging has the potential to be one of the most frequently used online maintenance tools as it not only allows for synchronous conversation with another user, but the addition of nonverbal affective cues through the use of emoticons can describe a variety of corresponding emotions. Applications such as e-mail, instant messaging, and chat rooms allow couples to spend “time” together even if not in the same room (Rabby, 2007). Even gaming can be used to substitute for a shared activity

(Rabby, 2007). Whereas one couple may spend a Saturday night bowling with others in a face-to-face context, another might spend it online by playing games with a larger group of people.

Managing Relationship Problems

Within the course of a relationship, it is inevitable that there will be “dark times.” Indeed, research on the “dark side” of communication suggests that people commonly experience problems such as jealousy, deception, and infidelity in their close relationships (Spitzberg & Cupach, 2007). Such behaviors reflect actions that violate our ideas of how “happy” relationships should operate. Researchers have labeled situations where one partner violates the implicit or explicit “rules” for how to behave in their relationships as relational transgressions (Metts, 1994) or problematic events (Samp & Solomon, 1998, 1999).

Some of the most common transgressions reflect infidelity of some sort. Infidelity may be sexual, wherein someone engages in sexual activity with someone other than a dating partner, or it may be emotional, wherein one partner transfers emotional resources such as time, love, and attention to some other person (Shackleford & Buss, 1997). Infidelity has also emerged into the Internet arena in the modern age. The glamour of a culturally diverse space, the potential for less inhibition, and increased self-disclosure-related intimacy all make the Internet an appealing forum for developing extrarelatinal affairs (Young, Griffin-Shelley, Cooper, O’Mara, & Buchanan, 2000). While infidelity was once carried out away from the home, the Internet allows individuals to betray their partners from the comfort of their home. As such, popular press magazines have changed their focus from advice to check a partner’s pockets or to look for lipstick on shirt collars as clues to infidelity to strategies focused on a partner’s computer use. For example, an article in *Ebony* magazine described the telltale signs that a partner is having an online affair, including the following: (a) the partner stops typing or turning off the computer in the presence of a relational partner, (b) the partner avoids checking e-mail in front of the partner, (c) the partner maintains multiple e-mail accounts, and (d) the partner makes credit card charges from unknown Internet merchants (Hughes, 2005).

Yet these transgressions may not be so severe as infidelity. For example, Samp and Solomon (1998) and Vangelisti (2001) have found that saying something hurtful to a partner through criticism or by betraying a partner’s confidence can damage the fabric of a relationship just as infidelity. Thus, any behavior that shows disregard for one’s partner or the romantic relationship as a whole can negatively affect the status quo of a pairing.

No matter what the behavior, relationships will only survive a rule violation when both the perpetrator and the victim communicate about the situation. Of course, a natural response to a relational transgression may be to break off the relationship or to “take a break.” Yet research suggests

that for perpetrators, the most explicit and relationally maintaining option is to seek a partner's *forgiveness* and to ask the victim to reframe the situation as a constructive opportunity for the relationship to be strengthened or redefined (Waldron & Kelley, 2005). Additionally, perpetrators may *apologize* for their wrongdoing (Weiner, Graham, Peter, & Zmuidinas, 1991), *justify* or *excuse* their behavior as due to some external or emotional circumstances, or refuse to acknowledge that the behavior is a problem at all. While it seems natural for a transgressor to work toward maintaining his or her relationship, Samp and Solomon (1998 & 1999) observed that transgressors may be instead concerned with self- and identity-related concerns, which reflect desires to reify their self-sufficiency and personal autonomy instead of focusing on relationship repair.

Considering the recipients of a transgression, it should not be surprising that appeals for forgiveness and apologies are the most effective means by which a victim may be encouraged to consider the transgressing partner to be a good person despite the relational wrongdoing (Kelley, 1998). Yet under some circumstances, the wronged partner may not demand a response to a transgression. For example, among a list of prorelational and highly communicative behaviors directed toward relationship maintenance, Ayres (1983) also found that individuals may decide to avoid talk of activities that might change the relationship. Furthermore, research by Solomon and Samp (see Solomon & Samp, 1998; Samp & Solomon, 2001) suggested that individuals may withhold relational complaints as a form of maintenance, particularly when the complaining partner perceives that he or she has less power than the partner under question.

Relational Dissolution: Yesterday and Today

As a common saying goes, "All good things must come to an end." So why do relationships end? Most breakups result from a decision by one partner (Baxter, 1984). Particular reasons that dating relationships end include the withering away of happiness, or atrophy (Cupach & Metts, 1986), spending less time together, physical separation (Kurdek, 1991), an increase in negative and unsupportive communication, committing a relational transgression (Cupach & Metts 1986), or death. No matter what the particular reason, research suggests that we have schemas for how relationships should break apart (Honeycutt, Cantrill, & Allen, 1992).

Models of Relationship Dissolution

Most models of relational breakups generally assume that dissolution does not occur in the blink of an eye. Rather, relationships are assumed to pass through several phases. Duck's (1988) model specifies four phases of relationship dissolution: (1) the *intrapsychic* phase, where relational dissatisfaction leads a partner to reflect on negative

aspects of the relationship, dwell on partner irritations, and think about what would happen were the relationship to end; (2) the *dyadic* phase, whereby concerns about relationship problems are explicitly addressed through communication and spur arguments, long discussions, or the withdrawal of one partner; (3) the *social* phase, where people turn to their social networks for support and complain about the relationship to friends; and (4) the *grave dressing* phase, where the breakup occurs and former relational partners construct a story about the relationship and why it did not work. Duck considers each of the phases to be interrelated, but it is not assumed that a couple in Phase 1 will necessarily end up at Phase 4; through communication, couples may be able to stop the dissolution process.

Another popular model is Knapp's "reversal hypothesis" approach to relationship disengagement, which represents a complement to his model of relationship initiation (see Knapp & Vangelisti, 2005). Knapp proposes five stages of dissolution: (1) *differentiating*, whereby members of the couple start to behave as individuals, emphasize differences instead of similarities, and engage in activities without one another; (2) *circumscribing*, when communication between the couple returns to a more superficial and impersonal level; (3) *stagnating*, where communication becomes awkward and discussions of the relationship are taboo; (4) *avoiding*, where partners physically separate from one another and try not to encounter each other in public; and (5) *terminating*, whereby the partners end contact and decree that the relationship is over. In contrast with the phase models, researchers have argued that some relationships may end in a "sudden death" due to a critical incident, such as infidelity or violence (Cupach & Metts, 1986). Yet, for the most part, people eventually go through some if not all the stages defined by Duck and Knapp as they decide to leave a dating relationship.

Dissolving Away Online

Just as the Internet has become a source of relationship initiation in the 21st century, relationships may break apart in this medium as well. Breaking up online can include myriad behaviors, ranging from complete relational withdrawal by no longer responding to e-mail or instant messaging to a distancing of oneself from a relational partner via a Web-based "announcement" (Merkle & Richardson, 2000). Recall that a prominent feature of the social-networking sites is a relationship status category. Just as a couple announce themselves as officially together, they also report their official separation to an entire social network. While there appears to be no common norm for the appropriateness of breaking up via the Internet, the notion that online communication facilitates ease of disclosure makes the Net an easier space to start these difficult conversations. Furthermore, the lack of physicality of Internet communication allows for both a thoughtful and a deliberative breakup and the avoidance of a partner's real-time face-to-face reaction (Starks, 2007). Furthermore, the Internet might not just

be a preferred channel for these discussions but also a tool in crafting dissolution rhetoric. *ibreakup.com* allows initiators to craft breakup letters from predetermined rationales and excuses, taking the difficulty of subtlety out of message creation and doing the rhetorical dirty work for site users.

Conclusion and Future Directions

One of the many reasons to study dating and romantic relationships is that such pairings will always exist. Due to the human condition, there will always be differences in how people think about, initiate, maintain, manage, and disengage from their romantic relationships. Therefore, the examination of dating relationships will always be an area ripe for inquiry and theoretical development and will serve as a useful lens for reflecting on social and cultural norms. Based on our review in this chapter, we see three important directions for future research on dating and romantic relationships. For one, research should develop a greater understanding of the dynamics of same-sex dating relationships. Many relationship theories are created based on assumptions about heterosexual couples and do not encompass the relationships of gay and lesbian partners. While there may be more similarities than differences among gay, lesbian, and heterosexual couples, some of the unique contextual constraints should be accounted for in theory and deserve further investigation.

Second, relationship research needs to continue to examine the role of the Internet in the development, maintenance, and negotiation of dating relationships. While there is still some stigma attached to online dating, sometime soon that stigma might be lifted, so that meeting someone on *match.com* might be equivalent to meeting one's future spouse in an anecdotal face-to-face way, such as in a bar, in church, or even on a plane. The proliferation of inexpensive Webcams and microphones, even built into computers as of 2008, has the potential to provide contact for long-distance dyads in a potential channel richer than the telephone. As more people log on each day, the nature of the intersection between face-to-face communication and computer-mediated forms is still unclear. Recent scholarship leaves uncertain whether or how these two channels will harmonize as equally viable vehicles for developing, maintaining, or ending a relationship. More mainstream sources seem to indicate that, right now, couples involved in relationships lived both on- and offline can experience a disconnect. This lapse in contextual overlap may have something to do with the tools (or lack thereof) that people have to negotiate their relationships in both spaces. As many Internet applications, such as social-networking sites, text messaging, and instant messaging, are relatively new, individuals might not possess salient relational schemas for negotiating the overlap of these two channels within their relationships. Cinderella never had to deal with making her relationship "Facebook official"; similarly, "real people" may not have had computer-mediated relational schema

modeled as they developed ideas of how relationships should operate. Without readily available schema, the interplay of relationships between face-to-face and Internet contexts may experience an open season of learn-as-you-go schematic development, with a potentially long learning curve. The uncertain status of schema for relationships entangled within the two contexts may, however, be a temporary impairment as adolescents grow up on the Internet and become accustomed to living life in both the physical and the cyber worlds.

Third, Bradbury (2002) argued that very little research on personal relationships is conducted with the goal of actually helping people change their relationships for the better. Part of this effort requires the collection of data from couples directly experiencing or likely to experience a problem. Theoretical development is certainly important as we seek to better understand the lives of those in voluntary romantic pairings. However, researchers should be encouraged to put their theories to the test in a variety of populations and a variety of contexts so that researchers, practitioners, friends, and family may help individuals build the strongest and most satisfying dating and romantic relationships. It should be evident from this chapter that there is plenty of research to be put to the test, and there will always be a multitude of dating and romantic relationships to study and enjoy in the future. After all, love will find a way.

SUPERVISORS, SUBORDINATES, AND COWORKERS

PATRICE M. BUZZANELL AND REBECCA L. DOHRMAN

Purdue University

Katherine, a recent college graduate, is in her first year as an accountant with a small firm in St. Louis, Missouri. Katherine excelled in her undergraduate coursework in accounting and graduated with the top grades in her class. She felt well prepared for the challenges that being an accountant would inevitably bring when she began her position. Almost a year has passed since Katherine began working at the firm, and she feels that she has built a very good relationship with her supervisor and coworkers. About a week ago, Katherine submitted her yearly report to her supervisor, which detailed her projects from the past year and the professional development in which she had engaged, which Katherine felt was extensive.

At today's staff meeting, Katherine's supervisor asked Katherine to sit next to her during the meeting. At one point in the meeting, the supervisor began reprimanding many of Katherine's coworkers for their lack of professional development and follow-through on their projects. The supervisor then turned to Katherine and noted to the group that "Katherine's work over the past year had been exceptional. In addition, the amount of professional development in which she has engaged is an example for us all." After the meeting, Katherine began to reflect on her supervisor's comments to the group. Although Katherine knew that her boss had good intentions and was truly pleased with her work, Katherine could not help but worry about how her coworkers would react. Katherine wanted her supervisor to know that her comments put Katherine in a

difficult position with her peers because she felt that her supervisor was treating her as a favorite. Katherine also was upset that her supervisor did not obtain Katherine's permission before relating information from her yearly report at the staff meeting. Katherine had perceived her annual report to be confidential and preparatory to her performance evaluation. As Katherine reflected on these points, she thought to herself, "None of my accounting classes prepared me for this. How should I handle this situation?"

Introduction

As this case about Katherine's first job in an accounting firm displays, understanding communication among supervisors, direct reports (often called subordinates), and coworkers is crucially important for organizational member effectiveness, good relationships, and satisfaction in business, governmental, and not-for-profit contexts. The consequences of workplace communication stretch far beyond the immediate setting; these processes affect people's family, leisure, spiritual, and community lives. In this essay, we describe and explore the nature of three specific organizational roles: supervisors, direct reports, and coworkers. We delve into both how individuals can better manage people who hold these roles and how these relationships are co-constructed by role-set members. Role sets are configurations of linked positions that "often

include the supervisor, subordinates, and certain members of the same or other departments with whom the member must work closely, and other organizational members” (Katz & Kahn, 1978, p. 189). These role-set members may work in diverse organizational contexts ranging from traditional “bricks and mortar” workplaces to virtual settings.

Each section of this essay includes a discussion of the fundamental communication issues that drive a particular organizational role, including conventional theoretical approaches to these roles as well as how these approaches have been reconsidered in light of current organizational communication research. Overall, our goal is to highlight communication strategies for individuals’ more effective management of workplace relationships: (a) supervisors, (b) direct reports, and (c) coworkers. We conclude by discussing some similarities that cut across these three types of relationships.

Managing Relationships in the Workplace

Supervisors

In this section, we begin by describing the different ways in which supervisors have communicated with their subordinates, or direct reports, in the workplace. We present the case of “Suzanne” to draw out implications for complex intergroup relationships. In these ways, we provide a series of possible communication strategies and their implications for supervisors and organizations.

Supervisory Communication

Organizations in the United States changed drastically during the Industrial Revolution, largely when the role of supervisor became formalized in organizational settings (see Conrad & Poole, 2005). Most formal organizations were structured using the classical approach to organizing, which positioned supervisors at the “top” of an organization overseeing direct reports. Except when their positions occurred at the top officer or entry-level worker positions, supervisors and direct reports communicated in both capacities because they functioned as “linking pins” for positions both above and below theirs (Likert, 1961, p. 113). The main elements of the classical approach to organizing included top-down communication, hierarchy, and centralized power.

Top-down communication is when supervisors speak to their employees without expecting and/or desiring a communicative response. Many contemporary organizations have resisted this practice because the one-way flow of communication can lead to problems such as misinformation, lack of information, dissatisfaction, and apathy. Instead, contemporary supervisors encourage their employees and direct reports to e-mail them with suggestions and

feedback. In addition, supervisors recognize that their employees often want to influence others, use their skills, and identify with work and workplaces that they consider to be meaningful. Rather than using top-down communication, supervisors recognize that employees express themselves about work, workplace relationships, and organizational policies, products, and services in various ways. These employees may blog; write cartoons, such as “Dilbert”; use wikis; construct social-networking sites, such as Facebook and MySpace; engage in dissent on resistance Web sites (e.g., www.radioshacksucks.com); or post a video on YouTube. As a result, supervisors must consider the multiple channels in which they and their subordinates communicate as well as contemporary workers’ desire to participate in decision making.

A second tenet of the classical approach is *hierarchy*, which is when individuals are organized based on position, rank, and authority and the connections among their own and others’ organizational roles can be displayed visually via an organizational chart. In firms where the organizational chart has fewer levels (i.e., where there is less distance between the top and bottom levels of the chart), the hierarchy is flatter. Flatter hierarchies typically are found in entrepreneurial businesses, small not-for-profit organizations, and many contemporary organizations. Flatter hierarchies can enhance the rapidity by which information flows internally and by which crises can be resolved (Cheney, Christensen, Zorn, & Ganesh, 2004). In addition, roles are less specialized, which promotes cross-functional training and skill development. However, there may be fewer opportunities for certain rewards, such as advancement. Implications for supervisory communication include being clear about and expanding the kinds of rewards offered, especially acknowledging and providing incentives for developmental activities such as on-the-job training and mentoring.

A third main tenet of the classical approach is *centralized power*, meaning that most of the power in the organization is centralized with management rather than spread out among the group. Not only is it centralized, but the assumption is that power and control are *simple*, meaning that managers overtly influence the everyday activities of their workers, which leaves the workers with little autonomy. In more contemporary organizations, forms of power and control, such as concertive control (Tompkins & Cheney, 1985), have largely been viewed as more effective than simple power and control because concertive control offers strategies whereby organizations influence the logic or premises underlying individuals’ decisions, attitudes, and feelings so that individuals act in the interests of the organization rather than in their own interests (Tompkins & Cheney, 1985). Whenever employees come to work while sick to complete a project or rearrange their personal schedules to accommodate work, then they probably accept the notion that there is little or no excuse not to get work done. When employees are controlled concertively,

supervisors and direct reports have implicit understandings about appropriate conduct that rarely need to be explicitly expressed.

Complex Intergroup Relationships

Complex intergroup relationships are the variety of relationships that occur in a workplace, including supervisor, direct report, and coworker. These relationships can be described as complex because individuals simultaneously enact two of these roles at one time and/or intersect with multiple role-set members (e.g., supervisors serve as direct reports for other supervisors, or several individuals in different roles might be involved in career developmental networks). Intergroup relationships can become even more complicated when there is defensive communication or an organizational culture typified by incivility, harassment, bullying, dysfunctional mentoring, and other problematic workplace relationships. Defensive communication “involves a self-perceived flaw that an individual refuses to admit to another person, a sensitivity to that flaw, and an attack by another person that focuses on the flaw” (Becker, Halbesleben, & O’Hair, 2005, p. 144). Destructive organizational cultures can have norms in which harmful communication that seeks to undermine others’ confidence, employability, relationships with others, productivity, and quality of work life is enabled or even encouraged (Fritz & Omdahl, 2006; Lutgen-Sandvik & Sypher, 2009; Ragins & Kram, 2007). To better understand defensive and destructive aspects of intergroup communication, consider the following case study of Suzanne.

The *case of Suzanne* involves Suzanne, the manager of a local pharmacy, who oversees four full-time employees, three of whom have worked at the pharmacy for more than 10 years, and one of whom, Nadine, began 6 months ago. Suzanne has a very high-quality relationship with the three long-term employees, which includes a great deal of social support for each other. Nadine felt like an outsider at the organization from her first day of work because she felt that Suzanne really liked the other three employees and Suzanne did not seem to communicate as freely and informally with Nadine. Suzanne, on the other hand, actually felt very shy around Nadine because Nadine was older than Suzanne, and this was the first time that Suzanne had ever managed someone older than herself. Nadine and Suzanne were initially polite but increasingly got to the point where they carefully considered every word they spoke to each other. After a while, they stopped engaging in supportive activities, such as words of appreciation, inquiries about the others’ leisure activities, and congratulations for accomplishments. After the first 6 months, Nadine became tired of feeling like an outsider at the pharmacy, and she began to dread coming to work. In the meantime, Suzanne mistook Nadine’s actions as questioning her authority and testing boundaries. Suzanne avoided Nadine but spoke about her to the long-term employees at

the pharmacy, especially when she perceived Nadine as not doing her work as well as the others. Toward the end of Nadine’s employment, Suzanne and Nadine no longer even exchanged greetings.

In our *case analysis*, Nadine considered the relationships of the other employees and their manager to be very collegial and supportive, in contrast to her perceptions of her own low-quality exchanges with these same people. Nadine’s analyses of her workplace relationships prompted her to feel less participatory and collegial in her organization. Suzanne and Nadine had different definitions and understandings of the situation, which led, in part, to their conflict. While it is simple to say that they should have engaged in dialogue to avert defensive and destructive workplace relationships, there are many different and conflicting intergroup relationship expectations that can create unanticipated and problematic consequences. For instance, some women may feel as though their conflicts about their treatment during workplace pregnancies and maternity leaves are irreconcilable because organizational and personal goals, understandings about fair treatment, and different parties’ use of particular negotiation strategies seem incompatible (Buzanell & Liu, 2005, 2007). To facilitate productive discussion among organizational members, regular meetings in which all workplace members rotate assignments to provide information about policies, practices, common intergroup concerns, generational cohort attitudes toward work, and hierarchical differences in outlooks about company strategies could go a long way to developing a supportive climate and providing a baseline (of automatic rights and knowledge) from which parties could negotiate conflicts.

To better manage this specific case situation, Suzanne, because she is the supervisor, could have anticipated her feelings about having someone older than her work as her direct report. By anticipating these feelings and reflecting on the appropriate response to them, Suzanne could have been more proactive in dealing with this situation. In addition, Suzanne could have talked with the other three employees of the pharmacy before Nadine started and told them that it was important that Nadine felt like a part of the team from the first day, despite the fact that the other three employees had worked together for so long. Intergroup history may affect the manifestation of problems and potential solutions; and supervisors who have been at the organization for a significant period of time, such as Suzanne, could analyze the impact that intergroup history may have on a new employee. Excellent supervisors are proactive in considering the needs of new employees because these supervisors realize that replacing dissatisfied employees who leave is costly and time consuming. Another option of which Suzanne could have taken advantage of is to invite Nadine to have a meeting with her on the first day, after the first week, and after the first month. Suzanne could have expressed that she wanted Nadine to be happy at the pharmacy, and the meetings could have

given Nadine and Suzanne the opportunity to talk through the minor issues they faced in the beginning, thus possibly preventing these issues from becoming major issues later on. Each of these suggestions is an option that Suzanne could have taken to improve Nadine's perception of her job at the pharmacy. In addition, there are several things Nadine could have done to improve the situation, which are discussed in the next section of this essay.

Interestingly, this pharmacy had only five employees, and yet there was a lot of conflict that developed in a short period of time. In addition to the number of employees, there are many other elements of a workplace that can affect the level of conflict and the perception of fairness in an organization, such as employees' generational differences, different education levels, gender, and technological capabilities. Intergroup communication can also become complicated when organizational members belong to different social-identity groupings. One example of this is that, for some African American women, "learning the ropes" and engaging in career developmental networks, such as mentoring relationships, networking groups, and challenging task force assignments can be difficult because of racial and gender stereotypes that prompt less participation on the part of colleagues, supervisors, and others (Allen, 1996, 2000; Ibarra, 1995). Supervisors also may discriminate or harass (consciously or unconsciously) based on sexuality, nationality, age, religion, and able-bodiedness (Allen, 2003; Liu & Buzzanell, 2006). To enhance effective communication, managers and other supervisory personnel can participate in everyday conversational practices that create connections through particular language choices and in workshops that discuss strategies for changing detrimental organizational cultures and intergroup communication processes.

Subordinates/Direct Reports

Learning how to communicate effectively with direct reports can be approached by first addressing a fundamental conflict in superior-subordinate relationships, namely, the paradox of organization. Next, we suggest that individuals have a responsibility to "manage upward," that is, manage the role-set member to whom they report. In some cases, managing upward may align with upward influence research, in which subordinates attempt to shape the opinions, feelings, and behaviors of the person in the position directly above theirs in the company hierarchy. However, theirs might not be a subordinate position in the sense of a traditional hierarchical structure and/or power-over relationship. Therefore, we use the label "direct report" to indicate that managing upward might also involve management of a supervisor to whom individuals report in more project-oriented "matrix" structures that cut across functional lines or in telecommuting, contingent, and other "nonstandard" work arrangements (Ballard & Gossett, 2007). Finally, more recent understandings of power dynamics can enable greater dialogue and collaboration among different role-set members.

The Paradox of Organization

The paradox of organization occurs when organizations need to control the work and production of their employees, but employees need to feel as though they have flexibility and can express creativity (Conrad & Poole, 2005). Both parties can experience frustration when their desires and goals are at odds. To circumvent this paradox when dealing with direct reports, Barker (1993) recommends that supervisors empower self-managing teams and other employees to discipline themselves by negotiating group values, norms, and acceptable behaviors that the group members then choose to follow. They can do this by creating situations in which employees feel greater attachment or higher identification with the work unit or company mission (Fairhurst, Jordan, & Neuwirth, 1997). They can also empower teams and groups to set their own rules for behavior and to monitor each other as well as themselves according to these rules (Barker, 1993). Through these processes, the needs of managers and workers increasingly coincide, so that all are working as if they are being monitored and in the best interests of the organization (Foucault, 1979). In the same way, organizational employees might feel that they are being monitored through computer technologies. The threat of potentially being watched often ensures that employees will comply with company rules, including self-monitoring of the Web sites they visit, e-mails they send out, or personal tasks they conduct on the Internet (i.e., paying bills, shopping).

The paradox of organization can be exacerbated when one or both parties experience communication apprehension and do not experience person-centered communication. Communication apprehension is the amount of anxiety that an individual feels prior to and/or during a communication interaction with another person, such as acute nervousness before an upcoming presentation before higher management or a televised interview (McCroskey & Richmond, 1979). With regard to communication by direct reports, those who reported high apprehension felt overwhelmed by the information they received (Bartoo & Sias, 2004). They are less likely to communicate about their needs and try to work with their managers to locate common needs that can be mutually satisfied for the individual and the organization. Person-centered communication largely "addresses relationships between individuals of unequal status" (Fix & Sias, 2006, p. 36) and therefore can be applied to the supervisor-subordinate relationship. Person-centered communication "generally refers to the extent to which one's communicative messages consider the perspectives of others" (Fix & Sias, 2006, p. 37) and is an important predictor of job satisfaction.

Managing Upward

Although people typically think of supervisors as the managers of their direct reports, Gabarro and Kotter (2005) argued that employees should engage in "the process of

consciously working with your superior to obtain the best possible results for you, your boss, and the company” (p. 92). They maintained that many individuals do not understand how important they are to their boss’s and organization’s success: “Some people behave as if their bosses were not very dependent on them. They fail to see how much the boss needs their help and cooperation to do his or her job effectively” (p. 93). When direct reports keep these issues in mind, their communication strategies might include initiating regular contact, providing information in advance so that the boss is not surprised at an important meeting, learning supervisors’ highest priorities, and understanding the boss’s communication preferences (e.g., e-mails over face-to-face meetings).

A second strategy for managing a relationship with a supervisor is using leader-member exchange (LMX) theory to develop high-quality information- and opinion-sharing relationships, which can increase both parties’ communication and job satisfaction. LMX is based on the idea that

leaders operate within multiple organizational constraints (e.g., time, role, and power) and, thus, share their personal and positional resources selectively with their members. As a result, leaders tend to develop and maintain LMXs with their members that vary in quality or maturity, spanning from high (in-group, “leadership,” “partnership”) to low (out-group, “supervision,” “managership”). (Lee, 1999, p. 417)

High-LMX relationships are characterized by increased levels of trust and communication between the relational members. Low-LMX relationships generally include less trust and more formal supervision on the part of the manager (Lee, 1999). Research has indicated that higher-LMX relationships offer greater career developmental challenges and opportunities, enhance direct reports’ influence in decision making, construct a basis for mutual and accurate feedback, and promote other positive outcomes for organizational members (Fairhurst, 2001). But these relationships require maintenance or they may deteriorate into low-LMX exchanges. For instance, Manzoni and Barsoux (1998) detail the way in which a superior-subordinate relationship can spiral downward quickly when a superior has low expectations for an employee based on a past track record or secondhand knowledge of the employee. Both superiors and direct reports need to maintain vigilance for subtle conversational changes that indicate that something is amiss. Through much dialogue as well as mutual commitment toward creating a better relationship, both parties can reverse the relational damage.

Power Dynamics

In the past few decades, scholars have been reframing traditional theories of supervising and power to meet the needs of a more educated labor force and the rapidly changing organizational and global environments. Rather

than depicting superior-subordinate relationships simply as *power over*; that is, “a traditional dominance model where decision making is characterized by control, instrumentalism, and self-interest” (Berger, 2005, p. 6), a relational approach to organizing, in which supervisors and direct reports collaborate (i.e., individuals work *with* rather than *for* managers), seems to better depict workers’ power sharing and cooperative exchanges.

This shift from *power over* to *power with* is reflected in research on the tensions and paradoxes involved in teamwork, developmental networks, and participatory organizations. In her multiyear investigation of oncology teams, Ellingson (2005) described how members of different health care specialties worked together for cancer patients and their families. While there was informal sharing of information and medical case impressions among different health care providers, these power-with exchanges were often among individuals of similar status, meaning that oncologists could and did expect that their own demands, expertise, and contributions would be privileged over those of others. Similarly, traditional mentor-protégé relationships, in which more experienced organizational and/or occupational members guide neophytes’ career progress, still persist. However, developmental networks, in which multiple parties of varying organizational and occupational statuses mutually develop each other, have created numerous forms of enrichment that include e-mentoring, strategic collaborative arrangements, reverse and spiritual mentoring, and guidance for particular life and career phases (e.g., mentoring for work-life balance or overseas assignments; see Ragins & Kram, 2007). Finally, research indicates that individuals often experience positive outcomes associated with greater workplace participation, identification, and personal assessments that their work is meaningful. However, organizations that desire to foster such connections may do so in contradictory ways (e.g., when they mandate particular forms of workplace democracy and all members’ involvement or when they fail to see the value of dissent [Stohl & Cheney, 2001]), unproductive ways (e.g., when they expect personal-organizational attachments despite the temporary nature of work arrangements [Ballard & Gossett, 2007]), and ironic ways (e.g., what individuals consider meaningful and desirable may not be what workplaces consider rewarding).

In this section, we have delved into the needs of individuals and organizations as both parties attempt to achieve their goals and interests. Rather than viewing direct reports as subject to the influence of supervisors only, we depict this role as embedded in a variety of workplace interactions that demand insight into complex communication processes, including collaboration and handling of contradictory relationships and situations.

In our case study of Suzanne and Nadine’s superior-subordinate communication, we now can see how their exchanges are not simply the result of misunderstandings and unmet expectations, they also demonstrate direct reports’

needs to manage upward, maintain proactive stances toward workplace interactional changes, and develop collaborative relationships. Returning to Suzanne and Nadine, we see that Nadine had a few options that she could have used while dealing with the situation at the pharmacy. Most likely, Nadine knew that Suzanne was younger than Nadine. On taking the position, Nadine could have considered that Suzanne may feel unsure about managing someone older than herself. In her first few days of work, Nadine could have requested a meeting with Suzanne and asked questions about Suzanne's communication preferences so that Suzanne knew that Nadine understood that Suzanne was the supervisor and that Nadine respected her position. In addition, Nadine could have worked harder to form strong alliances with one or two of her other coworkers so that she would not have immediately felt like such an outsider.

While recommendations for supervisors, such as Suzanne's, training in conversational language skills and organizational cultural change are still necessary, we now expand desirable communication training to include strategies for handling collaborative workplace arrangements, forms of interaction that enable mutually influential workplace conversations, and dissent or conflict.

Coworkers

In this section, we explain the nature of the coworker relationship as well as recent communication research that is helpful in understanding how one can effectively manage this most common relationship in organizations. We also present the case of Nancy and Sheila to illustrate some of the major components of the coworker relationship. Finally, we present recent trends in coworker research to supply insight and interventions to prevent and repair problematic communication situations.

Nature of Coworker Relationships

It is difficult to capture all the different elements of coworker relationships because there are many types of coworkers and organizations. Regardless, there are some guiding notions that help individuals better understand and manage these relationships, such as the nonhierarchical nature of coworker relationships, particular relational transitions, expectations for support, and nondifferential treatment.

First, unlike supervisory and subordinate/direct report communication, which, by definition, involves some element of hierarchy, coworker relationships are considered to be equal in status, remuneration, and influence. While research on LMX indicates that equality among coworkers is not necessarily so, the fact that coworkers are structurally on an equivalent footing means that these relationships serve different functions, such as socialization and coalition building. In these cases, coworkers may be formally designated to do on-the-job orientation sessions for newcomers and/or may informally share information and

survival tips even though neither socialization process is part of coworkers' job descriptions. Where coworkers participate in nonstandard work arrangements, such as telework, and in salary situations where hours are billable, there may be tensions between implicit work practices and those behaviors necessary for pay, promotion, or recognition (see Hylmö & Buzzanell, 2002). With regard to coalition building, coworkers may come together to advocate for particular workplace changes or support each others' best interests by covertly resisting what they perceive as unreasonable and unproductive organizational rules. For example, flight attendants at one airline agreed to work around appearance codes and eventually banded together to affect changes in workplace procedures (Murphy, 1998).

Second, relational transitions typically are different for coworkers than for supervisors and direct reports. Sias and Cahill (1998) addressed the multiple transitions that coworker relationships experience over time, such as "coworker/acquaintance-to-friend, friend-to-close-friend, and close friend-to-almost-best friend" (p. 273). This research shows that communication can help take coworker relationships from the basic level of working together to very close, intimate relationships, which are considered important in the lives of human beings.

Third, coworker relationships are ideally characterized by support, such as task-oriented and emotional support. Expectations for task-oriented support include the belief that one's peers or colleagues will instruct newcomers on correct procedures, teach shortcuts around cumbersome rules, and introduce them to key individuals. In situations where there is political infighting, bullying, and other dysfunctional workplace relationships, and (conscious or unconscious) adherence to stereotypes about abilities aligned with coworkers' social identity membership groups (e.g., race), then expectations about task-oriented and other forms of support are violated. Such violations may affect individuals' feelings of well-being and job satisfaction but may also lead to employment termination, less productive work groups, and litigation, such as when coworkers sexually harass each other. In cases of emotional support, Cahill and Sias (1997) found that male and female coworkers experienced this kind of support in different ways. They concluded that although women felt that emotional support was important more than men did, and women often had larger emotional support networks than men, there was no difference in the responses of men and women to their coworkers seeking emotional support. Emotional support is so important that when this support is absent, either through coworker job loss or telecommuting, the individuals who remain in the office may experience profound sadness and engage in grief phases akin to romantic disengagement, death, and other forms of loss (see Hylmö & Buzzanell, 2002).

Finally, as ideas such as leader-member exchange and concertive control have gained popularity, research has developed that addresses how individuals feel when they see their manager treating their coworkers in different

ways. Sias (1996) studied coworker discourse to determine how coworkers talked about this differing treatment. She found that individuals often engage in “bookkeeping” by noting how their manager treats their coworkers versus them and adjusting their behavior accordingly.

In short, coworker relationships and communication differ from those of supervisors and direct reports in a number of ways. In reviewing these differences, the case of Suzanne and Nadine is instructive because it privileged the supervisor-subordinate dyad to the neglect of any discussion about Nadine’s peers. Indeed, had Nadine and her coworkers developed a deepening connection from the initial on-the-job training that Nadine undoubtedly received, they might have been able to engage in sense making to determine what was going wrong with Nadine’s relationship with Suzanne and how best to deal with the situation. Instead, the inevitable loss of Nadine’s self-confidence, contributions to the pharmacy, and the resources associated with the hiring and training of a new employee cannot be recouped.

Next, we would like to present another case study that centers on a coworker relationship in a complex organization. The case of Nancy and Sheila is situated in the event-planning department of a large corporation in Minneapolis, Minnesota. Nancy had worked at the company for approximately 30 years. Nancy was over 60 years old and was very proud of her efficiency and hard work in her position. Sheila, a young woman straight out of college, began employment at the corporation in the office next to Nancy. They held the same position and often worked together as administrative assistants on large events. For one particular event, a reception celebrating the new CEO of the company, Nancy was assigned the task of making name tags for every attendee. Sheila was assigned the task of taking reservations for the reception, and thus these coworkers had to work very closely on this event. At one point, Sheila noticed that Nancy was retyping every attendee’s name from a printed spreadsheet to another document that formatted the name tags. Sheila immediately realized that Nancy could save a lot of time by simply merging the spreadsheet into the document, as she had done many times before in her work-study position during college. Sheila went to Nancy and explained that she could save time by using this quick trick. Nancy’s response was a dirty look as she said, “I’ve been doing this for 30 years. You’ve been doing this for 30 days. I think I know the best way to do this. I don’t need your help.”

Despite the fact that this coworker relationship had been amicable, though distant, until this occurrence, Sheila immediately felt very upset. Had she overstepped her boundaries by offering to help? Was Nancy just overreacting? Why did Nancy turn on her so quickly? The lack of emotional support that she felt when Nancy snapped at her made her feel very unsure of herself and unsure of her role in the office. What Sheila neglected to take into account in the situation was that although she and Nancy were

coworkers, Nancy may have felt threatened by Sheila’s college education and technological abilities. Once Sheila reflected on it, she realized that she was often called on to help other coworkers with their computer problems; she was seen as the computer guru of the office. Nancy simply felt threatened by this, particularly because she did not have a college education and because she lacked technological skills and increasingly felt that her lack of those skills made her a target for being laid off. Once Sheila thought through the reasons for her coworker’s reactions, she began to observe why Nancy did her work as she did and asked Nancy questions. She showed Nancy how—step by step—to learn other techniques when the two of them were alone and praised Nancy’s abilities to coworkers and bosses. She also provided short technology sessions to update everyone on techniques and not single out anyone. As we can see in this case study, coworker relationships are often just as complex as supervisor/direct report relationships. Issues such as differences in generational and technological ability, among many other things, can weigh heavily on a coworker relationship.

Recent Research on Coworker Communication

Traditional theories of coworker relationships stress the importance of coworker relationships not affecting productivity, such as the importance of workplace friendships and romantic relationships not adversely affecting work output. Indeed, Fritz’s (2002) analyses of behaviors that contribute to dislike of coworkers indicate that peers’ unwanted intrusion into coworkers’ personal and work lives, self-promotion, and controlling behaviors are some of the behaviors that are associated with negative workplace interactions. Fritz suggests that training in workplace civility and effective communication skills for impression management can enhance coworker relationships.

Moreover, in recent years, the nature, benefits and consequences of coworker relationships have been expanded. As the amount of paid work has increased and the scheduling of work leaves relatively little time for family and friends, research indicates that workers may locate their most meaningful relationships in the workplace rather than in the home or in previous nonwork friendship networks (Hochschild, 1997). The role of multiple network relationships within and outside one’s workplace suggests development of contacts for career pursuits, such as skills enrichment, advancement, and employability security, and for lifelong friendships and mentoring (see Ragins & Kram, 2007). However, issues of race, class, gender, sexuality, age, and other differences can affect coworkers’ satisfaction with and management of such relationships (Allen, 2003; Buzzanell, 2000; Cahill & Sias, 1997).

In the case study of Nancy and Sheila, we now see that Sheila could have used a more face-saving approach to helping Nancy. The approach she first tried made Nancy feel like the way she was doing her work was wrong,

which made her feel that Sheila was encroaching on her responsibilities. In the same way that individuals sometimes feel defensive when a coworker meddles in their personal life, it is important to be vigilant as coworkers try to help each other improve at specific work functions. Also, both Nancy and Sheila could have tried to understand the situation from the other's perspective and see that Sheila really did mean well and that Nancy really did just feel threatened by Sheila's insistence that her way was better. Sheila should try to approach the coworker relationships as collaborations. This is important for her current employment situation and also for developing a network of contacts that can assist her throughout her career. While some might say that Sheila should conduct a cost-benefit analysis and stop trying to help Nancy if her efforts don't seem to change the situation, a longer-term view might prompt Sheila to maintain a pleasant and constructive approach to Nancy.

As in this case study, greater awareness of, dialogue about, and commitment to creating workplaces in which participation of all coworkers, particularly those who view themselves or others as different on salient dimensions (e.g., professional or educational background, nationality, ethnic origins), can encourage greater quality of life, workplace contributions, and mutual growth (Buzzanell, Meisenbach, & Remke, in press). For instance, peers' unwillingness to continue meetings if a coworker needs to leave for personal or family reasons indicates recognition of others' value and contributions to projects. Similarly, attention to, analysis of, and replication of behaviors that build the kind of workplace in which individuals want to work and in which everyone experiences fair treatment can be encouraged through coworker communication processes.

Conclusion

Although we have separated the different workplace roles to highlight communication processes and strategies, communicating as supervisor, direct report, and coworker involves many more commonalities than differences. All are required to work toward the organizational goal as well as their own individual goals. All rely on effective communication to do their jobs, sustain their employability, build satisfying relationships, enhance their chances of promotion within their current and future organizations, and create developmental networks within and beyond their current workplace. Communication research provides insight not only into workplace relationships considered unsatisfactory and even destructive but also into specific organizational procedures and relational practices that can repair and enhance supervisory, reporting, and peer relationships. (For more extended treatment of these communication issues, see Sias, 2008.) Construction of positive relationships is increasingly

essential for workplace productivity as well as the quality of work and home life, the meaningfulness of work, and collaboration transnationally.

SOCIAL GROUPS, WORKGROUPS, AND TEAMS

J. KEVIN BARGE

Texas A&M University

The kinds of issues and problems we face as a society have become increasingly complex. Issues and problems such as health care, global warming, terrorism, energy, education, and economic innovation cannot be addressed by the actions of a single individual; rather, they require the coordinated action of people working together to craft plans and take action when working through these complex concerns. There is a growing recognition that collaborative effort is required to manage these kinds of issues as the depth and breadth of knowledge required to handle them far exceeds the capacity of a single individual.

The past 25 years has witnessed a dramatic growth in the use of groups, teams, and collaboration to address pressing personal, organizational, and social problems. *Collaboration* may be defined as “people with different views and perspectives coming together, putting aside their narrow self-interests, and discussing issues openly and supportively in an attempt to solve a larger problem or achieve a broader goal” (LaFasto & Larson, 2001, p. xvii). Persons participate in a variety of support groups for personal and professional development, such as groups that help manage addictions (e.g., eating disorders, substance abuse, and gambling); groups that manage issues associated with grief and bereavement due to the death or suicide of a child, parent, or friend; or groups that develop a person’s skills and abilities (e.g., theatrical groups, professional networks, and educational groups). Organizations such as Apple and Facebook routinely use teams to develop new products and services, including the iPhone

and social-networking sites. Nonprofit and governmental agencies employ teams to work with issues regarding poverty, drug abuse, affordable housing, and the location of landfills and hazardous waste facilities. Collaboration within groups and teams has become critical as groups typically make better decisions than do individuals; the wealth of knowledge and insight is greater within groups as many individuals bring their unique backgrounds and knowledge to the task at hand.

How can group members create and sustain effective collaboration? The short answer to this question is “Communication,” but this answer is deceptively simple as it leaves open what kinds of communication are needed and what counts as high-quality communication. This chapter focuses on the kinds of communication that are required to foster high-quality collaboration within groups. I begin by exploring what counts as a group and how its unique qualities may drive the kinds of communication that are required.

The Embeddedness of Groups

A *small group* has typically been defined as three or more people who interact with one another toward the accomplishment of a shared goal and who perceive themselves as members of a particular group. This definition carries with it three important assumptions. First, the lower bound for a small group is set at three people, but no upper bound is set. Most definitions of small groups use three as a lower

bound because three individuals allow for the possibility of coalitions to emerge where two people can form an alliance against one person. The upper bound for a small group is typically determined by the degree to which people perceive themselves as part of a group or the degree to which people carry with them an impression of other group members. Second, small groups emphasize interaction. This is what a communication approach to the study of small groups brings to the table—a focus on the pattern of signs, symbols, and messages that group members use to accomplish their task. Third, small-group members have behavioral and goal interdependence. *Behavioral interdependence* refers to the way a group member's messages affect and are affected by other group members' messages. *Goal interdependence* refers to the primary goal that group members share. For example, the members of local community boards of directors for organizations such as the Red Cross, the American Heart Association, or the American Cancer Association all share an interest in promoting their respective organization.

A recent approach to the study of small groups has emphasized the importance of recognizing that groups exist in a flow of preexisting understandings and structures that influences how the group and its members coordinate activities. This is so even for zero-history groups—groups of individuals who did not know each other previously; for example, trial jury members are influenced by their preconceptions of what it means to serve on a jury (Sunwolf & Seibold, 1998). The importance of recognizing that groups are embedded in context has been called the *bona fide group perspective* (Stohl & Putnam, 2003). There are at least three important ways in which we can say that groups are embedded within context.

1. *Group and team members bring their own distinct personal, professional, and cultural backgrounds to their present group experience.* Individuals do not enter groups *tabula rasa*, as blank slates. They do not check their knowledge, beliefs, and attitudes at the door and start their group experience from scratch. Rather, they base their interactions, in part, on their identity and their previous experiences with groups. For example, individuals from collectivist cultures that emphasize consensus and egalitarian relationships tend to perceive consensus decision making and shared leadership as important to high-quality group experiences. Similarly, if individuals have a high degree of group hate—an intense dislike for participating in groups, they will be less likely to actively participate in groups and take leadership positions.

The way the personal experiences of individuals enter into group life has recently been talked about in terms of diversity. Diversity within small groups has been conceptualized in terms of a variety of general social characteristics (e.g., national identity, gender, race, ethnicity, sexual orientation, and values) as well as organizational characteristics (e.g., membership within a particular department

or division, length of tenure within an organization, and technical expertise). Sometimes *fault lines* or coalitions or subgroups may emerge within groups and teams due to these demographic characteristics and may frustrate collaboration. These fault lines may hurt the ability of the group members to collaborate with one another and lead to conflict. Group members may hold radically different assumptions about the best way to approach the task given their unique set of background experiences.

Yet diversity may be more profitably viewed as a resource, not a constraint. Groups that are more diverse tend to make better decisions and are more creative. The challenge for groups and teams, then, is how to effectively manage fault lines within groups. Effective leadership includes anticipating the emergence of fault lines, using task-oriented behavior when initially conducting the group, and knowing when to make the shift toward relationship-oriented leadership (Gratton, Voigt, & Erickson, 2007).

2. *Groups exist in time.* Time is an important marker for a group's activities (Arrow, Henry, Poole, Wheelan, & Moreland, 2005). Group life does not exist in a vacuum; it exists within a particular time period, and this time period is associated with particular cultural ideas that people bring to the group experience that influences how they act toward each other. It also includes the agreements they negotiate throughout their group experience that influence how they respond to the task.

As I have already highlighted, the cultural ideas people hold about groups and teams influence how they make sense of and act in groups. For example, organizations have always used groups to perform tasks. Manufacturing organizations in the early 1900s used groups of individuals to manufacture various goods and products. In fact, Ford Motor Company pioneered the use of the assembly line to manufacture cars. Workers on the assembly line met the definition of a group as interdependent people organized to accomplish a shared goal. However, the group was organized according to values associated with scientific and classical management (see Chapter 37, this volume). The group was organized hierarchically with a single manager guiding the employees making up the group. Decision making was centralized with the manager, not the group as a whole, and communication, in the form of directives, flowed from the manager downward to the employees. The employees had little voice in the way their work was to be organized.

Compare the early-19th-century notion of groups with the 21st-century notion of teams. Groups have become teams within contemporary organizational life, which emphasizes all team members working together collaboratively and sharing decision making. James Barker (1999) conducted an important study in the creation and maintenance of self-directed or self-managed work teams within a high-tech computer-manufacturing organization. Self-managed work teams are groups of individuals who engage

in collective decision making about the best way to organize their work. The structure based on groups in the workplace has been complemented, and sometimes supplanted, with a structure that shifts the decision making from the hierarchically superior manager to the collective team. The historical and cultural time period of the group informs people's understandings and expectations of group life, and an appreciation of a group's experience must take the cultural notions associated with group life at a particular moment in history into consideration.

Groups and teams exist over time and, as part of their history, create understandings and agreements about the way they will engage with the group task and manage their relationships with each other. Most models of group and team development assume that groups start with an orientation phase where members orient themselves to the parameters of the work they are to accomplish and to each other. For example, Tuckman and Jensen (1977) offer a classic model of group development. In their model, groups start with a phase called *joining*, where group members get to know each other and determine the scope of their work. This is usually followed by a phase called *storming*, where group members may disagree over the nature of the task, which member is to act in what role, and what procedures should be used to perform the task. Ultimately, groups move from storming to *norming* and then onto *performing*. During the norming phase, group members come to agreement on the rules they will follow as they perform their task and what tasks and values are important. This agreement then allows them to perform or to accomplish their task.

The challenge for groups is to change or alter the habitual patterns they have created during the norming and performing stages. Once norms have been set, they are very difficult to change unless the group has some type of pressure or crisis that moves it to change. For example, a common pattern that has emerged across groups is that groups will maintain their normative structure until about halfway through the life of the group. Whether the group is working on a project that only lasts a few months or will last years, around the midpoint of the life of the group, group members experience pressure to re-examine their ways of working and the assumptions they make (Gersick, 1989). They then reset their strategies and operating norms and work differently as they continue to engage their task.

The notion of time also suggests that group members need to pay attention to the location of the group in time. This means paying attention to the societal, organizational, and group stories that might influence how group members should act in groups as well as the informal norms that the group has created among its members.

3. *Groups and teams are embedded in networks of other groups and teams.* To extend John Donne, no group or team is an island. Groups are embedded within networks of other groups and teams. At an individual level, the connectedness

may include overlapping group and team memberships and relationships among group and team members in other contexts. For example, consider an individual who simultaneously is a member of Lambda Pi Eta, a communication honor society, and a member of Phi Beta Kappa, a national undergraduate honor society. We could say that there is a connection between these two groups as one individual has membership in both. Similarly, we could say that when individuals who belong to separate groups interact with members of other groups, these groups are connected as well. When a member of Lambda Pi Eta interacts with members of other honor societies on campus, each becomes aware of the other groups and the possible connections they may have with one another.

At a group level, groups and teams are also connected to each other given their unique function or purpose. For example, in university settings, the information technology group is always connected to the registrar's office—the office that records grades. For the registrar to do his or her job well, the technology must be configured in a way that permits instructors and teachers to record their final grades in a secure environment, and this requires coordinating with the information technology department. Many tasks in organizations require coordination among groups. Consider the process of digital filmmaking. Digital filmmakers, such as Pixar, the company that has produced movies including *Toy Story* and *Finding Nemo*, have groups of animators, software engineers, marketers, and writers who must coordinate their activities to produce and market a film.

The notion of embeddedness highlights the importance of groups and group members learning to manage boundaries. At an individual level, group members need to learn how to manage potentially conflicting loyalties among the multiple groups in which they participate. Consider what happens when a person of color participates on a task force designed to create a diverse working environment. The task force does something objectionable to the racial community of which the individual is a member. Should such individuals resign from the task force to affirm their identity with their racial group, do they affirm the work of the task force, or do they find a way to manage the competing obligations to the two groups?

In terms of groups' connections with other groups, the key issue is how loosely or tightly connected the group is to other groups. The looser the connection, the level of influence that one group has on another is relatively weaker. For example, one of the chief frustrations of attempting to dismantle terrorist organizations, such as al-Qaeda, are that the individual terrorist cells are loosely coupled. While the activities of each cell share a common goal, the elimination of one cell has minimal impact on the activity of another cell. On the other hand, if groups are tightly connected, the actions taken by one group can directly influence the other. For example, action taken by the United Way regarding funding can directly influence local arts groups, if the United Way is their primary source

of income. This suggests that groups need to learn how to manage their boundaries by probing the environment to see how other groups could affect their behavior, forging key agreements with those other groups, placing members of their group with other groups to act as liaisons or boundary spanners, and developing the strength of the existing tie (Ancona & Caldwell, 1992).

Group Communication Activities

The idea of embeddedness suggests that we act from context and into context. The actions we take as we engage with the group are informed by the context of our previous experiences, the group's history, and the larger cultural stories about what it means to participate in groups. However, our actions are not totally constrained by the context; we can make wise choices about how we want to change our group and team and create a different context, which we will have to respond to in the future. For example, the leading group at Duke Energy, a South-Midwest utility company, wants to change the context in which the company exists (Pierce, 2008). Historically, utility and energy companies have been based on treating energy as a commodity with the idea that the more electricity you sell, the more money you make. Duke Energy is considering ways to "de-carbonize" their supply, to use more solar and wind power, and to shift to a "save-a-watt" plan. They would still make money from selling energy, but their new plan would also allow them to make money by selling and installing energy-saving features, such as computer monitors to cycle air conditioners on and off. Rather than be constrained by the context of the "commodity model," the leading group is trying to take actions that will reconceptualize how the organization will be in the future, and this re-visioning of the organization will serve as a context for groups to respond to in the future.

What this suggests is that we need to foster communication activities that help us make sense of context and make wise choices about how we want our group to work in the future. These four important communication activities are (1) information management, (2) decision making, (3) learning, and (4) relating.

Information Management

Information is the lifeblood of small groups. Useful and timely information is critical for small groups and teams to make smart choices about how to organize their activities and execute their tasks. First, groups need to have access to and be able to disseminate information quickly. Integrated information databases and file-sharing systems as well as communication technologies such as telephony or e-mail are important not only to capture needed information about the group and its environment but also to make it widely available to other group members.

Second, groups need to develop systems for monitoring their environments. While it is important to have the needed systems and procedures in place for collecting and disseminating information, the burning issue is *what kinds* of information need to be collected in the first place. Richard Hackman (2002) has argued that there are five important conditions that lead to group or team effectiveness:

1. Clear engaging direction
2. Facilitative group structure
3. Supportive organizational context
4. Available expert coaching
5. Adequate material resources

Developing successful teams, therefore, means that team members need to construct patterns of communication that help them monitor these key functions both in their diagnosis of the group's current state of affairs and in their forecast of what the group's future needs may be.

These key functions focus attention on both the internal mechanics of group members as well as their larger environment. Take, as an example, the board of directors for a community theater company. The managing director would need to ask questions that focus on the internal dynamics of the board of directors, such as "Do we have a clear direction?" (Function #1) and "Does our group structure align with the work we need to accomplish?" (Function #2). If the board's passion for their work is not high and the group structures slow down or inhibit work on their task, then the board will have difficulty directing its energy to do the work. The managing director would also need to pay attention to the board's larger group environment by asking questions such as "How supportive are our external stakeholders to the theatre?" (Function #3), "Do we have or need expert coaching to help us work through our challenges?" (Function #4), and "Are the needed material resources available to do our work?" The managing director could also offer opinions on the current state of the group or make proposals for what the group may need in the future, such as offering a reflection on the group's current level of material resources or forecasting what the group might need in the future.

Decision Making

One primary activity for any group is making decisions. Groups make a variety of practical decisions regarding their experience, such as when to meet and how often, as well as instrumental decisions, such as determining what their task is and how they would know if they had completed their task and deciding on evaluation criteria for determining how well they have performed on their task.

Making good decisions depends on performing certain communication functions during discussion:

1. *Developing an understanding of the problem*, including talking about the nature of the problem, its scope, its symptoms, and its possible causes
2. *Identifying criteria for solving the problem*, including discussing what standards must be met that would qualify a proposed solution or decision as “good” or “high quality”
3. *Generating a range of realistic alternatives* by brainstorming a variety of possible solutions to a problem that cover the range of acceptable choices
4. *Evaluating the negative and positive consequences associated with particular alternatives*: People are particularly good at identifying the positive consequences or benefits of particular alternative solutions. However, group members typically underestimate the risks or downsides associated with decisions. Good decision making evolves a balanced, accurate, and thorough examination of the benefits and risks associated with various decision alternatives (Hollingshead et al., 2004)

The above has been called a *functional approach* to group decision making. It involves group members either asking questions or offering comments and reflections regarding the problem, evaluative criteria, possible solutions, and solution evaluation.

To illustrate the importance of these communication functions, assume that you are a member of a city task force that has been assigned to address the “traffic congestion problem” the city faces. The first task for the group is to define the problem. At first glance, you might say that the problem is “traffic congestion,” which you interpret as too many cars for the existing roadways. On the other hand, what changes if you define the problem as “the need for environmentally sustainable public transportation”? Framing the problem as “traffic congestion” foregrounds the importance of building new roads to address the bottlenecks created by too many cars. However, framing the problem in terms of “environmentally sustainable public transportation” foregrounds two different pieces to the puzzle: the importance of environmental sustainability and the role of public transportation, such as light rail systems, subways, buses, and carpooling. Framing the problem or issue is not simple, and it becomes important to play with different ways to frame the situation and the problem because different problem frames move you to see situations in different ways.

The way you initially frame problems will inform how you determine what counts as appropriate criteria for making decisions. For example, there are several criteria that you could use to evaluate possible traffic plans, including cost, efficiency, environmental impact, public satisfaction, and political support. Framing the problem as

“traffic congestion” highlights that a good solution should decrease the average trip time and number of traffic slow-downs. The frame of “environmentally sustainable public transportation” highlights solution criteria that include minimizing the environmental impact and creating a plan that provides public transportation alternatives to citizens. Both frames may use political criteria to assess the viability of plans. What will the local politicians be willing to pay for? Would citizens be willing to pay for toll roads to ease traffic congestion? Would politicians and citizens be willing to invest in different public transportation alternatives, particularly in the United States, which is dominated by a car culture? Effective decision making requires groups and teams to articulate the criteria they will use to assess various decision proposals.

Finally, the group will need to generate different alternatives and assess their possible consequences. Groups may need to brainstorm and assess different ideas according to time (What solutions would be possible and viable in the short term? The long term?), stakeholder (What solutions would be possible and viable from the perspective of car owners? Politicians? Environment activists?), and costs and benefits (What are the solution’s relative costs and benefits?).

Learning

Many groups and teams are specifically designed to enhance the learning of their members. Sometimes, *skills training groups* are created by nonprofit community organizations to enhance a person’s basic life skills, such as assertiveness, conflict management, financial management, parenting, and job competencies. *Learning groups* are frequently used by schools and universities to enhance the comprehension and mastery of content by having students work in small groups. Work teams frequently engage in *team development and training* to ensure that they have the knowledge, skills, and abilities to meet their performance goals. Such activities are designed to help team members develop shared mental models, mutual trust, and a team orientation and learn to monitor their performance (Johnson & Johnson, 2005). Whether group members are learning life skills, mastering conceptual material from their classes, or sorting out what they need to know to perform well on their team, the kind of communication that is needed to foster learning depends on whether people simply need to learn and follow particular rules and operating procedures that inform the group’s activities or whether they need to make wise and informed choices about how the group is to operate and what needs to happen for it to move forward.

Sometimes people simply need to learn and master the rules that guide and inform the group’s activity. For example, what does an individual need to know to participate in a support group such as Alcoholics Anonymous (AA)? To fit in and participate in AA, an individual needs to know the

rules that guide the way AA meetings are structured, such as how to introduce oneself to the group, vocalize a concern, and give support to others. As is the case with AA, the goals are very clear and the steps that are involved to achieve them explicit. Senior participants who have a longer affiliation with the organization, such as AA sponsors, understand the rules that govern the group and are able to tell newcomers what those rules are and help them follow them. Learning that emphasizes mastering the rules and following them has been called first-order learning (Bateson, 1972). First-order learning occurs not only in groups such as AA but in a variety of other kinds of groups as well.

If the nature of the group's task is fixed and highly structured and all that is required is first-order learning, the type of group communication that is needed is typically informative and persuasive. Some member or members in the group simply need to inform others what the goal is and what steps need to be taken to accomplish the goal, and persuade them to comply with the rules. For example, if a patient goes to a doctor with a broken bone, the goal and the way to achieve the goal are very clear—the bone must be set using a hard or soft cast or a splint. Given that the doctor is presumed to have more expertise than does the patient, communication tends to be more one way, with the doctor informing the patient as to what needs to be accomplished. In groups, there may be certain protocols and procedures that are set and not open to discussion, and group members need to be informed of their existence and persuaded to follow them. In such instances, appropriate and effective communication that fosters learning needs to be clear and persuasive.

On the other hand, many times the group's goals and purposes are unclear, and the ways the group can accomplish them are ill-defined. For example, say a patient is diagnosed with terminal cancer by a doctor. What is the goal or task that the doctor and patient need to pursue? How do they accomplish it? There are numerous things a doctor and a patient could discuss to help the patient move forward, such as how to die with dignity, how to manage one's relationships with family and friends, the role of hospice in medical care, and managing one's finances. What makes this kind of learning conversation unique is that each party brings a different expertise to the conversation and the focus of the conversation needs to be jointly determined. The communication that is required in such an instance must include finding a way to pool the mutual expertise that each brings to the conversation and jointly determining the direction and focus of the conversation. Such a conversation may be termed dialogue.

Dialogue can be viewed as a form of communication that allows people to think collectively and examine each other's assumptions about situations. Dialogue involves the following kinds of activities:

- Seeing the whole among the parts
- Seeing the connections between the parts

- Inquiring into assumptions
- Learning through inquiry and disclosure
- Creating shared meaning among many people (Barge, 2002, p. 168)

Dialogue is about “seeing the big picture,” how things connect with each other, and taking into account the assumptions, values, and beliefs that lead people to make sense of situations in particular ways and then act.

Dialogue involves keeping advocacy and inquiry in a constructive tension with each other. In dialogue, we learn about each other's positions through the processes of inquiry and disclosure. We try to remain open to each other's positions and beliefs and try to learn as much as we can about them. This does not mean that we give up our own positions and interests. Rather, we also have a responsibility to explain our views in ways that help others make sense of our positions and to advocate our position. By balancing inquiry with advocacy, being open to the views of others while advocating our own positions, and by respecting the perspectives of others while not taking them (or ourselves) too seriously, we hope to build the group's resources for understanding the situation and creating new possible actions.

This form of communication called dialogue can be created and sustained in groups through a variety of methods. Perhaps one of the most important ways for fostering dialogue is the creation of discussion rules. Group and team meetings frequently use discussion rules to make sure that all opinions and perspectives are heard in a safe and respectful manner. Discussion rules that foster dialogue focus on creating a safe space for all group members to vocalize their opinions and to inquire into them deeply. Examples of discussion rules that may foster dialogue include the following:

- Asking questions is as important as making statements.
- Ask curious questions.
- Respect others' opinions even if they are different from your own.
- Share talk time.

Such ground rules help balance people's levels of advocacy and inquiry and help them inquire into the positions of others with a respect for one another. A second way that we can foster dialogue is to invite patterns of communication that emphasize affirmation. It is through the process of affirmation and the role that it plays in fostering high-quality relationships that learning can occur.

Relating

Effective relationships are built on the power of affirmative communication. When we affirm something about another person, we recognize the value of that person's ideas, values, actions, or beliefs. We convey to the other

person that who they are, what they have said, or what they have done has value for us and is appreciated. Affirmative forms of communication simultaneously affirm our own sense of self and self-esteem as well as the other person's. When we feel that we are affirmed, we feel closer to the other members of the group and have a stronger sense of identity with the group.

There are several different communication practices that emphasize the power of communication and its ability to construct high-quality relationships. A classic essay by Jack Gibb (1961) argued that communication that emphasizes empathy, spontaneity, provisionalism, equality, description, and problem orientation can create a supportive group environment. Supportive communication invites people to participate in the group and to feel more a part of the group. This early finding regarding the power of affirmation can also be seen in more recent work on group conflict management. Integrative styles of conflict management emphasize the importance of creating win-win outcomes where both parties are satisfied. These styles involve an affirmative approach that facilitates the flow of communication among parties, by acknowledging that they have heard the other person and reflecting statements that recognize the emotions of the other person; attempts to understand the needs and desires of the other; inquiries into the commonalities that bring the two parties together, as opposed to the differences that separate them; and invents options from which both can benefit. Integrative styles of conflict management in groups have been demonstrated to foster higher-quality decision making.

When we use communication that is affirmative (i.e., that tries to find ways to integrate the needs and desires of the other person with our own) and supportive, we are likely to not only develop better working relationships with one another but also make better decisions. In some ways, this is intuitively true, as affirmative styles of communication create a supportive group environment where individuals are willing to share information and challenge one another's ideas. When we are able to pool our knowledge of the area and subject our ideas to a rigorous test, it is not surprising that we will be more likely to accomplish the important decision-making prerequisites.

What goes unnoticed many times, however, is the close connection between affirmation and challenge. One of the reasons why affirmation facilitates decision making and learning is that it creates the space for people to challenge each other regarding their thinking. If people are already defensive, challenging their thinking can be viewed as a personal attack or as a negative evaluation, which moves them to respond in kind. As a result, people are not able to share information and reason together. However, if they feel that they are being affirmed, they feel supported, and they have the space to be challenged and to grow and develop. Csikszentmihalyi (1996) refers to this as "flow," where there is a balance between support and challenge. People feel that they have the needed support to do their

job and work and at the same time are stimulated through challenge to grow and develop. For example, members of championship sports teams typically talk about the tight bonds they have with their teammates and also how their teammates challenged them to become better. They feel simultaneously supported and challenged in their relationships with their team.

Creating positive relationships that foster learning within groups requires keeping a balance between affirmation and challenge. Too much affirmation and not enough challenge don't generate learning, because people feel that their current way of relating to one another and the group is fine. Too much challenge and too little affirmation, and people feel defensive and are not open to learning. Keeping the tension between affirmation and challenge is key to developing healthy relationships and fostering learning.

Discussion

Groups and teams play an important role in our personal, social, and professional lives. The challenge that group and team members face is to create groups that allow them to fulfill their individual as well as the group's or team's needs, goals, and desires. This means that group members must recognize that their group experience is complex because it is embedded in a set of ongoing identities and relationships. Group members bring their life experience, which informs their participation in the group. Groups also exist in specific cultural times that carry with them expectations for what it means to belong to and participate in a group. Groups are connected to other groups and teams, which means that they must address and respond to the expectations that these groups and teams have for the group.

Kurt Lewin once said that there is nothing as practical as a good theory, which meant that the theories and ideas about how communication works in groups and teams should have practical implications. Theories and ideas should help us make judgments about how well the group is doing and what kinds of messages we may need to perform to make the experience better. So how can the ideas associated with embeddedness and the communication activities of information management, decision making, learning, and relating help us recognize how well a group is working and what needs to be done when the group is not working well?

First, the idea of embeddedness suggests that groups are performing well when they manage their relationships with group members, as well as individuals and other groups external to the group, in ways that allow them to accomplish their task. Simply put, effective groups and teams create productive working relationships. For example, when people feel that they are being supported by other group members, they are more motivated to share

information openly and to participate in the activities of information management, which, in turn, allow them to make better decisions. They are more relaxed and open to learning. Similarly, effective groups are able to identify key external stakeholders outside the group—important individuals and groups—who can influence their ability to perform the task. When groups have cultivated strong working relationships with key stakeholders, they are more likely to acquire the needed information and resources that allow them to do their job.

Judging your group's level of performance involves asking two kinds of questions. As you participate in a group or team, it is certainly important to ask *task-oriented questions*: What is our task? What are the standards we can use to assess our performance? How well are we performing our task? Such questions generate important information about your group's level of performance and standards for its assessment. But if we take seriously the idea that the quality of relationships directly influences our ability to perform our task, we also need to be asking a set of *questions about our relationships*: Do we have supportive working relationships within our group? Who are the important stakeholders—either individuals or groups—outside our group that can influence our ability to perform our task? What is the quality of relationship we have with these external stakeholders? The challenge is to develop a set of internal and external working relationships that allow the group to coordinate its activity and to perform its task.

Second, the idea of embeddedness and the communication activities of information management, decision making, learning, and relating provides us with a set of tools for making choices about how to intervene when our group is not performing at a high level. Is the group having difficulty performing its task because it does not have access to relevant information in a timely fashion? If so, group members need to engage in communication that helps them acquire the needed information and build useful information systems. Is the group having difficulty because it does not know how to transform the information into well-thought-out decisions or has framed the problem in a poor way? If so, group members can use ideas from the functional approach to determine what decision-making function needs to be improved and perform more communication that addresses that function. Is the group having difficulty clarifying the task and identifying appropriate means for accomplishing the task? If so, the group may need to engage in dialogue—listening and asking questions—in order to foster learning. Is the group having difficulty because it does not use supportive and affirmative types of communication? If so, group members may need to learn how to be spontaneous, empathetic, and provisional in their communication.

Groups are interconnected sets of people and communication activities. Therefore, as you think about your group experience, it is important to make sure that the communication activities of information management, decision

making, learning, and relating align in a synergistic way so that they reinforce each other. It makes little sense to say that a group is effective if it has good decision-making processes but is poor at information management. Bad or limited information will lead inevitably to poor decisions. It is difficult to engage in dialogue if people do not trust each other or dislike one another because they will not be able to openly express their ideas and be genuinely curious about another group member's thinking. What this means is that you need to assess not only the quality of individual communication activities, such as information management, but also how these individual communication activities reinforce and support each other.

Communication plays an important role in managing the challenges and opportunities arising from embeddedness. When group members pay attention to the way they manage information, make decisions, learn, and construct relationships, they will be better able to manage the tasks their group must perform. While one can never identify the exact set of causal factors that will perfectly predict a group's experience, it is more likely that your group experience will be positive when the individual activities of information management, decision making, learning, and relating are performed competently and in such a way that they mutually reinforce each other.

STUDENTS AND TEACHERS

STEVEN A. BEEBE

Texas State University–San Marcos

TIMOTHY P. MOTTET

University of Texas–Pan American

One of the most prominent relationships you have with others is the relationship you develop with those who teach you new concepts and skills. From your earliest teachers—your parents—to your professors in college, the relationship between teachers and students is one of the most pervasive in our lives. This chapter is about the role and function of communication between teachers and students. We'll discuss not only how teachers affect students and their learning through communication but also how students affect teachers and their teaching.

Instructional communication is the label researchers have given to the formal study of communication between teachers and students. Specifically, instructional communication is the process by which teachers and students stimulate meanings in the minds of each other using verbal and nonverbal messages. This definition is applicable not only in traditional primary, secondary, and higher education contexts (McCroskey, 1968), but also in nontraditional education contexts, such as corporate training and community education programs (Beebe, Mottet, & Roach, 2004). In emphasizing the role of communication in the teaching and learning process, the instructional communication researchers Hurt, Scott, and McCroskey (1978) noted, "Communication is the crucial link between a knowledgeable teacher and a learning student" (p. 3). Teaching and learning cannot occur without communication.

Rhetorical and Relational Approaches to Instructional Communication

The communication discipline has two rich traditions that influence how communication specialists study communication between teachers and students. We'll first discuss the *rhetorical* tradition and then the *relational* tradition. Both of these traditions have influenced the study of instructional communication (Mottet, Richmond, & McCroskey, 2006).

The Rhetorical Approach to Instructional Communication

From a *rhetorical* perspective, teachers use verbal and nonverbal messages with the intent to influence or persuade students. To persuade is to develop messages that change or reinforce attitudes, beliefs, values, or behaviors. As noted by McCroskey and Richmond (1996), "The function of rhetorical communication is to get others to do what you want or need them to do and/or think the way you want or need them to think—to persuade them" (p. 234).

The rhetorical function of communication, which draws on classical rhetoric with roots in the 4th century BCE, is source centered, or teacher centered. The focus is on how the source of the message intentionally attempts to achieve

a specific outcome. In the case of teachers communicating with students, the desired outcome is learning.

Aristotle's (1991) *The Art of Rhetoric*, written in 333 BCE, continues to be one of communication studies' most influential works and is considered by many communication educators to be the first "textbook" in public speaking. To Aristotle, there are three factors that enhance a person's ability to persuade: (1) *ethos* (the personal character of the speaker), (2) *pathos* (the use of emotion), and (3) *logos* (the logical, rational nature of the message). If teachers are to be successful in their attempts to communicate source-centered meaning to their students, students must first perceive them to be credible or believable (*ethos*). Teachers must also help students learn by using verbal and nonverbal messages that stimulate students' affective or emotional responses (*pathos*). Various instructional message variables that focus primarily on nonverbal messages have been found to influence students' emotions. Finally, teachers must present logical, rational messages using appropriate evidence and reasoning (*logos*).

The rhetorical approach to instructional communication assumes a "process-product" view of teacher and student communication. Researchers using the process-product paradigm study the teaching and learning *process* (including the messages teachers and students use to influence each other) and then measure the *product* of learning. The learning product includes how much students learned, as reflected in test scores, students' own perceptions of how much they learned, as well as students' affective response to the learning process.

The Relational Approach to Instructional Communication

In addition to the rhetorical perspective, a second communication perspective examines instructional communication as a *relational* process in which both teachers and students mutually create and use verbal and nonverbal messages to establish a relationship with one other. A relationship is an ongoing connection made with another person through communication (Beebe, Beebe, & Redmond, 2008). From a relational perspective, rather than focusing exclusively on message content and behavioral outcomes, teachers and students are concerned with the emotions and feelings that are a part of the teaching and learning process. The relational perspective of communication, with its emphasis on affective or emotional responses, draws on contemporary models of communication in which meaning is mutually created and shared between individuals. An additional emphasis of the relational approach to instructional communication is a focus on both teacher and student perceptions of well-being. In essence, the relational approach focuses on how teachers and students perceive and affectively respond to each other, which influences teachers' motivation to teach

(Mottet, Beebe, Raffeld, & Medlock, 2004) and students' motivation to learn (Ellis, 2000, 2004).

A major emphasis of relational communication research is on teachers' and students' use and interpretation of nonverbal messages. Nonverbal messages are those in which behavior, other than written or spoken language, creates meaning for someone (Beebe, Beebe, & Redmond, 2008). Nonverbal cues such as eye contact, posture, facial expressions, and gestures stimulate the majority of the emotional or social meaning in messages (Burgoon, Buller, & Woodall, 1996; Mehrabian, 1972). Teachers who are nonverbally expressive or immediate (by establishing eye contact, smiling, using gestures, and moving closer to students) in the classroom positively influence students' liking for teachers (Frymier, 1994), motivation to learn (Richmond, 1990), and perceived learning (McCroskey & Richmond, 1992).

Although we have compared and contrasted the rhetorical and relational approaches to communication, we don't suggest that these two traditions are polar opposites. Both of these perspectives simply reflect different emphases of the communication process that are evident in teacher and student communication *at the same time*. To quote Aristotle's (1991) opening sentence in *The Art of Rhetoric*, "Rhetoric is the counterpart of dialectic." Rhetorical communication is the counterpart of relational communication. They are the two sides of a coin. Both perspectives have the same goal—to improve the quality and effectiveness of communication. In the instructional context, the goal is to facilitate learning. The rhetorical communication approach is more teacher directed in that the teacher traditionally determines classroom communication channels (by determining who talks and who listens) and outcomes (what the assignments are and what is tested). The relational approach to teacher-student communication is more collaborative: Both teachers and students are involved in creating meaning and making sense out of the communication messages that occur during learning.

Theories About Teacher and Student Communication

According to Kerlinger (1986), a theory is a set of interrelated concepts, definitions, and propositions that presents a systematic view of the world. Theories help us explain the world we experience and also assist us in making predictions about what will happen in the future. Theories help us have greater control of our lives because we have a better sense of why things may happen as they do. In addition, a theory helps us organize our experiences into categories (Shaw & Costanzo, 1970). Rather than relying exclusively on theories from other disciplines such as education, psychology, or sociology, instructional communication researchers draw on rhetorical and relational communication theories to explain and predict what makes teaching and learning effective.

As an area of academic study, instructional communication was first developed in the early 1970s, although the origins of investigating how teachers and students communicate extend back as long as there have been teachers and students. Each decade since 1972, when the International Communication Association formed the Instructional Development Division, an article has been published that reviews and summarizes the status of instructional communication theory and research. In 1977, Scott and Wheelless's *Communication Yearbook* article, titled "Instructional Communication Theory and Research: An Overview," suggested that instructional communication theory and research were not yet clearly defined. Despite the challenge of identifying specific instructional communication theories, Scott and Wheelless reviewed various programs of research that they classified as falling into one of the following six research domains: (1) teachers as sources and receivers, (2) students as sources and receivers, (3) message variables, (4) learning strategies, (5) media, and (6) feedback and reinforcement.

Seven years later, Staton-Spicer and Wulff's (1984) *Communication Education* article, titled "Research in Communication and Instruction: Categorization and Synthesis," developed a slightly different structure to help instructional communication scholars organize instructional communication theory and research. Reviewing research from 1974 to 1982, Staton-Spicer and Wulff's analysis of theory and research in instructional communication resulted in the following six categories, which are slightly different from those identified in the earlier Scott and Wheelless (1977) review: (1) teacher characteristics, (2) student characteristics, (3) teaching strategies, (4) speech criticism and student evaluation, (5) speech content, and (6) speech communication programs. To develop more useful instructional communication theories, Staton-Spicer and Wulff (1984) suggested that research efforts be more integrated, rather than focusing on unrelated, individual research variables. They further suggested that the various research studies that investigated instructional communication lacked a coherent theory, which would help researchers make more general explanations and predictions about teacher and student communication.

In 2001, Waldeck, Kearney, and Plax's *Communication Yearbook* article, titled "Instructional and Developmental Communication Theory and Research in the 1990s: Extending the Agenda for the 21st Century," commended instructional communication researchers for demonstrating the central role of communication in effective instruction. Yet, although acknowledging the progress, Waldeck and colleagues (2001) suggested that there were "few examples of theoretically grounded or programmatic research" that appear in the literature (p. 208).

Waldeck and colleagues' (2001) systematic review of the research literature identified 11 categories of theories that had been tested in the instructional context or used to explain the effects and relationships identified in instructional communication research: (1) arousal theory, (2) Keller's

ARCS (attention, relevance, confidence, and satisfaction) model of instructional design, (3) French and Raven's bases of power, (4) attribution theory, (5) expectancy learning/learned helplessness, (6) arousal valence theory, (7) approach/avoidance, (8) information processing theory, (9) social learning/cognitive theory, (10) cultivation theory, and (11) developmental theories. In the same article, Waldeck and colleagues categorized instructional communication variables and programs of research by identifying the following six categories: (1) student communication, (2) teacher communication, (3) mass media effects on children, (4) pedagogical methods/technology use, (5) classroom management, and (6) teacher-student interaction.

Although each of these three important articles has aided researchers in thinking about instructional communication theory, there is more work to be done to help researchers *develop* instructional communication theories. One limitation that runs across the three summary articles is that each summary of instructional communication theory and research was descriptive rather than prescriptive. By descriptive, we mean that the researchers simply identified key research and theory themes, rather than suggesting or prescribing new theories.

Rather than generating unique instructional communication theories, instructional communication researchers have had a tendency to either test theories from other communication contexts (such as interpersonal communication) or draw on theories from other disciplines (such as psychology) to explain their findings (Waldeck et al., 2001). Instructional communication theory has been especially influenced by interpersonal communication theory and research (McCroskey, 1998).

Instructional Communication Research Methods

For the most part, instructional communication researchers have used quantitative research methods to investigate teacher and student communication and to test instructional communication theory. Quantitative research methods involve testing hypotheses and answering research questions using controlled research experiments, gathering research data through the use of surveys, or interviewing subjects. In an experimental study, one or more research variables are manipulated (such as comparing a teacher using a high level of nonverbal immediacy cues with a teacher who uses few or no nonverbal immediacy cues) and then the effect of use or nonuse of specific behaviors on learning (such as affective or cognitive learning) is measured. Quantitative research methods also include the research technique of asking research subjects questions by using a survey or personal interviews. Subjects could be asked to describe the type of communication their teacher uses and then to answer questions about how much the student perceives that he or she has learned in the class. The

researchers then look for patterns, relationships, or trends between the type of teacher communication behaviors used and perceptions of student learning.

Communication researchers have used a variety of models to examine how teacher and student communication works (or doesn't work) in the classroom. Two of the most common research models are *experimental* and *naturalistic*.

The Experimental Model

The experimental model is often thought of as the most "scientific" and is usually considered the most valid approach to instructional communication research. A well-designed experiment controls and manipulates certain factors in the learning environment that are believed to influence certain instructional outcomes. All other factors in the instructional environment are held constant. For example, if more learning occurred as a result of a teacher using certain communication behaviors that were present in one condition and absent in another condition, then researchers can conclude that these communication behaviors affect student learning. Although this method may seem simple, it's actually quite complex, and researchers are required to follow certain experimental designs and protocols.

One common experimental design used by instructional communication researchers is referred to as the *pretest/posttest* with a control group design. This design includes two groups and is illustrated in the following manner:

G1	01	X	02
G2	01		02

G = Group 0 = Test X = Manipulated
 Communication Behavior

Assume that a researcher is interested in examining the impact that a teacher's use of humor has on students' understanding of a particular concept. Students in G1 are in the treatment group. These students take a pretest (01) so that the researcher can measure how much they know about the concept. Then, they listen to the teacher who uses a number of humorous stories (X) in her lecture. Following the lecture, the students take a posttest (02) so that the researcher can measure how much they learned.

Another group of students (who are similar to the students in G1) are in the control group (G2). These students take the same pretest as those in G1, but instead of the same teacher using humorous stories in her lecture, she presents a lecture without humorous stories. Following the lecture, the students take the posttest (02) so that the researcher can measure learning. The researcher hopes that the G1-02 scores (treatment group posttest scores) are significantly higher than the G2-02 scores (control group posttest scores).

Experimental research designs allow instructional communication researchers to show causation, that is, to conclude that students' learning a particular concept was caused by the teacher's use of, for example, humorous stories in her lecturing. Although experimental designs allow researchers to show causation, they're artificial and unnatural. They lack authenticity. For example, most teachers use a variety of communication behaviors when teaching and don't limit their teaching to only using humorous stories while lecturing. To combat this particular weakness, researchers also examine teacher and student communication using naturalistic models.

The Naturalistic Model

The naturalistic model of instructional communication research includes researchers examining and studying teacher and student communication in its natural environment—the classroom. Much of the research on instructional communication reported in recent years has focused on the study of instructional communication in regular classes at various levels of instruction. Most of the research in this area of study has used survey methods. A survey or questionnaire is a document that contains a number of questions or scales. Students read the questions or scale items and then provide the appropriate response that reflects their feelings, attitudes, or beliefs. Usually, this includes circling a number on a scale or providing a brief response. For example, if a researcher was interested in students' perceptions of their teacher's use of humor, the researcher would include a number of items on the survey assessing student perceptions. A researcher might ask, "How often did you see the teacher telling jokes?" and then ask the student to circle the appropriate number, where 0 = *never*, 1 = *rarely*, 2 = *occasionally*, 3 = *often*, and 4 = *very often*. Surveys usually include several pages with several different instruments. Once the data are collected, researchers enter the data into a computer and then use statistical software to examine the data.

Survey research allows researchers to demonstrate how two variables are related to each other. Rather than concluding that teacher humor *causes* student learning, survey research allows researchers to conclude that teacher humor is *related* to student learning. What remains uncertain is the direction of the relationship. It could be that student learning influences students' perceptions of teacher humor behaviors. Put another way, students who learn more may also be more perceptive of teacher humor behaviors.

It's important to understand that experimental and naturalistic models of instructional communication research have strengths and weaknesses. Neither model is perfect. The experimental model allows researchers to show causation (i.e., teacher humor causes increased learning); however, experimental designs are artificial and "not real." The naturalistic model is more authentic; however, this model doesn't allow researchers the control that the experimental model allows. What's important is to interpret research

findings while also considering the limitations of the research design whether experimental or naturalistic.

Applications and Conclusions of Instructional Communication Research

Instructional communication researchers, using both experimental and naturalistic research designs, have identified relationships between several teacher and student communication variables and learning outcomes. These research conclusions have clear applications to both teachers and students. The conclusions support specific advice for helping teachers increase learning and also help students be more aware of how their communication behavior may influence teachers and how teachers evaluate students. Instructional communication research has investigated communication variables that have implications for both rhetorical and relational instructional processes. Rhetorical instructional research variables include teacher credibility, clarity, and humor, to name a few. Research variables that have relational communication applications include immediacy, affinity-seeking, and relational power. Although there are many other instructional communication research variables that have been studied, we review these six research areas to present a general overview of instructional communication research conclusions and applications.

Credibility

One of the key sources of rhetorical influence a teacher or student has is *credibility*. Anchored in Aristotle's concept of ethos, credibility is the perception of character, intelligence, and goodwill that a speaker is perceived to possess. Speakers who are perceived as highly credible are viewed as more persuasive, organized, skilled in responding to questions and are overall perceived as more competent than are speakers who are not perceived to be credible. In the context of the classroom, credibility is the overall perception that someone has toward a speaker in terms of the person being believable, knowledgeable, trustworthy, and dynamic (McCroskey, 1998). As in other speaking situations, teachers who are perceived as credible have more influence over students than teachers who are not perceived as credible. Although the first research studies investigating credibility were focused on public figures, such as politicians or religious leaders, McCroskey, Holdridge, and Toomb (1974) examined the role and function of credibility in the classroom.

Here are eight research conclusions about and applications of teacher credibility as summarized by Myers and Martin (2006):

1. Teachers who have higher perceived credibility are also perceived as more effective teachers.
2. Students who perceive their teachers as having high credibility are more motivated to learn than students who perceive their teachers as having low credibility.
3. Students who perceive their teachers as having high credibility report higher cognitive learning than students who perceive their teachers as having low credibility.
4. Students who perceive their teachers as having high credibility report higher affective learning than students who perceive their teachers as having low credibility.
5. Students who perceive their teachers as having high credibility are more likely to recommend the course and instructor to their friends than students who perceive their teachers as having low credibility.
6. Students who perceive their teachers as having high credibility are more likely to participate in class discussions than students who perceive their teachers as having low credibility.
7. Students who perceive their teachers as having high credibility are more likely to talk to their teacher outside of class than students who perceive their teachers as having low credibility.
8. Students who perceive their teachers as having high credibility are more likely to take another class with the teachers than students who perceive their teachers as having low credibility.

Clarity

A teacher's *clarity* or lack of clarity has been demonstrated to affect how well students learn. To be perceived as clear, research suggests that instructors should speak articulately and audibly, stay on task without wandering to other topics, and use commonly understood vocabulary (Chesebro & McCroskey, 2001; Land & Smith, 1979). When a teacher is clear, students comprehend the instructor's intended meaning better than when a teacher is not clear (Chesebro & McCroskey, 1998, 2001). Research on teacher clarity has focused both on the structure of lecture presentations and on several verbal characteristics of instruction (Chesebro & McCroskey, 1998). These two research streams have demonstrated that to be clear, teachers need to explicitly organize their presentations using verbal transitions, signposts, and checkpoints to ensure that their students understand the course content (Cruickshank & Kennedy, 1986). As summarized by Chesebro and Wanzer (2006), here are four research conclusions and applications of research about teacher clarity:

1. Teachers who are perceived as clear are perceived as more effective teachers.
2. Students who perceive their teachers as clear learn more than from teachers who are perceived as not clear.
3. Teachers who are clear reduce students' fear or apprehension of communicating in the classroom.
4. Teachers who are perceived as clear are liked more by their students, and students liked their course content more than that of teachers who are not perceived as clear.

Humor

Aristotle noted that pathos or emotion has a rhetorical effect on the communication process. Instructor *humor* has an effect on the emotional climate of a classroom. Like instructor credibility, humor is another variable that has an effect on an instructor's rhetorical influence on students and the learning environment. There is evidence that teachers at all levels use humor when teaching (Chesebro & Wanzer, 2006). Research by Gorham and Christophel (1990) found that the majority of humor behaviors that teachers use in the classroom were purposeful humor attempts that were directed at students, the class, the university, department, national and world events, the subject matter, and the teacher. Researchers have identified categories of both appropriate and inappropriate humor (Frymier, Wanzer, and Wojtaszczyk, 2008; Wanzer & Frymier, 1999). Appropriate humor includes humorous statements that are related (or sometimes unrelated) to course material, nonverbal behaviors, self-deprecating humor, humorous props, sarcasm, and unintentional humor. However, the researchers also found that students perceived some of the same kinds of humorous categories as inappropriate humor. It's apparently not the category of humor that makes an attempt at humor appropriate or inappropriate. There are some kinds of humor that were generally perceived as inappropriate: humor at the expense of a student, sexual humor, swearing, humor based on sexual or racial stereotypes, or making light of very serious issues. "Making fun of students" was cited as the most inappropriate type of humor.

Research conclusions about humor in the classroom include the following (Chesebro & Wanzer, 2006):

- Teachers who win awards for their teaching use moderate amounts of humor.
- Students do not prefer teachers who use an excessive amount of humor but do like teachers who use some humor when teaching.
- Students have individual differences and preferences for the amount and type of humor used by instructors.
- High school teachers use the same kinds and types of humor in the classroom as college teachers but not as extensively.

Immediacy

Teacher *immediacy* is one of the most researched instructional communication variables. Immediacy is a perception of physical and psychological closeness. Such closeness, either literal or psychological, has a major effect on the perceived quality of a communication relationship. According to the psychologist Albert Mehrabian (1969), the originator of the immediacy concept, immediacy consists of communication behaviors that "enhance closeness to and nonverbal interaction with another" (p. 213). Perceptions of immediacy expressed through behaviors

such as forward body leans, head nods, and eye contact, which enhance relational development (Mehrabian, 1969) in interpersonal communication situations, are also applicable to relationships between teachers and students. Standing closer to someone, moving from behind barriers, (e.g., a desk or a lectern), as well as leaning toward someone are all immediacy behaviors.

Building on Mehrabian's definition, Andersen (1979) defined teacher immediacy as "the nonverbal behavior manifestations of high affect" (p. 543). Gorham (1988) further expanded the construct to include verbal immediacy messages as well. The use of specific words and phrases (e.g., saying "we" or "our" rather than "me" or "mine") increases perceived closeness with others. Using students' names is also a verbal immediacy strategy. The immediacy principle can be summarized this way: The more a communicator uses immediacy cues, the more others will like and evaluate highly the communicator. The opposite is also true according to the immediacy principle: The less a communicator uses immediacy cues, the less others will like and evaluate highly the communicator.

Andersen and her colleagues found that teacher immediacy accounted for a major portion of the variance in affect toward the instructor, affect toward the course content, affect toward the behaviors recommended, and the likelihood of enrolling in another course of the same nature (Andersen, 1978, 1979; Andersen & Andersen, 1982). Teachers who use immediacy behaviors resulted in students who have overall a more positive attitude toward the instructor and the course.

Some of the most important findings for teacher immediacy are noted below (Richmond, Lane, & McCroskey, 2006; Witt, Wheelless, & Allen, 2004):

- Verbal teacher immediacy increases student cognitive learning. Teachers should use immediacy behaviors to help their students learn.
- Verbal teacher immediacy increases student affective learning. Teachers who use verbally immediate language, such as "we," "us," and "our," and call students by name help their students have more positive feelings about both the teacher and the course.
- Nonverbal teacher immediacy increases student cognitive learning and information recall.
- Nonverbal teacher immediacy increases affective learning. Students appear to like the instructor and the course more if teachers use nonverbal immediacy behaviors.
- Nonverbal teacher immediacy increases students' perceptions of teacher effectiveness.
- Nonverbal teacher immediacy plays a mediating role in the reception and effectiveness of teacher control strategies. If, for example, a teacher is trying to encourage students to read their assigned reading (a rhetorical communication strategy), a teacher's use of immediacy behaviors (a relational communication strategy) will increase the likelihood that students will both comply with the request and have more positive feelings toward the teacher.

- Verbal and nonverbal teacher immediacy is significantly and positively related to perceptions of teacher clarity. Teachers who are immediate are perceived as providing more clear instruction than teachers who are not immediate.
- Teacher immediacy produces a reciprocal liking among teachers and students.

Additional evidence supports such findings across many different grade levels (Plax, Kearney, McCroskey, & Richmond, 1986) and ethnicities (Powell & Harville, 1990; Sanders & Wiseman, 1990), different course types (Kearney, Plax, & Wendt-Wasco, 1985), and modified or nontraditional classroom structures (Andersen, 1979; Kearney et al., 1985).

The key application of immediacy is this: *Teachers who are perceived to be immediate help their students learn.* There is also evidence that students who are nonverbally responsive toward their teachers are perceived more favorably than students who are not nonverbally responsive (Mottet, Beebe, Raffeld, & Medlock, 2004; Mottet, Beebe, Raffeld, & Paulsel, 2005).

Affinity Seeking

Affinity means liking. Whether you like someone or not is a key element in determining the nature of the relationship between you and the other person. If you have high affinity toward someone, it means that you like that person. *Affinity-seeking* behaviors are those verbal and nonverbal behaviors that are used to get others to like you. Evidence suggests that teachers who are liked by their students enhance the learning climate (Frymier & Wanzer, 2006; Gorham and Burroughs, 1989). Gorham and Burroughs (1989) found that teachers' use of affinity-seeking strategies, that is, specific behaviors that cause them to be liked, result in increased student affinity with both the teacher and the subject matter.

Some affinity-seeking behaviors seem to be especially important in helping teachers be liked by their students. Here's a list of teaching strategies that are associated with positive relationships with increased learning, motivation, and an overall positive climate:

- *Facilitating enjoyment:* The teacher purposefully works to increase student enjoyment of classroom activities, lectures, and assignments.
- *Optimism:* The teacher expresses a positive, hopeful, upbeat outlook.
- *Assuming equality:* The teacher minimizes status differences between teacher and students.
- *Conversational rule keeping:* Teachers are polite, don't interrupt students, and treat students with respect.
- *Comfortable self:* The teacher is confident, relaxed, and overall appears comfortable in the classroom.
- *Dynamism:* Teachers are enthusiastic and energetic.
- *Eliciting others' disclosures:* Teachers provide individual attention to students, invite students to talk about themselves, and then use the information they learn from students to compliment the student.

- *Altruism:* Teachers are helpful to students and go beyond expectations to assist students.
- *Listening:* Teachers listen without interrupting a student.
- *Sensitivity:* Teachers express caring, empathy, and warmth toward students.

Several research studies summarized by Frymier and Wanzer (2006) identify applications to teaching and learning:

- Teachers who use affinity-seeking strategies are perceived to be more credible—that is more knowledgeable, trustworthy, and dynamic—than teachers who do not use affinity-seeking strategies.
- Teacher use of affinity-seeking strategies is moderately correlated with student motivation to learn.
- Teachers who evoke more positive feelings from students enhance the learning climate.
- Teachers who consciously use affinity-seeking strategies engender increased affinity with both the teacher and the subject matter.
- Teachers who use selected affinity-seeking strategies (e.g., assuming equality, conversational rule keeping, eliciting others' disclosure, facilitating enjoyment, and optimism) enhance student liking toward the teacher.
- Teachers of lower grade levels use different affinity-seeking strategies than teachers of higher grade levels.

Relational Power

To have power is to have the ability to influence someone. The level and nature of influence with another person is central to determining the quality of the relationship that you have with that person. The source or basis of power depends on the specific nature of the relationship. Sometimes power is granted to someone because of his or her role or position, and, at other times, power develops organically as we begin to trust and like someone. People whom we like and respect have greater power to influence us than people whom we don't like and respect.

A series of research studies conducted by Plax and Kearney (1992) and Plax, Kearney, McCroskey and Richmond (1986) explored the influence of what the researchers called behavioral alteration techniques (BATs) and behavioral alteration messages (BAMs) used by teachers to influence students. The researchers documented the types of power messages and techniques that had an effect on student learning. Researchers discovered that certain types of power messages had a more positive impact on learning than did others. The more positive messages teachers use to influence students were called prosocial BATs and BAMs. Some of the more positive or prosocial BATs and BAMs include (a) offering rewards, (b) appealing to enhanced self-esteem if students would perform certain behaviors (e.g., read the assignment), (c) expressing liking toward the student, (d) being responsive toward the student, and (e) noting that others have performed the same behavior and that the teacher has modeled the behavior.

Here are several research conclusions that stem from investigations of power and influence messages in the classroom (Roach, Richmond, & Mottet, 2006):

- Teacher communication strategies or BATs and BAMs are used by teachers in the classroom to exert power over students.
- Use of positive or prosocial BATs and BAMs leads to higher student affect toward the instructor.
- Prosocial BATs and BAMs are related to increases in perceived student cognitive and affective learning.
- Teacher power usage is mediated by teacher nonverbal immediacy. Teachers who use antisocial BATs and BAMs are perceived by students as using prosocial BATs and BAMs if teachers use nonverbal immediacy behaviors.
- Teacher use of BATs and BAMs affects student motivation toward learning.

Conclusion

This chapter has explored the theory and research that explains and predicts how teachers and students communicate with each other. Two traditions influence the study of instructional communication—rhetorical and relational. From a rhetorical perspective, teachers use verbal and nonverbal messages with the intent to influence or persuade students. Student learning is achieved through a teacher's influence. From a relational perspective, teachers and students mutually create and use verbal and nonverbal messages to establish a relationship with each other. Student learning is achieved through the relationship.

The health of any academic field of study is reflected in its theory generation and in research applications that allow theories to be tested. A number of researchers have reviewed the development of instructional communication theory throughout the past three decades. Although these authors note theoretical progress, they also acknowledge that a unified theory of instructional communication has yet to emerge from the research. Some senior scholars would probably argue that the lack of a unified theory of instructional communication is not all that unexpected in a field of study that is only four decades old.

Two models of research currently dominate instructional communication research—experimental and naturalistic. The experimental model, which is artificial and lacks “realness,” allows researchers to control the variables to demonstrate causation. The naturalistic model—which doesn't allow control, and therefore claims of causation cannot be made—allows researchers to illustrate how teacher and student communication variables and learning are related to each other. Both models of research have strengths and weaknesses, and readers are encouraged to interpret research findings in the context of the limitations.

Finally, a number of teacher and student rhetorical and relational communication variables have been studied: credibility, clarity, humor, immediacy, affinity-seeking, and relational

power. Each of these variables has produced a number of important applications for teachers and students. When these research conclusions are applied and used, teachers become better teachers and students become better students.

PATIENTS, DOCTORS, AND OTHER HELPING RELATIONSHIPS

WAYNE A. BEACH

San Diego State University

Relationships between patients and providers are an inevitable part of everyday life. Throughout the life cycle, humans have fundamental needs requiring care by diverse medical experts, including (but not limited to) physicians, physicians' assistants, nurses, counselors, and therapists. Medical professionals are trained to address, resolve, and seek healing for a wide variety of health-related biological, social, and psychological problems. Physical and bodily symptoms may be associated with pains, discomforts, and disabilities, restricting full and active participation in daily activities. Variations in lifestyle (e.g., nutrition, exercise, weight, addictions, sleep, and stress) influence both the quality and length of life, as well as behaviors creating and reducing health risks. For example, the American Cancer Society (2008) estimates that more than one-third of cancer deaths could be prevented by changes in patients' health and lifestyle behaviors. Experiences with and the emotional impact of sickness, as well as mental illness, troubled relationships, and the spiritual dimensions of wellness, also contribute in significant ways to overall health. And across family, social, and working relationships, the ongoing presence/absence of comfort, support, alienation, and unresolved conflict affect the delicate (im)balance of mind, body, and spirit. All these dimensions are interrelated, each shaping and shaped by additional factors, such as family medical and genetic history, predispositions toward specific types of disease (e.g., diabetes, breast cancer, depression), and chronic health conditions.

The investigation of communication between patients and providers has focused on diverse types of encounters. For example, a wide array of social activities and distinct patterns of interaction have been examined during medical

interviews involving primary, outpatient care (see Beach, in press; Byrne & Long, 1976; Heath, 1986; Heritage & Maynard, 2006; Roter & Hall, 2006; West, 1984), therapy sessions (see Morris & Cheneil, 1995; Peräkylä, Antaki, Vehviläinen, & Leuder, 2008), AIDS counseling (Peräkylä, 1998), patient-centered cancer care (Epstein & Street, 2007), treatment recommendations for breast cancer therapy (Roberts, 1999), and the ways parents and doctors negotiate antibiotic prescriptions for children (Stivers, 2007).

This chapter focuses primarily on communication between patients and physicians during medical interviews. The following issues are addressed: (a) the *ideal* features of patient-provider relationships; (b) a brief history of "biomedical" versus "patient-centered" approaches to medical care; (c) studying the organization of medical consultations; (d) examples of power and authority as practical achievements (selected transcribed excerpts from actual interviews are included, providing readers with the opportunity to ground their understandings by inspecting interactions and becoming engaged in analysis of key moments); and (e) a glimpse of communication and medical care in the 21st century.

Ideal Patient-Provider Relationships

Patients' maladies require understanding, compassion, diagnosis, and treatment. During medical encounters, ordinary "lay" persons (i.e., nonmedical experts) must somehow report their problems to medical professionals, the authorities whose care is being sought to assist with managing

health issues. *Ideally*, patients are able to clearly describe their physical/bodily symptoms, medical history, and related concerns about everyday life circumstances (e.g., job, family, relationships, finances, exercise, and diet). Patients' experiences and emotions will also be disclosed and thus made available for providers' consideration. And when asked questions, patients are able to provide sufficient and informative answers. To ensure their understanding and care, patients will become informed about their medical problems (e.g., through literature, Internet sites, and/or speaking with others who have had similar experiences), seek clarifications, and ask their own questions in assertive yet respectful ways. Patients will also be open and receptive to having their own "lay diagnoses" (Beach, in press) revised, altered, and perhaps even rejected altogether by informed medical experts. So, too, will patients' family members or significant others work closely with the patients to enhance their comprehension and acceptance of the illness and of strategies for treatment. And patients will follow medical advice, complying with regimens such as exercise, diet, and taking of prescriptions.

In turn (and again, *ideally*), providers balance two equally important and related capabilities: (1) they are skilled in diagnosing medical problems (alone and with care teams) and technically competent in using appropriate medical technology and prescriptions to treat medical problems and (2) they will not impose their biomedical agendas (described below) at the expense of patients' concerns but are compassionate in their caring, that is, adept at hearing and being responsive to patients' reportings, both willing and able (a notable distinction) to work together on problems each perceive as important.

Providers who are particularly gifted continually form active partnerships with patients and their families/significant others. Rather than enacting behaviors contributing to foreign, impersonal, and dehumanizing medical encounters, provider-patient relationships are bound together by mutual respect exhibited through encouragement, reassurance, and the development of trusting communicative environments. Each party is understood and valued as bringing important life-world experiences and knowledge to the encounter. Each possesses unique skills and insights, and each displays recognition that they must work together, effectively and efficiently, to minimize suffering and promote healing outcomes.

To optimize quality patient care and satisfaction, skilled providers also recognize and work creatively when managing the inherent constraints of time and resources. Essential medical jargon is clarified when needed. Bad and good news are not withheld but delivered honestly and with sensitivity (see Maynard, 2003), yet the power of hope is not discounted (Beach, 2009). Patients are not blamed and shamed for lack of medical knowledge or unhealthy lifestyles (e.g., smoking, being overweight, poor diet, or failing to comply with medical advice), but they are heard and understood as engaging in specific types of behaviors in the midst of what are often complex yet (for

them) normal daily circumstances. For example, a patient may be wounded from adverse experiences as a child or adult (see Adverse Childhood Experiences Study [ACE], 2008, www.acestudy.org, accessed March 8, 2008) and, relatedly, stressed from multitasking across families, relationships, finances, and jobs. These chronic conditions—"root problems" underlying a significant percentage of adult health problems—can promote unhealthy lifestyles and thus reduce length and quality of life. And when patients attempt to diagnose their illnesses through "lay" knowledge (e.g., personal experiences, speaking with others, media, and/or the Internet), their explanations should not be prematurely discounted. Even if patients' "lay" diagnoses are inaccurate, they should be rewarded for being involved and active partners in care. If necessary, patients will be educated (not lectured) on how alternative diagnoses are more compelling and suited to the medical problems at hand. When providers do not know what or why something is occurring—medical experts are no more or less infallible than patients—they make timely but appropriate referrals. And, critically, from the inception of care, providers work in close and respectful collaboration with nurses and staff, who work as a team to ensure patients' health and well-being.

Of course, we do not live in *ideal* social worlds or relationships, and medical encounters are certainly no exception. How do the social actions listed above, for both patients and providers, get enacted during clinical interactions? Research findings make clear that as patients and providers work together, they produce distinct patterns of human communication that are often less than ideal. Several of these patterns are summarized below, including particular kinds of recurring problems between providers and patients as "biomedical" and "lay" agendas get negotiated interactionally. Selected transcribed excerpts, drawn from naturally occurring interviews, will be used to exemplify these communication patterns by providing readers with opportunities to inspect, firsthand, the kinds of moments that routinely determine patient-provider encounters.

A Brief History: "Biomedical" Versus "Patient-Centered" Orientations to Care

Physicians are traditionally understood as exhibiting "biomedical" orientations to patient care. More than 30 years ago, Engel (1977) described how, in primary care, "the biomedical model . . . encourages bypassing the patient's verbal account by placing greater reliance on technical procedures and laboratory measurements" (p. 132). Engel's position is clear: What patients report about their life-world experiences should not be reduced to medical symptoms and their treatments but analyzed "in psychological, social, and cultural as well as in anatomical, physiological, or biochemical terms" (p. 132). Patients should not be reduced to bodies with assorted symptoms but

treated as unique persons engaged in daily life circumstances that are, for them, somehow related to the illness experience. An emphasis on bodies and symptoms, stripped of persons' everyday life-worlds, contributes to derogatory stereotypes that doctors are just "body mechanics," while patients are only "medical record numbers" trapped in an assembly line of depersonalized medical care (Starr, 1982).

Distinctions between *illness* and *disease* are critical for understanding often competing orientations to medical diagnosis and treatment (e.g., see Cassell, 1985; Mishler, 1984). *Illness* emphasizes the inherently emotional, affective, and experience-based dimensions, while *disease* focuses on how particular kinds of symptoms give rise to specific diagnoses (e.g., diabetes, cancer, or cardiovascular problems contributing to strokes and heart attacks). In everyday life, these dimensions are tightly interwoven and should not be falsely dichotomized through reductionist and thus dehumanizing medical care. It was for this primary reason that Engel (1977) offered a "biopsychosocial" approach to understanding and treating the rich complexities of the human condition. The key is to promote doctoring centered on patients' concerns and problems, an integrative focus that has triggered ongoing developments in "biopsychosocial" research, clinical application, and medical training (Frankel, Quill, & McDaniel, 2003). A host of other factors have also been put forward as contributing to reductions in the offering of personalized medical care: (a) because doctors must increasingly adhere to financial restrictions associated with managed care, they struggle with constraints on time, which prohibit patients from fully disclosing their concerns; (b) doctors avoid addressing patients' emotions not only because they feel inadequately trained as therapists but also because doing so takes time that is not considered to be available during normal interview slots; (c) concerns about malpractice influence the lack of full descriptions about health problems (e.g., see Levinson, Roter, Mullooly, Dull, & Frankel, 1997); (d) increased reliance on sophisticated technology actually distances doctors from patients; and (e) inadequate communication training promotes indifference to what patients treat as important.

But it is clear that patients whose voices are heard and attended to are much more likely to become more actively involved with ongoing care. Increased participation, evident through communicative involvement, promotes enhanced satisfaction, accuracy of diagnosis, reduction of suffering, and improved healing outcomes (see McGee & Cegala, 1998; Street, Krupat, Bell, Kravitz, & Haidet, 2003).

Advances in "patient-centered care" provide viable options to disease-centered or biomedical approaches to diagnosing and treating patients. Priority is given to the therapeutic possibilities of medical consultations (Balint, 1957; see Excerpt 2, p. 362 of this chapter), values and actions that are all too frequently undermined: such as attending closely to patients' affective experiences of their

illnesses and their life-world circumstances (i.e., the psychosocial context in which their illnesses occur), building trusting relationships and partnerships, and increasing patients' involvements in their care through shared decision making (Frankel, Quill, & McDaniel, 2003; Roter & Hall, 2006; Street, Gordon, Ward, Krupat, & Kravitz, 2005). One classic quote is attributed to Hippocrates (470–360 BCE), reputed to be the Father of Medicine: "I would rather know the person who has the disease than know the disease the person has." Thus, it is clear that the basic idea of treating patients as persons and not diseases reaches back to antiquity and should not be mistaken as solely a result of modern theorizing.

Yet numerous approaches to patient-centered care have emerged in the past several decades, echoed again in the introduction to Cassell's two-volume set *Talking With Patients* (1985), where he states, "Doctors treat patients, not diseases" (p. 1). Common priorities given to promoting "humanistic" medical care extend across diverse approaches to ensuring quality of care. Prominent resources such as the *Journal of the American Medical Association* have for years drawn attention to the importance of not overlooking how providers respond empathically (or not) to "windows of opportunity," particularly during moments when patients make available their feelings and experiences, often indirectly through hints or cues (e.g., Suchman, Markakis, Beckman, & Frankel, 1997). The long-standing need to enhance skills for communicating effectively has received considerable attention, including areas such as cancer care, where displayed sensitivity to patients' fears and uncertainties promotes improved outcomes (see Baile et al., 1997; Maguire, 1999). Questions have also been raised about the ways physicians' gender influences care (e.g., Roter & Hall, 2004), and research that begins to address whether female physicians, for example, exhibit more empathic communication styles. These and related concerns have triggered new accreditation standards for medical education, including a reorganization of the educational programs of residencies in the United States (Accreditation Council for Graduate Medical Education [ACGME], www.acgme.org/acWebsite/home/home.asp, accessed January 11, 2008). These humanistic and relationship-centered medical concerns are also promoted by the Institute of Medicine (IOM, www.iom.edu, accessed July 1, 2008).

To summarize, while technical knowledge about disease and treatment options are critical, "biomedical" orientations to care have repeatedly been found to restrict and minimize attention given to patients' experiences and emotions. In contrast, as a primary resource for building trusting and collaborative partnerships, "patient-centered care" attends closely to patients' needs, offering technically competent diagnosis and treatment options. Questions can then be raised: If and when patients' life-world experiences

are disregarded in the midst of diagnosing and treating “bodies,” what factors contribute to how communication shapes medical interviews?

Models Describing the Organization of Medical Interviews

Numerous researchers and clinicians have attempted to generate models of medical consultations. Attention has been given to the opening to closing phases of interviews, as well as to how to have the best impact on patients’ lives—for example, by offering understanding and support, challenging, motivating, and educating patients about healthy behaviors—all during relatively short amounts of clinical time (see Byrne & Long, 1976; Waitzkin, 1991). Among these efforts, the most frequently cited is an extensive study by Byrne and Long (1976), whose analysis of 2,500 primary care encounters yielded a description of six possible phases as well as a range of verbal behaviors and styles routinely used by doctors (e.g., closed attempts to gather information and more facilitative efforts to encourage and counsel patients). The six phases are as follows: (1) openings, during which doctors seek to develop a relationship with patients; (2) patients provide and/or doctors solicit reasons for the clinical visitation; (3) taking a verbal history and/or conducting a physical examination; (4) doctor works alone, and at times in unison with patients, to consider (i.e., diagnose) the patient’s condition; (5) detailing further treatments and/or investigations that may be needed; (6) doctor terminates and thus closes the consultation. These activities are frequently associated with eliciting and elaborating on patients’ chief complaints, taking a medical history, performing a physical examination, evaluating other investigations, and offering a diagnosis and treatment plan (Waitzkin, 1991).

While these and other phasic models are conceptually and theoretically intriguing, they are only suggestive and not anchored in specific details about the interactional conduct of both patients and physicians. As a viable alternative, Robinson (2003) describes a “project” including how possible phases—(a) establishing how “new problems” are the “reason for the visit,” (b) interactionally conducting history taking and physical exams, (c) actually delivering/receiving a diagnosis, and (d) offering and accepting/rejecting recommendations for treatment—are replete with a range of detailed, social activities produced by patients and physicians as they work together to coordinate medical encounters. Because “no one has yet demonstrated the internal validity of the proposed project or its consequences for physicians’ and patients’ communication behavior” (p. 32), Robinson (2003) has begun to develop a structural schema involving how new patients raise problems as “first topics” to be dealt with during medical interviews. By closely examining the interactional organization of recorded and transcribed moments from actual interviews, key insights can be advanced that explain (among other primary problems)

why and how patients are so passive during medical encounters. A similar orientation is evident in the volume edited by Heritage and Maynard (2006), a collection of studies unpacking the kinds of interactional details that constitute the overall structure of acute primary care visits—encounters most generally described as organized across the following phases: (a) opening, (b) presenting complaint, (c) examination, (d) diagnosis, (e) treatment, and (f) closing (p. 14).

Offering Candidate Explanations About Medical Problems

It has been suggested that patients’ low involvement is a function of passivity in the face of medical expertise, in part because patients lack technical knowledge and experience uncertainty, factors reducing their ability to seek relevant information and even ask appropriate questions (Street et al., 2005). Ongoing research is attempting to clarify how or if these kinds of possibilities get enacted in the midst of patient-physician interactions.

Consider, for example, a patient-physician excerpt from Robinson (2003). The doctor employs an open-ended question to solicit the patient’s description of “thuh problem”:

Excerpt 1. Eye Trouble (Robinson, 2003, p. 36)

- 11 DOC: What seems to be thuh problem?
 12 PAT: .hh I’ve been having a problem: (0.2) mostly with
 13 this eye but I’m- with both.
 14 DOC: Okay.
 15 → PAT: .tch I don’t know if it’s:=uh:- when do I- when I
 16 → was=uh: cutting lumber an’ .hh a:nd=uh: thuh
 17 → sawdust hit my (eyes),

Patient not only states a reason for his visit but, following the doctor’s acknowledgment with “Okay” (line 14), moves to offer his own diagnosis (lines 15–17). Patients routinely offer contributions about how they make sense of the symptoms they are experiencing and what they consider their problems to be (Gill, 1998; Gill & Maynard, 2006). By so doing, the patient also makes clear that the purpose of the medical encounter is to determine what is wrong, a prerequisite for doctors treating and resolving problems “in the service of diagnosis” (Robinson, 2003, p. 37). But it is also apparent that the patient, by speculating that his eye problems may be a result of “cutting lumber,” displays a need to further establish a valid reason for scheduling an appointment with the doctor. Prefaced with “I don’t know,” however, the patient’s candidate explanation is produced as doubtful, hesitant, and dysfluent. (Notice, for example, that and how the patient searches what to say with three “uh’s” and twice abruptly cuts off (-) and restarts the utterance.)

Gill (1998) has observed that, “when patients exhibit tentativeness and uncertainty about the knowledge they are displaying in their explanations, they also tentatively invite doctors’ assessments” (p. 356). Being tentative displays an orientation to proceeding with caution, downplaying their experiences and knowledge, even though patients’ explanations may (at least for them) seem not only reasonable but also even likely possibilities. And even when patients present *unlikely* candidate explanations, they have been shown to manage multiple and even conflicting constraints—for example, evidencing their ability to make sense of their condition, yet not advancing worst-case scenarios since it is doctors who are in a better position to make such assessments (Gill & Maynard, 2006; Pomerantz, Gill, & Denvir, 2007). So, too, are doctors in a position not only to grant or reject patients’ requests but also to respond in kind to patients who raise their concerns indirectly and delicately (Beach, in press). These actions further reveal how patients are tentative and cautious when attempting to draw attention to their expectations, needs, desires, hopes, and fears (see Beach, Easter, Good, & Pigeron, 2004; Excerpt 2, below).

To summarize, considerable evidence suggests that when offering explanations amounting to “lay diagnoses,” patients routinely defer and thereby subordinate their knowledge and authority to physicians. Patients display recognition of medical expertise: It is physicians who have not only received technical training but also accumulated experience across years of clinical practice, proficiency amounting to greater knowledge and ability to assess, diagnose, and treat what count as real or imagined problems (at least biomedically). And, as addressed below, there are additional reasons for a basic imbalance or asymmetry of power and authority during medical encounters. So, too, are moments evident when patients initiate assertive actions, at times contesting and resisting the doctor’s authority.

Power, Authority, and Asymmetry During Medical Encounters

Even prior to the outset and through the completion of the medical encounter, “the physician-patient relationship is marbled through with the exercise of authority” (Heritage, 2005, p. 83). Before the interviews begin, patients routinely wait for providers, and on their arrival, it is doctors who initiate greetings, arrange the physical space, and coordinate tasks, such as locating and reviewing medical records (Heath, 1986). When doctors do solicit patients’ opening complaints (e.g., “What can I do for you today?”), Beckman and Frankel (1984) discovered that doctors interrupt patients after they state a single problem, on the average within 18 seconds, moving—frequently with closed questions—to gather additional information about that single issue. And when interrupted, only 1 of 52 patients actually completed their full listing of concerns. By not asking patients if they

have additional concerns, which is not uncommon, physicians’ attempt to take control of the interview, which constrains and even halts important information patients could provide about their condition.

In a related study, Marvel and colleagues (1999) examined whether improvements had been made in appropriately soliciting patients’ agendas before redirecting to what physicians treat as important. In only 74 of 199 interviews did patients complete their initial statement of concerns, and in the majority of cases, patients were redirected by their physician after only 23.1 seconds. As with Beckman and Frankel’s (1984) original study—where interruptions occurred after 18 seconds, even though most completed statements occurred in less than 60 seconds and no more than 150 seconds—Marvel and colleagues (1999) concluded that completed statements of concern required only 6 additional seconds. Thus, by investing minimal additional time, physicians could improve their care (and patients’ satisfaction, compliance, and reduction of unnecessary return visits) by attending more closely to information anchored in patients’ concerns. And in both studies, patients who were interrupted at the outset of the interview more frequently raised concerns in the closing phase of the interview, moments when doctors have been shown to be even less receptive to adequately addressing patients’ problems.

The phasic progression of medical interviews is designed to facilitate doctors’ agendas by actions such as asking more frequent questions, delaying or failing to respond to patients’ initiatives, and shifting and closing down topics. Restrictions are also imposed on what reasonably counts as reliable information, knowledge, procedures to be taken, and appropriate utilization of time, prescriptions, referrals, and additional resources (see Beach, in press; Stivers, 2007).

Raising and Responding to Psychosocial Concerns

During particular moments, patients appear to prematurely solicit diagnostic information from physicians before the history-taking or physical examination has been completed (Jones & Beach, 2005). So doing essentially deviates from the typical ordering, where physicians (understandably) offer diagnoses only *after* relevant information has been gleaned. In Excerpt 2 (below), following an opening introduction and greetings, the doctor’s typical initiation of the patient’s complaint (e.g., “What can I do for you today?”) is preempted by the patient’s “Well I hope you can find out what’s wrong with me” (1→).

Excerpt 2. S14:1 (Jones & Beach, 2005, pp. 107–108)

Dr: H’lo Mister Steen.=
P: =Good morning.
(2.0)

- Dr: I'm Physician Krone.
(0.2)
- P: Pleased to meet sir.
- Dr: Nice to meet you.=
- P: 1→ =Well I hope you can find out what's wrong with me.
- Dr: 2→ We(h)ll I hadn't even seen you yet.
- P: 3→ (At's whuh) I say I still say I hope you can find out what's wrong [with me.
- Dr: 4→ [O:h, okay.
(0.4) Well we will.
- P: 5→ Whatever you think whatever
yo:- (0.5) u:h (0.3) whatever it is tell me:
so I can- (0.7) eh- (0.7) (keepn gih-)
get somethin done about it. Cause (.)
ma:n (0.4) it's worrying me.

Rather than respond to the patient's query as an anxious and hopeful bid for reassurance, in 2→, the doctor responds with surprise by stating the obvious: "We(h)ll I hadn't even seen you yet."

But this reply does not ease the patient's concern. In 3→, the patient restates his need and further pursues what is noticeably absent, namely, an offering of consolation from the doctor. It is only in response to the patient's second attempt that, and with hesitation, the doctor's next "Well we will" (4→) is provided. The doctor does not personally assure the patient that whatever is wrong with him will receive the doctor's full attention and/or that the doctor will work together with the patient to ensure healing. Rather, the doctor invokes "we" to mark institutional affiliation (Drew & Heritage, 1992), in a manner that minimally addresses the patient's concern yet does not clearly align with the twice-stated "hope" the patient is expressing. Matters of "hope," then, are not just located in the heart or mind but managed as ordinary interactional achievements (see Beach, 2008).

In 5→ with "you," however, and with considerable hesitation and dysfluency (i.e., multiple pauses and restarts), the patient squarely focuses attention back onto the doctor. Three times, "whatever" is employed to state, "Whatever you think" and "Whatever it is tell me," a request that the doctor not be withholding about "it"—an apparent and indirect reference to an illness or disease—and that the reason for his visit is that he wants to "get somethin done about it." And what is the urgency driving the patient to raise these concerns at the outset of the medical interview? The answer is straightforward: "Cause (.) ma:n (0.4) it's worrying me."

By initiating these actions at the outset of the encounter, it is "worry" that the patient is not only experiencing but also seeking solace from the doctor for. No symptoms have yet been mentioned, and no attempt has

been made by the patient to offer his own "lay diagnosis" of what "it" might be.

In contrast, a "psychosocial" need is addressed by the patient—albeit prior to the doctor having the opportunity to examine the patient—that seeks not the physician's impersonal acknowledgment but individual attention to the patient's anxiety (uncertainty, fear). These moments make clear that and how patients bring their "psychosocial" concerns to the clinic—numerous researchers suggest that a majority of patients' presenting concerns are "psychosocial"—and that doctors are faced with managing therapeutic (not just biomedical) aspects of care. To adequately address a patient's "worrying," at the outset or during any phase of a medical interview, requires that physicians transcend being medically trained bureaucratic representatives and be willing (and able) to offer personalized, therapeutic care that integrates comfort and support with sound diagnostic and treatment skills.

Excerpts such as 1 and 2 (above) are only a small sampling of moments when it is evident that communication between patients and providers occurs at the intersection of professional and lay, authority and subordination, biomedical and psychosocial orientations to providing and receiving medical care. There are inherent and dialectical tensions between these seemingly opposite ways of organizing medical interviews. But, ultimately, they get interconnected, and not only through conceptualizations or theories of medical encounters that stipulate that patients are not sufficiently involved, that when they do initiate actions they are not adequately addressed, or other notions about an imbalance or asymmetry of power in the clinic. Instead, "rather than visits embodying asymmetry, it is actions, activities, and projects of activities, and their constitutive relevancies, that account for asymmetry" (Robinson, 2003, p. 51). The task thus remains to continue explicating the details of actual, naturally occurring contingencies comprising medical encounters and, through close analysis, to advance understandings of routine ways that both patients and providers coordinate often delicate moments of interactional conduct.

Gaining Access to the "Diagnostic Moment"

Considerable attention has been given to what patients want, need, and expect from medical care. Repeatedly, patient surveys have revealed that patients seek to be informed and to receive understandable explanations for their medical condition (Roter & Hall, 2006). Yet patients also report not being well informed and being unable to understand their physicians (e.g., due to complex medical jargon). And by asking few questions, patients subordinate themselves to physicians—who, at times, display a strong dispreference for patient-initiated actions (Beach, in press; Heritage & Maynard, 2006)—even avoiding

physicians' offerings of prescriptive judgments (Stivers, 2007). In stark contrast, however, physicians report investing considerable time informing and explaining to patients their diagnosis and treatment options (Street et al., 2003). So how can these conflicting orientations be accounted for?

Citing what Paul Starr refers to as patients' "surrender of private judgment" in *The Social Transformation of American Medicine* (1982, p. 10), a response to dependence on medical expertise and the power of science, Heritage (2005) argues that

when patients get a recommendation from their doctor, they end up abandoning whatever private beliefs, uncertainties, fears, and misgivings they may have about their medical condition, and accept the physician's diagnosis and treatment recommendation . . . With respect to these moderate, primary care illnesses, preliminary evidence from studies of recordings of medical encounters suggests that patients do indeed abrogate their own judgments and more or less surrender with a blindfold on. (pp. 84–85)

Here again, the management of "authority" is a central issue for understanding how patients and physicians navigate their way through medical encounters. This is especially true during moments when diagnoses are delivered by physicians and responded to by the patient. When reviewing important studies focusing on the relationships between diagnosis and medical authority—from Byrne & Long's (1976) classic finding that across 2,000 medical visits, physicians were highly authoritarian and did not adequately discuss diagnoses with patients; to Heath's (1992) primary finding that patients respond passively to diagnoses; to Peräkylä's (1998) discovery that as physicians assert, provide evidence, and persuade patients about diagnoses, they hold themselves somewhat accountable for their judgments; and finally to both Heritage & Stivers (1999) and Stivers (2007) revealing how patients may contest physicians' recommendations and, in turn, how physicians can themselves resist patients' efforts to pressure physicians to prescribe antibiotics—Heritage (2005) makes clear that physicians' abilities to "name the world," and thereby exercise medical authority, are fundamental to communication during medical encounters.

And in just the ways physicians claim and assert authority, so too is it inherently problematic for patients to get their needs addressed. This is especially the case when patients raise psychosocial concerns that do not receive adequate attention. Beach and Mandelbaum (2005), for example, examine how a patient discloses "My mom had a stroke" three times over the course of an interview with a physician's assistant. The additional burdens placed on the patient to care for his ill mother, and also his ailing father, were repeatedly nominated by the patient as reasons for poor health habits, excessive drinking, inadequate exercise

and diet, and sleeplessness. In response, and despite the patient's persistence, however, the interviewer offered only minimal acknowledgment of the patient's life-world experiences—and shifted attention toward a series of bodily symptoms, namely, blood in the patient's stools, pancreas and liver damaged by alcohol (and the need for a referral to do other tests), high cholesterol, high blood pressure, and overweight. Excerpts from each of these three moments appear below. Even a brief inspection makes clear how the patient's focus on his mother's stroke is disattended by the interviewer rather than pursued as an opportunity to acknowledge, support, understand, and treat the stressful effects related to caregiving.

In Excerpt 3, the interviewer shifts to "**blo:od** in your stools or **bla:ck** stools?" rather than address the implications of the patient's mom having had a stroke:

Excerpt 3. "Do you drink?" (Beach and Mandelbaum, 2005, p. 347; INT = Interviewer)

((The Patient had just reported that he has about three drinks each night before going to bed, and the interviewer is seeking clarification about the amount of alcohol in each drink.))

PAT: 1→ My mom had a **stroke** (.) five years ago and u:h I have to go every night after work and help (.) my dad out with her. So: = .hh when I come home just ta unwind \$I have a few drinks\$ and then >go to bed<.

INT: 2→ Have you ever noticed any **blo:od** in your stools or **bla:ck** stools?

In Excerpt 4, the interviewer makes a referral as an alternative to responding directly to the patient's attempt to explain that daily drinking has only occurred since his mother's stroke:

Excerpt 4. "mom's had her stroke" (p. 354)

((The Interviewer has been summarizing the effects of excessive drinking on the pancreas and liver and thus the need to do additional tests to assess the possible damage.))

PAT: 1→ Oh but the daily you know the °drinking° everyday at night has been just since my mom's had her stroke the last four- four or five years. (.) >The diarrhea's been< since I really think nineteen years at least [(probably)].

INT: [Okay]
sometimes these things-.

PAT: 1→ >But I'll check it.< I don't know I \$hmp\$.

INT: 2→ NOW (.) we're also going uh to send a referral to Doctor Dorsey who is your designated primary care physician.

And in the final example, the interviewer's encouragement to cut back on drinking and to exercise more is, once again, countered by the patient: "°Not since my *mom* got sick°" (1→) has he been able to exercise. The patient next insists that he therefore *doesn't have time* (3→) to exercise (i.e., owing to his caregiving responsibilities):

Excerpt 5. "Not since my mom got sick" (p. 357)

((The Interviewer is discussing concerns and future treatment options with the patient.))

INT: Okay. pt .hh Now in terms of um (.) your drinking, .hh need I say (.) you certainly need to cut down. (.) Ideally no more than (.) two ounces a day. pt .hh Um: if that might become a problem area for ya .hh we do have a chemical dependency program.= I've circled the name and the phone number and you may call them at your leisure.

PAT: °Okay.°

INT: And I'd like to um (.) talk about some other things which are certainly important. One of tho:se is u::h (.) the need to exercise and I didn't ask ya are you exercising at all?

PAT: 1→ °Not since my *mom* got sick.° >I used to bike ride< three miles but I- I hadn't had time.

INT: 2→ Well exercises (.) even if it's no more than just walking for thirty minutes non stop three to five days a week .hh is a valuable tool. pt And uh it's certainly-
