PAT: 3→ I- I don't have thirty minutes <either. \$heh\$ But what I do is like> when I came here (.) is I took the stairs instead of the elevator.
((INT continues))

Though not included here, the interviewer continues not attending to the patient's concerns about lacking time in favor of emphasizing the positive health benefits of exercise—raising good cholesterol, managing anxiety and stress, and reducing blood pressure and weight.

The analysis offered by Beach and Mandelbaum (2005) makes clear that the more this patient *invited* attention to his personal and family dilemma, the more the interviewer *avoided* aligning with these patient-centered concerns. Yet, and importantly, it was the patient's own indirectness—hinting and offering clues about his mother's stroke, rather than directly asking the interviewer to talk about the impact of her stroke directly—that provided the interviewer with interactional grounds for not addressing the patient's caregiving stressors. At least in this instance, the

patient's indirectness thus facilitated the interviewer's evasiveness.

A Glimpse of Communication and Medical Care in the 21st Century

It is not news to state that the management of disease—or dis-ease, as is often the case—will continue into and beyond the 21st century. History clearly reveals that human evolution and the growth (or decline) of all civilizations are tightly interwoven with the ability to treat and heal bodily, psychological, emotional, and spiritual problems. And, as this chapter clearly indicates, communication is critical throughout all phases of medical encounters, in which quality relationships, not simply technical knowledge or advanced technologies, shape the overall quality of care and healing outcomes. Nor is it surprising to predict that monumental advancements in medicine will continue to emerge with the completion of investigations such as the Human Genome Project (HGP) in 2003, revealing a mapping of the hereditary codes in the 20,000 to 25,000 genes and 3 billion chemical base pairs constituting human DNA. The HGP has opened new horizons for gene testing and identifying genetic components of diseases, including the ability to locate and alter the hereditary errors in genes that contribute to thousands of diseases that negatively impact humankind. New pharmaceuticals and drug therapies are being generated, along with advanced technologies capable of previously unheard of interventions (e.g., strengthening immunity by inserting genes that suppress tumor growth).

But with the success of the HGP comes a series of moral, ethical, and legal implications bearing directly not only on patient-provider relationships but on families as well. Consider, for example, how genetic counseling involves helping patients and family members assess their inherited susceptibility, make decisions regarding treatment options, and shape their care in the face of an inevitably uncertain future. Below is a written description generated by a genetic counselor I worked on a project with designed to better understand the kinds of communication dilemmas arising in the of genetic counseling:

The woman contacting me has had breast or ovarian cancer, has daughters or sisters or nieces she is worried about, and wants to be tested in order to find information which might help her relatives. The issues here are whether these relatives want the information, and whether the woman realizes that a positive test would mean that she is at greatly increased risk for another cancer.

How do genetic counselors explain hereditary disorders and future health risks to patients? How do patients

express their fears about possible but uncertain diseases? In what ways do interviews vary depending on whether family members are present or not? We have only a limited understanding of how these discussions actually occur during genetic counseling sessions. We know even less about how those counseled share this information with their family members, outside of clinics (Beach, 2009), including the positive and negative consequences of talking about the implications of receiving (and/or avoiding) genetic testing. Extending the case study summarized above, what happens when a mother who may be susceptible to BRCA1 or BRCA2 breast cancer (National Cancer Institute, 2008) contacts a physician and requests that both of her daughters be genetically tested? What if only one of the two daughters wants to be tested and the other is vehemently opposed to discovering whether she is predisposed to a future and probable breast cancer diagnosis? How does the family manage potential conflicts arising from alternative stances toward receiving genetic testing (or not)? And if the family itself seeks genetic counseling to address and resolve these problems, what specific kinds of communication interventions are effective (or not)? What, then, are the long-term consequences of seeking genetic testing and counseling (or not) for individuals and families alike?

These questions only begin to address the ways in which communication is critical for managing future quandaries in medical care. Other communicative issues are equally daunting; information is readily available online concerning debates such as those surrounding governmental regulation of stem cell research (Stem Cell Information, The National Institutes of Health, <http://stemcells.nih.gov>, accessed March 18, 2008), privacy associated with online medical databases and access to medical records (Health Communication and Informatics Research, National Cancer Institute, <http://cancercontrol.cancer.gov/hcirb>, accessed November 12, 2007), and malpractice associated with the humbling occurrences of death caused by unnecessary surgeries and related medical errors (www.medical-malpractice.com, accessed June 22, 2008). As complex as the study of patient-provider relationships seems to be, it is useful to situate medical encounters within these and other encompassing health communication frameworks, such as cancer control, population sciences, and behavioral research.

PART VII

FACTORS AFFECTING COMMUNICATION

GENDER

JULIA T. WOOD

University of North Carolina, Chapel Hill

TV talk shows such as *Oprah* frequently feature experts on communication between the sexes; self-help books promise to teach readers the secrets of communicating with “the opposite sex”; and popular magazines such as *Essence*, *Cosmo*, and *Sports Illustrated* routinely include articles on how to attract, interact with, and hold the attention of the man/woman of your dreams. People are fascinated by how women and men communicate, especially how their communication differs.

Like the general public, academic researchers are interested in gender and communication. Since the 1970s, scholars have focused great attention on gender and communication. As a result, we now know a great deal about the ways in which sex and gender shape communication styles and, in turn, how our communication reinforces social views of women and men. One of the most important understandings to grow out of research is that we can become more informed and effective communicators if we understand the pivotal role that gender plays in both personal and cultural life.

Studying gender and communication heightens our awareness of taken-for-granted notions of sex and gender that are deeply woven into the social fabric and that we’ve been encouraged to accept. Once we become aware of these notions and think about them critically, we are empowered to accept those we find good or useful in a more informed way than we had. Equally important, becoming informed about gender empowers us to dispute conventional views of the sexes that we don’t find desirable or admirable. Sometimes, we challenge and resist social definitions of gender on an individual level—for instance, a man who chooses to be a stay-at-home dad instead of a primary breadwinner or a woman who is aggressive and domineering. We may also challenge and

attempt to change social views of gender on a broader level—for instance, arguing as some women in the 1800s did that women are rational enough to vote or contesting the long-standing practice of not allowing women in the U.S. armed services to be in combat roles.

In this chapter, we’ll discuss what we know about gender and communication and why it matters to us individually and to our society. The first section of the chapter provides definitions of three interconnected terms: sex, gender, and communication. In the second section, we examine how we develop gendered patterns of communicating and what language features are associated with feminine and masculine communication styles.

Understanding Sex, Gender, and Communication

Many people use the words *sex* and *gender* interchangeably, but actually they are discrete concepts. As we’ll see, the distinction between sex and gender calls our attention to the twin influences of biology and society—or nature and nurture—on our identities.

Sex

Sex is a biological category—male or female—that is determined genetically. Most individuals are designated as male or female based on external genitalia (penis and testes in males, clitoris and vagina in females) and internal sex organs (ovaries and uterus in females, prostate gland in males). Genitalia and secondary sex markers such as hair

growth and muscle mass are controlled by chromosomes and hormones. Most humans have 23 pairs of chromosomes, one of which determines sex. Typically, those people society labels male have XY sex chromosomes, and those that society labels female have XX chromosomes.

You may have noticed that I've used words such as *most* and *typically* when discussing sex. That's because there are variations from the most common patterns. For instance, some individuals classified as female have XO or XXX sex chromosomes, and some individuals classified as males have XYY or XXY chromosomes. Furthermore, intersexed individuals don't fit into the binary categories of male or female. They are born with the biological qualities of both sexes—for instance, internal sex organs characteristic of females and external genitalia characteristic of males. Transsexuals who have undergone hormone treatment and surgery may have some features and aspects of appearance that are not consistent with their sex chromosomes.

Gender

Gender is a more complicated concept than sex. In the 1970s, researchers began to draw a clear distinction between sex and gender. They defined gender as a social construction, which contrasts sharply with sex as a biological phenomenon. Understanding gender as socially constructed allows us to realize that views and expectations of masculinity and femininity grow out of specific historical moments and specific cultural contexts. Put another way, gender is the social meaning attached to sex within a particular culture and in a particular era. Gender influences the expectations and perceptions of women and men, as well as the roles, opportunities, and material circumstances of women's and men's lives.

Because gender is central to social order, society works very hard to convince us that its definitions and expectations of women and men are natural, normal, and right. From birth, most of us are socialized into our society's views of what it means to be a man or woman—what each sex should and should not do. Pervasive practices reflect and aim to reproduce social definitions of gender: pink and blue blankets, which are still used in many hospitals and home nurseries; toys marketed to boys (active, adventure toys) and girls (dolls and play stoves); chores parents typically assign to sons (outdoor tasks) and daughters (indoor tasks); kindergarten and elementary teachers' tendencies to allow boys to play rougher and be less attentive than girls are expected to be; workplace norms that make it acceptable for female but not male workers to take parental leave.

It's important to realize that studying gender involves learning about both femininity and masculinity. Gender is often perceived as a synonym for *women* or *women's interests*. Just as the study of race is mistakenly, but commonly, perceived not to have anything to do with Caucasians, the study of gender is routinely perceived as having nothing to do with men and masculinity. However, Western culture recognizes two genders, and some other cultures recognize more than two. Masculinity is just as socially constructed as femininity. Understanding how and why masculinity has

been constructed as it has helps us understand how many men define themselves and which attitudes and behaviors they do and do not consider appropriate for themselves. Studying gender helps us understand the processes by which each and all genders are constructed and—by extension—the ways in which existing constructions of each and all genders might be challenged and changed.

Beyond Gender as a Social Construction: A Performative Framework

By the late 1980s, many researchers found that defining gender as socially constructed didn't accomplish as much as they had originally thought. Although scholars still agreed that societies develop and advance particular views of femininity and masculinity, many came to believe that the social construction of gender is only part of the story and not the most interesting part. In 1987, Candice West and Don Zimmerman asserted that gender is not something people have (a personal quality) but rather something they do. Following this insight, Judith Butler (1993) argued that there is nothing “normal” or “natural” about gender. She rejected the widely held view that gender exists prior to particular actions. Instead, claimed Butler, gender comes into being only as we perform it in everyday life. We simultaneously enact and produce gender through a variety of mundane, performative practices, such as dress, gestures, and verbal acts, that embody—and, thus, confer an illusory realness on—normative codes of masculinity and femininity. In other words, for Butler and other performative theorists, gender is more appropriately regarded as a verb than as a noun. Gender is doing; without doing (without the action of performance), there is no gender.

We express, or perform, conventional gender through everyday practices such as dominating (masculine) or deferring (feminine) in conversations, offering solutions and judgments (masculine) or empathy (feminine) when a friend discloses a problem, and crossing our legs so that one ankle rests on the knee of our other leg (masculine) or so that one knee rests over the other knee (feminine). Conversely, we resist conventional views of gender if we act in ways that are inconsistent with the sex and gender society assigns to us.

But our performances of gender are not solo enterprises. They are always collaborative because however we express gender, we do so in a context of social meanings that transcend any individual. For instance, a woman who defers to men and tilts her head when talking to men (two behaviors deemed feminine and more often exhibited by women than men), is acting individually, yet her individual actions are stylized performances of femininity that are coded into cultural life, and it is precisely because these actions are coded and understood as feminine that a person performing them is perceived as feminine. Our choices of how to act in any given moment are based on, and are in response to, a social world made up of other people who

are either physically in the context or mentally present through our imagining of them.

Viewing gender as performative has three important implications. First, it leads to the realization that gender exists if and only if people act in ways that compel belief in the reality of masculinity and femininity and thereby fortify belief in that reality. Second, the argument that gender is not objective or natural implies that any gendered identity is as real (and as illusory) as any other. Thus, transvestites, gays, transsexuals, lesbians, bisexuals, and intersexed and transgendered people have sexual and gender identities that are as real—or unreal—as those of heterosexuals. Third, because a performative view of gender recognizes a range of genders, sexes, and sexualities, it undermines the conventional binary categories of male/female, masculine/feminine, gay/straight, and normal/abnormal. Because the performative view of gender, sex, and sexuality profoundly challenges conventional understandings of identity, it is powerful in opening up new questions about cultural values, beliefs, and definitions.

Communication

The third concept we will discuss is *communication*. Communication is a dynamic process of creating meaning through verbal and nonverbal symbols. Communication is related to sex and gender in a number of ways, four of which we'll discuss here.

Communication Socializes Us Into Gendered Identities

First, communication is a primary means by which new members of a society are taught existing views of gender. As parents interact with children, they teach gender. Boys may be discouraged from playing with dolls, and girls may be scolded for getting dirty—both messages that convey social views of gender in an effort to teach children how to perform identities that are consistent with existing social norms.

Parents are not the only ones who communicate society's views and expectations of gender. Siblings, other relatives, peers, and teachers talk differently to boys and girls

and give positive and negative responses to children's behaviors. Operating from conventional assumptions about appropriate behaviors for the sexes, a teacher may scold a girl who is raucous in first grade but allow a boy in the class to act up. Peers are likely to ridicule a boy who is scared of rough play; they may call him "sissy" or "mama's boy" in an effort to shame him into following norms for masculine behavior.

Media too socialize children into gendered identities by providing models of masculinity and femininity. Research shows that children's television programs tend to feature male characters who have active roles and female characters who have reactive or supporting roles. In both programs and advertising, girls are more likely than boys to be shown nurturing others (including pets and dolls), and boys are more likely to be shown engaging in adventures and risk. Video games and movies also provide models of masculinity and femininity, thereby helping socialize children into gender roles approved by Western culture.

Communication Expresses Gendered Identities

Second, as performative theorists assert, we use communication to express, or perform, gender. We know which clothes will be seen by others as masculine or feminine; we understand which postures are regarded as appropriate and inappropriate for women and men; we realize that certain words and tones of voice are regarded as more acceptable for men and others as more acceptable for women. In other words, we use verbal and nonverbal communication to "do gender."

Recently, I asked my students to give examples of behaviors that they perceive as expressing femininity or masculinity. Table 41.1 below presents a sample of the examples they gave.

Communication Challenges and Changes Social Views of Gender

Third, communication is a key means of changing gender. We can use communication to challenge existing views of men's and women's nature, behaviors, and rights. For example, the movement for women's suffrage, which began

<i>Behaviors That Express Femininity</i>	<i>Behaviors That Express Masculinity</i>
1. Wear makeup	1. Keep distance from other men
2. Bend over by bending knees	2. Bend over by bending at the waist
3. Smile	3. Don't smile often
4. Drop eyes if another stares at you	4. Hold eye contact if another stares at you
5. Share feelings	5. Do not talk a lot about feelings
6. Show interest in others	6. Show confidence and control
7. Be nice to others	7. Impress others

Table 41.1 Behaviors That Express Femininity or Masculinity

in the 1800s, included nonverbal (marches) and verbal (speeches, written documents) communication that challenged and ultimately changed the view that women were not entitled to rights such as voting, owning property, and pursuing higher education. Today, there are a number of fathers' groups that are challenging entrenched views that women are "natural" caregivers and so should have custody of children when parents split up. Senator Hillary Clinton's campaign to be the Democratic nominee for president challenged the view that women cannot run for president. We also challenge existing views of gender by engaging in transgressive everyday practices. Some of my students queer the binary categories of gender by, for instance, wearing a lacy dress and combat boots or skirts, heels, and a necktie.

Communication Names Issues and Identities

Finally, communication enacts naming, which is a critical means of making issues related to gender visible. We name things that we consider important and don't name things that we don't consider important. When we name phenomena that have not been named, noticed, or valued, we bring those phenomena into social awareness. Once we had names only for heterosexuals and homosexuals. The term *homosexual* was challenged, and today it is used less often than *gay* and *lesbian*, which are different ways of naming identities. Furthermore, we have named categories of sexual identity beyond the original two. Coining terms such as *bisexual*, *queer*, *trans*, and *intersexual* has named into social awareness identities that were previously unnamed and, therefore, largely unrecognized.

Communication can also name issues into social consciousness. Consider five phenomena related to gender and gender roles that once were not named but now have been named and, thus, brought into social awareness.

In a book that is credited with instigating the second wave of feminism in the United States, Betty Friedan (1963) called attention to "the problem that has no name." Friedan divided this problem into two parts. First, many middle-class stay-at-home mothers felt frustrated and not completely fulfilled because their lives were restricted to the home and family. Second, because the ideology of the time maintained that they were living the American dream, many of these women felt guilty for not feeling fulfilled and grateful. Friedan decided to name the problem; she called it the feminine mystique—the ideology that being a full-time homemaker was the ideal and the only ideal for women. When she gave a name to something that was common in women's experience but unmarked in language, Friedan gave visibility and social standing to what had been invisible and, thus, had no social legitimacy.

Sexual harassment is unwanted and unwelcome conduct of a sexual nature that interferes with performance in work and educational settings. Doubtlessly, sexual harassment has existed for centuries, yet it was not named until

the 1970s. Until that time, people, primarily women, who endured unwanted sexualized behavior at work and in school had no way to name what happened to them. The language of their culture provided no language that named the practice as illegal, much less immoral. Now that the term *sexual harassment* is part of our language, there is a way to name this experience for what it is.

Like sexual harassment, date and marital rape are not new phenomena. However, naming these practices as criminal acts—rape—is new. Only toward the end of the 20th century did most states adopt laws that specifically recognized nonconsensual sex between dates or spouses as the crime of rape. And only by naming nonconsensual sex in any context as a crime were the grievous violations recognized for what they are.

The sociologist Arlie Hochschild (2003) used the term *second shift* to name a phenomenon common in the lives of women who work outside of the home. The second shift is all the housework, cooking, and child care that women engage in after returning from a shift in the paid labor force. Hochschild reported that roughly 20% of men in dual-worker couples assume half of the work required to run a home and family. More recent studies have confirmed the persistence of inequity in responsibility for work in the domestic sphere. In naming this phenomenon as a form of work, the term *second shift* gives visibility to what had been invisible.

The second shift involves more than concrete tasks such as preparing dinner, bathing children, and vacuuming. In addition, it includes what Hochschild dubbed *psychological responsibility*, which is the responsibility to remember, plan, schedule, and so forth. For example, behind a prepared dinner sitting on a table are a number of generally unseen and unnoticed tasks such as considering household members' nutritional needs and dietary preferences, deciding on a menu, and shopping for the necessary ingredients.

Let's summarize what we've discussed so far. This first section of the chapter defined sex, gender, and communication. In the process, we highlighted the ways in which communication is related not only to individuals' gender but also to social understandings of gendered identities and issues. Our exploration of these three terms should give you a preliminary sense of how complex they are and should spark your thinking about the intimate ways in which gender shapes communication and, in turn, is shaped by communication. We turn next to a review of knowledge about gender and communication in our lives.

Gendered Communication Patterns

Male and female infants don't enter the world communicating in different ways. However, within just a few years, boys and girls do start engaging in some distinct communication behaviors. Many factors influence children's development, including their development as communicators. We'll focus on two particularly important influences on the development of gendered communication patterns: parents and peers.

Parents

Parents are an early and powerful influence on most children's understandings of gender. Perhaps most obviously, parents are typically models of masculinity and femininity. By observing parents, children often learn the roles socially prescribed for women and men. In heterosexual families that adhere to traditional sex roles, children of both sexes are likely to learn that women are supposed to nurture others, clean, cook, and show emotional sensitivity and that men are supposed to earn money, make decisions, and be emotionally controlled.

Parents' behaviors are another key influence on children's development of gendered identities and communication patterns. Although many parents today reject rigid sex stereotypes, many still communicate differently with sons and daughters and encourage, however inadvertently, distinct communication behaviors in sons and daughters. Typically, girls are rewarded for being cooperative, helpful, nurturing, and deferential—all qualities consistent with social views of femininity. Parents may also reward—or at least not punish—girls for being assertive, athletic, and smart. For boys, rewards are more likely to come for behaving competitively, independently, and assertively.

Ethnicity is related to parental gender socialization. Research shows that middle-class Caucasian parents in the United States emphasize and encourage achievement more when talking to sons than to daughters, and some Chicano/Chicana families discourage educational achievement in daughters to the point of regarding daughters who attend college as *Chicana falsa*—false Chicanas. On the other hand, Asian and Asian American families tend to encourage high achievement in children of both sexes.

Parents also convey distinct messages about assertiveness and aggressiveness to sons and daughters. As children, boys and girls don't differ a great deal with respect to feelings of anger or aggression. Because of gender socialization, however, they learn different ways of expressing those emotions. Research shows that parents, particularly white middle-class parents, tend to reward verbal and physical activity, including aggression, in sons and to reward interpersonal and social skills in daughters. Because many girls are discouraged from direct, overt aggression yet still feel aggressive at times, they develop other, less direct ways of expressing aggression, such as those featured in the film *Mean Girls*.

Parents, especially fathers, encourage in children what they perceive to be gender-appropriate behaviors, fostering more independence, competitiveness, and aggression in sons and more emotional expressiveness and gentleness in daughters. When interacting with children, fathers tend to talk more with daughters and to engage in activities more with sons. Mothers tend to talk more about emotions and relationships with daughters than with sons. Because both mothers and fathers tend to talk more intimately with daughters than sons, daughters generally develop greater relational awareness and emotional vocabularies than sons.

However, the general patterns for family interaction do not hold true for all families. In some families, sons are socialized to be emotionally aware and expressive. For example, a student of mine named Vince is very emotionally expressive—he hugs male friends and talks openly about feelings. As we were discussing family communication in my class, Vince noted that his family is Italian and they live in an Italian neighborhood. He pointed out that, as a group, Italians tend to be more expressive and emotional than many ethnic groups.

In general, parental gender socialization is more rigid for boys than for girls, particularly in Caucasian families, and fathers are more insistent on gender-stereotyped toys and activities, especially for sons, than are mothers. Fathers generally regard it as more acceptable for girls to play baseball or football than for boys to play house or cuddle dolls. Similarly, it's considered more suitable for girls to be strong than for boys to cry and more acceptable for girls to act independently than for boys to cling to others for support. The overall pattern is that parents, especially fathers, more intensively and rigidly push sons to be masculine than they push daughters to be feminine.

Peers

Peers have at least as much and perhaps more influence than parents on our identities and communication styles. A classic study by Daniel Maltz and Ruth Borker (1982) gave us initial insight into the importance of children's play in shaping patterns of communication. The researchers noticed that young children tended to play in sex-segregated groups, and groups of girls and groups of boys generally played different kinds of games. These two observations have been confirmed by more recent research.

The games that boys typically played included football, baseball, basketball, and war, whereas the games that girls tended to play included school, dolls, and house. Students in my classes have added to these lists, noting that boys' games also include cops and robbers and soccer and girls' games include tea party and dress up. The games noted by Maltz and Borker, as well as those added by my students, operate by quite different rules and cultivate distinct communication styles.

The games that boys typically play involve fairly large groups—nine individuals for each baseball team, for instance. Most boys' games are competitive, have clear goals (touchdown, basket, capturing the robbers or evading the cops), involve physically rough play (blocking linebackers, shooting robbers), and are organized by rules (nine innings to a baseball game, two points per basket) and roles (forwards shoot baskets, guards protect forwards) that specify who does what and how to play.

Because the games boys typically play are structured by goals, rules, and roles, there is limited need to discuss how to play, although there may be talk about strategies to reach goals. In playing games, boys learn to communicate to accomplish goals, compete for and maintain status, exert

control over others, get attention, and stand out. Specifically, boys' games cultivate four communication rules:

1. Use communication to assert your ideas, opinions, and identity.
2. Use talk to achieve something, such as solving problems or developing strategies.
3. Use communication to attract and maintain others' attention.
4. Use communication to compete for the "talk stage." Make yourself stand out; take attention away from others, and get others to pay attention to you.

These communication rules are consistent with other aspects of masculine socialization. For instance, notice the emphasis on individuality and competition. Also, we see that these rules accent achievement—doing something, accomplishing a goal. Boys learn that they must do things to be valued members of the team. Finally, we see the undercurrent of masculinity's emphasis on invulnerability: If your goal is to control and to be better than others, you cannot let them know too much about yourself and your weaknesses.

Quite different patterns exist in games typically played by girls, and they cultivate distinct ways of communicating. Girls tend to play in pairs or in very small groups rather than large ones. Also, games such as house and school do not have preset, clear-cut goals and roles. There is no touchdown in playing house, and the roles of daddy and mommy aren't fixed like the roles of guard and forward. Because traditional girls' games are not highly structured by external goals and roles, players have to talk among themselves to decide what to do and what roles to play.

When playing, young girls spend more time talking than doing anything else—a pattern that is not typical of young boys. Playing house, for instance, typically begins with a discussion about who is going to be the daddy and who the mommy. The lack of stipulated goals for the games is also important because it tends to cultivate girls' skill in interpersonal processes. The games generally played by girls teach four basic rules for communication:

1. Use communication to create and maintain relationships. The process of communication, not its content, is the heart of relationships.
2. Use communication to establish egalitarian relations with others. Don't outdo, criticize, or put down others. If you have to criticize, be gentle.
3. Use communication to include others—bring them into conversations, respond to their ideas.
4. Use communication to show sensitivity to others and relationships.

The typically small size of girls' play groups fosters cooperative discussion and an open-ended process of talking to organize activity, whereas the larger groups in which

boys usually play encourage competition and external rules to structure activity. Research on preschoolers found that boys gave orders and attempted to control others, whereas girls were more likely to make requests and cooperate with others. In another investigation, 9- to 14-year-old African American girls typically used inclusive and nondirective language, whereas African American boys tended to issue commands and compete for status in their groups. The bottom line is that girls tend to engage in more cooperative play, whereas boys tend to engage in more instrumental and competitive play.

Masculine and Feminine Communication Among Adults

The lessons of children's play are carried forward. The basic rules of communication that many adult women and men employ are refined and elaborated versions of those learned in childhood games.

Feminine Communication

Extensive research has identified seven features of feminine communication, which a majority of women employ. As we discuss them, think about how these features might grow out of the games typically played by young girls. First, feminine communication involves disclosing personal information and learning about others. For many women, personal communication is the primary means of building close relationships.

Second, feminine communication attempts to create equality between people. Instead of vying for MVP (most valuable player) status, women are more likely to communicate in ways that level the playing field. To create equality, women often offer matching experiences ("I've experienced the same thing") and downplay their individual accomplishments. In addition, women tend to work to include others and keep the conversation balanced so that participation is relatively equal.

Third, feminine speech tends to offer substantial support for others. In conversations, women routinely express sympathy, empathy, and agreement with others ("Of course, you feel hurt," "I know just how you feel," "I think you handled that really well"). In addition, women often communicate support by showing interest in learning more about others and their experiences ("How did you feel when that happened?" "Is this experience connected to earlier ones in your relationship?"). All these conversational behaviors demonstrate interest in others and concern for how others feel and what happens in their lives.

A fourth feature of feminine communication is doing what Pamela Fishman (1978), in a classic article, labeled "conversational maintenance work." This is the process of keeping a conversation going by inviting others to speak, asking questions that draw others into interaction, responding to what others say, and encouraging others to

elaborate their ideas. Rather than working to get and hold the talk stage for themselves, women who enact feminine communication are more likely to invest in getting everyone on the talk stage.

Fifth, feminine communication tends to be highly responsive, especially nonverbally. Women exceed men in eye contact during conversations, head nodding, and facial expressions that show interest, as well as verbal responses that demonstrate engagement in others and what they are communicating.

Sixth, feminine communication tends to include more concrete descriptions and ideas than masculine communication. Women typically include details when describing events and experiences and provide specific examples to illustrate abstract ideas. In addition, women are more likely than men to cite personal experiences as bases for broad judgments and values.

Finally, feminine communication tends to be more tentative than masculine communication. Women are more likely to use hedges (“I sort of think that plan is dangerous”), qualifiers (“I don’t have a lot of experience with this issue, but . . .”), and tag questions (“The weather is really nice, isn’t it?”). Although the tentativeness of feminine communication has been criticized for being unassertive and powerless, it is also inclusive, leaving the door open for others to enter the conversation.

Masculine Communication

Researchers have identified six features of masculine communication, which are employed by a majority of men. As you read about these, you’ll probably notice that the features are cultivated by the games that young boys typically play. The first feature of masculine communication is control or the effort to control. Many men see interaction as an arena for pitting themselves against others and proving their worth. The effort to control is displayed by asserting opinions, challenging others, and telling stories and jokes that capture others’ attention.

A second feature of masculine communication is instrumentality, which is accomplishing objectives. As a rule, males use communication to manage tasks—to do something. In interaction, instrumentality is expressed through problem solving, giving advice, devising strategies, and developing plans. In contrast to the attention to feelings and process that is typical of feminine communication, masculine style puts greater emphasis on facts and results.

Third, masculine communication tends to be used to express dominance and control. Although there are many jokes about women’s talkativeness, it is actually men who talk more in most contexts. Overall and across interaction contexts, males—both boys and men—talk more often and for longer periods of time than females—both girls and women. In addition, men are more likely than women to reroute conversations to their interests and agendas and to interrupt others to exert control over interaction and to maintain command.

Fourth, masculine communication tends to be direct and assertive. In contrast to the tentativeness of feminine communication, the masculine style tends to be more forceful, authoritative, and confident. In addition, masculine communication tends to be more direct, absolute, and unqualified than feminine communication.

Fifth, masculine communication is more abstract than feminine communication. Men rely less than women on concrete examples, specific experiences, and concrete reasoning. Instead, men often talk at abstract levels, relying on generalizations and conceptual levels of description. For example, a man might note that Barack Obama is “politically progressive,” which is an abstract and general phrase. A more concrete observation would be that Barack Obama voted against the war in Iraq and for legislation to provide support for children.

A final feature of masculine communication is restricted emotionality. In general, men’s speech is less emotional, and they disclose less about feelings, fears, concerns, and personal thoughts than women. In addition, men tend to be less emotionally responsive to others’ communication. By extension, they are less likely than women to express sympathy, empathy, or other feelings in response to what others say.

Anthony Mulac (2006) recently studied women’s and men’s language to see whether the differences noted in earlier research still exist. Based on his findings, Mulac stated that women and men “grew up in different sociolinguistic cultural groups, groups that have subtly different styles and therefore subtly different ways of accomplishing the same communicative task” (p. 236). Note that Mulac calls these “subtly different styles,” which is a more nuanced and accurate description than offered by some popular advice book authors who claim that women and men are so different, they are from different planets. Mulac identified 6 distinctive characteristics of men’s use language and 10 distinctive characteristics of women’s language. As you consider Mulac’s findings, which are summarized in Table 41.2, ask how each characteristic fits with the features of women’s and men’s communication that we have just discussed.

Qualifying Research Findings

Before we conclude this discussion of gendered patterns of communication, I want to emphasize the limits of what research can tell us. Research on gendered styles of communicating provides us with generalizations about how women and men, in general, communicate in a specific cultural context. It cannot tell us how any particular individual will communicate. Some men communicate in primarily feminine ways, and some women communicate in primarily masculine ways. As we saw in the example of Vince, ethnicity interacts with gender to shape communication style. Men who are socialized in expressive ethnic communities are likely to be more emotionally expressive than men who are not. Likewise, women who are socialized in emotionally inexpressive ethnic groups tend to be

<i>Women's Language</i>	<i>Men's Language</i>
Intensive adverbs (That's really exciting.)	References to quantity (A BMW Mini Cooper gets 50% better gas mileage than a Honda Accord.)
Emotion references (I feel overwhelmed by love for my child.)	Judgmental adjectives (That's a stupid opinion.)
Dependent clauses (I am majoring in communication, which is a very dynamic field.)	Elliptical sentences (Good job.)
Sentence-initial adverbs (When I stay up late, I feel terrible the next day.)	Directives (Work on it.)
Uncertainty verbs (I might get the job.)	Locatives (location markers) (The house faces north, northwest.)
Oppositions (The teacher is demanding, yet she is also fair.)	I-references (I have a busy schedule.)
Negations (Speaking up in class will not make you sound like a nerd.)	
Hedges (I'm sort of thinking we should stay in tonight.)	
Questions	
Longer sentences	

Table 41.2 Women's and Men's Use of Language

less emotionally expressive than women who are socialized in Western feminine speech communities.

We should also note that most people—regardless of sex and gender—engage in some masculine and some feminine communication behaviors. If you compare your own verbal and nonverbal behaviors with the descriptions of masculine and feminine communication we've discussed in this chapter, you'll probably discover that your communication includes some features that are classified as feminine and some that are classified as masculine. Very few of us communicate in solely masculine or solely feminine ways.

Finally, what is considered masculine and feminine communication varies across cultures and over time. For this reason, what is regarded as masculine in the United States might be feminine or androgynous in another culture. Also, what is considered feminine or masculine today might have been perceived otherwise in a different era. For example, it is not uncommon today for males to wear earrings or necklaces. In the 1800s, a man who wore such jewelry would have been seen as inappropriately feminine.

Conclusion

In this chapter, I introduced you to an area of research and teaching that has fascinated me for more than 20 years. In the first section of the chapter, I defined key concepts—sex, gender, and communication—and then examined how researchers have thought about each one and its relation to the other two. The second section of the chapter focused on gendered styles

of communication. We traced the influence of family and peers on children's development of gender identity and, by extension, gendered patterns of communication. We also considered specific features of masculine and feminine communication that researchers have identified.

What we've covered in this chapter tells us only what gender means in our society today. What it can or will mean in the future is an open question and one that you will take part in answering. Each of us is part of the ongoing process of constructing gender, communication, and culture. Each of us affects what they are and will be.

ETHNICITY

MELBOURNE S. CUMMINGS

Howard University

I am an African American, southern, Christian woman, born when the South recognized segregation as the embodiment of its strongest tradition—one that was legally mandated and had to be observed on penalty of ostracism for whites and even death for blacks. What I learned and practiced and lived from the day I was born is my culture. It was second nature to me and as much a part of my Louisiana upbringing as breathing.

I have always understood that culture and communication styles were an outgrowth of one's existence. With segregation looming large in my community as I grew up, everything about me was prescribed by cultural factors: who I was, where I belonged, what I could and could not do, where I could go or stay (live), when I could or could not do something, and how I must act. Everything was connected with my culture.

The knowledge base of my culture was its community, its people, and its institutions, and I learned from them all. Those early encounters taught me lessons about the rules of engagement for interpersonal interactions with both the White and Black people I would meet throughout my life.

I remember once, as a child of about 8 or 9, being sent to this White couple's home to pick up my older sister's weekly wages (for housekeeping). Not understanding "my place," I knocked on the front door but did not get an answer. I knew someone was home because of the sound of pacing back and forth and the movement of the window shades and curtains. Eventually, after a long wait at the door and constant knocking on my part, the owner opened the door ever so slightly, telling me to go around to the back. I told him what I wanted, and I guess I must have looked puzzled, so he quickly explained, very kindly, that the air conditioning was on and if he opened the door wider, all the air

conditioning would leave the house! Knowing nothing about air conditioning and believing that adults don't lie, I obeyed, went to the back door, collected my sister's wages and a piece of candy for myself, and went home.

After observing my family's looks of amusement, disgust, and shame, as well as listening to their remarks at my retelling, I learned several lessons about communication with Whites. My first rule was that I was to distrust them and never take what they said at face value. I also learned that if I was clear, direct, and persistent, I could get a White person to break down his or her resolve and begin negotiating.

I had very little contact with Whites as I grew up because my family wanted to protect me from the tremendous negatives of the reality of our existence. Also my contact with Whites was limited due to the very nature of the South at that time. Black people stayed in their neighborhoods, and Whites stayed in theirs, unless there were legitimate business reasons to do otherwise. The few contacts I did have simply reinforced my understanding of communication with Whites. (Communicating with people of other cultural groups was nonexistent for there was hardly any appreciable difference among them, from my limited understanding.)

Except for the occasional brush (name-calling) with the White kids who rode the bus past us as we (Black kids) walked to school, I never had a conversation or interaction with a White person my age until I was a graduate (PhD) student. Therefore, when the need for conversation and interaction with Whites arose (when they became my classmates), I was initially intimidated: I had been led to believe that they were naturally smarter (more intelligent) than me (or any Black person). I had heard from adults in my youth that "you have to study twice as hard as Whites to get half as far," which was meant to keep us focused on our studies

(but served to also raise the standards too high for some Black students). As my experience began to teach me, I learned better. Our parents and teachers had always told us otherwise. They would say, “The one thing Whites cannot take from you is what’s in your head. Study hard; learn even more than they learn. It doesn’t matter if the books are outdated; learn anyway.” I remember my first day of class in graduate school. I was in an English literature class, and a student from the back of the class asked a particularly naïve question. From the front, I turned completely around to assure myself that this was a White student before I said to myself, “I guess I’m home free in this class, if this is the level of intelligence that I have to deal with.”

I developed a somewhat cautious, questioning, and suspicious manner of communicating with Whites. I became with them proper, firm, and resolved. More than 30 years later, I still find myself using this style of communication with Whites, unless we have a personal relationship. My communication style (as is most people’s) is different with people from my own racial/ethnic/cultural background.

Growing up in the South, I was taught to speak to every adult I saw, no matter how many times during the day I saw them; to respond to them courteously by saying “Yes, m’am” (or sir); never to dispute the word of an adult; and never to look an adult straight in the eye, especially when being scolded. (“Girl, don’t you look at me in that tone of voice,” we would be told.) Respect and deference to adults was a requirement, and if ever reported otherwise, severe and swift punishment was given. As a little girl, I would pass “Miss Anna’s” house on my way to see my friend. I remember that, on one occasion, I didn’t speak to her, for I had done so a few hours before. As I passed her house, she called out to me: “Little girl, did I sleep at your house last night?” “No, m’am,” I said, with puzzlement. “Then why didn’t you speak to me? Did the cat take your tongue?” “No, m’am. How you doing today?” “Just fine, thank you. And the next time you don’t speak, me and your momma ‘gon tan your little hide. You understand me?” “Yes, m’am.”

Respect for adults was a serious matter. Each adult had the authority to spank a child, if spanking was needed. This respect and authority were assumed by every Black adult who knew one’s parents, and if the parent heard that her or his child had received a spanking from someone, the child was bound to get another for the same infraction when she or he got home. Whites were not given this unspoken authority, nor did they take it. Their threat was to ask for your parents’ names.

Children knew to be respectful to Whites, as to any other adults, but they often took liberties with them that they would never take with friends of their parents. An example that comes to mind is a time, as a teenager, when I worked as a receptionist for a Black-owned taxi company. The White owner of a store in town called a cab for a Black customer. She asked if we had a taxi that could pick up her customer, and my response was “Yes, we do.” She was outraged and asked if I knew who she was. My response was “Yes, you are Mrs. Anderson.” “Don’t you know that I’m a White woman, and didn’t your folks teach

you to say ‘Yes, m’am’ and ‘No, m’am’ to White folks?” Of course, I responded that I had been taught to be courteous to everyone and that I had been courteous to her. She eventually demanded from the owner that he fire me for “sassying” (talking back to) White people or she would not give him any more business. I refused. I was fired.

Disagreements about how Black people should speak and interact with Whites happened all the time, so most parents had prepared their children for certain eventualities. Usually, parents insisted that their children acquiesce to what the White person said for two reasons: one, so that the child would not get in trouble with the authorities or with any White person and, two, so that the child would be able to keep her or his job (the money was needed). In my case, I was saved because I had another job as a musician at a church and, most important, I *had* been courteous.

There were other things that dictated my (southern) behavior, as well. From the time I can remember, I went to church at least three times on Sunday and at least once during the week. We were told that with all the poverty and other indignities suffered during the course of a week, Black folks would go out of their minds if they did not have the Church as support. In church, they were able to “take their burdens to the altar (or to the Lord) and leave them there.” This ritual, this deference to God, would allow them to cope with the next week’s difficulties and situations. It was at church that we became familiar with our African heritage (though Africa was never mentioned—it had been made more a badge of shame than of honor).

It was at church that we were introduced to songs that brought memories of our past to the forefront, songs such as “Swing Low, Sweet Chariot,” “Gonna Lay Down My Burdens, Down by the River Side,” and “Steal Away, Steal Away Home.” These songs and others also showed us how our forebears were able to make it through slavery by depending on each other and on God. Drums and tambourines, the spontaneous holy dance, the call-response of the minister and the congregation, the prayers to God that also invoked the spirits of our ancestors—all were given a place and space in spirited worship services that allowed Black folks to be in touch with the very essence of their being. Songs told us to “hold on, a change’s gon’ come” because “God’s gon’ trouble the waters.” These songs were taught to us to give us the strength and courage to move forward.

Music, dancing, singing, and storytelling, whether in public or private settings, were a part of most interactions or gatherings. Even in serious conversation, the cultural tradition is to make points clear by sharing an experience, telling a story, referencing a Biblical passage or proverb, quoting some adage that had been overheard from an adult conversation or a sermon or hymn in church. This practice continues to this day. In gatherings of friends, it is not unusual, no matter what the topic, to hear someone say, “As my mother would say . . .” It is an African American cultural pattern to give homage to the ancestors, to remember and respect the past.

African American culture is solidly rooted in the Christian Church. Probably the most important institution we have is still the Church. It is probably the only institution that we can call our own, for though it is not indigenously ours, it was made ours by the ingenuity of our forebears. It was the place where Black folk could find relief, comfort, and peace from the negative forces of the world. We were taught early to respect and revere God and His house. The church was sacred ground, for not only did we worship there, we also learned how to live, how to conduct ourselves, and who we were as a people.

The church was also the place where we were taught to protest ill-treatment. The tradition of protest grounded in the Church was not confined to the 1950s and 1960s but reached back historically to the 1800s with the example of Absalom Jones, Richard Allen, and Bishop Henry McNeal Turner. We often heard of Booker T. Washington through discussions of the importance and prominence of Black colleges and universities. Teachers and a few business leaders talked quietly about W. E. B. Du Bois when they spoke proudly of the good that he did through the organization he founded, the National Association for the Advancement of Colored People (NAACP). They spoke quietly of him and the organization because they knew that if Whites found out that they were promoting and supporting the organization, they would be fired and even run out of town. It was considered subversive. Anything that dealt with ridding the South of segregation was considered anti-American or communist inspired and was the ground for all kinds of retaliation.

Despite the fear of losing their livelihoods, our parents, teachers, ministers, business people, and so on showed us pride, perseverance, and determination, telling us that, despite the odds, we would make it. I remember in the 1960s when we all went off to college, our parents proudly told us to go on and protest, to stand up for our people and for our rights but just try not to get our pictures in the newspapers because they (our parents and community folks) might get fired or run out of town. In the end, they evidently decided that their modeling behavior of “doing what was right” was more important than losing their jobs, their homes, or their businesses. (And while, initially, they were threatened with the loss of their jobs, the Whites realized they were unable to run their businesses without the Black people, so they rehired them.) They taught us to fight for our rights and for our freedom, to resist bondage no matter what the consequences. This seems to be a cultural trait dating all the way back to Africa. But for us in the South, we were taught what to do and how to do it in the church; the place we went for solace was also the place we went to learn to protest.

As a child growing up, the church was the center of our lives in the South. There was very little in the way of entertainment for Black youth then outside of school activities. Socializing, like most everything else, was left to the ingenuity of the adults, the children, and the needs of the community. It was through this ingenuity that cultural values, ways of knowing and being, were ingrained. After-school hours and weekends were spent cleaning the house, washing

and ironing clothes, fixing up things in the house and around the home that needed repair, helping neighbors or someone from the Church who needed help. Responsibility; concern for family, friends, and neighbors; respect for the home and the neighborhood were taught. As youth, we saw our community members rally around those in need, and as a result, we learned a respect and reverence for adults, especially older adults. We were constantly taking food to the elderly or someone who was ill. We had to go to the store for those who couldn't walk or found it difficult to do so.

There were certainly colorful ways to teach us lessons about how to behave, just as there were about how to treat each other, how and why to tell the truth, and so forth. Sometimes, we were told powerful stories with morals; at other times, we were given adages about truth and behavior. We all knew that “a child was to be seen and not heard.” That little saying had to do with the fact that no adult would tolerate “back talk” from a child. A child did exactly what an adult told her or him to do—nothing more, nothing less—or there would be severe consequences to pay. I heard over and over again that “what goes around comes around,” and I understood its meaning and teaching as if you do bad things to people, someone will do bad things to you. But when I heard a group of adults talking about something particularly egregious, I heard one say, “Don't nothing go over a devil's back that don't buckle under his belly.” I was floored. I had never heard that statement before, not in reference to things children did. I soon found out that for the old folks to use this reference, it had to be unbelievably bad behavior. I discovered later that something bad happened to the person who had initiated the first act. I heard the same group saying, “I told you, God don't like ugly!” And then the other person said the familiar “Folks don't believe that what goes around comes around.”

Girls were usually upbraided by adults who saw them do mean things to other girls with a gentler rebuke: “Pretty is as pretty does.” We all wanted to be considered pretty, so we were admonished by calling attention to our behavior with references to our physical attributes. We understood them to mean that we could not be pretty girls unless we treated people with a sweet, pretty spirit.

The dearest story I will always remember was about respect: not the usual respect a child must always have for adults, but how one particular man showed respect for my friends and me. It absolutely changed my behavior, which was why my mother took the time to explain it to me (and my friends) in such particular detail.

My friends and I had been playing and were sitting on the front porch resting, and giggling as little girls do. An old man (at least to us) who was passing by the house saw us, stopped, took off his hat and deferentially nodded to us as he said, “Good evening, Miss Peaches, Ms. Micky, and Miss Honey” (every Black child seemed to have had a nickname in the South). Naturally, we spoke to him, but then began giggling almost uncontrollably. Deacon Hall, as he was called, replaced his hat and went on his way.

My mother was nearby in the house and heard the entire exchange. She called us inside and had us sit down. We couldn't imagine what she wanted for we were just playing, staying out of her way. She had a very stern look on her face when she started to talk to us. She first asked us why we were laughing so hard when Deacon Hall spoke to us. We told her how silly and funny he was for calling us "Miss" and bowing at us with his hat in his hand. She, then, told us the story of slavery and segregation and how "Negro" people were treated. She told us how the Negroes had to work for White people, clean their yards, attend their cotton plantations, and entertain or play with their children. All the while when the children were 5, 6, 10, and 11, the men call them Mary, Jenny, and Martha (by their first names). But as soon as they turned 12 years old, these old men had to stop calling them by their names and called them "Miss Mary," "Miss Jenny," and "Miss Martha" just because they were White and the men were Black. Black men have to bow to them and take their hats off to them.

White folks say that that's the way they want Black folks to show White "women" respect. Deacon Hall believes that if he has to show White women respect when they turn 12 years old, then the least he can do is show his "own kind" respect, too. "So I never want to hear any of you laugh at Deacon Hall. Instead, I want you to smile at him every time you see him and speak to him. I want you to respect him because he's showing you how much he respects you." Throughout my mother's talk with us, she was crying. We didn't understand her tears then, but we all do now. I cannot remember ever disrespecting Deacon Hall or any other adult again. It was a powerful lesson, as were most of our lessons about race.

Just as powerful were our teachings about love, respect, and responsibility for family. These lessons started at home and were reinforced in school, at church and in the wider community. As children, we believed that the name of God and "mother" were practically the same. We always heard sayings such as "There's nothing like a mother's love," "A mother's love is more precious than gold," and "What did your mother say?" The family (as in most cultures) was the center of our existence. Being Black in the South, we came to know also that if our parents were not around (e.g., if they were at work), our older siblings were in charge. It was their responsibility to take care of the younger siblings in every way. I hardly knew the difference, except in name, between my parents and my older siblings, for I had to obey them in the same way I obeyed my parents. They helped me to do everything: They helped me with my school work, cooked and fed me, gave me baths and dressed me, fought my battles and interceded on my behalf. As they grew up and left home to start their lives on their own in places where segregation was not so blatantly practiced, they continued to act as surrogate parents. Each of them helped our parents provide for college for the younger ones. It was their responsibility.

As our parents aged, taking care of them became the responsibility of the siblings, as well, for their parents, the

thinking goes, cared for them the best they knew how when they were young and unable to care for themselves. According to each of their "talents and gifts," all the children provided for our parents, so that their lives were lived out at home, happy and fulfilled until their deaths. This was our duty, our responsibility, and, most important, our desire. It seems now, for many older Black southerners, an abomination to observe children placing their parents in nursing homes, despite "how times have changed."

One of the biggest things that "outsiders" celebrate about Black southern culture is our food. The South is known for its delicious food, and most southerners are excellent cooks. I believe that one of the reasons food is such a fixation is the tendency to use practically every living creature for eating. Growing up, I remember that the active pastime for men and boys was hunting. Most men had rifles, and a rite of passage for boys was receiving a B-B gun for Christmas. (Boys often got in trouble for aiming at and/or shooting at the wrong thing.) Fathers planned outings to go into the woods to hunt, often taking their boys along to teach them. They would come back with quail, rabbits, squirrels, possums, deer, and the boys would proudly bring back a small bird. They would hang their catch outside to drain the blood and "skin" the hides. All parts of these animals would be used (e.g., the intestines of hogs, fondly called chitterlings). The smell was awful, but our mothers (and sisters) would prepare the animals for delectable meals, using all manner of seasonings to rid them of their wild, natural taste.

Later, I discovered a lot of this was done because of poverty. Black families in the South were usually poor. Recipes had been passed down through generations of slaves who had been given only the leftover parts of animals to eat. "They made the best out of a bad situation and fed their families" is one of the more popular sayings that explains Black southern foods. It is because of poverty and ingenuity that one of the famous southern cultural traditions is its very tasty, spicy foods. The cakes and candies were made to reward the children for their good behavior and for eating whatever was placed before them.

There is not a time when we southerners go home for visits that our friends don't have a list of goodies that they require us to bring them back: meats, sauces, breads, cakes, and candies.

African American culture is an extremely complex subject, just as American culture is diverse and complex. Because a large part of American culture is based on immigrant cultures, depending on where one resides, the culture may consist of tendencies, beliefs, and ways selected from several different immigrant cultures. Additionally, as times and laws change, people relocate, technology advances, and educational levels increase, interactions with people of different backgrounds become a common part of our lives. No one in the United States of America lives in isolation.

Even southern culture during segregation varied depending on where—in which state and which part of the South—one resided. Rural and metropolitan ways of

interacting and socializing are also different, as individuals from the same families are different. People grow and change. Some change because the times change. Newer generations experience some of the basic tenets of their culture, but they also develop their own values and beliefs. Some are based on extensions of what they learned from their parents, but some also come from what they learned and experienced from their own surroundings and the ways they look at the world.

Though most of what I have discussed about Black American southern culture was that which was instilled in me as a child growing up in my southern town—where interactions were mostly Black to Black, by the time I left for graduate school in 1969, the revolution was well on its way. Not only had Black people gotten civil rights laws changed, but White women had joined the protest and were fighting for their rights as well.

My own initial realization that African American culture is a complex subject happened when I was a PhD student in my first intercultural communication class at UCLA. The class consisted of mostly White students, but there were two other African Americans as well. Clearly, there were differing opinions and perspectives between the Black and White students, but for me, the most salient disagreement was between another Black student and me.

The discussion centered on how people select role models as part of their cultural selves. What is it in one's culture that makes one person pattern her or his life after another? Is it her or his chosen profession, the sound of her or his voice, the way a woman or man carries herself or himself, or what and how she or he wears her or his clothes? And then there is the issue of values—what is important to a person, what does she or he find worthwhile, what does she or he consider right or wrong, what does she or he respect or disregard? It was this discussion that made me realize that there is not a monolithic African American perspective shared by all within the race and across generations.

Culture also has to do with environment, with exposure, with one's way of life. I talked of teachers as being my role models (as did the other female Black student in the class, whose parents had migrated from the South). The male student kept looking at me, incredulously, all the while I spoke. He finally exclaimed, "*Teachers!?* What kid wants to be a teacher? They're not cool; they have no money! No cool cars, no sharp clothes! Parents and teachers can't compete with the fast life of the city, sad to say, but I'm from New York City, and that is my reality."

Yet, as I relive our conversation, I realize that *his* reality still manifested itself into his being a PhD student. What accounts for that? Where were his parents born and raised, or their parent's parents? Despite "his reality," who had he chosen for his role models? How did he decide that he wanted to be a researcher, an academician? How far-reaching is culture?

Often, we look askance at our young people today and fail to see any of our own cultural traits or traditions in them. All we see is the media/technology culture that

surrounds their generation. Yet we hear them proudly speak of themselves as African Americans or Blacks. We see them dutifully care for their sick parents. We hear them speak the language of their peers: hip-hop, neo-soul, bling-bling, YouTube. We think that they have exchanged one Black American culture for another. But is that realistic?

There continue to be competing claims on "Blackness." This competition began in the 1960s, when we wondered aloud, "Am I Black enough?"; when we recognized that we actually enjoyed and liked our White friends; when we chose to straighten our hair and stopped wearing our "afros"; or when we chose to buy our homes in the suburbs and send our children to tony private schools for a better education.

I have no doubt that I am the product of my environment, that I reflect the opportunities and experiences I have had, that I am driven by the needs and wants and desires of my existence, and that I am my culture in a unique form. I communicate from this perspective, and I am confident of this truth.

Suggestions for Discussion

By recounting the story of Miss Peaches, I hoped to provide a personal account of African American culture from my perspective. But I always thought that while this perspective was unique to me, it was also shared by many others in my community. In fact, I believe that my story reveals quite a bit about how African Americans communicate, both within their own communities and outside of those communities.

In this section, I want to identify some of the dimensions of the story that I believe are worthy of further consideration from a communication perspective. I hope that you will reflect on the following dimensions of the story and come to your own conclusions when considering the challenges that I pose for each dimension.

Common Culture. It is widely believed that African Americans share a common culture. From my perspective, there are parts of Miss Peaches's story that reflect a common culture, and there are parts that argue against this idea. I hope that you will go back to the story and look for what it is about the story that justifies this belief and what dispels this notion.

Communal Culture. I pointed out earlier that an aspect of Black American culture is that it is communal. Look for examples of communalism in Miss Peaches's story. Is the characteristic of communalism limited to African Americans? Think about examples of communalism from other ethnic groups or from your own experiences and/or observations. How, if at all, does communalism vary among ethnic groups? How could communalism provide either a benefit or a barrier to effective communication between people of different ethnicities?

Afrocentrism. Afrocentricity is a broad notion of communication that deals with the idea of an African-centered means of interpreting what we perceive of the world. What, if anything, can you see in Miss Peaches's story that makes it Afrocentric? How does awareness of an Afrocentric point of view help or hinder communication among African Americans or between African Americans and people of other ethnicities? Is "Whiteness"—the tendency to view the communication patterns of the dominant culture as being "normal" and "taken for granted"—the opposite of Afrocentrism?

Interchangeability. I used both of the terms *Black* and *African American* in telling Miss Peaches's story. What is the significance of using these terms interchangeably? Are there times when one term is preferred over the other? Can you "get in trouble" if you are not African American by using the "wrong" term?

Nonuniqueness. Some of the cultural traditions I discussed from my experience of being African American are seen in other cultures. What does this say about culture in general? Are all cultures really mostly alike with only a few differences among them, are cultures mostly different with only a little overlap, or is the truth somewhere in between?

The Legacy of Segregation. Since segregation is no longer practiced in the United States on an official level, one might easily wonder what value there is in discussing it in today's society or in the context of African American culture. Yet segregation is still a very significant portion of African Americans' experience in the United States, and its legacy remains fresh through stories such as the one about Miss Peaches. How does the segregation of the past affect communication between various ethnic groups today? How does this legacy still turn up in everyday activities (e.g., separate Black tables in campus dining halls and campus clubs whose members are, pretty exclusively, Black students)? Should we forget segregation and if so, how? If not, why not?

Religion. In Miss Peaches's story, there were several instances where religion as a cultural tradition was mentioned. In the African American community, some scholars point to religion as being one of the negatives of this culture, but for Miss Peaches, religion was always a positive aspect of life as an African American in the United States. I hope that you will give some thought to how this aspect of Black culture can be seen as both positive and negative. And returning to the previous point, it has been said that church is one place where segregation still exists in the United States. I hope that you will think through why this seems to be the case, and what about separation in worship is both positive and negative.

Black Enough? Toward the end of Miss Peaches's story, I reflected on how Black culture has been in a constant state

of revision and how younger people may criticize older people for being, perhaps, "out of touch" or even "not Black enough." To me, it's the nature of culture to evolve, and yet some things do endure. I hope that you will think about the various cultural forms that being Black takes and that you'll consider how competing claims on who represents the "real" Black culture are part of that evolutionary process.

The Role of Gender and Generation. Miss Peaches's story is about a woman who grew up and progressed through adulthood in a particular time and place. The story of a man from that same time and place would have similarities, but it would also have important differences. And African Americans who came of age even a generation later share a different story. As you consider Miss Peaches' story, think about what you can extrapolate from her narrative to understand gender, generational, and ethnic influences on cultural groups.

One or Many? Miss Peaches's story relates one person's experience and ideas about African American culture. It is, indeed, only one person's story; but if certain elements of it ring true, then it is probably shared by others as well. As you reflect on this story, I encourage you to think about how the perspective of one person's life informs you about African American southern culture.

In the final section of this chapter, I have provided citations to a range of excellent current scholarship on how various approaches to the study of communication consider the role of ethnicity in the communication process. I hope that you will use these sources as a means of deepening the understanding of the role of ethnicity that I have introduced to you by telling you the story of Miss Peaches.

SEXUAL ORIENTATION

BETTINA HEINZ

Royal Roads University

Sexual orientation emerged as a key issue in the communication discipline over the past 30 years. The topic initially surfaced in the 1970s as an issue brought forth primarily by activist scholars and over time evolved into an aspect of communication dynamics studied within and across virtually every field of communication. The term is typically used to describe the directionality of a person's physical and/or psychological attraction, with regard to the desired partner's sex. Sexual orientation is generally conceptualized to exist on a continuum rather than to occur as a discrete category. Scientists see genetic predispositions, environmental influences, and culture as the main contributors to a person's sexual orientation, acknowledging that individuals may express differently or reconceptualize their sexual orientation over the life span.

Less commonly defined as sexual preference because of that term's implicit notion of choice, sexual orientation has come to function as a gender or sexual identity category, particularly in North American and European cultures. However, in other cultural contexts, same-sex attraction or same-sex sexual behavior are often experienced separate from gender or sexual identity categories. Driven by queer theory, changing generational communication practices, and localized resistance to homogenizing Western values, some are questioning the political benefit and sociocultural relevance of labeling one's identity on the basis of one's sexual behavior. At the same time, activists and community members continue to call attention to the power of identity-based social organizing in the continued political struggle for equal rights. The terms *sexual orientation* and *sexual minority* are contested, particularly in light of queer scholarship, in the study of nonheterosexual individuals and groups. Today, some communication scholars continue

to use the term *sexual minority* in reference to nonheterosexual populations to call attention to the fact that its members belong to a numerical social minority that continues to be disadvantaged in terms of legal rights and social customs. Researchers tend to estimate the percentage of exclusively gay or lesbian individuals in a given population in a range from 3% to 10% across cultures.

The sexual minority model has been challenged by communication scholars emphasizing that those individuals' gender identities and sexual orientations tend to change over the life span. However, in light of persisting social and legal discrimination in the United States, some scholars argue that it is more important to study the dynamics affecting people who identify as nonheterosexual at a given point in time than to study the more abstract, cultural phenomena that provide the context for expressions of sexual orientation.

Today, sexual orientation is included in standard communication textbooks and recognized as a variable affecting communication patterns, an issue creating specific communication dynamics (e.g., outing, coming out), a media phenomenon, and a gender-related identity construction co-created in cultural settings.

Emergence of Sexual Orientation as a Communication Issue

Coinciding in time with the emergence of a gay liberation movement in the United States in the early 1970s and its transformation into a broader gay and lesbian rights movement in the late 1970s, scholars and teachers of communication began raising the issue of sexual orientation.

Most commonly, the beginnings of the U.S. gay and lesbian rights movement are attributed to the Stonewall Riots, June 27–29, 1969, in New York City, which occurred after a police raid on a gay bar. Since then, social and cultural acceptance of same-sex attraction and sex have increased in the United States. World history accounts for numerous changes in social and legal conventions and understandings of sexual orientation as a moral, legal, personal, private, medical, social, or religious issue. Periods of acceptance within nations and cultural communities have often been followed by periods of social persecution, although it seems that the current global level of nondiscrimination and protection is unprecedented.

The U.S.-based gay rights movement grew out of resistance to the repression, criminalization, and pathologization of same-sex practices as psychological disorders in the United States in the 1950s and 1960s. While sexual orientation no longer was commonly treated as an illness following the removal of homosexuality from the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* in 1973, there is no federal legal protection from discrimination on the basis of real or perceived sexual orientation to date. Less than half of the U.S. states have adopted laws prohibiting discrimination on the grounds of sexual orientation in public and/or private employment. The related issue of discrimination based on gender identity and gender expression particularly affects transgender people, who may or may not identify as heterosexual, gay, lesbian, or bisexual. Diagnostic categories pertaining to the lives of transgender people, such as "gender identity disorder" and "transvestic fetishism," continue to be included in the *Diagnostic and Statistical Manual of Mental Disorders*. Trends in legislation, however, are countered by trends in the corporate world. A record number of Fortune 500 companies offer protection from discrimination to gay and lesbian employees and their partners, and a steadily increasing number of private employers have adopted nondiscrimination policies, diversity training, and benefits designed to accommodate "lesbian, gay, bisexual, transgender, and queer" (l/g/b/t/q) families.

Analogous to the growing disciplinary awareness of the underrepresentation of women or ethnic minorities, several key concerns emerged in the 1970s: the invisibility of non-heterosexual people in communication textbooks and curricula; the pedagogical presumption that all students are heterosexual; the lack of gay and lesbian faculty, and the civil rights concerns of gays and lesbians.

Communication literature from this early time period primarily sought to rectify the legacy of unquestioned heteronormativity—typically defined as the assumption that people are heterosexual and that heterosexuality is the norm—by conducting studies with a focus on individuals who did not identify as heterosexual. The famous Kinsey Reports published in 1948 and 1953 by a team of researchers led by the biologist Alfred Kinsey had fundamentally challenged the notions of sexual behavior

prevalent in the 1950s. The Kinsey Reports documented the existence of sexual orientation on a continuum, implying that while some individuals are exclusively heterosexual or exclusively gay or lesbian, many experience varying levels of attraction to the same and the opposite sex.

Initially, some scholars studied the communication patterns and experiences of gay men and lesbians within their own communities; some scholars set out to document differences in communication dynamics between heterosexual and gay and lesbian speech communities; some scholars focused explicitly on language and its role in gay and lesbian communication. With these studies, communication scholars brought to light the differences and similarities in communities resulting from sexual orientation dynamics.

James W. Chesebro was probably the first U.S. communication scholar to explicitly conceptualize same-sex orientation, or the construction of homosexuality, as predominantly a communication problem. In 1981, he edited the groundbreaking collection of essays titled *Gayspeak: Gay Male and Lesbian Communication*. The volume was prepared through the (then) Caucus on Gay Male and Lesbian Concerns of the (then) Speech Communication Association. For the communication discipline, this collection of 25 essays was unique because of its emphasis on communication within gay and lesbian communities as well as between gay/lesbian and heterosexual communities. The essays explored verbal and nonverbal communication. They addressed the social meanings of the words *homosexual*, *gay*, and *lesbian*, as well as communication within gay communities and the phenomenon of homophobia—the irrational fear of, or aversion to, homosexuality or l/g/b/t/q people.

The essays also addressed institutional forces shaping public images of gay males and lesbians, gay liberation as a rhetorical movement, gay rights and political campaigns, and the construction of homosexuality by heterosexual communication practices. The publication of this volume made a substantial contribution to the slowly growing validation and respectability of the study of sexual orientation within communication studies. Communication scholars increasingly began to present competitively referred papers and panel contributions at regional and national communication conventions. But it wasn't until 1994 that a follow-up volume to Chesebro's *Gayspeak* was published.

The text, *Queer Words, Queer Images: Communication and the Construction of Homosexuality*, edited by Jeffrey Ringer (1994), sought to extend the first contributions of communication theory pertaining to sexual orientation. The essays in this volume examined the rhetoric of gay politicians, the symbols and strategies used during the coming-out process, the strategies used to resolve conflicts in gay and lesbian relationships, considerations about coming out in the classroom, and media portrayals of gay men and lesbians. While the text focused on extending insight into unique gay male and lesbian communication patterns, it moved the treatment of sexual orientation further into the discipline by presenting sexual orientation as an issue

whose study can enrich a general, holistic understanding of human communication. Ringer's goals for the book were to provide current substantive research findings on homosexuality from a communication perspective, to identify how research into gay and lesbian behavior informs communication theory in general, to provide a research agenda for the future, and to provide a supplemental textbook for communication courses. At the time of its publication, sexual orientation was typically not addressed in communication textbooks.

The majority of scholarship generated between the early 1970s and late 1980s did not question the dichotomy of heterosexuality/homosexuality. Like other communication research at the time, it was mostly conducted by white researchers involving white participants; it was predominantly conducted and published in English; and the experiences of bisexual, intersex, transsexual, or transgendered people were rarely mentioned. The experiences of gay men and lesbians were often studied as discrete phenomena. Access to human participants was difficult. The risk for researchers and human participants was substantial and skewed participation to those less affected by social, legal, and political considerations, as examined in Toni McNaron's (1996) *Poisoned Ivy: Lesbian and Gay Academics Confronting Homophobia*, which reported on the experiences of about 300 lesbian and gay academics.

Starting with the late 1990s, three overlapping social developments particularly affected the communication dynamics surrounding sexual orientation: an evolving social focus on cultural diversity, communication changes resulting from the popularity of emerging technologies, and trends in popular culture and media representation.

Social Focus on Cultural Diversity

Recent research and scholarship have addressed the dynamics of sexual orientation within specific co-cultural groups, in other national or ethnic cultures, and on a global level. Scholarship involving bisexual and transgender people has increased and seeks to be more inclusive of sexual orientations and gender identities other than gay male or lesbian in communication studies. The phrase *lesbian, gay, bisexual, transgender, and queer* (l/g/b/t/q) was widely adopted, locally and globally, to denote nonheterosexual communities. On college campuses in particular, several groups opted to acknowledge intersex individuals, straight supportive people, and those questioning their sexual orientation and gender identity by including them in group titles and acronyms. Within the communication discipline's leading academic associations, name changes to sections and divisions reflected the desire to be more inclusive. The National Communication Association's (NCA's) Caucus on Gay and Lesbian Concerns changed its name to the Caucus on Lesbian, Gay, Bisexual, Transgender and Queer Concerns and broadened the title of its Gay/Lesbian/Bisexual/Transgender (GLBT) Studies Division; the

International Communication Association renamed its Gay and Lesbian Studies Interest Group the Gay, Lesbian, Bisexual and Transgender Studies Interest Group. Scholars in these interest groups pursue the analysis and critique of discourses of sexuality and gender, particularly those that inform the lives of l/g/b/t/q people. Studies examine links to broader social and cultural practices and investigate individual and group identity formation.

Popular Culture and Media Representations

A significant body of scholarship has focused on media constructions and representations of sexual orientation. The (in)visibility of l/g/b/t/q people in the media emerged as a popular topic of communication scholarship in the last decade, prompting assessments of historical developments in the making. In the 1950s and 1960s, mass media portrayals of l/g/b/t/q people were limited to criminalized or diseased characters. L/g/b/t/q people appeared rarely and remained largely invisible; a few portrayals were heavily coded, allowing for in-group consumption only. Such portrayals of gay, lesbian, bisexual, and transgender characters have been decoded in documentaries and media analyses such as Vito Russo's (1987) landmark book and film *The Celluloid Closet*. Russo, a gay activist and film historian, cofounded the Gay and Lesbian Alliance Against Defamation (GLAAD), a media-monitoring group that follows representation of l/g/b/t/q characters in the mainstream media.

In the 1970s and 1980s, portrayals became more sympathetic. Same-sex orientation was typically construed as a problem, however, and the often one-dimensional characters were preoccupied with their same-sex desire. Such sympathetic portrayals were often linked to the gay and bisexual men's communities that struggled with the spread of HIV infections and AIDS, such as in the 1993 movie *Philadelphia*, which centers on a gay man suffering from AIDS who is fired from a conservative law firm because of his condition. Portrayals of l/g/b/t/q people changed drastically in the 1990s and 2000s, when gay and lesbian characters began to be cast in recurring characters rather than one-time appearances and were shown as multidimensional characters. Media scholars began to bring to light past underrepresentation and to critically analyze new forms of representation. Sheridan Nye, Nicola Goodwin, and Belinda Hollowes (1994) examined the underrepresentation of lesbian voices on British radio and pointed out the lack of research on lesbian media consumer practices. They suggested that gay men dominated community newspapers, magazines, and advertising media and argued for an active movement to create broadcast channels of communication that would allow lesbian people to address one another and society as a whole.

During the late 1990s and early 2000s, bisexual and transgender characters saw greater visibility on television,

in the news, and in the movies. The mainstream appeal of transgender characters in movies such as *Boys Don't Cry* and *Transamerica* brought visibility to a marginalized community within the 1/g/b/t/q population. Since then, hundreds of studies within and beyond communication studies have analyzed the portrayal of 1/g/b/t/q and straight characters in television and film. Robert Alan Brookey and Robert Westerfelhaus analyzed the portrayal of gay male drag queens in *To Wong Foo, Thanks for Everything! Julie Newmar*. The then-highly controversial “coming-out episode” of the show *Ellen*, which featured the first openly lesbian leading character on prime-time television, was debated and analyzed by communication scholars. In September 2007, readers of the popular gay and lesbian magazine *The Advocate* voted the actress Ellen DeGeneres as their No. 1 hero in the magazine's 40th-anniversary issue because of the cultural impact of her television show. Gay and lesbian characters appeared in supporting roles on primetime shows such as *NYPD Blue*, *ER*, and *Law & Order*. The popularity of the sitcom *Will & Grace* and reality show *Queer Eye for the Straight Guy* spawned a flurry of analyses. Television shows with predominantly gay or lesbian characters aimed at primarily 1/g/b/t/q audiences such as *Queer as Folk* and *The L-Word* became popular. Communication scholars analyzed the portrayals of gay and lesbian characters in textual analyses, questioning, for example, the class status and highly feminine presentation of the majority of characters on *The L-Word*.

Openly gay and lesbian participants took part in reality television shows such as *The Apprentice*, *Survivor*, *Idol*, and *The Real World*. Communication scholars assessed the often successful, and in instances, surprising mainstream reception of shows focusing on 1/g/b/t/q characters or themes. Didi Herman (2003) argued that shows such as the British Television show *Bad Girls* succeeded in creating a certain degree of homonormativity—defined as a representation of same-sex desire as normal and unremarkable, which may contribute to increased social visibility and acceptance.

1/g/b/t/q audiences emerged as distinct and popular targets for marketing and advertising campaigns. Research in advertising, marketing, and public relations quickly focused on the ability to reach 1/g/b/t/q markets but then expanded to test the inclusion of 1/g/b/t/q content in mainstream advertising outlets. Some studies affirmed the effectiveness of clear lesbian interaction (compared with those with veiled lesbian attraction) in mainstream display advertising; others documented the appeal of cross-dressing and gender-ambiguous characters and themes in television commercials. Other studies suggested the effectiveness of implicitly homophobic messages in advertising campaigns. The idealized body images of men and women in advertising geared at 1/g/b/t/q audiences came under criticism. Media scholars engaged in discourse analyses and conducted content analyses of advertising and marketing within 1/g/b/t/q-oriented media as well as mainstream media, including highly targeted health communication inquiries such as analysis of noncommercial tobacco content in the lesbian, gay, and bisexual press. The

communication scholar Larry Gross (2001) chronicled the gradual emergence of gay and lesbian visibility in news and advertising and demonstrated a gradual shift in *The New York Times* coverage in his book *Up From Invisibility: Lesbians, Gay Men, and the Media in America*. The commercial and artistic success of the 2005 Academy Award-winning film *Brokeback Mountain*, directed by Ang Lee, reflected the changes in popular culture since the film focused on a complex emotional and sexual relationship between two cowboys. In addition to mainstream media addressing 1/g/b/t/q content, a number of broadcast networks created by, and geared exclusively at, 1/g/b/t/q audiences emerged in the 2000s.

The communication scholar Bonnie Dow (2001) offered a detailed contrast of contemporary queer visibility on television and the lack of actual legal and political progress on equal rights. Dow argued, as do a number of other scholars today, that positive media portrayals do not necessarily translate into greater political equity. She interpreted the success of shows such as *Will & Grace* and *Ellen* not as a sign of increasing public acceptance of open same-sex orientation in the media but as a celebration of personal honesty, rendering television portrayals personal but not political. She is joined by other communication scholars who point to the interpersonal, rather than political, construction of 1/g/b/t/q identities prevalent in media constructions. Some, such as Jeffrey Bennett, caution against dismissing the performance of sexual orientation in a culture that increasingly conceptualizes sexuality as fluid. Bennett analyzed two reality dating programs, *Boy Meets Boy* and *Playing It Straight*, which exposed the inability of individuals to determine another's sexual orientation, regardless of their own orientation.

Communication scholars agree on the documented and unprecedented visibility of 1/g/b/t/q people and issues prevalent in mainstream and alternative media today. They disagree, however, on the implications of this visibility. Legal and social policy change in the United States has not matched the pace of increased visibility in the media, and even in the media, the notion of sexual orientation remains cast as an issue. Some scholars note that the current popularity of 1/g/b/t/q social and cultural topics in the media is likely to be short-lived and may pass without advancing fundamental actual legal and political representation. Others point to the power of increased visibility to change people's perceptions and find it asserted in growing social acceptance.

The Influence of Emerging Technologies

The relevance of Internet-based communication, which allowed 1/g/b/t/q people to speak for themselves, create their own images, seek partners, and establish communities in electronic space, has greatly affected the relationship between sexual orientation and communication. The medium became so popular with 1/g/b/t/q populations in such a short time that they appeared to be the most widely

represented demographic group on the Internet in the early 2000s. Internet-based practices such as blogging and creating Web pages facilitated the coming out of individuals to such a degree that the practice became essentially unremarkable. While early Web pages, news magazines, and online community groups by and for 1/g/b/t/q people were heavily dominated by an assertion of pride and resistance, within a few years, people began to look for greater diversity and to portray their electronic selves as multifaceted people. For individuals in isolated physical or social locations, the Internet offered the only chance to finding out about a larger community in an anonymous way, a role it continues to play for many in such locations. In tandem with changing personal electronic communication practices, greater representation in the popular media fuelled the increasing visibility of 1/g/b/t/q people.

Communication scholars examined Internet portals such as PlanetOut.com and Gay.com, which are directed at 1/g/b/t/q visitors, by focusing on mainstream marketing and surveillance of 1/g/b/t/q communities at a time when niche marketing to such consumers was very popular. Others studied the embodiments of cybersexualities by 1/g/b/t/q and heterosexual Web users. The popularity of online chat rooms in male gay communities and, to a lesser extent, in lesbian communities, provided ample data for the study of online interaction management; studies also explored the practice of Webcasting in online communities. In addition, the rapid creation and production of online magazines by 1/g/b/t/q Web users for 1/g/b/t/q Web visitors and readers attracted scholars from various national and linguistic backgrounds to analyze the cultural constructions of sexual orientation offered on globally available Web sites. Jonathan Alexander, for example, interviewed the Webmasters of a gay-affirmative Web site serving Southern Africa, calling attention to the cultural construction of such sites since many Africans do not describe same-sex identities or behavior in terms of gay or lesbian identities. In 2004, Alexander published a report sponsored by the GLAAD Center for the Study of Media and Society on the ways in which 1/g/b/t/q youths used the World Wide Web to articulate their personal, social, cultural, and political concerns on self-created sites. Alexander reported on the diversity of content of the sites created, the resistance to commercialism, and young people's ability to design Web spaces that meet their needs, needs that appear to be markedly different from those of earlier generations of 1/g/b/t/q youth.

Sexual Orientation and Queer Communication Studies

During the 1990s, queer scholarship and theory began to manifest itself as a major intellectual movement. The work of queer theorists such as Judith Butler, Teresa DeLauretis, and David Halperin was integrated into communication studies, at first mostly in the areas of critical and cultural studies and performance studies.

Some communication scholars began to identify themselves as queer theorists, regardless of their own sexual orientation, and contributed to the application of queer theory in communication studies. One of the earlier applications of queer theory to communication studies with a focus on performance is Fred Corey and Thomas Nakayama's 1997 *Text and Performance Quarterly* essay "Sextext." The essay, presented as a fictional account of text and body as fields of pleasure, prompted strong responses and controversy, illustrating disciplinary resistance to queer theory as an intellectual framework and the topic of gay male sex as a legitimate topic of inquiry. Within a decade, however, queer theory had established itself as a major recognized intellectual framework used by communication scholars. The communication scholar Judith Halberstam (1996) proposed a notion of female masculinity, situating "stone butch" identities between female masculinity and transgender identities. Halberstam argued that popular language needs to integrate new words that represent the notions of gender variance established in academic scholarship. In other words, scholars have called attention to the fact that thinking about ourselves in static categories, such as "man" and "woman," "gay" and "straight," does not reflect the range of gender expressions humans experience. Brenda Cooper (2002) offered a critical analysis of the film *Boys Don't Cry*, which she praised for its innovative narrative on female masculinity.

While the prominence and popularity of queer theory has undoubtedly led to greater visibility and support for scholarship on sexual orientation, it has also come under scrutiny for obscuring the need for such scholarship. Many, if not most scholars, acknowledge the value of not contributing to static descriptions of population groups based on one particular aspect of their identity. But some also argue that as long as some members of the population at large do not have the same rights as others, based solely on their sexual orientation or gender identity, research on these groups as groups is needed.

From a pedagogical perspective, several scholars have argued that sexual orientation remains a minority and diversity issue that needs to be addressed. Bryant Alexander (2006) not only acknowledged the potential of queer theory but also considered the value of self-articulation as a black/gay man/performer/teacher/scholar. E. Patrick Johnson (2001) sought to reconcile the theoretical benefits of queer theory and the practical standpoints of 1/g/b/t/q people of color in a new theory of and for gays and lesbians of color—"quare studies." James Darsey (2004), who coauthored with Fred Jandt one of the earliest essays on coming out from a communication studies perspective, reviewed three contemporary texts on gay culture and communication. His review of these books on the construction of homosexuality and HIV/AIDS via the media or national communication campaigns focused on the issue of representation. Darsey questioned the critical lens through which queer scholars tend to approach their analysis and suggested that not all readers can be presumed to share the authors' views of 1/g/b/t/q lives.

Sexual Orientation From a Global Perspective

Starting in the mid-1990s, the impact of cultural, political, economic, and social globalization trends began to be reflected within communication studies, including those studying concepts related to sexual orientation. Communication scholars representing previously unrepresented ethnic and cultural minority groups began to study specific communication dynamics to prevent an artificial homogenization of the study of sexual orientation in the communication literature. Frequently, such scholarship sought to integrate the dynamics of national, ethnic, cultural, and sexual identities. For example, Gina Masequesmay (2003) engaged in participant observation of a support group for Vietnamese lesbians, bisexual women, and female-to-male transgender people. Her research sought to show how gender and sexuality interplay in the process in which Vietnamese American identity is established. Frederick Corey (1996) studied gay male interaction in Irish pubs and examined sexual difference, cultural identity, and illegal immigration in Irish America.

Barbara Freeman published a feminist cultural and critical analysis of articles about lesbians in the Canadian women's magazine *Chatelaine* between 1996 and 2004. At communication conventions, scholars presented research exploring the particular cultural understandings of sexual orientation and differences in specific communities in diverse nations, ranging from examinations of the media relations strategy of the 1/g/b/t/q Tongzhi Hotline Association movement in Taiwan to conceptualization of same-sex sexual behavior on online sites in the Middle East and Africa. Parallel in time, communication scholars began to explore the international and global dimensions of sexual orientation. Driven by economic, social, political, and cultural globalization, a global gay rights movement began to emerge in the early 2000s that centered on advocating for legal rights and protection for 1/g/b/t/q people. Globally, a proliferation of legal rulings occurred aimed at either granting legal protection to 1/g/b/t/q minorities or at solidifying and legalizing discrimination against such minorities. Supported in part by greater media visibility, legal rights for 1/g/b/t/q people appeared to be on the increase from a global perspective. Scholars documented, examined, supported, challenged, and critiqued the emergence of global English as the global gay rights language. Global human rights organizations such as Amnesty International adopted campaigns focusing on discrimination against 1/g/b/t/q people.

Sexual Orientation in Social Scientific Research

Communication scholars have studied sexual orientation from a social scientific perspective as a variable or discreet

characteristic playing a role in communication and as a cultural phenomenon. Early scholarship on sexual orientation in communication focused on the coming-out processes (intrapersonal, interpersonal, mediated), as well as the politics of "outing" others.

For example, the relationships of lesbians and gay men were the subject of a chapter in a 1995 volume on understudied relationships edited by the interpersonal communication scholars Julia Wood and Steve Duck. In this chapter, Michelle Huston and Pepper Schwartz sought to move research on gay men and lesbians away from a focus on normalizing their experiences. Huston and Schwartz pointed to systematic differences and similarities in gay and lesbian relationships compared with heterosexual relationships. They argued that the study of gay and lesbian relationships is important not only to bring light to understudied types of relationships but also to help communication scholars understand how human relationships are affected by gender, power, and social practices, such as the institutionalization of same-sex marriage.

A decade later, communication scholars have moved on from the generalizations about 1/g/b/t/q communicative practices and explicitly address the heterogeneity of 1/g/b/t/q speech communities. However, the importance of shared linguistic practices as a resource for group cohesion and identity remains prevalent, as scholars of language and communication such as Fern Johnson and William Leap stressed in their work. For example, several scholars have studied the way teenagers use language to express negative or discriminatory attitudes toward others with nonheterosexual orientations or variant gender identities. Such language use has been found to contribute to the creation of school climates hostile to 1/g/b/t/q individuals. More recently, scholars have also documented ways in which teenage conversations sometimes challenge heteronormativity (where which heterosexual orientation is presumed to be normal) and heterosexism (where heterosexual orientation is portrayed or understood to be better than same-sex or bisexual attraction).

The contentious issue of the legalization of same-sex marriage preoccupied much of the sexual orientation literature; the research agenda during the late 1990s and early 2000s reflected the social, cultural, and political emphasis on this issue. While some communication scholars examined the relational effects of prohibited legal marriage for same-sex partners, others focused on the language practices resulting from such nontraditional relationships and family constructions. Some scholars approached this topic from the perspective that the exclusion of 1/g/b/t/q people from access to legal marital rights warrants research and generation of policy recommendations. Others argued that rather than affirming the place of marital rights in society, scholars should focus on studying and generating policy recommendations for separating individual legal rights (e.g., inheritance, taxation, insurance coverage) from marital rights.

The increasing number of individuals outing themselves also contributed to a social and scholarly focus on 1/g/b/t/q family constructions. More lesbian and gay couples began to coparent their biological or adopted children openly, a social practice that invited study by interpersonal and family communication scholars. Communication scholars explored symbolic attempts to construct nonbiological lesbian mothers as legitimate parents by documenting how family members create special names to acknowledge the presence of two mothers—one biological, one not—within one household. They also studied the general dynamics of fatherhood, motherhood, and parenthood in 1/g/b/t/q families and created models of romantic and family relationships for 1/g/b/t/q couples and families.

Several scholars have examined the phenomenon and role of self-disclosure with regard to sexual orientation. Self-disclosure carries a primary role in interpersonal communication involving 1/g/b/t/q people because, unlike discrimination based on visible (skin color, disability) or audible (accent) characteristics, 1/g/b/t/q people often have to choose between passing for a heterosexual or self-disclosing membership in a stigmatized group. Self-disclosure has also been found to play a significant role in interactions between individuals who are affected by HIV or AIDS status.

The construct of homophobia, typically defined as a fear of same-sex attraction, lesbian, or gay people, has also been studied widely in communication studies. Such scholarly attention is warranted by the observation that a majority of 1/g/b/t/q people report having experienced verbal harassment, including physical threats, on the basis of their sexual orientation. Kory Floyd and Mark Morman (2000) had participants complete a questionnaire measuring their levels of homophobia and linked higher levels of homophobia with more negative assessments of affectionate statements between same-sex individuals. This is one of many studies involving perception processes of same-sex orientation. Jeffrey Hall and Betty La France (2007) studied how homophobic messages were constructed in a male fraternity and showed that fraternity members who perceived the presence of gay members as a threat to the desired male-male bonding also held more negative attitudes toward gay fraternity members.

Speech communication scholars also conducted controlled experiments to determine what people listen to when judging a speaker's sexuality, leading to the conclusion that perceptions of sexuality are ideologically linked to other perceptions of personality and personhood. Catherine Gowen and Thomas Britt (2006) examined the joint effects of gay male linguistic variation and sexual orientation on the stigmatization of male students applying for college admission. Gowen and Britt found that participants responded more positively to the gay male speaker when he spoke with stereotypical gay speech than with standard speech but less positively to heterosexual speakers with gay speech. Sexual orientation and gay speech did not predict admission or scholarship decision ratings.

Speech communication experts Mary Gorham-Rowan and Richard Morris (2006) conducted aerodynamic analyses of male-to-female transgender voice production since a feminine-sounding voice is often highly desired by male-to-female transgender persons.

The construction of 1/g/b/t/q identities has been an important focus of research on sexual orientation in communication studies. Using social identity theory, scholars have documented heterosexual communication schemas for conversations with gay men. Victoria Land and Cecilia Kitzinger analyzed tape-recorded phone conversations in English lesbian households and found that coming out in phone conversations disrupts heteronormative assumptions. Shinsuke Eguchi (2006) argued that due to current societal situations, gay and bisexual men may internalize homophobia and construct conflict within themselves. Eguchi suggested that a better understanding of external and internalized homophobia would help members of 1/g/b/t/q communities resolve intra- and interpersonal conflicts more effectively.

Studies of particular 1/g/b/t/q communities sought to demonstrate the group construction of co-cultural identities. For example, Myra Hird and Jenz German (1999) examined the ways in which a lesbian community in Aotearoa, New Zealand, narrowly defined what kind of lesbian they would consider to be an authentic member of their community. They joined other scholars pointing to the negative construction of bisexual attraction, desires to parent, feminine appearances, sado-masochism, and sexual assertiveness within many lesbian communities. Using literary, psychological, and sociological models, scholars from various humanistic and social scientific fields of study have proposed models of gay and lesbian identity development.

Health communication scholars also began designing studies with a focus on greater sexual diversity in the last 15 years. Such studies focused on issues specific to communities engaging in shared sexual practices linked to health risks. In this vein, health communication scholars found that an exposure to a storyline about syphilis in gay men had a positive public health outcome on users of Internet chat rooms for men who have sex with men (MSM). A pattern mirrored in other specialty areas of communication, this particular field began with studies conceptualized by and for heterosexual communities, then saw an effort to design studies focusing on the experiences of 1/g/b/t/q communities, followed by an effort to steer away from study designs focusing on sexual orientation. Rather than conceptualizing such studies as geared at gay men, for example, the population construct MSM has emerged as more useful, since it focuses on the practice, which may be engaged in by men who identify as heterosexual, bisexual, or gay.

Organizational communication scholars have also extended their studies to include 1/g/b/t/q communities. A series of scholars have examined workplace discrimination and the effects of homophobia on 1/g/b/t/q individuals;

corporate attitudes toward gay and lesbian employees; and differences and similarities between heterosexual and 1/g/b/t/q employees. Michaela Meyer (2004) identified three key tensions that influence the formation and maintenance of community: unity and difference, commitment and apathy, and empowerment and disempowerment. The coexistence of these tensions poses a challenge to community organizing, she suggested, and analysis of these tensions may be helpful to organizing practices beyond 1/g/b/t/q communities.

Sexual Orientation in Communication Studies Today

In 2001, an updated bibliography of books and journal articles on 1/g/b/t/q topics published by members of the NCA or the International Communication Association included 24 books and an average of five journal articles per year from the mid to late 1990s. For the years between 1973 and 1990, the number of such journal articles in communication journals was estimated to be about one per year. Currently, the Communication and Mass Media Complete database yields about 100 entries with the keyword *sexual orientation* and about 200 for the keywords *homosexuality* and *gender identity* each. However, use of the keywords *gay* and *lesbian* generates more than 1,000 entries. Keyword searches for *bisexual*, *transsexual*, or *transgender* yield about 50 or fewer hits for each in this database. The visibility of 1/g/b/t/q issues has increased on a general cultural, political, social, and legal level generally and specifically within communication scholarship and pedagogy. In 1999 alone, more than 50 convention papers or panel presentations at the NCA convention addressed lesbian/gay/bisexual or transgender issues. Many of these were sponsored by divisions or programs other than the GLBT Caucus or Division; a panel on homophobia in communication courses was selected as a spotlight panel for the overall convention. At the 2002 NCA convention, the panelists Chesebro and Gust A. Yep identified the historical transformations affecting the communication discipline. The panel addressed how 1/g/b/t/q and heterosexual cultures have and should transform each other, and the presentation conceptualized these cultures as co-cultures. The panel members asked provocative questions such as the following: Is it true that gay men can also represent lesbians while lesbians can only represent themselves? Are there misogynous issues involved in how the concept of gay and lesbian communication is used? In what ways and to what degree is gay/lesbian/bisexual/transgender communication a meaningful concept?

In 2003, Yep, Karen E. Lovaas, and John P. Elia published an edited volume titled *Queer Theory and Communication: From Disciplining Queers to Queering the Discipline(s)*. In several ways, this edited text has been seen as a follow-up to *Gayspeak* and *Queer Words*. Yep and colleagues framed their text in the understanding that it's

time to move on from studies focusing on the communication experiences of 1/g/b/t/q people as a minority group. Instead, they suggested, scholarship should focus on the ways in which all individuals' sexual and gender identities shift and vary and how they are intertwined with issues of race, class, and culture. This volume was the first to bring together queer scholarship in communication in a volume. A 2006 reader on sexualities and communication in everyday life edited by Lovaas and Mercilee Jenkins further challenged students to move beyond dichotomous views of heterosexual and 1/g/b/t/q identities, further sought to integrate queer theory into communication studies, and assisted in the understanding of the intersections of sexuality with other identity constructions.

Some have argued that despite the increase in the number of studies on 1/g/b/t/q issues in the 1980s and 1990s, such studies continue to lack visibility and recognition in the communication discipline. Sexual orientation remains a vital topic of communication study; changing social and cultural practices invariably call for new studies on emerging phenomena. It appears likely that research and scholarship on sexual orientation will continue to overlap, converge, and diverge as scholars from various methodological perspectives study manifestations of sexual orientation. The correction of myths will remain a challenge to research on sexual orientation and communication. It was not until the late 1990s, for example, that demographic assessments suggesting the relative wealth of gays and lesbians were corrected and replaced with studies suggesting that 1/g/b/t/q people are likely close to the income average of heterosexual people. With increased visibility and increased awareness of the heterogeneity of 1/b/g/t/q people, it is also likely that more studies will document convergence of communication dynamics in 1/g/b/t/q and heterosexual communities.

CULTURE

FRED E. JANDT

California State University, San Bernardino

That there is a relationship between culture and communication is obvious when misunderstandings occur in international relations and business: When a U.S. president greeted the people of Poland, his translator said in Polish, “The President says he is pleased to be here in Poland grasping your secret parts.” Chevrolet attempted to market its Nova compact car in Latin American countries. In Spanish, *no va* means “does not go,” or “it doesn’t run.” The car was renamed the Caribe. And for the 1994 World Cup, both McDonald’s and Coca-Cola reprinted the Saudi Arabian flag with its sacred words “There is no God but Allah, and Mohammed is his Prophet” on millions of paper bags and cans. Muslims objected to its use as a sales device and that the bags and cans with the sacred words would be thrown in the trash. On a more individual level, when any of us live for an extended period of time in a country other than our native land, we may experience some feelings of disorientation and anxiety when we discover that our assumptions about life and ways of behaving can be challenged.

In this chapter, we’ll review in more detail the relationship between culture and communication. First, we’ll distinguish among the various terms used to refer to this relationship. Then, we’ll review the barriers that can impede effective communication among individuals and the cultural values that help describe the ways cultures differ.

Then, we’ll look more closely at the relationship between culture and communication by comparing two cultures. Finally, we examine case studies of imperialism, immigration, and international advertising as examples of intercultural communication.

Defining the Relationship

There are many approaches to studying the relationship between culture and communication. International communication was a term used to refer to the study of the flow of communication among countries—particularly the communication between national governments—and the comparative study of national mass communication systems. More recently, global communication has been used to refer to transborder communication by groups, institutions, and governments.

The term *cross-cultural communication* technically refers to comparing phenomena across cultures. For example, a cross-cultural study of child rearing would compare what is done in many cultures. Development communication is used to refer to the study of communication to promote social and economic growth in poverty-stricken countries and areas.

The more generic term *intercultural communication* generally refers to face-to-face interactions among peoples of diverse cultures. The formal study of intercultural communication in the United States is said to have originated in 1946, when Congress passed the Foreign Service Act, which established the Foreign Service Institute to provide language and anthropological cultural training for foreign diplomats. Others date the origin to the publication of Edward T. Hall’s book *The Silent Language* in 1959. While Hall was associated with the Foreign Service Institute, he brought anthropological concepts to the practical world of Foreign Service. He also clearly defined culture as basically a communication process creating the climate for the

study of intercultural communication within communication departments rather than anthropology departments (Leeds-Hurwitz, 1990).

All these terms require an understanding of the term *culture* itself. In the 19th century, the term was commonly used to refer to Western civilization. In fact, it was commonly believed that all cultures progressed from savagery and barbarism to what was identified as Western civilization. While we may be surprised by that belief, it was not that uncommon. Ancient Greece and imperial China also believed that their own ways of life were superior to others. The idea that there was not one superior culture was slow to evolve.

Today, the term *culture* typically includes the following understandings:

- A community large enough to produce new generations without relying on outside people
- The totality of that community's thought, experiences, and patterns of behavior and its assumptions, understandings, and values about life that guide behavior
- The process of social transmission of these thoughts and behaviors from birth in families and other institutions over the course of generations
- That members consciously identify themselves with that community—referred to as cultural identity or the identification with and acceptance into a group that has shared symbols and behavior norms

Note that this definition of culture is not necessarily the same as the definition of a nation-state. One nation-state might include more than one culture. That recognition has led to the use of the terms *subculture* and *co-culture*. Within one nation-state, groups composed of a large number of people who identify with a culture, from which they derive distinctive values and rules of behavior, are referred to as a subculture. Subcultures are often based on economic or social class, ethnicity, race, or geographic region. French Canadian is a subculture within Canada, for example. As the prefix *sub* on the word *culture* seems to imply being under, secondary, and inferior, the term *co-culture* was suggested to convey the idea that no one culture is inherently superior to other cultures. One might question whether true situations of co-culture exist. To be so, one culture could not impose its values and rules of behavior on the other. For example, one could not impose its unique legal system on the other.

One final term should be introduced—subgroup. Subgroups, or membership groups, may provide members with some values and patterns of behavior. Subgroups exist within a dominant culture and are dependent on that culture. One important example is occupation, in which most people dress alike, share a common vocabulary and similar values, and share communication media such as newsletters and magazines. Examples are nurses and doctors, police officers, and employees of large organizations such as Disney.

Barriers to Intercultural Communication

One way to further study the relationship between culture and communication is to recognize the barriers to effective intercultural communication. LaRay M. Barna (1997) developed a list of six such barriers: anxiety, assuming similarity instead of differences, ethnocentrism, stereotypes and prejudice, nonverbal misinterpretations, and language.

Anxiety

When we are anxious because we are not sure what is expected of us, it is only natural to focus so much on what we are doing that we are not fully present in the communication itself. For example, speakers of English as a second language may experience anxiety over their English language skills and focus so much on how they are pronouncing words that they limit their interactions with English speakers.

Assuming Similarity Instead of Difference

Oftentimes, visitors to a new culture focus on the things that seem the same, that is, driving on the same side of the road, eating similar foods, and enjoying the same music and movies. When we assume similarity, we can ignore important differences. We may share photos of grandparents but have very different values about where those grandparents should live and the extent to which they should be involved in our lives.

Ethnocentrism

Ethnocentrism refers to negatively judging aspects of another culture by the standards of one's own culture. We are ethnocentric when we believe that our culture is superior and not understand that whatever exists in one culture makes sense if we understand that culture. If the average summer temperature was 43 degrees Celsius (109 degrees Fahrenheit), it would be logical to adjust school and business hours into evening hours to conserve energy. Long lunches and afternoon siestas make sense. It would be ethnocentric to attribute those long lunches and afternoon siestas to laziness.

Stereotypes and Prejudice

Both these terms refer to making judgments about another based on group membership. Stereotype refers to negative or positive judgments made about another based on any observable or believed group membership. Anyone can stereotype. Is the appearance of possible identification with a cultural group evidence of driving skills? Of athletic skills? Of math skills? Stereotypes impede communication

as they cause us to assume that a belief is true of any one individual, their use reinforces the belief that may in fact not be true at all, and they become a self-fulfilling prophecy for the person stereotyped.

Whereas stereotypes can be positive or negative, prejudice refers to the irrational dislike, suspicion, or hatred of a particular group, race, religion, or sexual orientation. The Roma (mistakenly named Gypsy by medieval Europeans, who thought all dark-skinned peoples came from Egypt) experienced persecution by Nazi Germany and Eastern European Communist governments. Japanese-born Koreans have been victims of social, economic, and political prejudice, as did the Irish in the United States.

Nonverbal Misinterpretations

Nonverbal symbols create meanings for others. Nonverbal communication refers to messages sent without using words. Many nonverbal expressions vary from culture to culture, and it is just these variations that make nonverbal misinterpretations a barrier. Consider the following examples.

Proxemics

Proxemics refers to our use of personal space. Edward Hall (1959) demonstrated that cultures differ substantially in their use of personal space. Hall demonstrated that in North America, personal space is from 18 inches to 4 feet, the lower end being handshake distance, the distance most people in North America stand from each other in public. In Latin American and Arab cultures, that distance is much less. In an intercultural context, one may attempt to stand closer by moving in, while the other may attempt to maintain the customary personal distance by moving back.

Kinesics

Gestures, body movements, facial expressions, and eye contact are referred to as kinesics. In his book *Bodytalk*, Desmond Morris (1995) explained that gestures can be intentional or unconscious. In ancient Rome, lower classes used four fingers and the thumb to pick up food; upper classes used two fingers and the thumb. This may have been unconscious, but it clearly communicated class.

The meaning of conscious gestures can vary from culture to culture. The forefinger-to-thumb gesture forming a circle can mean “okay” in the United States. In France, it can mean zero or worthless. In Japan, it can mean “money.” In Brazil, it can clearly communicate an offensive meaning. Even things such as nodding agreement can vary. Most cultures do indicate “yes” by an up-and-down nod of the head and “no” by shaking the head from side to side. But in Albania and Bulgaria, the gestures can be reversed. In Sri Lanka, a yes to a specific question is indicated as a the nod of the head, but general agreement is indicated by a slow sideways swaying of the head.

Certain facial expressions such as smiles are universal, but many are not. In the United States, people in conversation

maintain some degree of eye contact. If one person avoids eye contact, the other may assume that the person is evasive or dishonest. In some Asian cultures such as Japan, students will often avoid making eye contact with their instructors as a sign of respect. If a U.S. instructor did not have that cultural understanding, a communication barrier would exist.

Chronemics

Chronemics refers to the study of our use of time. The fact that cultures have differing meanings for the use of time can become a barrier. What time dinner is served, what time you arrive for a party, how long you are kept waiting for an appointment all depend on where you are.

Haptics

Haptics refers to our use of touch to communicate. In Thailand and Laos, it is rude for a stranger to touch a child on the top of the head because the head is regarded as the home of the spirit or soul. It is believed that a child’s spirit or soul is not strong enough to be touched and has a tendency to become ill if patted. In New Zealand, the hongi, the touching of noses to share the breath of life, is the traditional greeting of the Maori.

Language

To understand how language can be a barrier, we need to go back to the Sapir-Whorf hypothesis in order to account for the differences in languages across cultures. Scholars have divided the hypothesis into the linguistic determinist interpretation and the linguistic relativity interpretation. The linguistic determinist interpretation is that language controls thought and cultural norms, that is, each of us can only know that part of the world that our language permits us to know or that the language of our culture predetermines we can know. In other words, culture is controlled by and controls language. In the linguistic relativity interpretation, the difference between languages is not what can be said but what is relatively easy to say. The classic example is vocabulary. The Hanunov tribe has 92 separate words to refer to *rice*. From this we can assume that rice is important to that culture. Of course, other languages can see and understand how the 92 Hanunov tribe words for rice are different. They just don’t have separate words for each of those different states of rice. Another classic example is grammar. In the Eskimo language, it is common to use the word *if* rather than the word *when* in reference to the future, as in “If I graduate from college . . .” rather than “When I graduate from college . . .” *When* seems to communicate more certainty than *if*. Linguists assert that the more common use of *if* is associated with the harsh environment of the Eskimo, where there is little control over nature.

The Sapir-Whorf hypothesis can be used to explain translation problems between languages (Sechrest, Fay, & Zaidi, 1972).

Vocabulary Equivalence

This recognizes that languages differ in the number of categories or words available. Remember the 92 single words for rice. It is accurate to translate each of these into the single English word *rice* but to do so would lose the specificity of the original.

Idiomatic Equivalence

Think of the many idioms in English: *kicked the bucket*, *out to lunch*, *raining cats and dogs*, *break a leg*. Now think how the meaning is totally lost if these were to be translated word for word.

Grammatical–Syntactical Equivalence

Languages do not necessarily have the same grammar. You may need to understand a language's grammar to understand the meaning of a word. For example, in English, words can have different meanings as nouns, verbs, or adjectives. Look at the two simple phrases "book a place" and "place a book" to understand that in word-for-word translation, meaning would be confusing.

Experiential Equivalence

Objects and experiences may differ in cultures, while the word may be the same. Instead of using the Vietnamese word for *census*, which translates as "investigation of the population," the U.S. Census was sensitive to Vietnamese immigrants' experience with Vietnam's government tracking to individuals and used the phrase *Thong ked an so*, which translates as "survey of the population."

Conceptual Equivalence

In a similar fashion, abstract ideas may be different in different languages. The former U.S. President Jimmy Carter identified conceptual equivalence with the phrase *human rights*. According to President Carter, each country uses the term to refer to what it does well. In the United States, human rights typically refers to freedoms in the Bill of Rights, such as freedom of speech. In other countries, human rights refers to adequate housing or universal health care.

Finally, when a group with more power enforces the use of its language on another group, as Sapir-Whorf suggests, it is also enforcing its own culture on that group. Others suggest that the spread of any language also means the spreading influence of the culture associated with that language. Of course in the modern world, the dominant language is English. It is estimated that one-fourth of the world's population is familiar with English to some extent. English dominates in science, technology, commerce, tourism, diplomacy, and pop culture. Some 80% of the world's electronic databases and communication networks are in English. Even computer keyboards are typically

based on the English alphabet. The former French president, Jacques Chirac, told a group formed in France to preserve the use of French in cyberspace: "If in this new medium our language, our programs, our creations don't have a strong presence, our future generations will be economically and culturally marginalized." The French government has since decreed that e-mail will be pronounced *courriel*, from the French words *courier électronique*.

In fact, many of the world's 5,000 to 6,000 languages are on the verge of extinction. More than half are moribund or are no longer learned by children and therefore will disappear. Only about 10% of the world's languages are spoken by more than 100,000 people. Perhaps 90% of the world's languages will be moribund or dead by the end of this century. The loss of any language means the loss of the culture of those who spoke it and the loss of the knowledge that those cultures had codified in their languages.

Cultural Values

To better understand how cultures differ, in this section, we will examine the concepts of high-versus low-context cultures, the concept of face, and what has become known as dimensions of culture.

High- Versus Low-Context Cultures

The concept of high- and low-context cultures was popularized by Hall (1976). Think of context as the environment in which a communication takes place, which helps define the meanings of the communication. Think of a romantic restaurant for a date. The environment helps define the message. Cultures in which little of the meaning is determined by the context because most of the message is encoded in the language itself are labeled low context. In low-context cultures verbal messages are highly valued. Verbal messages are elaborate, highly specific, detailed, and redundant. Cultures in which less has to be said or written because more of the meaning is in the environment or already shared by people are labeled as high context. Very little is in the explicit coded message. High-context cultures are more sensitive to nonverbal messages and are more likely to provide a context and setting and let the point evolve. In high-context cultures, people are brought closer by the importance of their shared context. The message may be lost in low-context cultures.

Examples of low-context cultures are Switzerland, Germany, North America, and the Nordic states. Examples of high-context cultures are China, Japan, Korea, most Latin American cultures, and southern and eastern Mediterranean cultures such as Greece, Turkey, and Arab states.

Imagine a high-context German negotiating a business contract with a low-context Chinese. The German may want to meet at any convenient place, may want to get right to the point, and may want to record agreements in writing. The Chinese may give thought to the setting where the

meeting is to take place and to the timing of the meeting and may want to establish a relationship with the other party before any negotiations take place. Understand that this example is a cultural studies approach as it describes an ideal personification of the culture to explain the actions of individuals.

The Concept of Face

Related to the concept of high- and low-context cultures is the concept of face. Face can be understood in two ways: Face can refer to the confidence of others in one's moral character, without which one cannot function properly in society. Face can also refer to one's prestige or reputation achieved through life.

In high-context cultures such as China, communication is more indirect or implicit and more likely to use intermediaries because social harmony and face maintenance are crucial. Communication through intermediaries eliminates face-to-face confrontation and reduces the risk of losing face. There is more indirect face negotiation and more mutual face or other face maintenance (Ting-Toomey, 1985).

In low-context cultures such as the United States, there is more direct face negotiation and more self-face maintenance. Imagine that you receive a lower test grade than you expected and on examination notice that your instructor has added up the points incorrectly. In a low-context culture, you would probably confront the instructor with the error demanding that the grade be corrected as soon as possible. Imagine how you might handle that same situation in a high-context culture. As the student, would you want to point out a mistake to your instructor?

Dimensions of Culture

In 1980, the Dutch management researcher Geert Hofstede first published the results of his study of more than 100,000 employees of the multinational IBM in 40 countries (Hofstede, 2001). Hofstede was attempting to identify the value dimensions, which vary among cultures. Although his work has been subjected to criticism, his dimensions have been frequently used to describe cultures and as the basis of research in several disciplines. Hofstede identified four dimensions: individualism, masculinity, power distance, and uncertainty avoidance. Later, a fifth dimension, Confucian dynamism (later more commonly referred to as long-term orientation vs. short-term orientation), was identified.

Individualism Versus Collectivism

The dimension refers to how people define themselves and their relationships with others from loosely structured to tightly integrated. In individualist cultures, the interests of the individual prevail over the interests of the group. Individualist cultures stress self-direction and

self-achievement. In collectivist cultures, the interests of the group prevail over the interest of the individual. Collectivistic cultures stress in-group loyalty and conformity. Examples of countries high in individualism are United States, Australia, Great Britain, Canada, The Netherlands, and New Zealand. Examples of countries high in collectivism are Guatemala, Ecuador, Panama, Venezuela, Colombia, and Indonesia. A male student from Colombia may study in the United States and earn a PhD, teach at a distinguished university, and publish important books, but when he returns to Colombia, people to whom he is introduced will want to know to whom he is related. Colombians want to know which family the student comes from because that places the student in society much more so than his individual accomplishments.

Young Yun Kim (2005) points out a relationship between individualism-collectivism and Hall's low- and high-context cultures. Furthermore, Kim characterizes individualism-collectivism as the most commonly used theory in cross-cultural research in communication, psychology, and anthropology.

Masculinity Versus Femininity

Hofstede labeled as masculine cultures those that strive for maximal distinction between what women and men are expected to do. Cultures that place high values on masculine traits stress assertiveness, competition, and material success. Those labeled as feminine cultures are those that permit more overlapping of social roles for the sexes. Cultures that place high value on feminine traits stress quality of life, interpersonal relationships, and concern for the weak.

Examples of masculine cultures are Japan, Austria, Venezuela, Italy, Switzerland, and Mexico. Examples of feminine cultures are Sweden, Norway, the Netherlands, Denmark, Costa Rica, and Yugoslavia. Jandt (2007) points out that the Nordic countries also rank highest on the United Nations Gender-Related Development Index, which reflects health, education, and income and the Gender Empowerment Measure, which reflects the political and economic advancement of women. The Nordic countries have the highest percentage of parliament seats held by women and have adopted gender equality and women's empowerment as national policies. They have legislated equal rights, inexpensive child care, free contraception and abortions, and parental leave policies.

Power Distance

Power distance refers to the way cultures deal with inequalities or the extent to which less powerful members of groups within a country expect and accept that power, prestige, and wealth are distributed unequally. Cultures with high power distance have power and influence concentrated in the hands of a few rather than distributed throughout the population. These countries tend to be

more authoritarian and may communicate in a way to limit interaction and reinforce the differences between people. Children are expected to be obedient toward parents and display respect for those of higher status.

High-power-distance countries include Malaysia, Guatemala, Panama, Philippines, Mexico, and Venezuela. Low-power-distance countries include Sweden, Ireland, New Zealand, Denmark, Israel, and Austria.

Uncertainty Avoidance

Uncertainty avoidance is the extent to which people in a culture feel threatened by uncertain or unknown situations and feel a need for written and unwritten rules. Students from high uncertainty avoidance cultures expect their teachers to be experts who have all the answers. In the workplace, there is a need to work hard. Rules, precision, and punctuality are valued.

Countries high in uncertainty avoidance include Greece, Portugal, Guatemala, Uruguay, Belgium, and El Salvador. Countries that are low in uncertainty avoidance include Singapore, Jamaica, Denmark, Sweden, Hong Kong, and Ireland.

Long-Term Versus Short-Term Orientation

After Hofstede's original work, a new dimension labeled Confucian work dynamism, now more commonly called long-term versus short-term orientation, was added. This dimension includes values such as thrift, persistence, having a sense of shame, and ordering relationships. Long-term orientation refers to dedicated, motivated, responsible, and educated individuals with a sense of commitment and organizational identity and loyalty. Long-term orientation is consistent with thrift, savings, perseverance toward results, and a willingness to subordinate oneself for a purpose. Short-term orientation is consistent with spending to keep up with social pressure, less savings, and a preference for quick results.

Countries that are high in long-term orientation are China, Hong Kong, Taiwan, Japan, South Korea, and Brazil. Countries with short-term orientation include Pakistan, Nigeria, the Philippines, Canada, Zimbabwe, and Great Britain.

Case Study Example

There have been many studies using the Hofstede dimensions. One example is Merritt and Helmreich's (1996), who surveyed 9,000 male commercial airline pilots working for airlines owned, managed, and operated by national cultures. Those pilots surveyed were of the same culture as the nationality of the airline. The results were consistent with the Hofstede research: Pilots from the United States, Britain, and Ireland had the highest individualism scores; pilots from Taiwan and Korea had the lowest. Pilots from Brazil, Korea, Mexico, and

the Philippines had the highest power distance scores; pilots from New Zealand, Australia, and South Africa had the lowest. The masculinity-femininity dimension did not discriminate within the pilot profession. A subset of the uncertainty avoidance items dealing with attitudes toward automation did indicate that cultures endorsing rules and procedures as a way of resolving uncertainty also endorse the use of automation. Pilots from Taiwan and Korea had the highest uncertainty avoidance scores; pilots from Hong Kong (British pilots), New Zealand, the United States, and Ireland had the lowest. More specifically, Anglo pilots with low power distance and uncertainty avoidance scores showed the least inclination to accept and trust automation but were also drawn to it. They disliked the lack of individual control and inflexibility that automation dictates yet enjoyed learning to work with the new technology. Pilots with high power distance and uncertainty avoidance scores were enthusiastic about automation because automation is perceived as authoritative and brings a reassuring level of certainty to flight management. Later, we'll see additional evidence that the Hofstede research did identify an important way of helping explain the relationship between culture and communication.

Cultural Perspectives on Communication

Earlier, we saw that from the Sapir-Whorf hypothesis that culture and language are inseparable. Now let's expand that to say that culture and all communication are inseparable. Godwin C. Chu (1977) observed that every cultural pattern and every single act of social behavior involve communication. Therefore to be understood, culture and communication must be studied together.

While this chapter has focused so far on defining culture, to fully explore the relationship between culture and communication, we need to explore what is meant by communication. Several chapters in this *Handbook* have defined the concept. What should be added here is that how communication itself is defined varies among cultures. Assuming that most commonly known definitions of communication come from Western cultures, to illustrate that communication itself is an element of communication, this chapter introduces a perspective on communication from cultures influenced by Confucianism. The societies heavily influenced by Confucian tradition are China, North and South Korea, Singapore, and many East Asian countries with large Chinese communities.

The Chinese scholar K'ung-Fu-tzu (later Latinized as Confucius by the Jesuits) lived from 550 to 478 BCE, a time of collapse of the feudal system in China. Confucius proposed a government based on morality and merit, and he set up an ethical-moral system intended to govern all relationships in the family, community, and state. Confucianism emphasizes virtue, selflessness,

duty, patriotism, hard work, and respect for hierarchy, both familial and societal. Confucianism guides social relationships: “to live in harmony with the universe and with our fellow man through proper behavior.” Confucianism considers balance and harmony in human relationships to be the basis of society. Consistently, then, communication is seen as a mechanism for maintaining harmony. Carey (1989) contrasts this understanding with the traditional Western understanding of communication in that communication in a Confucian understanding “is directed not toward the extension of messages in space but toward the maintenance of society in time; not the act of imparting information but the representation of shared beliefs” (p. 18).

June Yum (1988) describes five ways Confucianism has influenced interpersonal communication.

Particularism

There are no rules governing interactions with someone whose status is unknown. Instead, there are several patterns guiding interactions with others whose status is known. For example, in Korea, friends (*chingu*) are within a few years of age. Two strangers in Korea in the first minutes of conversation determine each other’s age and adjust their language appropriately to show respect. If a male acquaintance is older than the speaker’s “friendship age range,” the acquaintance is then addressed as *adjussi*, roughly equivalent to “uncle.” Korea also has special vocabularies for each sex, for different degrees of social status and degrees of intimacy, and for formal occasions.

Role of Intermediaries

One does not say what one actually thinks if it might hurt another. Rituals are followed in relationships. In China, it is not unusual to use a third party in dispute resolution to avoid direct confrontation.

Reciprocity

Complementary obligations are at the base of relationships. Gratitude and indebtedness are important. People feel uneasy to be indebted to someone, and payback is necessary to regain balance in the relationship. In Western cultures, obligations in relationships are contrary to individualism.

In-Group/Out-Group Distinction

In-group members engage in more open and deeper communication and may find it difficult to develop personal relationships with out-group members. There can even be different language codes for in-group members.

Overlap of Personal and Public Relationships

Business and pleasure are intertwined. This stands in contrast to Western practices of keeping public and private

lives separate. In China, much of commercial life is “lubricated” by *guanxi*, a concept translated as “connections.” Business relations are cemented by relationships of trust and mutual obligation.

Chinese terms for the English word communication include *jiao liu* (to exchange), *chuan bo* (to disseminate), and *gou tong* (to connect among people). The Chinese term *he* denotes harmony, peace, unity, and kindness. Seeking harmony with family and others is the goal of communication in Confucian cultures.

Cultures in Contact

Obviously, then, with such diverse perspectives, intercultural communication can be a challenge. We can see this challenge in the case studies presented below—examples of imperialism, immigration, and international advertising.

Imperialism

The critical tradition among U.S. communication scholars thinking about culture focuses on power and oppression. The term *othering* refers to the labeling and degrading of cultures, such as indigenous peoples, by a dominant group in language. Shome (1996) refers to this labeling of “underdeveloped” cultures of others as discursive imperialism.

Captain James Cook arrived in Hawai‘i in 1778. Cook and his men wrote of the Hawai‘ians as “savage or animal-like or heathen.” They interpreted the Hawai‘ians’ reactions to Cook as deifying him. In ship journals, the Hawai‘ians were described as venerating Cook almost to adoration, looking on him as “a kind of superior being,” and honoring him “like a god.” The Europeans labeled the Hawai‘ians in their language use, and hence their thought and subsequent actions, not by their uniqueness but on the basis of what they were not, that is, not civilized by European standards.

The language and thought made it consistent for them to treat the Hawai‘ians as they had labeled them. This contributed to the near destruction of the Hawai‘ian culture, loss of government, lands, and cultural identity culminating in the U.S.-backed overthrow of the Hawai‘ian monarchy. In 1993, a U.S. Congress resolution apologized to Hawai‘ians for the 1893 overthrow, noting that the economic and social changes resulting from that had been devastating to the culture and to the health and well-being of the Hawai‘ian people.

You can think of other examples of imperialism that demonstrate this aspect of the relationship between culture and language. The language used by a culture with greater relative power to label others can be used to justify suppression and even extermination.

Immigration

In this section, we’ll briefly examine the movement of people from one culture into another, whether for a short

stage or a permanent relocation. A person who visits another culture as a tourist may find the differences new and exciting and not experience much that is unsettling or a stimulus for rethinking how one thinks about one's self. A sojourner lives in a new culture for a limited period of time, from a few months to several years as a student or guest worker, while an immigrant fully expects to remain in the new culture.

Sojourners and immigrants are likely to experience "culture shock," or the feelings of disorientation and anxiety that most people experience while living in a new culture. Physical symptoms include overconcern about cleanliness, extreme stress on health and safety, great concern over minor pains, and a craving for things from home. Psychological symptoms include insomnia, fatigue, isolation and loneliness, criticism of the new culture, irritability, and emotional and intellectual withdrawal. It's not only that one's familiar ways of behaving are no longer appropriate (with regard to simple things such as transportation systems, foods, and the like), there is also an awareness that one's basic assumptions about life may no longer be appropriate. Pedersen (1995) has described culture shock as a five-stage process:

1. Initial euphoria, or the "honeymoon stage," where everything is new and exciting: The person is basically a tourist with his or her basic identity rooted in the home culture.
2. Disintegration of familiar cues and irritation and hostility toward the differences experienced in the new culture: Recognizing that one just isn't sure what one is expected to do can result in feelings of inadequacy and in withdrawing and becoming isolated.
3. Reintegration of new cues and an increased ability to function in the new culture: Surprisingly, though, even though one can function, one can feel anger and resentment toward the new culture for "being different."
4. Gradual adjustment toward autonomy and recognizing the "good" and "bad" elements in both the home and the new cultures: The individual becomes more comfortable in the new culture as more things are known and predictable.
5. Reciprocal interdependence, where the person has achieved biculturalism by becoming able to cope comfortably in both the home and the new culture: This stage can take years to attain.

For the immigrant, this development of functional and psychological fitness for a new culture has been referred to as acculturation. Young Yun Kim (1988a, 1988b) has identified predictors of an immigrant's success in acculturation.

Similarity of the Cultures

The similarity of the original culture to the new culture is one of the most important factors of successful acculturation. A Canadian has less difficulty with acculturation into the United States than does a rural Vietnamese.

Personal Characteristics and Experiences

Younger immigrants adapt more easily than older ones. Educational background plays a part, as does the immigrant's personality. Individuals who are high risk takers and who are gregarious, for example, acculturate more easily. Finally, previous travel and information garnered from the mass media can come into play.

Berry, Kim, and Boski (1987) have described acculturation in relation to two dimensions: the value placed on maintaining one's original cultural identity and the value given to developing relationships with other groups in the new culture. Using these two dimensions to describe acculturation results in four categories:

1. Marginalization refers to losing one's cultural identity and not having any psychological contact with the larger society. The person has feelings of "not belonging anywhere." The Hmong who served as mercenaries for the U.S. CIA in the 1960s and 1970s in Laos were forced to flee Laos after the U.S. withdrawal from Vietnam. Many of the original Hmong immigrants to the United States had few marketable skills and were ill prepared for modern life in the United States. These older, rural Hmong could not return to the culture they had fled and lacked the skills to acculturate in the United States and so existed in a marginalized state.

2. Separation and segregation refer to maintaining one's original culture and not participating in the new culture. The Amish in the United States exist as a culture that has chosen to live apart from the dominant culture and resist acculturation.

3. Assimilation results from giving up one's original cultural identity and moving into full participation into the new culture. Assimilation can be a long-term and sometimes multigenerational process. By family name, individuals of German heritage may be one of the larger, if not the largest, group in the United States. In the 19th century, German was the second most commonly used language in the United States. By the 21st century, these individuals are totally assimilated, and little, if any, identification with Germany can be said to exist.

4. Finally, true integration is maintaining important parts of one's original culture as well as becoming an integral part of the new culture. For some immigrants, there is no inconsistency in having loyalty to two cultures. In fact, that is valued. Certainly modern transportation and the mass media have made true integration more possible. An immigrant to the United States from Germany in the 1880s may have had little opportunity for either a return visit or occasional contact with family, friends, and institutions in Germany. Today's immigrant to the United States from the Philippines may have opportunities for return visits and easy contact with family, friends, and institutions in the Philippines through e-mail, the Internet, and satellite television. And as well, the immigrant's

category of acculturation significantly affects communication with others on an interpersonal level.

International Advertising

Coca-Cola, Pepsi, Disney, McDonald's, KFC, and Spam are marketed worldwide. If the world were one culture, the marketing of these products wouldn't change worldwide. Of course, that is not the case, and we can see the relationship between culture and communication again in the marketing of products.

De Mooij (1998) has related international advertising to Hofstede's dimensions of culture. Japanese advertising reflects Confucian and collectivistic values. The goal of advertising in Japan is to win the trust and respect of the consumer. Advertising in Japan is serene, mood creating, and subtle, with much symbolism, dependency, nature, and respect for elders.

Advertising in Taiwan generally links the product to the consumer's traditional Chinese values, such as family relations and respect for authority. The advertising is indirect and promises an ideal that may be reached through the use of the product. Spanish advertising is less direct than the advertising style of northern European countries because Spain's culture is more collectivistic. People are more likely to be depicted in family and other groups. Feminine aspects of the culture are seen in the softer approaches and relatively low use of celebrity endorsements. The use of art, color, and beauty is strongly related to uncertainty avoidance.

U.S. advertising reflects assertiveness, the direct approach, and competitiveness, which relates to a configuration of masculinity and individualism. Overstatement and hyperbole are typical, as are direct comparisons among products.

Even the most global of products, McDonald's, stresses its ties to the local culture.

Conclusion

Culture has continued to be defined and studied through communication. As the editors of a most successful collection of intercultural readings wrote,

In many respects the relationship between culture and communication is reciprocal—each affects and influences the other. What we talk about, how we talk about it; what we see, attend to, or ignore; how we think, and what we think about are influenced by our culture. Culture cannot exist without communication; one cannot change without causing change in the other. (Samovar & Porter, 1991, p. 21)

RISK

KATHERINE E. ROWAN

George Mason University

The movie, *Erin Brockovich*, starring Julia Roberts, told the story of a young mother with no legal training who won a court victory against Pacific Gas & Electric. Brockovich discovered that the company was illegally dumping chromium VI, a hazardous waste that caused severe illness for residents living nearby. Because of her efforts, her law firm won a class action suit against the company. The movie portrayed a case where the less powerful prevailed in court against a large company.

Because this story concerned efforts to communicate about a physical hazard, it is a story about risk communication.

The *Erin Brockovich* case is one sort of risk communication situation. Risk communication also involves underestimated hazards such as fire alarms that sound during a midterm exam or a tuna fish sandwich left in someone's lunch box too long, eaten, and vomited. Risk communication concerns physical hazards of any sort, those that harm people, those that do not, those that people are worried about, and those that people are not worried about but should be. Often, risk communication is about getting people excited or calming them down (e.g., Gordon, 2003; Gordon & Rowan, 2003).

In this chapter, you will learn what risk communication is. You will also learn about the factors that affect how angry or apathetic people feel about a risk, obstacles to communicating risk, and steps for addressing these obstacles. This chapter helps you think about your reactions to risks, safety, and danger. Knowledge about risk communication is important in public relations, journalism, management, counseling, health care, and emergency response.

Risk Communication: Definition and Connection to Related Fields

Definition

Risk communication is the process of sharing meaning about any physical hazard such as dangerous work sites, environmental pollution, radiation, food-borne illness, cancer, tobacco, climate change, crime, suicide, and terrorism (Rowan, 1991, 1994; Rowan, Botan, Kreps, Samoilenko, & Farnsworth, 2009; Rowan, Kreps, Botan, Sparks, Samoilenko, & Bailey, 2008). Risk communication occurs in interpersonal communication settings, organizations, and mediated environments such as the Internet, print news, and television. Some believe that risk communication mainly concerns reputation management. If an official makes a decision that brings harm to others, reputation managers help that person re-earn the lost trust (e.g., Benoit, 2004). In this chapter, and in communication research, risk communication is a broader endeavor that explores all challenges involved in communicating about physical hazards.

To understand risk communication, it is important to learn first about two related fields, risk assessment and risk management. Risk assessment involves determining the nature, likelihood, and possibility of hazards for individuals or populations. Risk assessors work for governments, research organizations, and the private sector. Their assessments provide technical support for decisions made about hazards.

Most risk assessments involve four core questions:

1. Hazard identification (Does the substance cause harm?)
2. Dose-response assessment (How much x causes harm to z ?)
3. Exposure assessment (Do they breathe, ingest, touch it?)
4. Risk characterization (A complete picture of the hazard) (National Research Council, 1983)

Some risk assessors analyze the effects of pesticides on animals. Others are “food safety detectives.” There are also risk assessment procedures in engineering, medicine, and occupational health and safety. Risk assessment can explain why chromium VI, the kind *Erin Brockovich* investigated, is harmful. In brief, chromium VI causes cancer in humans. It is used for “chrome plating, dyes and pigments, leather tanning, and wood preserving” (Agency for Toxic Substances and Disease Registry, 2001). Chromium (without the VI) is a naturally occurring element found in rocks, animals, plants, soil, and volcanic dust and gases.

Risk Management

Risk managers develop and implement policies that reduce the harm or likelihood of hazards. In one sense, anyone who owns or manages something that could be hazardous (a car, a home, a boat, a business) is a risk manager. In a more formal sense, those in the profession of risk management work in finance, government, corporate, and nonprofit contexts. Many with the title of risk manager are employed by financial institutions. Risk managers rely on risk assessments, regulations, policies, research, law, and ethics to safeguard the people and resources they protect (e.g., Pidgeon, Kasperson, & Slovic, 2003; Plough & Krimsky, 1987).

Social Scientific Studies of Risk

In the social sciences, there are many fields studying how people cope with risk—immediate, acute risks such as an earthquake or terrorist attack and long-term ones such as chronic disease. Scholars study hazard perception and management through the lenses of academic fields such as risk communication (e.g., Morgan, Fischhoff, Bostrom, & Atman, 2002), crisis communication (e.g., Coombs, 1999; Sellnow, Seeger, & Ulmer, 2005), persuasion (e.g., O’Keefe, 2002), health communication (e.g., Booth-Butterfield, 2003; Witte, Meyer, & Martell, 2001), disaster sociology (Drabek, 2001; Dynes & Rodriguez, 2005; Quarantelli & Dynes, 1985), neural sciences (e.g., Loewenstein, Weber, Hsee, & Welch, 2001), decision sciences (e.g., Slovic, 2000), and behavioral economics (e.g., Tversky & Kahneman, 1981). For example, in economics, discrepancies between expert and lay perceptions of financial risk were explored as early as the 1920s. In sociology, there is extensive research on the behavior of groups

during disasters (e.g., University of Delaware, Disaster Research Center, www.udel.edu/DRC/publications; University of Colorado, Boulder, www.colorado.edu/hazards). Scholars in several fields have explored responses surrounding the Love Canal chemical dump, the Chernobyl nuclear accident, the Alar on apples scare, and the 1984 Bhopal disaster—an accidental chemical release that killed more than 2,000 people in India. The Bhopal disaster awakened many to the realization that risks could be under- and overestimated by both experts and those affected by these risks (e.g., Plough & Krimsky, 1987; Shrivasta, 1987).

One finding from this research is that “experts” and “lay audiences” differ in their perceptions of risk and benefit. To think about this research, look at the items in List A and List B. Which ones upset you more?

List A

- Smoking tobacco
- Bicycle accidents
- Automobile accidents

List B

- Nuclear power plants
- Toxic chemicals in landfills
- Emissions from incinerators

Some view the items in List B as a greater source of danger and outrage than those in List A, despite the fact that data consistently show that smoking, automobiles, and even bicycles result in injury and death for humans more frequently than do nuclear power plants, toxic chemicals in landfills, and incinerator emissions. As Paul Slovic, Baruch Fischhoff, and others have found, risks that are perceived as voluntary, familiar, detectable, and natural tend to be underestimated, whereas risks perceived as imposed by others, unfamiliar, difficult to detect, and man-made tend to be overestimated (e.g., Fischhoff, 1989; Fischhoff, Slovic, Lichtenstein, Read, & Combs, 1978; Sandman, 1993; Slovic, 2000).

This pattern is partly explained by the ways in which people encounter a hazard. Unlike risk assessors, who focus on a physical hazard’s physical nature and consequences (i.e., the number harmed or killed), those who manage a hazard and those affected by it care about whether the hazard is voluntary, familiar, fair, just, detectable, and “monitor-able” (e.g., Sandman, 1993). For example, people may find secondhand smoke at their workplace and *Escherichia coli* bacteria on their fresh vegetables more upsetting than their own smoking or the number of automobile accidents in their city. In each instance, activities such as smoking or driving are perceived as voluntary and familiar, so they are less upsetting than harms imposed by others.

This response is not entirely unreasonable: The risks one chooses are detectable and monitor-able by the person choosing them, whereas harms imposed by others are not. And yet lives can be lost because too much attention is paid to one risk and not enough to the hazard causing the greatest harm. For instance, statistics show that firearms are more likely to be associated with death due to suicide than with death in connection with crime or an accident. As Ropeik and Gray (2002) noted, “While the use of firearms in crimes receives the most media attention, the largest number of gun deaths remain suicides” (p. 89). Ropeik and Gray also wrote that those most likely to commit suicide by firearm are over age 65. Because suicide is perceived—wrongly—as a voluntary choice, and not a symptom of illness, there is less attention to this cause of death than there is to death by gunshot in the course of a crime. Risks that feel involuntary get more attention.

The CAUSE Model for Addressing Risk Communication Challenges

The CAUSE Model for Risk Communication (Rowan, 1991, 1994; Rowan et al., 2008; Rowan et al., in press) is a tool that helps communicators analyze risk communication situations, identify obstacles to effective communication, and overcome them. The model was created by noting that all risk communication situations have the components any communication situation has: message sources, channels, content, and receivers. Following Bitzer (1968), I argue that risk communication situations are distinctive because communicating about physical hazards creates predictable tensions. Specifically, when physical hazards are the topic, we expect that there may be five fundamental tensions or obstacles. Each is indexed by the letters in the word CAUSE. Because stakeholders may distrust a message source (e.g., news from a manufacturer), risk communication situations may be plagued by a lack of Confidence. Because stakeholders may not detect (hear, see) a warning, risk communication situations are beset by a lack of Awareness. Because risk communication situations are affected by confusion about what a message means (e.g., what “tornado warning” means), risk communication is challenged by a lack of Understanding. Because risk communication situations can cause disagreement among the well-informed (e.g., about whether the benefit of nuclear power is worth the risk), risk communication situations are influenced by a lack of Satisfaction with analyses of physical hazards and their management. Finally, because risk communication situations are plagued by the difficulty of encouraging people to do what they say they believe (e.g., reliably buckle their seat belts), risk communication situations are burdened by a lack of Enactment.

In addition to identifying obstacles, CAUSE directs users to research that may overcome them. That is, there is research on

Earning	Confidence (in message sources),
Creating	Awareness (that a warning was sent and received),
Deepening	Understanding (about what the message means),
Gaining	Satisfaction (with analyses of problems and proposed solutions), and
Motivating	Enactment (moving audiences beyond agreement to action).

Earning Confidence, the C in CAUSE

Obstacles. When we communicate about physical hazards, two fundamental obstacles involve stakeholders’ perceptions of the messenger’s motives and competence. That is, audiences may reject a message because they question the messenger’s motives or ability to make accurate statements about a hazard.

Assume that a manufacturing facility has a chemical spill. If news coverage suggests that the organization’s leaders are unresponsive to the public’s concerns, the chemical spill seems more dangerous than it would if the company were compassionate and responsive. Sandman, Miller, Johnson, and Weinstein (1993) tested this idea. Groups were given news stories with information about the same physical hazard—clean up of a perchloroethylene spill. The content of the stories was the same. One group read a news account that indicated that there was considerable distrust or controversy. In the other news account, there was little indication of such problems. Those who read the news account filled with reports of controversy thought that the hazard was more severe than those reading an account without that information.

In addition, people reject assertions if they perceive that the message sender lacks *competence*. In *Erin Brockovich*, the heroine initially struggled to be viewed as competent. She did not have a law degree, and her clothing was more provocative than professional. During the movie, however, she interviews victims of the chromium VI releases and locates records showing that Pacific Gas & Electric knew that chromium VI was dangerous and failed to clean it up. Eventually, her intelligence, thoroughness, and persistence establish her competence.

Solutions. There are other approaches to earning an audience’s trust or confidence. One is spokesperson training. Training helps managers avoid common errors such as inadvertently seeming to disrespect stakeholders’ concerns. In a televised interview, Dr. Bruce Ames of the University of California, Berkeley, explained why the amount of pesticides on most fruits and vegetables was not likely to harm health. He said, “The amount of pesticide residue—man-made pesticide residue—people are eating are actually trivial and very, very tiny amounts” (Stossel, 2007; also, see Ames, Magaw, & Gold, 1987). Ames is an expert on this topic, and his statement has merit from a risk

assessment standpoint. But if one's goal is to earn audience confidence, it fails that test. The comment seems to imply that the audience's concerns and health are unimportant. Instead, courses in risk communication encourage communicators to earn trust by acknowledging an audience's concerns and answering the questions of most interest to them. According to Chess (2000), audiences most want to know, "What's the danger? What are you doing to protect me? What can I do to protect myself?" (see also, Dynes & Rodriguez, 2005).

A more comprehensive approach than viewing credibility as a matter of spokesperson training is to view this challenge as one of building credibility "infrastructure." Heath and his associates make this argument (Heath & Abel, 1996; Heath & O'Hair, 2008; Heath & Palenchar, 2000). To earn trust, organizations need to do regular safety audits and conduct drills to ensure that everyone they affect is familiar with how to judge safety and act in an emergency. If an organization manages a physical hazard such as a manufacturing process that could harm workers or the environment, then management needs to find ways to make its processes monitor-able by others.

Enhancing an organization's monitor-ability is the third approach to earning confidence, one advocated by Peter Sandman. Sandman (1993; see also, www.psandman.com) argued that no one earns trust by asking for it. To illustrate, he told the story of an incinerator controversy in Japan. He wrote,

The big issue with incinerators is temperature. The resolution of the controversy . . . was a 7-foot neon sign on the roof of the incinerator, hooked to a temperature gauge. If a citizen wanted to know if the incinerator was burning hot enough all he or she had to do was to look out the window. (p. 36)

Other ways to enhance an organization's monitor-ability are not merely to promise to be responsible but also to offer concerned groups the chance to negotiate a contract covering—for example, "What will happen in case of an accidental spill or release, how neighbors will be notified and how damages will be paid" (Sandman, 1993, p. 59).

Gaining Awareness, the A in CAUSE

According to Perry (Perry & Mushkatel, 1984), audiences may fail to receive a warning for two reasons: They may not be able to detect it or decode it. Detection involves the senses: One hears, smells, sees, and feels warnings. Decoding has to do with comprehending words or symbols in a message.

Obstacle 1: Detection. Think about a tornado approaching. How should emergency managers send a message that would reach every person on a university campus in time to protect them? Many students are focused on their studies or talking with friends. Many campuses are large. To increase the chances that everyone detects such messages, some

universities have warning sirens; others send emergency messages by text messaging. Unfortunately, not all students sign up to receive emergency text messages. If a major storm or other incident would occur, only some of those on campus would receive the message. Increasingly, research is identifying ways to improve emergency preparedness on campuses (e.g., Langford, 2007), but more work is needed.

Ensuring detection of risk messages is a challenge in other contexts. Warnings are placed on foods, medicines, and household products. Scientists test these labels for effectiveness (e.g., Viscusi & O'Connor, 1987). One challenge is that consumers accustomed to safe products may not be reading warning labels.

Obstacle 2: Decoding. Decoding involves being able to read the words and symbols used in warnings. Decoding skill is essentially literacy skill, and there is research on literacy challenges in health communication (e.g., Davis, Williams, Branch, & Green, 2000). For a safety context, consider the tornado again. Suppose an emergency manager sends a text message that says a tornado watch is in effect for Hamilton County. College Student X has signed up for text messaging. Does he know that he is in Hamilton County? This is a decoding difficulty; that is, the receiver can pronounce the words *Hamilton County* but he may not understand that they have relevance to him. Other decoding issues occur when people try to communicate about their location to emergency personnel. Although one might assume that 9/11 operators should know how to get to each location on a campus, according to one emergency professional (J. Callan, personal communication), 9/11 operators may be better at locating street intersections and street addresses than buildings on a multibuilding campus (for research on direction giving or referential communication, see Rowan, 2003).

Solutions. Perry and Mushkatel (1984) found that rather than immediately taking the recommended protective action, when people hear a warning, they respond by talking to one another ("Did you hear that?" "Should we do something?"). While taking time to talk could be dangerous, these researchers found that people need to engage in "confirmatory behavior." Talking to others helps people decide what the warning means, if they should respond, and how to respond. Perhaps warnings would be even more effective if message senders assumed that people will talk to share the warning. A text message such as "Tornado to hit campus. Tell people. Go to lowest floor, away from glass" may be effective. It may be that urging recipients to talk about a warning would increase its effectiveness, assuming the talk was brief.

Other steps are to increase text size and attention-getting graphics on warning labels, learn which languages are predominant in a target area, and learn which members of a population are experiencing hearing loss. Some disabilities are easy to detect, but hearing loss may not be. Ideally, organizations might have employees fill out

confidential surveys asking what the best ways are to communicate emergencies to them.

People have awareness of a word or symbol if they can detect it and recognize its referential meaning (i.e., that Hamilton County is my county; taking a pill twice a day means taking it once in the morning and once at night). In addition, though, one often needs more than awareness of a risk message. To appreciate messages about many risks, one needs deeper understanding about the meanings of key terms, the conditions under which a substance is hazardous, and so forth. Research says that there are several key obstacles to understanding complex science and technology (e.g., Rowan, 1999, 2003). Here are two challenges and ways to address them.

Deepening Understanding, the *U* in CAUSE

Obstacle 1: Confusing Terms. Although unfamiliar scientific terms such as nanotechnology or acrylamide seem the ones likely to confuse audiences, in fact, familiar words such as toxic, chemical, random, hormone, smoker, or even risk, terms that are easy to pronounce and spell, may be the bigger stumbling block if those communicating do not realize that they are using the term in a way that differs from their audience's interpretation.

Steps to Clarify Confusing Terms. Communicators can clarify the meaning of a frequently misunderstood term by taking several steps. These are (a) define the word's essential meaning, (b) say what it does not mean, (c) give several varied examples of its use so that audiences see the concept's meaning instantiated in several contexts, and (d) discuss a false instance that audiences may think is an example but is not. I call explanations that have these components effective elucidating explanations (e.g., Rowan, 1999, 2003). For instance, people may assume that because a substance was emitted during a manufacturing process, neighbors close to the plant were exposed to it. To clarify the distinction between emission and exposure, one might say that emission means release into the environment. (Note that oxygen and carbon dioxide are emissions according to this definition. The essential parts of the term's meaning are release and environment.) In contrast, exposure means contact.

Second, give a range of varied examples of the term, not just one example. This step is taken to ward off misconceptions about some irrelevant feature of a single example being core to a term's meaning. To illustrate instances of exposure, one might write, "You are exposed to a substance if you eat, touch, or inhale it. Exposure is measured with blood or tissue samples; emissions are measured in pounds released." To illustrate radiation, which is energy traveling through space, one would list radio waves, sunlight, X rays, gamma rays, not just one of these examples and not just the man-made or the natural instances. Seeing a range of examples helps audiences avoid wrongly inferring that all radiation is man-made.

Finally, it is sometimes helpful to discuss a false example and explain why it is false. In everyday use, the word *random* means "unpredictable" or "unimportant." In social science, the term refers to a specific way to select and assign participants in a study. Casual uses of the word *random* (e.g., "That remark was totally random") are false examples or nonexamples of a procedure where a researcher "randomly assigns participants to a condition." In this case, the researcher is not being casual or treating the participants as unimportant. Instead, the researcher is being very careful to make sure that every member of a population such as college students has an equal chance of being either in one group, such as a group getting a new instructional method, or in another group, getting the traditional instruction. Random assignment to groups allows scientists to infer that if the treatment group's performance on a test is significantly different from those in the control group, that difference occurred because of the treatment and not some other factor.

Obstacle 2: Difficulty Understanding Risk Numbers. A second problem that hampers deep understanding of physical hazards is that health and safety risks are often described numerically. Consider this statement, quoted by Woloshin, Schwartz, and Welch (2002): "This year, approximately 182,800 women in the United States will be diagnosed with invasive breast cancer, and approximately 40,800 will die from breast cancer" (p. 799).

While these numbers are large, it is hard to know what relevance they have to any particular woman. Ideally, readers want to know if they personally need to take steps to reduce their chances of contracting this disease. As these authors argue, to envision and use risk numbers, one needs to provide context and clarity.

There are several ways to do so. Woloshin and his colleagues (2002) analyzed statistical data on cancer incidence. Based on their analyses, they created easy-to-interpret risk charts for physicians' offices. Here is a portion of one of their charts:

Risk chart for women who currently smoke*

*Someone who has smoked at least 100 cigarettes in her life and who currently smokes any amount now counts as a smoker.

Find the line with your age. The numbers next to your age tell how many of 1,000 women will die in the next 10 years from each cause of death.

Age	Heart Attack/Stroke	Cancer (all kinds)	Any Cause
30	2	2	14
40	5	7	32
50	19	30	80
60	71	80	199
70	108	147	470

SOURCE: Woloshin et al. (2002, p. 802, Figure 3).

This chart allows a patient and a physician to focus on three predictors—age, gender, and smoking status—and then consider the links between those factors and the likely causes of death.

An important point to remember in communicating risk numerically is that there is no neutral way of presenting risk (Peters, Hibbard, Slovic, & Dieckmann, 2007). Any single numerical presentation focuses attention on some aspects of a hazard but not on others. It is best to seek multiple ways of thinking about a risk to understand it. As Kupperman and Nease (2000) wrote, “A medication appears less attractive when explained as having a 5 percent chance of side effects than when described as having a 95 percent chance of producing no side effects” (p. 6).

Creating Satisfaction, the S in CAUSE

Obstacles to Securing Satisfaction (With Recommended Solutions). The fourth obstacle highlighted by the CAUSE model is lack of satisfaction with analyses of physical hazards and their management. Someone may understand the disease of depression and how medications for the disease work but disagree that these medications are a good idea for him or her. Similarly, community members may understand that a train carrying spent nuclear fuel by rail through their town poses a very low risk of exposure to ionizing radiation for inhabitants but still not agree that the train should be allowed to travel through their town.

There are many other reasons why people may be unsatisfied with risk assessments and proposals for risk management (e.g., Clark, 1984; O’Keefe, 2002). Here are two:

1. Stakeholders may underestimate their personal susceptibility to harm and the severity of the potential harm (e.g., Will tanning beds cause me to get skin cancer? How susceptible are lawn care workers to hearing loss? [Smith et al., 2008; Witte et al., 2001]).
2. Stakeholders may overestimate how likely, frightening, dangerous, or dreadful some event may be (e.g., riding in an airplane, living near a manufacturing facility, surviving a fire, population increases, etc.).

Solutions: Addressing Underestimation of Risk. To address disagreement because of underestimation, one tested method is to offer ways to learn more about personal vulnerability (Kreuter & Strecher, 1995). For example, the Web site www.yourdiseaserisk.harvard.edu/ helps patients determine their vulnerability to a dozen cancers as “average, below average, or above average.” The site also lists steps that individuals can take to minimize cancer or other disease risk (e.g., taking a multivitamin tablet daily or increasing daily servings of leafy green vegetables).

Furthermore, if a hazard is underestimated, it may be because it seems natural, voluntary, or remote—some of the risk perception factors most likely to cause a risk to be ignored. To overcome these perceptions, communicators could offer information that suggests that the hazard is actually unnatural, imposed, and likely to cause harm soon (Sandman, 1993; Slovic, 2000). Skin cancer rates are increasing (Purdue, Beane Freeman, Anderson, & Tucker, 2008). While the sun is obviously a natural phenomenon, one might doubt how “natural” it is to expose one’s skin to the sun: fashions encouraging people to wear less clothing are trends. Tanning beds are not natural, and their use is associated with melanoma, the most dangerous skin cancer (International Agency for Research on Cancer, 2007). To question how voluntary smoking is, one could note that many begin smoking in late childhood or early adolescence (Krainuwat, 2005; Najem, Batuman, Smith, & Feurman, 1997). Third, future consequences may be closer than they seem: A 2008 study found melanoma incidence—the deadly skin cancer—is increasing for people aged 15–39 (Purdue et al., 2008).

Solutions: Addressing Overestimation of Risk. One source of overestimation occurs when people feel great fear toward hazards unlikely to do great harm. To manage fear, it is helpful to consider research on how frightening events are processed by the brain. Loewenstein, Weber, Hsee, and Welch (2001) wrote that there are two kinds of emotions: “*anticipatory emotions* are immediate visceral reactions (e.g., fear, anxiety, dread)” (pp. 267–268) to hazards. In contrast, *anticipated emotions* are not felt-in-the-moment. *Anticipated emotions* are those people think they *may* feel at some point in the future. *Anticipatory emotions* cause heart racing and stomach churning. As Loewenstein and colleagues (2001) explained, anticipatory emotion

causes us to slam on the brakes instead of steering into the skid, immobilizes us when we have the greatest need for strength, causes sexual dysfunction, insomnia, ulcers, and gives us dry mouth and jitters at the very moment when there is the greatest premium on clarity and eloquence. (p. 269)

On the other hand, the absence of any fear makes it difficult to care about a hazard. The challenge for communicators is to move an audience from feeling powerless to feeling satisfied that a recommended step will work and they can personally perform that step.

Witte and her associates (e.g., Stephenson & Witte, 1998; Witte et al., 2001) have conducted studies exploring conditions in which people become convinced that a recommended step will protect them from harm and that they can perform that step. That is, people want what Witte and her associates call response efficacy and

self-efficacy beliefs. Response efficacy is the belief that a recommended step will be effective. Self-efficacy is the belief that one can perform the recommended step. Using this analysis, officials who want a town to allow nuclear waste to travel through their community by rail should not simply assert that the likelihood of harm to residents is low. Instead, they should respectfully ask town inhabitants if they are interested in helping manage the hazard. Those transporting the spent fuel should share information on how to protect inhabitants in case of an accident and work with the town to create a contract covering emergency plans, drills, and conditions under which damages would be paid if an accident were to occur (Sandman, 1993; Witte et al., 2001).

Furthermore, self-efficacy is likely to develop if people (a) have taken the recommended action previously, (b) are physically capable of doing so, (c) receive messages encouraging the recommended behavior, (d) see others enacting the behavior, and (e) identify with groups where the desired behavior is encouraged (Bolan, Murphy, & Gleeson, 2004; Harwood & Sparks, 2003; Witte et al., 2001). For example, realistic training, rehearsals, and drills may be effective in helping people manage fear because they give participants a chance not only to feel anticipatory fear but also to manage this fear by, for example, grabbing an oxygen mask in a simulation of a plane losing its oxygen. At the author's university, residence hall counselors train to keep residents safe by participating in "Fire Academy." Instead of merely listening to lectures on fire safety, participants go to special training where they actually crawl through smoke-filled rooms, following the procedures taught to professional firefighters for staying alive in a fire. Participants find this realistic training informative and motivating (J. Callan, personal communication).

Motivating Enactment: The E in CAUSE

The final step in the CAUSE model for communicating about risk involves recognizing that satisfaction with a recommendation does not inevitably translate to enduring behavioral change. When a bare-headed cyclist suffers a head injury, his or her friends may vow to wear helmets the next time they ride, but movement from the desire to wear helmets to actually doing so is not a certainty. Behavior change research shows that there are two predictable obstacles: difficulties in initiating change and in sustaining the new behavior (e.g., Booth-Butterfield, 2003; Clark, 1984; Prochaska & DiClemente, 1984; Prochaska, Norcross, & DiClemente, 1995).

Obstacle 1: Resistance to Initiating Behavior Change. Even when people agree that change is warranted, they struggle because change is stressful (Prochaska & DiClemente, 1984; Prochaska et al., 1995). As Prochaska

and associates explained, change involves inevitable losses, such as enjoyed prior habits. According to Booth-Butterfield (2003), one should consider whether the behavior one wishes to change is relatively "embedded" or "unembedded." Embedded behaviors are frequent and integral to daily routine. For some, watching television daily and buckling seat belts are routines. In contrast, unembedded behaviors occur infrequently. Occasional trips to a city or cleaning the attic are examples of these kinds of behaviors.

Obstacle 2: Maintaining Behavior Change. Maintaining behavior change involves turning unembedded behavior into an embedded one. Unfortunately, shortly after a new risk reduction behavior is adopted, it can be easily extinguished (Prochaska & DiClemente, 1984).

Solutions to Encourage Behavior Change. Booth-Butterfield (2003) recommends that prior to making a change, one should consider how often a new behavior should occur, with whom, and in what setting, and how participants will react and feel. When a precise, reliable time for the behavior is identified, others who will be performing the behavior are found, the right setting is located, and inducements to encourage the right feelings are offered, then the new behavior is more likely to occur. Clark (1984) argued that behavior is most likely to change when initial steps are made easy, simple, and rewarding. Prochaska, Levesque, Prochaska, Dewart, and Wing (2001) recommended that a change initiator minimize the negatives by noting that the negatives are usually temporary. Someone new to exercising might tell himself or herself that the time it will take to exercise daily will be offset by reduced risk of injury and a sense of well-being.

Sustaining a new behavior is the next challenge. Airline passengers who fly frequently feel that they know all the safety instructions, so forcing themselves to attend to safety placards on each flight is difficult. Prochaska and colleagues (2001) suggested creating new goals to sustain behavior change. Perhaps a frequent flier could remind himself or herself that between 1983 and 2000, more than half of all passengers involved in serious aircraft accidents survived (Ripley, 2008, p. 45). According to Ripley, those who survive reported having read and remembered safety instructions. In a health context, good behaviors can be sustained with encouragement and reminders from physicians, such as appointment reminders (Lantz, Stencil, Lippert, Beversdorf, & Jaros, 1995).

While reminder cards and rehearsing may seem small matters, there is evidence this is not the case. Ripley (2008) told the story of Rick Rescorla, the head of security for Morgan Stanley Dean Witter at the World Trade Center. Rescorla was a Vietnam veteran who started "running the entire company through his own frequent,

surprise fire drills” (p. 44). The company, an investment banking firm, had employees who could literally make millions of dollars in the time a fire drill might take. Regardless, Rescorla had them drill. He would time them and encourage them to move quickly by yelling through a bullhorn. On September 11, 2001,

Rescorla heard an explosion and saw Tower I burning from his office window. . . . (He) grabbed his bullhorn, walkie-talkie and cell phone and began systematically ordering Morgan Stanley employees to get out. . . . When the [second] tower collapsed, only 13 Morgan Stanley colleagues—including Rescorla and four of his security officers—were inside. The other 2,687 were safe. (p. 45)

Rescorla and the security guards perished that day. His steadfast commitment to rehearsing evacuation, even with top executives, saved their lives.

Conclusion

This chapter defined risk communication as the process of sharing meaning about physical hazards, described the related fields of risk assessment and risk management, and presented the CAUSE model for effective risk communication. Risk communication is one of the most interesting and important areas of communication research.

The world is not going to run short of physical hazards or difficulties communicating about them. Readers of this chapter should feel encouraged to learn more about risk communication research and to contribute to this field themselves. The more savvy risk communication researchers there are, the safer we all will be.

FREEDOM OF EXPRESSION

DALE A. HERBECK

Boston College

The first 10 amendments to the U.S. Constitution are commonly known as the “Bill of Rights.” While this grand title sounds impressive, it creates an erroneous impression about the text to which it refers. The title suggests that the first 10 amendments to the Constitution establish a uniform set of freedoms and privileges guaranteed to all Americans. It suggests that there is a certain permanent quality about these protections; that these rights have a substance that can be touched. Moreover, it implies that the Founders of the republic, through the process of amendment, were able to perfect and articulate a shared understanding of “freedom” that is durable enough to transcend time, bridging their age with the 21st century.

The problems associated with such images are obvious on close reading. The Bill of Rights does not delineate a set of perfectly understood and inalienable freedoms and privileges. Rather, it is a list of general statements declaring what rights citizens may claim in disputes with the government. The actual protection afforded by these rights is often vague and elusive, and this is particularly true of the freedom of expression. The pertinent guarantees are specified in the First Amendment, which emphatically proclaims,

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for redress of grievances.

In this single sentence, the Founders defined the relationship between the government and the right of the people to criticize their elected officials. While the mandate expressed in the Free Speech Clause is absolute—“Congress

shall make no law . . . abridging the freedom of speech, or of the press”—the meaning of these 14 words is not as obvious as the words may suggest. Although the language is clear and straightforward, it is not as transparent as it seems. The very simplicity of the words is deceptive, so unequivocal that they have become equivocal, largely because it creates a right so absolute that it must necessarily be limited.

A comprehensive history of the Free Speech Clause is beyond the scope of this chapter. Suffice it to say that since the First Amendment was ratified in 1791, Congress has adopted and the Supreme Court has permitted restrictions on the content of speech. In many instances, the restrictions have been justified by asserting that the speech at issue has so little redeeming value that it is outweighed by the social interest in order or morality. This first half of the chapter explores these areas, and having considered the nature of “low-value” speech, the second half of the chapter identifies some general principles developed by the Supreme Court to assess the constitutionality of government restrictions on speech.

A Two-Tier Approach to Freedom of Expression

Walter Chaplinsky was a Jehovah’s Witness who attempted to distribute religious literature on the streets of Rochester, New Hampshire. Because his message was controversial—he promised to preach the “true facts of the Bible,” and he denounced organized religion as a “racket,” Chaplinsky was quickly surrounded by a hostile crowd. Believing that violence was imminent, a traffic officer asked Chaplinsky

to accompany him back to the police station for his own protection. Along the way, the twosome met the Rochester City Marshal, whom Chaplinsky denounced as follows: “You are a God damned racketeer . . . [and] a damned Fascist and the whole government of Rochester are Fascists or agents of Fascists” (*Chaplinsky v. New Hampshire*, 1942, p. 569).

Chaplinsky was promptly arrested and subsequently convicted by a jury for violating a New Hampshire statute that made it a crime to “address any offensive, derisive or annoying word to any other person who is lawfully in any street or other public place.” When Chaplinsky appealed his conviction, he found surprisingly little sympathy from either the New Hampshire Supreme Court or the U.S. Supreme Court. What makes this case interesting is not the result—the Supreme Court unanimously upheld Chaplinsky’s conviction—but rather the sweeping language contained in Justice Frank Murphy’s opinion. While he only needed to argue that Chaplinsky’s intemperate outburst posed a threat to public safety in order to uphold the conviction, Justice Murphy’s opinion in *Chaplinsky v. New Hampshire* (1942) includes a famous paragraph that seemingly places several broad categories of speech entirely beyond the protection of the First Amendment. In the pivotal passage, Justice Murphy notes,

There are certain well-defined and narrowly limited classes of speech, the prevention and punishment of which have never been thought to raise any Constitutional problem. These include the lewd and obscene, the profane, the libelous, and the insulting or fighting words—those which by their very utterance inflict injury or tend to incite an immediate breach of the peace. It has been well observed that such utterances are no essential part of any exposition of ideas, and are of such slight social value as a step to truth that any benefit that may be derived from them is clearly outweighed by the social interest in order and morality. (pp. 571–572)

These sweeping dicta, more than the decision in the case, offer a unique insight into the nature of freedom of expression in the United States.

Instead of focusing narrowly on fighting words, Justice Murphy laid the foundation for what scholars such as Harry Kalven (1988) have labeled a “two-tier theory” of the First Amendment. Speech in the higher tier, even if it is odious or distasteful, is entitled a full measure of First Amendment protection. At the same time, speech in the lower tier has minimal value, and it can be suppressed by the state with less judicial scrutiny. Lest there be any doubt about which speech lacks ideas and has no redeeming social value, Justice Murphy set out four neat categories: the lewd and obscene, the profane, the libelous, and the insulting or fighting words. To illustrate the nature of such speech, it seems appropriate to briefly consider the categories singled out by Justice Murphy for diminished protection under the First Amendment.

The Lewd and Obscene

The first U.S. Supreme Court decision to consider whether sexually explicit speech was worthy of constitutional protection was *Roth v. United States* (1957). In a decision that he later came to regret, Justice William Brennan built a theory of obscenity premised on the two-tier theory. Working from *Chaplinsky v. New Hampshire*’s (1942) assumption that “all ideas having even the slightest redeeming social importance—unorthodox ideas, controversial issues, even ideas hateful to the prevailing climate of opinion—have the full protection of the guarantees,” Justice Brennan concluded that obscenity was outside the First Amendment as it was “utterly without redeeming social importance” (p. 484). As it was without value, Justice Brennan did not consider whether there were harms associated with obscenity that might justify its regulation. In short, obscene speech is so worthless that it does not deserve to be measured by the standards applied to speech containing legitimate content.

In the years since *Roth v. United States* (1957), the Supreme Court has never revisited this assumption. Instead, the Justices have spent their time searching for a workable definition of obscenity and setting standards for assessing laws regulating sexually explicit speech. The most recent effort to define obscenity is contained in *Miller v. California* (1973), a decision that limits obscenity “to works which, taken as a whole, appeal to the prurient interest in sex, which portray sexual conduct in a patently offensive way, and which, taken as a whole, do not have serious literary, artistic, political, or scientific value” (p. 24). To enforce this definition, the Supreme Court added some standards for laws regulating obscenity. First, the *Miller* decision requires the use of “contemporary community standards” to determine whether or not speech is obscene. This means that there is no national standard for obscenity; a work that is protected in one community might be obscene and unprotected in another community. Second, the *Miller* decision also adds a requirement that state laws must be clear and specific in describing the type of sexual conduct that is prohibited. Finally, the *Miller* decision allows “serious literary, artistic, political, or scientific value” to redeem an otherwise obscene work.

In recent years, the sexual exploitation of children has become a special problem, and the courts have been forced to consider the constitutionality of a variety of measures designed to combat child pornography. Since obscenity is unworthy of constitutional protection, a law targeting child obscenity would be permissible so long as it adhered to the *Miller v. California* (1973) definition of obscenity. Laws targeting child pornography are more complicated, however, as these measures often seek to ban the portrayal of minors in sexual performances, even if the performances are not legally obscene. The constitutionality of one such law was tested in *New York v. Ferber* (1982), a case involving a store owner convicted of selling films showing children under the

age of 16 masturbating. The jury concluded that although the materials in question were not legally obscene, the defendant was nonetheless guilty of violating New York State's child pornography law. The Supreme Court unanimously upheld the conviction, thereby establishing nonobscene child pornography as a new category of prohibited expression and giving legislators "greater leeway in the regulation of pornographic depictions of children" (p. 756).

The Profane

At first glance, it may seem that the profane should be grouped with the lewd and obscene as such speech often contains sexual references. Under closer inspection, however, most profanity is not erotic and could therefore never be obscene. While it may be offensive to some, the Supreme Court has shown a surprising tolerance toward profanity. This relaxed attitude is evident in the "mother-fucker trilogy" of the early 1970s, three cases in which authorities sought to prosecute speakers for uttering this particularly distasteful phrase in public. In each instance, the Supreme Court vacated the conviction and held that speech could not be punished simply because it might be offensive to someone in the audience. The Justices then remanded the cases to the lower courts to determine whether the words might tend to incite an immediate breach of the peace.

The more difficult questions involving profanity today are related to the medium of expression. In *Federal Communications Commission v. Pacifica Foundation* (1978), for example, the Supreme Court upheld a ban on indecent language broadcast over the public airwaves during a time of day when children would likely be in the audience. While acknowledging that "these words ordinarily lack literary, political, or scientific value," the plurality opinion authored by Justice John Paul Stevens admitted that "they are not entirely outside the protection of the First Amendment" (p. 746). Citing precedent, Justice Stevens concluded that speech cannot be banned simply because it is offensive. The restriction on broadcast indecency was justified, however (1) because the broadcast media is pervasive and (2) because the broadcast media is uniquely accessible to children.

The Libelous

In *New York Times v. Sullivan* (1964), the Supreme Court considered the constitutionality of an Alabama law that allowed public officials to sue for defamation if the words are such as to "injure him in his public office, or impute misconduct to him in his office, or want of official integrity, or want of fidelity to a public trust" (p. 267). Unlike *Roth v. United States* (1957), however, Justice William Brennan's opinion in *Sullivan* denied the *Chaplinsky v. New Hampshire* (1942) categories their "talismanic immunity" (p. 269). Instead of assuming that

libelous utterances "are no essential part of any exposition of ideas," Justice Brennan started from the premise that the "freedom of expression upon public questions is secured by the First Amendment has long been settled by our decisions" (p. 269). Since the speech at issue was protected political criticism, Justice Brennan fashioned an "actual malice" rule that would require public officials to prove that a defamatory statement was made "with knowledge that it was false or with reckless disregard of whether it was false or not" (p. 280).

While the *Sullivan* decision has been applauded—one prominent scholar proclaimed it was an occasion for "dancing in the streets," it is important to note that the Supreme Court has never held that libelous speech as a class is worthy of constitutional protection. In *Gertz v. Welch* (1974), for instance, the Court used language eerily reminiscent of *Chaplinsky v. New Hampshire* (1942) when it suggested that "neither the intentional lie nor the careless error materially advances society's interest in 'uninhibited, robust, and wide open' debate on public issues" because "there is no constitutional value in false statements of fact" (p. 340). So, too, the Court has limited First Amendment protection in cases involving libelous statements about a private matter that is of no public concern.

In the years since *Sullivan*, the Supreme Court has expanded the actual malice rule to include both public figures as well as public officials, it has broadened the definition of public officials to include those who have substantial responsibility for the conduct of government affairs, and it has defined official conduct to include private matters that touch on a person's fitness for public office. These protections have created a space for speech on matters of public concern, even speech that includes false statements. Defamatory statements regarding matters of public concern are only subject to liability if it can be shown that they are made with actual malice. It should be noted, however, that false statements of facts about private persons receive limited First Amendment protection.

Fighting Words

According to the *Chaplinsky v. New Hampshire* (1942) opinion, fighting words consist of two classes of speech: words that by their very utterance inflict injury and words that tend to incite an immediate breach of peace. The Supreme Court eliminated the first class—words that by the very utterance inflict injury—in *Cohen v. California* (1971), a case that came about when Paul Robert Cohen entered the Los Angeles County Courthouse wearing a jacket bearing the words "Fuck the Draft" to protest the Vietnam War. Although no one complained about the language used on the jacket, Cohen was arrested by the police and charged with breach of peace. On appeal, the Supreme Court overturned Cohen's conviction. Writing for the majority, Justice John Harlan concluded, "It cannot possibly be maintained that this vulgar allusion to the Selective

Service System would conjure up psychic stimulation with anyone likely to be confronted with Cohen's crudely defaced jacket" (p. 20). As Justice Harlan saw the case, Cohen was being punished for the offensive content of his jacket, not because of its erotic nature or for fear that it would trigger a violent reaction. In the words of Justice Harlan,

While the particular four-letter word being litigated here is perhaps more distasteful than most others of its genre, it is nevertheless often true that one man's vulgarity is another's lyric. Indeed, we think it is largely because government officials cannot make principled distinctions in this area that the Constitution leaves matters of taste and style so largely to the individual. (p. 25)

Because reasonable people might find different words objectionable, Justice Harlan concluded that it was unconstitutional to punish speech on the theory that its very utterance might inflict injury.

The *Cohen v. California* (1971) decision narrowed the fighting words exception to include only language that tends to incite an immediate breach of the peace. This would seem to require an abusive personal epithet, addressed to a specific individual and delivered in a face-to-face context, under circumstances likely to result in violence. It is difficult to imagine how written words, language addressed at large audiences or broad classes of people, or speech mediated through the Internet could ever be suppressed under the reformulated *Chaplinsky v. New Hampshire* (1942) test. The definition of fighting words is so narrow, in fact, that the Supreme Court has not upheld a single conviction for the use of fighting words since *Chaplinsky* was decided in 1942. Given that fact, scholars such as Kent Greenawalt (1995) have wondered whether any fighting words remain.

Beyond Chaplinsky

Over the years, the Supreme Court has gradually reduced the *Chaplinsky* list to obscenity, libelous speech made with actual malice, and fighting words that incite a breach of peace. These are not, however, the only categories of speech that have been singled out for reduced First Amendment protection. Perhaps the two most glaring omissions from Justice Murphy's original list of low-value speech involve commercial speech and expressive conduct.

Although it is ubiquitous, commercial expression has historically received little First Amendment protection. In *Valentine v. Chrestensen* (1942), the Supreme Court unanimously declared that commercial advertising (in this case, handbills being distributed on the streets of New York City) was not essential public information but rather expression intended to produce a private profit. In a dismissive opinion that was only half a page in length, the Justices noted that while it was clear that public streets could be used "for the exercise of the freedom of communicating information and disseminating opinion," it was

equally clear that no such privilege protected "purely commercial advertising" (p. 54). For more than 30 years, the *Valentine v. Chrestensen* doctrine prevailed, and the state and federal courts consistently ruled that commercial speech was unworthy of First Amendment protection.

During the 1970s, however, the Supreme Court reversed direction and rehabilitated commercial speech in a series of remarkable opinions authored by Justice Harry Blackmun. One of Justice Blackmun's more notable declarations occurred in *Virginia State Board of Pharmacy v. Virginia Citizens Council* (1976), where he argued, "Advertising, however tasteless and excessive it sometimes may seem, is nonetheless dissemination of information as to who is producing and selling what product, for what reason, and at what price" (p. 765). By this reasoning, advertising is akin to high-value speech because a free-market economy allocates resources based on personal economic decisions. This argument does not, however, extend to false or misleading advertising, as it contains no such information. Nor does it mean that advertising receives the same measure of protection as noncommercial expression. Two years after *Virginia State Board of Pharmacy v. Virginia Citizens Council* (1976) was decided, the Supreme Court stressed the point by emphasizing that commercial speech remains in a less protected category "commensurate with its subordinate position in the scale of First Amendment values" (*Ohralik v. Ohio State Bar Association*, 1978, p. 456). This is a notable distinction because it suggests the court will allow regulations on advertising that might not be permissible in the realm of noncommercial expression.

The Supreme Court has also held that *speech plus*—expression that is accompanied by conduct such as picketing, burning a draft card, or wearing an armband—receives less First Amendment protection than does "pure speech" (such as giving a talk to an audience in an auditorium). The general principle is that the more "plus" (conduct) in the act of expression, the less that expression is protected by the Constitution. An example occurred in *United States v. O'Brien* (1968), when the Supreme Court upheld David Paul O'Brien's conviction for burning his draft card to protest the Vietnam War. Writing for the majority, Chief Justice Earl Warren declared, "We cannot accept the view that an apparently limitless variety of conduct can be labeled 'speech' whenever the person engaging in the conduct intends thereby to express an idea" (p. 376). When "speech" and "nonspeech" are combined in the same expressive conduct, Chief Justice Warren concluded, "a sufficiently important government interest in regulating the nonspeech element can justify incidental limitations on First Amendment freedoms" (p. 376).

Finally, it should be noted that some commentators have proposed adding new categories of speech to the original *Chaplinsky v. New Hampshire* (1942) list of low-value speech. Alexander Bickel (1975), for example, would add "filthy and violent rhetoric" and other forms of "assaultive speech" on the grounds that such discourse undermines

our common moral environment. Catherine MacKinnon would add pornography because she views it as more insidious than obscenity. Not only does pornography have little social value but MacKinnon (1993) believes that it demeans women and validates attitudes that lead to discrimination and violence against the female half of the population. For similar reasons, Mari Mastuda would add racist hate speech to the *Chaplinsky* list. According to Matsuda (1989), this speech shares three identifying characteristics: (1) the message is of racial inferiority; (2) the message is directed against a historically oppressed group; and (3) the message is persecutorial, hateful, and degrading. Much as pornography denigrates women, Matsuda argues that racist hate speech has real consequences in the daily lives of the members of minority groups singled out for such verbal abuse.

Standards for Judicial Review

Having come this far, it might safely be concluded that Justice Murphy erred when he suggested that there are “certain well-defined and narrowly limited classes of speech” that are unworthy of First Amendment protection. These categories are neither well-defined nor are they limited. Ever since *Chaplinsky v. New Hampshire* (1942) was decided, the Supreme Court has struggled to find a workable definition of obscenity. At one point, an exasperated Justice Potter Stewart lamented the difficulty of “trying to define what may be indefinable.” He then added one of the more memorable lines about obscenity, “I know it when I see it, and the motion picture involved in this case is not that” (*Jacobellis v. Ohio*, 1964, p. 197).

So too, the Justices have struggled with the categories that comprise the *Chaplinsky v. New Hampshire* (1942) list. While obscenity remains outside the First Amendment, the Court has rehabilitated profane and libelous speech and narrowed the definition of fighting words. Although not on the original list, the Court has also held that commercial speech and speech plus are entitled to less protection than high-value speech. Even with these additions, it has been suggested by some that assaultive speech, pornography, and racist hate speech should receive less First Amendment protection.

There is, however, a more fundamental problem with the *Chaplinsky v. New Hampshire* (1942) dicta. With all due respect to Justice Murphy, the problem with low-value speech is not that “such utterances are no essential part of any exposition of ideas” or that they “are of such slight social value as a step to the truth.” In fact, the problem is exactly the opposite. The Supreme Court singled out the lewd and obscene, the profane, the libelous, and the insulting or fighting precisely because this speech clearly communicates messages that the Justices found objectionable. By discounting the value of such speech, Justice Murphy marginalized its value and avoided the need to assess its content.

This observation notwithstanding, the two-tier theory helps explain why some classes of speech receive more

constitutional protection than other classes of speech. As the name implies, the two-tier theory creates a hierarchy of speech. Speech in the upper tier—high-value speech—receives a full measure of constitutional protection. Speech in the lower tier—low-value speech—necessarily receives less protection. It would be a mistake, however, to conclude that low-value speech receives no constitutional protection. In *R.A.V. v. St. Paul* (1992), Justice Antonin Scalia cautioned that it is sometimes said that these categories of expression are “not within the area of constitutionally protected speech,” or that the “protection of the First Amendment does not extend” to them. Such statements must be taken in context, however, and are no more literally true than is the occasionally repeated shorthand characterizing obscenity “as not being speech at all” (p. 383).

In other words, while low-value speech is entitled to less First Amendment protection, it is not “invisible to the Constitution.”

To enforce the hierarchy of speech, the Supreme Court employs different standards of judicial review when assessing laws regulating speech. While the Supreme Court has never adopted an absolute interpretation of the Free Speech Clause, the Court has been reluctant to uphold restrictions on high-value speech. If speech falls in the upper tier, the Court employs a “strict scrutiny” test that requires that a restriction on speech be justified by a compelling state interest and achieved through the least restrictive means. Under this level of review, it is difficult to justify restrictions on high-value speech. In contrast, the Court employs “intermediate” or “minimal” scrutiny when reviewing restrictions on low-value speech. By design, these standards are more deferential to the government. For example, a regulation can be justified because it satisfies a “legitimate” instead of a “compelling” state interest. Rather than requiring the “least restrictive” means, the Court will accept “reasonable” means. Since these standards are easier to satisfy, the Court upholds most regulations on low-value speech.

Laws Regulating Freedom of Expression

The fact that speech has value does not, however, mean that it can never be regulated by the government. While the language of the First Amendment is absolute, the Supreme Court has upheld a variety of measures restricting the freedom of expression. It is, unfortunately, impossible to summarize First Amendment jurisprudence neatly as the Supreme Court has offered a variety of rules, tests, and standards for assessing efforts to regulate speech. The result is a complicated body of law that has befuddled some of the greatest legal minds. By way of illustration, the Court has created a four-pronged test for regulating commercial speech; there are three standards for assessing state laws regulating obscenity, three types of public forums, and multiple standards for judicial review. There

are also unique rules for regulating speech in special settings such as schools, the military, and prisons.

While lengthy legal treatises have been devoted to the circumstances under which government can regulate expression, several broad principles can be identified. These principles are not transcendent, but they help explain how the Supreme Court approaches laws that restrict expression. Moreover, because they are not unique to specific areas, these principles can be broadly applied. The five principles hold that (1) prior restraints are generally unacceptable; (2) the advocacy of abstract ideas is protected; (3) restrictions on speech must be content neutral; (4) reasonable restrictions governing the time, place, and manner of communication are permissible; and (5) the freedom of speech must sometimes be balanced against competing constitutional rights or government interests.

Prior Restraints Are Generally Unacceptable

Prior restraint occurs when the government stops a message before it is communicated. This contrasts with another method of communication control referred to as post facto punishment, which means that the source of the message is punished after the communication has occurred. This may seem like a trivial distinction, but it has significant practical consequences. If a theater is prohibited from screening a movie, prior restraint has occurred. If the theater is allowed to screen the film, after which it is prosecuted for “disseminating obscenity,” post facto punishment has occurred. The difference, of course, is that prior restraint prevents the audience from viewing the film, while post facto punishment occurs after the audience has seen the objectionable content.

While prior restraint has a long history in English law, the U.S. Supreme Court did not consider the constitutionality of prior restraints until *Near v. Minnesota* (1931). This case involved a challenge to a Minnesota statute that allowed local officials to obtain a court order that blocked publication of “obscene, lewd and lascivious” or “malicious, scandalous and defamatory” content. In response to partisan attacks, local officials invoked the law and obtained an order blocking publication of future issues of *The Saturday Press*, a newspaper published by Jay M. Near. When Near challenged the order, the Supreme Court declared that the Minnesota statute violated the First Amendment, in a narrow 5–4 decision. According to the majority opinion authored by Chief Justice Charles Evan Hughes, “the general conception that liberty of the press, historically considered and taken up by the Federal Constitution, has meant, principally, although not exclusively, immunity from previous restraints or censorship” (p. 716).

While the decision was rightly heralded by Fred Friendly (1981) and others as a landmark victory for a free press, the holding is tempered by some important qualifications. First, Chief Justice Hughes was careful to note that

the liberty of the press did not confer immunity against post facto punishments. So, while government officials might not be able to prevent publication of a libelous newspaper, aggrieved parties could sue the publisher for defamation after the paper was printed. Second, Chief Justice Hughes warned that in a limited number of circumstances, prior restraint would be permissible. To illustrate this possibility, Chief Justice Hughes noted that “no one would doubt but that a government might prevent . . . the publication of the sailing dates of transports or the number and location of troops” or act to protect the “security of community life . . . against incitements to acts of violence and the overthrow by force of orderly government” (p. 716).

Advocacy of Abstract Ideas Is Protected

While the First Amendment limits the use of prior restraints to extraordinary circumstances, the Supreme Court allows the post facto punishment of expression in certain instances. So, for example, the Court will allow the state to punish speech that advocates criminal activity. The modern standard for incitement was established in *Brandenburg v. Ohio* (1969), a case involving a speech given by a leader of the Ku Klux Klan of Ohio. The speech—which warned of “revengeance” against the President, the Congress, and the Supreme Court—was recorded by a local television station. After hearing excerpts from the speech on the news, local officials arrested Brandenburg, who was tried and convicted for violating Ohio’s Criminal Syndicalism Act, a law that made it a crime to advocate the use of violence or terrorism in order to accomplish political or industrial reform. The Supreme Court overturned Brandenburg’s conviction on the grounds that

the constitutional guarantees of free speech and free press do not permit a State to forbid or proscribe advocacy of the use of force or of law violation except where such advocacy is directed to inciting or producing imminent lawless action and is likely to incite or produce such action. (p. 447)

In *Brandenburg v. Ohio* (1969), the Supreme Court set out a clear standard, stating that, to be punishable, antigovernment speech must have the intent of producing “imminent lawless action” and is “likely to incite or produce such action.” To sustain a conviction, the government must prove three things: (1) that the speaker advocates breaking the law, (2) that the speech calls for immediate lawless action, and (3) that the immediate lawless action is likely to occur. As Franklyn Haiman (1981) has observed, this is a challenging burden because it requires proof not only that the speech advocates illegal action but also that the action is likely to occur. Because of *Brandenburg*, the abstract advocacy of ideas, even dangerous ideas, is now protected by the First Amendment.

Restrictions on Speech Must Be Content Neutral

A third principle involves the distinction between content-based and content-neutral restrictions on expression. A law that is content-based singles out expression based on the content of the speech. So, for example, a law that banned wearing swastikas in Jewish neighborhoods or prohibited cross burning as an expression of racial animosity would be content-based because it targeted speech based on its message. In contrast, a law that banned all noisy activities outside a school or near a hospital would be content neutral because it applies to all speech, regardless of the message.

In recent years, the Supreme Court has shown little sympathy for content-based regulations on expression. One of the Court's more emphatic declarations on the subject can be found in *Police Department of the City of Chicago v. Mosley* (1972). In an oft-quoted passage, Justice Thurgood Marshall declared, "Above all else, the First Amendment means that government has no power to restrict expression because of its message, its ideas, its subject matter, or its content" (p. 95). In this instance, the Court held that a city ordinance that prohibited picketing near schools was unconstitutional. The flaw in the law, according to the majority, was due to the fact that the ordinance was not a flat ban on all picketing. Rather, that law contained an exception for labor picketing, and that meant that it singled out nonlabor picketing based on its content.

Under closer examination, it may seem odd that the Supreme Court is less sympathetic to content-based than to content-neutral restrictions. Both restrictions limit speech, but a content-neutral restriction will often be more restrictive than a content-based restriction as it reaches more speech. For example, a ban on all forms of solicitation at a municipal airport would be content neutral, yet it would restrict more speech than a narrow ban on religious solicitation at the same airport. The explanation for this seeming anomaly goes to the heart of the First Amendment. Content-based restrictions are problematic because, as Cass Sunstein (1993) has noted, they are often based on illegitimate reasons. This contrasts with content-neutral restrictions, which are usually justified by appeals to broader societal interests. So, for example, the ban on all forms of solicitation in airports might be justified based on security grounds. A ban on religious solicitation would nominally improve security, but such a ban would be problematic because the government seems more interested in singling out religious solicitors than in protecting travelers.

Finally, while the neutrality principle may seem intuitive, it is important to note that it is not absolute, as the Supreme Court has in fact upheld some content-based regulation of speech. An oft-cited example is *Burson v. Freeman* (1992), a case involving a Tennessee law that banned political speech within 100 feet of polling places on Election Day. At face value, this law seems problematic on

two counts: first, it restricted high-value political speech, and second, it restricted speech on public streets and sidewalks, forums traditionally open for discussion and debate. Despite these concerns, the Supreme Court upheld the law, reasoning that it was a commonsense measure intended to prevent voter intimidation and election fraud.

Reasonable Restrictions Are Permitted on the Time, Place, and Manner of Communication

Taken together, the first three principles suggest that the government can exercise little control over expression. Prior restraints are generally unconstitutional, the advocacy of abstract ideas is protected, and restrictions on speech must be content neutral. This does not mean, however, that government has no power to regulate speech, as can be demonstrated by government restrictions on the time, the place, and the manner of communication. A restriction on time, for example, might prohibit parades on city streets during the evening rush hour when traffic is heavy. A restriction on place might ban demonstrations inside prisons or on military bases. Finally, a restriction on the manner of communication might limit how speakers communicate. Many municipalities prohibit the use of loud speakers in residential neighborhoods.

One of the great champions of political speech, Alexander Meiklejohn (1948), invoked the image of a New England town meeting to justify freedom of speech. The town meeting provides a place for neighbors to gather, to debate matters of common concern, and to vote on issues affecting the community. For this sort of deliberate democracy to work, freedom of expression must be guaranteed. At the same time, Meiklejohn also recognized that a town meeting would be a disaster without some limits on speech. That is why a moderator is selected, an agenda is negotiated, and all speakers must adhere to rules governing the order and length of speeches. Time, place, and manner restrictions can be analogized to the rules that govern a town meeting. If anyone were allowed to speak anytime, anywhere, and using any medium of communication, the result would be chaos. Much like the rules governing a town meeting, it is often argued that restrictions on the time, place, and manner of communication actually increase the freedom of speech.

As might be expected, government bodies have used their authority to impose a broad range of time, place, and manner restrictions, and many of these restrictions have been challenged in court. While a thorough review of these cases is beyond the scope of this chapter, several simple generalizations are possible. A time, place, or manner restriction that is content based would likely fail as the court would apply a strict scrutiny test. On the other hand, content-neutral restrictions on the time, place, or manner of communication would be subjected to intermediate

scrutiny. To satisfy this standard, the government must show that the law serves an important interest, that the law is narrowly tailored, and that other means of communication are available. So, for example, the courts have consistently upheld content-neutral ordinances that require permits for holding parades on public streets or rallies in public parks, so long as the municipality has a clear policy that is consistently and equitably enforced.

A decision in a recent Supreme Court case involving time, place, and manner restrictions is instructive. *Watchtower Bible and Tract Society of New York v. Village of Stratton* (2002) came about when Stratton, a village in Ohio, adopted an ordinance regulating canvassing and soliciting in residential neighborhoods. Under the ordinance, would-be canvassers had to request a free permit available from the mayor's office. The Watchtower Bible and Tract Society—more commonly known as the Jehovah's Witnesses—challenged the law on First Amendment grounds. While village officials claimed that the ordinance was intended to prevent fraud and protect privacy, the Supreme Court found that the measure was overboard and unconstitutional. Not only did the ordinance restrict Jehovah's Witnesses and door-to-door salesmen, but it also barred political candidates, Girl Scouts selling cookies, Halloween trick-or-treaters, and even neighbors from going from door to door without a permit.

Speech Rights Must Sometimes Be Balanced

The previous discussion treats freedom of expression in isolation. In many situations, however, the courts are required to balance competing constitutional rights. Anthony Lewis (2007), for example, has written about the tension between the constitutional guarantees of a free press and the right to a fair trial. A case in point is *Nebraska Press Association v. Stuart* (1976), in which a local judge issued a gag order against the press before a murder trial as a way of preventing pretrial publicity that might prejudice the jury pool. In this instance, the First Amendment rights of the free press came into direct conflict with the Sixth Amendment right of the accused to a trial by an impartial jury. The Supreme Court refused to “establish a priority applicable in all circumstances” and balanced the two competing rights, both guaranteed by the Constitution. While acknowledging that the Sixth Amendment is important, the Court came down on the side of the free press and overturned the gag order.

It would be misleading, however, to suggest that the only circumstances in which speech might be limited is when another constitutional right is involved. Concerned legislators sometimes adopt measures that limit speech to address societal problems. In recent years, for example, the Supreme Court has been asked to consider a wide variety of measures restricting commercial speech. To handle such cases, the Supreme Court created an ad hoc balancing test that was first articulated in *Central Hudson Gas and*

Electric v. Public Services Commission (1980). Under the *Central Hudson* test, courts must determine (a) whether the expression to be limited promotes legal products, services, or activities; (b) whether the government has a substantial interest in prohibiting or limiting the commercial speech; (c) whether the restriction directly advances the government interest; and (d) whether the restriction is only as broad as necessary to advance the government's interest. Application of the *Central Hudson* test, in most instances, requires the court to balance the benefit of the proposed restriction (the second factor discounted by the third factor) against the burden imposed on the freedom of speech (the fourth factor). The results of ad hoc balancing using the *Central Hudson* test are case specific and cannot be generalized.

At first glance, balancing offers an easy way to resolve conflicts between free speech and other rights or interests. By assigning appropriate weights to both the right of a free press and the right of a fair trial, the Supreme Court was able to strike the appropriate balance in the *Richmond Newspaper* case. While the result in this instance makes intuitive sense, the balancing approach is not without its critics. The very flexibility that makes balancing so intellectually appealing means that it may threaten freedom of speech. For that reason, absolutists such as Justice Hugo Black (1960) rejected the idea of balancing First Amendment rights against asserted state interests.

Conclusion

Rodney Smolla (1992) cautions against simple answers to all questions related to the freedom of expression. It is difficult to find organizing principles and impossible to neatly reduce the freedom of expression to a single book chapter. While the language of the Free Speech Clause is unambiguous, academics and jurists have struggled to find bright lines for distinguishing between protected and unprotected expression. Even when it is possible to assign speech into discrete categories, transcendent legal principles remain elusive. Depending on the type of speech at issue and the circumstances, different rules apply. The Supreme Court has admitted as much, noting that “each method of communicating ideas is a ‘law unto itself’ and that law must reflect the ‘differing natures, values, abuses and dangers’ of each method” (*Metromedia v. City of San Diego*, 1981, p. 501). For every principle, the Supreme Court seems to have acknowledged one or more exceptions.

This does not diminish the importance of freedom of expression. On the contrary, Thomas Emerson (1963) suggests that the difficulty in developing a coherent theory and transcendent principles reflects the importance of the task. No single formula or rationale is sufficient. Rather, each controversy must be considered on its own merits. The Free Speech Clause expresses an ideal, but this ideal is challenged by speech that is hateful, prurient, and threatening. Thomas Jefferson recognized as much when he warned that

the free and open discussion required for true democracy is not for the fainthearted, who might prefer the calm of despotism to sailing on the “boisterous sea of liberty.”

GLOBALIZATION

JOHN M. EGER

San Diego State University

Globalization—the integration and global interdependence of national economic and political systems—is the result in large part of the worldwide spread of communications. The resulting integration and interdependence is having a significant impact on existing communication systems and creating new uncertain trends in all communications and telecommunications systems in the 21st century.

Globalization, according to *The Economist* magazine, is one of the 10 most overused words of this decade. Phrases such as *global corporations*, *global media*, and *global economy* clearly reflect the term's popularity, but often its true meaning and implications become lost or obscured.

Nayan Chanda, editor of the online newsletter *Yale Global*, says that globalization means “reconnecting the human community, an effort that began some 50,000 years ago when the earliest forms of man began to travel out of Africa to North and South America and accelerated after Christopher Columbus discovered America in 1492.” Tribal conquest and the search for better life, or in Columbus's case the search for oils and spices, were the reasons for the earliest forms of globalization. Faith-based pursuits by religious groups and, more recently, pure curiosity have propelled the worldwide migration of people across the globe.

Transatlantic cables and satellites, however, greatly accelerated the interdependence of nations during the past 100 years. In the past decade, it has been the worldwide spread of the Internet, with its progeny the World Wide Web (WWW), that has caused what *The New York Times* columnist and author Thomas Friedman has called a “flat world.”

In the space of just a few years, the Internet has blossomed from an arcane tool used primarily by academics

and government researchers into a worldwide mass communications medium that has rapidly become the backbone of all communications and financial transactions within society and the new global economy. The World Wide Web, invented by Tim Berners-Lee in the early 1990s, provides the geographically based subsystem that ensures even more spectacular growth. The Internet has over a billion users and has been doubling every year over the past 10 years. At its current rate, everyone on the planet will have access to the Internet within approximately 5 years or less. No previous telecommunications advance—not the telephone, television, cable television, the VCR, the fax, or even the cellular telephone—has more cultural and political impact on the global media landscape than the Internet.

As nations around the world awaken to the importance of creating a robust communications infrastructure, they will be less dependent and less willing to accept what has been considered a one-way flow of information and communication goods and services from the United States. This flow undoubtedly places a greater burden on U.S. policymakers to pursue the basic idea of a free, unregulated, unrestricted flow of news, entertainment, and information. Clearly, trade in information goods and services and the future of journalism itself face new challenges.

Background

In his biography *Cicero: The Life and Times of Rome's Greatest Politician*, Anthony Everitt writes, “Even the largest empire the world had seen was created slowly because communications were slow and unreliable” (p. 10). He points out that although a network of “well engineered

roads were constructed, travel was limited,” and since Rome had no public postal service,

letters (which were scratched tablets or written on pieces of papyrus) were sent at considerable cost by messenger. . . . The trick by a private correspondent was to persuade a traveler going in the right direction to take his or her post with him and deliver it. (p. 10)

It wasn't until the wealthy French financiers, the Rothschilds, deployed racing pigeons around 1813 that the value of timely communications accelerated the concept of multinational business and finance. The family established a European-wide network of carrier pigeons to capitalize, among other historical events, on Napoleon's loss at Waterloo, which they knew about first.

Within a decade, the telegraph reduced the reliance on pigeons, but it wasn't until the introduction of undersea cables, originally laid for the telegraph and subsequently used for telephony, that multinational trade and commerce began to accelerate. In 1927, with cooperation between American Telephone & Telegraph (AT&T; “the Bell system”) and the British Post Office, a program of transatlantic communications between New York and London was begun, and a new undersea cable communications infrastructure was created that still exists today.

The next great leap forward occurred in 1957, with the Russian launch of the *Sputnik* satellite. “About the size of a basketball, but weighing 184 pounds, Sputnik whipped around the globe,” according to the space writer Leonard David (2002). “Every 98 minutes and with every orbit, Sputnik I thumbed its nose at America's technological prowess, political esteem in the community of nations, as well as its military strength” (para. 3).

Sputnik I started the so-called space race. President John F. Kennedy declared that the United States would put a man on the moon within a decade, and his administration formed the National Aeronautics and Space Administration (NASA). NASA created today's communications-satellite-based system. In 1962, the administration formed the Communications Satellite Corporation with the passage of the Communications Satellite Act. This legislation enabled the government, as 50% owner, to create a vehicle for the start-up of a new domestic carrier in competition with the existing AT&T monopoly, a global organization called INTELSAT (the International Consortium of Satellites). INTELSAT was the predicate for the first worldwide communications system available to every country in the world based on their individual use and investment.

Within 10 years, more than 80 countries had joined the INTELSAT system, further shrinking the globe and enabling broadcasting as well as telephony to expand exponentially. This innovative effort created yet another communications wave, encouraging the growth of multinational and transnational enterprises of all kinds. The global presence of these new multinational corporations accelerated the deregulation and demonopolization of

so-called PTTs (Postal, Telephone, and Telegraph) or government-owned and -run telephone monopolies. As a great deal of new capital was needed to launch competing services, only private companies could afford such expensive enterprises.

Broadcast and related media monopolies, which the government also owned or controlled, were also privatized for the same reasons; new capital was needed to build new media outlets and to satisfy the corporate demand for advertising. The result was striking. In 1980, according to a report by Christina Holtz-Bacha and Pippa Norris (2001), there were only a few commercial television systems in Europe. In slightly over 15 years, however, the balance was reversed, with only a few countries—Austria, Ireland, and Switzerland—with government monopolies in broadcasting.

The sudden expansion of private TV produced a huge surge in the import of U.S. programming, leading to new fears that commercialization of the media was akin to the Americanization, or “electronic colonialism,” of Europe. The same refrain followed in Latin America, Canada, and Asian markets, which like Europe soon opened their markets to private broadcasting and the deregulation of their public telephone systems.

As advertiser-supported media has grown, the future of public service broadcasting has been threatened. While there have been several studies that in general have suggested that commercial television produces less news and information, and therefore tends to erode the cultural and political fabric of individual nations, this concern has not been proved. In fact, there is a tendency, Holtz-Bacha and Norris argue, toward a sort of “self-selection strategy” that is always in operation. In other words, people who prefer news or information tend to watch and prefer noncommercial broadcasting, and there is an expectation that commercial television is more for entertainment. Moreover, their research suggests that when commercial channels did provide informational news content, there was a kind of “dummying down” of the news, or, as they called it, “infotainment.” The result is a “tabloidization” of the news, with an increase in sensationalism and an emphasis on negativity and personalization.

Governments, nonetheless, responding to public demand for more television options but not having the budgets to subsidize such expansion, favored noncommercial, advertiser-supported alternatives. As a consequence, the past 20 years have resulted in a significant increase in advertising to support such initiatives. Indeed, the 2007 worldwide budget for advertising now exceeds \$600 billion, twice what it was 20 years ago.

While U.S. media and program suppliers are criticized for preventing the development of a critical perspective on society, most nations around the world have successfully established their own—however embryonic—production outlets to feed the ever-growing media distribution channels. This component, related to the development of a robust communications infrastructure, is now widely seen

as important to national wealth and well-being and essential to participation in the global knowledge society and economy. As a consequence, so-called national information systems, economic plans that encourage and support new communications initiatives and infrastructure, are everywhere.

Computers and the Digital Age

While there is no doubt that the development of satellites contributed greatly to the expansion of commercial broadcasting throughout Europe in the 1980s and had a similar effect worldwide, it also created an avenue for the global expansion of trade and commerce.

The development of direct broadcasting by satellite (DBS) was also a threat to national hegemony. For example, the mere idea that tiny Luxembourg, with a population under 500,000 people living in an area of less than a 1,000 square miles, could launch a satellite with a “footprint” covering most of Europe was threatening to television executives and government policymakers throughout the European Union. Luxembourg, because of its multilingual heritage, was already a commercial broadcaster with international leanings. Its over-the-air signal covered all of Luxembourg and portions of France, Germany, and Belgium. Moreover, the tiny country decided almost from the beginning to broadcast programs with advertising in several languages. In the 1980s, CLT (Compagnie Luxembourgeoise de Télédiffusion), the largest commercial broadcaster in Luxembourg, launched a medium-power satellite service called SES ASTRA, which operates a fleet of satellites covering Europe, North America, and Africa.

The real threat to national hegemony was the development of the computer. The computer enabled creation of the Internet, and with the Internet came “media convergence,” a vehicle for the distribution of voice, video, and data over a single system.

Currently, there are in excess of 1.1 billion Internet users in the world. Depending on the growth of the mobile Internet, with the cell phone industry quickly embracing Internet-based protocols, it is likely that the world will be “connected” within the next few years.

The Period of Internet Boom and Bust

As mentioned earlier, it was the creation of the World Wide Web, the graphical user interface superimposed on the Internet, in 1990, that presaged the tremendous growth of the modern-day Internet. The Web, as it came to be called, revolutionized business and industry. The Web has also transformed education, health care, government, and other leisure and entertainment industries.

Creation of the Web, along with passage of the Communications Act of 1996, the first major rewrite of the law governing ownership and use of the telecommunications

infrastructure since 1934, led to the widespread perception that almost any business plan that proposed using the Internet was going to be an instant success. The 1996 Communications Act, while allowing cross-investments between existing players, clearly invited new players to the field of telecommunications. It has often been said that once the regulatory gates were opened in Washington, the capital markets in New York were quick to follow with financing.

Millions and millions of investment dollars poured into Internet start-ups as business, government, organizations, and institutions scrambled to increase their presence on the “national information highway.” Paradoxically, however, although the world’s information infrastructure was built in record time, as *The Wall Street Journal* reported, only about 3% of the new infrastructure was actually being used due to federal regulatory barriers.

This period of Internet investment in the United States and elsewhere in the world is referred to as the “dot-com boom.” Sadly, the “dot-com bust” followed soon after. Many of the business plans were built on the hopes and dreams of those proposing a new way of doing business. They lacked, however, real-world applications or were based on applications whose time had not yet arrived. The net result of these investments—by one estimate, hundreds of billions of dollars or close to the cost of building the entire U.S. national highway system—was that they had to be written off. Many of the fledgling companies had to file for bankruptcy or simply go out of business altogether. The good news is that the “dot-com bust” set the stage for yet another telecommunications revolution as many of these facilities and systems, expensive to build, were resold for “pennies on the dollar.” Now, literally thousands of new communications links have been established at a fraction of the original cost.

Beginning of the End of the Monopoly System of Communications

Given the worldwide spread of the Internet and the establishment or creation of the World Wide Web, there was a growing belief among policymakers and regulators everywhere that the monopoly concept was dead. In the United States, in any event, AT&T was given monopoly status at the turn of the century because of the belief that having basic phone service was a public necessity; a public good, and every American ought to have access to it. By the early 1980s, 97% of Americans had at least one phone and often more. In Western Europe, where the monopoly form of government enterprise was preferred, probably for both efficiency and control, this form of organization had run its course too. Privatization and deregulation of communication systems were common government responses as new telecommunications and information technologies were developed and competitive alternatives emerged.

More important, the development of the computer, the onset of digitization, and the creation of the Internet or

Network of Networks, clearly signaled the end of monopoly. In fact, this was evident worldwide. In the United States, the Federal Communications Commission was looking for ways to inject competition through the use of interconnection initiatives and the creation of the so-called specialized-carrier status. The Anti-Trust Division of the U.S. Department of Justice had already filed its massive lawsuit against AT&T for monopoly abuse. Other countries, particularly in Europe, were already making plans to privatize and deregulate their national telecommunications service in part to prepare for the changes the computer revolution was ushering in.

The New Geography of the Global Economy

In the wake of the rapid spread of computers and telecommunications, and the development of global corporations, yet another demand on nation states, and especially cities and regions across the world, was created. That demand was, and is today, to create the 21st-century information infrastructure so vital to the wealth and well-being of all cities and communities in a new global, knowledge economy and society. As the economies of the world become more integrated, one of the realities is that political power devolves to cities and regions worldwide. Information or knowledge becomes the new wealth, replacing gold as the monetary standard. As the former Citibank chairman Walter Wriston (1997) put it, "Information technology [becomes] the tools of wealth creation."

Even before the dot-com boom and bust era of the late 1990s, President Clinton and Vice President Gore were sounding the alarm. Gore particularly was promoting not only increased commercialization of the Internet but also the development of the broadband, high-speed Internet. He called it simply Internet II and was seeking federal funding from Congress to develop such a high-speed broadband system.

Both Clinton and Gore were keenly aware that we were entering a new uncertain era in which information or knowledge would become the most important indicator of national wealth. They knew that it was important for America to awaken to this basic shift in the structure of the global economy and that as a country we should begin to change institutions, both public and private, to respond to the challenges presented by the new global information economy.

Although the Clinton-Gore initiative, called the National Information Infrastructure (NII), clearly involved reforming the law to allow existing players to invest in the future and allowing new players to participate in that information age as well, the administration was aware that real growth had to take place within communities across America and that all sectors of our economy and society needed to be involved. Toward that end, billions of federal research and development dollars were targeted toward public projects across the country in health care, education,

business, and electronic (or "e") government. The Clinton administration tried to put the spotlight on community development.

The tiny country of Singapore in many ways created the model for what is occurring, indeed what must occur, worldwide to succeed and survive in the new global economy. As the technology of telecommunications and computers converges with the forces of the new global economy, political, social, and economic power is devolving rapidly to smaller and smaller entities. Probably, the best geopolitical entity for a rebirth or reinvention of a governing system that encourages knowledge-based production and activity is the city. Not surprisingly, the city in many ways has always been the center of commerce and the crucible of civilization. Today, in the new economy, where ideas themselves are the basis for the new wealth, the city becomes the most likely incubator of creative and innovative products and services.

More than 25 years ago, Singapore created a National Computer Board whose goal was to create "an intelligent island." By that, government leaders and policymakers meant not only the infrastructure of the new age but a mind-set that used technology as a tool of social, political, and economic transformation. As Prime Minister Goh Chok Tong stated in announcing the formation of a community-wide, government-created Intranet called Singapore One, the network "will empower Singaporeans to work efficiently in a smart environment to facilitate the use and access of information to enhance their business, personal, and family lives." The government saw the use and deployment of technology as crucial to the "next great leap forward." Although Singapore is only a small nation of less than 3 million people, the government aggressively began wiring the country and targeting key industry sectors for transformation. Eventually, every sector of the Singapore economy and society was automated.

Today, Singapore has launched what is called Infocomm 21, a broad strategic plan to take the country to the next level of the digital future. Singapore's stated goal is "to develop Singapore into a vibrant and dynamic global infocomm capital with a thriving and prosperous e-economy and a pervasive and infocomm savvy e-society."

Next door to Singapore, Malaysia, a far bigger country primarily dependent on agriculture, launched the Multi-media SuperCorridor Project. An area of approximately 10 by 20 miles and including the Kuala Lumpur International Airport, it is, in effect, a free-trade zone for IT and telecommunications research, development, and manufacturing. Like Singapore's government, Malaysian officials are appealing to global corporations to make the Multi-media SuperCorridor their Pacific regional headquarters and have offered a package of incentives to companies in the IT and telecom fields. For example, the SuperCorridor guarantees IT and software developers duty-free importation of all related equipment and a 100% investment tax allowance. These kinds of incentives are obviously attractive to IT companies such as IBM, Microsoft, or Google.

Like Singapore, Malaysia also promises world-class physical and IT infrastructures within the Corridor; no censorship of the Internet, and no taxes for the first 5 years of operation for those earning the so-called Pioneer status. Malaysia garnered major attention in the United States by inviting companies to its Corridor and reportedly had several billion dollars in investments promised when they first launched the initiative. By providing globally competitive tariffs, freedom of ownership, exemption from state and local ownership requirements and other permits and ensuring intellectual property protection and a series of legal innovations, such as digital signatures and the so-called new cyber laws, and ensuring and enhancing online security, Malaysia sought to position the Corridor as an attractive location to invest and operate.

Unfortunately, the SuperCorridor has not thrived as initially hoped due to the repressive, by Western standards, actions of the government, including limitations on press and political freedoms.

In the Middle East, the Gulf state of Dubai was taking out full-page ads in *The New York Times*, *The Wall Street Journal*, and other major publications proclaiming itself a “city of the future.” In October 2000, Dubai opened its “Internet City” in a technology and media “free zone.” Like Malaysia’s Multi-media SuperCorridor, Internet City provides tax-free locations for further development of knowledge-based industries and duty-free import and export of media and information products and services.

Through an arrangement with the U.S.-based company, Cisco Systems, which provided technological vision and expertise, Dubai built what has been labeled the world’s largest Internet facility in the world, allowing the highest technically practical transmission speeds throughout the Internet City. These amenities and others have attracted Microsoft, IBM, Dell, Siemens, Sony, Ericsson, and other global corporations. Dubai’s strategy is comprehensive. In addition to its telecommunications facilities, it also boasts a first-rate transport and shipping infrastructure, free health care for all its citizens, and virtually no crime, along with countless modern shopping malls. Despite its roots in Islam, Dubai has very few cultural and religious restrictions and serves a diverse population of 150 different nationalities, factors that make Dubai a truly cosmopolitan world city.

There are other cities all over the world attempting to replicate the successes of Dubai, Singapore, and Malaysia in one respect or another. Canada has launched a “Smart Communities” program, and Europe has an aggressive “digital cities” project. In the United States, despite the Clinton-Gore NII, which funded billions of dollars of innovative digital cities projects, significant progress has not been made. Sadly, in the second half of 2006, the United States had fallen to 25th in the world in household penetration of broadband technology.

However, the effort of Silicon Valley to create a private-public regional consortium is noteworthy. Kenichi Ohmae (1995) and social science writer Neil Pierce (1993), author

of *City-States*, both say we must acknowledge the emergence of a global economy; that national economies do not count as major factors in measuring innovations in governance. The city-state or region state is perhaps a more important way of looking at economic and social developments across the world. This national ability to encourage regional infrastructure development, and indeed an economy based on the use and production of media and information products and services, is the key to success for those regions and nations most likely to succeed in this new global economy. Silicon Valley succeeded without the kind of government support offered in other countries. Perhaps the lesson here is that the concept of devolution really works if communities can organize themselves to take advantage of the power they actually have.

The World Is Flat

Thomas Friedman (2005), *The New York Times* foreign affairs columnist and author of *The World Is Flat: The Globalized World in the 21st Century*, says, “Globalization . . . is shrinking the world from a size small to a size tiny and flattening the playing field at the same time.” It is

a force that gives it its unique character—is a newfound power for individuals to collaborate and compete globally. And the phenomenon that is enabling, empowering and enjoining individuals and small groups to go global so easily and so seamlessly is what I call the flat world platform. (p. 10)

Friedman points out that this platform is the byproduct of the convergence of personal computers and a new information infrastructure, the Internet, which suddenly allowed individuals worldwide to collaborate regardless of the distances between them.

No one anticipated this convergence. It just happened—right around the year 2000. And when it did, people started waking up all over the world and realized that they had more power than ever to go global as individuals, they needed more than ever to think of themselves as individuals competing against other individuals all over the planet, and they had more opportunities to work with those other individuals, not just compete with them (pp. 10–11). Friedman cited a number of applications such as accounting, radiology, and banking that are done out of Bangalore (now known as Bengalooru) for a price that is considerably lower than if they were done in the United States. For example, in the evening in the United States, a radiologist in Bengalooru, who makes less than \$15,000 a year, can read an MRI (magnetic resonance imaging) or other radiological report and have it back to the attending physician in the United States to read the next morning. Perhaps most important, he or she can do it for a fraction of what it would cost in the United States. This outsourcing of jobs, what has been called offshoring—shifting more work, including the relocation of business processes, to achieve a

labor cost advantage—is on the rise among global corporations around the world.

This worldwide competition for jobs is multiplied by a number of cities and regions around the world positioning themselves to capitalize on the new global information economy. Singapore's Intelligent Island project, Dubai's Internet City, or Canada's Smart Communities—whatever they're called, these new enterprise zones have both the broadband technology of the new age and aggressive plans to use technology to transform their regional economy and society. The best ones are those looking to play a leadership role in this new age. Recognizing that it is creativity and innovation that will be the hallmarks of the new global economy, they also have strategies to attract, retain, and nurture the most entrepreneurial, creative, and innovative workforce.

The Future of News and Information

It is clear that as the world becomes increasingly global and out of necessity every nation needs to develop robust communications infrastructures, the concern with American imports of television, music, films, and software of all kinds becomes a more acute problem when developing a domestic or national communications infrastructure. For many years, the Motion Picture Association of America (MPAA) has complained that governments worldwide are seeking ways to block the free flow of information, particularly theatrical films.

MPAA has been a leading proponent of free trade in part because many countries are opposed to the importation of American films. At the same time, American filmmakers have concerns about piracy, which is rampant in many countries. Clearly, while governments want to do one thing, the worldwide consuming public wants another. Television, which produces all forms of audiovisual materials, has run into the same nagging import restrictions, tariffs, and administrative barriers to the free trade of information goods and services.

More recently, the UNESCO (United Nations Educational and Scientific and Cultural Organization) adopted a treaty promoting or recognizing cultural identity. The MPAA, among others in the industry, opposed U.S. support of the resolution. The United States stood alone, along with Israel, in opposing the cultural treaty on the grounds that it would be used for trade purposes to block the importation of American information and entertainment products, which constitute a major percentage of U.S. exports.

This concern about the “free flow” of information across borders is certainly not new. In the late 1970s and early 1980s, the term *The New World Information Order* was introduced into the debate by the McBride Commission (named after the Nobel Prize winner Shawn McBride), which was concerned that the flow of information and communications heavily favored the United States. The developing countries were expressing their

frustration with what they called a form of electronic colonialism, with the United States and the West dominating media flow. In protest, the United States and the United Kingdom, among other countries, withdrew from the UNESCO in the 1980s and rejoined only a few years ago.

The concerns expressed by the McBride Commission with regard to the concentration and commercialization of and unequal access to information and communications still persist. The commission's call for a “strengthening of national media to avoid dependence on external sources” has seen some success, with many countries developing robust communications media unique to their national economies and cultures.

The concern with U.S. dominance of media flow does not extend to the developing nations alone. Indeed, in the mid-1970s, France published a treatise called “The Computerization of Society,” written by the then Secretary of the Treasury, Simon Nora, and coauthored by his assistant Alain Minc, which called for a way of taxing information flows as well as information assets. As early as 1976, the French government realized that there was a basic change in the structure of their economy and it was going to be increasingly difficult to tax or control information products and services. They were also concerned with the collection of information for subsequent data processing that was being done in the United States by multinational corporations located in France. To keep the data from being transmitted and processed elsewhere—and in turn to create a robust data-processing industry in France, the French devised the concept of “data protection” and argued that nations such as France had a duty to control “the transborder flow of data” in order to preserve and enhance the communications and information technology infrastructure so essential to the economy of the future. For the first time, it was clear that data flow and media flow were one and the same and that the loss of information could hurt domestic economic development.

France and much of Europe subsequently developed privacy laws to control the flow of all data—they called it “name-linked data”—under the guise of protecting privacy. Such laws applied to both persons and corporations and severely threatened the free flow of trade and commerce. Multinational corporations doing business in France and elsewhere in Europe were concerned about the new data protection laws and vigorously expressed their reservations. Consequently, government authorities backed off of strict enforcement as it applied to corporations. Yet the die was cast. It was clear for many reasons that, if possible, information processing should be done locally and that these nations would assume greater responsibility for developing the industries important to their future in the coming, yet-to-be-defined knowledge economy.

In 2005, at the International Telecommunications Union's (ITU) World Summit on the Information Society (WSIS) in Tunis, the European Union (EU) joined most developing nations in expressing their concern over the widespread development of the Internet and U.S. control. With support

from the UNESCO and other UN agencies, including the Office of the Secretary General, the ITU appears to have launched a new forum for resolving many of the problems UNESCO identified through the WSIS. These problems, or issues, are diverse. They include Internet governance and helping close the digital divide by providing more Internet-based tools and access to Third World countries.

Concentration of the Media

A related concern expressed by the McBride Commission, and now the object of growing consumer interest, is media concentration. Large media companies dominate the flow of all kinds of information in the United States and worldwide. This issue is of concern to governments and consumers alike. The key issue is that increased media concentration limits localism—diversity and pluralism at the local level. The business of commercial media is to attract large audiences in order to sell advertising. Quite understandably, when sports and entertainment attract larger audiences, then news and public affairs do not have the same profit potential.

More and more nations are deregulating and privatizing their existing national monopolies in both telephony and broadcasting. To pave the way for foreign investment in media development, commercial or advertising-supported initiatives are dominating growth worldwide. While some argue that this is, in itself, a healthy development because these new commercial initiatives are replacing the old monopoly organizations, this trend is troubling to all who believe in localism as a central component of a vibrant democracy. If one believes that democracy depends on a relatively informed electorate, and that diversity and pluralism facilitate such informed citizenry, the opposite is occurring. People are less informed while becoming more entertained. The consequence may in fact be a step backward for the worldwide growth of democracy.

Many media companies, particularly those fully invested in broadcasting, cable, or newspaper ownership, argue that there's more diversity and competition in the media now than at any other time in history thanks to the Internet, satellite TV, and other innovations such as the cellular revolution with its advertiser-supported video and mobile Internet services. However, according to filings with the Federal Communications Commissions (FCC) by the Consumer Federation of America, among others,

most people still rely on their local newspapers and local television stations as the most important sources of local news and information. Those sources thus have disproportionate impact on public opinion . . . and further consolidation would be highly problematic.

University of Washington Professor Lance Bennett (2000) agrees that while “the proliferation of media channels in more open markets has made for intense competition for

audiences . . . the diversity of content in both news and entertainment forms did not increase” (para. 3).

Lack of diverse content in local news and information is a global phenomenon. At a Harvard University conference in 2002, David Gergen, the former advisor to four presidents and Director for the Center for Public Leadership at Harvard, expressed “concern that international news coverage nearly reached a vanishing point in the mainstream press before 9/11 2001.”

The reasons for this phenomenon appear to be (a) the U.S. public's continuing decrease in interest in international news, (b) the transition of networks from being family owned to being part of conglomerates, (c) the loss of influence of newspapers' editorial pages, and (d) a reluctance on the part of news organizations to take responsibility for the lack of international coverage. In general, participants at that conference, and others in universities and think tanks across the country, are expressing concern about Americans' ignorance of world affairs and the state of journalism and journalism education, and asking what can and should be done to remedy the declining interest in international matters.

James Hoge Jr., the editor of *Foreign Affairs*, writing 10 years ago in the *Columbia Journalism Review*, asked the question, “Foreign news, who gives a damn?” Hoge further wrote, “A world less threatening to America is less newswy.” But in 2007, at least, one cannot make the argument that matters elsewhere in the world threaten America less.

This is precisely what concerns the retired CBS foreign correspondent Tom Fenton (2005) in his book *Bad News: The Decline of Reporting, the Business of News, and the Dangers to Us All*. “Corporate greed and indifference have all but killed the kind of news gathering ethos that produces results,” Fenton complained. He, for one, clearly has lost “the sense of duty and urgency” that motivated and drove him. “The mega-corporations that have taken over the major American television news companies squeeze the life out of foreign news reporting” (pp. 11–12).

Fenton (2005) explained how after the Tischs, the New York investment family that also owned Lowe's Hotels and other properties, took control of CBS from its founder William Paley in the mid-1960s, they began looking for ways to cut costs. Because foreign news gathering was so expensive, CBS was told to cut many of the foreign correspondents. The other networks have done the same and today essentially buy stories and pictures from a third-party news gatherer and do their own “voice-overs.” In light of what is happening to international news, Fenton and others have asked how Americans can really express their will about what is happening in the world if they remain uninformed and ignorant of world affairs. Fenton believed that to do so “means letting the government operate beyond our shores without our full knowledge and facing a world that increasingly hates us . . . it means effectively allowing interested lobbies to run areas of foreign policy without our consent” (pp. 68–72). The future of our democracy does not look good, he argued persuasively.

The Promise of the Mobile Internet

What most of us call a “cell phone,” developed from the architecture of the earliest wireless telephones in the early 1990s, has revolutionized communications. There are now close to 2 billion mobile phone users worldwide. Mobile phone penetration has crossed that of telephones connected to landlines. Perhaps more important, cell phone use in even the world’s poorest nations is experiencing double-digit growth. “In Bangladeshi villages, cell phones are widely shared and rented out by ‘telephone ladies’ found throughout the village. Farmers and fishermen use the phones to call markets to work out where they can get the best price for their products. Small businesses use them to shop around for supplies. Mobile phones are used to make cashless payments in Zambia and several other African countries” (*The Economist*, 2005, p. 11). They can have, says *The Economist*, a dramatic impact, “reducing transaction costs, broadening trade networks and reducing the need to travel.”

A recent report by the Aspen Institute on the Fifteenth Annual Roundtable on Information Technology (Adler, 2007) concluded

that innovative mobile technologies are causing disruptive tectonic changes that will shape unalterably the way the next generation will live, work, play and interact with the world. . . . In India, worshippers send text prayers to the temple of a Hindu god. In China, coupons received on cell phones are redeemable at MacDonal’d’s. In Singapore, drivers can pay tolls and buy tickets with a mobile device. In South Korea, an online dating service sends a text message when a person matching another’s profile is nearby. In Los Angeles, high school students flirt, make dates and carry on courtship rituals in electronic forums. People in 22 countries cast 680 million text message votes for contestants during the most recent season of American Idol. (p. 3)

It has been reported that it took over 10 years to achieve the first billion mobile users but it will take less than 3 years to reach the second billion and for the third billion, less than that. Now that advertising is finding its way to the mobile Internet, allowing users to watch video clips of their favorite shows and receive regular reports of sporting events and other items of interest, cell phone costs are expected to drop. Declining costs will make it possible for essentially everyone in the world to have a personal mobile phone and, importantly, access to the Internet.

Democracy Reborn

The potential for a rebirth of democracy and citizen participation in global governance issues is enormous. Rick Stengel, editor of *Time* magazine, believes that we have indeed reached a critical juncture in the history of the world where technology is changing the very nature of the information age and empowering citizen participation in

world affairs as never before. In the United States, the former senator George Allen, a candidate for reelection from Virginia, was defeated in 2006 because of an ethnic slur captured by a cell phone and recorded on the Web site YouTube. Europe’s “mobile democracy” came of age, it is said, with a Spanish election. In March 2004, after a terrorist attack in Madrid, the Socialists rode to power on a wave of text messages expressing anger at the conservative government. In elections in the Congo and the Philippines, the same technique was used to rouse the faithful, and in the presidential election in South Korea, the current President Roh Moo-Hyun is said to owe his office to a surge of support from young people using their cell phones to connect with like-minded supporters.

Avazz.org, an online activist community for social justice, founded in part by MoveOn.org, has plans to operate in 10 languages targeting citizens in eight countries and four regions to reach 70% of the global online population of 900 million people. Their aim is to end global poverty, create an alliance for regulations and policies that stem global warming and climate change, and, among other issues, identify and promote candidates for UN leadership.

This new wave of democratization sweeping the world is more than just a fad limited to young people alone. It is more than simply a protest or indication of one unique demographic’s opposition to what is happening worldwide. It portends a framework for a new method of exercising the will of the people. Yet it is reactive. The technology invites such participation. Taken together, such initiatives may fall short of the new digital governance that Rick Stinger of *Time* Magazine envisions.

Conclusion and Observations

It is clear that communications will continue to play a comprehensive and critical role in the expansion of the global economy and the world community. The integration and interdependence of the economic, social, and political systems of nation-states, which began more than 50,000 years ago and is now accelerating through the Internet, will continue at an even faster pace.

Government and governance—how we relate to those who are elected and appointed to serve us—must change too. We are already seeing the development on a global scale of mechanisms for ensuring that the global corporation has some checks and balances on its far-flung activities and influence worldwide. By retooling many of these existing organizations and creating new ones, the rights of privacy and intellectual property, piracy, terrorism, the free flow of communication, and democracy itself must be addressed. Through new international/global agreements, the framework for global policy and some form of regulation is inevitable.

The interdependency of nations that is driving globalization is unquestionably economic, but the social and

political integration and interdependence are also very real. Interdisciplinary understanding of the connections between social and political needs and concerns, and mechanisms for harmonizing such differences must be a priority for governments and institutions. Doing so will require a new global awareness of world affairs by citizens everywhere.

PART VIII

CHALLENGES AND OPPORTUNITIES FOR COMMUNICATION

ETHICAL AND UNETHICAL COMMUNICATION

JOSINA M. MAKAU

California State University, Monterey Bay

This chapter explores the relationship of communication to ethics. Introductions to general guidelines for ethical communication, related dialogic virtues and skills, and additional tools for recognizing and addressing ethical issues are included. The principles, guidelines, and tools outlined below reflect insights from numerous disciplines and are applicable within and across diverse 21st-century contexts.

Communication—the use of available resources to convey information, to move, to inspire, to persuade, to enlighten, to connect—is an inherently ethical undertaking. Regardless of context, communication involves choice, reflects values, and has consequences. These three key elements of communication form the basis of its ethical makeup.

Ethics is the study of values, of what is more or less important, of the “good,” of behavioral guidelines and norms. Ethics provides frameworks and tools for recognizing and assessing available options and for differentiating between more or less morally justified pathways in any given situation.

Scholars have identified numerous approaches to the study of communication ethics (Arneson, 2007; Boss, 2004; Bracci & Christians, 2002; Jaksá & Pritchard, 1994; Johannesen, 2002; Makau & Arnett, 1997). Some approaches focus on intentions, others on means, and still others on consequences. Some approaches to communication ethics focus primarily on duties, obligations, rights, and responsibilities, while others emphasize the importance of dispositional traits and related abilities, referred to

by many as virtues. Some communication ethics scholars derive guidelines from community, others stress the importance of authority, while still others turn primarily to the individual for ethical insight. Some perspectives on communication ethics focus on narrative, while others feature reason and argument, and still others integrate both approaches to understanding and decision making. Some communication ethicists stress situational factors more than others, but all approaches to the study recognize the importance of context. This chapter explores shared elements of diverse ethical frameworks and introduces resources for recognizing and responsibly addressing ethical issues across contexts.

Historical Links Between Communication and Ethics

Throughout history, unethical communication has been one of humanity’s most potentially harmful weapons. In interpersonal contexts, communication has the power to wound deeply, to undermine connection, and to thwart healthy human development. Within institutional contexts, unethical communication has been used to support greed and corruption, to bolster tyranny, and otherwise to foster oppression. Historically, communication has been instrumental in sparking and justifying economic injustice, violence, war, genocide, and tribal conflicts.

At the same time, the art of communication has been instrumental to the pursuits of truth, wisdom, justice, and

peace. Historically, responsible and effective communication has fostered loving connection, compassion, and understanding.

Communication's powers to hurt and to heal, to repress and to inspire, to betray and to uplift, to oppress and to comfort, to deceive and to enlighten, to wound and to mend are among the direct links between communication and ethics. The pages to follow will reveal the importance of ethics to fulfilling communication's constructive potential while addressing the myriad challenges associated with such efforts.

Key Elements of Ethical Communication

All communication—interpersonal, organizational, small group, mass mediated, political, informational, technical, or commercial, whether delivered orally, electronically, verbally or nonverbally, visually, or through a print medium—occurs within a context, including goals, means, and occasion. Ethical communication requires understanding of and responsiveness to each of these three key elements. *What* one hopes to achieve through the communication (the *ends*), *how* one chooses to communicate (the *means*), and the “real-world” *outcomes* (the *consequences*) of communication are particularly important features of ethical communication.

Choice, Moral Agency, and Responsibility

Communication ethics is, first and foremost, about choice. To the extent an individual or group has options available in any given situation, moral agency is at play. With moral agency—the relative freedom to choose one's pathway in any given situation—comes responsibility.

Although circumstances often limit individuals' options, adults interacting with others usually have at least some moral agency. When interacting with a friend or a close acquaintance, for example, people in diverse circumstances are often relatively free to choose how attentively they will listen to the Other. How will they respond to the Other's questions, concerns, insights, charges, and so on? Will they seek to manipulate the Other to their personal advantage? Seek to gain the “upper hand”? Will they listen defensively? Or will they seek to understand the Other? To connect with the Other? To foster the mutual pursuit of truth, insight, wisdom, informed and just decision making with the Other?

In encounters with strangers, the decision of whether to recoil or to express hostility, on the one hand, or to smile or otherwise express a sense of human connection, on the other, reflects elements of choice and hence of responsibility to the Other as well. Numerous factors—from cultural norms, customs, and traditions to individual preferences, abilities, genetic makeup, neurophysiology, and

many other variables within and outside the individual's control—influence how each person responds to the circumstances he or she confronts. Central to the deliberative process across contexts, however, is the overall state of one's heart and mind.

In interpersonal communication settings, for example, each individual's approach is shaped by goals, values, emotions, and perceptions. What does each party hope to achieve? How does each perceive the Other? What are their perceptions of stakeholders' interests? What about their own values, beliefs, and vested interests? How thoroughly has each considered the likely consequences of the interaction to the self, to others, and to the relationship? Responses to these questions all involve elements of choice and reflect values, influenced significantly by each participant's overall state of heart and mind.

Structural factors are relevant as well. People often find themselves in circumstances defined, at least in part, by power structures beyond their control. Institutional structures are especially relevant. Consider, for example, those situated at the “bottom” of a clearly defined corporate hierarchy. Even in such seemingly constrained circumstances, the state of one's heart and mind is instrumental to the quality, efficacy, and ethics of one's interactions. Individuals in such positions often have a much broader range of communicative options than appears evident on the surface. Often, for example, even those with limited institutionally sanctioned power have opportunities to facilitate transparency, to engender acts of loving-kindness, and to foster elements of just and caring communion. How these individuals choose to respond to their circumstances often profoundly affects the quality of the organizational environment.

This sense of quality relates directly to a second key feature of moral agency across communication contexts. While the communicator's goals (the intentions or ends of communication) are important, so too are the means communicators elect to use. Consider, for example, a situation in which one must decide how to respond when a friend asks questions regarding her performance at a concert the previous evening. Suppose that a fully truthful response could prove painful to the friend. There are many means available to avoid hurting the Other in such circumstances. Among these means are lies or other more subtle forms of deception. For reasons to be outlined later, however, these means are inherently ethically suspect. In contrast, pursuing compassionate and caring means to sharing the information truthfully in such circumstances promises to foster connection, mutual trust, respect, and understanding, thereby facilitating fulfillment of communication's constructive potential.

The centrality of means to ethical communication is especially evident in studies of social movements. Historically, pursuits of social justice in the face of tyranny and oppression have taken many forms. Some means—such as “random” violence, demonizing the Other, and

hate speech—have been shown to be inherently ethically suspect. Addressing this issue, prominent global leaders in the pursuit of social justice such as Mahatma Gandhi, Nelson Mandela, César Chavez, and Martin Luther King have noted that the means are the ends in the making (Boss, 2003; Makau & Marty, 2001).

This discussion of means and ends leads to exploration of a third, related element of ethical communication: The consequences of one's choices matter deeply. Thus far, the focus has been on "good" intentions and ethical means. However, even the most noble intentions and ethical means have the potential to cause harm. Consider, for example, the case of a journalist seeking to uncover abuses of power and using truthful means to convey the information. In such a case, the journalist can be said to be using ethical means (conveying information truthfully) in an effort to pursue noble ends (transparency, accountability, and justice). At the same time, however, innocent people could be gravely imperiled as a result of the journalist's revelations, particularly if the abuses uncovered by the story take place in an environment of "unchecked" power. Before publishing the story, the journalist has the responsibility to consider the likely consequences of the publication, especially to the most vulnerable members of the community.

Given the complexity of life's circumstances, predicting such consequences with certainty is impossible. The responsibilities associated with moral agency do not require the ability to prophesize in this way. However, responsible exercise of moral agency does require thoughtful consideration of the circumstances, particularly from the standpoints of all relevant stakeholders; moral agents have a responsibility to anticipate likely consequences as a part of their deliberations.

In sum, then, ethical communication across contexts requires attentiveness to at least the following: one's intention, the means used to fulfill these ends, and the likely consequences of one's choices. Even within these parameters, however, differentiating more or less ethical communication pathways is often difficult. Each set of circumstances is unique, and often the most ethical choice is not readily apparent. A number of resources are available to address these complexities.

General Guidelines for Ethical Communication

No set of rules or norms can provide certainty regarding the most ethical pathway in specific cases. Usually, some measure of uncertainty is inevitable. However, people unable to make absolute decisions nevertheless have the potential to make well-informed, ethical choices. General guidelines for ethical communication provide tools for discerning more or less ethical pathways, assisting decision makers in their efforts to make responsible choices.

The Principle of Veracity is illustrative. This principle provides resources for discerning whether, and how, to lie or use other forms of deception in any given set of circumstances. Although the Principle cannot provide certainty regarding this often difficult ethical choice, applying this general guideline to specific cases facilitates responsible and wise discernment regarding available options.

Truth and Truthfulness

To understand the Principle of Veracity and its role in guiding communicative acts, it is important to distinguish the pursuit of truth on the one hand and truthfulness on the other. The former is an important, but complex, undertaking. The quest for truth takes many forms, from the pursuit of verifiable empirical knowledge regarding the material world, on the one hand, to the search for deep transcendent insights and wisdom, on the other. Beliefs of either kind that are held to be "true" by most people in a community during one era and in one domain are often found to be "false" during another. The once widely held "flat earth" belief illustrates this phenomenon. For many years, people throughout many regions of the world believed that the earth was flat. Over time, however, evidence revealing the unreliability of that earlier view was widely disseminated. Most of the world's population today rejects the idea that the earth is flat.

Truthfulness is closely related to such pursuits of truth. Among other things, the quest for truth depends on peoples' truthfulness. Imagine, for example, if scientists and ruling authorities (including governmental agents) around the world had chosen to deceive the public about scientific research revealing compelling evidence against the "flat earth" thesis. Under these circumstances, humanity would not have benefited from the scientific community's evolving insights regarding the earth's dimensions and shape.

Within today's globally interdependent world, the relationship of truthfulness to truth is especially critical. For example, understanding of complex environmental issues—such as those associated with evidence of global warming, land use and ownership policy issues, resource allocation issues, sustainability, energy policies, and so on—requires access to scientifically verifiable information. Truthful representation of this information will be instrumental to responsible and reasoned decision making.

At the same time, however, truthfulness in this and other contexts does not depend on humans' abilities to arrive at definitive truths. It is possible, indeed critical, for people to be truthful even when they are confronted with the possibility that their beliefs will one day be shown to be false. Truthfulness is not so much about the capacity to know or to disseminate definitive truths but is rather a reflection of one's integrity. Communicators who make every effort possible—relying on all available resources—to confirm the truth of their statements before sharing their insights, who remain open to the possibility that they are

wrong, and who convey only information and insights they sincerely believe to be true at the time of their representations can be said to be speaking truthfully, even if future inquiries reveal that their beliefs were mistaken.

The case of perjury illustrates the point further. Witnesses can be convicted of perjury only if it can be shown that their false testimony was intentionally deceptive. The oath to “tell the truth” during a trial relates exclusively to expressing what one believes to be true and not on what turns out to be verifiably the case. District attorneys are especially aware of this distinction. The adage “eye witness accounts are both the most compelling and the least reliable” sources of evidence at a trial underscores differences between truth on the one hand and truthfulness on the other. Truthfulness is a necessary condition for judicial pursuits of truth and justice. However, given the frailty of human perceptions, truthfulness by itself is not sufficient.

The Principle of Veracity

With this distinction in mind, the Principle of Veracity relates not so much to truth *per se* but rather to truthfulness. According to this general guideline, although the use of deception is morally justified in some special circumstances, truthfulness has moral presumption in its favor (Bok, 1999). The Principle provides four discrete but related steps for discerning whether deception is morally justified in any given case.

Among the reasons why truthfulness has presumption in its favor across communication contexts are the inherent risks associated with lying and other forms of deception. For example, the decision to deceive another inevitably risks compromising the trust so critical to enduring relationships. Once undermined, trust is difficult to restore. Similarly, deceiving another—either by lying or through more subtle forms of deception—threatens the shared experience of respect at the heart of meaningful interpersonal connection. The use of deception, even for the most noble of purposes, also risks undermining informed and reasoned decision making. From the perspectives of the person being perceived and members of the broader community, these are potentially significant harms. Additionally, when communicators choose to deceive, they risk compromising their own personal integrity. Such compromises are potentially devastating, particularly over time. These inherent risks—threats to trust, respect, sound decision making, the broader community’s well-being, and personal integrity—are but a few of the inevitable dangers associated with deception within and across communication contexts.

Yet those who choose to deceive others often overestimate the benefits and underestimate the harms of their decision. Focusing primarily on their “good intentions,” deceivers often persuade themselves that their actions are morally justified. Taking thoughtful account of the inherent risks associated with deception—with particular attention to the long-term consequences to the deceived, to the relationship,

to one’s integrity, and to the broader community—helps mitigate this tendency. The Principle of Veracity provides resources to assist with this process.

Four Steps for Moral Discernment

The first step of the Principle calls for consultation with one’s conscience. Does the conscience—a particularly valuable resource for ethical communication—provide a clear sense of moral direction in the case at hand? Does the use of deception feel warranted by the circumstances? What are the “true” intentions underlying the decision to deceive in this case? For example, is the primary goal pursuit of justice, fairness, care, or loving-kindness? Or is the “true” intention to seek revenge, power over vulnerable others, or self-aggrandizement? Above all, what is the overall state of heart and mind governing the deliberative process?

Following consultation with one’s conscience, the Principle of Veracity calls for careful consideration of one’s available options. Are there viable truthful means available to fulfill the communicator’s goals? Is it possible to pursue the ends without using deception?

These first two steps are important and necessary to fulfillment of the Principle of Veracity. However, they are not sufficient to justify the use of deception. The third required step is consultation with peers. When available, people who share one’s interests, values, and beliefs offer potentially valuable insights for ethical deliberation. Consultations with people who are honest, thoughtful, forthright, and caring are especially helpful. If such peers are not available, imagining their likely counsel will meet the third step of the Principle. More specifically, if one’s peers were made aware of all the relevant facts in the case, would they be likely to view the use of deception in this case as ethically justified?

At this point, having checked in with one’s conscience, assessed one’s motives, sought truthful alternatives, and consulted with one’s peers, significant “checks” have been placed on the decision to deceive. Though fruitful, however, these preliminary steps are not sufficient to overcome the burden of proof against deception. One’s conscience and peers, for example, often privilege one’s own values and interests, leaving out critical insights regarding the needs and interests of all stakeholders, as well as the likely long-term consequences to the deceived and broader community. To attend thoughtfully to these important final features of ethical communication, the Principle of Veracity provides a Test of Publicity.

This fourth, and final, step calls for exploration of the circumstances through a “shifting of perspective.” In particular, the Test of Publicity requires exploration of how the deceived, those who share his or her values and interests, and members of the broader community would be likely to view the case. If these parties had access to all the available information, would they be likely to view the deception as morally justified? Would they view deception in this case as potentially helpful to the individual, the relationship, and the community, both short- and long-term?

Would they find compelling evidence that no viable alternatives are available? If fully informed of the circumstances, would they be likely to support the decision to deceive? Would they deem the act of deception as morally justified?

The classic “placebo” case in medical practice serves to illustrate. Medical practitioners have long recognized the powerful “healing” effect of “placebos.” Informing patients that they are receiving medicinal drugs has been shown to benefit many patients, even when the “drug” is merely an inactive placebo without chemical healing properties. In the past, many physicians have viewed the goal of providing patients a “placebo effect” as justification for this form of deception. As a result, paternalistic deception—deceiving someone for their own benefit—was once an accepted medical practice by many practitioners in the United States.

Applying the first three steps of the Principle of Veracity, physicians might well have concluded that this form of paternalistic deception is morally justified. Good intentions, the lack of viable alternatives to achieve the “placebo” healing effects, and counsel with peers (especially fellow physicians) would likely lead to such a conclusion. Application of the fourth step, however, offers moral insights previously unavailable to these decision makers.

During the past several decades, challenges by patients’ rights groups have served this purpose. Patients’ advocates have raised issues such as the right to make informed choices regarding one’s treatment. They have noted further that when asked, most (though certainly not all) patients indicate that they would prefer not to be lied to, even if they might experience “healing” benefits through the deception. Patients’ rights groups have spoken eloquently as well of the dangers “paternalistic lies” pose to the trust and respect so central to doctor-patient relationships. Through their testimonies, these advocates have helped physicians consider the communication context from the standpoint of the deceived.

The resulting revelations have led to changes in the professional association’s code of conduct. Today, physicians are admonished to avoid deception in most cases, even when the use of a paternalistic lie may serve beneficent ends.

This approach to moral discernment—checking in with one’s conscience, exploring available alternatives, consulting one’s peers, and applying the Test of Publicity—provides the foundation for the application of general guidelines for ethical communication across contexts.

Moral Development and Ethical Communication

There is direct alignment between this foundation on the one hand and findings in moral development theory on the other. For more than four decades, researchers exploring human moral development across cultural boundaries have uncovered three different phases, each with their own

discrete stages (Boss, 2004; Gilligan 1987; Jaksa & Pritchard, 1994; Kohlberg, 1987). In particular, they have found that during early development, young children tend to view the world through an “egocentric” lens. As a rule, most toddlers demonstrate the capacity for empathy. Most respond earnestly to others’ apparent suffering and appear responsive to others’ demonstrated pleasures. However, they also tend to assume that everyone shares their perceptions and experience and that it is their (and others’) “responsibility” to privilege their interests.

Following this egocentric phase (often referred to as “preconventional”), children evolve to develop more pressing concern for the well-being of others, particularly those within their own inner circle. Young people at this phase also tend to share a desire to be a part of a group. They tend to seek connections, to pursue meaningful relationships with others. They also tend to seek approval, especially from peers. At the same time, they find value in communal rules, conventions, and guidelines. They embrace the concept of loyalty and understand the importance of duty, especially to members of one’s group. Their moral community—those whose needs and interests they include in their moral deliberations—expands beyond just themselves to include family members, friends, others within their village, tribe, or immediate group, as well as peers. During this phase—often called “conventional”—young people also develop pronounced capacities for compassion and empathy.

The third phase of moral development generally begins in early adulthood and continues throughout the remaining span of a person’s life. Features of “postconventional development,” as this phase is called, include the expansion of the moral community to include all members of the human family (and, for some, all sentient beings) and a willingness and capacity to think critically about the short- and long-term consequences of one’s actions to all humanity. In this phase, pursuits of justice, fairness, and sound and reasoned decisions become routine. Other qualities marking “postconventional” moral development include responsiveness to others and to diverse circumstances with compassion, care, love, humility, moral courage, generosity, kindness, integrity, and truthfulness. The concepts of loyalty and duty remain important but tend to be associated with transcendent commitments (beyond narrow understandings of moral community). Although “authority” has a place during this phase, postconventional moral reasoning takes on a more heteronomous character. Decision making is based on thoughtful, careful, independent assessment of available information rather than on the appraisals of “authoritative” others.

This last feature of postconventional reasoning is often associated with development of what are called “intellectual virtues.” Among these are the willingness and ability to think critically; to avoid fallacies; to pursue reasoned and just decision making; to embrace diversity of perspective, intellectual humility, love of learning, and, in general, an openness of heart and mind.

Reversibility, Ethical Communication, and the “Golden Rule”

The resources explored thus far rest on several assumptions shared widely by students of communication ethics. The underlying assumption that “reversibility” is a prerequisite for moral justification is one such assumption. This concept derives from the related belief, reflected throughout this chapter, that communicating ethically requires attentiveness and regard for the needs and interests of others as well as one’s own.

This precept provides a foundation for most approaches to communication ethics. There are a number of sources for this shared assumption. Perhaps the most widely known across diverse religious, spiritual, and secular philosophical traditions is a principle often referred to as the “Golden Rule.”

Among the iterations of this ancient guideline, perhaps the most well-known among secularists in the West is “Do unto others as you would have them do unto you.” Within the Christian faith tradition, the guideline is articulated in the *New Testament* Gospel of Matthew as follows: “In everything, do to others as you would have them do to you: for this is the law of the prophets.” The Prophet Mohammed of the Islamic faith tradition is cited as saying, “Not one of you truly believes until you wish for others what you wish for yourself.” The Buddha is recorded as having admonished followers to “treat not others in ways that you yourself would find hurtful.” Within the Hindu faith tradition, the guideline appears as follows: “This is the sum of duty: Do not do to others what would cause pain if done to you.” Confucius is said to have told his followers, “One word which sums up the basis for all good conduct . . . loving-kindness. Do not do to others what you do not want done to yourself.” Within the Zoroastrianism faith tradition, the guideline is shared as follows: “Do not do unto others whatever is injurious to yourself.” Judaism’s Talmud teaches the following: “What is hateful to you, do not do to your neighbor. This is the whole Torah; all the rest is commentary. Go learn it.” In the Baha’i faith, followers are admonished to “lay not on any soul a load that you would not wish laid upon you, and desire not for anyone the things you would not desire for yourself.”

These iterations of the Golden Rule reflect strong, shared, cross-cultural commitment to reversibility as a key element of moral justification. At the same time, however, application of the guideline is not without difficulty. The discussion below will highlight both common ground and the special challenges associated with its application in specific contexts.

Common Ground

Most people, regardless of their backgrounds, experiences, or beliefs, share a need to be loved. Most wish to avoid suffering and want to be happy. Most prefer the experience of

loving kindness to meanness, and most want to experience peace in their daily lives. Most wish peace for their loved ones and for the broader community. And most relish the prospect of mutual respect and understanding.

Apart from these generally shared traits, much of the human family shares a set of values across cultural boundaries as well. Several of these beliefs about right and wrong, good and bad, what is more or less important can be found in the International Declaration for Human Rights. This document was first adopted by the international community in December 1948. In a celebration 50 years later, the United Nations General Assembly reaffirmed the Declaration. Among the core values expressed in this document are the “inherent dignity” and the “equal and inalienable rights of all members of the human family.” The document’s Preamble identifies these values as the foundations of “freedom, justice, and peace in the world.” Article 1 adds that all “are endowed with reason and conscience and should act towards one another in a spirit of brotherhood.”

Scholars (Bok, 1995; Boss, 2004; Christians & Traber, 1997; Johannesen, 2002; West, 1994) have identified related shared values and traits. Among these are commitments to empathy, compassion, truthfulness, human dignity, loving kindness, solidarity with others—particularly those who are vulnerable, love, justice, fairness, respect, moral courage, humility, and care.

For deliberative purposes, ethical communication takes these values as starting points. Authentic appeals to love, justice, fairness, respect, dignity and care, for example, hold the status of presumption, comparable with the role of truthfulness in ethical communication explored earlier in this chapter. In contrast, appeals to prejudice, intolerance, hatred, injustice, and fear of the Other require compelling justification through the use of the four steps outlined in the earlier discussion of the Principle of Veracity. Similarly, the use of communication to manipulate (especially to pursue ethically suspect ends) requires compelling justification. Application of all four steps, including the Test of Publicity, is required to justify strategic manipulation.

In these ways, general guidelines such as the Principle of Veracity and the Golden Rule provide valuable resources for those seeking to communicate ethically. At the same time, however, beyond such broad, generally shared common grounds, people cannot assume that others share their particular interests, values, beliefs, or dreams. This realization of difference is one of the most compelling challenges to the concept of reversibility at the heart of such general guidelines. As Seyla Benhabib (1992), Anthony Appiah (2006), Amin Maalouf (2000), and other scholars have noted, difference is one of humanity’s defining qualities.

Reversibility and Difference

Despite much common ground, diverse cultures have differences from one another. Some of these differences are deep, for example, potentially competing conceptions of

the “good.” While one group may privilege the individual’s interests, needs, and rights, another privileges the needs and interests of the community. While one group embraces a particular spiritual text as authoritative, another rejects the same text. While one group privileges rights to property ownership, another finds the concept of land ownership mystifying.

World religions are especially illustrative. On the one hand, monotheistic faith traditions such as Judaism, Christianity, and Islam share many beliefs and values. On the other, however, differences between these groups have been associated with violence and warfare.

Even groups sharing common religious affiliation often disagree sharply. Within the Christian faith tradition, for example, conflicts between Catholics and Protestants have led to violence and warfare and continue to pose significant challenges for the faithful. Similarly, conflicts between different Muslim sects have led to violence and warfare throughout regions in which large numbers of people embrace the faith tradition.

Apart from divisions both within and across cultural groups, individuals within each group have unique sets of characteristics and experiences. Even people who appear to share close bonds—such as genetic or familial links, socioeconomic ties, shared religious affiliation, similar age, shared ethnicity, race, gender, affectional orientation, physical abilities and limitations, intellectual skills, or other important features of personal identity—are nevertheless “different” from one another. Each individual is distinctive, with a particular constellation of material and philosophical characteristics shaping his or her personal identity. These distinctions help inform each person’s life’s experiences, which in turn help shape the individual’s unique perceptual lens and associated values, beliefs, interests, and needs.

Given such differences among “concrete” others, the admonition to “do unto others what you would have them do unto you” encumbers special responsibilities. Most important, ethical communication requires insight into the particular needs, interests, values, and beliefs of the Other; the ethical call to reversibility requires understanding of and responsiveness to the Other on his or her own terms. This is an essential underlying mandate of the reversibility requirement, when understood contextually.

A related theme is recognition of and responsiveness to the role of standpoint in communication. This concept combines features of identity with relevant power dynamics. Consider, for example, a university classroom context. The professor is vested with the hierarchical authority to “manage” the classroom, facilitate learning, assess and grade student performance, assign tasks, and so on. Within the classroom “hierarchy,” the professor’s institutionally vested power is manifest. Yet outside the context of the classroom, there are a number of officials whose hierarchical authority takes precedence over the professor’s. Among these are the college dean, the vice president of Academic Affairs, the university president, the system chancellor, the

board of trustees, and so on. In this sense, the professor’s hierarchical status shifts from context to context.

At the same time, however, the professor’s identity also plays an evolving role in the power dynamic. Race, ethnicity, gender, age, physical traits, and other defining features of personal identity help shape the relations of power between professor and student in the classroom, as well as between “ruling” authorities throughout the university hierarchy.

A further key factor shaping the context is how power is negotiated in diverse settings. For example, some professors adopt pedagogical strategies designed to enhance students’ authority over their own educations. Learning-centered instructional paradigms feature such shifting power dynamics. Similarly, some college administrators reject the “sovereign power” paradigm in which authorities routinely (and sometimes arbitrarily) exercise “power over” others and embrace instead a “mutual power” paradigm, in which people are provided opportunities and resources to share “power with” one another. Given these diverse understandings and exercises of power dynamics, simply identifying a person’s “official” status within an organizational structure does not fully account for the individual’s “standpoint” in a particular context. Ethical communication requires mindfulness of these evolving elements of standpoint and their role within particular communication contexts. Dialogic virtues and skills provide resources for attending thoughtfully to these and other dynamic features of communication across contexts.

Dialogic Virtues and Skills

Dialogue differs from other forms of communication in its responsiveness to the Other. Rather than communicating at, to, or for another, dialogue is characterized by communicating with others.

Ethical and effective dialogue requires several skills. Among the most important are attentive listening abilities. Communication is often thwarted by human tendencies to judge, to blame, or to defend in response to others. Whether in communication within intimate relationships or in interactions with strangers, this narrow pattern of response fosters defensiveness and inhibits the possibility of mutual understanding.

In contrast, the art of listening nondefensively opens possibilities for dialogic connection. Developing the habit of listening to understand fosters conditions for learning from and with others, for deliberating well together, and for building community.

There are at least three other dialogic virtues and related skills required to meet the Other on his or her own terms: keeping an open mind and heart, balanced partiality, and critical self-awareness.

Often, the willingness and ability to approach communication with an open mind and heart is confused with a kind of passivity, pursuit of “pure objectivity,” or lack of

passion for one's point of view. Importantly, however, these characteristics are neither required nor even helpful to ethical and effective dialogue. Without passion and personal commitment, for example, exchanges have little meaning. Without mutual recognition of the values and interests inevitably underlying each participant's point of view, interactions are unlikely to foster mutual understanding and informed decision making. Balanced partiality—the dedicated and caring commitment to fairness—helps participants acknowledge their own and others' partiality without compromising their receptiveness to others' perspectives.

Similarly, critical self-awareness—the process of acknowledging and recognizing how our standpoints influence our perspectives, as well as how others see us—is vital to ethical and effective dialogue.

Finally, the capacity to imagine the experiences and sensibilities of others is critical to ethical decision making. Seyla Benhabib (1991) and Martha Nussbaum (1997) are among the many scholars whose work has revealed the importance of developing the habit of representing to oneself the many perspectives, layers of meaning, and viewpoints constituting any particular set of circumstances. Development of one's moral imagination, as this capacity is often called, requires both willingness and an ability to challenge one's "self-centered perspective." Receptiveness of and responsiveness to the diversity and multiplicity of perspectives characteristic of the human family are especially helpful. As noted earlier, the Test of Publicity provides a particularly fruitful resource for attending thoughtfully to this facet of ethical decision making.

In summary, ethical communication requires a diversity of dispositional traits, intellectual virtues, and related dialogic virtues and skills. These resources have always been important. However, special challenges and opportunities unique to 21st-century contexts make them all the more compelling.

21st-Century Challenges and Opportunities

Never before have people from such richly diverse backgrounds, representing different interests, potentially competing values and beliefs, and distinctive ways of knowing, encountered one another so routinely. People around the world today cross cultural boundaries as a matter of course. More than 200 million people live and work away from their ancestral homes, in close proximity to people from culturally diverse backgrounds. Through the Internet and other communication technologies, vast reserves of information and widely divergent perspectives are delivered to people from richly diverse backgrounds across the globe each day as well.

These circumstances hold unparalleled promise for mutual growth and enlightenment. Sharing ideas and experiences with one another enables people to question their assumptions and achieve heightened awareness of issues from multiple standpoints, facilitates the "shifting of perspective" at the heart of ethical communication, and otherwise enriches possibilities for reasoned and just decision making. In these ways, communication in today's world holds great promise for fulfilling its creative and constructive potential.

At the same time, however, numerous challenges confront humanity at the dawn of this new era. As Ellul (1964), Jonas (1984), Christians (2007), and others have shown, technologies tend to create their own imperatives. People using communication technologies, for example, often succumb to a kind of instrumentalism, in which "efficiency" is privileged at the expense of relationships, connection, dignity, freedom, and other core values. Surveillance and control, manipulation, and power over others often take precedence when people using technologies acquiesce to this tendency. As machines become more and more sophisticated, it is likely that these risks will become increasingly manifest.

Similarly, although the power and ubiquity of mass communication creates valuable opportunities to foster shared understanding, to facilitate peace, to achieve justice, and to otherwise serve humanity, their ubiquity creates vulnerability to abuse as well. As control of news sources becomes increasingly driven by commercial interests in service to the few at the expense of the many, for example, access to reliable information may prove increasingly difficult. Similarly, speed of information transmission prevents the kind of scrutiny and reflection once considered hallmarks of sound reporting. Enhanced tools for manipulating messages pose additional challenges, undermining the ability to discern differences between "truthful" dissemination of information on the one hand and propaganda on the other. At the same time, sharp (and growing) disparities between the "haves" and "have-nots," characteristic of today's global economy, will likely exacerbate these and related risks.

Given these circumstances, explorations of how communications technologies and other forms of media are used—the interests they serve, the messages they convey, the consequences of these messages, and their underlying values—will prove critical to humanity's long-term well-being.

In sum, communication in today's globally interdependent world has both extraordinarily creative and devastatingly harmful potential. In such an environment, the relationship of communication to ethics takes on special importance. Discerning more or less ethical pathways for communication in any given context will prove key to meaningful relationships, to responsible participation in the global economy, to the understanding and resolution of complex social and political issues, and to

responsive civic engagement. The core values, virtues, skills, and related resources explored in this chapter are designed to equip individuals and groups for this dynamic and vital undertaking.

COMPETENT AND INCOMPETENT COMMUNICATION

SHERWYN P. MORREALE

University of Colorado, Colorado Springs

For as long as human beings have been communicating, they have tried to figure out how to communicate well, that is, with competence. In modern times, communication scholars and teachers have worked hard to understand and describe what it means to be a competent communicator. These attempts to better understand competent communication are in part a result of a large body of research indicating that the ability to communicate competently is critical to a person's personal and professional success in life. A 2008 analysis of 93 journal and newspaper articles, reports, and surveys provides evidence of the centrality of communication and the importance of communication instruction to developing as a whole person; improving the educational enterprise; being a responsible social and cultural participant in the world; succeeding in one's career and in business; enhancing organizational processes and organizational life; and even addressing emerging concerns in the 21st century such as health communication, crisis communication, and crime and policing.

Given the importance of competent communication in contemporary society, this chapter first describes the historical development of the most significant theories and models of communication competence over time. An illustrative list of advanced communication competencies for college graduates and several popular definitions of competence are included. Then, both effective communication and appropriate communication are described, and competent communication is compared with incompetent communication. Thinking about incompetent communication suggests the need to discuss the role of ethics in communication

competence. This chapter concludes by exploring the consequences of communication competence in specific communication situations and across time and relationships.

Theories and Models of Communication Competence

The history of competent communication dates back many centuries. Early Greek and Roman philosophers, such as Aristotle, Plato, and Cicero, were some of the first writers to attempt to describe what competent communication looks like and how it works. In fact, communicative competence (or the outward appearance thereof) was held in such high regard among the aristocracy of both Greece and Rome that an entire industry, sophistry, arose out of a need for communication instruction, particularly in public speaking, dialectics, and public debate. As this discussion of communicative competence unfolds, we will see how the centuries-old concepts about communication have reached fruition in some of the theoretical models of what now is referred to as competent communication. We begin our discussion, however, with a popular model of learning that did beget other models of communication competence.

Bloom's Taxonomy of Learning

At times, people around us exude an outward appearance of innate communicative competence; they have the "gift of the gab," so to speak. Others have to work at it. While there

may be some component to people's personalities that makes them more effective communicators, most scholars agree that communication behaviors and skills are learned. Therefore, any discussion of communication competence first should consider how people learn to communicate. Some of the popular models of communication competence appear to have their roots in a widely used and oft-cited model of learning developed by Benjamin Bloom in 1956.

Bloom's Taxonomy of Learning holds that human learning occurs as a result of three activities. The three types of learning or domains are psychomotor, affective, and cognitive.

Psychomotor learning is probably the most basic component of Bloom's taxonomy and also the most basic level at which a human learns to communicate. The psychomotor domain includes physical movement, coordination, and use of the motor-skill capacities. For example, infants as young as 7 months can learn to use gestures such as pointing and waving to greet others or indicate recognition of a parent or other relative. Many parents even choose to teach their children sign language as a stopgap method of communicating until their infants and toddlers can communicate verbally. Later on, many people effectively (or ineffectively, in some cases) accentuate their verbal communication with nonverbal gestures.

Affective learning refers to what has now come to be called "emotional intelligence," or the ability to not only express one's emotions and opinions but to effectively gauge those of others. The affective domain includes the manner in which we deal with things emotionally, such as feelings, values, appreciation, enthusiasm, motivation, and attitudes. Bloom divided the affective domain into five categories: receiving, responding, valuing, organizing, and characterizing. When we work to actively receive, interpret, and respond to communicative messages from others, we are taking our first steps toward communicative competence.

The third type of learning in Bloom's taxonomy occurs in the cognitive domain, which involves knowledge and the development of intellectual skills. This includes the ability to recall or recognize specific facts, procedural patterns, and concepts that serve in the development of intellectual abilities and skills. Bloom's cognitive domain is divided into six categories, starting from the simplest behavior to the most complex. Learning is based on a graduated six-step process, where more basic abilities beget new, more advanced abilities: knowledge, comprehension, application, analysis, synthesis, and evaluation.

For the purposes of this chapter, all three domains in Bloom's Taxonomy of Learning are relevant to the discussion of communicative competence. Through psychomotor development, communication skills and behaviors are learned over the years. In a cognitive sense, communication is a learned behavior, something that comes about with the reception, retention, recall, and utilization of information about the communication process.

Equally important is the affective ability to appreciate the impact of our words and actions and the need to respect what others have to say and how they feel. As we now will see, Bloom's taxonomy provided the foundation for other researchers to develop their models of what it means to communicate competently.

Early Models of Communication Competence

In the late 1970s and early 1980s, many scholars sought to empirically examine communicative competence. An early study of competent and incompetent communication behavior found that people who are judged as more competent demonstrated significantly more of the following behaviors than their incompetent counterparts: affiliation/support and empathy, social relaxation, and smooth management of their interactions through the use of more management cues. Later on, researchers advanced the idea that competence not only relates to possessing the necessary skills for effectively creating and sharing meaning with others, it also is about doing so "responsibly." Thus, communication scholars introduced a previously absent "ethical" element to the discussion of competence. These researchers, notably Stephen Littlejohn and David Jabusch in 1982, proposed a theoretical model of competence with four principal components: process understanding, interpersonal sensitivity, communication skills, and ethical responsibility. The relationship to Bloom's Taxonomy of Learning is apparent. Process understanding is similar to the cognitive domain of learning, interpersonal sensitivity to the affective domain, and communication skills to the psychomotor domain.

Process Understanding

Process understanding is the extent to which one comprehends the elements of a given communicative event and reacts to them appropriately. Proper comprehension of an interaction's dynamics, according to the researchers, allows us to effectively reflect on our ability and/or willingness to participate in that interaction. Effective comprehension and reflection on an interaction in turn lead to greater behavioral flexibility, which in turn allows us to recognize and select socially appropriate behavior for the communication interaction at hand as well as for future communication events. In other words, effective understanding and evaluation of a communication situation not only provide participants with the tools they need to successfully navigate a given interaction, they also provide a template that one may call on the next time a similar situation presents itself.

Interpersonal Sensitivity

Interpersonal sensitivity refers to our ability to effectively gauge the impact of our views, opinions, feelings,

and meanings on a given communicative interaction; it also includes our sensitivity to and awareness of the views and feelings of others. Some studies have discovered that the more cognitively complex the participants of an interaction are, the more interpersonally sensitive they are likely to be. Studies also point to a relationship between interpersonal sensitivity and the ability to empathize with others, to relax in a given communication situation, to manage interactions effectively, and to choose appropriate responses to the communication behaviors of others.

Communication Skills

Communication skill is the ability to use our physical and mental faculties and previously learned conceptual frameworks about communication to move toward the accomplishment of a given objective or goal. Communication skills fall into two categories: initiating and consuming. Initiating communication skills include asking and answering questions, adapting language, and speaking in public, to name a few. Consuming skills, on the other hand, consist of activities such as active listening, reading, or overall critical evaluation skills. At the request of numerous future employers, many communication researchers and university administrators have compiled lists of communication skills and worked to develop reliable and valid methods of evaluating the presence or absence of these skills. One such illustrative list of communication competencies for all college

graduates, developed by Rubin and Morreale (1996), is presented in Table 49.1.

Ethical Responsibility

As stated earlier, this model of communicative competence was among the first to include a discussion of ethics and responsible communication. Ethical responsibility means that communicators effectively balance their goals, interests, and desires with those of others for the maximum benefit of all involved in a given interaction. Three factors determine whether a communication interaction is ethical: (1) all participants receive positive outcomes as a result of the interaction (caring), (2) enough information sharing occurs among the participants of the interaction to allow all involved to equally share “responsibility for the outcome of the transaction” (openness), and (3) the situation in which the interaction occurs has a positive impact on how one chooses to interact with others in the future (generalizability).

Using the four components just outlined, Stephen Littlejohn and David Jabusch (1982) generally defined communication competence as the ability and willingness of an individual to participate responsibly in a transaction in such a way as to maximize the outcome of shared meaning. This early model of competence played an important role in opening up a crucial dialogue about ethics and communication competence. But the discussion was far from over, with several other researchers building on and expanding understanding of what these communication scholars had begun.

<i>General Skills</i>	<i>Speaking in Public</i>	<i>Relating to Others</i>
Identify and adapt to changes in audience characteristics. Incorporate language that captures and maintains audience interest in message. Identify and manage misunderstandings. Demonstrate credibility. Demonstrate competence and comfort with information. Recognize time constraints. Manage multiple communication goals. Demonstrate attentiveness through nonverbal and verbal behaviors. Adapt messages to the demands of the situation or context.	Incorporate information from multiple sources. Use appropriate statistics. Use motivational appeals appropriate for the audience. Develop messages that influence attitudes, beliefs, and actions.	Manage and resolve group conflicts effectively. Approach and engage in conversation with new people in new settings confidently. Negotiate effectively. Be open-minded and allow for and understand different views (often referred to as perspective taking). Assert self while respecting others. Convey empathy. Understand and value differences in communication styles. Motivate others and work effectively in a team. Use methods of building group consensus. Set and manage realistic agendas. Lead meetings effectively. Understand and adapt to people from other cultures, organizations, or groups. Identify important issues/problems, draw conclusions, and understand other group members.

SOURCE: Rubin and Morreale (1996).

A Relational Competence Model

Early research into communicative competence viewed it as a quantifiable, measurable, and observable characteristic of specific human behaviors. However, another theoretical perspective eventually emerged that viewed competence as situational or state specific instead of a static characteristic or trait that an individual possesses and that can be measured. This relational perspective advanced five new assumptions about communication competence.

First and foremost, competence is contextual; you may be perceived as competent in one context but not in another. Levels of context include the type of communication that is occurring and the number of participants in the interaction (dyad, group, public speech, etc.). You may be fairly competent in a dyadic discussion with one other person but not as effective giving a public speech. Other types of context that may affect communication competence include the time, physical space, or other circumstances of the situation in which a communication event occurs. Culture and cultural differences and the degree to which we feel an affiliation with others in the setting also affect perceptions of competence, as does the status relationship of the communicators in the event.

The second assumption is that competence can be viewed in terms of the effectiveness and appropriateness of a given communication act. In other words, communication can be effective but not appropriate; or it can be appropriate but not effective. Worse yet, it can be inappropriate and ineffective. Truly competent communication is both effective and appropriate. This assumption is discussed in further detail later in this chapter, but the third assumption is that effectiveness and appropriateness exist on a continuum and are not absolute. This concept harkens back to the idea of context and that what may be appropriate or effective in one context may not be so in another.

Functionality is the basis of the fourth assumption; communication does not exist or take place for no reason. Rather, it occurs to accomplish some relational function or a desired outcome. The responses of the other participants help determine whether or not that outcome is achieved at the end of the interaction. If a communicator is unable to effectively accomplish a desired function or outcome or if the response provided bears no relation to what was communicated, then neither communicator in the interaction is considered competent.

The fifth and last assumption is that competence is an interpersonal impression based on participants' perceptions of the outcomes of a communication interaction. Different people will reach different impressions about communication, but it is the participants themselves in any relational interaction who need to decide if the interaction was competent or not. Competence cannot be ascribed to a specific communicator or communicators by a third party who had no part in the interaction.

In sum, the focus of the relational competence model is on context and outcomes as a method of evaluating

communicative competence. A communicator is relationally competent if he or she is perceived as communicating in the given context in a way that accomplishes the desired outcome, function, or purpose of communicating.

Motivation, Knowledge, Skills Model of Competence

The assumptions of the relational competence model led to the development by Brian Spitzberg (1983) of another highly respected framework for understanding communication competence. Specifically, this model holds that communication competence is constituted of three basic factors that bear direct resemblance to Littlejohn and Jabusch's components of competence and Bloom's earlier Taxonomy of Learning. Spitzberg (1983) describes competence as constituted of motivation (affect), knowledge (cognition), and skills (psychomotor abilities).

Motivation

Motivation is concerned with the reasons we choose to communicate, or not, with others. Motivation may be thought of as positive and negative. A person who possesses a positive motivation to communicate (a) makes an active effort to communicate with others and (b) engages in communication that results in positive outcomes and perceptions of the interaction for all the communicators involved. For example, naturally extroverted people have a tendency to seek others with whom to communicate and share experiences and are thus positively motivated. Someone in a sales position who completes a transaction that is mutually beneficial to all parties involved (e.g., needs/wants met and commissions paid) is positively motivated to communicate. Conversely, a person who possesses negative motivation to communicate (a) finds every reason to avoid communication with others and (b) does not communicate for the mutual benefit of others. Negative motivation typically arises from communication apprehension, poor self-esteem, a negative self-image, or negative self-talk (e.g., "No one at this party is interested in talking to me" or "I'm not good-looking enough to walk up and talk to that person"). Additionally, if someone is inclined to communicate to achieve some sort of self-serving or socially unacceptable goal, he or she is negatively motivated. Using the sales example, if someone in a sales position completes a transaction that only benefits the salesperson but offers little or no benefit to the client or customer, this person is negatively motivated to communicate.

Knowledge

Knowledge in communication guides us about what to say and do and tells us the procedures by which we can do it. We have to learn how to form and interpret cultural signs, symbols, and cues in order to effectively share meaning with others. Therefore, communication competence is partially

determined by our knowledge of not only how to communicate but also the steps necessary to communicate well in a given context. Knowledge about communication may be thought of as content or procedural. Content knowledge is what we know about communication; how to form words by speaking or writing, how to gesture, vocal control, physical proximity, and so on. Procedural knowledge comes into play the moment we find ourselves in a communication situation. If we use the correct language and gestures, maintain proper volume and pitch of our voice, and remain conscious of appropriate physical distance, we have displayed procedural knowledge of how to communicate in that situation. When viewed in terms of Bloom's taxonomy, it can be argued that content knowledge and procedural knowledge lie in the realm of psychomotor and cognitive learning. From a psychomotor perspective, we learn from our parents, teachers, and peers how to physically form words, symbols, signs, and gestures. Cognitively, we have to remember what certain words, symbols, signs, and gestures mean. Furthermore, from a cognitive perspective, procedural knowledge of how and when to use words, symbols, signs, and gestures in a particular context must be stored away for later use. Without the benefit of our content and procedural knowledge of communication, we would simply plod through life repeating the same communicative mishaps and social blunders again and again.

Skills

Skills are deliberate, repeatable, goal-oriented behaviors that manifest both one's knowledge of how to communicate and the motivation to do so. Deliberateness and repeatability are important characteristics of skill; for an action or behavior to be considered a skill, it must be performed with intent, and the communicator must be able to duplicate the action and, hopefully, its outcomes. A chef who haphazardly mixes ingredients together to create a bad-tasting confection and who cannot concoct that culinary atrocity a second or even third time would not be considered skilled in his craft. However, the gourmet who takes care to select, measure, and mix ingredients as well as arrange them in such a manner as to appeal to both the eye and the palate would indeed be considered skilled in his art.

Based on the three factors just described, Spitzberg (1983) generally defines communication competence as the use of verbal and/or nonverbal behavior to accomplish preferred outcomes in a way that is appropriate to the context, situation, and the communicators. The motivation, knowledge, skills model played and is playing an important role in contemporary discussions of communication competence, particularly because it achieves two things: (1) it seamlessly includes ethics in the discussion instead of assigning it to a separate category as did the Littlejohn and Jabusch model and (2) it shows us how to evaluate communicative competence by considering what factors constitute appropriateness and effectiveness in a particular situation.

Effective and Appropriate Communication

Spitzberg (1983) and other researchers agree that judgments about communication competence are based on perceptions of effectiveness, the extent to which communication accomplishes valued outcomes, and on appropriateness, the extent to which communication fits the given context. It is important to discuss these characteristics of competence in detail.

Effective Communication

We enter many interactions with goals in mind. Salespeople do so with the intent of generating a commission. Job hunters do so with the goal of obtaining employment. Whatever the case, an important consideration in judging the effectiveness of communication is to determine whether or not a specific goal or outcome is achieved. Did the salesperson close the sale? Did the job candidate secure employment? If the answer is yes, then we can reasonably assume that the communication probably was effective. That said, there are other considerations when evaluating the outcomes of a communicative event.

While a goal may be achieved, some outcomes may occur by complete accident rather than as a result of effective communication. The car may have been purchased simply because it was the best bargain available. The candidate may have gotten the job because all other applicants were unacceptable. So we cannot assume that effective communication is always responsible for achievement of desired outcomes. Also, while we tend to view effective communication in terms of "valued outcomes," the means through which we achieve these outcomes may not always be to our liking. A salesperson with a high level of communication apprehension may find it arduous to call people on the phone or approach them at their doorsteps. However, if the salesperson closes a sale or two and gets paid, the salesperson has created a valued outcome for himself or herself and hopefully his or her client. At the end of the day, making a judgment about communicative effectiveness is a subjective judgment that relates directly to whether the communication acts or events also are appropriate.

Appropriate Communication

As mentioned earlier in the chapter, how we evaluate communicative competence has to do with the situation or context in which the communication occurs. To say that communication is appropriate is to say that it did not violate the rules and norms of the given context. Rules are prescribed behaviors for what should or should not be done in the particular situation. Some examples of rules would be "Don't yell fire in a movie theater" or "Don't raise your voice and speak disrespectfully to the professor in class." Norms, by comparison, are recurring patterns of behavior and sets of expectations in the particular situation. The norm at a rock concert dictates that attendees will show up

in their Saturday rags instead of their Sunday best. One could elicit quite a few odd stares from other attendees by showing up in a business suit or fancy dress when everyone else is in a T-shirt and jeans. We easily can determine if we have broken a rule or violated a norm. If we have violated a norm, the worst consequence is the perplexed stares from others because of our inappropriateness. If we have violated a rule, we typically elicit a negative sanction or feedback from others, which lets us know that a rule has been broken. Sanctions can vary in severity from a polite suggestion to lower your voice in class to being asked to leave the classroom. When we encounter sanctions from others as a result of our communicative behaviors, it should be clear that our communication, in some respect, is inappropriate.

A Communication Competence Grid

Communication can be complicated, which makes it difficult to accurately categorize an event as effective and appropriate or ineffective and inappropriate. Recently, Spitzberg and other researchers (Morreale, Spitzberg, & Barge, 2006) developed a grid, which simplifies this concept visually. The grid, depicted in Figure 49.1, describes four possible types of behaviors related to effective and appropriate communication and achieving goals: (1) minimizing, (2) sufficing, (3) maximizing, and (4) optimizing.

Minimizing communication is ineffective and inappropriate; it occurs if an individual fails to attain a goal and elicits a negative sanction from others, which is completely incompetent. For example, a manager who yells at and berates his employees may see a reduction in productivity and may even be reported to upper management for his tirades. He accomplishes little and may evoke sanctions in the form of a reprimand.

Sufficing means that an individual's communication is appropriate but ineffective, so it is partially competent. No rules or norms are violated, but no goals are attained, and the communication serves no function. A businessperson who puts on a nice suit and attends a networking event

with the local chamber of commerce may meet all the expectations for appearance, but if personal reticence prevents the person from making any new contacts, the purpose of attending the event is negated.

Maximizing communication is effective but inappropriate or, again, partially competent. This type of communication occurs when your own goals are accomplished but without concern for the goals, feelings, or beliefs of others. An example would be the salesperson who generates more commissions by going behind coworkers' backs and stealing their clients. The short-term gain is a larger paycheck, but the long-term impact is the loss of friendships, mistrust, and a reputation for deviousness that may have a negative effect on the salesperson's career.

Optimizing communication is effective and appropriate, so it is highly competent. When communication is optimized, an individual's goals are attained in a manner appropriate to the context and not at the expense of others. The salesperson who sells a product or provides a solution to a client with the firm belief that it will benefit the customer is optimizing. The salesperson has met the goal of generating a commission, the customer's needs and wants have been satisfied, and all this was accomplished in the most appropriate manner possible.

This grid is a useful tool in helping us determine a communicator's competence, but it bears noting that this grid is not an end-all method for evaluating competence; rather, it is but one more way to think about the nature of communication competence. It also is important to realize that as much as we might strive to optimize our communication, the context sometimes dictates that we must merely suffice. Ultimately, communication competence comes from a balance of appropriateness and effectiveness, which in turn comes about from honest and accurate self-reflection about our own communication competence or incompetence.

Comparing Competence and Incompetence

Early research into communication competence seemed to suggest that competence is simply possessing and using more of the effective communication skills than a less competent person. However, researchers more recently are thinking about competence and incompetence in other ways. Is incompetence just a lack of competent communication behaviors and skills, or is there a darker side to incompetence? As we think about the competence of ourselves and others, there are several important distinctions to keep in mind, which have ramifications for evaluating communication competence. What follows is a discussion of these comparisons and distinctions.

Competence Versus Proficiency

First and foremost, it is important to draw a clear distinction between communication competence and proficiency. While a proficient communicator possesses critical communication skills and knowledge, by comparison, a

Figure 49.1 A Communication Competence Grid

SOURCE: Morreale, Spitzberg, and Barge (2006).

competent communicator also is motivated to use those skills and knowledge to achieve desired outcomes in an appropriate manner for the situation. This distinction is especially important in terms of evaluating competence in communication. In point of fact, many schools and communication instructors face mounting pressure to provide proof of their students' competence in a variety of given settings including, but not limited to, public speaking, group/team communication, interpersonal communication, and written communication. However, any method or model that purports to effectively evaluate a person's competency based only on communicative skills or knowledge of communication is only assessing proficiency. A comprehensive evaluation of competence should assess knowledge, skills, and motivation. When we also consider an individual's motivation to communicate, we obtain a clear picture of a person's communication competence and potential to optimize communication appropriately and effectively.

Ends Versus Means

When making any attempt to evaluate communicative competence, another good start point is an evaluation of how the ends or goals of the communicative event were achieved. We need to judge our competence and that of others through an examination, at the conclusion of the encounter, of the means through which the ends or goals were reached or achieved. For example, if a salesperson uses deceitful persuasive strategies to entice a customer to buy a product or if a political leader uses biased evidence to promote a new program, we would not categorize these individuals as competent. These individuals are incompetent because they used their motivation, knowledge, and skills effectively but toward a socially undesirable and inappropriate end. If any of the participants walks away from a communication interaction with a negative impression of the event, it is safe to assume that one or more of the participants did not communicate competently and perhaps used inappropriate communicative means or methods to accomplish their goals.

Incompetence Versus the Dark Side of Competence

To clarify further, some researchers do view incompetence simply as a lack of competence, a state of affairs wherein a communicator does not possess the necessary motivation, knowledge, and skills to communicate competently. This mode of thinking also permits us to categorize, as incompetent, those who lack one or more of the three components of competence. In contrast to viewing incompetence as a lack of motivation, knowledge, and skills, more recently, other scholars have identified what they call "the dark side of competence." They point to the use of

Figure 49.2 A Communication Competence Continuum

communication to achieve dark or undesirable ends, citing examples such as sexual predators or the salesperson or political leader just discussed in the previous section. These individuals possess the necessary motivation, knowledge, and skills to communicate effectively; but they repeatedly use their knowledge and skills to accomplish goals deemed inappropriate or even reprehensible by society.

The continuum of communication competence presented in Figure 49.2 simplifies this notion visually and suggests a need to think more about what ethical communication is and how it works.

Ethics and Communication Competence

Exploration of the dark side of communication suggests a need to more closely examine one of the most important factors in judging true communication competence. As discussed earlier, the concept of ethics entered contemporary discourse regarding competence within the past 20 or so years. Prior to that time, the focus of communication scholars was on whether or not a person possesses the psychomotor, cognitive, and affective abilities to "speak well." But, as Cicero so aptly put it, competent communication must be about a "good man speaking well." To be a good person speaking well suggests that good character is relevant to communication competence. What follows is a discussion of how ethics affects our communication behaviors and our interactions with others.

Self-Interest Versus the Interests of Others

Earlier in the chapter, an imperative of competence was described as the balance of appropriateness and effectiveness. We defined effectiveness as attaining a specified goal or outcome through communication. Competent and ethical communicators accomplish their own goals and serve their own interests while fully respecting the goals, needs, and interests of all those involved in or affected by the communication event. The ability and willingness to balance self-interest and the interests of others is one ethical dimension of competence.

When choosing to engage in communication, it is important to examine our motivation to do so because our motives often affect how we choose to achieve the goals. At times, our motives may cause us to forget to strike a

balance between our own interests and those of others. Recall the earlier discussion of maximizing versus optimizing communication. Those who engage in maximizing communication achieve their goals and desires at the expense of the interests of others and thus are only partially competent. Those who engage in optimizing communication, which is truly competent, achieve their goals as well as those of others. Interestingly, researchers have found that people tend to judge the communicative competence of others not only by how well they communicate but also by whether they are respectful of the other person's goals. This is not to say that we should be completely selfless in our interactions with others, but it is a fair assumption that we should not be completely self-centered either.

Information Sharing Versus Manipulation

As we consider the balance between self-interest and the interests of others, we often find ourselves in a quandary as to what and how much information to share with others. The ability and willingness to share information appropriately with others is another critical ethical dimension of competence. When we maximize and choose to disclose information very selectively with others in an effort to attain only our goals, we are not engaging in ethical or competent communication. When we disclose information to others in an effort to deceive them and lead them to believe that their goals will be met, we are manipulating information. Manipulative communication appears to be optimizing and concerned for the goals of all those involved; in fact, it is actually maximizing and only serves our self-interests. A sexual predator who uses verbal language and nonverbal cues to deceive and lure a child into an inappropriate encounter is a prime example of manipulative communication behavior. While the stated need of the adult and child may be "friendship," the pedophile has only one goal in mind, a goal, that if attained, can only be to the detriment of the child. This is an extreme example but one that serves to drive the point home. A competent communicator must be cognizant of whether or not his or her actions in a communication event in fact are for the benefit of all involved.

To summarize and clarify, ethical communication means sharing sufficient and appropriate information with other people so that they can make fully informed choices about any matters of significance or consequence to themselves.

Consequences of Communication Competence

All participants in any communication interaction must accept responsibility for the consequences (and rewards) that may come about as the result of the interaction. The consequences or effects of any communicative act may be short-term and only affect the specific situation in which

you find yourself. Or the impact may be long-term and have a permanent effect on one or more relationships.

Short-Term Effects in Specific Situations

The outcomes and effects of any communication interaction are often the best indicator of how competently the participants communicated in a specific situation. However, we are not always mindful of the impact of short-term effects of communication competence on our interactions with others. It is said that the spoken word, once spoken, cannot be taken back. Therefore, attention to competence, to both effectiveness and appropriateness, is called for in all communication situations. Communication competence is the primary determinant of whether you optimize positive outcomes and experience positive short-term effects in any interaction or relationship.

That said, in our earlier discussion of appropriate and effective communication, we noted that circumstances sometimes dictate that optimized communication is not always possible. There are times when the situation is so awkward, the people so in disagreement, the context so stifling, that we must settle for an outcome that is short of optimum results. A significant part of competence is recognizing opportunities to optimize but also recognizing when a situation is unworkable. In those situations, thinking in terms of long-term effects and possibilities is better advised.

Long-Term Effects Within and Across Time and Relationships

Relationships are built slowly over time, and each communication interaction makes a positive or negative contribution to the strength of a relationship. Communication competence, or the lack thereof, can have a profound impact on the quality of our relationships over time and on how others perceive us. However, we rarely enter communication situations thinking about the long-term impact of our communication motivation, knowledge, and skills on others and on our relationships, personal or professional. While the old adage "You never get a second chance to make a first impression" holds true for new relationships, incompetence or a lack of communication competence will prove more detrimental to long-term relationships than anything else.

There are many factors that can influence how competently we communicate in relationships and how others perceive our communicative competence. Our levels of relaxation, our ability to empathize, and our ability to adapt quickly to a situation all have an effect. More specifically, researchers recently found that the more complex the messages you convey, the higher your perceived level of competence. This is not to say that employing a thick, multisyllabic vocabulary in all our conversations will ensure that others perceive us as competent; but effectively

relating and discussing complex concepts, problems, and solutions with others is an important relational skill. Additionally, it takes a certain degree of motivation and communicative awareness to be able to consider the other person's point of view and then communicate in the best interest of the relationship. Researchers have found that the more our goals appear to align with the goals of our relational partners, the more competent a communicator others perceive us to be. While these are but a few of the communication behaviors that characterize competent communication, they should serve to illustrate the potential long-term consequences of competent communication on relationships over time.

Conclusion and Future Directions

This chapter calls attention to the various theories and models of communication competence that have evolved over time. The history of the study of competent communication dates back many centuries to the early Greek and Roman philosophers. More recent theoretical models of communication competence appear to have their foundation in Benjamin Bloom's 1956 Taxonomy of Learning, which says that human learning occurs in the psychomotor, affective, and cognitive domains. For example, Stephen Littlejohn and David Jabusch proposed a theoretical model of communication competence with four principal components: process understanding, interpersonal sensitivity, communication skills, and ethical responsibility.

Several years later, other researchers developed lists of communication competencies for college graduates, and a model of relational competence emerged that viewed competence as more situational or state specific. These scholars advanced several new assumptions about communication competence. Competence is contextual, and it should be viewed in terms of effectiveness and appropriateness. Effectiveness and appropriateness exist on a continuum. Functionality is an important aspect of competence because communication does not exist or take place for no reason. Finally, competence is an interpersonal impression based on people's perceptions of the outcomes of a communication interaction. Brian Spitzberg used these assumptions to develop a model of communication competence that is constituted of motivation (affect), knowledge (cognition), and skills (psychomotor abilities).

Spitzberg and other contemporary researchers agree that perceptions of communication competence are based on effectiveness, the extent to which communication accomplishes valued outcomes; and on appropriateness, the extent to which communication fits the given context. Effective and appropriate communication may be understood based on four types of goal-oriented communication behavior. Minimizing communication is ineffective and inappropriate. Sufficing is appropriate but ineffective so it is partially competent.

Maximizing is effective but inappropriate so it also is partially competent. Optimizing communication is effective and appropriate so it is completely competent.

More recently, scholars have begun to compare and draw distinctions between competent and incompetent communication. For example, a proficient communicator possesses the needed communication skills and knowledge but, by comparison, a competent communicator also is motivated to use those skills and knowledge to achieve desired outcomes. Another important distinction, when comparing competence and incompetence, is to examine the means through which the ends are reached. When people use inappropriate means or communication methods to achieve their goals, then that communication is not considered competent. Finally, while incompetence may be viewed simply as a lack of competence, there also is a dark side to competence. When people use their knowledge and skills to accomplish goals deemed inappropriate or undesirable by society, that communication is not considered competent.

Thinking about incompetent communication suggests a need to consider ethics and communication competence. Competent communicators serve their own self-interest while fully respecting the needs and interests of others. They share sufficient and appropriate information with others so that those others can make fully informed choices about matters of significance or consequence to themselves. Communication competence is the primary determinant of whether you optimize positive outcomes and enjoy positive short-term effects in any relationship or interaction. Similarly, communication competence, or the lack thereof, can have a profound impact on the quality of relationships over time and on the way people interact and perceive one another.

Over time, communication scholars and researchers have gained great insight into the nature of communication competence. As these scholars look to the future, the changing nature of communication in the 21st century is taking on greater importance. The impact of technology and of globalization on how people communicate in contemporary society is being taken into account and is informing the development of new communication theories and models. Some scholars, for example, are advancing models of computer-mediated competence. Others are discussing the impact of increased diversity on communication in a global economy.

Indeed, humans are communicating using forms of technology that earlier researchers never imagined. We now need to consider what communication competence means when we are communicating using cell phones, e-mail, blogs, and video conferences. Do the earlier models of communication competence still apply, or do they need to be reconsidered in our technologically driven and highly diverse global communities? Do they satisfactorily explain our capacity to use technology to communicate instantly across countries, around the globe, and with people very unlike ourselves? These and other questions need to be raised and addressed as

we move with greater rapidity than anyone ever imagined into the communication world of the 21st century.

UNWANTED COMMUNICATION, AGGRESSION, AND ABUSE

BRIAN H. SPITZBERG

San Diego State University

WILLIAM R. CUPACH

Illinois State University

Like many species, humans have an innate need to belong, to feel attached, to feel a sense of intimacy, and to achieve a sense of identification and communion with others. Such a need would have evolved to serve important adaptive survival values, including (a) organizing and acting in groups, (b) selecting and courting potential mates, and (c) maintaining family bonds in the process of raising children. In the larger context within which these processes of human communication evolved, two underlying functions emerged: power and affiliation. All acts of communication implicitly or explicitly seek to influence or respond to attempts to influence and seek affiliation or disaffiliation from others. In the process of influencing and being influenced, affiliating and disaffiliating with others, communication can become abusive. This chapter examines the various ways in which communication distorts or exploits basic human functioning. Specifically, this chapter reviews forms of communication that are typically unwanted in normal relationships, with special attention to processes of relationship communication that become obsessive, harassing, and threatening in their pursuit of intimacy.

Terminology

A few terms need to be clarified before proceeding. The term *communicative aggression* will be used to refer to messages that function to diminish a person's preferred identity. When communicative aggression occurs over an extended period of time, it becomes a form of communicative abuse. Both the act or event of communicative aggression and its more extended pattern of use are typically encompassed by the term *psychological abuse*, which is commonly used in social psychology to refer to many of the communicative processes and messages that are the concern of this chapter.

When communication is employed in a campaign to achieve greater intimacy than the recipient of that attention prefers, it becomes a form of obsessive relational intrusion (ORI), which is a persistent pattern of unwanted harassment and violation of a person's sense of symbolic or physical privacy. When this type of pursuit becomes threatening or elicits fear in the recipient or target of attentions, it becomes stalking. Not all stalking is a form of ORI, and not all ORI is a form of stalking. Some stalkers have no interest in developing an intimate relationship with the person

being pursued, and some ORI is merely bothersome or frustrating rather than fear inducing. Nevertheless, research indicates that most stalking emerges from prior relationships, the majority of which were romantic in nature, and that most ORI is at least moderately threatening (see Cupach & Spitzberg, 2004; Spitzberg & Cupach, 2007b).

Some time ago, Noam Chomsky demonstrated that although there are a finite number of words in a given language, there are an infinite number of sentences that can be created from those words. Consider the following sequence of creative additions: “You are crazy!” “You are crazy as a loon!” “You are crazy as a loon on drugs!” “You are crazy as a loon on drugs after a long migration!” “You are crazy as a loon on drugs after a long migration and constant pecking by siblings!” And the possibilities continue ad infinitum. So it is with communicative aggression and abuse. People may have a limited number of actions and words available in their repertoire of behaviors, but these actions and words permit an infinite number of ways of offending, exploiting, antagonizing, and hurting others. Thus, there is no way to entirely review all the ways in which communication can be used in aggressive, abusive, or unwanted ways, but it should be possible to identify core types of unwanted communication.

Interest in communicative aggression and abuse has spanned millennia, but as a scholarly topic, interest has been quite recent. In the first half of the 20th century, Sigmund Freud and other psychiatrists (e.g., Harry Stack Sullivan, Karen Horney) interested in the neuroses of everyday behavior as well as the deeper motives of human evil pursued such topics from primarily psychological perspectives. Émile Durkheim and other more sociologically minded scholars were more interested in how contemporary societal structures and processes could communicate alienation and create a sense of personal meaninglessness for the individual. By the second half of the 20th century, the scholarly landscape had broadened, with scholars such as Erich Fromm (1992) attempting to explain *The Anatomy of Human Destructiveness* and Erving Goffman (1963) describing the social processes by which people created conditions of stigma for others. Scholars in the emerging field of social psychology were studying processes of coercion (Stanley Milgram, *Obedience to Authority*, 1983; Philip Zimbardo, *The Lucifer Effect*, 2007), whereas clinical psychologists were beginning to view mental illness through the lens of disturbed communication (Jurgen Ruesch, *Disturbed Communication*, 1972; Paul Watzlawick, Janet Beavin, Don Jackson, *Pragmatics of Human Communication: A Study of Interactional Patterns, Pathologies, and Paradoxes*, 1967). It was out of this nexus that scholars in the field of communication began studying *communication competence*, which naturally requires attention to distortions and failures of communication.

In the latter decades of the 20th century, and now in the beginning of the 21st century, interest in the various ways in which communication can be aggressive and abusive is interdisciplinary, multimethodological, and vibrant. Active scholarly research programs have emerged in the study of a host of topics, including anger, bad conversations, betrayal, breaches of propriety, bullying, codependence, complaining and criticizing, cyber stalking, deception, deviance, disaffinity and distancing, discouragements, disrespect, double binds, embarrassment induction, gossiping, guilt induction, hurtful messages, incivility, indirect aggression, infidelity, Internet pathology, intimate violence, irritations, jealousy expression, jealousy induction, narcissism, negative affect expression, paradox, privacy violations, profanity, social hassles, social rejection and ostracism, revenge, secrecy, sexual aggression, sexual harassment, social stressors, strategic ambiguity, teasing, threats, unrequited love, and a host of other forms of interpersonal unpleasantness. Such work has been investigated under the terms of the dark side, aversive interpersonal behaviors, counterproductive behavior, inappropriate relationships, difficult relationships, problematic relationships, and just plain behaving badly (see Fox & Spector, 2005; Fritz & Omdahl, 2006; Goodwin & Cramer, 2002; Griffin & O’Leary-Kelly, 2004; Kirkpatrick, Duck, & Foley, 2006; Kowalski, 1997, 2001; Rancer & Avtgis, 2006; Spitzberg & Cupach, 1998, 2007a). The work and topics have been far too diverse, and the research still too much in its infancy, to identify organizing theories. There are, however, a number of theoretical themes that run through most of these lines of research.

Importance

The old saying that “sticks and stones may break my bones, but names can never hurt me” appears to be in error. Research is beginning to reveal that when physical violence in intimate contexts is nonlethal, it tends to have less damaging effects on victims’ quality of life than communicative aggression (Dailey, Lee, & Spitzberg, 2007). The need to belong, to establish a satisfactory identity, and the basic need for self-esteem are all strong psychological drives, but they are also almost entirely subjective and social in nature. That is, almost everything people value about their lives is defined by social interactions rather than objective achievements. Status, attractiveness, intimacy, family, power, freedom, and so forth are all deeply embedded in sociocultural conceptions of value. Achieving a well-paying executive job is important to one person, whereas working for a non-profit organization helping people in need is important to another person. Achieving fame is important for one person, whereas working behind the scenes in relative obscurity better suits other persons. Such values are developed

through a lifetime of interactions with others, through which the views and values of others are taken into account in establishing a personal sense of achievement. In this context, therefore, when someone is neglected, ignored, insulted, criticized, yelled at, or the target of another person's communicative aggressions, the hurt can be more encompassing, more durable, and harder to ignore than a slap, push, shove, kick, or hit. People learn that bruises heal, but they have no first-aid kit for injuries to their egos. Society has never equipped people with simple treatments for being unloved, loved too much, or despised.

Just because communicative aggression and abuse may generally be more hurtful than physical violence, it is important not to diminish the importance of understanding both. Physical violence is a type of communication, and research indicates that when physical aggression occurs, verbal aggression almost always occurs with it (Dailey et al., 2007). The potential harms of physical violence are too often severe, including injuries and homicide. Substantial percentages of people in general, and college students in particular, experience both violence and communicative aggression in their relationships, and the effects of both are clearly harmful to many of those experiencing these forms of aggression (Coker, Smith, McKeown, & King, 2000; Cupach & Spitzberg, 2004). Communicative aggression may be a process that escalates to physical violence; reinforces physical violence; or in some relationships, substitutes for physical violence. If these processes of aggression, abuse, and unwanted communication are to be understood, an understanding of theory is in order.

Theory

Many theories of human communication began with an interest in describing, explaining, and prescribing ideal forms of communication. Since the 1920s, there has been interest in developing models and measures of human communication competence that would parallel theories and methods in intelligence. That is, if the intelligence quotient (IQ) can be conceptualized and reliably measured, then perhaps there is a similar form of social intelligence or traitlike ability to manage interpersonal relations satisfactorily. Models of emotional intelligence and multiple intelligences continue to interest scholars, educators, and organizational consultants alike. Throughout a century of attempting to conceptualize social and interpersonal competence, however, there were shades of interest in the darker side of social relations. Abnormal psychology, the sociology of deviance and conflict, and the study of failed rhetorical events and campaigns revealed an ongoing interest in the failures and fallibilities of competence. Theorists eventually began to change their questions from "Why does communication fail?" to "Is there something fundamental to human nature about the darker sides of communication in social relations?" By

shifting the question from thinking of aggression and abuse as failures of a normally functional process to thinking of them as serving some form of essential functions in social relations, scholars began to ponder the role of the darker sides of human nature (e.g., Miller, 1999).

At least two theoretical premises emerge as the study of communicative aggression and abuse has progressed. First, aggression, abuse, and unwanted communication tend to reflect a disjunctive goal structure. All communicators have goals for their behavior, even though these goals may be more or less conscious, more or less important, more or less prioritized, and so on. Goals are the objectives or ends that are sought through behavior. When communicators interact with one another, they may have conjunctive (i.e., compatible) or disjunctive (i.e., incompatible) goals. In a situation of unrequited love, for example, a would-be lover seeks the reciprocal affection of another person. But the fact that the love is unrequited (i.e., unreciprocated) means that these two people are seeking incompatible ends of their interaction—one seeks love, the other seeks something else (e.g., to be left alone by the pursuer, to "just be friends," etc.). When these communicators pattern their behavior toward these goals, it can be considered a type of structure. Thus, the pursuer will engage in patterns of behavior devoted to gaining the other person's attention and affection (e.g., sending notes, gifts, e-mails, instant messages, etc.), and when the other person devotes behavior to avoiding or rejecting such attentions, these behavior patterns reveal a disjunctive structure. Although most theories of competent communication have emphasized the achievement of compatible goal states through communication, the study of conflict, aggression, and abuse have had to develop theories of incompatible goal structures and processes.

In examining the disjunctive nature of communicative aggression and unwanted communication, two somewhat distinct goal structures emerge. Communicative aggression often takes on the disjunctive goal of one person seeking to harm the other against the other's preferences, whereas unwanted communication often takes on the disjunctive goal of one person seeking to elicit affection from the other person against the other person's preferences. Yet aggressive communication can end up serving both goal situations. A rejected lover may use aggressive communication to try and motivate the other person to pay attention, to reconsider, to reevaluate the costs and benefits of returning to the relationship, and so on. In other cases, however, aggressive communication is primarily used to exact retribution, for revenge, or to displace the aggressor's sense of frustration, anger, or rage.

A second premise to emerge from the study of aggression, abuse, and unwanted communication is that aggression is multiply determined. The traditional theoretical divide has been between nature and nurture. Theoretical approaches that explain aggression as a product of nature tend to attribute it to (a) evolution and genetics or (b) general personality disorders or traits.

Socio-evolutionary theories argue that across thousands of generations of human interaction, aggression became a type of behavior that in certain contexts provided some survival or mating advantage over competitors. Over time, those who could competently engage in forms of aggression would experience a differential advantage in passing their genes onto the next generation, and these behaviors and traits would become more “hardwired” in the subsequent generations. From this perspective, aggression is simply one of many tactics and dispositions that collectively comprise a repertoire of resources that humans may select and use as circumstances dictate. Those with broader repertoires, and with repertoires that included aggressive tactics, would have a survival advantage over those with smaller nonaggressive repertoires, and over time these repertoires would become part of the inherited predispositions of offspring.

Personality traits are dispositions or tendencies to perceive and behave in certain characteristic ways. Personality disorders represent maladjusted traits or dysfunctional organizations of a person’s development and perception. There are many approaches to personality, but most accept that there are certain traits that tend more toward aggressive or dependent tendencies, either one of which could be the source of communicative aggression or unwanted communication. Some people are simply more easily angered, more contentious or ill-tempered, more unstable in their mood, more insecure about how others view them, more desperate in their need for others’ approval, or more grandiose in their opinion of their own superiority to others. Such people are more sensitive to implicit or explicit criticism and more likely to strike out at others who they perceive as insulting, or persistently pursue relationships with people they perceive as important to their identity.

Nurture approaches tend to locate the source of aggression and unwanted communication in (a) childhood attachment experiences or (b) specific contexts that people experience. Aggression and unwanted communication are viewed as products of ongoing social experiences rather than the dispositions with which someone is born.

Attachment theories claim that the innate need for affection in infants can be responded to in various ways by caregivers. A caregiver who is consistent, generally available, and positively responsive to an infant will tend to reinforce a healthy expectation in the infant that social relations are sources of positive experience. In contrast, caregivers who are inconsistent, often unavailable, and sometimes negative or punishing in their reactions to an infant will tend to reinforce expectations that attachment figures cannot be relied on or may be unpleasant. These expectations form mental models, or schemas, which over time organize the developing child’s assumptions about social relations. Securely attached children tend to develop healthy and competent perspectives toward personal relationships, whereas insecurely attached children tend to

become dismissive of relationships (i.e., liking oneself but not others and thus not being particularly interested in developing intimacy with others), fearful (i.e., liking neither oneself nor others and thus experiencing anxiety in social relations), or preoccupied (i.e., liking others but not oneself and thus desperately seeking intimacy with others). Insecurely attached persons are most likely to develop personal dispositions that devalue or aggress against others or that result in patterns of pursuit that may be unwanted by the other person.

Contextual theories tend to locate aggression and unwanted communication in the particular intersections of recent experiences. For example, interpersonal aggression is often a reaction to situational stresses or provocations, an outgrowth of escalating conflict with another person, or exaggerated by the consumption of alcohol or drugs. Celebrities receive more unwanted attention from fans in part because they are in more contexts in which others may fixate on or develop a sense of attachment to them. Counselors, doctors, nurses, and teachers may face a greater risk of being the target of unwanted affections by the nature of their work contexts, in which they are in a helping and high-status role in relation to large numbers of diverse people. Thus, aggression and unwanted communication may not reflect personal dispositions per se but merely greater exposure to factors and opportunities that increase the likelihood of experiencing these communicative processes.

Almost all theorists understand that communicative aggression, abuse, and unwanted communication are determined by many of these sources of nature and nurture. For example, communicative aggression is likely to emerge from a combination of personal dispositions and contextual factors. A dismissive attached person, with a genetic disposition to be more aggressive, and who is under a lot of stress at work or school, is more likely to respond to a conflict encounter with a partner with aggressive behavior than a securely attached person with more affiliative genetic dispositions and whose work and social life are going smoothly.

An example of a theory that incorporates multiple determinants of unwanted communication is the relational goal pursuit theory proposed by Cupach and Spitzberg (2004). In general, the effort one exerts in pursuing any particular goal is a function of how much one sees the goal as desirable and attainable. Goals that lack worth, require inordinate effort, or seem unachievable are usually abandoned in favor of alternative goals. According to relational goal pursuit theory, desired relationships represent one type of goal. Thus, people pursue particular relationships insofar as they are perceived to be valuable and attainable. If the cost or effort to obtain a relationship exceeds its value or if the relationship is perceived to be out of reach, then it is no longer pursued. Obsessive relational pursuers, however, persist in their pursuit of an unrealistic relational goal. This occurs because the relationship pursuer links the

goal of having a particular relationship with other, more abstract and supremely important goals, such as self-worth and life satisfaction. In other words, the obsessive pursuer comes to believe that attainment of the relational goal is absolutely essential to the fulfillment of higher-order goals that cannot be abandoned or substituted. Statements such as “I can’t imagine life without you,” “I have to have you,” “You are the only one for me,” and “We were fated to be together” illustrate the linkage of a particular relational goal with higher-order goals. The obsessive pursuer thus exaggerates the value of the desired relationship and rationalizes that it is obtainable, even in the face of repeated rejection. This leads to persistent and excessive pursuit of the relational goal (i.e., escalated activities of flirtation, courtship, and attempts at establishing intimacy). When the desired person rejects such pursuit, it creates frustration and arousal, which fuel a process of uncontrollable obsessive thinking called rumination. The rejected would-be lover ruminates about the desired partner, the importance of the sought-after relationship, and the dire consequences of failing to achieve the relational goal. Paradoxically, these obsessive thoughts reinforce the importance of the relational goal and further motivate persistence in its pursuit. The ongoing frustration of the goal also develops complex pathways to ironic feelings of love and hate, desire and anger. Out of this ambivalent mix of emotions, would-be lovers often lose sight of normal boundaries of appropriate behavior and engage in a campaign of obsessive relational intrusion, in which both messages of abuse and messages of affection commingle.

Theories of communicative aggression tend to emphasize nature or nurture, individual or context. Scholars are recognizing increasingly that a full account of such unwanted forms of communication will have to draw from multiple theoretical perspectives and causes (Stith, Smith, Penn, Ward, & Tritt, 2004). There is nothing fundamentally incompatible between attachment theory and relational goal pursuit theory or socioevolutionary theory and personality theory. How communicative aggression is conceptualized, however, determines the methods selected for testing such theories.

Methods

Ethical concerns with communication and research prohibit efforts to study aggressive and unwanted communication by exposing people extensively to such harmful activities or by experimentally inducing them to engage in such activities toward others. Research consequently has tended to use less direct research methods. Most methods fall broadly into one of four categories: (1) qualitative/interview, (2) records/artifact review, (3) quantitative self-report, and (4) meta-analysis.

Qualitative and interview methods engage in a process of asking relatively open-ended questions of people and permitting those people to construct their answers as they

see fit. When applied to the study of aggression, these methods are often employed with people who are already understood as experienced in the process of aggression. For example, interviews with women at battered women’s shelters, with women seeking a protective order, with couples seeking marital counseling, or with men convicted of domestic violence would all exemplify these types of research methods. Given the broad-ranging types of responses resulting from such interviews, researchers have to engage in extensive processes of interpretation in order to bring coherence to the information. In this interpretive process, researchers may bring their own personal experiences to bear and may rely on any or all prior theories and research to identify the most relevant themes in the responses of the interviewees.

People often leave or provide information about themselves in various forms in their natural everyday activities. These artifacts often take the form of records of their information collected for another purpose. Studies of case records make use of information gathered for different reasons than the study at hand. For example, hospital records may be studied to see what kinds of injuries patients present when they enter emergency rooms, or police records might be studied to see what complainants report about their partner’s behavior. Such records offer valuable insights in part because they are recorded by trained professionals, but they often are also challenging because they tend not to record information in precisely the way the researcher would most prefer.

Quantitative self-report methods by far represent the most common social scientific approach to studying communicative aggression and abuse. In this method, a set of statements, or items, is developed, usually based on prior research, both quantitative and qualitative. These statements are presented to people who make judgments such as how often they have experienced or engaged in various behaviors (e.g., “I called my partner a dirty name,” “My partner criticized me for no reason,” etc.) or the extent to which they agree or disagree with a statement (e.g., “I am intolerant of criticism,” “My partner doesn’t respect me”). Because the response scales correspond to numbers (e.g., 1 = *strongly disagree*, 2 = *mildly disagree*, 3 = *undecided*, 4 = *mildly agree*, 5 = *strongly agree*), these items can be analyzed quantitatively, and the entire toolbox of statistical analyses can be used to identify which sets of items combine in ways that inform the researcher about the process being studied. Self-report methods permit not only the study of personality and personal characteristics but also perceptions of behavioral processes. Such reports, however, are subject to perceptual biases of the informant (e.g., downplaying one’s own antisocial behavior) and distortions that attend the retrospective recall of events.

After years of social scientific research has been conducted in a given topic area, it is often possible to conduct a meta-analysis, which is simply a way of combining research results across multiple studies. These multiple

studies are typically conducted by many different researchers, investigating somewhat different research questions, using somewhat different questions or methods and different populations of people. For example, one researcher may ask respondents how often they “have been called persistently” by an ex-partner, whereas another researcher may ask how often respondents “were called and faxed constantly” by an ex-partner. The wording of these items in these two studies is different, but clearly they are getting at much the same type of persistent pursuit, so a meta-analysis might categorize the percentages of respondents who answered both as “persistent phoning/faxing” and be able to generate a more reliable estimate because the results of multiple studies were combined.

Applications

The applications of methods such as these have yielded valuable information about the processes of communicative aggression, abuse, and unwanted communication. Research has largely examined four types of questions: (1) What types of aggression occur, (2) to whom and to what extent, (3) with what effects, and (4) with what responses by those aggressed against?

What Types of Aggression Occur?

There have been hundreds of studies on the topic, but research has begun to develop more comprehensive approaches that stand a chance to address what types of communicative aggression occur. For example, using a combination of methods, psychologists have identified 17 microlevel types of psychological abuse: threats/intimidation, destabilizing the person’s perception of reality, isolation/monopolization, treatment as inferior, establishing power through refusals, verbal abuse/criticism, jealousy/suspicion, monitoring/checking, rigid gender roles, control over personal behavior, withholding emotionally/physically, public embarrassment/humiliation, emotionally wounding behavior regarding infidelity, lying/deception, guilt induction/blaming, manipulation, and attacking a person’s looks/sexuality (Follingstad, Coyne, & Gambone, 2005). These types of aggression, in turn, were found to represent five more macrolevel types of abuse: threats to physical health (e.g., intimidate, harass), control of freedom (e.g., isolate, restrict movement), general destabilization (e.g., humiliate, criticism), domination/control (e.g., economic restriction, jealousy/suspicion), and ineptitude (e.g., blackmail, role failure).

A second program of research by communication scholars (Dailey et al., 2007) developed an extensive list of potentially microlevel aggressive forms of communication, which they found clustered into 11 more macrolevel forms: verbal aggression (e.g., screams for no reason, offensive tone of voice), freedom restriction (e.g., checks up on me, invades my privacy), risk taking (e.g., openly flirts with others, engages in offensive or illegal acts),

degrading dominance (e.g., forces me to do things, treats me like a personal servant), threatening valued resources (e.g., denies me money, threatens family or friends), isolation (e.g., isolates me from friends or family, turns my social network against me), humiliation (e.g., spreads stories about me, insults me in front of others), insecurity induction (e.g., threatens to have an affair, threatens to leave me), withdrawal (e.g., does not respond to my statements, withholds affection), name calling (e.g., uses profanity when referring to me, calls me negative names), and dominance (e.g., dominates decisions, controls who I see or talk to). These programs of research, from different disciplines and using somewhat different methodologies, have revealed both complexity and some coherence in the study of verbal aggression. There clearly is considerable overlap across the two programs. It is also clear that there is a broad array of tactics and strategies available for aggressing against a person.

Sometimes, however, the goal *per se* is not to aggress or harm another person but to gain that person’s attentions or affections. Using meta-analytic methods of combining results across studies representing all four types of methods discussed above, Cupach and Spitzberg (2004; Spitzberg & Cupach, 2007b) have identified eight macrolevel clusters of behaviors that individuals employ to obsessively pursue a relationship that is unwanted by the object of pursuit. Hyperintimacy tactics represent excessive forms of flirtation and courtship, including forms of expressing affection (e.g., notes disclosing love or attraction), ingratiation (e.g., constant compliments), escalation or relationship repair bids (e.g., promising to reform), and hypersexual messages (e.g., talking “dirty” to the person). Mediated contacts represent efforts to contact a person through various communication media, including landline telephones, cellular telephones, instant messaging, faxes, e-mail, and so forth. Interactional contacts are either direct or indirect tactics directed toward establishing opportunities for interaction or conversation. Direct interactional contacts involve face-to-face conversation, approaching the person in public or private places, showing up at a place the other person is at, intruding into ongoing conversations, invading personal space, and joining activities the other person is engaged in. Indirect interactional contacts involve friends, family, coworkers, or even professional third parties to assist in pursuing contact with or harassment of the other person.

Surveillance involves a variety of behaviors directed toward keeping tabs on someone, including synchronizing activities (e.g., coordinating schedules or group activities to be in the same place as the person being pursued), loitering (e.g., hanging out at a place the other person tends to occupy), surveillance or watching (e.g., voyeurism), following (e.g., keeping an eye on the person while moving about), and drive-bys (e.g., driving or parking by the person’s home). Invasion tactics involve violations of the person’s property or privacy boundaries, including information theft (e.g., stealing a diary or a cellular telephone

directory), property theft (e.g., stealing possessions such as underwear or pictures), property invasion (e.g., breaking and entering the other person's home), and exotic forms of surveillance (e.g., surreptitiously placing a GPS [global positioning system] device in the person's car). Harassment and intimidation reflect efforts to introduce challenge and difficulty into the other person's life, including nonverbal intimidation (e.g., leaving potentially threatening objects on the person's car), verbal or written harassment (e.g., derogatory notes), reputational harassment (e.g., spreading rumors), network harassment (e.g., derogatory graffiti or group e-mails), regulatory harassment (e.g., taking out a restraining order on the person), economic harassment (e.g., tying up the person's economic resources through nuisance suits), unrelenting persistence (e.g., saturation of communication media with notes, calls), bizarre behavior or leavings (e.g., leaving odd objects where the person will find them), isolation and network alienation (e.g., disenfranchising the person's social network).

Coercion and threats communicate some prospective punishment that will occur contingent on a person's behavior. Threats can be based on almost any value, but common ones include threats to reputation, property, economic livelihood, victim, friends, family, colleagues, or third parties. Threats can also imply forms of sexual or physical violence, sexual exploitation or coercion, and even self-destruction (i.e., suicide). Finally, physical violence is also used sometimes in an effort to gain another's compliance, attention, and, ironically, affection. The types of violence are varied but common forms include vandalism, assault, endangerment, kidnapping, sexual assault or rape, assault with a weapon, or suicide attempts. Violence may result in injury or even death.

Communicative aggression and unwanted communication reveal various areas of overlap. Messages that isolate, neglect, or limit another person, symbolically or physically, represent one common form of aggression. Messages that insult, criticize, or complain about a person also clearly reflect aggressive aspects (Cupach, 2007). Messages that challenge, frustrate, or otherwise erect obstacles to a person's life represent a form of aggressive harassment. Clearly, directing physically violent actions toward self or others represents a form of aggression. The study of unwanted communication, however, suggests that excessive efforts to pursue intimacy can also take on an aggressive function. To a large extent, these various forms of aggression are reminiscent of Karen Horney's classic tripartite distinction. In social life, people can move toward, against, or away from one another. Likewise, it appears that people can communicate aggressively by moving toward someone (e.g., hyperintimacy), moving against someone (e.g., verbal aggression, threat), or moving (the person) away (e.g., neglecting a person, alienating the person's social network, reputational harassment).

Prevalence of Communicative Aggression

A second common question addressed in the research on psychological abuse is to whom it happens and how often. Despite the elementary nature of this question, there are few data on the actual prevalence of psychological abuse, although there is extensive evidence on the prevalence of stalking. Summarizing research on the prevalence of psychological abuse, Dailey and colleagues (2007) estimate that between 77% and 97% of people have experienced at least one of the types of communicative aggression behaviors noted above in their current or past dating relationship. When the question is considered in terms of an ongoing or persistent pattern (i.e., abuse), the prevalence rate would be closer to between 10% and 50% of the population. In general, there are not very clear sex differences between men and women in their reported use of or victimization by psychological abuse.

Research on stalking indicates that in the general population and college population, approximately a fifth (18%–21%) have been stalked, although large-scale population surveys using rigorous definitions of stalking estimate far lower prevalence, ranging between 2% of men and 8% of women (Tjaden & Thoennes, 2000). It should be noted that approximately 75% of stalking victims are female and about 75% of stalkers are male, but when milder forms of obsessive relational intrusion are studied among college students, there are few apparent sex differences (Spitzberg & Cupach, 2007b). The average case of stalking appears to last about 1.8 years. About 75% of stalking cases emerge from preexisting relationships, the majority of which are previously romantic relationships (Cupach & Spitzberg, 2004; Spitzberg & Cupach, 2007b).

Effects of Communicative Aggression

The evidence is overwhelming that experiencing communicative aggression or obsessive relational intrusion has generally negative effects on people's quality of life (Coker et al., 2000; Cupach & Spitzberg, 2004; Spitzberg & Cupach, 2007b). People victimized by such behaviors are more likely to experience a number of unpleasant outcomes, including emotional (e.g., depression, anxiety, posttraumatic stress disorder), cognitive (e.g., distrust, distraction), behavioral (e.g., interference in daily routines), physiological (e.g., sleep or appetite disturbance), social (e.g., diminished social network), resource (e.g., lost job or income), and spiritual (e.g., loss of faith) health effects. There is some evidence, however, that most exposure to and most effects of psychological abuse are relatively mild (Follingstad, 2007). There is also some evidence that many victims of stalking either experience some degree of resilience or feel somewhat ambivalent about their experience (Cupach & Spitzberg, 2004). Some victims feel harassed and anxious by excessive pursuit, but they also feel somewhat flattered and desired. Some victims despise the experience of harassment, but they become motivated to "take charge" of their lives through self-improvement.

Coping With Communicative Aggression

The final typical question addressed by research applications studying communicative aggression and unwanted communication concerns how people cope with or respond to the experience of such activities. Given the variety of ways of enacting communicative aggression and abuse, it is no surprise that there are many ways in which people attempt to cope with unwanted communication. There is surprisingly little research on how people respond to communicative aggression per se, but there has been extensive research on how people respond to unwanted pursuit of intimacy. Studies indicate that people attempt to cope with unwanted pursuit in any or all of five possible ways: moving against, moving with, moving away, moving inward, or moving outward (Cupach & Spitzberg, 2004). Specifically, moving against involves attempts to cause or threaten harm to the pursuer. Moving with involves trying to negotiate or talk with the pursuer to attempt to redefine the relationship or get the pursuer to alter the pursuit behaviors. Moving away encompasses behaviors intended to avoid interacting with or encountering the pursuer. This strategy includes tactics such as changing routine behaviors to make them less predictable, “hardening the target” by improving home security, and ignoring the person in interactions. Moving inward activities represent efforts to “work on oneself,” perhaps through meditation, exercise, denial, drug use, or mental preparation. Finally, moving outward consists of contacting third parties who might be able to assist, such as counselors, friends, family, or the police.

Research indicates that victims of unwanted pursuit tend to try several of these tactics and strategies (Cupach & Spitzberg, 2004), and the fact that the average case lasts more than one and a half years is mute testimony to the relative ineffectiveness of such coping actions. Experts generally recommend two of these coping strategies over the others: moving away and moving outward. The remaining tactics involve contact with the pursuer (i.e., moving against, moving with), which may simply reinforce the unwanted activity or involve an overly passive approach (i.e., moving inward) that does little to deter the pursuer’s behavior.

Future Directions

The 21st century has already seen rapid advancements in communications technologies that permit greater interpersonal access across time and space than ever before. As access increases, however, so do opportunities for the abuse of such technologies. The activity of stalking was not explicitly made illegal until 1990. It is not surprising that not long after the activity was recognized, the term *cyber stalking* emerged, representing the experiences and possibilities of unwanted pursuit through communication technologies and in virtual domains.

To some extent, this “new world” is “brave” only in the sense that venturing forth into cyberspace requires placing one’s identity at great risk. The public access satellites of Google Earth are being used to spy on everyday people doing things they assume are private. GPS devices are being planted surreptitiously in people’s cars to keep track of people at a distance, and Trojan horse and zombie programs are being used to take covert control or provide unlimited access to people’s computers. Identities are stolen electronically on a daily basis. People log into various virtual spaces pretending to be a sex, race, age, or person they are not, and predators surf the Internet looking for potential prey, sometimes younger than the age of 10. Internet and online harassment can now extend an insult, phone message, photograph, or embarrassing moment from a momentary interpersonal exchange to the truly World Wide Web. Obsessive intrusion is almost a metaphor for the modern communications world, and this world is increasingly accepting the fact that these new media will be a primary means through which relationships will be found, initiated, maintained, and ended. In such a brave new world, there will be more opportunities for establishing relationships, but the cost will be less privacy and expanded opportunities for the abuse of such technologies by those who will find the media compatible with their aggressive or intimate designs.

Despite extensive research on aggressive and unwanted forms of communication, little is known about the more relational aspects of such behavior. For example, the research reveals the behaviors used to aggress and pursue intimacy in unwanted ways, and some research indicates how the receivers of such actions respond, but such findings occur in a contextual vacuum. Do people give off signals that they are capable of such forms of aggression and unwanted pursuit, and if so, how is it that these signs are so easily overlooked in the development of everyday relationships? To what extent can certain responses, or certain combinations of responses, used earlier in the initial experience of such unwanted activities, provide better protections against such activities? There are several theoretical approaches to conceptualizing why people engage in aggression or unwanted pursuit, but there are few theories that could inform ongoing processes of coping. Finally, can communicative aggression and unwanted pursuit be treated in such ways that couples may be able to reestablish healthy relationships out of the ashes of their former relationships? Future research and scholarship will need to pursue such lines of inquiry if progress is to be made in improving relationships in the 21st century.

Conclusion

Unwanted communication is an unfortunately common experience in everyday interaction (Spitzberg & Cupach, 2007b). It tends to take one or both of two basic goals: to establish greater intimacy with another or to harm the other person. Communication can serve both goals, and ironically,

those who seek intimacy often use aggressive forms of communication in an often failed attempt to achieve that intimacy. The study of aggressive and unwanted forms of communication has revealed a vast array of strategies and tactics by which intimacy and harm may be pursued. Furthermore, research reveals that these forms of communication tend to diminish the recipients' quality of life. There are several obvious ways in which recipients can attempt to cope with such aggressive and unwanted forms of communication, including moving inward, moving outward, moving away, moving with, or moving against the aggressor. Despite the availability and use of these coping strategies, the evidence indicates that there are few "tried and true" ways of competently stopping such aggressions and unwanted attentions. Advancing communications technologies will tend to make people more rather than less accessible and vulnerable to the aggressions and approaches of others. Given the limitations of existing coping strategies and the increased vulnerabilities implied by new technologies, the study of how unwanted communication can be managed becomes a major priority for the future.

SEXUAL HARASSMENT

DEBBIE S. DOUGHERTY

University of Missouri

Sexual harassment, a predatory form of sexual behavior in the workplace, has been a persistent problem for women—and for some men—in the workplace for centuries. Targets of the behavior have always known, and researchers have confirmed, that sexual harassment is a highly destructive workplace process. It creates stress, severe depression, and other health problems for the target and anxiety for all members of the workplace and costs millions, possibly billions, to organizations in terms of increased health care costs, lost productivity, legal fees, training, and replacing targets of sexual harassment who leave the workplace to escape the predatory sexual behavior by colleagues. Sexual harassment, even less aggressive forms, is never a good thing.

Despite the negative consequences of predatory sexual behavior in the workplace, it was not until recent times that sexual harassment was named and described as an illegal workplace behavior. Despite the fact that sexual harassment is illegal, it continues to exist in the contemporary workplace in diverse contexts such as higher education, the military, health care, corporate businesses, small businesses, and nonprofit organizations. For many years, only women were legally recognized as targets of sexual harassment. However, more recent rulings acknowledge that men can also be targets of sexual harassment. While some believe that only “weak” or “meek” people are victims of sexual harassment, the truth is that targets can be young and old, rich and poor, undereducated or highly educated, managers, secretaries, or even volunteers to an organization. Targets do not seem to share personality traits and common sex-role expectations. In fact, it often seems that the only similarity between targets is that they are so very diverse. Researchers, especially feminist researchers, have extensively examined

sexual harassment in the workplace since the 1970s. While researchers from a diverse array of fields study sexual harassment in the workplace, the field of communication provides a distinctive approach to this topic.

Early research viewed communication as ancillary to sexual harassment. It was typically conceptualized in very simplistic terms. For example, harassers use communication to harass; targets use communication to respond; organizations use communication to prevent sexual harassment from occurring. This early body of research tended to focus on the individual level. For example, some researchers focused on the victim, suggesting ways by which victims could have higher self-esteem so they would be less likely to be targeted in the first place. Other researchers focused on variables that could predict who would be a victim or who was more likely to be a harasser. Finally, some researchers provided prescriptive advice for organizations on how to manage sexual harassment. This advice was typically predicated on the misplaced notion that sexual harassment is an interpersonal problem and therefore needs to be dealt with at the microlevel.

As research on this topic became more sophisticated, researchers began to realize that sexual harassment and resistance to it are themselves acts of communication. Sexual harassment communicates social roles, norms, and expectations. It is a means by which gender integration in the workplace is resisted and differentiated gender roles are highlighted. Resistance to sexual harassment communicates dissatisfaction with the status quo. It signals at least a partial rejection of highly sexualized gendered expectations. Unfortunately, resistance also communicates an unwillingness to work within the status quo. For example, women who protest against predatory sexual behavior “can’t take a

joke,” “must be lesbians,” and are overly sensitive. Men who resist sexual harassment are called gay and are perceived as feminine. To better understand the dynamic interplay between sexual harassment and communication, sexual harassment will first be defined, a discursive approach to sexual harassment will be described, and several discursive contexts for sexual harassment will be presented.

Definition

Because it is an illegal behavior, the federal government and the court system have provided a consistent definition of sexual harassment. In contrast, lay definitions, that is, definitions provided by working men and women, tend to vary widely and may or may not match the legal definition of sexual harassment. In this section, a discussion of the legal definition of sexual harassment will first be provided. The legal definition and lay definitions of the term will then be compared.

According to the U.S. Equal Employment Opportunity Commission (EEOC, 2007),

Unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature constitute sexual harassment when this conduct explicitly or implicitly affects an individual's employment, unreasonably interferes with an individual's work performance, or creates an intimidating, hostile, or offensive work environment. (Paragraph 2)

Essentially, two types of sexual harassment are represented within this definition. *Quid pro quo* sexual harassment is literally translated as “this for that.” This is the most recognized form of sexual harassment and occurs when a person in a hierarchically superior position makes employment or promotion contingent on the receipt of sexual favors. The second type of sexual harassment is called “hostile environment.” Here, the unwanted sexual attention is so prevalent or so severe that the workplace becomes destructive or damaging to the target of the unwanted behavior. A third type of sexual harassment is becoming increasingly recognized by the court system. Third-person sexual harassment occurs when the victim was not the person harassed but was negatively affected by the harassment.

Despite the seeming clarity of the EEOC's definition of sexual harassment and the fact that most organizations have formal policies regarding sexual harassment, this behavior continues to be a persistent problem in the workplace. Cases of sexual harassment that seem fairly obvious and straightforward are denied by the harassers. Targets are often reluctant to label these behaviors as sexual harassment, even when they acknowledge that the behaviors have a strong negative impact on their working conditions. How is it possible for so much confusion to occur over a term with such a clear definition? The answer is that

lay definitions of sexual harassment are not nearly as clear or as consistent as the one offered by the EEOC.

While the definition above is used by legal institutions in determining sexual harassment, scholars have discovered that lay definitions are less uniform. In fact, the way sexual harassment is defined in everyday life appears to be highly interpretive and subjective. For example, men and women tend to define different behaviors as sexual harassment, with women consistently viewing more behaviors as sexual harassment than do men. These definitions are moderated by position in the hierarchy, organizational culture, and personal experience with sexual harassment. The strong differences in operational definitions of sexual harassment have prompted communication scholars to shift away from researching sexual harassment as a legal issue to conceptualizing it as a discursive phenomenon. In other words, we now think about communication as central to understanding and managing sexual harassment.

Sexual Harassment as Discourse

So what does it mean when scholars claim that sexual harassment is a discursive process? “A discursive focus places communication at the core of sexual harassment” (Dougherty, 1999, p. 437). Consequently, instead of viewing communication in simple terms—such as reception or interpretation of messages, “a discursive framework understands communication as creating and shaping social reality rather than just being influenced by it” (Bingham, 1994, p. 9). When viewed from a discursive perspective, sexual harassment could no longer be considered an interpersonal problem between two people. Instead, sexual harassment must be viewed as a communication phenomenon. In other words, sexual harassment allows us to observe macro forces at play in a micro context. Sexual harassers and their targets are enacting social expectations, and in so doing, they recreate and reinforce the presence of those social expectations at the macrolevel. Those social expectations tell us who men and women should be and how they should behave and define their “proper” roles in society. After reviewing volumes of literature on sexual harassment, prominent communication scholars shifted to studying communication as discourse because it held the greatest possibility of achieving change at the social and organizational levels (Bingham, 1994).

Language as a constitutive force lies at the center of discourse. Words do not simply name what already exists, they shape the way we understand and talk about any given issue. Language shapes our reality. The constitutive function of sexual harassment can be seen in the language surrounding sexual harassment. Probably, the cleanest example of sexual harassment as discourse lies in the very label “sexual harassment.” According to Julia Wood (1994), at one point in the fairly recent past, there was no word available to describe or make sense of unwanted sexual

attention in the workplace. Consequently, targets of these behaviors were unable to adequately describe the horror and humiliation of their experiences. In fact, this predatory sexual behavior was viewed as normal and acceptable by many people in organizations. Women who complained were viewed negatively. However, once the label “sexual harassment” was coined, women’s concerns and issues were legitimized, and predatory sexual behavior in the workplace was deemed abnormal and unacceptable (Wood, 1994). Simply by creating a new discourse of sexual harassment, women were able to problematize predatory sexual behavior in the workplace.

The single most significant consequence in the shift toward a discursive understanding of sexual harassment is the increased complexity and fluidity involved in the process. No longer is sexual harassment simply about the harasser-target dyad. No longer is communication simply how the harassment is communicated and responded to. Instead, scholars now tend to see sexual harassment as a socially complex phenomenon. This complexity has been explored by research on targets of sexual harassment, sexual harassment as a part of the organizational culture, and sexual harassment as a function of power. Each of these areas will be discussed.

Targets of Sexual Harassment

One mark of a discursive approach to sexual harassment is to view the phenomenon as more than a simple interpersonal problem. Even when only a single role in the behavior is targeted by researchers, there is an explicit recognition that other, powerful forces are at play. Many times, the force that inspires sexual harassment is social expectations for men and women. These social expectations inspire certain behaviors and reactions from some men and women in organizations. For example, we know that women in academia are targets of sexual harassment and that these experiences can be devastating. These experiences are not isolated. They are systematic, ongoing, and reinforce the patriarchal structures that make tenured women professors a minority group in the ivory towers. Formal policy and administrative roles often serve to further reinforce the gendered dynamics at play in sexual harassment. This problem is so intense that a special issue of one of the discipline’s top academic journals was dedicated to narratives of sexual harassment in the field of communication (Wood, 1992).

Hegemony is roughly defined as the pressure that non-dominant members of a society experience to conform to the standards and expectations of dominant members of society. This pressure often causes nondominant members to participate in their own oppression by adhering to social expectations. Hegemonic resistance occurs when, in the very act of resisting dominant behavior, nondominant members inadvertently reinforce the structures that oppress them.

Robin Clair’s (1993) work on how victims frame sexual harassment illustrates the interconnection between social structure and sexual harassment. Clair interviewed women who were targets of sexual harassment. She was interested in the ways they responded to predatory sexual behavior in the workplace. The women reported using a number of strategies to respond to the unwanted behavior. For example, some chose silence, while others privatized the interaction by referencing romantic relationships. According to Clair, by resisting sexual harassment in these ways, these women actually reinforced the social structures that allow sexual harassment to exist in the first place. For example, by privatizing sexual harassment, the women decreased the likelihood that the behavior would be scrutinized in the public domain; the behavior is viewed as private and therefore not a universal organizational issue.

Of course, responding to sexual harassment in a way that preserves the identity of the individual, effectively manages the behavior, and allows for continued employment is extraordinarily complicated. This complexity is enhanced when the multiple subjectivities, or roles, each of us plays is considered as a dynamic part of the response. When targets talk about sexual harassment, they often shift their discourse depending on the role (e.g., mother, worker, manager) from which they speak (Townsend & Geist, 2000). Regardless of the role they are speaking from, according to Townsend and Geist, sexual harassment tends to be normalized and therefore hegemonically reinforced through discourse. This normalization is possible because targets are often caught between competing discourses. They need to maintain a sense of professionalism, despite the predatory sexual behavior. They need to effectively respond in an administrative environment, which naturalizes the behavior and minimizes the opportunity to effectively respond. In this way, targets become trapped in a paradox in which no effective response is available.

While we know a considerable amount about women targets of sexual harassment, very little is known about how male victims manage the behavior. Only one scholarly article in the field of communication has documented the experience of a man who was sexually harassed (Clair, 1998). In this instance, it was a male assistant nurse who was the target of predatory sexual behavior from a cadre of female nurses and nursing assistants. The harassment directed toward “Michael” was primarily verbal and seemed to be focused on identifying and determining his proximity to the ideal male in Western society. For example, his female coworkers asked if he was a virgin, had oral sex, and had engaged in sexual activity with a black woman. Furthermore, Michael claimed that these women asked if he was homosexual. Each of these questions appears to be designed to clarify Michael’s masculinity. Not only does Clair illustrate the heterosexism of these comments, but she also analyzes the racism inherent in these questions. The assumption seemed to be that the ideal white male in Western society would have had sexual

relations with a black woman, playing into stereotyped images of black women as highly sexual savages. Clair (1998) writes, “the question now raised by the assistant nurses is whether Michael is ‘man enough’ to have slept with a black woman” (p. 140). As Michael becomes silent, the women ask more and more questions “desperate to label and define him” (p. 140). According to Clair, this man’s heterosexuality was questioned, and the extent of his sexual prowess and fantasies were open areas of speculation for his female colleagues. He was expected to enjoy this type of interaction, and when he didn’t, his masculinity was questioned. When he expressed discomfort to his boss, Michael was told how to acclimate to the harassment—something Michael claimed he could not do. Eventually, Michael was fired. In my experience, male victims are afraid to resist unwanted sexual attention because it brings their masculinity into question. Their entire identity as a man is on trial, making resistance particularly risky for male targets of predatory sexual behavior.

This body of research makes it clear that there is a significant interplay between social processes and individual experiences of sexual harassment. Sexual harassment is never simply a private issue between two people. It is a complex discursive problem that is extremely difficult to manage. The complexity of the problem and the difficulty in managing sexual harassment are best understood from an organizational culture perspective.

Sexual Harassment as Organizational Culture

While sexual harassment can certainly occur as an isolated event in an organization, scholars suggest that some cultures are more prone to sexual harassment than others (Dougherty & Smythe, 2004). Consequently, researchers have become increasingly interested in the ways in which discourse shapes the meaning of sexual harassment in a given organization. Of particular interest to this body of research is the way organizational members who are not harassers or targets talk about sexual harassment. The ways organizational members talk about sexual harassment represents a discursive negotiation over how sexual harassment is to be defined, enacted, and resisted in any given organizational milieu (Keyton, Ferguson, & Rhodes, 2001).

Sexual-harassment-prone organizations appear to cross organizational subtypes. For example, military, health care, academic, and correctional facilities have all been found to produce and sustain sexual harassment as part of the culture. But how does communication sustain this behavior, and, conversely, how does communication prevent or resist sexual harassment within an organizational culture? While the answers to these questions have not yet been fully revealed, there are some hints within this emerging body of literature.

While there are some persistent differences between men’s and women’s perceptions of sexual harassment, those differences can be strongly modified by organizational culture. For example, while women typically identify more behaviors as sexual harassment than men, Keyton and colleagues (2001) found that because of unique qualities of one organization’s culture, “men, not women were more sensitive to inappropriate social-sexual behavior” (p. 47) in the workplace. Furthermore, while typically women are the targets of sexual harassment, Zak (1994) found that men and women were targeted equally in one transportation agency. This equal-opportunity harassment was an attempt by some workers to maintain control of a culture that was becoming culturally integrated. It is clear, then, that the unique qualities of an organizational culture have a strong influence on perceptions and enactment of sexual harassment within that organizational context. While no single factor has been identified that characterizes a sexual-harassment-prone organization, one common thread in many of the scholarly works seems to be the presence of a strong authoritarian management structure. Strong authoritarian management structures attempt to impose a single unified meaning system on its workers, often with a disastrous impact on the workplace culture (Zak, 1994). The relationships between sexual harassment and rigid authoritarian structures have been noted in research on military organizations, health care organizations, and blue-collar work environments. Zak made the most direct link between strong authoritarian management structures and harassment-prone cultures. The primary disadvantage of an authoritarian style of management is the inflexibility in adapting to organizational change. Because authoritarian managers tend to have a singular, rigid vision of the organization, there is no way provided for a new discourse community to develop. For example, AVTA, a vehicle maintenance unit of a larger organization had no discursive structure to use when adapting to demographic diversification. As a result, the “bully boys,” those who saw themselves as the guardians of the original culture, began a systematic series of assaults on newcomers that ranged from racial to sexual harassment. While not all sexual-harassment-prone organizations have rigid authoritarian structures, it seems clear that rigid authoritarianism can provide the conditions that nurture sexual harassment in a given culture.

So how does an organizational culture become prone to sexual harassment? Of critical importance to answering this question is recognizing that organizational culture does not develop in a vacuum. Instead, the idiosyncrasies of a given culture develop to meet a functional need of its members. In other words, organizational cultures do something for the workers. Sometimes, such as in the case of sexual harassment, the behavior can be both functional and dysfunctional. According to Dougherty (2001), sexual harassment in harassment-prone organizations tends to be

functional for dominant members of the organization. For example, for men in one health care organization, inappropriate sexual behavior was used as a coping mechanism for stress, as a way of showing care to colleagues and as a means of creating and demonstrating camaraderie. However, for the women in this organization, this same behavior was not functional and for many was actually dysfunctional. Dougherty recommends that to effectively manage sexual harassment, it is necessary to identify how the behavior functions in the organizational culture and then to find an alternative means of managing that function. For example, finding an alternative means of managing stress could reduce the functionality of sexual harassment in a high-stress organization. For example, health care organizations are historically high-stress environments where an error in judgment can have disastrous outcomes. Staffing shortages, problematic scheduling, and notoriously low salaries enhance the stress level in health care settings. Not surprisingly, nurses and other health care workers have consistently told me about the high-stress environments in which they work. One strategy for decreasing stress might be more manageable and equitable scheduling so that health care workers can have an adequate amount of time and space to decompress. Furthermore, exercise has been shown to help workers manage chronic stress. By creating exercise facilities and yoga classes, it would be possible to establish conditions where workers can learn to manage their stress in productive and functional ways. By productively managing stress, it is possible that the function served by sexual harassment would cease to be an issue and this destructive behavior could also be managed productively.

Because sexual harassment tends to function in some important way in sexual-harassment-prone organizations, experiences with predatory sexual behavior in these organizations tend to be particularly intense, profuse, and strange. For example, the bully boys in Zak's (1994) study would simulate sexual intercourse with other men as they bent over an engine for repairs. One man claimed, "I guess after you're humped 40 times, you're accepted as a mechanic" (p. 291). In another instance, a maintenance worker declared that he was "captain of the butt check team" and that a female worker could not leave the room until he "checked her butt" (Dougherty & Atkinson, 2006). In another large sexual-harassment-prone organization, the butt of one woman was grabbed by her African American boss, who asked, "Have you ever made chocolate love?" (Dougherty et al, in press). It is important to understand that sexual harassment is not mundane, ordinary, or typical in any way. The behaviors are contextually weird and outside the scope of the relationship being breeched. This is particularly true in organizations that nurture this type of behavior.

Given the nature of sexual-harassment-prone cultures, it is important to ask how cultures can develop to resist the enactment of these behaviors. While a number of scholars have examined organizational cultures that are infused

with sexual harassment, less is known about those cultures that resist sexual harassment in the environment. One case study of such a culture does provide some insight. Dougherty and Smythe (2004) suggest that to effectively resist cultures of sexual harassment, men and women must be equally committed to treating each other with respect. In one academic organization, when an outsider sexually harassed three members of a department, members responded by listening to the stories told by the women, supporting the women, and rejecting the outsider by ridiculing him. In an organization such as this one, sexual harassment is unlikely to be tolerated. While the outsider's behaviors were likely functional in his own workplace, they were viewed as intolerable and crude in this academic unit.

It is clear that organizational cultures can both encourage and resist sexual harassment. Strong authoritarian structures, widespread predatory sexual behavior, and sexual behavior that functions in some important way for dominant members of the organization, all appear to characterize an organization prone to sexual harassment. Hidden within each of the characteristics is an overlooked but singularly important issue in sexual harassment. Researchers and organizational members generally agree that sexual harassment is not about sex. It is about power.

Sexual Harassment and Power

What is power? This term is used so frequently in Western society that the meaning seems like common sense. However, scholars have repeatedly found multiple types of power operating in organizations, particularly when it comes to sexual harassment. For example, there is power as a resource to use, power as traditional hierarchical control, power as patriarchy, power as social roles, and power as physical strength. If sexual harassment is about power, then how one defines power would very clearly affect the experience with this behavior.

Dougherty (2006) identified some ways in which different definitions of "power" can radically change the way organizational members identify sexual harassment. In a study examining the discourse of members in a health care organization, Dougherty used a complex qualitative research design to identify how men and women talk about sexual harassment. First, three focus groups of men and three focus groups of women from a large health care organization were conducted. Each individual was then interviewed separately and asked to describe what happened in the focus group discussion. This allowed those who were more silent to speak up, and it allowed participants to discuss any unexpressed concerns and reservations. Following these interviews, three mixed-gender focus groups were conducted, again followed by individual interviews. The participants in this study invariably agreed that sexual harassment is about power. However, the ways

women and men defined power were radically different. Men tended to define power in more hierarchically fixed terms. In other words, they believed that people have power as a product of their placement in the organizational hierarchy. The higher in the organizational hierarchy, the more power a person has. Those who define sexual-harassment-related power as hierarchically bound tend to have a very narrow understanding of who can be a sexual harasser. For these people, only those in hierarchically superior positions (such as a boss) can sexually harass because only these people have power.

On the other hand, other people, particularly women, also claimed that sexual harassment is about power. However, they tended to define power in a more fluid manner. Power for these people is a relational construct. This means that we create and enact power with others. These folks believed that we “give” power, “take” power, and relinquish power to others. So for these people, a boss may or may not be more powerful than an employee, depending on the nature of the relationship. Furthermore, because anybody can have power, bosses, coworkers, and even underlings can engage in acts of sexual harassment.

Now, imagine a conversation between “Person A,” who defines sexual-harassment-related power as hierarchical, and “Person B,” who defines sexual-harassment-related power as relational. Person A says that “sexual harassers abuse power at work.” Person B says, “I totally agree.” These two people think that they understand and agree with each other. However, Person A was talking only about bosses because only bosses have power. Person B thought that Person A was talking about all members of an organization who engage in sexually inappropriate behavior. By moving beyond the words used and exploring the underlying meanings, it becomes clear that the agreement reached by Person A and Person B was an illusion.

Because different definitions of power shape what sexual harassment means, who can sexually harass, and how victims should respond, a discursive approach to power is a useful way to understand this phenomenon. If, on the other hand, researchers begin with a preset definition of power, they lose the ability to understand the experiences of sexual harassment by everyday people. For example, Wayne (2000) compared two definitions of power to determine which is most significant during an adjudication process. The organizational definition of power views power as acquired through the organizational hierarchy. On the other hand, the sociocultural model defines power as disparities in privilege based on membership in different social-demographic groups such as sex, race, sexual preference, and age. The author found that neither definition of power adequately explained the findings. Consequently, she had to speculate about the function of a third model—the role-discrepant model of power. Had the author asked study participants to define power or to describe a powerful person at work, her findings would have been richer and more conclusive.

Managing Sexual Harassment

There is no easy answer for how to manage sexual harassment in the workplace. The behavior is strange and irrational. Consequently, simple training is unlikely to resolve the problem. Instead, a more complex and cohesive approach is necessary that addresses sexual harassment at every level of society.

Social Level

Sexual harassment is at its roots, a social phenomenon. The sexism and coercive behavior seen in sexual harassment are infused throughout society. Children, especially boys, are taught from an early age that they are “different” from and better than girls (Grauerholz, 1994). I believe that people are so concerned that their sons might become homosexual that they systematically train boys to be misogynists. Yet it seems unlikely that heterosexuality is that fragile. If playing with a doll “makes” a boy “gay,” then he probably was not heterosexual to begin with.

Boys and girls are carefully and specifically trained to be different from each other. They are praised when they are successful and punished when they fail to achieve and maintain this difference. This is not to suggest that boys and girls are the same. However, society tends to focus on the differences while ignoring the vast array of similarities between boys and girls. As the parent of two young children, a girl and a boy, I have been able to observe this phenomenon firsthand. The sex differentiation in behavior toward children is inescapable. For example, my daughter is constantly praised for her appearance. People in the mall stop her and say, “What a pretty dress, aren’t you a pretty girl?” It is fairly rare for people to admire her for her behavior, intelligence, sense of humor, or sense of compassion. Yet to me, these are her outstanding characteristics. On the other hand, people rarely comment on my son’s appearance, focusing instead on his energy, intelligence, and sense of humor. One of the more odd things people say about my son is that “he is all boy.” I have always found this statement perplexing. What if he isn’t all boy? What does a “part boy” look like? If they knew that my son was caring and compassionate, would people still say he was “all boy”? Or would they say, in that knowing way, “he’s part girl.”

It may surprise some folks to learn that children do not differentiate between male and female behavior in the same way as adults. This does not mean that they are confused about their gender. It simply means that they have not yet been trained to identify themselves in opposition to others. For example, 2-year-old boys like to wear their Mommy’s shoes and carry purses. My children’s day care has a dress-up box, and I have repeatedly observed boys and girls dressing in women’s shoes and toting around purses. I have also seen parents freak out when they see their sons wearing “women’s clothes.” Along the same lines, one of my graduate students told me about a friend of hers who was the mother of a young boy. One day the mother caught her

son playing with Barbie. She told her son, “Do not play with those dolls. Those are yucky girl toys. Boys don’t play with yucky girl toys.” This woman was quite proud that her son stopped playing with girl toys. She did not seem to realize that she has also trained her boy to believe that girls are “yucky” and therefore inferior and to be disdained. This type of attitude toward women is magnified in the enactment of gendered crimes such as rape and sexual harassment. Consequently, this type of differentiating behavior needs to be stopped. Instead, parents need to stop reinforcing stereotypes and accept the array of age-appropriate behavior that enriches the lives of children.

Organizational Level

Because sexual harassment occurs in organizational settings, organizational leaders have a responsibility to create an environment that limits the likelihood that sexual harassment will occur. Organizations have a responsibility to prevent sexual harassment for a number of reasons. First, sexual harassment is toxic to the organizational environment. Employees become unhappy, and turnover increases. Second, sexual harassment is illegal. For that reason alone, organizations should try to prevent sexual harassment from occurring. Finally, organizational leaders should try to prevent sexual harassment simply because it is hurtful to the victims and their families. In other words, they should prevent the behavior because it is the ethically correct thing to do.

While there are many actions that managers can take to minimize the possibility of sexual harassment, three strategies will be highlighted here. First, managers need to emulate the appropriate behavior. If a manager uses sexually inappropriate behavior, it is more likely that other organizational members will follow that person’s lead. Second, organization-wide training is necessary. Having a policy or simply training managers about sexual harassment is inadequate. In my experience, some of the worst cases of sexual harassment come from members at the bottom of the organizational hierarchy. A word of caution is necessary. Many organizational members will strongly resist this type of training. I’ve heard of organizational members who go to the training and sit with their backs to the trainer. Others read books, do other work, or text message friends. Despite this type of resistance, organization-wide training sends a clear message that sexual harassment will not be tolerated. Finally, organizational managers need to encourage a culture that rejects harassment of any kind. A culture in which people monitor their own behavior is ideal and needs to be protected at all costs.

Organizational Cohort Level

All members of an organization have a stake in preventing sexual harassment. Just as one bad tooth can cause the entire mouth to hurt, sexual harassment has a diffuse and negative impact on the workplace environment. Of course, the problem that organizational members face is

that it is sometimes hard to tell if a behavior is sexual harassment. What constitutes sexual harassment to some may be flirting to others (Dougherty, Kramer, Klatzke, & Rogers, in press). Nonetheless, coworkers should be alert for potentially unwanted sexual attention and seek advice from their personnel department. A short conversation with either the harasser or the target may also be productive. At the minimum, it may be useful to document the behavior so that future charges can be corroborated.

Men may be particularly important allies in preventing sexual harassment—especially when the sexual harassment targets women. While men tend to be the perpetrators, most men are not sexual harassers. They are caring and concerned citizens of the organization. They also tend to have a powerful voice because of the extra status afforded some men because of their sex. Dougherty and Smythe (2004) made this argument in their case study of sexual harassment in an academic organization:

Instead of treating white men as the enemy, it would be far more productive to attempt to understand how they may be part of the solution to sexual harassment. While acknowledging that it is the dominant white male privilege that often encourages sexual harassment in organizations, it is also important to identify ways that white men can participate in preventing sexual harassment. Scholars and practitioners should start with the assumption that white men want to do what is right. They have a human capacity for love and care and should be given an opportunity to protect their colleagues. White men are privileged as organizational insiders and therefore have an opportunity to confront sexual harassers in unique ways. (p. 314)

Although Dougherty and Smythe’s (2004) conclusions are drawn from a study looking at the reactions of white men to a case of sexual harassment, this argument should be extended to all men regardless of race, age, ethnicity, or sexual preference. There are many productive ways for men to act as agents of change. It is necessary to encourage these actions.

Targets of Sexual Harassment

The shock that sexual harassment could happen to them often prevents targets from responding effectively. Because we associate being a victim with being weak and passive, most people do not want to believe that they could be victims. As a result, when sexual harassment occurs, these people have no real schemas for how to manage the behavior and respond effectively. People are typically perplexed regarding why they were targeted because, after all, they don’t *act* like victims; they are too strong, too assertive, too mature, and so on, to be victims of sexual harassment. Consequently, people rarely have a realistic plan for how they will behave if they are targeted. Because they do not have a realistic victim schema for how to behave, most people freeze, resorting to standard politeness norms instead of effectively confronting the behavior.

While some people have no schema for how to respond to sexual harassment, others have unrealistic schema, such as believing that they should physically attack the perpetrator. This type of simplistic schema is bound to fail because it does not account for the interpersonal and social dynamics in society and in the workplace. For example, most women will not attack a sexual harasser because he is typically physically stronger and because they will likely lose their job. Instead, it is important for people—especially women—to understand that sexual harassment could easily happen to them and to develop complex schemas for how to handle the behavior and manage their feelings if and when it occurs.

Conclusion

Sexual harassment is a destructive workplace process that negatively affects the organization on every level. It is important to understand how to manage this problem, not only to maintain the productivity of the organization but also to create more humanistic and satisfying places to work. People spend a large bulk of their time and emotional energy at work. This experience should be as enjoyable as possible, and at the very minimum, working should not be an ongoing, painful saga. For those in sexual-harassment-prone organizations and for those who face predatory sexual behavior at work, sexual harassment is ongoing and painful.

Sexual harassment is not a simple construct that can be understood simply by measuring the psychological properties of the individuals involved. It is important to understand the discursive properties involved in enacting and resisting this behavior. Sexual harassment is highly complex, involving the dynamic interplay not just of the target and harasser but of all members of the organization. By examining the relationship between communication, larger social structures such as hegemony, sex-role expectations, organizational culture, and organizational power, it is possible to view sexual harassment as a larger social phenomenon.

DECEPTION

TIMOTHY R. LEVINE

Michigan State University

Deception is one of the sexier topics in communication research, and people seem to have a love-hate relationship with the topic. Being duped is usually undesirable and something to be avoided, as is being labeled a liar. People everywhere teach their children that lying is bad. Yet despite moral and ethical prohibitions against lying, deception is a behavior that most people do at least occasionally. In most cultures, little white lies, polite exaggerations, and other minor forms of deceptions are routine, normative, and mandated by politeness. Furthermore, learning to lie well seems to be a part of normal human development and is an essential part of being socially skilled. In extreme circumstances, lying is necessary for survival. However, deception can also be used for exploitation, manipulation, swindling, fraud, and other antisocial activities. In spite of its unsavory connotation, people have a morbid fascination for the topic, as can be seen in the popularity of books such as *A Treasury of Deception: Liars, Misleaders, Hoodwinkers, and the Extraordinary True Stories of History's Greatest Hoaxes, Fakes and Frauds* (Farquhar, 2005).

The social science of deception is also fascinating. Not only is it a sexy topic but also research on the topic continues to yield surprising and counterintuitive findings. Communication, and other social scientific research, is sometimes criticized as only documenting the obvious. Such a critique does not apply to work on deception, which seems to frequently contradict conventional wisdom and common sense. Simply put, things are often not what they seem in the realm of deception.

This chapter focuses on human-to-human deception, with an emphasis on the communicative aspects of deception. Deception is defined, and the communication research on deception is summarized.

An Introduction to Deception

Defining Deception

Deception is usually defined as intentionally, or at least knowingly, misleading another person. Deception involves purposely getting someone to believe something that the deceiver knows to be false. There are several implications to defining deception in this way.

For a start, truth and deception are not polar opposites, and deception and falsehoods are far from synonymous. For example, a so-called honest mistake, that is, saying something that one incorrectly believes to be true, is not deception. Or saying something known to be false is not deceptive if it is said in such a way that the hearer should know it is false. Sarcasm is an obvious example. None of these cases involves intent to mislead. However, saying something that is literally true in a sarcastic way so that the listener infers something false can be deceptive. In short, what is literally true can be deceptive, and saying something false need not be a lie.

Following this line of thought, useful distinctions can be made between actual deceptions, deceptive attempts, messages perceived as deceptive, and messages that are

functionally deceptive. Actual deception is meant to deceive and achieves this end. The target person is misled by design. In deceptive attempts, someone tries to deceive, and there is deceptive intent, but the target is not actually misled. This situation may be thought of as failed deception. In perceived deception, the target person thinks that someone was trying to deceive him or her even though there may or may not be deceptive intent. Finally, messages that are functionally deceptive mislead others regardless of the intent or perceived intent. Functionally deceptive messages lead to the same outcome as deception without getting into peoples' head to ascertain intent. So honest mistakes can be perceived as deception, functionally deceptive, or both.

A related implication is that message intent, message function or impact, and message features need to be distinguished because these things do not map perfectly onto one another. Someone can say something that is objectively false, omit information, or change the subject in a manner that is likely to, or intended to, deceive. The objective truth or falsity of messages may or may not actually function as deception, and such messages may or may not be perceived as deception. In short, the combination of speaker intent and message consequence defines deception, not the objective qualities of messages or information dimensions such as truth or falsity or degree of omission.

Development of Deception in Childhood

Because deception involves knowingly or intentionally misleading another person, deception requires both the mental ability to think about others' thoughts and the ability to use communication to affect others' thoughts. For example, telling a falsehood will not function as deception if the listener knows the truth. Saying that the sun comes up in the north every morning or that one's best friend is 10 feet tall or some other ludicrous thing is unlikely to fool people. In short, deception requires consciously misleading others, and to do so effectively, one needs some idea of what they already know and do not know. The mental ability to understand that another's thoughts are different from one's own thoughts and to think about what others might be thinking is called theory of mind. Theory of mind develops in most human children between the ages of 3 and 5, and with this cognitive development comes the ability to deceive. Before this age, children can say things that are false, but they do not grasp the concept of deception. By age 5, however, most children can spontaneously lie to achieve goals when the truth is problematic (Peskin, 1992). Learning when to deceive, when not to, and the social ramifications of deception continues to develop throughout childhood, and the ability to deceive well is typically well learned by adolescence.

Types of Deception

While an outright lie (saying something that is false) may be the most obvious way we deceive and the first type of deception to come to mind, it is not the only way people

deceive others, or even the most common. False information can be mixed in with the truth to create deception. Other types of deception besides falsehoods include omission, evasion, and equivocation. Deceiving with omission simply involves selectively withholding information, and this is probably the easiest and most common form of deception. Evasion involves actively steering a conversation away from the withheld information, while equivocation involves ambiguous language open to multiple and erroneous interpretations. While falsification, omission, evasion, and equivocation are not the only ways to deceive, they are the most common.

These four ways to deceive correspond to Grice's (1989) communication maxims of quality, quantity, relevance, and manner. Grice's maxims are reasonable presumptions that people make to make sense of and understand others' communication. Information manipulation theory (IMT; McCornack, 1992) suggests that this correspondence between Grice's maxims and the common types of deception is not mere coincidence. Instead, deception works by exploiting the presumptions that guide everyday nondeceptive discourse. Deception happens when people covertly violate one or more of Grice's four maxims. People are misled because they presume that others are following the maxims that guide communication when they are not. The different presumptions people operate under when making sense of others' messages lead to a useful way to categorize these different types of deceptions, with falsification corresponding to Grice's maxim of quality, omission to quantity, evasion to relevance, and equivocation to manner. Numerous studies have shown that, as specified by IMT, messages that covertly violate Grice's four maxims are perceived as deceptive. Preliminary findings suggest that the conclusions extend across cultures. Successful replications of IMT have been done in Japan, Korea, and Hong Kong.

The four main ways people deceive others is by proving false information, passively omitting or hiding information, actively evading or diverting attention away from the concealed information, and a strategic lack of clarity, which we might call equivocation or obfuscation. None of these are mutually exclusive, and any or all can be used in combination. Also, these are not all-or-nothing categories. People can mix true and false information, disclose all but a small, crucial bit of information, and so on. Considerable shading is possible and perhaps even typical. Also, people do all these things all the time without meaning to be deceptive. These count as deception only when consciously used to mislead.

Prevalence of Deception

Because deception, by definition, involves deceptive intent, many if not most messages that depart from the whole truth and nothing but the truth fall well short of deception. Most communication, for example, is of necessity truncated. If someone asks how you are, a simple "fine" will usually suffice, and a fully disclosive answer is

typically inappropriate. After all, Grice's (1989) maxim of quantity also applies to "too much information" as well as too little. As a consequence, studies assessing the prevalence of "information control" are not necessarily informative about the frequency of deception. Omission, evasion, and inaccuracies are commonplace in conversation, and while this is no doubt true, this is a different issue from deception.

While it is not possible to randomly sample deception, at least two studies provide an idea of how often people lie in everyday life. DePaulo, Kashy, Kirkendol, Wyer, and Epstein (1996) had 70 college students and 70 nonstudents keep a lying diary for 1 week. Over the week, the vast majority of respondents (95%) reported at least one lie, and on average, college students reported two lies per day, while nonstudents reported a single lie per day. For the students, a lie was told in 30% of all interactions, and 20% of conversations for the nonstudents contained a lie. These findings suggest that lying is not only an everyday occurrence but also relatively infrequent compared with nondeceptive communication. If one considers the sheer amount of communication we engage in during the course of a day, one to two deceptive messages is proportionally small.

More recently, Serota and Levine (2008) assessed the prevalence of deception in American life with a different methodology. They asked a nationally representative sample of 1,000 individuals (stratified by age, sex, education, income, and region of the country) if they had lied in the past 24 hours. The mean number of lies per day was 1.65, a value similar to that reported above. The distribution, however, was highly skewed. A total of 60% of respondents reported no lies in the past 24 hours, but a few of those who did lie reported as many as 54 lies. These findings suggest that many people may not lie each and every day, although it is a strong probability that almost everyone lies sometimes. More interestingly, these findings suggest that most lies may be told by a relatively few, very prolific liars. Together with the earlier findings, the conclusion seems to be that lying is prevalent in that we are likely to encounter lies on a daily basis, but it is infrequent in comparison with everyday honest communication. In other words, most people lie sometimes, but most people are more honest than not.

Deception Motives

Despite widespread social and moral prohibitions against deception, deception nevertheless occurs. The question that naturally arises is why do people deceive others?

The answer is that people lie for a reason. Since deception is, by definition, intentional, this must be the case. But knowing what leads people to form deceptive intent tells us something about what happens when people deceive and why they do so. People are prone to deceive others when the truth poses some obstacle to goal attainment. In the absence of some psychopathology, people usually do not deceive when the truth works just

fine. In short, most people follow the maxim "Do not lie if you do not have to" most of the time.

This maxim is consistent with what the noted philosopher and ethicist Sissela Bok (1999) has labeled the "Principle of Veracity." According to Bok, there exists a moral asymmetry between truth and deception. The telling of the truth requires no justification; deceit does. Honesty and trust provide a necessary foundation for human relations and symbolic exchange. Violating these requires ethical justification, whereas adherence does not.

Early work on deception motives worked to classify them in a variety of ways. Categories of deception motives included things such as saving face, maintaining relationships, exploiting others for personal gain or profit, and avoiding conflict. These more specific motives can be grouped according to who benefits from the deception. For some, the motivation for deception can be for self-benefit, for other benefit, or to benefit the relationship. However, none of the goals achieved through deception are unique to deception. That is, the various category systems listing the various motives for deception do not differ from the more general social motivations guiding nondeceptive behavior as well. For example, consider face goals. The goal of a face-maintaining message is not to deceive per se but to manage self and others' face needs, and these ends can be accomplished through both honest and deceptive means. Similarly, virtually all instrumental and relational goals can, depending on the situation, be achieved through both honest and deceptive actions. Thus, deception is best thought of as a possible tactic, strategy, or means for goal attainment rather than a desired end in itself.

The probability of using deceptive rather than honest means for goal attainment is likely conditional on situational features and constraints, not on the nature or type of the goal pursued. According to Bok's (1999) Principle of Veracity, the moral culpability associated with deception creates an initial imbalance in the assessment of deceptive and truthful alternatives, and adopting deceptive means requires justification that is not necessary for truthful means. So while deception is in almost everyone's social repertoire, it is generally employed as a tactical or strategic option of last resort or path of least resistance. People will not be deceptive when the truth is sufficient, efficient, and effective for goal attainment. It is only when the truth poses an obstacle to goal attainment, regardless of what that goal might be, that people entertain the possibility of being deceptive. That is, people are deceptive only when truthful alternatives are more effortful or less efficacious.

Recent research is consistent with the idea that people deceive when the truth makes honest communication difficult. For example, imagine that a friend invites you over for dinner. If you think that the dinner is delicious and delightful, then when asked, providing an honest answer is easy. If, however, you thought that the meal was truly awful, you might lie about how bad it was. DePaulo and Bell (1996) observed people discussing artwork with artists. When they liked a painting that the artist painted, they said so. However,

when they disliked a painting, they tried to downplay that. Similarly, Levine, Kim, and Hammel (2008) conducted a series of studies where people were asked what they would do in situations where either the truth worked just fine or honesty might make goal attainment difficult. People were honest nearly 100% of the time when the situation did not require deception. In situations where the truth was a problem, however, people were deceptive about 60% of the time. So people are not always deceptive when they have a motive, but they are almost never deceptive when they do not have a motive, and the motives that guide both honest and deceptive communication seem to be the same.

Deception Research Methods

The majority of research studies investigating deception seek either to identify behaviors that distinguish truths from lies or to assess people's ability to distinguish truths and lies. The former set is called cue studies, and the latter is called detection studies. Both sets of studies typically use experimental designs, and both require obtaining collections of truths and lies that can either be coded for behavioral differences or be judged for veracity. The important methodological considerations in these types of studies include issues of ground truth, sanctioning, and stakes.

In deception research, ground truth needs to be known with absolute certainty. Ground truth means that the research must know which messages are honest and which are deceptive. Second, unsanctioned lies are usually preferred. Sanctioned lies are made in response to researcher instructions, that is, deceivers are told to lie, whereas unsanctioned lies are ones in which the message sources decide for themselves whether to lie or not. Although most previous deception research has involved sanctioned lies, unsanctioned lies are desirable for reasons of ecological validity and diagnostic utility. For similar reasons, relatively high stakes are usually preferred. The stakes refer to the consequences for the liar if the deception is uncovered. High-stakes lies are presumed to be more arousing, and behavioral differences are more likely to be apparent in high-stakes situations (DePaulo et al., 2003). Whether the study is interactive or mediated on the particular type of scaling used seems to make no difference.

While most deception research involves laboratory experiments, other methods are used as well. Surveys with hypothetical situations, retrospective accounts, and diary studies have all added to the literature.

Theories of Deception

Much of the current thinking about deception has evolved from Paul Ekman's (2001) idea of "leakage." The idea is that (1) there are emotional consequences of deception; (2) emotions are conveyed nonverbally; and (3) emotional

expression is not entirely under conscious control. According to this view, compared with an honest message source, deceivers are likely to experience strong emotions such as guilt and fear of detection. Emotions are largely communicated nonverbally, especially through facial expressions and also through the voice and body language. Deceivers, of course, try to control behavioral displays so as not to give themselves away, but nonverbal cues to deception leak out anyway, often through channels that are thought to be more difficult to control. So leakage refers to inadvertent, unintentional, behaviors that stem from deception and that give away the liar.

According to Ekman (2001), emotional leakage can often be seen in microfacial expressions. Microfacial expressions are momentary signs of emotion that flash briefly on people's faces. The microfacial expressions are hard to see, but according to Ekman, if they can be spotted, they often give away a liar.

The leakage idea was expanded by Zuckerman, DePaulo, and Rosenthal's (1981) four-factor theory. The four-factor framework specifies four internal states that differentiate truths and lies: emotions, arousal, cognitive effort, and overcontrol. Because relative to truth tellers, liars are more likely to experience arousal, emotions such as fear and guilt, cognitive effort, and overcontrol of nonverbal displays, and because each of these internal states is thought to be associated with specific nonverbal behaviors (e.g., increased cognitive effort leads to long response latencies), clues to deception are leaked nonverbally.

The most recent iteration of this thinking is reflected in interpersonal deception theory (IDT; Buller & Burgoon, 1996). Liars strategically present themselves as honest but nonstrategically leak deception cues. Message receivers pick up on these cues and become suspicious. Liars, however, pick up on leaked suspicion and strategically adapt. So do receivers. Net accuracy depends on the liar's encoding skill relative to the receiver's decoding skill and how the interaction progresses over time.

Deception Cues

Nonverbal Cues

Most past and current deception theory holds that, relative to truth, deception provokes arousal, it leads to various emotional responses such as guilt and fear of getting caught; it is cognitively effortful, and liars try harder to monitor their performances than honest people. These factors should lead to systematic differences in nonverbal behavior that distinguish deceivers from their honest counterparts. Behaviors that actually differentiate truth tellers and liars are called authentic deception cues.

These authentic cues can be distinguished from stereotypical deception cues and decoded-as-deception cues. Stereotypical deception cues are those behaviors that

people believe signal deception. So if we did a poll and asked people, “How can you spot a liar?” the answers would reflect stereotypical cues. Now, imagine we had people watch others and we asked them if they thought the people were lying. Then, we could look at what the people who were believed were doing differently than those who were seen as deceptive. Those behaviors that differentiate honest-looking people from those seen as deceptive are labeled decoded-as-deception cues.

Interestingly, research indicates that stereotypical deception cues and decoded-as-deception cues are not always the same. This indicates that people are often not aware of which cues they are using to assess honesty and deceptiveness. Furthermore, research shows that neither stereotypical deception cues nor decoded-as-deception cues map nicely onto authentic deception cues. That is, what people think liars do, what liars actually do, and what people use to infer deception lead to three different lists that lack strong correspondence.

A noteworthy example is the case of eye gaze. Most readers have probably heard the expression that a liar won't look you in the eye. Perhaps the reader has even asked someone to look him or her in the eye to be sure that the person was being honest. Interestingly, this belief is surprisingly widespread. Bond and colleagues (2006b) asked people in 75 different countries about how to spot a liar. The “liars won't look you in the eye” belief was, by far, the most common answer worldwide. People everywhere believe this. But decades of nonverbal cue research has shown this to be absolutely false (DePaulo et al., 2003). There is no link at all between eye gaze and actual deception. Eye gaze is a stereotype that has no basis in reality, and someone looking you in the eye or not has no diagnostic utility.

Research shows that although people believe that deception is signaled by nonverbal behavior and that people use nonverbal behaviors to form opinions about the honesty of others, no surefire nonverbal deception indicator exists. DePaulo and colleagues (2003), in the most extensive review to date, summarized the results of 116 different studies of 158 different deception cues. The vast majority of nonverbal cues were unrelated to deception, and of the few that were different, the differences were small. On average, deceivers did exhibit more vocal tension, a higher pitch, more fidgeting, fewer gestures, and less facial pleasantness than truth tellers. Again, the differences were small. Thus, research to date has failed to find nonverbal behaviors that have much diagnostic utility.

Verbal and Linguistic Cues

Most deception involves the use of words, so there are verbal differences between honest and deceptive messages. Most deception involves some elements of falsehoods, omissions, evasive language, or equivocal language. The telling of deceptive falsehoods and the strategic omission of information, however, are difficult to spot

unless one knows either the speaker's true motivation or what the truth really is. The problem is, when we are being deceived, we know neither.

DePaulo and colleagues' (2003) cue research finds that there are no surefire verbal behaviors that always signal deceit. However, compared with nonverbal behaviors, verbal behaviors are more diagnostic. Lies, relative to truths, tend to provide fewer details; they are less logical, less plausible, and exhibit less verbal immediacy. While the nonverbal differences between truths and lies might be characterized as small effects, these verbal differences are moderate to large. Thus, research suggests that one way to spot a lie is to simply apply common sense. Does what is said make sense? If little information is provided and it does not sound reasonable, maybe it isn't. The catch, of course, is that some lies are quite plausible, well constructed, and compelling. Nevertheless, critically listening to content can help spot poorly crafted lies.

Statement validity analysis and reality monitoring approaches presume that truthful and deceptive accounts will systematically differ because of differences between true memories and fabricated stories. For example, the language used to describe an authentic memory should be higher in imagery, emotional connotation, and contextual information than that describing an imagined event. Consistent with these views, several studies report statistically significant differences in language usage that differentiate truthful and deceptive messages.

More recently, computer-based linguistic software has been used to examine differences between honest and deceptive language. So far, every study has reported that linguistic differences between truths and lies exist, but none of the findings have replicated from one study to the next. So while verbal and linguistic analysis seems more promising than nonverbal cues, research is far from conclusive.

Deception Detection Accuracy

Research finds that people are not very good at detecting deception. In fact, the finding that people are statistically significantly, but only slightly, better than chance at detecting deception is perhaps one of the most reliable and well-documented findings in all of social science. Meta-analysis of more than 200 separate lie detection experiments finds that people are, on average, about 54% accurate when they have a 50-50 chance of being right (Bond & DePaulo, 2006a). The results of most individual studies fall within $\pm 10\%$ of this across-study average (i.e., between 45% and 65%). Not surprisingly, this finding has become very widely accepted among deception researchers.

More recently, Bond and DePaulo (2008) looked at the variance in accuracy judgments rather than just average accuracy levels. This research divided accuracy scores into four components: demeanor, truth bias, transparency, and

ability. Demeanor is the tendency of a person being judged to appear honest (or deceptive), independent of whether or not he or she is lying. Variance in demeanor means that some people are just more believable than are others. Truth bias is the tendency to believe others whether or not they are telling the truth. Individual variance in truth bias means that some people are more gullible than others; others are more skeptical. Transparency refers to people who are good or bad liars. That is, people who are transparent liars tend to leak the fact that they are lying and are therefore relatively easier to detect. Finally, ability is an individual difference in skill at telling if someone is lying or not. Thus, demeanor and transparency reflect sources of sender variance, while truth bias and ability reflect variance in message receivers. Furthermore, demeanor and truth bias reflect different sources of bias; in other words, our tendencies to believe (or not) are independent of actual honesty, whereas transparency and ability reflect variance in the ability to discriminate correctly between honest and deceptive messages.

Bond and DePaulo (2008) found that variance in demeanor is huge, both in an absolute sense and relative to other sources of variation. Some people are just much more believable than are others, and this aura of believability has a large impact on how people perceive them. There are also substantial individual differences in truth bias, with these differences being much smaller than the variance in demeanor but much larger than the other two factors. So some people are more gullible than are others, while others are more suspicious. Research on generalized communicative suspicion (GCS; Levine & McCornack, 1991) assesses this factor as a communication trait. Finally, the variance in transparency is much larger than the variance in ability. Individual differences in ability contribute little (maybe only $\pm 1\%$ or 2% in overall accuracy). Thus, variance in believability and accuracy stems more from the target person (the person being judged who is lying or not) than the person judging the message, and the variance in bias swamps variance in ability. This explains why accuracy values across studies are so stable. The lack of individual differences in ability leads to small standard errors and stable findings.

Factors Affecting Accuracy

The slightly better-than-chance accuracy finding is very consistent, so not surprisingly there are few variables that affect accuracy. Those variables that do affect accuracy tend to have a relatively small impact. For example, nonverbal training improves accuracy only slightly, on average leading only to a 4% improvement in raw accuracy (Frank & Feeley, 2003). Variables that have little consistent impact on accuracy include source expertise/occupation, source-receiver relationship, extent of interaction, question asking, and whether honesty values are scaled or dichotomous. Common sense might suggest that the better

we know someone, the better will we be able to tell when they are lying. This is false. Relationship closeness has little impact on deception detection accuracy (McCornack & Parks, 1986). Or, as another example, if we ask probing questions, one would think that accuracy might improve. Again, research suggests that this is false. Research finds that asking questions, or even hearing another person questioned, compared with a lack of questioning, makes no difference in the ability to distinguish deceptive from honest answers (Levine & McCornack, 2001). Instead, both knowing the other person and hearing probing questions answered makes people more likely to believe the answer, regardless of actual honesty.

Reasons for (In)Accuracy

There are several reasons why people tend to be inaccurate lie catchers. First, there do not appear to be any strong, cross-situation behavioral cues that would make high accuracy possible. Although statistically reliable cues to deception are observed across studies, these are too inconsistent to be of much use in detecting specific instances of deception (Levine, Feeley, McCornack, Harms, & Hughes, 2005). Second, people pay attention to cues that lack diagnostic utility. For example, there is a widely held, cross-cultural belief that liars do not look other people in the eye, yet truth tellers and liars do not differ in eye behavior, and eye gaze has no diagnostic utility. Third, research designs preclude much potentially useful information. Research indicates that when people do detect lies, it is often done well after the fact and on the basis of information gained other than at-the-time verbal and nonverbal behavior (Park, Levine, McCornack, Morrison, & Ferrara, 2002). Instead, detection is often based on inconsistencies with prior knowledge, information from third parties, and physical evidence. Such information is not available in most deception detection experiments. Fourth, people are overconfident of their ability to detect deception. People tend to think that they can detect others' lies, but confidence is not related to actual accuracy (DePaulo, Charlton, Cooper, Lindsay, & Muhlenbruck, 1997). Finally, people are often truth biased and often fail even to consider the possibility of deceit (Levine, Park, & McCornack, 1999).

Truth Bias

Another reliable finding from the accuracy literature is truth bias. Truth bias is the tendency to judge messages as honest, independent of actual message veracity (Levine et al., 1999). Although there are individual differences in truth bias, it also exhibits a strong situational component. Research finds that truth bias tends to be stronger when people are interacting with others they know and trust; it is stronger in face-to-face interaction when the communication is mediated, and it is weakened by situational factors increasing suspicion.

Importantly, however, truth bias is reliably observable and has substantial impact across both individuals and situations. That is, truth bias varies in degree from person to person and situation to situation, but despite these differences, most people are truth biased most of the time.

There are at least three important reasons behind the strength and persistence of truth bias. First, truth bias stems, in part, from innate, hardwired, cognitive systems that govern how we process incoming information (Gilbert, 1991). Belief is a mental default, and while people can reject information as false, doing so requires additional cognitive resources and processes subsequent to comprehension. Doing otherwise would require a less efficient cognitive system, and thus there is likely an evolutionary basis for truth bias. Second, communication requires truth bias. If one questioned the veracity of everything others told us, communication could not operate. Making sense out of what others say requires a presumption that they are cooperating in the communication (Grice, 1989). Finally, humans are social, and getting along with others requires some degree of trust, coordination, and consideration. People give others considerable leeway so that social interaction is not disrupted.

The “veracity effect” (Levine et al., 1999) is an important implication of truth bias. The veracity effect refers to the finding that accuracy for truthful messages is usually higher than accuracy for lies. This follows from truth bias. Because people are truth biased, people are more accurate for truths than for lies, and therefore source veracity affects detection accuracy. Consistent with the veracity effect, when accuracy is calculated separately for truths and lies, truth accuracy tends to be well above 50%, while lie accuracy is often below 50%. This also means that accuracy depends on the number of judgments of truths and lies. The 54% detection accuracy finding only applies to experiments where there are an equal number of truths and lies. As the proportion of messages that are honest increases, so does accuracy, but accuracy declines predictably when most messages are deceptive (Levine, Kim, Park, & Hughes, 2006).

How People Really Detect Lies

According to a study titled “How People Really Detect Lies” (Park, Levine, McCornack, Morrison, & Ferrara, 2002), all judges in most of these experiments have to go on is the at-the-time verbal and nonverbal behavior of the message sources. Outside the research lab, however, people can check the facts, talk to others, and so forth. Consequently, lies outside the deception lab are most often detected well after the fact and by discovery methods other than verbal and nonverbal source behaviors at the time of deception. Park and colleagues (2002) simply asked participants to recall a lie that they had detected, to describe what happened, how they found out that the person was lying, and how much time had elapsed between

the telling of the lie and its detection. Only 2% of the recalled lies were caught at the time of the telling, based on source verbal and nonverbal behaviors. Most were detected after the fact, often much later, and discovery methods often included information from others, physical evidence, and later confessions.

Future Directions

There are several directions for future research on deception. First, almost all research on the topic has been done either in North America or in Europe. Very little comparative or indigenous research exists outside Western cultures. Remedying this is probably the most pressing issue for deception research.

Second, deception research desperately needs new and better theory. Current leakage-based theories have produced limited yield, and alternatives are needed.

Third, deception research needs to study deception from a more interactive perspective. Previous cue research shows little in the way of universal deception cues, and detection research finds meager accuracy. However, there may exist strategies that a questioner can use to prompt deception tells. For example, the behavioral analysis interview is an investigative technique developed and taught by John E. Reid and Associates, Inc. It is a nonaccusatory interview that tries to bait potential suspects into providing incriminating information. Future research should shift the focus from passive observation of cues to strategic veracity assessment.

Finally, recent technologies in brain scanning hold potential for detection deception. Although less than perfect, at present, the polygraph remains the most accurate deception detection device. New technologies such as functional magnetic resonance imaging (fMRI) will be increasingly the focus of investigation in the future.

Conclusion

A substantial and intriguing literature exists on topics related to deceptive communication. Deception is when someone knowingly misleads another person or persons. Lying is discouraged in every human culture, yet most people lie at least once a week if not daily. Thus, deception is a common occurrence, although it is infrequent in relation to honest communication. People deceive others when the truth proves problematic, and most people learn to do this by age 5.

Research has failed to uncover any reliable, diagnostically useful set of behaviors that can be used to distinguish truths from lies. Deception theory predicts that people unintentionally leak such deception cues, but the findings of research looking for cues fail to replicate from study to study. Deception cue research has focused heavily on nonverbal behavior,

but recent findings suggest that research on verbal behaviors holds more promise.

Research looking at people's ability to detect deception yields much more consistent findings. People are significantly, but only slightly, better than chance at detecting deception. When the chance level is 50%, people average 54% accuracy, with the results of most studies falling within $\pm 10\%$. Despite this poor performance, people believe that they can tell when others lie to them. That is, people are overly confident in their deception detection abilities. Instead, while some people are much better liars than are others, there is less variance in detection ability. Finally, people are almost always truth biased. They tend to believe others independent of whether the person is honest or not. As a result, people are usually correct in believing honest others but tend to mistake lies for truths. This is probably just as well because the tendency to believe what others say allows communication to function and is thus highly adaptive.

BIAS

ANDREW CLINE

Missouri State University

Human communication always takes place in a context, through a medium, and among individuals and groups situated historically, politically, economically, culturally, and socially. This state of affairs is neither bad nor good. It simply is. Bias is a small word that identifies these influences.

All forms of communication are subject to multiple biases—personal biases, psychological biases, political biases, and cultural biases. Bias is generally thought to cause distortion in messages that might otherwise be delivered and received in some pure or true form. The antidote for bias is supposed to be something called objectivity. There are two senses in which to understand objectivity in communication. First, objectivity, similar to the scientific method, is an inductive process of gathering facts and presenting the truth based on those facts. Objectivity may also be understood as the “worthy” but impossible philosophical ideal of observing and describing reality “as it is” instead of how we wish it to be.

If bias exists, if communicators and audiences have social, political, cultural, and economic histories they cannot escape, then a pure or true form of a message cannot exist. As-it-is objectivity cannot exist. That said, human beings can be made aware of their biases and learn to mitigate them in communication. One could argue, however, that the desire to mitigate bias, and the techniques used to do so, simply introduces new biases into the message.

Some communicators speak from positions of political, economic, social, or cultural power. Politicians, for example, speak from positions of political power. They are certainly biased in favor of their ideological positions, and they may even be overtly partisan. They belong to parties and espouse dogmas and policies. And while they may think their individual ideologies are simply common sense,

they understand that they speak from political positions. Citizens expect bias from politicians.

But what about powerful communicators who would have us believe that they speak the truth from a position of objectivity? Academics, for example, conduct research using well-established methods of inquiry that they believe help them develop theories about how the world works. Because academics are people constrained by the same influences as others, bias can be found in their messages.

The problem with bias is not that it exists, nor is it that bias somehow pollutes an otherwise pure message. The problem with bias is that it may distort a message sold to an audience as “objective.” What happens when the form of the message persuades us that the information is truthful yet the bias of the speaker distorts the truth?

This chapter will explore the role of bias in communication, focusing on the news media because it is in the arena of public affairs that the problems of bias seem most acute. Journalists attempt to get the facts and tell the facts without distortion. But this is clearly impossible because every act of communication requires some sort of structuring. Journalism is a heavily structured form. It is within the communicative structures of journalism that we find some interesting biases. At the dawn of the 21st century, the news media play a central role in politics and the so-called culture war, in which the clash of ideologies is often simplistically reduced to left versus right or liberal versus conservative.

Theory

Bias is a tendency, an inclination, or a bent that makes it difficult for us to communicate without prejudice. Bias indicates influences built into human cognitive and communicative abilities.

Theorists in cognitive science, such as Johnson and Lakoff (1999), contend that the human cognitive system is based on a human's unique physical relationship to the world. For example, people walk upright and see the world with bifocal, forward-facing eyes. As a result, and with a few interesting exceptions, people across cultures tend to speak of the "good" as being a state of "up" and the future as a place "ahead" on the path. People have the ability to name and categorize the objects and sensations they encounter and use metaphor to compare objects and sensations. Comparison leads to evaluation—the determination of good or bad. And such evaluations lead to bias.

Bias, then, may play an important role in human evolution. Consider the hypothetical example of an early human tribe encountering a new environment. Their ancestors had long since learned that animals of a particular kind eat people. They learned to identify and categorize these animals by distinct characteristics that separate them from other more useful or less dangerous animals. The dangerous kind hunt and kill prey, with forward-facing eyes, sharp claws, and large teeth. As the tribe explores the new environment, they encounter a strange animal. But they notice that it moves with the same smooth ease as the man-eaters they have left behind. They notice that it has forward-facing eyes, long teeth, and paws that possibly hide retractable claws. It is unlikely that they will approach this animal for a closer look. It is far more likely that they will ready their weapons to defend themselves. And one reason for this will be bias—a prejudice against animals with the characteristics of a man killer.

This process is also known as stereotyping—making an evaluation about a new person, object, or sensation based on comparisons and generalizations following from those comparisons.

In the case of our exploring tribe, bias plays an important role in keeping its members alive by helping them create new knowledge. Bias allows them to compare the new objects they encounter with similar objects from their former home. And these comparisons allow them to evaluate the new objects before actually studying them. So bias and prejudice were important, early defense mechanisms, and the source of rational evaluations of new experiences.

Furthermore, bias plays a role in reproducing culture. Suppose that this tribe believes that the new creature is connected in some important way to powerful gods. Encountering the new animal may certainly create a dangerous situation, but it almost as certainly creates an interesting cultural moment: The powerful gods they fear and worship apparently inhabit this new land, too. And so they are able to impose their culture onto the new environment. They will be able to think and talk about their new surroundings in familiar ways. The things that they know to be good will remain good. The bad will remain bad.

Bias works in similar ways today. For example, suppose you enjoy live theater and prefer such entertainment to the movies. You might argue, in a discussion with friends, that the live performance of a particular work is far superior to the film

version. Your bias in favor of live theater could cause you to overlook fine qualities in the film version. If you tend to speak about theater in consistently positive terms and speak about film in consistently negative terms, then your bias may be the cause. Your bias might even cause you to make sweeping generalizations about the quality of theater versus film.

A simple preference for live theater, however, may not be the only source of your bias. Perhaps you were raised by parents who actively promoted theater and disparaged film as low-brow entertainment. Perhaps they even made rude comments about the cultural norms and morals of people who enjoy the movies. Perhaps, as a result, you grew up believing that theater people are better than film people—associating theater with certain levels of education or a certain social and economic status. As a result of your upbringing, you may believe that movies are harmful to a proper culture.

All these influences—including family, socioeconomic status, and culture—contribute to your worldview or ideology. Ideology is the screen through which people see the world and make sense of it. Ideology is one of the foundations on which biases are built. So in addition to stereotyping, you may also think of bias as partly an outward expression of a worldview.

Bias of nearly any particular sort often appears to be merely common sense to the individual because of the role ideology plays in the formation of bias. Common sense is the feeling that an idea is true simply because it is painfully obvious. What makes it painfully obvious is ideology. Bias occurs in a message when you use common sense as your guide.

But suppose you have a plan. It is your goal to promote live theater and to denigrate film. So you start a weblog and write about how wonderful theater is compared with the swill offered by the movie industry. Furthermore, you make it a point to introduce the topic in discussions with people you meet. And you plan one day to write a book and appear as a guest on television talk shows so that you can further your goal of promoting theater over film. Such an effort may certainly fit your ideology, but it is not the result of bias. Instead, you would be engaged in propaganda—the systematic propagation of a doctrine or belief. In other words, if you are doing it on purpose, it is not bias. Bias is not intentional.

Methods

It is not possible to list all the things that influence a speaker and his or her message. Some influences, however, will be more important than others. And identifying these important influences—making the evaluation of important versus unimportant—will be subject to the biases of the investigator or critic.

The first consideration in evaluating a message for bias is understanding the complexities of the "rhetorical situation." This concept identifies the circumstances under which a speaker chooses to speak. The concept relies on understanding a moment called "exigence," in which something happens, or fails to happen, that compels one to

speak. For example, if the local school board fires a popular principal, a sympathetic parent might then be compelled to take the microphone at the board meeting. Bitzer (1968) defined the rhetorical situation as the

complex of persons, events, objects, and relations presenting an actual or potential exigence which can be completely or partially removed if discourse, introduced into the situation, can so constrain human decision or action as to bring about the significant modification of the exigence. (p. 6)

The following are eight of the elements of the rhetorical situation:

1. *Exigence*: What happens or fails to happen? Why is one compelled to speak out?
2. *Persons*: Who is involved in the exigence, and what roles do they play?
3. *Relations*: What are the relationships, especially the differences in power, between the persons involved?
4. *Location*: Where is the site of discourse? For example, a podium, newspaper, Web page, or street corner.
5. *Speaker*: Who is compelled to speak or write?
6. *Audience*: Who does the speaker address and why?
7. *Method*: How does the speaker choose to address the audience?
8. *Systems and institutions*: What are the rules of the game surrounding and constraining numbers 1 through 7?

Analyzing the rhetorical situation (which, at its most fundamental, means identifying the elements above) can tell us much about speakers, their situations, their persuasive intentions, and any biases they may have in regard to the situation.

Bias may also be studied beginning with one or more of four broad categories: ethnocentrism, in-group/out-group, stereotypes, and systems. These categories offer investigators a way to understand bias in terms of how the speaker is situated according to circumstances such as culture and racial/ethnic identity and according to direct influences on thinking such as group membership or professional practice.

Ethnocentrism

Everyone is part of a culture. The discipline of anthropology demonstrates that culture consists of the combined ways of being of a group of humans that must be reproduced from generation to generation, including mythology, art, politics, language, and traditions. Cultures generally consist of people of like ethnic background. Culture teaches a people how the world works and why. Cultures, in other words, reproduce ideology.

Cultural ideology appears to the members of the culture to be truth and common sense.

What is the “American way”? That term roughly identifies classical liberalism: representative government, self-determination, free markets, rule of law, and civil liberties. Americans are proud of this cultural tradition. Many Americans believe that the American way is really the only way, assuming that other people in the world would live similarly if only they learned how great the American way is. And Americans often find it surprising when people of other cultures reject the “gifts” of classical liberalism. There is nothing surprising about it. For many other cultures, it is truth and common sense that the fruits of American culture are poisoned.

Ethnocentrism, and the commonsense understanding of culture that drives it, sometimes leads people to assume that the words and deeds of those from other cultures are driven by irrationality at best and evil at worst. Bias based on ethnocentrism may then appear in the way a speaker assigns motive to those of a different culture in comparison with his or her own culture. The speaker may use consistently positive terms to describe the motivations of his or her own culture and consistently negative terms to describe the motivations of another culture.

In-Group/Out-Group

Related to ethnocentrism are the concepts of in-group bias and out-group bias. Humans are social creatures and love to associate with fellow humans in numerous ways. Some groups form by choice—clubs, political parties, professions. The members of other types of groups belong whether they want to or not—age groups, gender, race. In-groups are associations of like members, and out-groups are either an opposing group or the entirety of the population not “in.”

Members of political parties belong by choice—choice driven by a number of historical, cultural, and familial factors. Part of what defines a group such as a political party is its ideology, which will naturally differ slightly or drastically from the ideologies of other parties. In other words, members of Party A are likely to see the world differently from members of Party B. They are likely to believe that their way of seeing the world is the truth and common sense. Members of Party B may be thought of as mistaken or, in extreme cases, as dangerous or evil.

Biases based on in-group and out-group associations work in ways very similar to ethnocentrism. A speaker may use consistently positive terms to describe the motivations of his or her own group and consistently negative terms to describe the motivations of another group.

Stereotypes

One of the smart things humans do is place everything they encounter into categories. It is an important way of

understanding the world. The first reaction to a new object or experience is to compare it with something else already known in order to make sense of it. And if the comparison is close enough, people metaphorically and mentally place it into the box with the appropriate label—a category.

One of the mistakes people make concerning categories is assuming that objects or experiences in a category are similar in other ways or all ways. Consider the category “teenager,” for example. All members of the category belong, if they are aged 13 to 19. Now, further suppose that you shop at the local mall and often encounter teenagers there who disrupt the social scene with obnoxious behavior. You further notice that people outside the category “teenager” do not seem to behave similarly. To assume, then, that all teenagers are obnoxious is to engage in stereotyping. To act with regard to this stereotyping—treating all teenagers you meet with contempt—is to engage in prejudice. If you speak about teenagers in consistently negative terms and assign negative motivations to their actions, then you are biased against teenagers.

As in the example of the early human tribe demonstrated above, however, stereotyping and prejudice are not necessarily always bad. Even the current example—concern about the behavior of teenagers at a mall—might not be entirely ill considered.

Systems

A system is any method or procedure, based on an ordered collection of facts and/or principles, aimed at producing a desired result. A system may also be a collection of coordinated objects that together create a technology aimed at producing a desired result. Systems introduce bias into a message because people use systems to create and deliver messages.

Journalism, for example, is a profession in which its members may feel a strong connection in terms of professional identity. Such identity could lead to various biases based on the individual journalists being part of an in-group. But journalism also has a regular system of procedures that dictate what journalism is and how the would-be journalist should produce it. The system of journalism—the norms of its professional practice—exerts a large measure of control over the kinds of messages a journalist may produce.

For example, journalists structure hard news articles (breaking news about immediate events) using the “inverted-pyramid” concept: The first two or three paragraphs answer the six reporter’s questions: who, what, when, where, why, and how. This also happens to be the rough order in which most journalists use them because people appear to be affected by events happening now in a particular place for a particular reason and by a particular means. The events of the world and the human reactions to those events do not usually unfold in so neat a fashion as this structure. Hard news is biased toward a story of the world in which complex, and often ambiguous, events are presented in a simple hierarchy of importance.

Furthermore, journalists use various technological systems that introduce bias into the message. Television is a visual medium. Good journalism practiced in the medium of television is defined by the quality of pictures and sound. Some news situations are easily covered by television, for example, fires, car wrecks, protests, and mayhem of all sorts. There is an old saying in television news: “If it bleeds, it leads.” This may seem a cynical expression of journalistic pandering to the lowest common denominator. But it also demonstrates that television demands a certain type of content to be good television. The journalist who would hope to work in television is then encouraged to adopt the biases necessary to make it work.

Applications

The study of bias in communication is largely the study of texts by qualitative and quantitative methods. The news media provide an excellent opportunity to study bias. First, the news media produce an ever-expanding textual record of our world. And this record is captured and stored electronically, making it easy to find and study. Second, the charge of bias in the news media plays a role in the politics of the early 21st century. Most Americans experience politics through journalism, whose practitioners assert that they gather and present facts fairly, attempt to speak objectively, and deliver a message necessary to make democracy work.

Journalists, like politicians, speak from political, social, cultural, and economic positions, but usually not overtly, unless they are opinion journalists—columnists and pundits who are expected to interpret what they report. Journalists believe in the ethics of fairness and objectivity. These ethics have a strong influence on the profession. Fairness is understood as “getting both sides of the story.” In other words, journalists try to be fair by making sure that interested parties in a news situation have a say in the story. Journalistic objectivity is not the pristine objectivity of philosophy. Instead, a journalist attempts to be objective by two methods: (1) fairness to those concerned with the news and (2) a professional process of information gathering that seeks fairness, completeness, and accuracy.

It might seem that these journalistic ethics, and the process that supports them, would help reporters avoid bias and charges of bias. It might seem that journalistic practice is set up specifically to avoid bias. But the press today is often thought of as a unified voice with a distinct bias (right or left depending on the critic). This may be simplistic thinking that fits the needs of ideological struggle. Perhaps it is not useful in coming to a better understanding of what is happening in the world. Groups such as Accuracy in Media (AIM) and Fairness and Accuracy in Reporting (FAIR) thrive by critiquing the news media, based on opposite charges of bias—AIM charging liberal bias and FAIR charging conservative bias.

It should surprise no one that some charges of bias are politically motivated. Such motivation, however, does not

explain why 69% of Americans believe that the news media are politically biased (Pew Survey Report, 2000). Instead, the answer is generally quite simple: Bias affects all parties in a communicative situation. Bias affects the messages speakers deliver. An audience's own biases affect what it hears.

For citizens and researchers, it is important to develop the skill of detecting bias. Begin with a set of critical questions as follows:

- What is the speaker's sociopolitical and cultural position? A given speaker may certainly have political or cultural intentions for a message. These intentions are not the source of bias. Instead, bias will arise from commonsense assumptions that spring from the speaker's sociopolitical and cultural position.
- With what professional, social, ethnic, or culture groups is the speaker identified? Group members learn the biases of their group. In an important sense, a group's biases, springing from its structure and worldview, define what the group is and who belongs to it.
- Does the speaker have anything to gain personally, professionally, or politically from delivering the message? Money, power, and prestige also play an important role in bias.
- Who is paying for the message? Where does the message appear? Who stands to gain?
- What sources does the speaker use, and how credible are they? Does the speaker cite statistics? If so, how were the data gathered, who gathered the data, and are the data being presented fully?
- How does the speaker present arguments? Is the message one-sided, or does it include alternative points of view? Does the speaker fairly present alternative arguments? Does the speaker ignore obviously conflicting arguments?
- If the message includes alternative points of view, how are those views characterized? Does the speaker use positive words and images to describe his or her point of view and negative words and images to describe other points of view? Does the speaker ascribe positive motivations to his or her point of view and negative motivations to alternative points of view?

Bias in the News Media

Much recent research demonstrates that simply deciding how to measure bias is difficult to do when dealing with a journalistic piece—a text with a complex rhetorical situation. This difficulty is compounded by audience reactions to the journalistic text. One study demonstrated, for example, that partisans of opposing camps both detect bias against them in the same news coverage (Vallone, Ross, & Lepper, 1985). Another study (Domke, Watts, Shah, & Fan P, 1999) suggests that the liberal-bias argument used during presidential campaigns is partly strategic and occurs most often when coverage of conservatives is favorable or a conservative candidate has a news advantage (i.e., sustained favorable coverage). Furthermore, a recent study found that the perception of bias in the news media was related to the number of charges and amount of coverage of bias but not to actual

bias (D'Alessio, 2003). Another study in the same year, however, showed that personal discussions of political bias among like-minded people led to perceptions of bias in the news media (Eveland & Shah, 2003).

Perhaps more important than charging political bias is studying the inherent, or structural, biases of journalism as a professional practice—especially as mediated through television.

- *Commercial bias*: The news media are money-making businesses. As such, they must deliver a good product to their customers to make a profit. The customers of the news media are advertisers. The most important product the news media delivers to its customers are readers or viewers. The news media are biased toward news that draws readers and viewers.
- *Temporal bias*: The news media are biased toward the immediate and the fresh. To be immediate and fresh, the news must be ever-changing even when there is little news to cover.
- *Visual bias*: Television is biased toward visual depictions of news. Television is nothing without pictures. Legitimate news that has no visual angle is likely to get little attention. Much of what is important in politics—policy—cannot be photographed.
- *Bad news bias*: Good news is considered boring. This bias makes the world look like a more dangerous place than it may actually be. Plus, this bias makes politicians look far more crooked than they may actually be.
- *Narrative bias*: The news media cover the news in terms of “stories” that must have a beginning, a middle, and an end—in other words, a plot with antagonists and protagonists. Much of what happens in our world, however, is ambiguous. The news media apply a narrative structure to events, suggesting that these events are easily understood and have clear cause-and-effect relationships. Good storytelling requires drama, and so this bias often leads journalists to add, or seek out, drama for the sake of drama. Controversy creates drama. Journalists often seek out the opinions of competing experts or officials to present conflict between the two sides of an issue. Last, narrative bias leads many journalists to create, and then hang onto, master narratives—set story lines with set characters who act in set ways. Once a master narrative has been set, it is very difficult to get journalists to see that their narrative is simply one way, and not necessarily the correct or best way, of viewing people and events.
- *Status quo bias*: The news media believe that “the system works.” During the “fiasco in Florida” following the 2000 presidential election, the news media were compelled to remind Americans that the Constitution was safe, the process was working, and all would be well. The mainstream news media never question the structure of the political system. The American way is the only way, politically and socially.
- *Fairness bias*: Ethical journalistic practice demands that reporters and editors be fair. In the news product, this bias manifests as a contention between/among political actors (also see “Narrative bias” above). Whenever one faction or politician does something or says something

newsworthy, the press is compelled by this bias to get a reaction from an opposing camp. This creates the illusion that the game of politics is always contentious and never cooperative. This bias can also create situations in which one faction appears to be attacked by the press. For example, Politician A announces some positive accomplishment, followed by the press seeking a negative comment from Politician B. The point is not to disparage Politician A but to be fair to Politician B. When Politician A is a conservative, this practice appears to be liberal bias.

- *Expediency bias*: Journalism is a competitive, deadline-driven profession. Reporters compete among themselves for prime space or air time. News organizations compete for market share and reader/viewer attention. And the 24-hour news cycle—driven by the immediacy of television and the Internet—creates a situation in which the job of competing never comes to a rest. Add financial pressures to this mix—the general desire of media groups for profit margins that exceed what is “normal” in many other industries, and you create a bias toward information that can be obtained quickly, easily, and inexpensively. Need an expert or official quote (status quo bias) to balance (fairness bias) a story (narrative bias)? Who can you get on the phone fast? Who is always ready with a quote and always willing to speak (i.e., say what you need them to say to balance the story)? Who sent a press release recently? Much of deadline decision making comes down to gathering information that is readily available from sources that are well-known.
- *Glory bias*: Journalists, especially television reporters, often assert themselves into the stories they cover. This happens most often in terms of proximity, that is, to the locus of unfolding events or within the orbit of powerful political and civic actors. This bias helps journalists establish and maintain a cultural identity as knowledgeable insiders (although many journalists reject the notion that follows from this—that they are players in the game and not merely observers). The glory bias shows itself in particularly obnoxious ways in television journalism. News promos with stirring music and heroic pictures of individual reporters create the aura of omnipresence and omnipotence. Consider the use of the satellite phone with regard to glory bias. Note how often it is used in situations in which a normal video feed should be no problem to establish. The jerky pictures and fuzzy sound of the satellite phone create a romantic image of foreign adventure.
- *Class bias*: Journalists used to be working class. Early in the 20th century, the average journalist had a high school education and made a working-class wage. By midcentury, college graduates began showing up in newsrooms at America’s largest newspapers. But the working-class attitude persisted. The class status of journalism turned a corner in the 1970s. Reporters at smaller daily newspapers now have college degrees. And along with these degrees come greater earning power and a white-collar, middle-class lifestyle. Further separating journalists from the working class and poor is the ongoing move by corporate newspaper chains to cut back circulation among the poorest citizens because advertisers do not care to reach people without discretionary income. The result is that journalists, for the most part, have

become socially, economically, politically, and culturally separated from the poor and the working class.

Structural Bias as Theory

Some critics of the press think of it as speaking with a unified voice with a distinct ideological bias. A better understanding requires a theory. A theory offers us a model that tells us why things happen as they do. Furthermore, a theory allows the user to predict outcomes and behavior. Assertions of ideological bias do neither. While the press does demonstrate ideological biases with regard to certain issues or other localized phenomena, these and other behaviors are explained and predicted by the structural biases. Since the press sometimes demonstrates a conservative bias, asserting that the press is liberal neither predicts nor explains. Since the press sometimes demonstrates a liberal bias, asserting that the press is conservative neither predicts nor explains.

Test this for yourself. Choose a situation that is current—preferably breaking right now. For each of the structural biases listed above, write down what you would expect the press to do, based on that bias. Then, complete the exercise with a concluding statement that takes into account as many of the structural biases as possible. Now, follow the situation as the news event plays out. Collect texts from numerous sources—local and national. The Associated Press is an especially useful organization to study because its structural and stylistic norms have been adopted by most news organizations.

Compare the evidence from the texts with the predictions you made. Were your predictions correct?

This exercise can also become the basis for original research in communication generally and the news media specifically. Any professional communication will operate with normative practices that define the communication. Those normative practices are the source of structural biases. Furthermore, the culture of the profession will dictate other structural biases. In the list of structural biases of journalism, note that some (e.g., temporal and narrative) spring from normative practice and others (e.g., expediency and class) spring from the culture of the newsroom.

Future Directions

Among the social sciences, the discipline of psychology pays the closest attention to the concept of bias. Three of the four general categories for studying bias—ethnocentrism, in-group/out-group, and stereotypes—come directly from this field. Bias in communication from a communication perspective offers a wide-open opportunity for the student researcher. Bias is understudied in communication.

Part of the problem, as mentioned above, is that a good metric for determining bias does not exist. Textual analysts may certainly detect, describe, and theorize about various forms of bias in a given text. But as yet no measure exists for determining bias in broad classes of texts such as journalistic writing.

Niven (1999), however, has suggested a technique for comparing the performance of specific news organizations under similar circumstances. His study developed a method of determining bias based on analyzing coverage of specific types of news events by different news organizations. For example, the Niven study looked at 20 years of coverage of Democratic and Republican governors who had achieved similar results in two specific policy areas: murder rates and unemployment. His contention was that differences in coverage must then be attributed to partisan bias if the governors of different parties achieved similar results. He found no support for allegations of bias based on his metric.

Although Niven's results are interesting, they speak to a specific sort of situation. What about other types of coverage? Do his results hold up if the subject of the study is the coverage of state senators, presidents, or city managers? Niven's technique creates interesting opportunities for future research.

Another interesting area of future study is the bias caused by how journalists use language. It is readily apparent that journalism has a language all its own. For example, journalists use specific and regular expressions for attributing quotes and asserting relationships among people and events, such as in location and time. Anyone communicating through a regular system and medium will also be operating with assumptions about language.

Simply communicating by written or spoken words introduces bias into the message. If, as asserted earlier, there is no such thing as an objective point of view, then there cannot be objective or transparent language, that is, a one-to-one correspondence between reality and words such that a person may accurately represent reality so that you experience it as he or she does. Language mediates lived experiences. And evaluations of those experiences are reflected in language use. Rhetoric scholars generally accept that language cannot be socially or politically neutral; language reflects and structures our ideologies and worldviews. To speak at all is to speak politically. The practice of journalism, however, accepts a very different view of language that creates serious consequences for the news consumer. Most journalists do their jobs with little or no thought given to language theory, that is, how language works and how humans use language. Most journalists, consciously or not, accept a theory (metaphor) of language as a transparent conduit along which word-ideas travel to a reader or viewer, who then experiences reality as portrayed by the words.

Lakoff (2002) argues that journalism operates with many false assumptions about language. Journalists apparently believe, for example, that concepts are literal and nonpartisan. The standard six-question rubric of journalism (who, what, when, where, why, and how) cannot, however, capture the complexity of issues as seen through, and expressed by, incompatible ideologies. Journalists treat language use as neutral; the mere use of language cannot put anyone at a disadvantage: Words do not have a political reality. They

are merely "arbitrary labels for literal ideas." Following from this, journalists generally think that news can be reported in neutral terms. But to choose a discourse is to choose a position. To attempt neutrality confuses the political concepts. Is it an "inheritance tax," a "death tax," or an "estate tax"? What could possibly be a neutral term? Journalists believe that a general reader exists, and each shares the same conceptual system. Americans, for example, share the same English language, that is, its grammar. They often do not share dialects or the connotations of concepts, lived experiences, and ideologies. The statement "I am a patriotic American," means something entirely different to liberals as compared with conservatives. This difference is more than a matter of connotation. The differences in connotation spring from different social constructs and ideologies.

For further research, perhaps these false assumptions by journalists, rather than overt politicking, help create some of the political bias the public detects in news reporting. A conservative will quite naturally assert a conservative worldview by using concepts in ways comfortable to conservatives. The same goes for liberals. It is often pointed out that most news reporters are Democrats or vote for Democrats. Party affiliation, however, tells us nothing about political ideology. There are conservative Democrats and liberal Republicans. Be that as it may, the ethics of journalistic practice strongly urge reporters to adopt the assumptions about language and the structural biases listed above. The ethics of journalistic practice encourage journalists to adopt a (nonexistent) neutral language to mitigate any effects of ideological bias. Could it be that there is no concerted or sustained effort to slant the news for political purposes by mainstream news outlets?

Antibias Crusading as an Elitist Practice

For further research: AIM claims that the news media are biased toward liberal politics. FAIR claims that the news media are biased toward conservative politics. Supporters of these views see one group as right and the other as wrong. But the reality is not that simple. Yes, AIM and FAIR each point out coverage that appears to bolster their various claims. At times, the media do seem to be biased one way or the other. What these groups do not say, however, is that their mistrust of the media is also a mistrust of the people. Those who complain the most about media bias would see themselves as able to identify it and resist it. They get upset about it because they question whether the average American is able to do the same. If the average American can identify it and resist it, then there is little need to get upset about bias. The AIM and FAIR Web sites are full of material to help hapless Americans avoid the cognitive ravages of the "evil" conservatives or the "slandering" liberals and their media lackeys. What if the average American is quite capable of identifying problems with news coverage?

Conclusion

Every communicative situation is saturated with bias because communication always involves people who are situated historically, socially, politically, economically, and culturally. If this is so, then bias simply indicates a natural state of affairs. Calling it “natural,” however, should not indicate that bias is an inert substance in the communicative solution. Some powerful communicators assert, overtly or otherwise, that their messages are objective in one sense or another and, therefore, demand your acceptance. Journalists and academics, for example, fall into this category. Bias matters in the messages of those who claim objectivity precisely because they use objectivity as a structuring principle for their messages and as a stance for their claiming of truth. The claim of objectivity, then, can be a powerful means of persuasion. Detecting bias in a message requires critical thinking; one must examine the rhetorical situation and the structuring frames of a given discourse for clues to how bias might affect a speaker and his or her audience.

PART IX

MEDIA AS COMMUNICATION

TRADITIONAL AND NEW MEDIA

RAYFORD L. STEELE

Ball State University

As each generation enters our media-driven society, the term *new media* becomes very relative to their time and their immediate experience. Those readers born after the early 1980s have little experience in a world that was mostly not digital, and the “new media” around them were not new, just what they became familiar with in their time.

The purpose of this essay is both to create a very contemporary understanding of new media and to provide readers with a somewhat broader context that may help them as their “new media” become traditional and the next set of new media emerges, as it inevitably will.

If you are fortunate enough to survive a few decades, change will inevitably occur, and *new media* will be something else, again and again, no matter what it was when you started paying attention to it.

As a reader, I was, and I am even more today, a bit of a skeptic who wants to know why people know what they say they know. Thus, I will begin with a little of my own personal story, which may help you better understand the reason why a broader context may be valuable to you as you consider new media.

I am the first baby boomer, or one of the first. I was born just after midnight on January 1, 1946. The most common traditional medium of the time was radio, along with the daily paper. Families still actually gathered around the radio and listened to *Sky King*, *Fibber McGee and Molly*, and other shows. While television had been introduced to the public at the 1938 World’s Fair and CATV was just getting its start in Oregon and in the hills of Pennsylvania, *new media* was not much of a public issue just after World War II, nor was computing, though it existed.

By the early 1950s, however, television, the “new media” that was going to ruin radio, had begun to invade living rooms. It was a black-and-white and often fuzzy picture, and programming was limited. It was relatively expensive to own, and it was erratic in service, especially in areas outside cities.

Our neighboring family, an older couple, owned a television set and often invited us to join them for the *Jackie Gleason Show*, *Ed Sullivan Hour*, or wrestling, which had a sizable following long before the version we know today. Television was “new media.” It did not destroy radio, though it changed it, and it was peculiarly American.

As we moved through the late 1950s, television was evolving, with better dramatic programming and news and political content becoming part of the normal fare. Color television was just around the corner.

The Kennedy–Nixon presidential debates were televised in 1960, changing the playing field and the cost of politics forever, and computing continued to grow in larger organizations. Can you imagine in today’s world of political coverage on television and Web sites what those debates were like almost 50 years ago?

President John F. Kennedy proposed that we send a man to the moon, which ultimately broke the boundaries of our imagined tether to this planet. In 1957, satellites were launched, and this began to change the scope and distribution of new media in the 1960s, and color became the big deal as television evolved into three powerful networks that became our primary source of news, entertainment, and advertising.

Although the picture phone had been developed by AT&T’s Bell Labs in the late ’50s and realized some limited use in the 1960s, there were really no new media beyond

network television that were publicly recognized as I finished college and army service and entered law school as the '70s began. The satellite and later CATV were less new media and more new distribution devices for television-based programming in those days. Of course, CATV, or community antenna television, was expected to destroy the broadcast networks, according to some authorities attending the International Radio and Television Society meetings in New York City with me in the mid- to late 1970s. I went on to become a Frank Stanton fellow with the International Radio and Television Society, and the broadcast networks somehow survived.

During the 1970s and early 1980s, the new media issue initially focused mainly on how to record television programs. While the first prototype of a videotape recorder was reported to have been demonstrated all the way back in November of 1951, at Bing Crosby's recording studio in Los Angeles, it took until the late 1970s for the industry to finally sort out the competing standards and get something nearly inexpensive enough for the consumer market, if you consider about \$1,000 for a VCR a competitive price (Lardner, 1987).

As I entered the 1980s, three major events began to shape the context in which new media and my own career would evolve.

The computer had been evolving since the 1930s, when John Atanasoff had developed the Atanasoff Berry Computer. Then came the ENIAC in the '40s, and then the first UNIVAC computer was delivered to the U.S. Census Bureau in June 1951 by Remington Rand Corporation. Thomas Watson Jr. pushed IBM into building computers in 1950. Thus, with this background of big, military, government, and large corporation-based central (mainframe) computing, a major shock occurred when the PC began to become a part of the desktop and the home. While it was 1976 when Jobs and Wozniak introduced the Apple I, by the early '80s IBM had rolled out its PC and rapidly surpassed little Apple in sales (Bellaver, 2006). The age of distributed computing and incredible personal computing power on your desktop had arrived.

The second major event was the early '80s move by the Federal Communications Commission to allow a little of the federally controlled broadcast spectrum to be used for limited consumer wireless telephones. It was expensive and limited, but it began what we all take for granted today as our right to mobile communication, and that had implications for new media.

The third event was the breakup of AT&T, which officially occurred on January 1, 1984, after the consent decree was issued on August 5, 1983 (Bellaver, 2006). That milestone created the opportunity for the rapid expansion of competitive communications and technology development, leading to the networks we take for granted today.

I will not unduly bog the reader down with too much detail—I think the above three events are central to my own, as well as your sense of context, as we move on to our shared time in the 21st century. Certainly, my life and

career were forever changed by these events, and so was my sense of “new media,” although it was not always that clear to me at the time.

From 1982 to 1984, I led the process at the University of Pittsburgh that resulted in the creation of the first “Campus of the Future” in U.S. higher education. This eventual partnership with AT&T involved creating the first voice (phone) data (networked computing) and video system converged on a fiber-optic network for the entire campus. While it was a mix of analog and digital technologies, you could get what you wanted electronically, where you wanted it, when you needed it, and it allowed limited interaction with distant source machines as if you were in the same room. It sounds fairly standard by today's experience.

This prototype was evolved by 1987, in another partnership with AT&T, at Ball State University, and became a “market model” for both K–12 and higher education. I went on to lead projects like it across the country as head of my own consulting firm.

It was the precursor application, a kind of analog-digital hybrid of what we are now used to in applications as we use wired and wireless digital applications involving audio, video, text, and graphics. The university went on to become the number-one wireless university in 2005, according to Intel.

This market model demonstrated the kind of electronic environment that was able to deliver or shift in format many content sources. The basic policy implications of this shift had caused problems for the FCC chairman years before, in 1980, when he questioned “whether a newspaper delivered electronically is an extension of print and therefore free of regulation (First Amendment protection) or whether it is a broadcast and consequently under the control of (FCC rules) government” (Drake, 1995, p. 162). Electronic life had policy complications, and that could have implications for new media.

Without overcomplicating this legal mine field, simply understand that, in January 2008, the writers' strike, which almost ground Hollywood to a halt in production, was greatly about how writers are paid for the extended use of their work in new media areas. Most of the concern occurred when convergence allowed digitized content to move from known to new contexts.

Let me bring my story to an exit point briefly. The experiences I gained led me to found the Graduate Center for Information and Communication Sciences at Ball State University and to become a founding board member and President and Chairman of the Board of the U.S. Distance Learning Association in the late 1980s, where we would see satellite-delivered video education sessions evolve to online delivered classwork and streamed video, even cell-phone-based sessions. Through the 1990s, I led converged network-based campus projects across the United States and saw the evolution of what started as a military network and evolved to universities and then to what we all take for granted today, the Internet. The VCR and the videodisk

evolved to the DVD and hard drives that digitally stored video content, and the simple cell phone evolved to become a device for entertainment, texting, and visual directions delivered from satellite as well as the more common telephone device.

In 2003, I founded the International Digital Media and Arts Association and still serve on its board and as its executive director. I am continuously confronted by “new media” evolving from what I thought I understood to be new media, which have either disappeared or become the new old traditional media—does anyone remember eight-track tapes for audio?

This is the context, the ever more rapidly changing context, in which I will discuss new media, and I hope you will learn as I did not to hold too tight to your definition. Things change, and so will you. Nevertheless, we will also discuss some things that I hope you will agree are constants and fundamental to our common experience and to our shared future.

New Media Versus Traditional Media

As you now know from the preceding introduction, *new* versus *traditional media* definitions must relate to context and time from my experience. Almost every related technology, at some point in its evolution, may have been considered “new media.” That makes defining it a bit tough.

Be that as it may, let us establish a contemporary working definition for the purpose of this essay and use it as a baseline as we move forward. Although it is not as simple as we might like, the term *digital* might serve as our baseline label for defining *new media* with some reservations.

If we say that new media encompasses those technologies that move, store, manage, and allow manipulation of digitized information, whether for news, entertainment, communication, visual or other purposes, we may have a starting point.

We must remember that we are dealing with one of the more complicated areas in life, communication, and one of the more complex concepts, information. Every hour of our waking days we create information of all kinds. If we do it digitally, it is reduced to ones and zeros and then what? We must find an appropriate medium for communicating both the code and the message contained in that code with our desired audience. Media, new or old, do not exist for themselves, shocking as this may be to a sizable segment of the working world; they exist to help human beings get their information communicated.

Let us take a relatively simple example. A graphic artist has been asked to create the cover of the catalog for a digital art exhibit in Chicago. The exhibit has a theme, a title, artist contributors, a sponsor or some source of support, a somewhat defined audience, and the rest of the world, today or whenever in the future, who might pay some attention to this cover work.

All of the elements mentioned above were present “before digital,” but “after digital,” things are a bit more complex. While there is still the challenge to the graphic designer to create the visual information that communicates an acceptable, appropriate, and even creatively reinforcing message about the exhibit, in the new media world, life is both better and much more complicated.

Before digital designers had their experience, some limited research time to review related designs that were available nearby, the wishes of those who commissioned the work, the challenge of a relatively limited audience with modest potential for broad exposure—with limited lasting and broad-based archival potential, and their courage and creativity.

Now, what has changed after digital? Graphic designers still have the experience, but with the Internet and worldwide access to both contemporary and archival examples, the research of related designs can be both extraordinary and daunting. When do you stop? With texting, cell phones, e-mail, and other invasive personal access, when does the designer get enough input from those who commissioned the work, whose gallery will be featured, or whose works will be inside the catalog that the design will cover? Then, designers must also consider the impact of worldwide access to their work since it will, no doubt, be added to a Web page and available across the globe now and likely archived for future reference. Nevertheless, perhaps the saving grace is that artists still have their creativity and courage, and that may be the true bridge for all of us between before digital and after digital. As we move forward in this essay, the real issue between old media and new media may continuously come back to the concept of integrity in communicating information, and that involves the courage of the reader/viewer to question the accuracy of the content and the commitment of the creator of this information to integrity.

Exploring Technology and the Myth of Interactivity

Techencyclopedia’s (www.techweb.com/encyclopedia) definition of *new media* is an intriguing one:

The forms of communicating in the digital world, which includes electronic publishing on CD-ROM, DVD, digital television and, most significantly, the Internet. It implies the use of desktop and portable computers as well as wireless, handheld devices. Most every company in the computer industry is involved with new media in some manner.

For more than 20 years, we have been in an era of digitally based technologies that allow manipulation of all forms of digitized content that can be converged on broadband (often fiber optics) and easily and instantly transmitted across the planet via the Internet.

Before we leap forward to the myth of interactivity, it is critical to our lives as citizens of the 21st century that we consider what is significant about this technology discussion. It is not the coolness of Blu-ray or HD, iPhone, MP3, GPS, VoIP, or any other technologies. These will shift with engineering breakthroughs. Marketing will rename or reconfigure a service to enhance sales, and new opportunities will evolve, as they always have done. Technologies are simply tools.

What is important to us as we contrast new media and traditional media in a digital world is to understand the key words used in the foregoing. They are *manipulate*, *converge*, and *instant*, whether referring to accessed information or to transmitted information.

As citizens and potential professionals in the digital world, we have every aspect of our lives affected by new media. To be well informed, even educated members of our society, we cannot be naïve about the implications of these three key words.

Let us begin with *manipulate*. Once you digitize an image, a document, a film segment, it can be relatively easily manipulated. Now, we have been manipulating all sorts of media, and everything else for that matter, for a very long time. Analog films and video were edited, and “wet” or film-based photography was also manipulated, as were written articles or text. Our issue today in new media is that manipulation is relatively easy and most users of digital technology can do it: Certainly, younger people who have grown up digital find this to be no big deal to do. That was not the case in the analog world.

If a photograph used in a trial was manipulated in the analog world, there were a relatively finite number of professionals who might have had the experience or skill level to achieve this. Today, with a cell phone camera, little experience, and some relatively inexpensive software, it is no big achievement to capture and manipulate an image.

On Friday night, when we need to just get out of our space and see a film on the big screen, we do not care if the film footage was digitized in Hollywood and sent via broadband to New York, London, and Wellington, New Zealand for simultaneous editing by three different groups working on AVIDS as long as what we see on the big screen is entertaining to us. The end justifies the means for us.

Nevertheless, if two students, one in Queensland, Australia, and the other in Muncie, Indiana, are taking an online distance-learning class and go to a Web site and each turns in a paper that has a number of paragraphs “lifted” from the site and inserted into each of their papers without credit, this easy-to-do manipulation of text is called plagiarism, and it is especially painful if the faculty member happens to notice or if he or she is using software that now checks papers for this sort of dishonesty.

What is the point here for us? New media in a digital world open up vast manipulation opportunities to masses. The benefits, for example, to film making are remarkable. Without integrity as a key element in user judgment, the

potential for disservice to our society is significant in every field you can list due to the pervasiveness of our digital world. From identity theft to digital photo makeovers to political contests, we have a new obligation as citizens in the digital, new media age. We cannot assume that integrity is always a primary consideration in what we see and read, and, thus, critical thinking and a healthy dose of skepticism are required.

Convergence is the next key word. While not simple to achieve, it refers to a digital world where telephony, computer data, and video are all digitized signals that can be transmitted and switched over the same network that is IP or “Internet protocol”-based. The rules of economics and access have changed. A voice-over Internet protocol (VoIP)-based telephone call to China from the United States is today no big deal for a Chinese student calling home. It was a very big deal only a few years ago. A U.S. soldier serving in Iraq can sit down in a tent before a computer screen with a Web camera and visit with his family in California via an IP-based session. This “video conference” or call had a significant cost before the expanded capability of broadband Internet.

Today convergence of voice, data, and video signals over an IP-based network, transmitted across the Internet, means that both the technical and the economic barriers that limited our choices and breadth of communication and access are mostly gone.

So what, you might say? This is just the way it is today, after all. For new media and for citizens of this time in the digital age, we have access to the widest scope of information ever, and that means others have access to us as well. Privacy and personal judgment become more important to us as stalkers, friends, and even pedophiles, and, oh yes, potential employers visit our Web site, our Facebook, and other social-networking site entries. Using data-gathering software, marketers and others can easily profile us, and very little we do electronically can be held private. The concept of access is truly a two-way street, and personal privacy becomes a new challenge. If we put up something “stupid,” revealing, or just tasteless, the world can see it just as we can see others via new media.

While there are numerous examples of this phenomenon, none can be much more telling than the January 2008 story of the Michigan woman who advertised on craigslist, a popular Web site, for an assassin to kill her lover’s wife. She was quickly discovered and arrested. Stupid, we might exclaim, but the simple truth is that with all the good that comes with access in our new media world, judgment and responsibility end up being much more important today because we are so much more “exposed” than we were in past.

Just in case you assume this concern to be overstated, let me refer you to the 2007 book *The Cult of the Amateur: How Today’s Internet Is Killing Our Culture*, by Andrew Keen, someone who has pioneered a number of Internet start-ups himself.

It is easy to look back to the summer of 2003, when 12-year-old Brianna LaHara was caught by the Recording Industry Association of America after downloading, copying, and distributing 1,000 songs to her friends. She was young, the case was settled out of court, and the association needed to make a point.

Nevertheless, was the point clear to her slightly older contemporaries? Perhaps not, if you consider the June 2005 study of 50,000 undergraduates by the Center for Academic Integrity. In it, 70% admitted to cheating and 77% of them “didn’t think that Internet plagiarism was a serious issue” (Keen, 2007, p. 143). The issues of judgment and integrity become more prominent.

The availability of images, music, movies, and text, all someone else’s work, all converged on an incredibly accessible network, and all easily stolen (yes, this is stealing), represents a seductive temptation to us as users and a real threat to the culture of which we are a part. Thus, the notions of user courage and skepticism, and integrity in providing and using information are critical to our social and professional futures.

The third key word is *instant*. In this digital world, speed is all, and we can truly think it, access it, or record it and send it around the planet instantly, and that is both good and risky.

Much as I would never subject you to my writing in this essay without editing it, rethinking the content, and revising it, that is less likely in this era of “just hit the send key.” At the end of the day, after the editing this may not be great, but it will not be careless.

As a PhD and a professional with almost 40 years of experience, I have never received so much poorly written and insufficiently thought-out junk than in the last decade as e-mail and texting took over the majority of correspondence. New media have broadened the base of input in many areas, and instant communication has changed the quality of content, not always for the good!

Some limited examples should help to make my point. Note that while personal carelessness in electronic communication may just cause a little loss in confidence, when new media gets involved, much more is at stake.

My first example will be Wiki’s. Newton’s Telecom Dictionary notes that “a Wiki, in its simplest form, is a web site that can be written upon and edited by multiple users at once” (Newton, 2006, p. 998).

While there is nothing inherently wrong with democratically shared information, and no system of information development is without some fault or risk, would you trust your health to an MD who got his latest drug information from a Wiki? He might have gone to Web MD, a site with reviewed and vetted content, and gotten poor information, but which source has the greatest credibility and the least risk? Remember, a Wiki can be instantly available for access, and the qualifications of contributors are generally unknown.

Since this raises a both disturbing and very difficult set of considerations for the reader as well as the author in our time of new media issues, I want to go a little deeper and

once again involve you with Andrew Keen’s work, this time in the context of the January 2001 creation of Wikipedia by Jimmy Wales with Larry Sanger.

Keen (2007) reports the clash between Dr. William Connolley, a well-published and recognized climate modeler and expert on global warming, and a Wikipedia editor who punished Connolley for “strongly pushing his POV (point of view) with systematic removal of any POV which does not match his own.” The result was that Connolly, who Keen notes “was pushing no POV other than that of factual accuracy,” got restricted by the editor on this democratic information site without any consideration for relative expertise or credibility, and on appeal he was given the same deference as his unknown foe, “who, for all anyone knew, could have been a penguin in the pay of Exxon Mobil” (p. 43).

The implications of this should be disturbing to all of us unless you believe that a new college freshman is as competent to teach the Basic English course as is a tenured and well-published senior professor. Certainly, the freshman might be more entertaining and might make some valid points, but would you pay tuition or, more important, give your time for this level of expertise?

Let us jump ahead in Keen’s work to see why Larry Sanger, who ran Wikipedia’s day-to-day operations, left the company after 2 years. According to Keen (2007), Sanger found “that the democratization of information can quickly degenerate into an intellectually corrosive radical egalitarianism.” In effect, “he learned that fully democratic open-source networks inevitably get corrupted by loonies” (p. 186).

Keen (2007) noted that what Sanger realized to be Wikipedia’s problem “was with its implementation, not its technology (p. 186). Thus, in an attempt to do better, Sanger launched Citizendium in September 2006, which he described as “an experimental new Wiki project that combines public participation with gentle expert guidance” (p. 187).

Citizendium lists its difference as a Web 2.0 Wiki as “credibility and quality not just quantity,” involving “both general public and credentialed experts,” using “our real names, not pseudonyms,” and being “both collegial and congenial.”

Based on this and numerous other Web 2.0 examples, Keen (2007) notes that “This gives me hope that Web 2.0 technology can be used to empower, rather than overshadow, the authority of the expert, that the digital revolution might usher in an age in which the authority of the expert is strengthened” (pp. 188–189).

I have told my clients, my students, and my colleagues for 25 years that the technology is just a tool and what we do with it in application makes all the difference for the human condition.

The reason I have emphasized the Wiki issue is to help the reader consider how easy it is for those who have reason to know to be shouted down by so many who will only

work at the noise and not the content quality. In the new media world, credibility and careful thought presented with care, not just instantly off the top of the head, still matter.

My second example is Weblogs, or blogs, which are really nothing more than a Web site for an individual or individuals. Not being a great fan of blogs, I conferred with a colleague who has studied this digital world phenomenon. Dr. Jay Gillette described a blog as, primarily, an electronic diary or journal of an individual whose thoughts are made public by instant access via the Web. The blogger may be serious or not, 13 or 45, passionate about the topic, well-informed or not, biased or objective, but the blog is the blogger's unrestricted and unvetted thoughts. It is instantly accessible, and credibility is the challenge to the reader's judgment, as it is with any source, just more so in this case. We see bloggers everywhere, and especially in politics in an election year.

So what is the point? If the source of the information is not credible in a time of instant and immediate access, then the information may be worthless or, worse, deceiving and dangerous. If we do not develop a healthy sense of skepticism and check out the credibility of sources of information as citizens of a digital world in which instant access lessens effort, we are subject to the worst of new media, and that lessens our society. The more lazy easy access makes readers, the greater the risk to all of us. My final example involves one of our more trusted roles, the credibility of the editor function in new media in this time of instant access in the digital world.

The simple description of the role of the editor in traditional print or broadcast media was primarily to see that the story submitted fit the time or space available after judging its relative importance for placement in the paper or news show and to be certain that it was accurate and clearly presented to protect the credibility of the organization. It was always a time-challenged role where deadlines, scoops, and audience appeal were critical issues.

What is so different about the role of an editor in new media? First, in a world of instant access where everyone can be published or viewed, the time pressure and the volume increase make careful vetting that much harder, especially in the wide variety of new media outlets. Even traditional media such as the venerable *New York Times* and *CBS News* have lost credibility over the past few years from inaccurate stories from people as credible as the former CBS anchor Dan Rather, who reported stories alleging that the then-President George W. Bush had shirked his military duties as a young man, which proved to be false and happened to be reported in September 2004, just over a month before the next presidential elections. Rather left the anchor job as a part of the fallout.

In new media, the pressure of time, the breadth of sources, and the less concentrated competition for scoops, audience appeal, and glory make this editing role much more difficult. Since new and traditional media compete for audiences, this is true for both.

The very traditional *New York Times*, in May 2003, reported that Jason Blair, a 27-year-old reporter, regularly misled readers with "frequent acts of journalistic fraud" over months of reporting before he was caught.

So what is the point? New media, with all of its pressures and opportunities, has a somewhat weakened capacity to ensure accuracy. The responsibility for ferreting out truth and veracity in our information-rich world falls more heavily than ever on the reader and the viewer, who are bombarded by new media and all its competing sources. If we are too lazy, too rushed, too unconcerned with truth or at least credibility, we become the victims of new media, not the beneficiaries of greater and more immediate access to a world of new and creative information sources. It certainly complicates matters when these sources arrive two or three at a time on our screen.

In case this is becoming a bit depressing, there is a bright side, and once again I will turn to Keen's book for a great example of "managing new media and traditional content without compromising editorial standards or quality" (p. 188), as he puts it when he describes how the British newspaper *The Guardian* has moved part of its business online without compromising "high-quality news gathering and reporting."

One result has been that the online version, *Guardian Unlimited*, has more online U.S. readers than do top U.S. newspapers such as the *Los Angeles Times*. One critical and credible step has been that the division between professional reportage and amateur opinion has been clearly delineated.

Most of us love to see an underdog win, to see the amateur best the pro. It makes for great entertainment, but when it comes to our health, our living, our government, our laws, it really matters to us to know the source of our information. We make decisions, select paths, and base critical judgment on information, whether credible and accurate or not. We have the right and the responsibility to know the kind of source before we decide on the value of the information. We have the obligation of integrity as we become sources of that information in an information-driven economy where global access is now reasonably common.

Our content today is unquestionably the richest in information at any point in history, and access to it is worldwide. While not everyone has fully equal access, you can find an Internet café in almost any city in any country across the globe. The potential for changing lives with access to information is unquestionable. Can anyone question the impact that having access to information by people around the world had on the events of 1989 in Tiananmen Square in Beijing, China, had on the Chinese government in quelling student riots? Even after shutting down satellite visual access, the fax and Internet communication kept information flowing to the world and greatly affected the level of government reaction and harm to human life.

In a recent conversation with a stimulating friend who is president of Constellation Communication, I was challenged to imagine what might have been if young Anne Frank, a diarist in the Netherlands during the Nazi invasion of her home who hid in a secret set of rooms to survive while the world looked on, had been a blogger with access to the Internet of today. She may have brought worldwide attention more quickly to the atrocities being leveled against Jews by the Nazis. Unless she was extremely clever, she might have also been traced electronically and found more quickly, and therefore her diary might never have been shared. It is always a two-sided sword. Our endless opportunities in a new media world bring with them some serious new responsibilities.

The final issue I will discuss regarding new media within the technology area is interactivity, which some have tried to use as the more important or compelling aspect of defining new media.

Interactivity, as defined by Newton (2006), is “the ability of a person or device to talk to or communicate with another device in real time” (p. 484). So I ask you, if you are playing on a pin ball machine and the ball sticks and you hit the machine and the ball moves without (or with) a “tilt” penalty, is this an interactive experience? If you are working on your Mac and it freezes up and you reboot it and it becomes responsive, is this an interactive experience? If you speak to your SYNC-equipped Ford product and the requested song comes up, is this interactive? If you e-mail me and suggest that I am lost, and my laptop sends back an automatic “drop dead” or “I’m away” message, is that interactive?

They all may be somewhat interactive by definition, but most of us would not find this level of interaction very satisfying. The promise of interactivity, especially as it relates to new media, is a murky area and one that is more myth than deliverable in my experience except, perhaps, in gaming. If you have ever been caught up in a voice response system loop where you absolutely cannot get your question answered or your call shifted to a human, you understand the fundamental myth.

As humans, we are naturally interactive with each other, and we thrive on it, to a point, but in the world of new media, we face some obvious limitations, and often we resort to marketing-driven “overpromise”; since some of you will likely become Web 2.0 and, perhaps, Web 3.0 entrepreneurs as well as users, let me clarify this enticing area in a simple fashion.

Interaction requires access, and it tends in the new media world to expect a 24/7 level of responsiveness. I do not mind when an e-mail arrives at my machine. I begin to be concerned when I receive 100 between 2:00 and 3:00 a.m. on a business trip to Asia and I am expected to instantly respond. Machine interactivity is limited by artificial intelligence levels in terms of available choices in the software and the level of secured access. Online banking and other interactive services amply demonstrate

this, as does gaming. Nevertheless, there are limits that we humans have in a new media world of 24/7 access on a global basis. Businesses often figure this out when resources do not permit quality and quantity of personnel sufficient to meet the promises of marketers of consumer help and ever-present access. Then customers get turned off and depart.

Most of us, no matter how big a tech junkie, have capacity limits and therefore cannot dedicate 24/7 response time. We sometimes actually require a life separate from this hyper-interactivity; we even desire a bit of thinking time.

So what is the point here? Interaction is a human need and desire and a technology option. It is highly desirable, and it comes with limitations. Promise it wisely, and be somewhat skeptical of the level of interactivity promised to you. Understand the limits of the Second Life-type experiences and the addictive potential of Internet dating, gambling, pornography, ad nauseam. Both the human and the machine still have limitations.

Your time is your most valuable resource, and it is often the way new media players are measured for success. Interactivity, like seduction, is often a means to a not always satisfying end. Participate wisely since you can never get your time back, whether you are making the contact or promising to respond to it.

The promise of interactivity reminds me a little of what my colleague Scott Shamp, who directs the University of Georgia’s New Media Institute, calls “the Law of the Hammer. . . . when you have a hammer, everything looks like a nail.”

How New Media Are Developed and Assimilated

Most new media entrants in the time of our “digital” line in the sand definition were evolved from a combination of technological, marketing, and economic factors combining to create a new opportunity.

The Internet offers tantalizing opportunities to reduce distribution costs, to more broadly spread content from local to global access, and to create greater author access in the highly competitive field of print journalism. Who would have printed a diary of an unknown author for local or even regional distribution just a decade ago, and then the blog arrived? Now, some blogs are carried in print newspapers.

Who would have considered evolving a 30-second story for the six o’clock TV news into an expanded print version that would also be carried both in the electronic version of the newspaper and as the expanded subject of the author’s blog? Who would have believed that this would be done by a reporter working in a corporate contract for both print and broadcast interests, historically in competition with each other?

Who would have believed that YouTube would have opened a wide and very popular portal for so many wannabe video and film amateurs? This story, including that of social networks, is just in its early chapters.

Finally, who would have been persistent enough just a decade or so ago to assume that the wireless phone, then just a few years from being a big clumsy device sometimes carried in a good-sized bag, would become a pocket camera, a source of news, entertainment, texting and e-mail, gaming, and sports—and that list is still evolving as formatting issues are addressed.

Every market seeks growth for its opportunities and products. The developers of technologies often create a technology for more limited or differing uses than marketers can help sell to users. Most businesses, and print journalism and electronic news media are businesses, may come kicking and screaming into a new world changed mostly by the Internet, but they understand competition and survival, and they do change to survive.

Over the past 25 or so years, digital technology has been at the heart of the most rapid and broad set of changes, across the globe, that mankind has ever experienced. It has merged evolutions with revolution and curiosity with unprecedented access to information, and it is disturbing and disrupting to numerous cultures, our own included, in the United States. Previously held taboos are now fodder for Internet chats, and if they are out there, a very hungry new media segment sees no reason not to also discuss them, and that competition forces even the traditional media into the same discussion. Values, ethics, judgment, and integrity all sometimes suffer.

All this means opportunity, and it includes risks for every society and profession across the globe, not just this country.

Remember, each new generation comes to the world that it finds at its time. While assimilation of new media today is an issue for executives, investors, practitioners, and mature users, it is not such a big deal for the very young. If they have no sense of history or context, it is just the way it is to them.

The “So What?” Factor

It is essential in my view, to both a free and independent personal life and to an informed citizenry in a free democracy, that each generation realize that its tools of technology and the resulting new media and their consequences fit

into a time that is part of a greater context. That greater context includes both the lessons of history and the opportunities for choosing a better or lesser future that we can create via our choices and our tools.

At a time when rapidly appearing and shifting new media present us with an ocean of information that is both global and local, that is, not unlike our oceans, filled by both pure and polluted sources, that like the oceans ebbs and flows with the tides but is ceaseless in presence, the responsibility of both the users and the creators of our information has never been greater. Creators of information without integrity, sources without responsible editing, vetting, and valued credibility, can do great personal damage as well as harm to society. Open and universal access to such information means that those without the courage to be skeptical of sources, expertise, and veracity can be easily fooled, misled, and even harmed by foolish health or financial advice, bad drugs being promoted, character assassination—and the list is long.

New media will continue to evolve for the good and not so good: Will you have the personal responsibility and the courage to guide its use for you and your time to serve us well? That is the ultimate challenge, not the ability to tick off a list of new-media technologies.

Author’s Note

My thanks to my trusted graduate researchers, Anisha Chandrasekaran, Kelly Antoine, Vibashreya Srivatsan, and Sunaina Premkumar, and to Tracy Scott, my patient assistant, who suffered through the many redrafts, as did my proofreader and wife, Cynthia. I hope our combined efforts help a new generation make wiser decisions in a time when information appears more like the ocean than a respected volume in a library.

MEDIA PORTRAYALS AND REPRESENTATIONS

JAMES D. ROBINSON

University of Dayton

Communication scholars and researchers have long been interested in the way things are portrayed in media. Much of this concern stems from the pervasiveness of media in our daily lives. Currently there are more than 300 million people living in the 111,384,000 households in the United States. Recent Nielsen estimates suggest nearly every home in the United States has at least one television. The 114 million households with televisions have the sets on for about 7 hours per day, with the average viewer watching TV about 30 hours per week. Television viewing represents about 30% of the average American's leisure time and is the single largest leisure activity for most Americans. In addition, the Internet is becoming as ubiquitous as television.

The average American spends about 2.3 hours per week using the Internet for entertainment purposes.

While an extensive review of media usage patterns is outside the scope of this chapter, it is clear that if other media choices are included, such as time spent listening to the radio, reading newspapers, magazines and books, listening to music, watching movies, and playing video games, Americans spend a great deal of time with media. With so much media stimulation going on, it is no wonder that researchers spend a great deal of time discerning what sights, sounds, and vicarious experiences audience members are likely to experience. While this chapter will focus primarily on television, those interested in studying media portrayals research can examine media content in any of the aforementioned formats or channels.

Concerns about the way things are portrayed in media generally stem from two perspectives that we can call the “mirror of society” view and the “social influence” view. Scholars operating from the mirror of society view examine media content because they believe that such examinations provide insights into the nature of our culture. They believe that media portrayals are a reflection of the way society thinks or feels about an issue. In a simple sense, the mirror of society view suggests that what you see in the media is a reflection of what society thinks or feels.

Hacker (1951) and others have suggested that examination of media portrayals is important because the social status of groups and individuals can be identified through these portrayals. Hacker argues that groups of high social status will appear more frequently than will their low-status counterparts and that the portrayals of high-status groups and individuals will be more positive. Conversely, members of groups believed to be held in low esteem or who are of relatively low social status in society—such as the elderly—appear very infrequently in media. Evidence supporting this perspective is quite strong. Even the most cursory examination of the portrayals literature demonstrates that some groups are systematically underrepresented on television over long periods of time. On television, adults tend to be disproportionately white, young, attractive, wealthy, and male.

Because of its pervasiveness, social critics often focus their attention on media portrayals on television. The ubiquity of television is often offered as an argument for studying

TV content, but portrayals scholars have studied many different channels including comic books, radio, magazines, newspapers, music videos, the Internet, billboards, film, commercials, brochures, record covers, CD cases, and greeting cards.

While the media portrayals literature often focuses on television, literature reviews focusing on a particular portrayal across a variety of different channels can provide further evidence to support the notion that media are a mirror of society. For example, researchers examining portrayals of the elderly appearing in newspaper articles, magazines, prime-time television programs, children's programming and cartoons, magazine advertisements, letters to *Dear Abby*, children's literature, poetry, TV advertisements, magazine cartoons, birthday cards, and even jokes report that older adults are indeed underrepresented, occupy less prominent roles on television, and are often portrayed negatively.

By using media portrayals as a barometer of social status, researchers can make comparisons between the U.S. and other cultures. Research examining portrayals of the elderly in cultures where the elderly are held in higher esteem, such as China, Japan, and Korea, find the elderly represented quite differently. Older adult characters are found more frequently, occupy more prominent roles in the programs, and are portrayed in a more favorable light.

A much more common view adopted by media portrayals researchers is based on the notion that media portrayals affect audience members and their attitudes. From this perspective, scholars and social critics are concerned that inaccurate or stereotypical portrayals have a negative impact on audience attitudes and perceptions of reality. This social influence view is much more commonly employed in the portrayals literature and is predicated on a much wider set of theoretical underpinnings than the relatively simple notion of media mirroring society. In general, the social influence perspective or view suggests that media portrayals affect audience members but does not explain the theoretical mechanism causing these effects. Thus, a number of middle-range theories have been offered up by scholars to provide the specifics about how media portrayals influence individual audience members and ultimately society. The next section of this chapter examines some of those theoretical perspectives and discusses some of the research that has been produced from each perspective.

Theories Commonly Employed in Media Portrayals Research

Perhaps the most widely accepted theoretical explanation for media effects was first proposed by Albert Bandura (1977) to explain how television violence affects children. His theory—social learning theory—is in its most simple form a theory of modeling or imitation. Bandura believed, and much subsequent research has demonstrated, that in

addition to learning through the “trial and error” of their own behavior, children can also learn vicariously through the observation or modeling of others. In fact, Bandura suggests that anything that can be learned from direct experience can also be learned vicariously or by watching someone else—real or imaginary—enact the behavior. He further contends that people can often learn things more efficiently through modeling or imitation than they do through their own trial and error efforts. Research into the social learning process clearly indicates that audience members can and do learn vicariously from media models.

Social learning is far more than the mere imitation of mediated models, however. In addition to being able to watch the model behave, audience members can also learn about the consequences or outcomes of performing the model's behavior. Thus, from a social learning perspective, it is important not only to identify the types and frequencies of particular behaviors occurring but in addition to identify the outcomes or consequences of those behaviors. For example, a researcher interested in portrayals of sexual harassment might also examine the consequences of sexually harassing behaviors. If the harasser is punished or socially ostracized, the audience member may learn not to engage in sexually harassing behavior. If, on the other hand, the mediated portrayal of harassment is accompanied by a laugh track indicating harassment is just a “joke” and sanctioned by other characters, the audience members may learn that harassment is not a big deal. Clearly, that is not the message anyone involved in the writing of a television show intends to send, but it is nonetheless a distinct possibility—particularly within the realm of the situation comedy. The relevance of this theory to the study of media representations is even clearer when you realize the use of multiple models and models of high social status, when the situations or context of the model performing the behavior is realistic, and when audience members find themselves in situations similar to those presented in media.

The effects of social learning are not short-lived and have been shown to last as long as a month. Furthermore, when media portrayals provide detailed accounts of some target behavior and portray the consequences of such actions as positive, even if the positive outcomes are transitory and the deviant action is later punished, people can and do learn the antisocial behavior. The ultimate negative consequences can be easily forgotten or misunderstood by some audience members, and others may attribute the failure to unrelated factors (e.g., bad luck). In fact, Bandura (1986) suggests that audience beliefs about the nature of the behavior and its consequences often outweigh direct experience with the behavior and its consequences. Reliance on the source for information further increases the likelihood of social learning occurring.

Thus, from a social learning theory perspective, media portrayals provide models for audience members to acquire new behaviors and insights into the consequences of those behaviors. Social learning theory, however,

assumes that audience members have the ability to control their behavior and do so based on their understanding of the consequences of the behavior as well as their own moral and experiential worldview. So audience members do not mindlessly imitate what they see on television but rather use what they have learned—that is to say, the behavior-consequence link in their decisions about how they should behave along with what they believe to be right or wrong in their decision to enact or not engage in a particular behavior.

Another very common theoretical rationale employed in media portrayals research is the cultivation hypothesis. First proposed by George Gerbner (1969), the cultivation hypothesis suggests that when people watch television, they are acquiring or cultivating a view of the “real world” that is shaped by the way things are portrayed on television. Unlike a more traditional conception of learning, where the individual audience member does not merely learn the information presented to them via media, Gerbner argues that people do not intentionally or voluntarily adopt attitudes based on the information provided by a single television program, but rather, they acquire or “cultivate” a view of reality that is based on underlying cultural themes that occur throughout television programming. It is the underlying themes that cause audience members to cultivate a view of reality that more closely approximates the portrayal of reality in media. These underlying themes are things such as “The world is a scary place,” which arise because so many programs are predicated on the assumption that bad things happen all the time. Other such themes include “Might makes right,” which is based on the notion that violence is a common solution to problems; “It is ok to be impolite if you are being funny,” which assumes that being funny is valued more than other social norms; and “The elderly are a dying breed,” which suggests that the elderly are not valued.

The most interesting and perhaps the most controversial aspect of cultivation hypothesis is that it is the underlying myths or themes that run throughout media that are of concern to audience members. This is quite different from more traditional learning theories, which suggest that people learn about the world from television in much the same way they learn about anything else. They are exposed to the content, attend to the content, retain or store the content in their heads, and are able to recall the information when they need it. Cultivation effects occur without audience awareness of the process. Cultivation effects are particularly pernicious because the audience need not be aware that they are being exposed to those underlying themes and are consequently less able to defend themselves against the effects of media exposure. A further complicating factor is that it makes very little difference what audience members watch on television since the myths and themes are so pervasive that they run throughout television. In theory, the audience will be influenced just as much by watching the news or educational

programming as they will from watching *Jerry Springer* or *Dog the Bounty Hunter*. Television is seen as a primary vehicle of story in our culture, and television is seen as a primary vehicle for the inculcation of our young. Whether the story is *Hansel and Gretel* or *Live Free or Die Hard*, the moral, myth, or theme is the same.

So the cultivation hypothesis has been widely used as a theoretical rationale for studying media content and is particularly popular as an explanatory mechanism because it allows researchers a great deal of latitude in deciding not only what they will study but also how they will study it. Studying manifest variables such as the age of the actors is one thing, but with cultivation as a rationale, researchers can also study underlying or more interpretative behaviors, such as character values or incidents of being polite.

More recent conceptualizations of the theory have begun including two additional concepts—mainstreaming and resonance. While these are outside the scope of this article, suffice it to say mainstreaming and resonance are concepts used within cultivation to explain exceptions to the general cultivation rule, which is “The more you watch, the more likely you are to view the world as it is portrayed on television”—regardless of other factors such as education and personal experience. Resonance occurs when viewers have direct experience in addition to the symbolic experience they gain through media exposure. People who have been mugged and watch a lot of television tend to think that the world is an even more dangerous place than do those individuals who watch a lot of television but have never been the victims of violence. Mainstreaming refers to those instances when heavy viewers from different backgrounds view the world similarly—even when their backgrounds suggest that they should not. For example, audience members with a high socioeconomic status (SES) should view the world as being less dangerous than would audience members from a lower SES. This is because people from a low-SES background are more likely to have personally witnessed or experienced violence. Thus, mainstreaming and resonance are used by scholars conducting cultivation research to explain those anomalies that occur among respondents who are either more different than they should be or less different than they should be, based on their experiences.

While social learning theory and the cultivation hypothesis are most commonly employed, a variety of other theories can be and have been employed by media portrayals researchers. Most often, researchers employing other theories focus less on media portrayals and more on the impact of those portrayals on audience members. Agenda-setting research also places an emphasis on media portrayals but generally focuses on the representation of issues by media more than character demography or behavior. Maxwell McCombs and Donald Shaw (1972) first proposed their theory of agenda setting in 1972 in an article examining the impact of media on the 1968 presidential campaign. They suggest that media do

not so much affect audience behavior or even attitudes toward a particular topic. But media are most effective, according to McCombs and Shaw, at influencing the importance or salience of issues in the minds of audience members based on the prominence the issue receives in media content. In short, media can raise audience awareness levels about an issue by frequently discussing an issue. Thus, agenda-setting research often entails analyzing the content of some media channel (e.g., the newspaper) to determine which issues have been discussed, how many column inches were devoted to the issue, and where the stories were located within the newspaper (e.g., front page and above the fold). Once the prominence of the issues has been identified, the researchers typically survey audience members to find out how important they think those issues are. Often this is done by simply asking the respondents to rank the issues in importance. Agenda-setting effects are determined by finding a correlation between the prominence of the issue in media content (e.g., the number of times the issue was written about) and the importance audience members place on the issue (e.g., the rank they assign to the issue). In short, when an issue receives a great deal of attention, audience members should rate that issue as being more important than other issues that have received less attention.

Researchers initially focused on the first level of agenda setting. This first level corresponds to the preceding description of agenda setting. Such researchers simply identified an issue—say gun control—and then determined the prominence of that issue in media content. More recently, researchers have begun examining what is often described as the second level of agenda setting. While scholars are not in 100% agreement on the definition of the second level of agenda setting, it is reasonably safe to say that researchers examining the second level go beyond the frequency of issue portrayals in media to include the characteristics or attributes related to the issue presented by media. So in the case of the issue of “gun control,” portrayals can be framed as constitutional arguments (e.g., “The Constitution guarantees the right to bear arms”), self-defense arguments (e.g., “The police don’t come until the crime has been committed, so you must protect your own family”), or firearms-as-the-devil’s-tool arguments (e.g., “The widespread availability of guns in the United States contributes to or causes crime”). How the argument or issue is framed, as well as the characteristics of the issue that receive attention by media, is included in the analysis of media content. In terms of content analytic investigations, this means that the category systems are more complex and do not just include measures of issue portrayal frequency but also categorize issue portrayals by the type of depiction. This extension of the theory provides researchers a more complex and more specific measure of media portrayals. Generally, the more specifically two variables are measured, the higher the degree of correspondence you will find—assuming that a relationship actually exists between the two variables.

One criticism that has been levied against agenda-setting research has been the lack of a theoretical mechanism to explain why the prominence of an issue is related to audience perceptions of issue importance or salience. This shortcoming appears to have been remedied by Iyengar and Kinder (1987), who suggested that the mechanism underlying agenda setting may be the same mechanism that is used in cognitive psychology to explain “priming effects.” The simplest way to understand priming is to think of the mind as a device that needs exercise to be effective. When an individual gains information, that information is stored in an area of related information so it can be found or recalled in the future. When information in one storage area is activated or employed, the other information in that area is also exercised or activated. Consequently, when issues and their attributes are framed in a particular way, all that information is stored together within the mind and is recalled together on subsequent recollection efforts. Thus, when the National Rifle Association (NRA) pairs the issue of gun control with family safety and frames the issue in the Second Amendment of the Constitution, all those issues and related issues are stored together and are all activated when any part of that issue is relevant. Priming goes further, suggesting that not only are the issues stored together, but with exercise or activation, those beliefs are more easily recalled than other, less often considered beliefs.

It is important to note that agenda setting has traditionally focused on the prominence of issues in media content and the corresponding levels of salience or importance audience members place on that issue. Priming is a cognitive theory that focuses on how information is organized, stored, and retrieved within the brain. Thus, the correlations observed between media portrayal frequency and audience perceptions of salience are actually attributable to the way information is stored within the brain. This extension certainly does not reduce the value of the theory; rather, the addition of priming as an explanatory mechanism for agenda setting helps us better understand why issue prominence in media influences audience estimates of issue salience. It also helps explain why issue prominence does not affect all audience members in the same way. Some audience members have different types of information stored within that cognitive schema, and consequently, mentions of issues by media activate different information based on their idiosyncratic methods of storage.

While agenda setting, cognitive priming, and issue framing are not the same phenomenon, they often occur together. Examining not only the issue of prominence (agenda setting) but in addition the characteristics of the issue employed in the message (framing) and the other issues organized within the cognitive structures of the audience members (priming) provides a strong theoretical rationale for the studying of media content and portrayals.

Bradley Greenberg (1988b) proposed the “drench hypothesis” as an explanatory vehicle for the effects of media portrayals, though this is far less commonly employed as a

theoretical rationale for studying media content or portrayals. Greenberg's argument is clear and persuasive. In the drench hypothesis, Greenberg suggests that a single event can be far more influential or life changing than a series of smaller events. Events such as the shootings at Columbine High School, the Kennedy assassinations, or the space shuttle disasters (*Challenger* and *Columbia*) can have a much more pronounced effect on audiences than the stalagmitelike effects that occur over time with repeated exposures to much smaller and less meaningful events such as shootings by fictional characters on prime-time programming.

Greenberg is suggesting that highly memorable and impression-leaving events—real or fictional—can be more influential than repeated exposure to the small, less-memorable portrayals that occur on television. Seeing a single automobile accident—such as the death of Princess Diana—can be much more influential than the cumulative effects of a season full of NASCAR accidents or a lifetime of chase scenes from Hollywood. Proponents of the drench hypothesis recognize that, in terms of media portrayals, sometimes less can be more.

Greenberg also recognized that the argument underlying the cultivation hypothesis is weakened by the fact that audience members are still affected differentially by media portrayals. Some heavy viewers of violence, for example, view the world quite differently from other heavy viewers. This suggests that audience responses to portrayals differ, to some degree, by audience member. Thus, any theory focusing on the impact of the influence of media portrayals must take into consideration that audience members are affected differentially by the same message or series of messages. If audience members are affected differentially, then it is a logical necessity to recognize that different portrayals have different levels of influence on audience members.

While only a few studies have attempted to empirically test the drench hypothesis, the empirical evidence supporting the position is promising (see Bahk, 2001; Reep & Dambrot, 1989). There is, of course, potential for tautological reasoning when using the drench hypothesis. Portrayals that are highly memorable or have a high impact influence audience members more than low-impact portrayals do. Of course, the problem stems from the fact that if drench effects are observed, then the assumption is that the portrayals were high impact. If drench effects are not observed, however, it is not an indictment of the theory but rather evidence that the image was not impactful enough. This potential does not negate the utility of the theory but rather reminds us to scrutinize carefully the assumptions of the theories before we employ them.

What is very important here is the recognition that media portrayals can and undoubtedly do affect audience members differentially and that single events or portrayals can be just as important as or more important than the cumulative effects of media portrayals. This is not to say that the cumulative effects of media portrayals are unimportant. Rather, it is to suggest that the potential for media

effects is a complex and multifaceted issue. The effects of portrayals may influence audience members cumulatively as well as from a single exposure. Similarly, audience members may also go relatively uninfluenced by media portrayals as well.

It is also important to note that while all of the theories discussed here examine the same issue—media portrayals—they are all quite different. Agenda setting focuses on how issue prominence in media content influences audience perceptions of issue salience. Priming theory focuses on how information is stored inside the head of viewers and accessibility. Accessibility here means that people are able to recall information because they have been primed or provided the opportunity to exercise that recall through exposure to media portrayals. Cultivation suggests that media portrayals influence audience members as a cumulative effect. Furthermore, cultivation theory suggests that it is not the information in the portrayals per se causing the audience to cultivate a particular worldview. Rather, cultivation suggests that the themes that run throughout media content are the culprit and not the portrayal itself. This nuance is often lost in discussions of portrayals. Audience members do not learn that elderly people are not highly valued in our culture from the content within media depictions of older adults. Rather, the audience members cultivate a negative perception of the elderly because they are underrepresented or depicted in a negative or stereotypical fashion. Those perceptions come from shows that contain older adults as well as shows that do not. By favoring younger adults on programs, the show is helping audience members to cultivate the perception that older adults are not so important. Finally, social learning theory suggests that audience members can and do learn.

Research Methods and Portrayals Research

Communication scholars employ a variety of different research methods in their quest to understand media portrayals, but the vast majority of the studies employ content analysis. Perhaps the most important scholar writing about content analysis was Ole Holsti. In his classic treatise on the subject, Holsti (1969) defines content analysis as “any technique for making inferences by objectively and systematically identifying specified characteristics of messages” (p. 14). Holsti was one of the first scholars to recognize that the technique could be used with text as well as any other durable data including photographs, oral communication, Web sites, brochures, or television programs.

Content analysis is a research technique that takes samples of media content (e.g., a television program, newspaper article, Web site) and reduces the content into more manageable categories. For example, a scholar looking at media portrayals of race would watch the television program and every time a character appears on the screen would classify that character by their race. Thus, at the end

of the study, the researcher would be able to make claims about the racial composition of television such as “12.5% of the characters on television were black.” In this way, researchers can examine how closely the characteristics of television mirror the characteristics of reality. For example, Robinson and Skill examined television portrayals of the elderly and found that only about 2.5% of the prime-time television viewers were 65 years of age or older. Obviously, the key to meaningful content analytic studies includes the development of content categories (such as the racial cohorts on television or the types and frequency of sexual harassment behaviors on television). In addition, it is imperative that anyone trained as a coder can reproduce the same or nearly the same results from the same data. This reproducibility of results is called reliability in the realm of research methods and is critical to the researcher employing content analysis as a research tool.

Of course, content analysis need not focus exclusively on such “obvious” categories of interest. In fact, one common criticism of content analytic research is that too often content analytic schemes focus on easily observable phenomena instead of the most important images. It is relatively easy to count the number of door knobs that appear during the course of a television program, but it is not particularly interesting or useful. It is much harder, for example, to identify all the acts of altruism that occur within a television program. Acts of altruism are a much more complex phenomenon and much more difficult to identify or code. Someone telling a “little white lie” so that someone else is not embarrassed could be coded as an act of dishonesty, or an act of kindness to save the face of the other interactant can be an act of kindness in one coding scheme. Similarly, researchers can not only examine the portrayals of some behaviors but also content analyze the consequences of those behaviors, thereby providing a more complex and potentially more useful coding system.

Critical to content analysis are the techniques employed by the researcher in developing the sample. Anyone content analyzing the front pages of newspapers during the month of September in 2001 would undoubtedly find that nearly every story focused on the terrorist attacks on the World Trade Center. Anyone looking to see how often issues such as education, the war on drugs, or the economy occur would conclude that there is little or no interest in those issues, based on their frequency of occurrence in the newspaper. So it is critical to use sufficiently large samples of media content and to draw those samples randomly if at all possible. Much like survey methods, however, there are of course times when such efforts are not possible or even desirable. The goals of the researcher should guide the sampling techniques employed by that same researcher.

Of course, content analysis is not the only method employed by researchers examining media portrayals. For example, researchers employing the cultivation hypothesis as the theoretical rationale for their study describe the content analysis component of their investigation as “cultivation

analysis.” Once they have documented the content on television relevant to their study—either through their own content analysis or through previous studies that have analyzed media content—they may begin the second phase, which is often called “cultural indicators.”

Cultural indicators research typically involves conducting a survey of audience members to determine how much media they consume and their knowledge about and/or their attitudes toward an issue. For example, cultural indicators researchers ask respondents to estimate the proportion of the population that are police officers (e.g., 1 in 10, or 1 in 100, or 1 in 1,000) and generally find that heavy viewers believe there are more police officers than do light viewers. Thus, cultural indicators research is really survey research that attempts to find out if audience member perceptions of reality are indeed based on media portrayals.

The other theoretical perspective discussed earlier may employ such survey methods as well. Researchers employing social learning or priming theory as their theoretical rationale for the study are somewhat more likely to employ experimental or quasi-experimental designs. Nevertheless, most research media portrayals use content analysis to determine what content the audience is consuming and then employ survey techniques to examine the attitudes and beliefs of audience members.

Media Portrayals Research

It would behoove anyone interested in studying the media portrayals literature to read two books—*Life on Television* (Greenberg, 1988a) and *Life on Daytime Television: Tuning in American Serial Drama* (Cassata & Skill, 1983). Both books are excellent examples of scholarship, provide a historical context for current study of media portrayals, and address many of the theoretical, methodological, and coding issues that face media content researchers. The work by Gerbner and his colleagues in the area of cultivation is also well worth reading for the same reasons. Gerbner’s work (1969) is also useful because it will help students see how a theory and a method develop over time and how the theory guides researchers in their media content investigations.

If, however, a student were to be allowed only one reading on the topic of media portrayals, DeFleur’s (1964) article “Occupational Roles as Portrayed on Television” would be the definitive article to read. It is long enough and detailed enough to provide a wonderful introduction to the area. It is also an example of rigorous research that contains descriptions of the portrayals that are thick enough or sophisticated enough to give insight into the occupations and explains why such portrayals are potentially influential to children. Finally, it helps researchers see how decisions about issues such as sampling are actually made—DeFleur discusses why particular shows or types of shows were omitted from the analysis and how decisions about show inclusion were made. When two

shows that were intended to be included in the analysis occurred at the same time, DeFleur used the flip of a coin to determine which show would be coded and which show would be excluded. It is important to recall that DeFleur was content analyzing the 250 half-hour programs without the benefit of a VCR and is quite careful to describe the decisions about coding and sampling that were made a priori and on the fly.

More recently, the National Television Violence Study (NTVS) was published and represents a spectacular example of content analysis as well as studies investigating the impact of those portrayals on audiences. This multivolume set of books is literally the last word on television portrayals of violence. The coding details and sampling techniques and statistical decisions are so carefully explained and well thought out that the books literally represent a graduate course in media portrayals research.

The NTVS constitutes the largest and most systematic content analysis of television programming ever conducted and reported in a single investigation. Researchers examined more than 10,000 hours of TV content gathered between 1994 and 1997 that were randomly selected from 23 channels aired between the hours of 6:00 a.m. and 11:00 p.m. Rather than simply coding acts of violence, NTVS researchers coded nine contextual features that may increase or decrease the risk of harmful effects, including the attractiveness of the perpetrator and victim, types of weapons, realism of the portrayals, whether or not the violence was justified or not, how graphic the portrayals were, and the outcomes of the violence.

Just more than 60% of the programs analyzed contained some violence, and the levels of violence were relatively stable over the 3-year period. Just under 40% of the violence was perpetrated by the “good guys,” and 33% of the “bad guys” who engaged in violent behaviors were not punished. It is interesting to note that in more than 70% of the scenes containing violence, aggressors were not criticized by the other characters, did not appear to feel any remorse for their actions, and were not punished at the time. Data from the 1996–1997 television season suggests that children watching 2 hours of cartoons a day will view approximately 10,000 violent incidents in a year. Typically, these acts of violence are sanitized and/or trivialized and do not depict the long-term consequences of the violence. The typical violent program contained at least six acts of violence per hour, and more than 40% of the violent scenes were either couched in a humorous context or contained an element of humor. These acts of violence spill over into programming oriented to children. In fact, children watching 2 hours of cartoons a day will see somewhere in the area of 10,000 violent incidents in a calendar year.

Even though most topics have not been as well studied as violence, this body of literature is growing at an astonishing rate. Even a cursory review of the journals illustrates that this is a very popular area of study and one that is no longer strictly within the domain of media scholars.

Studies discussing how illness and health care professionals are portrayed appear in medical journals just as studies examining portrayals of the elderly appear within the social gerontology literature. These studies examining portrayals of institutions, professions, and individuals are generally offered as explanations for audience attitudes and stereotypes. While a detailed review would be far too long to include here, a more general overview will provide an insight into the kind of work currently being done and an opportunity to discuss some of the common or stable findings within the media portrayals literature.

The demography of television has always been a popular topic of study. Typically, these studies make comparisons between media portrayals and reality and often use census data for such comparisons. For example, Robinson and Skill (1995) report that research has consistently shown that the elderly are underrepresented on television (and in nearly every other media channel ever examined). Most studies find that elderly characters represent fewer than 3% of the characters on prime-time television, and in the United States more than 12% of the population is 65 years of age or older, and they tend to be relegated to minor roles. Elderly characters also tend to be portrayed in a negative or stereotypical light. Characters under the age of 18 also tend to be underrepresented on television, and characters between the ages of 25 and 45 tend to be overrepresented. This pattern exists on Saturday morning programming as well as prime-time programming.

Historically, portrayals research has shown that even though females represent 51% of the U.S. population, female characters have been underrepresented throughout the history of television. While estimates vary, most studies conducted before the 1990s indicated that females were outnumbered by males at a rate of 2 to 1, although this disparity appears to be decreasing. More recent estimates (see Glascock, 2001) of female characters on prime time suggest that about 63% of the characters on TV are male and only about 40% of all central or main characters are female. With well over 70% of the producers, directors, writers, creators, and executive directors being male, it is clear that this trend is just as true behind the camera as it is in front of the camera.

In addition to being underrepresented, female characters are more likely to be identified by their marital status than are male characters and less likely to be identified by their profession or occupation. Similarly, female characters are typically younger and occupy less prestigious and lower-paying jobs than do their male counterparts. While the percentage of female characters has improved significantly since the 1970s, they are portrayed in a different and often less positive light than are male characters.

Ethnic groups and minorities have also historically been underrepresented on television. Latino, Asian, American Indian, and almost all other groups appear on television very infrequently. They tend to be invisible, and when they do appear, they are cast in small and noncentral roles. They

are also likely to be cast in stereotypical or negative roles when they do appear. Television portrayals of blacks have increased fairly dramatically since the beginnings of television. Recent census data suggest that approximately 12.1% of the U.S. population is black, and during the years 1990 to 1995, about 14% of all prime-time characters were black.

A recent estimate of the 2001 prime-time season (Gluscock, 2001) suggests that those trends have remained relatively stable. Gluscock reports that 81.1% of all prime-time characters were white, 13.9% were black, 3.0% were Hispanic, 1.5% were Asian, and 0.5% were Native American. The demography of main or central characters changes these percentages slightly. Gluscock reports that 82.2% of all main characters were white, 13.1% were black, 3.3% were Hispanic, 0.7% were Asian, and 0.2% were Native American. The most recent census data suggest that the demographic profile of the United States looks slightly different from that of television. In the 1997 census, 72.7% of all U.S. residents were white, 12.1% black, 10.9% Hispanic, 3.6% Asian, and 0.7% Native American. Keep in mind that small fluctuations can be a function of sampling as well as the popularity of a particular type of show and do not necessarily indicate a cultural trend.

Other topics have, of course, received varying levels of attention from media portrayals researchers. A quick scan of the literature produced the following list of topics that have been addressed within the past few years:

- Demography of television
 1. Age
 2. Gender
 3. Race
 4. Socioeconomic status
 5. Occupations and professions
 6. Sexual orientation
- Health on television
 1. Illness
 2. Mental health
 3. Handicaps
 4. Suicide
 5. Diet
 6. Suicide
 7. Eating disorders and obesity
 8. Exercise
 9. Alcohol consumption
 10. Drug use
- Families and relationships on television
 1. Dating and romance
 2. Marriage
 3. Families
 4. Divorce

5. Relationships
6. Friendships
7. Grandparents
8. Stepparents
9. Self-disclosure

- Institutions on television
 1. Religion and religious behavior
 2. Politics and political candidates
 3. Science and scientific phenomena and skepticism
 4. Legal system and criminal justice system, including violence, crime, terrorism, hate crimes, gangs, and firearms portrayals
 5. Health care system and health care professionals
 6. The press and the media
 7. Educational system

This list is not meant to be exhaustive by any means and does not come close to identifying the variety of studies that would be subsumed under each topic. In most cases, a study that examines a particular portrayal also gathers data on a number of other variables in the process. Studies looking at violence also report gender and race and may report other variables such as presence and types of weapons, how graphic the violence is, or whether or not the violence was justified. This list is just an indication of some media portrayals that have been examined recently to give you an idea of what kind of work is being done within this area. Much of the work that has been done has focused on specific behaviors (e.g., sexual behaviors and violence), but other work has focused on topics such as portrayals of altruism or depictions of agencies. The ability to create or discover a way of identifying the portrayals you are interested in is really the only limitation to studying media portrayals.

Even though a great number of studies have examined media portrayals and representations, there is still a great deal of work that needs to be done. Certainly, media portrayals can and have changed over time, so there is a continuing need to maintain accurate records about media content. Studies that compare portrayals from different countries are becoming more and more common. Similarly, studies that examine portrayals in media other than television are becoming more popular again. Future research needs to examine portrayals across multiple media channels and cultures to determine how these portrayals affect audience members. In addition, future research needs to examine the differences in media representations between central characters and peripheral characters more closely. Central characters may be more important as potential sources for social learning, but the characteristics and behavior of peripheral characters may shed more light on attitudes held by audience members. Finally, the strengthening of the theoretical rationale for these media content studies will benefit both the content analysts and the social critics and help scholars better

understand the relationship between media and society. Anyone studying media portrayals would benefit greatly from considering these programs as narratives. Such an examination may illuminate the nature of what makes a good story as well as the potential for those portrayals to affect audience members.

MEDIA USES AND GRATIFICATIONS

CARRIELYNN D. REINHARD

Roskilde University

BRENDA DERVIN

Ohio State University

From one end of the globe to the other, people in all walks of life use media—in their homes, at their daily labors, and as they move by foot or vehicle from place to place. Every one of these uses involves an audience member making a conscious or unconscious, habitual or new choice among an increasing explosion of media options: traditional choices of radio, TV, and newspapers, magazines, and books and newer options such as Internet sites, video games, DVDs, and MP3 players. In addition, each user is faced with ever-increasing avenues for getting access to their media choices. Users, thus, make “choices” of what to seek and how. In the tradition of media studies known as “uses and gratifications,” the fundamental questions have been the following: Why do people make particular media choices? What needs are they filling by doing so? What impacts do their choices have on them? Under what conditions are some choices made and not others?

One person, coming home from a stressful day, may turn to an often-viewed TV drama, not so much for its content but because one of the actors is a familiar favorite, someone welcomed as a “friend.” Another may be suspecting that she has some kind of digestive disorder and goes online to find health-oriented Internet sites. Another is becoming increasingly upset about the state of world events and turns to his favorite politically oriented news show for confirmation of his worldview. A crafts fanatic turns to a do-it-yourself TV channel; a lonesome college student seeks refuge in a guilty pleasure, listening to rap music, while none of her usually critical family are home. Accounting for

these kinds of audience choices is the essential focus of the uses-and-gratifications approach.

Historical Origins: From Media Effects on Audiences to Audience Effects on Media

A number of intersecting events led scholars both in the social sciences and humanities to become interested in the relationships between media, audiences, and society. One was the rise of the mass media themselves, with the increasing presence in people’s lives resulting from the rapid diffusion, in turn, of newspapers, film, radio, and television. With each new technology, media use rose exponentially. A second major impact was World War II—the first war in which mass media were deliberately used on a massive scale to reach and in many cases to persuade citizens. Post-war documentation of the seemingly enormous impacts of media campaigns in Nazi Germany led social scientists in the United States to initiate research programs focused on media effects.

These interests in “audience research” took on a number of forms, each of them interrelated to each other. One interest in audiences resulted directly from becoming aware of the Nazi use of media. On the basis of accounts, it was expected that media could have immense direct “hypodermic”-like effects on audiences, where everyone would be affected the same way. This assumption led some social scientists and policymakers to a concern for the possible negative effects of media and to a host of the now

familiar questions on media effects. One common example is how violence portrayals by media affect audiences. A second early interest in audiences was essentially the opposite of a concern for whether media have negative impacts. Rather, the question became “How can media be used to sway audiences to societally approved impacts?” One familiar example is the question of how to use media to persuade citizens to stop smoking.

A third interest in audiences was also driven by a focus on media effects. As soon as media began to proliferate, media institutions needed to account for themselves—to their investors, advertisers, and society. This need led them initially to an interest in audience counts—how many people were using this or that channel or attending to this or that program. Soon, this interest evolved to asking what persons used what media, with initial attentions focused on such questions as whether more educated citizens were more likely to use newspapers or newly immigrated citizens less likely.

Each of these three early interests in audiences dominated media research in the 1940s through the 1960s. Each continues to be a major part of the media studies agenda today. Each is, at root, an interest in media effects on audiences. Yet, despite early anticipations of strong and direct effects, the quest to identify effects has been far more difficult and elusive than expected. It became a byword to suggest that audiences were difficult and expensive to reach, even “obstinate” (Bauer, 1964). “Effects” research moved from the early emphasis on finding direct effects to identifying limited or indirect effects. To discern indirect effects, researchers had to identify other factors that stood between media use and media impact. Increasingly, for example, it was proposed that a host of “selectivity” processes stood between media and its effects, usually summarized as selective attention, perception, and recall. A plethora of alternative theories of what mediates media effects began to be explored, including explorations of how characteristics of spokespersons (e.g., source credibility), messages (e.g., one-sided vs. two-sided presentations), channels (e.g., radio or television), receivers (e.g., audience member age), and contexts of media exposure (e.g., home or car) stood between media use and media effect.

This emphasis on understanding the conditions under which media affect audiences continues today. There is a general consensus that in fact media can affect audiences, sometimes in directly observable ways, but most often indirectly, and sometimes in hidden, concealed ways. The journey from the general acceptance in the 1960s, when at best media were seen as having only limited effects, to the current more complex understandings has been a long one. Various research traditions have pursued different lines of inquiry into these questions, often in relative isolation from each other. Thus, for example, media researchers in the “critical-cultural tradition” (Adorno & Horkheimer, 1972) have focused more on how media

negatively affect audiences in concealed ways, while those in the “quantitative empirical” tradition have focused more often on how media may be used to achieve societal-mandated ends such as a citizenry more involved in political life or more attentive to health concerns. Alternatively, “audience reception” (Hall, 1973; Morley, 1992) and “sense-making” (Dervin & Foreman-Wernet, 2003) studies have focused more on how audiences use media to make sense of their lives within the context of sometimes facilitating and sometimes hindering societal conditions. In contrast, uses-and-gratifications researchers have focused more on goal-oriented needs fulfillment.

These different ways of looking at media audiences are often called research traditions. Another name for them is *discourse communities*. This term is useful because it reminds us that research traditions differ not only in how they focus on audiences and their relationships to media but also in their assumptions and vocabularies that become like private languages. The very way these communities talk about media is influenced by and influences how they understand media. This is one reason why many media audience studies seem so contradictory.

Our focus in this chapter is specifically on the uses-and-gratifications tradition, providing a picture of the dominant emphases and accomplishments of that tradition as it began to slowly emerge in the late 1950s and stands today. It is important to note that in the very earliest years of media studies in the 1940s, there was an interest in how people use media to function in their lives, which arose almost simultaneously with the emergence of the emphasis on how media affect people. For example, in work that preceded any of the now formalized attentions to audiences, it was found that audience members were filling needs by listening to radio quiz shows and soap operas, and these provided more than mere diversion or entertainment. For some audience members, media provided education and emotional release as well. Likewise, researchers in these early years found that newspapers were being used not just for information but also as tools for daily living, respite, social prestige, and social contact. This early emphasis on audience motivations was, however, eclipsed by the massive focus on media effects that resulted from widespread public concern for preventing negative and promoting positive media impacts.

Despite marked differences in the various early attentions to media effects, all efforts to study media effects ended up challenged in one way or another by the “obstinate” audience. It came to be generally understood that audience members were using media for specific functions in their lives in ways that seemed to defy researcher attempts to identify media impacts. It was this challenge from recalcitrant audiences that served as an impetus for the turn toward understanding audiences in audience-oriented ways—to understanding why audience members use media and what they use it for.

Media researchers in various traditions took this turn toward audience-oriented studies of audiences almost simultaneously, although in very different ways. Thus, for example, marketing research began to focus more on audience motivations and lifestyle contexts rather than merely audience counts. Critical-cultural studies, formerly focused primarily on identifying biases and hidden ideologies in media messages, began to have a more intensive focus on how audiences make sense of media messages, attempting to unravel why it is that sometimes audiences passively accept media messages and sometimes they argue and negotiate with them. Using primarily qualitative approaches, this turn became known as *audience reception analysis*. The tradition that became known by the name *uses and gratifications* grew out of and remains anchored today in quantitative social science studies. This tradition was the earliest vigorous and systematic turn to audience-oriented studies of media-audience connection.

The Foundational Assumptions of the Uses-and-Gratifications Approach

The most fundamental conception of media audience uses and gratifications came from Elihu Katz (1959), who penned the term *uses-and-gratifications approach* in 1959. A media research pioneer and one of the many scholars who attempted to find elusive media impacts, in 1959 Katz called for research to no longer focus solely on “what media do to people” but instead to concern itself with “what people do with . . . media.”

The turn toward audiences in this way was in actuality one of the first turns toward looking at media-audience relationship as a communication relationship rather than merely a transmission relationship. The focus in the various approaches to looking at effects assumed that media were transmitting particular meanings in their messages and that audiences were passive recipients of these messages, for good or for bad. In contrast, the uses-and-gratifications turn toward audiences was opening the door to a larger question. Media institutions were no longer seen as the sole source of determining the meanings of media messages. Rather, audiences were proposed as having independent roles. In the media effects paradigm, it was assumed that there was only one way—the producer’s way—of making sense of a movie or hearing a song or understanding a story. Furthermore, it was assumed that there was only one way media could be used—in the way media producers predicted it would be used. In contrast, the foundational assumption of the uses-and-gratifications approach was that audience members have some degree of independent control over what they get out of media and how they use what they get.

While Katz laid down the call for attention to how audiences use media in the late 1950s, the approach known today as the uses-and-gratifications approach did not begin to emerge formally until the 1970s, when McQuail,

Blumler, and Brown (1972) began to put people’s use of media under their microscopes. It was Blumler and Katz who began to formalize the emergence of the approach in 1974.

Since these earliest formulations and continuing till today, the many researchers working in the uses-and-gratifications tradition have adhered to a central set of core assumptions. These have been discussed in a wide variety of ways but can be summarized as involving five essential propositions: (1) audiences are actively selecting from different media; (2) audience media selection is goal directed; (3) the media and other potential sources compete for audience attention; (4) personal, social, and contextual worlds mediate audience activity; and (5) the uses people make of media and the effects media have on people are interconnected. Each of these assumptions is reviewed below.

Audiences are actively selecting from different media. In the uses-and-gratifications tradition, it is assumed that audience members are active in their selections and uses of different media. The terms used to describe the different media that audiences are selecting can be very confusing because they vary across authors and across time. For example, what is meant by channel in one line of work may be described as technology or medium in another. Across many studies, the possibilities have included channels, mediums, technologies, genres, texts, and content. Channels, mediums, and technologies are often used interchangeably and refer to distinctions such as television, film, radio, newspapers, book, cell phones, the Internet, or sometimes a specific television station, cable network, or magazine. Genre is an often overlapping term but usually refers to classes of selections within a medium, such as soap operas, video games, or television news. Texts usually refer to specific content packages, such as a particular movie, game, or news article.

The body of work known under the label *uses and gratifications* has assumed that audiences actively select their uses of media from the array of possibilities available in society. It is assumed that what drives this media use reflects each person’s conscious or unconscious consideration of the usefulness of media to his or her life. Seeing audiences as active in this way has led uses-and-gratifications researchers to have debates with media effects researchers, who have tended to characterize audience members as passive recipients for whatever comes their way. The active audience characterization implies that people are more impervious to influence than media effects theories have allowed. Also, being active in general, people are also assumed to be able to report what media choices they have made and why.

Across the now almost 50 years of uses-and-gratification studies, it is fair to say that the most used “predictor” of audience gratifications has been the particular medium used. Study after study has explored the uses of this medium or that, this genre or that, this particular content or that, and then looked at the extent of and reasons for audience uses.

There have been studies, for example, of the gratifications obtained from traditional categories such as quiz shows, soap operas, and TV talk shows, and more recently the newer types such as video games, cell phone use, and MP3 player use. Usually, these studies focus on one media type at a time. Thus, for example, one sees many recent studies of audience uses of cell phones.

When multiple media types have been compared, the results show a commonsensical pattern to the findings. As examples, newspapers more often gratify needs for information, whereas TV does so more often for entertainment and pleasure and cell phones for connecting to friends and relatives. In saying this, however, it is important to emphasize that all studies show a great deal of variety in how audience members use specific media. Even for quite specific genre types, for example, quiz shows, the array of gratifications is diverse, indicating that individual audience members use media in different ways.

Audience media selection is goal directed. People are assumed to have specific reasons for selecting the media that they do. The fundamental idea is that audience members turn to media because they expect media to gratify specific needs. For example, a person alone in her apartment may feel the need for companionship and may turn on the television to engage in imagined interaction with characters on some show. While this link between the need and the expectation of a gratification is not considered the only predictor for media use, in the uses-and-gratifications approach, it is considered an important contributor once other factors such as access to media are taken into account. Furthermore, this link between need and expected gratification is central to the basic idea of uses and gratifications. Indeed, this link is the source of the approach's very name.

One of the primary goals in some 50 years of research has been to develop a catalog of possible media gratifications. Two basic approaches have been used. One is to simply ask members of a particular audience their reasons for media use, allowing them to answer in their own words. The second has been to ask audience members to indicate the extent to which a roster of gratifications applied to them and their media engagements. Researchers then developed from these responses, using various content analytic and statistical tools, categories of potential gratifications. With both approaches, the aim has been to develop typologies, or categorical lists, of underlying gratifications.

Because the studies that have pursued the goal of developing lists of possible media gratifications have differed widely in their attentions, no agreed-on list of gratifications has yet been developed that can be applied to all forms and instances of media use. Studies differ in ways almost too numerous to account for—what subgroups of audiences are studied, for what media, in what contexts. For example, a study focusing on children and television produces a somewhat different list of gratifications from one focusing on general-population audience uses of

public television or on teenage users of video games. Furthermore, as new media have proliferated and geographical locations of media use have multiplied, studies attending to these “new” media in “new” locations have added new gratifications to the roster or variations on older ones.

Despite all this often overwhelming diversity in media gratifications, there are some core coherencies. A basic set of four categories of gratifications permeate almost all the lists, albeit under different names and described in different ways. This basic four appeared, for example, in a 1972 study by McQuail, Blumler, and Brown under the labels *diversion*, *personal relationships*, *personal identity*, and *surveillance*. Some 15 years later, in his review of numerous studies, McQuail (1987) produced a summary of gratifications organized into essentially the same four categories but now with slightly different labels—entertainment, integration, and social interaction; personal identity; and information. McQuail also added a roster of illustrative subcategories. This roster of common reasons for media use serves as a useful illustration of the kinds of typologies that have been developed and still are being developed. It is shown in Table 56.1.

Media and other potential sources compete for audience attention. The third essential proposition that is foundational to the uses-and-gratifications approach is that audiences can gratify their needs in a variety of ways using both media and nonmedia sources such as family and friends. These alternative sources are in competition with each other as potential sources of audience need gratifications. This phenomenon is referred to by uses-and-gratifications researchers as the “functional alternatives” proposition (Rosengren & Windahl, 1972). Basically, it says that we exist in a world where there are a number of ways in which our needs for things such as companionship and information can be fulfilled. Media are simply a portion of the possible sources we turn to for gratifications.

The proposition that media compete for audience attention has, of course, been a long-term understanding. The idea that audiences have alternative media to turn to in gratifying any particular need has, however, developed much more slowly. There was a time once when with few media available, it was assumed, for example, that audiences turned to television to be entertained and newspapers to be informed. It was assumed that if you knew what kind of media an audience member turned to, you knew what gratification the audience member sought. This simple proposition, however, never offered a satisfactory explanation because even in the early days of media development, different audience members were deriving diverse gratifications from single-medium engagements. Thus, for example, if a group of 100 audience members turned to the latest Harry Potter movie, in a gratifications study, we could easily find at least a few mentions of every possible gratification.

<i>Gratifications as listed in McQuail (1987)</i>	<i>Examples</i>
Entertainment	
Escaping, or being diverted from problems	Working-class man whose work challenges his aging body collapsing at home into escape into sports TV
Relaxing	Teenager turning to the reggae music his father introduced him to in order to relax when school is stressful
Getting intrinsic cultural or aesthetic enjoyment	Besieged parent of twins sensing the joy of being human in a Longfellow poem
Filling time	Patient filling time with a portable electronic game player in doctor's office
Emotional release	Third-grade boy working out aggressions with a video game
Sexual arousal	Young woman feeling sexual stirrings watching romantic movies
Integration and social interaction	
Gaining insight into circumstances of others, gaining social empathy	Voter coming to understand how lack of health insurance is affecting his neighbors
Identifying with others and gaining a sense of belonging	Lonesome teen learning he is not the only one interested in collecting rocks
Finding a basis for conversation and social interaction	Secretary anxious to discuss last night's TV drama with friends at work
Having a substitute for real-life companionship	Isolated mother comforted by feeling she shares in human compassion on a talk show
Helping carry out social roles	Young boy seeing that even world-famous jocks have to apologize sometimes
Enabling one to connect with family, friends, society	Grandfather comforted by the e-mailed photos of his grandchildren
Personal identity	
Finding reinforcement for personal values	Mother seeking confirmation that her decision to instruct her daughter about birth control is wise
Finding models of behavior	Mother seeking models for convincing her daughter to practice abstinence until she marries
Identifying with valued others	Teenager gaining a sense of self by hearing a teenage celebrity share his views
Gaining insight into one's self	Employee struggling with boss seeing in a TV drama a possible way to think about his own behavior
Information	
Finding out about relevant events and conditions in immediate surroundings, society, world	Father concerned about his son's draft status seeking information on military actions
Seeking advice on practical matters or opinions and decision choices	Woman just diagnosed with high cholesterol seeking medical advice
Satisfying curiosity and general interest	Newspaper reader doing his habitual morning skimming of latest news
Learning and self-education	Student writing essay required for his English class
Gaining a sense of security through knowledge	Passenger seeking assurance that weather is conducive for flying

Table 56.1 Common Reasons for Media Use

SOURCE: As Reported by McQuail (1987, p. 73).

Now, as the traditional boundaries between media-defined functions have become blurred, no direct connection between type of medium and gratification obtained can be assumed. Understanding what predicts how audiences see connections between media and the gratifications they obtain has become even more critical. Uses-and-gratifications researchers now increasingly attempt to determine under what circumstances a specific medium will be chosen for a particular gratification. Recent research has documented that as new media source and content combinations are introduced into media landscape, audiences are actively comparing new ways of satisfying needs with old ones, sometimes retaining past choices, sometimes choosing new ones, and sometimes adding new ones to a personal set of media gratification options.

Personal, social, and contextual worlds mediate audience activity. This fourth foundational proposition grows out of the preceding one. Since the link between media choices and how audiences see those choices as filling needs has been shown to not be directly predicted by media type, uses-and-gratifications researchers have turned to identifying what mediates these relationships—what stands between media choices and how audience members are gratified by media use. The major thrust in this quest has been to predict audience reasons for media use. This has led to the development of a catalog of various predictors for the origins of needs. Three major classes of predictors of audience needs have been identified: (1) demographic, (2) psychological, and (3) environmental/contextual variables.

The most common set of variables offered as predicting the origin of needs has been the demographic characteristics of media audiences and users. Such variables have sometimes been referred to as the “social circumstances” of media users because demographics reflect the social categories and roles society uses to categorize people. Demographic variables commonly include measures such as age, level of education, gender, and ethnicity.

Personality or other psychological characteristics have been the second major group of predictors of audience needs. Using psychological motives for predicting communication behavior was given its first extensive consideration by McGuire (1974). Since that time, a variety of psychological variables have been tested as possible explanations for gratifications sought and obtained. Some have been derived from what is commonly called the “big five” personality model, which categorizes people based on five dimensions: (1) extroversion, (2) neuroticism, (3) openness to experience, (4) agreeableness, and (5) conscientiousness. Others have focused on qualities such as loneliness or a need for sensation seeking and arousal. Still others have gone further to suggest that these psychological differences are rooted in genetic makeups that then affect human temperaments, including traits such as activity level, adaptability, and attention span.

The third major group of predictors of the origins of audience needs has been factors external to media users—contextual and environmental factors. The reasoning here

has been that the life conditions audience members find themselves in may produce tensions, create problem awareness, frustrate real-life satisfactions, reinforce particular media-related values, or provide a field of expectations about media use (Katz, Blumler, & Gurevitch, 1974). A woman who just broke up with her significant other may decide to watch a movie for solace, whereas another may watch the very same movie to learn how to cope with a cheating spouse. These external factors may interact with audience personality and other traits, creating a complex picture of media use.

Researchers have in fact demonstrated the interconnectedness of these predictors and how they relate to audience needs and gratifications through media use. As this work has advanced over the years, audience needs have been increasingly defined as both innate to and descriptive of the individual and at the same time relating to the individual’s place in society and the constraints and freedoms associated with that societal location.

The uses people make of media and the effects media have on people are interconnected. Throughout the years, ongoing attempts have been made to link media gratifications research with media effects research. It has been argued that audience members who turn more to particular media to meet their gratification needs—whether these choices be conscious or unconscious—will be more likely to be affected (either negatively or positively) by the content and characteristics of that media. Such impacts have been hypothesized for a host of potential audiences—for example, young children who rely more heavily on media for information because of their relative lack of life experience and background information and get a distorted view of politics, teenage girls who rely heavily on teen magazines as their sources of models for being female and become obsessed with weight issues, isolated older adults who turn to television for feelings of being social but end up seeing the world as more fearful and threatening.

In this sense, it can be seen that the media uses-and-gratifications tradition, although actively pursuing an agenda of understanding audiences in audience-oriented ways, still straddles between effects-oriented and audience-oriented approaches, struggling with how to simultaneously see audience members as unique individuals and as anchored in societal conditions and highly constrained by media choices society offers them.

Underlying Mechanisms: Theories of the Media Use/ Media Gratification Connection

A great many studies such as those described above have been done focusing on predicting audience member needs and gratifications. Because of differences in how researchers measure the many variables involved and, in particular, what media they focus on and how they categorize

gratifications, it is not easy to extract consistent patterns across studies. Many of the patterns that have emerged do, however, meet commonsensical expectations. Thus, for example, a large number of studies have shown that in general, younger adults have been more likely to name personal identity and entertainment as media gratifications, whereas higher educated adults have been more likely to name information and women more likely to name integration and social interaction. Likewise, studies have shown that audiences using newspapers report more information gratifications, those using radio more diversion gratifications, and those using television more diversion and companionship gratifications. Most important, however, although differences have often been statistically significant, research has increasingly shown that predicting user needs and gratifications is not the same thing as understanding how users make connections between different kinds of media and how they use them.

As a result, the more sophisticated turn in this work has begun to dig much deeper, focusing in particular on mechanisms or theories of what it is that explains the connections audience members make between their media use choices and the gratifications they obtain from media use. Several consistent guiding propositions have emerged from this work, which we summarize below as four sets of explanations focusing on understanding the underlying mechanisms. None of these is considered the single explanation of audience media uses and gratifications, but taken together, they provide a developing complex set of understandings of what is involved in the media use/media gratifications connection. In addition, they have begun to provide empirical support for the basic assumptions on which the uses-and-gratifications tradition rests.

The first set of explanations has focused on understanding audience members' activities as ongoing processes. Thus, for example, Levy and Windahl (1984, 1985) were the first to propose that audience activities can change during single engagements with media. They were also the first to empirically study differences before, during, and after media engagement. This work has provided support for the idea that audience members are actively engaged in ongoing self-monitoring of their media use activities as these are embedded in time. On the surface, this may seem a commonsensical idea. But, given that uses and gratifications as a tradition emerged from a media effects paradigm, which expected constant and unchanging effects to operate directly from media to audiences, beginning to understanding how audience activities change during single-medium engagements constituted an important breakthrough.

The second set of explanations is also related to the understanding that audience members are self-monitoring and that their evaluations of media use change as a result of this self-monitoring. In a thrust of work known under the label *expectancy value theory*, researchers—in particular Palmgreen and Rayburn (1982, 1985)—drew on theories

focusing on attitude change in psychology to propose that audience member activity is a result of a person's belief in the probability of success (expectancy) for that behavior and the evaluation of potential consequences should that behavior succeed or fail.

Media users' expectations for their needs to be gratified have been a part of the uses-and-gratifications approach since its inception, of course. Nevertheless, this theory formalized the attention. A major focus in this work has been accounting for differences between gratifications sought and those obtained. For example, a user turns to the *Lord of the Rings* DVD set because she loves the books but on trying to view the movies finds them too violent. As a result, the gratification she sought is not sufficiently obtained. Failing to be gratified, her expectations for future similar media uses may be altered. This kind of theorizing has opened up deeper inquiries into how expectancies and evaluations of media use are formed.

The third set of attentions to underlying mechanisms also builds on the idea of media audiences as self-regulating. This development has begun to examine media as sources of affective regulation and mood management. Developed in part in response to criticisms that the uses-and-gratifications approach has placed too much emphasis on audiences as rational decision makers who weigh how best to gratify needs, this theory has proposed that media use is at least in part a function of audience members' needs for emotional regulation (Zillmann, 1988).

The idea is that media users select their media choices to minimize bad moods and maximize good moods. The choices may be conscious or unconscious and, indeed, may have started off as an accidental media engagement that over time became imprinted in user memories driving future media choices. Thus, an audience member may stumble across a comedy that makes him or her feel good, and the next time he or she feels blue, he or she may choose to watch that comedy again to achieve the same happy results. To some extent, it can be said that this theory has simply added another category of gratifications to those offered in Table 56.1, but some researchers are now pursuing it as a fundamental explanation of media use in its own right.

Although the underlying mechanisms described above may be considered as psychological in emphasis, the fourth is more sociological. As described in the section on predictors, some researchers have created integrative models whose aim has been to show how characteristics of individuals work in tandem with characteristics of societal conditions to predict media uses and gratifications. The intent has been to show that needs arise not only from biological and psychological traits but also from the connections people have with society and culture, including media economic structures and technology and social and situational circumstances.

The uses and dependency theory offered by Rubin and Windahl (1986) is an example of a theory focusing on how

media industries and society may affect audiences' choices. Society, they reasoned, can affect how accessible media are to audiences and how audiences perceive their needs and expectations for media, whereas media industries control the type of content available for audiences. For example, a given audience member may have a high need for information that compares liberal and conservative views but lack the money to purchase periodicals that are more likely to present such coverage. The audience member has become dependent on weekly Web surfing visits to political magazine sites. In this way, this theory has argued that these converging factors result in the user becoming dependent on some aspect of media to gratify particular needs. The theory has provided for understanding how individual and societal factors combine and has opened up additional avenues for complex analyses of media engagements.

The Big Unanswered Questions

When one reads the academic literature, one finds a confusing and contradictory set of criticisms within the community of uses-and-gratifications researchers and between this community and other discourse communities pursuing related issues. We provide here a general overview not of the specific criticisms about this kind of scholarship or that kind of method but rather of the big unanswered questions that researchers are continuing to debate. These same big unanswered questions are the source of ever-present debates among those using the uses-and-gratifications approach as well as among those in the critical/cultural, audience reception, and sense-making traditions of studying the society-media-audience relationship. In can be said, in fact, that these are the same big questions that dominate all media studies. We present them here without any attempt to review the plethora of arguments in the literature about each. Rather, we offer them to the reader as fodder for thinking.

How do we explain both external forces acting on audiences and internally motivated audience activities? This is, by far, the biggest and most central unanswered question. Among the many subquestions that are the focus of animated arguments are issues such as the following: If audiences are seen as the commodities they see to advertisers, can we even say that audience members have the freedom to actively select what media they use? How do we explain audience members' active and conscious choices of programs society would deem to be negative, such as pornography, while still respecting audiences' freedoms to choose? How do we explain when audiences' media choices reflect or defy larger social or cultural expectations when, for example, a member of a cultural subgroup does not reflect the dominant media uses and gratifications of his or her group?

It is at the juncture of these questions that we find young researchers in the various research traditions beginning to move toward each other in an attempt to explain the conjoint interactions of societal and individual forces on audience choices and uses. The overarching term for this issue is *the structure versus agency debate*—the question of when and under what conditions audience behavior is explained by societal forces or as a result of audience activity independent of these forces.

If there is any consensus emerging from the debates, it is that efforts must not explain what happens as “structure versus agency” but as “structure and agency.” The idea is that a media user's behavior must be addressed with multiple converging explanations focusing on both social forces and individual freedoms and coming to understand when society dominates, when the individual dominates, and when both work conjointly, whether it be in struggle or convergence.

If we look at the media life of a single user, we can illustrate this. Mary, a 20-year-old college senior, prides herself on being an independent woman, somewhat a feminist. Her dad encouraged that as well, and she loves TV shows such as *The Closer*, with strong, sassy women. Yet Mary also has a “secret” TV-viewing life. When she comes home exhausted by the strains of classes and paid work, she admits she has a “guilty pleasure.” She watches hip-hop MTV, with all the scenes of men brutalizing women. She says she doesn't understand why, but she is addicted. On the other hand, when Mary drives her car, she purposefully chooses to listen to NPR but then hardly listens at all. She describes it as having “1/100th of my ear” listening while thinking of other things. Mary also admits that she is a far too loyal member of the American consumerist society. “I am constantly buying things I do not need.” Mary acknowledges to herself that society may look down on her decision to watch MTV while applauding her choice to tune into NPR, but her preference for either medium does not reflect these social expectations. Mary's media use is complicated, as qualitative studies are beginning to show most media use is.

What is active or passive? Conscious or unconscious? Ritualistic or purposive? Habitual or goal directed? Collective or individual? Each of these pluralities pervades the various criticisms and countercriticisms levied between and within discourse communities. A host of very specific methods-oriented debates ensue. As one example, cultural studies researchers charge that uses-and-gratifications researchers assume that audience activity is conscious, purposive, active, individualistic, and goal directed and that audience members can articulate what they use media for. To counter these claims, cultural studies researchers ask these questions: What of unconscious needs—such as a youngster unconsciously feeling comforted by a particular show because the lead actor looks like his or her deceased father? What of

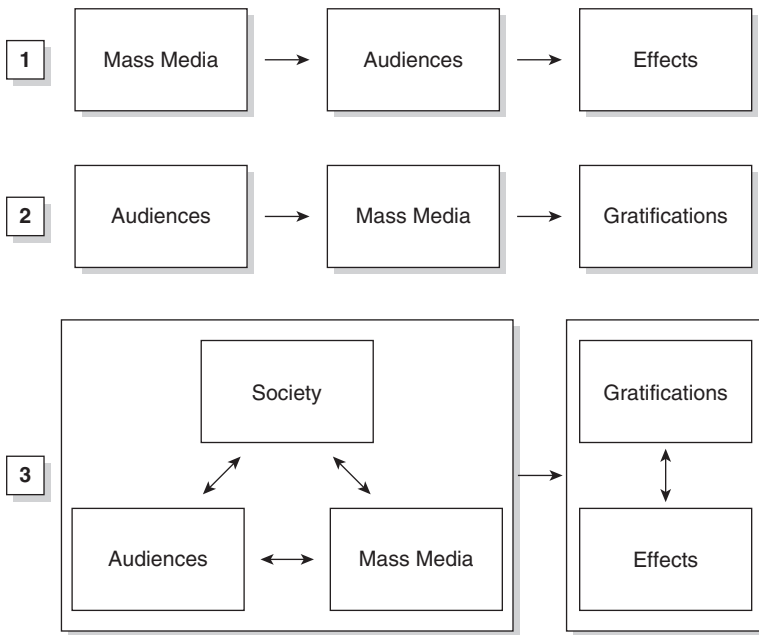

Figure 56.1 Three Ways of Looking at Media-Audience Connection

socially ritualistic media use, where friends play video games while simultaneously listening to hip-hop? Are these uses purposive? In what way? What of inarticulate users, not used to reflection and explanation? These pluralities form the fodder for not only debates but also future research directions.

What is the difference between a media effect and a media gratification? In one sense, this unanswered question rests on layers of subtle differences in complicated academic assumptions and vocabularies. But in another it is a fundamental question. On the one hand, the effects paradigm assumes that media are acting on people. On the other, the uses-and-gratifications approach assumes that people are acting on media. But some researchers counter this by suggesting that if media make offerings available that users use in particular ways, that in itself is an effect. When audience members choose to use particular media, expecting specific gratifications, aren't they predicting how media will affect them?

Conclusion

The tradition of media studies known as *uses-and-gratifications research* does not offer a grand or coherent theory of media use. Rather, it is best seen as a set of complementary and sometimes competing understandings of the connections between media uses and media gratifications. It is primarily psychological in orientation. In essence, it is an attempt to develop understandings of the psychological functions to which audiences put their uses of media.

In quantitative social sciences, mass media studies have consisted of two empirical emphases. Media effects researchers have focused on what impact media can have on people. The goal of that approach has been to prevent negative effects from harming people, promote positive effects that can help people, and provide media producers with the means by which to do either. In contrast, uses-and-gratifications researchers have sought to examine the reasons people have for using media they do. The differences between these two approaches are illustrated as rows 1 and 2 in Figure 56.1 media.

Row 3 provides a far more complex picture where somehow media, audiences, and society interact to yield media effects and/or media gratifications. This is a fair representation of the current state of attentions not only in uses-and-gratifications research but in all media studies focusing on the media-audience connection. In one sense, the complexity of row 3 may be seen as a step backward, as if somehow in 50 years there has been no resolution of the questions focusing on how media affect people versus how people affect media. But the important change is that the question has begun to focus more on multiple converging forces that acknowledge the power of society, media, and audience members. The uses-and-gratifications approach will continue to be one evolving avenue for exploring these complex relationships.

Among the theories of communication in the 21st century, agenda setting, which has its roots in the early 20th century, has proven to be one of the more robust theories, if not the most robust theory, in communication. The resilience of this theory is a result of its parsimonious, yet expansive, qualities, its roots, and its connection to other theories in communication. According to Blumler and Kavanagh (1999), “among the field’s master paradigms, agenda setting may be most worth pursuing” (p. 225). The pursuit of agenda setting has seduced many researchers into studying various aspects of the theory, resulting in hundreds of published works. This prolific work on agenda setting has continued to tweak the theory, making it as strong, if not stronger, than its origins.

Even though researchers have been very innovative in their agenda-setting research, the premise of the theory remains very simple. Bearing in mind that media are the main source of information for the public, the main idea behind agenda setting is that the issues that media deem salient will influence what the public in turn deems salient. This transfer of salience from the media agenda to the public agenda is what is known in communication theory as agenda setting. In other words, media tell us what to think

about. In addition to its simplicity, agenda setting shifted the focus of researchers from attitudinal to cognitive media effects, thus weakening, if not dismissing, Klapper’s (1960) thesis of the minimal consequences of media. Even though the initial focus of agenda-setting effects dealt with cognitive effects, evidence (as seen later in this chapter) points to possible consequences of agenda setting on attitudes and opinions as well as behaviors.

The robustness of agenda setting is due not only to its simplicity and to the proliferation of research but also to its roots, which run deep to earlier conceptualizations of public opinion. Walter Lippmann, in his book *Public Opinion*, published in the early 20th century, discusses the role of media as mediators between reality and the public. Lippmann (1922) argues that public opinion is a reaction to what we see in media content, which is not necessarily a reflection of reality. The importance of media is in their creation of this new reality or environment, resulting in a “pseudo-environment” to which people react. Cohen (1963) suggested that the press tell its readers what to think about. McCombs and Shaw (1972) are the ones who coined the term *agenda setting* in their empirical examination of a U.S. presidential campaign. They surveyed undecided voters and asked them

to indicate the issues they deemed important. McCombs and Shaw also content analyzed nine news sources. They then compared media's agenda with the public's agenda and found evidence that media agenda and the public agenda correlate and that indeed media tell the public what to think about. Further studies continued to focus on the transfer of issue salience from media to the public and established the causal direction between the two agendas.

The hundreds of research projects that ensued tested the underlying hypothesis of agenda setting in different circumstances such as with a variety of media, countries, research designs, topics, and agendas, as well as under different conditions. The influence of media agenda on the public agenda has been supported over and over again.

Agenda setting has links to several theories in communication. Connections have been established between agenda setting and cultivation theory among researchers who focus on the entertainment media. Others have examined the relationship between agenda setting and the two-step flow of communication. The link between agenda setting, priming, and framing is proving to be the most fruitful and at times the most controversial development of agenda-setting research.

Attribute agenda setting is the latest leap in agenda-setting theory, and it is through this second level of agenda setting that priming and framing come into play. The second level of agenda setting goes beyond the original premise of agenda setting in terms of the transfer of issue salience from media to the public to the influence of issue attributes on evaluation by the audience. Priming deals with the salience of attributes in the public's judgments of public officials and candidates for public office, whereas framing deals with the salience of attributes in the public's judgments of issues. Thus, media not only tell us what to think about, as established by the first level of agenda setting, but media also tell us how to think. The controversy lies in whether framing and priming are extensions of agenda setting or whether they are very different phenomena. Takeshita (2006) has concerns that the link between agenda setting and framing could lead to the theory's decline, whereas others see this link as evidence of the theory's strength. According to Ghanem (1997), "this shift in emphasis does not negate the basic agenda-setting hypothesis, but rather builds on what already exists. It is one highway linking up with another major thoroughfare" (pp. 4–5).

Agenda setting has thus become a two-level theory, with one level dealing with objects and the second level dealing with that object's characteristics and traits. It is interesting to note that the second level of agenda setting is also leading to a flood of research in many countries on different topics using a variety of methodologies just like the first level did and continues to do.

Volumes can be written on the various aspects of agenda setting, slicing it and categorizing it in many different ways. This chapter focuses on several aspects of agenda setting that seem particularly relevant at this point

in time based on the direction of the research and the controversy that has ensued as a result of some of that research. The areas of focus are the reemergence of an interest in contingent conditions, attribute agenda setting, and the second level of agenda setting as well as its relationship to framing. This chapter also examines the consequences of agenda setting that evidence indicates go beyond cognitive effects. In addition, this chapter will suggest other areas of possible agenda-setting research in the ever-changing media landscape.

Contingent Conditions

Researchers studying agenda setting have specified several conditions under which agenda-setting effects are more or less likely to occur. Research in this area has focused on the stimuli as well as audience characteristics that influence the agenda-setting process. Benton and Frazier (1976) examined the transfer of salience for issues as well as subissues. They divided several issues into three levels. Using the economy as an example, the first level would be the general category of the economy, the second level would include problems and solutions, and the third level would include pro and con positions. Their studies revealed that newspapers, but not television, produced agenda-setting effects at all three levels. Of course, in many instances the influences of newspapers and television are equal, but when there is a difference, newspapers are likely to be more influential as agenda setters. Others have examined the optimal amount of time needed for agenda-setting effects to take place. Depending on the issue, the time frame has varied from 1 week to 6 months.

The obtrusiveness of the issue, or the level of personal contact with the issue, also seemed to influence the transfer of salience from media to the public. The more unobtrusive the issue, the more likely it was for agenda-setting effects to take place. On the other hand, personal experience with an issue tends to dilute or diminish the role of media. Inflation would be an example of an obtrusive issue if it reaches the point where it affects our daily purchases. Foreign policy for many of us is an unobtrusive issue because of the lack of personal experience with the issue. Lee (2004) attempts to reconcile the obtrusiveness of an issue hypothesis with that of the cognitive priming hypothesis, which posits that personal experience enhances, rather than lessens, agenda-setting effects. He concludes that obtrusive issues tend to show agenda-setting effects within a shorter time frame than do unobtrusive issues. Closely related to issue obtrusiveness is the geographic proximity of the issue. Palmgreen and Clarke (1977) found that agenda-setting effects are stronger for national issues, which are usually less obtrusive than local issues.

Studies on the role of interpersonal communication on agenda setting provide mixed results, with some studies suggesting that interpersonal communication enhances

agenda setting and others reporting the opposite effect. McLeod, Becker, and Byrnes (1974) examined the role of interpersonal communication and found that it played a greater role in agenda setting when newspapers declined as an information source late in the campaign. Shaw (1976) found that interpersonal factors were good predictors of agenda setting. Studies by Erbring, Goldenberg, and Miller (1980) also found that interpersonal communication enhanced the agenda-setting effect. Other researchers found that interpersonal communication diminishes the agenda-setting effect. To add to the contradictory results, still others found that interpersonal communication enhances agenda-setting effects under certain conditions and reduces it under others. Jones, Denham, and Springston (2006) examined the role of interpersonal sources and health issues and found that interpersonal source of information had more of an influence on younger women, whereas older women were more influenced by exposure to media. Other studies just produced inconclusive results on this matter.

Several researchers continued to examine the conditions under which agenda setting takes effect by focusing on the individual and by examining the effects of demographic and psychological variables on agenda setting. Respondents who are interested in an issue and who have a positive attitude toward media are more likely to be susceptible to agenda-setting effects, whereas party affiliation and political philosophy had limited effects. In the same research venue, Tsfaty (2003) found that on the aggregate level, the correlation of the media and the public agendas was weaker for skeptics, those who mistrust the news media, than for nonskeptics. These results held true for both print and television. Examining media reliance and not attitude toward media, Yang and Stone (2003) concluded in their study that the more media reliant the public is, the more it will adopt the media agenda.

Perhaps the most complicated yet fruitful contingent condition is the need for orientation because it provides a psychological explanation for the agenda-setting process. It also provides an understanding of why some people are susceptible to agenda-setting effects while others are not. Weaver (1980) breaks down the need for orientation into two dimensions: relevance of the issue and uncertainty regarding the issue. Relevance and uncertainty occur sequentially, with relevance as the initial defining condition of the need for orientation. An issue is relevant if it has any personal or societal relevance. Uncertainty has to do with the amount of information desired on the topic. If an individual has all the information needed on the topic, the uncertainty level is low, and vice versa. A high need for orientation will include high relevance and high uncertainty. When people have a high need for orientation, they will be more likely to experience agenda-setting effects.

Matthes (2006) revisits the need for orientation, which he considers the most prominent contingent condition for agenda setting. He develops a three-dimensional scale of

need for orientation to account for the motivational factors involved in media exposure: orientation toward issues, orientation toward facts, and orientation toward journalistic evaluations. The three orientations tie in with the first and second levels of agenda setting, where the first level of agenda setting deals with the overall issue and the second level deals with the cognitive and affective attributes of that issue. The need for orientation toward issues can explain the first level of agenda setting, while the orientation toward facts can explain the cognitive dimension of the second level of agenda setting and the orientation toward journalist evaluations could help explain the affective dimension of the second level.

Attribute Agenda Setting

Most of the research on agenda setting has investigated the salience of public issues, but sometimes other objects, such as political candidates, have been the focus of investigation. Here the term *object* is used in the same way that social psychologists use the phrase *attitude object* to designate the thing that an individual has an attitude or opinion about. At the level of attention, which is the original arena for agenda-setting effects, the media agenda and the public agenda are defined in the abstract by some set of objects. In turn, these objects have attributes, a variety of characteristics and traits that describe them. When journalists talk about an object and when members of the public talk and think about an object, some of these attributes are emphasized and others are mentioned less frequently. For each object on an agenda, there is an agenda of attributes that influences our perception and understanding of the object.

These attributes have two dimensions, a cognitive component encoding information about specific substantive traits or characteristics that describe the object and an affective component encoding the positive, negative, or neutral tone of the descriptions of these traits when they appear on the news agenda or the public agenda. For example, a news story about a substantive attribute, the leadership ability of a candidate, might quote a supporter referring to this attribute of the candidate in a positive tone and his opponent referring to this attribute in a negative tone.

When the object on the agenda is a public figure, there is significant evidence that the images of these persons in the public mind parallel the media's attribute agenda.

Both traditional agenda-setting effects and attribute agenda-setting effects involve the transfer of salience. The core proposition for these two stages, sometimes referred to as the first and second levels of agenda setting, is that elements prominent on the media agenda become prominent over time on the public agenda. To paraphrase and extend Bernard Cohen (1963), media not only may be successful in telling us what to think about, they also may be successful in telling us how to think about it.

Attribute Agenda Setting and Framing

In its evolution over the past 40 years, agenda-setting theory has converged with a variety of other communication concepts and theories, and attribute agenda-setting links theory with framing. Although there are many widely divergent perspectives on framing, Robert Entman's (1993) frequently cited definition contains language that is complementary to agenda-setting theory in its use of the term *salient*:

To frame is to select some aspects of a perceived reality and make them more salient in a communicating text, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation and/or treatment recommendation for the item described. (p. 52)

Both framing and attribute agenda setting call attention to the perspectives of communicators and their audiences, how they picture topics in the news, and, in particular, to the special status that certain attributes or frames have in the content of a message. Nevertheless, detailed comparisons of framing and attribute agenda setting are complicated by the plethora of definitions for framing.

In an overview, Gamson (2001) identifies three research domains of the framing approach: (1) the origins and use of frames in the construction of messages, (2) the examination of specific frames in messages, and (3) the interaction of audiences and these messages. In communication research, both agenda setting and framing encompass the specific content of media messages and the effects of this content on audiences. And, as we shall see, the two approaches at times can be virtually indistinguishable in addressing questions about media content and the effects of media content. Nevertheless, the framing and agenda-setting approaches largely diverge in regard to the origins and use of frames in media messages, with considerably more emphasis on this domain in framing research. Here, we will focus on the content of messages and the effects of these messages on the audience, the domains encompassed by both approaches.

Over the long history of media message analysis, scholars have used many levels of abstraction, and three major approaches can be distinguished in both agenda-setting and framing research. One approach is a tight focus on a specific frame or attribute in media messages, such as Iyengar's (1991) distinction between episodic and thematic frames. Even more specific are Kahneman and Tversky's (1984) experiments on the consequences of whether information is presented rhetorically in terms of losses or gains. Nevertheless, many researchers favor a second approach widely employed in quantitative content analysis, in which message content is measured and described in broader, more comprehensive terms of what is selected, emphasized, and excluded. Framing research also frequently considers the central emphasis in messages (Barnett,

2005), and most of the frequently cited definitions of framing refer specifically to emphasis, selection, and exclusion. Gamson (1985) defines *framing* as the emphasis of certain features and the denying of others. Gitlin (1980) defines *frames* as "principles of selection, emphasis, and presentation composed of little tacit theories about what exists, what happens, and what matters" (p. 6). Tankard, Hendrickson, Silberman, Bliss, and Ghanem's (1991) definition is similar: "A frame is a central organizing idea for news content that supplies a context and suggests what the issue is through the use of selection, emphasis, exclusion, and elaboration" (p. 5). In addition to emphasis, Entman's (1993) definition also specifies consequences, the promotion of "*a particular problem definition, causal interpretation, moral evaluation and/or treatment recommendation for the item described*" (p. 52, italics in original).

In agenda-setting research, Ghanem (1996) introduced the concept of the compelling argument, the idea that certain attributes of an object function as compelling arguments for their salience. Compelling arguments are certain ways of organizing and structuring the picture of an object that enjoy high success among the public, an approach that considers the emphasis in media messages from the perspective of the audience. Ghanem examined a situation in Texas during the early 1990s, when intensive crime coverage in the news generated very high levels of public concern about crime as the most important problem facing the country. Nevertheless, during this same period of time, actual crime rates in Texas were declining and had been for several years. Ghanem's examination of the various ways in which crime was framed in the news revealed that the salience of crime on the public agenda was related especially to the frequency of news stories about crime in which the average person would feel personally threatened. This attribute of crime, this frame in the crime coverage, explained the salience of crime as a public issue even better than the total coverage of crime during this time did. This aspect of the coverage was a compelling argument among Texans for the salience of crime. More recently, Sheafer (2007) has demonstrated the impact of negative coverage of the economy as a compelling argument among voters across five Israeli elections for the Knesset between 1988 and 2003.

Both framing and agenda setting deal with cognitive effects. Agenda setting has long been touted as one of the theories that shifted the focus from attitudes to cognition. Framing is also seen as a cognitive effect associated with the construction of reality and how people think about important public issues. As with media messages, researchers examine these effects from many different perspectives. Kahneman and Tversky (1984) demonstrate that the alteration of messages, shifts in the rhetorical framing of messages, will affect which options will be selected by the public. Iyengar (1991) found that differences

in episodic and thematic framing influence the attribution of responsibility by the audience, with episodic frames leading to the attribution of responsibility to the individual and thematic frames leading to the attribution of responsibility to systematic causes.

Agenda-setting research has moved beyond the salience or perceived prominence of objects and their attributes to investigate the consequences of these effects. At the first level of agenda setting, this includes the priming of attitudes as well as the formation of attitudes and opinions. At the second level of agenda setting, there is evidence of attribute priming, the influence of both substantive attributes and their affective tone on attitudes and opinions.

There is an opportunity here to systematically explicate media effects, particularly regarding *how to think* about public affairs if framing and attribute agenda setting are considered as convergent or at least complementary approaches to the study of media effects. If we more carefully conceptualize and measure *how to think, what we know, how we interpret, and what we understand*, we can significantly advance our understanding of media effects.

Underlying Psychological Processes

Theoretical efforts to distinguish between framing and attribute agenda setting in terms of the underlying psychological processes have found mixed success, both in terms of empirical fit and in stimulating new empirical investigations. Price and Tewksbury (1997) and Scheufele (2000) focused on two aspects of knowledge activation, the concepts of accessibility and applicability (Higgins, 1996), arguing that framing is grounded in applicability, whereas agenda setting is grounded in accessibility.

Nevertheless, there is empirical evidence from the earliest years of agenda-setting research that the salience of issues on the public agenda is considerably more than the accessibility of those issues as a consequence of the frequency with which issues are portrayed in the news. When an individual is asked to name “the most important issue facing the country today,” the perceived salience of an issue presented through media content is significantly moderated by that individual’s state of mind, in particular his or her level of need for orientation. Weaver (1977) found that during the 1972 U.S. presidential election, the strength of agenda-setting effects among North Carolina voters increased monotonically with their level of need for orientation. Takeshita (1993) found a similar pattern in a Japanese local election. The strength of an individual’s need for orientation is a combined function of the perceived relevance of the topic and the individual’s uncertainty about the topic. Specifically in terms of the knowledge activation model, Todorov (2000) refers to applicability as the relevance of the knowledge context and noted that “the size of accessibility effects is a function of the applicability of knowledge activated by the

initial questions” (p. 430) and that “applicability constrains accessibility effects—a highly accessible concept may not be applied when it doesn’t share any relevant features with the stimulus” (p. 431).

One of the few attempts to empirically distinguish accessibility and perceived importance is Nelson, Clawson, and Oxley’s (1997) experiment comparing the effects of TV news stories that presented two different attributes of a highly publicized KKK rally, free speech versus public order. Significant effects were found for the perceived importance of the attribute emphasized in each of the news reports. No effects were found for the accessibility of these attributes. Nelson and colleagues concluded thus:

Our results contribute to the growing body of evidence questioning mere accessibility models of political judgment and opinion. . . . Our results point to a more deliberative integration process, whereby participants consider the importance and relevance of each accessible idea. (p. 578)

Kim, Scheufele, and Shanahan’s (2002) study of an urban development issue focused specifically on the accessibility of issue attributes. The salience of the issue attributes emphasized in the local newspaper was measured (inversely) on the public agenda by the proportions of survey respondents who indicated “Don’t know” or “Neutral” in response to issue attribute questions that asked how likely it was for each attribute to happen as a consequence of this proposed development. “In this operationalization, salience of issue attributes refers to their cognitive accessibility or the ‘ease in which instances of associations could be brought to mind’” (p. 15). Although the accessibility of the issue attributes increased sharply with greater exposure to the newspaper, the resulting attribute agendas among the public bore little resemblance to the attribute agenda presented in the news coverage. Unlike previous attribute agenda-setting studies grounded in a variety of open-ended and closed-ended measures of the *perceived importance* of attributes that found substantial correlations between the attribute agendas of media and the public, in Ithaca, the pattern of salience among the public measured in terms of cognitive *accessibility* did not replicate these attribute agenda-setting effects. What emerged was a different version of media effects in which the *relative* amount of increased salience for the six attributes among newspaper readers when compared with persons unaware of the issue paralleled media agenda in two of three comparisons.

Consequences of Agenda-Setting Effects for Attitudes, Opinions, and Behavior

Agenda Setting of Issues and Attitudes

When we talk about media effects, we often mean certain influences media messages exert on the audience. There

is no widespread agreement on what the concept of influence means. In mass communication, the division between two types of media effects is accepted—media-induced change in the public’s priorities and direct persuasion. Traditionally, attitudes and opinions were treated as similar concepts in assessing media influence, especially when opinions represented evaluative judgments about particular issues or events.

Mass communication scholars used a socio-psychological approach in explaining media effects through the 1950s and 1960s. The core concept of the socio-psychological approach was attitude change, and persuasion was considered to be the main tool of such change. Nevertheless, attitude change studies showed little or no effects through persuasion. Agenda-setting studies restored confidence in the idea that media have quite significant effects. Persuasive effects of media messages were understood as specific cases of a broader media function—to inform the audiences about the events.

Nevertheless, establishing the fact that media structure the opinion of the audience does not answer the question about whether or not media change the attitudes, and if so, how. Some findings suggest that the increased salience of media issues leads to stronger opinions and makes the attitudes more extreme. There was evidence that increasing salience helps form opinions and attitudes. An enhanced coverage of certain issues by media brings about variously framed information that leads to new or modified knowledge and subsequent opinion formation. Researchers also agreed that the psychological priming mechanism underlying the agenda-setting function might be accountable for attitudinal effects. Some authors consider priming as having more long-term effects: “The greater the cumulative exposure to relevant stimuli, the greater the likelihood that ‘mere mention’ of relevant stimuli triggered priming of applicable attitudes, regardless of the amount of recent coverage in the news” (Althaus & Kim, 2006, p. 973).

Nevertheless, these results do not elucidate the question whether the dominance of the media agenda over public opinion leads to the persuasive effects. In other words, the time has come to explore the link between issue salience and attitude change. Ideally, parallel and simultaneous testing of agenda-setting and attitudinal consequences in experimental studies could determine whether such a link exists. This task is difficult to accomplish without further elaborating particular variables inside media messages and determining the specific psychological processes that mediate transformations of public opinions. Leff, Protes, and Brook (1986) tried to test agenda-setting and attitudinal effects in a study with a quasi-experimental design; they found some limited indications of attitude change. The results were far from being conclusive due to methodological and theoretical limitations. The authors suggested that “the stylistic form of an investigative report . . . may affect profoundly its

degree of impact” (p. 313) and considered further exploration of a link between a message form, the nature of an issue, and relevant opinions.

Agenda Setting of Attributes and Attitudes

As agenda-setting research progressed to the attribute level stage, a new opportunity to reevaluate the relationships between agenda setting and attitudes appeared. Different classes of media messages were proposed, which identified finer distinctive elements inside broader categories, namely, substantive and affective attributes or frames of an issue. Unlike content frames, the numbers of which are constantly increasing and changing, these attributes capture the characteristics that apply to any media messages. Affective attributes, as an example, color the tone of issue coverage, which not only may raise the importance of the issue but may also help form a certain attitude in audience members or change an existing one. The evaluative character of affective attributes places them at a commensurate level of analysis with attitudes, evaluative in their nature. The impact of a negative or positive tone on the people’s assessment of the state of economy has been recently documented. Both experimental and nonexperimental studies confirm the role of affective attributes in shaping the attitudes and opinions of people.

Empirical evidence exists that not only the tone of textual messages but also television news images depicting the behavior of political candidates negatively or positively shape the corresponding attitudes of respondents to these candidates. The studies in the framing tradition brought converging results. These studies employed the concept of valence framing, which is similar to affective attributes. Such frames evaluate issues or situations in either positive or negative terms. Using frames with either negative or positive connotations, the authors found that “valenced frames and risk framing in particular are shown to affect individuals’ perceptions, evaluations, and behaviour” (Schuck & de Vreese, 2006, p. 22). Substantive attributes did not become the focus of attitude studies partly because of their matter-of-fact nature, which does not transform directly into the evaluative nature of opinions and attitudes. The substantive attributes may activate certain cognitive structures, which can trigger corresponding evaluative mechanisms. Although a comparative study of substantive and affective attributes did not measure the attitudes related to these attributes, it indirectly pointed at possible preferences the subjects might reveal in interpretation of corresponding issues. Brewer (2002) found that subjects explained their issue opinions either through “equality” or “morality” frames used in their particular treatments. More direct studies of a link between substantive attributes and attitudes can be compounded by a particular attitude to a specific issue or an event depicted in a

media message, not to a more general substantive attribute applicable across particular topics.

Agenda Setting, Attitudes, and Mediating Psychological Mechanisms

Attribute manipulation tied with attitudes toward and opinions about media messages might require an examination of mediating psychological processes in the relationship between agenda setting and attitudes. It is widely accepted that priming is the mechanism that underlies the agenda-setting process. Because of this mechanism, salience translates not only into issue prominence but also into specific voting behaviors. Nevertheless, as previously noted in the discussion of attribute agenda setting and framing, the priming mechanism understood solely within the bounds of the knowledge activation model's concept of accessibility does not provide an adequate explanation for agenda-setting effects. For example, the question whether the most active or the least active media users are susceptible to the agenda-setting effects is not solved. McCombs and Shaw (1972) found that those who were less knowledgeable of the media agenda followed its accounts more. McKuen and Coombs (1981) and Wanta (1997) think that those with more interest in politics and media coverage of politics are more susceptible to the agenda-setting effects. On the other hand, McLeod and colleagues (1974) and Iyengar, Peters, and Kinder (1982) found that the most interested individuals are less affected by the media agenda. The roots of the disagreement might lie in the different types of the need for orientation. But this need as a motivational factor must trigger a certain psychological process. There are some indications that Petty and Cacioppo's (1981) elaboration likelihood model (the ELM) might offer such a complementary mechanism. The ELM postulates that attitude change, as a result of media or personal influence, may happen both when people are highly involved in the issues and messages and are able to process them as well as when their involvement and ability are low. Although the authors of the ELM maintain that the attitudes become stronger when information processing is more elaborate, they also admit that increased repetition of peripheral cues or having a rehearsal of an attitude position, may enhance the accessibility.

Petty, Priester, and Brinol (2002) also point at the link between the agenda-setting approach and the ELM. They maintain that "by setting the agenda of what is important to evaluate, media can have important 'indirect' effects on attitude change" (p. 167).

Developments in agenda-setting research provide a way to systematically test the characteristics of the messages and the issues beyond the messages. The ELM offers two ways of processing information: It pays serious attention to the role of the message factor in attitude change, and it

embraces both the motivation and the ability of the audience to process the information. These features make the ELM one of the very useful tools along with the mechanism of priming for investigation of how agenda setting produces its media effects.

Although the terms *opinions* and *attitudes* are often used interchangeably in political communication, studying how agenda setting is linked to attitudes as more stable predispositions of the public to evaluate the issues on media agenda must be a distinct area in future research. Moreover, a better understanding of this link might boost further contributions to existing findings about the agenda setting/behavior relationship.

Looking to the Future

The first empirical study of the agenda-setting function of media was followed by hundreds of similar studies conducted in different countries. The explanatory and predictive power of accumulated knowledge allows several specific venues of future research in agenda setting to be envisaged, such as studying how new media pose challenges for understanding what is a common agenda for the media and the public. Another venue would be going beyond predominantly political communication emphasis into studies of media agenda setting through entertainment and other genres. Researchers can also continue to study the psychological processes in the need for orientation, which switches on the agenda-setting mechanism.

Agenda setting also plays a significant part in the broader social roles of media: surveillance of the larger environment, transmission of culture, and connecting different segments of society together. Furthermore, theoretical development of agenda-setting concepts would illuminate the links between issues as general categories and different attributes and demonstrate how issue and attribute saliences differ in their impact on the public perception of these issues.

Some researchers have expressed concern that the technological change in media with the Internet becoming a more and more dominant source of information will not only diversify the voices but will also lead to the fragmentation of the media and public agendas, with unclear consequences for democracy. Nevertheless, initial studies seemed to dispel these fears. Roberts, Wanta, and Dzwo (2002) demonstrated that there was a correspondence between the issues covered by media and the issues discussed in electronic bulletin boards (EBBs). Other studies reported evidence that the media agenda is still whole, not fragmented as some might argue. Another study showed that the second level of agenda-setting and priming effects of media work continuously in the digital environment. The issue attributes in online papers examined in the study successfully transferred to the attribute salience of the audience.

The role of entertainment media in the transfer of salience to the public agenda may become an area of serious attention considering the size of the audiences these media command. Holbrook and Hill (2005) found that non-news sources, in their case criminal dramas, heighten the accessibility and salience of certain issues for the viewers, leading to agenda-setting effects.

The agenda-setting paradigm contributes significantly to the current mass communication scholarship by constantly generating studies with fresh approaches and new angles. The concept of agenda setting has practical applications in academia, journalism, and politics. These are the healthy signs of agenda setting's viability. Moreover, the agenda-setting hypothesis is a part of the ongoing debate about the future of the mass communications field: This debate reflects the interest in agenda setting as one of the tools for truth seeking in the field of communication.

CULTIVATION AND MEDIA EXPOSURE

NANCY SIGNORIELLI

University of Delaware

Television is the storyteller of our nation and the world, telling most of the stories to most of the people, most of the time. As such, it has become our most common and constant learning environment, one that very few people can or even want to escape or ignore. Children today are born into homes in which most stories are told by a centralized commercial institution rather than by parents, peers, schools, or the church. Television thus shows and tells us about life—who wins, who loses, who is powerful and who is weak, and who is happy and who is sad.

Television is only one of many venues that help explain the world. What is different about television is that its version of reality is generated by a small number of multinational media conglomerates whose messages bombard everyone with basically the same perspectives at the same time. These views are not very different from those found in other media or imparted by other powerful socialization agents. Yet television is unique because it provides a common set of images to virtually all members of society and because people tend to spend more time with television than with other media.

Since television's inception, there has been concern about its effects. The popular press and the government continue to ask, "What does television do to us?" Teachers and parents wonder if television makes children more aggressive or if it helps or hinders learning. Although seemingly simple, these questions are complex, and the answers are far from simple or straightforward.

Cultivation analysis is one approach to find answers to these broad questions. It is the third component of a research paradigm that investigates (a) the institutional

processes that underlie media and the production of their content, (b) the prevalent images in media content, and (c) the relationships between watching television and audience beliefs and behaviors. In its simplest form, cultivation analysis asks if those who watch more television have views that are more reflective of what they see on television compared with people who have similar demographic characteristics but who watch less television (Morgan, Shanahan, & Signorielli, 2009).

Cultivation studies typically begin with identifying and assessing the most recurrent and stable patterns in television content, looking for those images and values that often cut across most program genres. These findings are then used to generate questions to uncover people's conceptions about social reality. These questions are then posed to samples of children, adolescents, or adults using standard techniques of survey methodology. A key element in these surveys is the assessment of television viewing. Questions about viewing typically ask how much time the respondent watches television on an average day. The analyses then determine light, medium, and heavy viewers on a sample-by-sample basis. Hence, the analyses look for differences in the amount of viewing, not specific amounts of viewing. The questions about social reality used in cultivation analysis do not mention television but rather provide answers that reflect either the dominant views or images seen on television or those found in reality. The resulting relationships between amount of viewing and the tendency to respond in terms of what is seen on television reflects television's contribution to viewers' conceptions of social reality (cultivation).

Those who watch more television are different from those who watch less television in many ways. Although all demographic groups have people who watch more or less television, there are overall differences between those who watch more and those who watch less in terms of sex, age, education, income, occupation, race, and other demographic and social variables. In short, cultivation analysis assumes that those who watch less television are exposed to more varied and diverse information compared with those who watch more television and thus rely more on television for their information. Consequently, cultivation theory predicts that the more time a person spends watching television and being immersed in this mediated world, the more likely his or her views about reality will reflect what is seen on television.

Does Genre Matter?

Over the years, some researchers have questioned whether exposure to specific genres of media messages should be a critical component in understanding the cultivation phenomenon and effects. Cultivation studies that were conducted by the group of scholars who began this line of research, traditionally associated with the Cultural Indicators Project (George Gerbner, Larry Gross, Michael Morgan, James Shanahan, and Nancy Signorielli), have assessed global amounts of viewing, typically asking how much television (not what types of programs) is watched on a typical day. "Classic" cultivation is thus concerned with the long-term and long-range effects of living with television in general. Consequently, these studies predict that those who watch more, television's heavy viewers, see more of these images and messages on a regular basis and that their views of social reality will be influenced by the messages and images they see day in and day out.

Others have explored and studied media effects in a cultivation framework but have measured viewing in a more specific than general manner. Some researchers have asked viewers to fill out viewing diaries (Hawkins & Pingree, 1981) or asked viewers to indicate what shows they regularly watch or have watched during the last week, sometimes choosing these programs from lists of available programs in the viewers' area (Slater & Elliott, 1982; Weaver & Wakshlag, 1986). Potter and Chang (1990), for example, asked high school students how often they watched 12 different television genres (situation comedies, movies, etc.) during a week, using this information to create different measures of viewing. They also calculated a measure of the total amount of viewing, including the amount of viewing of each type of program, and measures that combined the two responses proportionally. This analysis found that students' viewing was somewhat evenly distributed and that most of the students watched each program category about 4.5 hours a week. Although Potter and Chang did not find substantial cultivation

effects in this study, they concluded that a proportional measure of viewing might be the best overall indicator to explore the cultivation phenomenon in future research. Finally, there is also some thought that a measure of attention to media should also be assessed (Chaffee & Schleuder, 1986) and used in conjunction with viewing measures.

Some scholars believe that cultivation research should focus on different genres of programs because they assume that different types of programs present diverse views of the world and social reality. Cohen and Weimann (2000) note that different genres, although typically formula driven, tend to present viewers with diverse views about the world. News, crime, and action programs and programs that explore current events, for example, are thought to focus on social order, examining public rather than domestic life and typically distinguishing right from wrong. The plots of these programs examine events and action, with the characters presenting the motives and the context for the events. On the other hand, situation comedies, family dramas, and soap operas, again formulaic in nature, focus on domestic issues, family relationships, and friendships. Similarly, Grabe and Drew (2007) suggest that one of the reasons scholars have examined possible genre-related cultivation differences is that content analyses typically show variation in portrayals among genres. Situation and romantic comedies present different types of stories from crime dramas, with the former genres having considerably less violence than the latter genres.

Violence, Crime, the Mean World, and Interpersonal Mistrust

The area of study that has received the most attention and been most often associated with the phenomenon of cultivation is people's conceptions about fear, violence, and interpersonal mistrust. Studies of television content conducted in the cultural indicators perspective have found that network television's prime-time world has had a consistent and fairly high level of violence for more than 30 years. About 6 out of 10 programs are violent, with violence occurring at the rate of four to five acts of violence per program (Signorielli, 2003). Similarly, other studies of television violence, including the content analysis of the National Television Violence Study (Smith, Nathanson, & Wilson, 2002) in the mid-1990s, found violence across all channels (cable and broadcast throughout the day, with the most similarity during the prime time hours), with somewhat more graphic violence on the cable channels. As a result of this consistent level of violence viewing, cultivation studies have predicted and found that those who watch more television are more fearful and believe that they are living in a mean and dangerous world. They are more likely to buy guns and watchdogs for protection and to install more locks on windows and doors. These heavy viewers tend to overestimate the likelihood that they will

be involved in violence and tend to overestimate the numbers of police and others in law enforcement and crime detection. In short, viewing tends to heighten perceptions of danger and risk and maintain an exaggerated sense of mistrust, vulnerability, and insecurity (Gerbner, Gross, Morgan, & Signorielli, 1980).

Some researchers, however, have postulated that viewers' conceptions about fear and violence are the result of more genre-specific viewing. Several studies show relationships between conceptions about crime and the viewing of crime programs, despite the knowledge that television's crime programs typically distort statistics about crime in society. Dominick (1974), in a study of fifth-grade children in New York City, found that those youngsters who watched more crime shows believed that criminals typically were caught and, when arrested, had knowledge of their civil liberties. Carlson (1983), in a study of sixth- through twelfth-grade children in Providence, Rhode Island, found a strong relationship between crime show viewing and expressing attitudes not supportive of civil liberties. Interestingly, these findings were particularly strong for those students who came from middle-class families and whose parents were more likely to be nonconformist.

Hawkins and Pingree (1981) asked schoolchildren in Australia to keep viewing diaries and found that cultivation effects were genre specific and that different genres of programs offered subtle differences about social reality. Some of their analysis focused on the Mean World Index (television answer in italics) which asks if (a) people would be helpful or *just looking out for themselves*, (b) people would be fair or *try to take advantage*, and (c) people can be trusted or *you have to be careful in dealing with people*. They found that scores on the Mean World Index were related to the children's viewing of crime-adventure programs but not viewing cartoons. Scores on more general violence measures, however, were related to viewing both crime-adventure programs and cartoons. On the other hand, scores on the Mean World Index and violence measures were not related to viewing situation comedies or dramas. Although news viewing was also not related to these measures, Hawkins and Pingree noted that the cultural environment of Perth, Australia, was considerably different from those of many U.S. cities in terms of real world violence. In general, scores on the Mean World Index were related to overall viewing measures, whereas scores on the violence measures were more specifically tied to viewing different program genres.

A study of 4,840 Jewish high school students in Israel (Cohen & Weimann, 2000) found differences in cultivation that were genre specific and illustrated cultural differences. Israeli high school students who were heavy viewers of news programs were more likely to have more trust but less likely to express the fear of being victimized or of being exploited. Watching soap operas, on the other hand, was related to expressing less trust in others, whereas watching comedies was related to having more

trust in others. They also found that overall viewing was important and related to the youngsters' views about their safety. Those students who watched the most television expressed a greater sense that they might be exploited and a greater sense of an awareness of police presence in their day-to-day environment.

Holbert, Shah, and Kwak (2004), using a national probability sample, found that viewing television news and policy reality programs was related to measures of fear of crime but that viewing crime dramas was not. This analysis also found that viewing of programs that are not fictional (such as police reality programs) tended to be more strongly related to conceptions of social reality than the viewing of fictional crime dramas. They interpreted this difference as due to the increased perceived realism of the police reality programs.

There is also considerable evidence showing relationships between exposure to violent media and respondents' aggressive attitudes or cognitions, including aggressive political opinions. For example, there is a positive relationship between supporting the death penalty and viewing crime dramas (Holbert et al., 2004). Similarly, a study using data from the 1976 election study found that crime drama viewing by men was related to a willingness to use force to uphold the law and maintain order in society (Reith, 1999). Eyal, Metzger, Lingsweiger, Mahood, and Yao (2006), in a study of undergraduates, found that watching violent television programs (such as *Cops*, *The Sopranos*) was related to having more aggressive political opinions such as supporting capital punishment, vigilantism, and supporting the use of force by the police. Interestingly, this study found that playing violent video games was not related to holding aggressive political opinions. Along the same lines, using data from experiments and results from the 1995 National Election Survey pilot study, Holbrook and Hill (2005) found that frequent watching of crime dramas such as *Without a Trace*, *NYPD Blue*, and *Third Watch* was related to expressing the view that crime is one of the most important issues facing the nation. Moreover, respondents' overall judgments about the president were related to the president's actual performance in addressing crime in society.

An interesting study that surveyed first-semester college students and their parents found that parent viewing of crime dramas was related to having greater perceptions about the prevalence of crime as well as talking about and warning their children, particularly their daughters, about crime while their children were in high school (Busselle, 2003). This analysis, however, found no relationship between viewing and perceptions about crime for the college students, which was most likely due to the students' decreased viewing of crime programs (or any television viewing) while away at school.

There is also some evidence that viewing specific genres is related to perceptions of the federal government. Pfau, Moy, and Szabo (2001) found that viewing reality programs,

such as *Cops*, was related to positive perceptions of the law enforcement branch of government. At the same time, this study found that those who viewed dramas dealing with law enforcement and the law (e.g., *Law & Order*) did not have more favorable conceptions about the federal government, particularly law enforcement agencies, while the viewing of science fiction programs (such as *X-Files*) resulted in less confidence in the federal government. There was no relationship between conceptions about the federal government and the viewing of news-magazine-type programs.

Other Evidence of Cultivation

There is also considerable evidence as to the viability of the cultivation phenomenon that goes beyond assumptions about violence, crime, and interpersonal mistrust. As television programs have consistently underrepresented women and women's roles, analyses in the traditional cultivation model have found that those who watch more television tend to give more gender-stereotyped answers to questions about the roles of men and women in society and that youngsters who watch more television tend to say that boys and girls should do chores that are gender stereotyped, such as boys mowing the lawn and girls cleaning the house (Morgan, 1987; Signorielli & Lears, 1992a).

There is also evidence that viewing specific genres of programming is related to conceptions about issues relating to sex role stereotypes. For example, specific media use is related to male undergraduates expressing support for traditional masculine ideology. Ward, Merrywether, and Caruthers (2006), using a sample of 656 male undergraduates in a Midwest university, found that those young men who frequently read male-oriented magazines and consistently watched the top 35 prime-time comedies and dramas indicated cognitive involvement with television programs, watched music videos, and expressed support for traditional masculine ideals, including the conception of women as sex objects and as the "sexual gatekeepers" (p. 712). These young men also thought that men were more sexually driven than women and perceived dating as a "battle of the sexes" (p. 712). At the same time, the young men who had more traditional views of masculinity, both in general and in terms of their future life partner, expressed more negative views toward childbirth and less support for breast-feeding in public.

Tiggemann (2005) explored media use and conceptions about body weight in a sample of 1,452 high school students in South Australia. Although overall television viewing was not related to body image variables, those high school girls who often read fashion magazines expressed agreement with several measures of body image including striving for thinness, acceptance of bulimia as an option to reach their ideal body weight, and wanting to be more muscular. At the same time, there was

a relationship between spending more time watching soap operas (because these stories were perceived as being more realistic than other genres) and the desire to be thin as well as the internalization of societal or cultural ideals of beauty for men and women. Among the boys, watching both soap operas and music videos was related to expressing a desire to be more muscular. Overall, the high school students in this study who indicated that they often used television programs, such as soap operas, to learn about the world were more likely to have negative self-images, particularly of their bodies, and to exhibit disordered eating behaviors.

Another subject that has been isolated for genre-specific cultivation analysis is talk shows, particularly how watching these programs may influence teenagers' conceptions about life. Davis and Mares (1998) found that teens who watched more talk shows overestimated the number of teens who ran away from home, the number of teenaged girls who became pregnant, and the numbers of both boys and girls between 15 and 19 who have had sex. Similarly, Rossler and Brosius (2001), using a sample of teens in Germany, examined German talk shows in an experimental paradigm exposing some teens to a week of talk shows. They found that those teens who watched five consecutive episodes of talk shows overestimated the percentages of gay males and lesbians in Germany. They also found evidence that those teens who watched talk shows each day during 1 week had less restrictive opinions about lesbian or gay male relationships and displayed less restrictive attitudes about these issues.

Although relationships between television viewing and conceptions about marriage have been found in a traditional cultivation paradigm (Signorielli, 1991), genre-specific viewing is also related to conceptions about marital expectations. Segrin and Nabi (2002), studying a sample of college students, found that both idealized views (Marriage is forever, I will be married for life to the same person) and expressing intentions to marry soon were related to viewing programs that focus on romance, close personal relationships, and marriage (soap operas, romantic comedies, wedding-related programs). Overall viewing, however, was not related to these concepts in this sample. These authors also speculate that the respondents' exposure to romance-filled programs as children (such as Disney movies) may have contributed to expectations about marriage as young adults.

There is also some evidence that exposure to specific types of content is related to respondents' conceptions about sex. In a study of 3,261 seventh and eighth graders, Pardun, L'Engle, and Brown (2005) found that those youngsters who had greater exposure to sexual content said that they were more likely to be active sexually or to express intentions of future sexual activity. Specifically, those who said they watched movies with sexual themes also said that they were sexually active and that they intended to be sexually active in the future.

Finally, there is evidence that viewing specific genres is related to other conceptions about social reality. From a traditional cultivation perspective, studies have shown that those who watch more television typically underestimate the numbers of older people in the United States and are more likely to say that the elderly are infirm and to give more stereotypical responses about how people age (Gerbner, Gross, Signorielli, & Morgan, 1980). Cultivation analyses have also been conducted in areas related to people's health and nutrition. Two studies of middle-school-age children found that those who watch more television tend to say that the types of foods often advertised to children (sweetened cereals, fast food, candy, and soda) are more nutritious than they actually are (Signorielli & Lears, 1992b).

There is also some evidence that viewing different genres of programming is related to respondents having different perceptions about whites and blacks. Busselle and Crandall (2002), using a sample of undergraduates, found that having larger estimates of the amount of education blacks typically had as well as having perceptions that there are smaller differences between the educational levels of blacks and whites was related to viewing situation comedies. On the other hand, viewing television drama was related to the sense that whites are better educated than blacks and that there are greater differences in the amount of education whites and blacks have. Moreover, viewing of this genre was related to the respondents' belief that blacks' lack of socioeconomic success was due to discrimination. News viewing among these undergraduates was not related to estimates of education but was related to notions of modern racism. More news viewing and perceptions about the lack of socioeconomic success of blacks was positively related to saying that blacks lacked motivation and positively related to saying that blacks did not have fewer job opportunities.

Media use is also related to expressing biased conceptions about welfare in the United States. Data from a probability sample of respondents in the Midwest indicated that watching entertaining programs was related to conceptions that minorities made up most of those on welfare, whereas respondents who watched CNN news underestimated the age of those on welfare and overestimated the amount of money spent by the government on welfare. At the same time, those respondents who watched news programs about welfare and poverty (e.g., as seen on PBS's *The Newshour With Jim Lehrer*) were more correct in their conceptions of the types of people on welfare and underestimated how long people stayed on welfare and the amount of money spent on welfare. Similarly, reading newspaper stories about welfare was related to having more correct views about the age of those on welfare and how long the typical welfare recipient remained on welfare. At the same time, respondents' general support for welfare programs was eroded by viewing national and cable news as well as entertainment programs but supported by watching PBS news programs (Sotirovic, 2001).

Finally, Perse (1990) examined cultivation in relation to local news, including viewers' levels of involvement with such programming. She found that greater personal risk was related to respondents having an entertainment orientation to viewing the local news as well as respondents paying attention to crime news. Perse concluded that, overall, media may be more influential in relation to areas or topics with which people do not have direct personal experience.

We thus find that there are many instances in which exposure to very specific media, particularly specific genres of television programs, is related to having views about the world and social reality. One of the questions, however, that must be addressed is whether or not people, on a day-to-day basis, only watch one or two specific genres of programs. Moreover, even if people state that they have a preference for watching a specific genre, their overall media use typically encompasses viewing many different types of television programs as well as using other media such as magazines and newspapers. Most important, the full understanding of genre in relation to cultivation depends on the content to which people are exposed, yet many of the previously described studies did not begin with a genre-related content analysis. Consequently, without specific data to the contrary, it stands to reason that although someone may profess to have a television diet consisting primarily of crime programs, such as the *Law & Order* or *CSI* series, the images to which he or she is exposed may go far beyond just crime and violence. While the *Law & Order* and *CSI* programs are based primarily on the investigation of crime, they also focus on interpersonal and family relationships as well as other thematic elements showing how the world works. Consequently, heavy viewers of these programs will not only learn about crime and violence, they will also learn important life's lessons about how people interact with each other.

While the notion that media genre is a critical component in assessing the phenomenon of cultivation is interesting, it violates one of the basic tenets or assumptions of the cultivation hypothesis. As Shanahan and Morgan (1999) note, "What counts most is the total pattern of programming to which communities are exposed over long periods of time" (p. 31). Moreover, there is the possible problem that viewers and researchers may not define genres in the same way (Newhagen & Lewinstein, 1992). In addition, there is also the possibility that genre-specific studies may uncover more trivial than general effects (Shanahan & Morgan, 1999). Consequently, it can be argued that the body of studies that focus primarily on media genres is not made up of true studies of cultivation. Rather, these studies may be better described as dealing with more specific than general media effects that would best fit within a general learning theory paradigm rather than the cultivation paradigm.

At the same time, although genre may not be that important for cultivation theory, it may be important to

assess ongoing changes in the media environment to determine whether or not the new media environment is a critical component in the process of cultivation.

New Media

In many respects, the media environment has changed considerably in the past 25 years. The way we now receive media has evolved from the environment of the 1950s and 1960s, with strictly broadcast television (with community antenna TV in some of the more remote and rural areas of the country), theatrical films, or print media (newspapers, magazines, books), to the broad-based electronic media environment of the beginning of the 21st century. In the case of television, until the 1980s, ABC, CBS, and NBC commanded the lion's share of the television audience. There were only a few independent stations in each market, and films were seen in theaters or on television several years after the end of their theatrical run, whereas books, magazines, and newspapers were physical entities that were purchased in bookstores, supermarkets, or drug stores or at newsstands. Today, however, cable or satellite systems provide homes with hundreds of channels, and many homes now are staged to receive programs and movies on demand. Although many movies are still released in theaters, more and more films have a truncated theatrical run, and so they can quickly enter the more lucrative after-market of videodisks and cable movie packages. In addition, some films are produced solely for the cable/videodisk market. Finally, although we still can purchase physical copies of newspapers, magazines, and books, more and more consumers consume these media electronically, and online sources, such as Amazon.com, sell both electronic versions of books and the technology needed to "read" them.

Aside from cable, the technology of the VCR and now DVD players has become accessible to practically everyone. Movies are no longer "special" media, seen in either the theater or years later on television. The availability of videodisks allows consumers to build home libraries of movies and television programs, rent disks from video stores, or use services such as Netflix that deliver movies to your door via the U.S. mail and most recently through electronic sources. We have also changed the way we define what constitutes mass media, moving from broadcast, film, and print to include the World Wide Web and some computer technology. The question then becomes if these changes in venues affect the phenomenon we call cultivation.

Although the way we now receive our "stories" has changed, the way these stories or messages are produced and their content have not changed and, if anything, have become even more homogeneous. Media today are dominated by transnational, global conglomerates whose goal is to maintain a large share of the audience and increase profits. Indeed, as there are more and more channels and more

and more outlets, there are fewer and fewer companies responsible for creating the content to fill these venues. The number of transnational companies continues to become smaller and smaller, with Disney, Time Warner, Bertelsmann, General Electric, Viacom, and News Corp. among the largest and most influential.

Certainly, today's expanded channel media environment provides very content-specific programs dealing with any number of life-related issues (weddings, divorces, courts, food, pets) as well as the traditional fictional "stories." At the same time, the structure of the industry, with its small number of transnational and large media companies, produces messages about the world, its inhabitants, and how they work that are more similar than dissimilar. Consequently, the smaller number of production venues may result in a more homogeneous than heterogeneous media environment. Cultivation has always been concerned with the broad underlying elements of content and how audiences interact with these messages. Indeed, as Shanahan and Morgan (1999) note, "the content of messages is more germane than the technology with which they are delivered" (p. 201).

In light of this, the research in this area does not invalidate cultivation as an important and reasonable way to explain impacts of media on viewers. Beginning with studies on the impact of the VCR on viewing and cultivation, Morgan, Shanahan, and Harris (1990) found that rather than detracting from cultivation, the VCR actually served to amplify cultivation findings, noting that there are more similarities than differences between new technologies and television. Similarly, Dobrow (1990) found that those who typically watch more television (heavy viewers) used the VCR to extend their viewing habits, whereas those who watch less television (light viewers) became even more selective in what they chose to watch. Likewise, Perse, Ferguson, and McLeod (1994) found that those who spent more time watching videotaped movies expressed greater interpersonal mistrust than those who did not watch as many movies.

Cable is yet another venue that some predicted would have an impact on cultivation. Again, given the industry constraints and practices, cable typically delivers more of the same type of messages because many cable channels depend on syndicated network programs to fill most of their programming needs. At the same time, cable also professes to provide "new" and seemingly more diverse programming for viewers. Cable has fewer constraints, and some recent studies of content have found that programs produced only for the cable market often contain more violence and sex than do traditional network offerings (Shanahan & Morgan, 1999). Overall, however, the change cable has brought to viewing practices is mostly on the surface. As Shanahan and Morgan note, "People are still using their free time to view televised entertainment," and there has not really been "a reduction in our overall exposure to typical mainstream entertainment programs" (p. 208). In short, cable is an outlet that provides an intensified version of traditional network fare.

Cable may thus have some impact on cultivation findings but typically in the directions and ways we would expect from traditional heavy viewing of network programming because cable still provides mass-produced programs made by a small number of concentrated media organizations (Shanahan & Morgan, 1999). Morgan and Rothschild (1983), for example, found that in homes with cable, traditional sex-role perceptions were stronger compared with homes without cable. Perse and colleagues (1994) found that respondents who had cable subscriptions expressed stronger feelings of interpersonal mistrust, particularly if the respondents tended to use cable to watch typical network broadcast-type programs. At the same time, respondents who viewed more specialized cable offerings (A&E, C-Span, Discovery Channel) did not express greater fear or interpersonal mistrust.

The big question that now faces the study of media effects is whether today's increased interactive media environment will change how media influence those who use them. As computer technology continues to decrease in price, it has become more affordable for the average person, and children's education has become more tied to having access to computers and online technology such as the Internet. As of 2003, computers were found in just over 60% of U.S. homes, with almost 55% of homes having access to the Internet (*Statistical Abstracts of the United States*, www.census.gov/compendia/statab/tables/08s1099.pdf). A focus of continued research in the cultivation tradition thus must begin to assess the more general content of the Web and specifically to determine if those who spend time with computers using it as a primary entertainment venue come to view the world in much the way it is seen in the messages they receive on their computers. But it is critical for new studies to ascertain if the messages found in these computer venues present the same values and elements that we have consistently found in television programs. Nevertheless, given the close ties of Web sites with media-related industries, it seems reasonable to posit that those whose "entertainment" is now tied to computer technology will receive more traditional than nontraditional messages about the world and its people. As such, it also seems reasonable to posit that the evidence of cultivation will remain largely the same.

Evidence of Cultivation

As many studies in media effects, cultivation analyses, whether designed from the prototype of the more "traditional" or "classic" position or from a more genre- or media-specific prototype, typically generate small effects. As even those who watch very little television may watch 7 to 10 hours a week and certainly interact with those who watch more television, the cards are really stacked against finding evidence of cultivation. Consequently, finding even small differences between light and heavy viewers may indicate far-reaching consequences. Moreover, small

effects may have profound consequences. For example, a difference of 1 percentage point in ratings may indicate the success or failure of a program, and a difference of a few percentage points in an election may determine who wins or who loses.

Variations in Cultivation: Resonance and Mainstreaming

Cultivation is a continual, dynamic, ongoing process, not a unidirectional flow of influence from television to viewers, and research has found two processes that reflect differences in how cultivation may work. Direct experience may be important for some viewers; the phenomenon called *resonance* illustrates how a person's everyday reality and patterns of television viewing may provide a double dose of messages that "resonate" and amplify cultivation. For example, those who live in high-crime urban areas often show stronger relationships between amount of viewing and stated fear of crime. Although *resonance* might be an important explanatory concept for genre-related studies, most of these studies do not discuss this possible variation in cultivation-related findings.

Television and similar media venues provide a shared daily ritual of highly compelling and informative content for diversified viewers. Media images seen on television or in other venues typically eliminate boundaries of age, class, and region. Consequently, the mainstream is a relative commonality of outlooks and values that is cultivated by consistent and heavy exposure to the world of television. The phenomenon of *mainstreaming* means that heavy viewing or media exposure may override differences in perspectives and behavior that result from numerous factors and influences. In other words, attitudes or behaviors that would ordinarily be attributed to different social or political characteristics may be diminished or absent in groups of heavy television viewers or media users. For example, for some topics, the beliefs of those who designate themselves as liberal or conservative are often very different when there is little television viewing. But when heavy television viewers who call themselves liberal or conservative are asked about these same topics, the liberals may give responses that are somewhat more conservative and the conservatives may give responses that are somewhat more liberal. The result is that both groups reflect beliefs that are more moderate or middle-of-the-road. In short, *mainstreaming* reflects the sense that television cultivates common perspectives, a relative homogenization that illustrates how television viewing has become the true melting pot of the American people and increasingly the world. Most studies discussing *mainstreaming* focus on overall viewing levels rather than look at viewing of specific genres of programs, however. Few of the studies focusing on media genre using cultivation as a theoretical framework look at their findings in relation to these important variations in cultivation.

Conclusion

Our knowledge of cultivation and the cultivation process is by no means complete. Although the studies described in the forgoing certainly show that the phenomenon of cultivation is found in genre-specific viewing environments, the overall concern is whether viewers consistently maintain these very narrow viewing habits. Given television's importance in society and people's dependence on "entertainment," it is probably unlikely that viewers turn off the television set when they cannot find their favorite type of program. Rather, it is more likely that they continue to watch the next best thing that catches their attention. Or they may turn to another entertainment venue where they will be exposed to the same general types of media messages. All in all, the evidence certainly points to the finding that viewing, whether generalized or specific, is related to viewers' conceptions of social reality.

Cable exacerbates the influence of television, and we still do not know much about how new technologies such as the World Wide Web and computers may affect cultivation. Certainly, if people use computers as another vehicle to gain access to their usual viewing diets, then the computer will operate more as a television set than as a computing machine. Similarly, people may use the Web to spend more time with their favorite types of programs; to find more information about the actors and actresses who play the roles in these programs; or to serve as a vehicle to download movies, newspapers, or other print material. The actual technology (a computer) may not matter if it is being used as a television set or in the way other media have typically been used. What matters most is the system of messages to which people are exposed, and we need more studies assessing the nature of the messages to determine if there are similarities or if there are meaningful differences among media venues. Consequently, if we make the reasonable assumption of homogeneous messages in today's media environment, because those messages are produced and distributed by a small number of very concentrated and interdependent media industries and continue to imitate successful formats and genres. Today's greater competition for media audiences should thus continue to enhance rather than fragment television's contribution to people's conceptions of social reality, namely cultivation.

VIRTUAL REALITY AND PRESENCE

COREY BOHIL, CHARLES B. OWEN,
EUI JUN JEONG, BRADLY ALICEA, AND FRANK BIOCCA
Michigan State University

The Experience of Virtual Reality

Virtual reality (VR) creates a sensory and psychological experience for users as an alternative to reality. More than just one technology, VR is an ever-growing set of tools and techniques that can be used to create the psychological sensation of being in an alternate space. Underpinning the techniques used to create compelling virtual environments is the basic observation that information is fated for processing by a human sensory and perceptual system that has evolved to interact with regularities occurring in the physical world (Gibson, 1966, 1979). The more one can provide the system with sensory inputs that simulate and effectively mimic those encountered in nature, the more convincing the resulting perceptual and cognitive experience will be for the user. The ultimate goal of designers and users of VR environments is a computer-generated simulation that is indistinguishable to the user from its real-world equivalent. Reaching toward this goal has already enabled us to realize some of VR's potential for use in training, engineering, and scientific research and for providing uniquely gratifying entertainment experiences (Biocca, 1996; Hawkins, 1995).

Illusions for the Senses

The hardware and software used to create a VR system are designed to replicate the information available to the

sensory/perceptual system in the physical world. In other words, a computer and its peripheral devices produce outputs that impinge on the body's various senses, resulting in convincing illusions for each of these senses and thus a rich, interactive multimedia facsimile of real life. There are system components that create such illusions for each of the senses, in particular for vision, hearing, and touch (Burdea & Coiffet, 2003).

A virtual experience reproduces, to the extent that hardware and content are capable, the real-world experience of being in a space by creating the sights, sounds, and sense of touch associated with moving through and interacting with that place. Input devices determine what the user is doing and allow the VR environment to respond appropriately. The system monitors a user's actions and updates the presented information so as to make the behaviors and outcomes in the virtual environment as realistic and congruent with the real world as possible.

Immersion and Presence

The most deeply compelling VR experiences are associated with high levels of *immersion*. In the research community concerned with VR systems, immersion means the extent to which high-fidelity physical inputs (e.g., light patterns, sound waves) are provided to the different sensory modalities (vision, audition, touch) to create strong

illusions of reality in each. This is in contrast to *presence*, the *psychological* sensation of being in a virtual place (Biocca, 1997). (Commentators in the video game community often use the term *immersion* to refer interchangeably to either physical inputs or psychological presence.)

Presence is the sensation of nonmediation while experiencing a mediated environment (Barfield & Weghorst, 1993; Lombard & Ditton, 1997; Steur, 1995). In other words, media experiences such as cinema and VR can be so absorbing and compelling that the observer loses some sense of his or her physical surroundings (i.e., including the medium itself) and responds physically and emotionally in a way that is analogous to actually being in the mediated (i.e., represented) place.

Researchers studying presence further subdivide the concept into notions such as *telepresence*—the sense of *being in* some remote location represented by the medium (Hirose, Yokoyama, & Sato, 1993)—and *social presence*—the sensation of *being with* and interacting with someone in another place (Zhao, 2003). Applications of VR for telepresence can enable the exploration of dangerous (e.g., nuclear power plants) or hard-to-reach environments (e.g., remote medical diagnosis) from a distant location. Such applications of VR can even be accompanied by distant robotic effectors that respond to the physical movements of a user immersed in the VR environment. The result is a feeling of “being there” in the remote location.

There are many levels of immersion and presence that can be achieved through different combinations of input and display devices. These levels can be thought of as points along a “virtuality continuum” whose end points are the real world and completely virtual environments (Milgram & Kishino, 1994). Points in between correspond to what has come to be known as *mixed reality*. Mixed reality consists of *augmented reality*—the blending of mostly real and some virtual content—and *augmented virtuality*—mostly virtual, with some real content (games created for Sony’s EyeToy, which puts the player into a game on-screen, represent an example of augmented virtuality). Mixed reality is discussed in the section Future Directions.

The degree of presence experienced in a virtual environment tends to correspond to the degree of immersion. Technically speaking, modern PC- and console-based video games constitute a major portion of commercial VR applications. Although peripheral input and output devices are becoming popular to make these games more immersive (discussed below), these “desktop display” applications don’t quite live up to the archetypal sense of the term *virtual reality*.

The most compelling VR environments are implementations that literally envelop the user in a virtual world, surrounding the user with stereoscopic visual imagery and sound, tracking body motion, and responding to behavior in the environment. The user experiences the sensation of having entered a computer-generated landscape that surrounds him or her in all directions. Parts of the environment will allow for naturalistic, body-based interaction—the user can

walk through the environment while the scene changes in realistic ways, can hear different spatialized sounds while visiting different locales, and can reach out to touch and manipulate various features.

Strangely, as the realism of virtual humans approaches that of actual humans, observers tend to experience an uncomfortable sensation much like that created from observing a human corpse. Even in the most (currently) hyperrealistic virtual humans, the perceptual system’s extreme competence in detecting tiny aberrations from normal behavior and appearance lead to this surrealistic property. This sensation, referred to as “The Uncanny Valley,” was first described by Mori (1970). Paradoxically, people seem to prefer watching and interacting with less realistic human characters.

Virtual Reality Technology

VR applications can range from simple desktop applications, wherein the virtual environment is presented in a window on the desktop, to immersive motion platform systems that provide users with a complete virtual experience (Burdea & Coiffet, 2003). The world of systems can be divided into nonimmersive and immersive approaches.

Nonimmersive VR

The most basic nonimmersive configuration is a virtual world in a window on a computer screen. This modality is, indeed, the basis for many computer games and online environments such as *Second Life*. These systems require little more than conventional computing capabilities, though high-performance graphics cards are a common component. Manipulation of the environment and navigation within the virtual space can be done using keyboard commands, mouse input, or gaming controllers. Keyboard-based input systems are necessarily limited by the small number of keys that have clear meanings in a VR environment (such as the arrow keys). Keyboards are available for gaming applications with extensive relabeling, though these tend to be very game specific. Mouse input provides a simple yet rich interface. The mouse can be used to pitch and roll the view, navigate using aircraftlike control for fly-throughs, or select specific objects or locations in the space by clicking on them. Some means such as varying combinations of mouse button presses or keyboard selections must be provided to switch the usage through a variety of modes. Joysticks provide a more natural interface to some virtual environments in that aircraftlike navigation is more easily mapped to a more aircraftlike control. Modern gaming controllers often have multiple joysticks and additional buttons with clear navigational and selection meanings. Systems such as VR Commander allow users to communicate with a virtual environment using voice commands, though this is accomplished primarily via simple mappings to keyboard or mouse events.

In some cases, systems are augmented with sensors that allow direct 3D manipulation of the world. A *motion tracker* is a device that is able to continuously ascertain the position and/or orientation of a physical location in space, usually through the attachment of a physical sensor at that location (Foxlin, 2002). Motion trackers for desktop applications use handheld or attached devices such as styli that allow the user to move a corresponding graphical model. Styli are held like pens and allow the user to specify points or perform operations such as spray painting or drawing in the virtual world. Tracking systems can also be attached to the hands, allowing the user the ability to place virtual hands in the environment, either disembodied or as part of an avatar (virtual representation of the user). Hand instrumentation includes the system that tracks movement of the hands, simple gloves that recognize finger touches, such as the PinchGlove, or instrumented gloves that capture joint angles for the fingers. Motion trackers considerably increase the realism and degree of immersion of even desktop virtual environments because the motions of the controllers are directly analogous to motion in the environment. Tracking systems able to capture orientation allow users to directly manipulate orientation, with the object or camera in the environment matching the orientation of the sensor. Systems capable of tracking a position can virtually move objects.

The addition of 3D displays increases the impact of desktop applications. 3D is commonly accomplished by presenting two images in rapid succession on the monitor, one image for each eye, allowing for the perception of depth due to binocular cues. These displays are often referred to as *stereoscopic displays*. Any desktop monitor with sufficient frame rate capabilities can provide 3D in this form. Shutter glasses open and close before each eye in an alternating pattern so that each only sees the image appropriate for that eye. Persistence of vision prevents the perception of flicker, provided the frame rate is sufficiently fast, usually 120 frames per second. Since shutter glasses are rather large and cumbersome, multiple approaches exist that avoid their use. Displays such as the Planar StereoMirror and the iZ3D monitor present images to each eye with different light polarizations. All that is needed to view the display are simple polarized glasses as are commonly used for 3D motion pictures. Some displays, such as Philips WOWvx, dispense with the glasses altogether by placing miniature optics in front of the pixels that direct the image to only the appropriate eye. These monitors only work when the head is at a specific location (the sweet spot).

3D displays are implemented in a tracked or untracked mode. Untracked displays assume a fixed viewer position, which is reasonable for many desktop applications. The graphics system renders images for the eyes and their distinct locations. An increased perception of reality is accomplished by tracking the head so that the viewpoint can vary. This allows the user to move, increasing depth perception beyond pure stereo vision through the addition of motion parallax.

Immersive VR

Immersive VR systems seek to place the user *in* a virtual environment. The most compelling VR systems are *immersive*, so termed because they immerse the senses of the user in computer-controlled stimuli. These systems exist over a wide range of modalities. The most basic immersive system is a rear-projection screen with a stereo-capable display. The user has a motion-tracking system attached to the head so that the system can know the location of the user and render the environment as seen from that location. These systems are often augmented with tracking devices that can capture hand and body motion, allowing a more immersive experience (Foxlin, 2002).

Projection Display Systems

A single projection screen places a user next to a virtual window into a synthetic world. Additional screens can be placed around the user, forming a VR cave. A common cave configuration is five screens: four that surround the user and an additional screen above. Some systems augment this configuration with a sixth screen on the floor. Caves can provide a 360-degree immersive VR environment (Brennesholtz & Stupp, 2008).

Head-Mounted Displays

Head-mounted displays (HMDs) provide images directly to the eye and also provide a 360-degree immersive experience. A typical HMD consists of two small liquid crystal displays and optics that present an independent image to each eye. When used in conjunction with motion tracking of the head, an HMD can continuously present images to each eye that are rendered from the viewpoint of the eye in the virtual world. Turning the head pans and tilts the virtual camera so that the image appears stable to the user.

Sensors

A key element of many VR systems is the ability to track motion in space. Motion-tracking systems instrument the user's head, hands, other body parts, and any other objects that need to have analogs in the virtual world. Motion tracking makes it possible for a virtual camera to follow the motion of a physical person. Motion capture systems exist based on inertial sensors, magnetic fields, ultrasonic sound waves, infrared markers, and software-based tracking of camera images. The Xsens MTi uses inertial sensing in combination with a simple electronic compass to determine orientation. Orientation-only sensors are only appropriate for HMDs. The Polhemus Patriot uses a transmitter that generates three alternating magnetic fields. Sensors determine the location and orientation of a tracked element by analyzing the reception magnitude of three-directional coils. Magnetic sensors allow reliable and

fast tracking of the position and orientation of a sensor over a range of about 1 meter but are sensitive to magnetic fields. The Intersense IS-900 uses a large number of ultrasonic transmitters in combination with inertial tracking to determine the position and orientation of each receiver in a space that can be extended to several dozen meters square. The combination of ultrasonics, which provide high locational accuracy but at a slow rate, with inertial tracking, which is fast but subject to drift, is a sensor fusion approach that leverages the benefits of each system. The Intersense IS-1200 uses small cameras and ceiling-mounted fiducial images. A fiducial image, sometimes referred to as a marker, is a printed image with characteristics that make it easy for a computer-vision system to recognize and track it. Since a tracking space need only be equipped with pieces of paper, this approach can track over a large distance and complex geometry, though it is subject to occlusion and limited orientations. The Moven inertial-motion capture suit can capture continuous poses for the entire body using inertial sensors.

Capture of hand gestures allows the development of high-performance user interfaces. The FakeSpace PinchGlove captures combinations of finger presses, allowing simple grasp indications. More highly instrumented gloves, such as the Immersion CyberGlove II, capture all joint angles of the hand.

Haptics

Haptic devices apply forces, commonly referred to as *haptic feedback*, to the user, increasing the sense of immersion and extending the virtual experience to include the sense of touch (Bicchi, 2008). The SensAble Phantom family of devices have a stylus that can be manipulated by the user. The system tracks the stylus and uses servo motors to resist user forces or move the stylus directly. The amount of force exerted on the stylus by the servo motors can be precisely controlled. The net effect is the simulation of moving the stylus against resistive surfaces, the feel of moving over textured surfaces, and the sense that the stylus is subject to manipulation by elements in the virtual environment. A common application is virtual surgery, where the stylus becomes a virtual scalpel, with the haptic feedback simulating the resistance of flesh or bone as the surgeon conducts a virtual procedure.

Software

A variety of software solutions exist for the development of virtual worlds (Burdea & Coiffet, 2003). Many video cards have the ability to enforce stereo on existing programs, allowing games to be played in immersive environments with no modification, though the degree of immersion is limited to a single viewpoint and is most suitable for projection screen systems. Dassault Systems Virtools allows the creation of virtual worlds and 3D games

with a rapid prototyping methodology and supports HMDs and projection screens. The WorldViz Vizard VR Toolkit supports the development of a wide range of VR components including avatars.

Applications of VR

In the 1990s, there was a great deal of public excitement surrounding the coming of age of VR and all the ways it purportedly would revolutionize entertainment, education, engineering, and other activities. Today, however, a popular view is that VR has failed to live up to (often overstated) visions (Rheingold, 1991; Sherman & Judkins, 1993) and that the excitement has faded as dreams of hyperrealistic personal VR experiences have failed to come to pass. This view, though, may merely reflect a change in popular perception. The fact is that VR has steadily made inroads into an enormous number of application areas, albeit perhaps more quietly and gradually than suspected by early prognosticators (Burdea & Coiffet, 2003; Giannachi, 2004; Gutierrez, Vexo, & Thalmann, 2008; Harders, 2008; Riva, 2004; Schmorow, Cohn, & Nicholson, 2008; Wiederhold & Wiederhold, 2005). A large number of companies now specialize in equipment used in VR systems, and many have complete turnkey systems available. Furthermore, the industry may soon face another explosion in visibility and excitement as new variants (e.g., mixed reality) become more mainstream due to the ubiquity of portable devices containing many of the essential capabilities for VR (displays, camera and tracking systems, computer processing power).

Alongside evolving technology, VR applications have blossomed in a wide range of areas. VR has proven useful for gaining basic scientific knowledge, for medical diagnosis and treatment, for commerce and entertainment (especially in the realm of desktop VR), in training, and in cultural heritage. For illustrative purposes, we present here a brief sampling of VR applications.

Training

Virtual environments are often ideal to meet training needs (Schmorow et al., 2008). They provide standardized interactive experiences that are cost-effective as they are potentially reusable by a wide audience. They are safe learning experiences (i.e., mistakes only lead to virtual consequences, not costly or dangerous outcomes in the real world that make on-the-job training hazardous). They are compelling (users often report higher levels of engagement completing a virtual task relative to more traditional methods such as listening to a lecture or reading a book). It is well-known that high levels of motivation and engagement lead to improved learning outcomes. Training can be done using either fully immersive or desktop virtual environments.

Communication Skills

Researchers at the University of Florida used a CAVE environment to create a virtual “standard patient” for imparting communication skills to medical students (Lok, 2006). Named DIANA (DIgital ANimated Avatar), the virtual patient engages the trainee in the doctor/patient interview process, intimating the existence of various symptoms. A system such as this could potentially replace the current training regime, which requires live actors to portray patients, is costly, and lacks uniformity for trainees.

Researchers at Case Western Reserve University have created a training simulator to enhance communication skills in dental students (Case Western Reserve University, 2008). This desktop VR application makes use of the massively multiplayer online world Second Life. Like DIANA, the focus of this training simulation is to foster improved doctor/patient communication. Students get much needed practice in collecting patient history information, informing patients about treatment options, and describing dental techniques.

Medicine

One of the most widely explored applications of VR technology is in the realm of medicine (Harders, 2008). VR allows researchers to see patient behaviors and body structures in new ways and enables new and effective therapeutic approaches.

Rehabilitation

Many medical researchers have explored the use of VR in rehabilitating stroke victims. At the University of Haifa, researchers have found a way to assess different patterns of stroke-induced brain damage (University of Haifa, 2008). Patients’ hand motions are recorded as they respond to virtual flying objects (tennis balls). The researchers’ computer models use this motion data to diagnose patients with a high degree of accuracy (approximately equivalent to that of human physicians). The value of these modeling techniques lies in their capacity to illuminate the probable outcomes of various new treatment alternatives. The ultimate hope is that these models will allow diagnosis and rehabilitation decisions that outperform any human doctor.

In a similar application, researchers at Rutgers University in New Jersey (Boian et al., 2002) used a desktop VR system equipped with data gloves for stroke rehabilitation. The patient exercises his or her affected hand and arm by manipulating an on-screen hand to interact with a virtual butterfly, play a virtual piano, and perform other tasks. At least in part due to the increased engagement that this task creates for the participant, the system leads to marked improvements. In addition, the data gloves enable a valuable recording of day-to-day progress.

Another intriguing medical application has been to give virtual limbs to amputees. One of the outcomes of losing a

limb is the phenomenon known as phantom limb pain: Patients may feel the sensation that their missing limbs still exist. This sensation is so real that patients may feel itching, soreness, and even cramps in the nonexistent appendage. Research has demonstrated that an ability to see and control a virtual limb—controlled by the remaining contralateral one—enables patients both to visualize and to mentally exercise the missing limb, to rub out soreness and cramps, and generally alleviate short-term phantom limb pain. Researchers in the United Kingdom have demonstrated a VR system for aiding patients with this visualization process (Murray, Pettifer, Caillette, Patchick, & Howard, 2006).

Finally, an active area of VR-based neurorehabilitation research is in the postural stability community, which involves developing instrumentation that allows clinicians to decouple the contributions of various sensory cues such as vision and touch (Jeka, Schöner, Dijkstra, Ribeiro, & Lackner, 1997), diagnose disorders in stroke patients and the elderly (Keshner & Kenyon, 2004), and potentially understand how to improve balance using therapeutic means. In this area of research, visual stimuli such as a moving starfield projected onto a CAVE environment are coupled to a mechanical stimulus presented via a touchplate. Models of multisensory integration predict that both visual stimuli moving across the screen at a certain rate and touch stimulation of varying frequencies delivered at the fingertip will affect stability while standing upright (Jeka et al., 1997). Research such as this holds the promise of applying VR to improve the balance of individuals diminished by age or stroke. Furthermore, the coupling of visual or auditory simulations and mechanical stimuli may ultimately be applied to the design of more sophisticated wearable and prosthetic interfaces.

E-Commerce

In recent years, Web-based VR technology has been used to enhance the online shopping experience. The increased interactivity allows shoppers to explore details of a given product, and this has been shown to increase product knowledge, lead to more positive attitudes about the product, and increase the chance of purchase (Li, Daugherty, & Biocca, 2002).

Specialized VR applications such as Aarkid and TurnTool allow viewers to inspect 3D models of a product closely in order to learn more about its features. One limitation to using these techniques has been the inability to allow the user to interact with a product beyond merely inspecting it in 3D. Recent attempts have sought to create modeling environments that can implement Web-based product demonstrations that allow the user to experience, to some degree, interacting with a product. An example is BMW’s “Dress Your Car” tool, which allows users to visualize product options interactively (www.virtools.com/applications/marketing-bmw3.asp).

One interesting recent finding is that virtual online product examination leads to increased memory for product features.

Researchers at the University of Washington have examined the outcome of interacting with a virtual product (camera) and found that although participants remembered more product features than those viewing only static pictures (they also spent more time examining the VR product), they also had a tendency to falsely remember features that the camera didn't actually possess (Schlosser, 2006).

Basic Science

VR technology affords possibilities for basic scientific understanding, which is often difficult or impossible to achieve using other methods. VR offers greater realism and complexity than is commonly found in controlled laboratory experiments. Also, VR implementations often create more control and greater replicability than do standard field experiments.

Spatial Navigation

Researchers at Johns Hopkins University studying visual perception and spatial navigation have benefited from the ability to create lifelike navigation spaces. The researchers used a virtual forest to explore the degree to which navigation performance is influenced by peripheral vision. For some participants, performance deteriorated when their field of view was narrowed. Nevertheless, others still managed to navigate the forest well. These latter participants were those who relied more on, and had better memory for, virtual landmarks that could be used to guide their navigation (Fortenbaugh, Hicks, Hao, & Turano, 2006).

Similarly, researchers at the University of Pennsylvania used immersive VR to study how viewers perceive the rate of change of approaching objects (Schrater, Knill, & Simoncelli, 2001). Their research disentangled the relative contributions of optic flow (spatial change information) and changes in size. The study found that size changes alone can be an effective indicator for perceiving the object's approach.

3D Visualizations

One area of VR-based molecular modeling is in the area of protein and biomolecular simulation. Simulating the energetics and physics of processes such as protein folding in 3D can help scientists and students alike better understand the structure and function of biomolecules. Molecular simulations are also sensitive to the manipulation of both time and space. For example, proteins exist at the spatial scale of angstroms to nanometers (Hunter & Borg, 2003) but can be scaled up to centimeters using virtual simulations. Likewise, protein folding simulated at their natural timescale of nanoseconds is informative but does not explain dynamic processes such as photosynthesis or DNA repair. Simulations that operate at these longer timescales have been produced and can elucidate a number

of important biological processes (Humphrey, Dalke, & Schulten, 1996).

Consumer Gaming

Consumer gaming has adopted VR technology in a major way. Estimates put profits in the video game industry on par with the film industry. The sophisticated computer graphics used in today's PC and console games are the most widespread commercial adaptation of basic VR to date. As computer-generated graphics have advanced in fidelity, devices for sensory immersion have improved as well. Wide-screen, high-definition displays are becoming commonplace, and surround-sound audio systems implement highly realistic 3D spatialized sound. The realism generated by these devices can greatly enhance the sensation of presence while playing.

Devices that were once relegated to the VR lab have also begun to creep into the mainstream. Inexpensive stereo shutter glasses can turn a PC-based game into a life-like 3D stereoscopic experience. Also available are inexpensive HMDs, such as eMagin's 3DVisor, that serve the same purpose. The success of Nintendo's Wii system underscores the possibilities of, and enthusiasm for, tracking devices that translate a player's physical activity (beyond finger movements on a joystick or keyboard) into actions in the virtual world. Enabling senior citizens or other nontraditional game players to participate by swinging a virtual baseball bat or rolling a virtual bowling ball promises dramatic new outcroppings of VR gaming applications. Other companies have taken up this mantle by focusing on peripheral devices that increase immersion using haptic feedback (e.g., Novint's Falcon).

In addition to the home-gaming market, many sophisticated VR installations have been developed for entertainment purposes. Once the primary domain of video games, arcades have survived the home-gaming explosion by devising ever more immersive player experiences. Input devices have moved from joysticks and buttons to replicas of actual environmental objects, such as motorcycles and personal watercraft, that tilt and lurch in concert with the game action. Arcade game designers have gone so far as to make realistic fire hoses for playing virtual firefighter and even replicated the interior of a tractor-trailer for simulated truck driving. Even an entire room can be devoted for use in highly compelling, projection-based golf course or hunting simulations.

With the expansion of the gaming market and culture for the past several decades, virtual games have increasingly been used not only for entertainment but also for serious purposes such as learning, training, exercise, and therapy. So-called serious games have drawn much attention for their potential to radically change the tradition of brick-and-mortar classroom teaching to "digital game-based learning" (Prensky, 2005). Virtual games for educational purposes have been reported to provide educational effects such as increased motivation, memory retention,

and engagement. One of the principle adopters of video games for learning is the U.S. military. VR games have proven useful for teaching the proper use of military equipment, establishing tactical advantages, and collaborating with others in team-based missions. Examples include battle simulations such as the Navy's *Fleet Commander* and the Marines's *Close Combat: Marines and VBS1*. Flight simulator games have been used for years to shorten training time and reduce pilot risks. Likewise, simulation-based virtual 3D navigation games such as *Falcon 4.0*, *Fighter Ace*, and *AirForce Delta Storm* have been developed to provide virtual navigation experiences to game users.

Virtual Reality in Popular Culture

The fascination with VR's potential over the years is reflected in its portrayal by the popular media. Scores of books, movies, and TV series have explored the implications of making VR illusions part of our everyday lives. Nevertheless, due likely to the slowness of immersive VR technologies in becoming a part of the mainstream entertainment landscape, the public excitement about the technology seems to have waned to some degree in recent years. Nevertheless, VR remains a staple of science fiction writers today.

Probably the most prominent and influential vision of what VR could ultimately become is the Holodeck, depicted in the television series *Star Trek: The Next Generation*. Inside the Holodeck, participants are totally immersed (although not apparently outfitted with any gear) and feel a complete sense of presence in the virtual world: Although they know that they are in a facsimile of reality, nothing in the perceptual experience belies this fact. The Holodeck's perfect realism has made it a touchstone in discussions about the current and future status of VR in academic and popular discourse (Murray, 1998). The writers of another *Star Trek* spinoff, *Star Trek: Voyager*, included not a Holodeck but a virtual physician that gave all appearances of being real. Embedded into the real world, this holographic character interacted with others with no help from any technological gear borne by the humans. Like the Holodeck, this vision of a virtual human embedded into the natural world portrays a fanciful boundary condition for augmented reality.

Although in each of these examples the authors envision highly realistic, compelling, and ostensibly useful VRs, a common thread in most science fiction portrayals is that VR serves merely as a plot device to explore ethical and existential conundrums. For example, in the *Matrix* movie series, humans have been co-opted by a race of machines, keeping their bodies in suspended animation to harvest their electrical energy. To keep us content and submissive, the machines must supply humans with a virtual existence so real that we are unable to detect its being otherwise. Another recent movie depiction, 1999's *eXistenZ*, portrays a

future use of VR in which the boundary between the real and the virtual dissolves, creating a nightmarish existence where one can never be sure what is genuine. The television series *Virtuality* envisions a world where VR is required to exercise the imaginations of crew members enduring a year's-long voyage through space. As in much science fiction, the perils of technology are explored and emphasized. In this case, the virtual world frequented by the crew is eventually invaded by a malicious virtual being that terrorizes users. An earlier fictional account—*VR Troopers*—was a live action television series in which VR was an alternate dimension that could be crossed into and in which lived evil beings bent on the destruction of “true” reality. Although each of these examples envisions highly evolved and potentially beneficial versions of VR, writers routinely employ visions of misuse and malevolence.

Future Directions

Augmented Reality

Although VR continues to make inroads into a wide variety of fields, it is often characterized by large, expensive, stationary test beds or training facilities. While the adoption of these kinds of environments is still experiencing healthy growth, the major near-term growth appears to lie in applications of *augmented reality* (AR) (Bimber & Raskar, 2005; Haller, Billingham, & Thomas, 2007). Rather than providing a user with a perception of an entirely virtual world, AR technologies change the perception of the real world. A variety of AR technologies exist, including HMDs that overlay computer graphics onto the visual field and display systems that present modified camera views.

The primary benefit of AR is mobility. In traditional VR worlds, all features are computer generated—even the user has a virtual body (e.g., disembodied virtual hands controlled by user movements enable one to touch and grasp virtual objects). AR capitalizes on the user's real environment. The computer embellishes the user's field of view by adding computer-generated information only when and where needed. For example, virtual objects or characters can be embedded into a real room alongside the user. Imagine seeing virtual signage on the side of a building that provides information about what can be found inside (e.g., addresses, business names, directory information, or anything else you might find today on a company Web site).

The necessary ingredients for AR are largely the same as for traditional VR: a display system and input sensors, with the ability to track spatial location with some precision. Today's cell phones and other mobile handheld devices have increasingly capable displays and camera systems, and location monitoring is possible using camera-based fiducial tracking, ever more precise GPS tracking, or

other currently available means. Although these capabilities are still somewhat crude for widespread deployment of AR, all these system components are rapidly growing in precision and power, and nearly all these components are already ubiquitous in society.

Technological Advances

Another driving factor for near-term adoption of VR and AR is miniaturization of the needed components. HMDs have gone from cumbersome, garish devices as large as (or larger than) a toaster to small, monocular displays about the size of a cell phone, though some, such as the Microvision Mobile Device Eyewear, resemble conventional sunglasses. The goal of HMD designers is to make devices so compact ultimately that they can be worn anywhere by anyone without attracting undue attention (much like the Bluetooth headsets common today). Devices this small are thought to be “socially acceptable,” meaning that they could be worn without arousing fear or suspicion from bystanders. Current HMDs are small enough to be portable and can be adopted for use by first responders (e.g., paramedics, the police) and military personnel. Acceptance on a grand scale will likely require smaller systems that blend more naturally with civilian attire. In addition to HMDs, this involves the use of a cell phone, PDA, or tablet PC for implementing “magic-window” AR displays that allow the viewer to see their augmented environment simply by holding up the screen in front of their face.

In addition to miniaturization and increased mobility, many other sources of expense in creating VR are becoming more affordable and easier to use. Projectors capable of stereoscopic display now sell for a few thousand dollars, in contrast to earlier models costing tens of thousands. The software for creating virtual environments has also improved dramatically, due largely to the explosion of the consumer video-game market. Several companies now even offer turnkey VR software solutions.

Increased Sensory Immersion

Another factor likely to drive a new interest in VR is the recent success of peripheral devices—most notably Nintendo’s Wii controller—in tracking body movements and increasing sensory immersion. For decades, game companies tried to increase the player’s immersion by selling peripheral input devices such as steering wheels or gun controllers; such devices generally sold poorly. Sony’s EyeToy—a webcam that inserts the player’s image into the game and responds to user movements (in two dimensions), however, was a surprising success. The release of Nintendo’s Wii system, which uses infrared sensors and accelerometers to pinpoint the player’s hand position and orientation in 3D space, suggests a sea of change in the marketability of these devices. The striking

success of a consumer product (i.e., the Wii) that makes use of tracking technology developed decades ago in VR labs bodes well for the wider adoption of these techniques in coming years. Recent attempts at consumer products for haptic stimulation, such as Novint’s Falcon, have come on the market and make possible extremely compelling tactile stimulation.

Unconventional Input Devices

Perhaps the ultimate input device won’t respond to overt user behaviors at all but rather to physiological states produced by the body and sensed with electrophysiological and other recording devices. Numerous researchers are working on so-called brain-computer interfaces that enable continuous updating of information in the virtual world based on mere thought (using electroencephalogram data), changes in heart rate (using electrocardiogram data), skin conductance (using electrodermal response data), and other indicators (e.g., cerebral blood flow measured with functional near-infrared imaging).

Brain-computer interfaces hold great potential for restoring capabilities to users without use of their limbs. Monitoring these data is also of great interest to those interested in *augmented cognition*, which is a branch of human-computer interaction research concerned with improving learning and performance in computer-based tasks by making use of physiological states such as fear, boredom, or lack of attentional capacity. As with the other technologies described above, recent efforts have been made to commercialize headsets capable of recording brain and muscle activity for use in brain-computer interfaces. As with the video-game boom, renewed interest and vigorous research activity are outcomes likely to follow from widespread commercial adoption of these exciting new VR technologies.

Conclusion

VR combines the input and output from a variety of sensors and displays to create the psychological experience of actually being in some other, virtual place. Ongoing research and development have resulted in myriad new devices for monitoring body-based behaviors and for presenting increasingly realistic information to our visual, auditory, and other sensory systems. The growing availability of VR technology has led to its adoption in a wide range of application areas. VR enables enhanced perspectives on scientific questions, safe and engaging learning environments, new avenues for medical diagnosis and rehabilitation, and, of course, deeply involving entertainment experiences. With the recent widespread adoption of portable consumer products such as camera phones, GPS receivers, and the like, VR is set to break free from its stationary roots and begin populating our natural environment with valuable

location-based information, perhaps bringing with it a new wave of exploration and excitement.

COMPUTER-MEDIATED COMMUNICATION

LARA LENGEL

Bowling Green State University

Not much characterizes the 21st century more than computer-mediated communication. It's difficult to recall a time, just a few years ago, when we didn't spend up to several hours a day sending e-mails, participating in instant messaging (IM), or surfing the World Wide Web. Today, it's not uncommon to check e-mail before breakfast, IM friends while working on a class assignment, glance at our Facebook and MySpace pages at lunchtime, entertain friends with our most recent discovery on YouTube in the evening, and add a new entry to our blog, logging off just before nodding off at night.

When and how did our computer-mediated communication (CMC) become so pervasive, so suddenly? Did we notice it becoming woven into the fabric of our lives—our learning, our work, our relationships? Did we sense our increasing connectedness to the world as more and more people, organizations, and resources were accessible to us online?

Do we remember a time when information and communication technology didn't feature so heavily in the news? Countless news reports of the next greatest technological development, or the newest "killer app," create the hype that has encouraged so many of us to consume, to upgrade, to get the newest, coolest gadgets in this season's most fashionable colors, the most portable laptop, the fastest connection.

It's provoked a lot of fear as well—early press reports indicated that much more than 85% of all online content is pornographic; predators and stalkers are more dangerous online than off; and if you're online too much, you're going to become an "Internet addict," a recluse with eyes

glued to the screen, fingers attached to the keyboard, neglecting friends and family, and eventually becoming a law-breaking hacker or a cyberpredator, or both. Gosh, what a scary place the cyberworld is!

Most of us have negotiated this hysteria as information and communication technology have become, well, a mundane part of our lives, a set of useful tools to help us connect with others, do our work, check the weather. Nevertheless, it is an important part of our lives. And even if it does seem mundane and we take tech for granted, if we take a few moments to look back on the past decade (or the past two decades, for many of us not-so-newbies), it's clear that there has been an explosion of communication technology in our lives. And it's not surprising that there's been an explosion of research analyzing the impact of CMC on our lives. CMC research is pervasive in our discipline as well. Recall in the first volume of *21st Century Communication*, the chapter "Communication as a Field and as a Discipline" cited nine subfields identified by the National Communication Association in 2004: (1) Communication and Technology, (2) Critical/Cultural Studies of Communication/Media, (3) Health Communication, (4) Intercultural/International Communication, (5) Interpersonal/Small-Group Communication, (6) Mass Communication Research, (7) Organizational Communication, (8) Political Communication, and (9) Rhetorical Studies. Whereas, obviously, CMC has featured heavily in the research in communication and technology it has been studied in all nine subdisciplinary areas, as well as numerous other disciplines including psychology, sociology, and computer science, to name a few.

A Brief Look at Early CMC Research

Although CMC research spans the breadth of communication studies and related disciplines, it has a relatively short history. Compared with other areas of media and communication research that have spanned half a century or more, CMC research is still in its infancy—a newbie, as the tech savvy might say. Even the concept of CMC has changed to encompass the different types of technologies and communicative styles that have developed in the past few years. For example, CMC originally was defined as human communication across two or more networked computers, through services such as e-mail, chat rooms, and IM. As technology became more pervasive and user-friendly, other forms of CMC were analyzed, such as Weblogs (now known merely as “blogs”), visual chat, Web-delivered chat, webcams, and Web pages. CMC grew to include online group decision-making systems, which will be expanded on in the next chapter of this volume. Later, the definition expanded to include additional forms of human interaction including text messaging via mobile/cellular phones.

Some of the first instances of CMC research were published in the 1980s. In these early days, researchers focused on the organizational contexts of CMC, primarily in the impact of decision making and leadership in local-area networks (see, e.g., Rice & Love, 1987; Siegel, Dubrovsky, Kiesler, & McGuire, 1986). At the first signs that CMC was becoming useful for recreational and interpersonal communication, researchers asked if CMC was appropriately suited for “‘social’ uses” (Baron, 1984, p. 136). Since CMC was so new, some researchers looked back to other technological developments to see how other forms of communication technology affected social interaction. Research on telephone usage, some decades earlier, compared the degrees of “social presence” of communicating by telephone versus communicating face-to-face (f2f).

Some of the research debates occurring around factors influencing social interaction not only worked under the assumption that CMC was, in fact, inappropriate for “social uses” but also analyzed in what ways CMC is, to borrow from the Beastie Boys, “ill communication.” The popular press warned of all kinds of ills, “Internet addiction” ranking as the number one disease (without bothering to check if this addiction has ever existed). Debates centered on claims that CMC was asocial or antisocial (or both). Some critics of CMC argued that it is asocial because the quality of the communication is decreased due to technological constraints. Others contended that CMC is antisocial because it can have a damaging effect on “real life,” or “offline,” communication and relationships (Thurlow, Lengel, & Tomic, 2004). Researchers also questioned the “cuelessness,” or lack of nonverbal cues and indicators of identity (such as class, gender, and ethnicity), inherent in CMC. Howard Rheingold (1993), for example,

discusses the limitations of CMC for cultures that rely more heavily on nonverbal communication to express meaning, respect, and social hierarchy.

Other researchers saw such “limitations” as liberating. Instead of harming communication, the lack of cues and identity markers enhanced communication because it broke down barriers resulting from classism, racism, homophobia, and other social injustices. The democratic potential of CMC arises from what Susan Herring (1993) calls its “social decontextualization.” According to Herring, the decontextualization inherent in CMC “neutralizes social status cues (accent, handwriting/voice quality, sex, appearance, etc.) that might otherwise be transmitted by the form of the message.” Although Herring admits that the lack of social status cues can make CMC less personal, CMC can equalize the social status of communicators. Thus, there is “the possibility that traditionally lower-status individuals can participate on the same terms as others—that is, more or less anonymously, with the emphasis being on the content, rather than on the form of the message or the identity of the sender.”

In debates countering the asocial and antisocial nature of CMC, researchers such as Joseph Walther (1992) argued that social interaction and bonding in an online environment is not only possible but, given time, relationship establishment and relationship building through CMC can equal f2f communication. This idea, which he termed the *social information processing model*, received a great deal of attention in the CMC research arena. A few years later, Walther (1996) argued that not only can CMC equal f2f communication for social interaction and relationship building, but CMC can actually be hyperpersonal—more intimate communication that “surpasses normal interpersonal levels.” How can this be?

Walther (2007) argues that “users exploit the technological aspects of CMC in order to enhance the messages they construct to manage impressions and facilitate desired relationships” (p. 2538). Many people find that they can take time to express their ideas with more wit and thoughtfulness, edit out errors, and make sure they’re not going to blurt out something they may regret, compared with f2f communication. They can think about the most appropriate style and tone for the relationship they wish to establish or enhance with their communicators, before hitting “send.”

The hyperpersonal aspect of CMC also brings to mind the “social decontextualization” concept (Herring, 1993). Because online communication focuses on content rather than on physical appearance and other social status cues, some people may be more comfortable communicating online. Herring (1999) suggests that “the loose, fragmented nature of computer-mediated interaction constitutes part of its appeal, and may even lead some users to prefer it to [f2f] social interaction” (p. 13). In addition, because of the relative level of anonymity and/or because participants feel the comfort a safe haven of an online community of like minds, many people have disclosed some of their most intimate

details of their lives online. This has usually occurred in community spaces such as bulletin boards, newsgroups, and chat rooms, where users are surrounded by supportive community members, similar in temperament and attuned to the same concerns and issues.

The hyperpersonal argument has been sustained through various studies that have extended and expanded research in this area to online group and organizational communication. For example Turner, Grube, and Meyers (2001) analyze the hyperpersonal nature of online communities. They suggest that “CMC enables close relationships to develop and flourish, most relationships do not occur in a vacuum but in the context of a network of supportive relationships inside and outside the virtual community.” These supportive relationships and shared experiences of the community members “interact with and cumulatively influence the development of hyperpersonal relationships” (p. 246). Walther’s own work (see, e.g., 1996) with online work groups attests that they outperformed f2f group efforts.

Many researchers argue that users can adapt CMC to their purposes despite the limitations existing in online environments. Thurlow and Brown (2003) argue that a “communication imperative” is at work. In their research on text messaging, they found that despite its creation for commercial purposes, “texting”

is in fact yet another example of how the human need for social intercourse—a kind of “communication imperative”—bends and ultimately co-opts technology to suit its own ends, regardless of any commercial (e.g., the telephone) or military (e.g., the Internet) ambition for the technology. (para. 2)

Key Questions in CMC Research

The “communication imperative” suggested by Thurlow and Brown (2003) is one of the communication phenomena that kept researchers interested in the constantly new, fluid, and adaptable ways in which people engaged in CMC. It also confirmed that CMC is an important means of social interaction. At the dawn of the 21st century, most CMC scholars and practitioners alike were comfortable with the fact that CMC is essentially social, and they moved beyond the basic queries posed in the 1980s and 1990s. Having established the important social interaction functions of CMC, they directed their attention to other key research questions: How do we portray (or perform) our identity in a computer-mediated environment? How do we disclose highly personal information online? And new questions about the impact of CMC on our establishing, maintaining, or enhancing our interpersonal relationships emerged (Baron, 1998; Parks & Roberts, 1998). Research continues to analyze how people meet online, with subsequent f2f interaction in the formation of intimate relationships (see, e.g., Baker, 1998; Parks & Floyd, 1996).

Researchers also examined the nuances of CMC, for example, the different types of CMC and their impact—both subtle and explicit—on interpersonal communication. Differences between asynchronous (where there is a delay between messages and posts) and synchronous media (“real time”) were studied. Asynchronous media, including discussion forums publicly accessible through Internet services such as Usenet newsgroups, bulletin boards, and message boards were of interest. As synchronous forms of CMC such as Internet relay chat (IRC) became more widely used, research in this area expanded. IRC was followed by IM, which the CMC researcher Nancy Baym calls a “more targeted form of chat,” directed by “buddy” lists that indicate what friends are online at any given time.

Along with differences between asynchronous and synchronous communication contexts, researchers also acknowledged the various contextual elements that needed to be included in analysis (Thurlow et al., 2004). Is the communication between two individuals, within a small group, or across extensive multinational organization? Is the communication public or private? What is the topic, and how do participants react to that topic? How do participants, for that matter, react to using CMC? Are they new to computers, are they uncomfortable with technology, or do they feel more at home expressing themselves online than through “old” communication technology, such as pen on paper? And let’s not forget that a pen *is* a form of communication technology. It’s easy to take old technology for granted because it becomes “invisible,” meaning that the technology has matured to the point that you don’t think about it and the hype and hysteria about it have passed as more and more people started using that particular communication technology.

Impact of Gender, Ethnicity, Cultures, and Other Aspects of Identity

Other aspects about CMC that can’t be taken for granted are the numerous factors that influence communication. In addition to contexts specific to CMC, other factors having an impact on communication come into play online. Recall the numerous “Factors Affecting Communication” in the first volume of *21st Century Communication*: gender, ethnicity, sexual orientation, culture, risk, freedom of expression, and globalization. Globalization has played a role in the hybrid nature of identities (Tsaliki, 2003). By interacting with people from other nations and cultures, we adapt our identities to reflect this interaction. Globalization also plays a role in our understanding of intercultural communication (Lengel & Murphy, 2000), diasporas, and languages. In the mid-1990s, up to 90% of Net users were English speaking. By 2000, that figured had dropped to 54% (Thurlow et al., 2004). Now the majority of Net users are non-English speakers. As information and communication technology (ICT) has advanced, the ability to communicate in

other languages, such as Chinese, Arabic, and the several languages that use the Cyrillic alphabet, has become more accessible. In addition, there are efforts to use ICT to create new ways to articulate languages and raise awareness about languages that may be lost as older generations of speakers pass away.

Gender is another factor that has been widely analyzed (see, e.g., Herring, 1993, 2003, in press; O'Brien, 1999. See also Chapter 10, "Gender," and Chapter 29, "Feminist Approaches to Communication," in Volume 1 of *21st Century Communication*). Technology has been constituted traditionally as a male domain. Jonathan Sterne (1999), analyzing Internet research from a cultural studies perspective, attests, "No doubt, the Internet was originally a men's club and is still male-dominated in many places" (p. 273). Men and boys constituted the majority of the early adopters of the Net and of CMC. Many gender studies, women's studies, and feminist studies scholars of ICT have brought to our attention that, historically, there have been relatively few women-focused or women-only online spaces. They also suggest that we go beyond basic gender analyses to look for a distinct social and cultural vision for women's online roles and communicative agency (see, e.g., Miller, 1995).

This is likely an extension of the gender bias found in most computer programs and games, at least until recently. Whereas online fantasy and science fiction games are almost invariably populated by young men and male teenagers, research suggests that e-mail has a much more balanced usership. Some research suggests that women are more likely to use e-mail and IRC than are men, which is perhaps related to the concept that women are more prone to relationship building and maintenance than are men.

Communicating Identities Online

Recall the social decontextualization of CMC discussed above, which would suggest that identity markers such as ethnicity, age, and gender can be "invisible." We choose to communicate, or perform, our identities online by revealing aspects of our identities explicitly or by maintaining the anonymity afforded by text-based CMC. Researchers initially hypothesized that participants in CMC would prefer to benefit from the anonymity of cyberspace, which would make for a more equal playing ground than would f2f communication. Through years of study, however, some scholars argued otherwise. Susan Herring (2003), for example, commenting on the gendered nature of CMC, claims that "traditional gender differences carry over into CMC, in discourse style and patterns of disparity and harassment, and on the Web, in images, content, and patterns of use" (p. 218). She also attests, "Women themselves choose to reveal their gender when they could remain anonymous, and produce gendered images (including pornography), just as women choose to frequent commercial Web sites that offer mainstream, gender stereotyped content" (p. 218).

Much research has examined how communication contexts affect the way we perform aspects of our identities online. Earlier research on constructing online identities focused text-based communication spaces such as MUDs (multi-user dimensions) and MOOs (MUDs, object oriented), where role playing and identity play occurred. It is the identity play and identity construction, originally examined by researchers of MUDs and MOOs, that opened up a vast research arena. Arguably, the study of online identity construction also brought cultural studies scholarship into CMC. Cultural studies scholars helped us understand the complex, fluid, and ever-changing nature of identity. Researchers extended the ideas of theorists such as Michel Foucault, whose notion of technologies of self (originally intended to explicate how we represent ourselves through personal letters and diaries) forwarded the thinking on how we represent ourselves through CMC.

Chang (2000) argues that cyberspace is "a massive Web wherein people constantly construct, reconstruct, and co-construct the meaning of their existence through their seemingly contradictory attempts . . . to maintain their identity while at the same time extending themselves into multiple domains of experience" (pp. 49–50). The reconstruction and co-construction emphasize the fluid and collaborative nature of online identities.

Early research focused on the disembodied nature of CMC. An article by Myers (1987), "Anonymity Is Part of the Magic," addressed the potential for identity play online. The title of the article came from a quote of Myers's respondents, who spoke about the captivating nature of identity fluidity. Nancy Baym (2006) argues,

By divorcing our selves from our bodies, from time and from space, the computer opens a realm in which the multiplicity of identity that is taken to characterize contemporary life reaches an apex. We can be multiple people simultaneously, with no one of these selves necessarily more valid than any other. (p. 67)

Sherry Turkle was one of the first scholars cited widely for her work on online identities. In her groundbreaking book *Life on the Screen: Identity in the Age of the Internet* (1996) and subsequent work (see, e.g., Turkle, 1997), she writes of the "intoxicating," cathartic, even therapeutic nature of anonymity and identity: "You can be who you want to be. You can redefine yourself if you want" (Turkle, 1995, p. 184). Before chat and other forms of CMC had the capacity to easily include images, text was the primary way in which people could represent themselves. "All they see are your words" (Turkle, 1995, p. 184). It is through those words, Turkle and others suggested, that we not only create our identities but through our social interaction online identity construction is a collaborative process between communicators.

There are various ways in which CMC can be a collaborative space for identity construction as well as open dialogue. Douglas Kellner (1998) argues that the Internet has "produced new public spheres and spaces for information, debate, and participation that contain the potential

to invigorate democracy and to increase the dissemination of critical and progressive ideas.” Whatever the CMC means used—e-mail lists, newsgroups, Web pages, there is potential to engage others in dialogue that would, in other social, political, and cultural contexts, be silenced.

Blogging is a means for portraying identity and a key form of CMC for what Kellner calls “critical or progressive ideas.” Of course, bloggers have many different motivations to share their stories with the world. Those who create and maintain blogs have used their online narrative spaces to “document their lives, provide commentary and opinions, express deeply felt emotions, articulate ideas through writing, and form and maintain community forums” (Nardi, Schiano, Gumbrecht, & Swartz, 2004, p. 41). Blogging keeps people (research indicates more women than men) connected with their communities, whether their communities are down the street or across the globe. With the development of diasporas, or large-scale movements of communities and populations, entire cultures have become displaced from their historical and geographical roots. CMC allows these communities to expand globally while maintaining contact with others of their heritage (Newsom & Lengel, 2003).

Social-networking systems are a particularly collaborative way to construct identity. Facebook, a popular online social-networking system used by millions of adolescents and university-aged men and women, has received recent attention by researchers of online impression management (see, e.g., Ellison, Steinfeld, & Lampe, 2007). This is a particularly exciting research area because it allows collaborative identity construction. Once a user puts up an online profile, others can contribute to it. For the most part, these contributions are favorable; however, “friends” have also been known to “post discrediting or defamatory messages on users’ Facebook websites” (Mazer, Murphy, & Simonds, 2007, p. 3). In a study conducted by Walther, Van Der Heide, Kim, Westerman, and Tom Tong (2008), the researchers found that “complimentary, pro-social statements by friends about profile owners improved the profile owner’s social and task attractiveness, as well as the target’s credibility” (p. 44). The researchers note,

It is less costly to alter or distort claims that one makes about oneself (e.g., one’s own profile) than to modify or manipulate statements made by others (e.g., their pictures and wall postings). Thus, information reflected in others’ “testimonials” should be of special value to an individual making a judgment about the profile owner. (p. 45)

Seeking Safe Havens Online

The testimonials in social-networking systems, and various other ways to make and articulate judgments online, can be either beneficial or injurious. Some research, and a vast amount of popular press, has alerted us to the potential dangers lurking online and unethical CMC. Online harassment (see, e.g., Li, 2005), hate speech online (see, e.g., Lengel,

2000), and online ethics (see, e.g., Thurlow et al., 2004) have been analyzed since the early 1990s and continue to be important topics of research (see also the chapters “Unwanted Communication, Aggression, and Abuse,” “Sexual Harassment,” and “Ethical and Unethical Communication” in Volume 1). Online harassment also includes *flaming*, defined as “hostile and aggressive interaction via text-based computer mediated communication” (O’Sullivan & Flanagan, 2003, p. 69). The phenomenon is so named to represent “a metaphorical flamethrower that the sender uses to roast the receiver verbally” (p. 70). O’Sullivan and Flanagan suggest that we are careful—many different definitions of flaming are evident in research. Furthermore, flaming is subject to misinterpretation. Postmes, Spears, and Lea (2000), in a study of a group of students’ CMC, argue,

Although a message might seem rude to an outsider examining it out of context, it is not certain that rudeness was either intended by the sender or perceived by the receiver. This underlines the importance of looking at the context and meaning of messages. (p. 357)

Again, the importance of context emerges. O’Sullivan & Flanagan (2003), analyzing the different definitions and the potential problems with flaming, suggest that “‘flames’ are intentional (whether successful or unsuccessful) negative violations of (negotiated, evolving, and situated) interactional norms” (p. 84).

The anonymity factor has been flagged as having the greatest capacity to do harm. Young persons have admitted in research that they are more likely to say disparaging comments online than *face-to-face*. In addition, as identity theft has become more of a concern since the time of early CMC research, so too has the potential danger of identity play. Although much of early CMC research critiqued the hype and hysteria (see Thurlow et al., 2004) resulting from the way the popular press has reported on ICT developments and on CMC, there have been all sorts of reasons to be concerned, some coming as a surprise, as the next story indicates.

One recent case suggests the potential of identity play gone wrong. Called a “21st Century Parent’s Nightmare” (*Los Angeles Times*, 2008), it is the story of Megan Meier, befriended by “Josh Evans,” an attractive 16-year-old boy on MySpace. The online relationship went sour, with “Josh” hurling abusive affronts, including “The world would be a better place without you” (Pokin, 2007). Megan hanged herself in her bedroom closet, dying a day before her fourteenth birthday. Six weeks later, Meier’s grieving parents learned that “Josh” was, in fact, an amalgamation of a few neighborhood girls in the small Missouri town. More surprisingly, “Josh” also comprised Lori Drew, the mother of one of those teenage girls, and Drew’s part-time employee, Ashley Grills. Drew was indicted by a federal grand jury in Los Angeles (the location determined as the jurisdiction since the MySpace headquarters are in Beverly Hills) on charges—not of murder—but of conspiracy and unauthorized access to a computer.

Megan Meier's story, becoming widely known as the "MySpace Suicide," is not only a parent's nightmare but also a wake-up call to participants and legislators on the phenomenon of cyberbullying. *Cyberbullying* has been defined as "the use of the Internet, cell phones, or other technology to send or post text or images intended to hurt or embarrass another person" (Wolak, Mitchell, & Finklehor, 2007, pp. S51–S52). At the time of Lori Drew's indictment, cyberbullying legislation was rare, with notable exceptions such as a Vermont cyberbullying law, passed in 2004 after the suicide of another teen, Ryan Patrick Halligan (Ruedy, 2008). Several states did have cyberstalking laws in place by that time. Although cyberbullying has received attention for several years, it is the Meier case that could have lasting legal effects and highlights the evolving nature of CMC, the Internet, and the governance of online behavior and communication. It also distinguishes the "real world" from the "cyber world." This distinction is particularly noteworthy because in early CMC research, particularly in the 1980s and 1990s, there was much attention to the "real" versus the "cyber." As CMC and the Internet became more embedded in our lives, the borders and boundaries of these "worlds" blurred. Now new borders and boundaries are being drawn. Ruedy (2008) argues,

Just because an online behavior is analogized to a legal "real world" behavior does not necessarily imply that the online version should also be legal. This distinction between "real world" and "cyber world" behavior shows that analogies of computer crimes to traditional crimes are not always valid. (pp. 337–338)

For CMC participants, the emerging legislation could have serious implications for online identity and anonymity. Whereas many would like to see Lori Drew and Ashley Grills behind bars for their alleged involvement in the cyberbullying of Megan Meier, the case could have a widespread impact on any Internet user. Legislation from this case could be used in the future for various types of anonymous CMC (*Los Angeles Times*, 2008). There are many good reasons why someone would want to maintain anonymity—think of women trying to escape domestic violence, for example—and many ways they, too, could be charged. It depends on the court decision and how the precedent of this case may affect those in the future.

This is the way of CMC—so much is transforming in the way we communicate online that it is virtually impossible to keep on top of the changes. We don't know what the future holds, both the distant future and what is just around the corner.

Conclusion

Because CMC is one of the newest and most frequently changing areas in 21st-century communication, this chapter has merely touched on a few developments and issues—tomorrow an entirely new chapter could be written! This

is what makes CMC so fascinating to communication researchers.

In this chapter, you have been introduced to the historical roots of CMC research, the key research questions and debates. You've learned about the different types of CMC, from early newsgroups, MUDs, and MOOs. You've thought about the current online spaces such as Facebook and MySpace, which have had a massive increase in participants in just a couple of years. These and other social-networking sites are growing in scope and importance so quickly that it's challenging to even touch on the phenomenon, let alone research it.

Other aspects of CMC, although changing, have persisted as important to communication researchers. One aspect that has been addressed here is the role of online communities and the social support they provide to community members. Another aspect is how various communication contexts affect CMC and how the factors affecting communication—gender, ethnicity, sexual orientation, culture, risk, freedom of expression, and globalization—play a role online. The chapter has explored the nature of online identity, particularly the fluid nature of self, and impression management. Finally, it has addressed both the privileges and the abuses of anonymity, with a specific focus on safety online, and has looked to the future of the ever-changing ways we engage in CMC.

GROUP DECISION SUPPORT SYSTEMS

MARSHALL SCOTT POOLE

University of Illinois at Urbana-Champaign

IFTEKHAR AHMED

Texas A&M University

A group decision support system (GDSS) combines communication, computer, and decision technologies to support group decision making, problem solving, and subsequent activities. Communication technologies incorporated into GDSSs include electronic messaging and chat, teleconferencing, document management, calendaring, wikis, and blogs. Computer technologies include portals, service-oriented architectures, and Web-authoring tools. Decision support technologies include agenda setting, decision-modeling methods (such as risk analysis or the Analytic Hierarchy Procedure), structured group methods (such as stakeholder analysis or the Nominal Group Technique), and rules for directing group discussions (such as the Parliamentary Procedure) (DeSanctis & Gallupe, 1987).

Groups engage in a wide variety of activities as they make decisions and solve problems, including information sharing, problem identification and formulation, problem analysis, criteria development, solution identification and development, solution evaluation and selection, and implementation planning. Other group processes, such as leadership and facilitation, planning, project management, conflict and conflict management, creativity, negotiation, role definition, socializing, and team development, also contribute to effective decision making and problem solving. Most GDSSs have been designed to support decision making, problem solving, facilitation, and project management but most also incorporate features that support other activities.

For example, GROOVE™, a popular online tool set that can be used as a GDSS, provides a shared whiteboard that can be used for group drawing, which contributes to creativity (Griffith & Sawyer, 2006) but is also for playing around with. Because they provide general support for groups, these systems have also been referred to as electronic meeting systems (EMSs) and group support systems (GSSs). In this chapter, we will focus primarily on their use in decision-making activities as defined above.

GDSSs are employed in a wide variety of groups for general decision making, strategic planning, product design, and quality improvement, among other uses. GDSSs can be used by groups that meet face-to-face (FTF) or by virtual teams. A typical GDSS meeting starts with an agenda outlining the meeting and indicating the features of the GDSS that will be used in various steps. For example, a group might (1) brainstorm ideas using an idea generation tool; (2) discuss the ideas; (3) consolidate similar ideas to reduce the list using a categorization tool, which puts similar ideas under a common category; (4) vote on ideas using a voting tool; and (5) make a final decision based on the vote. Note that only Steps 1, 3, and 4 require the use of the GDSS. In Steps 2 and 5, the group engages in free discussion. A GDSS is not intended to replace existing modes of group communication. Rather, it is intended to support and encourage verbal and non-verbal interaction, as well as to provide additional channels for communication and decision support. Typically,

members work at the GDSS episodically, using it for a time, then interacting without it, then coming back, and so on.

The potential of GDSSs lies in their ability to augment group information processing and analysis and to facilitate communication during decision making. GDSSs may also increase the salience of procedures to group members, thus promoting their beneficial effects. For example, if a GDSS prompts members to “Enter ideas into the brainstorming tool,” member activity is synchronized and attention is focused on this step of the decision-making process. By increasing the salience of procedures, GDSSs may also help educate groups and create an awareness of the importance of systematic approaches.

Historical Development

Douglas Englebart and colleagues at Xerox Parc, early developers of many interactive computer technologies, demonstrated the use of computers for collaborative work in the early 1970s. Many of the earliest applications of networked computers were motivated by a desire to support group work. Murray Turoff used the precursor of the Internet to conduct Delphi sessions involving dozens of authorities in the development of future scenarios. The development of computer conferencing was also driven in part by the goal of supporting group decision making and deliberation (Hiltz & Turoff, 2000).

The group decision support system grew out of research and development on decision support systems (DSSs). The concept of DSSs was given an early articulation in Little’s (1970) *Models and Managers: The Concept of a Decision Calculus*. Keen and Scott Morton (1978) provided the first broad behavioral orientation to decision support system analysis, design, implementation, evaluation, and development. The original DSS concept was most clearly defined by Gorry and Scott Morton (1989), who developed a framework based on organizational activities related to various types of decisions. They motivated DSS not on the basis of technology but on the basis of decision-making activities, viewing information systems as support tools for decision making.

Freyenfeld (1984) developed a six-category classification of DSS components. He viewed DSSs as an interactive user-friendly data-processing and display system that uses terminology familiar to the user and with its selective features helps the user avoid information overload. His six categories were (1) chief executive information systems, (2) commercial operational analysis and planning systems, (3) industrial operational analysis and planning systems, (4) preference determination systems, (5) cognitive mapping systems, and (6) expert advisory systems.

In the early 1980s, a number of researchers applied DSSs in group settings, and by 1986, the idea of developing DSSs into dedicated systems specifically designed for groups gained currency. Articles by Huber (1984) and DeSanctis and Gallupe (1987) defined the parameters of the growing field.

By the early 1990s, a number of GDSSs had been developed, mostly stand-alone systems that required special servers (Bostrom, Watson, & Kinney, 1992). In recent years, GDSSs have moved to the Internet. The number of available GDSS systems peaked in the early 1990s and has markedly decreased since about 1995. At present, ThinkTank™ and Facilitate.com™ are the two major commercially available GDSSs. However, general-purpose meeting and conference systems such as WebEx™ and GROOVE™ are sufficiently powerful and flexible so that GDSSs can be improvised within them by a knowledgeable user.

GDSS Configurations

Configurations for GDSSs vary in terms of the physical layout of the space in which the technology is used, in terms of the features the system incorporates, and in terms of the technological platform the GDSS runs on. The physical layout of GDSSs is a factor because human groups take up space and the arrangement of meeting areas influences how groups operate. The spatial arrangement of groups is strongly dependent on their size. Small groups of three to seven members can easily arrange themselves so that everyone can see and communicate with everyone else. The arrangement of larger groups must be more carefully designed if all members are to participate. Of course, information and communication technology means that groups need not convene FTF. Dispersed or virtual teams are quite common, and they add an additional spatial dimension.

DeSanctis and Gallupe’s (1987) typology of GDSSs distinguished physical layouts based on their size and whether group members were colocated or distributed. The *local area decision network* supports small distributed groups, typically in the same office building and working on the same project or task. Members typically work in their own spaces and may interact via text messages, audio links, or video links. The *computer-mediated conference* supports larger groups whose members are dispersed but must work on common tasks. Several modes of communication are available for computer-mediated conferences, but there is also often a need for tools or leaders to facilitate participation (e.g., to form a queue to speak). Small, FTF groups meet in the *decision room*. A typical design for these rooms has members seated around a U-shaped table with a common display at the front of the group and a workstation for each member. The *legislative session* supports larger colocated groups. Spaces for legislative sessions must be carefully designed and often include break-out rooms in addition to a large general-assembly room.

The DeSanctis and Gallupe typology was very fruitful for GDSS research and development but needs to be expanded in at least two respects. First, the colocated and fully dispersed groups represent extreme cases. Many virtual groups combine both colocated and dispersed aspects in that subsets of members may be colocated in different places (e.g., two

members in one office in city Z, one member in city X, and three members in one office in city Q). Second, the spread of wireless communication has altered the nature of GDSSs (and all group support tools) in several respects. First, unlike the dispersed members in the DeSanctis-Gallupe typology, members of today's dispersed groups need not be fixed to computers hardwired into offices or homes but can roam freely. Second, portable computers and wireless networks make decision rooms and even legislative conference centers "portable." Even a GDSS for a colocated group no longer needs to be fixed in place.

The second aspect of GDSS configurations, after their physical layout, is their features. A wide range of procedures may be incorporated into a GDSS, including agenda setting; idea generation; commenting on ideas; categorizing ideas; evaluating ideas through voting, rating, or ranking; minute taking; and more complex procedures such as multicriteria decision analysis, stakeholder analysis, and synectics. De Vreede, Briggs, and Kolfshoten (2006) have recently described a number of "thinklets," basic modules into which many procedures can be decomposed, which promise to be useful in GDSS design. Other features may be built into the GDSS as well, such as a "group" display screen that displays common group information (e.g., lists of ideas or vote tabulations; this supplements the traditional flip chart or chalk board); a shared whiteboard for group drawing; links to project management tools, calendars, and databases; and communication media such as instant messaging, audio links, and video links.

The final aspect of GDSS configurations is the technological platform that they run on.

Most GDSSs rely on computer workstations, fixed or portable, although some specialized tools such as "clickers" (remote push-button voting or rating devices) may be used with large groups. Early GDSSs were implemented as specialized software packages that had to be purchased and installed on a network. Today, GDSSs are also available via the Internet and can be rented as well as purchased from application service providers such as GroupSystems™, which developed ThinkTank™.

Theories of GDSS Impacts

Research on GDSSs has been guided by several theoretical frameworks. The initial work, similar to early work on DSSs, consisted of taxonomies and structural descriptions that defined the major dimensions of GDSSs. Particularly noteworthy is a highly cited framework by DeSanctis and Gallupe (1987) that distinguished different levels of support GDSSs could offer, four contexts of use (outlined above), and a number of possible functions GDSSs could serve in groups. Huber (1984) wrote a prescient paper on issues in the design of GDSSs, in which he argued that GDSSs should be designed around the activities of information sharing and use, particularly textual and relational information, rather than centering on numerical analysis, as most DSSs

do. He also argued that decisions sufficiently significant to warrant a GDSS do not occur very often. For these reasons, he predicted that it will be more difficult to convince organizations to procure and implement specialized, dedicated GDSSs than if the GDSS were offered on a service or rental basis. Finally, Huber argued that dedicated support personnel and a degree of familiarity with the management of groups would be necessary for GDSSs to succeed.

Subsequently, several theories of GDSS effectiveness were advanced. Hiltz's (1988) systems contingency approach posited that the impacts of GDSSs on productivity and performance were contingent on "characteristics of the higher-level systems within which the technology is used" (p. 1440). For instance, GDSS's impacts depend on compatibility with the demands of the organization, which may vary among organizational subunits.

Nunamaker, Dennis, Valacich, Vogel, & George (1991; see also Dennis, George, Jessup, Nunamaker, & Vogel, 1988) developed a high-level input-process-output model that describes the major influences a GDSS (and electronic meeting systems in general) can have on group processes and outcomes. The factors influencing GDSS outcomes are group characteristics (size, member characteristics, cohesiveness, etc.), task characteristics (task type, task complexity, etc.), contextual characteristics (organizational culture, incentives and reward systems, etc.), and the specific GDSS technologies in use. These authors argued that a GDSS improved the quality of group decisions by minimizing "process losses," such as restrictions on member participation and free riding, while maximizing "process gains," such as the ability of members to catch each others' errors and build on one another's ideas.

Poole and DeSanctis (1990, 2004; see also DeSanctis & Poole, 1994) proposed adaptive structuration theory (AST), which was intended to resolve some of the conflicting results gathered from empirical research on GDSSs. AST factors the way in which groups use the GDSS into the equation. The basis of the model comes from a distinction between *system* and *structure* made by the British social theorist Anthony Giddens (1984). The system is the observable behavior of the group using the GDSS, whereas structures are unobservable (but definable by inference), "rules and resources actors use to generate and support this system" (Poole & DeSanctis, 1990, p. 179). Structures come into play in the process of structuration, members' generative use of structures in generating and maintaining the system. Poole and DeSanctis (1990) argue that GDSSs embed structures underlying the procedures that are built into them (e.g., a brainstorming module) and the resources they provide for the group (e.g., the facility for all members to enter ideas into the brainstorming model at once). In the case of brainstorming, the structures include the rules for brainstorming (e.g., no criticism of ideas) at the feature level. Another type of structural element in a GDSS is the overarching set of values it is designed to promote, such as creativity or participative decision making, which is called the "spirit" of the structural set.

Structuration of group decision making occurs as members use the GDSS, thus appropriating various structures from the GDSS to enable and constrain their work. Each group does this differently. Some groups, for example, might use a voting procedure as a straw poll to get an idea of their members' opinions, whereas others might use the same procedure to browbeat the minority into accepting the will of the majority. The different modes in which groups develop "structures-in-use" account for the range of processes and outcomes that occur in groups using GDSSs. Unlike contingency theories and most input-process-output frameworks, which presume that a set of variables causes or accounts for outcomes, the AST advocates a "softer" determinism, in which the GDSS may enable and constrain the group but actors have considerable control over how it is used and hence over group processes and outcomes. The AST expects there to be a considerable degree of unpredictability in processes and outcomes promoted by GDSSs.

Gavish and Kalvenes (1996) advanced an economic model of GDSSs that considers GDSS use by groups to be in the format of a search problem with a substantial solution space. According to this model, which solutions are feasible depends on the cost of performing the search versus the payoff of the solution. One important parameter in their model is group size, which has complex effects on the size of the solution space and other aspects of the model.

Dimensions of GDSSs

To characterize GDSSs for purposes of research and development, it is important to identify the basic dimensions underlying their configurations. This enables researchers to move past the very large number of possible designs and focus on fundamental distinctions. One important dimension is *synchrony*, the degree to which members must use the GDSS at the same time versus the capability to use the GDSS at different times. In synchronous work, members must be coordinated more tightly than in asynchronous work, placing greater demands on the group. A second dimension along which GDSSs vary is *distribution*, the degree to which members can use the system if they are in different locations. The synchrony and distribution dimensions represent the two dimensions of time and place in the DeSanctis and Gallupe (1987) typology of GDSS configurations.

GDSSs in general and their features may also vary in the degree to which they constrain user behavior, that is, in their *restrictiveness* (Silver, 1988). Some tools are highly restrictive because they require users to follow closely specified rules about how to use the tool and do not offer members much freedom to adapt them. An example of this would be a multi-attribute decision-making tool that requires users to enter options, enter criteria next, and then rate the options on the criteria, after which it provides a graphical display of results. In this case, the user behavior must follow the "script" provided by the GDSS. Other tools, such as a virtual whiteboard,

are low in restrictiveness because they present a "blank slate" to the group that members can use as they wish.

GDSSs differ in terms of the *level* of support their features offer. DeSanctis and Gallupe (1987) distinguished three levels of GDSS support, each of which incorporates the level below it and adds additional capabilities. *Level 1* GDSS features support more efficient and effective communication among group members. Examples of Level 1 features are instant messaging, idea generation, evaluation techniques such as voting or rating, and minute taking. Idea generation, for instance, enables members to simultaneously enter ideas into the system, which are then displayed for the group to view, greatly increasing the speed with which the group can generate ideas and the pool of ideas they generate. The group could also list ideas "manually" by going around the group and having members state their ideas, which are then written on a blackboard. Level 1 features essentially enhance and improve traditional modes of communication and add the ability to communicate across distance.

Level 2 GDSS features provide decision support tools, such as multicriteria decision making, stakeholder analysis, and creativity techniques. These more complex tools are added on top of the Level 1 tools. A Level 2 GDSS supports activities that members could not accomplish unaided and brings advanced decision models into meetings. A multicriteria decision-analysis tool, for instance, would enable members to define evaluation criteria for a set of options, then enter weights reflecting the importance of the criteria to them, and then rate each option on the criteria. The GDSS would then calculate weighted averages of the ratings for each option, in a mathematical process that would take considerable time if done manually. The system might then provide numerical and graphical displays of the results for the group as a whole, with indications of the variability in ratings and weights for each item. This would enable the group to determine points of disagreement, which they could then discuss and resolve. Level 2 features fulfill the promise of the GDSS to improve group decision making through more sophisticated decision analysis.

Level 3 features seek to overcome a major barrier to the effective utilization of Level 1 and Level 2 GDSS features, the members' lack of knowledge about procedures and how to employ them. It takes time to learn procedures, organize meeting agendas that incorporate them, and facilitate the group's use of them. In the absence of a trained facilitator or consultant, a GDSS can present a steep learning curve to busy leaders and group members. Level 3 features attempt to flatten out the learning curve by providing guidance for the group through tools such as automated facilitation and expert systems that advise the group on strategies and approaches for making the decision. Some Level 3 systems are currently being developed, but this level of support remains some time away from general use.

A final dimension on which GDSS features vary is *parallelism*, the degree to which members can communicate or work with the system simultaneously. Electronic

brainstorming, for instance, is high in parallelism because all members can enter ideas at the same time. A public display of results of a stakeholder analysis is typically lower in parallelism because members must view it and discuss it together. Parallelism enables GDSSs to overcome the human limitations of discussion in FTF groups, in which only one or two members can hold the floor at the same time. It promotes gains in efficiency for groups in tasks that require individual inputs and not simultaneous discussion.

Key Findings of Research on GDSSs

There have been a number of reviews and meta-analyses of GDSS research (Dennis & Wixom, 2001–2002; DeSanctis, Poole, Zigurs, & Associates, 2008; Fjermestad & Hiltz, 1998–1999, 2001; McLeod, 1992, 1996; Rains, 2005; Scott, 1999). The results of these reviews are for the most part consistent, so specific works will not be cited in this discussion unless there is a unique finding.

More than 50 studies have compared GDSS groups with FTF groups that did not use a GDSS (though some of them did use procedures manually). In terms of group outcomes, GDSS groups attain higher levels of group effectiveness than do FTF groups, when effectiveness is measured in terms of decision quality, quantity of ideas generated and considered, quality of ideas, confidence in the decision, depth of evaluation, and commitment to results. On the other hand, GDSS groups are less efficient than FTF groups in terms of time to decision and ease of decision making but more efficient on tasks that could be done in parallel (such as idea generation) or complex decision-making tasks (such as multicriteria decision analysis). Members of GDSS groups are less satisfied with their decision and decision process than are members of FTF groups. Members often reported that the GDSSs were difficult to use. Finally, GDSS groups have more trouble coming to a consensus and face more conflict than do FTF groups.

There are several moderating variables for results on outcomes. When the level of GDSS features is taken into consideration, most studies find that FTF groups are no different from groups using Level 1 GDSS features in terms of effectiveness but that Level 2 GDSS groups outperform both Level 1 and FTF groups. Groups with a Level 2 GDSS also attain a consensus better and manage conflict more effectively than do groups with a Level 1 GDSS; Level 2 GDSS groups showed no differences from FTF groups on these variables. However, FTF groups are still more satisfied with their group and decision process than were users of either level of GDSS.

Distribution of the group is a second important moderator. Outcomes are markedly better for groups meeting FTF in a decision room than in the small number of studies that have thus far been conducted on distributed GDSS groups. This is a concern in view of the migration of these technologies to the Internet.

Task also moderates outcomes. Outcomes for GDSS groups are superior to those of FTF groups for idea generation tasks and for complex decision and planning tasks. These types of tasks can benefit from the technology regarding idea generation because the GDSS allows fast parallel entry of ideas by all members and complex tasks since GDSSs can help groups carry out complicated decision analysis and decision support procedures. For simpler, more straightforward decision or judgment tasks, the technology does not provide as much benefit.

In terms of the decision-making process, the reviews suggest that GDSS and FTF groups are about equal in terms of process gains and losses, with both process gains and losses for both technologies being shown across a wide range of studies. Nevertheless, the GDSS has positive effects on structuration processes in comparison with FTF groups (DeSanctis et al., in press; Fjermestad & Hiltz, 1998–1999). The guidance provided by the GDSS appears to help the groups use procedures more faithfully and effectively. Rains's (2005) meta-analysis found that GDSS groups also have greater equality of participation, influence equality, and experience less member dominance than do FTF groups (though, see Fjermestad & Hiltz, 1998–1999, who report no difference on the basis of a simple count of results across studies). Level of GDSS also appears to moderate their effects on group process, with Level 2 GDSS features leading to more positive group processes than do Level 1 GDSS features. Using a GDSS also increases the degree of task-oriented behavior compared with FTF groups.

Facilitation and leadership have strong effects on GDSS process and outcomes. GDSS groups that are facilitated have a much greater likelihood of positive outcomes than do groups with no facilitator. Dennis and Wixom (2001–2002) found that facilitated groups have higher decision quality and greater satisfaction with their process than groups working without a facilitator. There is some evidence that a flexible form of facilitation is more effective than rigid, tightly scripted facilitation (DeSanctis et al., in press).

Reviews that compared field studies of GDSS with laboratory studies report more favorable results for the field implementations compared with the lab for some outcomes. Field studies regularly report that GDSS groups are more efficient than regular FTF groups, a finding inconsistent with the laboratory studies. This may be because the groups in most field studies are engaged in longer-term, more open tasks, whereas most laboratory tasks are kept relatively simple to fit into the time allotted for the experimental session. Hence, there is more room for improvement over common meeting practices in the field than in the lab. Field studies also typically report higher levels of user satisfaction with the GDSS than is measured in laboratory studies. This may be due to the care with which GDSS groups in the field are facilitated and supported. In most field studies, the researchers have a vested interest in having the GDSS succeed because if the group does not do

well, GDSS use is discontinued and the study stops. So researchers take special care to ensure that the groups using the GDSS have the best possible experience. In those field studies that report unsuccessful implementations of GDSSs, the factors leading to negative outcomes include lack of facilitation or poor facilitation, little training or support, inflexibility in applying the GDSS, and a domineering or unenthusiastic manager or group leader.

Finally, we should note that the effects of GDSS procedures depend on how they are implemented in ongoing groups. Differences in results for field and lab studies, for instance, appear to stem from the greater level of auxiliary support given to groups in the field than in the lab. So, too, are there differences in how individual groups use the GDSS. Many GDSS features are complex and require some guidance or practice to use properly. Members do not always understand the rationale behind GDSS procedures and existing group norms, or organizational culture may conflict with the spirit of the GDSS. As groups adapt the GDSS to their own goals and norms, they may change the procedure in subtle yet important ways. For example, when a GDSS designed for U.S. users was employed in an experiment in Singapore, several groups did not use the voting procedure to indicate individual preferences but instead had the leader vote first and only then entered all their votes (in agreement with the leader). This was consistent with the collectivistic culture of Singapore but led to considerable changes in the impacts of the GDSS. The AST was developed to track and account for the impacts of appropriations by individuals and groups on the effects of GDSSs.

Diffusion and Implementation of GDSSs

The reviews cited in the previous section identified several critical success factors in implementing GDSSs. One important factor is training. In addition to “nuts and bolts” training in using GDSS features, users must be trained in the general philosophy behind the GDSS, the tasks it is best suited for, and how to design agendas. Without the “big picture,” users cannot understand what the features are for. A second critical success factor is facilitation. As noted in the previous section, effective facilitation increases the effectiveness of GDSS use. The facilitator not only serves as a resource for the group but also becomes a technology advocate and often identifies and cultivates “champions” for the system among members.

Third, it is important to tailor the GDSS and how it is used to the local context. The GDSS must be used in ways acceptable to its users and consistent with the overall culture of the organization. Nevertheless, it is also important to recognize that GDSSs are often introduced to change current organizational practices. There is a fine balance between fit with the organization and realizing the benefits of the GDSS. Finally, it is important that members experience success with the GDSS. If the group can use the GDSS effectively early on

and see concrete benefits, it is more likely to continue to use it and be willing to put the requisite effort into learning the system. For this reason, it is important to employ the GDSS only for tasks it is well suited for and to ensure that members are trained and that there is an effective facilitator. Members who have had good experiences with the GDSS are likely to become ambassadors to the rest of the organization.

Despite these suggestions, GDSSs have achieved at most a moderate level of diffusion and utilization. Many organizations installed GDSSs in decision rooms during the late 1980s and early 1990s, when they received a good deal of attention in the business press, and there were notable success cases. For example, the Internal Revenue Service used a GDSS to implement a quality improvement program in one of its regional offices (DeSanctis, Poole, Desharnais, & Lewis, 1991). The oil company Texaco built several elaborate decision rooms equipped with multisite video conferencing and GDSSs to enable distributed meetings (DeSanctis, Poole, Dickson, & Jackson, 1993). Nevertheless, over the long term, GDSSs have tended to be underused, and many decision rooms have since been repurposed or dismantled.

There were several reasons for this. As Huber (1984) presciently observed, organizing and managing GDSSs takes a good deal of time and energy, and therefore they are used primarily for special-purpose, important tasks. Hence, decision rooms often remained unused for considerable periods of time, creating a temptation to appropriate them for other purposes. Second, most users did not have the requisite expertise in working in groups or in using procedures that the GDSS provided. The steep learning curve for the technology, mentioned earlier, served as a barrier to utilization. Third, because of this barrier, facilitators were necessary to promote utilization of the GDSS. Nevertheless, facilitators were expensive and were often the first to go when the organization experienced a downturn.

The result was a dip in demand for GDSSs. Only a few commercial GDSSs are available at the time of writing, and most meeting support or conferencing systems offer only Level 1 tools. This does not mean, however, that the GDSS should be written off. Videoconferencing endured two previous periods of experimentation and failure before its successful diffusion in Web 2.0. The next section discusses new developments that may improve prospects for the GDSS.

Conclusion and Future Directions

The GDSS began as an extension of the decision support system and has developed into a distinctive technology organized around the demands of group processes. Supporting group communication, problem solving, and deliberation requires not only decision models but also a design that supports social interaction processes, promoting those that contribute to group effectiveness and counteracting those that degrade decision making. Over the past 20 years, distinctive configurations of GDSSs have evolved around different

arrangements of groups in time and space, and other dimensions underlying GDSSs have been defined, including restrictiveness, level of support, and parallelism. Research has shown that GDSSs can improve group processes and outcomes, but mixed results suggest that their effectiveness depends on a number of other factors. These include level of GDSS employed, distribution, task, and facilitation. There is no simple deterministic model of GDSS impacts. Rather, GDSS impacts depend on how the system is used and on how groups appropriate it as they work.

At least two trends seem likely to influence the future of the GDSS. First, the growth of Internet applications for groups and the concomitant increase in virtual groups has created a demand for distributed GDSSs, and such systems are now available commercially. Indeed, although GDSSs in decision rooms have not been a great success, a second generation of distributed GDSSs, which can be leased or purchased from application service providers, offer a promising future. Nevertheless, much less is known about distributed GDSSs than about GDSS configurations designed for FTF meetings, and current research suggests a disadvantage for distributed GDSSs compared with those used in colocated groups. Whereas Level 1 features such as idea generation and voting are straightforward to implement and have been incorporated into many conferencing tools, higher-level features represent a challenge. Procedures such as multi-attribute utility analysis and stakeholder analysis are typically run in colocated groups with facilitators, and there are questions as to how effectively they can be implemented at a distance. The communication problems, conflicts, and coordination difficulties faced by virtual teams pose severe challenges for distributed GDSSs.

As Fjermestad and Hiltz's (1998–1999, 2001) review shows, studies of FTF GDSSs outnumber those of distributed GDSSs by a large margin. It is not clear to what extent results from the former apply to the latter. Will distributed GDSSs be more efficient than FTF groups with or without a GDSS? Will Level 2 features of distributed GDSSs garner the gains observed with Level 2 features in FTF groups using GDSSs? How satisfied will users of distributed GDSSs be?

Another set of questions revolves around whether GDSSs can enable virtual teams to meet their challenges. Virtual teams often suffer due to a lack of common context, which fosters misunderstanding and negative attributions and can set harmful social identity dynamics into motion (Poole & Zhang, 2005). A distributed GDSS provides an online space that would give virtual teams a context to interact within. Once established, this common context could help virtual team members to communicate more effectively and understand one another, reducing negative attributions and conflict. In essence, the GDSS could function as a boundary object linking members in different locations. Virtual teams also seem to benefit from an initial focus on their task, which is often the most

important thing that binds members into a group. A distributed GDSS provides an organized environment for working on the group's task and thus should promote early development of the group. Social relationships tend to follow task accomplishment in virtual teams, and a GDSS that enables the virtual team to make clear progress can also be a vehicle for relationship development.

The second trend that has the potential to influence GDSSs is the rapid advance of information technologies. As we have noted, a major barrier to effective implementation and use of GDSSs is a lack of skill and knowledge on the part of the potential user. As a result, facilitators are needed to help plan and run sessions at present. Facilitation is particularly important for more complex procedures such as multi-attribute utility analysis. Nevertheless, a facilitator represents a considerable overhead for the organization that employs him or her and for the meeting convenor or leader, who must work with her or him to plan the session. One way of minimizing this problem is to develop Level 3 GDSSs that automate guidance and facilitation. These systems would bootstrap meeting planning and facilitation, making GDSSs more accessible to users. At present, Level 3 GDSSs primarily operate in terms of help systems and agendas that describe what the group should do (e.g., Limayem & DeSanctis, 2000). Nevertheless, advances in agent-based and intelligent systems could enable the implementation of Level 3 systems that are considerably more active and responsive than current models. A Level 3 GDSS, for example, might also learn the characteristics and tendencies of a group, allowing it to tailor its advice to the users' level of sophistication. A more active Level 3 system might also give advice "on the fly" in response to events in the system or group and interact with the group.

Another way in which advances in information technology may shape GDSSs is through enabling development of novel, more natural interfaces for distributed meetings. Current GDSSs, especially distributed GDSSs, offer a fairly sterile and restrictive mode of interacting, quite unlike the immediacy of FTF meetings. New technologies coming online, including improved videoconferencing, tele-immersive environments that bring virtual reality to telecommunication, and haptic interfaces that operate through touch and motion, may enable the construction of meeting environments that are less intrusive and are easier to use, and promote a sense of presence far exceeding that yielded by current configurations. This may mitigate some of the challenges distributed GDSSs face. Web 2.0 technologies may also enhance the GDSS experience. Rather than meeting with other disembodied members via text, audio, or video conferencing, groups may meet in venues such as Second Life™ and interact via avatars. These and other new technologies may enable new, more compelling forms of distributed meetings.

The next 10 years will be a critical time for GDSSs. New and developing technologies and applications will

determine whether they remain a useful but somewhat marginal tool or gain widespread acceptance and use.

MEDIA LITERACY

W. JAMES POTTER

University of California, Santa Barbara

Media literacy is a popular term. If you were to do a search of the academic literature using one of the many databases available at university libraries, you would find somewhere between several hundred and several thousand citations for scholarly books and articles that use this term as a keyword. And as I write this chapter, a search for “media literacy” on Google results in more than 792,000 hits. Clearly, media literacy is a popular topic among not just scholars but among the general population, which includes parents, teachers, social activists, and policymakers.

It should not be a surprise that there are many definitions for *media literacy* across all this writing. In this chapter, I will first show you the range of definitions for this term and highlight the major issues that span across that great variety of definitions. Then, I will use the major ideas in those definitions to describe the characteristics that a media-literate person should exhibit.

Different Approaches

Variety of Definitions

The availability of so much information on this topic is a very positive characteristic because it indicates that the topic is an important one to so many people. There is a lot of vitality, which produces many ideas. Note the range of definitions in Table 62.1. Some of these definitions were constructed by scholars working in groups; examples include the National Communication Association and the

National Leadership Conference on Media. Media groups (such as the American Psychiatric Association) and governmental groups (such as the Office of National Drug Control Policy) also have constructed definitions. Nevertheless, most of these definitions were constructed by small groups of individuals or created by citizen activist groups that challenge the mass media and criticize many of their practices and content.

Among scholars, there is also a great variety of thinking about media literacy. Some scholars argue that media literacy should be treated primarily as a public policy issue (Aufderheide, 1993); as a critical cultural issue (Alvarado & Boyd-Barrett, 1992); as a set of pedagogical tools for elementary school teachers (Houk & Bogart, 1974); as suggestions for parents (DeGaetano & Bander, 1996); as McLuhanesque speculation (Gordon, 1971); or as a topic of scholarly inquiry from a physiological (Messaris, 1994), cognitive (Sinatra, 1986), or anthropological (Scribner & Cole, 1981) tradition. Some writers focus primarily on one culture, such as American culture (Manley-Casimir & Luke, 1987;), British culture (Buckingham, 1990; Masterman, 1985), or Chilean culture (Freire, 1985), or on several countries and/or cultures (Brown, 1991; Scheunemann, 1996). *Media literacy* is a term applied to the study of textual interpretation (Buckingham, 1998; Zettl, 1998), context and ideology (Lewis and Jhally, 1998), and audience (Buckingham, 1998). The term is also used as synonymous with or part of media education (Sholle & Denski, 1994). Table 62.2 presents a sampling of some of these scholarly definitions. Again, note the range in the definitions.

Action Coalition for Media Education	Encourage critical thinking and free expression, examine the corporate media system, and inspire active participation in society (www.acmecoalition.org)
Alliance for a Media Literate America	Critical inquiry, learning, and skill building rather than media bashing and blame (www.amlainfo.org)
American Psychiatric Association	Rather than allow the media to promote unchallenged the quick fix of violent solutions, conflict resolution skills involving patience and negotiation should be taught (www.psych.org)
Center for Media Literacy	“A framework for accessing, analyzing, evaluating and creating media. The development of critical thinking and production skills needed to live fully in the 21st century media culture.” Also defined as “the ability to communicate competently in all media forms, print and electronic, as well as to access, understand, and analyze and evaluate the powerful images, words and sounds that make up our contemporary mass media culture” (www.medialit.org/pd_services.html#crash_course)
Children Now	Media literacy is a way to foster critical viewing skills in young viewers (www.childrennow.org)
Citizens for Media Literacy	How to think critically about TV and advertising (www.main.nc.us/cml)
Coalition for Quality Children’s Media (KIDS FIRST!)	Recognize programs that are intellectually and creatively stimulating; that break down racial, gender, handicapped and cultural boundaries; and that are produced with high technical and artistic standards (www.kidsfirst.org/kidsfirst/html/whatcq.htm)
Media Awareness Network	Critical thinking skills to “read” all the messages that are informing and entertaining and selling to them (audiences) every day (www.media-awareness.ca)
Media Education Foundation	The tools and vocabulary needed to re-examine media images and their influence on how we think about our personal, political, economic, and cultural worlds (www.mediaed.org)
Media Watch	Challenge abusive stereotypes and other biased images commonly found in the media (www.mediawatch.com)
National Communication Association	A media-literate person understands how words, images, and sounds influence the way meanings are created and shared in contemporary society in ways that are both subtle and profound. A media-literate person is equipped to assign value, worth, and meaning to media use and media messages (www.natcom.org)
National Leadership Conference on Media	The ability to access, analyze, evaluate, and communicate messages in a wide variety of forms of literacy (Aufderheide, 1993)
The National Telemedia Council	The ability to choose, to understand—within the context of content, form/style, impact, industry, and production, to question, to evaluate, to create and/or to produce, and to respond thoughtfully to the media we consume. “It is mindful viewing, reflective judgment” (Considine, 1997). Also, the ability to access, analyze, evaluate, and create information in a variety of print and nonprint media formats (http://www.nationaltelemediacouncil.org)
New Mexico Media Literacy Project	“The ability to access, analyze, evaluate and create messages in various media” (www.nmmlp.org)
Northwest Media Literacy Project	The ability to critically assess media messages to understand their impact on us, our communities, our society, and our planet. It is also a movement to raise awareness of media and their influence (www.mediathink.org)
Office of National Drug Control Policy	“To (a) recognize how media messages influence us (e.g. develop a vocabulary to recognize manipulative techniques, develop skills to protect oneself against messages about drugs or negative lifestyle choice that are embedded in the media), to (b) develop critical thinking (e.g. know that messages are constructed by people with points of view and commercial interests, uncover value messages inherent in media, evaluate information for accuracy and reliability), to foster self-esteem (e.g., creatively produce satisfying and constructive messages)” (www.nytimes.com/learning/teachers/NIE/medialiteracy/intro.pdf)

(Continued)

Table 62.1 Definitions of Media Literacy: Citizen Action Groups

(Continued)

Adams and Hamm (2001)	“Media literacy may be thought of as the ability to create personal meaning from the visual and verbal symbols we take in every day from television, advertising, film, and digital media. It is more than inviting students to simply decode information. They must be critical thinkers who can understand and produce in the media culture swirling around them” (p. 33).
Anderson (1981)	The “skillful collection, interpretation, testing and application of information regardless of medium or presentation for some purposeful action” (p. 22).
Barton and Hamilton (1998) (cited in Margaret Mackey, 2002, pp. 5–6)	They define literacy as “primarily something people do; it is an activity, located in the space between thought and text. Literacy does not just reside in people’s heads as a set of skills to be learned, and it does not just reside on paper, captured as texts to be analysed. Like all human activity, literacy is essentially social, and it is located in the interaction between people” (p. 3).
Hobbs (2001)	“Literacy is the ability to access, analyze, evaluate and communicate messages in a variety of forms” (p. 7). Hobbs says this definition suggests the following characteristics: inquiry-based education, student-centered learning, problem solving in cooperative teams, alternatives to standardized testing, and an integrated curriculum.
The National Leadership Conference on Media Literacy (Aufderheide, 1993, p. xx)	“The ability to access, analyze, evaluate and communicate messages in a variety of forms.”
Sholle and Denski (1995)	These authors argue that media literacy should be conceptualized within a critical pedagogy, and thus “it must be conceived as a political, social and cultural practice” (p. 17).
Silverblatt and Eliceiri (1997) in their <i>Dictionary of Media Literacy</i>	They define media literacy as “a critical-thinking skill that enables audiences to decipher the information that they receive through the channels of mass communications and empowers them to develop independent judgments about media content” (p. 48).

Table 62.2 Definitions of Media Literacy: Media Scholars

The writing about media literacy is like a large complex patchwork of ideas. Many of these ideas are truly inspired. But it is difficult to make sense of all these ideas and to grasp the essence of what media literacy means. In characterizing this condition, Zettl (1998) complained that “the plethora of available articles, books, classroom materials, and information on the internet dealing with media literacy does not seem to help very much in answering the question, ‘What is media literacy?’” (p. 81).

Many scholars have had the same feelings as Zettl expressed about the mass of ideas concerning media literacy, and periodically groups of these people have joined efforts to struggle with crafting a definition they can all accept. For example, in 1992, U.S. scholars interested in media literacy convened the National Leadership Conference on Media Literacy and after several days of discussion agreed that literacy “is the ability to access, analyze, evaluate and communicate messages in a variety of forms” (see Table 62.2). In this chapter, I continue this effort to synthesize a definition of

media literacy from all the ideas contributed in the literature thus far. This synthesis begins in the next section with a highlighting of the key issues that span these writings.

Key Issues

Given the many definitions of *media literacy*, it is important to find the key issues that cut across all this thinking. That is, we need to identify the major themes that emerge from all this definitional work. In this section, I highlight three of these key issues and display the range of thinking on each in the accompanying boxed text.

The first of these issues is “What are media?” When we talk about media literacy, we must clarify which media we mean. As you can see in the following, there is a wide range of perspectives. Some focus on one medium (such as television or computers), some focus on a type of medium (print or pictorial), and others are very broad and include all forms of information sharing.

<p>Which Media?</p> <ul style="list-style-type: none"> • Print media (Scribner & Cole, 1981; Sinatra, 1986) • Television (Zettl, 1998) • Pictorial media of still and moving pictures (Messaris, 1994) • Computers (Adams & Hamm, 2001; Gardiner, 1997) • Multimedia (Buckingham, 1993; Buckingham & Sefton-Green, 1997)
--

- All technologies that deliver information (Adams & Hamm, 2001; Hobbs, 2001; Potter, 2008; Silverblatt, 1995)
- All forms (even nontechnological, such as interpersonal) of communication (Johnson, 2001)

What Is Literacy?

Primarily Developing Skills

- Sholle and Denski (1995) emphasize three skills: (1) rereading media—learning how to construct different meanings when viewed in different contexts, denaturalizing the text; (2) affective reflexivity—students need to pay more attention to their own affective investment as they consume media; and (3) rewriting and the vital strategy of authorship—students need to get into the practice of creating counterrepresentations of the messages they see.
- Adams and Hamm (2001) take a broad approach to defining *media literacy* and say that *literacy* is “the ability to read, write, speak, listen, think, and view” (p. vii).
- Alvermann, Moon, and Hagood (1999) say that *critical media literacy* is “providing individuals access to understanding how the print and non-print texts that are part of everyday life help to construct their knowledge of the world and the various social, economic, and political positions they occupy within it” (pp. 1–2).
- Messaris (1998) argues that “a central component of media literacy should be an understanding of the representational conventions through which the users of media create and share meanings,” especially visual representations (p. 70).
- Silverblatt, Ferry, and Finan (1999) say there are five types of analysis of media literacy: ideological analysis, autobiographical analysis, nonverbal communication analysis, mythic analysis, and analysis of production techniques.
- Brown (1998) says that traditionally media literacy “has involved the ability to analyze and appreciate respected works of literature, and by extension, to communicate effectively by writing well. In the past half-century it has come to include the ability to analyze competently and to utilize skillfully print journalism, cinematic productions, radio and television programming, and even computer-mediated information and exchange (including real-time interactive exploration through the global internet)” (p. 44).
- Adams & Hamm (2001) define media literacy as “composing, comprehending, analyzing and appreciating the multiple print and nonprint symbol systems” (p. 4).
- Mackey (2002) argues that the skills used with one medium are applicable with other media. She says, “When it comes to making meaning, strategies can be imported across media boundaries” (p. 6). So children can learn about the shaping of a story by watching television and then use this knowledge when learning to read a short story in a book. “Young people learn about text processing within the broad and complex context of a social, cultural, educational, and commercial textual ecosphere” (p. 8).

Primarily Increasing Knowledge

- Pattison (1982) requires consciousness of the questions posed by language, regardless of the medium that transmits that language.
- Silverblatt (1995) said that there are four keys that people need to interpret media messages. These are the understanding of the process, context, structure, and production values.
- Masterman (2001) analyzed media literacy movement in Europe between 1970 and 1990 and says that there are eight component ideas:
 1. The central and unifying concept of media education is that of representation. This means that media do not reflect reality but represent it.
 2. A central purpose of media education is to “denaturalize” media. This means creating an understanding that media messages are constructions and do not occur naturally.
 3. “Media education is primarily investigative. It does not seek to impose specific cultural values. It aims to increase students’ understanding of how media represent reality. Its objective is to produce well-informed citizens who can make their own judgements on the basis of the available evidence. In so far as media education deals with value judgements, it does so in the ways which encourage students to explore the range of value judgements made about a given media text and to examine the sources of such judgements (including their own) and their effects. It does not seek to impose ideas on what constitutes ‘good’ or ‘bad’ television, newspapers, or films” (p. 41).
 4. Media education is organized around key concepts, which are analytical tools rather than an alternative content. They do not seek to replace “bad” content with “better” content.
 5. Media education is a lifelong process.

(Continued)

(Continued)

6. Media education aims to foster not simply critical understanding but critical autonomy.
 7. The effectiveness of media education may be evaluated by two principal criteria: (1) the ability of students to apply what they know (their critical ideas and principles) to new situations and (2) the amount of commitment, interest, and motivation displayed by students.
 8. Media education is topical and opportunistic. It seeks to illuminate the life situations for learners by harnessing the interest and enthusiasm generated by media's coverage of topical events.
- Messaris (1998) says, "Media literacy can be defined as knowledge about how the mass media function in society. . . Ideally, this knowledge should encompass all aspects of the workings of media: their economic foundations, organizational structures, psychological effects, social consequences, and, above all, their 'language,' that is the representational conventions and rhetorical strategies of ads, TV programs, movies, and other forms of mass media content" (p. 70).
 - Meyrowitz (1998) argues that there are multiple literacies, so people need a range of knowledge that includes an understanding of media content (understanding of the conduits that hold and send messages), of media grammar (understanding of the language or aesthetics of each medium), and of the medium (understanding of the type of setting or environment).
 - Zettl (1998) says, "We need to know how the basic aesthetic building blocks are used to create and shape our cognitive and affective mental maps" (p. 81).

Combination of Skills and Knowledge

- Bazalgette (2001) talks about the diversity of skills and tasks that fall under the umbrella of the term *media literacy*. She says, "One or more of the following may constitute 'media literacy,' depending on what country you are in and what level of education you are addressing: mastery of a repertoire of semiotics-based techniques for the analysis of visual images; the ability to plan and record/shot (and maybe even edit) a film, video, audio tape, or photo sequence; the acquisition of a range of critical theories from sociology, or cultural studies, or art history, and the ability to redeploy them in relation to media; knowledge and appreciation of certain key texts (usually films) and the ability to speak or write about their aesthetic, dramatic, or moral values; knowledge of the industrial and economic structures of media industries; a general awareness of the economic and ideological functions of media texts and the ability to identify stereotypes and bias" (pp. 73–74).
- The National Leadership Conference on Media Literacy says, "A media literate person . . . can decode, evaluate, analyze, and produce both print and electronic media" (Aufderheide, 1993, p. 79). People also need to know five things: (1) media messages are constructed; (2) media messages are produced within economic, social, political, historical, and aesthetic contexts; (3) the interpretation of meaning-making processes involved in message reception consists of an interaction between the reader, the text, and the culture; (4) media have unique languages, characteristics that typify various forms, genres, and symbol systems of communication; and (5) media representations play a role in people's understanding of social reality (Aufderheide, 1993).
- Hobbs (2001) says that the skills media-literate people need are the abilities to access, analyze, evaluate, and communicate. In addition, they need production skills. Knowledge is also important, with the "key analytic concepts" being the following:
 1. All messages are constructions.
 2. Messages represent their makers' notions of social reality.
 3. Individuals negotiate meaning by interacting with messages.
 4. Messages have economic, political, social, and aesthetic purposes.
 5. Each form of communication has unique characteristics.

Purpose of Media Literacy

Improvement of Individuals

- Anderson (1983), in a review of television literacy projects until the early 1980s, listed 11 objectives that he found to be prevalent in those projects. As objectives, this list describes what a literate person should be able to do and think.
- In the United Kingdom, academics and practitioners were able to agree on the following points. Media education should foster "the development of a critical spirit" while encouraging "collaboration with professional people and agencies in both fields" (Huguier, 1992, pp. 222–223).
- Buckingham (1993) points out that television has been regarded, especially in America, as having powerful negative influences on children, such as being addictive, being harmful to mental health and personal relationships, and being the cause of social unrest and disintegration. The purpose of literacy is to blunt the negative effects of television.

The National Leadership Conference on Media Literacy says, “The fundamental objective of media literacy is critical autonomy in relationship to all media . . . including informed citizenship, aesthetic appreciation and expression, social advocacy, self-esteem, and consumer competence” (Aufderheide, 1997, pp. 79–80).

- Desmond (1997) says that people need to be critical consumers of entertainment and advertising fare and they need to have insight and information to enable intelligent viewing.
- Rafferty (1999) says that people need to be critical consumers of ideas and information. This involves interpreting media messages (creating personal meaning from codes and conventions) as well as thinking critically about them.
- Lewis and Jhally (1998) say that “the goal of media literacy is to help people become sophisticated citizens rather than sophisticated consumers” (p. 109).

Teaching

- Grow (1990) reasons that if the goal of media programs in higher education is to educate students to become reflective, self-directed, communication citizens and, perhaps, practitioners, then the process of teaching can be seen as moving students from dependency to self-direction.
- Buckingham (1993) points out that the pedagogical role of television literacy has been for educators to defend those who are believed to be less capable of defending themselves from negative effects. “The ultimate aim of most television literacy curricula is to encourage children to police their own viewing behaviour—if not by reducing the amount of television they watch, then at least by watching it in ways which are assumed to minimize its influence” (p. 21). Furthermore, he challenges those who argue that teaching media literacy can be both proscriptive and non-hierarchical when he says that the aim to “demystify” students while using a “non-hierarchical” pedagogy “clearly places the teacher in a contradictory position—on the one hand, as the bearer of a ‘truth’ that is not available to the students, yet on the other as an equal partner in dialogue” (p. 287).
- The National Communication Association (formerly the Speech Communication Association), which has taken a lead in communication and media assessment efforts, released a set of national standards, with two applying to media literacy:

Standard 22: The effective media participant can demonstrate the effects of the various types of electronic audio and visual media, including television, radio, the telephone, the Internet, computers, electronic conferencing, and film, on media consumers.

Standard 23: The effective media participant can demonstrate the ability to identify and use skills necessary for competent participation in communication across various types of electronic audio and visual media. (Speech Communication Association, 1996)

- The Center for Advanced Technology (1997) says that media literacy is concerned with helping students develop an informal and critical understanding of the nature of mass media, the techniques used by them, and the impact of these techniques. More specifically, it is education that aims to increase the students’ understanding and enjoyment of how media work, how they produce meaning, how they are organized, and how they construct reality. Media literacy also aims to provide students with the ability to create media products.
- Aufderheide (1997, p. 80) believes that media educators hold the following ideas in common:
 1. Media are constructed and construct reality.
 2. Media have commercial implications.
 3. Media have ideological and political implications.
 4. Form and content are related in each medium, each of which has a unique aesthetic, codes, and conventions.
 5. Receivers negotiate meaning in media.
- The Council of Europe Resolution on Education in Media and New Technologies says, “Pupils should be given an understanding of the structures, mechanisms and messages of the mass media. In particular, pupils should develop the independent capacity to apply critical judgement to media content. One means to this end, and an objective in its own right, should be to encourage creative expression in the pupils’ own media messages, so that they are equipped to take advantage of opportunities for the expression on particular interests in the context of participation at local level” (Masterman, 2001, p. 15).
- Masterman (2001) argues that there is a sense that the very act of studying media can help democratize the teacher-student relationship because the act of critiquing is one of “reflection and dialogue” (p. 44). There is even a sense that media literacy demands a different type of teaching that is democratic and nonhierarchical (Bazalgette, 2001; Masterman, 1985, 2001).

(Continued)

(Continued)

- Masterman (2001) argues that the objective of media literacy is to “produce well-informed citizens who can make their own judgements on the basis of the available evidence. In so far as media education deals with value judgements, it does so in the ways which encourage students to explore the range of value judgements made about a given media text and to examine the sources of such judgements (including their own) and their effects. It does not seek to impose ideas on what constitutes ‘good’ or ‘bad’ television, newspapers, or films” (p. 41).
- Masterman (1985) believes that the goal of media education is to help people understand how media distort aspects of reality as they manufacture their messages and how symbol systems mediate our knowledge of the world.
- The Council of Europe Resolution on Education in Media and New Technologies, which was adopted by European ministers of education says, “Education in the new technologies and media should play an empowering and liberating role, helping to prepare pupils for democratic citizenship and political awareness” (Masterman, 2001, p. 15).
- Brown (1998) says, “A major goal of media education is to help recipients of mass communication become active, free participants in the process rather than static, passive, and subservient to the images and values communicated in a one-way flow from media sources” (p. 47).
- Some believe that the purpose of media literacy education is the same as the purpose of education in general, that is, to educate people to be aware of their place in the world as well as to become empowered citizens and consumers (Blanchard & Christ, 1993; McLaren, Hammer, Sholle, & Reilly, 1995; Sholle & Denski, 1994).

Activism

- Anderson (1983) uses the term *impact mediation* to refer to thoughts or behaviors that are stimulated by social issues that are, in turn, influenced by media content; these issues are things such as violence, materialism, nutrition, body image, distortion in news reporting, and stereotyping by race, class, gender, and sexual orientation.
- Lewis and Jhally (1998) contend that media literacy should go beyond textual analysis into ideological/political economy issues.
- Communities of people who interact in complex social and cultural contexts should be created, and this awareness should be used to decide what textual positions to accept (Buckingham, 1998).

The second issue is “What do we mean by literacy?” Again, there is a wide range of thinking. Some regard media literacy primarily in terms of increasing skills. Other scholars focus on building knowledge. And a third set of scholars take the perspective that media literacy requires both the development of skills and the building of knowledge.

The third issue is “What should be the purpose of media literacy?” Most writers who address this question say that the purpose is to improve the lives of individuals in some way, usually by giving them more control over how media messages will affect them. A considerable number of writers also talk about the purpose of media literacy in an educational curriculum, and some argue that media literacy has a purpose in social activism.

What Is a Media-Literate Person?

As can be seen in the above analysis of definitional work on media literacy, there are many different types of definitions and many positions taken on the three issues of which media, what type of literacy, and the purpose of media literacy. Nevertheless, it is important to note that the scholars who write about media literacy and address it from one

particular point of view do not argue against other points of view; that is, their different positions are not adversarial. Instead, different writers chose to emphasize different aspects of this large, complex phenomenon of media literacy. It is important to keep this in mind as we try to organize all this thinking. Therefore, we need to take a broad view of media literacy—one that tries to take into consideration as many of the ideas as possible in a complementary fashion. To this end, I provide a description of what a person needs to think and do in order to be considered media literate. There are nine characteristics as follows:

1. *Both skills and information are important.* If we have a great deal of information but weak skills, we will not be able to make much sense of the information. The information will be likely stored in our memories, but it will not be evaluated and integrated into useful knowledge structures. Skills are needed to sort through information and organize it. The key skills are analysis, evaluation, grouping, induction, deduction, abstraction, synthesis, and persuasive expression. On the other hand, if we have strong skills but don’t expose ourselves to a range of media messages or real-world experiences, our knowledge structures will be very limited and unbalanced. The key areas for knowledge are media industries,

media content, media effects, real-world information, and knowledge about self. (For more on these skills and knowledge components, please see Potter, 2004, 2008.)

2. *Media literacy is the set of perspectives from which we expose ourselves to media and interpret the meaning of the messages we encounter.* We build our perspectives from knowledge structures. The knowledge structures form the platforms on which we stand to view the multifaceted phenomenon of media—their organizations, their content, and their effects on individuals and institutions. The more knowledge structures we have, the more of media phenomenon we can “see.” And the more developed our knowledge structures, the more context we will have to help us understand what we see.

3. *Media literacy must be developed.* No one is born media literate. Media literacy must be developed, and this development requires effort from each individual. The development is also a long-term process that never ends; that is, no one ever reaches a point of total, complete media literacy. Skills can always be more highly developed; if they are not continually improved, they will atrophy. Also, knowledge structures are never finished because media and real worlds are constantly changing.

4. *Media literacy is multidimensional.* The information in the knowledge structures is not limited to cognitive elements but should also contain emotional, aesthetic, and moral elements. The four types of elements work together such that the combination of any three types helps provide context for the fourth type.

Strong knowledge structures contain information from all four of these domains. If one type of information is missing, the knowledge structure is less elaborate than it could be. For example, people who have a knowledge structure without any emotional information are able to be highly analytical when they watch a movie and quote lots of facts about the history of the movie’s genre, the director’s point of view, and the underlying theme. But if they cannot evoke an emotional reaction, they are simply going through a dry, academic exercise.

5. *Media literacy is not limited to one medium.* The key idea here is that the old idea of literacy was limited to reading and further limited to recognizing symbols. This continues to be the essence of literacy for print media. But media literacy is something much broader, that is, constructing meaning from experiences and contexts (economic, political, cultural, etc.). Media differ in terms of the symbols they use, how they regard audiences, their motives for doing business, and their aesthetics. The more people know about these differences across media, the more they can appreciate commonalities and the more they can understand how messages are sensitive to the medium in which it is delivered.

6. *Media-literate person exhibits an understanding that the purpose of media literacy is to exercise more control over exposures and meaning making.* The purpose of becoming more media literate is to gain greater control over one’s exposures and to construct one’s own meaning from the messages in those exposures. When people do this, they are in control of determining what is important in life and setting expectations for experiences in those important areas. If they do not do this for themselves, the flood of media messages will do this for them in the default condition. Media will not only set the agenda and tell people what to think about, but media will also set the standards for important things in a person’s life—standards for success, happiness, character, and beauty. Media will set impossible standards for how we should live our lives, the appearance of one’s body, the velocity of success in careers, the value of material goods, and the intensity of relationships.

7. *Media literacy must deal with values.* Masterman (2001) argues that media education “does not seek to impose specific cultural values.” He continues, “It does not seek to impose ideas on what constitutes ‘good’ or ‘bad’ television, newspapers, or films” (p. 41). Of course, that position in itself is value laden. Whereas media educators may not be defining bad and good messages, they are implying that mindless exposure to messages is bad and that interpreting the messages actively is good. The issue is not whether this enterprise of media literacy is value laden or not. Instead, the issue is focused on identifying what those values are and who controls them.

8. *Media-literate person increases mindful exposures.* A person who has a strong perspective on media phenomenon has a high potential to act in a media-literate manner. The set of knowledge structures by itself does not indicate media literacy; the person must actively and mindfully use the information in those knowledge structures during exposures to media messages. Thus, people who are more highly media literate spend less exposure time in automatic processing of messages. They are more consciously aware of their goals for the exposure and are consciously making decisions about filtering and meaning construction. This is not to say that highly media-literate people do not spend considerable time in automatic processing; they do. Nevertheless, when they are in the state of automaticity, they are being governed by automatic routines that they have had a hand in forming rather than being governed by routines conditioned almost exclusively by media.

9. *Media-literate people exhibit an understanding that media literacy is a continuum, not a category.* Media literacy is not a category where a person either is media literate or is not. Instead, media literacy is best regarded as a continuum—like a thermometer—where there are

degrees. We all occupy some position on media literacy continuum. There is no point below which we could say someone has no literacy, and there is no point at the high end where we can say that someone is fully literate—there is always room for improvement. People are positioned along that continuum based on the strength of their overall perspective on media. The strength of a person's perspective is based on the number and quality of knowledge structures. And the quality of knowledge structures is based on the level of a person's skills and experiences. Because people vary substantially on skills and experiences, they will vary on the number and quality of their knowledge structures. Hence, there will be great variation in media literacy across people.

People operating at lower levels of media literacy have weak and limited perspectives on media. They have smaller, more superficial, and less organized knowledge structures, which provide an inadequate perspective to use in interpreting the meaning of a media message. These people are also habitually reluctant or unwilling to use their skills, which remain underdeveloped and therefore more difficult to employ successfully.

Conclusion

There has been a great deal of dynamic scholarly activity producing a wide range of ideas about what media literacy should be, its purposes, and the techniques that can be used to achieve it. Nevertheless, all this scholarly activity has not translated into a clear definition that is shared by all media literacy scholars and practitioners. People continue to debate which elements are the most important ones for media literacy.

Across all the thinking about media literacy, there are several themes that underlie a great deal of that thinking. Media literacy must be developed, and that development requires the use of skills to build knowledge structures. These knowledge structures about media and the real world then form perspectives that we use to understand media. Therefore both skills and knowledge are important. Media literacy is not limited to any one medium but instead provides perspectives to understand all kinds of content presented by all media. The purpose of media literacy is to help people develop greater understandings so that they can control the influence of media on them in their everyday lives. Greater control is not simply limiting exposure to media. Instead, greater control begins with the ability to know the difference between those media messages that can enhance one's life and those messages that are likely to be of harm to oneself. This understanding can lead people to use media as tools to achieve their own goals rather than allow media to use them as tools to achieve media's goals. Finally, values are important. People who have a clear

understanding of their own moral, emotional, and aesthetic values will be less likely to accept the values presented in media messages without questioning them.

PART X

COMMUNICATION AS A PROFESSION

PROFESSIONAL COMMUNICATION PRACTICES

DALE CYPHERT

University of Northern Iowa

Since ancient times, certain individuals have earned their living as professional communicators. Before the invention of writing, poets and storytellers functioned as entertainers, teachers, and historians, supported by the audience to whom they communicated the community's greatest truths. The earliest forms of written language were developed and used by professional scribes, who continued to play an important role well into the Renaissance. Both society and communication technologies have grown more complex over the centuries, giving rise to specialization among professional communicators.

The jobs of the ancient poet are spread among today's artists, teachers, media celebrities, and motivational speakers. The scribe's legal and administrative functions are now performed by lawyers, accountants, journalists, and legislators. With the invention of the printing press, and to an even greater extent, with the rise of electronic media in the 20th century, entire industries of publishing, journalism, and broadcasting have taken on the job of spreading news throughout the community. Meanwhile, the increasing complexities of contemporary business, politics, and religion have produced specialists to perform, create, and teach communication in virtually every arena of modern society. This chapter will review how communication is used professionally, along with the various skills and practices required of professional communicators.

Professional Communication Careers

It is possible to think of professional communicators in several ways. First, rather obviously, there are some positions

for which *people are hired specifically to communicate*. Writers, platform speakers, Web site developers, customer service representatives, or preachers, for example, perform various kinds of communication tasks as their primary job duties. Second, there are fields of communication—public relations, journalism, filmmaking—in which *individuals might specialize in just one aspect of an entire communication process*. An advertising agency's bookkeeper, for instance, will have expertise in the accounting details of media buys and print production but is unlikely to get involved in the creative aspects of advertising design. These individuals might be less likely to call themselves "professional communicators," but they would certainly think of themselves as working "in communications" as a professional career choice.

A third way to think of professional communication is the *way in which communication is carried out in a professional field*. For example, a medical doctor can learn how to communicate with patients from a specialist in medical communication or health communication. Both the doctor and the specialist could be described as experts in the professional communication involved in the medical field, one as a practitioner and the other as a scholar.

Of course, nearly anyone who works for a living will need to communicate as part of the job, and a fourth way to think of professional communication involves the standards and expectations of the workplace. Communication skill is consistently ranked by both employers and workers as one of the top factors in gaining and keeping employment, in doing the job, and for getting ahead in a career. As a result, professional skills can also be thought of as *those communication skills that are required to be successful in a professional setting*.

Professional Specialties

Because there are several ways to think of professional communication, there are a large number of communication specialties that could usefully prepare a person for a professional communication career. The focus of preparation will differ somewhat with the sense in which professional communication is defined, as will the kind of communication responsibilities that will be part of the day-to-day job.

Developing Expertise:

Communication for Special Purposes

In those situations in which people are hired specifically to communicate, the professional job will virtually always require the individual to communicate about something specific. That is, a professional writer will more typically be a medical writer or a petroleum industry writer. A professional speaker might be a motivational speaker or a safety trainer. A specialist in electronic media or interpersonal communication will similarly be an expert in an industry, becoming a sports marketing Web site developer or a cancer patient counselor.

Professional communicators sometimes specialize in one mode of communication, spending all their time writing newsletter articles, for example, designing presentation visuals, or interviewing clients. However, the communication environment of most organizations is becoming more integrated, and the typical professional communicator will generally be an expert in several modes of communication. A public relations professional, for example, would be expected to handle telephone and videoconferencing equipment, create both electronic and printed newsletters, conduct and give interviews, and speak competently at both live and virtual press conferences.

Furthermore, the expectations of contemporary audiences for multimedia messages, the easy availability of software to manipulate both photographic and video images, and the ubiquitous use of the Internet to deliver all manner of messages now require professional communicators to integrate text, visual images, and interactive elements in virtually all their messages. Even when only one communication technology is being used, contemporary equipment generally accommodates a variety of symbolic and artifactual communication elements. The typical writer, for example, is now expected to manipulate graphic images in a document as well as code the text for use on a company Web site. The corporate trainer now combines a lecture with video feeds and computer-based learning modules into a fully interactive course. The graphic artist becomes responsible for selecting, manipulating, and editing both text and images to meet various communication goals. Interviews might be held by way of Web site or video meeting software, requiring the use of both interpersonal and electronic media skills.

Joining an Industry:

Communication and Communications

A few industries engage in communication as their primary product, and it is common to speak of the professional communications fields of journalism, public relations, radio or television broadcasting, or film production. These fields are all covered in more detail in this handbook, but the size and complexity of these industries is such that many individuals make their living by specializing in just one narrow area of expertise.

Rather obviously, someone with a career in broadcast communication might be a photographer, filmmaker, recording artists, or announcer. These jobs are only a part of a much larger universe of professional positions. The production crew will also include carpenters, administrative assistants, cost accountants, and food service managers. The broadcast company will fill management positions in finance, human resources, and law. The newspaper's staff will include purchasing agents, salespeople, and printing press technicians. Each of these positions requires some kind of expertise in the communications industry, but it is essential to combine that preparation with relevant technical expertise to fulfill a specific function for the company.

Many individuals in these communication fields do not identify themselves as professional communicators but rather in terms of their specific roles within the industry. A media lawyer will probably attend law school before specializing in communication law, just as a carpenter, secretary, or accountant would probably gain those skills before putting them to work in a communications industry. Even journalists, who obviously spend much of their time writing, will generally call themselves reporters or editors rather than focus on the more generic communication elements of the position.

Communicating as a Professional:

Communities of Discourse

Attention to the communication that people do within a professional field is a relatively new and multidisciplinary field of communication study. Building on research in linguistics, sociology, psychology, and anthropology, as well as communication, a growing body of research demonstrates how communication practices and patterns define and maintain the unique communities that call themselves professions. Lawyers and doctors, for instance, must communicate daily to accomplish their professional tasks. The ways in which they communicate, however, are not the same. A paralegal, familiar with the communication practices of the legal profession, could be described as communicating like a lawyer—assertive, analytical, and confident—in spite of the lack of a law degree. On the other hand, a bonafide doctor might find himself or herself unable to effectively treat patients because he or she has never

learned the medical communication techniques required to clearly explain diagnoses and procedures to them.

Even within a profession, there will be areas of specialization. Health care communication, for example, would be found in a pharmaceutical sales brochure, in a retirement community's patient advocacy program, and in a developing country's public health education agency, and each context requires a different type of communication. The person training health professionals to be better communicators must understand both the medical profession and the community in which those practitioners will operate. For instance, a public relations specialist for a pharmaceutical company would need to understand both the legal and business environment of medical research and development and the communication norms of the medical profession. The increasing availability of medical information on the Internet adds yet another wrinkle; these days a health communication expert might also be expected to understand the cognitive effects of various media technologies.

While a specialized understanding of context and technique is important, an understanding of the communication necessary in a particular profession goes far beyond learning the technical formats or the jargon of the field. Karl Weick, James Taylor, Elizabeth Van Every, and many others have shown how communication defines and maintains any organization as a coherent whole, and professional organizations are no exception. In fact, critical theorists such as Stan Deetz and Dennis Mumby have shown how the economic and social power of professional organizations is sustained by communication. In a global economy, where large multinational corporations have taken on some of the traditional functions of government, professional associations play a big role in setting the social and governmental policies, and social advances depend on improved communication processes, a communication career in a professional discipline might easily have more impact than a career in politics.

While it is possible to discuss communication in these professional communities in general terms, a key point is that the communication practices in each profession are very different from one another. The effective business communicator, for instance, is typically trying to get a group to act collaboratively, while an engineer might be trying to guide a team through a highly technical discussion of test results or design specifications. Someone with excellent skills as a patient advocate in a hospital might be of very little value as a public relations specialist. Even the communication expertise of a patient advocate in a large teaching hospital might be quite different from that of a patient advocate in a rural program serving an immigrant population.

*Professional Expectations:
Communication in the Workplace*

An increasingly important perspective on professional communication recognizes that in the media information

society of the 21st century, communication has become a critical component of virtually any profession. The ability to communicate well has long been a requirement for success at the highest professional and managerial levels. Increasingly, however, job success at all levels relies on successful communication with clients, suppliers, and colleagues around the globe. The rise of the Internet has intensified the importance of information flow as an element of success for any enterprise, whether it is for profit, nonprofit, or personal. The vast majority of corporate information now flows electronically. Even more profoundly, the emerging paradigm of the "learning organization" places communication front and center as the means by which human beings maintain themselves as productive communities.

With the turn of the 21st century, the U.S. Department of Labor had acknowledged a class of "knowledge workers" as a critical element in a global, information-based economy. Knowledge workers are defined as those who add value to data by analyzing, manipulating, and communicating it to others as information. Not surprisingly, many would argue that any decently paying job in the United States now fits that description. *The Wall Street Journal* recently reported that office workers now spend up to 70% of their time dealing with written material, while manufacturing jobs are now most often organized within teams that depend on sophisticated communication skills to accomplish everything from planning their own work to maintaining production quality standards.

At the beginning of the industrial age, professional communication meant the preparation of business documents. Effective communication now includes the full range of written, presentational, interpersonal, team, and electronic forms that are required for success in a contemporary business, as well as the healthy social relationships, effective critical thinking, and attention to stakeholder audiences that support the enterprise. Almost none of this workplace communication is simple. One researcher notes that workplace writing

is but the end result of a complex set of negotiations between the writer and the writer's real and imagined audiences; between the writer and the text's stated and unstated purposes; between the writer and the beliefs, practices, and constraints of the community. (Matalene, 1989, p. vi)

Similar conclusions have been drawn about the complex interpersonal communication found in a work setting; the sophisticated skills that are required to facilitate problem-solving discussions in large organizations; and the complex cognitive issues that must be solved in designing visually complex Web sites, presentation slides, or document graphics.

Professional Preparation

With such a wide variety of ways to think about professional communication and an equally wide range of potential

career paths, it is impossible to specifically define how one might prepare for a professional communication career. The distinctions among these various ways of looking at professional communication can be ambiguous. It isn't hard to find examples of jobs that seem to cross all these boundaries: Think of a nurse who has gone back to school for a degree in professional writing and now develops Web site content and writes a daily blog as the director of education for a public health agency.

Furthermore, there is very little consistency in the way organizations name or structure their various communication functions. Some companies hire communication specialists; others hire content specialists with excellent communication skills. Some companies see communication as the responsibility of all organizational members, while others look to specialists to facilitate their communication functions. We could conclude that any expertise in communication can be put to use in some professional context, but it is just as true to say that communication skill is never enough, by itself, to reach a professional status. Still, there are a few patterns of preparation that are fairly common.

Developing Expertise

For many, professional communication preparation involves a combination of expertise in two distinct areas. A love of baseball is combined with training in public speaking to land a job as a sports announcer. Work experience in the beverage industry is combined with a degree in marketing communications to qualify for a position designing point-of-sale advertising messages. Excellent interpersonal communication skills are combined with a degree in social work to land a job as a patient advocate in a hospital. Coursework in organizational communication coupled with experience with the payroll practices of an industry might lead to a position as a compensation and benefits counselor. A health communication major might take a position at a hospital, in a public health program, or in an assisted living facility to develop expertise in the issues of that medical context. A degree in interpersonal communication coupled with corporate management experience could lead to a career in executive coaching.

Professional Programs

In a few communication professions, degrees or certificate programs are available. The first specialized professional communication courses focused on writing for specific careers, and it is now possible to study communication as it is used in professional contexts such as journalism, business, training, health care, risk management, science and technology, and agriculture. There now are journalism or broadcast communication programs at virtually any university, and many universities offer programs in filmmaking, photography, graphic arts, public relations,

and so on. Professional preparation could take another route, of course, for the media lawyer or the production company's financial manager, who might get the law or business degree before taking an entry-level position in the industry. In most industries and professional fields, however, professional communicators build their content expertise through extracurricular activities or on-the-job experience.

Communication in the Disciplines

Within any community of discourse, a person could prepare to be a professional communicator in a discipline in two rather different ways. The doctor, lawyer, banker, or engineer who wishes to be successful will need to become comfortable with the methods, formats, and style of communication that mark a professional in that field. Many law, medical, and engineering schools offer communication courses as a formal or informal part of the curriculum. Professional organizations also offer resources so that an individual can enhance his or her communication skills throughout his or her professional career. Alternatively, one might choose to help doctors, lawyers, or businesspeople become better communicators. These specialists in communication are becoming quite common on the faculty of professional schools, and there are many independent consultants and trainers as well. Virtually any communication specialty could serve as the basic preparation for this kind of a career, although education or experience in the specific community of practice would also be required.

The Information Economy

Communication courses of some kind are required for virtually any college degree, although most employers complain that the typical college graduate is not sufficiently prepared to communicate in a "professional" manner. Many companies offer additional training or coaching to their employees, especially for managerial and professional positions. Others expect their workers to develop excellent communication skills on the job. Unfortunately, poor communication skills remain the most frequent reason given for lack of promotion or termination in the contemporary workplace. Any college graduate who plans a career in the 21st century should take care to develop key communication skills, whether they are learned as part of college coursework or developed through extracurricular activities.

How Communication Is Used Professionally

Given the breadth of professional communication, the set of specific skills, practices, and competencies might seem impossibly broad. What could a professional labor contract

negotiator have in common with an advertising agency's media buyer? What similarities could either have to that of the safety trainer for an agricultural co-op, a counselor who specializes in dysfunctional-family communication, or a freelance writer? Do these communication professionals have any skills in common with the professional manager, health care worker, or materials coordinator who spends up to 90% of his or her day in communication activities? Surprisingly, there are several important similarities. Despite systematic differences due to managerial level, functional goals, communication methods, and industry history, professional communication is characterized by (a) the explicit, strategic application of communication principles to meet professional goals; (b) a highly collaborative production process; and (c) a high degree of competence in the use of communication techniques.

Predictable Differences

Beginning with the more obvious differences in various professional communication situations helps us to see the more complex, underlying similarities across various professional communication contexts. Differences in the purpose and content of messages will exist due to the level of managerial responsibility in a given position, with managers typically focusing on abstract, strategic concepts, while lower-level workers communicate technical details. Content across professional functions will vary, with some specializing in technical or mathematical information, while others deal with emotions or personal values. Differences also occur when communicators choose face-to-face versus mediated modes of transmission or choose to speak to a large group versus one-on-one. Finally, the historical development of industries has created variations in the expectations of various stakeholder groups, such that some professional communicators are more focused on customers, others on stockholders, and still others on government audiences.

Characteristics of Professionalism

Despite the many differences across professions, organizations, and industries, the practice of *professional* communication is characterized by strategic application of principles to meet goals, collaborative work environments and production processes, and careful attention to competent performance of the communication method. Each of these elements has a foundation in the practical nature of professional communication. Professional communication does not concern itself with abstract principles or with communication for its own sake. With very few exceptions, professional communication is concerned with accomplishing something within an organizational context, and consistent success in accomplishing a purpose requires that *strategic* communication be accomplished *collaboratively* at a high level of *competence*.

Strategic Communication

While virtually everyone holding a professional position would be expected to do a great deal of high-quality communication, reaching a sufficient level of competence to be regarded as a professional generally requires an individual to also supervise, coach, or train others in communication practices and procedures. These duties require that the professional communicator be able to strategically plan communication, explaining to others what to do, why to do it, and often how to do it—all of which require a conscious awareness of the details of the communication process.

Furthermore, there's a good chance that a professional communicator will be asked to justify the choices he or she has made in targeting an audience, constructing a message, or choosing a communication method. Especially when working in a managerial capacity, the professional will be asked to demonstrate the need to spend money on staff, supplies, or other resources to accomplish specific communication purposes. When things do not work out as planned, the professional will also be expected to explain what went wrong. In short, the professional communicator does not merely communicate; he or she must also be prepared to explain to others how and why communication ought to happen in just that way.

Conscious, strategic choices require the ability to predict the outcome of certain kinds of communicative behaviors, therefore strategic communication necessarily involves the *application of general principles within a specific context*. Strategic communication thus involves four key steps:

1. *Turning Purposes into Goals*: The classical communication professional has been a persuader—the salesperson, preacher, or political operative—and the communication goal is to persuade some audience to act in a certain way, often to buy a product but also to believe, vote, join, or behave in a desired way. Career counselors will often guide skilled communicators toward jobs where persuasion is the communicative purpose: for example, sales, public relations, fund-raising, marketing, advertising, politics, law, and education. Other kinds of communication purposes can require the services of a professional as well. Especially in the media industries, the communicative purpose might be to inform the public about current events or to entertain various kinds of audiences. A health communication professional might be aiming to create better doctor-patient relationships. A science writer might be hired with the purpose of educating and informing. An employee relations director could be focused on creating a generally positive attitude toward the company.

Given a general sense of purpose, the strategic communicator will define specific goals, often within the framework of upper management's overall strategic planning process. The hospital's communication specialist, for example, could define "better doctor-patient relationships"

in terms of goals for “warm, nurturing relationships” or for “effective diagnostic conversations.” Obviously, these different goals would require the effective application of very different communication principles.

It can take considerable skill to translate general communicative purposes into specific, concrete, and actionable goals. The professional will need to fully understand the general purposes of communication as well as the specific needs of the organization and the potentially competing interests of its stakeholders. The health communication specialist who must decide between developing warm, nurturing relationships and providing an effective diagnosis will be making the choice within the framework of the hospital’s overall mission. Is it a small local hospital that stays in business because its patients feel “at home” in the setting? Or is it a teaching hospital that has an overriding purpose to train doctors to be excellent diagnosticians? Even more difficult, do the patients, doctors, board of trustees, and nurses all agree on the priorities?

A further complication arises from the dynamic and complex nature of contemporary organizations. Not only is the professional communicator crafting messages to multiple audiences with conflicting interests, backgrounds, and needs, but the nature of the audience is constantly changing, as are the availability of resources and the constraints of the environment. The more we learn about the dynamics of complex adaptive systems, the more we recognize the oversimplification in the instrumental model of a communicator who sends a message to accomplish a purpose. The reality is often an aggregate of micromessages that lead to adaptive responses—a tacit, invisible organizational learning process that has only a weak link to intentional communication efforts.

In short, setting goals can be considerably more difficult in a professional setting than it might appear from the perspective of a communication classroom. The first step in any assignment is likely to be to define the goal, but it is unlikely that one’s teacher and classmates will object to the goal, refuse to authorize the project, or propose an alternative objective, as one’s professional colleagues are likely to do. Similarly, a communication student is seldom concerned with the budget, staffing, or timing issues that often drive organizational decision making. Nor is anyone likely to question the underlying assumption that any intentional communication will have any appreciable effect at all.

2. Situation Analysis: Once a goal is determined, the professional communicator’s primary work begins. The next task is to decide how to proceed, which requires both a solid understanding of communication principles and a careful analysis of the situation in which the communication will take place. Whether the field is health communication, public relations, politics, or training, the communicator will need to decide the best way to meet the stated goal. The actual work process will vary with the industry and position, but the basic steps are the same.

First, the facts of the situation must be determined. A public health analyst might do surveys to determine the number of cigarettes a group is currently smoking or whether fresh fruits are available to the population or how much sexual activity is normal. Information must also be gathered about the target audience’s needs, motivations, resources, and ability to meet the desired goal. Generally, complete information is unavailable, and for a professional communicator, the ability to extrapolate data and make good guesses is as important a skill as having an excellent research methodology.

Second, knowledge of communication principles will be applied to predict the most effective messages and methods to achieve the desired effect. A knowledgeable advertiser, for example, might predict that a media buy of 20% newspaper, 10% local television, and 70% cable will yield the best response from the targeted consumers. Obviously, a conclusion such as this is always subject to change: Media outlets vary their mix of programs, and audience tastes evolve. Virtually any communication professional will face this kind of dynamic decision environment. The professional is always seeking updated information and an updated understanding of communication options and their likely outcomes.

Finally, any communication that is implemented requires planning of the allocation of resources. Neither the public health professional nor the advertiser can plan a communication campaign that exceeds the available time, budget, or operational staff. The professional communicator must know what a communication effort would cost, in terms of money and other organizational resources, and what the benefit would be in terms of its probable effectiveness. A political operative, for example, might be able to predict the effectiveness of assigning campaign staff to making door-to-door calls and engaging in one-to-one conversations with potential voters. Even so, an analysis of the organizational resources might lead to the conclusion that the same amount of money could be better spent on travel costs to take the candidate back to Washington, where he or she could gain important political points by voting on key legislation.

Developing a resource budget is generally not done alone. The organization probably has other needs to meet, many of equal importance with the communication project, and only a limited set of resources. The professional communicator might be competing for staff, training time, or funds to make outside purchases. A budget might be created quickly in a single meeting, or it might be developed over the course of an annual or a multiyear strategic planning cycle. The process might be collaborative or antagonistic. Generally, creating a plan of action will require the technical skills that allow an accurate prediction of costs and outcomes, along with the people skills involved in successfully negotiating for resources against the competing needs in an organization.

The professional communicator applies some basic principles: rhetorical situation, audience analysis, and resource availability. Each industry or organization represents a

different context, and the professional will have to spend some time gaining expertise in the specifics of communication in that context. Still, any strategic communicator is answering a series of questions that are fundamental to virtually any communicative situation: Given the tools at my disposal, what is the most effective way to accomplish my purpose?

3. *Taking Action:* Peter Drucker, a major influence on contemporary management practices, has said that a primary characteristic of professional practice is the *implementation* of an idea. Politicians and academicians tend to spend most of their time deciding on the right course of action, but Drucker (2004) points out, “For the solution to become a decision, action is needed” in a managerial context. The work of a professional communicator does not end with deciding on the most effective marketing campaign or the most promising way to communicate change to an organization’s employees. The professional communicator must next locate and organize all the resources it will take to implement that decision.

Resources can include everything from employee time to the purchase of printing services to the creative and intellectual resources needed to design a training program or a Web site. In some cases, the resources may have already been secured during the project-planning phase. The communication director may have already hired a staff that includes a graphic designer, a writer, and a publicist. The employee relations manager might be working in a company that already owns server capacity for a large intranet as well as Web site development software. Other resources will need to be located and purchased for a specific project. Either way, a professional communicator will now begin to deal with the issues of actually using those resources to get the communication task done.

Implementation of a plan always requires communicating goals, standards, and plans for those who will be performing the various parts of the overall project. The work involves communicating information and instructions to those who are responsible for the actual performance of the tasks. The complex tasks that characterize a professional environment can involve careful coordination of information, schedules, and resource use among the members of a single work team—or across functional, organizational, and national boundaries. The manager is the lynchpin in a vast network of communications that are required to implement a project. Finally, the manager’s ultimate responsibility is to control the process by setting up feedback mechanisms so that he or she can determine whether the resources are being used as budgeted and the work is being performed to the required standards.

4. *Evaluation:* The final step in strategic communication involves an evaluation of the effort in terms of the original objectives. The evaluation process might be a formal one, requiring sophisticated research skills to determine the reach of an advertising campaign or the impact of a public health

program. In many cases, evaluation is more informal or complicated because of the inability to separate communication from multiple other influences. An executive speechwriter who is aiming for a more positive corporate image, for instance, might not be able to determine the relative influence of the CEO’s speech at an industry conference, the company’s excellent quarterly earnings, or an influential blogger’s recent praise. Whether the evaluation is formal or informal, difficult or easy, an important element of the professional communicator’s job is explaining to others whether or not something was effective and why.

Collaborative Communication

With only a few exceptions, a second characteristic of most professional communication is its collaborative nature. The economic reality of the job market is that only relatively large organizations can afford to hire individuals to focus exclusively on communication functions. That means, in turn, that a professional communicator is nearly always working in a relatively large organization, with all its financial and political realities. The result is that professionals will primarily communicate as members of teams, departments, or organizations. The individual voice of a novelist, the individual graphic eye of an artist, or the individual eloquence of an orator has very little place in a large organization that is trying to reach a collective goal.

Instead, the professional communicator is part of a communicating group, and each act of communication is performing important functions *within* the group at the same time it is serving to reach the group’s goals. Carolyn Matalene (1989) describes the work of professional writers, for example, where creating a document “may have more to do with reaching consensus, setting goals, inventing solutions, revising priorities, or establishing control than the finished pages reveal” (p. vi). The typical professional document is reviewed or revised by three to five people at various levels of management. The typical sales presentation is created by a team that includes marketing and sales staff along with communication specialists. The typical Web site is the result of collaboration among writers, graphic designers, and user interface developers.

As a result of this highly collaborative environment, the professional communicator’s job involves as much attention to principles of interpersonal and organizational communication as it does to the strategic use of communication to accomplish the explicit goals of the position. Effective publicists are not only interested in the effect of a message on external audiences, but they are also equally aware of the effect that the process of creating that message has on the organization itself. A new mission statement, for instance, might be targeted for a spot on the company’s Web site, but in the process of creating that mission statement, the organization will engage in a series of complex communications designed to compare individual perceptions about the organization and discover a sense of shared identity. The publicist who tries to bypass that process, crafting a mission

statement as though it were an individual writing task, is likely to be ineffective on multiple levels. Not only is the statement liable to miss the mark, but the organization will have lost an important opportunity for internal development.

The massive amount of collaboration that can occur in a professional setting has given rise to a set of special technical skills that many professional communicators will often need to master. Even the simplest document, presentation slide, or Web site will be created with software that includes tools for reviewing and tracking revisions, maintaining a consistent template of graphics and format, and sharing files among multiple users. At a bare minimum, the contemporary professional must be able to move and share electronic files and production drafts. In some situations, document control requires compliance with International Organization for Standardization (ISO) regulations. Even in less technically rigorous contexts, collaborative communication activities often involve protocols for formatting, review and revision controls, as well as guidelines for distribution and retention of the messages.

Competent Communication

Perhaps it goes without saying that professional communication is performed at a highly competent level. Anyone who enters a communication profession will probably have received an education in some aspect of communication or technical training with one or more communication technologies. It's probably a reasonable assumption that the professional is thus capable of doing a better job than the nonprofessional. In many fields, competence is very often described as being "highly professional"! Such definitional circles don't really answer the question, however, of what constitutes more "professionally" competent communication or a "better" job of communicating.

It is possible to list the practical consequences of doing communication work on a regular basis in a paid capacity, and three key components provide a fairly good description of what people seem to mean by professionally competent communication.

1. *Attention to Detail:* Professionals are obsessively careful about production details. In part, this is the result of the high cost of creating thousands of copies of a marketing brochure, a television show, or a commercially viable Web site. Production costs alone can be astronomical, making the cost of reprinting an annual report or reshooting a training video simply unacceptable. Sending even a single letter can cost a company a hundred dollars. Making a presentation to just a few key executives will cost the company several thousand dollars to hold the meeting and another few thousand for the presentation team to produce its message with slides, video clips, and glossy handouts. Careful reviewing, editing, proofreading—and then checking the message again—are thus normal in a professional environment.

In addition, professionally produced communication is the only means an organization has for communication

with its various audiences. When an individual makes a small spelling mistake in an e-mail, there are few real repercussions. The reader might also know the person on an interpersonal basis and probably has read many, many perfectly spelled words in previous e-mails. An error is seen as just a minor blemish within a much larger amount of positive information about the person. Just the opposite is generally true for an organization. The company often has just one chance to get its message in front of a customer, potential employee, or prospective shareholder. Errors simply cannot occur. Professional communication, in practical terms, means endless attention to the details of print production, language use, color reproduction, server capacity, and so on to create a perfect output.

2. *Multiple Drafts:* The high cost of error combines with the collaborative nature of the professional context to create a second common characteristic of communication: The message that is sent is *never* the first draft. Obviously, the need for multiple reviews and approvals means that the communication is typically edited, modified, and fine-tuned before it can be considered complete. The strategic and collaborative nature of the term *professional* also contributes to the need for editing and revision.

The strategic nature of professional communication means that there might be several options to consider and the choices are not always clear-cut. Judging the potential effectiveness of communication might involve drafting several possible storyboards or paragraphs. Extensive video footage might be shot so that an editor can choose the scenes that work best together. The navigation on a Web site might be tested with focus groups or a sample of early customers. The collaborative context often requires that team members share perceptions, adjust perspectives, and paraphrase ideas to achieve concordance—a process that involves multiple shared drafts before the communication authentically reflects the views of the entire group.

The result is that multiple drafts are a normal part of professional communication. Some editing is done to catch mistakes, but much more attention is given to testing and refining a message to maximize its effectiveness. Individuals who have worked in such an environment for any length of time will find that audience analysis becomes an automatic part of any writing, speaking, or design task. E-mails are reread to ensure that the tone is appropriate. Letters are rewritten for clarity and style. Slides are reworked to ensure their persuasive and aesthetic impact. Even sticky notes are rewritten so that the handwriting conveys exactly the right mood to the reader.

3. *State-of-the-Art:* A final practical result of the professional context is the degree to which communication methods and mode reflect state-of-the-art technological capabilities. This can include the technology of production—using the latest embedded graphics or animation options in presentation software—as well as the technology of message delivery—video conference rooms or webinar technology to hold a meeting. Sometimes, the focus on the latest "bells and whistles" can seem like a superficial attention to the form of

a message at the expense of content. In most cases, however, there are obvious reasons for professional communication to reflect the state-of-the-art.

PART XI

JOURNALISM

THE IDEA OF JOURNALISM

JOHN STEEL

University of Sheffield

What is journalism in the early 21st century? At a very basic level, one could argue that journalism today is the application of a set of skills that provides current information about the world—news—to the public at large. Certainly, journalism is as much about news as it is about its public. Yet such a simplistic definition of what journalism might be misses out so much of the significance and complexity that pertains to journalism in our society today and historically. Journalism has a history; indeed, it has histories; that is to say, there is no single account of journalism that provides us with a definitive understanding of how what we now recognize as journalism has come about (Curran, 2002). The journalism of the 21st century is what it is not because of a simple linear development of technology and social and political progress, though these factors are no doubt significant. Similarly, news itself, the product of journalistic processes, is not simple to define and requires close investigation of its development and function.

The purpose of this chapter is therefore to explore how our present ideas of journalism and news have emerged by looking at a range of factors that have contributed to the development of journalism as we understand it today. It will also reflect on contemporary developments within journalism before contemplating how we might expect our ideas of journalism to change as the 21st century unfolds.

Contemporary thinking about journalism's role and function is not clear-cut and without controversy. Some suggest that journalism has numerous important roles within any democratic society. These include ensuring political accountability as well as enabling public understanding of

the economic, political, and social world. Others suggest that journalism also plays an important role in the cultural life of societies. It entertains and amuses us, but it can also play an important role in shaping and reflecting a range of constituencies and communities in society. In this sense, journalism can add to the fabric of public life by providing the social glue that helps bond communities together and shape our understanding of who we are—our identity (Anderson, 1983). It could be argued therefore that journalism is more a shaper of identity than a provider of news in any objective sense, in that it seeks to connect with and therefore create its audience as a symbolic ritual (Carey, 1989).

More critical analyses of journalism, however, stress the role it plays in helping maintain established positions of power within societies. This is not necessarily the fault of journalists themselves but relates to the context and environment in which they work and the economic and temporal pressures they are under. Journalists have historically worked for highly competitive news organizations, the main purpose of which has of course been the drive for profit. In this sense, journalism can be seen as reflecting particular values that prioritize the interests of those who have the most to gain from the market of news production and dissemination. It has been suggested that such values are in fact a component of the means by which the most powerful in society maintain their position of dominance by framing the role and function of journalism in ways that reinforce and reflect their particular interests (Chalaby, 1998; Herman & Chomsky, 1988). In attempting to ascertain how our present understanding of journalism has come

into being, all these perspectives on journalism shall be explored in this chapter with a view to developing a deeper understanding of how contemporary journalism is as it is and what the future might hold for it and for us.

Journalism and Its Values

In May 2007, the World Journalism Education Congress (2007) set out its declaration of principles; chief among these was the commitment to serve the public in an ethically informed manner. It suggests that “this commitment must include an understanding of and deep appreciation for the role that journalism plays in the formation, enhancement and perpetuation of an informed society” (para. 2). Similarly, the Project for Excellence in Journalism (1997), originally affiliated with the prestigious Columbia University Graduate School of Journalism, suggests that “the central purpose of journalism is to provide citizens with accurate and reliable information they need to function in a free society.” They continue, “This encompasses myriad roles—helping define community, creating common language and common knowledge, identifying a community’s goals, heroes and villains, and pushing people beyond complacency” (para. 1–2). In Britain, Journalism UK cites Article 19 of the United Nations’ (1948) *Universal Declaration of Human Rights*, which states, “Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers;” and the International Federation of Journalists (1954) suggests that “respect for truth and for the right of the public to truth is the first duty of the journalist.”

Though the specific articulations of the core values and ideals of journalism may differ, as it seems from the examples above, one of the recurring themes is that journalism has a commitment to truth and to inform the public. Indeed, Harcup (2007) suggests that “our job is indeed to get at the truth” (p. 2), while Klaidman and Beauchamp (1987) argue that “just as physicians and lawyers are morally required to be truthful with their patients and clients, journalists are morally obliged to deliver truth to the public” (p. 30). This emphasis on serving the public and providing it with “the truth” is often framed in terms of journalism performing an important political function—acting as an intermediary between politics and the public at large.

Yet to see the history of journalism and its values merely in political terms is to miss much. To be sure, though periodical print culture developed in tandem with the erosion of the ancien regime and the birth of modern democracy, it is far too simplistic to suggest that the precursors of journalism were solely concerned with radically altering the social and political arrangements of their day in the “long march” to democracy. Though, as we shall see, public writing has a strong political history, the

antecedents of journalism were also concerned with other matters that provided much broader cultural and economic functions. The appetite for gossip, rumor, and speculation as well as the spectacular, sordid, and horrific is as evident in the history and ideals of journalism as any political dimension. Truth was not a priority here.

More broadly, as Raymond (1996) suggests, “the desire for news, with its concomitant dangers, has probably been an aspect of most societies through history” (p. 2). Conboy (2002) also highlights the way in which tradition, folk culture, and superstition blended with an emergent commercial imperative to produce popular printed news that went far beyond the confines of political imperatives. As well as providing “intelligence” on matters of import, news also provided entertainment to those who read it. Such entertainment might be in the form of poems or ballads. It might be a gory account of a murder or public execution, or of a natural disaster in some far off land. Indeed, as Winston (2005) suggests, in the 17th and 18th centuries, this type of information was far more common than political news, which could be dangerous to produce.

In all likelihood, the celebrity-obsessed and sensationalist news agendas of today’s tabloids have their roots in the journalistic experiments of early-modern public writing. News was not just dry political and economic information, it was also intended to amuse and entertain. The so-called tabloid genre has always been close to newspapers’ key function to provide entertainment and amusement. Sloan (2001) suggests that the sensational crime story and “human-interest” story have been evident in America since the 1830s, with newspapers such as the *New York Sun* and the *New York Herald* seeking to expose lucrative gaps in the newspaper market with a cheap press that would be both informative and entertaining to the working people of America. These “penny dreadfuls” as they were known would “give the masses some thrills and chills for their money that couldn’t be found anywhere else” (p. 19).

The penny dreadful emerges from a tradition of journalism that has what might be termed a “social conscience” in that it sought to expose and uncover the dark underbelly of society. Most famously, Charles Dickens’s accounts of Victorian England highlighted the plight of the miserable and wretched as well as entertained and amused (see Tulloch, 2007). Similarly, W. T. Stead exposed child prostitution in late-19th-century London in the *Pall Mall Gazette* (Harcup, 2007). Yet such stories also performed an important economic function, as Conboy (2004) suggests, given that this form of “New Journalism” imported from America emphasized human-interest stories, gossip, and sensation, as well as devoting a lot of its pages to advertising. Schudson (1978) has described this phenomenon as the “journalism of entertainment,” which would later be exploited by rival news organizations headed by William Randolph Hearst and Joseph Pulitzer. “Yellow” journalism had arrived, a legacy that continues today (Campbell, 2001). Indeed, the commercial success of popular journalism is a testament to the

ways in which it not only helps construct our sense of national identity through language (Conboy, 2006) but also provides a moral framework within which we might orient ourselves.

Karen Sanders (2003) also suggests that journalism has an important role in contributing to the moral fabric of societies and helps reflect and shape our identity. She notes that “journalists sketch in the contours of our moral landscape. They contribute to the business of telling us who we are, interpreting the world for us, making it intelligible” (p. 9). In historical terms, as Black (2001), talking about journalism in England at the beginning of the 17th century, suggests, “news helped explain life” (p. 3).

So, according to Sanders and Black, journalism can also perform an important moral function in sorting out good from bad, right from wrong. Indeed, if we look at the moral indignation expressed in the pages of tabloid newspapers, we can see at a glance just how this construction of moral norms occurs. As Gripsrud (2000) suggests when talking about the ritualistic nature of tabloid news, “Tabloid forms provide the audience with existential and moral help, and support in the daily struggles to cope with an everyday life marked by the uncertainties characteristic of modernity” (p. 297).

The journalist and scholar Michael Ignatieff (1997) posited that journalism should also be expressive of a deeper sense of humanity in playing an important role in breaking down barriers between different peoples and different cultures. Ignatieff is talking here mainly about the role of objective reporting in national and ethnic conflict. He indicated that what is required is a deeper sense of context that not only helps explain why conflict occurs but should also seek to uncover that which transcends some of the causal elements of conflict—our common humanity (see Plaisance, 2002).

Journalism is also then about making judgments and about comment, not solely about attaining the “objective truth.” Journalism as a literary form, for instance, therefore may be able to tell us more about ourselves and the societies we inhabit than the “factual” reporting of the courts or the local council. One only has to look at the literary contributions from authors as diverse as Jonathan Swift and Daniel Defoe to George Orwell and Martha Gellhorn to see that journalism offers us a rich source through which we can tap into our cultural identity and its history (see Collier, 2006; Keeble & Wheeler, 2007).

So from this brief summary we can see that journalism is not now, nor has it ever been, solely about a political imperative to aid democracy. The historical development of journalistic ideals also emerges from the specific historical contexts in which the practices with which we associate journalism started to become accepted. These in turn are linked to the changing social, political, and economic contexts in which these practices, which became known as journalism, started to emerge. For example, the idea of objectivity in journalism is of course one that is central to

our modern conceptions of what journalism (or at least good journalism) should be about. However, the journalistic ideal of objectivity was not something that was a component of journalism even in the 19th century. Journalistic objectivity is something that has emerged over a period of time in different ways and in different contexts. Some media historians argue that journalistic objectivity emerged because of specific economic tensions between rival news organizations. For example, Keeble (2001) suggested that “as newspapers gradually lost their party affiliations, journalists worked to establish their independence as searchers for objective truth” (p. 129). This emphasis on truth would therefore provide a news organization with a competitive edge over its rivals.

Another interpretation of the emergence of journalistic objectivity stems from an analysis of the technological developments of the telegraph and wireless in the 19th century. Carey (1989), for example, suggests that it was the spatial range of news aided by technological innovation that meant that news had to be “stripped of the local, the regional; and colloquial” (p. 210) and be more in keeping with the language of science with its emphasis on authenticity and accuracy. However, Schudson (2001) takes issue with the economic and technologically orientated approaches to the historical development of the notion of journalistic objectivity; instead, he cites the emergence of a professional culture of journalism, and along with it practices such as interviewing and note taking, that sought to create and maintain a distance from the proprietors of news organizations and their political backers. According to Schudson, journalists also wanted to generate their own sense of “collective integrity,” which would “endow their occupation with an identity they can count as worthy” (p. 165).

Embryonic Journalism

To put a specific date on the “invention of journalism” would be to court controversy and possibly ridicule. Some commentators suggest that journalism, or at least the practices associated with journalism, can be dated as far back as ancient Roman times with the *Acta Diurna* (Hudson, 1873, p. xxix), which provided information about court proceedings and political affairs. Others suggest that journalism has its beginnings in the political turmoil of the English Civil War in the early 17th century (Frank, 1961; Siebert, 1952/1965). It has also been asserted that journalism was “invented” after the onset of the industrialization of the press in the mid-19th century (Chalaby, 1998), when news production became part of a much larger corporate enterprise with specific commercial interests and objectives. According to this perspective, journalism and its values took shape according to the priorities of the market.

If we were to look for examples of “journalism” in history, we would find that its history is relatively brief.

The first mention of the word in English was in the 1830s. However, as Conboy (2004) suggests, many of the “practices and traditions” of journalism were already well established by the time the word *journalism* was adapted from the French word *journalisme*. Therefore, to come to some judgment about a starting point for when journalism began becomes highly problematic. This noted, if we are to look historically at how our ideas of journalism have come about, some discussion of early journalistic writing is warranted as this will, it is hoped, allow for a greater sense of clarity about how, why, and when the ideas and ideals of journalism came into being.

Context, of course, is everything, and the changing economic and political complexion of Europe as it emerged from the “late middle ages” into a new era of global trade and mercantilism is the starting point for our historical overview. Around the 15th century, a new system of proto-capitalism was developing out of the collapse of the Hapsburg Empire, with states jostling for supremacy. Given the political and economic rivalries of the 15th and 16th centuries, economic advantage was seen as a key element in securing the objectives of the new nation-states, and it was information that provided the main ways in which such an advantage could emerge. Up-to-date and accurate information was therefore an essential requirement for those who sought to achieve or indeed retain economic and political power. Information, in this new era of trade and national rivalry, therefore assumed value, in both political and economic terms. Information about trade and economics, information on international affairs, the goings-on in court (though not yet in Parliament), and local rivalries were important to the emerging mercantile class and those individuals of status who had commercial and political interests in receiving such information (Wilson, 2005).

Given the powerful status of news, those in authority considered its control imperative to the maintenance of the status quo. The printing press in particular had made the production and dissemination of news more widespread to the extent that control of its output was perceived as essential.¹ The desire to control the spread of information is evident as long ago as the early Tudor period in England, as the debate about the limits of royal power and the religious orientation of the monarch was prominent in the print culture of the day. As a result, Henry VIII sought to achieve control over all printing to ensure that it conformed to the royal view, a trend that continued through to the reign of Elizabeth I. Such was the fear of print, and its ability to stir up opposition to authority, that various systems of control came into force to ensure that printers were brought into line with authority and the press was controlled. These mechanisms of control wavered in their effectiveness throughout the Tudor and Stuart periods, though they lasted until the English Civil War in the mid-17th century, when the licensing system collapsed, only to be revived during the interregnum (Siebert, 1952/1965).

Such a period of political turbulence, of course, produced many examples of public writing that were intended to serve explicitly political purposes. Officially printed material required licensing by the Stationers Company, which was loyal to the throne and had a commercial interest in restricting the market. It was during this period of political unrest that the print medium was being used explicitly as a political weapon. One of the first newspapers used to reflect unambiguous political ideas was Gilbert Mabbott’s *The Moderate*. Mabbott was inspired by John Lilburne and the political ideals of the Levellers and their radical proposals for democracy. As such, *The Moderate* sought and expounded the virtues of democracy and the political rights of all—“The laws of this land hold out an equal right and common interest to all.”

Another early example of public writing that could be seen as informing modern conceptions of journalism was provided by John Milton (1608–1674), who wrote *Paradise Lost* and, of course, *Areopagitica* (1644/1999). *Areopagitica* was essentially a plea for the repeal of the licensing system, which was being reimposed by Parliamentary rule. Milton’s thinking was shaped by the social and political turbulence of the day, and his arguments about freedom and truth can be seen as emanating from the enlightenment emphasis on human agency, rationality, and, of course, progress. Controls on the press were deemed to hinder such progress and stifle human agency. Licensing meant that open discussion and a progressive movement toward certainty hindered debate, which was seen as the key to greater understanding and truth. However, *Areopagitica* should not be seen as the archetypal liberal argument for press freedom; Milton did advocate the censorship of certain public texts, particularly those printed by Catholics. It would be wrong therefore to call Milton a journalist. Rather, Milton’s ideals influenced our modern conceptions about the power of journalism—the potential that print could have in advancing the “truth” about the world. Other public writers or pamphleteers of this age include William Walwyn, Henry Robinson, and John Lilburne (Siebert, 1952/1965). Following the Restoration of the Monarchy in 1660, journalism in its early forms began to engage more fully with politics and with its public constituency. This new constituency was the rising bourgeoisie; this increasingly influential mercantile class required up-to-date information on politics and foreign affairs to assert themselves both politically and economically.

In America, news letters had appeared from the mid- to late 17th century, as did a number of English newspapers (Mott, 1941), but arguably the first American journalism in what might be termed the first American newspaper was titled *Publick Occurrences* and printed by Benjamin Harris in Boston in 1690. The newspaper contained both foreign and domestic news but had its first edition banned 4 days after publication for contravening the licensing restrictions. It was these licensing arrangements that ultimately

ended Harris's journalistic endeavors. The *Boston News-Letter*; however, became "the first continually published American newspaper" (p. 11), and other titles soon followed: The *Boston Gazette*; *The New-England Courant*, which sought to provide information on trade, foreign affairs, as well as "human interest stories"—and, as Mott suggests, "with its appearance entertainment may be said to enter the history of American journalism as a definite newspaper function" (p. 16). As the productive dynamics of society were altering, so too did the opportunities to exploit the desire for news. News, because of its ability to reflect both a sense of place and a sense of time, can be seen as very important in allowing people to construct a more coherent sense of place, temporally, spiritually, geographically, and, of course, politically. Given the emerging importance of the idea of news in building a sense of collective awareness of the community and wider spatial and political environments, its commercial potential was soon realized. News became a commodity, and this commodification has had as much impact on the idea of journalism as any political impulse.

It was during the early 18th century in Europe and the later 18th century in America that we get the formation of what Habermas (1989) terms the public sphere—the realm of public, political discourse that both reflected on and sought to influence the changing dynamics of European political and economic life. The bourgeois public sphere then was an arena facilitated by journalism, public debate, and argument which would shape the relationship journalism had to both politics and economics from here on. It was this idea of the public sphere that would provide a guiding sentiment in the political transformation of both Europe and America as the 18th century unfolded. Conboy (2004) suggests that it was at this time that the

story of journalism over the next two centuries was to be an account of the ways in which this class negotiated its central role in society through print culture and the impact that this had on the formation and discourse of journalism. (p. 45)

Moreover, this idea that journalism and periodical print culture contribute to the broader functioning of the political community is of central importance to emergent ideas of journalism, and it is to this political framing of journalism that I will now turn.

Journalism and Politics

Probably the most popular and traditional view of the historical development of journalism frames its emergence in terms of its role as the fourth estate—the so-called watchdog role of the press. Historically, this perspective charts the development of journalism as a struggle between authority—Church and State—and the democratic impulse that had its foundation in the Enlightenment thought of

Hobbes, Locke, and Rousseau. The idea that journalism and freedom of the press developed as a tool of political emancipation does indeed have a very strong historical basis in the many political tracts that explicitly sought to challenge the political hierarchies of their time. Such political dissent usually consisted of printed material that sought to challenge established positions of power and can be traced from the earliest agitational literature of the 16th century through the "struggle" for freedom of the press in the 19th century to the "watchdog role" that journalism is supposed to have today. According to this history of journalism, the development of press freedom in America on independence from Britain in 1776 and in the mid-19th century in Britain enabled democracy to thrive as the press enabled public scrutiny and therefore accountability of politicians.

Journalism also ensured that the public had information at their disposal with which to make informed choices about who they would want to have in power. In short, journalism was perceived as essential to the effective working of democratic societies. This conventional account is in many ways very convincing, especially in its European and North American historical contexts. According to this perspective, the history of journalism, from Wilkes to Watergate, is littered with examples of brave journalists fighting political corruption, greed, and power on behalf of the people. The idea of journalism here then is that of a servant of the public, acting on their behalf as monitors of power and articulating the voice of the people.

In historical terms, the relationship between journalism and democracy seemed to crystallize following the Wilkes controversy in the late 18th century. Wilkes, an MP, sought to expose political corruption and incompetence via the publication of his pamphlet, *North Briton*. It could be argued that the Wilkes affair was historically important in creating the link between the narrow political constituency of Parliament, whose members were essentially self-interested, and the public at large. It was via Wilkes that it became possible to publish the proceedings in the House of Commons so that the public would be provided with information and intelligence on matters of direct importance to them.

In America, the press was also increasingly used as a means by which political battles could be fought. It was a mechanism through which support for political struggles could be developed, particularly in the battle for independence from Britain. Before the War of Independence, newspapers such as the *Boston Gazette* were pivotal in shaping opinion against the British. Newspapers therefore were being used as a means to undermine the authority of government and to advance alternatives to the political status quo, as Mott (1941) suggests when he notes that "it was a group of local radicals that filled the columns of the *Boston Gazette* with the kind of political articles which eventually prepared the minds of the people for the idea of

independence” (p. 75). Here, in the pages of the *Boston Gazette*, we can see the link between politics and journalism being consistently articulated, primarily in terms of undermining established unrepresentative authority. Such was the power of the press that those in authority sought to counter the arguments made in their own Tory newspapers.

A key figure in the democratic movement of the late 18th century and one who would cement the connection between the press and politics was Tom Paine. Paine (1995) would influence the development of democratic politics in Europe and America with his *Common Sense* (1776), *American Crisis* (1776), *Rights of Man* (1791), and *Age of Reason* (1795). Paine sought to articulate the idea that man had certain inalienable or natural rights and that government should be organized so as to protect and reflect these rights; chief among these were political rights. “A government of our own is our natural right,” he asserts in *Common Sense*, and the democratic sentiment from Paine’s writings influenced both revolutionaries and reformers in America and in Britain. Moreover, in a similar vein to Wilkes, Paine suggested that a free press should facilitate the connection between a democratic government and the people. In America, of course, this sentiment found its expression in the first article of the Bill of Rights.

However, in Britain at the beginning of the 19th century, the press was hindered from serving the people in this way because of the system of taxation, which meant that newspapers and pamphlets could not legally be produced or obtained by the majority of people. Arguments to repeal the taxes were made by both middle- and working-class publicists. These arguments were incorporated into broader movements that looked to establish a wider political franchise, provide a system of education for the poor, and, for the middle-class reformers, free the print market from government taxation and control (Hampton, 2004; Hollis, 1970).

Once these controls were removed in the mid-19th century, it seemed that journalism, independent from government control, could exist as part of a well-functioning democratic system on both sides of the Atlantic.² This connection between journalism and politics has helped forge a set of ethical guidelines for journalists, who, in principle at least, should attempt to open up the executive and the legislature to the gaze of the public. Journalism’s relationship with democracy since the mid-19th century has centered on ensuring accountability and providing the public with sufficient information to enable them to make rational decisions about their political allegiances. This idea that journalism provides people with the means of scrutinizing government lends itself to the notion of the fourth estate—journalism as independent from government yet performing a key function for democracy.

Another way of thinking about the development of journalism is one that is in almost direct opposition to the above interpretation. According to this script, journalism emerged in the middle of the 19th century as an important

element in the constraint, rather than liberation, of the masses. The idea of journalism here is about the expression of political and economic power and the dominant values of capitalism. Perversely, the story in its early stages is somewhat similar to what might be termed the traditional liberal view in that the idea of public communication was seen as progressive and emancipatory. However, it is during the industrial revolution in England, according to this more critical history, that the progressive emancipatory values of journalism started to become undermined by the priorities of profit. Chalaby (1998) suggests that before the end of printing restrictions on the press in the mid-19th century, journalism did not exist. Rather, what existed were popular appeals to the public made by politically motivated publicists in newspapers and pamphlets. Publicists, rather than journalists, provided news and information about the prevailing political institutions and climate; they also commented critically on the political and economic system, which they viewed as repressive and corrupt. According to this view, it was only after the final repeal of the stamp tax in 1855 that the commercial press expanded rapidly, and with it the prevailing views of capitalism and the free market.

Historically speaking, this relationship between the market and journalism has undermined the democratic spirit of journalism and sought to bind us into thinking that democracy and capitalism are synonymous and that journalism itself is of necessity tied to the market to function correctly in its democratic role (Curry Jansen, 1992). Of course, democracy and the “invisible hand” of the market are separate entities with separate histories and orientations.

Debate about journalism’s political function, however, seemed to diverge following the publication of Walter Lippmann’s (1922, 1925) studies of the American public. The essence of Lippmann’s arguments were that political life is far too complex for most Americans to comprehend, and therefore, journalism should contend itself with simplifying political information so as to retain its democratic ethos. According to Lippmann, the job of journalists was to “translate the technical deliberations and actions of political leaders and experts into a publicly accessible language to inform, as best as possible, a citizenry incapable of governing itself” (Haas, 2007, p. 7).

So the function of journalism should be to act as a conveyor of political information to the public in ways that enhance their understanding of politics, which allows for politicians to be held accountable. However, Dewey (1927) held that journalism’s role is not one of conveying a simplified form of political information to the masses but rather of engaging the masses in debate about political affairs. This deliberative model of journalism, then, is in stark contrast to the idea that journalism should convey information in that it adds the idea that journalism should also be an arena of public debate and should stimulate both the thinking and the doing of politics. Such is the essence of public, or civic, journalism.

Some of Dewey's sentiments seem also to have been absorbed by the findings in 1947 of The Hutchins Commission on Freedom of the Press, which, among other recommendations, asserted that journalism should "serve as a forum for the exchange of comment and criticism" (cited in Hass, 2007, p. 8). However, critics suggest that it is dangerous for journalism to venture into territory that might undermine long-established and effective news production processes (Davis, 2000). Again, we come back to the issue of objectivity in journalism, the ritualistic mantra that is taught in journalism schools around the world. Yet, as Altschull (1997) writes, "objectivity simply does not exist. . . . Objectivity is the mechanism for ensuring the status quo" (p. 148). In other words, the notion of objectivity is anything but objective as it orientates journalists away from serving the public and toward maintaining the far too close relationship between the political and economic elite (Franklin, 2004). The rise in political PR (public relations) and journalism's increasing reliance on such sources also undermines journalism's democratic imperative (Davis, 2008; Lewis, Williams, & Franklin, 2008).

So what is the answer? Does it lie beyond the realms of the physical world, in cyberspace? Contemporary debate about civic journalism seems to have been reinvigorated by advances in information and communication technologies, particularly the Internet. Indeed, the advent of the Internet has heralded new forms of public journalism that not only transcend the commercial imperatives and established institutions of traditional journalism but can also orient themselves toward greater deliberation and public awareness about politics and the wider world. According to some, the era of "alternative" media and alternative journalism is here (Atton, 2003). This is because of the ways in which new information technologies liberate communication, journalism, and its relationship with politics and the wider public more generally. According to McNair (2006), we have shifted from a paradigm of control, in which the political elite have been in a position effectively to censor and stifle public debate about politics, to one of chaos, in which technologies have enabled individuals and journalism to create a genuine public sphere. As McNair suggests, "Where the media have been expected to play a watchdog role over power in capitalism for centuries, the emerging environment provides enhanced means and opportunities for the exercise of that role" (p. 170). McNair also claims that the benefits of this shift are enhanced critical scrutiny of the elites, enhanced critical scrutiny of the media, decentralization and diversification of media production, and globalization of the public spheres (p. 170).

Yet how convincing is the idea that technology liberates us from the control paradigm? Sunstein (2007) has recently suggested that rather than enhancing the deliberative conception of democracy, technology has instead generated channels of communication that tend to limit the

deliberative spirit. Sunstein also suggested that one of the novel features of such technologies is that individuals can tailor information to their specific requirements. From RSS feeds on particular topics to the "blogosphere," where journalists, professional or amateur, can engage with the public on matters of interest to them, users can now manage their own information channels in ways that suit them. This, Sunstein argues, might close down deliberative opportunities rather than opening them up, as people tend to be drawn to material that reflects rather than challenges their political principles and ideals.

Winston (2005) proposes that the promise that technologies will throw open the doors of innovation in journalism is an overstated claim, as much of what appears as online journalism is taken directly from print hard copy. Even though we might be able to navigate through material with greater precision and speed, where is the innovation in that?

Conclusion: What Is Journalism?

So what is journalism, and how are we to understand how our ideas of journalism have developed? This chapter has sought to argue that there is no single idea of journalism. Rather, journalism and its ideals have emerged via historical intersections of political, cultural, and economic factors. Journalism is not just about politics; it is also not just about reinforcing culture. Nor is contemporary journalism necessarily about the bottom line, though market pressure does seem to shape the orientation of professional journalism. The central claim here is that if we are to understand journalism today, we must comprehend the development of journalism across these particular historical planes. Journalism is as much about power as it is about people as it is about profit. Journalism in the early 21st century seems to be a mixture of professionalized cultural practices aligned to political, cultural, and commercial aspects of the social world. Such practices are necessarily constrained within the development of the cultural values that correspond to each of the components above.

The idea that journalists have a responsibility to the wider community is also paramount. This enables journalism to amplify a cultural sense of place that meshes with our sense of identity and helps create common understandings and shared experiences—a sense of community established via a commitment to the public good as well as a commitment to uncovering the truth.

And what of the future? If we are to reflect historically about what might emerge in the future for journalism, we may pessimistically conclude that it is the profit imperative and the ever-increasing framing around technology that will further devalue journalism's core ideals. However, as has been suggested elsewhere (Conboy & Steel, 2007), it is ultimately the public itself that has the ultimate say in where the future of journalism lies.

Notes

1. Winston (2005) suggests that the idea that journalism is a “child of the printing press” is overstated as accounts of events and the gathering and distribution of “intelligence” to the public were provided both in handwritten form and orally, in the form of the ballad, long before the press was used to print the early newsbooks.

2. Though, in Britain, full franchise for all males was not achieved until 1884.

THE CHANGING NATURE OF “NEWS”

MICHELE WELDON

Northwestern University

What Are News Values?

“Man bites dog” is an old newsroom joke demonstrating what kind of event would be considered universally newsworthy to tell any audience, what would justifiably make it to the printed front page or the opening moments in a television newscast. It is a story that has time-honored news values, including timeliness, proximity, conflict, impact, and unusualness.

The story is timely as well as local, and the conflict arises from the notion that a dog is no longer man’s best friend, which has broad implications and consequences. Of course, it is unusual, and if the man biting the canine turns out to be a celebrity, then the story has prominence as well. And if the dog is famous (appears in commercials, movies, or skateboards in a YouTube clip), well, then we have an undeniably newsworthy story with double the celebrity value.

But such simple definitions of news have become splintered and confused in an increasingly chaotic and crowded media landscape. How the local man-bites-dog story is told in the 21st century depends on the audience and the delivery mode—whether it is received as text, digital, or broadcast, or all these combined. The content of the story would not stop at the simplistic text answers to the most fundamental and traditional questions of who, what, where, when, why, and how in an inverted-pyramid-style story of 250 words.

It would be an elective experience for the audience on many platforms and in many shades of intensity driven by personal interests.

Today, a consumer would go to the newspaper’s Web site, see the bulleted brief or a simple headline—perhaps 15 words underlined and in blue, click on it, and watch a video of the man being taken away by the police, perhaps following a car chase resulting in a reality-TV-ready arrest. The bitten dog’s owners would be interviewed on a separate audio podcast, with links to information about the breed, how to report pet abuse, plus a Flash-enhanced timeline of man-bites-dog incidents in history, as well as a photo slideshow with audio of comments from neighbors and coworkers on the “canine-ivorous” man’s recent behavior. A link would be available for a longer text profile of the man who bit the dog, accompanied by a visual graphic of a timeline, explicitly defining the chronology demonstrating how exactly the bite happened, and a separate graphic of the anatomy of a man’s head and mouth compared with a dog’s. A Man Bites Dog blog would be available for readers to post their comments as well as their own video and audio about related stories. Readers/viewers/users would then vote online their preferences for segments of the story they liked most, and pieces of the story would likely become viral through blogging and social network sites such as MySpace or Facebook, with related photos posted on Flickr. This is a case study demonstrating a model of information flow that is more about less.

The newsworthiness of the story would be closely connected to the voluntary behavior of the audience and would shift according to the needs of that audience. The story would then erupt into a user-driven multimedia package with nearly infinite incarnations involving perhaps one

mobile journalist, several staffers and freelancers, citizen journalists, bloggers, and consumers providing different informational pieces of the totally puzzling experience.

Timeliness, Proximity, Unusualness, Prominence, Impact, Conflict, and Human Interest

The definitions of news have altered because the playing field for news has been disrupted, redefined, and sculpted to court and suit a highly fickle audience. It is an audience no longer defined principally by geography but also by social demographics, age, education, ideology, affiliations, behaviors, and specific media use. They can create a self-motivated audience craving more information about fewer topics or less information about more topics. The 21st-century media landscape for news offers the possibility for consumers to delve into topics a mile wide and inch deep or an inch wide and 100 miles deep. They can be mobile and technologically savvy consumers who no longer sit patiently for the delivery of the newspaper on the front doorstep to read the news or who lounge passively in their living room at the appointed time of 5, 6, 10, or 11 p.m. to watch the newscast delivered by two well-paid anchor readers.

These are often consumers who intend to participate in the choice of news stories offered, the gathering of news, public commentary on the news, and the ongoing news choices made by editors and journalists. This is a different approach to the news than we have seen in the previous media age beginning in the mid-19th century of top-down, elitist, editor-driven journalism. So today’s journalism requires a modernized toolbox of news judgment factors. Yes, there is still an audience who waits for the newspaper every morning to enjoy it with a cup of coffee and then unwinds at night with a favorite local newscast. But this is a shrinking audience. The feared extinction of this audience and the necessity for news producers to chase new audiences and capture their attention is why news has changed.

In generations past, “readers needed news and had limited ways to learn about current events,” Michael Hirschorn wrote in the December 2007 edition of *The Atlantic*. “Editors would tell us what to read and we would read it. News didn’t have to be interesting, because it was important, and any self-styled citizen of the world needed to know what was important” (p. 137).

In the 21st century, not only is the reader/user/participant pressed for time and bombarded by more options for information, but the walls between user and news provider have become porous. In many instances, the barricades have fallen completely away as citizen journalists contribute to mainstream media and to their own viable, vetted citizen journalism Web sites and popular blogs. Since the debut of South Korea’s OhmyNews International in 2000 and, later on, domestic citizen journalist hyperlocal sites such as

Backfence.com, Goskokie.com, NorthwestVoice.com, and hundreds more, the formerly passive consumers now want to be part of the journalistic process. They want to participate in stories important specifically to them, but they also require the option to consume stories offered by the mainstream press that they could not otherwise find on their own. The question of access in many instances is still insurmountable for citizen journalists. Though bloggers can get press credentials at a national political convention, citizen journalists are still not granted wide backstage access to the events, drawing rooms, and offices of major newsmakers.

A tolerance for top-down “news you should know” that fits rigidly into the old definitions of news as construed by a finite group of journalists in a closed-door editorial meeting has given way to a consumer push for a breadth of stories told in a variety of ways. These stories can forgo the traditional justifications of timeliness, proximity, unusualness, prominence, impact, and conflict, as long as they can be sheltered by the umbrella of human interest.

And it is that humanistic element, the connecting anecdotal link, the character portal leading the audience into the story, that drives the news consumer’s desire and appetite for news. The overall dramatic shifts in types of stories from text, digital, audio, and video outlets toward a focusing on citizen sourcing and a casual writing style reflect this cultural reverence for the personal story and a revolutionized set of news definitions. No longer will a story be relevant solely because it delivers news such as “The mayor said Monday” edict. The story must be told in a compelling way across a variety of media, illuminating the stories of individuals while personally connecting to the lives of the audience. It is no longer one door the consumer enters that opens onto the news but a series of doors, windows, hallways, and obscured passages that the consumer can choose from.

Just as the audience has become accustomed to changing cable channels in a millisecond, they can instantly click away from the news site and go somewhere else. Logistically, a printed newspaper now is the last to cross the finish line on news. If something is breaking news and is hot, it has already been reported in a video online, recounted on TV and radio, and blogged about on countless sites. Digital media has stolen print’s thunder. So printed news reinforces and reinterprets the news through a different lens, rather than breaking the news first. The consumer already knows that there was a fire in a department store from TV, radio, and Web sites. Now they want to read the longer story of the firefighter who saved the customer.

So many options compete for the news consumer’s time that delivering a relevant story across any and every platform becomes a race to offer the most useful, engaging, and informative content. Never has accurate and keen reporting been as crucial or eloquent and insightful multimedia storytelling been as important to capturing the attention of the audience. As the traditional elements of newsworthiness continue to contribute to the decisions of what stories are

played in print, online, and digitally in broadcast and radio, additional forces factor into news judgment.

News does not have to portray a rigid sense of timeliness; the story can be current, ongoing, recent, upcoming, or merely hypothetical. It can also be any item, individual, phase, trend, or event that was previously unknown to the audience. While the news may be commonplace in one area of the community or the world, it is “new” to this target news consumer. Timeliness has become elastic. Just because an event happened yesterday no longer deems it automatically newsworthy. The notion of yesterday’s news told today or today’s news delivered tomorrow has evaporated as news can be communicated digitally in real time. Traditional timeliness is an antiquated notion left over from an era when citizens would not know of a news item unless it appeared in the newspaper or on radio or television. Because of text messaging, cell phone photography and videography, as well as audio recording on portable digital voice recorders, unfolding news events can often be broadcast live by amateurs on their Web sites. Consider the images and reactions from citizens following any number of recent tragedies; these were urgent, immediate, and raw visuals and commentary that were unfiltered by professional journalists. The lesson of immediacy that was learned in those unfortunate events is that no one has to wait for the reporter to arrive before the “news” is published, disseminated, and absorbed by a wide audience.

Because of the universal accessibility to publishing, a news story is no longer constrained by geographic proximity. A global economy mandates a global information network, so a story about a young girl in Kenya struggling to succeed in school is as engaging and newsworthy as a story about a young girl in Kenosha struggling in school would be to local Wisconsin readers. At a time when we are submerged in the infinite and boundless flow of information online, and Facebook and LinkedIn users swap personal stories across all physical boundaries, it becomes less important to define proximity limited by spatial closeness as a news parameter. Human interest serves as the overarching, inclusive bridge.

The irony here is that being unlimited by the shackles of location in mainstream media, hyperlocal news has built an enormous following in community journalism sites, weekly publications, zoned newspaper editions, newspaper Web sites, and blogs. Traditional media outlets such as newspapers, magazines, and the local television or radio station no longer have exclusive rights over local news. A single community blogger can succeed in informing a local audience of local city council votes or even the latest scores in middle school football. An audience can be built around a garden club, alumni group, or local transportation issue, offering news that would no doubt be ignored by the larger press.

“What does it mean to me?” is still a question the news consumer wants answered in his or her media. While the impact, importance, and consequence of a story for the consumer can be subjective, it remains influential as a factor in news judgment. But the interest quotient has

shifted from the flat response “Now I know” to “What can I do about it now?” The news user in this current 21st-century iteration wants to take the information from a simple story told and apply it elsewhere, transforming facts into action, perhaps, and using this story as a springboard for deeper examination, reflection, active feedback, involvement, and possible advocacy.

For instance, at the end of the 20th century, a simple text story of 10 or more inches in the metro section of a newspaper reporting on a city council vote to increase property taxes in a suburb or city would quote only council members on their official comments during the meeting. Now, however, that simple story evolves into a multimedia package telling citizens what action they can take, how to contact council members, and how to have a home’s value reassessed, providing profiles with photos and audio of each council member and the mayor, along with a podcast of the meeting, a video of citizen reaction to the vote, an avenue for bloggers to post suggestions, as well as photos of homeowners and their homes affected by the property tax hike. Still, the news of the tax increase may be the same, but the manner in which the news is delivered is a thousand times more complex, urgent, and democratic. The rationale for that delivery has morphed into a more layered and faceted portrayal of the news guided by the consumer’s needs. News gathering has become much more complicated, enhanced, some say, by the technology of multimedia tools, while others claim that the multimedia options have only burdened the consumer with unnecessary bells and whistles that dilute the impact of the message, distracting the consumer from the core news itself.

While unusualness still holds true as one undeniable factor in defining the focus for news; the story must be more than just odd, such as the man-bites-dog story. As the media reaches far beyond the boundaries of town, city, county, state, country, and continent, what is unusual for one audience group is commonplace for another culture, and not even a distant culture. What is understood as an everyday occurrence in the far western suburbs of Chicago may be unheard of within the city limits. Is this a story that for the main audience would be unknown or inaccessible without the journalist’s intervention? Is this a trend, event, or person so little understood or examined broadly that an illuminating and enterprising story informing the audience would be edifying and useful to the consumer? Or is the consideration of this as unusual merely a reflection of the journalist’s myopic view of the community and the broader world? And would publishing this as news alienate part of the audience and only underscore the notion of the traditional ivory tower editors making decisions disconnected from the broader consumer’s interests? The element of unusualness must be viewed through the lens of diversity and inclusiveness, as news gatherers must embrace a higher sensitivity to all groups whether they are defined by age, race, gender, religion, ideology, disability, geography, education, income, or behavior. Because a news item is personally unfamiliar to the journalist or editor, this does

not grant it unusual status. In the sweeping reach possible with 21st-century media, a narrow view of newsworthiness may render the news itself irrelevant.

An individual’s celebrity or prominence can control decisions of newsworthiness, but who is labeled a celebrity in the transaction of news has changed. While webzines, blogs, television entertainment news shows, and gossip columns in the mainstream press have maintained an obsession with the comings, goings, arrests, births, deaths, and outrageous acts of a handful of Hollywood and MTV royalty, the culture’s celebration of the amateur has invited a new brand of individual into the spotlight. A college student can become globally well-known for a clever YouTube clip, while a diligent inventor can be vaulted into googledom for an ingenious solution to a universal problem, such as a prescription bottle that easily opens or a coffee mug that does not spill. Just by inclusion in the story itself, the individual secures his or her own celebrity and prominence. Being listed as a source in a reaction story run on a popular Web site can turn the average Jane Doe into an oft-quoted and sought after expert on even the most obscure topic.

Conflict is a historically traditional sustained news value and is a fundamental component of human nature. A 2007 study in *Newspaper Research Journal* of Yahoo! News found that both producers and users of news ranked conflict as the news value occurring second most often in more than 1,000 news stories, ranked only behind impact. It appears that no matter how the news changes in content, style, or sourcing, the drive to understand conflict, whether it is political, social, professional, interpersonal, or more general, influences decisions to present news and information that contain these dramatic human elements.

Economic Factors Affecting the News

The first decade of the 21st century was tumultuous for the traditional media. Newspaper closings, layoffs, downsizing, revenue slides, bankruptcies, and sell-offs of major chains such as Knight Ridder and Tribune Company seemed to further erode a wounded industry scrambling for identity, relevance, and profitability. Declining circulation among the majority of the country’s newspapers had been in effect for more than 20 years, and circulation was only stabilizing or gaining in a few markets. The former editor of *The Wall Street Journal*, Paul Steiger, reminisced on his 40 years as a journalist in a *Journal* column in December 2007:

The cornucopia of national, international and business news, sports and especially opinion available free on the Web is rich beyond historical parallel. Anyone with a fact, a comment, a snapshot or a videoclip can self-publish and instantly compete with the professionals. . . . What happens next? Change, rapid and largely unpredictable. Nearly every company in the industry needs major new revenue, big cost reductions or a healthy dollop of each. (para. 8, 47)

As readers fell away from traditional print news, and advertising revenues migrated online, with newspaper Web sites accounting for nearly 34% of local online advertising in 2007, news consumers also moved online, but not exclusively. Consumers did not report reading only the newspaper or only going online for news. According to the Project for Excellence in Journalism in the 2007 *The State of the News Media* report, about 92 million people around the country get their news online, compared with about 51 million Americans who buy a daily newspaper and 124 million who read the printed newspaper. This number accounts perhaps for all those copies left on tables in Starbucks and dental offices across the country as some single copies of newspapers have several readers. In 2007, 90 newspapers in this country had a reach of 64% of adults in their communities each week. In spite of closings of papers such as the *Cincinnati Post* and the threat of closing at the *Chicago Sun-Times*, as well as layoffs and firings at the *Los Angeles Times*, *Philadelphia Inquirer*, and others, there were more than 1,450 newspapers in the United States as of 2006, some with healthy and slightly increased circulations.

In a January 2008 opinion column in *The Washington Post*, the writer David Simon, executive producer of the HBO series *The Wire*, wrote,

Isn’t the news itself still valuable to anyone? In any format, through any medium—isn’t an understanding of the events of the day still a salable commodity? Or were we kidding ourselves? Was a newspaper a viable entity only so long as it had classifieds, comics and the latest sports scores? (para. 6)

The answer is no, a newspaper is more than that, and news is more than ink on paper. But the notion of what is considered the news of the day has changed. And how the news is delivered previously molded the content, but now content must be adaptable across delivery modes. The reality is that news outlets can no longer be considered in separate silos, as entities of printed text, digital text on a laptop, video on a screen, or audio from a car radio. Newspaper companies have succeeded in presenting a multitude of online formats, as radio stations also present slideshows, photo galleries, video, and text on their Web sites. While the talk of convergence journalism has been prevalent since the start of the 1990s, what is necessary in the first part of this century is to view the news media industry as one in flux, at the cusp of emergence journalism.

Few consumers exclusively read the newspaper or check news online; there is crossover, there is a hybrid consumer who gathers information from a variety of sources—print newspaper, multiple online sources, news magazines, niche magazines, radio, television—as if he or she is building a dinner plate at a salad bar. One would think that the consumer is not just heaping vanilla pudding or green beans on his or her plate over and over but, instead, sampling from many different sources and delivery modes to build a well-rounded information flow. A 2006 Pew Internet and American Life study reported that

71% of broadband users in this country got their news online daily and 43% of Americans get their news from reading the physical newspaper. Additionally, the study showed that 32% of those surveyed reported that they get their news online from the Web site of their local paper.

The nearly limitless offerings of news and information and the many transformations of news outlets has succeeded in creating a monster of an audience—at once demanding, disloyal, fleeting, and capricious—who can easily be misunderstood. News companies and news purveyors may have initiated their brands as a print product but know that they must continue to offer an expanded online presence, no longer limited to stories “shoveled” onto the site after they have been printed. A print news company’s Web site will also offer audio, video, photos, interaction, expanded graphics, as well as value-added text in an effort to differentiate the products and to make the experiences of reading a newspaper and the news company’s Web site distinctive and separate.

For instance, a news Web site from a traditional newspaper company such as *The Washington Post* or the *Chicago Tribune* will daily offer photo slideshows related to stories or existing on their own without print support, as well as opportunities for the news consumer to add comments in a blog or contribute his or her own media. The *Tribune* newspaper refers to online-only offerings, and the Web site is not a reproduction of the paper. For instance, on January 25, 2008, the *Tribune* Web site listed no full stories but rather little text, more than 50 headlines, photos that clicked onto videos, photo galleries, and links to columnists, sections, and options to “share your thoughts” and “post your photos.” Aside from the headlines, only the lead news story with the largest photo had text, and that was limited to about 20 words. What story could be read in toto was completely the choice of the user and required action by the user. Having a headlines-only home page also suggests that the reader was already familiar with the stories, needed no explanation, and was only clicking for further enlightenment on a story he or she already was aware existed. This is the practice of many newspaper Web sites, from *boston.com* to *USAToday.com*, which can offer sometimes more than 100 links to text and multimedia on the homepage.

Changes in Content, Style, and Sourcing

The end delivery mode or presentation of the news information changes how the news is gathered, who gathers it, and who is the intended consumer. Just as the definitions of news have been reshaped, so have the outlets for the news. No longer involved in a monogamous relationship with print readers or a reliable partnership with broadcast viewers, news companies have been forced to reinvent their presentation of news in content, style, and sourcing. The physical news hole or space available for news on paper has been literally shrinking on many major newspapers in an effort to cut costs without taking a more aggressive machete

to the newsroom payrolls. Smaller paper dimensions mean fewer stories. Fewer stories may be the result of shrinking newsrooms and restricted budgets. But the online product is still limitless.

News providers then are struggling with brand identity through content. If the content now is received primarily as text on paper, how will the content change if it is received by phone or on a screen on the back of a train seat? Perhaps a recorded interview can be used as an audio podcast and also referred to as quotes in a text story, but repetition would make the story redundant, and new content must be delivered in each platform. If the journalist covering the story has been trained in producing text only, how will the job of that journalist change to accommodate the needs of the news consumer? How will journalists be trained for new roles, or will there be instant turnover to enlist a new staff with multimedia skills and no history as news gatherers? If news providers can make this transition to a cross-platform, multidimensional gaggle of content fluid and easy for consumers to understand and participate in, then the news industry will have succeeded in reinventing itself.

That reinvention will also have to include an adaptive, modernized media business model, one not limited by department store display ads and classified ads for used cars and garage sales. Revenue has been rapidly diminishing from traditional media online, and more inventive models need to be established for content to be available for the consumer. “When people think of the ‘media business model,’ they usually just think of advertising,” wrote Chris Anderson in January 2008 on his blog, *The Long Tail*, named after his 2006 book, *The Long Tail: Why the Future of Business Is Selling Less of More*. He added, “That’s a big part of it, to be sure, but as those of us in the media business know, it goes far beyond that.” Anderson went on to describe the possibilities for media revenue in cost-per-click ads, banner ads, lead generation, subscriptions, subscriber list sales, brand licensing, syndication, and many more.

But just as the advent of television was falsely heralded as the death of radio and the airplane was feared to signal the death of train travel, the Internet is not the single cause predicting the extinction of print news. It is a complement and supplement to it and vice versa. What is changing is how consumers opt to receive their news and the kind of news they elect to experience, and it is these changes in information flow that are forcing revenue models to be adjusted and redirected. The market for online news offered by traditional print companies is robust: On December 2007, *The New York Times* reported more than 17 million unique visitors to *nytimes.com* in 1 month, with *USA TODAY* reporting close to 10 million unique visitors for the same period.

Cultural Factors Affecting Content

Everyone knows and understands that the days of waiting for the newspaper to arrive to see who won yesterday’s football game are long gone. Consumers already know the

news before it appears in the newspaper the next day. Because of so many competing outlets of information, the newspaper is no longer a time capsule of the day before; it is a more general, personalized account of what is happening now, happened recently, or happened in the distant past, with a new twist. Unless it is an enterprise story—and that is usually a feature—or an investigative reporting exclusive, the odds of the news in the paper being first-time news to readers is slim. The audience already knows what happened because they got it online, from radio, or from TV. So people need a different approach to the same event. They need humanistic stories. They need to deliver to the audience a friendlier product that goes into more depth, answers why, and emphasizes who. The what, when, and where they likely already know. They want more information about the who.

Journalism is not just the rough draft of history; rather, it articulates how we expect and demand delivery of information and what kind of information we seek. Journalism has shifted to become an anecdotal companion to history in the 21st century. As a culture, recently, we have altered the priorities in news to revere personal story over official commentary, which can represent a democratization of news and an implied mistrust of official sources. This change from paradigmatic knowledge to a quest for narrative information controls the kind of story and content. The content is predominantly more narrative and emotional than factual and staccato regurgitations of events in a “he said, they said,” format. The notion that consumers of information prefer news to be slower at times and more in-depth, personalized, and humanistic than news told in factoids and bullets tells a lot about how we allow ourselves to be informed as citizens.

More news today than ever before revolves around an individual’s personal take on events. This is a reflection of how contemporary culture sanctifies the roles of non-celebrities in society. The flip side is also a cynicism with regard to information offered from official sources. We experience the signs of this reverence for the individual voice throughout the culture. Product Web sites selling everything from Botox injections to White Castle hamburgers, Hanes underwear, diamond rings, and Volvos solicit posts, video, photos, and text from users about their own stories of interaction with the brand. Citibank urges consumers in magazine ads to disclose their own personal anecdotes: “Whatever your story is, your Citi card can help you write it. What’s your story?”

It is undeniable that real stories of real people saturate the media landscape both editorially and noneditorially. We’re not seeing celebrity spokesmen so much anymore; we are seeing real people tell their stories of car insurance, home sales, makeup, and jeans. This is marketing by anecdote and personal testimony, a move parallel to telling news stories by anecdote and unofficial commentary. It can be a confluence of events that contribute to this sanctifying of personal stories—the paranoia that official sources spin or lie; the need to connect with individuals and feel

empathy and compassion for their stories; the belief that reading about others’ lives will bring a deeper humanistic understanding or some brand of redemption; and as a result of globalization, a realization that stories of real people offer connection and meaning to our own lives.

The plethora of reality TV shows accordingly reflects this worship of the amateur. Whether it is a show about wife swapping, nannies, or home makeovers, millions tune into the dramas of average citizens relishing their life details, anecdotes, and stories. The formerly voiceless are given voice in a variety of formats for a growing, responsive, and welcoming audience. The popularity of shows such as National Public Radio’s *This American Life* or *The Story* demonstrates a cultural appetite for democratic narrative and information shared through the eyes of the individual. The rise in documentaries as film, shown on television, and through podcast or online on current.com also exemplifies a cultural need to understand events through the voices of individuals. News information has gone from a push-down to a pull-up model.

Whether information and news are offered in print, online, or through broadcast, you are more likely in the 21st century to experience news through the portal of a character or an unofficial observer or participant than you are to understand news information through the eyes and ears of an expert or administrator with a title. For example, a news story on a presidential campaign speech will likely begin with an unrehearsed, spontaneous reaction from someone in the audience. With citizen journalism and a higher degree of participation in mainstream journalism from a previously passive audience, the profession has evolved to tell in greater detail the stories of the common man and woman, the person on the street. When you read a story about changes in city services, it will likely begin with an anecdote of a resident who can’t get his or her garbage picked up on time. Consider a story about a local parade. A journalist, blogger, or citizen journalist can report the news by talking to everyone standing on the curb waving flags, the spectators and the participants, getting their reaction and focusing on their anecdotes. The end result will be a decent reaction story. These kinds of sources are necessary in stories because they add color, humanity, and depth. So unofficial sources are a good thing, but that does not mean that official sources are bad or immaterial. To be accurately informed, the consumer needs to know with authority how much the parade cost, how many floats were in it, and how many people attended. Unofficial commentary is valuable, but accuracy and correct information still uphold solid journalism. This is not information you can get from the Cub Scout leader on the Snoopy float.

To qualify as fair journalism, the reporter needs to get the final, authoritative word from the head of the parade or a city official, so journalism needs both official and unofficial sources in stories. The shift toward greater prominence and use of unofficial sources should never be at the expense of all official sources. Reliable journalism needs a

balance of both sources in its content. Otherwise, journalism runs the risk of turning into Chicken Little Journalism, or the musings of individuals convinced that they know the truth (the sky did appear to be falling even if it just was an apple falling from the tree) but who are, in fact, spreading untruths and urban myths.

Just as youtube.com changed the face of video, this kind of “younews” is a concept that is changing the tone and content of print journalism. What I call such younews grants a higher significance to stories of ordinary people. Studies from Northwestern University’s Readership Institute quantify the attitudes of consumers who decide that they want to read stories about people, not just concepts, facts, and interpretations but stories about real people offering reactions to information they want to know, which makes them smarter and keeps them informed. Perhaps it is the fragmentation of society and the breakdown of genuine in-person communication that creates a craving for storytelling about individuals and a need for community building through narrative. If we can’t talk to real people, at least we can read the stories of real people.

Matters of Style

The inclusiveness of this kind of citizen-friendly content breeds a casual tone that has also influenced the style of news writing. The immediate and off-the-cuff approach of blogs has made journalistic style less stiff and formulaic because readers have become accustomed to a less formal top-down approach to their news. While some blogs are merely outlets for rants and personal attacks, or what can be called “blog-bys,” the conversational approach embraced on thousands of viable, intelligent, and information-packed, insightful blogs has forced mainstream media to oblige by making the writing style in text, online, and through broadcast more casual and less like “the spokesman said Thursday” kind of news. Blogs are based on opinion and the individual stories of everyday citizens. Bloggers demand that their voices be heard, and newspapers want to be more inclusive of these unofficial voices. So news delivery outlets mimic this voice, the immediacy and accessibility conveyed through a more approachable and understandable style.

Recent history also has played a role in the change of news writing style. Much has been written about how the events of 9/11 have changed journalism. But when viewed with more distance and objectivity, it is easy to see that perhaps the entire industry did not change its practices, but instead a change in tone was manifested in the reporting of more humanistic and emotional stories. The terror that was born that day in New York and Pennsylvania, and echoed throughout the world, contributed to an alteration of the approach to daily journalism. The raw reporting of the day’s events allowed a more intimate tone, resulting in writing that was more descriptive and infused with opinion and

insight rather than being strictly a rehashing of events through exposition and colorless quotes. It was preferable to tell the stories from the street, using the voices of the people directly affected, speaking about emotion and heartfelt dismay, mainly because the official sources had little to no information. From that day continuing forward, media outlets concentrated more often than previously on description, observation, and direct reaction to the day’s events, telling the story in a more personal, humanistic way.

The impact of *The New York Times’s* bold “Portraits of Grief,” brief, anecdotal profiles of the fallen of 9/11, on how all news would be written in the future was enormous. News could be informative as well as evocative. No longer was a mainstream media provider expected to be unbiased and straightforward telling just the facts, but rather, a eulogistic tone and reverence for the individual was expected. And because consumers became accustomed to reading the kinds of personal and emotional stories from the weeks and months following 9/11, they did not want to go back to strict hard news. Rather, they began to show a preference for interpretive, descriptive, immediate, personal, and emotional narrative stories as a vehicle for news. It would be like expecting a theatrical audience once invited to view a performance from the main floor of the auditorium before the orchestra pit to go back to the third balcony and rely on opera glasses to absorb the action of the play. Once consumers became accustomed to such softer news deliveries of stories, it would be difficult for them to regain an appetite for news briefs.

The narrative movement in journalism was not born as a result of the events of 2001, but rather, the genre of narrative became more emphasized in more newsrooms in the 21st century than in previous generations. Narrative had been practiced by maverick writers, such as Joan Didion, Tom Wolfe, Hunter S. Thompson, and Gay Talese, in the 1960s and 1970s under the genre “new journalism.” However, the cultural reverence for storytelling and what can be considered evangelism for bringing the narrative form to daily journalism was energized in the 21st century.

Narrative made the format of news more about craft and style than the objective delivery of news. That is not to say that the masters of the craft, from Tracy Kidder to Alex Kotlowitz, Katherine Boo, and Anne Hull, were not solid reporters making painstaking efforts to be accurate, fair, balanced, and ethical in their stories. But the methodology of narrative writers—applying the craft of fiction writers to the coverage of news events—was widespread and encouraged more often than other forms at the start of the 21st century. It is a form of news storytelling that is highly rewarded by editors and by prize committees, with 73% of the news stories receiving Pulitzer Prizes in 2005 told in the narrative form.

The most talented reporters and writers are granted time to write enterprise stories and given the space to translate assignments into narrative masterpieces, which can be the result of months of investigative reporting and meticulous

writing. The problem is that not everyone is good at writing narrative news and delivering simple information in the narrative form. Not every news story deserves a narrative approach, and not every story should be 50 inches long. As Ken Fuson of the *Des Moines Register* said, "Sometimes there is no universal truth. Sometimes it is just a parade."

What Is News Now and Going Forward?

Contemporary culture has succeeded in altering our perceptions of newsworthiness, forcing us to redefine what is news, away from the time-honored and perhaps outdated news values of unusualness, timeliness, proximity, impact, prominence, consequence, human interest, and conflict.

Many cultural and economic influences have helped us create a demand for information that is conveyed in a different way or in a multitude of platforms, meeting a different set of news value requirements. This is news with an emphasis on individual and unofficial voices, relayed in an intimate style of narrative that conveys information as story, turning newspapers into storypapers and stories into reinforcements of a media company's brand. The author Doris Lessing said in her Nobel Prize acceptance speech in 2007, "It is our stories that will re-create us, when we are torn, hurt, even destroyed." Storytelling is such a powerful tool in our culture and used in the mainstream of news in the 21st century that the recounting of individual stories may serve as a mechanism for readers' understanding of the immediate and larger world of our culture today and for generations to come.

Even with the changing definitions of news and news values, it may well hold true that the man-bites-dog story forever remains newsworthy, captivating us with the base unusualness. And then what could be truly worth waiting for is an exclusive interview with the dog.

REPORTING, STORY DEVELOPMENT, AND EDITING

K. TIM WULFEMEYER

San Diego State University

Telling a good story is the heart and soul of journalism; however, you can't tell a good story without doing a good job of reporting—gathering information to share with your audience. Identifying important and interesting issues, events, and people to report about is a critical part of the reporting process. In addition, carefully editing the semifinished product to ensure that it fits the allotted time or space and to ensure accuracy, plus to check for proper grammar, spelling, punctuation, and style, is necessary to increase the chances that audience members will find the story interesting, informative, entertaining, and thought provoking.

Story Selection

Selecting interesting and/or important aspects of life to report about would seem to be a relatively easy thing to do, but declining readership, listenership, and viewership for many of the traditional news media clearly contradicts that assumption. The key to identifying and developing compelling news stories is always to keep in mind what's likely to be relevant to audience members (Brooks, Kennedy, Moen, & Ranly, 2008, p. 4; Hansen & Paul, 2004, pp. 31–39). What people, places, things, and issues are audience members interested in, and what do they care about the most? Perhaps a time-honored prescription about what is good journalism sums it up best: “Make the important story interesting and the interesting story important.”

Years of practice and research in journalism have identified a number of factors that play a part in the process of achieving that critical goal. Among these are the “uses and gratifications” (see also Chapter 56, this volume) that people associate with news media messages; the news values/elements/qualities used by journalists to help them select which issues, events, and people to report about; and the traditional five Ws and the H—who, what, where, when, why, and how.

Uses and Gratifications

People have told researchers that they become news consumers for a variety of interesting reasons. They have a number of “uses” for the information they obtain, and they obtain a number of “gratifications” from consuming such information (Levy, 1978; Levy & Windahl, 1984; Vishwanath, 2008). By knowing about and understanding such uses and gratifications, reporters can begin to build a framework for their information-gathering mission. Among the major uses and gratifications are surveillance, reassurance, intellectual stimulation, emotional fulfillment, and diversion.

Surveillance deals with simply keeping up with what's happening in your town, city, state, region, country, and world. Reporters who can find interesting information about the important happenings of each day will be successful.

Reassurance deals with information that helps people feel better about themselves, the decisions they make, and their lives in general. Examples include providing the views

of experts, providing good examples and bad examples, providing how-to advice for helping deal with the common problems in life, plus including information about alternatives that might make life better.

Intellectual stimulation deals with information that causes people to think and provides them with opportunities to compare their views with those of others. Getting experts, celebrities, and even lay people to illuminate, praise, criticize, explain, analyze, synthesize, and speculate often can provide such information.

Emotional fulfillment deals with information that helps people relax, smile, cry, feel good or bad about something, and feel some empathy. Delving into historical or back-story-type elements, how people cope with problems, achievement-related statistics, and acts of courage/heroism often can provide such information.

Diversion deals with information that helps people forget about their problems (at least for a little while), reduce stress, and decompress after a tough day. Searching for humorous anecdotes, off-beat developments, unusual outlooks, and strange incidents often can provide such information.

News Values/Elements/Qualities

News values/elements/qualities include significance, prominence, proximity, timeliness, conflict, oddity, achievement, sex/romance (Brooks et al., 2008, p. 6; Campbell, 2004, pp. 104–125; Reese & Ballinger, 2001). Significance deals with how many people will be affected and how deeply they will be affected. An adage holds that the greater the scope of the impact, the greater the chances that events and issues will become news. Prominence deals with the status and/or notoriety of the people involved in an event or issue. The more well-known a person is, the more likely it is that whatever he or she does will be judged newsworthy. Proximity deals with the “localness” of the events and issues. The nearer events and issues occur to the target audience, the more likely it is that the events and issues will become news. Timeliness deals with how recent events and issues are. The more recent the events and issues, the more likely they will become news. If conflict exists in connection with events and issues, it’s more likely they’ll become news. The more unusual, out of the ordinary, strange, and off-beat events and issues are, the more likely they’ll become news. If events and issues feature elements of setting records and establishing standards of excellence, the more likely they’ll become news. If events and issues contain elements of sex, romance, and affairs of the heart, the more likely they’ll become news. In addition, if events and issues feature emotional aspects that tug at the heartstrings, have humorous or at least amusing aspects, serve as examples of good things to do or bad things to do, include acts of heroism or selflessness, or have an animal associated with them, the more likely they’ll become news.

The Five Ws and the H

The five Ws and the H provide more scaffolding for the process of selecting what issues and events will become news (Gibbs & Warhover, 2002, pp. 102–117; Hansen & Paul, 2004, p. 55). Who is involved, what’s going on, where it’s all happening, when it’s happening, why it’s happening, and how it’s happening normally are important considerations in the news decision-making process. The five Ws and the H are important parts of the reporting process, too, of course, but they often are used in an effort to select the events and issues that will be reported about.

Generating Story Ideas

Ideas for stories can come from a variety of sources (Harower, 2007, pp. 66–77; Hansen & Paul, 2004, pp. 37–39; Quinn & Lamble, 2008, pp. 15–28). The life experiences of journalists, their family members, friends, neighbors, associates, acquaintances, colleagues, advertisers, and audience members are typical sources. The joys and heartaches of everyday life, coping strategies, successes, and failures can all be fertile ground for story idea generation.

Other traditional sources for story ideas include localizing regional, state, national, and international events and issues; following up on stories done by competing news organizations; and investigating the issues associated with breaking-news events. If something interesting happens miles away in another town, city, state, or country, is there a local angle that can be explored? Were local people, companies, agencies, or departments involved in any way? If so, the local angle might be developed into a local story. Even if no locals are involved, perhaps a check with local officials, companies, and experts to find out if something similar has ever happened locally, or perhaps could happen locally, might lead to a good local story.

If a news organization reports a story one day, it’s not uncommon to see follow-up stories on subsequent days by competing news organizations. Different angles and elements typically are reported about in such stories, and different sources of information are consulted.

A variation of the follow-up story is an examination of the issues associated with a breaking-news event. For example, after reporting about a major traffic accident at a local intersection, a series of stories might be done that examine ways to improve traffic safety, that explore techniques that help increase survival chances when involved in a traffic accident, that analyze proposed legislation to force automakers to build safer vehicles, or that provide a historical evaluation of the most dangerous intersections in your city.

Story ideas can come from periodic checks with agencies, departments, and groups that regularly are involved in news-making events and issues. So-called beat checks are

conducted with law enforcement agencies, legislative departments, nonprofit organizations, military representatives, and other public and private groups to determine if anything newsworthy has occurred, is occurring, or is likely to occur. Such checks often are conducted at least once a day and often several times a day.

Many story ideas come from public relations, public information, or public affairs practitioners (“Journalists Rely on PR Contacts,” 2007). In fact, research has shown that between 50% and 75% of the news stories reported by traditional media organizations have some sort of public relations connection. By using telephones, fax machines, e-mail, Web sites, blogs, text messaging, printed news releases, audio news releases, and video news releases, organizations can inform journalists about newsworthy events, issues, and developments. Such efforts are designed to generate favorable media coverage and gain publicity for clients, but with good reporting, such promotional, advocacy-oriented information can be turned into valid news stories.

Gathering Information

No matter where story ideas come from, to ensure quality journalism, it is critical that solid reporting follows. The gathering of accurate, complete, balanced, and interesting information provides the raw materials that journalists use to produce news stories that inform, educate, entertain, help set public policy, help promote social change (or the status quo), and monitor the activities/decisions of government officials and business leaders (Brooks et al., 2008, pp. 8–10; Hansen & Paul, 2004, pp. 44–45). Information can be gathered in a multitude of ways, but most fall into four major categories—reading, interviewing, observing, and experiencing.

Consulting Documents, Databases, and Web Sites

Much information is obtained by reading documents, databases, and Web pages (Alysen, Sedorkin, Oakham, & Patching, 2003, pp. 103–131; Brooks et al., 2008, pp. 95–114; Harrower, 2007, pp. 71–73; Quinn & Lamble, 2008, pp. 59–102). Books, academic journals, trade publications, newspapers, magazines, news releases, faxes, letters, memos, annual reports, case files, posters, billboards, microfiche, and e-mails are read regularly. Databases associated with government agencies, consumer groups, industry organizations, academic institutions, and think tanks are analyzed regularly. Web sites for groups, organizations, departments, agencies, institutions, businesses, and individuals are visited regularly. Blogs are another favorite information source for many journalists (Quinn & Lamble, 2008, pp. 29–41; “Survey,” 2008). Not everything you read in a document, database, blog, or Web site is true, of course, but it’s important to consult a variety of such sources as part of the reporting process.

It’s critical that reporters evaluate the quality of documents, databases, and Web sites. Who are the authors, and what are their qualifications? Who paid for the information to be made public? What’s included, and what’s excluded? Why is information included or excluded? How current is the information? Is attribution clear and sufficient? Any grammar, spelling, or punctuation mistakes? By answering such questions, reporters usually can feel confident that the information they’re sharing with the public is accurate, timely, fair, and balanced.

Talking to People

Interviewing often is the main information-gathering technique used in news reporting (Alysen et al., 2003, pp. 101–117; Brooks et al., 2008, pp. 42–60; Gibbs & Warhover, 2002, pp. 183–204; Hansen & Paul, 2004, pp. 94–111; Harrower, 2007, pp. 76–79). Talking to people, having conversations with people, is a good way to obtain answers to important questions. In addition, it’s an invaluable tool in achieving one of the main goals of journalism—to get people to explain why they believe what they believe, why they value what they value, and why they do what they do. What better way to accomplish this critical part of the journalistic mission than to get the information directly from the people involved in significant events and issues?

Interviewing can be done face-to-face, on the phone, via regular mail, via e-mail, and via text messaging. Face-to-face interviewing is preferred because it allows the interviewer to make note of nonverbal communication and environmental factors, but sometimes it is difficult, if not impossible, to meet with sources, and it takes time to make appointments and travel to interview locations. Phone interviews lose the observation component but retain some of the “human communication” aspects of face-to-face meetings and can be an effective way to gather timely information. Regular mail takes time, and the interviewer loses some control over who actually answers the questions. E-mail and text messaging can produce quicker results than regular mail, but again, some control of the interview scenario is lost, and, as with regular mail, spontaneity is not what it could or should be. Sources have plenty of time to plan their responses to make themselves and their organizations look as good as possible.

Getting people to talk about their beliefs, attitudes, values, and behaviors is not always easy, especially if they’re shy, stressed, grieving, in shock, fearful, distrustful, embarrassed, guilt-ridden, angry, or annoyed. Most of the time, most people are cooperative and willing, if not eager, to be interviewed; however, when people are reluctant to speak to journalists, several techniques can be employed in an effort to persuade the hesitant person to agree to talk. A journalist might attempt to develop a rapport with the person. A brief chat about the weather, sports, popular culture, or some other relatively nonthreatening subject can help calm an agitated or suspicious person. A journalist might start an interview with relatively innocuous questions before delving into the tougher, more threatening subjects.

A journalist might offer anonymity or confidentiality to a reluctant interview subject. Sometimes, a person will provide information if he or she knows that his or her name will not appear as part of the news story. The use of anonymous or confidential sources can damage credibility and sometimes results in the passing along of inaccurate information, so offers of anonymity or confidentiality normally are given as a last resort when all other methods to convince a person to talk have failed.

Effective, efficient interviewing truly is an art. You can enhance your chances of conducting artful interviews by following a few, basic guidelines. If time permits, and most often it does, it's critical to do as much "backgrounding" as possible prior to meeting with your interviewee(s). Backgrounding involves finding out as much information as you can about the person(s) and subject(s) you'll be dealing with. The benefits of such efforts include being able to ask better, more pointed questions; being able to better understand what the person is talking about; being able to gather useful information that you won't have to waste valuable interview time gathering; and being able to establish a better rapport with your sources by having greater knowledge and insights about what they have done and are interested in. Backgrounding can be done by surfing the Internet, consulting databases, reading books, reading magazines, reading newspapers, reading news releases, visiting libraries, checking your news organization's archives, talking with your colleagues, talking with friends of interviewees, talking with family members of interviewees, and talking with associates of interviewees.

Once you've gathered an appropriate amount of background information, you can begin to finalize the process of developing specific questions to ask your source(s). It's a good idea to prepare a list of questions, a long, complete list. Creating a list helps build confidence, provides a roadmap for the interview, and gives you something to fall back on if memory fails or a source refuses to answer your first couple of questions. Don't be too tied to your list, though. Be ready to depart from the list if the interview takes off into new, interesting, and unanticipated territory. Be flexible, and ask spontaneous or follow-up questions when appropriate. Always be on the lookout for unique angles and information. If they come up, explore and develop them. They'll likely be more interesting and/or important than what you had planned to explore.

You won't be able to pick up on unexpected interview paths if you don't listen to what sources say in response to questions. Too often, reporters really don't listen to what sources say in response to questions. This is especially true if the interview is being recorded. No matter what the situation and what technological assistance you have, listen carefully and analytically. Ask follow-up questions. Ask for clarifications and explanations. Take notes, too. Taking notes is a good form of feedback for the source. It shows that you care enough to write down what he or she is saying. If you're interviewing a source over the phone, let him or her know that you're taking notes. Taking notes can save you time

when it comes to preparing your final product (you won't have to listen to the entire recorded interview over again), and you never know when a recording device might fail you.

Be sure you're talking to the right people about the right things, events, and issues. If you're reporting about renewable energy sources, talk to experts on that specific subject. You also might want to talk with experts in related fields, but your main focus should be interviewing on-point, on-issue experts. Ordinary people who are or who likely will be affected by or who are associated with the issues can provide useful information, too.

Strive for a balance among your sources. It's traditional that journalists attempt to include all (or as many as possible) sides of an issue. That means talking to proponents *and* opponents *and* those on the fence. In addition, it's critical to balance sources on as many dimensions as possible, including age, gender, race, occupation, educational attainment, political party, income levels, geography, and religious affiliation. You won't always be able to achieve complete balance for every story, but it's a good goal to have, and over time across the variety of stories you're likely to do, it's an important one to achieve. Society needs and deserves as complete a picture and understanding of the beliefs, attitudes, values, and behaviors of its members as possible. It's the job of journalists to provide that picture and help in developing that understanding.

Good interviewers use a variety of approaches to elicit information from sources. Being flexible in your approach is the key. Sometimes you need to be a source's "friend." You need to be a sympathetic listener. You need to let the person vent and/or unburden himself or herself. At other times, you need to be more aggressive and assertive, perhaps even demanding and/or threatening. Your job is to gather information. Your job is to get people to give you information by answering your questions. Within reason, you need to do what is necessary to persuade people to answer your questions. Use your interpersonal skills to judge the situation and to get a "read" on the people you need to interview. Most of the time, a courteous, respectful, calm, and straightforward approach works best and is the most professional. Most sources generally will respond favorably to such an approach. Occasionally, when people who should talk to you are reluctant to talk to you, a more forceful, adversarial approach is necessary. Remember that nobody *has* to talk to you, but public officials and regular newsmakers normally ought to talk to you. The public doesn't have an absolute right to know absolutely everything, but it does have the right to know as much as possible. Journalists can help make that happen if they do their jobs as information gatherers well.

Quite often, it's a good idea to let your interview subjects know what you want to talk to them about before you actually go to conduct the interview. If you need to gather specific statistics or acquire specific historical information, let your sources know what you need and give them enough time to find it. A prepared interview source normally is a good interview source. There are times when

you want more spontaneity in your interviews. In such cases, you might want to be a bit more general in your request for an interview. Perhaps you don't want your sources too prepared or too rehearsed. You might want their "top-of-the-head" responses. This is especially true when you're dealing with sensitive, embarrassing, or incriminating evidence.

Going Where the Action Is

Observing the activities of people and animals, how machines and technologies operate, plus what environmental factors exist often can provide important bits of information that can be used in news stories (Brooks et al., 2008, pp. 369–370; Gibbs & Warhover, 2002, pp. 208–221; Hansen & Paul, 2004, pp. 72–84; Harrower, 2007, pp. 72–73). Carefully noting who does what to whom and with what effect, plus where it's done, when it's done, and why it's done, is critical. Noting the sights, sounds, actions, smells, and textures associated with environments helps journalists get a better feel for what the people involved in newsworthy events and issues are dealing with. It can help provide important clues for why people believe what they believe, value what they value, and do what they do.

Normally, journalists observe participants without actually participating themselves. Participant observation involves going to where the participants are and noting what they do and what they say. Generally, information is gathered rather unobtrusively, with the journalist remaining relatively passive, a sort of "fly on the wall." It is critical that the journalist avoid doing or saying anything that might cause the participants to act significantly differently than how they normally act. Eventually, of course, a journalist will need to ask questions and become a bit more intrusive, but early on, it's usually best simply to observe and take note of what takes place. If it becomes necessary, advisable, or desirable for a journalist to become an actual participant, care must be taken to avoid behavior that might cause participants to become self-conscious or to act "abnormally." Becoming an actual participant is fraught with ethical dilemmas and other problems, so in "hard news" situations, it's best to get involved only if participation seems necessary to earn the confidence and/or cooperation of the participants. In "soft news" or feature-reporting situations, becoming a participant can be an effective way to gain a greater understanding of what participants face. It can be an effective way to tell their story.

Just Do It

Journalists can gather valuable information by experiencing things for themselves (Brooks et al., 2008, pp. 369–370; Gibbs & Warhover, 2002, pp. 208–221; Hansen & Paul, 2004, pp. 72–84; Harrower, 2007, pp. 72–73). They can wear a fat suit to see how overweight people are treated during an average day. They can get a job as a fast-food worker. They can go back to school and become a student again. They can try to hit a fastball from a professional baseball pitcher. They

can do just about anything, of course, but do they do it as an announced journalist or do they go "undercover" in a type of covert "sting" operation?

In most cases, it's more professional for a journalist to identify himself or herself as a journalist, but sometimes a journalist can obtain more valuable, more accurate, and more revealing information if he or she goes undercover. Again, such extreme information-gathering methods normally are used only as a last resort when the more common and acceptable methods of information gathering have failed.

While observing participants or actually participating, journalists should be on the lookout for any written materials that might help them with their stories. Official documents, flyers, brochures, catalogs, memos, letters, contracts, bulletin board announcements, salary schedules, files, evaluation forms, diaries, journals, annual reports, Web site content, and mission statements can all provide useful information for the public and help journalists gain a greater understanding of the issues facing the participants.

Typical News-Gathering Situations/Stories

There are five typical news-gathering situations/stories that confront journalists on a regular basis—advance stories, scheduled/expected events, unscheduled/unexpected events, follow-up/reactive stories, analyses/commentaries, and enterprise stories (Harrower, 2007, pp. 66–87). Advance stories include pre-meeting, pre-speech, pre-news conference, and any other pre-event coverage. Often, such stories are designed to let people know if attending an event is worth their time, energy, and money. Such stories also can provide preview examinations of critical issues, help put things in perspective, and help develop needed meanings associated with events. The five Ws and the H come into play, of course, but good reporters go beyond the basics and seek out expert evaluations and insights about the critical issues likely to surface during the upcoming events.

Scheduled/expected events include meetings, speeches, news conferences, concerts, demonstrations, and sports events. In such situations, reporters need to keep in mind that many other journalists will be in attendance, so it is important to look for unique, or at least different, angles to report about. All the basic information should be gathered, of course, but an effort must be made to find something that can serve as a unique focus for your story. Such things often can be found by gathering anecdotes from participants, taking special note of environmental factors/features, concentrating on causes/effects/alternatives, and simply asking participants what's different about this particular event or the subjects talked about during the event. Another thing that good reporters do is to supplement the information they obtain from "official" sources—spokespeople, handouts, agendas—with information from people who are or will be affected by what takes place during scheduled/expected events. Such events should be *part* of the information-gathering process, not the end of the process.

It's important to learn as much as you can about the people and issues associated with scheduled events prior to attending the events. By doing a good job of backgrounding, journalists increase their chances of doing more meaningful, insightful event coverage. Other tips include arriving early and staying late; sitting up front; taking notes; making sure you keep the names straight of who says what; noticing environmental factors; noticing audience reactions to comments and decisions; noticing non-verbal language; asking questions of the participants; asking questions of audience members; asking questions of people who will be affected by what happens during the event; asking follow-up questions if you don't get an adequate response to a question; asking follow-up questions to other reporters' questions if necessary; analyzing why the event was scheduled; and finding out what the organizers hoped to achieve and whether they achieved it.

Unscheduled/unexpected events include traffic accidents, plane crashes, fires, robberies, murders, hostage situations, floods, hurricanes, tornadoes, earthquakes, and volcanic eruptions. Once again, it's likely that many journalists will be reporting about the same events, so, after getting answers to all the basic who, what, where, when, why, and how questions, good reporters look for unique angles to differentiate their stories from their competitors' stories. Humanizing the story—telling it by focusing on one person, family, or small group—is one common technique used.

Follow-up/reactive stories include “day-after” reporting of major events, getting responses from people affected by major governmental or big business decisions/developments, and finding related information when a competitor has a story you don't have. Follow-up/reactive stories almost always deal primarily with issues. It's important to get a variety of reactions from the people involved in events and issues, but it's also important to get a variety of comments from sources who have expertise in the areas being explored but who do not have any real stake in what is taking place or has taken place. These so-called “referee sources” include lawyers, doctors, professors, and officials outside the geographic area covered by a local news organization.

Analyses/commentaries include more personalized, in-depth explorations of events and issues. Such stories require detailed information gathering. Reporters need to find information that will help them create a greater understanding of the five Ws and the H among audience members. In many cases, reporters need to find information that will help them persuade audience members to change their beliefs, attitudes, values, and behaviors. Such efforts require consulting multiple sources of information, conducting numerous interviews, and making extended observations.

Enterprise stories include investigative reports, in-depth features, and unique-lifestyle explorations. Such stories require voluminous information gathering. Reporters must search through numerous documents, conduct numerous interviews, use a variety of observational techniques, and *verify, verify, verify* (Ettema & Glasser, 1998, pp. 139–153). Very often, the reputations of important people and influential

organizations are involved. Reporters must take great care that the information they include in their final products is as accurate, complete, balanced, and fair as possible. Reporters generally get much more time to produce enterprise stories, so they are expected to discover new sources of information and to explore such sources more fully so that they can produce stories that break new ground and reveal little-known facts about the important people and institutions in society.

What Interests Audience Members?

In any news-gathering situation, it is critical for a reporter to take into consideration the topics and things that people are interested in and care about (Brooks et al., 2008, p. 6; Campbell, 2004, pp. 104–125; Hansen & Paul, 2004, pp. 31–35; Harrower, 2007, p. 17). Attempts should be made to obtain as much information about such topics and things as possible in the time available prior to the deadline. News values/elements/qualities help in this area, too, but there are many more topics and things that people find interesting.

People are interested in events and issues that affect them in some way. They are interested in what well-known people say and do. They are interested in knowing about timely “breaking news.” They are interested in conflicts between people, groups, organizations, and countries. They are interested in achievements and the setting of records. They are interested in acts of courage and heroism. They are interested in sex and romance. They are interested in what animals do. They are interested in money. They are interested in what things cost and what benefits are associated with such costs. They are interested in winners and losers, pros and cons, advantages and disadvantages, causes and effects, impacts and meanings. They are interested in what has happened in the past and what will or might happen in the future. They are interested in what alternatives may be available to deal with current problems and situations. They are interested in timetables and the timing of events and issues. They are interested in the size of things, the number of things, and the frequency of things. They are interested in steps, procedures, and processes. They are interested in requirements, limitations, and parameters. They are interested in demographics—age, gender, occupation, educational attainment, religion, politics.

One of the worst things that can happen after a news story has been printed, broadcast, or made available online is for audience members to say “So what?” or “Who cares?” An important goal of every information-gathering effort should be to obtain information that will answer such questions. Normally, such information surfaces as part of the reporting process, but if it doesn't, a reporter must revisit sources or develop new sources to be sure that impacts/meanings are clear and that important stories are made interesting and interesting stories are made important.

The five Ws and the H provide a good framework for information gathering (Gibbs & Warhover, 2002, pp. 102–117; Hansen & Paul, 2004, p. 55). Of course, there are many more Ws than five and many more Hs than one. In fact, for most

stories, the Ws and the Hs are just about endless. They include the basic *who* is involved, *what* has happened, *where* did it take place, *when* did it take place, *why* did it happen, and *how* did it happen? They also include the following:

Who was involved?	When has it happened?	Where has it happened?
Who will be involved?	When will it happen?	Where will it happen?
Who could be involved?	When could it happen?	Where could it happen?
Who should be involved?	When should it happen?	Where should it happen?
Who is affected?	When will we know?	Where do we go from here?
Who was affected?	When should we know?	Where could we go from here?
Who will be affected?	What will happen?	Why will it happen?
Who pays?	What could happen?	Why could it happen?
Who has paid?	What should happen?	Why should it happen?
Who will pay?	What might have happened?	Why do people need to know?
Who benefits?	What is the significance?	Why will people care?
Who has benefited?	What has been the significance?	Why should people care?
Who will benefit?	What will be the significance?	How should this happen?
Who wins?	What is affected?	How could this happen?
Who has won?	What has been affected?	How much?
Who will win?	What will be affected?	How many?
Who loses?	What causes the situation?	How often?
Who has lost?	What has caused the situation?	How easy?
Who will lose?	What will cause the situation?	How difficult?
Who is at fault?	What is being done?	How high?
Who has been at fault?	What has been done?	How low?
Who will be at fault?	What will be done?	How big?
Who is guilty?	What does it mean?	How small?
Who was guilty?	What has it meant?	How well?
Who will be guilty?	What will it mean?	How poorly?
Who is innocent?	What is the result?	How fast?
Who was innocent?	What has been the result?	How slow?
Who will be innocent?	What will be the result?	

If reporters get answers to as many of the five Ws and the H questions as possible, it's unlikely that audience members will be able to say "So what?" or "Who cares?" after reading, listening to, or watching news stories.

Getting Access to Information

Freedom of the press is a relatively empty freedom if information gatherers are prohibited from obtaining the information they need to satisfy the public's right to know about significant events and issues (Brooks et al., 2008, pp. 390–393; Garrison, 1992, pp. 249–251). No person can be forced to speak to a reporter, but thankfully, most sources are either relatively willing to speak to journalists or at least can be persuaded to talk. Sunshine laws protect the right of journalists to attend meetings of public groups, and freedom-of-information laws protect the right of journalists to obtain copies of public documents. There are exceptions, of course, but most of the time, journalists have the right to sit in on meetings and official proceedings and the right to examine reports and other documents produced by governmental agencies.

Accurate, Balanced, and Fair Information

Before reporters introduce information in their stories, they should be convinced that the information is accurate, balanced, and fair (Brooks et al., 2008, pp. 10–15). Normally, this can be accomplished by getting the same information from multiple sources. Confirming information, validating it, and vetting it are critical steps in the reporting process. It's especially critical when dealing with sensitive, revealing, embarrassing, or incriminating information. Most news organizations require that a reporter have at least two sources, preferably three sources, that contain or that have offered the same, or very similar, information. Double-checking and triple-checking facts, figures, quotes, allegations, assertions, perceptions, and opinions must be a regular part of any legitimate, quality news-reporting effort.

Legal and Ethical Problems

Failing to confirm and validate information prior to sharing it with the public can lead to a variety of legal and ethical problems (Brooks et al., 2008, pp. 464–513; Campbell, 2004, pp. 126–152). Over-the-top, overly aggressive, out-of-control, mean-spirited, biased, and revenge-motivated reporting can have the same result. Typical legal and ethical problems include libel, invasion of privacy, copyright infringement, fabrication, plagiarism, sensationalism, and conflicts of interest.

Libel occurs when journalists report false information that damages a person's reputation. Invasion of privacy can occur when journalists use hidden microphones/cameras, go onto private property, falsely attribute information or endorsements to people, or give a false impression of a person to the public. Copyright infringement can occur when journalists "borrow" information from printed sources without providing proper attribution.

Fabrication is one of the major taboos in journalism. Information and quotes should never be made up. Plagiarism is another taboo. Taking the work of another writer and passing it off as your own should never be done. Embellishing and/or exaggerating information to dramatize and sensationalize the news have limited initial benefits—higher ratings and circulation, but in the long run, such tactics usually lead to audience dissatisfaction, distrust, and disbelief. Conflicts of interest can result when reporters have a stake in the topic on which they're reporting. They might have a financial interest in a piece of real estate or own stock in a company that they're asked to report about. They might be asked to report about a group or organization to which they or their family members or friends belong.

Legal and ethical problems can lead to a loss of credibility for a news organization. Since credibility is one of the major things that news organizations "sell," any loss of credibility can lead to a reduction in ratings, readership, or circulation. Reporters must do everything they can to ensure that the information that reaches the public is as accurate, complete, balanced, and fair as possible. Deadlines and difficulties associated with gathering all the information that's needed can sometimes result in some inaccurate, incomplete, unbalanced, and unfair information reaching the public, but such instances can be kept to a minimum if reporters do their jobs well and care about informing and educating the public.

Editing Improves Quality

Careful, rigorous editing by reporters, editors, and news managers can help avoid many of the legal and ethical problems that often plague journalists (Alysen et al., 2003, pp. 132–148; Brooks et al., 2008, pp. 73–79). Editing can improve accuracy. It can remove redundancies. It can increase preciseness and conciseness. It can eliminate

grammar, spelling, and punctuation errors. It can help ensure consistency in style and tone.

The editing process begins when reporters check, double-check, and sometimes even triple-check their facts. Fact checking also is done by editors and news managers. Some news organizations even have designated "fact checkers." Everyone's goal is to avoid passing along inaccurate, misleading information. One technique that helps ensure that information is accurate is to perform simple mathematical calculations whenever numbers are involved in a story. "Do the math" and/or "Check the math" are common commands/expectations in newsrooms (Alysen et al., 2003, pp. 132–148; Harrower, 2007, pp. 84–85). By adding, subtracting, multiplying, and dividing numbers, journalists can catch their own mathematical mistakes and those of their sources.

For example, a reporter writes that a local business has 10,000 customers and takes in an average of \$5,000 each day. Simple division results in an average expenditure of 50 cents per customer. Since nothing the business sells even costs 50 cents or less, clearly an error has been made. It might be that the reporter transposed the numbers or misunderstood the business's accountant. It might be that the accountant misspoke. In any case, the inaccurate information should not be passed along to the public. A call, e-mail, or visit to the accountant should be made to determine the correct figures.

Another common editing practice is to look for "red flag" words, phrases and constructions. For example, whenever the word *there* is used in a story, reporters, editors, and news managers need to consider whether the use of *there* is correct or whether the word should be *their* or *they're*. In addition, is the correct word to be used *it's* or *its*? Is it *to*, *too*, or *two*? Is it *who* or *whom*?

Other editing concerns include the following: Do subjects and verbs agree in number? Does the copy flow? Are more transitions needed? Are there any awkward or confusing spots? Are quotes inserted and punctuated properly? Is more attribution needed? Does more information need to be gathered and presented? Has proper style been used?

The Associated Press Stylebook (2008) is a good resource for reporters, editors, and news managers. It includes recommended guidelines for abbreviations, numbers, capitalization, punctuation, and other typical content-related issues. It even includes tips for handling polls and surveys, plus how to avoid libel and ethical problems.

Conclusion

One of the fundamental keys to successful journalism is the ability to "tell a good story." No matter what medium has been used, is being used, or will be used in the future to convey information to people—print, radio, television, online, cellular, holographic, journalists—if they're to be successful, have to present interesting and important

information in an attention-getting, entertaining manner. Identifying important and interesting people, events, and issues to report about is the first part of the process. By doing so, journalists play a key role in keeping the public informed, educated, and entertained.

Doing quality reporting—gathering important and interesting information—is the second part of the process of telling a good story. Finding out what people believe, what they value, and what they do, plus why they believe what they believe, why they value what they value, and why they do what they do helps us all gain greater understanding of our own culture and the cultures of others. Gathering information in a legal and ethical manner is important, too.

Editing the story to ensure accuracy, completeness, clarity, fairness, and balance; to improve grammar, spelling, and punctuation; and to improve the flow and readability of the story is the final part of quality storytelling. In most cases, the entire process—coming up with an idea, reporting and editing the final product—must be completed in less than 24 hours, and often the process must be completed within an hour or two. No matter how much time a journalist has to develop and present a story, the goal is still the same. Make important people, events, and issues interesting, and make interesting people, events, and issues important.

INVESTIGATIVE JOURNALISM

HUGO DE BURGH

University of Westminster

From the perspective of many established investigative journalists and some other thoughtful commentators, very great changes are taking place in the media ecology of the Anglosphere, of which developments in investigative journalism are merely an epiphenomenon. In the course of these changes, the name, if not the substance, of investigative journalism is being co-opted into mainstream media, rather as the worker demonstrations of the 19th century were transmuted into party rallies in the 20th century. Because of this, those who wish to preserve the essence of investigative journalism need to invent another name, another site, another rationale for it. As to why this is the case and on what grounds it is being argued, we shall return to it later.

Meanwhile, at the outset, we describe the status quo ante: the idea of investigative journalism, its conventional role in the process of reporting the news, and some of the techniques used by investigative journalists. The illustrations used in support are mostly from the United Kingdom, but what is termed investigative journalism in the Anglophone countries is increasingly found in many other societies, from China to Italy, from Brazil to Russia.

There is a widespread premise that an investigative journalist can be defined as a person whose profession it is to discover the truth and to identify lapses from it in whatever media may be available. Literary and filmic representations of investigative journalists are mainly Anglophone, and they are represented in general as lonely crusaders for virtue. John Grisham's novel and film *The Pelican Brief* and the film *The Insider* are typical; factual books also play up these aspects, as in *The Typewriter Guerrillas* (Behrens, 1977) and *Raising Hell* (Chepesiuk, Howell, &

Lee, 1997). However, other cultures do not necessarily see investigative journalists in this way (de Burgh, 2005).

Acts of investigative journalism are contrasted with apparently similar work done by the police, lawyers, auditors, and regulatory bodies in that they are not limited as to target, are not legally founded, and usually earn money for media publishers.

Investigative journalism is distinguished from dissenting journalism, although they are often closely connected. It is a long-standing feature of Anglophone societies that they, relative to most other polities, tolerate disagreement with authority, and it is a tradition that has been fought for, since at least the 17th century. Campaigns on behalf of this or that oppressed party, polemics for a better way of doing things, and divergence from the accepted line are usually permissible. Wartime has always been an exception.

One of the most cogent critics of investigative journalism ("the lowest form of newspaper life") believes that it is not a discipline but a cast of mind that is typical of arrogant, privileged, and sneering journalists in current affairs. Bernard Ingham (1991, p. 363), who was Chief Press Secretary to former British Prime Minister Thatcher, has diagnosed a number of journalists' diseases, of which the first is pertinent to investigative journalism: "the conviction that government is inevitably, irrevocably, and chronically up to no good, not to be trusted, and conspiratorial. This is known as 'le Carré syndrome' and so sours and contaminates the judgment of otherwise competent journalists as to render them pathetically negative, inaccurate, and unreliable. In this context, Watergate has a lot to answer for here—and across the world" (Ingham, 1991, p. 363).

Aside from the justice of investigative journalism, or its right to exist, some challenge its competence to undertake the task of scrutinizing authority on the basis that where this task is necessary, there should be legislation to create offices sufficiently skilled and resourced to do that work properly (Kedourie & Mango, 1988); this is an interesting critique that deserves to be examined further. Another view of investigative journalism is represented by Charles Moore, a former editor of the *Daily Telegraph*, who sees it as “a distraction from the proper functions of journalism, which are to report and to analyze” (Page, 1998, p. 46).

Investigative Journalism and the News Agenda

News journalism has a broadly agreed set of values, often referred to as “newsworthiness.” The news journalist makes his or her selection from a range of conventionally accepted sources of information, sources that are in effect the providers of the “news agenda” and whose regular production of information is diarized; selection from them is made according to these and other criteria of newsworthiness.

The multitude of factors that tend to condition the journalist’s acceptance of sources as bona fide and the way in which he or she treats the information have been extensively studied and are reviewed in Shoemaker (1996) and McQuail (1994), among others.

Investigative stories are different in that they may not be on the same agenda. They involve a subject that the journalist has to insist is something we should know about, in effect, by saying, “Look at this, isn’t it shocking!” But the basis of the insistence is a moral one. To some, this is the essence of all journalism, and the term *investigative journalism* only came about when most journalists had given up or forgotten what their purpose was, on account of the increasing domination of the news by the entertainment industries, job insecurity, and the greater detachment of journalists from the general population because of changes in industry organizations (de Burgh, 2008, p. 13).

Relationship to Reporting and Analysis

News reporting is descriptive, and news reporters are admired when they describe in a manner that is accurate, explanatory, vivid, or moving, regardless of medium. Analytical journalism, on the other hand, seeks to take the data available and reconfigure it, helping us ask questions about the situation or statement or see it in a different way. Clive Edwards, of the British Broadcasting Corporation’s (BBC) flagship investigative current affairs program *Panorama*, argued in 1999 that even though his program is not always investigative in the sense of resulting from long-term investigation and revelation of the hidden, in some sense, every week’s *Panorama* is telling you about things that you do not know enough about. Even a relatively

innocuous subject such as house prices will be treated such as to show you the way they are affecting society and to bring to your attention the problems caused by the situation that most people take for granted. Investigative journalists are trying to get to the bottom of exactly what is happening, and the forces behind it.

Going further than this, investigative journalists also want to know whether the situation presented to audiences is the reality. They further invite us to be aware of something that we are not hearing about at all or to care about something that is not being cared about. At its furthest extent, investigative journalism questions the basis of orthodoxy, challenging the account of reality that the powers-that-be wish us to accept.

Definitions of Significance

Whereas news deals very rapidly with received information, usually accepting what is defined for it by authority (ministries, the police, the fire service, universities, and established spokesmen) as events appropriate for transformation into news, investigative journalism is expected to select its own information and prioritizes it in a different way. The distinction is not by any means absolute, and neither are news editors as passive nor investigative journalists as active as this simplification suggests. Moreover, there are great differences between commercial and public media, national, regional, and local ones.

Taking the events supplied for them, news journalists apply news values in prioritizing those events; investigative journalism picks and chooses according to its own definition of significance. What are those definitions? Investigative journalism comes in so many shapes and sizes that it is not easy to generalize. That stories affect many is the criterion of one journalist; another is content to reveal what has been done to only one victim. There is, though, always a victim and, even if it is collective, always a villain to blame. Usually, there is a failure of the system, whether that of the administration of justice, of bureaucratic management, or of the regulatory bodies of this or that sphere. The villains may be so because they stand to make money, because they are brutal xenophobes, or because they are ignorant and deluded.

All the villains want to stop the story from coming out—or at least wish to control its presentation. A common definition of investigative journalism is “going after what someone wants to hide,” although not everything that someone wants to hide is worth going after.

The Moral Impetus

The urge to get at the truth and to clarify the difference between right and wrong is most clearly evident in stories about the miscarriage of justice, where every possible trick has to be used to encourage the audience to see an event as a contradiction of equity and where the audience, if anything,

must be presumed to be skeptical of claims of innocence by murderers and thieves. In the revelations of misconduct over the promoting and conduct of the invasion of Iraq, the context of wars in which extreme suffering was taking place has been used to demonstrate the moral dimension to what would otherwise have been merely commonplace dishonesties by people in power.

Usually, investigative journalists appeal to our existing standards of morality, standards they know that they can rely on being held by people they know will be shocked by their violation. In this sense, they are “policing the boundaries” between order and deviance. The fact that much investigative journalism ends with legislation or regulation being promised or designed is not therefore an accident.

Even if investigative journalists are less autonomous in identifying wicked things and inspiring moral umbrage than popular culture might have us believe, they may nevertheless be expanding our ideas of what we should think or care about, making us think in a certain way about an event or an issue. Moreover, the claim that they are reaching for “the truth” is not necessarily rendered absurd by the acknowledgment that there is no truth, in the sense of an absolute hard fact against which to measure their own versions, because what the investigative journalist is after, as is the historian, is a more complete version of the truth. Our minds can move toward a more complete truth by collecting good evidence and by corroborating the accounts of people, who can be shown either to be disinterested or to speak from different vantage points.

When asked what skills are of most importance to the investigative journalist, it is the desk skills that journalists mention first. By this, they mean the thorough knowledge of information sources and types and the rules that govern them, the ability to read documents for significance, and an understanding of statistics. Also needed are the empathy that will get people to talk; the ability to take account of potential impediments to truth, such as false memory and question formulation; the gall and wit to doorstep; and the ability to efface oneself sufficiently to go undercover if necessary.

Motivations

What are the aims of investigative journalism? With clash after clash between journalists and government during the 18 years of Conservative rule in Britain (1979–1997), it was an understandable assumption made by some that investigative journalism was merely a tactical weapon of the Left. The then government was very happy to fuel this prejudice in order to justify its resistance to criticism; however, there is no reason to assume that investigative journalism is a prerogative of the Left.

In fact, investigative journalists function as agents of change, in that they want to affect the way we see events or to make us care about something we have not thought of before; tell us what is and is not acceptable behavior; champion the weak; or accuse the guilty.

Investigative journalists attempt to get at the truth where the truth is obscure because it suits others that it be so; they choose their topics from a sense of right and wrong, which we can only call a moral sense, but in the manner of their research, they attempt to be dispassionately evidential. They do more than disagreeing with how society runs; they point out that it is failing by its own standards. They expose, but they expose in the public interest, which they define. Their efforts, if successful, alert us to failures in the system and lead to politicians, lawyers, and policemen taking action even as they fulminate, action that may result in legislation or regulation.

Investigative Journalism in the 21st Century

There seems to be much more investigative journalism, and a wide variety of topics is dealt with; celebrity investigators and undercover operations are more in evidence than ever before; how much of investigative journalism really qualifies as such is open to question, following a spate of revelations of dishonesty or error; it is argued that some of the most important stories are avoided.

Below are some examples of the kinds of investigations that have been undertaken in a variety of areas.

Business

Although in recent years there have been many examinations of politicians' affairs, there have been relatively few on business.

A business investigation that hit the headlines was “Ryanair: Caught Napping,” transmitted February 13, 2006. Ryanair is Europe's largest low-cost airline, operating 270 low-fare routes to 21 European countries. As the network's Web site recounted it,

Two Dispatches undercover reporters spent five months secretly filming Ryanair's training programme and onboard flights as members of the cabin crew. The reporters reveal what really takes place behind the scenes: inadequate safety and security checks, dirty planes, exhausted cabin crew and pilots complaining about the number of hours they have to fly. (www.channe14.com/news/microsites/R/ryanair_caught_napping)

Seroxat is an antidepressant drug that had for a number of years first been prescribed for adults and then for children. “Secrets of the Drug Trials: Glaxo Smith Kline (GSK),” transmitted in 2007, claims to show not that Seroxat is unsafe, because an earlier BBC *Panorama* program had already done that in 2006, but that the system supposed to monitor the drug companies is inadequate and that research supposedly written by respected academics can be ghost written by drug company researchers and their PR officers.

David Leigh and Rob Evans's work is available on www.guardian.co.uk/baefiles. In August 2008, their latest allegation was that BAE Systems, a British aerospace/defense company, secretly paid Prince Bandar of Saudi Arabia more than £1 billion in connection with Britain's biggest ever weapons contract.

Welfare

Interrogation of Britain's health and welfare provision has increased. Goaded first by the promises of reform made by successive politicians and then by the spectacle of those politicians preferring, apparently, to pour huge sums into public services rather than properly to reform them, British journalists have been unflinching in pointing out the failures of the health and welfare systems.

Cruelty and neglect in care homes for the elderly have been revealed by both a BBC *Panorama* investigation and several newspapers. *Panorama*'s "Please Look After Mum" (transmitted February 12, 2007) exposed shocking abuse, as did the *Sunday Times* investigation "Exposed: Filth and Abuse in Care Homes" (Newell, 2007), which contrasted the huge profits made from care homes with the squalid conditions of their residents. *The Observer* revealed "errors and negligence" in UK hospitals "that result in stillbirths or disabled babies," following a tradition of investigating hospitals.

Another much discussed topic was adoption. Davies (1997) brought in a new angle by showing how a way of ensuring that children born to women who, often with regret, could not bring them up might be given a stable home has turned into a business in which young women are encouraged to supply babies. While childless couples benefit, so too do lawyers and commercial adoption agencies; the agencies are accused of providing material incentives for and applying moral pressure to vulnerable young women to provide more product, that is, babies.

Foreign Affairs

It used to be a truism that only a tiny minority of British people cared what happened abroad. Now, apparently, this is not so for English audiences. Kevin Sutcliffe, head of investigations at C4 TV thinks that the events of September 11, 2001, made a big difference. Among the programs he has been able to commission as a result are a series on what has been going on inside Iraq, such as *Iraqi Death Squads*, which claims to be a revelation of how Iraq is really run today—by gangsters who happen to be the police. The program shows us the trigger-happy thugs at work and secretly films inside an illegal prison.

Public Policy Issues

The burgeoning power of the state in Britain, and the accelerating privatization of functions and their removal

beyond public oversight, is a phenomenon widely identified. Increasingly, journalists look to the making and implementation of public policy in representative areas of state activity.

There have been many programs on immigration, but one of the most arresting was when *Panorama*'s Richard Bilton went to the southern town of Slough to find out the effects of immigration on the citizens and on the local council's finances. He found out not only that at least 10,000 Poles had moved in in 3 years but also that central government no longer had any idea at all of the numbers, that local government was overwhelmed, and that earlier immigrants were frightened of the implications for the community of the waves of new arrivals. *Immigration: How We Lost Count* showed in microcosm what was happening in many other towns and cities, but the investigative element was the revelation of the incompetence of the government.

Environmental Concerns

To "whitewash" something means to cover something with a coat of white paint so that you cannot see the "reality" underneath. In the program *Dispatches: "Greenwash,"* the reporter reports on how government and companies pretend that they are pursuing "green" (beneficial to the environment) policies whereas in fact they are not. For example, a car manufacturer pretends that its cars are environmentally beneficial, whereas only a tiny number of their cars are; the government introduces regulations on housing construction but does not police their implementation, and so on.

Corruption

It has seemed, over the past 10 years, that there has been a new revelation almost every week. The first to hit the public consciousness was the Ecclestone Affair, when the eponymous racing promoter paid millions to the Labour Party in the belief that his company would be exempted from new legislation. The one that is probably indelibly dyed into the consciousness of the British public is the investigation of Prime Minister Blair over selling seats in the Upper House of Parliament, which dragged on until, at about the same time, politicians managed to squash the inquiry and Tony Blair resigned both from office and from Parliament.

When is a work of journalism investigative and when "merely" analytical or even polemical? This question has often been asked of the work of, for example, Peter Osborne, who has produced three books that tell us a great deal about how Britain is run; the most powerful of them, *The Triumph of the Political Class* (2007), was produced just as we went to press. In Osborne's work, it is the factual revelations that shock, as much as the arguments derived from them. He, and others, have theorized about the rise of a political class in Britain as representing a complete rupture with the politics to

which we are accustomed, retaining only sufficient of the outward forms of past politics to deceive us into thinking that the content remains.

Mere polemic would not back his assertions with more than cursory evidence, but Osborne has assembled a good deal of evidence and examined it within the perspectives of recent past practice in British politics and political theory, so it is much, much more than polemic. He treads a path first marked out by Bob Franklin, when he identifies the ways in which the 1997 government sought to politicize the civil service, and by Ivor Gaber and Steven Barnett and in several books by Nicholas Jones, when they described the government's misuse of the media. Osborne goes further, showing how there has been a change in the nature of government and showing the development of a culture of bullying and manipulation as well as a subverting of normal procedures, which has had disastrous results.

Some of Osborne's best work is his analysis of the behavior of the Standards and Privileges Committee of the House of Commons, where he revealed how Standards Commissioner Filkin was persecuted and discredited, the techniques used by the leadership to nobble members, and the different standards applied to the cases of compliant and well-connected MPs regardless of political party and those not protected. The complicity of the three parties appears to make clear that the adversarial system of government is in abeyance.

Osborne goes further, too, when he shows how, to an unprecedented degree, leading members of Blair's government (1997–2007) abused their positions to enjoy sexual favors, enrich themselves, and provide gifts to their friends at public expense; to use civil servants for personal, and sometimes demeaning, tasks; to break rules of conduct that if broken by a civil servant would have resulted in sacking; to extract free holidays and other personal advantages; and routinely to lie about their transgressions. Furthermore, it seems at least plausible that British foreign policy was carried out under the influence of the only man willing to support Blair's greedy lifestyle on retirement, Rupert Murdoch, with an eye out for Blair's future earnings in the United States. Unfortunately, Osborne's researches stop there; he asks, as have others, why the clandestine and suspicious relationship between Blair and Murdoch has not been investigated properly.

The Media

Investigation of the media themselves seems to be a new excitement. BBC Radio 4's Document "Letters to *The Times*" reveals how the BBC had been complicit in government propaganda; it had sacked journalists who were skeptical about the European Union on the recommendation of a (British) Foreign Office propaganda unit.

The *Sunday Times* investigated in "How the BBC Dances to an IRA Tune" (McDonald, 1997) the demonization of the Irish Protestants and sympathy for IRA. In

another examination of the BBC, a thorough piece of investigation done by a senior BBC executive on sabbatical reported that in one particularly tendentious and influential documentary, the journalist reporting on a particular group was an outright, active opponent of those on whom he was reporting, who chose his evidence partially, excluded facts where they did not suit his case, misused statistics, selected case studies so as to mislead, distorted arguments, traduced interviewees, misrepresented the opinions of interviewees, uttered false statements, and made damaging accusations without giving opportunity for rebuttal.

To conclude this brief survey of topics, investigative journalism has covered an ever wider variety of subject matter, although its critics suggest that it avoids the really difficult, though potentially most rewarding, subjects, such as the recent prime minister's financial affairs, the governing party's relationship with postal unions, the quangocracy, local government, and the doings of all but a very few major businesses.

Format

Looking back to the 1990s, it is now clear that a new phenomenon had come about—the investigative reporter became an actor, an entertainer, much as the earnest gumshoe of yore. It started with Roger Cook, a pioneer. By the early years of this century, others had taken his ideas much further.

We see those ideas, for example, in Cook's (1993) "Bird Bandits," an investigation into the illegal export of peregrine falcons, an endangered species. The birds were sold mainly in the Arab world, where they are used in sport. The team films robbers of birds' nests and secret meetings with prospective Arab buyers. But the tease emphasizes Cook the magician. In part of the program, Roger Cook disguises himself as a wealthy and be-robbed Arab to trick thieves into selling him the birds. This is trailed heavily at the start, where Cook is shown being made up and having a false beard attached.

Soon we have other players in this game. Whereas Cook exuded a certain authority, a certain moral gravitas, the younger Paul Kenyon, of *Kenyon Confronts*, hams up a "chirpy chappie" image, making clear that he is just any old bloke, with no more skills than you and I or Maureen by the slot machine might have. He's just employing his citizen wits in "Bogus Marriage Gang Exposed" (BBC, 2001), and his hectic activity is made part of the story. The issue is serious; it seems that there are many tens of thousands of marriages that are false, in the sense that they are undertaken by strangers so that one side can gain the UK citizenship of the other. Some of the women—they are usually women—have been married in this way many times and earn a good living at it. He checks out the marriage registers to see who is pretending to a false address; treks around the streets knocking on doors to locate the

couples he wants to check up on; videos weddings to show how dodgy they are; pretends to be a wedding photographer and, scattering confetti, and calls out for the grooms to kiss the brides.

From cheeky chappie to sex symbol: Donal MacIntyre of *MacIntyre Undercover* shows off techniques and torso. In the trailer, you see him stripped off to wire himself up for recording, unshaven chin exuding maleness, the deep voice that of the seducer. The *MacIntyre Undercover* series have covered many different subjects, including football hooligans; homes for subnormal children, and the European fashion industry, where MacIntyre found that the people responsible for taking care of young models were both getting them hooked on drugs and enjoying them sexually. At the start of each program, he introduces himself: "I'm Donal MacIntyre, and I'm a reporter for the BBC." He then reviews his recent achievements, over clips of himself in dangerous situations with thugs, rapists, and gangsters. You know that with Donal, you're in for something juicy: violence, sex, corruption, cruelty. It's like those old-fashioned horror films that start with the vampire sticking his teeth into the virgin's neck at the very start. Shudder, and enjoy!

By contrast with the butch style, ITV, in August 2007, introduced Nina Hobson, the *Undercover Mum*. Hobson is given to us as "an ordinary mum with two children. She used to be an undercover police officer investigating everything from rape to robbery." In a three-part series, Hobson investigates family issues: children's food, teenage drinking, and families that are going thousands of pounds into the red to fund their lifestyles.

Techniques

The key skill required in investigative journalism is research. The journalist needs to know how to get information, how to analyze it and how to evaluate it. But whereas a few investigations tell you how they go about that—as does the film *Erin Brockovich*, there is more and more emphasis on the entertaining aspects:

- Infiltration
- Impersonation
- Secret filming
- Dramatization
- Reconstruction

Infiltration

Perhaps the most famous British infiltration of the period was Mark Daly's, reported in BBC's *Secret Policeman* in 2003. He joined Greater Manchester Police as a trainee and spent 5½ months posing as a probationary constable.

He secretly filmed at the national training center in Warrington, Cheshire, recording commonplace racism among police recruits. He was arrested in August and accused of getting his salary by deception. Immediately

after the transmission of the program, several police officers were dismissed, but the then minister responsible for domestic security criticized the program and suggested that the BBC intended "to create, not report" a story.

In *C4 Dispatches*: "Undercover Mosque," a reporter joins various Muslim communities and claims that he proves that "an ideology of bigotry and intolerance is spreading throughout our country, with its origins in Saudi Arabia." The Muslim Wahabi sect of Saudi Arabia is training young imams and activists, then sending them around the world to replace more moderate, peaceful, imams. These imams are taught to believe that all non-Muslims are enemies, that Muslims should overthrow, or at least undermine, non-Muslim states. The documentary secretly films imams stirring up hatred against non-Muslims and advocating war against them. It also finds hidden Web sites and DVDs for children spreading hatred and encouraging martyrdom. The documentary later came in for criticism from West Midlands Police, which made a formal complaint to Ofcom, the regulatory body, claiming that it was "distorted." This was rejected by Ofcom.

Impersonation

Zaiba Malik, working for *Guardian Weekend*, spent a month undercover as a hotel cleaner. She described the exceedingly hard work, poor pay, low standards of sanitation, and rough working conditions, in particular of those cleaning luxury hotels (Malik, 2006).

A black Englishman goes to Africa to experience the journey that an illegal immigrant must make if he wants to get to the United Kingdom from Africa. In *Dispatches*: "Living With Illegals," he is sometimes accompanied by (an invisible) cameraman, sometimes not. We see him, for example, after he has been smuggled to Spain from Africa, trying to earn some money by selling flowers on the street and trying to find somewhere to sleep in bank lobbies.

Secret Filming

You can trick the audience into thinking that they are watching something of some weight, of some importance by putting some secret filming in, perhaps using a couple of doorsteps, so using all the old tools that we would have used to do serious investigations, and the bonus of course for the TV companies is that it's an awful lot cheaper. So you can easily get a house and attract some dodgy plumbers in there, and you could probably turn that around in a couple of weeks and put it out on some prime time slot, and it will cost you a tiny amount. Whereas we know that a serious investigation would normally take at least a year to do depending on the subject matter. It's become increasingly less viable to do long-term investigations like that, and I believe they have been supplanted by some of the broadcasters by things that give the appearance that a lot of work has been done when it hasn't really. (Kenyon, 2007)

More and more undercover operations are being undertaken. Technology has been a major factor.

Now your reporters are carrying more or less undetectable and certainly very small pieces of technology that can record for a very long time. That has had an impact on what people expect of investigation—people want to see things now. Whereas before a reporter would tell you things, now often a piece of investigative journalism gets noticed because it's showing you things. (Sutcliffe, 2007)

Although traditionally we had done secret filming for gun crime and serious criminal practice, commissioners realized that viewers come in as soon as they see secret filming because they think it's going to be intriguing. So I think the bar was dropped very much lower to the point where they said, "Look, we can actually do dodgy builders and dodgy plumbers and dodgy estate agents, and we can do all that kind of things, bring in a very good audience; we use all the same tools that we used to use for serious investigative journalism, now we use it for this kind of watchdog area, consumer affairs type journalism," and I think they realize it's an awful lot cheaper. (Kenyon, 2007)

C4 Dispatches on postal workers in May 2004 was fiercely criticized by the postal workers union as an unfair and misleading representation of post office workers as lazy, dishonest, and inefficient. However, the company itself, Royal Mail, was fined £11.7million in February 2006 for "disastrous failings," which were discovered as a result of investigations by PostComm, the industry regulator. These inquiries were undertaken after the revelations made in the *C4 Dispatches*.

Reconstruction

It is unusual to have more than a few seconds of dramatic reconstruction in a documentary, but *Panorama*: "A Fight to the Death" is almost entirely dramatic reconstruction. Here it was considered necessary because very few of the events it reveals and analyses could be filmed. The subject is a very sensitive one—exactly what happened over the Kelly Affair, when the government scientist Kelly killed himself after he was quoted by the BBC reporter Gilligan as having said that the British government knew that its reasons for the war in Iraq were false. There followed an inquiry by a senior judge, at which Prime Minister Blair had to defend his behavior.

Dramatization

The film *Ghosts* illustrates a new trend—investigative journalists using what have traditionally been considered quite separate media. A number of them have recently branched into comedy, putting on satirical shows based on in-depth research; others have written plays for the theater.

C4 Ghosts is a drama film of 96 minutes. The reporter Nick Broomfield is famous for his observant documentaries. This time, he chooses to tell the tale of a group of Chinese cockle-pickers who drowned off the Norfolk coast

because their gangers did not tell them about the dangers of the sea tides. He wanted to show the dark side of illegal immigration, using this story as a case study. The trailer shows the deaths of the cockle-pickers, desperately crying out for help as the waves engulf them. The young woman in the party uses her cell phone to call her little son in China for the last time, and we then find ourselves in southeastern China a few months earlier, as the same young woman is making the momentous decision to buy her way to the West so that she can earn the school fees her child will need. We see the whole process, from being sucked in by the promises of a local broker to the appalling journey, smuggled like contraband goods; the tragic squalor of living with other desperate people and the misery of being unable to communicate; the succession of short-term jobs, from the pay of which her Chinese master lifts his share. It is deeply moving but also well researched.

Another drama based on current affairs investigation that deserves note is Tony Marchant's *The Mark of Cain*, transmitted on C4 in October 2007. Struck by the nonchalance by which a young British soldier had, when home, handed in to be processed a roll of film of the abuse of Iraqi detainees, he decided to try to understand how youths can become so insensitive. He and a colleague investigated the case, as it became, of abuse by the Royal Fusiliers and the trial of the soldiers. By the time the drama was transmitted, two further cases of atrocities by young British soldiers had been revealed, such that his drama, highlighting the contrast between the high moral sentiments of the commanding officers and the culture of brutality in the ranks, seemed vindicated as a cameo interpreting what appeared suspiciously as if it might be a common phenomenon.

Conclusion

With the huge increase in media of many different kinds that has followed from digitalization, all have to compete for attention, such that the stories have to be more gripping so that they compete with drama and the cutting has to be faster to compete with commercials. All these factors make for more investigative journalism, or apparent investigative journalism, more rapid work and more risk. Thus is investigative journalism affected by market developments.

There are other changes. Issues and stories are personalized to conform to the culture of human interest that now permeates most journalism. Celebrity culture, or the giving of prominence to individuals because they appear to be glamorous or powerful, requires that journalists too need to compete, so they promote themselves.

Increasingly, journalists are more assertive; they take moral positions and step forward with their own ideas instead of merely reporting or interpreting events. Events in Georgia and Ukraine in particular bear this out. Connecting with all these changes is the fact that journalism is increasingly "globalized," at least in the limited sense that it is influenced by the international.

Not only does the Internet pervade all we do, with the potential that it provides both for international research and for cooperation, but journalists are ever more educated by international educators or by their own travels abroad. They are little by little forming an international community of like-minded people. On the one hand, this may make them more detached from their own countries and publics. On the other, it may also give them valuable contacts and a certain independence. This may result in outcomes such as journalists abroad helping journalists to expose what cannot be revealed in their own country, as in the case of the revelations of SARS in China and other notable stories.

Anna Politkovskaya's bringing to light the shameful behavior of the Russian military in Chechnya is an important example. Her book, *A Small Corner of Hell: Dispatches From Chechnya* (2003), was published a few months before she was murdered. She received worldwide encouragement, and her audience was bigger outside her own country than it was within it.

Globalization may simply give a wide audience to something that might in the past have been restricted in its diffusion—Seymour Hersh's stories, for example. This veteran American reporter, famous for his influential reports of the My Lai massacre of the Vietnam War, revealed the torture at the Abu Ghraib prison during the second Iraq War.

Or it may permit hundreds of journalists working together to produce a book such as Stephen Grey's (2006) *Ghost Plane*. He relied on his international colleagues to help track the international story of how prisoners from Iraq were being transported all around the world to be interrogated.

All these developments have intensified the relationships between government and investigative journalism, as the number of books dealing with these relationships, and cited here, bears witness. The UK studies I have cited suggest that while something is indeed wrong in the relationship between the media and politics in Britain, to blame the media is to fail to look at the forces framing and driving those media. Politicians get the media they deserve: Only they can get us out of the mess they have got us into, perhaps by attending to the forces that influence the media. Why is there sensationalism and chicanery? Why are corporate and political interests so powerful as to stymie important investigation? The legislation that provides the framework, that drives the competition and sets the standards, is at least partly to blame.

From an international perspective, the idea that the media in Britain have become the enemies of democracy is a curious one, since elsewhere they emancipate, even where they do so against great odds. All over the world, the media are acquiring new functions and demonstrating new types of influence over society and politics. Institutional and technological changes that are global combine with local political and cultural circumstances to hand the media new powers.

And the most powerful development in investigative journalism may only be just starting to show itself: blogging. As the conventional media is less and less trusted to investigate certain areas and as the exposure of marginal areas of life are undertaken using techniques so that they can be claimed to be investigative journalism, it may be that we turn to specialist Web sites and blogs to provide what the critics say is missing from the mix. Yet meanwhile, the mix still offered by the conventional media is varied and contains much that is well worth revealing. Investigative journalism remains a powerful force and an essential counterbalance to the pretensions of those who have power over the rest of us.

MAGAZINE AND FEATURE WRITING

EDWARD JAY FRIEDLANDER

University of South Florida

Magazine articles and newspaper feature stories in the United States have been somewhat closely related journalistic forms since the 1800s, when the newspaper feature story first appeared as a genre distinct from the breaking news story. The history of the relationship between the magazine article and newspaper feature story is extremely murky, but there is some evidence that magazine article writing in the United States began to be significantly influenced by newspaper feature writing style beginning in the late 1800s, and that the two related styles essentially merged in the late 1990s. The few differences existing now are largely explained by the differences between magazines and newspapers, as well as by their significantly dissimilar operational practices. As magazines and newspapers develop more extensive Web sites in the 21st century and gain more profit from those sites—at the expense of the traditional printed product—articles and feature stories appearing both online and in print in magazines and newspapers will become more important, more prevalent, and much more similar if not essentially identical.

History

Magazines historically have been storehouses of a variety of reading material and usually have been published infrequently enough to permit generous deadlines for their writers and—in the past 50 years—rigorous fact-checking for accuracy. In addition, in most magazines, article paragraphs are longer than are their newspaper counterparts, and stories, in fact, are much longer.

In the United States, general-circulation magazines coexisted with magazines with more narrow audiences from the 1800s until the middle of the 20th century, when general-circulation magazines such as *Life* and *Look* began to vanish. These large-circulation, general-audience magazines gradually were replaced after the 1950s by a tidal wave of specialty publications, ranging from magazines for cat owners to publications for airline travelers using a specific carrier to magazines for owners of specific types and brands of computers.

As a result, articles for U.S. magazines today typically are aimed at a carefully targeted readership rather than a large number of undifferentiated readers. Magazine publishers and editors usually know exactly who their readers are, including their gender, age, income, and lifestyle, and these editors insist on articles carefully targeted to those readers. At the same time, magazines, which historically have had small staffs compared with newspapers with similar circulation, and find their staffs shrinking even more, must rely more than ever on freelance writers and photojournalists to meet these article needs. The freelance process, by the way, begins with a written article proposal called a *query*. If an editor accepts the query, the article is written. When the article is accepted or published, the writer is paid.

Newspapers, too, have historically been storehouses of a variety of material, but those stories have been produced under a daily or weekly deadline for a broad audience, with modest fact-checking, if any at all. Paragraphs are short, and stories in print are short, too. In addition, newspaper feature stories are usually staff written, and only newspapers with large feature sections or Sunday publications purchase significant amounts of freelance material. Staff photographers usually provide the photographs.

By the late 1990s, as noted, magazine articles and newspaper features began to look similar, separated mostly by the magazine's need for a highly targeted story and the newspaper's desire for a story of interest to a more general readership. Magazine and newspaper online article and feature story versions often are quite similar if not identical in structure.

Comparison of Newspaper and Magazine Feature Forms

The 21st-century magazine article and newspaper feature story share a common overall structure, whether published online or in print.

Although there are many literary forms used to begin a feature, articles and features often begin with a number of *descriptive* sentences or paragraphs called a *lead* or *lead block*. Here is a typical descriptive lead block from a magazine story about a major earthquake destined to strike Arkansas, Illinois, Missouri, and Tennessee by 2050. The “giant” in the lead paragraph is the New Madrid Fault and the resulting temblor.

The first people to feel the wrath of the giant are driving south from Blytheville, Arkansas, on Interstate 55.

Near the Burdette, Arkansas, interchange, about seven miles south of the city, the highway pavement begins to shake and roll. Drivers, already straining to see in the twilight of an early December afternoon, struggle to keep their cars on the heaving, buckling road.

At Arkansas Northeastern College, south of Blytheville's main business district, students walking to class lose their balance and fall to the ground while glass shatters around them.

In the Blytheville business district, the shaking lasts for what seems like a full two minutes.

When the earth finally stops moving, downtown is burning rubble. The giant has turned multistory buildings into piles of masonry and wood. The giant has also wrenched and partially collapsed single-story buildings. Live wires dance across the torn, buckled pavement of Highway 61 south of downtown.

Throughout the city, fires fed by broken gas lines send flames 40 feet into the air. Water from smashed pipes spurts skyward, then cascades down the sides of broken buildings and across the city's cracked streets.

In residential areas, the giant has torn many homes from foundations. Walls are cracked, ceiling fans are pitched to the floor, and bookcases and furniture are overturned.

In some parts of town, structures sink into the now-jellied earth, and the ground, in turn, forces some objects, including septic tanks, to the surface.

The giant, of course, is an earthquake, long awaited and long dreaded by area residents, and long predicted by geologists. The quake is of an intensity geologists would call “moderate,” measuring 6.5 on the Richter scale.

Unlike a newspaper news story, in which the lead is usually only a paragraph or two, the magazine article or

newspaper feature story lead may be many paragraphs and as much as 10% of the entire story. That is, in a 5,000-word magazine story, the lead could be 500 words. The lead above is 275 words, or about 11% of a 2,500-word story. The final lead paragraph, of course, leads the reader into the middle and largest part of the article, which traces the history of earthquakes in the Mississippi River Valley, the geological causes, the probable destruction, and suggestions for the preservation of people and property.

Between the lead and the ending, the typical article or feature is usually *highly descriptive* and laden with direct, partial, and indirect *quotations*. Magazine articles and newspaper features also often have an easily discernable *point of view*, and for that reason, they are often described as *subjective* rather than objective.

An online or printed newspaper and magazine feature story is typically *structured* with a distinct beginning, middle, and end. The most common linking structure is *chronological*, although many articles and feature stories present a *problem* and then end with a *solution*. More rarely, articles and features will present a concept in the lead and then *repeat* it through the story until the end.

Finally, articles and features often end with descriptions or quotations that link readers back to the beginning of the story. This is sometimes called a *tie-back* or *circle technique ending*. On occasion, articles and features will simply *summarize* the essence of the story. This is in contrast to the traditional online or print breaking-news story that simply stops, having reached the least consequential part of the story.

Online versions of the same magazine article or newspaper feature story that are simultaneously or later published in a printed magazine or newspaper often appear to be a little shorter, but only because of embedded links that lead readers to small related chunks of the story called “sidebars” or to external Web sites that provide additional details.

Story Topics

There is no standard list of magazine article and newspaper feature *story topics*. Most newspaper feature and magazine article writers cannot even agree on what to call some common feature forms, and there are many variations in these forms. To be sure, however, there are at least 10 *story topics*:

1. *Anniversary* stories, which recall persons or events
2. *Business* stories
3. *Decalog* stories, which depend on a 10-best or 10-worst list
4. *Explanatory* stories, which show how processes such as earthquakes occur
5. *First-person* stories written about events that happened to the writer

6. *Historical* stories about people, places, or events
7. *Medical* stories of afflicted people, disease processes, or pending cures
8. *Profiles* of people, places, and events that are interview intensive
9. *Travel* stories, which often incorporate other story types
10. *Unusual occupation* stories, which focus on individuals with strange jobs.

Examples of Blended Forms

Both magazine and newspaper feature stories are often blended in several ways. A story written for a magazine may appear essentially unaltered in a newspaper, and a newspaper feature story may appear in a magazine, although perhaps with somewhat longer paragraphs. In addition, both magazine articles and newspaper features—while now almost indistinguishable—often incorporate blended elements such as leads, structure, endings, and topics.

For example, the leads may be blended. For example, here is the *descriptive* lead used in the earlier example blended with a *quotation* lead:

“I knew I was going to die,” John Clark says. Clark, of Fayetteville, Arkansas, was one of the first people to feel the wrath of the giant. He was driving south from Blytheville, Arkansas, on Interstate 55.

Near the Burdette, Arkansas, interchange, about seven miles south of the city, the highway pavement began to shake and roll. Clark and other drivers, already straining to see in the twilight of an early December afternoon, struggled to keep their cars moving down the heaving, buckling road.

In addition, the narrative structures may be blended, as when a *chronological* narrative is combined with a *problem-and-solution* structure.

Endings can be blended, as can *story types*. For example, a magazine travel story about Los Angeles may use *decalog* story characteristics in listing the 10 most interesting mammals at the Los Angeles zoo or the 10 most dangerous street corners in Los Angeles. If the story is aimed at amateur historians, the story type might be a blend of the *decalog* story type and the *historical* and *travel* story about the 10 most famous locations used in Hollywood motion pictures made in the 1930s.

Superb examples of the blending of the magazine article and newspaper feature forms—structure, including lead, structure and ending, and story type—are exemplified by the winners of the Pulitzer Prize for feature writing. The Pulitzer contest, which is for newspaper entries, is extremely prestigious; the competition is intense; and the judges’ actions are closely scrutinized. More important, unlike most Pulitzer contest categories, feature writing is judged more on the basis of literary quality than whether the subject was previously covered. The Pulitzer Prize board notes that the feature writing award is “for a

distinguished example of feature writing giving prime consideration to quality of writing, originality and concision, in print or in print and online.”

The Pulitzer Prizes, created with money left by the *St. Louis Post-Dispatch* and *New York World* publisher Joseph Pulitzer, were first awarded in 1917. Prizes are given for fiction, nonfiction, drama, history, biography or autobiography, poetry, music, and journalism. As of 2008, journalists competed in 14 categories, ranging from reporting to photojournalism to feature writing. Each journalism winner (except for the Public Service winner) gets \$10,000.

Many biographies have been written about Joseph Pulitzer. Among the best known are Barrett (1941), Brian (2001), Granberg (1965), Juergens (1966), and Seitz (1924).

Books about the Pulitzer Prize award process and its history include Bates (1991) and several books by John Hohenberg (e.g., 1959, 1974, 1997).

A 25-year history of the Prize winners reveals distinctive magazine article and newspaper feature story forms in the 1970s, a slow turn toward blended forms in the 1980s, and examples of feature stories by newspapers after that in the mid-1980s that are almost indistinguishable from what would have been published in a magazine.

Beginning in 2007, the Pulitzer Prize feature story entries could and did include online components, which further muddled the differences. By the time the 2008 winner was announced, about one in five Pulitzer entries across all journalism categories had significant online components, and some included significant new material published only on the newspaper’s Web site. In fact, the 2008 Pulitzer Prize for feature writing, a *Washington Post* magazine story about a world-class musician playing for pennies in the District of Columbia subway system, featured numerous online video segments and a musical segment that significantly contributed to the story’s impact. Structurally, the 2008 winning feature story entry also was a blend of the best qualities of a magazine article and a newspaper feature story.

For these reasons, an examination of the Pulitzer Prize winners in a writing-intensive category such as feature writing is particularly helpful in explaining the varieties of feature story leads, structures, endings, and topics available.

Detailed Findings

The Pulitzer Prize board created the feature-writing category of the Pulitzer Prize awards in 1978, and the first Pulitzer Prize for feature writing was awarded in 1979. David Garlock, in his 2003 book, *Pulitzer Prize Feature Stories*, wrote that Pulitzer Administrator Seymour Topping noted that there was no information in the board minutes regarding the reason for creating the new feature category. Many journalism categories were similarly created, merged, or modified over the history of the contest.

An examination of the Prize-winning feature stories between that year and 2003 reveals 45 separate stories over two decades, though there were a few anomalies. Some

sources cite only 41 separate stories in 25 packages. This is because the Pulitzer Web site and other sources indicate that the 1980 winner, Madeleine Blais of *The Miami Herald*, won for a single story called “Zepp’s Last Stand” (1979), a profile of an elderly man who felt that he had been unfairly given a dishonorable discharge from the Army in World War I and who took a train from his home in Florida to Washington to plead his case. In undated 1986 correspondence to the author of this entry, however, Blais said that the *Herald* entered five stories in the contest:

The stories that won include an essay on friendship, a profile of Tennessee Williams, and two portraits of two families with peculiar afflictions as well as a story about an 83-year-old man who felt he had been unfairly dishonorably discharged from the army in World War One because he had been denied conscientious objector status and who took a train from Florida to the Pentagon to plead his case,

she wrote. Because the nomination package then was limited to as many as three long stories or five short stories, the Pulitzer Prize jury and/or the Pulitzer Prize board may have ignored Blais’s other stories. Blais, by the way, worked for *The Boston Globe* and *The Trenton Times* before writing for *The Miami Herald*.

Numerous books about the journalism winners cover decades of awards by each Pulitzer category or by news organizations. In addition, at least one book deals with winners who work from a specific region of the United States. For example, see Beasley and Harlow (1979). For biographical information about all Pulitzer winners, see Brennan and Clarage (1999). This book provides reliable, but not necessarily complete, information about all Pulitzer Prize winners from the first awards until 1998.

Although a writer at a weekly (Teresa Carpenter), a wire service (Saul Pett), and a newspaper magazine (Alice Steinbach) each won the feature Pulitzer, winning stories were typically produced at large-circulation newspapers, with 18 of the 23 awards won by dailies captured by *The New York Times* (4 awards); *The Evening Sun* or *Sun* in Baltimore and the *Los Angeles Times* (3 each); and *The Philadelphia Inquirer*, the *St. Paul Pioneer Press and Dispatch*, the *St. Petersburg Times*, and *The Wall Street Journal* (2 each). Large-circulation newspapers produced many of the winners because most of the Pulitzer Prize-winning stories—at least 18 of the 25 winners—were the result of long-term projects supported by publications with vast staff and financial resources. Of the 45 stories, however, 27 could easily have been published in a magazine instead of a newspaper, and all but a few of the stories written since 1990 were essentially magazine articles published in a newspaper.

It is instructive to look at the stories of the winners who weren’t from large-circulation newspapers, however. Teresa Carpenter was a writer with *The Village Voice*. Carpenter won for freelanced *profiles* about the murders of a suburban New York housewife, a popular political

activist, and a *Playboy* model. The best known of Carpenter’s three stories is the profile about the model, “Death of a Playmate” (1980), which was the basis for the motion picture *Star 80*. Carpenter had reported from Hawai‘i for a Japanese business magazine and a New Jersey monthly before beginning her freelancing career. The freelancing encompassed *The Village Voice*, and she became a *Voice* staff writer just before she won the Pulitzer.

Saul Pett was an Associated Press (AP) special correspondent. In his 60s when he won the award, Pett won the Prize after a news career that began with a job as a copy boy for the New York *Daily News*, followed by a 6-year reporting stint for another wire service and more than four decades with the AP. Pett took nearly half a year to research and write his winning entry. His story is a 10,000-word explanatory story of the U.S. government called “The Bureaucracy: How Did It Get So Big?” (1981). Pett’s papers covering his career with the AP between 1940 and 1993 are housed in the Library of Congress Manuscript Division and include correspondence, interview notebooks, stories, and other materials.

Alice Steinbach was a Baltimore *Sun* feature writer. Steinbach’s profile, called “A Boy of Unusual Vision” (1984), is about a blind Baltimore boy who, she writes, “rides a bike, watches TV, plays video games and does just about everything other 10-year-old boys do.” Steinbach, like Blais and Carpenter, freelanced for newspapers and magazines before joining a newspaper staff.

In the first 25 years of awards, winning stories shared many common characteristics. Although 25 packages containing 45 separate stories (including many multipart series) were winners between 1979 and 2003, 35 of the 45 stories were *profiles* or variations of profiles. Leads varied significantly, but the most common profile structure was *chronological*, and the favorite type of ending was a *summary*, in which events or attitudes or reactions were summarized. *Explanatory* stories were the second most common type of winner. Multimedia versions of the stories, complete with extensive commentaries by the writers and interactive Internet electronic links with the story subjects, routinely appeared beginning with the 2007 winner.

A paper by Jeanie McAdams Moore and Chris Lamb in August 2003 to the Association for Education in Journalism and Mass Communication provides additional analysis of Prize-winning features. “Angels and Demons: A 20-Year Analysis of Pulitzer Prize-Winning Feature Stories” identified several trends, including domination of the Pulitzer Prizes by writers working for large-circulation East Coast newspapers and numerous stories that followed subjects through problems or conflict. Stories with Christian references also were common, the authors concluded.

For example, the first Pulitzer for feature writing was awarded to Jon Franklin, a feature and science writer for *The Evening Sun* in Baltimore. Franklin, who specialized in explaining science and medicine, wrote about a woman named Edna Kelly, who had brain surgery to try to stop the

growth of a tumor she called “the monster.” The two-part story, later known as “Mrs. Kelly’s Monster” (1978), is a blend of the explanatory and medical feature categories, and by structure, with extremely short sentences and paragraphs, it is clearly a traditional newspaper feature story.

On the other hand, J. R. Moehringer, the *Los Angeles Times* Atlanta bureau chief, won the 2000 Pulitzer Prize for feature writing with “Crossing Over” (1999), a 10-part, 9,600-word *profile* of a woman named Mary Lee Bendolph and her Alabama hometown of Gee’s Bend. Moehringer visited Gee’s Bend over a full year. Moehringer had a good deal of experience to help him report and write this story: He began his newspaper career as a news assistant at *The New York Times*. In 1990, he became a reporter for the *Rocky Mountain News* in Denver and then moved to the Orange County edition of the *Los Angeles Times* 4 years later. Three years later, he became Atlanta bureau chief for the *Los Angeles Times*.

Through Bendolph’s eyes, Moehringer describes the possibilities of a proposed ferry for Bendolph’s isolated river community and its population. In a story stylistically similar to a magazine story, Moehringer effectively reduces the struggle for equal rights in the United States to the relationship between the people of a rural African American community and the residents of the nearby, predominately white community of Camden, Alabama.

The backgrounds of these writers varied more than their stories, by the way. Winning the feature Pulitzer typically was a midcareer accomplishment. Winners ranged in age from 27 to 64, with an average age of 40.5 years. Similarly, winners had full-time journalism experience ranging from 4 to 42 years, with an average of 17.3 years of experience. Most of the winning writers held journalism degrees. Twenty-two of the 25 winners had undergraduate college degrees, with 12 holding degrees in journalism and 10 with degrees in other areas, mostly English. Nine had master’s degrees, with seven of the winners holding graduate degrees in journalism. In all, 19 of the 22 winners with degrees had either undergraduate or graduate degrees in journalism. Many Pulitzer winners also freelanced articles to magazines before and after winning the prize, and most also wrote books after winning.

In all, the story of the Pulitzer Prize for newspaper feature writing since the 1980s also is the story of a profound blending of newspaper and magazine article forms as well as an adaptation to the needs of the Web.

Writing Newspaper Features and Magazine Articles

Developing a Newspaper Feature

Most newspaper feature stories are written and photographed by staff writers and staff photojournalists. Feature stories may be either assigned by editors or developed by writers as enterprise stories. Many stories, however,

are written as a result of news stories. If, for example, a newspaper reported a minor earthquake on a Monday, an editor might assign a writer to report and write a short feature for Sunday publication about how readers could prepare their homes for a more serious quake.

Reporting a Newspaper Feature

Reporting precedes writing. Reporting is, of course, simply gathering information, and the feature writer reporting an earthquake preparedness story likely would interview disaster management experts in the community to determine the probability and severity of an impending earthquake. Based on that information, the writer would seek information and recommendations from local, state, and national sources regarding preparations for apartments and homes. The writer additionally would interview home improvement and specialized contractors to establish a range of costs for earthquake preparedness and also would contact state government insurance sources to determine how many readers within the circulation zone of the newspaper carry earthquake coverage, which is almost always an optional and ignored extra-cost item for renter’s and homeowner’s policies.

Writing a Newspaper Feature

With the story assigned on Monday and reporting requiring 2 days of telephone calls and interviews, it is safe to assume that writing would not begin until Thursday morning, with a Friday evening deadline looming for a Sunday print and online publication.

Depending on the publication, the writer might create a print version first and adapt it for online publication, or the writer might create an online version first and adapt it for print. In the early part of the 21st century, it is more likely that a long print version would be written first and that modification for online use would follow.

Writing techniques vary with the writer, of course, but there are two general approaches. The first approach is to complete the reporting and then write the story in one long sitting, without checking quotes, facts, punctuation, or even spelling. After the first draft, the writer would then verify the quotes and facts and perfect the punctuation and spelling. This type of writer usually takes the story through a third draft, which purges unnecessary language and tightens up the entire story. At this point, sometimes the writer also reorganizes the story for better effect. This rearranging is often done by printing the story, numbering the paragraphs, and then playing with the order on a bulletin board until an effective structure is achieved.

The second writing approach is to visualize the entire story and then write each sentence perfectly, with the expectation that there will be no revisions. A second draft, if necessary, may result in minor editing and rearrangement, but the clean draft writer rarely changes much of the story after it is written.

After the print version has been written, the writer tackles the online version. The main body of the online story is shorter, and parts that would appear in the main print body are set aside for linked sidebars or supplements. In addition, the writer will identify document links and key those to the story. If audio was recorded during the interviews, the writer would edit the audio for additional sidebar use. The photojournalist probably would prepare a gallery of pictures beyond those used in the print story and may provide video segments as well. Both the writer and the photojournalist would collaborate on additional gallery segments that would include both audio interviews and photographs in an online show.

The stories and photographs and other elements, of course, are then submitted to print and online editors, who check the material for accuracy, completeness, and balance and also further check the elements for spelling and grammar.

Publishing a Newspaper Feature

At some news organizations, the online story would be released before the printed version. At other organizations, the printed version would appear first and refer to unique online segments. At others, both versions would appear simultaneously and refer to one another.

In particular, the online version would include a reader feedback loop in which comments could be posted. The writer and photographer also might participate in a virtual discussion room for interested online readers.

Developing a Magazine Article

A freelance magazine writer working with the same topic of earthquake preparedness would approach the topic differently. There is little point in reporting and writing a magazine story if there is no market for it. (Magazines employ very few staff writers. Freelance writers provide most of the content for most magazines.) As a result, the freelance writer needs to research the market to find a magazine appropriate for the general topic of earthquake preparedness and then hone the topic to the particular magazine. For example, an insurance company magazine might be interested in a story on the topic, but the magazine writer would need to determine if the insurance company sold homeowner's insurance and if the magazine circulated in areas with active earthquake fault zones. If the magazine readers were at risk for earthquakes, the writer might have to write several versions of the story for each edition of the magazine, and each version would be linked to an individual geologic fault zone.

Selling a Magazine Article

The magazine article sales process begins with a *query* letter—either mailed or sent by e-mail depending on editor

preferences—to the magazine editor. The letter must be preceded by expert research about the magazine. Does the company offer earthquake coverage? If so, in what parts of the United States? What are the active fault zones in those parts of the country? What are the destructive expectations for these earthquakes? Minor damage? Devastation?

The writer's query letter serves several purposes. It interests the editor by presenting enough of the story for the editor to learn whether the article might help his or her readers. The letter also gives the editor a taste of the writer's style and provides the editor with information regarding the writer's writing and educational credentials. The query letter is rarely more than one page, but the best ones are usually as well-written as the articles that follow.

Reporting a Magazine Article

If the editor agrees to buy the article, either as a direct assignment or on speculation, the writer begins work reporting and writing the article. A direct assignment means that the writer will be paid if the article meets the general terms outlined by the editor. A speculative assignment means only that the editor has expressed interest and will buy the article if it meets the magazine's needs when it is submitted.

Reporting often takes weeks if not months. Writer and editors frequently exchange e-mail notes regarding progress.

Writing a Magazine Article

Writing the magazine article is somewhat like writing the newspaper feature story, but deadlines are usually both longer and more flexible. Great care must be given to matching the story writing style to the magazine writing style. Magazines often fact-check articles, and so the accuracy of the story—particularly a scientifically based story such as one about earthquakes—must be exceptional.

Depending on the agreement with the writer, several versions of the story may have to be written. In addition, if the magazine has an online site, an online version of the article with multimedia may have to be created.

Magazines often pay as much for photography as for the writer's words, and so if the magazine writer is a photojournalist, it may be possible to double the freelance fee.

Publishing a Magazine Article

Magazine lead times are long, and the writer must understand that the article pitched in January may not appear for 18 months. That lead time requires avoiding contemporary references that might change in a year. In addition, some magazines pay on publication, which means that the check will not arrive until several months after the long-delayed publication. Magazines that pay on acceptance are preferred. Fees vary, of course.

Future Directions

Just as magazines and newspapers are becoming more similar by publishing for audiences on the first available platform—usually simultaneously in print and online for magazines and usually on their Web sites first for newspapers—magazine articles and newspaper feature stories have become more similar.

The model for the magazine article and newspaper feature story of the early 21st century likely will be an article written twice. The print version likely will be long and have a sidebar or two, and perhaps several printed links to the Web for readers interested enough to pursue the story to drill down into a database mentioned in the story. On the other hand, the Web story will be sliced into multiple parts with a few paragraphs per Web page. Within those paragraphs will be links to sidebars, and within those sidebars will be additional links to database and original sources, including the feature writer's notes about how the story was reported, written, and edited. Beyond the source, links will be rich with multimedia journalism: video interviews with key sources, galleries of photographs that took up too much space for the print edition, portable document files (pdf) of source materials, and audio segments. Beyond the multimedia will be numerous Web enhancements, such as a chat room for readers and the writer and a place for readers' comments.

Conclusion

In summary, U.S. magazines in the last decades of the 20th century and the first decade of the 21st century typically were weeklies and monthlies targeted at a narrow audience and written by a few staff writers and an army of freelance writers and photojournalists whose work was completed under generous deadlines and also was typically carefully fact-checked by editors. In contrast, the typical late-20th-century and early-21st-century newspaper was a daily publication aimed at a general-circulation readership. Its feature articles were written and photographed by staff writers and staff photojournalists working on extremely tight deadlines. Because of this, newspaper feature articles often used fewer sources than their magazine counterparts did, and fact-checking was limited. Despite minor differences, the magazine article and newspaper feature story forms were rather similar between the late 1880s and the late 1990s, after which they became essentially identical except for the magazine world's targeted audiences and more generous deadlines.

It can be argued that the Pulitzer Prize for feature writing exemplifies the best in the form and the most recent Pulitzer Prize-winning feature stories are as much magazine articles as newspaper feature stories. The profile of a winning feature Pulitzer story is a nondeadline, multipart profile suitable either for a newspaper or for a magazine

and that uses a *chronological* structure and ends with some sort of *summary* of events, attitudes, or reactions. Multimedia became a storytelling factor beginning in 2007. The typical winner of the Pulitzer Prize for feature writing in the first 25 years of the award's existence was a 40-year-old journalist with 17 years of experience. The award-winning journalist held a journalism degree at either the undergraduate or the graduate level and worked for a daily newspaper with a circulation of more than 250,000 copies per day. Many also wrote for magazines as freelancers.

With feature stories for magazines and newspapers now essentially similar, the forms probably will completely merge in the early years of the 21st century, but with the added benefit of multimedia journalism. That will bring new forms, perhaps involving readers as citizen journalists. Done well, the 21st-century magazine article and newspaper feature story will provide a significantly richer experience online and in print for readers.

References and Further Readings

Hundreds of trade books offer guides to magazine article and newspaper feature writing and are too numerous to list. There also are a few widely read university-level textbooks in use for decades, including the ones by Friedlander and Lee, and Garrison. Books about the craft of feature writing include the two classics by Blundell and Franklin. The following list includes landmark newspaper stories as well.

- Barrett, J. W. (1941). *Joseph Pulitzer and his world*. New York: Vanguard Press.
- Bates, D. (1991). *The Pulitzer Prize: The inside story of America's most prestigious award*. New York: Carol.
- Beasley, M. H., & Harlow, R. R. (1979). *Voices of change: Southern Pulitzer winners*. Washington, DC: University Press of America.
- Blais, M. (1979, November 11). Zepp's last stand. *The Miami Herald*.
- Blundell, W. E. (1988). *The art and craft of feature writing: Based on the Wall Street Journal Guide*. New York: Plume.
- Brennan, E. A., & Clarage, E. C. (1999). *Who's who of Pulitzer Prize winners*. Phoenix, AZ: Oryx Press.
- Brian, D. (2001). *Pulitzer: A life*. New York: Wiley.
- Carpenter, T. (1980, November 5). Death of a playmate. *The Village Voice*, p. 35.
- Franklin, J. (1978, December 12–13). Mrs. Kelly's monster. *The Baltimore Sun*.
- Franklin, J. (1994). *Writing for story: Crafts and secrets of dramatic nonfiction by a two-time Pulitzer Prize winner*. New York: Plume.
- Friedlander, E. J., & Lee, J. (2004). *Feature writing for newspapers and magazines: The pursuit of excellence* (6th ed.). Boston: Allyn & Bacon.

Chapter 6 of the Friedlander and Lee text discusses newspaper feature story leads, structures, and endings. The discussion also is applicable to magazine articles. Chapter 8 provides variations for magazine articles.

- The Best American Magazine Writing* series (New York: Columbia University Press, 2007, and other years) offers numerous examples of award-winning magazine writing in the United States. Pulitzer Prize-winning entries for feature writing offer examples of award-winning writing for both magazines and newspapers. Prize-winning examples for the first 25 years of the award are reprinted in the following book edited by David Garlock:
- Garlock, D. (Ed.). (2003). *Pulitzer Prize feature stories: America's best writing, 1979–2003*. Ames: Iowa State University Press.
- The most recent Pulitzer Prize-winning examples are available from the Pulitzer Prize Web site at www.pulitzer.org. In addition, the *Best Newspaper Writing* series (Washington, DC: CQ Press), edited by faculty at the Poynter Institute for Media Studies and issued each year, also has many examples of award-winning newspaper feature writing.
- Garrison, B. (2004). *Professional feature writing* (4th ed.). Mahwah, NJ: Lawrence Erlbaum.
- Granberg, W. J. (1965). *The world of Joseph Pulitzer*. London: Abelard-Schuman.
- Hohenberg, J. (1959). *The Pulitzer Prize story*. New York: Columbia University Press.
- Hohenberg, J. (1974). *The Pulitzer prizes: A history of the awards in books, drama, music, and journalism, based on the private files over six decades*. New York: Columbia University Press.
- Hohenberg, J. (1997). *The Pulitzer diaries: Inside America's greatest prize*. Syracuse, NY: Syracuse University Press.
- Juergens, G. (1966). *Joseph Pulitzer and the New York world*. Princeton, NJ: Princeton University Press.
- Moehring, J. R. (1999, August 22). Crossing over. *Los Angeles Times*, p. 1.
- Moore, J. M., & Lamb, C. (2003, August). *Angels and demons: A 20-year analysis of Pulitzer Prize-winning feature stories*. Paper presented to the Association for Education in Journalism and Mass Communication, Columbia, SC.
- Pett, S. (1981). *The bureaucracy: How did it get so big?* Associated Press.
- Seitz, D. C. (1924). *Joseph Pulitzer: His life and letters*. New York: Simon & Schuster.
- Sims, N. (2007). *True stories: A century of literary journalism*. Evanston, IL: Northwestern University Press.
- Sims provides a thoughtful history and analysis of the blending of newspaper feature writing, magazine article writing, and narrative nonfiction. The roots of the contemporary magazine article and newspaper feature story structure are obscure at best. For a plausible history, see pp. 43–86 of Sims's book. Sims believes that modern newspaper feature stories first emerged in the United States in newspapers from Chicago and New York and other urban centers during the late 1880s as variations of an earlier literary form called the "sketch." The sketch, which has essentially disappeared from the U.S. newspaper journalism scene, was a creatively written article of varying length that often was entirely or partially fictional but with an authoritative author's voice. Sims suggests that editors' demands for sketches that were both accurate and objective forged the contemporary newspaper feature story by the late 1880s and early 1890s. (He also argues that the contemporary newspaper opinion column content and structure has roots in the sketch.) The newspaper feature form, he suggests, became common in U.S. magazines a decade or two later.
- Although there is some debate, most observers agree that variations of these 100-year-old literary forms now dominate the U.S. magazine article and newspaper feature structure, whether online or in print. As a result, it follows that most if not all of the Pulitzer Prize-winning newspaper feature stories are descendants of the 19th-century sketch, and most of them also are models for magazine article content and structure.
- Steinbach, A. (1984, November). A boy of unusual vision. Baltimore, MD: Baltimore Sun.

PHOTOJOURNALISM

JAMES E. MCNAY

Santa Barbara, California

Photojournalism Defined

Photojournalism is first and foremost making pictures that tell stories. Initially, photojournalists used still-photography cameras and film to do this work. Today, they use digital still cameras, video cameras, and computers. The key is this: They are working to do nonfiction storytelling that informs a wide audience about their community and the world.

For the professional, the essence of photojournalism often means covering news. Definitions of news can include what people want to know or need to know. News has also been described as what people are talking about.

News coverage often includes events in the local community where the photographer lives. Local festivals, parades, and county fairs might qualify as local news, since they are often daily events and are of interest to people in the community. The resulting pictures often fall into a picture category journalists call soft news or features, since the content of the pictures is often interesting to the viewers but less dramatic than pictures from major news events.

News pictures also could be about events of national or international importance near where the photographer lives or in locations where the photographer must travel to provide coverage.

At certain times and for certain media outlets, select topics come under the news heading. These include sporting events, award shows (Academy Awards, Grammys, Emmys, Tonys), and coverage of things such as fashion week in New York or a large automobile or electronics trade show. Certainly, when companies such as Apple

Computer or Microsoft introduce new products, there is the chance this information will dominate some portion of daily news or business coverage.

Unfolding Events

There are some similarities to all these events. First, they often show reality in that what happens is beyond the control of the photographer. The event or activity unfolds in front of the camera, and the photographers record what they see to the best of their ability. Photojournalists do not direct what happens during the coverage of a fire, an accident, or a war. Even during the cleanup after a fire or parade, photographers only have the opportunity to see and record, not control the events. Generally speaking, photojournalists do not have and do not want to control what happens in front of the camera. Their ethic is, life happens in front of them, and they record it.

Portraits: An Exception to Arranging Pictures

Portraits are an exception to the preceding guideline. From time to time, members of the public, politicians, and business leaders are not able to give extended, in-depth access to their lives. However, they might have a few minutes to sit for a portrait. Photojournalists are often trained to make excellent portraits. Such work is often done quickly, with strobe lights or by making the best of available light somewhere near where they meet their subject. While some people might come to a studio for such a picture, more often than not, photographers go to the person, taking the lights

and necessary equipment with them. The resulting picture is often made in less than 5 minutes, sometimes in a minute or two, and often with excellent results if the photojournalists have prepared themselves for this type of work.

Publishing Outlets

Traditionally, photojournalists have worked for newspapers, magazines, and similar publishing enterprises. This might be as staff photographers, which means that they are full-time employees of the company. Under such arrangements, the employing company often owns their photographs. Freelance photographers (i.e., independent contractors) may also work for these organizations if the company occasionally wants their services. For many years, most magazine photographers have been freelancers. This tradition continues today.

Often, freelancers own their photographs unless they agree to other arrangements with the hiring company. Companies frequently seek some form of work-for-hire agreements with photographers. Such arrangements give the company ownership of the photographer's work. Today, many publishing outlets seek to own the photographs or even the freelancers who work for them. Many freelancers believe that such work-for-hire agreements are counter to their best interests and when possible seek to negotiate some other arrangement. By owning their work, photographers build up their own collection of photographs, which they can resell later to other clients. Retaining ownership this way provides photographers with income in future years.

The Relevance of Video

Today, photojournalists include photographers who shoot video. In some organizations, video photographers may be called videographers. They might work for local television stations, the television networks, or the Web. They may be staff employees or freelancers. With the blossoming of video on the Web, there are now more freelance still and video photographers than ever.

Citizen Photojournalists

The traditional definition of a photojournalist blurs more each day with the use of tiny point-and-shoot cameras and cell phones by amateurs to shoot digital still pictures and video. This allows everyone with such a device to record pictures and video at any moment. Invariably, from the most remote parts of the world or at the most insignificant events when a prominent person is present, a citizen is taking a still photograph or video and is recording an event of significance or embarrassment. Photo agencies and wire services often want to distribute these images. We live in a time when everyone might well assume that they are on camera at every moment.

Consequently, news organizations are using still pictures and video captured by citizens who happen to be on the scene. And while professional photojournalists may be at the location of an incident, the presence of many other cameras operating from dozens of points of view may mean that citizen journalists get the most interesting or compelling pictures of any one significant moment. Television networks have started assigning video photographers (called "imbeds") with high-quality small video cameras to cover major political campaigns as a way to acquire material beyond what their staffers and freelancers gather.

High-Definition Video

The technical evolution of video into the realm of high-definition (HD) video has altered the profession. These cameras produce video images of exceptional quality. In addition, there is enough information in each HD video frame to allow traditional print publishing organizations to frame-grab an image and publish a picture of sufficient quality in a newspaper or magazine. Consequently, some organizations have started to phase out the use of digital still cameras, since their photographers can obtain both video and still images from HD video cameras.

Photojournalist Versus Spectator With a Camera

If every photojournalist has a camera, why is everyone with a camera not a photojournalist? There are some distinctions that move the storyteller with a camera into the professional ranks.

The first is that the motivation of the photojournalist is to make an accurate visual report of what is happening in the world. While it may be impossible to show capital-T "Truth" with a camera, visual storytellers can work to show what is actually happening and can bring back an accurate visual report of events.

The ethics of journalism also dictate that stories and pictures be an accurate, unmanipulated representation of events. This means that photographs are not faked, just as reporters' quotations from people in the news are not invented. And while devices such as computers are at the heart of still and video digital editing, professionals are expected to use them to assemble an accurate representation of events. While these same tools can be used to construct images and stories from scratch, such techniques are most often left to the narrative storytelling of Hollywood and others who work in that style, a different form of storytelling from photojournalism.

Another element that separates the professional journalist from others is a review process known as editing. At a minimum, this is a second set of human eyes that examines the writing or photography before it is presented to a wide audience. In large media organizations, there are multiple editors who examine the material for accuracy and ask questions to make sure that the communication is clear and honest.

On the other hand, the material that bloggers and personal Web sites generate and post for worldwide consumption is often written, reviewed, and posted by one person only, often without a formal understanding of basic journalism practices. Even the most careful writer or photographer would benefit from a review by at least one other knowledgeable person.

Storytelling: The Heart and Soul of Photojournalism

The purpose of photojournalism is to tell stories. This can be done through one or more still pictures as well as video. Projects of varying length extend all the way to theatrically released feature documentaries.

The drive of the photojournalist or documentarian is to tell a story. One key to such stories often is finding a subject that is unusual or offbeat in some way.

The word *drive* is important because often in photojournalism there are considerable obstacles to getting a story or project completed. People may not want a story told. Journalists spend considerable time thinking and talking about how to get access to the people and subjects they want to cover. Successful journalists find a way to get access. This may also mean that journalists invest significant amounts of time and personal funds to get a project accomplished. Journalists can learn from Hollywood filmmakers, who understand that they may have to invest 10 years of their time to bring a narrative film to the screen.

Another challenge facing the journalist is to understand the nature of a story in considerable depth. This comes from doing the reading and research necessary to comprehend all aspects of the story. National Geographic photographers often say that their assignment is like a graduate course in the topic to which they are assigned. Solid research does not always lead directly to pictures. However, if fortune favors the prepared mind, then learning everything possible about a topic can set up photographers for ultimate story success.

Preparation: To Attend College or Not to Attend College

Often, photojournalists get their fundamental training through studying for a university degree. While this is not necessary, it is a common path into the field.

Self-trained photographers have always found a place in photojournalism. There have always been considerably talented individuals who learned photojournalism on their own. There are those who can look at pictures, look at the books of those who came before them, and get the essence of what it takes to make a picture, to tell a story. As long as they can tell a story in pictures, they may not need more formal education than they get from life.

Whatever path photojournalists take, today their preparation, whether in college or on their own, must include the multimedia world. This means that, besides an understanding of the still photograph, photographers need to have an idea of audio, picture sequencing, and ultimately video storytelling. Audio can be the first step on this path as skills are added incrementally over time. But photographers should start wrestling with these topics in school or early in their careers. Few organizations are looking for someone who only has still photography skills. Employers want visual storytellers with at least an understanding of audio. They probably want video shooting and editing skills as well.

Similarly, training through formal or informal apprenticeships or seminars may be all the training a photographer needs. Taking a workshop from time to time may enable photographers to grow at their own pace over time.

For those who attend college, the option is to study photography and journalism or instead to pursue some other unrelated subject. Photography and journalism programs can certainly give students a wide range of training in the essentials. These opportunities in college can give students considerable time to shoot pictures and tell stories. As students, photographers have the opportunity to experiment, to make mistakes. Such experience can prevent them from making grave errors that can bring their professional career to a quick end.

Another strong contingent among working journalists are those who say, “Don’t study journalism in college. Study something else.” They encourage students to skip journalism training to concentrate on learning about the world through a study of liberal arts, the humanities, and the social sciences. Studying political science, international relations, foreign languages, history, English, psychology, economics, or a variety of other subjects can train one about the world journalists will cover.

Whichever path one chooses, it is necessary to get trained and learn about the world. How that happens is less important than that it happens. No two photojournalists accomplish this in the same way.

Business and Marketing

Whatever training photographers pursue, in a world full of independent contractors, global economies, and a rapidly changing media landscape, it is crucial that photographers understand something about business practices and marketing. It has been suggested that at some point in their career, most photographers will go through a period as freelancers. The best protection of a photographer’s business enterprise comes from knowing something about the business environment.

Students in college can easily take business courses as electives or as the minor for their degree. Community colleges, adult education programs, and community centers often offer one-off business courses. Key topics could include how to

develop a business plan, marketing principles, business law, finance, taxation, and accounting. Students and others who serve assistantships (mini-apprenticeships) can start to learn these skills under the direction of a working professional before they start their own business and have to compete with veteran photographers with established businesses.

Professional societies also do some training in the subject of business practices and photography, either for their members or for nonmembers who have an interest. The National Press Photographers Association (NPPA, www.nppa.org) has a business practices committee that addresses this subject. Similarly, the American Society of Media Photographers (ASMP, www.asmp.org) has long been a strong advocate, urging photographers to understand the ins and outs of the marketplace. It has a collection of books on this subject and offers seminars from time to time. An online group formed to address business issues is Editorial Photographers (EP, www.editorialphoto.com). Their online discussions answer many questions.

Making the Work Visible: Portfolios and More

In the past, photojournalists showed portfolios of slides or prints to obtain work. Those days are over for the most part—unless an editor asks for pictures in this form.

Today, photojournalists' portfolios are more likely shown as pictures on Web sites. Photographers put up their best work in a way that shows their photographic strengths and interests. This makes it easy for editors to review a body of work quickly before deciding whether or not they wish to contact the photographer for further discussions.

One alternative to a Web presence is for photographers to put their portfolios on CD-ROMs or DVDs. The latter are particularly important for those showing video as part of their presentation. These can be sent to interested editors. In addition, they can be carried to an interview and are easily left in the hands of hiring managers at the end of the interview.

Seeking Critiques

Even in the digital age, it is important to get feedback on one's work. The long tradition in photojournalism of photographers having editors and photographers provide feedback about a portfolio is still valid. Traditionally, these conversations have been face-to-face. This tradition continues today largely at workshops and seminars. In place of prints and slides on light tables, the pictures are often shown on a computer.

Workshops and Seminars

Another way photojournalists get their work reviewed is by participating in workshops. When photographers convene, there is always an opportunity to have work

reviewed. Sometimes, the workshop organizers build time for portfolio reviews into the workshop program. On other occasions, photographers can request reviews informally and privately from photographers and editors at a workshop.

The additional training available from workshops and seminars comes in a variety of forms. The time involved can be a day or a week. The cost can be nearly negligible or quite substantial. Some travel and adventure workshops visiting other countries on cruise ships accompanied by high-profile photographers can run to several thousand dollars. Some of the best information about workshops comes from photographers who have attended these programs in the past.

All this brings photographers to the key question: What do I want to learn from a workshop? Where am I in my career, and what workshop will help take me to the next level I want to achieve?

If workshops are low cost, it does not necessarily mean that these workshops are of low value. An inexpensive workshop with the right instructor can be a life-changing experience.

For a longer description of all kinds of workshop possibilities, see this link: www.sportsshooter.com/news/1586.

Contests and Competitions

If one challenge in photojournalism is to build credibility and to become known to editors, one of the most powerful methods photographers use to do this is by participating in the various annual photojournalism competitions widely recognized by the industry. Like taking home an Oscar or a Grammy, photographers who win the Pulitzer Prize or the top award in World Press Photo or are anointed with one of the photographer-of-the-year titles become widely known by editors across the country and around the world.

Competitions such as the Best of Photojournalism (<http://bop.nppa.org/2008>), Pictures of the Year International (www.poy.org), the W. Eugene Smith award (www.smithfund.org/aboutfund/overview), the Robert F. Kennedy award (www.rfkmemorial.org/legacyinaction/journalismawards), and the Overseas Press Club award (www.opcofamerica.org) can add significant clout to an eager photojournalist's resume and portfolio. College students can enjoy a similar impact at the start of their career by doing well in the College Photographer of the Year competition (www.cpoy.org/?s=Home) or the Hearst Journalism Awards Program (www.hearstfdn.org/hearst_journalism/index.php).

Writing: Necessary or Not?

Photojournalism has traditionally been referred to as telling a story with a camera. It is a demanding profession, requiring one's full attention. The written story has often been left to writing journalists—people who devote themselves full-time to the written word.

That said, photojournalists are nearly always responsible for the written captions that accompany published photographs. Since they are the journalists on the scene, traditionally photojournalists have been expected to gather the facts about the events shown in the photographs. This often includes the basic information of journalism, summarized by the questions who, what, where, why, when, and how. In some publications, photojournalists write the captions themselves. In other organizations, their captions are rewritten or are written by word journalists from the information the photojournalists provide.

Even today, photographers must learn how to write basic caption information. This information should accompany their pictures when they show their portfolios or send their work on a deadline to editors. At a minimum, the caption information should be attached to the File Info window of the picture file in Photoshop. If photographers find a way to make captions available on-screen when showing a portfolio, such a move can help viewers understand the picture. This alone may cause the photographer's stock to rise with the viewing editor.

The basics of caption writing can be found in many of the excellent basic photojournalism textbooks in the marketplace. Guides from some of the wire services or stylebooks outlining the policies of major media companies are also helpful.

With that in mind, especially in an age when information gathering and storytelling are converging in new ways, those photojournalists and documentary photographers (with both still and motion cameras) who have or who develop the ability to write often open doors for themselves in ways their competitors cannot.

Photojournalists with still or video storytelling skills who can write a proposal or pitch, craft memos to foundations, or put together successful magazine, newspaper, and Web stories may find editors willing to give them assignments over their competitors. As budgets become tighter, buying one airplane ticket for a fine photographer who also has acceptable writing skills beats buying two tickets for a writer and a photographer.

By providing the written as well as the visual story, photojournalists may find an opportunity to guide or control more aspects of the story. By eliminating at least one other layer or filter between the project and the audience, photographers may help ensure that the overall coverage is seen as intended.

The same is true for documentary photographers who have dreams of long-form video storytelling. Being able to write a proposal or even a full-blown script if needed may help documentary storytellers see that their projects receive the green light and appear on the screen as intended.

Ideas: The Coin of the Realm

Perhaps rising above all other skills discussed so far is the ability to bring forth ideas that will be of interest to a wide

audience. Journalism and publication are about communicating with many people. Audiences of several thousand are believed to be better than audiences of a few thousand.

The most successful photojournalists and storytellers start with questions such as "Why is this important?" and "Why would a wide audience care about this story?" Those who can answer such questions successfully and then produce pictures and stories successfully addressing these questions will often find a place for their work.

Another way storytellers approach a project is from a personal point of view. They tell themselves, "If I find this interesting, others will find this interesting too." This approach may work to focus on one's personal taste when developing story ideas. However, in journalism, concentration on personal interests is often more risky than focusing on the potential wider audience.

Whatever the case, all storytellers will know that they have the beginning of a successful idea when they can answer in a sentence or two the question "What is your story about?" Answering such a question briefly and succinctly takes practice. Professional storytellers often imagine themselves in a 20-second elevator ride with someone who has money or the power to publish. A 20-second pitch can lead to a two-minute pitch. This can lead to a 20-minute pitch. If the journalist can tell his or her story in a short, pithy way, he or she may have a chance to see the project come to life.

But ideas are key. No photojournalist or documentary photographer should go into a meeting without several ideas rehearsed and ready. Some editors are happy to hear two or three ideas. Others expect ten. Preparation on the photographer's part is key. One noted editor was famous for saying that he had many journalists calling regularly asking for assignments. Few called offering ideas they wanted to develop.

The Importance of Having a Project

Besides having photographers generate ideas, editors are impressed when photographers are engaged in projects. It is good to show completed projects (picture stories, photo essays, multimedia stories, video documentaries). However, a few pictures shown as work-in-progress also gets editors' attention. They want to see that photographers are engaged in the storytelling process, even if those stories and projects are incomplete and will be unfinished for months to come. All this helps editors see the direction of a photographer's mind and passion. This gives editors a deeper understanding of the photographer and opens editors to what kinds of stories and projects a photographer might do for them or for one of their professional colleagues.

Internships and Assistantships

One of the ways photographers starting out gain experience in photojournalism and storytelling is by interning

with a publication or news organization. Similarly students, recent college graduates, or aspiring photographers might assist a working professional in his or her business. Both experiences are valuable and give the new photographer an understanding of the profession. Interns may be treated as regular staff members and may produce pictures for the publication on deadline. Some companies offer roles more in the background. These allow a chance for photographers to develop new content for their portfolios and educate photographers about industry practices.

Students need to find a way to generate fresh content above and beyond what they produce for class assignments. Through internships, assistantships, and self-assignments, which aspiring photographers take on outside of class, making time to create single pictures and for longer projects is the best way for a photographer to show his or her drive and special storytelling interests to potential employers.

Internship and assistantship experiences are often available to college students at publications, broadcast outlets, Web sites, wire services, and photography businesses throughout the country. Sometimes the details are posted on an organization's Web site. If not, students can often approach editors and photographers who work for such organizations and learn the details of internship possibilities. Universities often post such opportunities either on campus or on the Web. Professional organizations such as NPPA make such listings available electronically to their members.

It is not unusual for photographers breaking into the business to serve several internships while in school. Summer breaks are the high season for internships, so the most eager students work to arrange internships each year they are in school. The best internships often are competitive, so a first internship starting in the summer following a freshman or sophomore year can lead to second or third internships at major organizations by graduation.

Some internships are paid, some are not. Ideally, aspiring photographers will gravitate toward those internships that pay well. If students take unpaid internships, they should see if their school grants academic credit for completing an internship. Often, such experiences can count as an elective or as an independent study course. Students should never be asked to pay for the privilege of doing an internship. Organizations that make such demands on students misunderstand the nature of internships.

Covering War

While it is possible to have a long career in photojournalism without covering conflicts, for some storytellers, war is at the heart of being a photojournalist with a still or video camera. For visual storytellers with these aspirations, there are conflicts in every corner of the world ripe for coverage.

Wise photographers will research what others have done, before setting out on their own. Many photographers have written candidly and eloquently about what it means to be under fire. Aspiring war photographers should read some of the biographies of experienced war photographers and look at some of their videos where photographs talk about their experiences. It is useful to understand what it means to be in conflicts zones, to understand the risks.

Because photographers and members of the media are often targets to be shot at or kidnapped, photographers may want to go to battle zones with an organization, military or civilian. Media companies have people on the scene to provide some measure of support in the conflict area. If a photographer can be hired by such organizations, it may give him or her access to medical care and evacuation in case of injury.

One way to prepare for war zones before getting on an airplane is to work in some of the more challenging areas of one's own country. By finding a way to tell stories about U.S. inner cities, whether from the point of view of the people who live there or from the side of law enforcement authorities who patrol these areas, photographers can gain considerable street sense by challenging themselves with such assignments before going to a foreign country.

The Money

Like the worlds of music and sports, it is possible to make large amounts of money in photography. However, as with these other professions, only a small number of the industry's participants actually succeed at a high level. For the most part, photography is like teaching, the priesthood, nursing, acting, social work, working for NGOs (non-governmental organizations), and the like: It is not about the money. Something else motivates people to get into the profession.

In the case of journalists, photojournalists, videographers, and filmmakers, the motivation is often to tell stories. In many cases, the resulting stories and projects are intended to make a difference. While it can bring great satisfaction to accomplish these goals, it is the rare project that brings Oscar-like wealth and recognition. This means that photographers must find satisfaction in other benchmarks of success.

Because the work of photojournalism and storytelling with still or video cameras and multimedia equipment is so challenging, some argue that this is a profession people should pursue only if they cannot see themselves doing anything else. The technological challenges are considerable. The access to willing subjects seems to close down every day. The distribution of completed projects doubles the work involved in any undertaking. Unless aspiring storytellers are compelled to take on these challenges, they would do well to consider other work, unless they simply cannot imagine doing anything else.

However, those who do take up the challenge regularly report that they have chosen the best job in the world.

Copyright

One of the ways photojournalists and visual storytellers help ensure that ongoing income from the work they create is by registering their work with the U.S. Copyright Office (www.copyright.gov). Such a move helps those in the creative arts maintain legal ownership of the work they write, photograph, film, paint, and compose. It is not enough to do the work: Creative people must register their finished work with the U.S. government. The process is relatively simple and inexpensive compared with the consequences of not registering.

With the digitization of photographs and films, the opportunity to steal a photographer or filmmaker's work is easier than ever. If a photographer is good, chances are that at some point, someone will take the photographer's work for some purpose. If the originating photographer or filmmaker has registered the work with the copyright office, the opportunity to seek legal redress becomes significantly easier.

How easy? When a creative artist calls to complain that one of images or film clips has been taken and used without compensation, the first question asked in response often is, "Has the copyright on this work been registered?" If the creative photographer can answer in the affirmative, the lawyers of the person who used the work without payment or authorization take the complaint far more seriously—because the penalties for taking a copyrighted work are so much more significant than for the illegal use of unregistered work.

Ideally, the copyright law is something creative artists study and monitor throughout their careers. Congress modifies this law regularly, and courts make important decisions about copyright law all the time. Copyright is a subject to follow over time.

There are many books and resources to help with this process. In addition, professional societies such as the NPPA, the ASMP, and the filmmakers' International Documentary Association (IDA) and Web sites such as the one created by EP all follow this subject and do what they can to spread key information to participating professionals.

Trends: Looking Ahead

Perhaps the most important trend around photojournalism and documentary storytelling is that this world will become increasingly digital. Stories will be told on the Web in a multimedia environment using still pictures, audio (music, narration, interviews, natural sound), video,

and the written word. These elements may exist as individual components of the story or in a blend.

Therefore, for photographers who want to work in storytelling, the key is to learn as many of these techniques as possible—or partner with those who know them—in order to produce accurate and fair storytelling.

While it is possible for one individual to develop a wide range of software and technical skills, it is good to remember the model of the motion picture director. Starting out in the business, filmmakers often learn enough script writing, photography, audio production, lighting, and editing to do small projects reasonably well. As they advance in their careers and take on larger projects, directors often team up with friends and colleagues who have greater aptitude in certain areas of the process. This allows the directors to bring their best skills to the project and allows other highly skilled professionals to bring their diverse talents to the project.

This means that the best films, the most fascinating books, and the most amazing Web sites often result from the collaboration of many highly creative minds brought to bear on one project. While one might attempt to do something by oneself, projects often succeed when partners are involved as collaborators.

Fortunately, the Web has considerable room to display one's work. Creative minds are no longer limited to just the space of the printed page or the distribution system of major film studios. With the Web, everyone can be a publisher or a studio head. Individuals no longer need millions of dollars for a brick-and-mortar building, a printing press, or a series of theaters for a distribution system. With a computer, a blog, a Web site, anyone can tell a story and exhibit material where it can be seen.

The key, however, is paying attention to the viewer's attention span. Just because writers and photographers can post a story equivalent to 25 pages of printed material, does that mean the audience will stay with it? Just because we can post a feature-length film project to the Web, will an audience care?

Viewers will migrate to and will stay with compelling storytelling. If visual storytellers can do that, they have a chance to have their project seen by the audience they want to reach.

References and Further Readings

Getting Started

Once photographers have learned the basics of photography, they find their interest moving toward photojournalism.

Kobre, K. (2008). *Photojournalism: The professionals' approach*. Burlington, MA: Focal Press.

While there are many fine texts on the basics of photojournalism, much of what photographers want to know is in this one volume.

Readings for Early Career Enhancement

At the beginning of their career, photographers can often use a little boost from experienced photographers who have thought long and hard about picture making.

Bayles, D., & Orland, T. (2001). *Art and fear*. Eugene, OR: Image Continuum Press.

Labelle, D. (2005). *The great picture hunt 2: The art and ethics of feature picture hunting*. Lexington, KY: Kernel Press.

Magnum Photos

Founded as a cooperative at the end of World War II, this organization went on to become one of the most important organizations in photojournalism.

Miller, R. (1997). *Magnum: Fifty years at the front line of history*. New York: Grove Press.

Here is a history of Magnum Photos in which the reader will see that it is a miracle the organization has managed to survive so long.

Morris, J. (1998). *Get the picture*. New York: Random House.

The author, former director of photography at *LIFE Magazine* and former executive director of Magnum, writes about some of the key moments in the history of photojournalism, including Robert Capa's coverage of the D-Day invasion.

Important Photographers' Lives

By reading about how other photographers lived, those starting out can get a perspective for themselves and can perhaps avoid some of the mistakes made by those who have gone before them.

W. Eugene Smith

One photographer, W. Eugene Smith, deserves his own category.

Hughes, J. (1989). *W. Eugene Smith: Shadow and substance*. Columbus, OH: McGraw-Hill.

For those who want an in-depth biography of Smith, this is the volume.

Madow, B. (1985). *W. Eugene Smith: Let truth be the prejudice*. New York: Aperture.

A fine book with many pictures that draws on Smith's letters.

Smith, W. E., & Smith, A. (1975). *Minamata*. Austin, TX: Holt, Rinehart & Winston.

This was the last large project by this master photojournalist. Some say its publication helped launch the environmental movement.

Other Photographers

Capa, Robert (1999). *Slightly Out of Focus*. New York: Modern Library.

Capa admits not every word in his autobiography is necessarily true, but it is the tale told by the photographer himself.

Goldberg, Vicki (1986). *Margaret Bourke-White*. New York, NY: Harper and Row.

By reading this biography, photographers can fill in some of the gaps found in Bourke-White's autobiography covering the same material.

Halberstam, David (1979). *Powers That Be*. New York, NY: Knopf.

A classic behind the scenes look at major media institutions as only Halberstam could do it.

Hendrickson, Paul (1992). *Looking for the Light: The Hidden Life and Art of Marion Post Wolcott*. New York: Knopf.

Hurley, F. Jack (1989). *Marion Post Wolcott: A Photographic Journey*. Albuquerque, NM: University of New Mexico Press.

Kennerly, David Hume (1979). *Shooter*. New York, NY: Newsweek Books.

An inside look at TIME magazine, covering the White House as the president's official photographer, and winning the Pulitzer prize for work done in Vietnam.

Light, Ken (2000). *Witness in Our Time: Working Lives of Documentary Photographer*. Washington, DC: Smithsonian Institution Press.

By reading this book photographers learn challenges of making a successful life in photography have been consistent over the decades.

Loengard, John (1998). *Life Photographers: What They Saw*. New York, NY: Little, Brown & Company.

In this one volume this former director of photography at LIFE magazine lets us see in the careers of several leading photographers.

Meltzer, Milton (1978). *Dorothea Lange: A Photographer's Life*. New York, NY: Farrar, Straus, Giroux.

Ostroff, Roberta (1992). *Fire in the Wind: The Life of Dickey Chapelle*. New York, NY: Ballantine Books.

Chapelle was a woman photographer of considerable courage who worked for National Geographic and other publications and who was killed in Vietnam.

Parks, Gordon (1992). *Voices in the Mirror: An Autobiography*. New York, NY: Doubleday and Anchor Books.

Parks wrote his biography several times under different titles. Any of them are worth a photographer's time.

Whelan, Richard (1985). *Robert Capa*. New York, NY: Knopf.

This is the biography of Capa by a knowledgeable historian.

The Challenge of Storytelling

The essence of photojournalism is telling stories. It is also one of the supreme challenges of the profession. The volumes below give some insight into the process.

Allard, W. A. (1989). *The photographic essay*. New York: Bulfinch Press.

Although this veteran of the *National Geographic* uses the word *essay* in his title, much of what he says relates to photojournalistic storytelling.

Boot, C. (Ed.). (2004). *Magnum stories*. London: Phaidon Press Limited.

In this massive collection, members of Magnum write about their careers, and each is given a chance to describe one of the projects.

Coles, R. (1998). *Doing documentary work*. Oxford, UK: Oxford University Press.

This Harvard-based Pulitzer Prize winner has much to say about all kinds of documentary material, including photography, folk songs and tales, and much more.

Understanding War

Many photographers have made a name for themselves by finding the most interesting current war and then going to cover it. Photographers who want to understand what happens in conflict zones through the life experiences of other photographers can look at the following titles.

Buell, H. (2006). *Uncommon valor, common virtue: Iwo Jima and the photograph that captured America*. New York: Berkley.

This book tells the story of the most famous picture from World War II and the battle where it was taken. With so many World War II veterans having passed away, fortunately this amazing story is captured here, reminding us of the many fine pictures that were made during this time.

Howe, P. (2002). *Shooting under fire: The world of the war photographer*. New York: Artisan.

Kogan, D. C. (2000). *Shutterbabe: Adventures in love and war*. New York: Random House.

A young college grad decides to try photojournalism and goes to the hot spots around the world: Afghanistan, Zimbabwe, Romania, and Moscow during the fall of communism. Despite the potentially misleading title of her book, she is a serious photographer who does good work under challenging conditions.

Leroy, C. (2005). *Under fire, Great photographers and writers in Vietnam*. New York: Random House.

Leroy was one of the women of great courage who went to Vietnam and did great work. She understood the importance of writers and photographers.

Loyd, A. (2000). *My war gone by, I miss it so*. New York: Atlantic Monthly Press.

This is a no-holds-barred look at the war in Bosnia, and what a novice British photojournalist discovered in covering this brutal conflict.

Marinovich, G., & Silva, J. (2001). *The bang bang club*. New York: Basic Books.

A group of news photographers cover the passing of apartheid in South Africa. Several people are killed, several Pulitzers are won.

McMullen, D. (1992). *Unreasonable behaviour: An autobiography of Don McCullin*. New York: Knopf.

This is an excellent look at what it takes to photograph in war zones by a photographer who was “everywhere” when things were at their worst. He even survived capture by the forces of the dictator Idi Amin.

Midcareer and More

Once photographers have launched their careers, they may want help and insight on taking their careers to the next level.

Chapnick, H. (1994). *Truth needs no ally: Inside photojournalism*. Columbia: University of Missouri Press.

The head of the Black Star photo agency helped many photographers get their start in the business. Some of his suggestions are collected here.

Lamott, A. (1994). *Bird by bird*. New York: Pantheon Books.

Excellent instruction on writing well, a skill many photographers can add to their skill set. Outrageously funny as well. Worth reading once a year.

Moss, B. (2006). *Photosynthesis: A simple guide to the magic of photography*. Corydon, IN: Self-published by the author at <http://www.lifeinamerica.us/photosynthesis>

BROADCAST JOURNALISM

MARK LEFF

Ohio University

One of me.

More than one of you.

I'm not in the room with you. And I'm trying to tell you something you don't know. That's the essence of communication. If there are a lot of you, we call it *mass* communication.

If I'm talking and you're listening—or better, watching—all at the same time and what connects us is a form of electricity, that's broadcasting. If I'm telling or showing you about something that just happened, that's broadcast news. If you're not all seeing it or hearing it at the same time, you're getting it asynchronously. And if I'm a broadcast journalist, that's probably not a word I'd want to use, I'd want to use words and sounds and pictures to tell you what I know, and to do it in less time than it took me to learn it. Broadcast news is an effort to give you a sense of the reality that the reporter and/or videographer experienced. But it's a compressed reality. If you don't have time to sit through, watch, or experience an entire city council meeting, house fire, election, stock market meltdown, revolution, or that cat being rescued from a tree, radio and television news can at least give you a sense of it in a very short time.

How well broadcast journalists do their jobs can be determined in several ways. Stations and networks measure it by the number of people who tune in to hear or see the broadcasts (and the commercial announcements between the stories or segments). Some people listen to or watch certain broadcasters because they like the reporter/anchor's appearance or voice or way with words. Some people watch because they find the reporter easy to understand.

The best reporters just talk to you. And the idea of speaking the news to people who are not in the same room goes back even before the invention of radio.

In this chapter, we'll look at how broadcast news works, starting with how broadcast news developed into a particular form of journalism, then detailing the people and technical requirements for a 21st-century broadcast news operation. We'll see how a news story is produced and conclude by looking at what it takes to become a broadcast journalist.

Some History

“Jo Reggelt”

No, that's not the world's first anchor. It's “good morning” in Hungarian. Back in February 1893, you could check into a hotel in Budapest, put on a pair of earphones connected to a telephone line, and listen to men in a downtown studio giving you the news of the day. *Telefon Hirmondó* (Telephonic News Dispenser) was very similar to the all-news radio stations you can hear today in some big cities, with local news, European and world news, business news, and sports news depending on what time you listened.

An American company tried the same wired-news idea in Newark, New Jersey, in 1911. Radio would not become a mass medium for several more years. But by November 1920, people in Pittsburgh could tune in to KDKA for live election returns and hear that Republican Warren Harding had beaten Democrat James Cox hours before they could read it in the morning papers. Sometimes, just having the information makes people want to listen.

Radio and newspapers competed for audience attention throughout the 1920s and 1930s. Television wasn't introduced to the American public until 1939, and TV news had to wait until after World War II. But the *idea* of news with moving pictures had also been a reality since the late 1800s—except that you had to go to a movie theater to see it.

Silent news films were first shown in France in 1895; Abner McKinley's American newsreel company, Biograph, filmed part of his brother William's presidential campaign in 1896. Sound came along in the 1920s, and by the 1930s, Fox Movietone, Paramount, Universal, Warner-Pathe, and Hearst Metrotone were among the equivalents of NBC, CBS, and ABC. Twice a week, they would produce newsreels running for 8 minutes or so for distribution to theaters, and they would compete fiercely with each other and with the other news media to bring audiences the first words and images of the news of the day.

“Oh, the Humanity!”

Emotion is also a key factor in a good broadcast story. On a stormy day in May 1937, the WGN Chicago radio reporter Herb Morrison and his sound engineer Charlie Nehlsen were sent to Lakehurst, New Jersey, to record a radio feature story on the giant German dirigible Hindenburg making its first transatlantic crossing of 1937. Morrison was describing the slow, majestic docking of the airship when fire suddenly erupted on the hull. He tried to describe what he was seeing but simply ran out of words as the emotional impact of watching people die hit him. His recorded description (which was never planned as a live broadcast) may be the first case in American radio of a reporter “losing it” at the scene of a violent event.

Newsreel cameras were also at the Hindenburg crash. But nobody except the journalists and other people on the scene saw it “live.” More than 70 years later, we're surprised when we *don't* see something live. Immediacy is another factor in determining what makes a good broadcast story; it's one reason why radio and television newscasts have so many field reporters interacting with the anchors before or after their recorded reports.

“This . . . Is London.”

Presence is an important criterion for many broadcast stories—having a reporter “on the scene” describing or summarizing what is happening. Edward R. Murrow, who built the CBS News team of radio reporters who covered World War II, was a master of description that conveyed both factual information and emotion. His accounts of a German bombing raid on London or flying in an Allied bomber over Germany, to cite two of his most famous broadcasts, set the standard for what are still called radio on-scene reports, or ROSRs (pronounced RO-zers).

The January 1991 bombing of Baghdad as carried on CNN was essentially a ROSR. CNN had installed a special audio line to the hotel room where its correspondents were

staying, intending to use it just for communication. But once the attack began, there was no way to get live television pictures out. So, for several hours, viewers in the United States and much of the world could only *hear* the live description by John Holliman, Peter Arnett, and Bernard Shaw of what was going on. Only later did video of the anti-aircraft fire and explosions make it out of Iraq. By the time the U.S.-led coalition was fighting the second Gulf War 12 years later, American TV correspondents were broadcasting live pictures from military vehicles racing across the desert toward Baghdad.

Television and Television News Anytime

Just as radio news challenged newspapers for audiences (and advertisers) in the second quarter of the 20th century, television news was a new competitor as the broadcast networks grew after World War II. The first newscasts were short broadcasts of theatrical newsreels; in 1949, NBC began the 15-minute *Camel News Caravan* using newsfilm that its own cameramen had shot. The three broadcast networks—ABC, CBS, and NBC—eventually expanded their newscasts to 30 minutes; as of mid-2008, PBS was the only broadcast network doing an early-evening 60-minute news program, called simply *The NewsHour With Jim Lehrer*.

Radio news also expanded after World War II. In the 1960s, as demand for news grew—especially in bigger cities—some radio stations began offering nothing but news 24 hours a day. All-news radio sprang up in San Francisco, Los Angeles, San Diego/Tijuana, Chicago, New York, Washington, D.C., and other cities, where it remains a successful format. In 1975, NBC News tried a national 24-hour radio network feed called the NBC News and Information Service; it lasted only until 1977 and never made money.

But in 1980, the cable TV entrepreneur Ted Turner decided to try 24-hour news on television. CNN was born in the basement of a little wooden house next to his WTBS television studio in Atlanta and spent its infancy in the basement of a remodeled country club not far away. The growth of 24-hour cable and satellite news networks such as CNN, MSNBC, and Fox News in the United States, BBC World and Sky News in the United Kingdom, Al Jazeera in Qatar, and Euronews in France, among others, extended the 24-hour news radio concept into television—constantly updated information and images on a schedule that the audience can remember.

At the international level, the 24-hour news services often have national identities. CNN International is not Voice of America television, but it is sometimes television with an American voice. The U.S. government does fund and run television services for viewers outside the United States: Al-Hurra in Arabic and TV Martí in Spanish. BBC's international television services reflect a British

worldview. China Central Television (CCTV) International is news from an official Chinese perspective. Al Jazeera's Arabic language service has been the most successful of the various pan-Arabic news channels, and its English language channel has a distinctly Arab point of view.

And as the chapter "The Changing Nature of 'News'" (67) has pointed out, the nature of news is changing—now, some stories are available online faster and in more depth than broadcast news can possibly provide. But from those first silent newsreel films more than a century ago to the latest form of vodcast, some things remain constant about telling stories with spoken words and moving pictures.

The Big Picture: Getting It In and Getting It Out

Television news is not a career choice for hermits. Even in the smallest TV newsrooms, more than a dozen people can be involved in turning an event in one place into a report in front of a viewer's eyes and ears in another place. They work in one of two broad areas: getting the news from the source to the newsroom (known as news gathering or news intake) and getting the news from the newsroom to the viewer (known as news production).

Here are some of the jobs involved. Depending on the size of the news operation, one person may do more than one of them.

The Camera Operator. Sometimes called a videographer or photographer, this person captures the images and sound of the event. Although some small consumer-type video "camcorders" can take broadcast-quality video, most professionals use much larger cameras that can cost more than \$50,000.

The Sound Technician. You've seen pictures of news crews surrounding an interviewee where some people are holding what looks like a fishing pole with a fuzzy gray salami on the end near the person speaking. The "soundman's" job is to get the best possible audio by getting the microphone close to the speaker, while the videographer concentrates on getting the best possible image and camera angle.

The Light Technician. Some television news crews have a third person whose primary responsibility is getting the right kind of light at the right angle on whatever the videographer is shooting, whether it's a sit-down interview or just something happening in a place that doesn't have enough natural or artificial light.

The Reporter/Correspondent. The viewer sees and hears this person deliver the report from the scene or later from the studio/newsroom. He or she may gather all the information on the scene, interview all the available people, and write the script for a prepared report or make notes to do a live report.

The Field Producer. In larger news operations—especially the broadcast and cable networks—this person may do everything the reporter does except actually go on the air. Field producers often do interviews for stories, often gather information for stories if the correspondent is busy doing on-air reports, and are often the people "in charge" of coverage at the story location. That includes making all the logistical arrangements and sometimes writing the story script with or for the correspondent.

The "Truck Operator." You have all seen pictures of TV news vehicles with big dishes and/or antennas on their roofs. Some are the size of minivans; others are as big as delivery trucks and even semi-trailers. Before the Internet added yet another distribution and transmission medium, television news crews covering a story "in the field" had two basic ways of transmitting their stories back to the studio. If they were in the same city as their newsroom, they could use microwave transmission to broadcast from an antenna on the truck to a receiving antenna or a series of antennas that would deliver their pictures and sound to the station. If they were in a different city, they would have to get the story back to the station by satellite—using a different kind of antenna that relays their pictures and sound to the station through a receiver/transmitter "hovering" 22,000 miles above the earth. Both microwave transmission and satellite transmission work on the principle of "line of sight." The transmitter has to be able to "see" the receiver—either a microwave receiver that's usually on a tower like a TV transmitter tower or the satellite in space. Sometimes, in urban areas with lots of tall buildings, it's impossible to see either one from a truck on the street. And a satellite can "see" only about a third of the earth's surface. So if a correspondent is transmitting a report from China to the United States, it may have to go through *two* satellites—up and down and up and down—before it gets to the newsroom. Each of those transmissions takes time—not much, but it adds up. That's why if you watch an anchor in New York interviewing a correspondent in Beijing, there's a couple of seconds delay between the time the anchor finishes asking the first question and the time the correspondent *hears* that question 12,000 miles away.

The Assignment Editor. Usually, the most frazzled-looking person in the newsroom, the assignment editor is in charge of all aspects of news gathering, both editorial and logistical. As any good reporter does, the editor (sometimes known simply as "the desk") keeps in touch with sources and contacts and keeps track of upcoming events that are worth covering. The desk also dispatches and coordinates crews in the field, using two-way radios, telephones, and various forms of text messaging to make sure that videographers and reporters and transmission trucks are where they need to be, which is usually wherever the producers (see below) want them. As a result, assignment editors often have to think ahead in several different directions—kind of like playing speed chess. Often, the desk will do

research to pass on to reporters in the field who are too busy covering one aspect of a story to get all the information needed for a complete report. Sometimes the desk also handles the logistics for microwave and satellite transmissions from the field to the studio, though many stations and networks have a separate department for that.

The Producer. Just as the assignment editor is in charge of getting the news into the newsroom, the producer is in charge of the newscasts that get the news from the newsroom to the viewers. Producers design the broadcast using a rundown that lists each story/element of the program; who the anchor or reporter is; whether it's in the studio, newsroom, weather set, sports set or whether it's a remote broadcast from a reporter; how long each segment is; what graphics are to go with the story; and when to pause for commercial announcements. Producers make sure that there is a "flow" between related stories and often write much of the broadcast—especially the important "teases" designed to keep the viewer from changing channels during the commercial breaks. A producer may be responsible for one or two newscasts each day; there's often an executive producer in overall charge of a 2-hour morning program or a 90-minute early-evening newscast.

The Assistant/Associate Producer (AP). In some newsrooms, this person helps the producer by designing over-the-shoulder and full-screen graphics that help anchors and reporters tell stories visually. The AP often coordinates all the visual elements in the newscast, making sure that there is video for every story in the producer's rundown. Like producers, APs also write some of the newscast.

The Video Editor. Without video, a television newscast might as well be on the radio. Editors work with the material that videographers shoot locally and with nonlocal material that may feed in from a bureau in another city or from a network or news agency. Through the mid-1970s, editors worked mostly with images shot on 16-mm film—cutting it into individual shots and assembling the stories by gluing or taping the strips of film together. Then came the shift to videotape, where editing happened by dubbing (copying) shots and sounds from the camera source tape to the tape that would be played back on the air. Now, most television news operations are moving to computer-based (nonlinear) editing, using much more sophisticated versions of the simple video-editing programs found on most personal computers. Many of those newsroom computer video systems also play the edited video back during the broadcasts.

The Writer. Many newsrooms have people who write stories that the anchors will deliver on the air. Most reporters write their own scripts (sometimes together with a producer). Working from the producer's assignments in the newscast rundown, writers look at video and information (and sometimes gather information on their own) and

combine them into the most effective way for the anchors to deliver the story to the audience.

The Director and Studio Production Crew. When a newscast is on the air, the producer is in charge of the editorial (news) content, deciding whether to cut a report short or eliminate some planned stories in order to get "breaking news" into the program. The director—not a journalist—is in charge of the control room and studio crew that gets the broadcast on the air. He or she tells the technical director (or switcher) which image to put on the air: the studio camera pointed at an anchor, a recorded report, or a series of graphics (still images) that help tell a story; the technical director pushes the buttons on a device that can look like an electronic version of a five-keyboard church organ to make it all happen. Studio camera operators point the cameras at the people on the set, and a floor director relays time cues and other information from the director. And there is somebody running a device that electronically projects the scripted words onto a mirror in front of the studio camera lens so that the anchors can maintain eye contact with the audience. The best-known brand of those in the United States is TelePrompTer; in Britain, it's called AutoCue, but the generic term is "prompter." The president of the United States uses them too when making major scripted speeches in public, such as the annual State of the Union speech to Congress. Look for what appear to be clear glass rectangles on poles several feet in front of the president on either side. The audience sees the glass. The president sees the words of the speech scrolling by.

The Anchors. No, we haven't forgotten them. Anchors are the voice, face, and personality of a television newscast (and of radio, too, without the faces). Their job is usually to lead the viewer through the summary of the day's events but can also involve hours of free-form talking during "breaking" news—speaking calmly to the viewers while the producer is snapping orders and providing information through a small earphone. Anchors often write many of the stories they deliver. But an important part of their job is to deliver stories that other people have written and to do it in such a way that they appear to be just talking to the audience.

Don Hewitt, the producer who created *60 Minutes* at CBS News, coined the term *anchorman* to describe Walter Cronkite's duties at the 1952 Democratic convention, where he acted as a kind of host and central reference point for the various correspondents covering different parts of the event. Hewitt saw the position as similar to the captain of a track team. Outside the United States, people doing that job are often called presenters or news readers. But the greatest skill an anchor has is the ability to deliver information without a script. The term for that is *ad lib*, from the Latin *ad libitum*, which can mean at one's pleasure or as much as one likes.

Anchors may specialize in news, sports, or the weather. Many weather anchors are trained and certified meteorologists who understand the science behind the forecasts and may even do their own forecasting rather than relying on

the National Weather Service. They often design their own maps and graphics—the visual aids you see behind them on the screen. In reality, there is nothing behind them in the studio except a green wall. A technology called chromakey inserts the graphics electronically; the weather anchors position themselves by watching small monitors on either side of the wall and on the camera that show what the viewer sees at home. Most weather anchors hold a device that looks like a TV remote control. They are changing their own graphics as they speak—watch closely as they manipulate the controls.

TV News and Technology

In broadcast news, journalism and technology are inextricably linked. As technology improves, journalists have more tools to help them tell the story. But sometimes, the tools *drive* the storytelling.

Everybody who watches television news has seen reporters standing in front of something that relates to the story they're telling. Often, it's part of a recorded report. As often as possible, it happens live—the reporter precedes and follows a recorded and edited report or continues to talk live as recorded or live pictures of the event appear on the screen.

As we have seen, it can take a lot of people behind the scenes to end up with a reporter speaking live to the viewers from somewhere outside the studio. And the fact that a reporter *can* “go live” often adds to the perceived importance of the event.

When CNN went on the air in June 1980, live transmissions of things that were not scheduled events, such as presidential news conferences or political conventions were expensive, difficult, and rare. CNN promoted itself as “the news channel.” Because of the emerging technology, that meant trying to be the *live* channel whenever possible—a characteristic that now applies to CNN, its competitors, and television news operations almost everywhere.

CNN's first day of broadcasting included live reports from Key West, Florida, where thousands of Cubans had been arriving by boat in a huge wave of legal emigration. The correspondent Mike Boettcher later talked about the problems of getting the satellite truck and its huge transmission antenna ready in time for his broadcasts and the technical problems of coordinating with producers in the Atlanta headquarters—which were solved, he recalled, by having someone on a pay phone hundreds of yards away relaying instructions.

The Power of Technology: Two Examples

In May 1981, a Turkish gunman critically wounded Pope John Paul II as the Pope was riding through St. Peter's Square at the Vatican. The state-run Italian TV (RAI),

which had camera positions throughout the Vatican, was covering what had been a routine event until the shooting. Within minutes, RAI was transmitting live and recorded pictures throughout Europe over the Eurovision network that linked almost all of the continent's national broadcasters and transmitting by satellite to news organizations all over the world.

The author—then a producer/correspondent in CNN's Rome bureau—quickly found himself on the air via satellite through a jury-rigged system at the small RAI building where the CNN bureau was located, while the international assignment desk in Atlanta was frantically trying to reach the bureau chief and camera crew, who were away from Rome covering another story, in order to get them and other reporters back to Rome to help deal with what had suddenly become a huge story.

The relatively new technology enabled the speedy trans-Atlantic hookup, which meant that the author in Rome was able to report *live* to the American audience—even when there was nothing new to say because the information was so sketchy. Technological improvements in the decades since have made it easier to “go live” from almost anywhere. But talking to anchors and the audience when the reporter has little actual information in a “breaking news” scenario remains, for many journalists, one of the most difficult things to do.

Just a month after the papal shooting, a 6-year-old Italian boy named Alfredo Rampi fell into a backyard well near his house. The story attracted a lot of local attention, because it had all the elements of human drama—a little boy, a race against time. But it also had something new—live coverage from RAI, which sent its new “live trucks” to the well because it was in a village very close to Rome.

The author included a short recorded clip of the rescue effort in the daily 10-minute international news video compilation assembled from a variety of international news sources and sent by satellite to Atlanta, and planned to file a telephone report after the transmission so that editors at headquarters could combine the pictures and narration into a story that would run in newscasts for the next several hours.

But when CNN executives in Atlanta found out that a live picture was available from Italian TV, they ordered a new and very expensive one-hour satellite transmission from Rome. The author, on the phone from the Italian TV control room with Atlanta technicians, suddenly found himself on the air and had to talk for nearly an hour about what was going—getting information by listening to the Italian TV reporters who were actually on the scene describing it for their own audience.

The pictures themselves were not compelling—just a bunch of people standing around a hole in the ground. But the drama so captivated the Italian audience that the president of Italy eventually went to the scene. CNN was one of many news organizations to use the live pictures from RAI during the 80-hour rescue drama; a story that had begun as a local accident quickly became a worldwide phenomenon.

At the time, Italians debated whether such coverage was a good thing. That debate continues among journalists and their audiences around the world more than a quarter-century later. But there is no question that the technology made the story what it was. Little Alfredo Rampi died in that backyard well, and a nation mourned him.

A week or so later, an almost identical incident happened in another Italian village that was too far away from a major city for Italian TV to send a live truck. It never became more than a local story. But in October 1987, 18-month-old Jessica McClure fell into a well in Midland, Texas. And what some critics called a “media circus” began all over again. That story had a happier ending. But whether it’s live coverage of a dramatic rescue, a war, or police chasing a car down a freeway, the debate continues.

The Anatomy of a Story

Television—and television news—has much in common with motion pictures. While the technology now exists to allow just one person to gather information, shoot, edit, and transmit a video report, the combination of available budget and manpower (often involving union rules) means that it very often takes more than one person—sometimes dozens—to do the job.

In 1979, the author interviewed the African politician Robert Mugabe, then leading one of the factions attending a London conference on who would rule a postcolonial Rhodesia (Mugabe would eventually become president of Zimbabwe). To record an interview for excerpting in a story on the conference for an American network, there were three of us, including a two-person crew (one for camera, one for sound). To record the same sort of 5-minute sit-down interview to run at the end of a British documentary that night, the British network had 11 people—because it was for the “current affairs” department, not the evening news.

The growth of 24-hour news services on domestic cable and international satellite has changed the news gathering and production process. The need to “fill” 24 hours with as much “new” information as possible sometimes means that stories that once would have been considered of limited local interest now have a new prominence.

From North Platte, Nebraska—the smallest U.S. city that has locally produced TV news—to New York City, where at least eight stations and local cable services compete for the local news audience, the process is much the same.

News in any medium comes from a variety of sources. Sometimes a reporter or producer will come up with a story idea individually or at one of the daily story and assignment meetings that go on in every newsroom. Sometimes story ideas come from press releases. Sometimes they come from listening to emergency services

dispatchers and crews talking to each other by radio. And sometimes they come just by chance.

What If . . . ?

The scenario below has not happened—but it could. It’s based on circumstances and events that *have* happened, in one form or another.

Let’s say a reporter and a videographer from a TV station in a small Midwestern town are supposed to cover an academic conference on international relations at the local university. A news release from the university alerted them to the meeting. It’s about “conflict resolution” and includes academics and minor government officials from several countries. On their way to the university in the morning, the reporter and the videographer are trying to figure out how to make an interesting story out of a bunch of people in a big room. They will interview some of the important players, get video of the speeches and the audience, shoot a “stand-up” report, and bring the videotape back to the station to edit a story for the evening newscast.

The reporter knows that material from the event won’t be enough. So he asks for video from “the feed” to incorporate into the story. The broadcast networks and cable news services, including ABC, CBS, CNN, Fox, and NBC, provide video feeds to their affiliated local stations of national and international news that they either generate themselves from their own bureaus or obtain from international broadcasters such as the BBC in Britain or CCTV in China or from international news agencies such as Reuters TV and APTN, which maintain bureaus in many cities around the world. The assignment desk or a producer records some video clips from that day’s feed of fighting in Iraq, refugees in Africa, and a troop buildup on the border between two Asian nations and keeps the recording and associated written information for the reporter to use when it’s time to write and edit the story.

But before the crew gets to the event, the assignment editor hears the highway patrol dispatcher sending troopers, fire trucks, and ambulances to a crash on a four-lane highway along the river that loops around the town. He tells the conference crew to head there instead and report back on what’s going on.

It’s bad. As the crew arrives, the highway patrol closes that road and another major highway that intersects it. Three cars are burning, and an overturned tanker truck is leaking something into the river. The reporter and the videographer leap into action, shooting video and interviewing the police and witnesses. At least three people are dead. This is a big local story.

The producer of the noon newscast wants a live report. That means the assignment desk has to divert the microwave truck from another story and move it to the crash while updating the station’s Web site with what he and the reporter are learning about the crash. It happens all the time in local TV news.

When the truck with its antenna and portable editing system arrives, the reporter and the videographer edit the middle part of their story to transmit back to the station before the newscast. The station's control room will play back that part after the reporter introduces it live from the crash site, unless the editing is finished so close to the broadcast that the truck operator must roll it "live." Engineers and producers prefer to have it in the control room ahead of time.

Because the crash has now closed two major highways through that part of the state, two news helicopters from stations in the state capital show up overhead just before the noon newscast, shooting overhead video of the crash scene to transmit back to their own noon news programs. And one of the producers in the capital, whose station is with the same network as the local station, calls to ask the reporter to do another "live shot" for his station, which will relay it to the capital using satellite transmission.

Now, the local reporter has to do *two* reports—one for a local audience, in which he can make specific local landmark references for people who know the area as well as he does and another for an audience 75 miles away. People in the capital don't know or care that the crash is near a spooky old former mental hospital on a hill called The Ridges, so the reporter has to describe the scene in broader terms, and focus on the regional traffic disruption.

Just after the noon newscasts, there are more developments. The county and state environmental protection agencies have identified the substance from the truck that is leaking into the river. It is threatening the fish in the river and the water supply of three communities. The county issues a "boil order" for thousands of water customers. Now, a routine traffic accident has turned into a major public health story. Radio stations, newspapers, and their Web sites and the Associated Press news service are all giving the story wider distribution.

The local station goes into "crisis mode." The entire news department is now working on live coverage of the health threat. The local university (the one sponsoring the international affairs conference) offers several experts for interviews and analysis. Student journalists are running around shooting video and interviewing people for online, print, and broadcast coverage.

Now the local station's network news headquarters calls from New York. Because of the environmental impact, the network wants video of the crash, the river, the water treatment plant, and anything else it can get from the station along with a complete on-scene story to feed its local affiliates while its own reporter, camera crew, producer, and live transmission truck are on the way. So once again, the local reporter has to prepare a different kind of story—environmental, not traffic—for an audience that only vaguely knows which state the reporter is in and doesn't care about the victims or the traffic mess.

Back at that international relations conference, there is concern because the featured luncheon speaker—a former

graduate student who is now the deputy interior minister of his oil-producing African nation—didn't show up. Then, police release the names of the three people killed in the crash. He is one of them. Now the crash itself isn't just local news.

The phone rings in the local station's newsroom. It's the executive producer of the national network in the minister's English-speaking country. He has just seen the minister's name online, and his network is about to do a special report on the minister's death because he was about to be named the opposition candidate in that country's presidential election. He pleads for video and a live report from the crash scene and arranges a satellite transmission to get the material to Africa for a show that begins within an hour. The station hires journalism students from the university to go through old yearbooks and archived video from when the minister was a student 15 years earlier to find something relevant to use for the overseas report.

Now, the overworked original reporter and videographer at the crash scene have yet another story to prepare. For this one, the reporter must quickly learn how to pronounce the minister's name (his first and last names each have five syllables) and put together a story focusing on the minister and the international conference that they had never reached that morning because of the accident.

So in this very possible scenario, within 6 hours of the accident, the videographer's images of the crash scene and the victims being put into ambulances are on the air in a country thousands of miles away, and the reporter has had to prepare four different reports for four different audiences on four different aspects of the story.

That's television news in the 21st century.

What It Takes to Be a Broadcast Journalist

The "modern" television journalist is often doing much more than reporters did in the early days of television news—and doing it much faster. That puts a lot of pressure on the people who do the reporting, because in reporting (presenting) what they know to the audience, they often don't have enough time to do the *other* kind of reporting—gathering the information.

At the International Press Institute conference in Belgrade in June 2008, the British journalist Misha Glenny, who used to cover southeastern Europe for the BBC, talked about changing times and changing pressures. Glenny, a scholar's son whose first reporting job was for a newspaper, suggested that the role of a foreign correspondent had changed over the years—and not for the better—because of pressure from employers. He described the BBC's 1964–1986 India correspondent Mark Tully, who was born there, as "someone who knew everything about India and everybody worth knowing in the Indian elite."

But he said it is rare now for reporters to know their countries—that the pressures of multiple filing demands

from the BBC's domestic and international radio and television services plus online create conditions in which he said basic reporting—let alone investigative reporting—is impossible.

Many journalism schools are training and educating their students to try to meet the demands of the “converged” newsrooms of the 21st century. The tools of the trade are getting smaller, cheaper, and easier to use. But using them to tell good stories well remains a challenge for anybody who wants to work in broadcast journalism.

Your Turn?

We have seen how the techniques of broadcast journalism have evolved over more than a century—from live speech on the telephone to live and recorded speech on the radio to silent and then sound theatrical newsreels to live and recorded television to pictures and sound online. Over the years, journalists have adapted their storytelling techniques to take advantage of the new technology and method of distribution. But, from the KDKA announcer Leo Rosenberg, broadcasting the 1920 Harding-Cox presidential election returns, to the hundreds of anchors and reporters and bloggers covering presidential election night 2008, the aim has been the same: Whatever the technology, get it to the audience quickly—and be sure to get it right.

Broadcast journalism continues to evolve in the 21st century. If you're interested in pursuing a career in it, be sure to learn something about something other than broadcast journalism. Expertise in economics, business, politics, or international relations will help you tell better stories. The education and training you get in a broadcast journalism program will teach you how to tell stories. The best journalism schools teach students how to do everything—reporting, shooting, editing, anchoring, crafting Web stories, producing, and assigning, because even at the big-city and network levels, there's a growing demand for people who can do it all. They used to be called “one-man bands.” Now some people use the term *backpack journalists*.

Not everybody does everything equally well, but if you're fortunate enough to be working as a reporter or producer in a newsroom that has dedicated videographers

and video editors, you will do your own job better because you know firsthand what they can and cannot do. And whatever the medium, the job of a journalist is ultimately to put clear, concise information into the audience's heads—accurate information that educates, enlightens, and, yes, sometimes entertains. Still interested?

NEW MEDIA JOURNALISM

JOHN V. PAVLIK

Rutgers University

New media journalism emerged in the late 20th century and has continued to evolve in the early 21st century. It is a form of journalism based on the convergence of digital, or computer-based, technologies and telecommunications, especially but not limited to the Internet and World Wide Web. New media technologies are reshaping journalism in four basic ways. First, new media are transforming how journalists do their work. Second, new media are producing a restructuring of journalistic organizations and institutions. Third, new media are giving rise to new media content forms. Fourth, new media are leading to the reinvention of the relationships between and among journalists, journalistic organizations, and their many publics, especially these five: audiences, sources, regulators, financiers, and competitors. This set of changes is leading to a form of new media journalism with greater citizen involvement and participation in a discourse with journalists, newsmakers, and other citizens. At times, this discourse is little more than opinions and pandering to base interests. But at times, this discourse is reasoned, informed, and refreshing.

Journalism and New Media Technologies

Journalism has long been driven by technological change. The rotary printing press, photography, the telegraph, wireless communications, television, and other technologies have all exerted profound influences over the shape and nature of journalism. It is thus not surprising that new media technologies have facilitated a transformation of

journalism in the late 20th and early 21st centuries and the emergence of new media journalism (Boczkowski, 2005).

To understand the influence of new media on journalism, we must first define what we mean by the key terms *new media* and journalism. Notably, the term *media* is plural and is a Greek word. *Medium* is the singular form. Therefore, “new media” *are*, not *is*. Journalism refers to the process of gathering, or reporting, current information, or news, from multiple sources (including primarily by interviewing people, reading or reviewing documents, and making direct observation of events, places, or people); editing and fact-checking that news; and distributing (broadcasting, publishing) that news, typically via storytelling forms, but also in other forms, as well as interpreting those facts via analysis or opinion. New media journalism is thus the convergence of new media and journalism into a new form of news reporting in the digital age.

New media emerged in the latter part of the 20th century, with the advent of various digital technologies, especially the Internet and World Wide Web, and also technologies such as digital cameras, satellites, and digital broadcasting. In its most familiar form, new media journalism is synonymous with online journalism. Although this is the most familiar, it is not the only significant part of new media journalism. The new media continue to evolve and represent a changing landscape.

Five Technological Functions

To fully appreciate the nature and scope of new media journalism, it is useful to identify five broad technological functions related to the new media. These five functions

are acquisition, storage, processing, distribution, and access or display. For each of these functions, there are a host of specialized new media technologies, although increasingly, convergence is leading to the development of individual devices capable of performing all five functions.

Acquisition

Acquisition refers to the process of gathering information, or data, in various forms, such as audio, images, moving pictures, or written text in the form of a reporter's notes. Traditionally, reporters' notes have been the foundation of all reporting. In new media journalism, a reporter's notes continue to be vitally important but are increasingly in electronic, or digital, form, with reporters typing or otherwise entering (e.g., using an electronic tablet that recognizes handwriting) their notes on handheld or laptop devices. Of course, many other devices are used in news gathering, including primarily digital cameras and digital audio recorders.

Processing

Processing refers to the editing of digital content gathered by the reporter. Whether text, audio, images, or video, reporters and editors use computer-based tools to sort, refine, or edit that material from its raw form into stories, graphics, or other formats for ultimate delivery to an audience. Computer-based processing, like all computers, is becoming faster and less expensive, following what is called *Moore's law*. Moore's law specifies that the number of components on a single computer chip doubles every 18 months (Moore, 1965). This essentially means that computers get twice as fast every year and a half. As a corollary to Moore's law, miniaturization has also swept through the world of computing, as digital devices have become not only more powerful but also much smaller in size. As a result, 2007 saw the emergence of the laptop computer as more prevalent in the marketplace than the desktop computer in the United States. Journalists are also increasingly using laptop computers as their preferred device for processing news in raw data form or refined storytelling format.

Storage

Storage refers to the archiving of digital content, initially in its raw form and later in its processed form, for subsequent search and retrieval by either journalists or the lay public. There are many such digital storage devices of increasingly powerful form. Digital storage devices are also subject to the patterns of increasing speed, power, and miniaturization that characterize processing devices. As a result, few reporters go out into the field without one or more powerful miniature digital storage devices. These include USB sticks (universal storage buss) that can hold

gigabits of data (billions of bits, 1,000 times a megabit, which is 1,000 times a kilobit, which is 1,000 times a bit). Many devices commonly used by new media journalists, such as digital cameras, cell phones, or handheld computers not only have built-in massive storage capabilities, but they also typically have ports for portable external storage devices. Such portable storage devices are important in journalism because they can be easily slipped into a pocket or past a censor.

Distribution

Distribution refers to the delivery of digital content, or news, from one location to another, either a short or a long distance. In a new media context, this distribution is typically done over a digital telecommunications network, including the Internet, but also via digital television, other wireless spectrum, or other digital delivery media (such as Bluetooth, a local-area wireless technology). Such distribution systems in journalism are increasingly made secure in the same fashion as banking, satellite or cable television, or other applications. Security is important for a variety of reasons, including not only protecting copyrighted content but also guarding against computer hackers (friendly) or crackers (unfriendly).

Display or Access

Display or access is the final step in new media journalism, although it is the most visible and often thought of as the defining quality of new media journalism. Technologies such as computers, handheld devices, cell phones, and MP3 players (including Apple's iPod) are among the most common display or access technologies used in new media journalism.

Transforming Journalism in the Age of New Media

New media as described above are reshaping journalism in four basic ways. First, new media are transforming how journalists do their work. Second, new media are producing a restructuring of journalistic organizations and institutions. Third, new media are giving rise to new media content forms. Fourth, new media are leading to the reinvention of the relationships between and among journalists, journalistic organizations, and their many publics, especially these five: audiences, sources, regulators, financiers, and competitors.

Transforming How Journalists Work

New media are transforming how journalists do their work. In days past, newspaper reporters relied on principally a telephone, a notepad, and a pencil, with an occasional

photographer sent on assignment. In television, reporters typically were accompanied by a videographer and, depending on station size or if a network level, also a sound or lighting technician. In radio, the standard operating equipment was a microphone (lavalier or lapel) and audio recorder. New media have meant a series of changes in the tools reporters bring with them into the field and a corresponding series of changes in how reporters often work. To begin, most reporters, regardless of medium, make heavy use of the Internet and World Wide Web as research tools and e-mail as a communication tool. Reporters also make extensive use of cell phones to reach sources and stay in touch with editors. Many reporters also rely on various handheld devices both in news gathering and in communication. Mobile e-mail or text messaging is commonly used. Reporters will often type a short version of a story while still in the field and e-mail it to an editor for review.

One interdisciplinary research project at Columbia University launched in the late 1990s featured the design and field testing of a mobile journalist workstation (MJW), which was in fact a hybrid of news gathering, production, storage, distribution, and display technologies encased in a wearable backpack. The MJW permitted a single reporter to gather news of any type, deliver it wirelessly to a remote location, or display it in geographically annotated format based on the specific coordinates obtained from the global positioning system (i.e., satellite system). Such digital backpack journalism was first conducted by Steve Mann (2008), now Professor of Computing and Electrical Engineering at the University of Toronto. Mann developed the wearable computer in the 1980s and used his convergent system to report on a series of breaking news events and provide stories and photos to local newspapers via wireless data transmission.

Restructuring Journalistic Organizations and Institutions

New media technologies are producing a restructuring of journalistic organizations and institutions. Since at least the 19th century, the newsroom has been the central organizing spine of American and most of the world's journalism. Editors and other decision makers have operated from the newsroom, meeting with reporters, assigning stories, and editing text, images, audio, and video. The flow of information in and around the newsroom has largely depended on the capabilities and limitations of analog technologies. In the early 20th century, the click and clack of the typewriter and teletype machine were pervasive in virtually any newsroom, especially those of the daily newspaper. Copyboys physically carried from one location to the next the copy, or text, of stories typed by writers or ripped from the teletype machine, where wire-service copy arrived over analog telephone lines and was delivered to the appropriate news desk or editor.

The development of high-speed online technologies, including broadband wireless, as well as increasingly powerful and inexpensive mobile computers and other devices, has brought about a revolution in the modern newsroom. Increasingly, newsrooms are organized in ways that facilitate the production, editing, and distribution of multimedia content in digital form. Sometimes called a converged newsroom or an information center, newsrooms of the past are rapidly disappearing. Typically, any editor can get access to any story, file, or bit of data regardless of its format (i.e., text, audio, video, photo, graphic). As a result, reporters and editors can work much closer to the deadline. They can produce stories for any delivery outlet, whether print, online, television, or radio.

New media have fueled even more radical structural change in American and global journalism. Emerging is what might best be called the *virtual newsroom*. The virtual newsroom is a journalism structure freed of the physical constraints of a traditional newsroom. A virtual newsroom uses inexpensive yet powerful mobile technologies, including laptop and handheld computers as well as megapixel digital cameras and digital audio recorders. The virtual newsroom takes advantage of the flexibility afforded by broadband wireless technologies. It permits reporters to stay in the field longer while covering more stories, interviewing more sources, and expending little time traveling to and from a central newsroom to meet with editors. News conferences can happen via cell phone or laptop. Stories are filed electronically, regardless of whether they involve text, photos, graphics, video, or audio. Staying in the field while on assignment is of course not a new thing in journalism. Reporters have famously called into a newsroom from just outside a courtroom where a major verdict was just handed down, requesting "re-write."

Yet mobile broadband has enabled structural change of an entirely new magnitude in new media journalism. New media technologies have made possible the development of unique one-person news operations, or news operations with extremely small staff, mostly freelancers or stringers, who cover local or regional geographic communities, topical domains, or beats at very low cost. There is no need to maintain an expensive central newsroom. With Internet delivery, there is no need to invest in an expensive printing press or television or radio transmission tower or acquire a broadcast license. Instead, entrepreneurial news operations have emerged across the United States and are internationally designed to exploit the capabilities afforded by new media to do quality journalism.

Moreover, because the costs are so low, business models based on small or limited revenues are still viable. Consider the case of RedBankGreen.com, an online news operation founded by a long-time Gannett journalist. Red Bank Green (www.redbankgreen.com, accessed January 4, 2008) is a very local online news service produced by John Ward, a veteran newspaper journalist, who in 2006, left the ranks

of daily newspaper journalism to pursue his vision of producing quality local journalism delivered online. A two-decade veteran of traditional journalism in the analog media environment, Ward saw an opportunity to reinvent local journalism in the New Jersey community where he lives, Red Bank, through a new news structure, one based on community. His vision is captured in his estimate of the number of stories waiting to be reported: “There are 12,000 people in Red Bank,” Ward says. “That’s at least 12,000 stories.” Ward’s wife, Trish, is a Web-site developer and graphic artist and is responsible for all the design aspects of Red Bank Green. The name of the site is a reference to the extremely local nature of the reporting and the interactive quality of the medium. It is meant as an online village green or commons where people can meet to learn about and discuss what is going on in the town. Ward practices what has long been called shoe-leather reporting, what many consider the hallmark of great journalism. He walks the town and reports. He stops in stores and chats with business owners and customers. He sees people about town and talks with them. He asks them what is going on and what is on their minds. He observes and reports. He tells people’s stories. He has a digital camera and takes pictures and shoots video. He has a digital audio recorder that can record up to 13 hours of audio. He writes and edits on his laptop computer. He has a growing number of advertisers and advertising revenue and hopes to grow the business side of things so it can sustain even more journalism, including investigative reporting. Ward’s goal is not to be objective in the traditional sense of mainstream journalism. That is impossible, he says, although it is a worthy pursuit. Ward writes from his own perspective and in his own style. His goals as a reporter and editor are to be accurate and to be fair.

Producing New Content Forms

New media are giving rise to new media content forms. New technologies have often led to new content forms in journalism. The Frenchman Louis Daguerre’s early-19th-century invention of the Daguerreotype led to the introduction of photography in newspapers. The French Lumiere brothers’ late-19th-century invention of moving pictures led to the popular newsreels of the early 21st century. Italian Guglielmo Marconi’s late-19th-century invention of the wireless led to the development of radio journalism in the early 21st century as well. American Philo Farnsworth’s early-21st-century invention of electronic television led to the development of the most widely seen journalism in the United States, television news. New media are following this long tradition of reshaping news content based on new technological possibilities, only this time in the digital age.

Among the first forms of new news content to emerge in the new media environment was the Web-based newspaper. Online and electronic newspapers had existed in various

forms since at least the 1970s, mostly as text with limited graphics. But these primitive, early, online newspapers were radically overhauled with the 1989 invention of the World Wide Web by the English scientist Tim Berners-Lee (www.w3.org/People/Berners-Lee, accessed January 3, 2008). Since then, online news sites have exploded, adapting dramatically in form based on the capabilities made possible by the Web. Among the most important evolutionary changes in news content on the Web is the introduction of hyperlinks, or online connections to related Web pages. These links (typically in the form of embedded Web addresses, or URLs, such as <http://news.google.com>) serve several important functions in online news. First, they can offer readers a chance to look at a related Web page for more details or context. Second, they permit readers to see other relevant Web pages that have been previously screened by the reporter for quality, relevance, or appropriateness. Third, they can enable access on demand for the news consumer to multimedia content produced by the news organization or another organization but related to the current page. Fourth, links can serve as a vehicle to facilitate user engagement, such as in an interactive reader poll.

The legendary singer Frank Sinatra’s FBI file entered the public domain on December 10, 1998 (Pavlik & Ross, 2000). Newspapers, television, and radio stations throughout the United States and internationally reported on the release of the report and the allegations it contained. Among the topics reported were Sinatra’s alleged mob connections, his arrest for “seduction,” and his 4F status of psychological instability making him ineligible for the draft during World War II.

Illustrative of the standard journalistic accounting of the 1,300-page file was *The New York Times* report, which examined these subjects in an approximately 2,500-word account. The report was available in print and online and serves as an exemplar of how most general-interest newspapers or news magazines would approach a story such as this. First, a primary source releases newsworthy information, and second, news organizations report on the report, giving an overview of its contents, noting the highlights, and perhaps adding interviews with key sources.

Contrast this with the approach employed by APBnews.com (a now-unfortunately discontinued news site covering crime and criminal justice). APBnews covered the Sinatra report in pure new media journalism style, employing a range of online media capabilities, including text reporting, interactivity, images, and all 1,300 pages of the FBI Sinatra file electronically scanned and made available online. This put the APBnews report into the full context of the original source material. *The New York Times* made the Starr report on President Bill Clinton’s affair (running to several hundreds of pages) available on its Web site and in the paper, but it did not publish the Sinatra file online or off. APBnews also didn’t annotate the 1,300-page Sinatra file but featured several side-bar reports about each of the most important sections of the report.

APBnews's Sinatra report illustrates the unique potential of new media journalism. Journalists and the news are no longer constrained by the technical limitations of analog media boundaries of print, television, or radio. Rather, new media journalism can feature virtually all modalities of human communication to make storytelling as powerful and complete as possible. Of course, this is the potential. The realities of new media journalism still constrain it by the fiscal requirements of publishing quality news content. Without a viable business model, even the best-intentioned new media journalism as illustrated by APBnews can still fail due to the lack of economic resources.

Since the advent of the basic news Web site, various other more specialized forms of Web-based news content have emerged. Among these are Weblogs, or blogs, twitter, and Podcasts. Blogs have emerged as among the most pervasive and popular forms of online, new media journalism. Gartner Consulting (www.gartner.com, accessed January 2, 2008) estimates that as of 2007, there are some 100 blogs. Having evolved from online diaries, blogs are Web sites in which postings are typically presented in reverse chronological order. Most blogs use browser-based software and are sometimes hosted by dedicated blog-hosting services. Some blogs run on blog software, including blogger, LiveJournal, and WordPress. Jorn Barger coined the term *Weblog* (Wortham, 2007) on December 17, 1997. Peter Merholz created the contraction, *blog*, by which Weblogs are known universally in 2008. Merholz (1999) introduced the term on his blog peterme.com in April or May 1999. Since their inception, blogs have grown dramatically in their popularity, reach, and impact.

By 2008, there are many types of blogs. Among the more common, somewhat specialized blogs relevant to new media journalism are Vlogs and Linklogs. Vlogs are blogs that include or feature video. Linklogs are made mostly or entirely of links to other Web sites. Blogs designed for mobile devices such as a mobile phone or a personal digital appliance (PDA) are called Moblogs. Many blogs concentrate on a single topic, including politics, travel, or fashion. There are also search engines that focus on searching the content of blogs. These include blogdigger, Feedster, and Technorati. The general domain of all blogs is known collectively as the blogosphere.

Blogs constitute an important form of new media journalism. Although many blogs focus on opinion, some also break news and introduce original reporting. As a result, blogs have become popular around the world. Perhaps the single most popular blog is that of the Chinese actress Xu Jinglei (English: <http://sino-angle.blogspot.com>; Chinese: <http://blog.sina.com.cn/xujinglei>, accessed January 2, 2008). Her blog is reported by the Chinese news service Xinhua to have more than 50 million page views a month (*China Daily*, 2006). Jinglei's blog also has (as of 2006) the most incoming links of any blog (another measure of blog popularity).

Blogging has become a significant part of what is often called participatory journalism, or journalism produced by lay citizens rather than professional journalists employed by mainstream, commercial (or not-for-profit) news media. One of the reasons blogging has become valuable to those engaged in participatory journalism is that it can avoid the filter typically imposed by established news media. This filtering process, or gatekeeping, can be important in providing editorial review and fact-checking. It can ensure higher-quality journalism, more responsible reporting, and fewer possibilities of libel or other legal action in response to potentially flawed reporting. It can protect the credibility of news reporting. Yet the mainstream news media filter can also inhibit diverse perspectives and viewpoints. It can limit the range of opinions or even subjects reported on. It can force a certain uniformity of voice. Some contend that bloggers fail to respect copyright by republishing other reporting. The blogosphere has often played a vital role in bringing critical attention to important news stories that the mainstream media had ignored or were not in a position to cover effectively. Video bloggers, for instance, proved important in reporting the tsunami that wreaked havoc on much of Indonesia and beyond in 2004. In one case, a federal investigating team found the video blog of a Seattle-based reporter of such value in pursuing its investigation of alleged terrorists that it jailed the blogger for not revealing his sources. Josh Wolf, a Seattle, Washington, video blogger was jailed by a federal prosecutor in August 2006 for not revealing his sources during anti-WTO (World Trade Organization) protests in April 1999 in Seattle (Blue, 2006). The blogosphere demonstrated its robustness in identifying questionable media, political, and other activities when, in 2006, bloggers discerned that the news photo of an Israeli bomb attack in Beirut had been manipulated. Still, much of the blogosphere is of dubious or limited quality and sometimes is designed specifically to mislead, distort, or propagandize.

Mainstream journalists also produce their own blogs. CyberJournalist.net's J-blog report lists some 300. Jonathan Dube of *The Charlotte Observer* published perhaps the first use of a blog on a news site in August 1998, when he chronicled Hurricane Bonnie (Scanlan, 2003).

Twitter and the Double-Edged Sword of Speed

Twitter is a form of blogging that is based on the use of mobile devices and text messaging to upload short messages to blogs while on the fly. Twitter is especially popular for current information, such as what a candidate for president is doing on the campaign trail.

On the downside, Twitter demonstrates one of the most significant concerns about new media journalism. Twitter at its best demonstrates the currency of new media journalism. A blogger can follow a candidate on the campaign trail and

post the very latest information from the field directly to the public without more than a moment's delay. The public can have the absolute latest information in near real time.

At the same time, Twitter points out the potential deepest flaw of currency: no time for thoughtful reflection. New media journalism in the form of Twitter or other near-real-time reporting provides a direct, unfiltered look at current events, but the events may be taken completely out of context with virtually no depth in the reporting.

Other New Media Content Forms

Podcasts are another important content form of new media journalism. These are audio files created for online distribution, formatted for downloading to MP3 players such as the iPod, using syndication technology. Listeners can subscribe to Podcasts and have them downloaded automatically when new content is added via aggregator software or feed reader tools such as RSS (really simple syndication) or Atom (a syndication protocol using XML, the extensible markup language). Podcasts can be downloaded from a variety of online locations, including aggregation sites such as iTunes. Podcasts can also be made available via any Web site or blog.

Video Podcasts (vodcasts) are increasingly popular. A list of vodcasts is available from Vodstock (www.vodstock.com/vodstock/vodcast-directories.php, accessed January 3, 2008). Some of the more popular vodcasts are listed on Mefedia (www.mefedia.com/feeds, accessed January 3, 2008). The top 10 vodcasts for the week of January 6, 2008, included the vodcasts of *The New York Times*, *The Today Show*, and the Discovery Channel.

Some news Web sites also feature animation, typically made using a software application called Flash. Flash animations or animated gifs (short animated pictures based on the graphics interchange format) are often used to present animations online that might parallel the types of animations sometimes seen on television news, such as a rotating globe.

One of the more interesting new media journalism forms is virtual reality. Reuters, a major international news service, has created and staffed a news "island" in the popular online virtual reality environment Second Life (www.secondlife.com, accessed January 3, 2008). Open to anyone, Second Life has emerged as a compelling 3D virtual reality for millions of citizens around the world who have created avatars (virtual representations of themselves) to populate and live in an altered state where personal flight is a reality, altered egos can flourish, and real money (US\$1,296,257 were spent during the 24 hours concluding at 10:19 a.m. eastern time January 7, 2008) can be made without ever setting foot into the real world. The Reuters Island in Second Life is a virtual version of the Reuters real-world news service but covering the domain of Second Life for the citizens of Second Life (numbering 11,807,742 residents as of January 5, 2008).

More experimental forms of news content in a new media environment have also been developed. Among these are

- immersive video,
- 3D graphics,
- interactive photographs,
- situated documentaries, and
- locative media.

Immersive video refers to various video formats that provide a 360-degree, spherical video experience for the viewer. In a new media journalism context, this most typically refers to panoramic video displayed on a computer monitor allowing the viewer to use a mouse or keyboard controls to pan, tilt, or zoom about a full hemispheric view of a news scene or location. Although this can be provided in still photo images, video provides an especially powerful news medium. Such technology enables new media journalists to tell stories in new ways that help place events in a greater context. While standard photojournalism and video reporting help focus attention on a subject, they by their very nature remove much of the surrounding context for the image or video. Immersive video can put this context back into the story. Through software, directional photography or videography can still be produced from images or moving pictures shot with an immersive camera system. But the viewer can be provided with the option of being able to pan, tilt, or zoom into or about a scene to examine the background previously unavailable to the viewer of a news photo or television report.

When reporting on a protest, for example, this context might help the viewer better appreciate the scale of the protest or other potentially relevant facts. Pavlik (2001) and his former students at Columbia University collaborated with new media journalism organization APBnews.com (no longer in operation) to report on the 1999 slaying of Amadou Diallo in the Bronx, New York (West Bronx News Network). An immigrant from Africa, Diallo was stepping from the vestibule of his apartment building one night when four undercover police officers pulled up in their unmarked squad car and mistook Diallo for a criminal suspect. Apparently mistaking Diallo's wallet for a gun, and then inexplicably hearing nonexistent gunfire, the police officers open fired on Diallo, shooting a fusillade of 41 bullets, killing Diallo instantly. Several of the bullets entered the dead man's feet as he lay prone and bleeding in the entrance to his building. Pavlik's students used an experimental 360-degree camera invented by the Columbia University computer science professor Shree Nayar (www1.cs.columbia.edu/CAVE, accessed January 7, 2008) to record the scene in immersive fashion. The immersive photos were posted on the APBnews.com Web site, along with other accompanying reporting. Viewers were able to look about the vestibule, examine the scene, click on the entrance to the building, and access an immersive view from the street, getting a sense of the police perspective when they first arrived on the scene.

Pavlik's students also used the 360-degree video camera invented by Nayar to cover the Irish-Lesbian Gay Organization's (ILGO) protest of and arrest in the 1997 St. Patrick's Day Parade in New York City. Banned by the parade organizers because of their sexual orientation, ILGO members attempted to march in the parade anyway and were arrested by the police. Pavlik's students covered the events leading up to the parade as well as the parade itself. They produced an award-winning pioneering 360-degree immersive video documentary, in which viewers could use their mouse to pan, tilt, or zoom about the scene during any portion of the video to examine activity beyond the roughly 90-degree (or less) field of view typically available in video shot by a standard camera. The human eye takes in a field of view of approximately 160 degrees horizontal by 75 degrees vertical. By providing an immersive video experience, 360-degree video or photography can give viewers a feeling of presence not possible when viewing photos or video with the standard field of view. There are various commercial providers of 360-degree imaging technology (e.g., fullview.com, remotereality.com, ipix.com).

3D graphics are graphics with three visual dimensions, width, height, and depth. Most graphics in journalism are two dimensional, width and height. Adding a third dimension is possible in online or digital environments, and in new media journalism 3D graphics can provide an additional valuable tool to the reporter's storytelling palette. With 3D graphics, a reporter can provide complete visualization of an object central to a story, such as a science or health story. A 3D model of a human internal organ, such as a heart or heart valve, can be provided on a screen, and the reader can examine the model from all sides or from any angle. 3D graphics have been used experimentally in new media journalism trials, such as those of Pavlik and his students when, in 2000, reporting on a story about the possibility of a terrorist bombing in New York City.

Interactive photographs present another storytelling tool for new media journalists. Interactive photographs are increasingly being used online at sites such as Facebook.com, where members can post pictures of themselves, friends, or family, and then insert mouse-over labels onto the photos. Similar tools are being used in new media journalism, although they are not yet mainstream news applications. Interactive photos can take a variety of other forms in new media journalism. In one of Nayar's computational camera systems, called high dynamic-range imaging, a photographer can capture a photo of a subject involving high contrast and permit the user to see all portions and objects in the field of view without overexposing or underexposing any portion of the image (Nayar, 2008).

Situated documentaries refer to a new form of documentary developed by Pavlik and his Columbia University computer science colleague Professor Steve Feiner (www1.cs.columbia.edu/graphics/projects/mjw, accessed January 5, 2008). A situated documentary involves the use of the mobile journalist workstation (Pavlik & Feiner,

1998) previously described. In this application, the wearer walks through a location and sees through the head-worn display 3D virtual objects that act as story markers. The head-worn display incorporates a gyroscopic head tracker linked to GPS (global positioning system) and GIS (geographic information system), technologies that together permit the user to look at an interactive object for a half-second and thereby select it, much as a user on a desktop computer would select an object by moving the cursor onto it and clicking on it. This system is known as gaze approximation. It is a particularly useful tool in a mobile computing and communications environment. Through the use of gaze approximation technology the user looks at any of these virtual objects, typically a color-coated flag, selects one, and initiates a multimedia sequence or storytelling narrative. Pavlik's students produced a series of situated documentaries about past events at Columbia, including the 1968 student strike or revolt, Edwin Armstrong's invention of FM radio, and the prehistory of the Columbia Morningside Heights campus when in the mid-19th century it was home to the Bloomingdale Asylum for the Insane.

Locative media is an emerging form of new media journalism content that extends the situated documentary into a broader context. Locative media embraces all forms of media content based on geographic location. Most often, locative media is produced for online access. It is typically powered through Google Earth, a geographic visualization system made free to the public by Google (<http://earth.google.com/download-earth.html>, accessed January 8, 2008). Many news organizations such as ABC World News Tonight make extensive use of Google Earth as a visual tool for locating remote stories for the viewer. A view of the Earth from space opens the story or segment, and then a zoom down to the ground locates the story for the viewer. The digital imagery and software needed is provided freely by Google Earth, as assembled from satellite photography or photos taken from an airplane. Using this same technology, new media journalists tell stories about specific locations on Earth. A text, video, or audio report is prepared about a person, place, or event and tagged with specific geographic coordinates in Google Earth. A growing number of interesting locative media projects are under way (www.locativemedia.org/projects/C93, accessed January 4, 2008). The Center for Locative Media (www.locative-media.org, accessed January 3, 2008) provides a window into several such projects, including a geo-tagged Mississippi Blues Trail exploring the growth of the blues through the Mississippi delta. A useful examination of ongoing developments in locative media is provided by the blog of the PBS new media journalist Leslie Rule (2008).

Reinventing Relationships

New media are leading to the reinvention of the relationships between and among journalists, journalistic organizations, and their many publics, especially these five:

audiences, sources, regulators, financiers, and competitors. These relationships are essential to the continuing operation and impact of journalism in society. Perhaps most fundamentally, the relationship between news media and the general public, or what has often been called the audience, is critical. Without an audience, news media would have no purpose. Essential to this relationship is the trust of the public. Credibility is the cornerstone of the news media/public relationship. Credibility is a multidimensional concept, including not only trust but authoritative-ness of both the source and the message or content itself. As we move into the age of new media journalism, the relationship between news media and the public is evolving in significant ways, and credibility is changing as well. First and foremost, the public is evolving from a largely passive receiver of news media messages to an active participant in a two-way dialogue between and among the news media and the public. As such, the idea of “audience” is changing. Citizens have become active participants in online discussions with journalists, public figures, and each other. This is seen in a variety of venues, perhaps most visibly on the so-called YouTube debates in the early stages of the 2008 U.S. Presidential campaign. Segments of the YouTube debates (2007) are available online for on-demand free viewing. With the rise of a more active public in political dialogues, the notion of an apathetic or uninvolved citizen may decline or be replaced by a citizenry highly and directly involved in the political arena.

Other important relationships between the news media and sources, regulators, financiers, and competitors are also undergoing significant change in the age of new media journalism. Sources are those individuals or organizations journalists turn to for original information, whether through interviews, Web sites, or other materials. In the days of analog media, the barriers to publication or broadcasting were significant, and most sources with a message they hoped to deliver to the public were generally limited to going through the filter of professional news media. The growth of the Internet, World Wide Web, and various digital media of content production and delivery has made it increasingly practical, affordable, and efficient for individuals or organizations to go around the media gatekeepers and deliver their messages directly to desired publics. Whether through blogs, mass text messaging or e-mailing (sometimes called spam), RSS podcasts, or social-networking sites such as YouTube, MySpace, or Facebook, individuals and organizations can often deliver potentially powerful multimedia messages to targeted groups.

Yet such unfiltered messages can sometimes lack the credibility of messages delivered via traditional or new media journalism. Sources still often rely on journalists to tell their story, even if it is not exactly the story they would like to tell. When new media journalists talk with sources, they often do so not just face-to-face or by phone but by e-mail. And when on the phone, it may be via Skype, an online telephone service with very inexpensive or free national or international rates.

Regulation of new media journalism is increasingly not just a domestic matter. As online messages reach the farthest corners of the globe, international regulators and regulations come into play. A reporter or report legally published online in the United States can violate law in a foreign country and subject that reporter or employer to possible fines, imprisonment, or other penalties. New media journalists are typically required to adhere to the same laws (e.g., libel) as other journalists but may not enjoy the same freedoms or opportunities. Not all laws recognize bloggers as journalists and may not accredit them to gain access to news venues, such as the White House, as other recognized journalists.

Financers of new media journalism are still in a state of evolution, and it is not clear what viable business model will emerge to support journalism in the digital age. Advertising-supported journalism has operated as the main business model of journalism since the rise of the Penny Press in the 19th century. Whether online news media will enjoy these same revenues is unclear. Google, with its news aggregator service; craigslist, with its efficient online classified advertising; and other online media have emerged as powerful advertising environments, and original producers of online journalism have struggled to compete. Whether citizens in general will learn to pay for credible new media journalism remains to be seen. *The Wall Street Journal* online and a handful of other premium and specialized (e.g., *The Wall Street Journal* focuses on business news) online news sources have cultivated significant pay subscribers.

Competition in the new media age is robust and increasingly nonlocal. Frequently, competition for audience eyes and ears (not to mention dollars) is fierce in the online arena and elsewhere (e.g., digital cable is competing with telephone companies and satellite providers for television audiences as well as high-speed Internet services, all of which serve as important environments for new media journalism). This competition is not only local but national and international, as audiences find it increasingly easy to click on Al Jazeera (the Arabic news service, <http://english.aljazeera.net/NR/exeres/55ABE840-AC30-41D2-BDC9-06BBE2A36665.htm>, accessed January 7, 2008), Google News, or their personalized Yahoo page with customized news, as it is to click on *The New York Times* online or other traditional news providers.

Conclusion

This chapter has examined the nature and scope of new media journalism. New media journalism is differentiated from traditional or mainstream journalism and distinguished based not only on the tools used by journalists working in an online, digital domain and the means of delivering news online and on-demand but also in terms of the content new media journalists create, the structure of new media news organizations, and the relationships between new media journalism and its publics. The emergence of an active public

engaged in a participatory discourse with the media, newsmakers, and other members of the public is one of the most important qualities separating new media journalism from the journalism that preceded it and to a certain degree continues to exist in mainstream media. Whether through blogs, text messaging, or social-networking sites such as YouTube, the public has entered into a new and closer-than-ever media relationship and is demonstrating a growing interest in not only receiving messages but also creating and sharing its own content and voice. Oftentimes, this voice may be shrill, biased, or just plain silly, but sometimes it is thoughtful, insightful, and unique. Such is the promise and the peril of new media journalism.

MEDIA LAW IN THE UNITED STATES

SANDRA DAVIDSON

University of Missouri

How much freedom of expression is desirable? Should anyone be able to express anything at any time? Perhaps the English philosopher John Stuart Mill made one of the more eloquent statements supporting the freedom to air even the most repulsive ideas in 1859 in his work *On Liberty*. Mill says,

The peculiar evil of silencing the expression of an opinion is, that it is robbing the human race, posterity as well as the existing generation. . . . If the opinion is right, they are deprived of the opportunity of exchanging error for truth; if wrong, they lose what is almost as great a benefit, the clearer perception and livelier impression of truth, produced by its collision with error. (p. 10)

Mill is displaying confidence in humankind's reason. If an idea is erroneous, let it be openly aired so people can see for themselves the error. Of course, one has to have some confidence in the basic rationality of people, as Mill does, before this view of openness is appealing. But even Mill thought that freedom of expression needed some limits:

Even opinions lose immunity, when the circumstances in which they are expressed are such as to constitute . . . a positive instigation to some mischievous act. An opinion that corn-dealers are starvers of the poor . . . ought to be unmolested when simply circulated through the press, but may justly incur punishment when delivered orally to an excited mob assembled before the house of a corn-dealer. (p. 11)

Likewise, U.S. Supreme Court Justice Oliver Wendell Holmes saw limits to freedom of expression when he famously said, "The most stringent protection of free speech would not protect a man in falsely shouting fire in a theater and causing a panic."

How much freedom of expression should a society tolerate? This chapter will explore how the U.S. Supreme Court has grappled with this question in three primary areas of communications law: (1) sedition; (2) prior restraint, also known as censorship; and (3) libel of public officials.

Sedition: A Roller-Coaster Ride for the Supreme Court

Openness and toleration, or lack of the same, play a large part in the topic of sedition. "Sedition" means verbal attacks on government and its trappings—its officers, laws, and institutions. Governments generally are more tempted to pass and enforce laws against sedition when their countries are in turmoil. The United States has followed that pattern, as the following history of sedition law demonstrates.

The First Amendment to the U.S. Constitution, passed in 1791, says, "Congress shall make no law . . . abridging the freedom of speech, or of the press." But the First Amendment is not absolute, and it did not guarantee that the United States had true freedom of expression. Only 7 years after the First Amendment became law, Congress passed the Alien and Sedition Acts of 1798.

Events across the Atlantic helped passage of the Alien and Sedition Acts. France had had its revolution in 1789. It was a bloody affair, and some people in the United States were revolted because it was so bloody. Then, England went to war with France's leader, Napoleon. There were split feelings over here about which country we should support—France or England.

Tensions mounted between the United States and France. Still, U.S. Vice President Thomas Jefferson and his Republicans favored France. President John Adams, and his Federalist Party, who favored England, passed the Alien and Sedition Acts in part to control Jefferson's Republicans. Under one part of the Sedition Act, it was a crime to conspire with others (1) "to oppose any measure . . . of the government of the United States." Conviction could result in a large fine and jail time.

Those convicted included Republican editors from Boston, New York, Philadelphia, and Richmond, Virginia, and a Vermont Congressman who referred to President Adams's "continual grasp for power" and his "ridiculous pomp, foolish adulation and selfish avarice." The reaction of the American people to these arrests could simply be called backlash. The Vermont Congressman's constituents reelected him by a vote of 2 to 1 over his nearest rival, and Thomas Jefferson became the president in 1801, defeating the incumbent Adams (Davidson & Winfield, 2007).

In *New York Times Co. v. Sullivan* (1964), the U.S. Supreme Court commented on the Sedition Act, saying,

Although the Sedition Act was never tested in this Court, the attack upon its validity has carried the day in the court of history. . . . Jefferson, as President, pardoned those who had been convicted and sentenced under the Act . . . , stating: "I discharged every person under punishment or prosecution under the sedition law, because I considered . . . that law to be a nullity, as absolute and as palpable as if Congress had ordered us to fall down and worship a golden image."

Also, Congress, by an act passed on July 4, 1840, repaid fines because Congress considered the fines to be unconstitutional.

The Supreme Court did not test a sedition law until 1919, when it heard a case arising under the Espionage Act of 1917. When tensions heightened in 1917 with the Russian Revolution and with the United States becoming involved in World War I (a "war to make the world safe for democracy"), Congress passed the Espionage Act. Under the act, people could be punished for obstructing military recruitment, for causing disloyalty or insubordination within the armed forces, or for conspiring to obstruct recruitment or cause insubordination. The act imposed severe fines and imprisonment. Also, the law allowed the postmaster general to exclude seditious material from the mail. The following year, 1918, the law was broadened: Congress also criminalized urging curtailment of the production of necessary war material, such as ammunition.

The U.S. Supreme Court's first sedition case was also its first case interpreting the First Amendment. *Schenck v. United States* (1919) started when Schenck, the general secretary of the Socialist Party of the United States, and some other defendants mailed leaflets out to draft-age young men, telling them that the draft violated the Thirteenth Amendment to the U.S. Constitution (1865). That amendment prohibits slavery or involuntary servitude. One leaflet, the Court said, "intimated that conscription was . . . a

monstrous wrong against humanity in the interest of Wall Street's chosen few," and said, "If you do not assert . . . your rights, you are helping to deny or disparage rights which it is the solemn duty of all citizens . . . of the United States to retain." Arguments on the other side, the leaflet said, came from crafty politicians and a mercenary press. Predictably, given the Espionage Act of 1917, the government said that the leaflet encouraged obstruction of the draft. Also, the government said that the defendants unlawfully used the mail to disseminate the leaflet.

Schenck and his codefendant were found guilty of violating the Espionage Act. They appealed, claiming that their leaflet was protected by the First Amendment. Justice Oliver Wendell Holmes wrote the opinion for the U.S. Supreme Court. The Court upheld Schenck's conviction. In *Schenck v. United States* (1919), Holmes articulated his "clear and present danger" test. Holmes said,

We admit that in many places and in ordinary times the defendants in saying all that was said . . . would have been within their constitutional rights. But the character of every act depends upon the circumstances in which it is done.

Then, he uttered his famous line, "The most stringent protection of free speech would not protect a man in falsely shouting fire in a theater and causing a panic." The question, according to Holmes, is whether the words themselves and the circumstances in which they are used "create a clear and present danger that they will bring about the substantive evils that Congress has a right to prevent." This "clear and present danger" test creates no bright line between what words are acceptable and what are not; whether there is a clear and present danger must be made on a case-by-case basis.

One week after deciding *Schenck v. United States* (1919), the Supreme Court upheld another conviction in *Frohwerk v. United States* (1919). Frohwerk was convicted of conspiring with another in producing the *Missouri Staats Zeitung* (the *Missouri State News*) and received a 10-year sentence. The paper allegedly attempted to obstruct military recruitment and to cause disloyalty in the military. Justice Holmes thought the language was on a par with that in *Schenck v. United States* (1919), with one article, in Holmes' words, "declaring it a monumental and inexcusable mistake to send our soldiers to France" and speaking of "the unconquerable spirit and undiminished strength of the German nation." Another spoke of the few amassing "unprecedented fortunes" and of the United States going to war to protect Wall Street loans: "We say therefore, cease firing." On the same day it decided *Frohwerk v. United States* (1919), in *Debs v. United States* (1919), the Supreme Court upheld the conviction of a man who ran for president five times on the Socialist ticket. Eugene Debs believed that "the capitalist system has outgrown its historical function" and that it was "incompetent and corrupt and the source of unspeakable misery and suffering to the whole working class." He was sentenced to 10 years for a speech he made

in Ohio criticizing the government's prosecution of persons for sedition. He extolled the virtues of socialism in his speech, but that is not what got him in trouble. The problem was that he told the crowd that he had just returned from a prison where he was visiting three of his friends who had aided and abetted another friend in failing to register for the draft. He eulogized those three friends and said that he was proud of them.

Debs did not help himself when at his trial he said this to the jury: "I have been accused of obstructing the war. I admit it. Gentlemen, I abhor war. I would oppose the war if I stood alone." Holmes wrote the opinion upholding Debs's conviction for obstruction of recruitment. Eight months later, Holmes, who is sometimes called the "Great Dissenter," dissented although the majority of the Supreme Court upheld the Espionage Act convictions in *Abrams v. United States* (1919). As for the facts leading to the case, the five defendants in *Abrams v. United States* (1919) were born in Russia. In the summer of 1918, the United States had sent marines to Siberia, which was supposed to be a strategic move against the Germans on the eastern front. But Abrams and his friends thought that this was an attempt by the United States to crush the Russian Revolution, so they put out pamphlets that attacked the special American expeditionary force that they said was sent to Russia to defeat the new Communist revolutionary government.

Convicted of conspiracy to encourage resistance to the war with Germany, Abrams and his four friends were sentenced to 20 years apiece for their leaflets—leaflets based on confusion. One of their pamphlets says, "Awake! Awake, you Workers of the World! Revolutionists!" It ends with this note: "It is absurd to call us pro-German. We hate and despise German militarism more than do you hypocritical tyrants. We have more reasons for denouncing German militarism than has the coward of the White House." The majority opinion in the *Abrams v. United States* (1919) case is seldom quoted. The Court said, "Even if their primary purpose and intent was to aid the cause of the Russian Revolution, the plan of action which they adopted necessarily involved . . . defeat of the war program of the United States." The Court pointed out that the five were trying to persuade people not to work in ammunition factories and Congress had made it a crime to urge curtailment of the production of necessary war material, such as ammunition.

The Court's opinion in *Abrams v. United States* (1919) activated Holmes's gag reflex. Holmes had written the court opinions in *Schenck v. United States* (1919) and *Debs v. United States* (1919) that upheld convictions, but he drew the line in *Abrams v. United States* (1919). In a fiery, impassioned dissent, Holmes called the leaflets "poor and puny anonymities" and said,

In this case sentences of twenty years imprisonment have been imposed for the publishing of two leaflets that I believe the defendants had as much right to publish as the Government has to publish the Constitution of the United States now vainly invoked by them.

Holmes's most famous words from this dissent came, however, when he said,

When men have realized that time has upset many fighting faiths, they may come to believe . . . that the ultimate good desired is better reached by free trade in ideas—that the best test of truth is the power of the thought to get itself accepted in the competition of the market.

In short, Holmes introduced the marketplace-of-ideas theory into American jurisprudence in this often quoted dissent.

The "clear and present danger test" as applied in *Schenck v. United States* (1919), *Frohwerk v. United States* (1919), *Debs v. United States*, (1919), and *Abrams v. United States* (1919) did not protect freedom of speech and press. It was a balancing test, and the Supreme Court tipped the balance in favor of suppression of speech.

Suppression can come in many forms, including economic suppression. The *Milwaukee Leader*, a Socialist newspaper, had its second-class mailing permit revoked by a third assistant postmaster general in 1917. This meant that postage would cost 8 to 15 times as much for the newspaper. The U.S. Supreme Court upheld this revocation in *United States ex rel. Milwaukee Social Democratic Publishing Co. v. Burleson* (1921). Editorials had called World War I an unjustifiable, dishonorable, capitalistic war and had called the president an "autocrat" and the Congress a "rubber stamp Congress." One editorial said that soldiers in France were becoming insane in such vast numbers that long trains of closed cars were transporting them away from battle. The Espionage Act also made it a crime to "willfully make or convey false reports or false statements with intent to interfere with the operation and success of the military or naval forces of this country, or with the intent to promote the success of its enemies." The Supreme Court said, "We cannot doubt that they [the newspapers] conveyed to readers of them, false reports and false statements with intent to promote the success of the enemies of the United States." The newspapers also attempted to cause disloyalty in the military and to obstruct recruiting, the Court said. Again Holmes dissented, saying, "The United States may give up the Post Office when it sees fit, but while it carries it on, the use of the mails is almost as much a part of free speech as the right to use our tongues."

In 1925, a defendant in a sedition case did make some headway with the U.S. Supreme Court. In *Gilow v. United States* (1925), the Court agreed with him that freedom of speech and press are among the "fundamental liberties" protected by the due process clause of the Fourteenth Amendment. The Fourteenth Amendment, passed in 1868, in part says, "No State shall . . . deprive any person of life, liberty, or property, without due process of law." The Fifth Amendment, passed in 1791, says that the *federal* government may not deprive a person of "life, liberty, or property, without due process of law."

Gitlow had violated a New York statute that made it a felony to advocate violent overthrow of the government. That statute was passed in 1902, after President William McKinley was shot and killed. A member of the Left Wing Section of the Socialist Party and business manager of a magazine called *Revolutionary Age*, Gitlow arranged for a “Left Wing Manifesto” to be published in the magazine. The Manifesto called for mass strikes aimed at destroying the democratic state in the United States and establishing a “revolutionary dictatorship of the proletariat.”

Although the Court agreed that freedom of speech and the press are fundamental liberties, the Court also upheld Gitlow’s conviction. According to the Court, the Manifesto was not abstract philosophical doctrine or mere prediction of Communist victory; that would not have been enough to convict Gitlow. Instead, the Manifesto contained “the language of direct incitement.”

“A single revolutionary spark may kindle a fire that, smoldering for a time, may burst into a sweeping and destructive conflagration,” the Court said. The state, according to the Court, did not have to wait for “actual disturbances of the public peace or imminent . . . danger of its own destruction.” Instead, the state could “suppress the threatened danger in its incipiency.”

In this case, the Court said, it did not have to apply the “clear and present danger” test because the New York legislature had already determined that a danger existed from specific language—language advocating the violent overthrow of government. And if a legislative body had already determined that specific words “involve such danger of substantive evil that they may be punished,” then the question of whether the words are “likely” to bring about the evil is “not open to question.” In short, the Court deferred to the legislature’s judgment.

Holmes dissented in *Gitlow v. United States* (1925). He thought the Court should apply the clear and present danger test. “Every idea is an incitement,” Holmes opined. “The only difference between the expression of an opinion and an incitement . . . is the speaker’s enthusiasm for the result. Eloquence may set fire to reason.”

Now, the United States was moving toward World War II. Fear of domestic Communists was also causing tension. In 1940, the U.S. Congress passed the Alien Registration Act, also known as the “Smith Act” because Representative Howard Smith of Virginia had introduced it.

The Smith Act was quite similar to the New York law under which Gitlow had been convicted. Advocating violent overthrow of the government, printing anything that advocated violent overthrow of the government, or conspiring with others to do either was forbidden under the Act. In 1951, the Supreme Court heard its first case arising under the Smith Act, *Dennis v. United States* (1951). The 11 defendants in *Dennis v. United States* (1951) were charged with conspiring to organize a Communist Party to advocate violent overthrow of the government. The trial in federal court in New York took more than 9 months and produced 16,000 pages of transcript.

The *Dennis v. United States* (1951) defendants wanted the U.S. Supreme Court to use the “clear and present danger” test, and the Court, in contradiction to the deference it paid to the legislature in the *Gitlow v. United States* (1925) case, did apply the test. But applying the test ultimately made no difference for the defendants. The Court upheld their convictions. As a matter of fact, the U.S. Supreme Court only reversed convictions in one case using the “clear and present danger” test—three Jehovah’s Witnesses in the case of *Taylor v. Mississippi* (1943). The Jehovah’s Witnesses had been convicted under a Mississippi sedition law for publicly urging people not to support World War II and for urging people not to salute the flag. National security won out over freedom of speech every other time.

After saying in *Dennis v. United States* (1951) that “we are squarely presented with the application of the ‘clear and present danger’ test,” the Court said that it “must decide what that phrase imports.” But first, the Court said what “clear and present danger” does not mean: It does not mean that “probability of success is the criterion” or that “before the Government may act, it must wait until the putsch [the overthrow] is about to be executed.” The Court decided to adopt the view of Judge Learned Hand, a brilliant federal judge from New York. This is Hand’s interpretation of “clear and present danger”: “In each case, [courts] must ask whether the gravity of the ‘evil,’ discounted by its improbability, justifies such invasion of free speech as is necessary to avoid the danger.”

This definition can be converted to the following formula:

Gravity – Improbability = Invasion of free speech.

On one side of the equation is the gravity of the evil, discounted by its improbability. On the other side is the amount of invasion of free speech necessary to avoid the danger. The greater the gravity of the evil and the lower the improbability (meaning the higher the probability), the greater the invasion of free speech that a court will allow. If the gravity of the evil is not that great and the improbability is high, the invasion of free speech cannot be that great. In short,

High gravity and low improbability = A high degree of
invasion of speech,

Low gravity and high improbability = A low degree of
invasion of speech.

In the *Dennis v. United States* (1951) case, the Supreme Court found that a highly organized conspiracy created danger that justified the convictions. Although Holmes was no longer a member of the Court, dissents were blistering. For example, Justice Hugo Black protested that the First Amendment had been watered down until it would

not protect anything but “safe” ideas that did not need protection in the first place. He wanted tougher judicial review of legislation. Chief Justice Douglas, also dissenting, said that he would uphold the convictions if Dennis and his friends were teaching, say, how to plant bombs or assassinate the president, but they were just teaching “Marxist-Leninist doctrine.” He saw no clear and present danger. Douglas used words that the Court would see again—but in a majority opinion. He said, “Free speech—the glory of our system of government—[should] not be sacrificed on anything less than plain and objective proof of danger that the evil advocated is imminent.”

Because the Supreme Court upheld the convictions in *Dennis v. United States* (1951), the U.S. government continued to prosecute Communists under the Smith Act. The Supreme Court did not agree to review any of these cases until it accepted the case of *Yates v. United States* (1957). In *Yates v. United States* (1957), the Court overturned the convictions of 14 people. The Court did not rely on the “clear and present danger” test, however. *Yates v. United States* (1957) held that the Smith Act does not prohibit “advocacy and teaching of forcible overthrow as an abstract principle.” The Court determined that “it is only advocacy of forcible action that is proscribed.” Still, *Yates v. United States* (1957) does not say that the action advocated has to be imminent or probable.

Four years later in another Smith Act case, *Scales v. United States* (1961), the Supreme Court stated, “[Communist] Party leaders were continuously preaching . . . the inevitability of eventual forcible overthrow” of the U.S. government and that this “systematic preaching” constituted “advocacy of action.” The Court opined that advocacy of *future* violent action is just as punishable as advocacy of *immediate* action. Justices Black and Douglas again dissented, joined by Justice Brennan. Eight years later, a Court majority accepted the dissenters’ point of view.

The case enunciating the modern doctrine of incitement is *Brandenburg v. Ohio* (1969). Brandenburg, the red-robed leader of a Ku Klux Klan group, had invited a Cincinnati television reporter to a rally. The reporter also brought a cameraman to the rally, which included a flag burning and oratory by Brandenburg: “We’re not a revenge organization, but if our President, our Congress, our Supreme Court, continues to suppress the white, Caucasian race, it’s possible that there might have to be some revenge taken.” After the televising of the rally, Brandenburg was convicted, under an old Ohio statute passed in 1919, for “advocat[ing] . . . crime, sabotage, violence, or unlawful methods of terrorism [are there any lawful methods of terrorism?] as a means of accomplishing industrial or political reform.”

The Supreme Court overruled Brandenburg’s conviction, saying, “Constitutional guarantees of free speech and free press do not permit a State to forbid or proscribe advocacy of the use of force or of law violation *except where advocacy is directed to inciting or producing imminent*

lawless action and is likely to incite or produce such actions [italics added].” This *Brandenburg* test contains a subjective part (advocacy must be “directed to inciting or producing imminent lawless action”) and an objective part (advocacy must be “likely to incite or produce such actions”). Or the *Brandenburg v. Ohio* (1969) test may be viewed as a three-part test requiring (1) intent, (2) imminence, and (3) likelihood.

After all the flip-flops in its reasoning, after all the upholding of convictions, the U.S. Supreme Court had finally landed on an incitement doctrine that would protect freedom of expression. The Court had tempered sedition as a threat. Only direct incitement could lead to the slamming of prison doors.

Prior Restraint: Gangsters and Good Law

Unlike the sedition cases, where the Supreme Court flailed for 52 years, the Supreme Court got prior restraint right the first time. In *Near v. Minnesota* (1931), the Court set the standard that it has consistently maintained through the years. Like *Brandenburg v. Ohio* (1969), *Near v. Minnesota* (1931) was a 5-to-4 decision.

The historical context of a case can often provide indicators of the policy the High Court would want to pursue. As for the context of *Near v. Minnesota* (1931), World War I had ended, the stock market had crashed in 1929, and Prohibition was in full swing, and along with Prohibition came bootlegging, gangsters such as Al Capone and Bugs Malone, and public officials on the take. In Minneapolis, a man by the name of Jay Near and his partner were busy starting a paper called *The Saturday Press*. They published that the Minneapolis government had connections to local gangsters, including an allegation that the local police chief was in cahoots with gangsters. After the first issue, gangsters shot but did not kill Near’s partner. Near wrote that the prosecuting attorney was not doing enough to clean up the situation. Unsurprisingly, this allegation angered the prosecutor.

A Minnesota statute permitted abatement, or elimination, as a nuisance of any “malicious, scandalous and defamatory newspaper” or other periodical. The prosecutor used the statute against Near and his partner, and *The Saturday Press* was perpetually enjoined from publishing.

On appeal, the U.S. Supreme Court said that the question presented was whether the restraint of publication authorized by the statute was consistent with liberty of the press. Answering “no,” the Court spoke of the Constitutional guarantee of freedom of the press: “It has been generally, if not universally, considered that it is the chief purpose of the guaranty (of freedom of the press) to prevent previous restraint upon publication.” The Court also used another term for “previous restraint” or “prior restraint”—censorship.

In striking down the Minnesota statute, the Court used the Fourteenth Amendment, saying, “It is no longer open to doubt that the liberty of the press and of speech is within the liberty safeguarded by the due process clause of the Fourteenth Amendment from invasion by state action.” Still, the Court rejected the notion that there could be no prior restraint. Instead, the Court made clear that prior restraint could occur but only in the following four “exceptional cases”: obstruction of military recruitment; publishing sailing dates, the number, or location of troops; obscenity; and incitements to violent overthrow of government. In 1976, in *Nebraska Press Association v. Stuart* (1976), the Court would add a fifth exceptional case: prior restraint to protect a criminal defendant’s right to a fair trial.

Note that the Court did not list cases involving malfeasance of public officers, and that is what the Court thought this case was about—trying to use prior restraint of a publication dealing with alleged malfeasance of the prosecutor, a public officer. For roughly 150 years, according to the Court, there had been almost no attempts at prior restraint of publications dealing with malfeasance of public officers, and this fact is “significant of the deep-seated conviction that such restraints would violate constitutional right.”

In short, the “character and conduct” of public officers “remain open to debate and free discussion in the press,” the Court said. Far from restraining the press, the Court even gave the press a pep talk. After all, it was the days of the Great Depression, Prohibition, and gangsters, and some public officials undoubtedly were on the gangsters’ payrolls. The Court said,

The administration of government has become more complex, the opportunities for malfeasance and corruption have multiplied, crime has grown to most serious proportions, and the danger of its protection by unfaithful officials and of the impairment of the fundamental security of life and property by criminal alliances and official neglect, emphasizes the primary need of a vigilant and courageous press, especially in great cities.

But what if a newspaper makes false accusations? The public officer will have to use the libel laws, the Court said.

In 1971, the Supreme Court followed *Near v. Minnesota* (1931) and ruled against the U.S. government when the Justice Department tried to stop *The New York Times* and *The Washington Post* from publishing stories about the *Pentagon Papers*. Demonstrating the importance the Supreme Court places on attempts to shut down the press, the Court heard the arguments for the case on June 26, only 13 days after the first story ran in *The New York Times*. Four days later, the Court issued its decision in the *Pentagon Papers* case, *New York Times Co. v. United States* (1971), saying, “Any system of prior restraint of expression comes to this Court bearing a heavy presumption against its constitutional validity.” The federal government had simply failed to carry its burden of proof that stories

based on the *Pentagon Papers* would cause irreparable harm to U.S. defense interests. So while the conflict in Vietnam raged on, the presses rolled, criticizing U.S. entry into that divisive, undeclared war.

Libel: The Supreme Court Starts a Revolution

But even if the Supreme Court is protecting freedom of expression from government interference in the areas of sedition and prior restraint, that is insufficient if civil suits—suits brought by private individuals or corporations—threaten the vitality of the media. Libel had become a serious threat to media vigor.

Granted, society has a strong interest in protecting peoples’ reputations. According to U.S. Supreme Court Justice Potter Stewart in his concurring opinion in *Rosenblatt v. Baer* (1966), this protection “reflects no more than our basic concept of the essential dignity and worth of every human being.” But freedom of speech also needs protection, of course.

Before 1964, the balance between protecting reputations and protecting speech tilted sharply in favor of protecting reputations. Three doctrines, an unholy triumvirate for the press, made winning a libel suit easy for the plaintiff: These were strict liability, presumed damages, and the burden of proof on the defendant. Under strict liability, the only question for the press was “Are those your words?” The question of how careful or not a reporter had been did not arise. The plaintiff did not have to prove that he or she in fact suffered damages because courts assumed that damages had occurred, and the defendant had either to prove the truth of the statements in question or suffer loss of the case. Libel law, in other words, was stacked against the press. Of course, the upside was that the press would perhaps be more careful. But perhaps the press would also be intimidated.

In its landmark case *New York Times Co. v. Sullivan* (1964), the Supreme Court for the first time assessed the libel situation, and the revolution of U.S. libel law began. Successful libel cases were having a chilling effect, the Court found, and a timid press is inconsistent with democracy. So the Court set out to unthaw public debate on public issues, by making it much more difficult for public officials to win libel suits. Justice William Brennan wrote the decision. He said, “We consider this case against the background of a profound national commitment to the principle that debate on public issues should be uninhibited, robust, and wide-open, and that it may well include vehement, caustic, and sometimes unpleasantly sharp attacks on government and public officials.”

New York Times Co. v. Sullivan (1964) posed the question of whether the First Amendment permitted a law of libel. The Court then took a halfway position. It did not say that libel law was unconstitutional, but it said that the way

states were handling libel law was unconstitutional. The Court reversed Sullivan's win. The Supreme Court held that the Alabama view of libel was constitutionally deficient. Alabama failed to provide the safeguards for freedom of speech and press required by the First and the Fourteenth Amendments of the U.S. Constitution. The Court declared that a public official who claims to have been libeled can only win if he or she jumps high legal hurdles. The public official must prove, with clear and convincing evidence, that the defendant newspaper or broadcaster acted with "actual malice," that is, with "knowledge that a statement is false, or reckless disregard of whether it is was true or false." In other words, the official had to prove that the defendant either knew that what he or she said was false or at least entertained some serious doubts about whether it was true or false. Furthermore, the public official had to prove that the statements caused him or her to suffer damages. And the public official had the burden of proof to prove that the allegedly libelous statements were in fact false. In short, the unholy triumvirate of strict liability, presumed damages, and burden of proof on the defendant was now dead.

The alleged libel of Sullivan, the commissioner who supervised the Montgomery police, occurred in an editorial advertisement, "Heed Their Rising Voices." It was a full-page ad with 10 paragraphs of political speech taken out by a civil liberties group dedicated to the struggle for equality by African Americans. Sixty-four persons' signatures appeared under the ad, including those of a number of celebrities. The ad began by saying,

As the whole world knows by now, thousands of Southern Negro students are engaged in wide-spread, nonviolent demonstrations in positive affirmation of the right to live in human dignity as guaranteed by the U.S. Constitution and the Bill of Rights.

But the ad said that these nonviolent demonstrations were being met

by an unprecedented wave of terror by those who would deny and negate that document which the whole world looks upon as setting the pattern for modern freedom.

The ad contained some errors. For example, it said, "In Montgomery, Alabama, after students sang 'My Country, 'Tis of Thee' on the State Capitol steps, their leaders were expelled from school and truckloads of police armed with shotguns and tear-gas ringed the Alabama State College Campus." The students instead sang the National Anthem, and the police did not "ring" the campus.

The Supreme Court said that the ad did not forfeit its First Amendment protection because some of its statements were false or because they were allegedly defamatory. "Neither factual error nor defamatory content remove the constitutional shield from criticism of official conduct."

Talking about the need for "breathing space," the Court said, "erroneous statement is inevitable in free debate, and . . . it must be protected if the freedoms of expression are to have the 'breathing space' that they need to survive." The court pointed out that the \$500,000 civil judgment in Sullivan was 1,000 times greater than the maximum fine provided by Alabama's criminal libel statute and 100 times greater than the maximum fine under the Sedition Act of 1798. The Court said that even if newspapers could survive financially, "the pall of fear and timidity" would create "an atmosphere in which the First Amendment freedoms cannot survive."

As for requiring the defendant to prove the truth, the Court said that it leads to self-censorship. Having to prove truth deters criticism because the critic, even if the critic knows that something is true, might doubt whether he or she could prove it in court or might fear the expense of having to prove it in court.

The most revolutionary statement concerning constitutional restraints in libel cases is this:

The constitutional guarantees require . . . a federal rule that prohibits a public official from recovering damages for a defamatory falsehood relating to his official conduct unless he proves that the statement was made with "actual malice"—this is, with knowledge that it was false or with reckless disregard of whether it was false or not.

There were no dissents in the *New York Times Co. v. Sullivan* (1964) case. Three justices, Black, Douglas, and Goldberg, wrote concurring opinions saying that they would have gone even further than the rest of the Court by recognizing an absolute right to publish criticisms of public officials. Had the court gone as far as these three, then public officials would have been precluded under the Constitution from bringing libel suits concerning their official conduct.

In 1966, the Supreme Court extended the *New York Times Co. v. Sullivan* (1964) rule of actual malice to nonelected public officials and to former public officers when there is still public interest in a matter (*Rosenblatt v. Baer*, 1966). The following year, 1967, the Court extended this doctrine of actual malice to public figures (*Curtis Publishing Co. v. Butts* and *Associated Press v. Walker*, 1967).

As for who qualifies as a public figure, the Court explained in *Gertz v. Robert Welch, Inc.* (1974) that "in some instances an individual may achieve such pervasive fame or notoriety that he becomes a public figure for all purposes and in all contexts." Famous entertainers, athletes, or other persons whose names almost everybody recognizes are public figures for all areas of their lives and thus must always prove actual malice to win a libel case. "More commonly," the Court says, "an individual voluntarily injects himself or is drawn into a particular public controversy and thereby becomes a public figure for a limited range of issues."

In *Gertz v. Robert Welch, Inc.* (1974), the Court applies a different rule than actual malice for these private persons for two main reasons. First, “Public officials and public figures usually enjoy significantly greater access” to the media. Thus, they have a greater opportunity to “counteract false statements” than do private individuals. They can engage in “self-help,” as the Court calls it. But private individuals are “more vulnerable to injury, and the state interest in protecting them is correspondingly greater.” Second and more important, the Court says, is a moral consideration at the base of this distinction between public and private plaintiffs: “An individual who decides to seek governmental office must accept certain necessary consequences,” and running the “risk of closer public scrutiny” is one of them. “The media,” according to the Court, “are entitled to act on the assumption that public officials and public figures have voluntarily exposed themselves to increased risk of injury from defamatory falsehoods.” But “no such assumption is justified with respect to a private individual.” In short, the Court says, “Private individuals are not only more vulnerable to injury than public officials and public figures; they are also more deserving of recovery.” Therefore, in *Gertz v. Robert Welch, Inc.* (1974), the Court held that states could “define for themselves the appropriate standard of liability for a publisher or broadcaster” who defames a private individual, “so long as the states do not impose liability without fault.” Negligence, or not using the degree of care that a reasonable person in similar circumstances would use, is thus an acceptable standard of proof for private individuals. But even private individuals who seek punitive damages must prove actual malice. The Court in *Gertz v. Robert Welch, Inc.* (1974) defines punitive damages as “private fines . . . to punish reprehensible conduct and to deter its future occurrence.”

The revolution in libel law ended in 1974. The Court continued to struggle with the sometimes fuzzy lines of who constitutes a public figure, but the basics of libel law were in place. The Court had gutted the old law of libel and left in its place a law of libel that sometimes made recovery of damages impossible even for persons who the media had intentionally wronged: “Plainly many deserving plaintiffs, including some intentionally subjected to injury, will be unable to surmount the barrier of the *New York Times* test,” the Court had admitted in *Gertz v. Robert Welch, Inc.* (1974). Perhaps the pendulum had swung too far in favor of protecting the press, but the Court was expressing the importance of the press to a democratic society—“the primary need of a vigilant and courageous press” that the Court had emphasized in *Near v. Minnesota* (1931).

In 1988, in *Hustler Magazine v. Falwell* (1988), the Court emphasized the importance of protecting the press even when it printed material designed to hurt feelings, especially political cartoons: “The appeal of the political

cartoon or caricature is often based on exploration of unfortunate physical traits or politically embarrassing events—an exploration often calculated to injure the feelings of the subject of the portrayal.” Indeed, history, according to the Court, is on the side of caustic cartoons: “From the early cartoon portraying George Washington as an ass down to the present day, graphical depictions and satirical cartoons have played a prominent role in public and political debate.”

In libel, as well as in prior restraint, the Court had gone directly to protecting freedom of expression. The Court had not spun its wheels, grinding up defendants, as it had in sedition cases.

Conclusion

Sedition, the crime of criticizing government or its officials, laws, or institutions, took its toll on freedom of expression while the Supreme Court floundered. Many years were wasted in prison by persons convicted for “crimes” such as criticizing the draft or opposing the making of armaments and war. Arguably, the United States did not get true freedom of political expression until 1969 and the *Brandenburg v. Ohio* (1969) decision, which said, “Constitutional guarantees of free speech and free press do not permit a State to forbid or proscribe advocacy of the use of force or of law violation except where advocacy is directed to inciting or producing imminent lawless action and is likely to incite or produce such actions.”

But the Supreme Court got it right the first time when asked whether a publication could be shut down for criticizing a public official for alleged malfeasance in office. In 1931, the High Court in *Near v. Minnesota* (1931) declared, “It has been generally, if not universally, considered that it is the chief purpose of the guaranty (of freedom of the press) to prevent previous restraint upon publication.” And the Supreme Court took it upon itself to revolutionize libel law in 1964, ruling that public officials could only win libel cases if they could prove by clear and convincing evidence that the defendant acted with “actual malice”—with “knowledge that a statement is false, or reckless disregard of whether it is was true or false.”

Although the Supreme Court is the ultimate authority on freedom of expression in the United States, perhaps one of the best statements regarding the importance of freedom of expression came from a New York trial judge in the *Pentagon Papers* case. Judge Murray Gurfein, in *United States v. New York Times Co.* (1971), wrote,

There is no greater safety valve for discontent and cynicism about the affairs of Government than freedom of expression in any form. This has been the genius of our institutions throughout our history. It is one of the marked traits of our national life that distinguish us from other nations under different forms of government.

JOURNALISM ETHICS

CLIFFORD G. CHRISTIANS

University of Illinois at Urbana-Champaign

Journalism ethics is a dynamic and growing field. Ethical issues in news have been debated since the 1890s, but by the 21st century, journalism ethics had become a major enterprise. Textbooks, workshops for media professionals, research, university courses, professors who specialize in ethics are now commonplace. Advertising and public relations ethics, and entertainment ethics are taken seriously too, but journalism ethics is especially strong.

In 1980, following decades of slow advance, journalism ethics received a major boost from two sources that catapulted the field into the new century. In the United States, the Hastings-Carnegie studies of professional ethics in American higher education were completed that year (Hastings Center, 2000). Journalism was included within the domain called *professional ethics*, along with high-status occupations such as medicine, law, business, and engineering. It established for media ethics, the baseline statistical measures and many of the issues that we continue to use in research today. It gave to journalism ethics the status of philosophy. Journalism is included in the academic organization that resulted, The Association for Applied and Professional Ethics. The *Journal of Mass Media Ethics*, which began publication in 1985, contributes to professional ethics as a whole, not just narrowly to the ethics of reporting.

Many Voices, One World also appeared in 1980. Sean MacBride, the UN delegate from Ireland, spearheaded a study for the United Nations Educational, Scientific and Cultural Organization (UNESCO) of international media policies and professional practices. It emphasized the developing world as an equal partner with industrial nations, insisting on the rights of the South to speak for itself in its own terms. Mass communication ethics passed

the international watershed and has been global of necessity ever since.

Since journalism ethics has become a large and complicated field of study, it is divided somewhat differently by various authors and thinkers. But generally, four important ethical issues dominate the agenda for 21st-century communication: truth, technology, social philosophy, and universals. The health and vitality of journalism ethics for the future depends on the sophistication with which these complicated issues are handled.

Truth

The press's obligation to truth is of paramount concern at present. Truth telling is the generally accepted standard of the media professions. Communicators are to be specialists in truth in the way politicians ought to specialize in justice and business leaders in stewardship. Credible language, in fact, is pivotal to journalism's very existence. But living up to the truth ideal is nearly impossible these days. Budget constraints, deadlines, self-serving sources, and the frenetic pace all complicate the production of truth in newswriting. Our impressive technology generates almost unlimited news copy and requires difficult choices without the opportunity to sift through the intricacies of telling the truth.

The prevailing view of truth as accurate information is too narrow for today's social and political complexities, though objectivity remains entrenched in ordinary practices of news production and dissemination. With this historic scheme under duress, some heavy thinking by both practitioners and academics is critical for transforming the concept of truth intellectually.

A more sophisticated concept of truth is disclosure, getting to the heart of the matter. Already in 1947, the famous Hutchins Commission Report, *A Free and Responsible Press*, had called for this alternative. It advocated a deeper definition of the press's mission as "a truthful, comprehensive and intelligent account of the day's events in a context which gives them meaning." Dietrich Bonhoeffer contends correctly in his *Ethics* (1995, chap. 5) that a truthful account includes the context, motives, and presuppositions involved. Truth as authentic disclosure means, in other words, to strike gold, to get at the core issue, the heart of the matter, to see the essence of things (Pippert, 1989). When the truth is told, the response is "You're right. Now I get it."

The best journalists understand from the inside the attitudes, culture, and language of the persons and events on their news beat. In the process of weaving a tapestry of truth, reporters' disclosures will be credible and realistic to those being covered. Rather than reducing social issues to the financial and administrative problems that politicians define, the truth principle requires that the news media disclose the depth and nuance that enable readers and viewers to identify the fundamental issues themselves.

During a formative period for the media in the 1920s to 1950s, a dichotomy between facts and values dominated Western thinking. Genuine knowledge was identified with the physical sciences, and the objectivity of physics and mathematics set the standard for all forms of knowing. Journalistic morality became equivalent to unbiased reporting of neutral data. Presenting unvarnished facts was heralded as the standard of good performance. The best news mirrored reality. Objective reporting was not merely a technique, but withholding value judgments was considered a moral imperative. With scientific naturalism being the ruling paradigm in the academy, universities institutionalized the convention of objective reporting in journalism curricula.

Objectivity has become increasingly controversial as the working press's professional standard. Rather than surrendering the idea of objectivity altogether and defining journalism ethics without it or alongside it, Stephen Ward (2004) argues for transforming it into pragmatic objectivity. This is another alternative instead of defining truth as authentic disclosure. It is an idea that warrants ongoing discussion, analysis, and application. Pragmatic objectivity is a "modest conception of truth that is closest to common sense" (p. 267). It understands "truth as the slow process of coming to know more and more things about our empirical world and to grasp them in a more accurate and comprehensive manner" (p. 271). Ward correctly challenges professionals to participate in its definition and implementation.

Technology

Ethics has its roots and longest history in print journalism. But the field is challenged in the 21st century by the revolution in media technology. The communication technologies

that produce and distribute information today have become an economic paradise. Clusters of high-tech communication firms are remapping the planet. Previous geographical alignments organized by political power are being reordered in terms of electronic megasystems.

The revolution is not taking place in abstraction outside of everyday affairs. The menagerie of fiber optics, super-computer data, and satellite technology, though inescapably global, is local and personal as well. Television, CDs, and DVDs, online databases, iPod, Facebook, MySpace, video games, cellular telephones, and virtual reality—the electronic highway has become the everyday world of advanced industrial societies. Mass media technologies are converging into digital formats, Internet chat rooms, multiuser domains (MUD), Web-based publications, and hyperlink— together they are producing new forms of human interaction. Public life in the 21st century is being altered in complex ways through ubiquitous multimedia technologies, and ethics is essential for coming to grips with them. Language is indispensable to our humanness and the social order; therefore, when our communication capacity is mediated in fundamentally different ways than before, the impact is substantial and far-reaching. Accounting for the social influence of media technologies is a historical and empirical task but clearly the domain of journalism ethics as well. And its grounding in print technology means that the field needs to be updated and transformed.

Historically, communication ethics arose in conjunction with concerns related to the print media, so that it requires substantial work to extend the original developments to the more prominent digital technologies. Print news and the ethical standards for newspaper reporters were the first concerns of anything that could be called communication ethics. The harm that an unregulated press could do to society was first explicitly linked to ethical principles in North America and Europe during the 1890s, when critics began assessing journalism philosophically. These initial forays blossomed into the first systematic work in communication ethics during the 1920s in the United States. Four major books emerged from America's heartland during that decade, their authors among a Who's Who of journalism luminaries: Nelson Crawford's *Ethics of Journalism* (1924), Leon Flint's *The Conscience of the Newspaper* (1925), William Gibbon's *Newspaper Ethics* (1926), and Albert Henning's *Ethics and Practices in Journalism* (1932). These authors understood ethics as a scholarly enterprise and left a permanent legacy. In Europe also, several ethical issues emerged in the early 20th century. Sensationalism was considered contrary to the public service role of the newspaper. Freebies and junkets, scourged by media critics already in the 19th century, were treated more systematically in the context of rising business competition. Together, they carved out much of the structure that dominates journalism ethics across Europe and North America in the early 21st century and, with some nuances, in various regions around the world.

But those intellectual roots of press ethics were formed when print technology was the exclusive option. Most of the heavyweights in communication ethics in industrialized democracies have shown a predilection for news, and news in its literary rather than electronic broadcast form. Many of the perpetual issues in media ethics—invasion of privacy, conflict of interest, sensationalism, confidentiality of sources, and stereotyping—get their sharpest focus in a print context. Meanwhile, newspapers outside the mainstream have scarcely been considered, making exceptions such as Patrick Washburn's book *The African American Newspaper* (2007) an important one for ethics.

The media situation changed in the late 20th century. Television became the primary source of news for most people, and information radio, such as National Public Radio, became vital. Research emphasized the news function, tackled cases and problems from broadcasting, the wire service agencies, and documentaries, in addition to everyday reporting. And beyond news, the electronic media's role in persuasion and entertainment became pervasive, socially significant, and ethically charged. The result was burgeoning research in the ethics of public relations, organizations, face-to-face encounters, the music business and cinema, libraries, book publishing, confidentiality in computer storage, fiction, new media technologies, the mass-mediated sports industry, and more.

The dark side of ethical research into this expansive field of all media functions has been faddishness and fragmentation. However, the widening spectrum did open new insights and fresh approaches to issues that lie beneath the surface. Deception and economic temptation were seen as common in all mass-mediated communication. Sexism and racism are deep-seated everywhere. Reporters often failed to recognize sensationalism in the news until they confronted the difference between gratuitous violence and realism in the entertainment media. Invasion of privacy, easily excused in news, becomes an insufferable evil when government agencies access confidential information from data banks without permission. The challenge for journalism ethics yet today is to demonstrate how ongoing ethical quandaries ought to be examined across a diverse range of media technologies and functions—not only in print and broadcast media but also with digital technologies primarily.

In outlining an agenda for communication ethics in terms of the entire spectrum of media technologies rather than print journalism alone, several issues emerge as primary. Each can profit from the past, though several are new or have such dramatic intensity at present that thinking rooted in the communication ethics of the 20th century is no longer directly relevant. Meanwhile, the electronic media have achieved some important successes. The Internet makes it possible for people who disagree with government policies to unite and protest against them. The Landmine Ban Treaty among the world's nations, for example, could not have happened without new media technologies. Television was the stimulus for humanitarian

intervention in Somalia and prison reform in the U.S. military. Strengthening the media's role in democracy is important for journalism ethics while identifying the negative dimensions that are already obvious.

Violence in television and in films has been a major ethical issue for decades. Internet technology has complicated the problem with hate speech and terrorism. In the United States, for example, studies have shown that by high school graduation, the average 17-year-old will have seen 18,000 murders in movies and on television. From the horrific shootings at Columbine High School in 1999 to similar tragedies in other states and countries before and since, teenagers who slaughter their classmates and teachers, and then kill themselves, are linked by debate or research to the culture of violence in which they live. While the United States leads the world in the amount of violence on television, television programming in all parts of the globe contains a great deal of violence, including a high percentage of guns as weapons and the terrible consequences only hinted at or not even depicted at all. Gun-related deaths in the United States have reached the level of a public health epidemic.

Violence is a serious ethical issue because it violates the persons-as-ends principle. The 19th-century ethicist Immanuel Kant made a standard formulation still used today—people must treat all other rational beings as ends in themselves and never as means only. The gratuitous cheapening of human life to expand ratings is a reprehensible mistreatment of human beings. From the persons-as-ends perspective, there is a special concern about the sexual violence so common in music video, horror movies (especially slasher films), and video games. Sadistic, bloodthirsty torture in pornography is a particularly offensive form of dehumanization.

A new dimension of violence has emerged with hate speech on the Internet. In 1995, the former Ku Klux Klan (KKK) leader Don Black established Stormfront, the first white supremacist Web site. As access to the Internet became less expensive and creating Web pages much simpler, the number of Web sites and people visiting them grew exponentially. Mirroring this growth, Web sites promoting various kinds of bigotry have multiplied dramatically, now numbering in the thousands. In the past, hate was promoted through crude graffiti and low-quality pamphlets. Bulk mailings to even a few hundred people were difficult. But with the Internet, slick Web sites devoted to hate are available to a potential audience of millions. Though late in the 20th century the KKK was fragmented more than at any time since World War II, its factions are now using the Internet to revitalize the organization as the so-called "Klan without robes." The KKK sites maintain and defend the superiority of the white race and warn against interracial marriage. Jews are vilified as Satan's people, and immigration is condemned as an uncontrolled plague. Numerous neo-Nazi Web sites promote the anti-Semitic racism of Adolf Hitler, with the National Alliance being the most

prominent Hitlerian organization in the United States thanks to the Internet. Jews are blamed for inflation, media brainwashing, and government corruption, with blacks depicted as criminals and rioters. A host of Web sites are devoted to Holocaust revisionism, denying the murder of Jews in World War II. Web sites of hate groups that claim religious legitimacy are flourishing as well. The Christian Identity site is virulently racist and anti-Semitic. The World Church of the Creator calls nonwhites physiologically sub-human. The site for White Aryan Resistance rails against the nonwhite birthrate. Other sites are anti-Catholic and anti-Muslim or militantly anti-abortion.

This is one example of how digital technology challenges journalism ethics in a new way. In dealing with the various moral problems in the media, some ethical theories are more appropriate than others, and different theories do not always give the same answer. But hate speech on the Internet is contradicted by all major theories without exception. This across-the-board condemnation suggests that all personal, educational, and policy efforts to combat Internet hate speech are permissible, even mandatory, but obviously without the revenge and aggressiveness that contradict good ends.

The worldwide reach of high-speed electronic technologies has made communication systems and institutions of global scope possible. Dealing with these new entities requires a technologically sophisticated, cross-cultural ethics commensurate with the worldwide reach of the media. In the process of identifying and responding to specific issues, communication and media ethics must make the questions raised by technology a central focus for the 21st century. As true of professional ethics generally, journalism ethics ought to become international in character. In place of its largely Western, gender-biased, and monocultural traditions, media ethics of the future must be ecumenical, gender inclusive, and multicultural.

A diversified, transnational ethics, with a level playing field rooted in equal respect for all cultures, is by no means unproblematic and involves an act of faith. The claim that all cultures have something important to say to all human beings is a hypothesis that cannot be validated concretely. Yet it serves as an open horizon for moving transnational study forward. Of the various types of applied and professional ethics, journalism ethics has its roots most deeply in language, culture, and human dialogue. In that sense, a multicultural style is required for its own identity.

Here is a way to summarize and clarify technology as today's challenge for journalism ethics. Over the history of journalism ethics, decisive changes have occurred in media technology from print to electronic. In the 21st century, another major shift is under way to digital. When journalism ethics entered its major phase in the 1980s, broadcast technology dominated our media systems; presently, the important ethical concerns focus on digital technology instead. Journalism ethics, as it took hold with MacBride and the Hastings-Carnegie studies, was rooted in print technology.

In the digital era now, ethics must establish its agenda in terms of the distinctive properties of this new technological system. An early version of this task was the special issue of the *Journal of Mass Media Ethics* in 1998 devoted to new media technologies. A double issue of the *Journal of Mass Media Ethics* in 2003, "Virtual Reality and Communication Ethics," developed the idea that the virtual world as the innovative edge of online technologies is the most advanced context at present for coming to grips with ethics. David Gunkel's *Thinking Otherwise: Philosophy, Communication, Technology* (2007) centers on ethics throughout, philosophical ethics and media ethics both. He develops a model of moral responsibility within the context of the newest innovations in information technology. Michael Bugeja's *Living Ethics Across Media Platforms* (2007) identifies moral issues that are similar across the various media technologies.

Based on this scholarship to date, the ethics agenda needs to be developed in full for the digital world of search engines, online networking, and computer databases. Some issues are new, some amplify or transform the ethics of the past, and others create new levels of complexity heretofore unknown. Regarding the latter, cyberwarfare and cyberterrorism have been given special urgency since September 11, 2001. Long-standing issues have taken on a new complexity or orientation, such as Web-based surveillance and theft of private information. The ethics of representation now has a different orientation with gender, race, and religion debated in anonymous cyberspace. Equitable allocation of information technologies is one moral problem of justice, confronting as it does the injustice of the digital divide between the information rich and poor.

Other problems are rooted in computer technology itself, such as the ethics of blogging and online journalism. Blogging is only possible in an age of sophisticated technology. As a digital revolution at home and at work, it requires special emphasis in developing ethical principles that are appropriate. A code of blogging ethics developed by Martin Kuhn and the Association for Education in Journalism and Mass Communication focuses on the struggle to build human relationships and communities in cyberspace. The quality of interaction by the participants is considered the core duty that a code of ethics must address (www.cyberjournalism.net/news). Together these dramatic technological changes offer an obvious challenge for developing ethical guidelines that are appropriate to them.

Social Philosophy

The emphasis in journalism ethics throughout the 20th century was on professional morality, on the character of news, and on the values and structures of news organizations. The classroom and research focused on the insider: reporters and sources, problems of daily newsgathering,

the economic temptations to put circulation and audience above the best possible reporting, the press's invasion of privacy, and so forth. Case studies were typically recommended for teaching since they deal with concrete issues and actions. For the bulk of its history to date, the agenda of journalism ethics has been set by the profession, its struggles and problems as understood from the inside out and the bottom up.

The challenge for the 21st century is grounding journalism ethics first of all in the general morality. The rationale for a practitioner orientation to date is obvious. The complexity of the field and its changing dynamics require ongoing concern for professional morality. However, rather than developing rules for experts, media ethics needs to be preoccupied now with the moral dimension of everyday life. The venerable issues of social ethics should determine the agenda (e.g., justice, human dignity, truth telling, no harm to the innocent), and journalistic practice should be understood in that larger context. How the moral order works itself out in community formation must be the focus, not what practitioners consider virtuous. Rather than refining journalism codes of ethics, the ultimate standard for media professionals is the moral life as a whole. With this broader orientation, reporters and management would operate in the same arena as their readers, viewers, and clients. The compelling need for this century is a citizen's ethics rather than a profession-based ethics per se.

To develop journalism ethics in these larger terms, democracy as a political system ought to be the framework for understanding the media. The important book *The Press*, edited by Geneva Overholser and Kathleen Hall Jamieson (2005), gives us the right perspective here. Democracy in this volume is the context in which the structure and function of the news media are understood. The health of journalism by itself is not the main concern of *The Press* but the vitality of democratic politics. As the authors put it, journalism is the means, and the end is democracy. Rather than provide audiences and readers with information, the press's aim is citizens who are literate about democracy. In that sense, ethical journalism is the foundation of genuine democracy.

Journalism ethics is not only concerned with the flourishing of democratic practice, but it also has a stake in democratic theory as well. For the 21st century, thinking on democracy is moving beyond individual rights and government policy to cosmopolitanism. Political theorists are seeking to make democracy more global, more responsive to and more viable in a world where political participation extends beyond traditional nation-states and requires forms of democracy not bound by geography. David Held (1995), among others, focuses on what he understands to be a new and pressing need for a global democratic order stronger than the United Nations, without discounting the importance of the local, regional, and national. Cosmopolitanism sets the highest and most accurate standard at present as the democratic context for understanding the

ethics of news—particularly Appiah's (2006) version, which deeply engages diversity.

In fact, diversity is one of the central issues in journalism ethics and society at present. Indigenous languages and ethnicity have come into their own. Ethnicity has replaced Marxist class struggle as the most powerful force of the 21st century. Sects and religious fundamentalists insist on recognition. One's culture is more salient at present than one's nationality. Muslim immigrants are the fastest-growing segment of the population in France, and they are not interested in full assimilation into French language and politics. A total of 30,000 Navajos live in Los Angeles, isolated from their native nation and culture. The nomadic Fulani, searching for good pasture throughout sub-Saharan West Africa, are held together by clan fidelity, but their political future hangs in the balance. In contrast to the melting pot of the previous century, immigrants to the United States in the 21st century insist on maintaining their own cultures, religions, and languages. The majority of European origin is under siege in North America. In the United States, for example, 1.5 million people from across the globe become new citizens every year, but debates over immigration policy are acrimonious and irresolute. More than 50% of the schoolchildren in New York State belong to non-Caucasian ethnic groups. In cultural terms, south-central Los Angeles is a continent away from residential Hollywood. A subculture of Chaldean Christians with Iraqi roots owns 1,500 small stores in Detroit, Michigan. Amish farmers in Pennsylvania and the Amana Colonies in Iowa struggle to maintain their identity. Consensus under the melting-pot thesis holds little salience.

On a global scale, according to anthropologists, nearly 20,000 culture groups are locked away from the social mainstream. For the most part, these hidden peoples exist without recognition or adequate representation. Urdu-speaking Muslims are aliens in the state of Punjab in India. Since winning independence in 1989, the Belorussians have had little success in creating a sovereign state; for 70 years, their history and language had not been taught. Their identity crisis reaches even to the parliament in Minsk. Only the remnants of Mayan culture survive in the Yucatan peninsula of Mexico, obscured under the government's official commitment to the Spanish language and to nationalism. Anthony Cortese (1990) documents how deeply moral commitments are embedded in social relations—his cross-cultural evidence including among others an Israeli kibbutz, Kenyan village leaders, Tibetan monks, and folk societies in Papua New Guinea and India. Ethnic identity is now considered essential to cultural vitality. As a result, social institutions such as the mass media are challenged to develop a healthy cultural pluralism in their thinking, organizational structure, and reporting practices.

If the task of ethical journalism is to enable local communities to speak in their own language and to participate actively in public life, what glue is left to hold us together? With cultural identity coming into its own from Miami,

Florida, to East Asia, is ethnic conflict inevitable? The Hutu and Tutsi massacres in Rwanda, Russian soldiers shooting people in the streets of a Chechen village, and brutal warfare in Bosnia are not stories about tribal disputes only but also about ethnic cleansing. Is anarchy likely?

Therefore, the question is whether in a democratic view of public life and the press, we are referring to local cultures only. Without a commitment to the common human good, we will not avoid tribalism. The issue for ethical journalism is not communal values per se but universal ones—not the common good understood as the community's good but common in its richest universal meaning.

To make ethnic, racial, and cultural diversity come true in the 21st century, media programming and policies should move away from melting-pot homogeneity and replace it with the politics of recognition. Obviously, news cannot be ethical unless the challenge of cultural diversity is met, and this requires a fundamental shift from homogeneity to recognition. The basic issue is whether democracies discriminate against their citizens in an unethical manner when major institutions fail to account for the identity of their members. In what sense should the specific cultural and social features of African Americans, Asian Americans, Native Americans, Buddhists, Jews, the physically disabled, or children publicly matter? Should not public institutions ensure that democratic citizens share an equal right to political liberties and due process without regard to race, gender, or religion? The Canadian philosopher Charles Taylor considers the issue of recognizing multicultural groups politically as among the most urgent and vexing on the democratic agenda. Beneath the rhetoric is a fundamental philosophical dispute about the ethics of recognition. As Taylor (1994) puts it, "Nonrecognition or misrecognition can inflict harm, imprisoning someone in a false, distorted and reduced mode of being. Due recognition is not just a courtesy we owe people. It is a vital human need" (p. 26). Guaranteeing that people have their own voice, define their own identity, and are respected as equals on their own terms is a foundational issue for democracy and for the news media, which constitute the public arena where ethnic identity is represented and understood.

News professionals are generally committed to the flourishing of particular cultures, religions, and ethnic groups, but this commitment needs to be applied more aggressively. Paul Lester and Susan Ross's *Images That Injure* (2003) has become a staple of instruction for students and practitioners toward that goal. Downing and Husband (2005) help fulfill this agenda also with their literature review of three decades of racial stereotyping as background for proposing a new "multi-ethnic public sphere" model for representing race. And Robert Entman and Andrew Rojecki (2000) illustrate a deep application of cultural pluralism to race. Race in the United States

remains a preeminent issue, and their research indicates a broad array of white racial sentiments toward African Americans as a group. They emphasize not the minority of outright racists but the perplexed majority. On a continuum from comity (acceptance) to ambivalence to animosity and finally racism, a complex ambivalence most frequently characterizes the majority. Whites bring combinations of misinformation, emotional needs, assumptions, and experiences to their thinking about race. They may believe, for example, that blacks face discrimination but argue against welfare spending out of a suspicion of government programs. Correcting white ignorance and dealing with ambiguities hold the most promise for the media. There is little evidence that the media, in either news or entertainment, focus on ambivalence and pull their viewers and readers toward comity. In Entman and Rojecki's study, the media did little to enhance racial understanding among the ambivalent majority most open to it. The challenge for the media is to provide the news and programming that this important swing group needs to move policy and institutions toward cultural pluralism.

For journalism ethics, ethnic identity cannot be a half-hearted pursuit. We are fully human agents through language. Language makes community possible; it is the public agent through which our identity is realized. The lingual dimension forms humans and their relationships into meaningful units, and its vitality or oppression inevitably conditions our well-being. In that sense, the media as our primary form of public communication are a crucial arena through which ethnic pluralism comes into its own.

Universals

It is imperative that ethics in the 21st century be broad and strong enough to match the media's international scope. Fortunately for the field's long-term vitality, theoretical models of the universal are being developed for media ethics, as they are by academics in philosophy and the social sciences. Thomas Cooper's *Communication Ethics and Global Change* (1989) was the first comprehensive survey of journalism ethics across cultures by an international network of media professionals and teachers from 13 countries. The quest for truth, desire for responsibility, and call for free expression were identified as three major areas of worldwide concern. Another research strategy he developed for understanding our universal humanity is learning from indigenous groups (Cooper, 1998), noting in particular their sophisticated understanding of truth and their integration of heart and mind. The Christians and Traber (1997) study of ethical principles in 13 countries on four continents affirms the sacredness of life as a universal principle. Hamelink (2000) appeals to international human rights for moral guidance vis-à-vis cyberspace technology. Stephen Ward's (2005) global thinking revolves around a

modified version of social contract theory. Shakuntala Rao and Herman Wasserman (2007) use postcolonial theory as their framework. Lee Wilkins (2008) has established neuroscience as a theoretical framework for moral universals. None of them promotes transcendental metaphysical abstractions, but they recognize diversity across cultures by keeping ethics rooted in everyday experience.

Individual rights are the axis around which most journalism ethics has revolved—individuals making decisions as professionals and then being held accountable for them. While this focus on personal responsibility covers a large amount of everyday experience, the global society taking shape in the 21st century needs a broader and more comprehensive framework than individualism. The most radical alternative to individual rights is universal human solidarity. The beginning point of universals in ethical theory is global oneness. Starting at this end of the spectrum does not ignore individual decisions but comes to them from the larger perspective of the transnational and the needs of human beings as a whole.

What could this possibly mean? What is human solidarity? What are some universal principles on which we could all agree? Are there common goods in spite of the splendid variety of human ingenuity? If we are to foster good journalism on the local level, we need a vocabulary of master norms and of universal values, not lame appeal to community standards only. In its theorizing and everyday practice, journalism must advocate principles that hold true universally. Rather than either universals or communities, they need to feed from one another. If adjudicating among individual rights is often impossible, we confront the same issue among competing communities: Which one is legitimate, and which ones are not?

Universal values provide a framework for bringing our communities into perspective and under judgment as necessary. Obviously, not every community ought to be celebrated. Humans tend to make their local situations supreme and in the process overlook racism, sexism, and injustice within. Universal values are a way of keeping our common human solidarity as the ultimate and of restricting particular conventions on the local level to secondary status. Cultures need norms beyond their own heroes and ideals to be self-critical. An outsider lets us know that we are limited. In fact, without norms that are more than contingent, dehumanization cannot finally be condemned except on the grounds of personal preference or emotional appeal. Without a commitment to common principles, history is but a contest of arbitrary power.

Universal principles in the past have proved to be oppressive. They typically have been designed from a certain perspective—Western, male, and abstract, for example—and then imposed on others in a patronizing manner. The universals that are legitimate in the 21st century are not rigid, formal, and domineering but respect the diversity of the human race even while seeking commonness among peoples everywhere.

One such master principle is human dignity, most widely known as the *Universal Declaration of Human Rights*, established in 1948 by UNESCO:

- Recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice, and peace in the world. (Preamble)
- All human beings are born free and equal in dignity and rights. (Article 1)
- Everyone is entitled to all the rights and freedoms set for in this Declaration, without distinction of any kind, such as race, color, sex, language, religion, political or other opinion, national or social origin, property, birth or other status. (Article 2)

Every child, woman, and man has sacred status without exception. Inspired in large part by the atrocities of World War II, the Preamble refers to “barbarous acts which . . . outraged the conscience of mankind.” The *Declaration* is generally considered the most universal expression of the moral aspirations of the civilized world.

Humans are a unique species. No society has open hunting season on people: “In October you can shoot three as long as you have a license.” On the principle of our unassailable dignity as human beings without exception, we begin to articulate notions of justice and public policy. Periodically, there are brief attempts to make human rights across the board the centerpiece of government action, and this is the master norm of human dignity at work. When journalists are serious about diversity and gender equality without stereotyping, they are acting on the principle of human dignity.

Human rights, as worked out among the world’s peoples in the United Nations, is one basis for the cross-cultural ethical principle of human dignity. Another strategy for establishing human dignity as a common good across cultures is rooted in the sacredness of human life. The German philosopher Hans Jonas (1984) argued that when giving birth to others, we do not begin with a neutral calculus trying to decide whether to take responsibility for this new human being. Rather our primal instinct is toward preserving life, protecting it, and giving unquestioned commitment to it. Parental duty to children is an archetype of responsibility among the human species—that is, irrevocable and without negotiating the terms every time some new person appears. Out of this notion of the sacredness of life emerge ethical theories about not harming the innocent as an obligation that is cosmic, primordial, and irrespective of our roles or contracts.

Human dignity illustrates the manner in which certain norms have a broad, taken-for-granted character. Given the oneness of the human species, its universal solidarity is the basic principle of ethics and the basis of all human communication. Our common humanness we share intersubjectively as a moral demand across cultural, racial, and historical boundaries. Instead of constructing a purely rational foundation for morality, our mutual human existence is

the touchstone of ethics. In this view, ethics is as old as human beings and a primordial force in human existence. Given the social nature of communication, the community's life story is the home of ethics. Society is inconceivable without an overriding commitment to each other's dignity. As an agent of our common life, the public press has no choice but to honor this master norm as well. It does not merely mean that we expand international reporting, though thinking globally is a necessary condition of adequately understanding the common good.

A commitment to universals does not eliminate all differences in what we think and believe. Journalism ethics grounded in universals is complex, and in an era of global communications, it inevitably involves pluralism. The issue is whether a community's values affirm human dignity. As our ideologies, philosophies of life, and beliefs are debated within the public sphere, some agreements will emerge that form a common good. While there are differences in nuance and application, the issue is whether at the deepest level we honor human dignity.

Communities tend to be hidebound and turned inward. To better shape journalism ethics by universal criteria, more experiments are needed that come to grips with community life in global terms. Some glimmers of that consciousness are emerging over the environment; overusing our share of the world's resources has now taken on moral resonance. Rather than local communities focusing on themselves in isolation, journalism can initiate public debate on issues such as this one.

The news media as agents of community formation stitch the issues into a universal norm, engrafting ordinary questions about community life into our human oneness. As a result, cultural diversity does not become self-centered tribalism in the extreme but an opportunity for helping communities work constructively from their own backyard and from the bottom up. In the process, local groups still make decisions for themselves, while resonating in principle with other human beings across the globe who are struggling with human values of a similar sort. Universal solidarity and our home territories are all rooted in the same human spirit and revolve around the same axis. At least it is possible to escape the excesses of individual rights and to avoid tribalism, but only if the common good is understood correctly and implemented.

Conclusion

After a history of steady work for three-fourths of a century, journalism ethics was established by 1980 as a legitimate enterprise and reasonably well-known in both the academy and the profession. With the dramatic growth in the field since then, journalism ethics has a wealth of resources at present for meeting the challenges of the 21st century. Textbooks and specialized courses in ethics are abundant; the codes of ethics for news are up-to-date and

reasonably sophisticated; and increasingly, reporters with a specialty in ethics are writing about moral issues with clarity and relevance.

All these dimensions of journalism ethics need ongoing attention to keep the field fresh and influential. But the four areas emphasized in this review are of particular importance and warrant the most attention.

Truth is a difficult concept to advocate or even understand in this postmodern age where reason and facts are no longer considered legitimate. The concepts of truth proposed here for journalism ethics take account of today's epistemology and can be defended even in an environment of skepticism about truth. But given these complexities, truth deserves extra effort in journalism ethics. And this review takes the same general approach regarding technology. It is highlighted in this overview because the world is now fundamentally different technologically than before. The media have radically shifted from print and broadcast forms to the dominance of digital technologies. Since our work to date in ethics has been oriented to earlier technologies, the field needs to be rethought in terms of online cyberspace. While journalism ethics has always had a social dimension, the complicated demands of multiculturalism and diversity are more accented than ever and make it necessary to give specific emphasis to ethnicity and gender today. And the fourth area accented in this overview also has a new urgency—developing universal principles that are equal to the global media, and to shifts in international politics from a Western axis to the developing world instead.

It is hoped that with that demanding agenda, journalism ethics can attract the best minds in both academia and the profession.

INTERNATIONAL JOURNALISM

SAM CHEGE MWANGI

Kansas State University

International journalism in the 21st century has largely been defined by transformative changes in communication technologies and a growing culture of democratization around the world (Thussu, 2006). New communication technologies have made it easier for information to travel across borders, while the democratization wave around the world has led to greater freedom of expression in global societies and a rising growth in grassroots and community media. The overarching changes have created a vibrant civil society and a new generation of empowered citizens who expect to have an active voice in deciding the issues of the day in their societies. As a result, journalism in the newly democratizing nation-states of Eastern Europe, Asia, Africa, and Latin America is in search of an appropriate communications model that would help tap into citizens' voices and engender a culture of civic engagement that places citizens at the center of the democratic process.

Previously, media in authoritarian states tended to follow a paternalistic model, where issues that merited attention were determined by the media houses. The search for a democratic model of communication in these countries has borrowed heavily from civic engagement theories and is aimed at making the media inclusive democratic forums by tearing down fences around the arena of public discourse. This has led to various media experiments aimed at capturing citizens' voices on various issues deemed as important to these societies. Such civic engagement projects exploit the new information technologies and flourish in the widening democratic space that has empowered and encouraged people to tell their own stories. This chapter will examine several civic engagement models from around the world.

Defining Civic Engagement

The sociologist James Coleman, who wrote widely on public issues involving schools and families, is widely credited with laying the theoretical foundations for the civic engagement movement. His writing helped bridge the gap between the individualistic market-oriented thinking of economists and the sociologists' concerns with social networks, values, and norms (Coleman, 1988). He used the term *social capital* to show ways in which social ties and shared values and norms can help people become better educated, amass economic wealth, make careers, and raise well-socialized children. He argued that economists should pay attention to social ties and culture (Coleman, 1990).

The political scientist Robert Putnam borrowed some of Coleman's ideas on social capital in his seminal book *Making Democracy Work*, to explain effective democratic governance in Italy. Putnam found that regional governments in Italy, which looked very similar on paper, worked very differently depending on which region had a rich array of voluntary social groups (Putnam, 1993).

In a follow-up book, *Bowling Alone*, Putnam (1995) used social statistics to argue that the United States has experienced a decline in social capital in the late 20th century and Americans are increasingly going it alone instead of joining groups such as churches, bowling alleys, or civic organizations. He argued that the problems facing U.S. democracy and governance can actually be traced to the decline in social connections (Putnam, 1995). His research has inspired other scholarly works and discussions on social and political change, including studies on social capital that pay tribute to such networks as significant in the development of a democratic culture and participation

of citizens. The Center for Information and Research on Civic Learning and Engagement (CIRCLE, 2003) has compiled a comprehensive list of indicators of civic engagement, which include voting in national elections; joining a political party; being a candidate for local office; and civic activism such as writing letters to a newspaper about social or political concerns, collecting signatures for a petition, collecting money for a social cause, and boycotting products or services because of social concerns. For citizens to be engaged in civic life, they must be equipped with certain skills such as knowledge and understanding of community issues, values that support a civic culture, a willingness to act to advance the public good, and the skills and ability to imagine a better society and direct social change (Carpini, 2000; Pratte, 1988).

The media can provide an excellent platform to cultivate such a culture of civic engagement by covering and framing stories in a way that educates citizens on the issues of the day and inviting them to participate in public deliberations of such issues. Indeed the civic journalism movement that was largely popularized in the United States has borrowed heavily from the civic engagement literature and inspired several international journalism civic engagement projects. Described as both an experiment and an idea in the making, civic journalism seeks to help communities work through their own problems by framing stories in a way that provides the community with possible choices to stimulate public discussion on public issues. Jay Rosen (1996), a leading proponent of civic journalism, defines the practice as a type of journalism that seeks to encourage civic participation, improve public debate, and enhance public life without sacrificing the independence that a free press demands. He also argues that civic journalism, at its best, augments a community's ability to "recognize itself, converse well, and make choices" (p. 20). He advises that civic engagement in international journalism must not try to replicate the U.S. model but be informed by the unique political, economic, and social structures in other countries.

David Mathews, the president of the Kettering Foundation, which has funded civic journalism experiments in the United States and hosted international journalists interested in learning civic engagement, defines it this way:

Civic journalism isn't any one particular thing. It is simply a way of looking at journalism that puts journalism in the context of a democracy, or approaches it from the context of good democratic practice. It, itself, is not a practice. It is a way of thinking. If you tried to explain it by trying to find one good example of public journalism, not only could you not do it, but, it would be misleading, as it is a way of thinking. (Mwangi, 2001)

The journalism professor Camille Kraeplin defines civic journalism by comparing it with traditional journalism. Kraeplin (2000) says that traditional journalism plays the role of a town crier: "We see something happen, or a

problem that affects our readers and we say, 'Hey! Did you know about this? Here is what's up.' Then we stand back and wait for a reaction."

Kraeplin argues that civic journalism, on the other hand, recognizes that civic and political institutions are sometimes inadequate to the task of fixing the problems that traditional journalism identifies. Civic journalism goes one step further beyond the town crier approach and prods anybody who cares about the problem to come together to figure out what to do about it. Sometimes, journalistic institutions convene meetings and work with various stakeholders in addressing an issue.

In his article "Public Journalism as a Democratic Practice," Lambeth (1998) provides a framework in which civic journalism can tap the community's voice. He says that civic journalism seeks to do the following:

- Listen systematically to stories and ideas of citizens, even while protecting its freedom to choose what to cover
- Examine alternative ways to frame stories on important community issues
- Choose frames that stand the best chance to stimulate citizen deliberation and build public understanding of issues
- Take the initiative to report on major public problems in a way that advances public knowledge of possible solutions and the values served by an alternative course of action
- Pay continuing and systematic attention to how well and how credibly the media are communicating with the public

Critics of civic journalism argue that any involvement of journalists in solving community problems would compromise objectivity and other professional standards of journalism and that such involvement turns journalists into manufacturers of news (Buckner & Gartner, 1998; Hoyt, 1995; McManus, 1994).

The controversy surrounding the movement notwithstanding, at its heart, civic journalism speaks directly to the role of the media in a democracy. It aims at helping shape an enlightened populace that can take part in public discourse and deliberation (Carey, 1997). While the model has inspired controversy in the United States, it is very appealing in newly democratic societies, especially where the concept of public deliberation is culturally ingrained and there is a tradition of people coming together to discuss community issues, as is common in many developing countries. Today, there are media houses in Latin America, Asia, and Africa experimenting with the idea of civic journalism as a viable communications model of civic engagement (Mwangi, 2001).

Another theoretical inspiration for civic engagement models in international journalism is the body of work in development communication theories in recognition of the centrality of the quest for development in the democracy debate. To understand this theme, one must step back and understand the context of democratization in these societies, especially in Africa. The collapse of the Soviet Union

in the early 1990s unleashed a wave of democratization in countries that were hitherto under dictatorships. For example, in the 1990s, nearly three-quarters of African countries experienced upheavals in the form of protests and demands for more open systems of governments that would adequately meet development and societal need. The demand for change had both external and internal causes. Externally, in the early 1990s, the strategic importance of Africa declined in the eyes of the West after the fall of communism (Monga, 1996; Nzongola-Ntalaja & Lee, 1997). The new Eastern European states were now competing for Western aid alongside African states. While in the past, aid to Africa was largely allocated on the basis of African countries' loyalty to Western allies, donor nations in the 1990s adopted different aid conditions. Arguing that after 30 years of receiving aid, Africa had little to show for it, donors insisted that African governments now had to be transparent and accountable in the management of their political and economic affairs (Ndegwa, 1996; World Bank, 1989). These values, they insisted, could only be achieved in a democratic environment.

The demand for change internally could be seen by the fact that the wave of independence in the Eastern bloc had caught on in various African countries, leading to massive protests and demands for more democratic political systems (Monga, 1996; Siddiqui, 1997). Today, nearly all African countries have given in to these demands and have embarked on a process of democratization. This was often done by adopting a multiparty political system followed by general elections. Over the years, the emphasis has shifted from elections to building institutions such as a vibrant press and civil society to support African democracy. Because of this history, a viable communication model in these societies must make a connection between democracy and development, and hence the marriage of development communication theories to civic engagement.

Development communication is a relatively young field that began to rise in the 1960s with the publication of Daniel Lerner's classic book, *The Passing of Traditional Society* (1960). The book was based on years of research that Lerner had conducted in North Africa and the Middle East. He traced correlations between expanded economic activity and other modernization variables such as urbanization, high literacy levels, media consumption, and political development (voting). He argued that the media could serve as a promoter of development by communicating development messages to their audiences.

Drawing from Lerner's research, the United Nations Education Scientific and Cultural Organization (UNESCO) commissioned the renowned development communication scholar Wilbur Schramm to try and find out the exact place and role that the media played in development. Schramm's research was published as *Media and National Development* (1964), a monumental book that provided the solid theoretical foundations for development communication for the next decade and a half. He believed in the concept

of an all-powerful media that could persuasively deliver messages about innovations, use of high-yield seed, and improved daily health habits. This form of communication was authoritarian in nature and therefore nonparticipatory. It involved development agencies sending messages to a passive audience.

Schramm's theoretical conception of the media as the great multiplier of development received a major boost from another scholar, Everett Rogers, who came up with the theory of the diffusion of innovations. Rogers argued that there appeared to be a pattern in the way innovations were adopted and accepted in societies. The sequential pattern of adoption involved "the opinion leaders" or early adopters, late adopters, early majority, and late majority. Rogers's theoretical model was a major contribution to development communication. Indeed, as a result of Rogers's theory, the World Bank and the United Nations Development Program funded thousands of what were called development extension projects located in rural areas, where trained agricultural officers would use media such as radio and opinion leaders to expose farmers to these innovations. The research of Schramm and Rogers provided the main theoretical focus of development communication in the 1960s and early 1970s.

A major paradigm shift took place in 1975, when development communication scholars met in Honolulu to assess progress in the field. The main reason for the conference was that despite more than 15 years of development efforts using the dominant paradigm, poverty was still widespread in the world. The scholars, therefore, wanted to rethink their approach to development. The results of the conference are published in a book edited by Rogers (1976), titled *Communication and Development: Critical Perspectives*. The conference resolved that the dominant paradigm was not compatible with the development agenda; instead, they should use the human-centered approach. This was a significant shift that placed the people at the center of development. Unlike the top-down dominant paradigm, this was horizontal and encouraged participation, input from project beneficiaries, and use of indigenous knowledge.

The people-centered paradigm, which currently provides a theoretical framework for development communication has an interesting parallel to civic journalism. It is pluralistic and does not suffer from the authoritarian overtones of the previous dominant paradigm. According to this model, communities are expected to set their own priorities and standards, which may be unique to their problem situations. It focuses on the human and economic needs of the people rather than the general theoretical emphasis on economic growth through capital industrialization. Greater emphasis is given to the basic needs of people and the participation of beneficiaries in development programs set up for their benefit. This paradigm emphasizes indigenous and self-reliant development, which is predicated on the utilization of indigenous knowledge. But most important, this new approach seeks to democratize

the decision-making process and make it accessible and sensitive to people's needs, an approach that is parallel to civic journalism.

Gillis and Moore (2000) argue that this shift in development communication serves as the best link between civic journalism and development communication. They claim that both development communication and civic journalism serve the people, and the people use the media to get the information that is critical to them in their daily lives. The media are partners with the people in seeking solutions to their problems, in seeking self-help, self-growth, and nation building. Thus, both concepts provide a voice to communities by letting the people know what is going on in their communities and providing them with the opportunity to be a part of the solution to community problems. Both approaches refer to models of communication that allow citizens to participate in the decision-making process, deliberate on their needs, and help design solutions. And while civic journalism places a heavy emphasis on citizens' participation in democracy and development communication's emphasis on participation in the development process, it is important to recognize that democratization in most of these countries was inspired and driven by a quest for development and a better way of life. Hence, a good communication model must recognize this symbiotic link between democracy and development.

Case Studies

The following case studies of international civic engagement models are inspired by the unique political, social, and cultural environments within which the media operates.

Africa

The sprawling suburb of Pikine in Dakar, Senegal, resembles any other urban slum in African cities where poverty and unemployment collide to create a vast sea of hopelessness. In more ways than one, Radio Oxy-Jeunes reflects its surroundings, where only the very determined ever make it. Conceived as an idea in 1996, it remained just that for 3 years due to bureaucratic lethargy and government's preference for foreign-owned stations capable of paying the huge licensing fees.

Faced with a bureaucratic stone wall, the young people behind Radio Oxy-Jeunes resorted to writing hundreds of protest letters to the Ministry of Communications, followed by many unfruitful visits. But a chance encounter with the country's president changed all that. He ordered that a license be issued immediately.

Today, Radio Oxy-Jeunes is Senegal's only community radio for youth and represents a good example of how a media house can engage the citizenry. Its programming focuses on the life and concerns of the people of Pikine. It

does this by giving a platform to marginalized people and strengthening community organizations by trying to get people involved in development and civic awareness. In a society where oral traditions are more valued than the written word, the station attempts to capture and express the views of ordinary people through programs such as *The Street*, *Political Satire*, *Traditional Healing* and a news program called *Pikine for Pikine* focusing specifically on local news. It broadcasts in all local languages, including those of immigrant workers.

The following are among the station's stated aims:

- To support the people of Pikine in improving their critical thinking skills and insights related to the political processes that affect their conditions and prospects.
- To promote traditional African culture across the spectrum of cultures represented in Pikine
- To encourage the people of Pikine to understand their rights and to take action to make sure those rights are applied
- To facilitate and support open talk among the population of Pikine on the major issues that concern them

Programs

The following are some of the programming initiatives by Radio Oxy-Jeunes that work toward the above goals:

1. *Dialog Conseil*: This is one of the most popular political shows in the radio's programs. Every Sunday night, a mayor is invited to discuss, with a live audience of his or her constituents, issues and problems in their quarter. Each week, the focus is on a different quarter and its mayor. Prior to the show, Radio Oxy Jeunes reporters (who are local people) interview people in the relevant quarter in their homes and on the streets. These interviews reveal the major issues that concern the community. The interviews are played, for response by the mayor, as part of the live broadcast, which also allows citizens to follow up on concerns by either being present during the taping or phoning in. When, after three editions of this program, the mayors refused to appear because of the questioning and criticism they faced, the program continued in their absence, making the mayors seem unconcerned and uncaring. Today, no mayor dares miss a taping, and the program is ranked as one of the most popular.

2. *Blah Blah*: This program airs every week night and focuses on evaluating local political life, issues, and dynamics. Hosted by two local comedians, the show relies on contributions from local people through phone calls, interviews, and written contributions to provide biting satire with serious political points and debate.

3. *The Bus*: In one of its most innovative programs, the station sends out a bus to experience and discuss a prominent local issue. *The Bus* morning show, which airs every week

day from 9 a.m. to noon, focuses on issues such as the state of the local markets and features a live coverage of the discussion involving stall holders, customers, and market management, among others. The topic changes each morning depending on the urgency and nature of the problem.

4. *Xam Sa Walla (Know Your Rights)*: This program focuses on the promotion of socioeconomic rights among young people and is aired once a week. It usually commences with a short drama on a rights issue relevant to young people. A recent program, for example, focused on the issues facing young people trying to get a small loan from a bank for an income-generating idea that they had developed. It is then followed by a live discussion that brings together the main people in the community relevant to the issue—in this case, young people who have been refused loans, young people who have obtained loans, bank and insurance company managers, teachers, parents, employers, and unemployed young people. As its popularity among the 1.5 million inhabitants of Pikine attests, the program stands out as an example of a form of engaging journalism that has emerged spontaneously in response to community needs.

Another project of note is the public journalism short course introduced by United States Information Services (USIS) in the South African country of Swaziland and taught via interactive video to midcareer journalists in Swaziland. The project was modeled after the American model of civic journalism in combination with development journalism. The design of the Swaziland project included 2 teleconference meetings held in September and October 1997, 12 interactive Internet video meetings with the journalists, and a 2-week field experience. The project adopted the six-step public journalism model of public listening, developing community issues and a time frame, developing community forums, collaboration between media within the community, promoting the concept with the community, conducting the project, and evaluating community response. Participants chose to focus on rural health care, rape, and incest stories. These final stories were published in the various media represented in the project.

As a result of this course and subsequent seminars by USIS, the Swazi Broadcasting Corporation now has a weekly regular feature on rural communities. *The Observer* newspaper started an ongoing weekly community page that appears on Mondays, based on community forums convened to discuss community problems. In both situations, however, the two media houses have stuck to the American model, perhaps due to the way the concept was introduced to them. Also, the two media houses do not collaborate with each other in tackling common problems.

The Swaziland case study is also interesting in that public journalism was introduced as “a practice” rather than a way of thinking and a greater emphasis was placed on teaching the media the required steps. This has placed a greater responsibility on the media, which, for instance, feels obliged to convene forums. Such a practice hinders

the devolution of power and shared responsibility that is expected to occur when citizens come together to tackle their own problems.

Asia

As the world’s third most populous nation and emerging democracy, Indonesia presents a fascinating case study of an innovative media trying to rise above decades of dictatorship to represent the public voice.

Due to Indonesia’s vast territory, radio is the only medium that can reach the remote areas of this archipelago. Today, there are more than 700 private radio stations serving the entire population. During the 32 years of the Suharto regime, the stations largely aired music and entertainment programs. They were only allowed to broadcast the news provided by the official broadcasting system.

After years of entertainment programming, the opening up of the political space after the fall of Suharto in 1999 provided both enormous opportunities and unexpected challenges to the media. Most rural radio stations in Indonesia are small structures with outdated equipment. They also had no trained broadcasters.

But with the help of the UNESCO, 25 radio stations serving outlying remote areas have come up with the idea of networking among the radio stations to offer the Indonesian population new avenues and possibilities to participate in the new democratic process. The project is called *Democracy on Air Project*.

To prepare the stations for this maiden role, UNESCO organized successive conferences in 1998 and 1999 to provide reporters with skills in journalism and, more important, news programming with a special perspective on the democratic process that Indonesia was going through at the time. To strengthen the stations further, UNESCO linked them through an Internet-based network that allowed the daily exchange of news items among the news organizations. This was important in several ways. First, the networks that were otherwise constrained by budgets could freely obtain and broadcast news items from all parts of the country. Second, for the first time in Indonesia, people could tune in to local stations that were truly broadcasting what was happening in the community. In a country accustomed to vertical and authoritarian communication, the stations embarked on civic education campaigns broadcasting items on democratic principles, good governance, and even development issues. Every station managed to run a campaign independently by setting its own agenda. UNESCO’s role ended with the provision of technical equipment and training. In subsequent years, the stations embarked on a campaign against corruption, which was seen as the number one impediment to democratization.

Socially, people use the radio to convene meetings, send invitations to a marriage or to cultural events, or discuss local issues in a talk-show format. This service is especially critical in the remote areas, where phones and post offices are a rarity.

Australia and New Zealand

The Australian Public Journalism Project is interesting for the way it has tried to fine-tune the American version of civic journalism to serve the Australian socio-political situation. In the early 1990s, Australia faced the same challenges that led to the emergence of public journalism in the United States, namely, declining newspaper circulation figures, a disconnect between media and the communities they serve, and a declining interest in public affairs and in civic participation. Suggestions to try out the kind of civic journalism projects going on in the United States to help build and strengthen links between the media and their audience were met with skepticism by defensive editors who argued that they were already doing that through community forums, meet-the-candidates nights, and newspaper-sponsored activities in schools and business areas. But such reactions did not address the key issues being raised by those promoting public journalism, such as a polarizing and pejorative debate on the vexing race issue in Australia or the absence of avenues for citizens to be a part of the daily news agenda.

That resistance, however, changed in 1998 when the Queensland University of Technology and the University of Wollongong established the Public Journalism Project to try out the public journalism concept using a case study approach. Known as “Public Journalism, Public Participation and Australian Public Policy: Connecting to Community Attitudes,” the project was a collaboration between the media (The *Courier-Mail* newspaper, Rural Press Limited, and John Fairfax Limited), community organizations (The Australians for Reconciliation Project and the Ethnic Communities Council), and university researchers. Drawing directly from the Pulitzer Prize-winning *Akron Beacon Journal* series on race relations in the United States, the project called on the public to set an agenda for debate on race relations and immigration in Australia.

More than 600 people attended the two forums, a remarkable number considering that they were held during the election campaign period for a federal and state election. And although all the stories were competing for space with a major political event, The *Courier-Mail* devoted two eight-page lift-outs to the forums plus various articles in its regular edition reflecting the range of perspectives on the issue. This was unlike any coverage previously devoted to the topic, and the articles elicited more letters to the editor, hotline comments, and opinion pieces than the election campaign itself.

The *Courier-Mail* won the United Nations Association of Australia Media Peace Prizes in 1998 and 1999 for its coverage of both the immigration and the indigenous issues under the public journalism initiative. Today, the Public Journalism Project has extended its activities in Queensland and outlying rural areas.

There have been other public journalism projects in Australia carried out by individual media houses, such as the one in 1999 by the newspaper *The Australian* around the referendum to consider whether Australia should become a republic.

The Australian Broadcasting Corporation has also held a number of public forums to identify issues of local significance in Ipswich and the suburb of Fortitude Valley in Brisbane. Local issues raised included crime, politics, race, and quality of government services. The forums were broadcast live, and among those in attendance were municipal officials. It was hoped that the issues raised would feature prominently in future planning of municipal affairs.

New Zealand began its experiments even earlier using the American public journalism model. During the 1993 general election campaign, politicians, frustrated with the journalistic reliance on “bad news,” 10-second sound bites, and the adversarial A versus B reporting model made unprecedented use of talk-back radio and television talk shows that allowed them to interact directly with the voters. This public journalism technique allowed politicians the opportunity to engage directly with the citizens. Two New Zealand newspapers, *The Evening Standard* and *Waikato Times*, quickly adopted this community-centered journalism, and each recruited university researchers to conduct public opinion polls, asking readers to identify campaign issues. Among the technique tools used for the polls were telephone surveys, readers’ panels, and deliberative opinion polls that brought citizens together for discussions. Journalists then wrote stories based on the issues identified by citizens and asked parties to respond. When a party failed to answer, the papers printed a block of white space with the words “no response.” Naturally, this happened only once, when the National Party objected to the newspapers’ attempts to drive the campaign. But after the “no response” space was published, neither party missed a deadline.

Europe

Heavily inspired by American examples, the *Dagens Nyheter* newspaper in Stockholm, Sweden, has over the years been trying to apply engaging journalism to its coverage of Swedish issues with what the project coordinator, Petter Beckman, called *increasing success*. A small group of three reporters and Beckman spearheaded the effort, which aimed at strengthening and widening the paper’s capacity as an inclusive democratic forum by tearing down fences around the arena of public discourse.

The project started off with a focus on socioeconomic division and ethnic/racial relations, which are both hot-button issues in Sweden, but later drifted more toward other unsolved problems of modern society, such as the ubiquitous shortage of time and connected issues.

They also carried out a deliberative series of stories on teenage fashion and the peer pressure that such trends put on parents and teens (in many ways depriving both kids and parents of their freedom of choice).

The group’s last project was an attempt to connect the rather technical political debate on tax levels to how low-income groups have been affected and deprived by the tax laws.

In the Scandinavian countries, efforts to launch civic engagement projects date back to 1997, when *Aamuhleti*, one of the biggest dailies in Finland, and two university researchers, Heikki Heikkilä and Risto Kunelius, launched a short-lived pilot project. The project, which was carried out in the city of Tampere, brought together a group of 12 citizens (dubbed the budget jury) to discuss the city's budgeting priorities in a series of meetings. A reporter from the paper covered the public talks. Out of these deliberations and the subsequent coverage in the newspaper, the researchers observed that the traditional method of reporting stories is poorly equipped for reporting deliberative forums. They are in the process of trying to develop a better method for reporters to capture deliberative talk, which they will then test out in future forums.

But this did not deter other experimental projects from taking place. So far, the largest and perhaps most fruitful project is one carried out by *Savon Sanomat* (a daily published in Kuopio, in eastern Finland). Between autumn of 1998 and spring of 1999, the paper conducted three small-scale projects involving six journalists, a researcher, and an informal support group within the newsroom. The reporters gathered six groups of ordinary citizens who were invited to discuss their concerns, frame problems, raise questions, and find solutions. The idea was to have these groups contributing to the news work, while the reporters would commit themselves to developing public discussion on the basis of these contributions.

The participants were selected using the "snowball" technique. First, a group of reporters set up an advisers' list of persons who neither were journalists' friends, nor established news sources. Once the advisers had been informed of the projects by phone, they were asked to suggest two or three names they would like to see in a group. This round of phone calls produced a list of more than 150 candidates, of which about 50 were invited. Eventually, 46 of them took part in the discussions.

The first project (which was called *Citizens!*) focused on generational differences in Kuopio, the paper's hometown. The participants were divided into three groups, that is, senior citizens born in the 1930s, those born in the 1950s, and younger adults born in the 1970s. Each group met twice for 7 to 8 hours of intensive talk. In the first session, the groups focused on problems, in the second they tried to find solutions to the problems they had detected. During the project, the groups became so interested in each other's viewpoints that a third meeting was held in which some members of all groups were present. This extra session was more informal, but it was also covered in the paper.

The second project was launched a couple of months later in two small municipalities, where "community groups" met on three occasions. In the first two sessions, the groups reflected on their concerns and the extent to which residents could influence local decision making. In the third meeting, the groups had the opportunity to present their questions and suggestions directly to the local

authorities. The third project (called *Voters*) was an ad hoc experiment in which a group of citizens spent an evening discussing topics they thought would be relevant in the parliamentary elections; the following evening they were allowed to "interrogate" local political candidates. Since this project ended, the paper has decided to convene the group once a year to meet the MPs elected from their constituency.

All these group meetings and discussions took place in the presence of two reporters and the researcher, who also acted as a moderator. The discussions resulted in a dozen stories, which were expected to lead to "spin-off stories" and transform into public processes or even "beats" that would be under constant supervision in the newsroom. The projects were open-ended, but as it turned out, they remained rather short-lived. Spin-off stories that were supposed to develop public discussion further and cater to it with the journalistic tools available remained quite sporadic, and after May 1999, they ceased altogether. Later papers took a step toward institutionalizing a similar approach by establishing a weekly section to cover local issues from the residents' perspective. The reporter responsible for the projects is also in charge of this new section.

Latin America

The civic engagement project in Argentina represents a case where an American model has been modified to fit a local situation. The project began when Fundacion Ciudad, an Argentinean civic organization promoting citizen participation in public affairs, organized a civic journalism seminar with support from the United States Information Agency. The two-day seminar was devoted to the theories and techniques of civic journalism and was attended by more than 60 Argentinean journalists. The conference explored ways to adapt civic journalism to problems in Argentina.

Two American journalists, Max Jennings and National Public Radio's John Dinges, were sponsored by the Pew Center to speak about their experiences in organizing civic journalism projects.

Jennings described the *Dayton Daily News* project *Kids in Chaos*, in which the newspaper convened community forums to deal with a local problem as an example of how some media organizations in the United States are trying to frame their reporting around citizens' concerns and voices. Dinges, on the other hand, described the NPR election coverage project, which was built around an election agenda set by citizens through polls and small forums.

But unlike the U.S. situation, where civic journalism arose out of a concern of declining public confidence in the media, participants heard a different story in the case of Argentina. The Argentinean media enjoys a high level of confidence from citizens, due to its years of opposition to military dictatorship. And even after the fall of the military dictatorship in 1983, the media has continued to play this activist role as Argentina attempts to build a democratic

government. One of the most memorable activist press projects, since the fall of the military dictatorship, was the vigorous campaign to expose the corruption that has shrouded the privatization of state-held enterprises.

Despite this impeccable role as a watchdog, the conference heard from participants that the reporting of public affairs does not generally incorporate the views of citizens. Participants described the media's treatment of ordinary people as paternalistic, a treatment that massages rather than challenges them. Participants resolved to work on two civic journalism projects to change the way the media relates to citizens.

The first project, named *Citizens' Agenda*, focused on the coverage and citizen participation in the election of the mayor of Buenos Aires and a convention to draft a city charter. The election was a major break from tradition in that the mayor had previously been appointed by the central government. As part of this project, *Clarín* and *La Nación*, the two main newspapers in Argentina, held public forums in which the people of Buenos Aires attempted to set a citizen's agenda that they felt ought to drive the elections. The papers also organized meetings between candidates and the citizens in an attempt to have the candidates address the people's concerns. As a result of these forums and subsequent coverage, the June 2000 mayoral elections are today regarded as the pioneer example of a civic journalism project in Argentina.

Argentina's television station, Channel 13, also introduced a news program doing some pioneering work in public journalism as well. Known as *Noticiero de Santo* (Santo's News Program), the program focused on helping people solve their daily problems by providing them with service-related programs.

According to Ruben Garcia, the show's producer, the service was something that is not likely to be seen on any other media. The show is built around the high profile of Argentina's top journalist, Santo Biasati. In his regular broadcasts of "Santo the citizen," the journalist immerses himself in the daily routines of Argentinean citizens and reports his experiences live. Some of the most memorable episodes include Santo riding the subway in scorching summer heat and reporting on people's complaints. Other shows have taken Santo to the neighborhoods of greater Buenos Aires to cover city life issues such as bumpy roads, speed ramps, street lights, and even safety. The best part of the show is the power that it wields over policy and decision makers, who quickly respond to issues raised in the show by solving them.

But the Argentinean initiative was by no means the first civic engagement project in Latin America. Colombia hosts an interesting project established by Ana Maria Miralles, a university researcher. As the coordinator of Voces Ciudadana Por la Seguridad y Convivencia, a public journalism project based in Medellín, Colombia, she has worked with newspapers, television stations, and NGOs to get proposals from citizens on ways to address issues of concern to citizens. One of their earliest projects involved

addressing the issue of insecurity in Medellín. Maria, who has also written a book on public journalism, is currently engaged in experiments on innovative public journalism techniques to gather people's opinion and ideas on issues through a toll-free number. Such opinion is accessible to the media participating in her project, and they can use it for story ideas.

In Costa Rica, the leading news radio station, Radio Reloj, launched a civic engagement daily program called *Reloj, you and your community*, which aims at involving the community more in the news and giving people information relevant to their community. This is a radical departure from the earlier techniques of gathering news in that it lets the readers and viewers set the agenda of the issues around which journalists set their stories. Some of the issues that they have covered so far—crime in neighborhoods, overcrowding, and corruption—are at the top of citizens concerns.

Conclusion

There are a few key points that one can take away from the forgoing discussion. International journalism is currently engaged in a search for suitable journalistic narratives that reflect the changed environment in which it now operates. The traditional watchdog narrative leaves out voices that now want to be heard. In countries with widening democratic spaces, there is an urgency to tap into those voices. There is no single model that can be replicated across boundaries. Instead, the emerging models are informed by the cultural, political, economic, and social conditions unique to that environment. Most civic engagement initiatives are conducted as individual projects within a given time frame. There is a need to move beyond project-based initiatives and mainstream civic engagement as part and parcel of international journalism narratives.

THE BUSINESS OF JOURNALISM

ROBERT DOWLING

Tsinghua University

When the first plane hit the World Trade Center at 8:46 a.m. on September 11, 2001, the New York newsrooms were still waking up. From an editorial floor in midtown Manhattan, it looked like a small private jet from one of the regional airports had tragically wandered off course. When the second plane struck Tower II at 9:03, an editor at the McGraw-Hill building in Rockefeller Center exclaimed, “Oh my God, a press plane must have come in too close.” But everyone knew the press used helicopters. By then, CNN was reporting that at least two airliners had been hijacked from Boston. The awful realization dawned on us: America was under attack.

Newsrooms became electrified in New York and Washington, where a third plane had hit the Pentagon. Within minutes, one-sentence headlines from the event had stopped business across the United States, and soon the world. Journalists saw the biggest story of their careers unfolding. Editors ripped apart print publications to make space. Broadcast trucks raced to the scene. No expense would be spared.

The Wall Street Journal, headquartered in a suddenly uninhabitable building next to the ground zero site, moved its newsroom and staff to facilities in New Jersey, where it produced its national edition for the next 11 months. *The New York Times* added extra pages to its news section for 4 months and in weeks to come would devote two additional pages to individual Portraits of Grief profiles of the more than 1,800 who had died in the attack. New York’s tabloids streamed reporters to the scene. Anchors of the three big TV networks as well as cable channels stayed on air 24 hours a day with uninterrupted coverage. No one was buying ads.

In the world of journalism economics, a great news event, from terrorism, war, an earthquake, or a global pandemic, means that there is no budget constraint. The press spends what it has to to provide coverage, and the public expects it to do just that. In the United States and many other countries, press rights are constitutionally guaranteed because it’s believed that the free flow of important information is vital to having an informed public. In return for this privilege, journalists are expected to spare nothing to get that news reported and distributed.

If you pay an annual subscription fee of \$88 for your home-town newspaper, \$828 for *The New York Times* national edition, or \$99 for a specialized newspaper such as the *Financial Times* or *The Wall Street Journal*, you might think that you are paying for a good share of this coverage. But in the world of newspaper economics, your subscription might at best cover the cost of delivery to your home or office. If you read magazines and newspapers online, you get nearly all coverage free. Radio and TV news is mostly free, too, except for cable and satellite fees. These include the cost of news gathering, but in much larger part the fees cover the cost of entertainment programs. The government-supported press, such as the British Broadcasting Corporation of the United Kingdom and America’s Public Broadcasting System, is funded by viewers, donors, and taxpayers. The BBC gets revenue from a tax on each TV set in the United Kingdom. In the United States, the Public Broadcasting System solicits donations from listeners and viewers with campaign drives and gets corporate sponsors to contribute in return for mentioning their names and often products.

What all this means is that with some government-supported exceptions, in the United States and most other nations, it is advertisers who really cover the costs of news. According to Veronis, Suhler, and Stevenson's annual survey of U.S. communication spending, ad spending in all media in 2007 was about \$880 billion (www.vss.com/news/index.asp?d_News_ID=166, accessed December 30, 2008). Of that, \$62 billion went to newspapers, \$25 billion to magazines, \$49 billion to broadcast TV, \$132 to cable and satellite TV, \$21 billion to radio, and \$81 million to alternative media, mainly online sites and digital distributors using mobile phones and portable devices. That total, about the size of the GNP of Saudi Arabia, was about one-third of all U.S. media spending in 2007.

Advertisers have very specific criteria. They want to reach the audience of the publications, broadcast stations, and online sites where their ads have the most impact. Who are the readers and viewers? What are the demographics? How do you reach the fickle 18-to-35 youth market? Corporations, their ad agencies, researchers, and creative teams spend thousands of hours plotting the right way to spend the ad marketing budget. Media advertising in the United States is nearly a \$1 trillion business; globally it is worth about \$2.2 trillion. There are about 10,000 paid and free newspapers, 12,500 magazines, 12,500 commercial radio stations, and 3,500 TV stations in the United States to choose from. Internationally, it's newspapers 60,000, magazines 22,000, radio 44,000, and TV 21,500. Nearly all these media in many languages and cultures are competing to get a share of someone's ad budget, or ad pie as the industry calls it.

Advertisers aren't especially interested in being associated with what is called *hard news*—wars, scandals, terrorism, elections, airplane crashes, and natural disasters, the news that most drives journalists. They'd much rather be around media that makes you feel good enough to want to buy their products and services. So business news sites, from newspaper sections to specialized investing magazines to online services, seek to attract mutual funds, retirement specialists, stock trading services, and investment advice advertisers. Women's magazines such as *Glamour* seek to attract health, fashion, and cosmetic advertisers. Lifestyle publications and home magazines such as *House Beautiful*, called *shelter books* in the trade, attract appliance and furniture makers, interior design firms and national real estate chains; travel publications attract luxury resort, cruise, and eco travel specialists, and so on. *The New York Times*, which carries about 35% hard news over a weekly cycle, also produces ad-rich softer news sections on travel, culture, fashion, health, and real estate. As Executive Editor Bill Keller told his public editor about the *Times*'s soft news sections, "We put out a daily newspaper plus about 15 weekly magazines." The sections, Keller noted, "exist in large part to generate advertising revenue."

What about countries with heavy state control of the press, such as Russia and China? Doesn't the government pay the bills there? Yes, but to a much lesser extent than

you might think. Russia's leaders indirectly control most broadcast networks through state-owned companies and can subsidize the kind of news they want with government funds. But when viewers know the news is state controlled, they look to independent alternatives. Small newspapers, magazines, and online sites in Russia struggling to fill the information gap depend on advertisers for support. In China, where all media is required to be government affiliated, there is a push to make the nation's newspapers and broadcast stations pay most of their own way even while their editorial operations are under state control. Newspapers in China now must try to cover 80% of their operating costs with ads, and that percentage will likely grow larger as the government cuts back on subsidies.

For Western journalists, there are libel and professional constraints on news gathering and writing but usually not government-mandated controls. For decades, the free nature of Western publications meant that most news organizations did not want their journalists to be concerned with the business side of journalism. There were good reasons for this. Reporters worried about advertising pressures or concerned about proposing costly but worthy big story ideas might hesitate in doing their jobs. A so-called Church and State wall was erected to keep journalists pursuing the story no matter where it led them. In practical terms, even then, most journalists knew that a story that took on a big advertiser might be handled with extra care. But unless they personally were shareholders in the media company, they usually didn't pay much attention to the finances of their employer.

Not so today. With newsrooms everywhere under extreme cost pressures and the media fragmenting into thousands of online sites and blogs, reporters and editors are critically involved with the financial health of their employer. Newsroom job cuts across the board have been unprecedented. In just 1 week in June 2008, some 900 editorial jobs were eliminated in U.S. newspapers. Knowing how the business of journalism works has become everyone's job.

The biggest threat to the established press everywhere, whether in the United States, Europe, or China, is not the government but digital media. The erosion of revenues from traditional media, often called *mainstream media*, or MSM, by digital competitors has been accelerating for 10 years and shows no sign of stopping. Online revenue is growing an average 30% a year. While many newspapers, magazines, and broadcasters have developed large and effective online news sites, the revenue they can generate by selling ads on these sites is still a fraction of what they need to maintain news staffs and run their parent companies.

In the digital world, nearly all information is free and the start-up costs are miniscule compared with the fixed costs of editorial, printing, and circulation for a large print news organization or for those broadcasting news over a national TV or radio network. Sending camera crews with producers to cover a large news event such as 9/11 or the Iraq War costs millions; the broadcast licenses and transmission over the airwaves is also a million-dollar expenditure each day.

Then, there are the daily business expenses of running a network, a cable company, or a large, independent TV or radio station. These include administrative expenses for top management and real estate; production, printing and distribution costs; and business-side marketing to sell ads and increase circulation.

How this seismic shift is taking place and the degree to which online journalism replaces print and broadcast media is an evolving story. It has sharply divided analysts and opinion makers. In one camp are those who believe that the age of large print publications and large broadcast companies is over. Marc Andreessen, the founder of the search engine *Netscape*, told a conference of media owners on July 9, 2008, "If you have old media, you should sell. If you own newspapers, sell. If you own TV stations, sell." In the pro-print camp, people such as Rupert Murdoch, the chairman of News Corp., one of the world's largest owners of newspapers, said in a March 2006 speech, "I believe that traditional newspapers have many years of life left but equally I think in the future that newsprint and ink will be just one of many channels to our readers."

To see how this landscape develops, let's look at the pillars of the news media today, starting with newspapers.

Newspapers

Newspapers, from local publications, such as the *Stamford (CT) Advocate*, to the large national newspapers, such as *USA TODAY*, rely on advertising for 80% or more of their revenue. Large full-page or partial-page ads, called *display ads*, account for about 85% of the ad revenue. Classified advertising amounts to 15%. In recent years, both have been losing ground to competitors such as direct mail and marketing service companies, as well as digital sites. Advertising sales can be local, such as a home-town auto dealer, to regional, a large department store, to national, such as Wal-Mart. Local advertisers today offer the strongest support for many smaller newspapers because there are no good alternatives that target their buyers. But if online media becomes more locally focused, it could also take a share of local newspaper revenue as it has of national revenue.

A large daily newspaper such as the *Los Angeles Times* until recently funded a newsroom of close to 1,000 reporters and editors. An unofficial estimate of its annual editorial cost for news, features, sports, culture, living, real estate, and other sections most readers desire might be about \$100 million a year. If that was 25% of its total cost, another \$300 million would go to printing, daily distribution, ad sales, and general overhead expenses. In good years, the newspaper would aim to generate a 20% before-tax return for its shareholders. So in the old days, when ad revenues softened cyclically because of a weaker economy, a large daily would ride through the downturn with at most marginal cuts. But because today's change is viewed

as structural, the paper is permanently reducing staff and costs. The *Times*, for example, started 2008 with 970 editorial employees. In July, it cut 250 of its editorial staff, bringing it down to 720. A decade ago, in its golden years, the paper had 1,300 editorial staffers. The July cut of 15% matched what the paper said was a 15% decline in revenues in the first 3 months of 2008. Increasingly, as revenue falls to what management believes is a permanent lower level, cuts that match revenue declines are likely.

Magazines

Magazines face a more varied future than newspapers even though both depend primarily on print advertising. There are about 10,000 magazines in the United States catering to nearly every taste and interest, from salt water fly fishing to needlepoint. Of that number, about 2,000 are prominent, and of that number, about 40 are large, above 1 million in circulation. Because a magazine often has a closer relationship to the reader than a newspaper, it has what the industry calls "shelf life." A newspaper is discarded the next day or sooner; a magazine can have value long after it is printed. It can also offer targeted features and columns to the reader and present sections with a visual flourish so compelling that many magazines are desired by subscribers first for their photos and design. *National Geographic*, for example, has an almost permanent shelf life. Copies of old issues sell for more than new ones because the magazine is considered a collector's item. Many home and fashion magazines have loyal subscribers who renew annually. The cost of renewal from \$12 for *House Beautiful* to \$15 for *Vanity Fair* is a fraction of the delivery cost, not to mention paper and production. In these cases, the magazine is using very inexpensive subscription pricing to maintain a large subscriber base while producing very attractive editorial, both to satisfy advertisers. This formula has so far kept many glossy magazines relatively healthy.

The publications closer to the news are the ones hurting the most. Newsweeklies such as *Time*, *Newsweek*, and *U.S. News and World Report* and business magazines such as *BusinessWeek*, *Fortune*, and *Forbes* have seen a significant decline in their pages in recent years as online news outpaces their ability to deliver value-added or original stories against digital competition.

Most magazines like to keep a ratio of ad pages to editorial pages in the range of 60% ads, 40% editorial, or at worst, 50% to 50%. Because of seasonal variation, that ratio can drop to 30% of ads or less in some months, with the expectation that it will come back in other periods. The first quarter of the year is usually a weak one for many larger magazines because it follows a surge of advertising spending during the holiday season. Mid to late summer is also a doldrums period because of vacations. That is why revenue-producing ad pages are so carefully watched for the fall run, the last time to make up weak performance.

This is the period when big glossy magazines such as *Vogue* and *Vanity Fair* carry a few hundred extra pages. *Vogue*, for example, ran 725 pages in its September 2007 edition. Reflecting a softer U.S. economy, its 2008 September issue carried 674 pages but still weighed nearly 5 pounds.

Two widely followed sources for the strength of ad pages and magazine circulation are the Publishers Information Bureau (PIB) and *Media Industry Newsletter* (MIN), a trade publication that tracks the industry with a weekly box score. In recent years, the MIN box scores have become of prime interest to journalists following the health of their publications. In mid-July 2008, for example, MIN scores showed leading U.S. magazines such as *Time* off 27% in pages from the year earlier, *Newsweek* off 23%, and *U.S. News and World Report* off 28%. *BusinessWeek* reported pages 17% lower than the year before, and its competitor *Forbes* was lower by 18%. But *The Economist* was up 5%, and its competitor *Fortune* was up 2%.

Like newspapers, magazines have limited options when rising costs meet dwindling ad revenues. Because magazine managements believe that the decline is a permanent condition, most of their choices involve cost cutting. They can cut business and editorial employees, discount from posted ad rates on their rate card, reduce the number of pages they carry, and reduce their circulation. The last is especially important because magazines usually guarantee advertisers a minimum number of readers per issue, called their rate base. If a publication goes below the rate base, it must pay back advertisers either with free extra pages or with financial payments. The number of subscribers compared with the cost of an ad is a critical consideration here because the advertiser is buying readers. The cost of an ad page is measured per 1,000 readers, called a CPM. The CPM is a critical competitive index. If the cost is higher than the competition's, the publication must argue that the demographic quality of its subscribers is higher. Among the three leading U.S. business magazines, for example, *BusinessWeek* claims senior management readers; *Forbes*, high-level investors; and *Fortune*, chief executive and board members. In contrast, *The Wall Street Journal*, which is the leading place for business print ads, claims an overall high net worth of \$2.5 million per household.

A decade ago, the rate card reflected the real cost of a page. But, like suggested retail car prices, today, it is a benchmark for discounting. Advertisers and analysts thus treat ad sales numbers produced by rating services as guidelines rather than actual revenue figures. A box score from MIN that says a publication that sold 2,300 ad pages at \$65,000 a page each earned revenues of \$138 million for the year reflects only the nominal price requested. In reality, discounts off the rate card might be from 20% to 40% or more for some big advertisers. If costs can't be controlled, the publication could be losing money when it might appear to be growing. Analysts and advertisers thus look at the actual number of pages sold and make their

own back-of-the-envelope calculation of what the publication is earning. Looking at the actual pages sold from year to year also gives them a more realistic view of the publication's condition.

Magazines have a few other levers to use for sales and cost control. Because they have a longer shelf life than a newspaper, they multiply their number of subscriptions by a "pass-along" factor to arrive at a readership rate. Independent research companies such as Halls and MRI sample readership and report pass-along scores. Thus, a magazine with a subscription base of 1 million may in fact claim almost 5 million readers based on a pass-along rate of 5 readers to each subscriber. While the number is an estimate based on a sample of impressions from readers, the industry and most advertisers accept it as a measurement standard.

Magazines can also try to trim weight, since most are mailed to subscribers. They can do this by trading heavier paper for lighter paper, called "reducing stock." They may also trim the magazine page size. In August 2008, *Rolling Stone* editor Jann Wenner said, "All you're getting is nostalgia," in announcing that his 1.4-million-circulation rock biweekly would reduce to a smaller newsstand size from the distinctive larger format it has had since its founding.

Television

Television and radio like print are mainly ad-supported businesses, but their revenue comes from commercials or "spots" that are sold in 30-second or shorter time periods. TV ads are sold against programming, and the more the viewers the more a station or network can charge for airtime. Each spring, the industry rolls out its schedule for all programming, news, and entertainment and asks advertisers to place orders for the season in what is called the "upfront market." This means that networks get paid up front. But they really don't own that revenue because like the magazine industry they must guarantee a minimum number of viewers. If a show falls short on viewership, they have to repeat the ad on free airtime until the required number of viewers has seen the commercial. Because they are giving up finite airtime to cover "make good" airtime, the practice can create a perverse effect where there is less time available for spot buyers. This means that advertisers seeking immediate spots, called "scatter advertising," can see rates go up in price even through there is an overall declining market. As the Project for Excellence in Journalism points out in its 2008 report, advertisers buying in advance in the upfront market are really reserving time, not actually paying for all of it. So a strong spring buying season in media headlines may end up down if advertisers trigger cancellation clauses or demand "make goods."

Extravagant opportunities are the exception. Both the 2008 American Super Bowl, where a 30-second spot for a football game sold for \$2.4 million, and China's 2008

Olympics, where NBC sold more than \$1 billion in advertising, had a waiting list of sponsors. A local TV station might accept \$2,000 for a spot if its cost of programming is low. TV shows are based on longer-term programming that can come from a network or outside production company. *Nightline*, a U.S. news show by Ted Koppel that ran for years on the ABC network, is now produced by Koppel himself and sold as a syndicated news program to local stations. Many entertainment shows are financed and sold by independent producers and then licensed for international revenue.

Audiences are measured by rating services. The leading providers in the United States are Nielsen, for national and local, and Arbitron, for local listings. Both use a small sample of total viewers to arrive at their local and national market ratings. Nielsen works with a universe of households based on sampling techniques accepted by the industry. In their book *This Business of Television*, Howard J. Blumenthal and Oliver G. Goodenough observe that while print publications sell to advertisers against their subscription and total readership numbers, broadcasters must convince advertisers that so many thousands of people “are actually watching a commercial message at a given time.” For a regional TV station, a sample of 300 households or less may be enough to satisfy advertisers that a million or more viewers are watching the show at the time the commercial appears. For a national ranking of 90 million households, the sample may be only a few thousand viewers, they point out.

Both Nielsen and Arbitron rely on the cooperation of sample households to keep track of their viewing habits. Because viewers can easily click away, mute, or use pre-recording boxes such as Tivo to escape the ad, Nielsen, a few years ago, introduced the electronic PeopleMeter for national rankings. This is a device attached to the TV set that records what channel is on and for how long. More sophisticated devices now also allow ratings companies to monitor actual viewing remotely so that household information arrives in real time to produce the overnight ratings that are being developed. Nielsen offers a real-time measurement tool called C3, which attaches to all viewing devices from TV to DVR, video game box, or set-top box and feeds live-viewing information, including what commercials are being watched in real time, into a data bank. New set-top boxes and viewer cards for digital TVs will also provide instant feedback and monitor how long a viewer stays with an ad and where the ad is placed in the programming.

High-profile events where ad time gets bid up don’t yet require this precision. Five days into the 2008 Beijing Olympics, for example, NBC Universal could claim that viewership was up 15% based on the current rating system. But that aside, more precise measurement of audiences and the need to raise ad revenue is a global trend, even in countries with tight government control of networks. Whether it’s an ad dollar, ruble, rupee, or yuan, broadcast TV is

increasingly required to fund itself by selling airtime, along with various kinds of taxes, subscription fees, or direct government support to supplement ad revenue. Running against the grain, Britain’s BBC remains one of the few successful noncommercial experiments. The BBC is not allowed to show any commercials in the United Kingdom, although it can get licensing revenue from selling shows abroad to commercial stations. Households in the United Kingdom pay a tax for owning a TV of about \$270 annually, which covers any number of sets in a house. Although the BBC competes against three commercial channels, its two main channels are watched by some 90% of Britons each week and have a 27% share of total viewing, even though viewers also have access to some 200 commercial channels on satellite networks. With live sports programming, the BBC usually has a much higher proportion of viewers for a match than commercial channels, a fact that analysts say shows that viewers want the game uninterrupted. In the largest emerging markets, TV viewing is free, but channels are limited, and editorial content is under especially tight state control. China’s national network, CCTV, for example, a government monopoly with 600 million viewers, is likely to generate \$60 million in Olympic revenue along with 30% growth in 2008, according to Martin Sorrell, the CEO of WPP, a major ad buyer in China. Russia has 20 major channels; India, a very competitive media market, has hundreds.

Radio

Radio also earns most of its revenue from advertising, with the remainder from fees and licensing, and broadcasters face the same cost pressures as all traditional media. But while radio stations have seen flat revenue growth, they must have invested more airtime in news—40 minutes a day from 37. According to the Radio and Television News Directors Association annual survey, the news increase has been primarily in major markets with an audience of 1 million or more, targeted to morning commute “drive” times. The economics of radio news is much simpler than for TV. An average newsroom can function with no more than four full-time and part-time employees, and regional news generated by one newsroom often gets used by several stations. The consolidation of stations under one corporate parent also cuts costs by homogenizing the news. Clear Channel, a U.S. radio consolidator, owns more than 1,300 stations.

Radio has a greater measurement problem than print or TV because it can’t tell with precision who is listening at any one time. There are about 14,000 licensed broadcast stations in the United States, and advertisers spent a total of \$21.7 billion on radio spots in 2008. But as the Project for Excellence in Journalism points out in its State of the Media 2008 report, “The strongest growth story in the radio universe is the Internet.” Although still small, ad spending

for radio on the Web grew some 15%, from \$1.3 billion to \$1.5 billion. If radio could produce a more accurate listener measurement, it might be better able to sell advertisers on airway ads as it can with Internet advertising. One experiment by Arbitron, which rates radio listening, is to have sample listeners carry around a portable transmitter that would send listening data to the rating agency in real time. While this has been withdrawn for now, other experiments to improve metrics this way may be forthcoming.

Online and Digital

It's clear that the future of journalism globally will be about how traditional media sort out revenues and audience in competition and aligned with the digital world. If publicly traded media companies lose investor confidence, they won't have the capital to remake themselves. Financial health, not size, is the criterion that measures their business. No matter how large a traditional media company looks, from CBS News to *The New York Times*, investors and advertisers have made a decision to bet much more heavily on digital than print and broadcast, and unless that trend abates, the value of traditional media of all kinds is at risk. As the media writers Jay Yarrow and Jon Fine asked in a recent column, "How can *The New York Times* be worth so little?"—noting that the paper itself, even with its online site, the Paris-based *International Herald Tribune* and a radio station, seems to be worth just \$750 million.

So who are the dominant players in digital journalism? Many are traditional media. Nearly all newspapers, magazines, and broadcasters have online news sites. *The Wall Street Journal*, *The Washington Post*, *The New York Times*, CBS, NBC, and ABC support large online staffs who produce original stories well beyond what the parent enterprise offers in print and broadcast each day.

But the biggest providers of news globally are increasingly not news companies at all. The giants in the field, Google, Yahoo, and Microsoft's MSN, call themselves aggregators rather than news sites, even though they are among the most heavily visited for news. As aggregators, they collect and distribute news and any other kind of information that they find useful. They have made the word *content* a substitute for what used to be called news, information, entertainment, classified advertising, and just about anything else that a print reader or broadcast listener might have found in a newspaper or on TV. The most watched provider of content is Google.

For journalists, Google epitomizes all that is both admired and feared about digital media. Journalists use Google constantly for their story searches and may also have their private e-mail accounts with Gmail. But at the same time, they know that Google's power to attract advertising in competition with their employers' media companies means that their own financial position weakens.

What is Google? When Google announces earnings each quarter, the financial press and Wall Street often call it the world's largest media company. That's because on any day, you can find a large share of the world's stories and broadcasts on Google for free. For example, Google News is a channel of constantly changing selections from the world's newspapers and broadcasters. YouTube, owned by Google, puts up clips from broadcasters as well as individuals that often beat the networks on spot news coverage anywhere in the world. This means that Google, an enterprise that started out as a pure search engine in 1996, is also a powerful distributor and facilitator of news.

If you are one of the world's most important places to check each day for news, are you not a media company? Google says no. Instead it calls itself a distributor of global content. "Our mission is to organize the world's information and make it universally accessible and useful" is Google's mission statement.

Jon Friedman, the media columnist for *Market Watch*, owned by Dow Jones, the parent of *The Wall Street Journal*, agrees. "Google doesn't create content which informs and entertains people as media companies do. Instead, Google compiles facts and delivers information as well as news clips to its panting audience," he says.

If Google does not produce original news or create content, is it then a news distributor, as Friedman says? Many people think so. This means that the company that is one of the world's largest deliverers of media gets nearly all its content without cost. The U.S. broadcast and newspaper industry spends close to \$70 billion a year to gather hard and soft news. Google gets nearly all that material free.

Google earns its income from ads on its site paid for by order of placement and from keywords that direct a user to an advertiser on another site. But unlike a newspaper, magazine, or broadcaster, it gets paid by the number of users who click on an ad. In Google's financial statements, it reports income by the number of "aggregate paid clicks." On an annual basis, the number of paid clicks, meaning visitors to the Google site, has been increasing by 30% a year. In 2008 Google's total revenues were \$21.7 billion, up from \$16.5 billion the year before. Against those revenues, Google's main costs were compensation for 20,000 employees to the amount of \$8.6 billion; research of \$2.8 billion; and sales, marketing, and general administrative expenses; bringing total costs to \$15.1 billion. That allowed Google, before deducting for some investment losses and taxes, to earn \$5.8 billion. By comparison, *The New York Times* lost \$57 million in 2008.

Like all online sites, Google's attraction for an advertiser is the precise measurement and cost it offers from "hits." Each time a user uses the search engine, highlighted links that are prepaid by an advertiser show up in descending order on the search results. In a right-hand column separate from the search, there are also "sponsored links," similar to the kind of ads you might see on a traditional media online site.

Suppose you wanted to develop a low-cost shipping service. You might buy 100 keywords from Google ranging from *Low Cost* to *Cheap Shipping*. The keywords are sold at an auction, so the most popular are the most costly. If you monitor your list, you can see instantly which ones work for you and cut out the ones that don't. If *Low Cost Boxes* is \$1 a click but generates strong traffic to your site, the cost per click becomes worth it. If words costing 20 cents a click are cheap but don't draw users, you discard them. The Google model with variations is why the number of "eyeballs," meaning people visiting the site, is so critical. Google draws millions of search users a day. Users click a link, and if the link generates an inquiry or a sale, Google can measure that and report it back instantly to you. Traditional media cannot offer that precision.

According to Technorati, an online tracking service, there are some 100 million online sites worldwide. Some, such as Yahoo, spend some income on personal finance stories that they generate on their own. Many others use writers attached to their sites who may write for the print and broadcast companies that own them. When the stories that are used are new for the site, they are there to attract viewers. When they are stories taken from the print publication, or "repurposed," readers and viewers are getting older content but viewing it online.

A second way in which print revenues have been transferred to online services is through digital classified sites. The community-based San Francisco free online listing service called craigslist now has replicated its online listing model in many major U.S. cities. Craigslist has severely eroded classified advertising in newspapers, taking an estimated \$65 million of the classified market in San Francisco alone. According to *InternetWeek*, classified advertising in all forms is a \$30 billion business in the United States; about half of this still remains with daily newspapers but faces increasing competition from online services.

Craigslist and other online shopping services continue to take a share from print publications. In the employment category, online jobs boards such as CareerBuilder, Monster, and HotJobs have been growing at a 30% to 50% rate a year and account for about 20% of the classified job ad market, which is a \$1 billion-a-year business for newspapers.

In shopping, increasingly direct buying as well as key research for big ticket items such as autos, furniture, appliances, and vacations takes place primarily on an online site. Think of Edmunds.com for car buyers and Orbitz for travel. Amazon, once a bookseller, is now a digital department store for much of the world's consumer goods, with revenues of \$14 billion in 2007.

Then there are blogs. Most blogs do not make money, and most have low readership. According to Technorati, there are 56 million blogs worldwide growing at a rate of 22% annually. The blogosphere is mostly an avocation, but the number of blogs hosted by specialist contributors means that blogs get a following on key events. Blogs can affect the future of traditional media in two key ways. They

can swarm with expert opinion to challenge or drive the editorial views of large news organizations. They also draw eyeballs away from print- and broadcast-affiliated online sites, thus reducing the traffic needed to produce a high volume of "clicks" for advertising revenue.

Here is a huge debate about whether bloggers are journalists at all. But for the bloggers themselves, the debate is beside the point. As independent and usually unpaid commentators and reporters, bloggers have been vital to the information food chain, and their influence is felt on many public issues. Bloggers challenged the authenticity of a letter that was aired on the *CBS Evening News* that presumed to show that U.S. President George W. Bush did not participate in Alabama National Guard exercises as Bush said he did. Bloggers argued that the letter was a fake because the typeface used did not exist on electric typewriters available on the date that was printed on the letterhead. The CBS anchor Dan Rather, who initially defended the letter as authentic, retired from the network soon after.

If blogs can successfully challenge the top editorial views of traditional media, what effect do they have on large media revenues? It is too early to say what share of the media market blogs will command. As some blogs mature and become more like established online sites, they will be competitors for ad spending and become attractive takeover targets. Two leading U.S. news and opinion blogs, The Drudge Report and the Huffington Post, have low news costs and high visibility. Writers contribute to the Huffington Post mostly for free. The Drudge Report is run by one editor, Matt Drudge, who aggregates stories on his site. Thousands of other bloggers are seeking to follow these models and earn revenue through consortiums that sponsor and sell their content.

Conclusion

What this overview of the business of journalism shows is that the media world continues to fragment without a clear view of who will pay for quality news ahead. Online Web sites attached to traditional media companies are seriously committed to developing high-quality online journalism. They are also experiencing solid rates of growth that match growth among independent online sites. But their ability to monetize their editorial in a way that offsets or supports the losses they have from traditional advertising does not show signs of reversing. Over a longer time, this suggests a shrinking role for print and broadcast media since newsrooms will not be able to support their staffs even after repetitive cuts. This does not mean that the traditional media are going away altogether but that their effort may be focused on much more local coverage, with softer and high-profile online features that drive traffic to the Web site. Some traditional media executives see the day when their online business will become their dominant revenue source, big enough to sustain a healthy online news staff and generate enough revenue to also support a

smaller print and broadcast stepchild. This uncertain future is already creating divisions in newsrooms.

Print and broadcast newsrooms now post on their Web sites their most viewed and most e-mailed stories of the day. This creates sudden acclaim for popular writers but for reporters who are on serious but not always exciting beats, the practice is discouraging and threatening.

The good news is that the job demand for journalists with multimedia skills is increasing. Even with a downturn in the 2007 U.S. economy, a survey from the University of Georgia found that 63% of journalism graduates from 80 U.S. universities landed jobs within 8 months with an average starting salary of \$30,000, indicating no decline from the year earlier.

There is also a debate about what the number of editorial jobs means in the world of digital journalism. “Saving journalism isn’t about saving jobs” maintains Jeff Jarvis of Buzz Machine, who argues on his influential blog that future media investment should be in growing jobs outside newsrooms and training journalists to report and write to professional standards. Practices such as “twittering”—sending short instant messages—are now used by some traditional media to take files from “citizen reporters” at news sites, such as a bridge collapse, and turn them into constantly updated stories in a running narrative of the event. Entrepreneurs and journalists able to build stories out of these kinds of free editorial feeds are now trying to find ways to monetize their work, such as selling stories to mobile phone users and perhaps eventually selling their creations to large media companies. But unless and until there is a drift toward consolidation, it appears that the universe of new media will continue expanding into multiple digital pieces offering easy entry but limited structure and training for beginning reporters.

PART XII

PUBLIC RELATIONS

HISTORY AND CONCEPTS OF PUBLIC RELATIONS

GLEN M. BROOM

San Diego State University

Much like atmospheric pressure, the practice of public relations affects all of us even though we usually are not aware of its presence. What you read, what you see, and what you hear in the media are often the direct or indirect effects of organizations trying to establish and maintain relationships with those important to their success or failure. The organizations include corporations, nonprofits, associations, health care organizations, educational institutions, governmental agencies, military branches, and many more.

Archeologists have found evidence of public relations activity in ancient Iraq, India, Greece, and Italy. Historians documented that kings in England several centuries ago had the Lord Chancellor to attend to their relationships with “the people.” The Catholic Church employed “propaganda” in the 17th century when it established the *Congregatio de Propaganda Fide* (Congregation for Propagating the Faith). U.S. historians have documented what was likely the first systematic fund-raising campaign by Harvard College in 1614, how the revolutionaries stirred public opinion to fight a war against England and to form a new government and promoted the expansion and settlement of the new country (Basham, 1954; Cutlip, 1995; Davidson, 1941; Nevins, 1962).

Much of contemporary practice, however, can be traced to early practitioners in the 20th century, with two “founding fathers” typically credited with much of the emerging profession’s “DNA” and its evolution from press agency to public relations—Ivy Ledbetter Lee and Edward L. Bernays.

Origins of Modern Public Relations

Public relations today reflects the evolving roles of organizations in society, the growing power of the media and public opinion, the increasing interest in applying the findings of the social sciences, and the never-ending march of social and cultural change. Contemporary public relations developed during four eras: (1) public-be-damned, (2) public-be-informed, (3) mutual understanding, and (4) mutual adjustment (Broom, 2009, pp. 92–93).

Public-Be-Damned Era

This era took its name from the infamous remark allegedly made by William Henry Vanderbilt, son of the wealthy shipping and railroad businessman “Commodore” Cornelius Vanderbilt: “The public be damned.” Although this was reported by a Chicago freelance writer in 1882, the young Vanderbilt denied having made the remark disparaging the public interest versus the rights and privileges of the wealthy titans of industry. Nevertheless, the words epitomized the tone of the time and the often abusive power of big business in the 19th century.

For example, Bank of the United States president Nicholas Biddle and his associates attempted to influence public opinion in their political battles with the popular President Andrew Jackson and his adviser, Amos Kendall. By making loans to editors and buying advertisements in their papers, banks were able to influence many newspapers and silence others in the public debate.

Biddle's publicist, Mathew St. Clair Clarke, decided to promote "a brash, loud-talking Tennessee Congressman, the colorful Colonel Davy Crockett and to build him up as a frontier hero to counter Old Hickory's [President Andrew Jackson's] appeal to the frontiersmen" (Cutlip, 1995, p. 100). As Scott Cutlip reported, "The transfiguration of Davy Crockett from a boorish, backwoods boob into a colorful frontier statesman was the work of several ghostwriters and press agents," when in fact Crockett "spent four years loafing and boasting at the Congressional bar" (p. 101).

The Crockett campaign included ghostwritten books, widely distributed ghostwritten speeches (not the words he actually spoke!), and ghostwritten letters to editors. The strategy failed, however, to keep Jackson from winning a second term as president and to prevent the election of his successor, Martin Van Buren, in 1836. After failing to get himself reelected, Crockett headed to Texas, where he was killed by Santa Ana's troops in the siege of the Alamo. It was Walt Disney who revived the legend and polished the "Legend of Davy Crockett" to cash in on the creative work done by press agents more than 100 years earlier.

Press agents also introduced many practices to promote circuses and traveling road shows:

Today's patterns of promotion and press agency in the world of show business were drawn, cut, and stitched by the greatest showman and press agent of all time—that "Prince of Humbug," that mightiest of mountebanks, Phineas Taylor Barnum. (Cutlip, 1995, p. 171)

Barnum employed his own press agent, Richard F. "Tody" Hamilton, whom he credited with much of the success of his circus (now known as the Ringling Bros. and Barnum and Bailey Circus). Likewise, Colonel William F. Cody ("Buffalo Bill") used press agency and hyperbole to promote his "Wild West Show." As a result of such successful promotions, press agency spread from show business to closely related enterprises, including powerful business interests.

Westinghouse Electric Company created the first corporate department to engage in press agency in 1889. George Westinghouse and his new electric corporation were promoting his revolutionary alternating-current (AC) system of electricity. The "battle of the currents" followed as Thomas A. Edison's Edison General Electric Company, which used direct current, tried to prevent the adoption of Westinghouse's AC technology (Cutlip, 1995, pp. 199–200).

Edison and his business associate, Samuel Insull, launched a propaganda scare campaign against the "lethal" AC, including the electrocution of stray cats and dogs:

Edison General Electric attempted to prevent the development of alternating current by unscrupulous political action and by even less savory promotional tactics. . . . The promotional activity was a series of spectacular stunts aimed at dramatizing the deadliness of high voltage alternating current, the most sensational being the development and promotion of the electric chair as a means of executing criminals. (McDonald, 1962, pp. 44–45)

Westinghouse recognized the need for specialized help to counter the scare campaign and to get his story to the public. He hired Pittsburgh journalist Ernest H. Heinrichs, who moved quickly to challenge the misrepresentations of AC. When Westinghouse's system won public acceptance despite the Edison-Insull propaganda scare campaign, it demonstrated "that performance and merit are the foundation stones of effective public relations" (Cutlip, 1995, p. 203).

As press agents' exploits became more outrageous, it was not surprising that they would arouse the hostility and suspicion of editors and an increasing skeptical public. Pressures for change led to changes in how public relations' predecessors would deal with both the media and the public in the 20th century.

Public-Be-Informed Era

Powerful business interests in the early 1900s employed publicists to defend themselves and their monopolies against muckraking journalists and a growing push for change and regulation. Thus, the first public relations firms—actually publicity agencies—were established to serve such clients. The strategy was to tell their side of the story and to counterattack to influence public opinion. The goal was to prevent increased governmental regulation of business.

The nation's first publicity agency—The Publicity Bureau—was founded in Boston in mid-1900. Although it would take on corporate clients later, Harvard University was the Publicity Bureau's first client and was paid on what was surely the first fixed-fee-plus-expenses arrangement:

In the matter of payment, we understand that you are to pay the Bureau \$200 a month for our professional services, and those of an artist where drawings seem to be required. That this sum is to include everything except the payment of mechanical work, such as printings and the making of cuts, and the postage necessary to send out the articles themselves to the various papers, which items are to be charged to the University. (Cutlip, 1994, p. 11)

The Publicity Bureau came into national prominence in 1906, when it was employed by the nation's railroads to head off adverse regulatory legislation then being pushed in Congress by President Theodore Roosevelt. Operating in secret, the firm used the tools of fact-finding, publicity, and personal contact to saturate the nation's weeklies with railroad propaganda. In spite of the Publicity Bureau's effort, a moderately tough regulatory measure—The Hepburn Act—was passed in 1906, after President Roosevelt had used the press and his "bully pulpit" to argue a more persuasive case. The Publicity Bureau faded from the scene in 1911 (Cutlip, 1995, p. 16).

Also early in the public-be-informed era, the former Buffalo reporter and veteran political publicist George F. Parker and a young Ivy Ledbetter Lee established Parker

& Lee in New York in 1904. They worked together in the Democratic Party headquarters handling publicity for Judge Alton Parker's unsuccessful presidential race against Theodore Roosevelt. The firm lasted less than 4 years, but the junior partner—Lee—was to become one of the most influential pioneers in the emerging craft of public relations.

The Princeton graduate and former New York newspaper business reporter, Ivy Ledbetter Lee, was among the first to recognize the potential of honest publicity and helping corporations tell their story. Even though this former journalist had difficulty labeling what he did for clients, he changed public relations forever.

Going against the prevailing feeling on Wall Street that “the public be damned,” Lee declared that the public was no longer to be ignored, in the traditional manner of business, or fooled, in the manner of the press agent. It was to be informed. Unlike the Publicity Bureau, which operated in secrecy, Lee sent a “declaration of principles” to all city editors in 1906 and introduced what would later become the “press release”:

This is not a secret press bureau. All our work is done in the open. We aim to supply news. This is not an advertising agency; if you think any of our matter ought properly to go to your business office, do not use it. Our matter is accurate. Further details on any subject treated will be supplied promptly, and any editor will be assisted most cheerfully in verifying directly any statement of fact. . . . In brief, our plan is, frankly and openly, on behalf of business concerns and public institutions, to supply to the press and public of the United States prompt and accurate information concerning subjects which it is of value and interest to the public to know about. (Morse, 1906, p. 460)

The oil and mining magnate John D. Rockefeller, then the world's richest man and one of its most reviled, would become one of Lee's clients. Ida Tarbell's *History of the Standard Oil Company* (1904/1987), described at the time as “a fearless unmasking of moral criminality masquerading under the robes of respectability and Christianity,” exposed abusive practices and energized calls for breaking up the oil monopoly. In 1911, upholding the Sherman Antitrust Act of 1890 and trust-busting President William Howard Taft's attempt to break up the Standard Oil Trust, the U.S. Supreme Court ordered the Trust to break with 33 affiliated companies and to distribute stock to each company's shareholders.

The unpopular Rockefeller was finally persuaded to retain Ivy Lee in 1914 after a disastrous strike and killings at the Rockefeller-owned Colorado Fuel and Iron Company in Ludlow, Colorado. Rockefeller and his family were blamed for “Bloody Ludlow”—the massacre of women and children living in the tent city set up by the striking miners. In the years that followed, Lee used his journalistic skills and reputation for dealing with the press to highlight Rockefeller's generosity and philanthropy. By the time Rockefeller died in 1934, 2 months short of age 98,

he was known for his philanthropy and the many foundations, universities, and medical schools he had endowed.

Lee was still working for the Rockefeller family when he also died in 1934. He sometimes described what he did as “publicity,” but he also counseled his clients, thus establishing the principle that performance determines what is said in the publicity written by others. But the journalist publicity model was not the only approach.

Preparing the nation to enter World War I, President Woodrow Wilson appointed a presidential commission, the “Committee on Public Information.” George Creel headed a staff of young propagandists whose goal was to unite public opinion supporting the United States entering the war. During those early years, public relations took the form of one-way persuasive communication—“propaganda.” Some staff members, having learned new skills, formed public relations firms after the “Great War.” Even today, many practitioners work with managers and clients who think that public relations is simply one-way communication to persuade others.

Mutual-Understanding Era

One of the Creel staff members who did not subscribe to the one-way communication concept was Edward L. Bernays. Thus began what Bernays labeled the era of mutual understanding.

Bernays, a nephew of Sigmund Freud, had translated his uncle's books on psychology and psychiatry into English, so he had background in early behavioral science that he had not acquired as a forestry major at Cornell University. He, like Lee, recognized that there was a business opportunity in what he called *engineering public consent*. Based on his propaganda work with the World War I Creed Committee, he was ready to apply the lessons learned to the needs of paying clients. Bernays also wrote the first public relations book, *Crystallizing Public Opinion* (1923/2004), and with his wife and business partner, Doris E. Fleischman, introduced the term *public relations counsel*. If Lee and Bernays are to be called the “fathers of public relations,” which they are, Fleischman surely deserves recognition as the “mother of public relations.”

Bernays saw public relations as an applied social science, drawing on the newly available findings of psychology, sociology, and political science. He was not a publicist. Rather, he sought ways to change public views of what was acceptable or desirable and to change public behavior. For example, he is credited with and was greatly remorseful in his last years for having helped make smoking in public acceptable behavior for women in the 1920s. He also is credited with introducing orange juice as a staple with breakfast, to help Florida growers have a market for their produce that otherwise was fed to pigs. During his long career until he retired from active practice in 1962, he counseled the heads of major corporations, U.S. presidents, and uncounted practitioners aspiring to his status and position in the field. Before he died in 1995 at age 103, *Life Magazine*

included Bernays in its 1990 special issue as one of “The 100 Most Important Americans of the 20th Century.”

Doris Fleischman, an early feminist, also left her mark on the field and society. After marrying Bernays, she used her maiden name long before the feminist movement made that fashionable:

During the next three decades, Fleischman continued to sign into hotels—and twice into maternity hospitals—as “Miss Doris E. Fleischman,” and in 1925 she received the first U.S. passport granted to a married woman under her birth name. That was her name on the 1928 book she edited on careers for women and on the seven magazine articles and book chapters she published between 1930 and 1946. (Henry, 1998, p. 1)

Although Bernays credited her as being an equal partner in their firm, Fleischman struggled for professional equality during a time when women simply did not advise males in leadership positions. As she wrote in one of her books, written after she adopted her married name:

Many men resented having women tell them what to do in their business. They resented having men tell them, too, but advice from a woman was somewhat demeaning. I learned to withdraw from situations where the gender of public relations counsel was a factor or where suggestions had to be disassociated from gender. If ideas were considered first in terms of my sex, they might never get around to being judged on their own merits. (Fleischman Bernays, 1955, p. 171)

No list of the pioneers shaping today’s practice would be complete without the name Arthur W. Page. Page had three successful business careers yet found time to contribute his considerable talent to many public service efforts. He was a writer and editor at the publishing company he was being groomed to lead, Doubleday, Page and Company, from 1905 until 1927. Then, he accepted an offer to become vice president of American Telephone and Telegraph Co., from fellow Harvard graduate and AT&T president, Walter Gifford.

Page made it clear, however, that he would accept only on the conditions that he was not to serve as a publicity man, that he would have a voice in policy, and that the company’s performance would be the determinant of its public reputation. As a result, Page is widely recognized as having been the first corporate vice president of public relations. He was among the first to use systematic public opinion polling to probe public perceptions in order to help shape company policy. He later summarized his philosophy in this statement:

All business in a democratic country begins with public permission and exists by public approval. If that be true, it follows that business should be cheerfully willing to tell the public what its policies are, what it is doing, and what it hopes to do. This seems practically a duty. (Griswold, 1967, p. 13)

Even while vice president of AT&T during World War II, he devoted much of his time to the war effort. As Page’s biographer Noel Griese reported, Page’s most widely distributed

news release, written for President Harry S. Truman, was issued in Washington, D.C., at 11:00 a.m., Monday, August 6, 1945:

Sixteen hours ago an American airplane dropped one bomb on Hiroshima, an important Japanese Army base. That bomb had more power than 20,000 tons of TNT. It had more than two thousand times the blast power of the British “Grand Slam” which is the largest bomb ever yet used in the history of warfare.

The Japanese began the war from the air at Pearl Harbor. They have been repaid manyfold. . . . It is an atomic bomb. It is a harnessing of the basic power of the universe. The force from which the sun draws its powers has been loosed against those who brought war to the Far East. (Griese, 2001, pp. 229–230)

Page retired on January 1, 1947, after integrating public relations concepts and practices into the Bell System. He died in 1960 at age 77. However, Page’s precepts and principles not only endure in the companies that used to be part of AT&T (broken up in 1984 by court order to foster competition) but also are renewed and promoted by the Arthur W. Page Society, an association of senior corporate public relations executives and leaders.

Although sophisticated opinion measurement methods were not introduced until the 1930s, the postwar work of social scientists contributed much to advance behavioral research and communication science. Page was among the first to apply the new skills and knowledge to public relations practice.

Mutual-Adjustment Era

Even before World War II, research on media effects did not appear to support assumptions about powerful media effects, instead suggesting a limited-effects model with more active and more resistant audiences. More realistic concepts of public relations evolved to include notions of two-way communication and relationships. Definitions began to include words such as *reciprocal*, *mutual*, and *between*, indicating a maturing view. For example, an interactive concept appeared in *Webster’s Third New International Dictionary’s* definition: “The art or science of developing reciprocal understanding and goodwill.” The British Institute of Public Relations defined the practice as an effort to establish and maintain “mutual understanding between an organization and its publics.”

Early editions of the field’s leading text also defined public relations as an interactive concept—“the planned effort to influence opinion through good character and responsible performance, based on mutually satisfactory two-way communications” (Cutlip & Center, 1952/1984). Another influential text published in 1984 presented yet another version of the interactive concept—“the management of communication between an organization and its publics” (Grunig & Hunt, 1984, p. 6).

Ahead of his time, Yale professor and *Public Opinion Quarterly* founder Harwood L. Childs introduced an even more advanced concept in the late 1930s. Childs concluded that the goal of public relations “is not the presentation of a

point of view, not the art of tempering mental attitudes, nor the development of cordial and profitable relations.” Instead, he said the basic function “is to reconcile or adjust in the public interest those aspects of our personal and corporate behavior which have a social significance” (Childs, 1940, pp. 3, 13). Childs saw the function of public relations as helping organizations *adjust* to their social environments, a concept that reemerged many decades later in contemporary public relations. “Consumerism,” “environmentalism,” “racism,” and “sexism” became serious issues on the public agenda beginning in the 1960s. Add to those “isms,” “peace.” A new breed of investigative muckrakers and powerful new advocacy groups pushed for social change, new social safety nets, and increased government oversight of business and industry. Protecting the environment and securing civil rights became the flagship causes of this era.

Reminiscent of the early part of the 20th century, books led the charge against “big business.” For example, many credit Rachel Carson’s 1962 book, *Silent Spring*, with beginning the environmental movement. President John F. Kennedy directed his science advisory committee to study the book’s documented charges that DDT indiscriminately killed all manner of insects and animals when applied to crops as a pesticide and that DDT had contaminated the entire food chain. Public apathy soon changed to public demand to regulate the pesticide industry and to protect the environment.

General Motors also became a target of protest and public scrutiny, opening the door to greater corporate accountability. Ralph Nader gave birth to the consumer movement in 1965, when he wrote *Unsafe at Any Speed: The Designed-In Dangers of the American Automobile*. Nader charged that the Chevrolet Corvair’s suspension system made the car subject to rolling over. GM’s legal department responded by investigating Nader’s private life. Subsequently, the company’s president had to appear before a Senate subcommittee and apologize to Nader for resorting to intimidation. In addition, the company settled lawsuits out of court for invading Nader’s privacy and agreed to change the Corvair suspension system. Nader used the cash settlement and his book royalties to establish the Project on Corporate Responsibility, staffed by young lawyers and investigators. Corporations suffered many setbacks as “Nader’s Raiders” continued to press for corporate accountability for decades. For example, the National Traffic and Motor Vehicle Safety Act of 1966 spelled out safety standards for all vehicles. Congress also mandated safety in the workplace when it passed the Occupational Safety and Health Act (OSHA) in 1970.

However, Dr. Martin Luther King Jr. is the icon of this era of social change and empowerment. His rise to national leadership began in 1955, when he stood up for Rosa Parks, who was arrested for refusing to give up her seat on a bus in Montgomery, Alabama, to a white passenger. He gave his famous “I Have a Dream” speech on August 28, 1963, at the Lincoln Memorial in Washington, D.C. Dr. King gave his prophetic last speech, “I’ve Been to the Mountain Top,” in Memphis, Tennessee, the day before he was assassinated

on April 4, 1968. He became the martyr and symbol of the Civil Rights Movement, which produced, among many other changes, the 1965 Voting Rights Act and the Open Housing Law of 1968. Dr. King and the Civil Rights Movement played a major role in defining this as the era of change and empowerment.

Surely the Vietnam War protests were the most divisive of this era, contributing to the “generation gap,” “hippies,” the “sexual revolution,” and—ultimately—Watergate and the impeachment of President Richard Nixon. A popular saying of the time “Power to the People” surely captured the essence of this era.

Public relations textbooks written during this era also reflected a major change in public relations practice from the “journalist-in-residence” model based on telling our story. The changed balance of power in society required a new role for public relations in organizations responding to the heightened change pressures. For example, the sixth edition of *Effective Public Relations* by Cutlip, Center, and Broom (1985) introduced “adjustment and adaptation” as the basis of contemporary practice. Research courses became part of the public relations curriculum on many campuses, and practitioners who engaged in information gathering joined the management decision-making teams in many organizations.

Contemporary public relations deals with adaptation and adjustment both inside and outside organizations, whereas the one-way concept of public relations relies almost entirely on propaganda and persuasive communication. Typically in the form of publicity, the two-way concept emphasizes communication exchange, reciprocity, and mutual understanding. Additionally, the two-way concept includes counseling management on *changes* needed *within* the organization. Although old concepts still dominate in many settings, contemporary practice is increasingly a management-level function that has a major role in determining both corrective action and two-way communication strategy. As the Burson-Marsteller cofounder Harold Burson (1990) observed, early in his firm’s history, clients’ questions changed from “How do I say it?” to “What should I say?” Beginning in the 1980s, however, clients began asking, “What should I do?” That question is a fitting transition to defining contemporary practice.

Concept and Definition of Contemporary Practice

People enter into relationships with others to satisfy mutual wants and needs. The continuum of social systems formed by these relationships runs from the smallest—the dyad, two people—to the largest—the global community of nations. Because these relationships are essential to meeting common needs, establishing and maintaining relationships at all levels of social systems are important areas of scholarly study and professional practice.

For example, *human relations*, *marital relations*, and *interpersonal relations* describe the study and management of

relationships between individuals. Professionals specialize in counseling individuals and couples to resolve relational problems and improve relationships. At the other extreme, *international relations* deals with relationships among nations in the largest social system. Likewise, there are specialists and political leaders who practice the art and science of helping nations deal with their ever-changing and sometimes threatening relationships. Courses and books are devoted to the study of all these relationships, as well as relationships in families, work teams, groups, organizations, and other social entities.

Public relations deals with the *relationships between organizations and their stakeholder publics*—people who are somehow mutually involved or interdependent with particular organizations. The social system of interest comprises organization-public relationships, and public relations deals with establishing and maintaining those relationships. It is one of the fastest-growing fields of professional practice worldwide.

Elements of the Concept

Hundreds have attempted to capture the essence of public relations by listing the activities that make up the practice—what public relations does. Such lists provide little guidance to help define public relations conceptually. A blue-ribbon panel of Public Relations Society of America (PRSA) leaders in 1982 wrote a definition that stresses public relations' contributions to society—the “Official Statement on Public Relations.” The many definitions suggest elements common to the underlying concept. Public relations

1. holds membership on an organization's management team;
2. focuses on the organization's relationships with its stakeholder publics;
3. monitors knowledge, opinions, attitudes, and behavior inside and outside the organization;
4. assesses the impact of the organization's policies, procedures, and actions on stakeholder publics;
5. counsels management on the establishment of new policies, procedures, and actions that benefit both the organization and its stakeholders;
6. facilitates two-way communication between the organization and its stakeholder publics to change knowledge, opinions, attitudes, and behavior both inside and outside the organization; and
7. produces new and/or maintains relationships between the organization and its publics.

Public Relations Defined

Definitions help us understand the world around us and to argue for a particular worldview of how one concept relates to other concepts (Gordon, 1997, p. 58). Consequently, the following definition of public relations

describes what public relations is and does, as well as sets parameters for deciding what is not public relations. “Public relations is the management function that establishes and maintains mutually beneficial relationships between an organization and the publics on whom its success or failure depends” (Broom, 2009, p. 7). This definition positions the practice of public relations as a *management function* and implies that management in all organizations must attend to public relations. It also identifies building and maintaining *mutually beneficial relationships* between organizations and their publics as the moral and ethical basis of the profession. And finally, it suggests criteria for determining *what is* and *what is not* public relations.

Relationship to Marketing

Marketing is the management function most often confused with public relations. Whereas public relations is charged with taking into account all of an organization's stakeholders, marketing typically focuses on customers or clients. It is as if marketing uses a telephoto lens to zero in on the target customers, while public relations uses a wide-angle lens to scan the scene for all the stakeholders.

Confusion is common, however, as job openings for “public relations representatives” turn out to be positions as sales representatives or telephone solicitors. In many small organizations, the same person does both public relations and marketing, often without distinguishing between the two. Practitioners add to the confusion themselves when their business cards say that they do “marketing communications” (often referred to as “marcom”) or “integrated marketing communications.” Some public relations firms have “marketing communications” or “marketing public relations” in their titles and on their letterheads.

Although the two are not always clearly defined in practice, public relations and marketing can be distinguished conceptually and their relationship clarified. Fundamental to the concept of marketing is the marketer delivering a product or service to a customer in *exchange* for something of value. According to the marketing scholars Philip Kotler and Gary Armstrong (2008), “Exchange is the act of obtaining a desired object from someone by offering something in return. . . . Marketing consists of actions taken to build and maintain desirable exchange relationships . . .” (p. 7).

Successful marketing attracts and satisfies customers on a sustained basis to secure “market share” and to achieve an organization's economic objectives. It is the special relationship—two parties *exchanging something of value with each other*—that creates quid pro quo relationships in which ownership changes hands that distinguishes marketing from public relations: “Marketing is the management function that identifies human needs and wants, offers products and services to satisfy those demands, and causes transactions that deliver products and services in exchange

for something of value to the provider” (Broom, 2009, p. 6). Product publicity and media relations are among the tactics used to support marketing. Because public relations specialists typically know how to write for the news media, how to work with journalists, and how to plan and implement internal communication programs for sales staff, marketers call on them to help in the marketing effort. Apple Computer, for example, capitalized on the news value of their new products by using publicity to launch new models and new products—even getting CEO Steve Jobs on the cover of *Time* magazine and in the lead stories of television news programs. Mattel used press conferences and other publicity to defend the company and to announce product recalls during the marketing crisis associated with lead paint on toys made in China as toy sales plummeted during the holiday shopping season.

Effective public relations contributes to the marketing effort by maintaining a hospitable social and political environment and by dealing with the news media. For example, a hospital that maintains good relationships with volunteers, nurses, physicians, local employers, local government, and community groups will likely enjoy success in the marketing effort to attract patients, physicians, and referrals. Likewise, successful marketing and satisfied customers help build and maintain good relations with employees, investors, government regulatory agencies, and community leaders.

On the other hand, misguided marketing strategies and gimmicks illustrate how these efforts can backfire and create public relations problems. “Joe Camel” may have been an effective marketing tactic for reaching children and teenagers, but it may have been the straw that broke the camel’s back for the tobacco industry as it defended itself in numerous court cases. Nestlé’s marketing of the Nan™ baby formula—ignoring the World Health Organization’s Code of Marketing Milk Substitutes—prompted the National Alliance for Breastfeeding Advocacy to charge Nestlé with “using a vulnerable population for a grab at market share” (Jordan, 2004, n.p.).

Confusion With the Parts

The contemporary concept and practice of public relations includes many activities and specialties. Some practitioners, for example, focus on relations with employees—the “number one public” or “the organization’s most important asset.” They work in departments called “employee communication,” “employee relations,” or “internal relations.” They plan and implement communication programs to keep employees informed and motivated and to promote the organization’s culture. “Internal relations is the specialized part of public relations that builds and maintains mutually beneficial relationship between managers and the employees on whom an organization’s success depends” (Broom, 2009, p. 10).

Much news and information in the media originates as *publicity*. But because sources do not pay for the placement,

they have little or no control over *whether* the information is used; *when* it is used; and *how* it is used, or misused, by the media. Media gatekeepers may or may not use the information, based on their judgment of its news value and interest to their audiences. From the perspective of readers, listeners, or viewers, the medium carrying the information is the source.

Publicity is information provided by an outside source that is used by the media because the information has news value. This is an uncontrolled method of placing messages in the media because the source does not pay the media for placement. (Broom, 2009, p. 11)

Events also generate publicity by attracting media coverage. Groundbreaking ceremonies, ribbon cuttings, open houses, reunions, dedications, telethons, marathons, ceremonial appointments, honorary degrees, contract and legislation signings, protest demonstrations, press conferences, and other “media events” are designed to be “news.” Successful publicity events have real news value; appeal to media gatekeepers; offer photo, video, or sound opportunities; and communicate the source’s intended message.

Unlike when using publicity, *advertising* gives the source *control* of content, placement, and timing by paying for media advertising time and space. “Advertising is information placed in the media by an identified sponsor that pays for the time or space. It is a controlled method of placing messages in the media” (Broom, 2009, p. 13). Organizations use advertising for public relations purposes when they want to address criticism in the media—over which they have no control, when they feel that their point of view is not being reported fairly, when they feel that their publics do not understand the issues or are apathetic, or when they are trying to add their voices to a cause. For example, when Andersen Consulting changed its name to Accenture, the company placed advertisements in business publications announcing the new name. Kuwait’s embassy in the United States purchased full-page advertisements in major U.S. newspapers announcing “America is our ally” and supporting “the international effort to eradicate terrorism.” Merck & Company used advertising to announce its withdrawal of VIOXX™ from the market. The American Cancer Society has long relied on advertising to achieve its public awareness goals:

The society was the first traditional health charity to engage in paid advertising and, to be sure, for years our ad budget, which is less than 2% of our revenues, was spent raising awareness of things such as colorectal cancer and breast cancer screenings and tobacco prevention. (Wender, 2007, p. A17)

In *Walking the Tightrope*, the late Hollywood publicist Henry Rogers (1980) summarized his view of *press agency*: “When I first started, I was in the publicity business. I was a press agent. Very simply, my job was to get the client’s name in the paper” (p. 14). In other words, the goal of press agency

is to create the perception that the subject of the publicity is a newsworthy subject deserving public attention. Press agency is creating newsworthy stories and events to attract media attention in order to gain public notice.

Negative publicity seldom has positive outcomes, however. Press coverage featuring the antics of Britney Spears, Michael Vick, and one-time presidential candidate John Edwards may bring public notice—even celebrity—but surely will not positively affect their respective lives and careers. Confusion results when press agents describe what they do as “public relations” or use that term to give their agencies more prestigious titles. As a result, many journalists still mistakenly refer to all public relations practitioners as “flacks,” even though the *Associated Press Stylebook* defines “flack” as “slang for press agent.”

The armed services, many governmental agencies, and some corporations use *public affairs* as a surrogate title for public relations. This title is part of a name game dating back to the 1913 Gillett Amendment to an appropriation bill in the U.S. House of Representatives. The amendment stipulated that federal funds could not be spent for publicity unless specifically authorized by Congress. The historian J. A. R. Pimlott (1951/1972) concluded that limitations imposed on government public relations “springs from the fear lest programs undertaken in the name of administrative efficiency should result in an excessive concentration of power in the Executive” (p. 76).

In fact, the 1913 amendment did not refer to public relations. Many federal, state, and local governmental officials nevertheless confuse publicity with the larger concept of public relations. As a result, governmental agencies typically use titles such as “public affairs,” “public information,” “communications,” “constituent relations,” and “liaison.”

In corporations, *public affairs* often refers to public relations efforts related to public policy and “corporate citizenship.” Corporate public affairs specialists serve as liaisons with governmental units; implement community improvement programs; encourage political activism, campaign contributions, and voting; and volunteer their services in charitable and community development organizations.

Public affairs is the specialized part of public relations that builds and maintains relationships with governmental agencies and community stakeholder groups to influence public policy.

An even more specialized and often criticized part of public affairs, *lobbying*, attempts to influence legislative and regulatory decisions in government. The U.S. Senate (2008) defines lobbying as “the practice of trying to persuade legislators to propose, pass, or defeat legislation or to change existing laws.” Registration laws and their enforcement vary from state to state, but all who engage in lobbying the U.S. Congress must register with the Clerk of the House and Secretary of the Senate. Twice a year, lobbyists also are required to report their clients, expenditures, and issue-related activities.

News stories sometimes report illegal or questionable cash contributions to legislators, lavish fund-raising parties, and weekends at exotic golf resorts. However, lobbying more often takes the form of open advocacy and discussion on matters of public policy.

Lobbying is a specialized part of public relations that builds and maintains relations with government primarily to influence legislation and regulation.

Issues management requires early identification of issues with potential impact on an organization and a strategic response designed to mitigate or capitalize on their consequences. As originally conceived, issues management included identifying issues, analyzing issues, setting priorities, selecting program strategies, implementing programs of action and communication, and evaluating effectiveness (Chase, 1977). Conceptually, if not always administratively, issues management is part of the public relations function.

Issues management is the proactive process of anticipating, identifying, evaluating, and responding to public policy issues that affect an organization’s relationships with its publics.

Another specialized part of public relations practice is also the highest paid. Sometimes referred to as “IR” or “financial relations,” *investor relations* is part of public relations in publicly held corporations. Investor relations specialists work to enhance the value of a company’s stock. This reduces the cost of capital by increasing shareholder confidence and by making the stock attractive to individual investors, financial analysts, and institutional investors.

Investor relations is a specialized part of corporate public relations that builds and maintains mutually beneficial relationships with shareholders and others in the financial community to maximize market value.

Investor relations specialists keep shareholders informed and loyal to a company in order to maintain a fair valuation of a company’s stock. They track market trends, provide information to financial publics, counsel management, and respond to requests for financial information. Those aspiring to careers in investor relations typically combine studies in public relations with coursework in finance and business law. An MBA degree is often necessary preparation.

If investor relations helps finance publicly held corporations, fund-raising and membership drives provide the financial support needed to operate charitable and nonprofit organizations. *Development* specialists work for charities, public broadcasting stations, disease research foundations, hospitals, community arts groups, museums, zoos, youth clubs, universities, and religious organizations. Organizations that rely on donations, membership fees, and volunteers often have a “director of member services and development.”

Development is a specialized part of public relations in nonprofit organizations that builds and maintains relationships with donors and members to secure financial and volunteer support.

Toward Recognition and Maturity

Whatever name is used, the basic concept and motivation of public relations are similar from one organization to the next—large or small, local or global. *All organizations strive to establish and maintain relationships with those identified as important to their survival and growth.*

Some scholars credit public relations for the heightened attention to public accountability and social responsibility among government administrators and business executives. Others emphasize the function's role in making organizations more responsive to public interests and more accepting of their corporate social responsibility. As one business leader long ago said,

We know perfectly well that business does not function by divine right, but, like any other part of society, exists with the sanction of the community as a whole. . . . Today's public opinion, though it may appear as light as air, may become tomorrow's legislation for better or worse. (Cutlip & Center, 1958, p. 6)

So public relations also helps organizations anticipate and respond to public perceptions and opinions, to new values and lifestyles, to power shifts among the electorate and within legislative bodies, and to other changes in the social and political environment. Public relations also makes information available through the public information system that is essential to both democratic society and organizational survival. Finally, the practice serves society by mediating conflict and by building the consensus needed to maintain social order. In summary, public relations' social mission is to facilitate adjustment and maintenance in the social systems that provide us with our physical and social needs.

THEORIES AND EFFECTS OF PUBLIC RELATIONS

CARL BOTAN

George Mason University

This chapter introduces public relations theory and effects and is divided into three sections. Section 1 covers a brief review of some of the social and economic effects of modern-day public relations—what students who chose public relations will walk into in terms of job availability, pay levels, and the like. The second and third sections then look at theory. The second section explains how often unconscious or unnoticed assumptions about public relations combined over time to create misunderstandings about the field in the minds of students, the general public, and some supervisors. These unconscious assumptions often function as lay theories. A lay theory is an informal theory that lay (i.e., nontrained) groups and individuals develop on their own to explain how things work or are related. The third section is a short summary of more formal public relations theory based on a longer review of public relations theory that was published by Maureen Taylor and this author in 2004. This section uses a bit more field-specific jargon, although it has been reduced to a minimum. The reader needing additional formal academic discussion of public relations theory is referred to the Botan and Taylor article in *Journal of Communication* (2004) or to two public relations theory books coauthored by this author, *Public Relations Theory* (Botan & Hazleton, 1989) and *Public Relations Theory II* (Botan & Hazleton, 2006).

Social and Economic Effects of Public Relations

Public relations affects a society in many ways, from direct economic contribution, such as promoting a product or company, to public diplomacy and nation-building campaigns. Public diplomacy is the branch of public relations in which one government seeks to influence the policy of another government by first influencing the publics of that other government through a public relations campaign in the hope that those publics will, in turn, influence their own government. Nation-building campaigns are those used to help build underdeveloped nations or nations trying to rebuild from civil war or some other large disaster. Such large-scale effects are interesting and have been addressed by many authors (e.g., Kunczik, 1997; Signitzer & Wamser, 2006; Sriramesh & Vercic, 2003), but the effects of primary concern in this chapter are ones that affect the work experience of those in the field.

This overview of the social and economic effects of public relations is divided into two parts: makeup, which affects practitioners and publics alike, and pay. Not discussed under these headings are several attributes of the field that are not central to the argument developed in this chapter but that are still discussed briefly in the conclusion—that public relations has become highly international and intercultural, that public relations has become a research-centered field,

and how much public relations has moved up the organizational and corporate ladder.

Makeup of the Field

Public relations has grown and changed at an amazing rate in the past quarter-century. It is a field on the upswing, and its changing composition is one indicator of that. The resulting effects include substantial opportunities for women and a growing role in areas that have previously been the domain of journalism and advertising.

Gender Composition

A long time ago, the public relations field was predominantly male, but the 2006 report of the National Curriculum Commission's (Curriculum Commission, 2006) report on public relations education said that in "a field that was once predominantly male, females now constitute almost two thirds of all practitioners and as much as 70 to 80 percent of undergraduate enrollment in some university programs, an imbalance that has been increasing since 1999" (p. 13).

Growth Compared With Other Areas Within Communication

Public relation has grown to the point that "public relations' large enrollments often are used to fund other subject areas" (Curriculum Commission, 2006, p. 16) in departments of communication, mass communication, and journalism. The large enrollments of public relations are easy to see and well documented, particularly in comparison with another popular, career-focused specialty in communication, advertising. The May 2005 newsletter of the Association for Education in Journalism and Mass Communication reported that in just the 197 universities responding to a survey, there were 281 programs and that of these there were 133 for public relations, 95 for advertising, and 53 for joint programs. Most important, however, the newsletter went on to report that between 1992–1993, the number of public relations programs increased by 14, while advertising dropped 25. The Public Relations Student Society of America, the campus branch of the primary national professional organization, the Public Relation Society of America, has grown to 275 chapters (Curriculum Commission, 2006).

In fact, public relations' growth has been so great that the National Curriculum Commission identified finding enough qualified faculty to teach public relations as one of the major problems the field faces. The Commission saw this problem as so great in 2006 that it issued the following warning in its report:

In the past, teaching vacancies in the field have too often been filled with instructors without the PhD or research and theory knowledge, without actual practitioner experience, or both. Absent documented and specific public relations experience or graduate study in public relations, a degree in English, business, advertising, journalism, mass communication, or another professional field, is *not* evidence of preparation to teach public relations. (p. 14)

The high growth rate of public relations is not surprising in light of the expanding number of jobs (and the increasing pay scales). The 2006 *Occupational Outlook Handbook* published by the Bureau of Labor Statistics (BLS) predicted that public relations employment will grow from 18% to 26% between 2004 and 2014 while jobs for news analysts, reporters, and correspondents, for example, are expected to be relatively flat over the same period, growing only 0% to 8%.

The BLS's *Occupational Outlook Handbook 2008–2009* currently lists 243,000 jobs for public relations specialists, exclusive of the 50,000 or so jobs for public relations managers (BLS, 2008). This same source projects 286,000 jobs for public relations specialists in 2016, an increase of 43,000 and a growth rate of 18%. In the same period, jobs for public relations managers are expected to grow 24.1% (www.bls.gov/oco/cg/cgs030.htm).

Pay Scales in Public Relations

What was once a fairly low-paying field has divided into two quite distinct groups, both much better paid than in the past. Public relations specialists include the lower ranks of pay and those who choose to make their living doing only technical-level work such as layout or clipping files. Public relations managers, however, are those who either manage the public relations function within an organization in which public relations is just a subdivision or have a management role in a public relations firm. Because a very common goal of those taking university public relations courses is to achieve such management-level jobs, this discussion of pay scales will focus mostly on the pay of public relations managers.

While *median* hourly earnings for public relations specialists are about \$24.05 in 2008–2009 (BLS, 2008), *mean* hourly wages of public relations managers are \$46.71 for a mean annual income of \$97,170 (BLS, 2008). During the 2005–2007 period that Labor Department source ranked public relations managers, then earning mean annual salaries of \$85,548, as the 17th most highly paid profession, well below physicians and surgeons (\$139,849) and lawyers (\$126,530) but well ahead of economists (\$79,585), engineers (\$79,381), nuclear technicians (\$73,271), physical scientists (\$71,660), and advertising and promotion managers (\$67,018). In some markets, such as Washington, D.C., public relations pay is appreciably higher, and the field may rank

among the top 10 in income, but in other locales public relations pay scales may drop below the top 20.

Such highly competitive pay scales and the rapidly increasing number of public relations jobs suggest that the field is having greater and greater effects both on the organizations it is part of and on society as a whole. For example, two reasons for the higher pay scales of public relations specialists and managers in recent years are the greatly expanding use of social scientific research methods in the field and the growing internationalization of the practice of public relations.

As public relations has increasing effects on society and the economy, and more and more people are called on to use it, learning about the assumptions and lay theories that color the day-to-day practice of public relations becomes important. These assumptions and lay theories are what a student often walks into on a new job, and we turn our attention to them in the next section.

Assumptions and Lay Theories

Assumptions about what public relations is and how it should be used often rule the workplace, and sometimes even the college classroom when teachers lacking proper public relations credentials are hired because of the teacher shortage. The assumptions of nonprofessional lay people often come from lay theories. Some lay theories are based on hundreds of years of experience and are quite sophisticated, such as some of those involving folk medicines. Some lay theories, on the other hand, are not based on much more than wishes and superstitions—even those affecting life and death matters. For example, some of our ancient ancestors believed that wearing blue face paint or human sacrifices would appease otherwise angry gods. Some lay theories are very widely accepted but are still wrong. Kerlinger (1986) used the example of a coin that has come up heads five times in a row when flipped and the commonsense (i.e., lay theory) notion that according to something they call the law of averages it is due to come up tails. Naïve bettors no doubt keep many gambling casinos in business by doubling or even tripling their bets on the fifth flip—when the odds of a tail are the same 50% as they were on the first flip.

Thus, sometimes assumptions, and the lay theories that are often behind them, are useful, and sometimes they are not. The same is true regarding the assumptions many people make about public relations, so this second section of the chapter examines the technician approach, the most commonly held assumption about public relations and the one most frequently run into in the workplace and in the mass media.

Technician Approach

The most commonly held assumption about public relations is that it is just a set of technical writing and publicity

skills, so public relations practitioners should be called on to implement the technical aspects of plans only after these are made. This assumption is most commonly called the technician approach or technician role, although it is sometimes also referred to as the functional approach.

The technician view sees public relations from a non-strategic and nonethical perspective as just a set of technical journalism-based skills to be hired out. Most important among these is the ability to write press releases well, but organizing and hosting news conferences, laying out or editing publications, taking pictures, and handling media relations are also important skills (Botan, 1994). In effect, the practitioner becomes no more than a hired journalist-in-residence or a mechanic for media relations whose job is to get as much free advertising as possible. In fact, the productivity of public relations practitioners working for this kind of employer is often assessed by reporting the amount of dollars that it would have cost to buy advertising of the same length. This is known as advertising equivalency in the trade and is disparaged by most experienced public relations people as the second weakest way to evaluate public relations work (the weakest is by just measuring the output of public relations workers, such as how many news releases they send out).

In the technician approach, the practitioner cedes unquestioned authority to decide major ethical and strategic matters to someone outside themselves, in most cases to corporate leaders. In doing so, the public relations department usually accepts a one-way communication role and ensures that it will have little voice in strategic planning, deciding what is ethical or exactly how public relations will be practiced. Those making the calls under this model are often organizational leaders with little or no training in public relations who, thus, rely on lay theories and assumptions.

Hired-Gun View

The technician approach is based on what Sullivan (1965) and Pearson (1989) called craft and partisan values. Good public relations is defined as being loyal to the employer and doing good craft work such as writing good news releases. So this approach is often likened to the hired-gun stereotype of the Old West. The assumption is that public relations should try to make bad practices look less bad than they really are and poor practices look positively dazzling—thus the term *spinmeister*, or to spin a story. When teaching public relation students, I often refer to this kind of practice as perfuming the pig—making something smell better than it really is. I tell my students this is bad public relations, at best, and that if you allow yourself to be trapped into perfuming other people's pigs not only will you probably never work your way out of the sty but sooner or later enough the sty will rub off on you: that others will start to think you smell worse than the pigs and, thus, should not be allowed even to work perfuming other pigs.

Lay Theories Behind the Hired-Gun View

There are at least three lay theories behind the hired-gun/technician approach to public relations: If they only knew what I knew . . . , hypodermic needle or silver bullet, and the court of public opinion.

*If you only knew what I know,
you'd make the same decision . . .*

One of the lay theories underlying the technician approach to public relations is reflected in the management assumption that they know more than publics do, that their interests are the most legitimate, and that the company has already looked at all aspects of a problem. Thus, they assume, if the publics only knew these truths, they would come to the same decision. With this assumption, they feel that what all public relations practitioners have to do is get their story out effectively and everyone will fall in line. Unfortunately, they also often believe the inverse—that when publics do not go along with them the public relations staff is at fault, since their own actions and decisions are beyond reproach. Clearly, then, the hired-gun view is not good for publics, not good for clients, and certainly not good for practitioners. In fact, this line of reasoning has been debunked many times, including by Gaudino, Fritch, and Haynes (1989).

This lay theory, that the only problem is that publics do not understand things as they should, is inherently paternalist and assumes that publics need only to be informed about how smart management decision making really is in order to be convinced to buy the product, vote for the candidate, quit smoking, or the like. This lay theory about public relations, in turn, draws on two others, one from mass media and one from public relations.

Hypodermic Needle or Silver Bullet

Although these are actually two different ideas, they serve somewhat the same role in assumptions about the practice of public relations, so they are treated together here. Actually, the hypodermic needle/magic/silver bullet was at one time a formal mass communication theory (see Bineham, 1988, for a review) that said that individuals are directly and very heavily influenced by what they see and hear from the media. In the academic arena, this theory was debunked long ago and replaced by what came to be known as the limited-effects model of media influence (Bauer, 1964; Klapper, 1960).

Although no longer generally accepted by researchers, the old silver-bullet view—that in each situation a single mass media message exists that can shape how people think—remains firmly entrenched as a lay theory in the minds of many. Those who argue that television or particular music causes violence and leads our youth astray may be essentially arguing this view. Thus, if a silver bullet exists,

it only makes sense to hire the technically most proficient public relations practitioner available and assign him or her the task of finding and using it. Furthermore, since these same folks often assume that “if they only knew what we know, they would agree,” there is, of course, no need to do any research on publics, to check the organization’s motives or practices, or take any other steps except search for the magic bullet. Real public relations professionals reject this and do research on both the public and the organization hiring them.

Court of Public Opinion

Public relations practitioners are sometimes cast as the hired advocates of a company that merely deserves its day in [the] court [of public opinion]. Thus, this lay theory holds, the job of a public relations practitioner is to pull out all the stops to get their client off, just as television lawyers do for their clients. When combined with “If you only knew what I know” and the belief that a magic bullet exists if you can just get your story out, this last lay theory offers justification for some very backward public relations practices.

Of course, this analogy between a court of law and a court of public opinion falls down when examined closely. First, in a court of law, both sides are nominally equal because they both can be represented by a trained attorney. In the public domain, on the other hand, single individuals or small groups of citizens and activists have nowhere near the resources of the large corporations and government bodies with which they contend and do not typically have equal access to the media. Second, there is no assurance of a trained, objective, and disinterested authority (a judge) who can see through the two one-sided presentations in a court of public opinion. The weakness of the court of public opinion argument becomes even more evident when one of the parties involved in a public policy dispute is a government body. Not only does government often have the sole authority to pass judgment on its own behavior, but it also can use tax money (including the taxes of those who are disagreeing with a particular government action) to defend its practices.

For example, many developing countries complain bitterly about how they are portrayed in the media of developed countries such as the United States. Since their complaint is against the multibillion-dollar media conglomerates that control access to the channels of mass communication by virtue of owning them, it can be difficult for them to even get into the court of public opinion, let alone get an impartial verdict. Interestingly, however, an increasing number of developing countries are hiring U.S. public relations firms, possibly because some of them also buy into this lay theory. In addition to these and other lay theories, there is a whole body of academic theory about public relations to which we now turn.

Formal Public Relations Theory

Academics have discussed a number of competing approaches to public relations all the way from the level of paradigms (Botan, 1993b) to four specific models (Grunig & Hunt, 1984) and from systems theory, critical models, and the rhetorical approach (e.g., Crable & Vibbert, 1985) to the very backward and unprofessional hired-gun approach discussed above. But how is such a varied theoretic history best organized for understanding?

We faced a similar challenge some years ago, when Maureen Taylor and I (Botan & Taylor, 2004) reviewed the state of formal public relations theory and summed it up in what we called the *functional and co-creational perspectives*. To do this, we first reviewed the five major meta-analyses of public relations theory that had been published up to that time. A meta-analysis is an analysis of analyses, a doublespeak way of saying that a meta-analysis is a summary and evaluation of previous analyses. The five we looked at, in chronological order, were Pavlik (1987), Botan and Hazleton (1989), Pasadeos, Renfro, and Henily (1999), Vasquez and Taylor (2000), and Sallot, Lyon, Acosta-Alzuru, and Jones (2003).

A Short Summary of Public Relations Research and Theory

Contrary to the assumptions of those with a technical perspective on public relations, this specialty is one of the most researched in the broad field of communication and mass communication. In 2003, for example, there were more than 250 scholarly research papers presented at conferences just in the United States (Botan & Taylor, 2004) with many more in Europe, Asia, Australia, and elsewhere. Public relations is taught in several hundred universities in the United States, but the densest public relations enrollments may be in Australia and, increasingly, in Korea. There are two international academic public relations journals (*Public Relations Review* and *Journal of Public Relations Research*), with a semi-academic journal (*Public Relations Quarterly*) and the closely allied *International Journal of Strategic Communication*, as well as two primarily public relations journals in Britain, one dedicated journal in Korea, and others. All these journals and academic papers mean that lots of work is published on public relations theory each year. Far too much, in fact, to go into any kind of detail here, so this chapter resorts to very broad strokes and generalities in the interest of readability. For more detail, see the five meta-analyses referenced in the last paragraph as well as Botan and Taylor (2004).

The history of public relations was covered in the previous chapter, but public relations theory has its own history. Public relations theory began to come into its own in the United States in the late 1970s and early to mid-1980s, sparked in part by the work of Scott Cutlip and his students coming out of the University of Wisconsin. These scholars

produced some of the first real theory work in public relations and contributed to overthrowing the technical approach, which had, up to that time, largely dominated college campuses as it did the practitioner community. Drawing mostly on existing social science and mass communication theories, these and other scholars began to develop a recognized area of theoretic work in public relations in the 1980s and 1990s. They also identified some of the major questions the field is still wrestling with today, including whether public relations should be focused on relationship building (Ferguson, 1984), whether it should be practiced from a symmetrical or asymmetrical model (Grunig & Hunt, 1984), and what roles public relations practitioners play and should play in the workplace (Broom & Smith, 1979).

Botan and Taylor (2004) looked back on the evolution of public relations theory and said that it could best be summarized as representing two very different views of what the field is and what it should be. The first of these, the functional, was based on the technician view discussed above. The second, the co-creational, represented a sea change from the old message-and-sender focus of the technical view. It adopted a new and much more humanistic focus on the role of publics—particularly the role of publics as co-creators of meaning. Thus, a co-creational view sees publics not just as groups that react to what an organization does but as equal players in defining the environment in which they and the organization interact as equals.

Functional Perspective

Of the functional perspective, of which the technical approach discussed above is a part, Botan and Taylor (2004) said,

The most striking trend in public relations over the past 20 years, we believe, is its transition from a functional perspective to a cocreational one. A functional perspective, prevalent in the early years of the field, sees publics and communication as tools or means to achieve organizational ends. The functional perspective traditionally uses public relations theories to achieve specified outcomes. The focus is generally on techniques and production of strategic organizational messages. Research plays a role only insofar as it advances organizational goals. (p. 7)

In spite of the weaknesses of the lay theories and assumptions underpinning the technical approach (discussed above), it remains overwhelmingly the most popular lay theory about public relations. Thus, there was a major lay theory supporting the functional approach, and some of the works in the early body of academic literature accepted it.

Co-Creational Perspective

Of the co-creational perspective, Botan and Taylor (2004) said,

The cocreational perspective sees publics as cocreators of meaning and communication as what makes it possible to agree to shared meanings, interpretations, and goals. This perspective is long term in its orientation and focuses on relationships among publics and organizations. Research is used to advance understanding and the field embraces theories that either explicitly share these values (e.g., relational approaches or community) or can be used to advance them. The major relationship of interest is between groups and organizations, and communication functions to negotiate changes in these relationships. The cocreational perspective places an implicit value on relationships going beyond the achievement of an organizational goal. That is, in the cocreational perspective, publics are not just a means to an end. (p. 8)

We went on to state,

Examples of cocreational research include the shift to organizational-public relationships, community theory, coorientation theory, accommodation theory, and dialogue theory, but the most researched cocreational theory is symmetrical/excellence theory. (p. 8)

A co-creational approach to public relations assumes that the ability to construct what Boulding (1961) has called mental images is a fundamental part of the human experience and that public relations practices that facilitate this process inside publics are more ethical than those that inhibit it. It shares the view that humans are uniquely equipped to use symbols and that it is this ability that sets humans apart from other creatures (Burke, 1966; Wieman & Walters, 1957), so in many respects it is the antithesis of the technician perspective, which focuses on the capacity of a message to elicit the desired behavior from publics, often by short circuiting rational decision making or manipulating publics.

The reader should also note that the co-creational approach did not simply evolve after the functional because one focus did not disappear before the next took hold and a given theory might reflect aspects of both of these at once. One outstanding historical example of how a single theory or body of work with a theory implicit in it began at a functional level and moved to a more cocreational level is found in role theory.

Role Theory

The technician view of public relations might be thought of as assuming a single, invariant role for the public relations practitioner as a technician. The natural next evolutionary step then was to study other possible roles, often by comparing them with the technician role. Thus, roles research is important in the history of public relations theory because it represents one of the earliest points at which widely held nonacademic assumptions come face-to-face with solid scholarship.

Role refers to the repetitive set of behaviors a person plays out within an organization (or elsewhere). For example, you might have the role of a boss at work; the role of a

friend with certain people; and the role of a husband, wife, or parent at other times. As a boss you are called on to display one pattern of behaviors, while as a friend you live out a very different set of behaviors.

Although roles were first discussed in other fields in the organizational context, public relations research into roles is primarily associated with the work of Broom and various coauthors (see Broom & Smith, 1979; Dozier & Broom, 2006). For a more in-depth discussion of public relations roles, see Dozier and Broom (2006). From this point of view, practitioners might fill any of several roles within an organization, including communication technician, media relations expert, writer, and so on.

As public relations grows both in practice and theory, more and more roles will emerge, and our sophistication in identifying them is likely to grow as well. For example, from the simple technician versus manager dichotomy of early role research, an understanding of the difference between the tactical and strategic approaches to public relations has evolved. As we move more into a cocreational approach, other roles and role relationships may be studied including, possibly, the interdependent roles involved in co-creating meaning itself.

Conclusion

This brief survey of the theory and effects of public relations has necessarily left out many of the effects and theories that characterize the field. It has, however, discussed the effects and economic impact of public relations and examined the assumptions and lay theories behind some of the common understandings—and misunderstandings—of the field. In the last section, a quick look at formal public relations theory was offered.

There are several very important issues affecting the public relations field and its theory that have been left out of this chapter. This has been because they did not fit well before this point or because it would take whole books such as this one to cover them adequately. Among these are the following:

1. *Political campaigns:* Public relations has always played a major role in political campaigns, but that role is becoming more and more central each year as public relations becomes more strategic, moving up the ladder from a simple technical practice to one located at the very center of strategic campaign planning and execution. Nowhere was this ascendancy clearer than in the 2008 U.S. presidential elections. During the Democratic primary, the pollster Mark Penn—who is also the CEO of the world's largest public relations firm, Burson-Marsteller—emerged as a key, or the key, strategist in the Clinton campaign (Washingtonpost.com, 2008) and drew front-page coverage of his own for representing the governments of other nations.

2. *Centralization*: The major public relations firms are rapidly becoming centralized in the hands of a few multinational conglomerates, much as has been happening in journalism and mass media. There are a number of reasons for this trend, but one that is often mentioned has to do with the tremendous growth of public relations, making its firms good investments, while another has to do with the need to diversify in the face of the information revolution. As new information technologies contribute to the demassification of messages, both traditional media outlets, such as printed newspapers, and the advertising industry, with all the waste coverage inherent in mass-media ads, are being confronted with economic challenges. The public relations industry, however, is experiencing a virtual golden age, in part because of the communication revolution. Thus, public relations firms with their record of stability and growth in the face of new information technology have become particularly attractive acquisitions for large conglomerates that are heavily invested in traditional media and advertising.

3. *Health*: Public relations techniques have always been important in public health campaigns, such as those for wearing seat belts or cardiovascular health campaigns. As public relations has become more strategic and research based, it has become an even more prominent area within public health. In fact, the Public Relations Society of America (PRSA, www.prsa.org) has a whole membership section dedicated to health campaign practitioners. In many areas of health, however, the term *public relations* is not used; the more common term is health marketing or social marketing (Centers for Disease Control, 2008). Health and social marketing practitioners often take as their starting point advertising or marketing models, sometimes without noticing that the parts of those models were, in turn, taken directly from public relations.

4. *Intercultural Work and Diversity*: The rapid internationalization of public relations practice was mentioned above, but the important and closely related concept of intercultural public relations was not. International public relations work is also always intercultural public relations. In addition, some of the public relations practiced within a large multinational state such as the United States or Russia is also intercultural public relations. The field has become increasingly attentive to the need to respect cultural diversity and to tailor campaigns to the needs of diverse audiences. For example, the 2006 National Curriculum Commission Report "A Professional Bond" (Curriculum Commission, 2006) said, "Diversity in public relations often takes two forms: intercultural/multicultural communication and diversity management" (p. 28), with the latter including human resources, staffing, and personnel decisions.

5. *Research*: Nowhere is the evolution of public relations from a mere technical field into a management and strategic

area more clear than in the important role that research has come to play in all aspects of the field. In fact, as the National Curriculum Commission (2006) report also said, "Training in research methods should now be only a half step behind writing training as a priority in the public relations curriculum because sophisticated research is central to strategic planning and evaluation" (p. 14).

For the reader who wishes to explore the theory base and effects of public relations in more depth, a list of further reading follows.

PUBLIC RELATIONS RESEARCH

DON W. STACKS

University of Miami

MARCIA WATSON DiSTASO

Pennsylvania State University

Public relations research (also known as public relations measurement) is a hot topic. This comes in light of the demand for accountability and transparency in organizations. Campaign decisions are not and should not be made in the dark but instead require research to make informed decisions. Public relations research focuses on the entire public relations process and examines the relationships that exist among and between an organization or person and their target publics (Lindenmann, 2006).

Public relations research is the preparation and gathering of “data” in support of a campaign to inform or change a public’s or audience’s perception or behavior. Public relations research differs slightly from what most would call research in that it has been primarily set in the field in support of business objectives. Academics have argued that its focus needs to shift from descriptive to inferential. That is, public relations research has focused on the here and now, describing what the products of a campaign or program were instead of inferring the impact of those products on the outcome of interest. (A *campaign* for our purposes is defined as a public relations effort that has specified beginning and ending points. A *program*, on the other hand, is a public relations effort that once begun continues for an unspecified time span. As such, public relations campaigns are typically associated with agencies, while programs are associated with corporate [internal] public relations efforts.) For instance, a research might describe the number of press releases submitted and printed or video news

releases (VNRs) distributed and shown—explaining what was accomplished as a simple description and not providing evidence that the public relations activities actually influenced the final outcome.

Regardless of the argument, research in the practice of public relations differs from academic public relations research in that its focus is often on establishing the impact of public relations on return on investment (ROI). The key to understanding public relations’ impact on ROI is to view public relations as a mediating factor in the introduction, change, or reinforcement of conditions that will affect the outcome of a client’s bottom line. As such, public relations seeks to provide the information, motivation, and behavioral intent necessary to get a specific targeted audience to act (or not act) in a particular way. This has moved public relations from a technical production skill to a strategic managerial position in the corporate environment and a counselor position in the agency environment. Thus, public relations strategy focuses on the effects of actions rather than on the production of products supporting those actions.

The role of public relations research from the early 20th century to date has shifted from the simple act of counting publicity materials to a more sophisticated evaluation of public relations’ effectiveness. This shift, however, still relies primarily on the descriptive nature of the communication as “published” in the mass media, often aimed at establishing a “buzz” for the client or product. This activity has in

the late first decade of the 21st century become known as “word-of-mouth” promotion, and its value is seen in the marketing industry’s taking it over as one of its tools.

Today’s public relations research activities, although still descriptively entrenched, have moved toward making inferential predictions of effect. This has resulted in a new breed of practitioner and academic who is well versed in advanced methodology and statistical applications.

History and Theory

Although we can trace the history of public relations to the ancient Egyptians and its more modern practice to the Romans, time has resulted in a chasm between public relations education and public relations practice. In tracing contemporary practice, one goes back to the early-20th-century “pioneers” such as Edward Bernays, Paul Garrett, John W. Hill, Doris Fleishman, Ivy Lee, and Arthur W. Page. Although there were others, Bernays, Fleishman, Hill, and Lee represent one large practice approach, while Paul Garrett (General Motors) and Arthur W. Page (AT&T) represent the other large practice approach. The former were counselors, and from their initial work came the large public relations agencies of today. The latter was the model for what is labeled today as *corporate communications*. The agency represents a number of clients and products, and agencies range from “full service” to those that are specialized in what they handle (e.g., crisis management, travel tourism, integrated communications), often taking on a marketing orientation. The corporate communication practitioner is usually a corporate vice president or senior vice president whose role is the strategic management of corporate communication to a number of key audiences, often split between stock- and stakeholders, employees, governmental agencies, customers, and financial analysts. It should be noted that most of the early public relations practitioners were trained in the journalist tradition, a training that still has an impact on contemporary public relations research.

Grunig and Hunt (1984) offered a historical approach to 20th-century public relations in the form of public relations functions that can still be seen today. They labeled early-20th-century practice as “press agency.” That is, public relations was practiced as propaganda and simple promotion. Reaction to propaganda and promotion evolved into a “press information” function, where information was crafted based on more factual and truthful communications aimed at the press. The role of public relations was to get the client’s message to media “gatekeepers” (editors, opinion leaders) through press releases, media alerts, and the like and then track how many times they were picked up in the media.

After World War II, the public relations function became more strategic. Grunig and Hunt (1984) label this function *two-way asymmetric*; this was where the social scientific method and analysis was first applied to public relations practice. In this model, the effect of messaging was evaluated

through survey research, and the campaign and its messages were reevaluated. Today, the model describes public relations as a “two-way symmetrical” function where public relations is practiced with continuous feedback in the communication environment, and the public relations function has moved from technical producers of messages to the strategic decision-making realm of top management. Furthermore, it has been stated that what should be aspired to is excellent public relations that is “both symmetrical and asymmetrical, two-way, ethical, and both mediated and interpersonal” (Grunig, 2001, p. 30).

Although Grunig and Hunt’s model is simplistic, it does reflect the change in public relations from the early 1900s to date. Over the years, there has been one constant—the public. As Grunig and Hunt (1984) said, “If an organization does not need to be responsible to its publics, it also does not need a public relations function” (p. 52).

Another significant change in public relations has come as a response to new technologies. Both the academic study and the practice of public relations, has never been more difficult; this is because the public spaces in which we compete and communicate have never been more complex and unpredictable. In a matter of seconds, organizations have the ability or obligation to communicate directly to countless stakeholder groups about information that directly affects their success. This includes online forums, chat rooms, blogs, social-networking sites such as Second Life, Twitter, and Flickr, along with collaborative Web sites such as Wikipedia, YouTube, MySpace, Flickr, LinkedIn.com, Writely.com, and Ma.gnolia.com. These allow for two-way communication in ways that are evolving more and more each day.

Research and the Academy

By definition, one would assume that academic research would be based on theoretical formulations. Public relations academic research, however, has been more informed by the practice than by theory. This is not to say that public relations is atheoretical; indeed, public relations has developed a rich theoretical base, but it is a young academic discipline, one that like other communication areas borrows heavily from other disciplines. The vast majority of public relations research is found in descriptive methodologies and simple counts. Historical case studies, surveys, and qualitative approaches emphasizing in-depth interview and focus group methodology were dominant until the late 1980s, as evidenced by articles in *Public Relations Quarterly* (PRQ) and *Public Relations Journal* (PRJ). PRQ and PRJ focused largely on matters of practice. In 1989, the volume that would become the *Journal of Public Relations Research*, the *Public Relations Annual* (Vols. 1–3, edited by Larissa and James Grunig) produced the first academically oriented journal in public relations that looked for a theoretical base to research. As will be noted later, some very sophisticated research methodologies have been employed in the academic side of public relations research.

Research and the Practice

When considered in isolation, public relations research can be described as working along a continuum ranging from precampaign activities through the actual campaign implementation to evaluation of campaign effectiveness and finally to how that campaign helped the business (company, client, product) achieve its overall objectives. Research, then, can be assessed by the methods employed in each of the three phases of a campaign and across the three phases and extended to correlate with the business outcomes of interest. We label these phases as developmental, refinement, and evaluation. The correlation to final business objectives can be looked at phase by phase or continually through the campaign.

This correlation between outcomes and phases represents one of four assumptions public relations practitioners make about research. They also assume that decision making is approached the same way in all organizations, that all research is based on measurable objectives from which communication strategy is formed, and that public relations research is behavior driven and knowledge based (that it is formulated in public relations and social science theory). To understand this, you must first understand how business objectives drive research objectives, which, in turn, contribute to ROI.

Research Objectives

The goal of public relations research is to meet the larger objectives of a client (person, organization, or brand). As such, public relations research focuses on the perception of the client in three areas: (1) information (awareness, knowledge), (2) motivation (internal reasons for action), and (3) behavior (predictive of actual behaviors). Research objectives must include a clearly stated causal relationship: what is done (“outputs” such as press releases, VNRs, blogs) to influence the messages of opinion leaders (“outtakes” such as editorials, analyst reports, experts) that lead to certain ends (“outcomes” such as purchase behavior, reputation ratings, relationship evaluation, trust). The general notion is that informational objectives must be met prior to motivational objectives, which must be met before behavioral objectives can be met. That is, behavior that is not motivated by key messages is idiosyncratic and random.

To write clear, concise, and measurable objectives, one must be familiar with the differences between outputs, outtakes, and outcomes. According to the *Dictionary of Public Relations Measurement and Research* (Stacks, 2006, pp. 14–15),

outputs are what is generated as a result of a public relations program or campaign that influences a target audience or public to act or behave in some way—this is deemed important to the researcher (also known as a “judgmental sample”), the final stage of a communication product,

production, or process resulting in the production and dissemination of a communication product (brochure, media release, Web site, speech, etc.);

outtakes are the measurement of what audiences have understood and/or heeded and/or responded to in a communication product’s call to seek further information from public relations messages prior to measuring an outcome; audience reaction to the receipt of a communication product, including favorability of the product, recall and retention of the message embedded in the product, and whether the audience heeded or responded to a call for information or action within the message; and

outcomes are quantifiable changes in awareness, knowledge, attitude, opinion, and behavior levels that occur as a result of a public relations program or campaign, an effect, consequence, or impact of a set or program of communication activities or products, and may be either short term (immediate) or long term. (p. 14)

Thus, through the use of properly written objectives, a public relations campaign uses research to establish benchmarks against which to gauge campaign effectiveness, check for progress during the actual campaign, and determine whether or not the campaign contributed to the client’s overall business objectives. Depending on the specific objectives, different types of research methodologies are employed across the campaign.

Methods

There are three general types of research methods employed in public relations research. Public relations methods include historical/secondary, qualitative, and quantitative approaches to research. Historical/secondary research is usually found at the developmental stage, where previously published research is reviewed to establish industrylike benchmarks. Sometimes the client’s needs are such that no historical or secondary research is available and the practitioner must conduct primary research of his or her own to establish benchmarks—through in-depth interviews, surveys, focus groups, or even participant observation. Conducting primary research, however, is more expensive than conducting historical or secondary research. Although experimental or simulation methodologies are also available, currently they are rarely conducted in public relations.

Phases

During the refinement phase, surveys and polls, in-depth interviews, and focus groups may be employed at regular intervals across the campaign to verify that informational and motivation objectives have been met. If they have not been met, then the outputs associated with campaign strategy are reexamined, and the strategy is altered. Research at the various intervals has targeted goals set against preestablished benchmarks.

Initial research across targeted audiences may first establish that the information being communicated has been seen or heard (information awareness objective) and is understood (information knowledge objective) through a poll or survey or through requests for more information contained within the outputs being used (press release, VNR, paid advertisement, 1-800 call numbers, or mailer cards). While this can ascertain whether large numbers of people are aware of and understand key campaign messaging, more qualitative data may be required through the use of focus groups (moderated group discussions) and possibly in-depth interviews with key influentials. Focus groups and interviews may be used to gather more in-depth information about whether the strategies employed are on target.

If it has been ascertained that the campaign's informational objectives have been met, then motivational objectives can be tested. Generally, this is done through audience surveys, through either one-shot surveys or longer, more expensive panel surveys where the same participants are questioned over a set length of time. The surveys attempt to gauge attitudes and beliefs toward the campaign's client and serve as a way of establishing predispositions toward behavior. If attitudes have been modified or maintained (depending on the campaign's goals), the research then attempts to gauge the behavioral intentions of the audience. Will they purchase the product? Did they change their opinion of the company? Will they vote for a candidate or for an issue?

Fairly unique to public relations research is the use of *content analysis* as a research method. Content analysis provides a way to objectively measure the messages of opinion leaders across the media. Contemporary public relations has gone beyond simply counting the number of press releases printed or minutes of client airtime (outputs); now the campaign's key messages (Were they picked up? If so, how?) and the general tone of the messages (positive, negative, neutral) are evaluated as outcomes. Content analysis can be used on anything written or observable, such as corporate communications or media content. This can take the form of an analysis of the content or the tone or looking for a mention of certain things. This analysis can also include prominence (the location of the coverage), quality (includes tone, volume, prominence), and competitive analysis (looking at comparisons between coverage of competitors). Content analysis methodology can be conducted by human coders after extensive training or through the use of computer programs such as NVIVO7, *Diction*, or *The Ethnograph*.

Measurement

The topic of measurement has been controversial in public relations research. As the profession has moved from counting the products of a campaign, such as the number of clips or minutes of air time, to measuring the effects of a campaign, the question has become whether

public relations can be measured. And if it can be measured, what exactly is measured and how should it be measured? Part of the measurement conundrum lies in the definition of what public relations is: Is public relations the free placement of messages, or is it more the management of relationships, reputation, trust, or credibility?

Outputs or Outcomes?

Since the first publicity campaign, success in public relations has centered on the producing of outputs. It was often measured by showing the client the "clipbook," or copies of the output that had made it into print, on air, or in whatever mass medium was targeted. Those who buy into the definition that public relations is the free placement of messages in the media tend to refer to public relations' success in terms of what it would have cost to place such messages in the media as a marketing strategy to provide estimates of influence as *financial indicators*. Hence, this point of view would measure success in terms of the cost of advertising in targeted media, or the "advertising value equivalency" (AVE) of the placement of the message. Another measure often used in this "measurement" is the "opportunity to see" (OTS) measure, which estimates message exposure.

Impressive piles of outputs were thought to have demonstrated public relations impact and probably did have some impact on a client's perception of public relations success. Simple counting, however, cannot demonstrate an impact on the client's public relations ROI. To demonstrate impact, the public relations campaign or program must demonstrate how its strategic use of those outputs has affected client final financial outcomes.

Complicating the matter are controversies related to what is an appropriate measure of public relations. There are two problems with AVE and OTS, and both are based on the way they are "calculated." First, both are heavily influenced by circulation numbers in the print media. That is, an AVE's monetary value is a function of circulation, which is a function of sales, and sales drive advertising costs. This can be a problem because circulation numbers are often exaggerated to drive up advertising costs. Second, circulation is often defined differently for street versus home sales, which are often multiplied by the average family size, insinuating that all members of a family will read or see the message. The same is true of broadcast media. Internet-produced messages have yet to yield a good way of measuring their impact, although "hits" and "key throughs" (going to a second page or site on the Internet page of question) have been examined and found lacking in validity or reliability.

Outtakes as Predictors of Outcomes

A different definition of public relations focuses public relations' strategic place as a management tool. Stacks (2002), for instance, defines public relations in terms of the

management of a client's credibility. Others define public relations in terms of the management of client relationships and trust. Still others define public relations in terms of the management of client reputations. As such, public relations is seen as mediating the expectations that target audiences have of the client.

Stacks (2005) argues that a client's credibility is a function of the public's perceptions of trust in the client's actions and products, its relationship with the client, and how it perceives the client's historical reputation with the public. It is the role of public relations to manage these *nonfinancial indicators* to the client's best interests. These then interact to influence the public's perceptions of the client, which in turn affect the client's ROI for public relations activities. He further argues that ROI comes from not only financial indicators such as sales, profits, and expenses but also from nonfinancial indicators and how they influence stock-and-stakeholder perceptions of the client.

Thus, from a management (as opposed to marketing) definition, public relations seeks to influence through the strategic production of key messages targeted at influentials (anyone who a target audience would see as a credible source of information), where the messages are factors that (1) set expectations and (2) help predict outcomes that establish public relations' impact on client ROI. As noted above, the targeted audience in such instances would be editors or stock analysts, or anyone who might serve as an influencer (outtake) for a particular target audience or public, and measurement then would be whether the client's key messages were communicated in the manner expected.

What is measured today in this approach is typically the content of influentials' messages. The methodology employed is *content analysis*, a research method that provides both qualitative and quantitative interpretations of messages and is particularly important from a strategic management of the communication approach to public relations. Content analysis provides a measure of not only how many (counting) times a client's name is found in the media but also how the client's key messages have been received and communicated to the target media audiences. Thus, content analysis can provide several measures of public relations success across informational, motivational, and behavioral objectives and provide information for the refinement phase of the campaign.

The first measure establishes whether the client's key messages were picked up and understood. If the messages were not being relayed to the larger target audiences, the influential was not serving a mediating purpose, and the public relations strategy must be rethought. Hence, the first measure provides feedback on whether public relations strategy is actually working. If the influential has picked up on the client's key messages, how are those messages being internalized by the influential? Generally, content analysis today looks beyond the "clipbook" number of media mentions and tries to establish if the influential's message about the client is positive, neutral, or negative.

An excellent example of this is found in Michaelson and Griffin's (2005) measurement of a MetLife media relations campaign.

Second, measures of public relations success can be established by comparing the client's "share of voice" or the client's share of messaging in the client's particular industry against that of competitors (Jeffrey, Michaelson, & Stacks, 2006, 2007). Share of voice provides evidence of how the client's key messages are being picked up and where they are being picked up, and then the share of voice is correlated with that of other competitors.

Third, measures of information/key message success can be assessed to see how the influentials are internalizing the messages and thus are motivated to extend the client's credibility, trust, and reputation through relationships with the publics and relationships with the influentials. This yields a "third-party endorsement" strategy that provides extra credibility to the client's messages (see Cameron, 1994; Grunig, 2000; Hallahan, 1999; Michaelson & Stacks, 2007).

Finally, the results of the measurement can be used to establish whether or not the public relations campaign has had an effect through surveys, focus groups, or in-depth interviews of selected individuals from the targeted publics in order to establish if the expected behavioral intent is strong enough to predict the outcomes as expected for the client's business interests, thus either confirming public relations' success or providing the feedback necessary to make changes in the campaign. Measurement, then, becomes an integral part of public relations practice.

Applications

Evaluation Methods

Evaluation methods and tools differ greatly depending on whether the research is being conducted by an academic in the pursuit of extending knowledge or by the practitioner as a way of conducting a client campaign.

Academic Research

As noted earlier, scholars have criticized academic research as being too descriptive and not inferential; that is, academic public relations research has not defined or tested those mediating factors such as credibility, relationship, reputation, or trust enough to provide causal evidence of effectiveness. This is the result of two things: a lack of theory for an area as large as public relations and difficulty in measuring actual results in a very competitive practitioner world. It is also difficult to engage in theoretical research when the issue under study deals with crisis communications in today's politically correct academic environment. Imagine if you will be trying to get, through a human subjects committee, a study that might cause confusion, concern, stress, or even embarrassment on the part of students (who make up most experimental study populations). Consider, too,

whether a company would want its name or brand associated with a negative news report or negative rumor.

These problems leave most academic research in the realm of content analysis of public relations practice or descriptive methodologies employing in-depth interviews and focus groups or surveys. Some research (e.g., Carroll, 2006) has used industry data to model public relations outcomes, but getting access to data is often problematic and getting into the “real world” to conduct experimental research is both difficult and costly.

Michaelson and Stacks (2004, 2007), for instance, have conducted two studies seeking to establish whether a “multiplier effect” actually exists that provides public relations with an advantage over advertising. Practitioners have argued that public relations is anywhere between three and eight times more effective than advertising, but the “multiplier effect” has never been really tested. If the effect was obtained, they wanted to know how large the multiplier was. They questioned whether the industry-wide practice of arguing that public relations’ ability to inject a third-party endorsement would increase the client’s credibility, homophily (a variable that reflects how much individuals see a product brand as similar to themselves and their friends), product knowledge, and intent to purchase a product. They conducted two experiments. In the first, they randomly exposed undergraduate students to a public relations editorial endorsement of a product against a print advertisement, an Internet advertisement, and a radio advertisement and found no differences on *any* outcome. Furthermore, when conducting the study, they asked the students their media uses and then analyzed student use against that reported for the general public; they found no differences between student and general public media uses, thus ruling out that the students use of media could have influenced the results (and if there were differences, they should have come out in the Internet and print media exposures).

Intrigued by this finding, Michaelson and Stacks (2007) attempted a field experiment. A field experiment controls the content of the experimental stimuli but cannot control the location or distractions and must employ a convenience sample of research participants. They felt that the initial experiment was too complex—that is, it had too many different stimuli messages (although each student was exposed to one and only one message, the number of students per exposure was reduced due to the number of messages), so they focused only on the print editorial and print advertisement, exposing participants to *only* the editorial or advertisement in isolation from any other stories or advertisements. A total of 351 participants who read newspapers on a regular basis were recruited from six major malls across the United States. An equal number of participants (150 each) were randomly exposed to either the editorial or the advertisement; 50 participants were randomly assigned to a control group that received no experimental stimulus. Results found that exposure to either editorial or advertisement produced significantly higher ratings for product credibility, homophily, product knowledge, and intent to

purchase the product. However, there were no differences between editorial and advertisement, except for higher homophily from participants exposed to the editorial. A third study that puts the editorial and advertisement on actual newspaper spreads is currently being conducted.

Although content analysis in practice typically looks at media coverage of an organization, person, or event, in academia, researchers often look at coverage of multiple organizations, people, or events or multiple messages about any one topic. DiStaso (2007) took this one step further when she conducted a content analysis looking at earnings releases from Fortune 500 companies compared with press coverage of earnings. She found that the local media paid greater attention to the positive aspects of the earnings releases (e.g., an increase in sales), while the national media focused on the negative aspects (the litigation and the decrease in net income).

Another example of academic research is Carroll’s (2006) study using structural equation modeling (SEM) to predict the influence of familiarity on corporate equity. By analyzing a sample of 1,500 participants, she found that familiarity does have a positive relationship with citizenship, reputation, and personality.

Practice Research

Evaluation methods and tools will differ from research phase to phase. In the developmental phase, the research may be based on extant secondary materials. Materials such as previous research conducted by the agency or corporation, industry publications, annual reports, and governmental publications may provide enough information to begin to plot public relations strategy for the problem at hand. Sometimes, secondary sources are not available, and primary data must be collected, typically in the form of in-depth interviews with influentials, focus groups of individuals from targeted audiences, or surveys of larger audiences or publics. In either case, the research conducted during the developmental phase should establish the baseline against which future research will be compared to measure success or failure during targeted dates in the refinement phase.

During the refinement phase, content analysis of key messages and surveys of intended audiences should be undertaken. Research at this phase establishes if the three major research objectives (information, motivational, behavioral) are being met as expected. Content analysis provides data on whether the client’s key messages are getting out and if they are understood (output to outtake). If not, then the campaign’s messaging strategy needs adjustment. Surveys and focus groups provide the data necessary to establish whether the information has caused the motivational outcomes anticipated in the campaign. Have attitudes or beliefs changed or been reinforced as required to meet the motivational objectives? If so, then, has the target audience through survey and focus group methodologies indicated an intent to behave as predicted?

At the evaluation stage, the public relations campaign's results are then examined to see if they did indeed influence the business objectives. If the campaign was carefully researched and research was conducted throughout the refinement period, to include assessment of audience behavioral intentions, then the campaign should have a demonstrated impact on the client's business outcome and ROI.

Statistical Tools

Understandably, the primary statistical tools used to analyze public relations research are simple descriptive statistics—frequencies, percentages, proportions, and now correlations (e.g., share-of-voice research). For the most part, the research does not use inferential statistics, but that trend is slowly changing as more statistically sophisticated academics and practitioners enter into public relations research. The movement from a stress on outputs to outcomes/outcomes provides both sets of researchers with the ability to use advanced statistical tools, and the movement toward measuring mediating variables has introduced into the research literature a number of highly sophisticated inferential tools.

Academic Tools

The drive to measure “what we cannot see” (Stacks, 2002) in terms of attitudes and beliefs and concepts such as credibility, homophily, purchase intent, trust, and even operationalizing relationships has introduced factor analysis as a statistical tool in the academic literature and slowly into the practice (particularly through the literature available from the Institute for Public Relations Commission on Measurement and Evaluation, www.instituteforpr.org/about/measurement_commission). From this, academic research has moved from exploratory factor analysis, whereby the underlying structure of measuring instruments is determined (Stacks, 2002), to confirmatory factor analysis, where the historical instrument's measurement structure is confirmed for the particular sample being observed (Stacks, in press).

The ability to create measures that are reliable and valid has led to the use of multivariate statistical tools such as multiple regression, path analysis, and sequential equation modeling (SEM). A number of academic researchers have used multiple regression as a tool to establish the effect of multiple mediator variables on public relations outcomes. Path analysis, which is best when used with “hard” data (e.g., economic, sales), takes the multiple regression and creates causal models of the direct and indirect impact of mediating variables on outcomes of interest (e.g., David, Kline, & Yang, 2005; Lee, 2005; Wan & Schell, 2007). Furthermore, path analysis has no limitation on the number of cases that it can analyze. SEM analysis, on the other hand, is best used with “soft” data (e.g., mediator variables such as attitude or belief measures) and begins by testing the measurement

instruments' reliability and validity and then produces causal models of the impact of direct and indirect mediating variables on the outcome of interest (e.g., Ki & Hon, 2007; Kim, 2001; Yang, 2007). Two other things differentiate path analysis from SEM. First, SEM is “theory driven,” that is the models created use theoretically derived relationships between the mediator and outcome variables, while path analysis is not. Second, SEM can only handle a limited number of cases, whereas path analysis can handle all the data that are available. Marketing definition-oriented researchers, then, should use path analysis as their modeling tool, while management, mediated-related definition-oriented researchers should use SEM as their modeling tool.

Practice Tools

The statistical tools used in most daily public relations practice are simple descriptive statistics. This is due mainly to the lack of research sophistication in the average practitioner and an even greater lack of knowledge of statistical tools and their uses. Seldom will research be reported to a client that includes inferential statistics, and such research usually employs analyses on what has been labeled *categorical* data—data that are differentiated by categorization; variables such as sex (male/female), income (high/middle/low), and occupation (blue/white collar) are examples, as would be age or income when broken into categories. The statistical tools used in such research are not typically presented to the client, although they may be used when asked about confidence in the findings.

There are exceptions to the elementary use of statistical tools, and they are found mainly in the corporate communications side of public relations. Companies such as General Motors, Microsoft, and Texas Instruments use advanced statistical tools to model their data and are increasingly using the models to establish the impact of their practice on business outcomes and ROI in particular. This makes sense when considered from an internal communications perspective, where years of organizational communication and industrial psychology research have established management theory on what makes a successful organization. Interestingly, there are research firms that are taking the sophisticated modeling capabilities of path analysis and SEM and looking for causal indications of reputation and trust. The research basically lacks a good theoretical base and often attempts to put all possible variables into the model, hoping to find which variables offer direct causal paths to the outcomes of interest.

Comparisons (Global/Topical)

There are no data available that allow for a comparison of public relations research other than what has already been discussed. A study by the International Public Relations Association is examining the research needs of practitioners

at various levels of experience, but for the most part, public relations research in the United States is far ahead of other country or region practices (Stacks, in press).

Future Directions

As noted above, public relations research is at a crossroads of sort. Interestingly, the Internet may provide the impetus for movement toward more sophisticated research methods and analytical tools (DiStaso, Messner, & Stacks, 2007). Before the Internet and the new social media, influentials were easily identifiable. Today's influential is more often than not a blogger who has gained a following from what he or she has written. Before the Internet, an influential's impact was felt on the circulation numbers associated with the media for which he or she wrote or aired in, and as we know, circulation numbers may not provide an accurate picture of influence or impact.

Today's social media blogger influence can be directly assessed from how many people visit the blogger's site, how many engage in communication with that blogger (indicating a relationship and credibility that builds quickly to a reputation and trust), and how long the blogger stays on the Internet. There are ways to assess the blogger's number of communications, trace the blogger's social network, and actually measure the density or capacity of the links between the blogger and his or her readers (Stacks & Watson, 2006). Social network analytical tools now provide ways of plotting, describing, and predicting blogger influence. Such data, once captured and analyzed, can then be used in other sophisticated modeling tools to establish predictive models of influence.

Conclusion

Public relations research encompasses all the traditional research methodologies and, increasingly, some of the more sophisticated analytical statistical tools. As the practice matures and settles on a direction, the practice of public relations research will become more sophisticated. Future research will still demonstrate the effect of public relations by simple counting of outputs, but more and more, it will move toward understanding and predicting the effects of mediating variables on business outcomes and establishing the effect of public relations on business ROI.

ETHICS IN PUBLIC RELATIONS

CHARLES MARSH

University of Kansas

Public relations ethics has much in common with the wedding tradition in which the bride wears “something old, something new, something borrowed, and something blue.” Although the “something blue” is problematic, the “something old” is ethics, the study of which dates to the dawn of philosophy. The “something new” is public relations itself. Unlike older, related professions such as advertising and journalism, public relations wasn’t recognized as a distinct discipline until the 20th century. The “something borrowed” has been the ethics codes of other professions: As public relations practitioners have struggled to find the ethical foundations of their young profession, they have looked to disciplines such as journalism and the legal profession for guidance. And—for better or worse—the union of something old, something new, and something borrowed has created a sometimes stormy marriage between public relations and ethics.

Part of the dawn of philosophy that introduced the concept of ethics occurred in classical Athens—the Athens of Plato and Aristotle. Both of those philosophers began their intellectual explorations by defining key terms. In a discussion of public relations ethics, for example, each might ask us, “What do you mean by public relations? And what do you mean by ethics?” By *public relations* (defined elsewhere in this book), we generally mean the management of relationships between an entity (an organization or individual) and the publics essential to its success. By *ethics*, we mean the concept of identifying and acting on our core values. In fact, Aristotle defined ethics as an activity: He believed

that ethics was the process of defining our most important values and ensuring that our actions reflected those values.

Public relations ethics, then, involves identifying the profession’s core values and, subsequently, acting on those values. The ordeal of how to develop and where to find those values, however, has led to continuing debate and uncertainty about the concept of public relations ethics. Traditionally, values exist at five sometimes-overlapping levels:

1. *International*: For example, the Caux Round Table, an organization of international business leaders, has drafted a set of international business standards that rests on two values: human dignity and *kyosei*, a Japanese word that means cooperating for the good of all.
2. *Societal*: For example, the Pledge of Allegiance, which many readers of this book would have recited every day in grade school, specifies values that ideally motivate U.S. citizens: liberty and justice for all.
3. *Professional*: For example, the Public Relations Society of America (PRSA) specifies six values for the profession of public relations: advocacy, honesty, expertise, independence, loyalty, and fairness.
4. *Organizational*: For example, Levi Strauss and Company, the maker of Levi’s jeans, asks its employees to act on four values: empathy, originality, integrity, and courage.
5. *Personal*: These are the particular values that motivate individuals. In fact, the English word *ethics* comes from the Greek word *ethos*, which means moral character.

The Search for Values: Journalism and the Law

In its search for values during the 20th century, the young profession of public relations turned to two related professions: journalism and the law. Many of the earliest practitioners of public relations had begun as journalists who, of course, communicated ideas to separate groups, so the logic of adapting journalistic values to public relations seemed obvious. Likewise, many of the earliest practitioners of public relations saw themselves as advocates, so the logic of embracing the values of the legal profession also seemed reasonable. Unfortunately, the objectivity of journalism and the advocacy of the legal profession had all the compatibility of fire and water, and those conflicting values struggled to control public relations ethics in the early decades of the profession.

Journalistic values informed Ivy Lee's 1906 "Declaration of Principles," in which that journalist-turned-public-relations-practitioner (1877–1934) declared,

We aim to supply news. This is not an advertising agency. . . . Our matter is accurate. Further details on any subject treated will be supplied promptly, and any editor will be assisted most cheerfully in verifying directly any statement of fact. Upon inquiry, full information will be given to any editor concerning those on whose behalf an article is sent out. In brief, our plan is, frankly and openly, on behalf of business concerns and public institutions, to supply to the press and public of the United States prompt and accurate information concerning subjects which it is of value and interest to the public to know about. (Guth & Marsh, 2009, p. 67)

The advantage of journalistic values is credibility: If public relations could have the reputation of delivering the truth, the whole truth, and nothing but the truth, the profession and its communications functions might gain almost unrivaled respectability among targeted publics. However, the disadvantage of journalistic values is practicality: Few, if any, organizations or individuals can afford to tell the whole truth. For example, should organizations reveal legitimate trade secrets? Should individuals disclose embarrassing information that no one has a right to know? And does all the communicated information have to be balanced, like the best stories in journalism? Are public relations practitioners responsible for telling all the relevant sides of a story, even those that oppose their employer's viewpoint? Furthermore, are public relations practitioners storytellers—or are their duties more diverse? On close examination, journalistic values don't seem wholly appropriate for public relations ethics.

Competing with journalistic values for a key role in forming public relations ethics were the values of the legal profession, primarily advocacy. If we cast public relations practitioners as advocates for their employer/client's viewpoint, the relevance of legal values seems logical. And just

as we presented Ivy Lee as the symbol of a journalistic ethos within public relations, we do no great harm to accuracy by presenting Edward L. Bernays (1891–1995) as the symbol of a legal/advocacy ethos within the young profession. As the author of the books *Propaganda* and *The Engineering of Consent* and part of the husband-wife team that coined the term *public relations*, Bernays (1947) offered this definition of "the engineering of consent":

This phrase quite simply means the use of an engineering approach—that is, action based only on thorough knowledge of the situation and on the application of scientific principles and tried practices to the task of getting people to support ideas and programs. Any person or organization depends ultimately on public approval and is therefore faced with the problem of engineering the public's *consent* to a program or goal. (p. 114)

In fairness to Bernays, he also advocated reverse engineering—the process of helping an employer/client to change in order to help win consent from a recalcitrant public.

Just as lawyers are advocates for their clients, striving to engineer consent within the courtroom, public relations practitioners—in the legal/advocacy view of the profession—engineer consent within the broader court of public opinion. In fact, if public relations practitioners are advocates for their employers/clients, several passages from the Model Rules of Professional Conduct of the American Bar Association (2008) might be adopted as governing values and principles for public relations ethics:

- [A] lawyer shall abide by a client's decisions concerning the objectives of representation and . . . shall consult with the client as to the means by which they are to be pursued. . . . (Rule 1.2)
- A lawyer shall not knowingly: (1) make a false statement of fact or law to a tribunal or fail to correct a false statement of material fact or law previously made to the tribunal by the lawyer. (Rule 3.3)

In the mid-1990s, a thought-provoking and controversial article in *Public Relations Review* contended that public relations had indeed adopted the values of the legal profession and thus had little obligation to help society discover large truths on particular issues. Instead, the article argued, public relations practitioners had acknowledged that they were simply one of many adversaries in the struggle for control of public opinion. Although they could not ethically lie, they could ethically present selective facts, withholding (within the limits of the law) any facts that might weaken their arguments. The responsibility for creating a fully accurate, comprehensive assessment of a situation rested with the public, which should gather information from many adversarial sources. After all, the article argued, lawyers are in an adversarial profession, and they don't attack their own cases. The article concluded that, for public relations, advocacy was a greater value than truth.

Among public relations practitioners and scholars, however, reaction to that article showed that public relations was not entirely comfortable with the values and adversarial nature of the legal profession. Four arguments in particular seemed to challenge the importation of values from the legal profession:

1. In many organizations, public relations practitioners serve as counselors on ethics and social responsibility. If, however, they have the reputation of withholding damaging facts, their credibility as counselors is at risk.
2. Not all publics are external. Within the subset of public relations known as employee relations, why would employees trust the claims of a colleague who was known to ignore or downplay damaging information?
3. For more than 2,000 years, teachers of persuasion theory have taught Aristotle's belief that the persuasive value of a speaker's good character (ethos) is more powerful than appeals to logic or emotion. If public relations practitioners damage their perceived characters by focusing only on employer/client interests and perspectives, they may sacrifice their most potent means of persuasion: their ethos.
4. Finally, the importation of legal values seems to rely on the notion that the purpose of public relations is to advocate an employer/client's viewpoint and to engineer consent. However, if we return to the definition of public relations presented at the beginning of this chapter, advocacy seems a secondary concern. Many practitioners believe that, properly understood, public relations is the profession of building relationships with particular publics that possess the needed resources. In *that* view of public relations, advocacy is not the goal and end of the profession; rather, advocacy is a means—one of many—that may be involved in building productive relationships.

At the end of the 20th century, then, this much could be said for public relations ethics: It was a work in progress, certainly not comfortable with the values of journalism and not entirely comfortable with the values of the legal profession. The evolving nature of public relations ethics was (and is) evident in the evolving ethics code of one of the world's largest public relations organizations: PRSA.

The Advocacy Debate

PRSA was created in 1948 through the merger of the National Association of Public Relations Counsel and the American Council on Public Relations. The new organization adopted its first ethics code in 1950 and then—indicative of the profession's struggle to find its ethical foundations—revised the code in 1954, 1959, 1963, 1977, 1983, 1988, and 2000. The current version of the PRSA ethics code, as noted above, specifies six core values for the profession:

1. Advocacy
2. Honesty
3. Expertise
4. Independence
5. Loyalty
6. Fairness

Similar values are inherent in the ethics code of the Global Alliance for Public Relations and Communication Management. Formed in 2000 through the joint efforts of PRSA, the International Public Relations Association, and other organizations, the alliance created a global protocol for the practice of public relations that rests on five values: advocacy, honesty, integrity, expertise, and loyalty. Clearly, the concept of advocacy continues to play a significant role in the evolution of public relations ethics. The title of one of the few books devoted solely to public relations ethics is *Ethics in Public Relations: Responsible Advocacy* (Fitzpatrick & Bronstein, 2006).

Again, the controversy regarding the ascendance of advocacy as perhaps the dominant value in public relations ethics relates to the definition of public relations itself: Are public relations practitioners primarily advocates for their employers/clients? If so, then the value of responsible advocacy would seem to be the logical primary value of public relations ethics. However, if public relations practitioners are relationship builders, striving to build and maintain the relationships that deliver essential resources to their employers/clients, then perhaps the primacy of advocacy—at least in the one-way, legal-profession sense—should be downgraded somewhat. This debate over the definition of public relations and the role of advocacy as a core value is evident in the constructive tension between two dominant, competing visions of the nature of public relations: excellence theory and contingency theory. Though the two philosophies are not entirely mutually exclusive, excellence theory is closer to the relationship-building view of public relations, while contingency theory is closer to the legal/advocacy view of public relations.

Excellence Theory

Excellence theory has grown out of an ongoing research project begun in 1985 by the Research Foundation of the International Association of Business Communicators. Led initially by Professors James E. Grunig, Larissa A. Grunig, and David M. Dozier, the project has, essentially, studied the practices of organizations known for excellent public relations and communication management—particularly as those practices relate to four different philosophies of public relations. Identified by James E. Grunig and Todd Hunt, the four philosophies, or models, of public relations are as follows:

1. The press agency model, which has only one mission, positive publicity for the employer/client
2. The public information model, in which practitioners act almost as in-house journalists, distributing unbiased information about an employer/client
3. The two-way asymmetrical model, which uses research to create messages that will engineer consent, winning essential publics over to the employer/client's viewpoint
4. The two-way symmetrical model, which uses research to create, maintain, and improve dialogue-based, mutually beneficial relationships with essential publics

The excellence project, as the research study came to be known, concluded that the most effective model of public relations was not the two-way asymmetrical model, with its value of one-way advocacy. Rather, the most effective model was the two-way symmetrical model, with its values of mutual understanding and two-way advocacy. In the two-way symmetrical model, practitioners not only advocate on behalf of their employer/client, they also may advocate on behalf of the public, urging their own employer/client to change in the interests of creating, preserving, or improving a relationship.

Significantly, although the excellence project determined that the two-way symmetrical model was the most effective philosophy of public relations, the project did not assert that excellent public relations and communications departments unfailingly used two-way symmetry. Instead, the project maintained that excellence often involved a "mixed-motive" model that preferred and predominantly used two-way symmetry but that occasionally also employed two-way asymmetry.

Also significant for public relations ethics is the excellence project's conclusion that the two-way symmetrical model incorporates an idealistic social role that rests on a simple core value: the public interest and social good. Therefore, if the dominant philosophy of public relations is the two-way symmetrical model with its mixed-motive option, the fuzzy picture of public relations ethics clears up a bit: If ethics means acting on core values, then public relations ethics involves ensuring that the profession works for the public interest and social good.

As studies of two-way symmetry have continued, that particular model has accumulated a set of core values that, ideally, should motivate the actions of ethical public relations practitioners. Those values tend to fall into two overlapping categories: values that guide relationship-building activities and values that characterize good, productive relationships. In addition to mutual understanding, two-way advocacy, and public interest/social welfare, values of relationship-building activities include loyalty to the employer/client (not simply acquiescing to whatever a public wants) and openness, in the sense of being willing to listen to and seriously consider a public's requests.

Regarding the values that characterize good relationships, the public relations scholars Linda Childers Hon and James E. Grunig have identified six core concepts:

1. Control mutuality, meaning that each party believes it has some control over the quality and future of the relationship
2. Trust
3. Satisfaction
4. Commitment
5. Exchange, in the sense that benefits are given and received by each party
6. Communal feeling, in the sense that each party would act for the benefit of the other without any immediate idea of reciprocation and payback

In brief, public relations ethics within the two-way symmetrical and mixed-motive models would involve acting, as much as possible, on these public-interest and relationship values.

Contingency Theory

As the dominance of excellence theory with its inherent two-way symmetry has grown, contingency theory has become an increasingly important reaction to that influence. One difficulty with excellence theory is that some critics believe that it describes and champions only a pure, undiluted form of two-way symmetry; they overlook the mixed-motive model that, according to the excellence project, characterizes excellent public relations departments. Other critics believe that two-way symmetry means acquiescence and radical accommodation, with an employer/client's public relation practitioners essentially taking orders from targeted publics. This mistaken belief overlooks both the mixed-motive model and two-way symmetry's core value of loyalty to the employer/client. Though contingency theory does not lapse into these errors, it does address the concerns they represent.

Contingency theory challenges the core values of two-way symmetry by offering a more situational model; contingency theory resists the idea that there is one best way to practice public relations, even if that one way has the flexibility of the mixed-motive model. The theory asks practitioners to imagine a spectrum with accommodation at one end and advocacy at the other. Unlike two-way symmetry and the mixed-motive model, contingency theory maintains that no one spot on that continuum is perpetually the best; instead, the best position on the continuum varies from situation to situation. In fact, contingency theory has identified more than 80 separate variables that can affect which point on the accommodation-advocacy continuum seems best for a particular situation.

For public relations ethics, a crucial difference between contingency theory and excellence theory is that contingency theory places a higher value on one-way, asymmetrical advocacy, especially when that approach may benefit the employer/client. And compared with excellence theory, contingency theory seems to place greater value on loyalty to the employer/client, placing lesser—though not insignificant—emphasis on the values of public interest, social responsibility, control mutuality, and exchange. Contingency theory, therefore, offers a different set of values for public relations ethics—a set that may actually be closer to the core values of PRSA, which, again, lists its first value as advocacy. Some proponents of contingency theory argue that it is more realistic than excellence theory; after all, employers/clients may not always be eager and willing to pay their public relations departments to sometimes advocate outside, competing ideas and viewpoints.

Some critics of contingency theory maintain that—perhaps like PRSA—the theory diminishes the nature of advocacy by defining it as a one-way process, with the practitioner being an advocate only for the employer/client. The PRSA ethics code, in fact, includes the phrase *responsible advocates for those we represent*. Absent in this notion of advocacy, responsible or not, is a practitioner's advocating the interests of an important external public to the leaders of his or her own employer/client. That expanded view of advocacy is more consistent with two-way symmetry and the mixed-motive model.

Another criticism of contingency theory is that it sometimes seems to mischaracterize two-way symmetry as being synonymous with uncritical accommodation of the wants and needs of key publics. Advocates of two-way symmetry note that because the model tempers the value of a public's well-being with the value of loyalty to the employer/client, the model is not synonymous with uncritical accommodation.

As frustrating as the clash between excellence theory and contingency theory may be for those who seek a clear understanding of public relations and the ethics of that profession, the debate is healthy: It focuses on finding the best definition of a young profession as well as identifying the values that must be inherent in that profession's ethics. Again, if ethics means identifying and acting on core values, ethical public relations practitioners must begin by defining what those values are.

Challenges to Ethical Behavior in Public Relations

The concept of public relations ethics begins with the identification of values—but the concept remains incomplete until public relations practitioners act on those values. Challenges to ethical behavior in public relations tend to emerge from seven broad areas:

1. *Ignorance*: Some practitioners, new or otherwise, are unaware of the values and even the laws that guide the profession of public relations; perhaps they have even failed to identify their own values and are unaware of the values of their employer/client. For example, a practitioner unaware of the core value of loyalty to one's employer/client might easily commit actions that his or her employer would view as unethical.
2. *Overwork*: Hard work is certainly a value for many public relations practitioners. However, when a workload becomes so overwhelming that it allows no time for reflection on the connection of core values and current actions, then hard work becomes a potential cause of unintended unethical conduct.
3. *Legal/Ethical Confusion*: Illegal conduct often is unethical because it tends to violate social values. But the converse—all legal actions are ethical—is, of course, untrue. For example, an employee of Levi Strauss and Company who did not act on that organization's core values of empathy, originality, integrity, and courage would probably not be guilty of illegal conduct. In the eyes of the company, however, that employee probably would be guilty of unethical behavior. Legal/ethical confusion also can extend to the troubling notion that an ethical action might be illegal. The concept of "civil disobedience" involves the intentional, peaceful breaking of laws by those acting on what they believe to be higher values.
4. *Cross-Cultural Situations*: Related to ignorance, this source of possible unethical conduct occurs when members of different cultures interact—an increasingly common occurrence in public relations. Acceptable behavior in one culture might violate important values in a different culture. For example, a non-Muslim practitioner who values sensitivity to other cultures may mean no disrespect by unthinkingly wearing shoes into a mosque, but in doing so, he or she has violated an important cultural standard.
5. *Short-Term Thinking*: Aristotle was among the first to identify this challenge to ethical conduct when he condemned individuals who opt for immediate pleasure or relief at the expense of long-term pain. For example, a member of PRSA might violate that organization's value of honesty by telling a lie to resolve, seemingly, a difficult, embarrassing situation. Because that action would go against a core value, it would be unethical. Furthermore, if the lie were revealed, the practitioner would have done long-term damage to his or her reputation, as well as the reputation of his or her employer/client.
6. *Virtual Organizations*: These entities are temporary groups of, usually, far-flung associates, perhaps united only by online media, who come together to complete a project. For example, to produce a corporate annual report, a freelance public relations practitioner hired to oversee the project might commission freelance writers, editors, photographers, illustrators, and printers. The group might never meet in person, and

because it is temporary, it almost surely would lack a written ethics code and any sustained discussion of core values that might unite its members. At worst, the actions of some members might seriously violate other members' core values.

7. *Dilemmas*: Dilemmas are problems that lack painless, win-win solutions. In ethics, dilemmas involve clashing values; they arise from situations in which no matter what course of action an individual takes, his or her actions will be inconsistent with at least one core value. Of all the challenges to ethical behavior, dilemmas can be the most painful. For example, a public relations practitioner who embraces the concept of two-way symmetry might experience an unpleasant clash of values if he or she believed that the actions of the employer/client—actions the practitioner had tried to change—were unfairly damaging to an important public. That practitioner might be torn between the values of loyalty to the employer/client and the values, as noted above, of trust, exchange, and, in a broader sense, the public good.

Dilemmas demonstrate the need for critical-thinking tools within the broad field of ethics. When core values clash, we sometimes surrender to stress and confusion, and our thinking can become muddled. Ideally, critical-thinking systems can combat that confusion by providing structure. Critical thinking is characterized by four qualities: It is (1) goal oriented (we seek the best solution to the dilemma), (2) objective (we try to temporarily set aside our personal biases), (3) comprehensive (we draw on many opinions and sources of information), and (4) systematic (we have a specific procedure to guide our thinking). The acronym COGS—comprehensive, objective, goal oriented, and systematic—can be used to describe critical thinking.

One well-known critical-thinking tool in ethics is the Potter Box, designed by Ralph Potter, a retired professor of social ethics. In essence, the Potter Box consists of four quadrants: (1) definition, in which we establish what we know and don't know; (2) values, in which we identify and evaluate the values inherent in the dilemma; (3) principles, in which we seek guidance from philosophers such as Aristotle and Immanuel Kant as well as from ethics codes; and (4) loyalties, in which we evaluate the involved publics and consider which ones deserve our loyalty. Using the Potter Box, public relations practitioners can help ensure that their attempt to resolve an ethics dilemma is comprehensive, objective, goal oriented, and systematic.

In 2004, PRSA began to issue Professional Standards Advisories, describing specific ethics challenges of particular concern to its members. To date, the advisories have included these challenges to ethical behavior:

- The overbilling of clients
- The creation of so-called front groups, which don't acknowledge their true creators and financial sponsors
- Truthfulness in war-related activities

- Disclosure by seemingly independent commentators of any payments that might represent a conflict of interest
- Disclosure of the true sponsorship and authorship of blogs

The inclusion of full disclosure of blog sponsorship and authorship demonstrates how technological innovations can pose new ethical challenges for public relations practitioners.

Case Study: Starbucks Coffee Company

Ethics, as we know, involves identifying and acting on core values. In the difficult days that followed the September 11, 2001, terrorist attacks on the World Trade Center and the Pentagon, the Starbucks Coffee Company proved itself to be a positive example of an organization that strives to integrate its core values and its actions.

In the chaotic aftermath of the collapse of the World Trade Center towers, a Starbucks employee in New York City sold bottled water to a paramedic. Starbucks had intended to donate the water, but in the turmoil of that unprecedented day, a company employee made a mistake.

When word of the sale reached Orin Smith, then-president of Starbucks, he contacted the paramedic's employer to apologize and return the money. Smith then contacted New York employees to reinforce the company's decision to donate supplies to rescue workers, and Starbucks issued a news release—a key tactic of media relations—apologizing for the action and announcing its donation policy.

One beneficiary of those supplies was the Emergency Room staff at St. Vincent's Hospital, only blocks from the rubble and smoke of the World Trade Center. Days later, Smith received a letter from a St. Vincent's nurse that included this passage:

I wasn't scheduled to work, but I needed to go to the ER and help. . . . Hours passed and the staff was getting tired. I told my co-worker Jay, "I would love to have a cup of Starbucks right now." We didn't want to leave the ER, not knowing what would come through the doors. An hour later, I noticed my co-worker Karen with a cup of Starbucks! She informed me that the Starbucks on Greenwich Avenue brought fresh coffee and water for the ER staff. Mr. Smith, I cannot tell you how much that cup of coffee meant to me. . . . I want to thank you personally for your generosity and support. ("New Yorker Shows Support," para. 3)

"I have never been more proud of Starbucks [employees] than I am right now," Smith responded in yet another news release, but he still had not forgotten Starbucks' initial, unintended departure from its values. "The decision [to charge the paramedic] is not defensible and is totally inconsistent with what we stand for," he said ("Starbucks

President,” para. 1). As order gradually returned to New York and Washington, D.C., Starbucks donated \$1 million to relief efforts in those cities.

Going the extra mile to ensure that it is acting on its values has become characteristic of Starbucks’s corporate behavior. When protestors rallied at Starbucks’s 2001 annual stockholders meeting, company officials offered to meet with the protestors to evaluate Starbucks’s policies on food additives, which was the issue in question. The protestors, however, were not as accommodating: They refused to meet unless Starbucks agreed in advance to their demands.

Starbucks’s values-driven behavior has helped the company earn a perennial spot on *Business Ethics* magazine’s annual list of “100 Best Corporate Citizens.” In the past decade, the company has won more than a dozen national and regional awards for ethical behavior. Starbucks also issues an annual corporate social responsibility report.

At the core of Starbucks’s values-driven behavior is a mission statement that includes six guiding principles. The succinct statement reads as follows:

Starbucks Mission Statement: Establish Starbucks as the premier purveyor of the finest coffee in the world while maintaining our uncompromising principles while we grow.

The following six guiding principles will help us measure the appropriateness of our decisions:

1. Provide a great work environment and treat each others with respect and dignity.
2. Embrace diversity as an essential component in the way we do business.
3. Apply the highest standards of excellence to the purchasing, roasting, and fresh delivery of our coffee.
4. Develop enthusiastically satisfied customers all of the time.
5. Contribute positively to our communities and our environment.
6. Recognize that profitability is essential to our future success. (www.starbucks.com)

Starbucks also has an environmental mission statement that pledges “environmental leadership in all facets of our business” (www.starbucks.com).

The principles in Starbucks’s mission statement virtually ensure conflict. Emphasizing profits, quality, and corporate citizenship can simultaneously stretch a company in at least three different directions, as Starbucks learned in 2000, when protestors charged that the company paid poverty-level prices to coffee growers in developing nations. A key demand of the protestors was that Starbucks purchase Fair Trade coffee beans. Fair Trade involves paying individual farmers in developing nations a living wage for their crops. Crops grown by large corporate farms cost less and can force individual farmers into poverty.

Starbucks’s response to the situation underscored the creative tensions within its mission statement and principles. Company officials acknowledged that Starbucks had

earlier sought Fair Trade beans but had not located any that met Starbucks’s standards—a direct reference to the company’s mission of supplying “the finest coffee in the world.” However, the same officials promised a more rigorous search—a direct reference to the company’s principles of excellence in purchasing and building better communities. Soon after announcing the new search, Starbucks bought almost 80,000 pounds of Fair Trade beans, and it promised to purchase more if it could locate crops that met company standards. Within a year, Fair Trade coffee became part of Starbucks’s worldwide product lines.

Starbucks’s repeated willingness to evaluate whether its actions incorporate its values earns respect even from potential critics. “The company is often grudgingly considered by many social activists to be a ‘socially responsible’ company,” said one analyst (Maloy, 2001, para. 26). A college journalist offered the same idea in slightly less formal language: “Even though Starbucks exemplifies corporate ickiness, the giant coffee company [has begun] selling Fair Trade Certified Coffee” (“100% Fair Trade Coffee,” 2000, para. 1).

Case Study: Front Groups

Front groups present a continuing challenge to public relations ethics. Such organizations often have noble names and seem independent; however, they receive secret support from a silent partner that hopes to benefit from the group’s advocacy efforts. In the late 1990s, the Associated Press (AP) published evidence suggesting that international pharmaceutical giant Glaxo Wellcome had quietly supported a front group in the hope of influencing federal health care policy in the United States.

Are front groups unethical? If they violate the values of involved individuals, organizations, or professions, the answer almost certainly is yes. By embracing values such as honesty, accuracy, and the public interest, public relations organizations throughout the world have strongly suggested that front groups are inconsistent with the values of the profession. The current PRSA ethics code specifically includes “front groups” among its examples of “improper conduct” for ethical practitioners.

In 1996 and 1997, the U.S. Food and Drug Administration (FDA) received almost 10,000 letters asking it not to ban a particular kind of asthma inhaler known as an MDI. Because those inhalers contained ozone-damaging chlorofluorocarbons, environmental-defense organizations wanted them removed from the market. In many of the letters, opponents of the possible ban referred to information received from the Committee to Protect MDIs.

According to the AP, the Committee to Protect MDIs was a front group secretly sponsored by Glaxo Wellcome, which had fallen behind its competitors in developing environmentally friendly inhalers. The public relations

consultant who oversaw the Committee to Protect MDIs told an AP reporter that she couldn't recall how her involvement with the organization began, nor would she answer the reporter's questions about the committee's members and financing.

Ironically, in the early days of the MDI controversy, a pharmaceutical-industry newsletter reported that Glaxo Wellcome denied conducting any lobbying efforts to delay a ban on MDIs. The same story, however, noted the aggressive lobbying of the Committee to Protect MDIs, and the story ended with a quotation from the head of the committee—the same consultant who later would not discuss the committee's financing and membership.

To its credit, Glaxo Wellcome answered the AP's questions about its involvement, acknowledging that it did, indeed, finance the Committee to Protect MDIs. And many of the company's later public relations tactics in the battle to preserve the inhalers seemed both legal and ethical: Its representatives spoke with reporters about problems with non-MDI inhalers, and the company openly financed a survey by an independent inhaler-users group.

Repercussions from the AP exposé were few. Glaxo Wellcome endured a handful of negative stories in the news media, but the Committee to Protect MDIs vanished from the headlines almost as quickly as its Web site went dark.

If the end always justifies the means (a dubious notion in ethics), then the Committee to Protect MDIs may have been a public relations success. The FDA delayed its ban on the inhalers, and Glaxo Wellcome won time to continue its development of environmentally friendly alternatives. The company later merged with another pharmaceutical giant and now regularly reports annual sales exceeding \$40 billion.

The public relations practitioner who supervised the Committee to Protect MDIs went on to represent another multinational pharmaceutical company and has been frequently quoted in the news media.

Unfortunately, it's impossible to document the damage to the public relations profession in the minds of those who may have felt deceived or perhaps betrayed by the Committee to Protect MDIs.

Public Relations Ethics: Values in Action

As a relatively young profession, public relations continues to seek the core values that are essential to any concept of ethics for the discipline. Despite the occasional frustrations inherent in the ongoing debate, many participants—practitioners as well as scholars—have come to realize a significant advantage in viewing public relations ethics as a work in progress: Passionate, sustained discussions about values and values-driven actions in public relations help

keep those topics at the forefront of the profession. And voices from many viewpoints must be welcomed to the debate—feminist perspectives, postmodern perspectives, international perspectives, and more. After all, an enduring, high-profile discussion of how public relations can honor the most important values ranging from the international level to the personal level is surely good for a profession that seeks credibility and an honorable reputation.

ISSUES MANAGEMENT

ROBERT L. HEATH

University of Houston

Imagine, for the moment, the following scenario. You are in the office of a CEO (Chief Executive Officer) of a major company in the early 1950s. You and other members of the company are feeling pretty good about business prospects. The Great Depression is over. That era in American (and international) business demonstrated that unrestrained business activities could lead to food lines, bankruptcies, and family dislocation of epic proportion. Tons of governmental regulation came about to “prevent” that sort of financial catastrophe from recurring. You were engaged in some of those public policy battles whereby business critics achieved new legislation and regulation. Now, however, those business nightmares seem to be ending. And you and your business colleagues have just helped win World War II. The world brought together millions of military personnel, but several countries, none more than the United States, demonstrated that the ability to manufacture war materiel is a crucial factor in the kind of global war experienced in the 1930s and 1940s.

Imagine that you are the same (or another) CEO a decade later—the mid-1960s. All of a sudden, you sense that the world is at unrest. What seemed to be so tranquil is becoming turbulent. Antinuclear weaponry protests get visibility. The USSR is growing in power. The Civil Rights Movement is becoming more determined. Labor believes that it should have better living and working conditions. And the war in Vietnam is trying to take shape. We read a series of articles that suggest that pesticides are destroying entire species of birds, including the American symbol, the bald eagle.

Imagine yourself now in the mid-1970s. Protests against the war are tearing at the social, economic, and political fabric. Civil rights has made many achievements, but more are demanded. Consumer rights, environmental

rights, women’s rights—heavens! Industry and government are being attacked from every point and for many reasons. The old rationale for the sociopolitical system and the “traditional” political economy is up for grabs. Antinuclear activists are protesting the construction of nuclear-generating plants to manufacture electricity. International strains are occurring over oil and other mineral resources. There are many demands from all sides for something called corporate responsiveness, or corporate responsibility—and even corporate rectitude. So you call in your public relations team. You ask them to offer advice. They say, we simply have no clue. Perhaps we should issue a series of ads blasting protestors. We might even suggest that they are inspired by the Soviets. Let’s paint them as un-American. Let’s tell the activists who are protesting the building of nuclear-generating plants that they can “freeze to death in the dark as far as we care.” Leave us alone. We are the American free enterprise system that defeated the Great Depression and won World War II.

That scenario is more real and telling than you might imagine. During those decades, public relations as it was being practiced by many, but not all, had become merely product promotion and publicity. Starting during the Eisenhower years, public affairs was coined to replace public relations as the corporate function that would deal with the difficulties of companies working with key constituencies. The Public Affairs Council had been formed. Then, some executives, advertising persons, and eventually some public relations people (who were well prepared to at least explore this challenge) asked what discipline is needed, what it should be called, and what functions it must perform. Out of questions such as those arose issues management.

The theme exposed in this opening is both simple and complex. How could corporate America (and other countries around the world) be so caught off guard by the emergence of effective activism at the time when they were renewed in their self-confidence that they were “doing the right thing”? Were the old tools to deal with criticism and dissent inadequate or merely misused? Was something different that required new approaches? Is a communication response the only or even the essential theme of issues management? That point is made in a historical context by the fact that early “issue managers” were surprised that one or two issue ads seemed not only to have no effect on an issue’s life but likely brought out more anger on the part of critics, who thought that companies believed that they could merely communicate away their troubles. Those who supported the creation and the evolution of issues management believe that it offered a “new and improved” approach to controversy.

This chapter explains what issues management is, what its four pillars are, how communication alone is insufficient but nevertheless vital to issues management, and how the future is open to students who want to play important roles in the discussion and debate of public policy themes and bring that knowledge to bear to make organizations both more savvy and more responsive to their changing role in society. To that end, the chapter first addresses the question of whether issues management is something unique in the practice of public relations or merely just public relations. The chapter then progresses to discuss the dominant theoretical underpinnings that support its theory and practice. One of the lessons learned from 30 years of discussion is that public relations practitioners necessarily play a major role in issues management as they help management manage their response to issues. Public relations practitioners cannot carry this load alone, especially if management does not respond proactively as well as reactively. And the major way to blunt or respond ethically to criticism is to change the organization, not merely change the messages put out by the organization.

What Is Issues Management?

Issues management (strategic issues management or SIM)—or as some authors prefer, issue management—got its name in the 1970s at a time when corporate practitioners and those senior practitioners in high-profile agencies were struggling to recraft the discipline to address an era of hostility. The end of the Great Depression and the victory at the end of the World War II left American industry at a high point of public popularity and support. Measures of corporate leadership were high, both for effectiveness and ethics, as the 1960s started. But this age of deference was soon to end. The national poll data on corporate honesty and ethics would plummet. From a time when most people believed that corporate leaders were honest and ethical, the era would dawn when only 16% to 20% of the respondents would so believe.

The anti-Vietnam war sentiment coupled with the Civil Rights Movement to spawn an era where every establishment institution was scrutinized and most were found wanting. Under pressure from all sides, the corporate public relations leadership crafted the term *public affairs* and help found the Public Affairs Council. Among advertising professionals, a substantial debate transpired to coin a name for the practice: issue advertising, controversy advertising, theme advertising. Such debate suggested not only that communication was the best and most effective response to the controversy and loss of confidence in corporate leadership but also that by telling some citizens about this matter those critics would be silenced or would stop their criticism. The opposite occurred. The criticism heated up, and activists created organizations and institutions that formed the foundation for a robust social movement era. Other leadership, especially the work of W. Howard Chase (1984), led to the issue(s) management process. Because Chase’s book was published 20 years ago, as a hallmark of the issues management movement, this chapter is somewhat of a retrospective.

To formulate new ways to meet this challenge of the prerogatives of corporate governance, leading practitioners, academics, and business leaders developed issues management through many heated discussions at the senior executive level. Tradition has it that W. Howard Chase drew on his experience at American Can Company to develop the concept as a means for strengthening large organizations’ ability to monitor, analyze, and respond to the challenges being voiced by myriad critics of private sector practices and policies. His efforts were supported by others, such as John E. O’Toole (1975a, 1975b), who may have coined the term *advocacy advertising*, which was offered to strengthen the corporate voice in response to strident challenges by critics.

In the discussion of issues management, we are wise always to take a management rather than merely a communication perspective. And in such discussions, management can be interpreted as manipulation. In the context of issues management, this balance is important. Management entails choices that make or are selected to make organizations effective given near- and longer-term circumstances. After some initial false starts, issues management under CEO-level leadership began to feature the centrality of management and strategic business planning (regardless of whether the organization is a company, non-profit, or government agency).

Only the naïve practitioner or overly ambitious critic ever believed that advocates of issues management believed that issues could be “managed” to the eternal preference of the sponsor of this organizational function. Most believe that issues are multifaceted and that the playing field consists of multiple publics (stakeholders and stake seekers) who engage in robust competition to influence the direction and outcome of issues. One reality is that issues management must be part of strategic business planning. Issues management practitioners and experts such as Sawaya and Arrington (1988) argued that issues

emerge and take many directions. For this reason, managements must consider issue implications, trajectories, and challenges, looking for opportunity and threat. They made the point that issues can often offer opportunity and should not be seen as necessarily threatening. For this reason, issues management was often seen by such experts as a way of thinking as well as a way of acting.

Issues management has grown as an applied and research discipline to compensate for what some believed was an insufficient approach to the practice of public relations in the mid-1970s. The inadequacy of the then state-of-the-art approach to activist criticism was repeatedly demonstrated by strategic responses to corporate critics through counter-publicity efforts rather than solid issues engagement and corporate strategic planning adjustments. Instead of taking more sound responses to such criticism, many organizations engaged in stonewalling, expressed outrage at what were alleged to be presumptuous outbursts by critics of big business, and blamed the problems of society on the persons who were trying to call attention to and offer ways to solve those problems. This reactionary response that often tried to blame the messenger believed that no civil rights, consumer rights, or environmental rights problems would exist if the critics would cease their clamor.

Despite Chase's influence, issues management was not the brainchild of any one person. In fact, his views were shaped by senior practitioners such as John W. Hill, the cofounder of Hill & Knowlton, Arthur Page, and Harold Burson. Several academics, corporate leaders, public affairs/public relations practitioners, and even some advertising persons decided that a new or renewed array of strategic options was needed to respond to and even combat the broad and resilient challenges to corporate America and the U.S. government that were voiced during the activist era of the 1970s. To review the leadership of this movement, Heath and Cousino (1990) examined several hundred articles and other publications to better understand the analysis and responses that leaders made to the deficiencies they had discovered in organizations' preparedness to respond to their critics.

Critics of government and business eventually reshaped the culture and ideology of society in this era on topics related to civil rights, environmental rights, consumer rights, worker rights—and the list continues. New sociopolitical dynamics began in the 1960s to guide government policies and private sector practices. Businesses lost much of their public policy clout as the result of four dramatic changes. (1) Activists claimed that natural resources, found to be limited and rhetorically defined as the property of the citizens of the nation—and even the world, were to be managed in the collective interest. (2) Society became sensitive to the increasing heterogeneity of values, attitudes, beliefs, interests, and cultures, which destroyed the business-first policy consensus that prevailed at the start of the 1960s. (3) Citizens became more unwilling to act with deference toward business and government; they lost confidence in the ability of large institutions such as government, media, and business to

recognize and solve problems. Citizens placed their confidence in activist groups and called on them to exert their collective power. (4) Standards of corporate responsibility changed (Pfeffer, 1981). This fertile ground fed the growth of business criticism and issues management.

The central theme that is extracted from this literature can lead one to conclude that the rhetoric of issues management examines the rationale, motives, processes, and outcomes of advocacy discourse on public policy matters that influence the relationships between corporate entities and their stakeholders/stake seekers. The ultimate effort of this rhetoric is to forge sufficient concurrence so that interested members of the general public, business, government, media, and nonprofit sectors can forge mutually beneficial policies. The upshot of this dialogue is a constant revision of the expectations the citizenry has of the ways business, government, media, and nonprofit organizations should conduct their business.

From this robust debate, we can determine a definition of issues management. Some define it as a subfunction of public relations. Without much trouble, one can find agencies that list issues management as one of their several functions. Those who do may only think of it as requiring attending meetings and/or issuing press releases on controversial matters. The Issue Management Council defines SIM as follows: "Issue management is the process used to align organizational activities and stakeholder expectations" (www.issuemanagement.org, accessed June 14, 2007). The Public Affairs Council defines it as

the process of prioritizing and proactively addressing public policy and reputation issues that can affect an organization's success. Many large companies, in particular, use issues management techniques to keep all of their external relations activities focused on high-priority challenges and opportunities. (Doug Pinkham, President, Public Affairs Council, http://pac.org/issues_management, accessed June 14, 2007)

Heath (2005; see also Heath, 1997) has defined issues management as

a strategic set of functions used to reduce friction and increase harmony between organizations and their publics in the public policy arena. Issues management entails four core functions: (a) engaging in smart business and public policy planning that is sensitive to public policy trends, (b) playing tough defense and smart offense through issue communication, (c) getting the house in order by meeting or exceeding stakeholder expectations, and (d) scouting the terrain to gain early warning about troublesome issues. Applied properly, it gives organizations the opportunity to reduce the harm of threats and to take advantages of opportunities created as public policy changes occur. (p. 460)

Stressing this view of issues management, the former Allstate Insurance Company executive for public affairs, Raymond Ewing (1987), concluded that it "developed within the business community as an educational task

aimed at preserving the proper balance between the legitimate goals and rights of the free enterprise system and those of society” (p. 5). The battle over public policy and value principle hegemony is best when it seeks and achieves a mutually beneficial middle ground between interested parties. Twenty years ago, Ewing defined it as a new organizational discipline that features “public policy foresight and planning for an organization” (p. 1). Stressing outcomes deliverable by issues management, he defined it as “simply public policy research, foresight, and planning for an organization in the private sector impacted by decisions made by others in the public sector” (p. 18). It can help fill

the policy hole in the center of corporate management, making it possible for the CEO and senior management to strategically manage their enterprise as a whole, as a complete entity capable of helping create the future and “grow” their company into it. (p. 18)

Its greatest contribution is gained by early and proactive efforts “to intervene consciously and effectively and participate early in the process, instead of waiting passively until the organization finds itself a victim at the tail end of the process” (p. 19).

This view, by one of the pioneers in issues management, and a former public relations practitioner, emphasized how SIM is more than communication. He also stressed that the playing field often found activists pitted against companies. However, the battles might also occur within an industry and between industries. From his vantage point at Allstate Insurance, he was able to suggest, for instance, that however tenacious and effective Ralph Nader might have been in increasing automobile safety, the lobbying power of the automobile insurance industry was crucial as a power balance to the Detroit automobile industry. Car insurance companies, among the most powerful industries in the United States, pressed for automobile safety, not only because it was in the interest of those who might be injured or killed but also in terms of the ability of the insurance industry to calculate costs for such injuries. In that case, death is an easier cost to calculate than is long-term spinal injury, for instance.

By definition and as a matter of practice, then, SIM entails strategic business planning; constant efforts to raise the standards of corporate responsibility; issue monitoring to scan, identify, monitor, and analyze issues and trends; and issue communication. The latter function, often thought of as the exclusive role of SIM, embraces a wide array of media and contexts, but it also focuses on efforts to weigh in on matters of fact, value, policy, and identification. A central theme, thus, is the effort to narrow the legitimacy gap (Sethi, 1977) between what companies are expected to do and what they do with regard to matters that affect their stakeholders and stake seekers.

Although the name of the practice was coined in the 1970s, it is not a new practice in principle. Major companies

fought for favorable legislation and regulation during the last years of the 19th century. This was the period called the Industrial Revolution, or the era of mass production fostering mass consumption. Within decades, America and much of the industrialized world went from small businesses to large corporations. For instance, dozens of small oil companies were combined into Standard Oil, as were hundreds of small steel and iron manufacturing companies brought together as U.S. Steel. This was the era of the robber baron. Industrial giants fought over manufacturing and other industrial standards, including the battle of the currents. During that “war,” George Westinghouse fought Thomas Edison to set the standard of electrical generating: a battle between alternating current and direct current. Lobbying and other measures were employed to create a climate favorable to one industrial interest, often at the disadvantage of some competitor and perhaps against the interest of labor. And as it happened during the last half of the 20th century, activism of many kinds fought to make these large industrial giants responsive to the needs of customers, workers, and other stakeholders.

Viewed as such, SIM draws upon resource dependency theory, social capital theory, principles of reflective management, insights into issue monitoring and futurism, a burgeoning body of literature relevant to corporate responsibility, and ethical and responsive issue communication.

The Four Pillars

The logic of issues management rests on a relatively simple assumption. Organizations are stakeholders as well as stake seekers. Other individuals and organizations in society also are stakeholders and stake seekers. A stake is something of value, tangible or intangible. For instance, purchasing dollars are stakes customers can use to lever products and services from companies. A product, as is a service, is a stake. The relationship between stakeholder and stake seeker is resource specific, and the quality of the exchange defines the relationship, as the quality of the relationship may define the quality of the exchange. Companies are stake seekers who need customers’ purchase dollars. Customers hold stakes, but they also seek stakes.

As well as purchase dollars, the stakes might be support or opposition (intangible stakes, but nevertheless powerful). Activists serve as stakeholders who work to use their stakes to lever management policy change from companies, other activist groups, and governmental agencies. Thus, SIM centers on power resource management strategies. It entails the push and shove of interests, seeking through communication in various forms to achieve change and concurrence for that change, if not consensus. But in such battles, companies hold stakes that activists want as stake seekers. The stakes they seek are changes they believe will effectively address some issue.

These battles for stakes focus on issues. The issues are contestable matters of fact, value, policy, and identification.

Strategic Business Planning

Each organization seeks to accomplish some mission and vision. To do so requires an understanding of the policy environment in which the organization operates. For this reason, companies are not only subject to constraints but also are given latitudes or opportunity because of the public policies related to their operations. In short, activists and even other companies often try to change the principles of public policy to influence how the organization achieves its mission or vision. For instance, if a company or industry, sells products that are harmful to customers' health, those customers are predictably going to work to change the policies.

As such, management is the applied and theoretical discipline that works to achieve those ends through savvy planning/budgeting, strategic management, and continuous evaluation and adjustment. Each organization must operate within (as SWOT analysis) the market system and public policy arenas relevant to its ability to acquire and use resources. Each organization is resource dependent. Its ability to acquire resources depends on its social capital, the nature of the systems where it operates, the balances between stakeholding and stake seeking, and the formation of meaning that constitutes and defines activities in these arenas. As such, savvy management works to understand and manage their responses to issues that can affect effective resource acquisition and application. This process is both reactive and proactive.

Issue Monitoring

A wise management team wants to know what is occurring, what thoughts, opinions, facts, identifications, and policies are changing that might affect their ability (positively or negatively) to achieve their mission and vision. Scouting the terrain in which the organization operates is necessary to determine the issues and trends, as well as those power forces that promote and constrain the organization's planning and management options.

Issue monitoring consists of scanning, identifying, analyzing, and prioritizing issues. Issues often emerge well outside the public view. By the time they make their way into popular literature, they are likely to have been discussed and debated for months, and even years. Matrices of key members of the organization (and some outside consultants) are needed so that the most knowledgeable and insightful minds are encouraged to participate in a process often created and managed by public relations specialists. This SIM function keeps the organization vigilant and open to trends, issues, and power dynamics in the environments where it operates. It helps the organization be an open system-letting information

in that can be used to manage the business plan and issues response.

Public relations and public affairs experts need to be central to this issue-monitoring process, but they need to work in matrices with other experts. Most issues are not "communication" issues. They are matters of operation that are likely to be best understood by engineers or other technical experts. They might be legal issues. They might relate to human resources policies such as employee safety and sexual harassment. Public relations personnel simply are not expert on every issue that might affect the organization. Thus, matrices need to be created, maintained, and made effective to keep the organization vigilant.

Corporate Responsibility

One of the most solid aspects of SIM is the fact that the better the organization is (the higher its standards of corporate responsibility), the less it will be criticized or constrained in its operational choices, and the more it will receive the stakes it wants and need to achieve its mission and vision.

The reality of modern issues management depends on the appreciation for activist and social movement efforts to constrain and reward organizations for the quality of their policies and business activities. Senior SIM and public relations practitioners know the value of getting the house in order. That metaphor stresses the importance of organizational character, the willingness and ability to know the high standards of corporate activity expected for the organization to deserve and receive needed resources.

One of the fundamental and historical logics of SIM is that outsiders seek to obtain and use power resources to control or at least guide each targeted organization from the outside. By this logic, environmentalists hold high standards and advocate their wisdom in battles to influence the business planning of timber companies. Similar logics abound, and savvy SIM specialists know that external influence can come from within their industry and from other industries as well. Applying Sethi's (1977) logic of the legitimacy gap, one can argue that as long as organizations do not meet high standards of corporate responsibility, they will be targets for change by groups that advocate for and apply pressure to raise those standards.

Issue Communication

Over the years, issue communicators have engaged in strong offense and sound defense. Organizations have learned that if they don't communicate on some matter, other voices will make statements that create the "public record." Such communication entails bringing facts and opinions into public discourse. It requires thoughtful and reflective policy recommendations. It can appeal for people to identify with one line of thinking as being more constructive than its alternatives. Such public statements are part of what has been called the rhetorical heritage, the

spirit of public debate, collaborative decision making, advocacy, and negotiation. It consists as dialogue rather than monologue.

Issue communication rests on a fundamental assumption. In a succinct statement of that assumption, Lentz (1996) reasoned, “Truth should prevail in a market-like struggle where superior ideas vanquish their inferiors and achieve audience acceptance” (p. 1).

The rhetorical heritage underpins modern organizations’ efforts to cocreate meaning that guides their activities, defines the marketplaces in which they operate, and sets the standards of corporate responsibility. Rather than assuming that the ostensibly dominant voice of industry or one company can drown out others, the reality is that many advocates compete by asserting their facts, values, and policy positions. This wrangle can be dysfunctional, but in its absence, we must accept a philosopher emperor who decides cases for the key players rather than having a system by which we assume that the best ideas triumph—at least eventually—over inferior ones. Jaques (2006), for instance, has argued that proactive and constructive communication can lead to collaborative and constructive decision making. Such outcomes are not accidental but require honest effort at collaboration and a willingness to listen to and regard the ideas of others, and the use of a variety of communication channels, including new technologies. On this point, Jaques (2006) noted,

Professionalism of activism is in some respects a direct response to the growth of stakeholder participation as a key element of issue management. Processes such as community consultation or corporate social responsibility or stakeholder engagement have accelerated and formalized participation by external parties. (p. 414)

The days of issue dominance and intimidation are limited because of the quality of engagement and the power resource management skills of the parties engaged in issue communication.

The Challenges of Issue Communication

At this stage, several points should be clear and apparent. First, issues management is more than communication. Second, public relations practitioners cannot address and solve issues alone. Indeed, issues always are management issues. So practitioners can help management address and respond to issues. Third, issue campaigns are likely to require sustained communication in many venues. One of the lessons learned from the period of inception of the new era of issues management is that one or two cleverly worded and effectively placed ads are unlikely to resolve an issue. In fact, the ads may inflame the fires of criticism. Fourth, the best communication paradigm for understanding issue communication

is argumentation, advocacy, contention, and debate. Fifth, sometimes one side of a controversy is right and the other side is wrong, but don’t count on that paradigm for issue communication. The truth and preferred interpretation of facts, values, policies, narratives, and identification often fall within the points of contention, not in favor of either one. Finally, in all that is said and done, the character of the organizations engaged in the discourse is as much on the line as is the case when two individuals advocate points of view in public. Credibility and character are fundamental principles of effective communication. That leads to two more conclusions. As communicators, we become accountable for the quality of the messages we help craft and put into play. And all of what the organization does and says becomes part of the message, as does the breadth of interest demonstrated in the position adopted.

Issue communication begins with matters of fact. The emergence of an issue often results from someone putting a fact into place that may suggest the presence of a problem or a call for a better solution than what has been advocated. Examining the rhetorical heritage, Campbell (1996) championed this form of discourse as “the study of what is persuasive. The issues it examines are social truths, addressed to others, justified by reasons that reflect cultural values. It is a humanistic study that examines all the symbolic means by which influence occurs” (p. 8). Campbell compared scientists for whom “the most important concern is the discovery and testing of certain kinds of truths” to “rhetoricians (who study rhetoric and take a rhetorical perspective) would say, ‘Truths cannot walk on their own legs. They must be carried by people to other people. They must be explained, defended, and spread through language, argument, and appeal’” (p. 3). From this foundation, Campbell reasoned, rhetoricians take the position “that unacknowledged and unaccepted truths are of no use at all” (p. 3). The rhetorical tradition is founded in facts because since the age of Aristotle, rhetors are required to assert and demonstrate their propositions by producing facts.

Facts are the foundation of issue communication. How they are discovered, addressed, framed, and included in decision making becomes a vital part of strategic issues communication. In such cases, truth counts. How the facts are framed counts because it can suggest that the framing privileges one interest against another. One reality is that if scientists discover facts, such as the harmfulness of a product, activists of various kinds may put that fact into play. Thus, they do so from a position that often seems to have more persuasive impact because they are arguing for “public safety,” for instance. As the company or industry addresses the fact, if they only frame it in terms of the interest of the company or industry, that can weaken the role it plays.

Platforms of fact, and other platforms, are put into play in many communication venues: lobbying, legislative and regulatory hearing, direct negotiation and collaborative decision making with various activist and other interested parties, Web sites’ home pages, special reports, commissioned

studies, books, magazines, general mass media of all kinds, news stories, feature articles, press releases, advertisements, talk show appearances, speakers' bureaus and other public-speaking events, various events that are issue centered such as Environmental Protection Days, Internet e-mails, intranet communication, and on and on. Issue communication happens in many media and venue opportunities. These points of engagement are important places for participating in the dialogue. They are a meeting place where other discussants of issues appear.

Such venues are also an important place for issue communicators to discuss values and evaluations, giving their thoughts, opinions, and recommendations on such matters. In addition to putting facts into play that point to actual or potential problems needing solution, activists play an important role in issue communication as they make their case for a higher sense of value. Such value positions tend to indict organizations for some failure in their sense of what values define corporate responsibility. Part of this battle focuses on the willingness and ability of various organizations to know and implement appropriate standards of corporate responsibility. Thus, timber companies are challenged to engage in logging activities that protect species, promote the heritage of old growth stands that take generations and even centuries to replace, and protect water quality by minimizing runoff of sediment and other pollutants. Sometimes in such value battles, companies respond by arguing that their practices are designed to provide low-cost materials for home owners and to stimulate local economies dependent on the logging industry for jobs and taxes. Such typical debates pit different value perspectives against one another.

We can operate out of the logic that given the facts and the evaluation of those facts, a specific (but often contestable) definition of problems results. Given the awareness of problems, advocates conclude, efforts must be taken to solve those problems by creating, refining, or abandoning policies. Thus, we come to the third argumentative foundation of issue communication: platforms of policy. As mentioned above, some of these policy battles don't occur only when activists press companies. They occur within industries and between industries. One of the most important—and famous—led to the adoption of alternating current as the superior form of electric generation and distribution. That standard survives today and defines the efforts of the electric generation industry. Policy battles focus on matters of workplace conditions, environmental quality, fair business practices, equal treatment of all citizens, and such. SIM is inherently connected to democratic society in which various interests contest with one another over which of many policies is best to solve collectively experienced problems.

Another line of analysis in issue communication focuses on identifications. Each side in a controversy asks key publics to join in their view of the world, to identify with their sense of fact, value, and policy. Activists appeal

to general audiences to join the cause—to identify with the organization, its values, its policy recommendations, and the “cause.” It's predictable that companies and even government agencies call for key publics to identify with them. Political parties are a form of identification, as they specialize in cause-oriented appeals. As power is an important aspect of issues management, the number of persons—and the stature of those persons—can be power, something worth calling for through appeals to identification. Herein may lie the foundations for legitimacy and the power of the legitimacy gap.

At least two general kinds of rhetorical problems (Bitzer, 1968) also are worth mention as we conclude our discussion of the challenges of issues communication. Bitzer suggested that persons engaged in issues to debate should realize the importance of recognizing the challenge of rhetorical problems. A rhetorical problem is a challenge that requires one or more spokespersons to make a statement or engage in extended discourse. If an activist group, for instance, claims that a sports apparel company is engaging in business activities that foster sweatshop working conditions, the company (and industry, and probably related industries) now faces a rhetorical problem. What must and should be said and to what end?

A crisis, and many occur in the history of organizations, necessarily creates a rhetorical problem. If senior management creates business activities that lead them to be wealthy while bankrupting the company and harming employees and stockholders, that is a crisis. If governments are not properly prepared to prevent storm damage and to respond if a storm of the magnitude of Katrina occurs, then one or more government entity experiences a crisis. A crisis requires that responsible organizations provide facts, values, policies, and identifications that demonstrate that they have the character to respond appropriately to protect interests that are affected by the crisis. A crisis is a predictable moment; the actual moment of occurrence is difficult or impossible to predict as is the number of persons who will be affected and the magnitude of the impact.

Crises can focus on fact. Did a crisis occur? Who or what is responsible for the crisis? Was the focal organization properly prepared to prevent, mitigate, and respond to the crisis? Perhaps, in fact, the organization thought to suffer the crisis might not be “guilty.” A crisis might not have occurred, or some other entity might actually be responsible. So the crisis can be contestable, but sooner or later the narrative of the crisis will emerge. Responsible organizations are willing and able to accept responsibility (a matter of character) and demonstrate how they can put matters right.

Another context for issues management is the collective management of risk. We can argue that society is formed to collectively manage risks. That rationale can account for the creation and sale of products. For instance, toothpaste is designed and sold to reduce damage to gums, teeth, and breath. Cars are touted as being safe. And in these ways,

various forms of organizational communication address risks through advertising, promotion, and publicity. Organizations also engage in risk communication targeted at recommending lifestyle changes (such as exercise more and reduce weight) as a way to help individuals be more healthy, a public health challenge. Risks also are defined as exposure to chemicals. Actual or alleged presence of harmful chemicals can lead to a product recall. Recently, a lot of attention has focused on contaminated pet foods, adulterated health products such as toothpaste, and the presence of lead in paints on children's toys. These have been associated with lax or fraudulent business practices in countries that manufacture products to be sold into other economies.

A risk manifested, such as a contaminated product, produces a crisis. A crisis can lead to an issue, what should be done to reduce the risk. Issues can lead to crises. If the automobile industry is saddled with engineering energy-efficient cars, that is an issue that can pose a crisis for the industry.

Because of the many ongoing dialogues in society, there is plenty of work for skilled and ethical communicators. These communicators are challenged to understand facts, know the best form of communication engagement to resolve the issue, aspire to associate with commendable values, understand policy positions that are not only limited to defending the organization but also aim at reducing risks and know how to build the foundations of identification.

SIM and Future Practitioners

The future is open to students who want to play an important role in the discussion and debate of public policy themes and bring that knowledge to bear to make organizations both more savvy and more responsive to their changing role in society. SIM calls on individuals who are willing to constantly strive to master facts that are vital to a wide array of circumstances. It asks individuals to think deeply about the values and policies that actually benefit society and demonstrate sound character. It calls on individuals who love to engage in responsible and responsive debate. The outcome of such debate and discourse, however, is not the individual winner but the sense of the collective good, a stronger sense of society. To this end, persons who engage in issues management are continually called on to make society more fully functional.

CAMPAIGN DESIGN AND MANAGEMENT

RONALD D. SMITH

State University of New York, Buffalo State College

The role of strategic planning in public relations is rooted in today's understanding of the profession, an understanding that can move a practitioner beyond being simply a wordsmith or organizational mouthpiece and into a seat at the management table. Practitioners skilled in strategic planning are sought out to help build relationships and solve problems.

This chapter focuses first on some definitions dealing with projects versus campaigns and then on two types of campaigns, proactive or reactive. This chapter goes beyond *projects*, the tasks associated with public relations, such as writing effective news releases, creating an interactive Web site, or orchestrating a knock-'em-dead special event. Such tasks are important, but they are only the tools of the trade. A *campaign* is a systematic framework that underlies many projects. It offers a planned and comprehensive interaction with an organization's environment. For example, a campaign to reduce underage drinking on campus may have a series of associated tactical projects such as a brochure, public presentation, displays, a television program, and student ambassadors offering face-to-face information. Consciously or not, organizations undertake campaigns every time they attempt to build a new client base, increase membership, raise funds, generate support for positions and policies, respond to criticism, react to crises, or otherwise seek to influence their environment. In short, campaigns are *strategy*, the problem-solving and relationship-building function of organizations that creates messages to be carried by the *tactics*.

Public relations campaigns may be *proactive*, initiating a focus on the opportunities before the organization, or *reactive*, responding to problems or crises. Either way,

campaigns are in a carefully implemented planning process that is part of the management function of an organization. This is a four-phase process that (1) begins with formative research, (2) focuses on strategic decisions, (3) creates and implements a range of communication tactics, and (4) concludes with evaluative research. Some see this as a cyclical process, though perhaps a spiral would be a better metaphor. Strategic planning for public relations involves a series of information gathering, decision making, implementation, and evaluation, leading to another set of information gathering, decision making, implementation, and evaluation, and so on.

Background: What Is a Strategic Public Relations Campaign?

Developing as it has out of journalism, public relations is rooted in the communication of messages: messages about organizations—more specifically, directed messages intended to generate good will, understanding, and support for the organization. Many veteran practitioners made the transition from journalism to public relations rather seamlessly, generally by applying what they had learned in journalism to public relations. It was a simple transfer process. Past job descriptions for public relations often read as a sort of journalist-in-residence, with the most common tasks of the practitioner being to generate news releases, edit internal publications, give speeches, organize displays, and perhaps produce organizational videos. This is the role of a *communication technician*, a specialist in the tasks associated with public relations and

still the role of most entry-level newcomers to public relations. The distinguishing characteristic of technicians is the level of autonomy; they generally do not make their own decisions but rather implement the decision of others, and they seldom are asked for advice beyond their specialty skill.

Public relations' role has evolved as organizational needs expanded beyond mere dissemination and as the knowledge base expanded to draw on organizational communication, persuasion, relationship building, and problem solving. Lean times caused many businesses and organizations to hold public relations accountable for its impact on the bottom line: product sales, enrollment, fund-raising, attendance, membership, and so on. Like other organizational players, public relations was expected to know its role well, perform effectively and efficiently, and document its success.

Meanwhile, books and articles were being written positioning public relations as part of the management function within organizations. Insight was being drawn from the academic disciplines of business, sociology, and psychology. More than simply an organizational mouthpiece, public relations practitioners were becoming seen as counselors and advocates appreciated for their insight and management ability and considered for a seat at the table and a voice among the decision makers. *Tactical managers* make decisions on specific and practical day-to-day issues: news release versus news conference, brochure or Web page, four color or spot color. *Strategic managers* make more nuanced high-level decisions concerning trends, policies, and organizational structure. They determine what issues to deal with, gauge the crisis readiness of the organization, and prepare other executives for media interviews. Strategic managers develop the message, then let the tactical managers decide how best to handle dissemination.

Today, people preparing for careers in public relations have two complementary goals: to master an entry-level skill in order to obtain a job as a communication technician and to begin developing insights and amassing experiences that will move them toward the role of a communication manager. It is no longer enough merely to know how to write effectively, though this certainly is important. It's not enough even to be able to creatively package messages and tactics, though this too is necessary to position an organization or client vis-à-vis the competition. Creativity and excellent writing need to be directed, for without a clear focus, creativity risks becoming mere novelty and writing devolves into wordiness. Careful crafting and creative presentation of messages need to flow from a clear and methodical process of planning. Public relations practitioners must know what is important to their organizations, how public relations fits into the organizational response to problems and opportunities, and who the important publics are. They need to know what to do, why it is important, and how to evaluate its effectiveness. We call this process *strategic communication*.

The job of strategic communication planning calls for four specific skills: (1) understanding the why, what, and how of research and planning; (2) being able to make strategic decisions by setting goals and objectives; (3) knowing how to creatively and effectively implement those decisions and carry the organization's message to its publics; and (4) completing the process by measuring the outcomes and evaluating the effectiveness of the program.

Theory Base: Learning From Other Disciplines

Applying theory to a topic such as campaign management is perhaps a misleading venture, because there is no single source for the theoretical underpinnings. Public relations draws quite naturally from theoretical understandings in both interpersonal communication and mass media. For example, Aristotle's rhetorical concepts of ethos, logos, and pathos give a foundation for organizational choices for message sources and the logical/emotional content of messages. Paul Lazarsfeld's (1944) theory of the two-step flow of communication, later evolved into a multistep flow, provides a base for an organization's efforts to employ both interpersonal communication and mass media in their persuasive campaigns.

The theory of *agenda setting*, associated with Maxwell McCombs and Donald Shaw (1972), offers insight into how organizations can tap into the issues on which the media focus. Two other concepts are associated with agenda setting. *Framing*, the rhetorical packaging of a message to affect meaning and interpretation, is attributed to Erving Goffman (1974), who drew on earlier work on framing in economics. *Priming*, the role that media-presented information plays in establishing standards for audiences to make political and social judgments, draws on the political science research of Shanto Iyengar, Mark Peters, and Donald Kinder (1982).

Another source of theoretical concepts for public relations is organizational management. From organizational sociology, for example, W. H. Evan (1976) drew the concept of *linkages*, patterns of relationships that exist between an organization and its various publics, and James Grunig and Todd Hunt (1984) adapted these into their process for managing public relations.

From classical rhetoric, Keith Michael Hearit (1994) drew on the concept of *apologia*—the formal and public defense of one's positions and actions—as offering organizations a strategic opportunity, particularly in times of crisis. William Benoit (1995) advanced the theory of *image restoration* on the premise that criticism offers an opportunity to rebuild a positive reputation.

Social psychology is another fertile theoretical base for public relations. One framework for analyzing publics is found in Abraham Maslow's (1968) theory of *human motivation*, commonly called the *hierarchy of needs* based on

the concept of *prepotency* (the order in which human needs must be met). Meanwhile, the study of *psychological type*, developed out of the work of Carl Jung by Isabel Myers and Catharine Briggs (Myers, 1987; Myers & Myers, 1980) and the derivative work of David Keirsey and Marilyn Bates (1984), provides a framework for developing persuasive messages based on the psychological predispositions and temperament.

From the study of business and marketing comes the concept of *positioning*, the development of a perception about an organization and its products, messages, and so on. Al Ries and Jack Trout (1987) explained that positioning is not what is done to a product but rather what is done to the mind of a person hearing about the product. The pattern of awareness-acceptance-action in public relations objectives neatly parallels the *AIDA* pattern (attention, interest, desire, action), which has been part of the theoretical base of advertising since the 1920s (Lipstein, 1985).

Education also has provided a theoretical source for public relations, such as measures of *readability*, including the *Fog Index* associated with Robert Gunning (1952), which assists public relations writers in presenting messages that are understandable to readers.

Methods: The Four-Stage Planning Process

There are perhaps as many different approaches to strategic planning for public relations campaigns as there are practitioners. However, the planning process generally involves a four-stage approach, which has become common within the profession. Most contemporary textbooks dealing with public relations encourage a four-phase process. Some use acronyms to outline the process. For example, John Marston (1963) in *The Nature of Public Relations* outlined the RACE (research, action, communication, evaluation) acronym. In *Public Relations Cases*, Jerry Hendrix (2003 and previous editions) used the acronym ROPE (research, objectives, programming, evaluation). In *Public Relations Campaign Strategies*, Robert Kendall (1999) offered RAISE (research, adaptation, implementation strategy, evaluation) as another formula. Most public relations textbooks, however, simply refer to a four-stage process without constraining it into an acronym. In *Strategic Planning for Public Relations*, Smith (2009) offers the model of four phases subdivided into nine steps, the process echoed below in this chapter.

Marketing communication books similarly present a step-by-step process, though with little consistency about the number of steps involved and less reliance on acronyms. In his cross-over text *Social Marketing*, Philip Kotler and his colleagues (Kotler, Roberto, & Lee, 2002) identify eight steps in four general stages that focus on (1) analysis of the environment, (2) identification of audiences and objectives, (3) development of a strategic approach, and (4) development of the implementation plan.

Drawing on the common four-stage process, here is an outline of an approach to strategic planning for public relations campaigns. Essentially, it involves tactics growing out of strategic planning, with the entire process bracketed by preliminary analysis and concluding evaluation.

Phase 1: Formative research

- Step 1: Analyzing the situation
- Step 2: Analyzing the organization
- Step 3: Analyzing the publics

Phase 2: Strategy

- Step 4: Establishing goals and objectives
- Step 5: Formulating action and response strategies
- Step 6: Developing the message strategy

Phase 3: Tactics

- Step 7: Selecting communication tactics
- Step 8: Implementing the strategic plan

Phase 4: Evaluative research

- Step 9: Evaluating the strategic plan

The succession of these steps is deliberate, and they need to be taken in sequence. After identifying a problem, it is tempting to skip ahead to seeking solutions, but leaping over research and analysis can result in unwarranted assumptions and false steps.

Phase 1: Formative Research

During the first phase, attention is on gathering information and analyzing the situation. The planner draws on existing information available to the organization and creates a research program to obtain additional needed information. Fran Matera and Ray Artigue (2000) call this *strategic research*, the systematic gathering of information about both issues and publics that affect organizations, particularly those organizations that are engaged in a two-way communication relationship with their publics. They also identify *tactical research*, which helps guide communication projects and activities that are implemented within the campaign.

Step 1: Analyzing the Situation

The first part of strategic research involves a careful analysis of the situation. This involves a process Aguilar (1967) called *environmental scanning*. Howard Chase (1977) called it *issues management*. Whatever the name, the concept had been around since the days of Ivy Lee. Specific formulations vary, but here is a synthesis of the issues management process: (1) identifying issues that may affect an organization, (2) researching each of those issues, (3) considering options in responding to each issue, (4) developing an action plan for the best option, (5) implementing the plan, and (6) evaluating the effectiveness of the response.

Such analysis plays a particularly important role in crisis management. According to the Institute for Crisis Management, only 14% of organizational crises burst

suddenly onto the scene. Rather, 86% are smoldering situations: white-collar crime, labor disputes, mismanagement, environmental problems, defects and recalls, class-action lawsuits, and similar activities that can be anticipated and thus handled through effective issues management.

Step 2: Analyzing the Organization

The second step in the planning process involves a careful and candid look at three aspects of the organization: (1) its internal environment (mission, performance, and resources), (2) its public perception (the organization's visibility and reputation), and (3) its external environment (competitors and opponents, as well as supporters). The SWOT analysis credited to Albert Humphrey of Stanford University provides a useful format for organizational analysis, with its focus on the organization's strengths, weaknesses, opportunities, and threats.

Step 3: Analyzing the Publics

Key publics that interact with the organization on the issue at hand are the focus of this step, which includes an analysis of each in terms of its wants, interests, needs, and expectations about the issue; its relationship to the organization; its level of involvement with various media; and various social, economic, political, cultural, and technological trends that may affect the public. This step revolves around John Dewey's (1927) classic definition of a public as a grouping of people who share a common interest vis-à-vis an organization, recognize its significances, and set out to do something about it. Publics may be internal to an organization (such as employees or volunteers) or external (such as customers or donors). They may serve to support and sustain an organization, or they can be negative forces against it. *Opinion leaders* and *intercessory publics* also play a role in this stage of organizational analysis.

Grunig and Hunt (1984) provided a framework for analyzing publics according to their stage of development: latent, aware, and active publics and nonpublics, based on their level of conscious involvement with an organization over a particular situation. Smith (2003) adds the concept of apathetic publics, those that know but don't care about a situation.

Phase 2: Strategy

The second phase of the planning process presents the decision-making stage of campaign development. It is here that direction is set, options and alternatives are considered, and messages are created.

Step 4: Establishing Goals and Objectives

Ever since Edward Bernays (1955) talked about "engineering consent" in the 1940s, public relations has been

associated with strategic action toward public influence. This step focuses on the ultimate position being sought for the organization and its product or service. In a classic application of management-by-objectives to public relations, Norman Nager and T. Harrell Allen (1984) used the analogy of transportation: Goals provide direction, while objectives pinpoint the destination. Within campaign development, serious attention is given to the identification of goals (general statements rooted in the organization's mission of what the campaign seeks to achieve) and objectives (specific statements that are rooted in the goals, addressed to a specific public, linked to research, and focused on impact that is explicit, measurable, and time definite). Objectives generally are presented in a hierarchical triad that addresses the desired impact on knowledge/awareness, attitude/acceptance, and action.

Step 5: Formulating Action and Response Strategies

In every public relations situation, the organization has a range of options on what to do and say. The "doing" part first involves decisions about being proactive or reactive. Proactive strategies focus on the organization's performance and efforts to improve or adapt to new conditions. Organizations connect with their publics through audience participation and engage their colleagues through alliances and coalitions. Activism is another proactive strategy that allows organizations to engage supporters in advancing a cause. Finally, organizations engage the news media, particularly by exploiting the newsworthiness of information and events associated with the organization.

Reactive strategies often draw on the concepts of apology, reputation, and image. Options include offensive responses such as attacks or threats, as well as defensive responses such as denial, excuse, and justification. Also in this category are diversionary responses such as disassociation and relabeling and vocal commiseration such as expressing condolence, regret, or apology. Responsive strategies also involve rectifying behavior such as investigation and corrective action.

Step 6: Developing the Message Strategy

This step deals with various decisions about the message: identification of persuasive sources who will present the organization's message with credibility and charisma; the message content, tone, and style; verbal and nonverbal cues; and related issues.

Of particular importance to this step is the selection of an appropriate spokesperson. Research identifies three characteristics of a persuasive message source as a person with credibility (based on audience perceptions of expertise, honesty, competence, and status), charisma (based on likability, presumed familiarity by the audience, and similarity to the audience), and control (the degree of authority

or power the message source has over the audience). A related question is the relationship of the spokesperson to the organization—celebrity, typical consumer, organizational official, professional colleague, and so on.

Phase 3: Tactics

The third phase of the planning process deals with tactics, the visible elements of the campaign. Tactics are what the audiences see, the communication vehicles that carry the organization's message and allow the organization to interact with its publics.

Step 7: Selecting Communication Tactics

This inventory deals with the various communication options. Specifically, the planner considers four categories: (1) face-to-face communication and opportunities for personal involvement, using venues such as speeches, seminars, demonstrations, and special events; (2) organizational media involving communication vehicles such as brochures, newsletters, direct mail, Web sites, CDs and DVDs, and other media through which the message content, packaging, and dissemination are controlled by the organization; (3) news media such as newspapers, magazines, news services, radio, television, and online news outlets, through which the organization works with journalists and media gatekeepers to present its message; and (4) advertising and promotional media, another form of controlled media, often with a hefty price tag, involving outlets such as print and broadcast advertising, Web-based promotion, and out-of-home advertising and organization-directed promotional items such as clothing, consumer items, and accessories. While all these tools can be used by any organization, not every tool is appropriate for each campaign, and it is in this step that the repertoire is considered, options are analyzed, and tactical choices are made.

Step 8: Implementing the Strategic Plan

This step focuses on the administration of the tactics identified in the previous step and on managing them into an effective public relations campaign. It involves the development of schedules and the assignment of accountability for tasks. This step includes full budgets that account for personnel (with the fair-market value of pro bono work as well as the involvement of people on the organizational payroll), along with costs of material, media buys, equipment and facilities, and administrative expenses.

Phase 4: Evaluation

The final phase rounds out the process with a focus on evaluation and assessment.

Step 9: Evaluating the Strategic Plan

While formal evaluation cannot be undertaken until the campaign is under way (via progress reports) or completed (final evaluation report), plans for such evaluation are made before implementing the campaign tactics. Generally, this planning involves returning to the goals and objectives articulated in Step 4 and applying them to each of the tactics identified in Step 7. Each tactic is measured and analyzed in light of the expected outcome articulated through the objectives.

Research design for evaluation includes both before-after studies and after-only studies, though the former are generally more useful because they provide a basis of comparison. Research methodologies can begin with judgmental assessments (informal personal observations) and measurement of communication outputs (message production, distribution, and cost). But more useful are evaluations based on the campaign objectives: awareness measures such as message exposure, readability, and recall; acceptance measures such as audience feedback and benchmark studies; and action measures such as audience participation and direct observation of impact, such as voting or attendance figures.

Application: How Strategic Campaigns Work

In the past, public relations existed rather autonomously from other functions in most organizations, whether corporate or nonprofit. Public relations purists considered "marketing" a four-letter word; some academics and some practitioners railed against comingling the two disciplines. As a part of marketing, advertising enjoyed large budgets, which necessitated a high level of accountability. Fewer eyes watched the smaller numbers in public relations. But through strategic communication, public relations has become part of a coordinated plan of action rooted in the organization's mission and focused on its bottom line. Such planning comprehensively uses all the communication tools available, from publicity to advertising and beyond, to present the strategic message.

Tom Harris (1993) called integrated communication an outside-in process that begins with an understanding of the consumer publics, with public relations as particularly effective in building brand equity. Helen Ostrowski (1999) of Porter Novelli found marketing-oriented public relations at the root of public relations. After all, it was the founding father Edward Bernays who engineered a debutante march in New York City's Easter Parade aimed at making smoking acceptable for women so his client, Lucky Strike, could sell cigarettes to a new market.

Examples of strategic campaigns can be seen all around. It is a common feature in the offerings of agencies providing the standard range of public relations services. Other places where integrated strategic campaigns can

commonly be found are in marketing communication, public health and social marketing campaigns, diplomacy and international relations, constituent relations, and ecumenical or interreligious affairs. Public relations itself is sometimes known by alternative names, often linked to auxiliary areas such as media relations or employee communication; businesses call the function corporate communications.

A process of research-based strategic planning is necessary for effective management of all the various subcategories of public relations, including community relations, special events planning and promotion, political campaigns, nonprofit events, and fund-raising and development (Austin & Pinkleton, 2001). Similarly, we can add other elements of strategic public relations that rely on a base of research and strategic planning: public affairs, issues management, crisis communication, public information, consumer and customer relations, lobbying, investor relations, and so on. Some new specialties include litigation public relations, risk communication, and reputation management.

New names are emerging to reflect the emerging multidisciplinary approach, which sometimes is called *strategic communication* or *integrated communication*. Regardless of the label, we look to public relations for leadership and insight in the practice of strategic communication, because most of the related fields and specialties have adopted the set of skills and approaches that public relations has developed over the past 75 years or so (Botan, 1997; Botan & Soto, 1998). Meanwhile, public relations is beginning to more consciously borrow techniques and practices associated with other disciplines, particularly marketing and one of its primary communication tools, advertising.

Strategic planning for communication, based on this integrated model, occurs globally. Philip Kitchen and Don Schultz (1999) reported that the concept is gaining acceptance not only in the United States but also in the United Kingdom, New Zealand, Australia, and India. The author has had personal contact with public relations professors in Russia and Japan, communication doctoral students in Turkey and Hong Kong, and the Azerbaijan Public Relations Association expressing interest in this strategic planning model. Leading public relations agencies in Japan, the Philippines, South Africa, Brazil, and Egypt offer integrated communication services. Companies such as Saturn, Xerox, Motorola, Hewlett-Packard, and Federal Express have been extolled as examples of companies that have effectively integrated their strategic communication.

Case Studies: Real-World Examples of Strategic Campaigns

Some of the most successful corporations integrate into their public relations campaigns a blend of publicity and advertising to present a clear and consistent message to

their publics. For example, when McDonald's introduced its McLean sandwich, it used publicity and other public relations tactics to create awareness through the media and then followed them up with advertising messages. It was publicity that enabled Goodyear to sell 150,000 new Aquatred tires before the first advertisements ran, and it was publicity that led Pfizer to sell \$250 million of Viagra and gain a 90% market share before any consumer advertising began. Crayola Crayons generated \$23 million in sales based on a \$35,000 publicity campaign built around a Crayola Hall of Fame.

Nonprofit organizations also have successfully used integrated communication approaches. One study suggested that nonprofit organizations are particularly open to the coordinated use of public relations and marketing communication techniques (Nemec, 1999). For example, the American Cancer Society used an integrated approach for its campaign for sun block. Similar efforts have been adopted by social campaigns dealing with bicycle safety, teen smoking, animal rights, birth control, utility deregulation, and AIDS research.

Integrated campaigns often begin with publicity, followed by advertising. Al Ries and Laura Ries (2002) noted this in *The Fall of Advertising and the Rise of PR*: "The purpose of advertising is not to build a brand, but to defend a brand once the brand has been built by other means, primarily public relations or third-party endorsements" (p. xiv). "Advertising cannot start a fire. It can only fan a fire after it has been started" (p. xx). They provided an overview of organizations that have achieved success with this format: Wal-Mart became the world's largest retailer with little advertising; Starbucks spent less than \$10 million in advertising during its first 10 years; Harry Potter books soared to previously unheard of sales without any appreciable advertising. *The Art of War* surged onto the best-seller list when Tony Soprano told his psychiatrist in *The Sopranos* TV series that he liked the book.

Comparisons: Public Relations in Different Cultures

Public relations campaigns are created and implemented throughout the world, often with similar approaches. However, effective campaigns also take into account the cultural environment of both the organization and the publics. Thus, public relations planners must be aware of and sensitive to cultural issues, not only how cultures differ but also how those differences affect public relations strategic planning. It is important to keep in mind that public relations practice has largely been rooted in Western culture, practiced by Western-oriented organizations, and intended for Western audiences in Western environments. Yet public relations can be applied to non-Western situations but often with cultural accommodation.

Public relations planning also takes into account cultural approaches based on the oral tradition of non-Western cultures. Metaphor, analogies, and storytelling, for example, are part of an oral tradition more appreciated in Arab, Asian, and Native American cultures than in Western/American society. This is true also of Hispanic culture even in the United States, true also for various geographic/demographic differences in the United States. Thus, public relations directed toward such audiences will employ more strategic use of story, linguistic symbols, and allusion to events and persons relevant to those publics. A campaign aimed at Native American communities, for example, might reflect the cultural appreciation for family, nature, and heritage. Likewise a campaign developed for use in Hispanic communities will take into account the rich diversity within Hispanic America.

Consider an example within an Arab cultural setting. Ali Kanso, Abdul Karim Sinno, and William Adams (2001) noted that public relations campaigns in Arab culture need to take into account the indirect, often symbolic aspect of Arab communication style, the high-context nature of Arab communication that imbeds meaning not only in common language codes but also in interpersonal relationships. The nature of language also is important; English is a practical code useful in transferring information, while Arabic is a more artistic code that fosters the creation of a social experience. They also noted important social differences. For example, Arabs share a common nationality amid many different countries, whereas Americans have a common country but many different nationalities. Americans tend to treat religion as a more private matter than Arabs. America is more youth oriented, whereas Arab cultures give more value to age and wisdom.

A second example is an Asian public relations situation involving a crisis. Amon Haruta and Kirk Hallahan (2004) studied similar Japanese and American airline air crashes that occurred only 10 days apart, each resulting in hundreds of deaths. Japan Air Lines handled its crisis in typical Asian fashion, within a culture that values formal rules, the importance of reputation, the speedy delivery of bad news to the media, the desirability of social harmony, the avoidance (even shamefulness) of litigation, and the importance of public apology. Japanese culture also presumes male organizational leaders who accept responsibility, are visible in crisis situations, and take decisive action. Each of these is vastly different from the typical American response to crisis. Delta Airlines, on the other hand, operated within an American framework, in which CEOs are reluctant to be part of bad news, where litigation is presumed and thus organizations try to remain tight-lipped, where responsibility is avoided and apologies are anathema, and where action is tentative at best.

The third example stems from the 2007 Cherokee citizenship vote that ended in a decision to recognize Cherokee blood as a key element in eligibility for status as a tribal citizen. The decision thus removed citizenship for

the Freedmen, descendants of pre-Civil War slaves whom the federal government had forced into Cherokee citizenship a century ago. Content analysis of media coverage (Smith, 2007) showed that journalists framed the story in different ways—most as a civil rights issue oppressing black Indians, some as a self-determination issue for a sovereign Indian nation, a few as the inevitable result of former federal policy that 100 years ago arbitrarily mixed two distinct and disenfranchised groups. Both the Cherokee and the Freedmen mounted public relations campaigns to give their perspectives on what became the focus of international news coverage. Though pointedly different, each campaign included messages that sought to present historical information in a context to explain contemporary events.

Future Directions

The emerging relationship between public relations and marketing on which integrated communication is founded can be uneasy at times. At the management table, the marketing side has accepted the partnership with public relations, though perhaps still in a subsidiary role. Robert Gray (1998) reported a British survey that public relations is no longer peripheral but rather “one of the most important elements of the marketing mix” (p. 24). The survey by Countrywide Porter Novelli, one of the largest public relations firms in the United Kingdom, reported that 92% of marketing directors believe that public relations is integral to business objectives, 58% said that it is of equal importance with advertising, and 66% expected public relations spending to increase. Philip Kitchen and his associates called this integrated strategic model the major communications development of the last decade of the 20th century (Kitchen, Brignell, Li, & Spickett Jones, 2004).

On the other hand, when the Association for Education in Journalism and Mass Communication suggested integrating public relations and advertising into a shared curriculum reflecting practices in both fields, the Educational Affairs Committee of the Public Relations Society of America quickly opposed such a blending. Nevertheless, the biggest growth area in public relations education is in schools that blend public relations and advertising/marketing communication. A study by two practitioners-turned-academics—Debra Miller, a former PRSA president, and Patricia Rose, the former president of the Miami Advertising Federation—reported that practitioners embrace an integration that leaves the educational community with mixed feelings. They said that practitioners accept integrated communication as both a necessity and a reflection of real-world practice (Miller & Rose, 1994).

More ominously, some unwanted links between public relations and marketing are emerging that give pause. At root is the historic legal reality that the government can place some limits on advertising messages, restrictions that some

are now eyeing as potentially being applied to news- and publicity-oriented communication by organizations. Writing in the *Journal of Advertising*, Kathy Fitzpatrick (2005) noted several legal challenges to integrated communication, in which, because of the blending of commercial speech and political expression, more potential has been created for courts to regulate corporate messages. This is happening both in the states and at the federal level. While the U.S. Supreme Court has not yet specifically addressed the question of whether and/or how to apply advertising limits to organizational public relations, some lower-court rulings could serve as precedents.

A pertinent example is a significant case, *Kasky v. Nike, Inc.* (2002). The consumer activist Marc Kasky sued Nike under false-advertising provisions over its public defense against charges of using child sweatshop labor. A trial court ruled in favor of Nike, which had presented a First Amendment defense, and an appeals court affirmed that decision. But the California Supreme Court overturned those decisions and upheld Kasky's claim that Nike had engaged in "commercial speech" (a legal euphemism for advertising), which enjoys fewer First Amendment protections than other forms of speech (including public relations messaging). This ruling came despite the fact that the company had done no advertising but instead had used traditional public relations practices—news releases, Web site, speeches, and letters to the editor—to defend against the child-labor charges. In essence, the court said that Nike had mixed commercial and political speech, and thus could be held to the narrower regulatory standards allowed for commercial speech. An out-of-court settlement in 2003 ended the 5-year legal battle but did not settle the legal question of where public relations ends and marketing begins.

Fitzpatrick (2005) concluded that "perhaps the most important finding is that public relations expression is not fully protected under the First Amendment as both conventional wisdom and some scholarly studies have suggested" (p. 99). Conversely, she also concluded that

not all public relations communication will be automatically categorized as commercial if a company integrates its communication functions. The Supreme Court has made it clear that corporations enjoy the right to engage in fully protected speech in the political arena. (p. 99)

The future of integrated strategic communication, then, is likely to include greater care on the part of organizations in framing messages that clearly separate the commercial from the noncommercial elements, as well as more potential lawsuits dealing with the balance.

Conclusion

Both the design and management of public relations campaigns are strategic functions that underlie the potential

success of the tactical and task-focused projects associated with them. Well-planned and well-managed campaigns provide the ground bed and structural framework for the public relations activities of every type of organization. Effective campaigns are rooted in knowledge gained through research on the issue, organization, and publics. They are designed to meet particular goals and objectives and to implement carefully crafted action steps and messages that further the organization's mission. They involve a range of tactics that allow the organization to interact with its publics and present its messages. And finally, effective public relations campaigns are evaluated against the intended impact that was sought by the organization for each public.

CRISIS COMMUNICATION

KATHLEEN FEARN-BANKS

University of Washington

A crisis, by definition, is not a mild occurrence; however, the degree of damage caused by a crisis can vary greatly from adversely affecting normal business operations to putting companies out of business or toppling governments. A crisis can cause temporary public humiliation; it can force the resignations of heads of organizations. A crisis can place an individual popular to mass audiences on the road to obscurity.

All companies, organizations, and individuals who depend on image and/or reputation to be successful should always accept the fact that they are always in a stage of crisis.

A crisis has five stages: (1) detection, (2) prevention/preparation, (3) containment, (4) recovery, and (5) learning. These stages can overlap and an organization (from this point on, “organization” refers also to companies, other businesses, and public individuals) can be in more than one stage at a time.

The *detection stage* should be a process of constantly monitoring one’s operation for signs of impending crisis. *Prevention* is taking steps to avoid a crisis, putting out little fires before they become infernos. Closely connected to *prevention* is *preparation* or planning how one would fight the crisis should it occur. The first two stages can only be advantageous to an organization when there is no crisis. It is much too late to plan a course of action when one is forced to communicate to publics immediately, rapidly, and frequently.

Containment is the stage after the crisis has occurred, and the goal is to end it as soon as possible; get out of the newspapers; and not let one’s bad news be a continuing topic of popular conversation.

Recovery is the desire and effort to return to normal operations. *Learning* is the process of being careful not

to make mistakes, oversights, decisions, and omissions that caused the crisis.

If an organization has never suffered a crisis, it is always in the detection stage as well as the prevention/preparation stage. If the organization has recovered from a crisis, it is, or should be, in the learning stage, the detection stage, and the prevention/preparation stages. Consequently, principles to follow, policies to adopt, tactics to make can sometimes, but not always, be categorized into the five stages.

Stage 1: Detection

Develop a policy of watching and heeding prodromes or warning signs. During almost every news-making crisis or disaster, after the initial shocking story, the news media writes about warning signs that were not heeded. After Hurricane Katrina, in 2005, led to devastating floods in New Orleans and killed and displaced thousands of people, the world learned that there were definite warning signs. Joel K. Bourne Jr. had written in October 2004 in *National Geographic Magazine* a narrative describing mass destruction in New Orleans very similar to the way it actually occurred. The *New Orleans Times-Picayune* had written several articles about geologists’ prediction that considering that acres of coastal wetlands had been lost and that the Gulf of Mexico was close to the city, stronger hits from earthquakes were possible, even likely.

There was severe flooding in New Orleans in the years prior to Katrina, and every New Orleanian knew that the levees could fail, that the city was below sea level, that the big one was overdue. That was why Mayor Ray Nagin, in his warning to evacuate, said, “This is the real deal.”

Much has been written and said about the failure of the federal, state, and local governments to respond to the tragedy, but the critical time for these governments to take action was before the hurricane hit, when the levees and flood walls could be rebuilt to withstand strong hurricanes. The warning signs were the previous floods, the weak-looking levees, and the news articles.

Also, in Blacksburg, Virginia, in 2007, when a troubled student at Virginia Tech shot and killed 32 students, faculty members, and himself, news articles appeared about the warning signs that were not heeded. Professor Nikki Giovanni of the English Department had reported the student to her chairperson because of his strange writing and behavior in class. Students, even his roommates, had found him incommunicative and disturbed. One professor called the young man the most disturbed student she had seen in two decades of teaching. All these were warning signs only seen in retrospect. Afterward, the university adopted some security plans, which it is hoped will help. This is much like closing the barn door after the cows escaped.

In recent years, blogging and blog sites became another form of communication to watch, making every blogger what some call a “citizen journalist.” One never knows the credibility or the expertise of the blogger but what information is placed on sites can be damaging. Organizations should monitor blogs to see what is being said about them and respond when necessary. Also, sometimes attack sites are set up by enemies, competitors, irate employees, consumers, and people who merely take pleasure in knowing that they can be noticed. In mid-2007, Apple’s iPhone made its debut in stores with a big publicity blitz that had consumers waiting in line to buy the product. Tim Klein, Vice President of PR at AT&T, said that the company would communicate with bloggers and online influencers, keeping tabs on what they were saying. “We have a blogger and industry analyst/influencer program that we’re . . . implementing. But we’re obviously also reacting to the activity we’re seeing in the news reported out of these sites and individuals,” Klein said.

Watch crises of similar organizations. They are also warning signs. Other universities scrambled after the Virginia Tech shooting to institute security safeguards to avoid a similar incident on their campuses. This is a particular problem at public universities, where the campus is open to the public because the institution belongs to the taxpayers. After Katrina, other cities in the hurricane area took measures to expedite evacuations. West Coast cities renewed their fear of earthquakes and used the New Orleans crisis as a warning to them to be prepared for “the big one.”

When Pepsi Cola was hit by a crisis caused by consumers placing hypodermic needles in cans of soft drinks so that they could sue the company, the hoaxsters were said to have feared contracting HIV from the needles. The virus is not spread through soft drinks, but for sometime, the public was fearful of drinking Pepsi, and this caused a

decline in sales. Pepsi was able to turn the tide and showed suspicious people that it was next to impossible to place needles in their cans. This was a warning to other soft-drink manufacturers and a time to examine their own operation and determine what they would do if such a ridiculous crisis hit them.

Of course, and unfortunately, such responses to warning signs are short-lived and usually die in the fickle minds of decision makers before real solutions are developed.

Watch for the revealing of corporate secrets that may damage the organization’s reputation. Benjamin Franklin said, “Three may keep a secret if two of them are dead.” If an organization learns or knows that it has committed an error that if revealed to the public could cause furor, a decision should be made as to whether it should reveal the error and take the outcome or hide the error and take a chance of the error getting out later . . . and often in a bigger way. The cover-up can shatter reputations more than the original mistake.

For example, during the Watergate crisis, which led to the resignation of President Richard Nixon in 1974, the original error or crime was the break-in of the Democratic headquarters in the Watergate, a hotel/apartment/office complex in Washington, D.C. It was the cover-up that led to the political scandal, lies in congressional hearings, and the downfall of Nixon and his allies. As Franklin predicted, the secret was not really a secret when pressure was applied.

Similar results could have occurred in the case of Johnson & Johnson and the Tylenol poisoning case in 1982. Cyanide-laced Tylenol capsules had killed five people in the Chicago area. Company officials told the news media that there was no cyanide in the plant so the poison couldn’t have come from the production process. Later, the company learned that there was indeed some cyanide in the plant but there was no way it could get into the capsules. If Johnson & Johnson had kept that information secret, reporters may have found out, and the company would have appeared responsible because of the guarded secret. Instead, the company told the news media about the cyanide and how it was used and that none was missing. The crisis was later eased when the bottles of tainted capsules were found to have originated from various Johnson & Johnson plants, making it extremely unlikely that an internal accident or crime had taken place.

The detection stage of a crisis is the time to stop a problem before it develops into a full-blown crisis. This is also issues management. To detect prodromes, organizations form employee committees that function like lighthouse keepers watching for vessels at sea, watchdogs, and whistle-blowers who report warnings in their own ways. Organizations, then, implement plans to avoid the crisis or at least prepare plans to address their publics and the news media.

Stage 2: Prevention/Preparation

Several theorists have identified the characteristics and practices of crisis communications. If an organization adopts these characteristics and practices *before a crisis*, the theories suggest that the organization will either avoid a crisis or suffer less financial, emotional, and perceptual damages than the organization that does not adopt the characteristics and practices. Therefore, these practices are categorized in Stage 2.

Most of the following characteristics and practices are derived from the excellence theory identified by James Grunig and others.

Design public relations programs for all key publics. In 1992, Grunig and Fred Repper wrote,

An organization has a relationship with stakeholders when the behavior of the organization or of a stakeholder has consequences on the other . . . Ongoing communications with these stakeholders helps to build a stable, long-term relationship that manages conflict that may occur in the relationship. (p. 124)

All of an organization's public relations programs and campaigns are, or should be, designed to build positive relationships with key stakeholders, both internal and external, and prevent crises. It is a basic reason for having public relations in the first place.

The airlines have frequent-flyer programs designed to make consumers loyal to a specific airline. There is a communication program aimed at these flying consumers. This is consumer relations, a type of public relations. After consumers have enjoyed the benefits of the frequent-flyer program—upgrades, free tickets, cheap tickets, shorter lines in airports, and so on, they want their airline of choice to be crisis free. If the airline goes into bankruptcy, the flyers want it to recover. They defend the controversial actions of the airline. They are the first to complain, however, if there is a problem such as late flights, untidy planes, holding passengers on the tarmac for too long. This, too, is a positive move because these frequent flyers are part of the detection stage of a crisis. If they are upset, there are numerous other flyers who are also upset and may decide not to fly that particular airline again. So the loyal flyers are a support group. Their loyalty is for a selfish reason, but it still benefits the airline. Other businesses, such as restaurants and credit card companies, have frequency programs aimed at consumers, all aimed ultimately at increasing sales and buying loyalty.

In addition to consumers, organizations should design PR programs aimed at employees (employee relations), volunteers (internal relations), community groups and leaders (community relations), and other publics, which may be crucial to survival and success.

Develop and maintain strong relationships with the news media. The researcher Francis Marra, also building on the

excellence theory, spoke specifically about the news media being one of the key publics with which organizations should have positive relationships. Editors and reporters should know that PR representatives and spokespersons are reliable, that the news releases emanating from the organization have accurate timely information, that they always get back to the media when additional information is needed, and that they respect the news media's deadlines.

Many people realize that news personnel are often supporters of organizations in a crisis; some must be pushed into being adversaries. One of the earliest "textbook" cases of crisis communications was the Johnson & Johnson Tylenol poisoning case. A *Chicago Sun-Times* editorial employee telephoned asking questions about how the company was organized. He did not know how the information would be used, but he told others at the newspaper that Johnson & Johnson had questions. A reporter called the company to alert them that there had been reported deaths from the intake of Tylenol Extra Strength and provided them with the information gathered at the time.

This gave the executives time to make a plan before the newspaper was published later in the day.

The reporter was not obligated to give the company that information. The newspaper could have held the news and let Johnson & Johnson find out when everyone else found out. However, Johnson & Johnson had a positive relationship with the news media. It had a two-way communications ideology with the news media and with its key publics identified and segmented by its company credo.

Identifying and segmented publics are two other characteristics of organizational effectiveness in the time of crisis. The company credo indicated that its first obligation was to consumers, meaning medical personnel, parents, patients, and others who used its products, people serviced by the news media. Its second obligation was to its employees; next was the community—meaning the neighbors of the plants as well as the world community. In other words, people who are not necessarily customers were concerned and are needed to respect and support the company's reputation. Last, the company was obligated to stockholders.

When the *Sun-Times* story was published, it merely gave the facts; there were no claims or charges made of Johnson & Johnson. The *Chicago Tribune* also had the story on page 1 but the name Johnson & Johnson was not mentioned on the entire page. In fact, some stories mentioned McNeil Consumer Products Company, a lesser-known subsidiary of the company.

A similar story of positive links to the news media occurred in 1998, when, in Seattle, a city bus driver was shot by a disturbed passenger, forcing the driver to lose control of the bus, which plunged over a bridge. Three people died, 32 were injured. The Seattle news media positioned Metro Transit as a victim of the crime, and the national media followed suit. The news media could have

made the stories concentrate on the bus system's failure to protect the passengers. Dan Williams, the PR spokesman from Metro Transit, said that the preestablished relationships with the news media and the quick responses to media requests paid off.

Williams said, "Most of the reporters sympathized with what Metro was going through. . . . [It] was important to have credibility with the media as I tried to make the case with reporters and editors for the effectiveness of our security program." He said that only one reporter, one he did not know, was suspicious and antagonistic.

It must be mentioned that if Metro Transit had had numerous incidents of unsafe buses and if Johnson & Johnson had had incidents of possible internal tampering, the news media would have been obligated to cover the stories in a different way.

The head of communications should be important to top management. Some crisis communications experts say this means that the head of communications should report to the CEO or to another title for the head of the organization. Others maintain that it is only important that top management continually confer with the communications department—usually, but not always, the head of communications—on policy matters and decision making.

The experts who advise that the head of communications report directly to the head of management say that it is the placement of the communications department in the company that is crucial, not only the relationship between the CEO and the communications head. If communications is not highly valued, the communications head may leave the company and the new communications head may not have a "dotted-line" relationship with the CEO, leaving the organization open to a failure to communicate externally or internally.

Frequently, crises arise, and the organization's spokesperson has no idea what is going on. He or she cannot respond easily to the news media and must say, "I don't know; I'll get back to you." While the spokesperson is searching for the answers, the news media realizes that there's a communications gap, that the responses might not be forthcoming, and therefore, they look for the story elsewhere. When the organization loses control, issues can become a news-making embarrassment.

Ron Ziegler was Press Secretary to President Richard Nixon. After Nixon resigned following the Watergate crisis, Ziegler, though claiming to be Nixon's friend, said that unlike other White House staff members, he was never indicted and was not part of the cover-up. Yet he had to answer reporters' questions for which he had no answers during the investigation.

In 1991, *The Washington Post* was researching for an investigative article about United Way of America CEO William Aramony, and the PR staff members were like sitting ducks waiting to be slaughtered. They heard through various connections that the Pulitzer Prize-winning journalist Charles Shepard was gathering information, but they

had no idea what was going to be in the story. They felt from what they had been told by persons who were being interviewed that there were problems and that a scandal might be brewing.

In early 1992, Shepard asked the PR department for some information and an interview with Aramony. The PR staff member said that he got the interview set up and that that process "was much more contact with him than I normally had." The story was primarily positive; Aramony was a man with connections that resulted in a lot of funds being raised for the nonprofit organization. However, the page 1 story had a few paragraphs about Aramony's excessive spending, perks, and large corporate-type salary. It was those few sentences that caused national concern among United Way agencies and the American citizens who donate hard-earned money to charities. This was a severe crisis for United Way and caused the eventual resignation of Aramony.

Develop relationships with communications departments at other organizations that may share the same crisis. If fire is a potential problem, know how to contact the PR people at the local fire department. If a crime is a worst-case scenario, know how to contact the PR people at the police department. This policy paid off for Metro Transit when the city bus went over the bridge in 1998. The PR reps from the transit company, the fire department, and the police department had met prior to the crisis and exchanged phone numbers—office, cell, and home. They agreed that in the event of a crisis, they would only answer questions from the news media that were specific to their own agency's responsibilities. If the question was about the crime that caused the driver to go over the bridge, they would refer the reporter to the police representative. If the question was about rescue, they would refer the reporter to the fire department spokesperson.

This way, there was little chance that the story would have inaccuracies. At the site of the incident, the three met and briefly shared information about the incident, the crime, the number of injured passengers, and so forth. They agreed to inform each other as information changed.

Have a crisis communications/crisis management plan. This is a major step in being prepared for a crisis. The key to the crisis plan is crisis inventory. The organization must decide what the worst-case scenario would be. Too often, organizations are so determined to "think positive" as if thinking positive will prevent something negative from happening. They even say, "It never happened up to now." That's all the more reason why a crisis is likely to occur.

Crisis inventory is a way of determining what crises are most likely and what crisis would be most damaging. A team of key people, not all in management, discuss outcomes and likelihood based on issues and crises befalling similar organizations. Blue-collar workers often see potential crises of which executives are not aware. Then, a crisis communications plan is developed to address the crisis

deemed the most likely and the most damaging. This crisis communications plan can be part of a crisis management plan that would include broader issues such as evacuation and staff changes. More often than not, the crisis communications plan stands alone. It should be handy. Everyone who needs it should have it in advance and should be familiar with it, knowing what each person will do in the event of a crisis.

Some of the crucial components of the crisis communications plan are a director of the crisis communications team and the duties of each member; how key stakeholders will be notified; how the news media will be alerted, who will be the spokesperson(s), talking or speaking points to be emphasized in interviews and news conferences; background data about the organization, and other documents. It should not be so big or unwieldy that crisis team members can't find the information and instructions they need.

During a crisis, many people find that information normally on the tips of their tongues is forgotten. Phone numbers they call everyday are forgotten. Equipment they take for granted is lost during natural disasters when electricity is out. During Hurricane Katrina, Mayor Nagin and his staff not only had no electricity and landline phones, but cell phone towers were also not operative. During an earthquake in Los Angeles, a PR professional had to seek a manual typewriter when there was no power. A crisis plan would indicate alternative supplies and serve as a kind of substitute brain.

One PR practitioner said, "A crisis plan is a waste of paper, a bad reason for cutting down a tree." He and other critics of the plan say that a crisis never happens the way you plan it. This is true, but numerous professionals who had plans and used them through crises say that having a plan for any crisis helps you cope with other crises.

The Pepsi Cola Company never dreamed that hypodermic syringes would be placed in its soft-drink cans, but its worst-case scenarios did include tampering, and the existing crisis communications plan worked well. Often, only the speaking points need to be changed. The stakeholders to be notified remain the same. The crisis team remains the same. Background of the organization is gathered and in one place.

Stages 3 and 4: Containment and Recovery

The tactics of ending the crisis and recovering from the crisis are often similar. In fact, planning recovery is often an effective way of containment. The 9/11 terrorist attacks were not blamed on the airlines, but it was a crisis for the already financially beleaguered airlines because passengers were understandably reluctant to fly. Immediate and increased security, although a nightmare in itself, helped convince potential passengers that airports were making steps to prevent a similar attack. The attack will never be forgotten, but the increased security was a step toward containment and recovery. The airlines/airport communication

personnel notified the public through the news media of the new security standards.

An organizational spokesperson should express sincere concern if there are injuries or loss from a crisis no matter who is responsible. However, the spokesperson should not accept blame if the organization is blameless. The Pepsi Cola Company and Johnson & Johnson both recalled the products in question during their crises even though they did not believe that their employees were responsible. It was important to put the public at ease while the investigation continued.

No one had been hurt by the syringes in the Pepsi can, so there was no reason for an apology, but concern was expressed from the beginning. Carl Behnke, the head of the Seattle Pepsi plant, the site of the first syringe in the can, worked with a PR agency and issued an advisory urging consumers to simply pour the contents of soft-drink cans into a second container before drinking. The crisis cost Pepsi a \$30 million loss in sales, but the communication tactics soon caused sales to rebound.

There had been deaths from the poisoned Tylenol, and the recall was a step of concern that cost the company \$100 million in sales, although Johnson & Johnson's management was certain the poisoning did not take place in its plants. Johnson & Johnson's Corporate Vice President Lawrence Foster also expressed concern and was open and honest with the news media.

Neither Pepsi nor Johnson & Johnson ever accepted blame. The heads of the companies were spokesmen to the news media, insisting that they would be vindicated. Both were.

In *apologia theory*, an organization may make a full apology accepting blame. It may totally deny charges. Or it may try *redefinition*, expressing that it did not intend to commit the misdeed; publics may forgive organizations that are contrite. There is also *dissociation*, in which case the organization informs publics that it may appear that it is guilty but actually it is not. *Dissociation* was the choice Pepsi and Johnson & Johnson made; the public may not have accepted any stronger denial until after investigations were completed.

If the organization has erred, admit guilt and be sincerely sorry. Whether at fault or not, convince publics of a plan to try to prevent a recurrence of the crisis. Make certain the plan is carried out; be true to your word. Again quoting Benjamin Franklin, "How few there are who have courage enough to own their own faults, or resolution enough to mend them" and also "Well done is better than well said." Americans tend to be forgiving as long as the guilty party is truly repentant.

If the CEO of Exxon had come to the site of the Valdez oil spill and cried his eyes out on seeing the birds covered in oil, the newspapers would have written about that, and photographers would have gotten the photo of the man holding a bird and getting oil all over his hands and expensive suit.

And the image of Exxon would have been totally different. As it was, it wasn't the most oil that was ever spilled by a ship, but the CEO's refusal to come to the site told the world that Exxon didn't care.

At the University of Washington in Seattle in 2007, a female employee was shot and killed by a former boyfriend, who ambushed her in her office. As expected, after a couple of days, news coverage turned to security failures at the university. Security at the university became even more urgent because a few days after the news coverage began to die down, a gunman shot and killed students and faculty members at Virginia Tech.

The two shootings were different in that the Virginia shooting was random and the Washington shooting was relationship oriented. Norman Arkans, Vice President of University Relations at Washington, commented, "The Virginia Tech incident magnified our incident. They were different in cause and effect but both occurred on college campuses and were thereby linked in the media."

Immediately after the shooting, senior-level administrative meetings were held to deal with understanding what had happened and to communicate with the family of the deceased, the students, and staff in the College of Architecture (where the shooting occurred), and the broader campus. "It became apparent right away," said Arkans, "that we needed to understand more about relationship violence and how to provide resources." After the university president expressed concern both publicly and directly to the family of the deceased and her colleagues in the college, the president appointed a broadly representative committee to evaluate resources and support mechanisms for dealing with relationship and workplace violence and to implement a more streamlined and focused program for people seeking advice, guidance, and help of any sort.

Some of the improvements were the following: (1) a 24-hour hotline for people in need of protection, (2) a poster distributed widely with the hotline phone number, (3) a reinstated campus Nightwalk program, (4) a new workplace violence Web site, and (5) a plan for annual training of faculty and staff.

Other than the presence of the organizational head in a news-making crisis, the PR specialist should be the primary spokesperson. Crisis communications experts (particularly the theorist Francis Marra) agree that public relations should have autonomy to speak during a crisis. A crisis is often won or lost in the first few hours of communications with the news media, and PR professionals should know how to present themselves to the organizations' advantage. Lawyers tend to be more concerned with their battle in the courts and fears of litigation than with reputation and image. They choose words to limit liability. If the battle in the court of public opinion is lost early in the crisis, the organization's image is negative and the battle in the court will be even more difficult.

If reputation is protected or gained, the lawyer's job may be easier. However, the legal staff and the PR staff

should be in communication before statements are made. During the prevention/preparation stages, the two staffs should discuss actions to be taken during worst-case scenarios so that when a crisis hits, the discussion is not new.

Several corporate crises were adversely affected because PR persons did not have autonomy, including the Exxon Valdez oil spill and the Firestone 500 tire crisis.

Select an appropriate expert to be a spokesperson as well as a person ranking high in management. If there are deaths, significant injuries, and great financial loss, the CEO or some high-ranking officials should be the spokesperson for the company. As already mentioned, this was one of the problems in the Exxon Valdez oil spill crisis. A front-page crisis is not a time for the PR person who is normally spokesperson to represent the organization; the publics expect to see and hear from the head of the organization, a person who can make promises on behalf of the organization and represent its concern. The PR professional can only "represent" the management of the organization and speak words accepted by the public as perhaps coming from top management but perhaps not.

The spokesperson in a front-page crisis should not be an external PR consultant. David Marriott, a PR consultant who specializes in crisis communications at Gogerty Stark Marriott, Inc., advises his clients to never put "the hired guns out front." He said,

I believe companies should speak for themselves—not hired consultants or their lawyers—except in certain cases. The media prefers someone from the company, plus, I believe that a company spokesperson carries greater credibility with the public. Outside PR experts can be a valuable resource to a company going through a crisis and should be used for that purpose.

Often, an organization in crisis will improve its situation by having, in addition to the company representative, an expert in a related field who can persuade publics. This person should not only be highly credible in the subject field but also be able to speak in simple English and not jargon. Often after earthquakes, seismologists are used in news conferences to explain to the public the technical aspects of tremors. After fires, fire investigators explain the causes of fires. Sometimes, organizations err when these experts, though highly qualified in their fields, either speak with foreign accents or are unable to depart from technical language and therefore become nearly useless.

Tropical Fantasy, a New York soft-drink manufacturer, selected the right spokesperson when it was hit by a crisis caused by the outrageous and possible malicious rumor that its beverage caused sterility in African American men. This was 1991, when the city's mayor was David Dinkins, an African American. At a news conference, the mayor drank a Tropical Fantasy drink to prove to witnesses that the drink was safe. In this case, the mayor's credibility was that he was a black man and the most notable black man in the city.

In the case of a restaurant called Snapps in Florida, a rumor circulated among high schoolers that a manager with the AIDS virus had intentionally bled into the hamburger meat. In this case, no one died and no one was injured. The restaurant chain headquarters was located in another state, so an expert was used as a spokesperson. First, all the managers in the restaurant volunteered to be tested for the HIV virus; none were positive. Also, the director of the local health department told news reporters and the public that all the managers tested negative and also that AIDS could not be transmitted through food and that it was safe to eat at Snapps. The news conference was held at the office of the health department, where TV news cameras would focus on its building or its name as an establishing shot.

Don't blame others. Shifting the blame is a strategy tried but rarely successful in the recovery stages of a crisis. First of all, it doesn't end the news coverage; it compounds it. And sometimes the shifting backfires when other organizations or individuals refuse to accept blame. Shifting the blame occurs easily when reporters and others ask the baited question "If you're not responsible, who is?" Don't take the bait.

Exxon's CEO Lawrence Rawl blamed the officials of the State of Alaska and the U.S. Coast Guard for its crisis after the oil was spilled and continued to spread while arguments ensued over who was to clean up and how. Rawl said that Exxon's hands were tied because it couldn't get authorization to clean up the oil or use dispersants. Actually, it was the responsibility of the Alyeska Pipeline Service Company, a consortium of several oil companies working on Alaskan waters. Exxon was only part of the consortium. However, the public never accepted any placing of blame elsewhere. Newspapers and television news stations ran photos and footage of the ship that leaked the oil, and it had the name "Exxon" on it. So, to most people, Exxon was responsible. The other oil companies in the consortium were not anxious to share the great public shame Exxon faced.

Be prepared to lose access to normal tools and facilities. During natural disasters, electricity and other utilities are often, very often, not available. During Hurricane Katrina, not only electricity but also landline telephones and cellular phone towers were down. Drinking water was not available. During a California earthquake, PR staff members of one university found their building condemned. They had no phone numbers, media lists, or access to computers. They located an ancient manual typewriter and used a car for an office during the first day of the disaster.

The 9/11 terrorist attack in New York had numerous companies scrambling to locate surviving employees. All employees should know how to report in when the work site is gone or damaged. Crucial information about employees as well as important day-to-day operations should be available offsite at a place known to employees.

Tell your own bad news, first if possible. Telling one's own story has always had its advantages. There is less fear of

misunderstanding and misquoting if the complete story originates from the company in crisis. Some organizations call news conferences and reveal the details of a crisis. Some give the story to one newspaper known to be accurate and let other media get the basics from that newspaper. In recent years, it has become crucial for an organization in crisis to put its own information on a Web site for all to see—reporters and concerned publics.

An Alaska Airlines plane crashed off the coast of California in 2000, and within an hour, its communications team had placed the story on a Web site used by employees but easily accessible by the media. News media, as well as consumers and employees, accessed all the information Alaska had up to that point, before a news conference could be called. The information was updated as new information was acquired. This was one of the first major companies in crisis to use its Web site to get the word out immediately. Crisis Consultant David Marriott said, "It became a huge asset for us in getting out to a variety of audiences. Alaska now has a crisis Web site which can be activated quite quickly."

Stage 5: Learning

The learning stage begins after the crisis is not the subject of news coverage, and phone calls, e-mails, and other communications from publics have subsided. During the learning stage of a crisis, the organization is learning not only about how it has been affected by the crisis but also how its image and reputation have been affected.

Develop strategies to repair and restore reputation and image. This requires research to determine where the organization stands with various publics, including, but not exclusively, employees, consumers, community members, and government leaders. Focus groups, surveys, interviews, monitoring blogs and Web sites, and other fact-finding strategies may be employed. When the strategies determine the problems, the organization can set appropriate programs and policies to make amends.

Sometimes making amends means compensating victims, usually publicly. Sometimes it is announcing a corrective policy or program. William L. Benoit is known for image restoration theory, and he describes restorative approaches. Some of Benoit's approaches are taken during the recovery stage of the crisis, while others are done after the news coverage has ended. Some organizations hope that compensating victims and announcing corrective programs will end the news coverage on a high note.

Other organizations wait until litigation is complete. If the organization does not wait until after litigation, it takes the risk of being seen as taking steps to avoid litigation or improve its position in court. Judges may look on some restoration approaches as a positive indication that the crisis will not recur. This is a decision that must be carefully weighed and timed.

Be prepared for anniversary stories. Following every crisis, the news media will keep tickler files to remind themselves of anniversaries of news-making crises. At first, it will be every year, then perhaps every 5 years, every 10 years, and so on unless another disaster or catastrophe diminishes it. The anniversary of the 1941 Japanese bombing of Pearl Harbor will definitely be revisited on December 7, 2011, the 70th anniversary. The 9/11 terrorist attacks of 2001 are still annual revisits; they replaced the Oklahoma City bombing, everywhere except in Oklahoma, where the news media remind the public that the incident is not forgotten. In the rest of the country, that domestic terrorist attack may be remembered if no greater news stories abound.

The organization or country that suffered the crisis is expected to answer questions about progress made since the crisis and convince the public that steps have been taken to prevent future similar crises.

The Columbine High School shooting incident, which left 12 students and a teacher dead, took place in 1999. The head of PR for the Jefferson County (Littleton, Colorado) School district said that in addition to the anniversary stories, there were phone calls or questions by e-mail from the news media or from parents or other school districts every day for 1 year and 2 months; then the rate slowed down to about once a week for many years. When 33 students and teachers were killed at Virginia Tech in 2007, it became the most memorable school shooting, and on April 16 for many years, stories retelling that tragedy will be told, and the news media will want to know about the latest security precautions implemented.

Study the crisis. Analyze the news coverage. What were the difficult questions posed by reporters and publics? Why were the questions difficult to answer? Could the organization have prevented the crisis? If so, by doing or not doing what? What can now be done to prevent such a crisis again? What were the positive and negative outcomes? Could it have been worse? Can the organization make positive moves that will boost positive relationships with publics? If so, make a plan to do so. Devise a crisis communications plan or a better crisis communications plan. Organize a system of notifying management of issues that may become crises and go into Stage 1: Detect the next crisis.

POLITICAL COMMUNICATION

SHARON E. JARVIS AND SOO-HYE HAN

University of Texas at Austin

Political communication is the exchange of information between a nation's leadership, the media, and the citizenry. As an academic discipline, it draws from research in political science, psychology, mass communication, journalism, communication studies, rhetoric, sociology, history, and critical and cultural media studies.

At the core of political communication scholarship is a fascination with how political elites, the press, and the public persuade each other. To learn more about these patterns of influence, scholars study the texts associated with political campaigns, governance and the formation of public policy, political and social movements, political socialization processes, citizen organizing, political entertainment programming, and politics on the Internet.

Perhaps because of the number of contexts examined, there has been a conscious effort to avoid offering strict definitions of *what is* and *what is not* political communication. Key terms included in most definitions, however, include political symbols and language; elites, press, and publics; political processes; actual or potential effects; the regulation of conflict; and the functioning of political systems.

Assumptions of Political Communication

Political communication scholars generally hold a set of common assumptions about this subfield.

First, political communication is a dynamic process. It is not automatic. At best, a political candidate, the press, or a citizen can control just a part of a message; other political

forces (including oppositional candidates, another political party, adversarial interests), the media, and the citizenry are constantly questioning and challenging any statement. Moreover, political psychologists note that individuals understand messages in complicated ways, often processing incoming data through partisan stereotypes, personal reactions to the speakers, and emotional responses to a message's content. So while political leaders and the press may have the resources to start many political conversations, competing forces also shape the scope and direction of any political discussion.

Second, political communication is tied to power. Most political communication scholars study campaigns, governance, and public policy. In most of these instances, political elites are discussing plans for allocating society's resources. To paraphrase the political scientist V. O. Key, the person who frames the conversation guides its outcome. For this reason, the conversation between political elites, the media, and the citizenry features a constant negotiation for control of the political agenda. Political communication scholars listen intently to this discussion to trace how resources are allocated in a polity.

Third, political communication is guided by a normative concern. How can the exchange of information between political elites, the media, and the citizenry best contribute to effective and just governance? Empirical and theoretical studies, alike, harbor an explicit or implicit desire to locate processes to aid political elites in communicating their messages, help the media best inform the electorate, and encourage citizens to hold elected officials accountable to them.

Fourth, political communication occurs in a context. All messages and processes are influenced by the cultural and social norms of a system, the economic and legal structures in place, and the channel or medium through which entities communicate. While most studies in the United States focus on national concerns, many scholars believe that future comparative work will sharpen what is known about American practices and allow researchers to ask macrolevel questions to advance the theoretical and empirical development of the subfield.

Fifth, political communication is closer to citizens than political activity. To paraphrase the political scholar Murray Edelman, people are more likely to encounter political messages than to engage in political actions (such as voting, volunteering, or protesting). For this reason, the language of politics is critically important, as it introduces political understandings, frames political possibilities, and prevents certain issues or policies from being discussed.

History of Political Communication

The history of political communication can be traced broadly back to Greek democracy or specifically to the formation of institutional divisions in scholarly associations. Scholars also point to seminal pieces in political persuasion such as Aristotle's *Politics* and *Rhetoric*, Sun Tzu's *The Art of War*, and Machiavelli's *The Prince*. Foundational works in the American context include The Declaration of Independence, *Common Sense*, *The Federalist Papers*, and the Gettysburg Address.

In tracing political communication patterns in historical contexts, researchers have attended to advancements in information technologies and how these tools have altered both the message landscape as well as the democratic discussion. Notable innovations include the printing press, the political pamphlet, the newspaper, radio, film, television, and electronic technologies (including the Internet, mobile phones, personal digital assistants such as Blackberries, etc.). Each of these developments have increased the reach of political messages, and, according to their specific properties, altered the political landscape. Namely, the printing press helped disseminate information that was largely held by the elites; the partisan pamphlet allowed for political and personal expression; the newspaper accelerated the spread of current affairs; and radio, film, and television transcended literacy levels (and, because of the rich personal cues appearing in these channels, have created a heightened awareness of the personal attributes of politicians). The influence of electronic technologies such as the Internet (including the World Wide Web, e-mail, and instant messaging) has increased the speed with which information is disseminated across and through publics.

A more precise history of the political communication as a scholarly subfield has its roots in (1) propaganda analyses

during World War II, (2) early voting studies in the 1940s to 1960s, and (3) rhetorical analyses of political—often presidential—texts.

To begin, several seminal thinkers were commissioned by the U.S. government to study wartime communications. These projects ranged from the political scientists Paul Lazarsfeld (Columbia University) and Harold Lasswell (University of Chicago) working for the Rockefeller Foundation Communication Seminar to outline an agenda for understanding the nature of propaganda and its effects to Lazarsfeld's work with the sociologist Robert Merton (also at Columbia) in measuring the influence of specific radio, film, and print propaganda (efforts that led to the creation of the *focused interview*, a precursor to today's focus group methodology). This work serves as an early example of many commitments of the subfield of political communication, including *methodological plurality* (these scholars employed quantitative techniques to assess the effects of messages followed by qualitative approaches to understand the nuances of message properties and the unfolding process of influence), *an applied focus* (they employed scholarly approaches to attend to critical issues in the 1940s), and *normative concerns* (they addressed questions connected to the sustenance of a democratic state).

Next, early voting studies also contributed to the development of the subfield. One of the most notable studies in the field is the 1940 Erie County study, a project guided by Lazarsfeld. In this endeavor, researchers conducted 600 personal interviews each month for 6 months prior to the 1940 presidential election (Lazarsfeld, Berelson, & Gaudet, 1948). Lazarsfeld's hypothesis was that the media (viz., print newspapers) would have a powerful effect in influencing citizen attitudes and behaviors in that election. His findings revealed, however, that only 54 of the 600 participants interviewed shifted their support from one candidate to another during the course of the campaign. These data suggested that an overwhelming percentage of those studied had chosen their favored candidate prior to the campaign (or its news coverage).

This classic study led to two key findings for the understanding of political communication: the start of a *minimal effects* model, whereby Lazarsfeld and others argued that the press did not have a powerful influence on the electorate, and the *two-step flow-of-communication* model, in which Lazarsfeld's team believed that politically aware opinion leaders pass along public affairs information to others via interpersonal conversations. This *two-step-flow* approach highlighted the *complementary roles* that media and interpersonal communication play in influencing political attitudes and behaviors. While subsequent studies—and the emergence of television in the 1950s as a force in American life—locate a *stronger-effects* model in mass communications research, the Erie County offers an important baseline of the influence of personal predispositions, interpersonal communication, and press coverage during a presidential campaign.

Subsequent voting studies have shifted from an emphasis on interpersonal conversations to the influence of psychological variables. In *The American Voter* (1960), for instance, a group of political scholars from the University of Michigan employed survey data to argue that political partisanship had become the key cue in predicting political choices. Their study is critical for two reasons: (1) Their use of the National Election Studies survey data established the standard for hundreds of subsequent projects examining voter decision making and (2) their identification of partisanship as the critical predictor of electoral behavior continues to be a central finding in political science research. Studies following *The American Voter* have also looked for psychological (and social-psychological) predictors of decision making, focusing on cues such as *gut rationality* (attending to some cues in the information environment; see Popkin, 1991) and the power of personal reactions to political leaders (Hart, 1997). These voting studies have been a primary path for political communication research.

Additionally, rhetorical analyses on political leaders (largely presidents) also serve as a precursor to contemporary political communication scholarship. Rhetoricians have engaged in criticism and theory building, attending to the messages, motives, and styles of political speech. In doing so, scholars have focused on (1) speakers (assessing the development, delivery, and exigencies of political speech) as well as (2) audiences (noting the audiences honored or hailed by specific speeches as well as those denied and negated through political silence) in rhetorical situations.

Why Is Communication an Important Part of Politics, Particularly U.S. Politics?

Political communication plays an important role in ensuring the legitimacy and future of American democracy. The following propositions explain how and why this is the case.

Political communication preserves democratic governance. A first cause for political communication is structural: A dialogue between the government, the media, and the citizenry can preserve a democratic regime. Political theorists contend that a democratic system is only possible when an informed, engaged, and participatory citizenry protects itself from the inevitable greed and power of political elites. They contend that the legitimacy of a system can be gauged by levels of political participation and that the stability of a system can be assessed by participation over time. Political messages, then, help individuals navigate their rights and responsibilities as citizens.

Many political scholars note that the role of communication in preserving democratic life is particularly important because democracies are fragile. As Mindich (2005) articulates in his analysis of why young people need to be

engaged in political life, democracies are always just a short decline from potential despotism. A system with a free press and access to robust political conversations and norms of debate can protect itself in the political present and into the future.

Political communication connects leaders with the public. This second point refers to political leaders, candidates for public office, and elected officials. Hart's (1987, 2000) research has shown that political candidates and elected presidents have addressed the public with increasing frequency over the years and that campaign addresses are more direct and detailed than presidential speeches or briefings. The very act of a campaign, Hart argues, forces candidates to consider the needs of the public and to speak to those needs in forthcoming ways.

Studies show that public communications can benefit political elites, as well. In her longitudinal analysis, Ragsdale (1984) found that changes in public approval rankings and national events increase the likelihood that presidents will deliver an address (whereas worsening economic conditions such as inflation and unemployment or expanding military situations decrease the likelihood that a president will speak in public). Intriguingly, she also found that a president's popularity increases significantly with the delivery of a prominent speech. In a similar type of project, Kernell (1997) has studied the process of *going public*—the pattern of presidents talking directly to the American people to gain power (in the form of public opinion) over other branches of government. Kernell notes that this process can allow popular presidents “to soar” (p. 260), but it can also lead to an unstable marketplace, “whose currency is public opinion” if a president encounters a drop in favorability with the electorate.

Political communication shapes political agendas. This third point deals most directly with the media and the scholarship that investigates the ability of the press to put ideas into people's heads and thereby set agendas for publics.

To begin, one of the most widely studied theories in contemporary mass communication is the agenda-setting theory. This line of research was inspired by Cohen's (1963) observation that the mass media may not be successful much of the time in telling people what to think but the media are stunningly successful in telling their audience what to think *about*. During the 1968 presidential election, McCombs and Shaw (1972) examined the transfer of issue salience from news media to the public by comparing the most prominent issues appearing in news coverage and what the public regarded as the most important problems in their minds. The study revealed that the issues that are salient in the news become the issues that are salient among the public. Since the initial study in 1968, the agenda-setting theory has been studied hundreds of times across the globe.

One of the theories borne out of the continuous investigations of the agenda-setting function of the media is the attribute (or second level) agenda-setting theory. While the original agenda-setting theory focused on the transfer of *issue salience* from the media to the public, the attribute agenda-setting studies the transfer of *attribute salience* from the media to the public. For instance, Golan and Wanta (2001) revealed that voters' evaluations of candidates were significantly associated with attributes salient in three newspapers in New Hampshire during the 2000 presidential primaries. The study of attribute agenda setting adds a new dimension to the traditional agenda-setting theory, introducing the media's power to influence not just *what to think about* but also *how to think about it*.

Similar to the agenda-setting theory, framing and priming are two other well-researched constructs in mass communication. The theoretical approach of framing examines the presentation, selection, emphasis, and exclusion processes inherent in organizing news stories. To frame a story, writes Entman (1993), is to "select some aspects of a perceived reality and make them more salient, in such a way as to promote a particular problem definition, causal interpretation, moral evaluation and/or treatment recommendation for the item described" (p. 52). News frames provide cues as to how to think about dramatized problems; how to diagnose their causes; how to evaluate their generators, victims, and effects; how to cast (or avoid casting) blame; and if and how these problems should be resolved. Indeed, studies have identified how frames influence how individuals think, process topical information, discuss issues with others, and move to public action.

The notion of media priming also has connections to the agenda-setting studies. *Priming* refers to the ability of the media to "isolate particular issues, events, or themes in the news as criteria for evaluating politicians" (Ansolabehere, Behr, & Iyengar, 1993, p. 148). Iyengar (1991) states that news stories have a *priming effect* on the public by guiding viewers into evaluating political leaders by the criteria discussed in news stories. In their experimental examination, Iyengar and Kinder (1987) found that "through priming (drawing attention to some aspects of political life at the expense of others) television news help to set the terms by which political judgments are reached and political choices made" (p. 114).

Another prominent effect of the news media is the spiral-of-silence theory. Conceived by Noelle-Neumann (1993), this approach is best understood in light of the dynamics of public opinion, pressures to conform to majority viewpoints, and fears of isolation. The theory asserts that people are unwilling to express unpopular opinions (particularly on issues that have a strong moral component) because doing so might lead to social rejection and isolation. The process of not sharing unpopular (or minority) opinions can become cyclical; if people do not see their preferred position in the media or supported

by others, they will be less likely to speak out (and, accordingly, their positions become even less likely to appear in the news or in future conversations). Because people evaluate the prevailing public opinion based on the portrayals of public opinion communicated through mass media, the media induce certain opinions to be silenced.

While these aforementioned studies discuss how the media shape public opinion, some researchers also study how publics make sense of mediated messages in light of their own prior predispositions. The constructionist perspective, for instance, asserts that the media and other political elites can set agendas but cannot determine the meaning of politics. In their impressive study of media coverage, candidate speech, and citizen sentiment in the 1992 campaign, Just and colleagues (1996) found that citizens used personal knowledge and experience to actively interpret media messages and candidate images and that as people became more engaged with the election, they drew more on their own experiences—both direct and indirect—to evaluate campaign information. Similarly, Delli-Carpini and Williams (1994) have noted how television viewers *converse* back to television programming and are somewhat self-reflective with regard to how television persuades them. This constructionist approach addresses how people bring some of themselves to their understandings of mediated texts.

Studies show that different types of media can have different effects. Newspaper reading has the strongest association with political interest, knowledge, and many acts of political participation (including voting, attending political meetings, displaying a campaign button, sign or sticker, working for a political candidate or political party, or donating money to a campaign). Television news also contributes to political knowledge and participation, although it is not as strong a predictor of the many acts of participation as print news. Television news has been praised for being entertaining, for breaking through the attention barrier and capturing viewers' attention, for getting people interested in political topics, and for motivating and educating individuals with lower levels of knowledge and sophistication. At the same time, however, television news has been critiqued for unnecessarily heightening the dramatic aspects of politics and restricting coverage to topics that yield easy and compelling visual images.

Research on talk radio suggests that regular listeners have more political knowledge than nonlisteners, although this relationship is not statistically significant when one controls for the reality that most talk radio listeners are highly educated and often consume other forms of media, as well. Studies on the audience of talk radio reveals that listeners are mostly male; that a majority of this audience distrusts the mainstream media; that programs have been created largely for a conservative or Republican perspective; and that programs are more successful in encouraging audiences to oppose a candidate, policy, or idea than support one.

Research on the effects of entertainment media yields mixed findings. On the one hand, viewers of traditional entertainment programming on television are less likely to be politically informed or to participate. On the other, studies on infotainment programming (such as Jon Stewart's *The Daily Show* or the *Colbert Report*) reveal that regular viewers of these programs report higher levels of political information than traditional cable news audiences. An early explanation for this trend suggests that audiences must know something about public life to enjoy and understand these shows; it remains to be seen if the infotainment informs them directly or motivates them to know more in order to enjoy and comprehend the content of these programs.

Political communication can activate citizens. This fourth point addresses how political communication between citizens can protect their individual and collective interests (and even improve their well-being). Classic voting theories suggest that political participation contributes to the personal development of citizens. It has been argued that paying attention to politics and engaging in civic and political acts encourages people to pay attention not only to their own interests but also to those of a community and the country as a whole—a process that is believed to broaden perspectives.

Campaign messages, too, have been credited with being beneficial for the public. In his analysis of candidate, media, and citizen campaign discourses from 1948 to 1996, Hart (2000) contends that campaign communication is good for citizens, as it can *teach* (citizens learn during campaigns), *preach* (democracy is reperformed during campaigns), *sensitize* (campaigns increase public support for political elites and a democratic system), and *activate* (citizens experience higher levels of political efficacy during campaigns). Popkin (1991) advances a similar case, arguing that louder campaigns (with more vibrant and visible political communications) help engage more citizens in the process.

Key studies in this area have examined how political texts (candidate statements and advertisements, news coverage, Web pages, statements from other citizens) and experiences (voting, volunteering, political discussions, serving on a jury, etc.) influence individuals' attitudes and behaviors. Variables of interest here include *political engagement* (often regarded as the activities intended directly or indirectly to affect the selection of elected representatives and/or the development, implementation, or enforcement of public policy through government—such as voting, working for a political party, or contacting an elected official), *civic engagement* (refers to addressing public concerns directly through methods that are outside of elections and government—such as volunteering or working with a community group or neighborhood association), *internal political efficacy* (the sense that one's participation can actually make a difference), *external*

political efficacy (the sense that a political system would be responsive to this participation), *civic duty* (a sense of responsibility and obligation to a system), *political interest* (attentiveness to government and public affairs), *tolerance* (acceptance of difference and diversity), and *political trust* (faith in a system and its leaders).

Additionally, Putnam's (2000) *Bowling Alone* has generated considerable attention in academic and nonacademic settings. The central premise behind his approach is that relationships (social networks) have value (social capital) for people. Specifically, Putnam has traced how strong social networks increase reciprocity (the likelihood that people will look out for each other), information sharing (the opportunities to hear about ideas, jobs, and political happenings), and cooperation (the chance to organize in order to effect change beyond what an individual could do alone). All three of these resources help individuals lead richer and more meaningful lives.

Putnam's research has located specific examples of the value of networks. These intriguing patterns include how (1) joining and participating in just one social group can reduce a person's chances of dying over the next year in half; (2) crime can be as effectively curbed in a community when neighbors know each others' first names as by adding additional police to the streets; (3) educational reforms can benefit more directly from parental involvement than by hiring more teachers; and (4) each 10 minutes of additional commuting time per day reduces all forms of social capital by 10% (meaning 10% less church going, 10% fewer club meetings, 10% fewer evenings with friends, etc.; see Putnam's *Better Together* [2003] advocacy group, a by-product of his *Bowling Alone* [2000] text). Putnam summarizes these patterns by noting that civic engagement is like a "health club for the 21st century" that is free, that improves both individual and community health, and that perpetuates the growth of social ties. Researchers have also explored how deliberation educates and empowers citizens. Gastil (2008) contends that "people deliberate when they carefully examine a problem and a range of solutions through an open, inclusive exchange that incorporates and respects diverse points of view" (p. xi). He maintains that deliberation is an important means of fostering coordination in a democracy and helps citizens to really understand the reasons behind points of view different from their own (a process that is almost impossible without deliberation).

Gastil holds that deliberation has these components: It begins when people have a solid information base to understand an issue; it functions when individuals identify and prioritize key issues to be addressed; and it progresses as individuals locate solutions and address the pros, cons, and trade-offs of these solutions. Research shows that when deliberation is well organized, participants report satisfaction with the process and have greater support for and investment in the outcome. In contrast, when the deliberative experience is not well organized, or when a deliberative

group is not given clear directives, this process can suppress deep difference, discourage frank statements, and exaggerate consensus.

How Are Political Images and Messages Constructed?

Political leaders, the media, and citizens all construct messages in unique ways. Their strategies and goals reflect their unique needs in the democratic conversation.

Political leaders create messages to improve their public image. Scholars have studied these processes in a set of ways. To begin, political marketing—or the application of marketing principles and procedures in political campaigns by various individuals and organizations—has become a major force in elections and policy making (Newman, 1999). Like product marketing, a key goal in political marketing is to have a market orientation, anticipate audience needs, and work to create innovative products and services. Unlike product marketing, however, the goal is not to make a profit; rather, political marketers work to improve the quality of life and create the most benefits at the lowest cost for citizens. A key way of making this happen is by helping candidates acquire political capital through compelling public images and powerful messages.

Research on candidate images has located a set of personality traits that are vital in marketing, including trustworthiness, authoritativeness, competence, sociability, composure, experience, leadership ability, intelligence, and honesty. Scholars have attended to the relative influence of issue stances and personality characteristics on candidate image. While scholars once held a distinction between these two forces, data now show that citizens employ both types of information while evaluating candidates. Moreover, studies show that citizens attend to a candidate's appearance, his or her resemblance (or lack thereof) to an audience, and general expectations of what candidates should be like in reacting to candidate images.

Research is commonly a part of a campaign strategy. Campaign researchers often gauge reactions to candidates via focus groups and surveys (or public opinion polls). Focus groups are a method in which a group of individuals who share a specific characteristic (being of a common age, background, education level, social class, political party, or biological sex) are brought together for a group interview. A moderator typically guides a set of 6 to 12 people in a conversation in which the participants are asked to respond to a situation, a candidate communication, or concerns about a candidate's opponent. Moderators listen for patterns in group discussion, moments when group members question or build on each others' statements and times when the group surprises itself. Focus groups are a valuable way for campaigns to tap into socially created and shared

opinions, and they offer in-depth information from a small set of individuals on questions of interest.

Surveys (or public opinion polls) are another commonly used method to gather broader reactions from the public. Campaigns can poll the public to search for levels of support and patterns of favorability for candidates, issues, messages, and specific campaign communications. While focus groups offer in-depth information for a small number of participants, surveys offer less detailed observations on a much larger group of people.

Scholars have located some best practices for candidate communications. Returning to Hart's (2000) analyses, he found a variety of patterns in leaders' speech, including how *winning candidates* speak as centrists and employ common terms and phrases (they are not rhetorically distinctive, nor do they call unnecessary attention to themselves); *incumbent candidates* are more optimistic and collective in their speeches, whereas *challenger candidates* are more negative and ideological; and *Republicans* speak in straightforward ways (arguing directly from cause to effect), whereas *Democrats* speak in a more complex way (employing more nouns per verb, discussing the nuances of a situation in making their arguments).

Studies on female candidates have shown that they must campaign amidst powerful gender stereotypes. While the number of female candidates and the prominence of office for which they seek have increased, research shows that they are often viewed as less competent and unable to handle the tough negotiations associated with politics. Moreover, they are expected to be less assertive and aggressive than men, and they must use more specific and precise statements than men. To avoid a negative backlash from voters, female candidates typically critique their opponents on issues and avoid making direct charges on their opponents' characters (see Powell & Cowart, 2002).

Studies have also examined the message properties of a variety of genres of campaign discourse (Hart, 2000). Campaign speeches tend to be more direct and optimistic than addresses delivered by elected officials. Campaign ads traffic in images and say things that candidates, themselves, cannot say. Debate performances add prudence to campaign discourse, reduce bombast, and bring focus to the political conversation. Candidate-sponsored Web pages tend to avoid partisan cues, are positive in nature (with candidates placing more negative charges in other forms of discourse), increasingly feature verbal and video content, and can help candidates generate positive news coverage. As Web sites are regularly visited by journalists, a well-organized and detailed Web site can translate into favorable coverage for a candidate.

Media outlets create messages to tell and sell stories. Although they are central to preserving a democratic state, many scholars note that the media are not truly in the *democracy business*. Rather, they are a *for-profit business*, and their need to create an audience to sell advertising influences how news stories are presented.

Researchers have studied how the need to create an audience influences news as a genre of political communication. In so doing, many potential biases in the news have been discussed, including a *straight news* perspective (that news outlets are not biased and that they offer direct reportage of the facts), a *leftist bias* perspective (that most reporters identify as Democrats or Independents and therefore deliver the news through a liberal slant), a *rightist bias* perspective (that media ownership leans conservative to Republican and their business model requires news stories that are friendly to corporate interests and the status quo), an *organizational bias* perspective (that reporters learn reporting strategies from journalism schools and tend to follow the leads of prominent reporters in covering stories), and a *narrative bias* perspective (that the news is a story and must feature certain properties to command an audience). While many agree that a variety of biases can be detected in any story, scholars often gravitate toward the narrative perspective as it helps interpret the news as political texts.

Bennett's (1988) research has been particularly notable on this score. To tell and sell stories, he contends that news stories feature the following narrative properties: *personalization*—such that the “news gives preference to the individual actors and human interest angles in events while downplaying institutional and political considerations that establish the social contexts of those events” (p. 26); *dramatization*—such that “reporters and editors search for events with dramatic properties and then emphasize those properties in their reporting,” so that the content of the news “has more to do with” dramatism than “any natural preeminence they may have in the political scheme of things” (p. 35); *fragmentation*—such that events “exist in self-contained dramatic capsules, isolated from each other in time and space” so that the news resembles a “jigsaw puzzle that is out of focus and missing many pieces” (p. 44); and *normalization*—such that “the news overlays situations as quickly as possible with familiar images (both moral and empirical) of a normal world . . . images that drive bothersome details out of mind” (p. 51).

Since the 1980s, there has been a proliferation of cable news programs on television. To compete in the cluttered media marketplace, several have sought out (and others have simply been perceived by the public as having) a partisan slant. Scholars are beginning to study how these cable news and entertainment shows feature unique programming that may lead to unique effects. Recent work on partisan selective exposure traces how individuals seek out media that matches their partisanship (congenial programming) and that the process of seeking out this media can lead to higher levels of political polarization, differentiated patterns of agenda setting, and distinct issue priorities connected to news-seeking habits.

Citizens create messages to influence the agenda. A key action that citizens have employed to make their voices

heard in a democratic system is the vote. Outside of voting, however, individuals have other opportunities for influence, including writing pamphlets, engaging in assembly and protest, writing letters to the editors of newspapers, calling into radio programs, and donating money to political causes to express political views.

Developments in interactive technology increase the options available to citizens. On the Internet, they can increasingly respond to news articles through interactive Web features, join social-networking groups surrounding civic or political interests, or create a blog (or post to blogs) to share political perspectives.

What Are the Forms and Types of Messages We Should Expect to See in the 21st Century?

Researchers have some expectations as to the future of candidate, media, and citizen communications.

Candidate-centered campaigning. A decline in the power of the political parties in the candidate selection process and the emergence of television and the Internet as disseminators of information have led to an increasing personalization of politics. This process has been widely documented in the United States, and comparative scholars report an increased emphasis on candidate-centered politics across the globe.

An emphasis on the candidate has given rise to new lines of inquiry and theorizing. Two important variables for political communication scholars to attend to in the future include the *likability* and *authenticity* of political communicators. *Likability* is not a new variable for political life. Political theorists have long been suspicious of attempts to gain power through likability (as it can lead to unstable public opinion if a candidate becomes unlikable; see Kernell, 1997; Machiavelli, 2004). Communication scholars, marketers, and advertisers take a different approach to likability, however. Their studies show that likable people (often measured as those who are regarded as attractive, who inspire a sense of identification or commonality with others, and who compliment their audiences) have an increased ability to persuade others.

Authenticity is a second notion that becomes important in an overcommunicated, personalized message environment. In an era of reality television and heightened political cynicism, the news media and citizens have ample opportunities to question the motives of their political leaders. While such questioning surely predates the current candidate-centered era, a proliferation of cable news programs, of personalized and dramatized news narratives, and of a celebrity-driven culture fixates attention on the causes underlying elite political behavior. Early definitions of *authenticity* focus on a candidate's transparency and consistency. Research will surely continue to sharpen this burgeoning concept.

Proliferation of internet applications. Technological advancements have shifted the content and tone of many political discussions. Notably, political Web sites and blogs, social-networking sites, and YouTube (and other political films) have altered the traditional political conversation. For instance, the Drudge Report—a news aggregation Web site run by Matt Drudge—became famous for being the first news outlet to run the story that President Bill Clinton had had an affair with intern Monica Lewinsky. Drudge's doing so broke the scandal, a story that other outlets such as *Newsweek* magazine refused to cover. Future studies will undoubtedly study the content of these political Web sites, trace the content, the information flow, and the intermedia agenda setting of these political sites.

Social-networking sites such as MySpace and Facebook present a new means of organizing online, of developing political capital, and of capturing the attention of the news media and the candidates. Studies will examine who joins these sites, the best practices of persuasion on them, and the effects these networks have on political attitudes and behaviors.

YouTube is a video-sharing Web site. It was created in the winter of 2005 to allow individuals to upload, view, and share video clips. The presence, familiarity, and open access of this site—paired with the ubiquity of handheld digital recording equipment—has created an instinct for citizens to become movie makers and a place for such films to be stored. In the realm of politics, the site holds clips from candidate statements to political groups, candidate interviews with the press, and citizen-created clips about the candidates. Political commentators believe that YouTube played a significant role in the 2006 defeat of Senator George Allen (R-VA) due to a video clip of him making allegedly racist remarks that was continuously replayed by YouTube viewers during the campaign. In the 2008 presidential campaign, citizen-created videos have brought considerable attention to the Obama presidential campaign. As with the other Internet applications, future studies will track the content, dissemination, and effects of these videos.

Citizen reactions to an overcommunicated era. Marketing estimates suggest that citizens encountered 200 commercial-brand impressions on an average day in the 1950s. By the late 1990s, such estimates skyrocketed to 5,000 a day. This overcommunicated environment has created new patterns of information seeking and influence for the citizenry.

Concerning information seeking, citizens (particularly conservatives and Republicans) are reporting an unprecedented lack of trust in the media. This frustration has led to a proliferation of programs with a conservative perspective (on talk radio, on the Fox news cable network, and on the Internet). Scholars have begun to study the aforementioned pattern of partisan self-exposure; the effects of conservatives seeking conservative media and liberals seeking liberal media will be important questions for the future.

Similarly, a lack of media trust, increased political cynicism, weaker partisan commitments, and advancements in information technologies (allowing citizens to self-select their programming and to record television shows and bypass political advertisements) have all challenged the impact of mass advertising campaigns. Scholars have found, interestingly, that in many instances, grassroots campaigning—including door-to-door political canvassing—is a cost-effective means of persuasion and of getting out the vote. Studies will continue to refine what is known about the best practices of face-to-face canvassing as well as grassroots organizing strategies on the Web, broadly, and on social-networking sites, specifically.

Efforts to recruit new stakeholder groups. Another set of questions for future research include demographic shifts in the electorate, including increases in the Latino population, normative and strategic interest in young voters (ages 18–29), and efforts to persuade uncommitted voters (who are less loyal to traditional party allegiances and are often seduced by candidate-centered strategies). Studies will examine the successes and unique challenges of minority and female candidates, efforts to communicate with voters in English and Spanish, and attempts to employ social-networking sites and cell phone text messaging to connect with younger voters. The key question for researchers, here, is how candidates can attempt to recruit and mobilize new voters while honoring the commitments of current stakeholders (to their candidacies or their political parties).

For Additional Inquiry

Research on these new paths of research will likely appear in the journal *Political Communication* (formerly *Political Communication Review*), which publishes quarterly peer-reviewed articles in the field. Research on and best practices for political strategists and consultants appear in the *Journal of Political Marketing* and are presented to meetings of the American Association of Political Consultants. Additionally, political communication is an organized division in major scholarly associations, including the International Communication Association, the National Communication Association, and the American Political Science Association.

Students interested in political communication can seek out the following courses on their campuses: political communication, campaign communication, mass media and politics, political (and presidential) rhetoric, sociology (and history or political economy) of the media, political persuasion, and public opinion.

Finally, key texts reviewing the history, development, and core theoretical and methodological commitments of political communication include Chaffee's (1975) *Political Communication: Issues and Strategies for Research*; Nimmo

and Sanders's (1981) *Handbook of Political Communication*; Sanders, Kaid, and Nimmo's (1985) *Political Communication Yearbook: 1984*; and Kaid's (2004) *Handbook of Political Communication*.

INTERNATIONAL PUBLIC RELATIONS

SUMAN LEE

Iowa State University

On the eve of the 21st century (December 31, 1999), CNN aired live coverage showing how people throughout the world celebrated the New Year at the dawning of a new millennium. Thanks to satellite broadcasting, this 100-hour television event showed a wide variety of festivities at more than 50 locations in the world, including Times Square in New York City, the Red Square in Russia, the Eiffel Tower in Paris, and many other corners of the globe. This coverage was available to about 1 billion people in more than 200 countries and territories (CNN News Group, 1999). It is undeniable that mass media plays an important role in providing the social perception of globalization.

In business, globalization is an effective and powerful strategy for businesses striving to be prosperous. Accelerated by global competition and free-trade developments such as WTO (World Trade Organization) and OECD (Organization of Economic Cooperation and Development), corporations are eager to create new markets abroad, as well as to find ways to lower production costs. In 1996, for example, more than 8,000 U.S. companies had international operations in foreign countries. Alternatively, more than 8,000 foreign firms operated in the United States. Foreigners have invested more than \$300 billion in the United States in joint ventures and direct investment (Porter & Samovar, 1996). As this trend keeps accelerating, the current world economy becomes more closely connected than ever.

What does this wave of globalization mean to public relations? One of the most frequently cited definitions of public relations is “the management function that establishes and maintains mutually beneficial relationships

between an organization and the publics on whom its success and failure depends” (Cutlip, Center, & Broom, 2005, p. 6). Many organizations today, both for profit and not-for-profit, operate globally, and the success or failure of their organizational goals and objectives depends on their publics, domestically as well as overseas. The assumptions and principles that organizations hold when practicing public relations in one country may not be applicable when practicing public relations in another country. Even the definition of public relations can be substantially different from country to country. The growing interest in international public relations comes out of the new challenge that practitioners and scholars face—the international and global environment where public relations operates.

The purpose of this chapter is to introduce the key conceptual developments in international public relations, some major areas of application, and a representative case of multinational organization.

Conceptual Development of International Public Relations

Even as interest in international public relations as a subarea of public relations continues to grow, there has been confusion over the concept of international public relations. To some, there is no such thing as international public relations, and to others, international public relations is “one of the fastest-growing areas in this field” (Vasquez & Taylor, 2001, p. 331). International public relations is a relatively new subarea of public relations that suffers from the lack of

theoretical foundations because public relations itself is still a growing area in the field of mass communications. As Kunczik (1997) pointed out, most articles on international public relations have been based on anecdotal or descriptive approaches, even “scientifically non-serious sources” (p. 24). Wakefield (1996) emphasized that “most of the attempts at scholarly examinations have been country-specific, discussing public relations in a particular country and how it varies from other countries” (p. 18).

To some extent, much international public relations research can be labeled as descriptive because it explores public relations practices in different countries and geographic regions without applying overarching theories and conceptualization. In the early stage of developing the field of international public relations research, a case study approach provides valuable knowledge about what others have accomplished in the field. However, isolated cases alone limit our understanding of international public relations. The current trend is toward more studies based on theoretical frameworks.

Wakefield (1996) identified four theoretical domains for international public relations. They are global society theories, cultural theories, management theories, and communication theories. He suggests that international public relations can benefit from these areas in building theoretical frameworks.

Grunig and his colleagues (J. E. Grunig, 1992; Grunig, Grunig, & Dozier, 2002; Grunig, Grunig, & Vercic, 1998; Vercic, Grunig, & Grunig, 1996; Wakefield, 1996) provide a good example of advancing these ideas in their research. They proposed a normative theory of global public relations excellence by combining their original IABC (International Association of Business Communicators) excellence theory (public relations framework) and a structured flexibility theory (management framework; Brinkerhoff & Ingle, 1989). This seminal study identified key characteristics of excellence in public relations as general principles. Their argument was that excellence characteristics of public relations identified by the IABC study hold true not only for the United States, the United Kingdom, and Canada (where original observations occurred) but also for other countries; however, contextual factors should be considered when applying these generic principles (specific application).

The generic principles of public relations excellence are (1) involvement of public relations in strategic management, (2) empowerment of public relations in the dominant coalition or a direct reporting relationship to senior management, (3) an integrated public relations function, (4) public relations as a management function separate from other functions, (5) PR head’s managerial leadership, (6) a two-way symmetrical model of public relations, (7) a symmetrical system of internal communication, (8) the PR department’s knowledge potential for a managerial role and symmetrical public relations, and (9) diversity embodied in all roles (Vercic, Grunig, & Grunig, 1996).

Involvement of public relations in strategic management means that public relations plays a significant role in identifying organizational goals, leading communication management to achieve those goals, and, most important, building good relationships with strategic publics both internally and externally. *Empowerment of public relations in the dominant coalition or a direct reporting relationship to senior management* means that the public relations unit and the public relations head should be a part of a powerful group of managers who are responsible for strategic decisions for the organization. *Integrated public relations function* means that public relations functions should be operated by a single unit or by a coordinating system. Only this integrated system can adapt to changing strategic publics. *Public relations as a management function from other functions* means that the public relations unit should be independent from other organizational units. In many organizations, public relations functions are subdued to other units (e.g., marketing, law, consumer management, human resource, advertising), which makes public relations less effective. Simply put, communicating with publics is different from dealing with markets. *The role of the public relations practitioner* means that excellent public relations can be secured by a managerial role (strategic program management) not by a technician role (writing and editing publications). *Two-way symmetrical model of public relations* means that excellent public relations uses social scientific research to communicate with strategic publics and actively seek out a mutually beneficial relationship (win-win zone) with them. Mutual understanding is a key purpose of communication. *Symmetrical system of internal communication* means that excellent organization allows autonomy to employees and creates participatory organizational culture to increase job satisfaction. *Knowledge potential for a managerial role and symmetrical public relations* means that excellent public relations practitioners should have acquired a body of knowledge in public relations and be active in professional development. *Diversity embodied in all roles* means that an excellent public relations unit needs variety to effectively communicate with diverse publics in society. Diversity in gender, racial, ethnic, and cultural backgrounds is highly pursued (Vercic, Grunig, & Grunig, 1996).

Specific contexts for applying the general principles are (1) the level of development in a country, (2) the local political situation, (3) the cultural environment, (4) language difference, (5) the potential for activism, and (6) the role of the mass media (Grunig, Grunig, & Dozier, 2002). These contexts are defined and elaborated in detail by Sriramesh and Vercic (2003).

Sriramesh and Vercic (2003) elaborated on these specific contexts (environmental variables) in moving international public relations research to the next level. As for political systems, they found democracy and political freedom as very important factors in the growth of public relations because “strategic public relations flourishes in pluralistic

societies” (p. 5). Also of interest to Sriramesh and Vercic is how other types of political systems, such as authoritarian regimes (e.g., China), affect public relations. As for economic development, Sriramesh and Vercic (2003) found that economic prosperity and private entrepreneurship are crucial for the growth of public relations. Activism is considered as both an opportunity as well as a threat to public relations professionals. Organizations can transform and innovate themselves to meet change pressures from activist groups, and as a consequence, they can be more competitive and socially responsible. However, the opposite consequence occurs when organizations fail to successfully adapt to this pressure from activist groups. Public relations in any particular country is influenced by the societal and organizational culture within that country. Knowing cultural norms and assumptions at both the national and the organizational levels is crucial to every stage of strategic planning for public relations. Media environment can be elaborated on by examining three dimensions of media: (1) media control (*Who owns the media?*), (2) media access (*Who can access the media?*), and (3) media outreach (*Who consumes the media?*). All three dimensions vary from country to country. Public relations professionals need to know this environment in a given society because the media is a powerful conduit to influence the target publics.

To test these normative propositions of generic principles and specific contexts, Grunig, Grunig, Sriramesh, Huang, and Lyra (1995) did a meta-analysis of research in India, Greece, and Taiwan and concluded that “the models must be generic to all cultures and that an approach to public relations that contains at least elements of the two-way symmetrical model may be the most effective in all cultures” (p. 182). Similar findings are supported by Grunig, Grunig, and Vercic’s (1998) study of Slovenian firms, Wakefield’s (2000) Delphi panel study, and Rhee’s (2002) study of public relations practitioners in Korea.

More recently, Curtin and Gaither (2007) introduced the circuit-of-culture model as a theoretical framework for international public relations. Taking a broader definition of culture (a crucial concept to international public relations), they identified five moments of “cultural space in which meaning is created, shaped, modified, and recreated” (p. 38). These moments of cultural space are labeled as moments of regulation, production, representation, consumption, and identity. The moments are closely interrelated to create meaning without any prescribed direction of relationships.

The moment of regulation is defined as “controls on cultural activity ranging from formal and legal controls, such as regulations, laws, and institutionalized systems, to the informal and local controls of cultural norms and expectation” (p. 38). This definition is similar to that of the contextual factors or environmental variables as applied to public relations operations. The moment of production “outlines the process by which creators of cultural products imbue them with meaning, a process often called

encoding” (p. 39). For example, technological constraints and organizational culture influence the process of planning public relations campaigns. The moment of representation is “the form an object takes and the meanings encoded in that form” (p. 40). The moment of consumption is “when messages are decoded by audiences . . . target publics in public relations bring their own semantic networks of meaning to any communicative exchange” (p. 40). Identities are “meanings that accrue to all social networks, from nations to organizations to publics” (p. 41). The authors were able to use this framework to explain various cases of international public relations issues and campaigns, which establishes this framework as a good example of theory-based international public relations research.

Along with theory-based studies, case studies continue to expand our understanding of public relations in other parts of the world. This is called a culture-specific approach, focusing on documenting the peculiar and distinct features of individual cultures. The main focus of these studies concerns how social, political, and economic contexts influence the practices of public relations country by country. For example, books titled *International Public Relations: A Comparative Analysis*, edited by Culbertson and Chen (1996), *The Global Public Relations Handbook: Theory, Research, and Practice*, edited by Sriramesh and Vercic (2003), and *Handbook of Public Relations*, edited by Heath (2001) include a lot of excellent case studies using this approach. Other examples include a meta-analysis on public relations in India, Korea, and Japan (Sriramesh, Kim, & Takasaki, 1999), the HIV/AIDS issue and Thailand public (Chay-Nemeth, 2001), the nation building in Malaysia (Taylor, 2000), and the image of public relations in Korean newspapers (Park, 2001).

Major Areas of International Public Relations

Public Relations and Multinational Organizations

Stohl (2001) examined the effects of globalization on organizations by introducing five types of organizations according to predominant national orientation: (1) domestic, (2) multicultural, (3) multinational, (4) international, and (5) global. These definitions can help us understand concepts related to “global” in the organizational context. A domestic organization has identification with one country and one dominant culture. A multicultural organization has identification with one country but a culturally diverse workforce. A multinational organization has identification with one nationality while doing business in several countries. It has a multinational workforce, management, clients, and environment; however, it represents one national interest. An international

organization has identification with two or more countries, each of which has distinct cultural attributes. Workforce, management, and clients are recognized as representing diverse national interests. Finally, a global organization has identification with the global system transcending national borders and is basically a stateless organization. In a global organization, organizational membership supersedes national orientation.

In the early stages of globalization, we observed many multinational organizations. But as globalization progresses, we begin to see more international and global organizations. With dramatic technological advancement in transportation and communication, even the distinction between domestic and international blurs. For most people, multinational, international, and global organizations are considered as one category, although there may be disagreement on what to label the category.

One of the biggest challenges facing multinational organizations is dealing with more diversified publics and stakeholders. Consider Mattel's toy recall in 2007. The company announced several recalls, totaling some 21 million toy products, from the global market due to the presence of excessive levels of lead paint and tiny harmful magnets that could be swallowed. First and foremost, Mattel's reputation was enormously damaged among many angry parents who were deeply concerned about the safety of their children. Governments and regulatory bodies in Asia, Europe, and other parts of the globe raised safety inspection standards due to this incident. Investors sold out Mattel shares, and stock price quickly plunged.

Mattel's initial response was not a good example of crisis public relations because they put much of the blame on Chinese manufacturers and the inadequacies of the Chinese regulation system. It created a lot of concerns about made-in-China products among consumers worldwide due to its tainted image triggered by Mattel's toy recall. Finger-pointing at others without sufficient supporting evidences turned out to be detrimental to Mattel. As the public soon learned, there were a substantial number of mistakes and problems on Mattel's side, such as product design deficiencies and inadequate safety guidelines. Mattel's top executives should have flown to China and apologized to the Chinese leaders and business partners for making such a hasty judgment. The worldwide media coverage of this scandal could not have been more negative, and recovery from this ordeal will seemingly be a tough uphill battle for Mattel for many years to come. Trust can be easily lost but is hard to rebuild.

Corporations are not the only form of multinational organizations. Many nongovernment organizations (NGOs, hereafter) promote their cause globally. For example, Green Peace international is headquartered in the Netherlands and has branch offices in 42 countries and regions. They are very active in influencing environment policy at the national and global levels, and their public relations campaigns often attract worldwide attention.

Consider the antiglobalization demonstration in Seattle in 1999. Activist groups throughout the world organized themselves around the event of the meeting of the WTO in Seattle to express their anti-WTO message to the world.

There are no national borders in cyberspace. Local NGOs or even individual blogs can get international attention overnight. Sony and Dell had to recall their notebook batteries when a few consumers uploaded video clips of burning laptops onto YouTube. The images spread quickly throughout cyberspace, gaining nearly immediate international attention. As the world has virtually shrunk, environmental scanning becomes more and more challenging for public relations professionals.

Public Diplomacy and National Reputation

Public diplomacy (Kunczik, 1997; Signitzer & Coombs, 1992) has some implications in the developing field of international public relations. Signitzer and Coombs (1992) described international public relations as

mainly concerned with practical problems arising from the relationships of multinational corporations with their foreign publics. How nation-states, countries, or societies manage their communicative relationships with their foreign publics remains largely in the domain of political science and international relations. (p. 138)

Public diplomacy is defined as "the way in which both government and private individuals and groups influence directly or indirectly those public attitudes and opinions which bear directly on another government's foreign policy decisions" (Delaney, 1968, p. 3). Public diplomacy is a communicative struggle in "a global marketplace of ideas" (Signitzer & Coombs, 1992, p. 139) to create favorable and intended attitudes and opinions toward a nation. The objective of public diplomacy is "to influence the behavior of a foreign government by influencing the attitudes of its citizens" (Malone, 1988, p. 3).

Building and maintaining a positive national image enable a nation to achieve a more advantageous position in global economic and political competition. A positive national image may drive other nations' foreign policies in favor of a country, increase revenues from trade, and draw tourists and foreign investment (Wang, 2006).

Cognizant of these benefits, many governments are active in practicing public relations to improve their national images throughout the world. Lee (2006) found that in 2002, more than 150 countries signed public relations contracts with agencies in the United States, based on his analysis of Foreign Agency Registration Act (FARA) data administered by the U.S. Department of Justice. He mentioned that "Asian countries were the most active in public relations in the U.S. followed by Western European and Middle East countries. Analyzing individual countries,

Japan was ranked as the first, remotely followed by the UK, Mexico, Taiwan, South Korea, and Germany” (p. 99). He also found that building a relationship with the U.S. partners was the most frequent activity type of international public relations, followed by information dissemination, event promotion, advertising, and media relations. The major U.S. partners were governmental officials, Congress leaders, media owners, journalists, corporate leaders, and investors, who are generally considered opinion leaders in the United States.

The foreign news media have become a major target for governments trying to influence news content about international issues and foreign affairs, especially with regard to their own countries. However, governments also reach foreign publics directly by disseminating information about their countries and launching government-sponsored international broadcasting channels (e.g., Voice of America) and Web sites. Governments also try to influence public opinion in foreign countries through cultural exchange programs (e.g., artistic performances, film festivals, second-language training, and student exchange programs). The Fulbright program, which subsidizes international students’ education in the United States, is a good example of such efforts.

To effectively execute public relations programs overseas, many governments hire public relations firms in target countries. According to Gilboa (2000), contracting public relations firms in the target country is believed to be more effective than any other governmental strategy in international public relations in reaching and affecting both foreign publics and the foreign media because it can “strengthen the legitimacy and authenticity” of the public relations campaigns. In addition, geographic proximity of the resident PR firms operating in the target country enables quick reactions when a crisis related to the target country occurs.

Development communication (Newsom, Carrell, & Kruckeberg, 1993) and nation building (Taylor, 1998; Taylor & Botan, 1997; VanLeuven, 1996) share some aspects of international public relations. Taylor (2000) mentioned that “a public relations approach to nation building focuses on relationships between governments and publics as well as the creation of new relationships between previously unrelated publics” (pp. 183–184). The role of communication in nation building is determined by which “diverse societies, regions, and groups within a country are linked into a national-state system” (Morrison, 1989, p. 18). This approach is now extending its meaning from domestic nation building to international relationship building among nations.

Hosting the Olympic Games has been considered by many countries as an effective public diplomacy tool, through which the host country could promote a desired national identity and image among foreign publics (Kunczik, 2003). Considering the exceptional amount of attention they get from spectators all over the world, the

Olympic Games provide a unique opportunity to appeal to foreign publics through maximum media exposure of the host country. For example, the 1988 Seoul Olympic Committee tried to change South Korea’s image from that of a war-stricken developing country to a prosperous country with economic success and advanced technology. More recently, China did the same by converting her negative image (e.g., that of a controlled communist country with human rights issues, lack of environmental protection, and poor quality of products) into a positive one by hosting the 2008 Beijing Olympics. China promoted the three themes of the Beijing Olympics: (1) green Olympics, which emphasizes China’s effort to improve environmental protection; (2) high-tech Olympics, which highlights China’s economic success and development accelerated by technological advancement; and (3) people’s Olympics, which puts “people” at the center of the Olympic spirit and sends messages to the outside world that China cares about human rights and tries to improve them (Berkowitz, Gjermano, Gomez, & Schafer, 2007). It must be an intriguing question whether the desired outcomes of the host country can really happen. Overall, many studies support “the Olympic effect” (Fishman, 2005; Spà, Rivenburgh, & Larson, 1995).

Culture and Public Relations

It seems generally agreed on that scholars and practitioners interested in international public relations need to look beyond their cultural biases and assumptions—the U.S.-centered understanding of public relations.

Zaharna (2001) suggested that international public relations scholars need to adopt more from the interaction and the processes of intercultural communication perspectives. Adaptation, negotiation, conflict management, and diplomacy are some of the ideas that should be applied to the study of international public relations. Zaharna’s in-awareness approach is focused on sensitivity to cultural differences. Zaharna sees public relations as defined by national parameters (country profile) and by cultural nuances (cultural profile), and then elaborated on with communication components. This approach emphasizes international public relations as a process of intercultural communication between client and practitioner. However, this approach needs to be extended because it is limited in scope to client-practitioner relationships, instead of to the bigger picture of organization-public relationships.

Kinzer and Bohn (1985) described two public relations models in multinational corporations—ethnocentric versus polycentric. The ethnocentric model (Illman, 1980) assumes that there is no difference between motivating people in domestic and in foreign countries. This model supposes that the people will respond similarly to the same message. This assumption leads to the idea that “what is known about public relations in the U.S. or the EU can be

applied in less developed countries” (p. 151). In contrast, the polycentric model ensures more freedom of decision making by local public relations practitioners.

Strongly opposing the ethnocentric model of public relations, Botan (1992) argued that

what has been called international public relations may not actually be the two-way multicultural exercise that its name implies. The practice of public relations across borders often and maybe increasingly, is controlled and directed by the home country based on assumptions inherent to the home country. (pp. 151–152).

Basically, Botan criticized the fact that the majority of international public relations discourse is rooted in the management-oriented definition of international public relations based on Western ethnocentric assumptions.

Simoes (1992) questioned the concept of public relations in a communication and promotion function. Instead, he suggested a “political” function of public relations from a Latin American viewpoint. He claimed that the assumption guiding his view of public relations is conflict based on power relations. In Simoes’s view, relationships between organizations and publics create political dimensions to organizational decisions.

Banks (2000) introduced a socio-interpretive approach as a contribution to intercultural public relations. He suggested that public relations assumptions be flexible and adaptable to whatever the intercultural situation presented. He developed three principles of communication policy in international public relations by focusing on cultural interpretations and community building:

1. Facts and values are culturally conditioned. Development is a Western concept with positive values in the West. But elsewhere, development often looks like exploitation and cultural imperialism.
2. Knowing other cultures’ rituals, languages, social norms, and values is necessary but not sufficient preparation for forming international community relationships. It is necessary also to remain open to the possibility of conducting business within others’ worldviews and effectiveness criteria.
3. The practitioner and researchers should be ready to redefine the nature of public relations situationally. We must leave open to interpretation and negotiation what constitutes the forms and goals of practice, depending on the cultural context. (p. 113)

Banks (2000) continued that

the global/local approach to managing international public relations should be modified to provide for interactivity through genuine dialogue. A first step is for practitioners and host nation officials to jointly create at the beginning of the relationship a public relations matrix for the host society, including its goals, plans, and projects. (p. 113)

A Case of Multicultural Setting

In 1995, there were more than 2,000 multinational companies located along the border between the United States and Mexico (McDaniel & Samovar, 1996). These companies are often called “maquiladoras”—“labor-intensive foreign-owned industries which assemble products for export to other countries” (Kras, 1995, p. xxi). Most maquiladoras are U.S.-owned, but many of the investors are from other countries, such as Japan, South Korea, Germany, and Canada. The two largest Mexican border cities—Tijuana and Ciudad Juarez—have grown from small tourist towns into urban industrial centers within a very few years (Kras, 1995).

Samsung Tijuana Park is one of the many successful maquiladoras in Tijuana. This plant is part of Samsung Group, a large business conglomerate in South Korea. Samsung Tijuana Park was established in 1996, beginning as a manufacturing complex for electronic commodities and components for color television sets, VCRs, monitors, and tuners. There were 100 Korean managers and 6,500 Mexican workers in 2000. Between 1997 and 1999, the number of Mexican workers doubled, and by 1999, Samsung Tijuana Park ranked as the second largest maquiladora in Tijuana (Patta, 1999).

In multinational companies such as Samsung Tijuana Park, two or more cultural factors affect the organizational culture as a whole. Figure 84.1 shows the cultural environment in Samsung Tijuana Park. “Border culture” is treated as a unique culture because people in Tijuana are more Americanized than people in the other Mexican cities, given the area’s proximity to the United States. As a result of many people moving to Tijuana for jobs in maquiladoras, they experience contact with cultures different from their own.

Without a doubt, the two national cultures represented by Korean managers and Mexican employees are the primary factors influencing Samsung Tijuana Park culture. In Samsung Tijuana Park, Korean managers and Mexican workers are cultural strangers to each other. Each cultural group within a multinational company has its own common pattern of cognitive, affective, and behavioral structures and processes. Because of this cultural gap, multinational companies may face challenges or “unintended conflicts” different from, and sometimes more serious than, those in their domestic settings. For example, there might be serious problems in training new employees and in cultural communication between managers and workers.

To measure perceptual similarities and differences between Korean managers and Mexican workers regarding various cultural dimensions such as individualism-collectivism, tolerance to uncertainty, and acceptance of power distance, Lee (2001) developed a new concept, “co-acculturation,” by synthesizing the co-orientation model and adaptation theory. Co-acculturation is defined

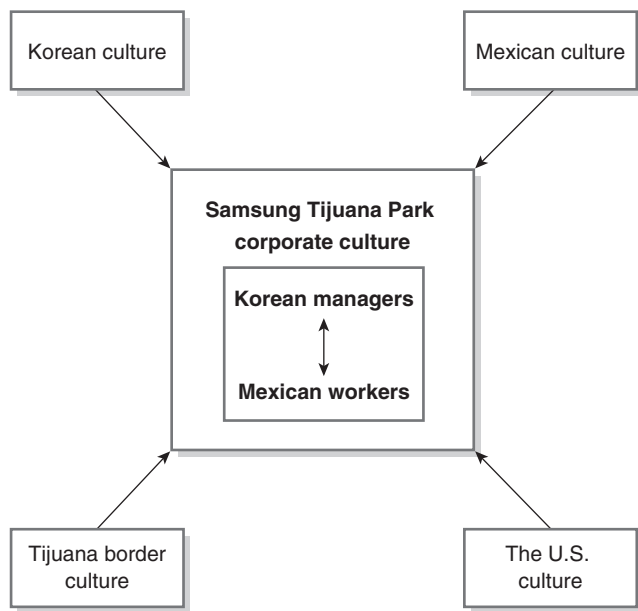

Figure 84.1 Multicultural Setting in Samsung Tijuana Park

as “simultaneous orientation toward each other and cultural dimensions” (p. 17). Co-acculturation is not one group’s acculturation to a host culture or the sum of each group’s acculturation. Rather, it represents “mutual acculturation” and “relational acculturation.” Based on a survey ($N = 255$), Lee found that (1) Mexican workers accurately perceive that they share power-distance values with their Korean managers, but the managers are generally less accurate in that they perceive greater differences than actually exist; (2) Mexican workers perceive that Koreans are as collectivistic as they are; however, Korean managers perceive that Mexicans are more individualistic than Korean managers; (3) Mexican workers perceive that Korean managers are more likely to avoid uncertainty at their job than they actually are; and (4) Korean managers perceive that Mexican workers are less likely to avoid uncertainty at their job than they actually are.

These misconceptions between cultural groups in multinational work settings may interfere with the integration of new workers and cause higher turnover. In this regard, the success or failure of a multinational company cannot be explained by economic factors alone. Effective intercultural communication and mutually beneficial relationship building between cultural groups, especially manager-worker relationships, serve as significant indicators of successful operation of multinational companies in the global economy.

From a public relations perspective, it is now commonplace for multinational organizations to include two or more cultures under a single corporate umbrella. Globalization makes work settings much more culturally heterogeneous. Not surprisingly, manager-worker

communication presents new challenges for both those directly involved and those charged with building and maintaining relationships within the organization—the public relations staff. Old assumptions and communication skills are put to the test when public relations practitioners must build and maintain new organizational relationships with culturally different employees, government entities, communities, and customers.

Furthermore, cultural heterogeneity is not necessarily limited to national culture issues. It also can be extended to other subcultures. For example, in an organization under merger and acquisition, people from different corporate cultures typically confront each other. This confrontation may pose a serious threat to building a new organizational culture.

Concluding Comments

In the field of public relations, the globalization of our world means opportunities and challenges for practitioners as well as for scholars. The fact that public relations practitioners need to communicate with international publics has become a reality for both small and large organizations. As Grunig (1993) pointed out, “The growth of international media, global business and global politics has strengthened the role of international public relations” (p. 141). Multinational organizations are regarded as more vulnerable to hostile reactions or crises than domestic organizations because of the increased numbers and complexities of those stakeholders who oppose them and the necessity for dealing with their cross-cultural contexts (Dilenschneider, 1992). International public relations “may be a necessary part of doing business for the public relations firms of the next century” (L. A. Grunig, 1992, p. 128). This promises to attract more attention and interest to this specific area of public relations and opportunities to build on the significant achievement previously attained.

Although educators are beginning to pay more attention to international public relations, there are only a few cases of international public relations classes being regularly offered in the university curriculum. Public relations educators need to find ways to expose students (future public relations professionals) to more of the various topics and issues related to international public relations because understanding public relations in this globalized world is not optional. It is must-have knowledge.

There is still a long way to go in building the body of knowledge about international public relations. What is missing in many previous studies titled global or international public relations is ironically the “global” or “international” aspect of public relations. It is clear that descriptive studies focusing on one individual country, without any overarching conceptualization, have limited value. Simply adding more and more isolated cases in multiple countries

cannot lead to adequate explanatory knowledge on international public relations.

THE BUSINESS OF PUBLIC RELATIONS

JOHN D. STONE

James Madison University

The public relations “business” is a multibillion-dollar industry practiced not only in the United States but also in most other parts of the world as well, with estimates varying for the United States from 158,000 (Seitel, 2007, p. 2) to 350,000 (Wilcox & Cameron, 2009, p. 2). Estimates of the number of practitioners in all countries in the world today, including the United States, are placed between 2.3 and 4.5 million public relations practitioners with an “annual global impact in the area of \$130–230 billion” (Falconi, 2006, p. 8).

In the United States, the two most prominent associations have a combined membership of nearly 35,000, while there are “an estimated 200 national and regional public relations organizations around the world” (Wilcox & Cameron, 2009, p. 3). In the United States alone, in 2005–2006, there were more than 250 colleges and universities offering programs in public relations, with about 34,000 students enrolled as majors in public relations or the allied areas of public relations/advertising or strategic communications (Wilcox & Cameron, 2009, p. 4).

Growth in the profession is expected to continue. The Bureau of Labor Statistics has recently predicted that

employment of public relations specialists is expected to increase faster than the average for all occupations through 2012. The need for good public relations in an increasingly competitive business environment should spur demand for public relations specialists in organizations of all types and sizes. (Seitel, 2007, p. 2)

That such growth will continue in all “areas” of the profession also seems quite apparent. We have witnessed not only the phenomenal growth in independent firms such as

Edelman Worldwide but the consistent emergence and growth of *new* agencies or firms as well. And, as suggested, this is a growth phenomenon in not just the United States but, primarily as a result of globalization, the entire world.

The Public Relations Agency

Guth and Marsh (2009) have listed the five major “settings” in which public relations is practiced:

1. Corporations
2. Nonprofit organizations and trade associations
3. Governments
4. Public relations agencies
5. Independent public relations consultancies

To this list, we must certainly add the practice of public relations in the international “theater.” This “global reach” will be discussed in a separate section later in this chapter.

This chapter focuses on the *public relations agency*. In the 21st century, the public relations agency is separated into two quite distinct areas: the *in-house component* and the *external agency*. And while there are estimated to be millions of public relations practitioners in the world today (Falconi, 2006), arguably the most recognizable “face” of public relations is that of the *agency*. It is important to note at the outset that the public relations agency is also commonly referred to as a *firm*. For most, the terms appear to be interchangeable. However, the functions are somewhat different in the overall sense. Quite simply,

the public relations *agency* (firm) has been defined as “a company that provides public relations services for other organizations on a per-job basis, by contract or on retainer” (Guth & Marsh, 2009, p. 558).

Clearly the public relations agency is an entity separate from the corporation or organization with whom it contracts. While the size and specialization(s) of a public relations agency (firm) may be argued, for present purposes we will consider a viable public relations agency to be *a structured group of no fewer than two public relations professionals, providing specialized public relations services on a full-time basis under the conditions of a retainer, fee for services, or conditional contract*. While the number of members in an agency (or firm) may be an issue for some, agencies do, in fact, range in personnel from 2 to well over 2,000. With the ability to add specialized contractors to small agencies (as needs may dictate), this seems a relatively moot concern.

Guth and Marsh (2009) continue by adding more concerning the function of the public relations agency. “Public relations agencies assist with the public relations activities of other organizations. Corporations, nonprofit organizations, trade associations, governments, and even individuals hire public relations agencies to help manage and execute various public relations functions” (p. 41).

The Scope of the Agency

There are public relations firms “found in every industrialized nation and most of the developing world” (Wilcox & Cameron, 2009, p. 107). Many of these large firms (such as Edelman Worldwide, Weber-Shandwick, Fleishman-Hillard, and others) earn millions of dollars in their multiple international offices—often as much or more than they generate domestically. In the United States alone, it is estimated that more than 9,000 such agencies or firms generating billions of dollars annually.

Public relations agencies express their vision of the role they should play through the Council of Public Relations Firms. In a statement of principles, revised and published in November of 2006, the Council made the following statement:

In their service to clients, public relations firms play a vital role encouraging public discourse. The professionalism and objectivity of our firms helps clients engage in that discourse, and clients turn to us for our counsel and assistance to vigorously pursue their organizational goals in educating and persuading audiences that matter most to them. Public relations firms help clients as diverse as government agencies, public and private companies, and not-for-profit groups. In a democratic and free society, our clients’ goals often put us in the sphere of such complex issues as thorny policy debates, intense market competition or critical education needs in areas of public health, safety and well-being. (p. 1)

Some of the most notable (independent) agencies, such as Edelman Worldwide, report an income of more than

\$300 million and list the number of employees in excess of 2,200; Ruder Finn reports nearly \$100 million in receipts, with nearly 600 employees; and Waggener Edstrom reports an income of more than \$90 million, with more than 600 employees—to list only three of the nation’s top-producing agencies (Werbel, 2007, p. 9). Modern-day firms, some obviously very large, offer many more services than the early public relations agencies. Such somewhat extensive service offerings include the following:

- Marketing communications (public relations efforts that compliment advertising and sales promotions)
- Executive speech training (helping managers to inspire as they deliver information and persuade orally)
- Research and evaluation (generating information and analysis that informs a campaign as well as data that can assess the effectiveness of that campaign)
- Crisis communication (assisting management in planning for emergency situations and implementing plans when such emergencies arise)
- Media analysis (assessment of media for potential placements of public relations messages as well as determining the effectiveness of the placements)
- Community relations (assisting companies in developing mutually beneficial relationships with their communities)
- Public affairs (developing effective relationships between government agencies and the communities served by those agencies)
- Branding and corporate reputation (establishing a unique collection of perceptions about a product or company)
- Financial and investor relations (the process of information and disclosure management between a corporation and the public)
- Environmental communications (the process of crafting and disseminating messages about the environment and how humans interact with it)
- Homeland security (the process of planning for and implementing those plans in cases of widespread community emergency)
- Litigation public relations (management of public communication related to legal disputes involving corporations)
- Employee-member relations (responding to and informing employees and their families)
- Government affairs (relations between corporate interests and government, especially regarding pending legislation)
- Issues management (anticipating and acting on key trends)
- International and trade relations (reacting to the political and legal aspects of the global-trading environment)
- Development/fund-raising (creating effective messages to spur financial and other contributions)
- Minority relations/multicultural affairs (creating welcoming relationships between an organization and members of a variety of ethnicities and cultures)
- Special events (planning and executing corporate gatherings)
- Health communication (devising messages and campaigns to improve health awareness and promote healthy behaviors)

- Reputation (image) management (using corporate communications systematically to groom an organization's public image)
- Social media management (devising user-created content for social-networking sites in the service of an organizational goal)

It is important to distinguish generally the functions listed above as they might be performed by *independent public relations firms* or *public relations components* in a larger organization from those efforts exerted by advertising or marketing—although such efforts may frequently overlap.

While advertising usually is accomplished through mass media outlets, it does so through the purchase of space and/or time for its messages. Public relations, on the other hand, is dedicated to obtaining coverage through the use of news items, press releases, feature stories, and so on that are printed without charge.

The communication functions of advertising are considerably more general and external than those “targets” of public relations—for whom quite specialized (designed) messages are constructed. Basically, the major goal of advertisements is to sell products and services. And while advertising and public relations often work “together,” their goals, methods, and measurements of success should not be considered the same.

Marketing and public relations often work “together” as well. Here again, the differences between the two are significant. The task of marketing is to identify, attract, and satisfy customers in order to achieve a company's sales goals. The publics with which the marketing functions of an organization are concerned are quite specific and limited. In contrast, the publics with which an organization's public relations efforts are concerned are quite broad and diverse.

These differences relate to *more* than issues of territoriality. For they evolve around both distinctions in the *goals/objectives* established, the *methods* used to achieve such goals, and the *criterion* applied in measuring the relative success of the efforts expended. Wilcox, Agee, and Cameron (2005) summarized this relationship well as they observed,

Although well-defined differences exist among the fields of advertising, marketing and public relations, there is an increasing realization that an organization's goals and objectives can be best accomplished through an integrated approach. (p. 17)

We should not be misled into thinking that the “integrated approach” is one that is accepted by (or acceptable to) all professionals in public relations, marketing, or advertising. For that is not the case. Many still prefer the disciplines to be separate and distinct. Both pragmatically and realistically, however, such integration seems to be a desirable end.

The Development of the Public Relations Agency

This nation's first public relations agency, the Publicity Bureau, was founded in Boston in the mid-1900s by Michaelis, Small, and Marvin and existed for some 12 years (Cutlip, 1994, p. 10). While few records of the Bureau's operations are extant, we do know that the firm represented Harvard University (1900), Massachusetts Institute of Technology (1907), and American Telephone & Telegraph (1903). Although the firm did accomplish some worthwhile goals for these three firms, it was attacked by the muckraker, William Kittle, in *Arena Magazine* in 1909 (Cutlip, 1994, p. 19). While Kittle's “report” must be considered in context, it does provide a description of the efforts of this nation's first public relations firm:

The Publicity Bureau, operated by two men—Michaelis and Ellsworth—is an effective organ in advancing the interests of a powerful group of gaslight, water and transaction companies and in prejudicing the public against municipal ownership of any of these utilities. The bureau has offices in Boston, New York, Washington and Chicago and from these centers, arguments, half-truths, and edited reports that are often misleading, are sent out to the press and paid for as regular advertising although they appear as “news.” (Cutlip, 1994, p. 19)

In 1902, William Wolff Smith opened a “publicity business” in Washington, D.C. This was the second public relations agency to start operations in the United States and the first in the nation's capital. Smith was a newspaperman and a part-time law student.

He worked on notable newspapers such as the *Baltimore Sun*, the *Cincinnati Enquirer*, the *New York Sun*, and the prestigious (at that time) *Buffalo News*. Smith was a self-described “publicity agent,” while the relentless Kittle took a different slant, portraying him as “a propagandist for big business” willing to use “something less than ethical means” to achieve the goals of his client (Cutlip, 1994, p. 28).

While other agencies of note emerged in Washington, D.C. (e.g., that of Thomas Roerty Shipp in 1914), as well as other parts of a more business-conscious America, Ivy Ledbetter Lee moved to establish his own firm—separate from his longtime association with George F. Parker. Lee was bolstered by his successful development of accounts with the Pennsylvania Railroad (1906) and the Southern Pacific Railroad (along with Parker, in 1907). Both were lucrative associations that would propel Lee closer to professional independence.

The third public relations agency in the United States was formed in November 1904 by Ivy Ledbetter Lee and George Frederick Parker. Parker and Lee, as the firm was originally called, served primarily to counsel in political and industrial circles. Although the firm was relatively

short-lived, they contracted with some major clients, including the International Harvester Company, Westinghouse, and President Grover Cleveland. In most instances, even though they were members of the same agency, Parker and Lee recruited and performed “press agency” duties for *different clients*. Parker, for example, worked with General Leonard Wood on his unsuccessful presidential campaign, the Filipino independence movement, and the Lehigh Valley Railroad. Lee, as previously mentioned, worked with the Pennsylvania Railroad but gained lasting prominence working with the Rockefeller family (1914) in the Colorado Fuel and Iron Company strike and as counsel in “public relations” on behalf of Standard Oil.

Lee was making a name for *himself* separate from George Parker, and his efforts were very much appreciated by the Baltimore and Ohio Railroad, as J. Hampton Baumgartner, a publicist for the railroad, praised Lee by saying,

I feel that the work which you have devoted to matters concerning the railroads and their *public relations* [italics added] have been productive of far reaching results, not only to Pennsylvania but to all public carriers by bringing about an intelligent understanding of the problems which confront the railroads and efforts put forth to solve them effectively. (Cutlip, 1994, p. 54)

Following his attempted resignation as counsel to the Rockefellers (1915), Lee’s next venture would be to establish his own firm (1916)—Lee, Harris, and Lee. In charge of the seventh agency to be founded in the United States and the last before World War I, Lee proceeded to pursue new clients. His first was Standard Oil of New Jersey. Lee went on to press for the formation of the American Petroleum Institute (API) and provided valuable counsel to the newly formed Red Cross Council. Lee’s advice was stellar. His level of true “public relations thinking” was outstanding. The principles on which Lee insisted that organizations be based and their business conducted was more than a new chapter in an old book—it was a new book! Needless to say, the success realized through his suggestions cemented both his credibility and his professional utility.

The Nature of the Firm/Agency

There is little doubt that the public relations agency as we have defined it is quite different from a corporate component or public relations division functioning *within* a larger organization. Because of its rather abundant resources, both financially and in manpower, the agency is also considerably different from the sole practitioner. Quite frankly, however, whether a firm is considered *independent* or a large agency *owned by a large holding company*, the operational capabilities seem very much the same.

From an internal perspective, the agency (because of its size and therefore its ability to provide specialization) often organizes “according to industry groupings larger agencies are divided into such areas as health care, sports, fashion, technology, finance, and so on” (Seitel, 2007, p. 96).

Newsom, VanSlyke Turk, and Kruckeberg (2004) discussed the specific nature of the public relations agency (or firm) from the standpoint of operations or functions:

Each agency or firm has its own internal structure, but generally the president of the firm shares the handling of accounts, as do the salespeople, who may be account executives. A firm may employ a bookkeeper, a secretary, a publicity writer, an advertising or graphics specialist and an artist. . . . Large firms have copy editors, media specialists, several artists and a production facility. (p. 6)

In essence, small firms (some as small as two practitioners) necessitate considerably more adaptation and obviously allow for less specialization than do large firms (agencies).

Retaining a Public Relations Firm: Advantages and Disadvantages

Hiring a public relations firm is not a decision that *should* be made without considerable thought. When an organization’s managers consider making such a decision, they should deliberate on both the advantages and disadvantages of retaining outside counsel. Wilcox and Cameron (2006) reflected both sides of the issue (pp. 118–119). Considering the advantages of such a “hire,” they suggest the following advantages:

- *Objectivity*: Because outside counsel is *not* directly connected to the organization, it is often more objective and can provide new perspectives on the issues in question.
- *Multiple Skills*: The larger staff of an outside firm, generally provides a variety of *highly skilled specialists* in given areas.
- *Extensive Resources*: Such resources include not just the talent pool of counselors but also the contacts that exist as a result of regular work in the essential areas of the profession (extended).
- *Office Network*: Public relations firms generally have other offices in other parts of the country—even other parts of the world.
- *Specialized Skills*: Firms are more likely to have practitioners with expertise in unusually specialized areas (crisis management, investor public relations, reputation management, etc.). (For additional discussion, see Seitel, 2007, p. 96.)
- *Credibility*: The proper selection of a public relations firm *should* result in the hiring of highly credible counselors. Such a credible reputation results from past “good works,” ethical behaviors, and the demonstration of high levels of professionalism.

- *Dedicated Time*: In most cases, a firm will have practitioners assigned to a particular client and should be able to devote (dedicate) the necessary exclusive time to the particular case (campaign, etc.).
- *Avoiding Groupthink*: While all internal public relations components do not have this “problem,” it is easy to see why/how they would tend to “go along” with the wishes of upper-level management. An agency (hired from the outside) is likely to offer more original thought.

Admittedly, there are certain “downsides” to hiring a public relations firm as well. As clients, such negatives must be weighed against the aforementioned positive considerations. Such disadvantages, again paraphrasing Wilcox and Cameron (2006, p. 119), might be as follows:

- *Understanding*: No matter how skilled a practitioner or how clear a client’s explanation, goals may be misunderstood. If such goals are not entirely consensual, problems will likely occur.
- *Time*: For both clients and practitioners, *time is money*. Whether justified or not, clients often feel that practitioners often *waste time* planning—perhaps the most important part of a public relations effort.
- It is not surprising that a client wants the firm to “*Get on With It*,” while the firm wants to make sure that they are prepared to achieve the goals the client really wants.
- *Internal Friction (Resentment)*: While it is *not* uncommon for any number of organizations to hire outside counsel *even when they have an internal component*, such an action may cause friction with the internal component. (“Are we not good enough to do this project?”)
- *Strong Internal Direction Needed*: While one of the purposes in hiring outside counsel was to relieve internal pressure and save time, it is possible that the opposite will occur. Rather than experiencing released time from the project, the administration will be called on frequently to provide guidance or make decisions for the agency.
- *Sharing Sensitive Information*: While most certainly *not always* the case, public relations firms may have a need for access to company data that are often *not* for public perusal. Such data may be financial or operational in nature. Needless to say, organizations do not generally share *sensitive* information with someone from outside the company.
- *Cost*: Public relations agencies price their services in a number of different ways (by the job, retainer, fee for services, hourly, etc.). Organizations may consider the cost of an agency prohibitive (\$200–\$300 per hour is not unusual for senior counselors). (For additional discussion, see Seitel, 2007, p. 96.)

The Independent Public Relations Firm

It is worth noting that until the early 1970s, most major firms were independent operations and owned by the principal officers/stockholders of that firm. In 1973, the firm of Carl Byoir and Associates, at that time the country’s third

largest public relations firm, was sold to the advertising firm of Foote, Cone and Belding (Wilcox et al., 2005, p. 115). Since that time, we can consider the “types” of public relations firms or agencies from two different perspectives.

The first is the totally *independent* agency. Such agencies are still controlled by the officers and stockholders of the company. The second is the agency that is “subsumed by communications holding companies” (Seitel, 2007, p. 97). Agencies in this category are “controlled” by the parent company—whether it is a large holding company, a general communications firm, an advertising conglomerate, and so on. Seitel has recognized that the world’s largest public relations firms are all owned by media conglomerates, among them Omnicom, The Interpublic Group, and WPP Group—organizations that tend to get larger each year. Needless to say, there are a large number of *independent agencies* operating in the United States as well as the rest of the world. Below is a list of the 10 firms that are considered the largest *independent* agencies, accompanied by a statement of their 2006 net fees and the number of employees, and those large agencies are owned by “communications holding companies” or conglomerates (see Table 85.1).

Agency Name/City	2006 Net Fees (\$)	No. of Employees
Edelman Worldwide, New York	324,488,483	2,259
Ruder Finn, New York	99,303,000	593
Waggener Edstrom, Bellevue, WA	92,303,000	629
APCO Worldwide, Washington, DC	81,844,117	470
Text 100 Int’l, New York	53,565,704	514
Schwartz Communications, Waltham, MA	26,601,999	172
Qorvis Communications, Washington, DC	23,900,000	85
Dan Klores Communications, New York	20,500,000	127
Taylor, New York	18,006,000	84
Gibbs & Soell, New York	17,908,000	105

Table 85.2 Public Relations Agencies Subsumed by Holding Companies

SOURCES:

a. Seitel (2007, p. 97).

b. PR Week (2004, pp. 25–29).

c. O’Dwyer’s Directory (2007, p. 13).

Until the 1970s, the largest public relations firms were independently owned by their principal officers or, in some cases, by employee stockholders. A significant change began in 1973 when Carl Byoir & Associates, then the third largest U.S. public relations firm, was sold to Foote, Cone, and Belding.

Table 85.2 demonstrates how that trend has continued into the 21st century. The table lists major public relations firms (considered “nonindependent agencies”) and the name of the “holding company” that owns the firm. Specific earnings by such public relations firms are not public record, although two financial categories are reported below that reflect the size of the overall operation(s).

From an objective perspective, this is *not* to suggest that because a public relations firm (agency) is owned by a larger organization (company) it does not continue to operate as a public relations “agency.” In most cases, an outside observer would not be aware which firms or agencies are “independent” and which are owned by a “holding company.”

Public Relations: 60 Years of Sustained Growth

“During the second half of the 20th century, the practice of public relations became firmly established as an indispensable part of America’s economic, political and social development” (Wilcox & Cameron, 2009, p. 56) as there were 17,000 men and 2,000 women practicing public relations in the United States (see Table 85.3).

The Bureau of Labor Statistics annually provides *national estimates* for some 800 professions in the United States. While such statistics are admittedly estimates and do *not include practitioners who do not use the denotation “public relations”* (included in this group is an estimated 45,000–60,000 government employees), these numbers are still somewhat revealing.

Highly relevant employment and salary data (see Table 85.4) are also available from the Bureau of Labor Statistics concerning public relations managers. The data are listed below in Table 85.5.

Year	Men	Women ^a	U.S. Agencies	Total in PR (U.S.)
1950	17,000	2,000		19,000
1960	23,870	7,271		31,141
1970				75,852
1980	65,000 ^b	61,000 ^a		126,000
1990				172,000 ^c
2005			3,000	350,000

Table 85.3 Growth in Public Relations in the United States

NOTES:

a. In 1979, it was estimated that women made up 41% of practitioners in the field. By 1983, this figure was 50.1%, and by 1993, it had increased to 66.3%. In 2000, this number was reported to be 70% (Wilcox & Cameron, 2006, p. 64).

b. Estimate.

c. Projected (Kendall put his estimate at 385,000. See Wilcox et al., 1989, p. 4).

Notably, this group (47,210) is *not* included in the total numbers listed above. Adding this group of managers, those members of the profession in governmental service (ca. 50,000) and the group of specialists (above) gives us a conservative number of public relations practitioners equaling 325,000 in the United States.

The Future of the Public Relations Agency

There is universal agreement that public relations is a rapidly growing profession. The “Department of Labor predicts that public relations will be one of the fastest-growing fields, with 39.8 percent growth for public relations specialists and 36.6 percent for public relations managers from 2004 to 2014” (Wilcox & Cameron, 2009, p. 56). It is also quite evident that when examining the growth in total income, the number of offices (both domestically and globally), as well as the increase in the number of practitioners over the past few years, the public relations agency will continue to grow at more than a steady rate.

Where will such jobs emerge and agencies develop? There will be a significant number of new positions in virtually all areas of the nonprofit sector. In addition, it is reasonable to assume increases for public relations professionals in the areas of investor relations, health care crisis management, reputation management, and the international theater (Taylor, 2001). “Public relations agencies . . . will continue to expand in the 21st century. Just as a plethora of high-tech public relations agencies emerged in the 1990’s, so, too, is it likely that the move toward public relations specialization among agencies will continue in the 21st century” (Seitel, 2007, p. 99). *Fortune Magazine* (March 21, 2005, p. 131) has predicted that there will be an increase in public relations jobs by more than 20% between now and 2012.

	Mean Hourly Wage (\$)	Mean Annual Wage (\$)	Lower 10% Wage (\$)	Lower 25% Wage (\$)	Median Wage (\$)	Upper 75% Wage (\$)	Upper 90% Wage (\$)
Hourly wage	27.45	57,100	14.22	17.99	23.94	33.17	45.49
Annual wage	29,580	57,100	29,580	37,420	49,800	69,410	94,620

Potential for earning is a normal concern. What jobs will pay the most in the coming years? What areas of the country will provide the most employment in the profession? What will be the future of the agency in the realm of compensation? First, we strongly feel that the development of public relations firms and agencies will be most pronounced, though not exclusive, in the East and West coasts—areas such as New York, Boston, Miami, and Washington, D.C., on the East Coast and Los Angeles, Seattle, San Diego, and San Francisco on the West Coast. Rapidly developing job markets will emerge in the middle of the United States as well as in areas such as Dallas, St. Louis, Chicago, Detroit, Cleveland, and Minneapolis. Most of these areas will be offering salaries above \$90,000 per annum, with some over \$100,000 per year.

Table 85.6 provides 2004 data on salary levels in the varying *areas* of public relations practice, while Table 85.7 provides similar data for practitioner salaries in various parts of the United States.

There is clear evidence that the employment of a public relations *agency* (outside the company or organization) is increasing. Wilcox, Cameron, Ault, and Agee (2007) observe that “a major trend for American corporations has been the outsourcing of services, whether telecommunications,

<i>Area of Public Relations Practice</i>	<i>Annual Salary (\$)</i>
Public relations agency	111,860
Companies/corporations	101,990
Professional organizations	79,820
Philanthropic services	76,870
Colleges and universities	74,780

accounting, customer service, software engineering, or even legal services. . . . the trend line is for more organizations to outsource their communications activities to public relations firms and outside contractors” (p. 105).

With the rapid increase in the sophistication of equipment (i.e., fiber optics, digital transmissions) and practitioner specializations (blogging, Web page development, and use of the Internet), it is understandable why such a trend is occurring.

The choice facing the entry-level public relations professional whether to work with a *larger agency* or a *small firm* is *not* always simple. Both have advantages. One should consider that the small firm will generally require that the public relations practitioner perform a larger number of differing tasks while on the staff—specialization is often not an option. Public relations professionals (in small firms) may well expect to be *generalists*. On the other hand, one obvious advantage of this environment is that the “new” practitioner is exposed to several different aspects of the profession and most often has greater autonomy in the performance of his or her task. Such autonomy allows for not only the development of new skills but also the application of considerable creativity.

The larger firm, or agency, provides the entry-level practitioner with an opportunity to both specialize more extensively in a given area (once the more fundamental tasks are mastered) and, very important, build a mentoring relationship with veteran professionals—an immensely valuable opportunity. Such a firm will provide an environment in which the more seasoned practitioner can develop and carry out “new” programs, develop new talent (in mentoring situations), and eventually move into upper-level management positions. Arguably, larger firms are generally more financially stable and able to offer higher salaries, benefits, and bonuses.

It is important for young professionals to carefully consider the aforementioned options when selecting the type of environment in which they want to work. Making an initial choice does *not* mean that one cannot change at a later time—and even move “back” if some moves are not satisfactory. Firms, either large or small, are not necessarily alike. Even though one’s experience at a “large” firm is unpleasant or professionally unrewarding, it does not mean that all such experiences will be the same—likewise with any size of firm or agency. Just as individuals are unique, so are public relations agencies.

Preparing for Employment in a Public Relations Agency

University students often decide to major in public relations as preparation for entering the profession. An excellent curriculum in public relations should include developing an understanding of theories of strategic communication; developing an ability to conduct practical research at a high level

of competence; honing writing skills to a level of precision and excellence; developing an understanding of effective teamwork and client relations; and providing opportunities for professional practice, both through classroom assignments for simulated and real clients and through structured, mentored, internships with public relations professionals. Discussion of case studies can prove to be an important learning tool in accomplishing these goals.

Figure 85.1 provides an example of the kind of case that might be studied to introduce students to understanding the business of public relations. The problems described in this case are ones that virtually all start-up public relations agencies encounter, and the case provides a good opportunity to look at the business issues inherent in public relations.

Most of us readily admit that people are the most important element in any business—whether large or small. The public relations profession is certainly no exception. In any organization, from the smallest retailer to the largest corporation, from the start-up business to the multimillion dollar nonprofit association, or from the U.S. government to the government of any number of foreign countries, public relations professionals will be needed to help establish good relationships with any number of relevant publics. The well-educated and highly skilled public relations professionals will find themselves in increasing demand as globalization makes our world much more interdependent and provides many more “seats at the tables” of commerce, politics, and social exchange.

Building the Independent Public Relations Agency

Background. While there are countless public relations agencies in the United States, no two are exactly the same. Frankly, many are quite different from one another. At the same time, there are a number of common concerns that all start-up public relations agencies encounter and must address.

Ron and Terry met in college, and both earned undergraduate degrees in public relations. Terry’s interests were centered in the general areas of media (electronic and print), while Ron’s major emphasis was in the area of management and budget. As juniors in a public relations management class, the two decided to form their own public relations agency on graduation.

Their experience consisted of two summer internships each and working on projects through their membership in the Public Relations Student Society of America (PRSSA). In addition, both Ron and Terry had agreed to public relations internships during the summer between their junior and senior years.

Situation. The formation of any business presents some problems or issues. Forming a public relations firm (business) presents some very unique problems that must be dealt with.

An initial issue deals with the *type of organization* Ron and Terry will form. While they understood the nature of other organizational structures including traditional partnerships and corporations, Ron and Terry chose to form their company in line with a more current trend. They chose to form a Limited Liability Company, or LLC.

Second, Ron and Terry needed to develop a realistic *business plan*. Such a plan would include financial matters, location, budget, equipment, income projections (5–10 years), rent/lease considerations, and so on. The SBA (Small Business Administration), the SBDC (Small Business Development Center), and SCORE (Retired Business Executives) helped with this plan. While the plan was general and needed more specifics on both expenditures and income, Ron and Terry felt comfortable with it.

A third concern was their *financial base*. Both Ron and Terry had more than \$10,000 each in college loans to repay, but knew they had to have a fairly substantial amount of money to start their business. With the help of their parents as cosigners and the endorsement of the SBA, Ron and Terry borrowed \$25,000 and established a “line of credit” for another \$50,000. The line of credit would be used only as needed.

Ron and Terry next determined a *specific location* (part of the country and specific city) in which to locate their business. They both loved the city of Charleston, South Carolina, but felt the economic outlook was a bit bleak there. They had both been raised in the Washington, D.C., area but knew the level of competition in the nation’s capital for public relations business was keen and they would be going up against some well-established and major firms. They decided on Denver, Colorado. There weren’t many major public relations firms with branches in Denver and none with their main office located there. Denver seemed to have plenty of businesses to support the efforts of a new public relations agency. Besides, both Ron and Terry liked to ski, and Denver was within an hour of major ski slopes.

Since neither Ron nor Terry has the needed expertise in writing or graphics, they realize they will have to acquire *additional staff*. Options include hiring full-time staff or contractors (as needed). They choose to hire contractors to fill specific roles on an as-needed basis. They believe that there are a considerable number of practitioners in the Denver area who would be able to provide the needed services. Ron will assume the duties of the manager since that is his primary interest, and Terry will handle media relations and electronic productions (video, audio, Internet, etc.).

Problems. Virtually all businesses have problems. The issue is whether and how one can deal with such problems. Listed below are some issues that faced Ron and Terry as they started their venture.

- Was the selection of the business type a good choice? Would the formation of a corporation add more credibility to their title? Does LLC provide legal protection(s) for them and their staff? Would a partnership be fewer “headaches” for the new venture? What about legal implications and liabilities? Is there interest in bringing in a new “partner” for some capital infusion? Is more capital needed at this time?
- Have they chosen their location wisely? Is it more advantageous to start a business venture in an area that has been proven to be willing and able to support such businesses (in this case, Washington, D.C., or New York)? Why is Denver the final choice? Is it a good business environment for their venture?

(Continued)

(Continued)

- One of the major issues in business success or failure is how well the business is capitalized? With the initial loan of \$25,000 and the \$50,000 line of credit, will there be enough money to see the new agency through until it can show a profit. While a public relations firm has no real “stock” or merchandise, there will be considerable expenses. Have such potential costs been addressed?
- How specific should a business plan be? Could a business plan with few specifics in projected expenditures and income potential help in obtaining money from banks or other lending institutions?
- Where will the new organization be housed? Will the principals lease (rent), buy, or even build? Will they try to find a location inside the city or on the outskirts (even a suburb)? Is the location and appearance of the office important? How large an office will be needed at the outset?
- What specific types of equipment will be needed for the new business? Is it wise to lease some of the major pieces of equipment (copiers and laptop computers)? Is it possible to buy used (in good condition) office furniture or equipment? What about expenses for office decorating, telephone and Internet services, and so on?
- Will additional staff be needed (practitioner or support staff)? It is a common practice to hire contractors as needed for a specific job. Is this a good move early in the life of a new business? Is it better to hire full-time staff and build a consistent team than to change the “mix” as different jobs demand? How will the search and interview processes be handled?
- How will salaries be paid? Will salaries be paid from the very outset? Will monies be paid on a percentage basis of business income generated by individuals in the agency? Will a benefit package be offered to members of the agency? What benefits will be offered at the outset, or will such benefits “wait” until profit levels are more meaningful? Will the originating “partners” receive a salary or income from the agency if such monies are generated by the firm?

PART XIII

ADVERTISING

HISTORY OF ADVERTISING

EDD APPLGATE

Middle Tennessee State University

Colonial American Advertising

Advertising appeared in America in pamphlet and signboard forms. Pamphlets, which were popular, explained in depth what was available. Signboards, on the other hand, resembled in design those used in England. Most of the time, these signs contained symbols as well as addresses, which consisted of brief copy, not numbers. Although these signs were popular among businesses throughout the colonies, the most colorful appeared in cities such as Philadelphia and Baltimore. Signs for taverns were the most visible.

In the early 1700s, John Campbell was a postmaster in Boston and knew several important politicians. Using his position and his friends, Campbell eventually asked the authorities to grant him permission to publish a newspaper. The first *Boston News-Letter* was dated "From Monday April 17 to Monday April 24, 1704," and was printed on an 8" x 12" sheet of paper. Copy appeared in two columns on the front and back. Rough in appearance, the *News-Letter* contained news from newspapers published in London. Often the news was out of date. Advertising received a maximum space of 20 lines. The cost per agate line was about 1.5 cents.

The third *News-Letter*, dated May 1 to May 8, 1704, contained the first paid ads. Although there were three ads, together they occupied only 4 inches of space in one column. The word *advertisements* separated them from the news. Two advertised rewards for the capture of thieves; the other advertised real estate.

As Campbell's paper continued, other kinds of ads appeared, including those for slaves. However, advertising was restricted; even after 3 years, 5 inches devoted to

advertising was rare. Some issues were devoid of any advertising whatsoever.

On December 21, 1719, in Boston, William Brooker published the *Boston Gazette*. The following day, in Philadelphia, Andrew Bradford published the *American Weekly Mercury*. Both newspapers were similar to the *News-Letter* in size and typography. Even the ads were similar, except that Brooker employed brief headlines that actually identified what the various ads concerned.

Two years later, Benjamin Franklin, who was 16, became the editor of Boston's *New England Courant*, which James Franklin, his older brother, had published. James had published controversial political essays and was arrested. Benjamin printed the word *Advertisements* in bold capital letters and separated it from the copy. The word attracted attention. Franklin's editorship ended 2 years later, and he moved to Philadelphia.

Franklin worked for Samuel Keimer, who published the *Universal Instructor in All the Arts and Sciences and Pennsylvania Gazette*. Franklin, with the help of a friend, purchased the paper and immediately shortened the name to *Pennsylvania Gazette*. He improved the writing and typography. Within several months, the paper was considered one of the most attractive newspapers in the colonies.

Advertising in the *Gazette* was important to Franklin. In the September 25 to October 2, 1729, issue, he printed the word *Advertisements* in bold letters, then left about a 1/2 inch of white space. The issue contained nine ads. The first letter of the first word of each ad was capitalized. In addition, each ad had at least a 1/2 inch of white space above and below it.

Franklin increased the number of pages from two to four so he could handle more ads and news stories. He

separated each ad with white space. He used at least a 14-point heading for each ad. Later, he incorporated small stock cuts or illustrations. In the May 23 to 30, 1734, issue he employed a stock cut of a ship for the *Three Bachelors*, which had docked. The ad informed merchants that the ship was accepting freight. Franklin realized that illustrations could enhance an ad, so he used half-column and column cuts made especially for certain advertisers. Readers could determine for whom or what the ad was merely by the illustration. Retailers who normally stayed away from advertising in newspapers realized that they could increase sales by advertising in Franklin's newspapers. As a result, Franklin had to enlarge his newspaper again. Instead of two short columns, he put in three deep columns, which made the newspaper about the size of a modern tabloid.

Franklin published ads for slaves, personal items lost or stolen, and goods for sale, including *Poor Richard's Almanack*, which he wrote and published.

On November 5, 1733, John Peter Zenger published the first issue of the *New York Weekly Journal*. However, Zenger criticized the provincial government and was arrested for libel. His lawyer, Andrew Hamilton, orchestrated a masterful defense, and Zenger was found innocent. Zenger's newspaper was superior to Bradford's. The *New York Weekly Journal* contained 8 to 10 ads, while the *Gazette* contained 2. In addition, Zenger used column rules to separate ads, and he did not restrict advertising to a particular amount of space. One ad was more than a half-page deep. Like Franklin, Zenger realized the importance of illustrations and used various cuts to improve the appearance of certain ads.

One of the most innovative newspapers in the mid-1700s was the *New York Post Boy*, which was founded by James Parker in 1742. Parker, who had apprenticed in Franklin's print shop, received financial support from Franklin. Originally titled the *New York Gazette, Revived in the Weekly Post Boy* and later, *Parker's New York Gazette*, or the *Weekly Post Boy*, the newspaper existed until 1773.

Ads in Parker's paper occupied as many as six columns, or half of the paper. Ads were for real estate, slaves, runaway apprentices, books, wines, medicines, and lotteries. Headlines were capitalized in typesizes of 10 point, sometimes 14 or 18 point.

By 1760, type sizes and typefaces varied within most ads. Headlines were at least 18 point. Display ads filled the columns. The newspaper became so successful among advertisers that ads filled three of the four pages. Parker's paper was probably the first in the American colonies to devote the entire front page to advertising.

The *Pennsylvania Packet and the General Advertiser*, which had been founded in 1771 by John Dunlap, illustrated how advertising could help sell newspapers. Dunlap realized the importance of how an ad looked. As a result, the ads in his paper were easier to read and attracted reader interest. Dunlap's newspaper featured commercial news, too, rather than political stories. Commercial news attracted

merchants. Thus, he was able to attract those who needed to advertise. He revived the illustration; special cuts were created for certain advertisers. Within 2 years, Dunlap's newspaper was so successful that he had to enlarge its size and increase its columns. Advertising accounted for two-thirds of the paper's content. In 1784, the paper, which had started as a weekly, became the first daily to be published in America, primarily because of the amount of advertising Dunlap received.

Another daily appeared a year later. Published in New York by Francis Childs, the *New York Daily Advertiser* contributed to advertising by running headlines as big as 36 point. These headlines, usually one word, were printed in bold to capture attention.

By 1800, the number of newspapers published in the United States was about 300. Most publishers were satisfied with their advertising. Few actually worried about how ads appeared. Thus, advertising remained constant in appearance for numerous years. In most cases, no more than one cut illustrated each ad. The copy was dull and usually small in size.

The Penny Press and Advertising

Benjamin Day started the *New York Sun* in 1833. By the second year, the paper was selling 20,000 copies. The large circulation made it a popular medium for advertisers.

Day wrote most of the copy, which consisted of 10 lines or less, for the ads. He realized the importance of the want ad, which advertisers in London had used. He solicited these small ads from businesses and readers and placed them under the heading "Wants." Day also published ads for theaters and museums. Day had to increase the paper's page dimensions as the number of ads increased.

In 1835, James Gordon Bennett founded the *New York Herald*, which, like the *Sun*, presented news of every type. Eventually, the *Herald* surpassed the *Sun* in circulation, and Bennett was more creative than his rivals in dealing with advertisers. Like the *Sun*, the *Herald* catered to merchants and manufacturers by the kind of news stories printed. Ads were separated by lines but contained no boldface headings.

Most ads carried little, if any, illustrations. Most ads were similar to want ads. They contained small first-line headlines, small amounts of copy, and thumbnail illustrations that identified businesses.

In 1836, Bennett's *Herald* published a two-column ad that contained a two-column illustration for the American Museum. The *Herald* and other New York newspapers published two-column ads, some with illustrations. In the late 1840s, advertisers who placed small ads complained to the publisher of the *Herald* about the few advertisers who placed large ads. The publisher banned all display ads. The paper's advertising columns looked the same and, consequently, unappealing.

In the 1850s, Robert Bonner purchased the *Merchants' Ledger*, a business sheet, and changed its name to the *New York Ledger*. Although he did not accept advertising at first, he made advertising history by publishing stories that appealed to women, which resulted in women becoming more interested in reading stories in newspapers and in ads directed to women. Bonner advertised his paper in other newspapers. He allowed display ads; he experimented with copy and typography, which caused other publishers to do the same. His paper soon had a circulation of 400,000.

Bonner's paper soon went to two-columns with reiteration, then to a full page. Some of his ads included a line being printed more than 600 times. His methods had an immediate effect on advertising.

The First Advertising Agencies

The advertising agency in the United States developed in the 1800s. According to Ralph M. Hower (1949), advertising agencies passed through four stages before N. W. Ayer & Son was founded. The first stage was the newspaper agency, which was inaugurated by Volney B. Palmer, who represented newspaper publishers. The second stage occurred in the 1850s, when agents became independent. Space jobbing, as this stage was called, became popular as agents realized that they could earn more by selling space to advertisers. This stage caused many agents to question their role. After all, they did not work for publishers, and they did not work for advertisers. Yet they referred to themselves as agents. The third stage developed out of the second when George P. Rowell purchased large amounts of space in newspapers and then resold it in small amounts to advertisers. This stage, which has been called space wholesaling, began in 1865. The fourth stage was based on Rowell's idea and appeared in the late 1860s. Called the advertising concession agency, this stage occurred when Carlton & Smith (later the J. Walter Thompson Company) purchased most—if not all—of the advertising space in certain publications for a specified period of time. Consequently, the agency, not the publisher, was responsible for securing advertisers for the entire publication. This practice actually closed the gap between agent and publisher, but the agent worked as an independent middleman nonetheless.

Volney B. Palmer

Volney B. Palmer, who had offices in Boston, New York, Baltimore, and Philadelphia, was a pioneer. He was the first advertising agent, and he represented more newspapers than did other agents of his day. In addition, he promoted advertising as an integral part of marketing and produced as well as delivered ads to publishers.

Palmer was born to Nathan and Jerusha Palmer in Wilkes-Barre, Pennsylvania, in 1799. His father, a lawyer

who held several political positions in Wilkes-Barre, moved his wife and six children to Mount Holly, New Jersey, in 1818, where he published the *Burlington Mirror*, a newspaper on which every member of the family worked. He changed the name of the newspaper to the *New Jersey Mirror and Burlington County Advertiser* about a year later. The newspaper continued to be popular among readers and advertisers, even after Nathan's death in 1842, when it was published by his widow and then his daughter, Eliza.

Palmer and one of his four brothers moved to Pottsville, Pennsylvania, in 1830, where he invested and worked in real estate. In 1841, after he married, Palmer moved his family to Philadelphia, where he attempted to sell real estate in an economically depressed city. By 1842, he had added a coal office as well as an advertising business to his real-estate venture.

Palmer remained in real estate for the next several years, even though his advertising interests were fruitful. In 1849, he used "Advertising Agency" in an ad for the first time. He claimed to be the sole representative of 1,300 newspapers. This, Palmer realized, allowed advertisers to be selective. In addition, Palmer created speculative presentations for these prospective advertisers. The advertiser was informed of the total cost, not just the space rates for each newspaper selected. Palmer received a 25% commission from the publisher on payment. The commission system is used today, except that agencies usually receive 15%, not 25%.

Palmer's agency provided more services than most agencies at the time. He promoted his services by using endorsements from publishers. According to Donald R. Holland (1973, p. 108), Palmer "urged business men to use advertising on a regular basis, to use it to develop new markets, to take advantage of the flexibility of advertising to specific regions or in specific seasons."

By the mid-1850s, Palmer was considered by numerous clients as a godsend, and his agency grew. He opened four offices in four major cities. He maintained the office in Philadelphia and hired others to manage the other three. He visited the other offices at various times throughout the year.

In the late 1850s, John E. Joy, W. W. Sharpe, and J. E. Coe became partners. When Palmer retired in the early 1860s, Joy and Coe operated the Philadelphia and the New York offices, respectively. The latter office was eventually purchased by W. W. Sharpe. The office in Boston was controlled by S. R. Niles.

George P. Rowell

George P. Rowell was born in 1838 in Concord, Vermont. When he was a teenager, he moved with his parents to a farm outside Lancaster, New Hampshire. At 17, he went to Boston to find work. He taught school for several years, then worked in a store. Eventually, he found employment with the *Boston Post*, for which he sold space to advertisers.

Rowell married Sarah Eastman in 1862. Although he earned enough to support his family, he created a theatrical playbill in 1864, for which he sold space to advertisers. He continued the playbill for several weeks and netted a comfortable profit.

In 1865, he left the *Post* and opened an advertising agency with his friend Horace Dodd. They devised a “list system” of newspapers for advertisers to consider. Unlike Palmer, they purchased large quantities of column space from these newspapers, then sold the space in small quantities to advertisers. In short, they purchased space at wholesale, then sold it at retail. They persuaded certain publishers to give them a discount based on continued patronage. The agents received an additional 3% off the card rate if they paid in cash within a 30-day period. The agents did not have to pay more than 25% of the card rate for most of the newspapers they handled. Rowell’s “list system” became instantly popular and was adopted by other agencies.

Rowell and Dodd started the *Advertisers’ Gazette*, a house organ that promoted advertising and the agency.

Rowell sold the agency to Dodd in 1867 and moved his family to New York, which had become the most important commercial city in the nation because of its location. Rowell established the agency George P. Rowell and Company and continued using the “list system.”

Rowell made an effort to make sure that the circulation figures claimed by publishers were accurate. Rowell realized that if his agency could supply exact figures to advertisers, then advertisers would know how much to pay for the space they purchased.

Rowell continued to publish the *Advertisers’ Gazette*, and in 1869, as a service to prospective advertisers, he published the first volume of *Rowell’s American Newspaper Directory*, which listed more than 5,000 newspapers in the United States, more than 300 in Canada the agency handled, and, of course, various advertisements, which defrayed part of the publication cost. Although Rowell had tried to eliminate so-called private lists, he was criticized by other agents for making available at a nominal cost more information than they offered. Rowell was also criticized by publishers for printing conservative circulation figures of their respective newspapers. The publication was updated and issued annually. As a result of this publication, publishers of newspapers eventually changed their circulation figures.

Rowell also published the *American Newspaper Reporter*, which was a house organ that preceded *Printers’ Ink*. The organ contained insightful features about individuals who worked in the advertising and newspaper businesses, as well as other informative articles.

By 1871, Rowell’s “list system” had been employed 6 years and had proved profitable. Rowell himself had accumulated more than \$100,000. Yet the firm continued to add to its various lists of newspapers and clients. Rowell’s firm placed numerous ads for various questionable remedies, for instance, even though Rowell’s opinion toward advertising patent medicine changed dramatically years later.

In 1878, Rowell issued a small pamphlet that expressed the principles and conditions that guided the agency. The same year, he sold the firm’s house organ, *American Newspaper Reporter and Advertisers’ Gazette*, to R. H. C. Valentine, who changed the subhead and design.

In 1880, he purchased a farm in New Hampshire and seldom worked in advertising. However, in 1888, Rowell returned to his office in New York and published *Printers’ Ink*, which contained articles about the business of advertising. The publication became a journal for advertisers and was so successful that eventually it had at least 200 imitations.

Rowell divorced in 1890 and married Jeannette Hallock in 1891. He retired from advertising in 1905 and wrote 52 papers about his life in the business. These papers appeared in *Printers’ Ink*, then in the book *Forty Years an Advertising Agent: 1865–1905*, which was published in 1906.

N. W. Ayer & Son

Francis Wayland Ayer was born in 1848 in Lee, Massachusetts. Nathan Wheeler Ayer, his father, had graduated from Brown University. In fact, Francis was named after Dr. Francis Wayland, one of Brown’s presidents.

Francis Wayland Ayer learned from his father the basic principles that helped him throughout his life. He learned what responsibility, integrity, and honesty meant. When he was 14, he taught in a country school in New York. A year later, he was offered a position in a village school.

In 1867, he attended the University of Rochester. Within a year, he had spent his savings. He asked his father for help, but his father was barely earning an income. Ayer left the university in search of a job. The publisher of the *National Baptist*, a weekly religious newspaper, hired him to solicit ads. Ayer earned \$1,200 in commissions in less than a year. His employer offered him \$2,000 a year to stay with the firm, but Ayer refused; he was certain he could earn more on his own. He persuaded his father to work with him, and on April 1, 1869, he opened the agency N. W. Ayer & Son. He named the agency after his father for several reasons, including because the name sounded more impressive than just F. W. Ayer.

The Ayer agency began with 11 religious newspapers. Like other agents of his day, Ayer solicited ads from advertisers, then placed them in the publications listed with his agency. In addition, he purchased the total advertising space in certain publications, then resold it in partials to advertisers. Thus, he acted as manager of advertising departments of publications. Ayer also placed ads in publications that were not on his list. In such instances, he estimated how much the space would cost, then quoted a price that was slightly higher than his estimated cost to advertisers. Ayer earned income the best way he knew how: by selling and bargaining. By the end of its first year, the agency represented more than

11 newspapers. Growth continued, and in 1870, Ayer had to move to a larger office and hire his first employee, George O. Wallace, a bookkeeper.

Within 2 years, the agency had to move again. It was handling more than 300 publications located in 27 of the 37 states that made up the nation. In addition, ads for clients were placed in other publications through other agents.

In 1873, N. W. Ayer died. Francis purchased his father's interest in the business. The same year, as a result of growth, Ayer asked Wallace to become a partner; Wallace accepted a one-fourth interest in the agency.

In 1875, Ayer married Rhandeen Gilman. The same year, the Ayer open-contract-plus-commission plan was initiated, after Ayer decided to represent advertisers, not publishers. Unlike Rowell, he would inform an advertiser as to how much space cost. Furthermore, he would inform an advertiser as to what the agency received for its services. Instead of being merely a space seller like other agencies, Ayer's agency would become a space buyer and therefore be paid by the client. Through trial and error, Ayer learned how to earn a profit from his commission system. The advertiser had to trust Ayer and vice versa. Ayer would buy space at the lowest possible cost for the advertiser. The advertiser would have access to Ayer's lists of rates. Thus, the advertiser could determine the cost of advertising space in a specific publication and, consequently, the commission to the agency.

This system allowed Ayer to buy advertising space wisely as well as consider the advertiser's needs, which are the hallmarks of modern agencies. The system, although sound, was not adopted by every agency that learned about it, but it forced every agency to recognize that advertisers had interests that needed servicing.

Throughout the 1870s, the Ayer agency grew. By 1876, it could place ads in any newspaper published in the United States or Canada, because Ayer had created a printing department a year earlier so the agency could print most of the ads in-house. This gave the agency an advantage over other agencies; most agencies hired independent printers to print their clients' ads.

In 1877, the agency purchased Coe, Wetherill & Company, another agency in Philadelphia. Coe, Wetherill & Company had succeeded Joy, Coe & Company, which had acquired Palmer's agency. In addition, the agency, like Rowell's, published *Ayer and Son's Manual for Advertisers*, primarily to promote its list of publications, and later, *The Advertiser's Guide*, a quarterly magazine filled with informative features and promotional pieces about advertising.

Ayer, like other agencies, placed ads for makers of patent medicine. Other clients included John Wanamaker, Montgomery Ward and Company, Whitman's Chocolates, Blackwell's Durham smoking tobacco, Singer sewing machines, Harvard College, and manufacturers of farm machinery.

In 1878, Ayer allowed Henry Nelson McKinney to become a partner. McKinney, an expert in sales, believed in the power of advertising and in the open-contract system. He was extremely important to the growth of the agency.

In 1879, Ayer started another service when it conducted a market survey of the nation to entice the Nichols-Shepard Company, which manufactured threshing machines. The survey presented the production of grains by counties and states. In addition, the agency included an in-depth advertising plan. This was the first advertising campaign based on a market survey. The company hired Ayer as a result of the survey.

In 1880, the agency focused on writing advertising copy in addition to printing ads. The same year the agency published the *American Newspaper Annual*, which listed every newspaper and magazine published in the United States and Canada. This annual later became the *N. W. Ayer and Son's Directory of Newspapers and Periodicals*.

Ayer's business policy changed in the 1880s. The agency refused advertising that would discredit the agency or would disappoint the advertiser. Nonetheless, the agency continued to grow, although clients curtailed their spending on advertising because of a recession in the mid-1890s.

In the late 1890s, businesses expanded, including Ayer. In 1899, it handled the major campaign that introduced the Uneeda Biscuit, which was sold in individual, airtight packages. The campaign, which was for the National Biscuit Company and was the largest up to that time, included newspaper, magazine, and outdoor ads. The campaign was an overwhelming success.

Although the agency had stopped accepting beer and whiskey accounts, by 1900 Ayer had become the largest agency in the nation, with more than 160 employees and profits exceeding \$58,000. Ayer opened branch offices in New York, Boston, Chicago, and Cleveland in the early 1900s.

Ayer realized that the agency had become too large to manage, even for his partners and himself. After hiring several managers who failed in their responsibilities, he hired his son-in-law Wilfred W. Fry in 1909. Fry had married Ayer's oldest daughter in 1904. Fry, a hard worker, was made a partner 2 years later. Ayer gave him the responsibility of managing the agency.

After the war, the agency's profits soared to more than \$500,000 in 1919, the year the agency celebrated its 50th anniversary.

Albert Lasker and Lord & Thomas

Albert Lasker shaped and characterized the advertising industry for the first 40 years of the 20th century. Born in 1880, Lasker grew up in Galveston, Texas, where his father was the president of several banks. When he was not in school, Lasker worked as a bookkeeper for his father and as a journalist for the *Galveston Morning News*. When he graduated in 1896, he worked full-time for the newspaper, until he moved to New Orleans, where he worked for the

Times-Democrat. Then he moved to Dallas, where he worked for the *Dallas News*. Eventually, he returned to Galveston. He desired to publish a small newspaper in Texas. His father agreed to buy a small newspaper on one condition: that he try advertising for a brief period. Lasker agreed.

Through his father, Lasker found employment at Lord & Thomas, an advertising agency in Chicago. Lasker worked as an office boy for \$10 a week. A year later, when a salesman left the agency, Lasker asked Ambrose L. Thomas, one of the partners, if he could have the salesman's territory until he found a replacement. Thomas agreed, and Lasker worked diligently. He and a friend, Eugene Katz, created several ads for the Wilson Ear Drum Company, which they showed to the company's president, George Wilson, who used the ads. The company's sales increased.

Lasker married Flora Warner in 1902 and demanded a higher salary. A year later, his salary had doubled. D. M. Lord, one of the agency's partners, retired, and Lasker purchased his share of the agency.

Lasker met John E. Kennedy in 1904 and hired him to write copy. From Kennedy, Lasker learned that consumers needed a reason to buy something. To Kennedy, a good ad contained a logical explanation as to why the consumer should purchase the product. Through Kennedy, Lord & Thomas pioneered "salesmanship in print" and "reason-why" advertising, which other agencies adopted.

Lasker publicized Kennedy's discoveries in the agency's house organ, *Judicious Advertising*, and in other publications. As a result, Lord & Thomas acquired more clients until it became one of the largest agencies in the United States.

Unfortunately, Kennedy left Lord & Thomas after 2 years. Lasker was in charge of editing all copy that was written for clients, even though he did not write any himself. He also introduced ideas, which were used in campaigns.

Thomas died in 1906, and Lasker and Charles R. Erwin purchased his share of the business. Erwin remained a partner until 1912, when he sold his share of the agency to Lasker.

Claude C. Hopkins, another copywriter, was hired in 1908. Hopkins employed Kennedy's style. Lasker paid Hopkins more than he had paid Kennedy. Hopkins enjoyed visiting clients to see how products were manufactured. He created memorable ads for Quaker Oats' products, Goodyear, and various manufacturers of cars and trucks. He emphasized brand images in his ads. He realized the significance of conducting tests and researching copy to determine which headline, which subhead, and which sentence of body copy attracted the most attention. Hopkins's ads were straightforward and simple, with few illustrations. Hopkins employed testing through the use of coupons and samples in numerous campaigns. He traced who responded, and this piece of information benefitted the client. Lasker learned a great deal from Hopkins and vice versa.

Lasker was responsible for Americans purchasing orange juice. Lasker learned that citrus growers in California produced so many oranges that they cut orange trees to limit the supply. Primarily to stop the destruction of the trees, Lasker had campaigns created to encourage consumers to not only eat oranges but also drink orange juice.

Lasker and Hopkins were involved in other campaigns, including the campaign that depicted Palmolive's beauty because of its color instead of its power to clean. For Van Camp's pork and beans, they employed tasting demonstrations as well as the power of suggestion.

Lord & Thomas prospered. Billings rose from \$3 million in 1906 to \$6 million in 1912. The agency had opened offices in New York, Toronto, Paris, London, San Francisco, and Los Angeles.

Before he became intrigued with politics in 1918, Lasker had contributed much to advertising. He had been partly responsible for the salesmanship in print and reason-why styles of copy. He and Hopkins had been responsible for "scientific" advertising. He had promoted ethical principles and had been opposed to questionable or dishonest advertising.

After working for the U.S. Shipping Board, Lasker returned to Lord & Thomas in 1923. Although Hopkins had been directing the agency in Lasker's absence, he realized that he and Lasker differed on how the agency should operate. Hopkins retired in 1924.

Lasker hired Ralph Sollitt; then, he fired every employee in the New York office. He was determined to make Lord & Thomas what it once was. He explained his years with the agency to his subordinates. Then, he had ads created to attract new clients. The agency captured additional accounts in the late 1920s.

For Kimberly-Clark's Kotex, the agency created factual ads that informed women that Kotex would be available in plain packages in certain stores. Other ads informed organizations how young women could be taught feminine hygiene. Sales increased as a result.

For the American Tobacco Company's Lucky Strike brand of cigarettes, the agency developed the "precious voice" campaign. Ads contained colorful photographs of opera stars in their costumes and the headline "My living is dependent on my being able to sing, and I protect my precious voice by smoking Lucky Strike." Women began to smoke Lucky Strike cigarettes in public. Within a few years, Lucky Strike became the best-selling brand of cigarettes.

In 1926, Lord & Thomas became Lord & Thomas & Logan, when Lasker asked Thomas F. Logan, who owned the Logan agency, to consolidate with Lord & Thomas. Through Logan, Lasker acquired some accounts, including Radio Corporation of America (RCA), which owned the National Broadcasting Company (NBC). For Palmolive, Lasker had an hour-long program created for radio. When this proved successful, he had programs created for other advertisers. By 1928, the year Logan died, Lord & Thomas

was responsible for about 50% of the advertising placed with NBC. With the help of radio, Lasker's Lord & Thomas agency became the largest agency in the world in the 1930s.

In 1931, Lasker cut salaries by 25%. Two years later, he fired more than 50 employees, a practice to which he had grown accustomed.

In 1936, his wife died. Soon after, Lasker retired from Lord & Thomas. However, when Don Francisco, the agency's president, left to go to work for the government during World War II, Lasker returned to the agency.

In 1942, he met with his three senior executives, Emerson Foote, Fairfax Cone, and Don Belding, and informed them that he wanted to sell the agency. The executives purchased the agency, and Lord & Thomas ceased to exist on December 30, 1942.

Changes in Advertising

Radio grew in popularity as an advertising medium. Commercials changed in the 1920s. At first, commercial messages were similar to lengthy essays. The sales pitch was hidden. Before the decade ended, the commercial message was direct. Consumers were instructed to purchase the advertisers' products.

Advertising agencies suffered during the 1930s, like other businesses. People lost their jobs as clients decreased advertising budgets. However, in the 1940s, America's economy improved as thousands of men and women went to war or to work building military goods. Advertising's role was somewhat akin to what it had been in the Depression. During the 1930s, advertisers had attempted to boost morale through ads. During the 1940s, advertisers informed citizens that products would be available after the war, but their main emphasis was patriotism. Occasionally, they tied the war effort to their business.

Television and Advertising

After World War II, the economy changed. Women were encouraged by the federal government through ads to return home so that others who returned from the war could have jobs. Some women paid attention to these ads; most did not.

Although television was not a strong medium in 1950, advertisers spent \$10 million on it. In the early 1950s, advertisers owned the programs they sponsored and consequently received criticism for manipulating content.

Dramas, mysteries, comedies, and westerns had been heard on radio. As more of these programs were produced for television, radio had to change to a different format. Music was the logical choice.

Advertising on television was not without its critics. Many complained that commercials were annoying, misleading, deceptive, and even manipulative. Critics notwithstanding, television became the most popular medium among national advertisers.

Most of the commercials in the 1950s included an announcer—sometimes a star of a program—who looked squarely into the camera and discussed the product. Copywriters had to be taught how to write for television. Eventually, other kinds of commercials—slice of life, animation, humor—were tried and adopted.

Advertising Concepts

“Brainstorming” was started by Alex Osborn at Batten, Barton, Durstine & Osborn (BBDO), when the agency started losing clients and personnel in 1939. It was popular at the agency in the 1940s. The concept was continued in the 1950s by Willard Pleuthner of the same agency. This concept simply separated the “creative mind” from the “judicial mind.” The former generated ideas; the latter tamed them. At BBDO, members from all departments participated in an open or free climate—brainstorming sessions—trying to create positive solutions to clients' problems. Some agencies adopted this idea; others did not.

In the 1950s, several agencies in Chicago employed “motivational research.” Pioneered by Ernest Dichter, motivational research employed certain methods from psychology and actually replaced statistical techniques of polling. In addition, when it was used by Leo Burnett, Foote, Cone & Belding, and other agencies, creating campaigns did not begin with products and their benefits. Campaigns started with consumers and what they wanted.

Another concept closely related to motivational research was “image building.” In 1951, David Ogilvy, the founder of Ogilvy & Mather, created one of the most famous ads for men's clothing in advertising's history—the man in the Hathaway shirt. The ad employed a distinguished-looking upper-class man wearing an eye patch. He projected sophistication and wealth. The consumer, if he purchased the brand of shirt, would project this image as well. This style of copy was recognized by others working in advertising as being persuasive. By the end of the decade, most agencies were using it to sell numerous products. Ogilvy also included reason-why copy in ads.

Another concept was the “unique selling proposition” (USP) of the late 1950s and early 1960s, which was promoted by Rosser Reeves, who worked for the Ted Bates agency. Reeves realized that consumers were exposed to hundreds of ads every day. For an advertiser to cut through this clutter, he reasoned, the advertiser's ad had to offer a USP as well as reason-why copy. Thus, the agency had to determine what the USP was and create advertising campaigns employing it. His advertising campaign for Anacin in the late 1950s, which included the now-famous black-and-white television commercial that contained three panels illustrating pain in a person's head and the line “Anacin gives you fast, fast, fast relief,” helped increase sales of the product immediately.

Al Ries and Jack Trout promoted “positioning” in the late 1970s and early 1980s. Positioning was another concept that became popular among agencies. Positioning

implies that the advertising “positions” a product in the consumer’s mind, such as the famous Avis “We’re Number Two. We Try Harder” advertising campaign.

Other concepts, including humor, were tried and shown to work for certain products or services.

Mergers and Conglomerates

Marion Harper Jr., worked at the McCann-Erickson advertising agency in New York and was named head of research in 1945. The research department became the driving force under his leadership. When Harrison McCann became the chairman of the board, he named Harper president. Harper was 32.

Harper became interested in quality control. He initiated review boards for checking work as it progressed through the agency. In addition, he captured larger clients, including Coca-Cola.

However, Harper acquired other agencies, including Marschalk & Pratt, and put them into the conglomerate Interpublic Group of Companies, in 1961. From three departments in McCann-Erickson, he formed three companies that specialized in market research, public relations, and sales promotion. He also founded Jack Tinker & Partners, for the purpose of solving problems and producing creativity.

In the 1960s, he continued to acquire agencies. According to Russ Johnston (1982, p. 261), from the beginning of 1965 to July of 1966, “Harper added new companies at the rate of one a month. The parent company could boast of 200 offices in 100 cities in 48 countries.”

Unfortunately, Interpublic had losses of several million dollars and was having problems paying loans. Harper attempted to resolve the problems, but the banks were not satisfied. The board voted to remove Harper from his position in November 1967. Harper left Interpublic several months later.

Other founders of advertising agencies followed Harper’s lead. They included Charles and Maurice Saatchi, who founded Saatchi & Saatchi in London in 1970. The brothers began acquiring other businesses in 1972, including agencies in the United States. Throughout the 1970s and 1980s, Saatchi & Saatchi Company PLC, the holding company, purchased some of the largest agencies in the world. Profits increased every year. However, the company’s stock, like other companies’ stock, dropped in value in 1987. Personnel differed as to which direction the company should move. Some senior executives believed that the company should emphasize consulting, while others maintained that the company should focus on advertising. Several large clients switched agencies. As a result, the company lost more than \$1 billion in billings. Spending on advertising slowed in the late 1980s, as fewer clients increased their advertising budgets.

In 1989, the company’s profits plummeted. To make matters worse, Kemper Financial Services, Chicago, sold 500,000 shares of Saatchi stock, causing the value

of the stock to decrease within weeks, according to Kevin Goldman (1997, p. 116). Other investment firms followed Kemper’s lead several weeks later. Saatchi & Saatchi Company PLC gave employees pink slips the same year. Robert Louis-Dreyfus and Charles Scott were hired to help save the company. They sold the company’s consulting firms to reduce expenses.

In 1990, Charles and Maurice Saatchi cut their salaries. Several board members resigned, while several senior executives were let go. Louis-Dreyfus and Scott proposed a restructuring of the company, which was finally approved by representatives of shareholders in 1991.

Louis-Dreyfus left the company in 1993, when he became the president of Adidas. A. G. Scott became his successor. However, Saatchi & Saatchi lost the Chrysler Corporation account and had to resign the Helene Curtis account because it conflicted with Procter & Gamble, another account.

Charles and Maurice Saatchi vowed to either purchase Saatchi & Saatchi Advertising or have Scott removed. David Herro, who had invested in Saatchi & Saatchi Company PLC for the State of Wisconsin Investment Board, then for Harris Associates L.P., learned about the brothers’ interest in buying Saatchi & Saatchi Advertising. He wrote to members of the board, stating that any member who was interested in purchasing the agency should relinquish his position on the board.

Differences of opinion among senior executives and board members reached the press. Herro met with Maurice Saatchi and expressed his displeasure about the campaign in the press; then he met with Charles Scott.

Maurice Saatchi was removed as chairman of the holding company in late 1994. He was offered the chairmanship of Saatchi & Saatchi Advertising Worldwide, but he resigned 2 weeks later, in early 1995. Charles Saatchi resigned soon after.

Advertising Agencies Today

Advertising agencies in the 1990s seemed to emphasize creativity in advertising. However, measuring this creativity’s effectiveness was a problem, no matter which medium was used. Return on investment (ROI) was expressed by clients. Yet agencies found it difficult to answer questions such as “Did the target market see the ad? Did the target market understand the ad? Did the target market respond favorably to the ad?”

Advertising agencies became leaner in the 1990s. The reason was not necessarily because agencies had hired more experienced personnel and had gotten rid of middle management. Rather, presidents of agencies had felt the need to cut costs.

Advertising agencies offered more services to their clients in the 1990s. Some of these agencies desired to offer more services as a result of becoming integrated marketing communications firms, but many had to offer more services in order to compete and remain profitable.

Today, advertising agencies are struggling to identify target markets, which are becoming smaller, and to provide their clients with better service. Specialty firms that focus on one or two specific services are growing in popularity. ROI is ever present, and alternative media are considered. Unfortunately, how to measure these new media is the question that many media personnel are asking.

RESEARCH IN ADVERTISING CAMPAIGN DESIGN

SAMUEL D. BRADLEY

Texas Tech University

TIMOTHY C. LAUBACHER

B&a Advertising

According to the trade publication *Advertising Age*, \$149 billion was spent on measured media advertising in the United States in 2007. That's approximately \$500 for every woman, man, and child in the country. Ultimately, that cost must be passed along to the consumer. The price you pay for every advertised product you buy includes money for advertising. Obviously, someone feels that this paid persuasion is important. This begs the questions "Why is advertising necessary?" "Why do advertisers pay so much to persuade us?"

One advertising executive estimates that you will come in contact with 1,500 brands on an average day and almost 35,000 if you visit the grocery store (Roberts, 2005). Every one of those brands clamors for your attention and money, and you do not have enough of either to go around. Instead, you must be persuaded to use a particular brand. Yet here again is a logjam. Every one of those brands wants to persuade you, and if you are like most people, you have grown up in an advertising-saturated society and have learned to tune out those 1,500 to 35,000 voices. Only effective advertising can break through the clamor, and effective advertising begins with effective research.

The Spectrum of Advertising Research

Advertising research is performed by various agencies and research specialists in numerous ways. Some agencies may tend to use quantitative research methods, while others may specialize in qualitative research. Certain agencies make research the foundation for brand development and advertising campaign decision making, whereas others undertake research only when absolutely necessary, relying instead on instinct alone. Research is useful for understanding the target audience, the competitive marketplace, and the actual advertisement more thoroughly so that the client has the best chances of success. If advertising is shooting an arrow at a target, then research shines a light on the target, providing the best chances of hitting the bull's-eye.

Consumer Voice

Advertising research is often focused on involving consumers in the process of developing advertising. Giving the consumer a voice in the process of creating advertising results in more accurate brand strategies and

positioning; copy and imagery with which consumers can identify; and an overall better understanding of the lifestyles, hobbies, motivations, and attitudes of target audiences. Unfortunately, an account planner, brand strategist, or research specialist cannot simply ask “What advertisement would you like to see so that you will buy the product?” This is an exaggeration, but in many instances consumers *are* put in the position of being marketers, which they are not. The saying that “there are no stupid questions” does not necessarily hold true in advertising research. To get the best answers, the right questions must be asked of the appropriate people in the correct ways.

In Search of Advertising Effectiveness

Perhaps the most oft-repeated cliché in advertising is the former merchant and postmaster general John Wanamaker’s statement, “I know I’m wasting half my ad dollars. I just don’t know which half.” Almost 100 years later, much of advertising research is dedicated to determining “which half.”

Definitions of advertising vary, but advertising is generally agreed to be the art and science of paid persuasion to a large audience. For both the practitioner and the academician, the science side of advertising reveals itself more easily. It is straightforward, for example, to determine the percentage of consumers who can freely recall your brand name when asked to name a brand in your product category. Likewise, extensive research has developed models of persuasion that specify the conditions wherein a message is likely to be most effective (e.g., McGuire, 1972; Petty & Cacioppo, 1986). However, testing a particular combination of layout and font proves to be more difficult. Similarly, it is difficult to ascertain when a particular popular-culture reference will be embraced by the consumer. The 1984 Super Bowl advertisement launching the Apple Macintosh computer is one of the most successful in history; however, it relied almost exclusively on a play on the title of George Orwell’s book *1984*. Had the audience failed to grasp that link, the ad likely would have failed.

Brand Identity

Perhaps the most fascinating aspect of advertising is that so few consumers believe that it works. Ask almost any consumer, and that consumer will tell you that he or she drinks Diet Coke because it tastes better and washes clothing with Tide because it cleans better. Blind comparisons, however, often show the folly of this illusion. A trip to the nearest supermarket is revealing as consumers readily pass over inexpensive store brands for the pricier brand names—even in product categories where performance cannot be distinguished when the labels are stripped away. Just as readers should not judge a book by its cover, so too, should consumers not judge a product by its label. Yet

judge they do. And often they judge labels favorably and willingly hand over hard-earned dollars for the privilege of taking that label home.

An entire branch of academic research, known as the third-person effect, has developed to account for this tendency to believe that media messages (in this case, advertising) affect others but not “me” (Davison, 1983). How does one go about researching a phenomenon whose effects are so persistently denied by those affected? If half of Wanamaker’s advertising dollars were wasted, likely far more than half of advertising research dollars were wasted. Indeed, when asked by the advertising student or inquiring practitioner, we must admit that we have made precious little progress in six decades of trying to provide a systematic answer to Harold Lasswell’s (1948) question, “Who says what, in which channel, to whom, with what effects?” (p. 37).

Advertising and Culture

At some level, advertising is an (applied) art form. As much as our paintings and poems can tell us about an era, so too, can advertising. For example, ads that once moved millions to buy now come across as sexist, racist, and crass. Advertising can capture an entire era: Just as people readily buy “Route 66” signs today, that bygone age also is captured by the Burma Shave signs that once lined American roadways with a series of rhyming catchy sayings: “Hardly a driver,” “Is now alive,” “Who passed,” “On hills,” “At 75,” “Burma-Shave.”

The link between advertising and culture should not be underestimated. Many large advertisers and consumer products corporations keep close tabs on the culture. DDB Worldwide, of Chicago, maintains an annual survey of American consumers known as the “Life Style” survey. Rather than asking what kind of pasta a consumer prefers, this data set includes questions about how often Americans attend club meetings, how much they value freedom of speech, and even how often respondents “gave ‘the finger’ to someone while driving my car.”

At first, these kinds of questions may seem to have nothing to do with advertising. But surveys such as this one allow advertisers to understand popular culture and the themes that permeate consumers’ lives. Not surprisingly, culturally oriented DDB launched the SignBank program in 2005 (Creamer, 2005). This program comprises small “signs” in popular culture, and everyone at the agency was expected to contribute, from receptionists to executives. The signs range from comments about Weblogs to customized sneakers, and together form a database that DDB account teams can use to understand consumers. One observation about the attire of a passerby likely will tell you nothing, but in the aggregate, hundreds of similar observations can shed light on the public mind-set.

This is not merely an esoteric exercise. In the current information age, genuine differences between competing

products are short-lived as technology allows competitors to copy or improve on any differences that give competitive advantages. In this landscape, the brand is king. And brands are fundamentally psychological enterprises—that is, they live in consumers' minds. What Snickers, for example, represents is less about peanuts, caramel, and nougat and more about the perceptions of 300,000,000 people and their thoughts about the brand. Is there any *evidence* that Snickers may stave off hunger better than a PayDay or any other candy bar? Likely, the answer is no. However, the “Snickers Satisfies” concept is so well ingrained among consumers that it is their default choice, which easily makes it the sales leader. A Snickers is not just a candy bar. It is part of the fabric of our culture. And that's not a status that consumers readily confer. Instead, a brand must be carefully constructed through a series of long-term advertising (and increasingly, public relations) campaigns. The message must be right, and it must be consistent. To find the right messages takes great research and a little luck—but rarely just luck.

Brand Personality

A brand does not actually belong to the business that created it. A brand exists in the minds of the people who are aware of the brand. Essentially, it does not matter if an executive says that his or her company's brand is caring, compassionate, and lighthearted. If the consumers find the brand to be arrogant and indifferent to their needs, then *that* is the brand. Executives at PepsiCo could not simply will Mountain Dew to be “edgier” than traditional soft drinks. Instead, decades of well-designed advertisements have carefully crafted that image. Advertising agencies and public relations firms can make intensive efforts to manipulate how the brand is perceived by the target audiences, but it is up to the consumers to internalize that image and identify with the brand.

That being said, a fundamental goal of advertising research is to learn what the client's brand represents. This is the *brand personality*. Rohit Bhargava (2008) defines personality as follows: “Personality is the unique, authentic, and talkable soul of your brand that people can get passionate about” (p. 6). One way to think about the importance of brand personality is to think of any brand as having both *attributes* and *personality traits*. The attributes are tangible brand offerings, whereas the personality aspects are more emotion based (e.g., hilarious, mature, and relaxed). The attributes generally define the category the brand exists in, whereas the personality components differentiate the brand from its competitors within the category. For example, both McDonald's and Burger King have attributes such as burgers, fries, and fast service. Although there might be small variations in their attributes (e.g., Burger King's flame-broiled patties), the real brand differentiation occurs in their personalities. Conducting research to understand a brand's personality

gives advertising agencies a mentality with which to plan campaigns and a voice with which to write advertising copy. It also helps advertising agencies steer clear of injecting messages into the market that are inconsistent with the brand's personality.

Conducting research with the client's own employees can be beneficial to developing a brand personality. For instance, much of the Starbucks atmosphere centers on interactions with the barista (the coffee server). If the baristas do not embody the personality of Starbucks, then the advertising is likely doomed.

Loyalty Beyond Reason

Kevin Roberts, CEO Worldwide of the advertising giant Saatchi and Saatchi, has extended brand identity into what he calls *lovemarks* (Roberts, 2005). Rather than trademarks or service marks, Roberts argues that lovemarks elicit loyalty beyond reason from their consumers. Although it may seem even more ludicrous than the idea of brand identification, most of us do have brands we love. We'll go thirsty if there's no Diet Pepsi, or we'll drive 5 miles out of the way to go to Target. Many Ohio State University sports fans will not even say the word *Michigan*. That's love! But Roberts argues that there is another key dimension: respect. “The Lovemarks of this new century will be the brands and businesses that create genuine emotional connections with the communities and networks they live in. This means getting up close and personal” (p. 60). Respect is a two-way street. It begins with understanding. And understanding begins with research.

Recent research, including work by the authors of this chapter, has helped explain the intimate relationship that consumers have with advertised brands. Not only do consumers assign personalities to brands, they also identify with these brand personalities. The most vivid example of this has been Apple's recent campaign with the “I'm a Mac” and “I'm a PC” advertisements. Through careful advertising over the years, Apple cultivated the image of a trendy user, which they featured in the advertising; the fact that no one had trouble understanding the metaphor attests to the degree with which people identify with the ads. In a recent study (Bradley, Maxian, Laubacher, & Baker, 2007), we asked participants about some of the most popular brands in the world. Their responses were telling: The more a brand was “loved” or “good,” the more it was “like me.” The relationship was almost perfect: In no case was a loved brand not like the consumer.

Although this seems to make sense on the surface, take a moment to ponder the absolute absurdity of the comparison. In exactly which way, dear consumer, are you “like” a Snickers bar or a Pepsi? Are you small and brown? Are you full of bubbles and caramel coloring? Of course not. Candy bars, soft drinks, beer, and laundry detergents are products to which advertisers have assigned personalities. And this assignment is neither inexpensive nor easy; it is

not simple to make people fall in love with a brand. To create the kind of relationship that Snickers has with consumers around the world, you need to understand your product, you need to understand your consumer, you need to understand your competition, and you need to understand the culture. This understanding does not come from intuition alone; it comes from careful, comprehensive research.

Targeting

Perhaps the greatest advertising limitation is its expense. There are more than 6.6 billion people in the world, and it costs money to get a message in front of them. Then add the obstacle that sales messages are everywhere, and most consumers will fail to even notice your message the first time. It costs a lot *more* money to get your message in front of the world several times. Since advertisers cannot afford this, it becomes crucial to pay to get your message only in front of the *appropriate* audience—namely, those most likely to buy your product. If your product is expensive, you want to advertise only to those who can afford it. If your product is bought by women, you will not advertise in men's magazines. If you're selling diapers, you want to advertise only to parents with young babies. These key consumers are your *target market*, so named because you target your advertising to them. One of the earliest stages of advertising research comes with identifying the proper target market.

Segmentation

The foundation for successful advertising is having a detailed understanding of the target audience or audiences. Whom, among the billions of people on the planet or the hundreds of millions of people in the United States, will you target? The process of dividing the population into meaningful chunks is known as *segmentation*, through which you literally segment the population based on a host of variables. Although the most talked-about audience descriptors are demographic data (e.g., gender, age, household income, and education level), fathoming a market segment goes much deeper. Research can be aimed at learning the target consumers' habits, hobbies, information sources, entertainment preferences, product and service preferences, and purchase behaviors. The reason gaining a detailed audience description is a common research goal is that with this information, an advertiser has better knowledge of how a brand fits in consumers' lives and where, when, and how the consumers are most susceptible to persuasion.

To segment the audience in a meaningful way, you must understand who uses the product or service and why. In some instances, demographic data will suffice. Fixodent denture adhesive likely relies on age segmentation, and Just for Men hair coloring obviously uses gender but

includes age segmentation, too. Toro snow blowers likely segment the population geographically. These cases are clear. But who buys Hallmark cards or Apple Macintosh computers? Those consumers likely have more in common behaviorally and psychologically than demographically.

When one is looking to advertise to current consumers, segmentation is usually relatively easy. Companies often keep data on their customers and can share these data with the advertising agency. Then it is simply a matter of looking for commonalities among the current customers. If you want to expand the current market, however, it is much more difficult. Of all the people who currently do not buy your product or service, which ones are the most likely to be converted? In this case, it is advantageous to connect with current noncustomers to learn why they do not buy your product. Focus groups, surveys, and in-depth interviews can provide valuable insight. Even then, however, meaningful segments and targets may not be clear. In these cases—especially when the budget allows—it is helpful to turn to proprietary segments constructed by marketing research firms. For example, Claritas offers the PRIZM market segmentation system, which divides people into dozens of categories, such as *the Cosmopolitans*, *Gray Power*, and *Shotguns & Pickups* (Belch & Belch, 2007, p. 51). For any given zip code, Claritas can tell you which groups are most common. SRI Consulting Business Intelligence also offers a segmentation tool, called VALS (www.sric-bi.com/VALS/help.shtml#1), that primarily categorizes consumers in terms of their degree of innovation and their financial resources. The value of these tools is the ability to identify what the company's customers have in common and then find more people like them.

Getting the Message Across

Once the audience is segmented and certain segments have been selected as the target, there is still much research to do. Although the target markets have been identified, advertisers must decide how to reach this audience. The process of researching where to deliver a message is known as *media planning* and is covered in Chapter 89 of this volume. Because of the in-depth nature of that chapter, we will not discuss media planning here except to say that current trends in media fragmentation and narrowcasting (i.e., targeting your message to a small and selective group) make media planning more challenging, more interesting, and more creative than ever.

When a message reaches those outside its target market, this is known as waste coverage. Proper segmentation and targeting, combined with accurate and creative media planning, can minimize waste and maximize the value of advertising. It should be noted that in many small and mid-sized advertising agencies, media planning is synonymous with advertising research. That is, many of the things discussed in this chapter are not among the repertoire of too many small firms. In these agencies, segmenting and targeting occur

during the selection of media. Once the media are selected, the research is complete, and the advertisements are written.

Crafting the Message

Now it's time to write the actual advertisements. To many people, message creation is the stage where science steps aside and art takes over. Obviously, this must be the case to some extent; however, effective research is as important at this stage as any other, particularly in determining the kind of image the ad should aim to construct.

In addition to portraying the correct image, a copywriter must understand the goal of the campaign before putting pen to paper: What should the ad accomplish? This might, at first, seem obvious. Advertising is supposed to sell, right? After all, one of the aphorisms of advertising is "It's not creative unless it sells." However, one cannot always move consumers directly to the cash register. In the case of new products, consumers have never even heard the name before. It is naïve to think that a single 30-second advertising message will be sufficient to drive the consumer off the couch and to the point of purchase just to try your never-before-heard-of product. Instead, initial advertisements may aim only to make the public aware of the brand.

For example, although it is difficult to diagnose a campaign from afar, the recent series of Super Bowl ads by the Web site registry GoDaddy.com appears to have been designed to create awareness. These sex-laden ads likely garnered attention when they first appeared. Only in subsequent years did the ads attempt to actively draw consumers to the Web site. The 2008 Super Bowl ad featured the race-car driver Danica Patrick partially undressing and encouraged participants to visit the Web site to see more "exposure." The Web-based ad was a sophomoric joke, and Patrick did not undress. According to *USA TODAY's* AdMeter results, the ad was not especially well liked (www.usatoday.com/money/advertising/admeter/2008-02-04-results-chart_N.htm). However, the media widely reported that the ad drew millions of viewers to the company's Web site. It is likely that this traffic was increased due to the *brand awareness* created a year earlier. Had the initial ad targeted Web traffic, viewers unaware of the brand may have been more reticent about visiting the site.

If the primary goal of a campaign is to generate sales (rather than awareness), then learning about the thought processes that lead to the purchase of a business's products or services is essential. For example, when advertising for a fast-casual Mexican restaurant, it may be important to know whether its customers think initially about the category of food they are hungry for (e.g., Mexican, Italian, or deli sandwiches) before narrowing their dining options down to a sit-down, fast-casual, or quick-service restaurant. Do the customers decide what they want to eat early in the morning at work and look forward to the meal until lunch or dinner, or do they make the decision while driving and discussing restaurants with a friend? If your target

market first decides food type and then picks a level of formality, then you need to sell fast-casual more than just Mexican. Conversely, if the consumer decides on the price first, then your pitch needs to concentrate on Mexican food. Understanding the purchase decision-making process is a logical and attainable goal for advertising research.

Advertising Effects

The last part of Lasswell's question is ultimately the most important: "With what effects?" If advertising does not ultimately sell, then the company will go out of business. You may need to generate awareness first, but sales are ultimately essential. With direct-response advertising, almost no research is needed to assess advertising effectiveness. When a Life Alert commercial comes on television, there is a toll-free number displayed at the bottom of the advertisement for almost the entire duration of the ad. If you want to buy, you pick up the phone and call. Within a few minutes of the ad's appearance, the advertiser will know whether it was a success as the majority of calls will come immediately after the ad. For most other products and services, however, the effects of advertising are not so readily determined.

What makes you stop at Taco Bell on the way home or buy a package of Oreo cookies? You have to be hungry, and the product has to be available. In the case of Oreos, the package has to be in the right place on the shelf for you to even see it. When you have the motivation and the opportunity to purchase a product, then some feeling deep inside you has to make you select Oreos from among the dozens and dozens of other cookie brands. Any given advertisement may make you hungry for Oreos *now*, but it also might contribute, ever so slightly, to the probability that you become a loyal Oreos customer for the next 30 years. This latter possibility is not easy to measure.

This difficulty in determining an ad's effects does not give advertising agencies a free pass. They must be held accountable for their degree of success. However, chasing immediate short-term success almost guarantees that you will never achieve long-term success. Instead, effective advertising research must take into account quantitative sales data plus more complex variables such as public opinion. A commonly measured advertising variable in this type of advertising research is *unaided brand recall*. This information is helpful in measuring the effectiveness of an advertising campaign designed to increase awareness. Following the campaign—sometimes as soon as a day after an ad runs, a telephone survey asks consumers to name a brand of cookie, for example. The proportion of people who mention Oreos can be ascertained both before and after the campaign. Although sales might not immediately increase, an increase in top-of-mind awareness suggests that the campaign was effective in achieving its goals. Awareness does not necessarily translate directly to

sales, so this type of campaign would, it is hoped, be part of a larger strategy.

Quantifying Brand Awareness

Because advertising is often attempting to get a brand noticed, a useful research goal is gauging brand awareness. Selected markets' increases or decreases in awareness of a brand can be used as a measurement of return on advertising investment. Investigating brand awareness should also involve the measurement of competitors' brand awareness. This allows for a relative understanding of how well-known a brand is in chosen marketplaces compared with its competition. Knowledge of brand awareness helps with planning for more targeted campaigns by indicating awareness gaps geographically and also indicating successes and failures in previous marketing efforts.

The Source of the Message

Those involved in advertising research seldom have much input as to the original source of the message; decisions such as brand name and even company name are usually marketing functions and are already decided before it is time to advertise. However, for an individual advertisement or campaign, advertising research can help determine the appropriate spokesperson or spokescharacter. The former founder of Wendy's, Dave Thomas, and Kentucky Fried Chicken founder, Colonel Sanders, often appeared in advertisements, and a cartoon likeness of the Southern gentleman pitched buckets of chicken even after his death.

Different message sources can be used to elicit feelings of humor, trust, expertise, and other desired outcomes. The inclusion of testimonials also allows advertisers to vary the source of their persuasive message. Advertising research can play a role in determining, retaining, or switching a spokesperson or a testimonial source.

Client Acquisition

Research can even help an advertising agency gain clients. When you show up at their door with original research examining their consumers and their current advertising, "there are few manufacturers whose curiosity is not piqued when you offer to show them the results of such a survey" (Ogilvy, 1963, p. 60). Research can be a successful new business tool for a number of reasons. The agency's unprompted and unpaid investigation into a prospective client's current situation shows a genuine passion to help them grow the brand. This also positions the agency as an expert rather than just another agency bargaining in without knowing the company's consumers, competitive landscape, or current struggles and successes. Often, company decision makers grow impatient awaiting the results of research, so initiating the agency-client relationship with some form of research already completed

gives the company the confidence that the agency is ready to hit the ground running.

Advertising Research Methods

Research should not be conducted simply because it seems like a smart idea to create a survey or host a focus group. All research should take place to fulfill specific goals. The results of the research should not be predetermined or assumed, but the aims of the research need to be clearly understood. The research goals will affect the types of participants involved and the methods used. Once the reasons for conducting advertising research are established, the following are some of the forms of research that can be employed.

Timing

Broadly speaking, advertising research is either *pretest* or *posttest* research. Research centered on campaign generation and development is considered pretest research. Research designed to measure advertising effectiveness is considered posttest research. As with so many dualities, this dichotomy is overly simple. For large brands, research is continuous, and data gathered after one campaign can be considered posttest for that campaign and pretest for the subsequent campaign. Posttest data often is diagnostic in nature; however, these data can also be used to help refine and improve market segmentation.

Survey

Advertising agencies survey current customers, potential customers, and company employees to measure brand perceptions, brand awareness, target audience attributes, and attitudes toward advertisements. A popular tool is the *semantic differential* that asks participants to choose a point between two adjective pairs. For example, the adjectives *cool* and *uncool* can be placed at either end of a scale separated by 9 points. The participants select the point that most closely relates to their opinion about the brand. The semantic differential can be used to measure the current state of a brand and its personality as well as testing the extent to which an advertisement fits the brand.

Consumers' agreement is often measured using Likert-type scales. With this measure, participants are asked the degree to which they agree with a statement such as "This advertisement fits with my concept of the brand." Participants are given several possible choices, such as *strongly agree*, *agree*, *somewhat agree*, *neither agree nor disagree*, and so on. This form of question allows the researcher to suggest more complex scenarios to the participant.

To assess brand awareness, open-ended questions can help determine what brands research participants have

heard of and purchased from prompted industries. For example, measuring brand awareness for an audiovisual products retailer might include surveying a sample of participants in a specific geographic region, and asking them to name all the stores they can think of that sell televisions or high-end audio equipment.

Measures of aided and unaided recall are typically gathered via telephone survey. These are open-ended questions usually intended to gauge brand or advertising awareness. *Unaided recall* (also called free recall) is the most sensitive measure; participants are asked questions such as “Can you recall seeing any advertisements on television last night?” *Aided recall* (sometimes called cued recall) is less sensitive and uses a prompt or cue. Thus, participants might be asked whether they saw a soft drink advertisement the night before. The least sensitive of such measures is *recognition*, for which participants might be asked whether they recognize hearing a particular slogan. In recognition tests, participants are often tested with genuine and fake slogans to ensure that they are not saying “Yes” simply to please the researcher.

The traditional use of paper surveys is still prevalent, but a promising recent development in survey research is online surveying. Once a survey is programmed, the URL can be sent to hundreds or thousands of participants in different markets across the country, and data can be available within days.

Focus Groups and In-Depth Interviews

For all the useful statistical significance of survey research data, they lack some of the ability to capture the emotion tied to a brand that focus groups and interviews can provide. Because so many purchase decisions are based on emotional responses and not simply logical decisions, talking directly to consumers is a popular form of advertising research. However, focus groups are widely understood by the general public, and this presents difficulties for focus-group moderators. They must keep the participants thinking and responding as themselves and not like advertisers. Although one-on-one in-depth interviews with consumers take more time, the quality of results can be outstanding.

Participation

To develop creative ideas for advertising a brand, the agency should strive to fully understand the brand experience. Unfortunately, unless agency employees were already customers of the company before the agency began advertising for them, it is difficult for employees to have an unbiased view. This is where *mystery* (or secret) *shopping* can be beneficial. Professional mystery shoppers participate in the brand experience by shopping and usually ultimately buying a product or service from the client company. The secret shoppers then report back to the

advertising agency with information about the atmosphere, customer service, and other impressions of the experience.

Observation

One challenge for all researchers is to study a phenomenon without personally having an influence on the results. The questions posed through survey or focus group research certainly will affect the way the participants share information. A way around this risk of a distorting influence is to simply observe the consumers in their natural environments. This might entail watching and taking notes or even videotaping consumers as they move throughout a store making a series of routine and spontaneous purchase decisions. For more information on this method, Paco Underhill’s (2000) *Why We Buy: The Science of Shopping* details the finer points of documenting and analyzing consumer shopping experiences.

Another place to monitor consumers is online. With the current popularity of online forums, blogs, and social networks, consumers are making a great amount of information publicly available. Agencies are wise to pay attention to how a brand is discussed, positively and negatively, online.

Experimental Design

True experiments are relatively less common in industry-based advertising research, although they are quite common among academicians. One industry practice is to pit two versions of an ad against one another. Doing so is easier for print (or online) advertisements, where each consumer can be assumed to see only one issue. Often called an A-B split, ad version A goes in half of the newspapers or magazines, and version B goes in the other half. This is especially effective in direct-response advertising, for which sales can be quite closely tracked. The analytic power of Web advertisements makes this methodology especially simple. Click-throughs are easily measured, and the relative effectiveness of multiple versions of a banner ad, for example, can easily and quickly be compared. Weaker versions of an ad can quickly be pulled from rotation.

Quasi-Experimental Advertisement Pretests

More common to industry research are designs that can best be described as quasi experiments because they do not involve true random assignment of people to experimental conditions. Such studies are quite prevalent and can help save a lot of money. As much as it costs to produce an advertisement, the majority of the expenses typically come from media placement: It can cost more than \$300,000 for one prime-time national advertisement. Advertisers, therefore, want some assurance of success before they actually run the advertisement. They employ many methods for pretest advertising assessment. Several print advertisements

can be assembled into a portfolio to be shown to members of the target market, known as a portfolio test. When more realistic conditions are desirable, the advertisement can be inserted into a dummy advertising vehicle, such as a magazine. With such tests, participants may not even know which ad is of interest when they look through the fake but realistic magazine. This way, consumers are not prompted to pay special attention to any one ad.

For broadcast ads, production costs add up quickly. Pretesting can help avoid unnecessary expenses here, too. In the early stages, a television commercial exists only as a storyboard—that is, a series of still drawings with the dialogue and special effects indicated beneath each drawing. Storyboards are inexpensive but difficult to visualize. The storyboard stills can be set to background dialogue and sound effects in an anamatic rough, or storyboard anamatic. Adding a layer of complexity, the still animations can be upgraded to photographs in the photomatic rough, or photomatic storyboard. All these tools can be useful in gauging audience reactions before the expense of production. However, anyone who has ever seen these roughs can attest that a good imagination is still necessary to visualize the ad.

Sales Data

Lest we forget, the bottom-line purpose of advertising is to sell. Sales data are the ultimate test. The benchmark test of sales usually is same-store sales. Because any given store chain is adding or closing locations, total sales may be misleading. Instead, it is usual to examine sales only in stores that were operational at the same time during the previous year. The focus on short-term sales, however, can obscure benefits to the long-term image of a brand. Constantly changing advertising messages in pursuit of quick sales is almost always disastrous in the long-term. This is problematic in a market-driven economy where managers and stockholders want instant results.

Technological improvements make sales data more up-to-date and, relevant: If after reading this, you go to Wal-Mart to purchase a box of Sharpie permanent markers, that sale will transfer almost immediately from the cash register to corporate headquarters in Bentonville, Arkansas. Given that Wal-Mart is the largest retailer in the world, their databases are powerful advertising effectiveness. Although the retailer works closely with the manufacturers to improve sales, these proprietary data are unavailable to the general public or to academic researchers. However, these large-scale databases are the closest those consumer products can come to the instant report card of direct-response advertisements.

Multiple-Method Research

When these methods are combined, the resulting research can be extremely powerful. The political consultant

Frank Luntz (2007) has become exceptionally successful and has changed the landscape of American politics with his *Words That Work*. As PBS's *Frontline* detailed in the documentary *The Persuaders* (www.pbs.org/wgbh/pages/frontline/shows/persuaders/), Luntz starts with popular culture. "I've got a rule, which is cab drivers and antique dealers know more about America than anybody else. And when the cab drivers feel a certain way, I know I need to listen," Luntz told *Frontline*. He begins with something similar to a focus group. He talks to members of the target market. He runs terms by them. He finds the terms that they like and dislike. For instance, Luntz and his contemporaries helped the Republican party relabel *estate tax* as *death tax* and rebrand *global warming* as *global climate change*. "It's the same tax," Luntz told *Frontline*, "but nobody really knows what an estate is, but they certainly know what it means to be taxed when you die."

After identifying key concepts, Luntz is ready to run more complex ideas by consumers. While a group of consumers watch someone talk about a political issue—which could as well be a product, the consumers hold a small dial. They turn it one way to indicate that they like the message and another way to indicate their dislike. This quasi-experimental technique allows Luntz to see in real time what parts of the message are accepted. Furthermore, he can look at the results separated by a political party. The parts of the message that achieve bipartisan approval should be the most effective with the general public. Although it is less common, this multi-stage research strategy should be equally effective at selling consumer products as political ideals. Rather than separate results based on political ideology, the data can be separated based on a market segment or a key demographic or psychographic variable. Every methodology has strengths and weaknesses. Multiple-method research allows researchers to get a better picture of the overall consumer landscape.

Theory Building

Perhaps the greatest difference between academic and applied research is in the realm of theory building. Practitioners need research to tell them what advertising is likely to work. Effectiveness is key. Conversely, the majority of academic researchers want to understand the process. While a practitioner may care about the customers' attitude toward a particular ad, an academic may care about how consumers *form* attitudes toward advertisements: How does persuasion function in general, and what are the relevant variables? In an ideal world, these two research avenues would intertwine and inform one another. However, industry research is often hidden behind a veil of proprietary secrecy, lest the competition benefit from the knowledge generated, and academic research remains bound within the ivory tower.

Conclusions

Research is a word that kindles passion in few souls, yet its importance in the advertising industry cannot be overstated. Few campaigns succeed that were not built on a solid body of research. Advertising is, as one textbook (Miller & Muir, 2004) puts it, “the business of brands.” And brands are not real. They are intangible objects that exist in the minds of consumers. Advertising can build on or obfuscate those mental images. To inculcate the desired image, the advertiser must understand the consumer, and that is no easy undertaking. If you pay a consumer to help with research, then that consumer usually will go out of his or her way to be helpful. And this is no help at all. To be of any use, consumers’ mental images must be queried as subtly as possible. Every question you ask suggests an answer, and research that finds only the answer the researcher desires is as bad as no research at all.

Instead, the best advertising research is carefully and cleverly crafted. In an ideal setting, the participant remains altogether unaware of the client or product. We may, for example, spend an hour talking about lunch choices when I care only about store-bought tuna versus a national chain of sandwich shops.

In the modern media age, the consumer is more of a partner than ever. If you carefully tailor an advertisement that resonates, they will reward you for it handsomely. They will write about your advertisements on their blogs, and they will post it to YouTube and social networking sites such as Facebook and MySpace. If you miss the mark, however, they will abuse you just as publicly online.

Perhaps most important, effective advertising research is about effective listening. You must ask the right questions in the right ways and *listen*. The typical consumers have spent a lifetime paying more than they otherwise would to purchase advertised brands. This gives them a stake in those brands and the right to have a voice in the public identity of those brands. If you find the appropriate consumers and the appropriate ways to communicate with them, the results can be powerful. In almost every case, this will begin with effective research.

Given the mysterious and intriguing nature of the modern consumer, advertising research should seem more like a Harry Potter novel than a root canal.

CREATIVE DEVELOPMENT AND COPYWRITING IN ADVERTISING CAMPAIGNS

DAVID KLOWDEN

The Lambesis Agency

You know the myth that creativity is a divine spark that strikes a select few: Either you're born with it or you're not. The persistence of this myth of the exclusivity of innate creative ability steers some away from careers in creative fields. Certainly, it does no harm to the ego of a successful "creative" (the adjective has become a noun in advertising) to argue that creativity cannot really be taught. But it is the elusiveness of the divine spark of creativity, not exclusiveness, that really sustains its aura.

That is not to say that there's no such thing as creative genius. In an advertising agency, clever, persuasive, and powerful creative concepts arise, but only after a lot of both individual and collaborative work goes into preparing the contexts in which they can. In the words of one of my advertising mentors, Nick Lambesis (personal interview, May 2008), "Creativity is always difficult." It might seem from the outside that difficulty would more likely attend creative fields with fewer parameters, such as painting and literature, where art is sometimes created "for art's sake," but in advertising, where creativity is always directed to a persuasive intent in the service of advancing a client's needs, it's not enough to create clever, funny, beautiful, or apt communication alone; the challenge is compounded by the mission to sell, build, and ideally sustain a brand. As Nick says, "The big picture is king in the world of brand development," even as the dominant force behind successful ad creative is "the passion to do good work."

This passion came to life during the trailblazing era of great creative advertising in the mid-20th century, when the aphorisms of pioneers such as the copywriter extraordinaire Bill Bernbach began to circulate as the lore of creatives: For example, "Rules are what the artist breaks; the memorable never emerged from a formula" (as cited in Klein & Donaton, 2005). Bernbach's quotations were even eventually compiled in a handbook for the employees of Doyle Dane Bernbach (DDB), the company he cofounded. In more recent decades, the decentralization of advertising from Madison Avenue to shops across the nation and globe, along with the expansion of new media, has given rise to a range of books, "how to" guides, journals, and blogs aimed at explaining the theory and practice of creativity to a much wider audience. In this chapter, I draw on the history, lore, and theory of creative development to examine a successful creative campaign and hope to provide some insight into the role of creative communication and copywriting in advertising at the dawn of the 21st century.

Unlike academic disciplines where theory often contributes to a metaliterature of writing primarily about the *meaning* of the work, theories of creativity in advertising are almost without exception developed by former or current advertising creatives on the ground. Take Luke Sullivan's (2003) *Hey Whipple, Squeeze This*, a highly regarded practical manual on creative copywriting. The nuggets of wisdom he'd learned from his heroes and mentors or developed through his own experience, jotted down

on scraps of paper over the course of his years as a professional copywriter, had begun to literally spill out of his file folder. Taking inspiration from Sullivan's overflowing file folder, I've attempted to gather together what I take to be some of the more useful and practical ideas about creative development in advertising circulating in the field and see how they apply to an actual case study. Through an overview of the history of creativity in advertising and a pragmatic, nuts-and-bolts case study of a real-world context, the following pages are intended to contribute to the demystification of the "divine spark of creativity" in advertising and give those interested in a career as a creative ad man or woman a bit more insight into what those of us who do it think about it; what counts as good work and how to produce it; and what skills, passions, talents, and preparation might help an individual succeed in this unique, challenging, rewarding, exciting, and sometimes crazy career.

The History of Writing Advertising

Creativity, you may be surprised to learn, is a relatively new approach to persuading people to use a particular good or service. The historian Daniel Pope (2003) describes advertising in colonial America as "dry" lists or announcements of products and services, generally relegated to the back pages of newspapers. Pope points out one exception: "Benjamin Franklin's *Pennsylvania Gazette* reached out to readers with new devices like headlines, illustrations, and advertising placed next to editorial material." Franklin was responding in part to the colonists' desire to replace British-made imports with new American-made goods and brought his enthusiasm for promoting new American enterprise to the task of elevating the appeal of newspaper announcements.

But even as Ben Franklin pioneered new approaches to raising interest in American products and services, the "market revolution" of the following century didn't lead advertisers toward much in the way of further innovations in strategy. Pope's (2003) examination of 19th-century ads revealed that

newspapers almost never printed ads wider than a single column and generally eschewed illustrations and even special typefaces. Magazine ad styles were also restrained, with most publications segregating advertisements on the back pages. Equally significant, until late in the nineteenth century, there were few companies mass producing branded consumer products. (p. 2)

Thus, with few brands to promote or distinguish from other brands, most advertising still had the look and feel of the classifieds section of a newspaper. The main exception Pope finds are the ads for cures and remedies of early patent medicines that competed against modern medicine, still in its infancy: "In an era when conventional medicine

seldom provided cures, manufacturers of potions and pills vied for consumer attention with large, often outrageous, promises and colorful, dramatic advertisements" (p. 2).

The bottle of Peychaud's Bitters in my bar, for example—the base ingredient of the very first "healing" tonics that became what we now know as cocktails—is covered with a facsimile of a 19th-century label, with headlines boasting that it has "no equal" and is the proud recipient of a "diploma of honor." The mystery of illness and recovery gave 19th-century witchdoctors the license to sponsor publications to promote dubious claims about the benefits of their potions. (It's notable that we've come somewhat full circle thanks to pharmaceutical company lobbying: Since 1991, prescription medicine advertising has become legal, and the contemporary media landscape is dominated by controversial promises to cure ailments such as lack of sleep and "restless leg syndrome.")

In the late 19th century, new industries began mass manufacturing of new products in factories filled with new immigrant labor. Standardized production led to innovations in finding and influencing buyers. Department stores lured urban populations to the burgeoning commercial city centers, and catalog advertising targeted the majority rural population. With the increase of available products and competition, advertisers had to follow Ben Franklin's lead to stand out from the crowd and began to feature more illustrations and bolder, even sometimes risqué (for the era) headlines, such as the famous 1911 campaign for Woodbury's soap, which featured the slogan "A skin you love to touch," invented by the pioneer female copywriter Helen Landsdowne. Her success foreshadowed by half a century the creative revolution that opened Madison Avenue's doors to women and minorities, which I'll discuss shortly. You've probably encountered the types of ads created by early-20th-century creatives such as Landsdowne in Sears Roebuck Catalogue pages laminated onto the tabletops of old-time themed restaurants. As a result of this expanding commerce, total advertising volume in the United States grew from about \$200 million in 1880 to nearly \$3 billion in 1920 (Pope, 2003).

Pope (2003) suggests that the standardization of enterprise reflected a larger cultural trend in the first half of the 20th century: It was an entire era of standardization, where "advertising and mass consumption would erase social differences." The influx of new immigrants would be made American in part through their buying into the standard consumption patterns of citizens. Pope quotes the ad agency executive Albert Lasker, who in the 1920s said, "We are making a homogeneous people out of a nation of immigrants" (p. 4).

Thus, even as increased magazine circulation and the spread of radio created more opportunities for advertisers, and the industry continued to grow exponentially and globally in the early 20th century, the delivery of ads, in the service of creating a homogeneous public, remained fairly uniform—that is, until the immigrant populations

themselves entered the field and began to prove that Americans were more heterogeneous buyers than advertisers had ever thoroughly considered.

This sweeping change began to stir up the industry in the early 1960s, when the Jewish American writer Bill Bernbach got into the game and threw caution to the wind, bringing risk to the page and leading the creative revolution that would inspire the entire direction of late-20th-century advertising. Pope characterizes this change as a reflection of the cultural shift from mass audience targeting to segmented marketing, but Bob Garfield (2005), in *Ad Age Magazine*, calls it the storming of the confining Bastille of advertising orthodoxy.

The ad revolution's emphasis on creativity is championed by contemporary creatives, such as the veteran copywriter Luke Sullivan (2003), as an elevation of advertising that has given it the power to become a more valued enterprise than bald hucksterism, offering the world clever, witty, aesthetically appealing communication. Sullivan's argument is not merely an analysis of why creative approaches work but is also a reaction against "successful" advertising that he finds nevertheless crass and uninspiring. *Hey Whipple: Squeeze This*, his book's title, is a reference to the well-known "Mr. Whipple" ads of the 1970s to 1980s for Charmin tissue, wherein a store manager tries to prevent his female customers from squeezing the packaged toilet paper, though he himself cannot resist its irresistible softness. Sullivan recognizes that the campaign was a huge moneymaker but finds the ads themselves unbearable and blames these and other dry or insipid ads and their ilk for giving advertising a bad name.

Clearly, the timing of the creative revolution in advertising was no accident: Where was there not a revolution in the 1960s? The cultural revolution, characterized by the free speech, civil rights, antiwar, and women's movements, along with bold experimentation in music, spirituality, art, and nearly all aspects of life, affected everyone, regardless of where one stood along the generation gap divide. The atmosphere of new possibilities and the questioning of the ethical dimension of the way lives were lived gave the "man [and woman] in the gray flannel suit" motivation to self-reflect, to justify, to defend the value of their work, and, significantly, to make it worth defending. In Pope's view, the creative shift marked a shift from homogenization and assimilation to recognition and acceptance of difference, albeit in the service of establishing market niches.

Prior to the revolution, advertising in the 1950s had begun to seek ways to explain what it was that it was doing. Sullivan (2003) cites Rosser Reeves's notion of the "unique selling proposition," the simple theory that if you "buy this product . . . you will get this specific benefit" (p. 5). Sullivan argues that the uncluttered environment of relatively few brands and the newness of television made distinguishing the uniqueness of a product sufficient for the prerevolutionary advertising landscape. The famed copywriters David Ogilvy, a former researcher, and Rosser

Reeves mastered this form of advertisement, which used clearly defined images and several columns of copy to tout the product benefit, based primarily in research of the product and its selling environment. "You must make the product interesting, not just make the ad different," Reeves argued in the early 1960s, criticizing the "subjective" work of the newer disciples of Bernbach, who sought to free themselves from strict adherence to research and dull forms of expression (cited in Higgins, 2003, p. 125).

But the unique selling proposition wasn't enough to overcome the uniform sameness that advertising had become. In the 1950s, the review boards of the large agencies oversaw every ad and did their best to stomp out anything that veered too far from what people said they found pleasing to look at. In her autobiography, *A Big Life in Advertising*, Mary Wells Lawrence (2003) writes that these boards listened mostly to research, and research told them that "America hungered for happiness and peace, so they produced advertising that was happy and peaceful" (p. 3).

Sullivan argues that part of what made the leap into the creative possible was the ever increasing "clutter" of brands on the market and the expansion of media to deliver them. The clutter was inevitably met with what Sullivan calls "the Wall."

The proliferation of more brands with more claims of uniqueness, promoted in happy ads full of smiling and waving Americans, available in more magazines and on more television sets became less and less distinct or convincing. The Wall refers to the "perceptual filter" that consumers erected to block themselves from this information overload.

The Wall was what Bill Bernbach faced, recognized, and learned to conquer when he ushered in the creative revolution that gave birth to modern advertising, accepting some of the principles of the likes of Ogilvy and Rosser but also challenging them to create new, modern forms of communication. Bernbach established groundwork philosophies for breaking through the wall of skepticism erected by brand-savvy, and brand-wary, consumers. It's important for any aspiring copywriter to consider Bernbach's insights and successes because they form the foundational wisdom of the field that undergirds the approaches and innovations that contemporary creatives continue to employ in the digital age, even as new media and event-oriented viral campaigns steer advertising in fresh directions.

Prior to the creative revolution, the creation of ads was literally considered the writing of ads, so dominant was text over image. Denis Higgins (2003), the editor of *Advertising Age* at the dawn of the Bernbach era, argued that "the essence of this business is putting effective words and phrases down on paper" (p. 9), without even mentioning images. In that era, copywriters were the ad men who became the creative directors of agencies. The division of labor in agencies separated the art department from the center of the action; writers created the ads and artists were brought in to illustrate them.

One of Bernbach's lasting contributions to the modernization of advertising was to establish as a common industry practice the pairing of a copywriter with an art director as a team to collaborate on the creation of the ad. At the core of this shift is the idea that the visual was no longer subservient to the verbal: Both worked together to produce effective communication. If anything, much of advertising has shifted in the opposite direction, with the visual dominating the verbal as the speed of information transmission has increased. Communication must be simple, direct, and quick: A picture is now truly worth a thousand words in advertising—but that doesn't mean an artist is now worth thousands more than a copywriter.

The death of the written word in the postmodern era is greatly exaggerated, and even a fragrance ad that is purely visual has a written script or storyboard. Copywriting is to this day a vital position in a creative department, and a great tagline or headline can be central to the creation of an iconic brand. What copywriters and art directors do together is no longer called the "writing" of an ad but rather "concepting" and "creation": And more often than creating a concept for a specific ad or series of ads, the call today is to create a big concept, a campaign concept, so even as ads may sometimes feature fewer words, the copywriter is also and perhaps foremost a "conceptor." One prominent Los Angeles agency currently asks its teams to present their concepts in the form of a press release: If it's not news, it's not a big enough concept. The creative revolution, then, can also be figured as the shift from ad writing to concept generation.

The Bernbach revolution also represents a more literal storming of the Bastille, as I mentioned before: Agencies became more creatively daring, in part because they became more diverse. With more women and minorities in creative positions, advertising began to reflect the diversity of its audiences and became more willing to accept and play to those differences rather than eliding them in the creation of an idealized consumer. Bernbach's famous campaign for Volkswagen targeted a new generation of drivers before the idea occurred to Detroit. In one well-known print ad, a photograph of a Beetle on a white seamless background is accompanied by the simple headline "Lemon." The body copy extols stringent Volkswagen quality control, which weeds out any car less than perfect, but it's the toying with the expectations of the reader that compels.

In her autobiography, DDB copywriter Mary Wells Lawrence explains that the campaign helped the Beetle become "the beloved icon for the intelligent man's car. Being small was seen as an advantage, modern, young, when that was the age to be" (p. 8). Recently, this Volkswagen advertisement was examined by the creative team at Sterling Cooper, the fictitious, conservative 1960s Madison Avenue agency, in an early episode of the TV series *Mad Men*; their mixed reaction of curiosity and disdain reveals the radicalism of the departure Bernbach took from established practices. The characters' anti-Semitism

suggests that the rejection of untested creative strategies was linked to resistance to new voices, attitudes, methods, and modes of expression. The opening of advertising to these new voices, the willingness to break rules in order to create fresh and effective communication, and even an unwillingness to compromise (Bernbach famously had no interest in advertising cigarettes), these are the legacies of the revolution that led modern advertising to aspire to the level of art, to clever storytelling, to communicate the benefits of products while respecting audiences.

Bernbach avoided explaining his methods—he argued that each one of the hundreds of creatives that cycled through DDB had their own methods and strengths; thus, I want to honor his approach by avoiding too much emphasis on methodology (Higgins, 2003). One of the best ways to prepare for creative work in advertising is to study in greater detail the history that I've only surveyed here, and most important, to examine how great agencies have created breakthrough communication through an admixture of problem solving and inspiration. In the next section, we'll take an in-depth look at one such campaign.

Creative in Action: The Revolution Continues

In this section, I present an investigation of how creative campaigns work, using as an extended example the Airwalk athletic shoes campaign led by Chad Farmer, Creative Director of The Lambesis Agency in the mid- to late 1990s. This is a useful model for four reasons: first, because it was highly successful, taking Airwalk from a \$16 million/year company to \$250 million/year in only 3 years; second, because it employed a highly intuitive and original creative campaign strategy that at first glance might seem outside the purview of what a copywriter does; third, because the campaign is a well-known case study, forming a chapter of Malcolm Gladwell's (2000) landmark bestseller on idea "epidemics," *The Tipping Point: How Little Things Can Make a Big Difference*; and fourth, because my role as Senior Copywriter at Lambesis has given me the opportunity to work closely with Farmer and the Lambesis team, to experience directly the approaches and processes at play in the trenches of this creative-driven shop. These four reasons make the Airwalk campaign a useful case study for our purposes of understanding how creativity in advertising arises and works and considering the major changes on the horizon for copywriters in advertising.

Bernbach said that attracting attention to an ad by standing a man on his head is not a good idea unless you're selling a product that keeps things from falling out of that man's pockets (Jewler & Drewniansy, 2001). In other words, creating memorable or surprising campaigns is not enough if they don't communicate the benefit of the product. That is the common thread that links Ben Franklin to

Ogilvy to Bernbach to the current and future advertising pioneers: The creator of the product or service is paying for a successful campaign, so agencies must deliver.

Creative work always begins with an objective, usually spelled out in a written document known as a creative brief. The objectives are arrived at through meetings with agency heads, an account team, and clients. These objectives are then presented to the creative department in meetings with the agency's accounts and planning teams. Creatives will be presented with the product's current positioning in the marketplace and the goals they hope to achieve. Creatives will often be presented with research about the potential target market for the product and the approaches and advertising budgets of competitors. Research, recommendations of the agency's media department, client needs, and budget considerations will help determine the media. Most campaigns today involve an ever-widening scope of media types, including radio, TV, print, outdoor, Web, viral, and guerrilla marketing, and a media plan will be based on the habits of the target market.

After the briefing, creatives will work in a team to create a goal. Even if the goal is not explicitly formulated or stated as such, it is an underlying reality of any advertising campaign, and as the author and creative director Mario Pricken (2002) points out, the goal can be articulated in a single question that guides the process toward creative solutions.

In Airwalk's case, two entrepreneurs in Southern California had created athletic shoes designed specifically for the local skateboarding subculture. The shoes had achieved cult status and popularity among the target market because the shoe was designed to be a better-quality, more stylish alternative to the leading skateboarding shoe at the time, Vans, which had become a mass mainstream brand. When Airwalk decided to expand and target the entire alternative sports community—snowboarders, surfers, mountain bikers, and so on, the company came to Lambesis to help them develop a strategy; using Pricken's formula, the goal might be formulated as this question: How can we create a series of print and television ads that make young people everywhere want to wear what are essentially specialized sports shoes?

Lambesis developed a strategy based on research—but not typical market research—that would likely focus on surveying young people to find out what they want in a shoe. They conducted field research to find out what Generation X believed in and cared about. Other shoe brands were emphasizing sports heroes and wearing athletic shoes as a way to emulate figures such as Michael Jordan. What Lambesis noticed was that the leaders or innovators in the Gen-X culture loved countercultural music and its antiestablishment, renegade character.

According to Lambesis Creative Director Chad Farmer, who cites Bernbach as an influence, “[Gen-X] was pretty much focused on anti-authority and anti-heroes. We capitalized on that for Airwalk, and made the communications more style-based, celebrating individual style, rather than

being like somebody else. It was OK to be yourself” (cited in Roux, 2008). The campaign would introduce cutting-edge antiheroes and quirky individualists to a wider audience and associate the shoes with these fresh, youth-based trends.

Every book listed in this chapter argues that you must know your product, client, and target. While Bernbach argued that research shouldn't overdetermine the creative, he also stressed that you can't be overprepared. Successful advertising “must stem from knowledge” and “you must relate the knowledge to the consumer's needs” (cited in Higgins, 2003, p. 17). Likewise, Sullivan suggests that creatives take seriously and read carefully everything they get from the planning department: “But don't just read it. Feel it. Take a deep breath and sink slowly into the world of the person you're writing to” (p. 31). The Lambesis preparation for the Airwalk campaign relied on agency representatives spending time among the consumer group they were targeting, learning not just how Gen-X felt about shoes, but more important, how they felt about themselves.

The process of executing a campaign moves from research, knowledge gathering, and a close examination of the product and target to establishing a direction. These are the big-picture, press-release-worthy ideas. The innovation of the Airwalk campaign direction was derived from a better understanding of the target market and how it took its cues from innovators who identified with antiheroes. In the Lambesis campaign direction, the advertising would mediate between the innovators on one side and the majority of Gen-X kids on the other. The shoe itself would be portrayed as the antihero of the communications, and thus the representative of innovator culture, now made accessible and less risky for the mainstream to co-opt.

But what would the ads look like, and what stories would they tell? Concepting is perhaps seen as a glamorous aspect of a creative's work, but for most, it does feel like work. Sullivan writes about blank moments spent staring at his art director's shoes. Most of the “how to” books mentioned in this chapter offer strategies for conquering the blank page, from brainstorming to doodling to listing. In an interview, one of the pioneers of advertising, David Ogilvy, recommended having a couple brandies before writing (Higgins, 2003)! That was, of course, the old days, and if you've seen *Mad Men*, you get a sense of the prominent role of drinking in the boy's club ad shops of Madison Avenue in the 1950s. Sobriety on the job is favored today, but my point is that there is no universal magic method, no secret formula for getting started. In Mario Pricken's (2002) *Creative Advertising*, he emphasizes the use of questions as launching points for concepting and lists hundreds of these questions, which I find particularly useful—for example, “What vision of the future or futuristic image can help to make a product feature visible at a glance?” (p. 41).

One approach that almost any creative, and certainly every copywriter, will tell you is necessary is this: You need to create a haystack to find a needle. Copywriters

write dozens, and sometimes hundreds, of lines to find the right one. A good line rarely comes right away; more often, you need to try playing with words, experimenting with points of view, getting it all down. In creating the Airwalk spots, Farmer and his creative team generated literally hundreds of concepts for print ads and TV spot treatments. The Airwalk ads were purely visual stories, with no copy other than the logo. TV spots with minimal to no dialogue were also produced. By brainstorming and posting as many concepts as possible featuring countercultural characters (a young suited spy, a gambling urban cowboy, a rockabilly piano stomper, a futuristic unicyclist, etc.), with their Airwalk shoes as the center of attention (as weapon, robot wear, oven mitt, object of affection, tool belt accessory, etc.), consensus among the creatives could form around the most startling and effective concepts.

One of the Airwalk TV spots featured a young Gen-X space traveler aboard a claustrophobic, futuristic spaceship doing battle with a cockroach. Using all the devices and modern weaponry available to him to no avail, the young spaceman eventually stomps the bug with his Airwalks. In the Airwalk TV spot, humor and cinematic flair invite the viewer to reach the conclusion that Airwalks are not only ahead of the game but also timeless and durable. The concept could have arisen directly in response to Pricken's creativity-generating question above, but rarely is the thought process laid so bare. The point is to use the established direction as a launching pad for exploration. A copywriter must be ready to think visually and imagine a story told with no dialogue; he or she must be a student, in other words, of cinema.

One Airwalk print ad featured a Buddhist monk in school, glancing down at the test answers on his Airwalks. At the time, Eastern spirituality had just begun to gain an iconic cache among trendsetters in the target population, and the Gen-X icons The Beastie Boys had begun to champion Tibetan Buddhism. By humorously (and controversially, since the ad rubbed some Buddhist organizations the wrong way) depicting the monk in a scene familiar to youth as a moment where they might break the rules, Airwalk was able to capitalize on an association with mild subversion and an insider awareness of a hip cultural icon.

As simple and graphic as the early Bernbach ads, the Airwalk ads depicted their iconic antihero characters and shoes in heavily saturated colors and clear images against a seamless background to give them the quality of fine-art posters, in order to make them collectable art rather than throwaway ads. The strategy worked. Kids were stealing the ads from bus kiosks as soon as they could be put up: the ultimate signal that the ad campaign had achieved the countercultural status with wide appeal that it aspired to—that and the 400% sales increase (Roux, 2008).

This strategy of creating art-quality imagery—along with a cutting-edge direction—foreshadowed the approach to advertising that creatives must adopt today: With more competing media types and options, more people getting their information from the Web, and the ability to skip

commercials on TV, creatives need a way to break through the wall of information and communicate directly with people on a powerful, emotional level. The Airwalk campaign shows how clever and exciting concepts can be leveraged to create real success. The key is having a product you can believe in, knowing the target market, developing a direction that will have a direct impact on the target, forming creative teams willing to do the hard work of multiple rounds of creative conceiving around the direction, and executing the campaign in a fresh and provocative way.

To become one of these hardworking creatives, you need a range of knowledge even more rich and eclectic than did the copywriters of previous generations. Creatives must immerse themselves in culture. Like the best creatives of the past, they should read trade-focused publications such as *Communication Arts* and *Advertising Age* and expand their knowledge of culture, politics, entertainment, philosophy, psychology, and technology. The more you know, the more you bring to the table when you're brainstorming a new concept or promotion.

But new creatives should also read *WIRED* and explore the Web. They should be familiar with widgets, blogs, banners, bluecasting, text messaging, user-generated content sites, search engine optimization, and the latest ways people are communicating this year, month, even week. There has been no campaign that I've worked on in recent years that doesn't include a strong Web presence, and in some cases, the Web has replaced television media buying. Beyond the Web, there are new forms of outdoor interactive billboards, inventive wildposting strategies, and a whole range of new paid media. A copywriter today is much more than a writer; she or he is part of a creative team that must be able to see advertising opportunities and storytelling possibilities in nearly everything she or he encounters. Luke Sullivan (2003) points out that you can now "print your client's good name on the stripes in between car spaces in parking lots" (p. 176). One of the main challenges of advertising at the dawn of the 21st century is to create buzz-worthy events, promotional ideas, stunts, collectible pieces, and surprising ads that don't seem like ads, since the wall that Bernbach faced is constantly being rebuilt in the cluttered minds of consumers.

But who wants to read an ad on the lines in a parking lot? Creatives must balance their mission to sell with their desire to create appealing communication. Creatives need to develop strategies that break through but also that, as Chad Farmer (2007) likes to put it, "elevate the general aesthetic." As in Bill Bernbach's day, there is no reason why the most successful brand campaigns can't be the most intelligent and appealing. The divine spark of creativity—which in fact can be nurtured in anyone with a passion to create, a willingness to view problems from multiple angles, to write, to play, to falter, to try again, to aim for something meaningful and engaging without being too crass, offensive, or wasteful—has at its heart an ethical/aesthetic component. If it doesn't,

creativity has the potential to add to the clutter, regardless of whether the strategy sells. And in the 21st century, we need less clutter and more creative solutions to the challenges that face everyone affected by choices made in the global marketplace.

Antin, T. (2003). *Great print advertising: Creative approaches, strategies and tactics*. Hoboken, NJ: Wiley.

Antin emphasizes communication and warns against creativity for creativity's sake. His methodical approach to advertising overemphasizes flow charts and rote formulas, and the ads he offers as examples feel outdated, but his argument that even the most creative work must be in the service of communication is stubbornly true, even as his formulism feels stifling. It is worth reading in part for having a rather dry text on advertising to react against.

Fallon, P., & Senn, F. (2006). *Juicing the orange: How to turn creativity into a powerful business advantage*. Boston: Harvard Business School Press.

When Fallon and Senn started their own agency in 1981, they argued that the status quo was characterized by the concept of "media leverage," or literally outspending competitors and saturating the market with ads. Fallon and Senn, admitted Bernbach disciples, felt that it was time to make a new push for creativity. They coined the term *creative leverage*, which refers to their approach of making creativity work for clients by outsmarting rather than outspending them. The argument in *Juicing the Orange* is very similar to the claims that I make in this chapter. What makes this book such an essential read is that it takes readers from the very inception of the Fallon Worldwide agency, through the early campaigns, and into the present. For readers interested in examining further case studies, such as the Airwalk campaign I discuss here, Fallon and Senn's detailed description of how they discovered creative solutions to a variety of branding problems is indispensable.

Farmer, C. (2007). *Lambesis 2007 agency book*. San Diego, CA: Lambesis.

This book is not available to the public, but an overview of the work discussed in this chapter and much of the work in the book may be seen at lambesis.com

Feinstein, J. S. (2006). *The nature of creative development*. Stanford, CA: Stanford University Press.

A fascinating study from the academic field of creativity studies, Feinstein's book includes accounts of the creative development of over 70 individuals, from the artist Jonathan Calder to Albert Einstein. Feinstein's emphasis on the formation of creative interests and pursuits rather than the breakthroughs at the end of the development process is useful in helping one reflect on how one's own creative development is a process. Creative inspiration, in his view, is the culmination of a process of immersion in a topic or field that usually starts well before projects are taken on.

Frankel, A. (2004). *Word craft: The art of turning little words into big business*. New York: Crown.

For aspiring copywriters, Frankel's book will either confirm their interest or drive them away. His careful analysis of how products are named and the very specific industry that has developed around it reveals an aspect of the copywriter's task that can be perceived as either tedious and mundane or fun and fascinating. Most important, Frankel reveals how much is at stake in the big business of coming up with the names of products while discovering that there is no single method or approach shared by professional namers but rather a collection of odd and creative people working with wildly different theories about how to come up with just the right name.

Garfield, B. (2005). Top 100 advertising campaigns of the 20th century. *The Advertising Century*. Retrieved August 3, 2008, from <http://adage.com/century/campaigns.html>

Gettins, D. (2006). *How to write great copy: Learn the unwritten rules of copywriting*. Philadelphia: Kogan Page.

Gettins's book is a useful example of a new wave of books on copywriting that argue that conceiving is really a better description of a modern copywriter's job. He breaks his approach to copywriting into eight fairly commonsense rules (from "know your target" to "do your research" to "be ambitious"), but since they are broad enough to encompass a wide variety of individual practices, his approach could be useful to aspiring creatives looking for a structure or system to apply to solving advertising challenges creatively.

Gladwell, M. (2000). *The tipping point*. New York: Little Brown.

Gladwell's famous text that changed the way people think about and understand the transmission of information, the rise and fall of trends, and the people who shape culture. He argues that "tipping points" are moments when key individuals trigger "epidemics" where information gains widespread momentum. Though the theory itself is questionably metaphysical, the examples he offers are useful for seeing how knowing one's target may sometimes mean reaching out to "connected" segments of the target first. The rapid viral spread of information that reaches key channels such as popular blogs in new media bears out the importance of this aspect of Gladwell's argument.

Higgins, D. (2003). *The art of writing advertising*. New York: McGraw-Hill.

A set of compelling interviews with advertising's great early pioneers, such as Bill Bernbach and David Ogilvy. When the interviews took place in the 1960s, the struggle between the new creative approach and the conservative

traditional copy-plus-illustration formulaic style was under way, and it makes for lively reading and gives one a good sense of the competing approaches, even if all the stakes can only be recognized in hindsight.

Jewler, J., & Drewniansy, B. (2001). *Creative strategy in advertising*. Belmont, CA: Wadsworth.

A textbook on advertising that emphasizes being creative and offers a variety of useful examples, test cases, problems, exercises, and guidelines. A good overview of what are considered the most breakthrough campaigns of all time and thorough analyses of why they work, along with practical advice for young writers and designers.

Klein, D., & Donaton, S. (2005). *The advertising century*. Retrieved August 3, 2008, from <http://adage.com/century/campaigns.html>

Landa, R. (1998). *Thinking creatively: New ways to unlock your visual imagination*. Cincinnati, OH: How Design Books.

It may be counterintuitive to apply exercises in visual thinking to the task of freeing up the creative writing mind, but Landa's practical exercises for designers can be useful for helping writers working on integrated concepts to see the connection between the impact of the word as signifier and the impact of the word as sign.

Lawrence, M. W. (2003). *A big life in advertising*. New York: Simon & Schuster.

An engaging autobiography of a female advertising pioneer. Well-balanced between her personal observations of the friendships and personalities central to her life in the early days of the creative revolution and her observations on the successes and challenges of the campaigns she worked on.

Morgan, A. (1999). *Eating the big fish: How challenger brands can compete against brand leaders*. Hoboken, NJ: Wiley.

Morgan argues that challenger brands succeed when they define themselves as such rather than imitating the strategies of larger brands. His emphasis on the need for challenger brands to establish an emotional rather than rational connection with consumers makes sense in light of the success of the Airwalk campaign discussed here. What is most useful in Morgan's book is that through his analysis of some of the largest challenger campaigns of all time, such as Apple's innovative marketing strategy and self-definition as a maker of renegade rebel-geek products, we can see how creativity is especially useful in brand building by leveraging a lower-tier position as an asset.

Ogilvy, D. (1963). *Confessions of an advertising man*. New York: Atheneum.

Ogilvy represents a bridge between the traditional and creative approaches to advertising. His major contribution was in bringing sophistication and wit to advertising, which set the stage for the more revolutionary aesthetic breakthroughs of William Bernbach. His 1963 *Confessions* reveals him to be an entertaining and colorful character whose approach to successful advertising tends to emphasize the bottomline over overtly creative style. In that sense, *Confessions* can be read in part as a reaction to the more artistic approaches on the horizon when the book was written.

Pope, D. (2003). Making sense of advertisements. In *History matters: The U.S. survey course on the Web*. Retrieved August 3, 2008, from <http://historymatters.gmu.edu/mse/Ads>

Pricken, M. (2002). *Creative advertising: Ideas and techniques from the world's best campaigns*. London: Thames & Hudson.

A very aesthetically impressive illustrated "coffee table" book of the most cutting-edge European advertising with a very useful text that centers on formulating the right questions to ask when searching for creative solutions to everyday problems in campaign development. This is the best book available for stimulating the creative mind merely from examining interesting existing advertising.

Roux, J. P. (1998). Lambesis. *Communication Arts*, 40(5), 74–85.

Sullivan, L. (2003). *Hey, Whipple, squeeze this: A guide to creating great ads*. Hoboken, NJ: Wiley.

Witty and practical, Sullivan looks at just about every aspect of conceiving, from the history of the creative approach, to the day-to-day life of a copywriter, to tools and approaches for filling a blank sheet of paper, to breaking into the business. The readability and scope of the book make it the most useful starting place for anyone pursuing a career in advertising or for junior copywriters interested in honing their craft.

Vonk, N., & Kestin, J. (2005). *Pick me: Breaking into advertising and staying there*. Hoboken, NJ: Wiley.

A great read for those getting started, *Pick Me* is a very practical nuts-and-bolts manual for breaking into the business, with good advice on putting together a portfolio, choosing a school or agency, and forging a career plan. Since Vonk and Kestin are successful creative directors, they explain how preparing for a career is connected to the type of work you see yourself doing.

MEDIA PLANNING FOR ADVERTISING CAMPAIGNS

DONALD W. JUGENHEIMER

In-Telligence Inc.

Media selection is critical to advertising success. The best advertising message ever created is completely wasted if it is not presented to the right audience through the correct media.

There are several other reasons why the media are an essential part of advertising campaigns. For one thing, media compose most of the advertising budget, far more than the research, message, or production facets (Wilson, 2007). At the same time, the media are often the least understood part of the campaign; most business executives understand marketing, and all media consumers understand the messages, but the media portion is more esoteric and thus less comprehended by most people. Also, the advertisers see their advertising campaign in the media that are selected, so an easy way to make sure that the advertiser client sees and hears the advertising is through proper media selection. That same proper media planning uses the advertising budget most fully and can free up money for additional advertising or for new promotions. So the media portion of advertising is critical to campaign success (Kelley & Jugenheimer, 2004).

Keep in mind that the media themselves are general types of channels, such as television, newspapers, or the Internet. Then come the media vehicles, which are the individual outlets of the media, such as ESPN, *The New York Times*, or Google. Finally, come the media units, the

specifications of the advertisements, such as a full-page four-color advertisement in a magazine.

Advertising Media Process

To understand how advertising media work, it is first necessary to understand the process of analyzing and selecting the media for an advertising campaign. First, one analyzes the product, service, or idea to be promoted, along with a competitive analysis and a survey of the marketing situation. Next come the objectives and goals, what is to be achieved with the campaign: marketing objectives, more specific advertising objectives, and even more specific media objectives. Then come the strategies, which are plans to achieve the objectives. The strategies include the campaign targets, including geographic targets (target markets), customer targets (target groups), and media targets (target audiences).

From all these analyses, it is possible to evaluate the characteristics of all the available mass media in terms of the campaign objectives and to begin to select the best media types for the campaign. Media tactics are the implementation of the plans and involve the specific media vehicles and units to be used, along with the schedules. The advertising media plan must also consider any media promotions, continuity or “fall-back” plans, the media calendar, the budget and the integration of the marketing, advertising, and media strategies and tactics.

The Role of Media in the Advertising Media Process

Four basic factors are most important in selecting mass media for use in advertising: reach, frequency, impact, and continuity.

Reach involves the audience with which communication is being made. Numerical reach is the number of persons, households, female heads of households, or other target groups, whatever categories of individuals are being sought. Percentage of reach is the portion of the target group with which communication may be made.

Frequency is the number of times an advertisement is used in a campaign. Frequency of insertion is how often the advertisement is run in the media, but because no audience member will see or hear every advertisement every time it appears, more important is the frequency of exposure (often called effective frequency), the average number of times an audience member sees or hears an advertisement. Effective reach refers to an advertisement being seen or heard a minimum number of times, such as audience members who read an advertisement at least three or more times.

Impact has many meanings in advertising. In the media, impact refers to the characteristics and specifications of the particular advertisement, such as size, length, use of color, use of bleed, and the like. A larger print advertisement has more impact than a smaller advertisement; a longer television commercial has more impact than a shorter commercial.

Reach, frequency, and impact all cost money, but *continuity* does not. Continuity involves the pattern of advertising, so that, say, a television viewer sees another advertisement for the same item before forgetting a previous commercial.

Consumers Avoid Advertisements

No matter how often an advertisement is run or where it appears, many consumers still try to avoid them. While watching television, viewers often switch channels when commercials appear (called “zapping”), and those who record television programs often fast-forward through the commercials (called “zipping”).

Advertising and Marketing

Advertising is usually considered a promotional facet of the marketing mix. The marketing mix includes what have become known as The Four Ps:

Product (an item or service or idea to be sold)

Price

Place (distribution to the buyer)

Promotion (including advertising)

The mix of marketing becomes more complex, not because of more elements but because of a faster time limit on advertising campaigns, on consumer attention spans, and on media transfer capacities. Many mass media are now carried in digital electronic formats, which speed up the processes while offering more choices to consumers, and with more selection search assistance available to customers.

Changes and Trends

The advertising media business has always been one of rapid change, but today’s progress and change are coming at ever-faster rates. Some of these changes have been under way for a few years, while others are new on the scene.

Ongoing Changes and Trends

The changes that have been under way are important, may be more important than those changes that have begun to occur most recently. The ongoing changes involve changes in the use of media in advertising, in the media themselves, in the media environment, and in the way the media are delivered.

Changes in Advertising Use of Media

For decades, advertisers have shifted their advertising dollars from one medium to another. Years ago, advertising investment was heavy in radio time, but when television appeared on the scene, much of it was shifted to television. Some former newspaper advertising monies were shifted to a selection of broadcast media. Advertising schedules in general-audience magazines have largely gone to television. Interestingly enough, as new media came onto the scene, the older media did not disappear: Radio did not disappear when television took on the primary advertising role, and magazines did not die when monies were shifted to television, although general-audience magazines have just about disappeared.

More recently, shifts from one advertising medium to another have been more pronounced. Money that once went to newspapers has been shifting to the Internet (Saba, 2007), and especially in the case of classified advertising, monies have shifted from help-wanted classified newspaper advertisements into Internet sites such as Monster.com. Network and other broadcast television advertising has shifted, at least in part, to wired systems such as cable and satellite television. Some radio advertising has gone to music Internet sites as well as to music television programming, such as MTV and VH1, and to wireless systems, such as iPhone and iPod downloads.

Another change involves broadcast ratings. The ratings project the portion of households or of individuals who are tuned to a particular broadcast station, program, or network

as a percentage of all the households (or people) that have television sets, whether those sets are on or not. Until recently, broadcast ratings were available only by 15-minute segments, but now ratings are available for minute-by-minute segments of programs, allowing advertisers to know more precisely what percentage of the potential audience was tuned to their actual broadcast commercials. This minute-by-minute ratings service gives advertisers much more detailed information about the success of their commercials media buys.

The concept of ratings is a valuable one because, in essence, the ratings percentage is the percent reach. Because of this usefulness, other types of media, including print media, have adopted the ratings approach for measuring audiences. This widespread use of ratings data allows for easier comparison of audience levels from one medium to another.

Shifts in Advertising Media Environments

As computer usage has grown and electronic transfer of information has become more prevalent, more mass media content has become digitalized rather than analog content. Digital storage of advertising content permits the rapid and easy transfer of the information from one format to another, say, from a broadcast script to a newspaper story or to an Internet posting. As the media become more similar through digitalization, it has become possible for media consumers, the audience, to select through which format they wish to receive their information and entertainment, including advertising. At the same time, digital storage allows advertisers to trace through what channel the audience members are gaining access to their advertising messages.

Convergence

Convergence is affecting all aspects and uses of the mass media. Convergence is the term used to define and explain how media message content, message effect, and simultaneous message delivery change, interact, and alter one another through multiple media. As digitalization and other shifts occur, making the mass media more similar to one another, convergence results, so the media delivery systems are more like one another and audience selection of media message delivery systems becomes more prevalent.

In advertising, convergence makes a broadcast television commercial more versatile because it can also be used in cable and satellite television, radio, cinema, and Internet formats. This permits broader choice for audiences but at the same time may make reaching those audiences through advertising media selections either more facile or more difficult, depending on whether audiences

select from a wide variety of media sources or stay with only a single or a few choices.

Interactivity

Advertising has benefited greatly from media interactivity, which permits audience members to interact with the media. Such interactivity most commonly occurs with e-mail and Internet advertising, which permit easy responses and exchanges of messages. Some interactivity can also occur with television or radio advertising, although the response may be through another medium such as telephone or the Internet rather than directly back through the same medium by which the advertisement was received.

Actually, media interactivity has been a part of the advertising business for a long time. Magazine subscriptions renewal notices sent through the mail sometimes included a small pencil so that respondents could write their responses easily and quickly, resulting in higher response rates. Many direct-mail offerings also used tear-off coupons or stick-on stamps to increase interactivity. Any coupon that is cut out and redeemed is a form of interactivity. Direct mail, other forms of direct marketing, and telemarketing have all provided interactive opportunities for decades.

Interactivity is important to advertisers because such audience involvement increases response and purchase rates and may result in higher recall rates for advertising messages and brand names. Thus, advertising media have had increasing interest in interactivity, and many media planners are instructed to consider interactive media more favorably than media that only deliver a message but do not provide for an immediate, interactive response.

New Media

New mass media developments, as noted earlier, do not necessarily obviate the older, existing media (Kokernak, 2007). Sometimes, the older media can add the newer elements to their offerings and can replicate some of the new-media benefits in some way. Some studies indicate that television is still a more powerful presenter of an advertising message than is the Internet (Berkowitz, 2007). More often, audiences do not shift to using the new media immediately and certainly not all at once, so both old and new media can provide news, information, entertainment, and advertising. Online media are widely used, but consumers are still influenced by the traditional media (Kee, 2007; O'Malley, 2007). It is only logical, however, that as more media types are developed, the existing advertising budgets are spread across more types of media, old and new, so the advertising revenues for the older media may decline somewhat as advertising

investments are shifted, at least in part, to new media types and outlets.

The rapid rise of the Internet as an advertising medium is one example of this kind of shift. Some uses of new media will grow even faster; mobile marketing, video games, advanced television, and digital out-of-home networks are predicted to grow at double the rate of online media in general (Mandese, 2007a), and these fast-growing formats offer new advertising opportunities (Kee, 2007). The new advertising opportunities on the Internet have been at the cost of some of the older media, such as newspapers, which once had a very large share of advertising dollars (Sass, 2007). The development of cable and satellite television has also resulted in advertising investments, partly at the expense of the older broadcast television medium. Yet advertising in the traditional media often encourages increases in the use of new media, such as television advertising resulting in more searches on the Internet (Berkowitz, 2007).

One irony is that older media types that were once wired, such as telephone, have become mobile through the use of broadcasting, and older media types that were once broadcast, such as television, are now available as wired media.

New Advertising Formats

Newspaper advertising no longer needs to be placed in rectangular forms; free-form advertisements allow shaping the advertisements like the product or some symbol, with regular newspaper information and editorial material around the advertisement. For years, magazines have included tear-out inserts and free-standing (not bound in) inserts; now, magazines can offer CDs, DVDs, product samples, and other original advertising formats. Television advertising commercial announcements once were a standard 60-seconds long, but now the standard is 30 seconds, and stand-alone (i.e., not combined with other commercials to make the slot longer) commercials are available in 15- and even 10-second lengths. Commercials are also available as full programs of 30 to 60 minutes, known as infomercials.

Some advertisers are posting their television commercials online, alone without other materials, and audiences are going to some of these Web sites and viewing the commercials in large numbers, sometimes in the hundreds of thousands. These Internet postings of commercials are not usually part of the original advertising media plan but offer an inexpensive and impactful way for advertisers to get their messages to interested customers.

All these options add to the complexity and information needs of the advertising media buyers, who now must weigh many new options against one another, each with its own costs, benefits, and drawbacks. Some format changes bring greater audience attention, helping the older media compete with the new (Elliott, 2007).

New Changes and Trends

In addition to ongoing changes and trends, there are newer changes in the mass media and in advertising's use of media that are coming into play. These may eventually turn out to be ongoing or long-term changes, or they could be experiments that do not last very long.

Combinations of Media Types

More media offer their content in a variety of formats. Newspapers place their stories and advertising online on the Internet, so advertisers can gain from advertising exposure in both media; there is a big overlap between the use of newspapers and of online information sources (Sass, 2007). Some newspapers, such as *USA TODAY* and *The Wall Street Journal*, are providing magazine formats of their news and advertising content, hoping that because magazines are kept in the home longer than are daily newspapers, such magazines will also remain longer and perhaps have more advertising impact (Ives, 2007). Radio stations make their programming available online in "blogs" (Web logs) or regular Web sites, and the advertising is carried both ways: broadcast and online. Television networks and stations are doing the same with Internet program repeats and even offering follow-up programs and outtakes via cell phones; some television commercials are widely viewed on Internet sites (Garner, 2007). Many magazines provide additional details about printed stories at their online Web sites.

It is not known what impact these kinds of new changes will have for advertising's uses of the mass media. These new developments are making the task of buying advertising media more complex and at the same time less predictable. Advertising media buyers are faced with the question of whether these additional avenues of message distribution are equal to or perhaps better than the more traditional channels. The media buyers must also quickly judge whether these additional outlets make the advertising buys worth more money.

Product Placement

Soon after motion pictures were invented, advertisers worked at ways to get exposure for their products in these movies. Sometimes, the movies were about companies and products and thus provided free publicity without inducements being sought or paid for by the advertisers.

Some advertisers simply made their products or services available for free, in return for the publicity. Other companies provided free products as prizes on television quiz shows, provided services in return for a listing in the program or movie credits, or offered facilities for filming or taping in return for a bit of background exposure.

More often now, advertisers pay for the placement of their products in programs, whether it be Coca-Cola on the

judges' tables for *American Idol* or a brand of beer on the counter for a television episode. Product placement has become an important part of advertising media usage, with weekly surveys of the most visible and effective placements of brand names and items.

For the media planner and buyer, this form of promotion presents additional problems. There is no standard price or fee for such placements, and there is no standard source that one can consult to find the value of such placements. Then, too, the effect or impact on the audience is not well researched, and thus the value of such placements is not well established.

Consumer Control

At one time, control of the media was in the hands of the programmers, advertisers, and media owners. Now, control is shifting to consumers. Digitalization of the media is one reason for this switch; consumers can now select through which outlets they wish to receive their news and entertainment. Consumers can also record broadcast programs to view when they wish, deleting advertisements. Esoteric information that was once hard to find can now be searched and located on the Internet from millions of sources throughout the world.

Consumers can also provide content for the media, something that was always in the control of the programmers, advertisers, and owners of the media. As a result, media content can come from anyone and anywhere.

When advertisers had more control of the media, the advertising uses of the media were more predictable and somewhat standardized. Now, with consumers gaining more control and input, advertising can appear in all sorts of places never deemed possible before, and with wide-reaching effects. Advertising media can use these new channels but with some trepidation because the outcomes are not clearly predictable and the economic return is, for the most part, only a guessing game. With consumer control gaining in importance, advertisers have less control over the environments in which their messages appear, and possible negative side effects are not only possible but an everyday occurrence.

Measurement

With all these new developments and changes, measuring the impact of the media becomes more difficult. Advertisers have less of an idea about what effects their advertising messages will have, on whom these messages will fall, and what the eventual outcomes might be.

Certainly, the long-standing media measurement techniques and institutions still exist and still contribute. Television ratings are still measured and used by programmers and by advertisers. The ratings services now have added newer types of media to their research parameters, so Internet and other new electronic advertisements can be

measured. Because of the interactive capability of these new media, sometimes the research data can be even more accurate than in the past, narrowing down audience information to individual media users. Yet with so many changes, so much fragmentation of the media, so many avenues for placing content in the media, what to measure and how to measure it have become much more complex questions.

Faster feedback may be one important change in media measurement (Friedman, 2007). New broadcast commercial ratings services can track audience attention in minute-by-minute, and in some instances second-by-second, attention spans (Campanelli, 2007). Some major consumer product companies are trying to relate to consumers' real lives, using immersion techniques during which marketers spend hours at a time visiting and shopping and talking with customers (Sewell, 2007).

Whether an advertisement is effective has always been a question that is difficult to answer, but now, with all these changes and developments that have come in recent years and are evolving at an ever-increasing rate, the measurement of advertising effectiveness is of even greater interest, while conducting the necessary research has become more circuitous and more convoluted.

Involving Advertisers in Media Plans

As consumers have gained more control over the media, advertisers also want more control, too, and not just of media content. Advertisers want more control of when, where, and how their advertising messages will appear.

Previously, the media plan was left in the hands of the advertising agency's media department and its media planners, estimators, and buyers. The media portion of the advertising campaign was understood only by a few of the corporate executives, and most of the advertising emphasis was on the message content, format, and presentation rather than on the media plan.

Modern advertisers want to know more definitively what the environment will be for their advertising messages, exactly who will be exposed to that message, how many times, in what kinds of progressive campaigns, and to what eventual ends.

Involving Audiences With Advertisement Usage

Almost a million customers downloaded a Budweiser commercial from the Internet. Imagine the impact on consumers who are so interested in a product that they go out of their way to view a commercial message. The same kinds of results occur for Frito-Lay's Doritos, GEICO's cavemen, and Apple's iPhone. Even the Conan O'Brien parody of the iPhone advertising drew millions of online

viewers, more than for the original commercials themselves (Garner, 2007).

This kind of opportunity provides new avenues for advertising media, and at the same time, new complications. Does the advertising message become so important that customers will find it on their own, or does the media placement expose the message to the correct audiences so accurately that they are drawn into the message and then follow through without further incentive or assistance?

Problems for Advertising Media

Not all developments offer a new opportunity. Sometimes, they offer new problems and mixed results. All businesses have problems, and the advertising media business is no different.

Clutter

A long-standing problem in advertising media is clutter, and it is getting worse. Clutter involves the number of advertisements and the amount of media time and space devoted to advertising. The problem is more pronounced in broadcast media, radio, and television, because it is more difficult for audiences of those media to avoid the commercials; print readers can simply turn the page, and Internet viewers can click on another site, but broadcast listeners and viewers must sit through the commercials or take actions to avoid them. Then, too, broadcast has a bigger concern with clutter because of the so-called irritation factor, when audiences actually become angry because of the number of commercials or irritated at an advertiser whose commercials run too often.

Ironically, the solution to clutter has been increased clutter. As more and more commercials appear on radio and television, the portion of a single advertiser's messages as a part of all commercial minutes, known as share of voice, has declined (Bloxham, 2007). To overcome this dilemma, advertisers have resorted to buying more commercials of shorter lengths so that the advertisers' messages appear more often. Where once there was only one commercial per minute, and then two, today, there may be four or more. Clutter has increased as advertisers try to fight the clutter from their competition. Yet longer messages still work better than do short ones (Loechner, 2007).

Another possible solution to clutter may involve the use of behavioral targeting, which aims advertisements at certain desirable audience segments rather than using demographic targeting. More specific targeting based on consumers' behavior would reduce the number of advertisements that go to audience members who are not really interested in that particular product or service (Leggiere, 2007).

Inflation

Economic price inflation is a problem for all businesses. It is especially a problem for advertising media. In recent years, media costs have been rising faster than the consumer price index in the United States. Another complication is the fact that some media are losing market share. Network broadcast television, for example, has lost audience levels for some years now, with the audience rating figures getting smaller each year. The solution for advertisers has been to try to reach the same size of audience as they did in the past, which, because of the decreasing ratings, forces advertisers to buy more advertising. So the demand for network television advertising time has been increasing, even though the audience ratings have been slipping. This is certainly an ironic situation: getting more demand because market share is slipping. Television networks have even raised their advertising rates to take advantage of the increased demand for television time, at a rate somewhat higher than the general inflation rate.

To some extent, the same trend has occurred in other media. Magazines have charged higher prices for advertising space as the demand for magazine advertising has declined (Mandese, 2007b). In addition, some media vehicles have been able to fight the declines in advertising faced by their types of media. Some newspapers have maintained or even gained advertising even while the newspaper industry as a whole has suffered from a dramatic decline in advertising (Roberts, 2007). Industry analysts have charged that the shifts in audience levels, advertising demand, and media prices have been disguised to take the advertisers' attention away from what is actually being offered in advertising buys (DeWitt, 2007).

Audience Attention Levels

More types of media availabilities mean that audiences have more choices of where to spend their time. This means that the audiences spend less time with the traditional media as their media exposure is spread across more types of channel outlets.

As people's lives get busier, they also spend less time on any one activity, be it recreation, entertainment, or information. These two factors, more types of media and more segmented activities, mean that audiences are spending less time with the media and that they are more likely to multifunction: doing two or more things at once.

If audiences try to balance the checkbook and take care of the children while the television is on, they obviously are not paying full attention to the television program.

These split audience-attention levels have obvious implications for advertising media. Buying an advertisement today may not give the advertiser the same audience attention even though it may reach the same audience size. There is no easy way to calculate the loss of attention and its impact on advertising media efficiencies, but there

certainly is a loss of advertising impact when the audience is not paying close attention to the message.

“‘Creative’ Sells Campaigns”

There is an old saying in advertising that “creative sells campaigns.” In the heading for this section, the word *creative* is in quotation marks because, even though many practitioners in the advertising business call the message strategies the creative portion of the campaign, all advertising involves creativity: media and research and production as well as message strategies. So what the saying means is that the advertisements themselves, the messages, are what sell campaigns.

Here, the selling of the campaign is not just to the audience but also to the advertiser. An advertising agency prepares an advertising campaign for its client, the advertiser, and the client must give approval before the campaign can run and money can be spent. Advertising agencies usually stress the advertisements when presenting the proposed campaign to the advertisers, because the message should be inherently interesting and thus might make the campaign easier to accept. Yet, even though the message may be stressed, the message and media strategies are ideally formulated together, in concert with one another, and neither one is more important than the other.

Effects and Effectiveness

Advertising is not an altruistic business. Businesses invest in advertising because they expect a return on their investments. A problem arises because the stimulus, advertising, may not be traceable all through to the response, sales. Also, not all advertising has sales as the goal; there are many other possible objectives, such as product awareness, opinion change, product knowledge, and similar outcomes. Yet most of these results cannot be traced back directly to advertising.

For that reason, much advertising research focuses on surrogates for the intended result. It may not be possible to trace sales results or opinion changes, at least not directly all the way back to advertising, often because a series of intervening steps is involved. So the surrogates used are outcomes that can be traced and that may be meaningful; examples of surrogates include readership of a print advertisement or recall of a television commercial.

Measuring the Contributions of Media in the Overall Campaign

An even more difficult research problem arises when trying to separate the media effect from the rest of the advertising campaign effect. If one cannot determine whether sales

occur directly because of the advertising campaign, then determining the effect from the media portion of the advertising campaign is virtually impossible.

Separating the media effect from the overall campaign effect cannot be researched easily, quickly, and economically, so again, surrogates are used. With media, coupons are often used, with a key in the coupon indicating where the advertisement appeared, so the coupon response can tell which advertising placement location brought the greatest response and can also measure cost per response. Keep in mind, however, that if a coupon response is not the intended goal of the advertising, the research is again measuring something other than the intended objective of the campaign.

Future

To understand the role of advertising media strategies in the 21st century, it is critical to try to predict future trends and developments. Of course, it is impossible to tell the future accurately and completely, but there are a number of current trends in the mass media that can help us forecast what may be happening in the coming years—probably not the entire 21st century but at least the coming decade or two.

Media-Buying Specialists

Media-buying specialty firms have been around for many years. These companies specialize in the media-planning and -buying functions of advertising.

Such work is often conducted by the advertising agency that handles the overall advertising campaign. But for a number of reasons, an outside firm may be sought. Many times, media trainees at advertising agencies are eventually promoted to some other line of work, such as account service or management, rather than continuing their experience and expertise in media work. Then, too, advertising agencies often encounter certain periods of peak activity, when several campaigns are due for a variety of clients, so using outside vendors for some of the work may be desirable.

The larger a media-buying department or company is, the better volume discounts it may be able to negotiate for advertising costs. Thus, combining several accounts into one buying activity gains budget volume, which can result in lower advertising rates, as well as gaining the economic efficiencies of larger operations. Combining several advertising agencies' work at a media-buying service can gain even more budget volume to provide lower rates and greater economies of scale.

Trends

In the mass media, there are several trends that appear to affect the way advertising, and particularly advertising media strategies, work. In addition, there are some general business trends that affect how advertising operates and

some general advertising trends that affect how the media function may operate (Kelley & Jugenheimer, 2008).

Convergence

Earlier, there was a discussion of media convergence, the fact that the media are becoming more similar and overlapping in their technologies, functions, and applications. As this trend continues and the media continue to become more similar, advertising media planning will simultaneously grow more difficult and less difficult.

This seeming contradiction can be easily explained. If the media grow more similar, buying media will be easier because one may be able to purchase a newspaper advertisement and a similar announcement on the newspaper's Web site, all with one easy media buy. However, when all media have Web sites, and newspapers also publish magazines, and other new forms and outlets are developed, there will be even more media choices, making the media-planning task more difficult.

Then, too, is the problem of common digitalization of the media. Digital media are simple and quick to save for future use, perhaps on a personal computer. If an advertiser is running a campaign and the audience holds the message until some future date, is the value of the advertisement decreased or perhaps lost altogether if a special sale or political vote is over by the time the audience gets around to calling back up the media content that was saved?

Interactivity

Advertisers like media that involve the audience members. There is some evidence that interactivity with an advertisement brings increased recall of that advertisement and perhaps even a more favorable opinion about the advertised item.

Interactivity can go even further, however. In some media such as the Internet, the audience can not only interact with the advertisement but also actually place an order for purchasing the advertised merchandise. This expansion in activity also changes the scope of advertising; advertising was once considered to be most effective in pretransactional and posttransactional roles, but the actual purchase was made at a store or in some other way separated from the advertising. Now, the purchase transaction can become part of the advertising. This means that the advertising media selection is even more important, because it may shorten the marketing channel and transform advertising into a transactional as well as a promotional tool.

Engagement

Currently, there is much discussion of engagement in advertising media. It is not enough, so it is thought, for audiences simply to read, see, or hear the advertisement.

It is better to engage the audience members in activities that may make a more lasting impression on potential customers. Engagement activities are not necessarily interactivity, as discussed in the previous section. Instead, engagement could be just something to keep the audience members busy, to induce them to stay with the advertisement longer, to encourage them to think more deeply and to remember longer the advertising message (Rose, 2006).

Television commercials that entertain as well as sell are a means of engagement. Most advertisers would be pleased to know that audiences actually look forward to their television commercials and that people may tell others to "watch this ad." One research study found that an engaged television viewer is worth eight regular viewers (Neff, 2007) and that return on investment increases 15% to 20% with engagement (Wilson, 2007).

Commoditization

The media are not the only converging development. Products and services are becoming more similar to one another, too. Pain relief products claim that "no other product is stronger," meaning that they are just as strong but no better. Banks all tend to offer the same services, lobby hours, and online services. As these products and services become more similar, they are more like commodities. Commodities are like agricultural products, such as wheat, that meet certain standards and that are assumed to be uniform throughout no matter who produced them.

If product and service differentiations disappear, or at least decline, the role of advertising changes dramatically because it is no longer possible to find the "unique selling proposition," the one thing about a service or product that made it different from its competitors. Yet the role of advertising will not decrease just because natural differences are diminished; rather, advertising will become more important when it is needed to create or imply differences between the advertised items.

Cadence

The world is becoming an ever-busier place. People do more now in a day than they may have done in a week when our country was founded. Mechanization, computerization, industrialization, and electrification have all made it possible to accomplish more in less time.

The pace of life, the cadence with which we live, is especially important in advertising media. If we have minute-by-minute television commercial ratings, how long will it be before an advertising media buyer is expected to shift the campaign to some other medium or vehicle not in a couple of weeks or in a few days but in the next couple of hours?

Cadence is important to advertising and especially to advertising media, and we have not yet begun to see the

increase in the pace of business activity that all the new media and new media developments will bring.

Future of Advertising Media

While it is not possible to predict the future with total accuracy, at least not for the long term, some trends in the mass media and in advertising can lead to reasonable forecasts for advertising media. “Aggregate mass audiences are diminishing and being replaced by smaller groups of individual consumers” (Picard, 2007).

As the media continue to converge, it is likely that most media reception may be able to come through a single device, whether it be a portable instrument such as a cell phone or a personal computer. Most likely, portability will be a prime desire among audiences. Media content will be wherever consumers want it to be (Smith, 2007).

At the same time, this convergence along with digitalization means that consumers will be able to select through which means they will receive the media information. Read the newspaper on the computer screen, listen to it on a cell phone, or have it printed out: These are possibilities now, and they are likely to gain more widespread availability and use.

The proliferation of types of media and vehicles will require that consumers be able to select which ones they wish to access and what kinds of information, opinion, entertainment, and advertising they wish to receive. Already, many e-mail advertisers ask recipients for permission to send promotional information, and consumers seem to like having that choice.

For advertising media strategies, these changes will mean that there will be less wasteful distribution of messages; advertisements need only reach those who are interested and perhaps opt to receive the advertising. At the same time, such changes may make it more difficult to introduce new products, services, and ideas because audience members will not choose to receive advertising messages about things about which they know nothing.

Database information about consumers is becoming more prevalent and more detailed. These kinds of in-depth information sources about consumers—what they buy, what they want, and to what media they pay attention—will make media selection more scientific and less haphazard, again reducing waste and, perhaps, increasing efficiency.

Because of the large number of media choices, it will be more difficult for advertisers to reach a large general audience, so specific targeting will be in demand by advertisers. Engagement will continue to grow in importance, perhaps through interactivity or through new media that have not yet been developed.

The pace of life, in business and in personal dealings, will continue to have a faster cadence. In advertising, the need will be to predict exactly what consumers want and give them exactly that.

No matter what changes occur in the future, advertising will be there, likely to support the costs of new media as well as to use the media to reach potential customers. Advertising media strategies will become even more crucial in the advertising effort, to take advantage of the new developments; to cut costs and gain efficiencies; to make advertising a desired selection among audience members; and to serve its essential economic function of expanding the economy, announcing new developments, and facilitating marketing and commerce.

INTEGRATED MARKETING COMMUNICATION

MICHAEL BELCH AND GEORGE BELCH

San Diego State University

Over the past decade, integrated marketing communication (IMC) has become of prime importance in both the academic and the practitioner communities. In both the business-to-business and business-to-consumer markets, numerous research studies have indicated that IMC is one of the top priorities in the new millennium. Interestingly, agencies have been ahead of their clients and, to a large degree, academics in the adoption of IMC.

The purpose of this chapter is to examine the evolution of IMC, its meaning and the reasons for its adoption, the current state of the art, and the future of IMC.

The Evolution of IMC

For many years, the promotional function in most companies was dominated by mass media advertising. Companies relied primarily on their advertising agencies for guidance in nearly all areas of marketing communication, and many companies also used additional promotional and marketing communication tools. Sales promotion or direct-marketing agencies and promotional-products firms were generally viewed as auxiliary services and often used on a per-project basis. Public relations agencies were used to manage the organization's publicity, image, and affairs with the relevant publics on an ongoing basis but were not viewed as integral participants in the marketing communication process. Many companies had separate public relations agencies that were autonomous and distinct from the marketing communications groups. Marketers built strong barriers

around their various marketing and promotional functions and planned and managed them as separate practices, with different budgets, different views of the market, and different goals and objectives. Departmental silos based on specific communications functions were established. These companies failed to recognize that the wide range of marketing and promotional tools must be coordinated to communicate effectively and present a consistent image to their target markets.

During the 1980s, many companies began to recognize the need for improved strategic integration of their promotional tools. These firms began moving toward the process of *integrated marketing communication*, which involved coordinating the various promotional elements with the other marketing activities that communicate with a firm's customers. As marketers embraced the concept of IMC, they began asking their ad agencies to coordinate the use of a variety of promotional tools rather than relying primarily on media advertising. A number of companies also began to look beyond traditional advertising agencies, employing other types of promotional specialists to develop and implement various components of their promotional plans.

Many agencies responded to the call for synergy among the various promotional tools by acquiring public relations, sales promotion, and direct-marketing companies and then touting themselves as IMC agencies that offered one-stop shopping for all their clients' promotional needs. Some agencies became involved in these nonadvertising areas in an attempt to maintain control over their clients' promotional programs and budgets but struggled to offer any real value beyond their advertising expertise.

However, the advertising industry soon recognized that IMC was more than just a fad and adopted their own perspective on the concept. Terms such as *new advertising*, *orchestration*, and *seamless communication* were used in the industry to describe the concept of integration. A task force from the American Association of Advertising Agencies (the 4As) developed one of the first definitions of IMC:

A concept of marketing communications planning that recognizes the added value of a comprehensive plan that evaluates the strategic roles of a variety of communication disciplines—for example, general advertising, direct response, sales promotion, and public relations—and combines these disciplines to provide clarity, consistency, and maximum communication impact. (Schultz, 1993, p. 17)

The 4As' definition focuses on the process of using all forms of promotion to achieve maximum communication impact. However, some advocates of the IMC concept (e.g., Schultz, 2004) argued for an even broader perspective that considers all *sources of brand or company contact* that a customer or prospect has with a product or service. Their perspective was that IMC calls for a “big-picture” approach to planning marketing and promotion programs in addition to coordinating the various communication functions. It requires that firms develop a total marketing communications strategy that recognizes how all of a firm's marketing activities, not just promotion, communicate with its customers.

Consumers' perceptions of a company and its various brands are a synthesis of the totality of the messages they receive and the contacts they have (e.g., media advertisements, direct-marketing efforts, publicity, sales promotions, and messages on the Internet and also price, package design, point-of-purchase displays, and even the type of store where a product or service is sold). In this perspective, IMC seeks to have *all* of a company's marketing and promotional activities in order to project a consistent, unified image to the marketplace. For example, a high price may symbolize quality to customers, as may the shape or design of a product, its packaging, the brand name, or the image of the stores in which it is sold. Luxury brands of perfume use a distinctive package and brand name as well as a high price to connote quality and an upscale image, and this is reinforced by the advertising. Typically, these brands employ a selective or exclusive distribution network to add to the overall image.

Many companies and agencies have adopted this broader perspective of IMC. They see it as a way to coordinate and manage their marketing communications programs in order to ensure that their customers receive a consistent message about the company and its brands. For these companies, the IMC approach represents an improvement over the traditional method of treating the various communication elements as essentially separate activities. However, as marketers become more sophisticated in their

understanding of IMC, they recognize that it offers more than just ideas for coordinating all the elements of the marketing and promotional programs. The IMC approach also helps companies manage their marketing and promotional efforts better by identifying the most appropriate and effective methods by which to contact customers, as well as other relevant stakeholders (e.g., employees, suppliers, investors, media, and the general public).

Reasons for the Growing Importance of IMC

The move toward IMC has been called one of the most significant marketing developments of the 1990s and continues to gain champions in the marketplace, for a number of reasons. One fundamental reason is that marketers recognize the value of strategically integrating the various communication functions rather than having them operate autonomously. By coordinating their marketing communication efforts, companies can avoid duplication, take advantage of synergy among various communication tools, and develop more efficient and effective marketing communications programs. Advocates of IMC argue that it is one of the easiest ways a company can maximize the return on its investment in marketing and promotion. Whether marketers adopt the broader perspective of IMC as presented here or concentrate these efforts in the communication area, the rate of adoption of IMC continues to grow.

The move to IMC also reflects an adaptation by marketers to a changing environment, particularly with respect to consumers, technology, and the media. Major changes have occurred among consumers with respect to demographics, lifestyles, media habits, and buying and shopping patterns. These changes have coincided with the development of new technologies and formats for reaching consumers. For example, over the past few decades, the expansion of cable television and, more recently, digital satellite systems has vastly increased the number of channels available to subscribers. Some of these channels offer 24-hour direct-shopping networks, while many others contain 30- or 60-minute direct-response appeals, known as *infomercials*, that look more like TV shows than advertisements. The 1990s also saw the arrival of the Internet—specifically, the World Wide Web. Online services now provide information and entertainment as well as the opportunity to shop for—and buy—a vast array of products and services through a medium that previously did not exist. Marketers responded by developing Web sites that provided them with the opportunity to advertise their products and services in an interactive fashion as well as transact sales. It became necessary, not optional, for these marketers to look beyond the traditional media options of the past.

In addition to the previously mentioned changes in the communication environment, a number of other factors have also contributed to the rapid growth of IMC.

A shift in marketplace power from manufacturers to retailers. Large retailers such as Wal-Mart are using their clout to demand larger promotional fees and allowances, which siphons off monies from advertising and increases the focus on short-term promotions.

The growth of database marketing. Marketers are increasing the development of databases. These databases are then used to target specific consumers through telemarketing, direct mail, and other forms of direct-response advertising. Companies develop customer relationship management (CRM) programs to reward their most loyal customers through sales promotions, discounts, and other tools, all of which increase costs. Airline loyalty programs are but one example of promotional programs that have become very expensive to operate.

Demand for greater accountability. An increased demand for accountability and a focus on return on investment (ROI) have led advertisers to consider a variety of tools that may enhance the cost-benefit relationship. It is no longer acceptable to say that one does not know how well the advertising program is working; too many other options for use of these dollars now exist. Companies have allocated more monies to sales promotions and direct-marketing programs and have increased their expenditures on the Internet in an attempt to determine how their communications are working.

The rapid growth of the Internet. While the Internet is just one of the numerous new media to become available to marketers, perhaps no other medium since television has had such a dramatic impact on the media landscape. The Internet continues to evolve, in some ways becoming more and more like television. Combine this with the advent of interactive TV, wireless Internet, podcasts, and other new media and marketers have had to rethink their traditional media strategies.

Technological advances. The ability to fast forward or skip TV commercials entirely when using digital video recorders and TiVo has led to a decline in viewing audiences watching commercials. Advertisers have reallocated some of these monies to advertising on the Internet as well as to product placements and integrations.

Changing media habits. Simply put, young people don't read newspapers or general-news magazines as much as their parents did. Newspapers have seen dramatic declines in readership and, as a result, advertising revenues. Many of those in younger audiences indicate that they now go to the Internet to keep current on news events. While general-news magazines (e.g., *Time Magazine* and *Newsweek*) have seen circulation declines, special-interest magazines have been experiencing the opposite trend.

In addition to these factors, there has been a dramatic shift in the media landscape. This shift has contributed even more to the necessity of an IMC approach to marketing communications.

The Changing Media Landscape

In the 1960s, Chevrolet spent almost its entire U.S. television media budget on one program—the *Dinah Shore Show*. At that time, prime-time viewers had only three network channels to choose from, and an advertiser could reach 80% of U.S. households on any given evening by running commercials on CBS, NBC, and ABC programs (Belch & Belch, 2009). Newspapers were a primary source of information, and cable TV and the Internet were decades away from development.

Currently, there are more than 400 cable TV channels in the United States, network TV audiences have declined at the rate of approximately 2% per year over the past decade, and cable TV now commands a larger audience than the networks. The Internet has experienced unprecedented growth, and advertising can now be seen on one's cell phone, in bathrooms, and in almost every conceivable (or inconceivable) location. Product placements and integrations have increased significantly. Erwin Ephron—a media consultant (www.ephronmedia.com)—estimates that in the 1980s, a media planner had nearly 1,250 scheduling options on television alone. In the 1990s, with 100 broadcast and cable channels to choose from, the number of options rose to 1.25 quadrillion. With more than 400 channels at present, the number of options is incalculable.

With the proliferation of new media—the Internet and interactive TV, wireless, podcasts, video on demand, blogs, and more—traditional media such as public relations, sponsorships, event marketing, and product placements have taken on a new perspective. Advertising is no longer king, as some of the largest TV advertisers (General Motors, Procter & Gamble, and American Express, among others) are shifting more and more dollars to the “new” media. As traditional media revenues decline, new media revenues are climbing at an unprecedented rate.

Evidence of this trend is abundant. In the 1990s, Procter & Gamble spent 90% of its advertising budget on television. Now, for some new products, less than 25% may be allocated to TV, with the balance going to sales promotions, new media, direct marketing, and related activities. McDonald's, which once spent nearly two-thirds of its communications budget on television, now spends less than one-third there. Ford, which spent less than 2% of its budget in nontraditional media in 2001, now spends more than 20% there (see www.stateofthenewsmedia.org/2006/narrative_online_economics.asp?cat=4&media=4). These are just a few of many examples of the shift.

Communication programs now require the use of a variety of media to reach the markets, as well as the integration of

these media to put forth a unified and consistent message. It is now obvious to marketers that it is no longer “business as usual” and that IMC addresses the issues involved in managing this changing media environment. At the same time, IMC provides a framework for establishing *communication objectives* to be used to guide the communication program and assess its effects.

As with the myriad changes in the overall marketing environment, there have also been numerous changes in the media landscape. Prior to discussing the factors leading to this transformation, it is necessary to establish a common ground. For the purposes of this chapter, we group media into three categories:

1. *Traditional media*: When one thinks about the media that have seemingly been around forever, what most likely comes to mind are television, radio, newspapers, magazines, and outdoor. While all these media forms have changed over the years (with, e.g., the advent of satellite radio, new forms of outdoor advertising, and online newspapers), for the most part, the basic structure has remained consistent. TV commercials may now be 20 seconds instead of 60 seconds, but there has not been a dramatic shift in the medium. The same holds true for the others as well.

2. *Traditional but different*: Media that have also been around for quite some time but have experienced significant changes over the past few decades include public relations, product placements, sponsorships, and direct marketing. For example, public relations, which (as previously noted) has traditionally been an independent component of organizations’ communication programs, has now become more integrated with marketing-oriented communication elements. The degree to which this integration has taken place varies from one end of the continuum—where the public relations function is still primarily independent but not completely detached—to the other end—where it has become essentially a marketing function. At this end, public relations has specific *marketing public relations objectives*. Likewise, product placements and sponsorships are nothing new but have changed in their scope and frequency: Remember when college football games were called the Orange Bowl, Sugar Bowl, and Rose Bowl? Direct mail and catalogs have evolved into direct-response TV commercials, infomercials, and home shopping channels as well as online retail shopping.

3. *New media*: While the list of new media seems to grow faster than one can keep up with, what we refer to here are the never-before-seen tools such as wireless, podcasting, blogs, search ads, product integrations, video on demand, and behavioral targeting.

While these media forms have all evolved in one way or another, the results are the same—marketers now have many more options from which to choose. When considering these

new options, the goal of creating the most effective and efficient media strategy takes on a whole new meaning. The marketer of today is assigned the task of using these tools to achieve media optimization and communication effectiveness. He or she must understand the characteristics of these media and how they affect the receiver—individually and in the gestalt. Planners must also understand that as the environment continues to change along with these media changes, the requirements necessary to achieve this understanding and manage the media process will increase dramatically.

Requirements for an Effective IMC Program

To establish an effective IMC program, it is necessary to understand the communication process, how changes in any of its components will affect this process, and the factors creating such changes. As discussed, the media landscape has changed, resulting in a much greater variety of options for message delivery. Determining how and when these media are most likely to be effective requires an understanding of how the receivers will use and respond to them. As the market changes, IMC strategies must evolve as well. The media landscape did not change in and of itself but rather as a result of changes in the technologies, market conditions, consumer behaviors, and so on.

While the consumers of the 1960s might have been characterized as a traditional family with one working adult, with few media options, and easy to reach through the TV, the consumers of today have different characteristics.

Money rich and time poor: For many consumers, the concern is not about having enough money but having enough time to spend it. Dual working spouses, longer work days, and changes in lifestyles leave consumers less leisure time and more time management requirements. In turn, these factors give rise to different demands on and different use of the media. CNN and CNN Headline News found success by providing consumers with the news when they wanted it—not when it was convenient for the network. *USA TODAY* provides national and international news in a much briefer format that allows for quicker reading. The increase in the use of digital video recorders and video on demand also reflects this time-management orientation. The result is that the marketer must now provide the commercial message when the consumer wants it—not at the marketer’s own convenience.

Multitasking. Hockey night in Canada has given way to individual family members watching TV on their own sets. Not only are they watching on their own sets, they are likely to be doing something else—multitasking—at the same time. Numerous studies have shown that most consumers multitask and that the likelihood of doing so is highest among the younger demographics. Watching TV while reading a maga-

zine or newspaper, talking on the phone, or using the Internet has become a much more likely scenario than sitting on the couch intently focused on the TV and the commercials. Reading a magazine or newspaper while listening to an MP3 player is also commonplace. Each medium used while multi-tasking constitutes a touchpoint for a marketing communication. This requires that the messages sent through each of these media be consistent and mutually reinforcing.

Media prolific. As noted previously, the increased number of media options has provided marketers with a number of new ways to deliver their messages. Likewise, the typical consumer has multiple media options of his or her own: Most households have more than one television set, household Internet penetration continues to grow (as does access at work), iPod and MP3 sales continue to increase. And is there anyone who doesn't have a cell phone? Three decades ago, of the items on this list, only the television existed. Daily exposure to ad messages has risen from 1,500 per day at that time to more than 4,000 per day now. Consumers love their gadgets, and each has become a medium for marketers to exploit.

Lifestyle diverse. It started with the characterization of the *baby boomers*, then *Generations X* and *Y*, and the *new millennium*s. There is the *gray* demographic, teenagers, and *tweens*. Boomers are more brand conscious. Gen-X is more conservative. Research has shown that tweens are more responsive to product placements and that Gen-Y consumers are more social, event oriented, and likely to purchase through the Internet or at a kiosk, and so forth. Even Facebook and MySpace have become demographically and lifestyle focused. It seems that each lifestyle has its own corresponding media preference.

Technologically savvy. E-mailing is out. Texting is in. The cell phone is a camera, an MP3 player, and a means for accessing the Internet. You can also use it as a GPS system, as a barcode receipt for an airline ticket, and for depositing money in your parking meter. While you can now use your TiVo to skip commercials, soon you will be able to use it to stop the commercial you are watching and order the merchandise being advertised. There are billboards that can talk to you. While each of these technologies creates more communication opportunities for the advertiser, what is perhaps more interesting is that so many people know how to use them. More important, they *do* use them, and they are becoming the means by which consumers acquire product information and make purchases. Ford and Lexus (among many others) understand the fact that more than 75% of potential car buyers who visit their showrooms have researched their automobiles on the Internet prior to coming in to make a purchase. At some restaurants, the customer may order and *pay* through a cell phone—the same way he or she located the restaurant and reviewed it.

Disenchanted with traditional media. As network television viewing decreases (cable now has a larger audience), other media fill the void. The YouTube phenomenon is not the result of better content alone. Rather, viewers have become disenchanted with television for a variety of reasons. Their trust of traditional news media is at an all-time low; many people now get their news from online sources such as the *Drudge Report* and blogs. The number of commercials on both television and radio has led to less positive attitudes toward these media, lower ratings, and less involved audiences. Lower ratings mean smaller audiences, hence advertisers' search for other options.

The combination of these factors requires that marketers change their approach to marketing communications. To adopt a successful IMC approach, marketers will need to address the following issues.

No longer carry on "business as usual." The traditional approach to communicating with consumers and potential consumers is dead. Marketers will no longer be able to focus on a one-medium strategy (see our earlier reference to Chevrolet). In the 1990s, when the World Wide Web started to take off, some marketers believed that the Internet would be the only medium necessary to market one's products. They predicted the death of shopping malls and advertising on television. As the Net has evolved, it has proven to be a powerful element in an IMC strategy, but it is not a stand-alone medium. Recent reports show that approximately 38% of Internet sales began with a television commercial, and the majority of Google searches focus on brands. Communication plans must now involve a number of media, each designed to contribute in its own way.

Capture consumers' involvement. As the media markets fragment, marketers will be required to focus more attention on capturing consumers' attention and involvement. Doing so will require more innovative programming and content, more specific targeting, and new ways to gain involvement. Commercials will be designed to reflect program content and be adaptable to a variety of media (e.g., the Internet as well as TV).

Rethink communication strategies. The adoption of an IMC perspective necessitates a new way of thinking. Traditional means of conducting business must give way to adapting to the new communication environment. One of the most critical requirements is to recognize that consumers' exposures to the media and messages are now under their control—not that of the sender. Technological changes leading to the development of new media is just one of the factors that have enabled receivers to obtain information when *they* want it, not when the marketer sends it.

In addition, marketers must recognize and accept the dramatic shift in media usage that has occurred—particularly

among the younger demographic segments. To successfully adopt an IMC orientation, companies will need to take several steps.

Recognize that consumer perceptions of a company and its brands are a synthesis of all the messages they receive or contacts they have with the company. The message being communicated, the media in which these messages appear, interactions with the sales force, the Web site, and public relations and publicity all help shape the perceptions of the company, its products, and its brand image.

Identify all the sources of contact that a customer or prospect has with the company. These contacts can include media advertisements, Web sites, articles and stories in newspapers and magazines or on television and radio stations, word of mouth, sponsorships or events, and product placements, among others. The IMC process starts with the customers or prospects and then works back to determine the best ways to reach them.

Consider the strengths and weakness of various communication channels and of the marketing communication tools that form an effective IMC program. For example, mass-media advertising—such as television—works well for building overall awareness but is less effective for communicating detailed information. Publicity lends credibility to a communication but is not always under the marketer's control. The Internet, while excellent for providing information, is less effective than other media for achieving reach. As noted earlier in this chapter, television commercials are often the initial contact and impetus for seeking additional information on the Internet.

Create a consistent unified message to present to current and potential customers. All forms of marketing communication should focus on the same key selling points, theme, and positioning platform and strive to speak with “one look and one voice.”

Focus attention on achieving communication objectives that will ultimately lead to the attainment of marketing goals. After years of discussion and research, marketers are only slightly further along in determining the ROI of various media in sales, market share, or other market objectives than they were decades ago. The reason for this is that the dependent variable—sales or market share—is affected by other environmental and market conditions beyond just the communication program. It is time to recognize the specific objectives that communications are designed to accomplish and to understand how achievement of these objectives will lead to the attainment of marketing goals.

Develop new ways to evaluate the effectiveness of IMC programs. New metrics must be developed and used. These metrics must be validated and consistent to allow for proper

measurement. The outcomes should include traditional measures such as recall and recognition but must also incorporate new criteria such as increasing Web site traffic, or other media-specific measures. A focus on the overall, combined impact of the various media used is essential.

Reorganize the department or agency responsible for communication. In most companies and agencies today, communication silos continue to exist. Those responsible for advertising and media buying often compete rather than cooperate with those in public relations, promotions, or new media. Rather than working toward a unified goal, these departments wage turf battles in a competition for budgetary dollars, fail to ensure adequate internal communication, and fail to comprehend the specific roles each should assume to contribute to the overall effort. The education and training of specialists in integrating marketing communications and the integration or elimination of these silos will be critical to the success of the program.

Barriers to the Successful Adoption of an IMC Program

While the adoption of an IMC perspective makes sense, the fact remains that this may be easier said than done. Instituting a successful IMC program will necessitate overcoming many of the following challenges.

Lack of IMC trained personnel. While the integrated approach has been adopted by more and more companies and agencies as well as in academia, the number of persons with the broad perspective and skills needed to make IMC work effectively is still very limited. As noted above, even in those organizations that undertake an integrated approach, silos continue to exist. While a growing number of the larger corporations are creating positions such as manager of IMC or vice president for IMC, at this point in time they are in the minority. Furthermore, many of these executives are not really trained in IMC but rather may have expertise in only one or a few of the communication areas. A search for university programs in IMC indicates that there are only a handful of such programs in existence. Thus, the pool of individuals that are academically trained or that have actually practiced integration is very limited.

Turf battles. As noted previously, communication silos are still prevalent in companies and agencies. The adoption of an IMC orientation will lead to changes beyond mere job requirements. As monies are moved from one communication area to another—for example, to new media at the expense of broadcast media, budget increases and decreases will create more opportunities for some and losses for others. The battle for turf can also be a battle for existence as roles and positions are created or eliminated. At the same time, it is a battle of egos in both agencies and

corporations as various roles increase and decrease in perceived importance.

Determination of leadership. A question arises: Who will assume leadership of the IMC program? Will the responsibilities lie with the agency or the firm? Will it be a top management position or the equivalent of a brand manager role? Some agencies and corporations currently employ committees for making such decisions, though this would not seem to be the optimal approach.

Agency compensation. In many existing situations, compensation for traditional and nontraditional media purchases is not equivalent. In the past, agency fees were often determined on a commission basis as a percentage of the media budget for print and broadcast media, with a different payment method employed for collateral services. If larger agencies do not have the capabilities for or expertise in, for example, new media or if additional agencies must be employed for this purpose, how will compensation take place? Will all be paid at the same rate—a break from tradition? Furthermore, reviewing the issues of leadership and turf wars, how will compensation systems differ if integration is not the responsibility of one agency only? Will the lead agency in charge of integration be compensated additionally for this responsibility?

Measurement. As noted throughout this chapter, metrics and communication effectiveness measurement have always been a controversial area. This issue became even more complicated when the Internet arrived: The online community employed different means and metrics for determining media costs as well as effectiveness. Now we are experiencing product placements and integration, wireless, and other media that have no established metrics or measures of effectiveness in place. Comparing media efficiencies as well as effectiveness now becomes even more a matter of apples and oranges—not to mention a few other fruits thrown in! A second issue in this regard is that of determining the effectiveness of the IMC program. As noted previously, while research is ongoing, the ability to measure the individual and combined contributions of media in an IMC program has not been established. Thus, some managers may be reluctant to invest in a strategy that (they believe) has no proven success (though the same can be—and has been—said about advertising in general).

The Future of IMC

Because it has become well established throughout business and industry, there is no longer a need to debate the merits of IMC. Prior arguments concerning whether IMC is a marketing fad or a viable management strategy have given way to its acceptance as a required means of developing effective communication programs. As consumers' needs and media habits

continue to change, media continue to proliferate and evolve, and clients continue to demand accountability, the need for an integrated approach will increase accordingly. The degree to which IMC advances, however, will depend on the degree of acceptance by those involved in communications. This acceptance will be predicated on changes in internal and external management thinking, the development of new metrics for assessing the effectiveness of communication, and continual adaptation to changing marketing conditions.

Indubitably, IMC is here to stay. There is also no doubt that those who adopt this approach will achieve a competitive advantage over those pursuing a more traditional approach. It is now time to prepare future employees for these tasks.

SOCIAL MARKETING CAMPAIGNS

TIMOTHY EDGAR AND MEGAN J. PALAMÉ

Emerson College

Social marketing is a perspective that is frequently used by people within the communication discipline to guide them on how to influence behavior. Social marketing can be traced to the writings of the sociologist G. D. Weibe, who in the 1950s asked the question “Why can’t you sell brotherhood like you sell soap?” (Weibe, 1951–1952, p. 679). Weibe was trying to make the point that marketing professionals over the years had developed very successful techniques for how to market to large-scale audiences in order to sell soap, cars, and other tangible goods. Weibe wondered why similar techniques could not be used to sell people an idea or a cause. In the 1960s and 1970s, other scholars began to follow his lead and began to develop the principles of what became known as social marketing.

To better help you understand what social marketing is, this chapter will be divided into two parts. The first part will provide an overview of the basic concepts and principles, and the second part of the chapter will offer two case studies of actual social marketing campaigns that will illustrate the concepts. The first case study tells the story of the VERB campaign that was aimed at 9- to 13-year-olds to increase their physical activity; the second case, which focused on environmental concerns, provides a unique example of how social marketing sought to help restore a threatened ecosystem in the Chesapeake Bay through an innovative campaign called “Save the Crabs, Then Eat ‘Em.”

What Is Social Marketing?

Answering the question of “What exactly is social marketing?” has proved to be a challenge historically. It is not its own academic discipline; it is not a science; and it is not a

formal theory or model. Perhaps it is best described as a tool or framework for behavior change. In an attempt to distinguish social marketing from other types of initiatives, the noted social marketing expert Alan Andreasen (2002) offered six defining criteria:

1. Behavior change is the benchmark used to design and evaluate interventions.
2. Projects consistently grounded strategy in audience research.
3. There is careful segmentation of the target audiences to ensure maximum efficiency and effectiveness in the use of scarce resources.
4. The central element of any influence strategy is creating attractive motivational exchanges with target audiences.
5. The strategy attempts to use all four Ps of the traditional marketing mix—product, price, place, and promotion.
6. Careful attention is paid to the competition faced by the desired behavior.

In the paragraphs that follow, we offer a portrait of the basic principles of social marketing by using Andreasen’s six criteria as the organizing framework.

Behavior Change

As stated in the first of the six criteria, social marketing ultimately is about behavior change. That may sound like a simple idea, but it can be quite complicated. In many instances, people do not want to change their behavior because they see no reason to do anything that is different, and their current pattern feels comfortable. The other reason

is that it is difficult for social marketers to agree on the exact behavior they want people to change. Too often, campaign planners become sidetracked when they fail to make careful choices about their precise focus, and in the end, they confuse themselves and their target audiences. For example, suppose that you wanted to create an initiative in which your ultimate goal is to significantly reduce the rate of unplanned pregnancies among high school girls. To achieve your goal, the key behavior that you might ask the young women to engage in is to always insist that their boyfriends use a condom whenever they have sexual intercourse. Or the behavior that you might ask them to adopt is to make an appointment with their family physician to get a prescription for the oral contraceptive pill. Or yet a third behavior you might choose would be to have them abstain from sexual intercourse altogether. All three behaviors are directly tied to the goal, but each is a unique behavior in which an individual can engage without necessarily performing the others. When a behavior or set of behaviors becomes too complicated, there is a high risk that an audience will ignore the initiative completely and retreat to past behaviors that are comfortable, familiar, and simple to process.

Audience Research

A second important feature of social marketing is that those who design and implement an initiative must thoroughly understand the members of the target audience whose behavior they are attempting to change. All this might sound obvious on the surface, but there are many examples of failed campaigns where designers were well intentioned but chose a strategy that was expert driven rather than audience driven. Those who take an expert-driven approach assume that the message they wish to convey will be received and acted on by target audiences simply because the experts believe that it is in the best interest of the audience to listen, attend, and behave accordingly. The social marketing perspective emphasizes that without using audience research to gain a deeper understanding of the lives of audience members and how people view a particular issue, there is little chance of persuading people to change their behavior.

Good social marketers typically begin with what is known as formative research, which allows them to gain insight into the mindsets and actions of potential audience members. Two of the most common ways of gathering data about an audience are surveys and focus groups. Surveys allow social marketers to ask audience members very specific questions over the telephone, through paper-and-pencil instruments, or through an online questionnaire. In focus groups, social marketers can bring together members of the target audience in groups of about 8 to 10 people to have an in-depth conversation about how a particular problem affects their lives. In addition to surveys and focus groups, social marketers might also use other data-gathering techniques, such as immersion hikes (day trips with

members of the target audience that permit relaxed, open discussions), ethnography (observing target audiences in their everyday environments), and person-on-the-street-interviews (interviewing unscreened respondents in locations where the behavior takes place) (Smith, 2006).

Once social marketers have gained insights into their target audience through formative research, they then typically engage in a process of pretesting message concepts and final executions of the messages to make sure that they resonate with the audience. The planning team might come up with what to them seems like a good idea based on their original audience research only to find out once they test it with actual audience members that it is not a good fit. Once implementation is under way, they should also engage in what is known as process evaluation to make sure that the audience is exposed to the message as intended. Social marketers also heavily emphasize outcome evaluation, which allows them to determine whether or not the strategy worked. That is, did members of the target audience actually change their behavior? If there is no evidence for behavior change, then the initiative cannot be considered successful.

Segmentation of Audiences

According to the social marketing approach, one of the most common reasons why behavior change initiatives fail is that planners target broad populations and assume that they can implement a message strategy with a “one-size-fits-all” approach. That is, an assumption is made that everyone within a population will respond to the same message in the same way. Although it is possible for that to happen, it rarely does. Social marketers pay special attention to what is known as *audience segmentation*, which refers to the process of dividing a population into distinct segments based on characteristics that influence their responsiveness to interventions (Forthofer & Bryant, 2000). For example, suppose that you wanted to develop an intervention to persuade women in the 40-to-65 age range to get a regular mammogram for the prevention of breast cancer. Audience research might tell the social marketers that women in their 40s who are still raising children will respond to a message that is very different from one that will appeal to women who no longer have children at home and are close to retirement. If that is the case, then it is crucial to carefully segment the audience in such a way that the end goal remains the same for both groups of women but they receive a different type of message to motivate them.

Exchange

One of the most important principles that guides social marketers is the idea that people will only change their behavior when they feel that they are getting something fair and attractive in exchange. In other words, people only change when they clearly see that there is something in it

for them. The basis for this principle comes from exchange theory, which is derived from psychological and economic principles and “assumes that we are need-directed beings with a natural inclination to try and improve our lot” (Hastings & Saren, 2003, p. 309). Social marketers see exchange theory as a key principle that differentiates their approach from other strategies for behavior change, such as education, which assumes that knowledge in and of itself leads to change, and an approach based on regulation, which emphasizes law enforcement as the most effective way to change the behavior of people (Smith, 2006).

The challenge for social marketers is to be able to frame the behavior in the minds of the audience so that they clearly see a benefit for themselves. The challenge becomes even greater if the benefit is not perceived by the audience as immediate. If social marketers try to present a payoff to an audience that is perceived as too far in the future, then they are not likely to respond in a positive way. A great example of this challenge comes from initiatives to try to convince teenagers to quit smoking or to not even begin. An obvious benefit is that people who do not smoke greatly reduce their risk of dying of lung cancer. However, enjoying the benefit of an additional 10 years of life is not something that someone can easily relate to when one is only 16 years old. Instead, social marketers have to present to teenagers an exchange that presents a benefit in the here and now. For instance, a more attractive exchange for 16-year-olds might be to quit smoking so that they do not have the constant unpleasant smell of tobacco and, thus, are more desirable as dating partners for the opposite sex.

Marketing Mix

The identifying characteristic with which many people associate the social marketing approach is what is commonly known as The Four Ps. This component, which is borrowed from principles of commercial marketing, includes promotion, product, price, and place. According to social marketing purists, an initiative cannot truly be referred to as social marketing unless all four Ps are part of the overall approach to behavior change.

The P that receives the most attention in any social marketing initiative is *promotion*. People who study communication often are most attracted to this element of the marketing mix because it most directly relates to the creation of the message for a campaign. Promotion receives the most attention typically because the actual message becomes the face of an initiative, and it is the part people can most easily identify. Having a carefully crafted promotion certainly is essential to success, but rarely will promotion alone lead to behavior change. The communication options available to a social marketer are many and varied. One can, for instance, promote behavior change through advertising, public relations, education, counseling, community organizations, interpersonal networks, direct mail, signage, special events and displays, printed materials, and entertainment media (Grier & Bryant, 2005; Maibach, 2002; Smith, 2000).

More specific promotional tools include TV and radio public service announcements, small-group discussions with target audience members, prescription pads for use by health care professionals, refrigerator magnets, newspaper articles, coloring sheets for children, and satellite broadcasts. The most successful promotional strategies typically incorporate a variety of channels through which the message is communicated to the audience.

The second of the four Ps is *product*. Whereas commercial marketers typically are trying to sell tangible products such as paper towels or computers, the social marketer has the challenge of trying to “sell” an intangible product that takes the form of an idea, social cause, or, as we have discussed most frequently in this chapter, a change of behavior. In many ways, the job of the social marketer is a more difficult one, because members of the target audience cannot easily hold or touch a behavior in the same way that they can paper towels or computers. The challenge, then, is for the social marketer to make “these ‘intangibles’ tangible in a way that appeals to the target audience” (Lefebvre & Flora, 1988, p. 306). A tangible product also is more easily defined. If a commercial marketer asks a potential customer to buy Bounty paper towels instead of Brawny, consumers can easily find Bounty on the shelf in the supermarket once they know the name of the product and perhaps the brand logo. As we discussed in the section on behavioral focus, social marketers sometimes make the mistake of not carefully defining the behavior for the audience, and when that happens, target audience members often do not know what to do. For example, one of the greatest challenges in developing physical activity campaigns for adults is to carefully define the “product” so that there is no doubt in the mind of the target audience how to engage in the appropriate behavior. If, for instance, the message of the campaign tells people that they should engage in 20 minutes of physical activity 5 days a week, the initiative might not be successful because people are confused about whether physical activity refers to any physical movement or if they have to reach a minimum heart rate for the activity to count as part of the 20 minutes.

The third P is *price*. In commercial marketing, price usually refers to the monetary value placed on a product (Edgar, 2008). In social marketing, dollars also factor into the price someone pays to change behavior, but price refers primarily to the totality of barriers that an individual must overcome to engage in the proposed action (Smith, 2000). That is, to engage in the proposed behavior, people typically are going to have to give up something they do not want to relinquish. Nonmonetary barriers can be social, behavioral, psychological, temporal, structural, geographic, and physical (Lefebvre & Flora, 1988). As we discussed when we talked about the idea of an exchange with social marketing, people are not willing to give something up unless they believe that there is a comparable payoff that will make the price that they have to pay worth it. Many people are willing to go into a restaurant and pay \$50 a person for a meal because they are convinced that the pleasure associated

with a fine meal and the ambience of a nice dining establishment is part of a fair trade for that amount of money. The customers give the restaurant \$50 per person (plus tip, of course), and the restaurant provides them with a memorable evening. If social marketers ask members of a target audience to reduce their body weight, then people have to decide whether the advantages of not being overweight are worth the price they will have to pay to reach that goal, such as bypassing the enticing tastes of favorite foods, taking time throughout the week from one's busy schedule to engage in an exercise program, and/or feeling embarrassed in front of family and friends at social occasions when they have to forgo desserts. The burden is on the social marketer to present the choice in such a way that audience members will view the price as a reasonable one.

Place is the final P and refers to “the process by which the product is made available to members of the target market at the time and place when it will be of most value to them” (Maibach, 2002, p. 11). For social marketers to take advantage of the most ideal places, they have to identify what Grier and Bryant (2005) called “path points,” which are locations people regularly visit; times of the day, week, or year of their visits; and points in the life cycle where people are likely to act. The ultimate goal of the place strategy is convenience. That is, the social marketer wants to communicate to the target audience about the product at a time and place where it is easy for them to process the information, and the social marketer must find convenient ways for people to actually engage in the desired behavior. The importance of the place strategy illustrates why social marketers cannot concentrate on promotion alone. To be successful, social marketers might also have to take steps to make changes to the everyday environment of the target audience or, at the very least, get audience members to view their environment in a different way. For example, for an initiative aimed at getting adults to walk more, part of the overall social marketing strategy might be to increase the number of walking paths within a community so that the target audience members have more places where they can actually engage in the behavior. Or if the social marketing team is not able to create new walking paths, then part of their place strategy might be to redefine existing places that people had never before considered as potential sites for walking, such as a local shopping mall. A place strategy also includes consideration of the role of intermediaries, who are people and/or organizations that provide goods, services, and information and perform other functions that help facilitate behavior change (Grier & Bryant, 2005). For the shopping mall example, social marketers might enlist the cooperation of the owners of the mall to get them to agree to open the property earlier in the morning so that people can use the mall as a safe place for walking before any of the stores open. The mall owners might be persuaded that there is benefit in the arrangement for them because the morning walkers might be enticed to stay and shop once businesses open.

Competition

In the same way in which commercial marketers analyze their position within a competitive marketplace, social marketers must identify the behaviors that compete with the ones they want their target audience to adopt. For example, if a social marketer creates a campaign to help save the environment by asking consumers to drive their cars less and burn less gasoline, then they must carefully analyze how a reduction in car use competes with the need to get to work and complete everyday errands. Part of the overall strategy for a social marketer is to provide a way for the target audience either to eliminate the competition completely, which in many cases is not possible, or to get the audience to think about the competition in a different way so that the conflict is less glaring. In the gasoline reduction example, for instance, social marketers might try to get their audience to think about the commute to work and the completion of errands as merged rather than separate behaviors. In other words, they might encourage the audience to plan activities such as grocery shopping and picking up the dry cleaning on the way to and from work rather than doing the errands at different times of the day.

Case Studies

VERB

The number of obese children in the United States continues to rise, creating a population at risk for lifelong health problems. The percentage of overweight children has even doubled in the past 20 years, bringing a needed effort to offset this trend. Reports indicate that childhood obesity in America stems from unhealthy eating and the lack of physical activity in children's lives.

What Was the Behavior Social Marketers Wanted to Change?

To combat this epidemic, the Centers for Disease Control and Prevention (CDC) was awarded \$125 million in 2001 to create a social marketing campaign targeted toward *tweens*, a term used to refer to children aged 9 to 13 years, to increase their participation in physical activity. VERB was launched in 2002 to do just that. The campaign focused solely on increasing the physical activity of tweens. Because campaign planners neither specified the exact type of physical activity in which tweens should engage nor the amount or frequency with which tweens should be physically active, some social marketing purists might have a problem with the way in which the planners of the campaign approached the definition of the behavior. However, as you will see when we talk more about the product within the marketing mix, the campaign planners were intentionally vague to more fully engage the tweens.

*What Was Learned
From Audience Research?*

The CDC knew that they wanted to target tweens, but to apply the principles of social marketing appropriately, they knew that they had to understand the tweens themselves as well as the important people in their lives. The campaign planners decided that because tweens are still dependent on their families, the campaign had to target their mothers as well (ages 29–46). It was also important to reach community members who influence adolescents, such as teachers and youth program leaders. To get this information about the audiences' needs and wants, the CDC conducted multiple focus groups with tweens and mothers. One of the most important lessons learned from the research was that most tweens wanted to be in control of choosing the activities in which they engaged rather than having the decision made by their parents.

How Was the Audience Segmented?

Because the campaign planners suspected that the issues surrounding physical activity might be different for various ethnic groups, separate focus groups were conducted for tweens of European white descent, African Americans, Hispanic/Latino, American Indian, and Asian Americans. The research revealed that, in fact, there were unique beliefs surrounding physical activity and unique barriers for each group that prevented the tweens from engaging in physical activity. Based on those results, the campaign planners developed unique variations of the VERB message for each of the major ethnic groups.

What Was the Exchange?

The planning team realized from the start that the exchange that they were offering tweens and their parents would not be an easy one to sell. For tweens to engage in more physical activity, they had to reduce the time spent doing some of the activities they currently enjoyed, such as playing video games and watching TV. With regard to the parents, increased physical activity on the part of their children had the potential to mean dollars spent. To counterbalance the loss that tweens and their parents might experience, the campaign planners positioned physical activity as something that would allow them to have fun, spend time with friends and family, and gain the admiration of their peers and community.

How Was the Marketing Mix Developed?

The *product* in social marketing is typically a precise behavior that the audience should engage in, cease, or maintain. VERB's product was physical activity, but as we discussed earlier, the campaign planners did not precisely define the type of physical activity in which the tweens should engage or say how long they should do it. They did

this intentionally. They knew that just like with any product on the market, physical activity had to be perceived as the winning item over other activities in tweens' lives. The type of physical activity tweens wanted to do was up to them, giving them a sense of choice and exploration. That is, the tweens were actively involved in defining the specifics of the product.

The *price* of physical activity potentially is financial, psychological, environmental, and/or time related. The benefits of the behavior had to outweigh the costs and barriers for tweens, their parents, and the community. Research gave insight as how to market the benefits, so that tweens and parents would be more likely to prioritize physical activity within their own "budget." Marketing materials had to convince tweens and their parents that physical activity makes tweens happier, healthier, and even "cooler" than those who did not participate. In other words, VERB had to anticipate that tweens would make excuses for not "feeling good enough" when they play, by counteracting it with a message that it is much "cooler" to participate than to play video games or watch TV all day. Another barrier was the cost of buying equipment or enrolling in sports teams. If financial cost was a barrier, tweens and parents had the opportunity to go to the campaign's Web site to learn about fun and safe ideas that were free or very low in cost.

One has to have a *place* to engage in physical activity, such as a park, school, backyard, or recreation department. VERB planners had to make sure that places for engaging in activities existed and that choices would be available year round. To make this happen, the campaign planners could not act alone. An important part of the place strategy was to develop partnerships within communities so that the demand could be met. For example, in communities where there were limited outdoor venues for physical activity, the campaign partnered with community centers to make sure that kids had a safe environment in which to play. Part of the place strategy also meant strategically marketing the message of VERB in locations where tweens would be exposed to the messages in their everyday lives, such as school; the campaign planners also bought TV advertising time on their favorite shows.

The *promotion* strategy was a very complex one, because the campaign planners used a large variety of channels and types of message executions to reach the tweens and their parents. Many social marketing campaigns are at a disadvantage because they lack sufficient financial resources, but the VERB campaign was fortunate to have a multimillion dollar budget. The CDC carefully strategized to make the VERB brand a part of tweens' lifestyle by intertwining a positive image of VERB and the product. To make the idea of VERB "cool" and relatable, the campaign planners used fun and colorful visuals. The tagline at the forefront of the campaign was "VERB—It's what you do," which gave tweens the sense of making their own decision rather than having their parents in control.

Here are only a few examples of how VERB was communicated nationally and locally:

- *Paid television advertisements:* Rather than using free public service advertising, over which the CDC would have limited control on when or how often the ads would be aired, the campaign planners spent a large portion of their budget on a sophisticated paid advertising initiative by buying time on cable networks that tweens regularly watch, such as Nickelodeon.
- *Print ads:* Print ads were placed in magazines that tweens read as well as in those their parents read.
- *Other media opportunities:* Celebrities and characters from tweens' favorite television shows, such as *Gilmore Girls* and *Kim Possible*, starred in VERB commercials. CBS produced a VERB public service announcement directed toward parents that featured the sports legend Deion Sanders.
- *Web sites:* The campaign Web site (www.VERBnow.com) was a key element of the promotion strategy. A "game generator" gave tweens the opportunity to create their own physical activities. Tweens could even write on a blog and talk about their favorite activities.
- *Schools:* Book covers, planners, and lesson plans were given to schools to integrate into their classrooms to start the conversation about physical activity.
- *Community-based events:* VERB joined cultural events such as pow wows to engage Native American tweens. Street teams distributed T-shirts, Frisbees, and temporary tattoos for tweens while creating a buzz about VERB.

What Was the Competition?

All these elements combined created hype about VERB and physical activity for tweens. This hype, or energy, in the campaign had to transcend beyond the competition that challenges tweens to refrain from engaging in physical activity. The planners knew that tweens wanted to play video games, preferred to do nothing at all, or had family obligations. Video games or television shows could not be eliminated as an option, but the campaign had to reprioritize so that physical activity was on the list of things to do for tweens. Parents also had to see the benefit of spending money or taking the time to help their tween engage in activity.

Outcome

A random sample of 3,120 tweens from across the country along with their parents was surveyed over the phone. The results showed that 74% of American tweens were aware of the VERB campaign within 1 year of the launch of the campaign. This exceeded the CDC's goal of reaching 50% of tweens. In the first year, the surveyed tweens also reported 34% more physical activity than tweens who were unaware of VERB.

Further Readings

For more details on VERB, read two journal articles written about the campaign by Wong and colleagues (2004) and Huhman and colleagues (2005). You can also see

examples of the promotional campaign at CDC's Web site, www.cdc.gov/YouthCampaign.

“Save the Crabs, Then Eat 'Em”

The second case study tells the story of a campaign with a very different topic from VERB, which like the majority of social marketing initiatives focused on personal health issues. This campaign instead focused on the environment and attempted to make the environment, which typically seems impersonal to most people, personal. The problem involved the Chesapeake Bay near Washington, D.C.

What Was the Behavior Social Marketers Wanted to Change?

The Bay has suffered from an overload of nutrient pollution, which threatens the quality of life and water in the bay. We usually think of the word *nutrients* in a positive way, but in the world of environmental health, they mean agricultural waste, waste from sewage treatment plants, and lawn fertilizers. Many people who lived in the area already knew that the Bay was severely damaged as an ecosystem, but most people either were not motivated to do anything about it or did not know how to contribute. Because lawn fertilizers make up 11% of the nutrients that load into the Bay, a reduction in lawn fertilizer usage had the potential to make a significant difference. In 2005, the Academy for Educational Development, funded by the Chesapeake Bay Program, identified the people who live in the greater Washington, D.C., area as their primary audience and aimed to change their behavior by convincing residents to fertilize their lawns only in the fall and to forgo lawn fertilization altogether during spring.

What Was Learned From Audience Research?

Before the campaign began, a random-digit telephone survey of 602 homeowners in the Bay area was conducted to learn about what people think. Results indicated that most people cared about the environment but did not engage in behaviors to bring about meaningful change. The research also showed that an attractive lawn was important to most residents. In addition, the team found that of the homeowners in the area, 84% did their own lawn work, while 16% used lawn services. Of those who did their own lawn work, most preferred to fertilize their lawns in spring. The latter finding introduced a major challenge for the campaign, because the goal was to stop spring fertilization completely.

How Was the Audience Segmented?

Although the campaign planners chose not to segment residents into subaudiences, the research indicated that they would have to incorporate the lawn services as an

audience as well. Partnerships had to be created with the service providers to promote environmentally sound practices that could last beyond the campaign.

What Was the Exchange?

The campaign planners decided that if they were going to ask people to give up fertilizing in the spring, then they had to offer something as an attractive exchange other than a good feeling about improving the environment. The team cleverly decided to position the exchange in a humorous manner by framing it within the context of food. Thus, the delightful taste of the Chesapeake Bay's blue crab became the bargaining chip for the campaign, which became known as "Save the Crabs, Then Eat 'Em." The blue crab is a culinary favorite of area residents, and the survival of the species in the Bay, whose population hit an all-time low in 2003, due in part to nutrient pollution, also is vital to the restaurant and fishing industries of the area. The goal of the campaign was to get people to accept the primary exchange of not fertilizing their lawns in spring in return for the benefits of a bountiful blue crab harvest.

How Was the Marketing Mix Developed?

The *product* in this campaign was not to fertilize lawns in the spring and to only do it in the fall. Lawn services that became partners with the campaign were asked to engage in using appropriate fertilizers approved by the Chesapeake Bay Program. Lawn services were given the opportunity to create a Bay-friendly lawn treatment that could be done in the spring.

For the *price* strategy, social marketers had to convince homeowners in the greater D.C. area that the benefits of fertilizing only in spring outweighed the barriers to adopting the new behavior pattern. The primary barrier was the strongly held belief that spring fertilization was a necessity for having a great lawn. In addition to offering the benefit of more crabs, the intervention team also attempted to counterbalance the "spring fertilization is good" belief by introducing information to the community that fall fertilization provides an advantage because there is less rain in the fall. Less rain means less runoff of fertilizer, which in turn means better root growth, which creates a stronger lawn. Because those who own and operate lawn services also were engaged as an audience (and they were concerned about losing revenue), the campaign planners had to offer them a fair "price" as well. The lawn services that became partners in the campaign by using these special treatments, received free advertising and recognition for being environmentally friendly.

The campaign reached the target audience in many different *places*, including their homes through television advertisements and on their way to work through posters placed on public transportation. Drink coasters were also used at participating restaurants, and restaurant staff were trained on how to answer questions about the coasters.

Unlike VERB, "Save the Crabs, Then Eat 'Em" was local and had a limited budget of only \$550,000 for a 1-year campaign. More than half of that money was spent on advertising, putting pressure on the planning team to make the *promotion* strategy as efficient and cost-effective as possible. The approach was to incorporate a humorous take on eating crabs. For example, one ad placed in *The Washington Post* stated, "Protect the Crabcake Population" and at the bottom provided a statement about fertilizing one's lawn in the fall along with a Web site link.

Many different elements were brought into the execution for the promotion of the campaign, including the following:

- *Television advertisements:* The campaign aired paid ads that were pretested by focus groups that liked and understood the connection between the blue crab and lawn care.
- *Print ads:* Major newspapers ran ads with a list of the names of lawn services that were part of the campaign. Flyers and drink coasters also were distributed at subway stops.
- *Web site:* Information on the Web site included facts about the Bay, lawn treatments, and even seafood recipes. In addition, "Chesapeake Club" lawn services were provided.
- *Promotional items:* Participating lawn care services were given window stickers and lawn signs that said, "No appetizers were harmed in the making of this lawn." By displaying these items, homeowners could show they were participating in a good thing.

What Was the Competition?

One of the primary sources of competition that concerned the campaign planners was the fatigue the public might experience as a result of being bombarded with so many messages about saving the environment. They had to rise above the competition by offering an innovative way to get the attention of residents. The blue crab angle was the approach they offered to cut through the message clutter.

Outcome

A random-digit dial telephone survey was conducted after the campaign, which included 599 homeowners who reported that their lawn had been treated with fertilizer at some point in the past year. They found that 72% of those surveyed recalled something about the campaign and there was a decrease in intent among residents to fertilize in spring.

For more details on "Save the Crabs, Then Eat 'Em," read the journal article written about the campaign by Landers, Mitchell, Smith, Lehman, and Conner (2006). You also can see examples of the promotional campaign

and recent articles about the campaign on the Web at www.chesapeakeclub.org.

Challenges and Future Directions

Social marketing has served as a very important tool for decades for individuals who want to change behavior to better the lives of others. By presenting the case studies on VERB and the Chesapeake Bay initiative, we only scratched the surface on the types of problems that social marketing can address. Social marketers have used the framework throughout the world to change the behavior of populations around issues as diverse as condom use, smoking, emergency preparedness, diabetes, food allergies, offering new food choices to children, mosquito netting, and hand-washing behavior.

In the years to come, the potential for social marketing to bring about continued change is enormous. For that to happen, however, the field of social marketing must take care to “market” itself so that its core tenets stand in clear contrast to other approaches to behavior change. One challenge that social marketing faces is that the term becomes so ubiquitous that it takes on a generic meaning that equates to all forms of campaigns and initiatives that use communication as the primary tool for creating messages about health and social causes. All social marketing, in fact, relies on communication as a key component in the promotion of an idea or behavior, but not all communication campaigns follow the principles of social marketing as we have articulated in this chapter (e.g., a focus on all four Ps, careful assessment of the competition, the needs of the audience as the driving force). The future utility of social marketing will depend in great part on the ability of the field to draw clear distinctions between itself and other change strategies.

To maximize its potential, social marketing must also keep up with the times. Adherence to core principles is key, but social marketers must be able to apply those principles within the context of a changing world. Continued devotion to innovation is crucial as the tastes, needs, and sophistication of audiences evolve. For example, R. Craig Lefebvre, who is one of this country’s leading experts on social marketing, has argued that social marketers will fail in their efforts if they do not adapt their approach to the role that new technologies and new communication forms such as cell phones, game boxes, wireless digital assistants, blogs, podcasts, and MP3 files play in our lives. He has stated that “these new technologies have implications for how we think about the behaviors, products, and services we market; the incentives and costs we focus on; the opportunities we present; and places where we interact with our audience and allow them to try new things” (Lefebvre, 2007, p. 32). The challenge for social marketers will be for their innovations in technique and strategy to keep pace with technological advancements.

INTERNATIONAL ADVERTISING

BARBARA MUELLER

San Diego State University

World trade in the 21st century is driven by global competition among global companies for global consumers. The 2007 *Fortune* magazine survey reports that the top 500 multinational companies alone generated almost \$21 trillion in revenues (*Fortune*, 2007, pp. 131–143). U.S. participation in world trade, measured as a portion of world market share, has declined dramatically. Today's global consumers drink Starbucks coffee and talk on Nokia cell phones, wear Adidas sneakers, watch Sony television sets, and drive their Toyotas to homes decorated with Ikea furnishings.

The growth and expansion of firms operating internationally have led to the growth of international advertising. At the end of World War II, the bulk of advertising activity was domestic, and 75% of recorded advertising expenditures worldwide were concentrated in the United States. Since then, the growth in advertising expenditure worldwide has been phenomenal. In 1950, estimated advertising expenditure totaled \$7.4 billion worldwide, including \$5.7 billion just in the United States. By the late 1970s, the advertising expenditure had swelled to nearly \$72 billion worldwide, including \$38 billion in the United States. In 2005, global ad expenditures hit a record \$570 billion (www.worldwatch.org/node/4346).

The United States continues to both produce and consume the bulk of the world's advertising. Multibillion-dollar, multiservice, transnational, mega-advertising organizations own the bulk of the advertising agencies around the world, and nearly half (12) of the top 25 such organizations have their headquarters in the United States, according to *Advertising Age* (<http://adage.com/datacenter/>

datapopup.php?article_id=116383). The largest of these is the American-based Omnicom Group, with 2006 worldwide revenues of more than \$11 billion. However, advertising's increasingly global presence is evidenced by the location of major advertising markets. In rank order, the top global advertising markets are the United States, Japan, the United Kingdom, Germany, France, China, Italy, Spain, Canada, Australia, Russia, and South Korea (www.adbrands.net/index.htm). Countries spending the most on advertising are primarily the rich industrialized nations. However, economic development is not the sole predictor of advertising expenditure. Interestingly, with rapidly maturing media markets and with advertising playing a growing role in their domestic markets, the fastest growing ad markets are in the Middle East, and Central and Eastern Europe (http://www.zenithoptimedia.cz/zenith_cz/press_reports/central_eastern_europe_adspend_growth_much_faster).

Procter & Gamble Co. heads the list of the top 100 global marketers, according to *Advertising Age* (2006, p. 2), which ranks advertisers by total worldwide media spending in 84 countries. Procter & Gamble Co.'s \$8.19 billion in media spending was almost double that of the runner-up, London-based Unilever, at \$4.27 billion. Overall, the top 100 spent \$98 billion on media advertising in 2005—with almost half of it, or \$47.46 billion, spent in the United States. Europe was the next biggest region (with \$30.17 billion), followed by Asia (\$15.57 billion). Just under half of the top 100 global marketers are U.S. companies. Thirty-two are based in Europe, 19 are Asian, but none are from Latin America.

The International Marketing and Advertising Environment

Firms engaging in international marketing must carefully analyze the primary environmental factors of each market they intend to enter. The marketer's task is to assess the demographic, economic, political-legal, and cultural environments in order to determine the potential of each market and also how variables in each of these environments might influence the design and implementation of marketing and promotional efforts.

The Demographic Environment

Just how the world's 6 billion or so potential consumers are distributed around the globe is of intense interest to international marketers. A country's population provides one basic indicator of market size. There is enormous variation in the population of countries around the globe. Indeed, well over half the people in the world live in only 10 countries, and China, the world's largest nation, has a population approximately ten thousand times the population of some of the smallest countries. Generally, the larger the population of a market, the greater its potential—all other things being equal. However, population figures alone are usually not a sufficient guide to market size. Population size is typically combined with many other factors, such as population growth rates and distribution patterns. Three important population distribution characteristics are density, age and age structure, and household size.

Another demographic variable of interest to international marketers is education. As one might expect, education is highly correlated with literacy. From an international marketer's standpoint, consumers must be able to read advertising messages and product labels. If large percentages of consumers are illiterate in certain markets, advertising programs and product packaging may need to be modified. Level of education is also of interest because it reflects the degree of consumer sophistication. Complex messages and products that require instructions may need to be adapted depending on the educational trends in a particular country.

The Economic Environment

The attractiveness of a market goes beyond sheer numbers of people—a nation's current and future attractiveness is also based on the willingness and ability of those people to spend. A clear understanding of a host country's economic environment—including type of economy, per capita income, and level of urbanization—is also essential in developing an appropriate marketing and communications strategy.

Historically, industrial economies have represented the greatest marketing opportunities for corporations, because consumers in these countries typically have the capacity to purchase the goods offered by international marketers. In addition, the communications, transportation, financial, and distribution networks necessary to conduct business are in place. However, such markets also tend to have stable, or even shrinking population bases, and as a result, the markets for many goods and services may already be saturated. Thus, marketers are increasingly turning to less developed nations, which tend to have expanding populations and therefore potentially greater growth opportunities.

Household income is a telling indicator of a country's purchasing power. In many developing countries, where the extended family is the norm, several family members may be wage earners, directly affecting the buying power of the family unit. And while the nuclear family is the norm in the United States, today that unit typically includes two wage earners. As a result, international marketers often pair household income with household size in analyzing a market's willingness and ability to spend.

The Political-Legal Environment

Both a country's political system and its local laws and regulations may have a direct impact on various aspects of the marketing program. In some countries, regulation may be quite limited, and the laws that reinforce such regulation quite lax, particularly in developing markets. In others, advertising regulation may be rather extensive and stringently enforced. The following categories of regulation can affect international advertising efforts.

Types of products that may be advertised. Most countries restrict the advertising of some types of products. The advertising of cigarettes, in particular, is restricted in some form in nearly every country in the world. Both Malaysia and China have banned cigarette-related advertising altogether, and the Korean government has imposed heavy restrictions on cigarette advertising, prohibiting all electronic and print advertising, consumer promotions, sampling, branded sponsorships, and signs outside shops or on shop windows. Many nations have also imposed stringent guidelines on the promotion of alcoholic beverages and pharmaceutical products.

The audiences that advertisers may address. The audiences marketers may address can vary from country to country. To date, the United States is one of the most lenient countries in the developed world when it comes to marketing to children. In contrast, in Sweden, the law forbids all television ads aimed at children under 12 years of age. In Norway, Austria, and the Flemish part of Belgium, no advertising is allowed around children's programs. Germany and Holland prohibit the sponsorship of children's

shows. Toy ads are banned on Greek television, and Italy, Poland, Denmark, and Latvia are studying plans for tighter regulations. Currently, there are no continent-wide rules regarding marketing to children; however, Sweden is pushing for its ban on children's advertising to be extended across Europe.

The content or creative approach that may be employed. Many countries have restrictions on the types of claims advertisers can make, the manner in which products can be presented, and the appeals that may be employed in advertisements. For example, in the United States, the Federal Trade Commission encourages advertisers to employ comparative claims, as they are seen as providing consumers with relevant product information. In Europe, comparative advertising is currently allowed in some countries but is illegal in others. The European Commission is working toward developing a uniform policy. The use of health and nutrition claims as well as price comparisons also varies significantly from country to country.

The media that advertisers are permitted to employ. Media availability is severely limited in many markets. In Saudi Arabia, direct mail is considered an invasion of privacy and is thus not used. And while the country has opened its national television system to commercial advertising, Saudi Arabia still does not permit advertising on its state-run radio system. How the media are used for advertising purposes also differs from market to market. American television viewers are accustomed to having their programming interrupted at regular intervals with commercial messages. Russian law prohibits the interruption of children's, religious, or educational programs by advertisers altogether. All other programs must not be interrupted more frequently than every 15 minutes (BBC Monitoring, 2001).

The use of advertising materials prepared outside the country. Government restrictions can also influence the use of foreign produced ads and foreign talent. With few exceptions, the Malaysian Ministry of Information requires that all footage for, and music in, television commercials be produced locally and use local talent. The government requires a "Made in Malaysia" (MIM) form to be submitted with the final checkprint (the finished, edited footage) (Frith, 1987). Peru bans foreign-inspired models and materials in advertisements appearing in that country in an effort to protect and enhance its national identity. Beyond nationalistic and cultural objectives, restrictions on foreign-prepared materials often are motivated by economic considerations—such as the desire to provide jobs for the local print production and film industry (Boddewyn & Mohr, 1987). There is also the fear that multinational ad agencies will hamper the development of the local advertising businesses.

The Cultural Environment

Each country exhibits cultural differences that influence the consumers' needs and wants, their methods of satisfying them, and the messages they are most likely to respond to. If they are to be successful in their efforts, marketers must become culturally sensitive—that is, tuned into the nuances of culture. Among the important elements of culture that marketers must take into consideration are verbal communication and the various forms of nonverbal communication.

Verbal Communication

Linguists claim that up to 5,000 different languages are spoken around the globe. Chinese tops the list as the most spoken language, but while the written language is uniform, there are literally hundreds of local dialects in China. Multilingual societies constitute the majority of the world's nations. For example, in India, more than 200 hundred languages and dialects are spoken. While language helps define a cultural group, the same language can be spoken in a number of different countries. English is spoken in the United States, England, much of Canada, Australia, and Ireland. Nonetheless, marketers must use caution when employing the same language in two or more markets. There are significant differences between American English and British English. Often, the same word or phrase may mean different things. Marketers must be particularly cautious with regard to errors in the translation of brand names, packaging copy, and advertising messages as these have cost businesses millions of dollars, not to mention damaging their credibility and reputation. Consider the following:

- When Kentucky Fried Chicken entered the Chinese market, to their horror they discovered that their slogan "Finger lickin' good" came out as "Eat your fingers off."
- Ford introduced the Pinto in Brazil. After watching sales go nowhere, the company learned that "Pinto" is Brazilian slang for "tiny male genitals." Ford pried the nameplates off all the cars and substituted them with "Corcel," which means horse.

Nonverbal Communication

We communicate not only through spoken language but also via nonverbal language. A number of classification systems of nonverbal language exist, but most include facial expressions, eye contact and gaze, body movement (such as hand gestures and posture), touching, smell, space usage, time symbolism, appearance or dress, color symbolism, and even silence. It is important to note that nonverbal methods of communication are no more universal than verbal methods. Nonverbal communication can pose serious problems for international marketers and advertisers. A thorough discussion of all the nonverbal aspects of

advertising is beyond the scope of this chapter. However, because of their importance to the international marketer, two areas will be addressed briefly: gestures, and colors, signs, and symbols.

Gestures. Thousands of cross-cultural examples prove that the meaning of gestures shift from culture to culture. Gestures refer to any movement of the fingers, hands, or arms. Gestures used in greetings vary as well. In the United States, the hand wave is a common form of greeting. Hence, in McDonald's restaurants across the country, life-size Ronald McDonald statues have their hands raised in a friendly wave. However, operators of McDonald's restaurants in Thailand were required to modify the figure to display the unique Thai greeting gesture, the "Wai," which consists of the palms of both hands being placed together and raised in front of the head as a sign of humility and respect. Thai operators had to custom manufacture the molded fiberglass and resin statue (*Advertising Age*, 2002).

Colors, signs, and symbols. Laurence Jacobs and colleagues (1991, p. 21) note, "Like language, marketers in a particular nation often take colour for granted, having experienced certain colour associations all their lives, and do not even question whether other associations may exist in different societies." International marketers need to know what associations a culture has in terms of colors and how they might affect product design, packaging, logos, and advertisements. For example, a number of years ago, a leading U.S. golf ball manufacturer targeted Japan as an important new market for its product. However, sales of the company's golf balls were well below average. As it turned out, the firm had offered its product in white packaging—a color associated with mourning in Japan. To make matters worse, it had packaged the balls in groups of four—the number signifying death in this country (Glover, 1994). Clearly, numbers also mean different things to different peoples. While Americans associate misfortune with the number 13, it has no particular meaning in most other cultures. The number 7 is considered bad luck in Kenya but good luck in the former Czechoslovakia, and it has magical connotations in Benin.

Culture and Values

To maximize the chances of success, marketers must examine cultural values. Several classification systems have been devised for assessing the dominant values of a culture. One, the Rokeach (1968) value survey, identifies 18 terminal and 18 instrumental values. Terminal values concern desired end states of existence that are socially and personally worth striving for. Instrumental values relate to modes of conduct and represent beliefs that are socially and personally preferable in all situations with respect to all objects. Value systems are identified by having individuals

complete a survey asking them to arrange all 36 values in order of their importance as guiding principles in their lives. This framework is effective in discriminating between people of culturally diverse backgrounds (Munson & McIntyre, 1978). For example, the instrumental value of "ambitious" means hardworking and aspiring. The degree to which consumers perceive themselves as hardworking may differ from one culture to the next, and this may have implications for promotional efforts. Numerous empirical studies have found that advertisements reflecting local cultural values are, in fact, more persuasive than those that ignore them (Gregory & Munch, 1997; Han & Shavitt, 1994; Taylor & Dale, 1997).

Coordinating and Controlling International Advertising

One of the first decisions a company must make when it decides to communicate with consumers in various markets is how to organize international promotional functions. A critical question relates to the locus of decision making: Will it be highly centralized at company headquarters, or will a more decentralized, collaborative, and participatory approach to marketing communications be adopted? It should be noted that there is a close relationship between the decision on centralization and the extent of advertising standardization ultimately employed. Tai and Wong (1998) propose that marketers have the following four basic options.

1. Global Approach (Centralized Decision Process, Standardized Advertising Approach)

Complete centralization of decision making related to international advertising implies a high level of head office control. Advertising agency selection, campaign planning, creative strategy and message development, media strategy and selection, budgeting, and sales promotion efforts all are conducted in the country in which the firm's headquarters is situated. One of the major advantages associated with centralization is that it affords the marketer complete control over all promotional efforts.

A centralized approach is significantly more likely to be employed if the marketing environments of the message sender and receiver(s) are highly similar and if there is minimal variation in both the media available for advertising and the regulation of advertising. Depending on the foreign market, the international marketer may not feel that local managers possess the management skills necessary to conduct effective research and to develop coherent advertising strategies. Subsidiaries may lack the financial resources necessary to produce advertising executions with high production values. The centralized approach is highly correlated with the use of standardized

advertising—employing virtually the same campaign in both domestic and foreign markets (Kirpalani, Laroche, & Darmon, 1988). Certain weaknesses are associated with highly centralized control as well. A firm employing such an organizational approach may find that it lacks (a) the ability to sense changes in market needs occurring away from home; (b) the resources to analyze data and develop strategic responses to competitive challenges emerging in foreign markets; or (c) the managerial initiative, motivation, and capability in its overseas operations to respond imaginatively to diverse and fast-changing environments (Bartlett & Ghoshal, 1986).

2. Local Approach (Decentralized Decision Process, Differentiated Advertising Approach)

Complete decentralization of international advertising means that all, or nearly all, advertising decisions are made by local managers in the foreign markets. The philosophy here is that international subsidiaries shouldn't just be "pipelines to move products. Their own special strengths can help build competitive advantage" (Bartlett & Ghoshal, 1986, p. 87). A primary benefit of decentralization is that promotional programs are tailored to the specific needs of each market. Nationals may be perceived as knowing the local market best and thus are better equipped to make necessary modifications to advertising campaigns as a result of differences in the local media scene, political-legal environment, or culture. An international marketer may also opt for a decentralized approach if markets are small or the volume of international business and advertising is too limited to warrant close attention from headquarters. Local managers are likely to be more highly motivated when given responsibility for the promotional programs in their market.

3. Regcal Approach (Centralized Decision Process, Regional Approach)

Tai and Wong (1998) note that the "regcal" approach is made up of "reg" (regional) and "cal" (local); that is, it uses a combined approach of centralized decision making and regional—sometimes even local—adaptation. For example, an international or network agency may be designated as the lead agency, responsible for developing what is termed *pattern advertising*. Pattern advertising refers to centralization of the "what" of an ad campaign and regionalization or localization of the "how" (Roth, 1982). Thus, the basic advertising strategy, general creative, and even media approaches are provided to each subsidiary; however, local managers are then free to select their own media and modify copy, visuals, or other elements of the message to meet regional or local needs. This approach allows for local input and adaptation while still permitting a degree of uniformity in a firm's international promotions.

4. Glocal Approach (Decentralized Decision Process, Standardized Approach)

"Glocal" is a combination of the "glo" (global) and "cal" (local) approaches. Here, the headquarters develops a global campaign, which local offices may or may not choose to follow, but most decisions are determined by local subsidiaries or distributors.

Agency Selection

Firms marketing their goods and services abroad must decide who should plan, prepare, and execute their promotional campaigns. International marketers have a variety of options, including employing their domestic agency, using their domestic in-house advertising department or a foreign subsidiary's in-house department, calling on the services of an international agency or global network, or hiring a foreign advertising agency.

Domestic and in-house agencies. In some instances, firms may choose to simply export advertising campaigns originally created for the domestic market. Indeed, there are numerous examples of campaigns that have been exported quite successfully: The Marlboro man, conceived of for the U.S. market, has traveled well all around the world—literally for decades. Firms may also choose to rely on their domestic advertising agency to prepare advertising messages for their foreign markets. A firm's domestic agency may well be affiliated with foreign shops capable of providing necessary translation services and assistance with media planning and buying. However, a very real danger of employing a domestic agency is that it may not be familiar with the many pitfalls associated with international advertising. Some companies rely on their in-house advertising departments for foreign advertising assistance. On the plus side, the in-house agency is likely to be intimately familiar with the product or service to be promoted. On the downside, domestic in-house agencies may lack the necessary experience in dealing with foreign markets. When international advertisers turn to a foreign subsidiary's in-house agency while they gain familiarity with the local market, they lose a degree of control over promotional efforts. Furthermore, there is no guarantee that the quality of the work produced will live up to the firm's expectations.

International agencies and global networks. International firms leaning toward a centralized approach are three times more likely to employ an international agency or global network than they are to use a foreign agency (Kanso, 1991). Clearly, it's easier for international marketers to deal with a single international agency than with a separate agency in each market in which they operate. Global networks clearly offer opportunities for synergy. They can deliver to their clients the ease of one-stop shopping for all their marketing and promotional needs. Conglomerates can also offer additional benefits to clients, including a means to

consolidate and cut administrative expenses. Size is also of benefit when it comes to securing commodities. On the downside, although agency networks offer multicountry coverage, there is no guarantee that the offices in each country will be equally strong. Critics complain that the holding companies have become too large and too complex and contend that the expansion of agency companies has smothered originality under a blanket of conformity.

Local agencies. If the multinational firm adheres to decentralization, the advertiser is significantly more likely to select local agencies to coordinate promotional activities for each market in which it operates. The selection of a local agency may even be left to overseas managers. Academics and practitioners who encourage the use of local agencies argue that only such agencies can truly appreciate the local culture and, as a result, can develop messages best able to communicate with foreign consumers. Because local agencies are often independent and typically smaller in size, they may demonstrate an innovativeness that agency networks cannot—and this may be just what a marketer is looking for. On the downside, using a separate local agency for each foreign market makes coordinating worldwide campaigns quite challenging.

Creative Decisions: Strategy and Execution

One of the most important strategic considerations is whether to standardize advertising worldwide or to adapt it to the specific needs of each market. Scholars and practitioners alike are divided with regard to the benefits and disadvantages associated with each approach. This debate carries a variety of labels. Standardized campaigns have also been referred to as globalized and universal in the literature; specialized campaigns have been called localized, adapted, and even customized.

Standardization Strategy

Many advertising and marketing executives agree with Harvard's Theodore Levitt that the needs and desires of consumers around the world are growing ever more homogenized. These experts contend that the world is one large market and that regional, national, and even international differences are at best superficial. Therefore, the consumer may well be satisfied with similar products and services. Levitt (1983) went on to note that not only would consumers around the globe be satisfied with similar products, but advertisers could sell them with similar messages. Standardization of international campaigns generally takes one of two routes. One option is to adopt a campaign deemed successful in the national or domestic market for a firm's foreign markets. Another option is a preplanned effort to develop a campaign for use in multiple markets.

Advertisers and agencies alike perceive very real benefits associated with this approach. For one thing, coordination and control of marketing and promotional programs is greatly simplified, and as a result, foreign campaigns can be implemented much more quickly. In addition, fewer marketing and advertising personnel are required at the local level to administer advertising campaigns developed at headquarters than are required to customize promotional efforts, and such staff reductions lead to cost savings. And it's certainly much less expensive to produce a single campaign for a number of markets than it is to produce a separate campaign for each specific market. Furthermore, good ideas can be exploited. If a campaign has proven successful in one market, there may be no need to "reinvent the wheel" in others. Finally, a consistent international brand or company image can be achieved.

Progress has been made in understanding under what conditions standardized advertising works best and for which products global campaigns are particularly well suited. The following are seen as well suited for standardized messages: products that appeal to market segments that are essentially similar in tastes, interests, needs, and values; products that are promoted with image campaigns that appeal to universal needs, values, and emotions; high-tech products coming to the world market for the first time, not steeped in the cultural heritage of a particular country; and products with a nationalistic flavor if the country has a reputation in the field (Fannin, 1984).

Localization Strategy

While globalization has been hailed as the new wave in marketing and advertising by some, others contend that the "global market" still consists of hundreds of nations, each with its own customs, life styles, economies, and buying habits (Green, Cunningham, & Cunningham, 1975; Hornik, 1980). In the case of a fully adapted or "specialized" campaign, the advertiser localizes message content for several countries or even for each country in which the firm operates. The primary benefit of specialization is simply that it allows for differences in the demographic, economic, legal-political, and cultural environments to be taken into account. This approach also recognizes that the media that advertisers are permitted to employ can vary widely. If a specific product's brand name differs from one market to the next, the international marketer may have no choice but to employ a specialized approach to advertising. Finally, if a specific foreign market is in a different stage of market development than the U.S. market, a given product may find itself in a different stage of the life cycle in that country. In some markets, an international firm will compete against other international marketers; in others, the competition may be purely national. Sound advertising strategy in one market will not necessarily be appropriate in another market with a different competitive environment.

Examples of effective standardized campaigns clearly do exist, just as do examples of ineffective ones. Similarly, there are numerous examples of both more and less successful specialized campaigns. The pros and cons of both approaches will continue to be debated. Many companies have moved away from viewing standardization as an all-or-nothing phenomenon and instead have chosen to employ a modified approach—standardizing some elements of their promotional plan while specializing others. The question is, in fact, one of degree, with standardization and specialization at opposite ends of a continuum and with many “shades” of adaptation between the two extremes.

Execution Decisions

If strategy refers to “what is said” in a campaign, then execution refers to “how it is said.” The advertising strategy adopted for a specific international campaign thus guides the execution—the selection of advertising appeals as well as themes and concepts. It is important that these are consistent with the values and tastes of the target audience. Indeed, one study found that, on the whole, consumers seem to prefer domestically generated commercials (Giacomotti, 1993). This reinforces the view that advertising carries its culture with it. It is not surprising, then, that commercial messages created in various markets differ significantly. In terms of creative execution, it appears that there are themes and concepts that tend to have better success at crossing borders, while others are almost guaranteed to cause the marketer headaches. The following list of universal and culture-bound themes and concepts is adapted from DeMooij (1994).

Universal Themes and Concepts

New or improved products: A common characteristic of consumers around the globe is that they look for new products, new uses for old products, or improvements on old products.

Basic everyday themes: Themes based on appeals such as hunger, thirst, affection, motherhood, pride, and jealousy can generally be used universally.

The made-in concept: The tendency for consumers to evaluate goods manufactured in some countries more favorably may encourage a marketer to highlight the country of origin when promoting those goods.

Product demonstrations: Demonstrations focus on how a brand works and its specific features. Products can be demonstrated in use or in “before versus after” scenarios. This technique often helps consumers visualize what the product can do for them.

Heroes: Hollywood has spread the faces of the silver screen around the globe, and many actors have become international heroes. Film stars are increasingly appearing in international advertising campaigns.

Lifestyle concepts: Here, the advertiser presents the user rather than the product. Lifestyle groups often featured include young people, the wealthy, businesspeople, and sports fans.

Culture-Bound Themes and Concepts

Sex appeals: When it comes to employing sex appeals in advertising messages intended for foreign audiences, marketers are urged to exercise caution. What may be considered as perfectly tame in one market can be perceived as downright indecent in another.

Individuality: The majority of the world’s cultures tend toward collectivism rather than individualism. Thus, while ads appealing to individuality may prove quite persuasive in some markets, the messages may not resonate with consumers in group-oriented cultures.

Comparative advertising: Comparative advertising is generally used to claim superiority to competing brands regarding some aspect of the product. While this is encouraged in the United States, international marketers must understand that the technique is banned in other markets.

Role of women: How women are depicted in advertising messages is strongly influenced by culture. In the United States, advertisers have been criticized for portraying outdated traditional roles. In other markets, particularly in Islamic countries, women may only be portrayed in traditional roles—as mothers or as caregivers.

Humor: In general, humor tends not to travel well because it employs cultural conventions, which generally are only understood by members of a particular culture. However, one study revealed that a certain type of humor known as incongruity (defined by the researchers as based on the contrast between the expected and the unexpected) does appear to have potential across markets (Alden, Hoyer, & Lee, 1993).

Opinions and attitudes: Themes based on cultural opinions and attitudes generally do not fare well when crossing borders. Opinions regarding feminine attractiveness provide an excellent example. A major criticism leveled at Western advertising by non-Western nations is that messages suggest not only which products to purchase but how one should look. Western models, by definition, tend to be tall, blond, blue-eyed, and extremely thin—an ideal that most women around the world simply cannot live up to yet continue to aspire to.

As a strategy, advertising standardization may work well for some products, marketers, and audiences, and in some situations. In other instances, specialization or adaptation will prove to be more effective. And sometimes something in between will be most appropriate (Quelch & Hoff, 1986). International marketers must carefully evaluate where along the standardization-specialization continuum a campaign destined for a specific foreign market should fall. Advertisers also must employ appeals suited to

each culture and understand how cultural differences influence advertising content.

Media Decisions

There are a number of ways that the media planning and/or buying function can be handled in the international setting. The traditional model has all planning and buying conducted by the client's domestic or lead agency. Another option is to conduct media planning centrally but to handle media buying on a local basis in each country in which the international advertiser operates. A third option is to turn the function (either all or part) over to an international media agency; such specialists have been cropping up over the past few years. These firms are generally responsible for finding the local media best suited to the client's needs and the target audience to be reached, providing accurate media data, handling negotiations and obtaining the best rates, making the purchase, and monitoring placement. Media buying agencies are able to obtain significant media discounts by purchasing time and space on behalf of groups of clients instead of on the basis of single companies or brands (Russell & Lane, 2002).

Media planners zeroing in on foreign markets have the option of using local/national media or employing media that cross national borders—better known as international media. Using a combination of the two is clearly an alternative as well. The decision of whether to employ local/national or international media is influenced by a number of factors, including but not limited to (a) how much centralized control the firm has, (b) what target audience the advertiser is attempting to reach, (c) whether the firm has chosen to employ a localized or globalized campaign, and (d) whether the firm works with national or multinational advertising agencies.

National/Local Media

National or local media offer advertisers a greater variety of vehicles—television, radio, newspapers, magazines, outdoor, direct mail, and transit, as well as many rather unique forms. They also permit use of the local language, which is generally more effective in reaching the local market. However, there are drawbacks in using local media. The practice of media planning and buying at the local level is quite complex because media environments rarely resemble one another. These differences can take the following forms:

Media availability. Media that commonly are employed in domestic markets may quite simply be unavailable in foreign markets. In Saudi Arabia, traditional values do not permit the showing of films to public gatherings; thus, the cinema medium does not exist in this country. Nor do they permit commercial messages on radio stations. As a result

of such limitations, a firm marketing its products in a number of nations may well find it impossible to employ the same media mix in all markets.

Media viability. Peebles and Ryans (1984) suggest that the international advertiser also explore whether the medium is “available in the quality and quantity and at a cost that will permit the international advertiser to successfully employ it.” For example, while commercial television may be available in a particular market, governmental restrictions may require local production of commercials. The added cost of producing a commercial in that country may well preclude the use of the television medium.

Media coverage. The degree to which media are diffused varies substantially. For example, the numbers of television sets and radio receivers in countries around the world varies significantly. In the United States, there are 854 television sets for every 1,000 Americans, in sharp contrast to the 6 receivers per 1,000 Ethiopians (World Bank: World Development Indicators, 2002, http://publications.worldbank.org/e-commerce/catalog/product?item_id=990561). The pattern is similar for radio receivers. In developing countries, a large percentage of the population simply cannot afford individual ownership of television sets or even radios.

Media cost. Advertising rates in all markets tend to be cyclical. During periods of economic prosperity, the media tend to inflate their rates. During economic downturns, when many marketers slash their advertising budgets, media rates typically drop significantly. Savvy marketers take advantage of such media recessions.

Media quality. Even if a particular medium is available, the quality may vary from that in the home market. For example, newsprint quality is so poor in many countries—India, for one—that it is nearly impossible to obtain adequate halftone reproduction. Many markets still have very limited access to color television, which may play a central role in a visually oriented campaign.

Role of advertising in the mass media. International advertisers should be aware that in numerous markets, one or more of the media may be government owned or controlled. As a result, they may choose not to accept commercial messages or to severely restrict the time and space allotted to advertising.

International Media

The second option for reaching audiences in various markets is the use of international media that have multi-market coverage. Print remains the dominant international medium, and magazines are considered the first of the internationalists. A number of U.S.-based magazines have

international editions, including *Reader's Digest*, *National Geographic*, *Time*, *Newsweek*, and *Cosmopolitan*, among others. It is not only U.S. magazines that make their way across foreign borders. *Marie Claire* and *Elle*, both French magazines, have global circulations. While many of these publications are translated into many different languages and are available in many different markets, their foreign readers are often quite different in terms of demographics from those who read these publications in their country of origin. In foreign markets, these publications appeal predominantly to international travelers and upscale, high-income consumers. Magazines that reach businesspeople on a worldwide basis include *Forbes*, *Business Week*, *Fortune*, and *Harvard Business Review*. A major plus associated with such publications is that they tend to lend the magazine's prestige to advertised products. One of the drawbacks of such publications, however, is that they generally offer only English, French, and Spanish editions.

A number of international newspapers exist that provide opportunities for global advertisers, including *The International Herald Tribune* and *The New York Times*. The *Times* of London and the *Guardian*, both British newspapers, are also considered global publications. A number of international newspapers are also directed toward the business community. For example, *The Wall Street Journal*, *The Wall Street Journal Europe*, *The Asian Wall Street Journal*, and *The Wall Street Journal Americas*, targeting Latin America. The *Financial Times of London* is another prestigious global business newspaper, though its circulation is significantly smaller than that of *The Wall Street Journal*.

Satellites have greatly enhanced the ability to use television to reach consumers around the globe. Cable has served to bring satellite TV into the homes of consumers and will likely remain the major means of receiving satellite transmissions. Those satellites with stronger transmitters allow households to receive signals directly via their own small dish antenna; however, penetration of such satellite dishes in most markets is still rather limited. Developments in high-powered direct broadcast satellites (DBS) have made reception even easier. DBS is likely to have a significant impact for those regions lagging in cable infrastructure. For example, STAR (Satellite Televisions Asian Region) TV is now the world's largest satellite network, stretching from the Middle East and India to South Korea. Broadcasting in eight languages, it reaches some 300 million viewers throughout 53 Asian countries.

By no means have all forms of local and international media available to the international advertiser been addressed. A media planner may also turn to radio, the Internet, autowraps on cars, toilet stall messages, and even advertisements in outer space, among a multitude of other media that in many cases may be specific to a particular market. An advertiser planning on entering a specific market must undertake an in-depth analysis of the media situation particular to that country.

Conclusion

International marketers must carefully analyze the major environmental forces in each market where they compete. Demographic, economic, political-legal, and cultural factors should be taken into account when assessing the potential of a market, for they directly influence the design and implementation of marketing communication programs intended for that market. Important decisions facing the international marketer include the locus of decision making (highly centralized at company headquarters or a more decentralized, collaborative and participatory approach); whether to employ a domestic, international, or foreign agency; whether to standardize advertising worldwide or to adapt to the specific needs of each market; as well as selection of the most appropriate media (local vs. international) to reach consumers in each market. This chapter has touched on much of the research related to international advertising that has been conducted over the past few decades; however, significantly more is needed to guide international marketers if they are to successfully navigate the minefield of today's global marketplace.

THE BUSINESS OF ADVERTISING

EDWARD W. RUSSELL

Syracuse University

When you think about advertising, chances are you recall a favorite commercial you've seen recently. Maybe it's a funny beer commercial you saw on television, a Hallmark commercial that brought a tear to your eye, or some obnoxious used-car dealer yelling at you until you turned off the television just to get him to be quiet. Advertising surrounds us everyday, all day. Some of it we like, some we like so much we actually seek it out on YouTube or elsewhere on the Internet. Much of it we may try (usually unsuccessfully) to avoid. But all advertising has one thing in common. The advertiser wants you to do something that will improve his or her business. That's because advertising is a business. Ultimately, the only reason anyone spends money on advertising is to sell you something.

In this chapter, we are going to take a look at the business of advertising. We'll start on a macro scale, looking at the size and shape of the advertising business globally, and work our way down to understanding the business in the United States. Finally, we'll look at the advertising agency business to see how that business operates as well.

How Large Is Our World?

How many people are there in the world right now? Let's try an easier one; how many people are there in the United States right now? How many families does that represent?

If you want to understand the potential of your product to sell around the world, basic demographic data like this will become very important. If you've decided just to sell in the United States, you should know (approximately)

what your potential is. The world population is approximately 6.6 billion split nearly perfectly between males and females. The United States is 310 million, or less than 5% of the world's population. There are 112 million households in the United States. The average size of a household today is 2.5 people. What we like to think of as the nuclear family with two parents and at least one child only makes up 20% of the total households in the United States.

Why does this matter? If you could make a \$0.03 profit by selling something to every household in the United States. You'd make \$3.4 million. That's a lot. If you could sell that to every person in the United States, you'd make \$9.3 million. If you could do that in the whole world, you'd make \$198 million. My point? Size matters, and there are trillions and trillions at stake every single day.

How Large Is the Advertising Business?

Advertising is approximately a half-trillion-dollar business annually around the world according to estimates made by GroupM, a division of the communications conglomerate WPP (\$479 billion estimated for 2008). What does that mean? It's not easy to get your mind around what a half trillion dollars means. Consider this. The advertising business is larger than the entire gross domestic product (GDP) of Norway, Poland, Belgium, Switzerland, and about 100 other countries. It's twice the GDP of countries such as Thailand and Argentina. Globally, it's equal to about 1/100th of the world's total GDP. That should give us a good idea that it's a pretty big business.

Globally, the advertising business is growing at a healthy 6.8% in 2008. There are a number of factors that influence the highly reactive advertising market globally. The first is the condition of the economy. While most industrialized countries with mature economies faced reasonably flat growth in 2008 due to stalled economies, developing countries such as China fueled the world's advertising growth.

The second factor that effects global advertising spending is the presence on national and international media events. In 2008, the Beijing Olympics pumped somewhere between \$1.3 billion and \$1.5 billion advertising dollars into the United States alone. The presidential election held in November of 2008 pumped an additional \$2 billion into the advertising economy.

The third factor that affects the amount of money being spent in advertising is the maturity of different media vehicles. In 1993, the Internet changed how we thought of advertising media forever. And while the growth has been bumpy, the near- and long-term impact of the Internet has fueled the growth of the advertising market all around the world. Growth in the medium has been approximately over 20% per year ever since. The Internet is already the largest advertising medium in Sweden, and GroupM estimates that the United Kingdom and Denmark will follow shortly.

The growing influence of the Internet has resulted in a shrinking influence of daily newspapers. Sites such as eBay and craigslist are credited with the dissolution of classified advertising, a major source of revenue for newspapers.

Sure, the Internet is growing in popularity and as an advertising vehicle, but is it really all that important? It all depends on how you measure it. The traditional way of measuring the Internet as an advertising vehicle looks at banner ads and "search advertising" and says that the Internet controls approximately 10% of the total. But isn't advertising on the Internet larger than that? Look at any auto manufacturer site. They tell you all about their car in great detail. They allow you to design and configure one exactly to your specifications. They tell you why their car is great and, more specifically, why it is better than their competitors, and in the end, they tell you where to go to get one. Isn't that 100% advertising? How about Amazon.com? What do they have? I asked a class one time, and they told me that Amazon.com primarily has books and a variety of other goods that make it a department store on the Internet. No, they don't. Amazon.com doesn't have a single book or anything else. Amazon.com has photos of books. They even review the books (like ad copy), tell you what other people think about the books (testimonials from users), and offer a variety of places and prices to purchase the book. But they don't have books; they have ads for books. Think about the Internet in these terms, and it's almost all advertising. Search and banner ads are the minor players in what the entire cost might be. So how much is being spent on advertising on the

Internet? If you look at it like I just did, it's already globally immeasurable.

Globally, spending is concentrated in mature economies. North America leads the world with 38% of all advertising spending, followed by Western Europe with 27%, Asia with 24%, Central and Eastern Europe with 5%, Latin America with 4%, and the remaining 2% in the Middle East. What does this tell us? For one, that there are mature advertising markets (e.g., North America and Europe) and growing markets (e.g., Asia, Eastern Europe, Middle East, etc.). The difference often has to do with the spread of democracy, capitalism, and a market-driven economy.

Largest Advertising Market in the World

The United States is the largest single advertising market in the world, with an estimated \$169 billion in advertising spending. Yes, the United States makes up 5% of the world's population and 35% of the world's advertising spending. Due to the sheer number of advertising vehicles, it's been estimated that the United States also receives nearly 60% of all advertising messages. Advertisers spend \$545 per year to reach every man, woman, and child in America, compared with about \$54 in the rest of the world.

It's no real wonder that Americans see more than 1,000 advertising messages each and every day; six times as many as the French, four times as many as the British, and twice the amount Canadians see.

Name all the ads you saw yesterday. Stop reading just long enough to write down every ad you saw. We'll wait.

Done? OK, if you are like most of the students in my class, in about a minute you could remember between three and five commercials. And chances are you didn't even see one or more of those yesterday but just remembered commercials you like.

What happened to the other 995 ads you saw yesterday? Advertising agencies tried their best to get your attention a thousand times yesterday, and only a few succeeded. Why? Because our brain has trained itself to forget more than 85% of everything we see and hear everyday within minutes. There is simply too much information bombarding us, so we filter out everything that is not relevant to us or that we don't enjoy or want to know, to constantly have room for things we do want to know.

Does this mean that 995 advertisers wasted their money on us yesterday? Not necessarily. I saw an ad for a Nissan Z. It was a truly beautiful ad and a beautiful car. It wasn't top-of-mind for me because I'm not looking for a car right now. However, I'm thinking of buying a car next summer, so I've conveniently placed it in a folder in my brain. Next summer, when it is relevant to me, I will likely recall the ad and the car and consider that car. I also saw a feminine hygiene ad (five of them actually). I couldn't tell you anything about any of them because they are not relevant to me and never will be.

The Top 10 Advertising Markets in the World

The United States is the largest advertising market, representing 35% of global spending. Japan is the second largest advertising country in the world (representing approximately 5% of global spending), followed by the United Kingdom (2% of global spending), Germany (2% of global spending), and France (1% of global spending). Note how quickly these markets fall off. Obviously, this is the result of size of both population (e.g., the U.S. population is 310 million, compared with France's 64 million) and the frequency with which we see advertisements in the United States.

Advertising, a Small but Important Part of Marketing

As large a business as advertising is, it's a relatively small part of the entire world of marketing. Marketing covers the creation, manufacturing, pricing, selling, and placement of goods and services. If we consider the total GDP of the entire world at something just over \$50 trillion per year, we can see that advertising is only about 1% of the world's GDP, whereas marketing covers much of the rest.

What is marketing? According to the American Marketing Association, "marketing is an organizational function and a set of processes for creating, communicating, and delivering value to customers and for managing customer relationships in ways that benefit the organization and its stakeholders." In the 1950s, Jerome McCarthy, a Michigan State University professor, wrote a defining textbook titled *"Four P's of Marketing: Product, Place, Price and Promotion."* This certainly wasn't the creation of marketing, but it was a formalization of how we would come to talk about marketing.

Advertising is only one part of the promotion "P." Along with advertising, the promotion "P" includes things such as sales promotion, public relations, event marketing, and personal selling.

So, to put it simply, if we want to market a product, we must design that product (i.e., how it will be made, its size, its smell, its packaging, maybe its taste, etc.), we must price it (generally at a price that will allow us to maximize sales and or profits), we must figure out where to sell it (the Place "P"), and we must figure out how to sell it (the Promotion "P").

Who Is Spending All This Money?

The largest advertiser in the world and in the United States is Procter & Gamble (P&G), maker of megabrands such as Tide, Oil of Olay, Pampers, Tampax, Gillette, Pantene, Oral B,

Crest, and about 400 more brands around the world. According to *Advertising Age (Ad Age)*, the leading advertising publication in the United States, P&G spent \$8.5 billion globally and \$4.9 billion in the United States during 2006. That's nearly 2% of all the advertising spending in the world. They were the number one spender in 16 of 90 countries measured by *Ad Age*. Keep in mind though, with so many different brands, the highest-spending P&G brand, Oil of Olay, is only the 34th largest spender, at nearly \$360 million.

The top megabrand spenders are phone companies, with AT&T/Cingular investing more than \$2.3 billion in the brand, followed by Verizon at \$1.9 billion and Sprint at more than \$1 billion.

Auto manufacturers make up the largest single category of advertisers, with 6 among the top 15 spenders (Ford is the largest auto advertiser, at more than \$1 billion).

How Do Marketers Determine How Much to Spend?

How much you spend on advertising depends on quite a few factors in your marketing plan. Are you advertising a new product, or is this an established brand? What are your competitors doing? Is the product category growing or declining? Are we trying to push the product into retailers by building consumer demand or pull it off the shelves?

And while there are many methods for budgeting advertising, there are several that are commonly used.

- *Advertising to sales ratio:* Most companies use some form of advertising to sales ratio. Sometimes called a "case rate" (i.e., \$X per case of product sold goes toward advertising), this method rewards growing brands with larger advertising budgets and keeps company focus on the most successful brands. On the downside, a product that has a bad year can be hurt for years to come by shrinking ad budgets.
- *Fixed allowance:* Some companies spend a certain amount on advertising every year and may adjust that by factors such as media inflation and new competition.
- *Zero-based budgeting:* Every year, the company starts from scratch, trying to figure out in the current competitive environment exactly how much should be spent.
- *Customer valuation:* Actual dollar amounts are put on customer groups that consist of your most likely purchasers and less on potential customers. For example, if you have a Porsche dealership, chances are your best customer is one who has already bought a Porsche from you at least once. Your second most valuable customer is one who is buying from your direct competitor (e.g., Mercedes SL). This customer has enough money and merely needs to be persuaded to go a bit sportier. And the third and least valuable consumer is a Porsche "wannabe." This person would love to have a Porsche but can't afford one right now. While he or she may be your least valuable customer in the short term, this is your most valuable customer in the long term, when you are trying to replace old customers.

Where Is the Money Being Spent?

We've looked at how much money is being invested around the world and in advertising's largest market, the United States. We've looked at what companies are investing that money, and now let's take a look at where the money is being invested.

Asked to guess the largest advertising medium in the United States, most students answer "Television." Television is large, but the number one advertising medium isn't television, it's direct mail. Why direct mail? Simple! You have to print an envelope full of full-color pieces and mail the entire ad to each house, whereas for television, I make one ad and then run it.

Every year, numerous agencies predict the future media spending habits of top advertisers. The industry standard has been Robert J. Coen of Universal McCann. Table 93.1 gives the most recent percentage by medium of total ad spending in 2006 from top to bottom.

The big news going into 2008 is that the Internet is expected to overtake radio this year in spending. I still contend that if the spending on the Internet were calculated correctly, it would already be in the top three and growing.

Where is this going in the future? Personalized media. Media vehicles that can personalize the news and content I want and eliminate the content I don't want will become my personal choice. I suspect that devices such as Apple's iPod will be in all our pockets, capable of downloading and storing news and content we want so that we can be connected anywhere at any time to the content we seek. Do you want to watch the evening news? Do so on your

Advertising Medium	Percentage of Total Spending	Growing Advertising Medium or Shrinking Advertising Medium
Direct mail	21	Growing
Newspaper	16.7	Shrinking
Broadcast television	16.5	Growing
Cable	6.7	Growing
Radio	6.9	Shrinking
Magazine	4.7	Growing
Internet	3.4	Growing
Outdoor	2.3	Growing
Business magazines	1.5	Shrinking

Table 93.1 2006 Spending by Advertising Medium
SOURCE: Robert J. Coen, Universal McCann.

schedule on your screen of choice. Missed *The Daily Show* last night? Watch it from the screen in your pocket or any other screen you happen to use. Newspapers, radio, TV, the Internet, whatever you want, wherever you want it, and at whatever time you want it. That's the future of media.

Who Pays for Advertising?

Actually in a market-driven economy, the answer is you do, and if everything goes right, *no one does*.

Advertising increases sales, which allow a manufacturer to make the product at a lower cost per item, with those savings getting passed along to you. Generally, that means that the cost of advertising disappears in the economies of scale that allow the manufacturer to make and sell dramatically more product at a greatly reduced cost per item.

Let's take a look at an example. A friend is starting a gourmet cookie business in the New York City area. He sells the cookies for \$5.00 per bag. How much of that \$5.00 per bag do you think he spends on advertising?

Here's a look at his balance sheet. Of the \$5.00 to the consumer, the retailer keeps \$1.00 per bag (20% retail margin), leaving him \$4.00 per bag wholesale. The product ingredients cost him \$1.75 per bag, and the services of the baker who makes the cookies cost him \$1.25 per bag. That leaves him with a net margin of \$1.00 per bag.

He can do anything he wants with that \$1.00 per bag he makes. He can keep it all, but he can't grow his brand if he does. He can reinvest most of it back into the brand and continue to grow. Since the product is new and relatively unknown, my friend reinvests \$0.40 of every bag sold back into sales promotions (in his case he uses it for sampling) and \$0.30 in advertising, and he keeps \$0.30 as his profit.

That's pretty typical in the food business. So, of every \$5.00 at the retail level, \$0.30 will return to advertising. Fortunately, he sells about 100,000 bags of his cookies per year, giving him a net margin of \$100,000, a sampling budget of \$40,000, and an advertising budget of \$30,000 (which isn't a lot nationally but adequate in his local area), and he keeps a salary of \$30,000 from the new venture (don't panic, he has other businesses).

As he considers regional expansion, he has estimated that he can increase sales to about 3,000,000 packages. If he does this, the cost per item will fall by \$0.50, which he plans to give back to the consumer in the form of reduced price (\$4.50/bag). Additionally, using the same formula, he will have a net margin of approximately \$3,000,000, a promotional budget for sampling of \$400,000, an advertising budget of \$300,000, and a salary of \$300,000. Not bad for making cookies!

But the product actually costs him \$3.50 per bag to bake and package. At this level, he makes only \$0.50 per bag, and since he only sells about 100 bags a week, the venture doesn't appear worth doing.

So money for advertising comes from sales of the product and then is invested back into advertising to increase sales, so there is yet more money for advertising.

Is Advertising the Only Way Marketers Compete?

Of course not. There are variations and combinations on four major ways that marketers compete. They are product superiority, distribution superiority, consumer insight, and marketing communications.

Product Superiority. Is your product simply a better product than any of your competitors? Certain companies such as Procter & Gamble, BMW, and Apple try to put clear product superiorities into everything they make. Tide detergent gets out stains no other detergent will get out. Crest toothpaste leaves your teeth whiter. Pampers leave your baby drier. BMWs accelerate faster, last longer, and so on. Product superiority is a great way to compete but becomes increasingly difficult in a world where almost all products perform pretty well.

Distribution Superiority. Is your product ubiquitous? I can give you \$2.00 and 10 minutes just about anywhere in the world, and you can come back with a Coca-Cola. The product is marketed “everywhere” and not difficult to find. In the early days of marketing Tampax in Spain, the General Manager of the company decided that his personal goal would be that consumers couldn’t walk 2 minutes in any direction in Madrid without encountering a Tampax logo (in a shop window, on a billboard, on the side of a city bus, etc.). In less than a year, this unknown brand became a normal household word simply because it was everywhere.

Consumer Insight. Do you understand your consumer’s wants and needs better than any of your competition? I love Amazon.com because the more I look at the site and the more I order from Amazon, the better they get to know me. When I log onto Amazon.com, they have loads of recommendations of products similar to what I purchased that they think I will like. Have you ever logged onto Pandora.com? Pandora, the music genome project as they call themselves, analyzes the style and structure of your favorite song and recommends songs and artists that you are likely to like. I hear new musicians all the time who I’ve never heard of, and I think they are fantastic. And as you can guess, they will take me right to a place where I can buy their CD. These marketers know me. They know what I look at, what I like, what I buy, what I reject, and in many cases, they even know why.

Marketing Communications. Do you simply out-advertise your competition? Remember the iPod launch? We all saw

that dancing silhouette on posters, on TV, on the Internet, in print ads. Everywhere we turned, we saw bold colors with a dancing person in silhouette. Now, do you recall Microsoft’s launch of their mp3 player Zune? Neither do I. Apple supported the launch with a huge advertising expenditure, brilliantly simple advertising from the TBWA/Chiat/Day advertising agency. Microsoft did something I can’t recall and don’t remember. Guess who sells more?

Please understand that marketers may “major” in one of these four techniques, but they use all four. The iPod, for example, was a clearly superior (at least in consumer perception) mp3 player compared with the competition, the product wasn’t difficult to find; the company understood their target audience’s total love for personal music anytime anywhere as well as its appreciation of the uniqueness (color) and contemporary design of their product. Finally, they simply advertised more than did any of their competitors.

What Are Marketers Really Selling?

Brands. Marketers manufacture products but sell brands. What’s the difference? The product is simply the tangible product. The brand is the product with all the added value elements that makes the product worth having. Let’s consider an example.

What is the iPod as a product? It’s a portable computer hard drive that can replay music and videos on a small screen with headphones. But as a brand, iPod is much, much more. The iPod is a high-tech device that not only allows you to carry 1,000 songs in your pocket. It’s about design, being in the “in-crowd” that “gets it,” and so much more. Probably the smartest marketing decision of the decade was making iPod’s earphones white. I don’t have to see your player to know you are a member of the club . . . or you aren’t. All the added value created by the design, the ease of use, the simple interfaces with Mac or PC, the advertising, the unique (and frequently changing) colors, the variety of shapes and sizes and memories, the unique look of the Apple Store, the Web site, iTunes, the packaging it comes in, the accessories you can add on, the experience of buying the product as well as the experience of both using and being seen using the brand, all add to an overall brand experience that makes the iPod worth more money than it’s competitors.

An iPod is a pretty sophisticated brand, so let’s take a look at something simpler. My local grocery store contains 54 facings of orange juice. There are differences in size, calcium content, level of pulp, and so forth, but it’s all basically orange juice. The prices range from \$2.99 to \$4.99 for the same 64-oz amount. What’s the difference? The cheap one is an unbranded generic, and the expensive one comes from Minute Maid. Is one really worth nearly 70% more than the other? I don’t know, but I

always buy the Minute Maid. What am I really buying? I'm paying for belief in the brand. I believe it will be fresher, of higher quality, better tasting, and I consider not buying it a risk. I'd rather pay the additional \$2.00 as "insurance" and for the assurance that I'm buying something I will probably like. That's the power of a brand over the existence of a product.

We've looked at the business of advertising. Now let's flip that statement around and look at the advertising business.

So Which Advertising Agencies Are the Most Successful?

It depends on how you define success. Is it the size of an agency that makes it successful? Is it the number of creative awards the agency wins? Is it the success of their clients? Is it the fastest-growing agency? As you can see, answering what is the most successful advertising agency is as complicated as asking what is the most successful ad on air today. There is no one definitive answer.

So let's look at this in a number of ways and see what names pop up over and over.

Advertising Agency Holding Companies

Earlier, we saw how advertising agencies are in "holding companies." The four largest are Omnicom, with \$12.7 billion in 2007 global revenue, followed by WPP Group (\$12.4 billion), Interpublic Group (\$6.6 billion), and Publicis Group (\$6.4 billion).

Worldwide Advertising Agency Size

The following is a list of the largest consolidated worldwide advertising agencies (all headquartered in New York except where noted):

1. DDB (with a 2007 global revenue of \$2.6 billion)
2. McCann Erickson (with a 2007 global revenue of \$2.5 billion)
3. Dentsu (headquartered in Tokyo, with a 2007 global revenue of \$2.5 billion)
4. BBDO Worldwide (with a 2007 global revenue of \$2.4 billion)
5. Young & Rubicam Brands (with a 2007 global revenue of \$2.2 billion)
6. Ogilvy & Mather Worldwide (with a 2007 global revenue of \$1.8 billion)
7. TBWA Worldwide (with a 2007 global revenue of \$1.8 billion)
8. JWT (with a 2007 global revenue of \$1.5 billion)

9. Euro-RSCG (with a 2007 global revenue of \$1.3 billion)
10. Draft/FCB (with a 2007 global revenue of \$1.2 billion)

What do these agencies have in common? They all have 50-plus-year histories as advertising agencies and manage many of the largest marketers in the world.

U.S. Advertising Agency Size

Looking at just the United States for a moment; the list is a bit different according to *Advertising Age*. The largest advertising agencies in the United States are as follows:

1. McCann Erickson (\$490 million in 2007 revenue)
2. BBDO (\$472 million in 2007 revenue)
3. JWT (\$316 million in 2007 revenue)
4. Young & Rubicam (\$307 million in 2007 revenue)
5. DDB (\$291 million in 2007 revenue)
6. Ogilvy & Mather Worldwide (\$255 million in 2007 revenue)
7. Grey (\$249 million in 2007 revenue)
8. Campbell-Ewald (\$239 million in 2007 revenue)
9. Draft/FCB (\$221 million in 2007 revenue)
10. TBWA (\$208 million in 2007 revenue)

Creative Awards

Creative awards in advertising are like the Academy Awards for film. It doesn't mean that the winner is the absolute best; it just means that the particular group of judges liked it best. Like the Academy Awards, most award-winning ads are quite good, and agencies that win a lot awards are producing work that is admired by their peers and usually (but not always) by consumers as well. When it gets right down to what an advertising agency actually does, it's the quality of their work as judged by consumers that makes the cash registers ring. But let's take a look at the top award-winning advertising agencies.

Every year, The Gunn Report tracks all the major advertising award shows around the world to rank the top 100 award-winning commercials (and print ads). In creating this database, they also analyze which agencies, agency networks, production companies, and even commercial directors are winning awards. The top award-winning agencies in the world for 2008 are as follows:

1. BBDO (New York)
2. Fallon (London)
3. DDB (London)
4. Saatchi & Saatchi (New York)

5. McCann Worldgroup/T.A.G. (San Francisco)
6. TBWA (Paris)
7. VegaOlmosPonce (Buenos Aires)
- 8., 9., 10. (tie) BBH (London, Jung von Matt (Hamburg and Berlin), Saatchi & Saatchi (Singapore))

Advertising Paid for by Media Commissions

For decades, the vast majority of advertising agencies were paid a commission by the medium they placed the ad in. For example, if Procter & Gamble wanted me to handle the Ivory Soap ad, I would create ads, and every time I placed one in a magazine, in a newspaper, or on TV, that medium would pay me 15% of the value of the purchase as a commission. This commission system spread around the world and was the primary way clients paid their agencies for nearly 100 years.

In the 1980s, when agencies were acquiring other agencies at an unprecedented rate, a few of the CEOs of advertising agencies became very wealthy, and publicly so. Bob Jacoby, CEO of Ted Bates Advertising, sold the agency to the Saatchi brothers in 1986 and personally pocketed well over \$100 million. While that is certainly still a lot of money, it was unheard of in 1986 and led many in the industry to think that they were overpaying their agencies. (It didn't, however, stop advertising agency CEOs from pocketing large sums of money. Ed Meyer, CEO and Chairman of Grey Global Group, sold that agency to WPP in 2006, personally pocketing stock worth approximately \$625 million.)

The 1990s were a decade of renegotiating contracts and renegotiating how advertising agencies should be paid. The end result is that agencies were generally paid less for the same amount of work, and the entire pay system became far more transparent. Marketers determined exactly what they wanted and estimated how much time and manpower it should take to provide the service. Agencies reorganized and cut back substantially on the service they were able to provide their clients. Agencies prided themselves on being "leaner and meaner," but generally it just meant that since they were making less, fewer people had to do as much of the same work load as they could.

Today, there are hundreds of compensation methods that marketers and their agencies use. While as far back as 1994, a full 61% were using a commission-based system, today that number is way less than 10%, and the commission they are paid is generally less than 10% as well. Most marketers and their agencies have gone to some sort of fee system (e.g., hourly fee, fixed fee by project, etc.); ideally, that links the agency's compensation to the success of the advertising in the market (e.g., percentage of sales, percentage of sales increase, etc.). Moreover, over half of all large advertisers pay bonuses for extraordinary results. The Miami-based advertising

agency Crispin Porter + Bogusky broke new ground several years back when they agreed to be paid for their efforts in stock ownership of their client Hagger. While this hasn't picked up as a major trend, the intention of rewarding the agency for success is built into most compensation systems.

There is still no perfect compensation system. Why? Because the overall success of a brand is far more complicated than just the advertising. Success depends on the product, the pricing, the salespeople selling the item, the competition, the stores that sell the product, and a thousand other things. If you run the world's best ad, and the product isn't on the shelf, is it fair that you should be penalized for something you have no control over? Certainly not. Marketers and consulting companies continue to work on fairer and better compensation systems all the time, but it's fair to say that none have found that magic bullet yet.

How Does an Advertising Agency Work?

With more than 25,000 advertising agencies in America today, needless to say there are many different ways to work. If you have an idea and a client, you can call yourself an advertising agency, and many do. However, the classic agencies that handle most of the business around the world all follow a pretty similar structure.

There are five departments in an advertising agency: the account management department, the research and planning department, the creative department, the media group, and finally the administrative department.

The Account Management Group. The account group (also called account executives, client service, and content managers) works directly with clients to determine the best ways to sell their products and manage the process from start to finish in order to ensure the best possible results.

Research and Planning Group. While the research department's job is self-evident, planning is a relatively new position in advertising agencies in the United States. The planning department was invented in the United Kingdom. The idea of an account planner is to have someone well versed in research techniques who could work alongside the creative department as the "voice of the consumer," helping to guide the work and inspire great work.

The Creative Department. The creative department is made up of copywriters (who write advertising copy), art directors (who determine what the ads will look like), and production personnel (who turn the ideas into finished ads). Copywriters and art directors work in teams, developing ideas and reporting to a creative director, who ultimately chooses the best ideas to present to clients.

The Media Group. The media group determines where and when an ad should appear. It must understand the target audience's habits and preferences to develop the best possible plan for reaching these people.

The Administrative Group. The administrative group houses all the support groups in an advertising agency, such as finance and accounting, legal, traffic (the people who physically get the right advertising to the right media outlets).

How Do We Go From “I Need an Ad” to a Commercial On-Air?

The account manager working with the client will determine that a new ad is needed. They will call a meeting to brief the team that will develop that ad and shepherd it from a mere idea to a finished ad running on whatever medium you choose. The briefing meeting will be attended by the account management person, the client, a planner, a creative director, and the media. The client will discuss the state of the business and the objectives going forward. At the conclusion of the meeting, the planner will write a creative brief, which defines what is to be accomplished and what we need to say to our potential consumers to get them to do and say what we hope they will. Once the client has agreed with the creative brief, teams of copywriters and art directors brainstorm hundreds and maybe thousands of ways to solve the problem in communications. The media person determines the best places to run the new ads and discusses this with the creative teams to make sure they develop the right type of media ads. Once the team believes that it has the best possible ad ready, it presents that idea to the client, who either agrees with it or sends the team back to do more work. Once everyone agrees to a certain ad, the production staff takes over in preparing the finished ad that will actually appear in the media.

Why is this important? Because in the advertising world, time is money, and this process, which can take 40 weeks for a reasonably complex commercial and involve more than 125 people, is an expensive one. Controlling costs in a business of low margins is critically important.

Economics of Running an Advertising Agency

Who needs to understand the economics of running an advertising agency? Everyone in the agency business needs to understand the basics. Advertising agencies are not all that complicated to run financially, but they are very fragile financially. One lost account can mean the difference between a good profitable year, where everyone gets a bonus, and mass layoffs.

Everyone in an advertising agency is held accountable to some extent for the profitability of their particular

account, and ultimately the overall profitability of the agency. Account management personnel will be held accountable for the profitability of their accounts and won't get promoted or receive any bonuses if they don't "make their numbers." Account planners and creatives often work on an hourly basis, so they not only must keep an accurate account of their work but frequently have assigned amounts of hours they are allowed for each project. If they go over their time allotment, the profitability of the assignment is immediately in danger.

How long does it take to develop a brilliant idea? You can easily see the conundrum in that question. Creativity doesn't work on timetables, but ultimately if an account isn't profitable, it can't be serviced. Media professionals work on budgets all day long and can't overspend a budget. The same is true of their time.

So what's so difficult about running an advertising agency profitably? Leo Burnett was credited with saying that 75% of his inventory went down the elevator every night. Think about it, what does an advertising agency make? They make ideas. They don't have factories or even machines that put out products. They have people who work hard and, if all is going particularly well, come up with brilliant ideas that grow brands. That's all they have. Most marketers invest about 5% to 10% of the revenue their company makes in personnel. The rest is invested in buildings, factories, and other capital expenditures. If they have a major downturn, they are more likely to get rid of a factory than try and save the money by laying off employees. On the other hand, about 70% to 80% of an advertising agency's revenue goes to paying employees. If they lose an account, they have no other option except to lay off employees.

There are just a few simple financial terms you'll need to understand. "Revenue" is the amount of money your client pays you for the work you do. Direct expenses are the salaries and bonuses of your personnel. Indirect expenses (also called agency overhead) include things such as building rental, computers, health insurance, and even the support departments, such as accounting and finance. Your direct expenses plus your indirect expenses are simply your total cost of doing business. The difference between your revenue and costs is your profit. When shown as a percentage, it's called an operating margin. It's really quite simple (see Table 93.2).

Advertising agencies target between 10% and 20% operating margin. Less than 10% (especially for a smaller company) is very dangerous and means that the company could be put out of business very easily, and more than 20% is generally seen as greedy by clients.

While a 15% operating margin may seem high to many marketers, the difference is the actual amount of money that represents. In our \$1,000,000 agency below, the final profitability is \$150,000. While that may seem like a lot of money, we could easily lose all that by one account walking out the door or by overspending on a new business pitch we

<i>Financial Item</i>	<i>Dollars (\$)</i>	
Revenue	1,000,000.00	100%
Direct expenses (salaries)	420,000.00	42% of revenue
Indirect expenses (agency overhead)	430,000.00	43% of revenue
Total costs (Direct + Indirect)	850,000.00	85% of revenue
Profit (Revenue – Total costs)	150,000.00	15% Operating margin

Table 93.2 Calculation of Operating Margin

don't win or by any number of other scenarios. This is what makes running an advertising agency so difficult.

Consider a few scenarios.

Scenario 1: A Good Client Cuts Advertising Late in the Year

- Your client has promised to spend \$10 million on advertising and agrees to pay you 10% of that amount (i.e., you have \$1 million) as revenue.
- You have 10 people working on the account across all departments, with a combined salary of \$420,000 (average salary \$42,000).
- Your overhead (e.g., health care, building rental, desks, computers, etc.) costs you an additional \$420,000.
- The total for salaries and overhead is \$840,000, leaving \$160,000 as profit. Your operating margin is therefore 16% (\$160,000/\$1,000,000).
- *Everyone is happy, and your business is growing!*
- Oops! Another product in the division isn't doing well, so in September your client asks you to cut all advertising from October to December.
- Your revenue just dropped from \$1,000,000 to \$750,000 for the year. But your costs are still \$840,000.
- What do you do?

Scenario 2: Account Losses

- You have 10 accounts all roughly equal in size. All are profitable, with a 10% operating margin.
- Two of your clients fire you (they don't like the work), and suddenly your revenue is off by 20%.
- What do you do?

You can easily see why everyone in the advertising business goes through periods of lay offs, as well as mass hiring when they win a new piece of business.

Conclusion

We've looked at the business of advertising and the advertising business in this chapter. The business of advertising is a large and growing business, with marketers spending nearly \$500 billion a year promoting their goods. The United States, only 5% of the world's population, is the number one advertising market in the world, with 35% of the total global spending. And as important as advertising is to the success of a brand, advertising is only one small part of marketing.

As for the advertising business, we saw how this business evolved right in step with the expansion of media outlets in the United States. After looking at how an advertising agency works from the inside out, we looked at the fragile economics of running an advertising agency to better understand how it is managed day to day.

PART XIV

MEDIA MANAGEMENT

MEDIA ECONOMICS AND OWNERSHIP

FANG LIU AND ALAN B. ALBARRAN

University of North Texas

Media economics is a field of study used to analyze the firms, industries, and activities of media enterprises, drawing on theories and concepts from economics. The earliest scholarly literature involving media economics began in the 1950s with the newspaper industry; contemporary scholars now address all forms of media, including new media technologies and multimedia. Historically, media economics tended to focus on a particular media industry. However, globalization, regulatory reform, social changes, and technology continually modify approaches to the study of media economics. In the 21st century, media economics must be examined across a broader spectrum of inquiry, as it cuts across numerous areas and levels of activity.

This chapter consists of two sections. The first section describes the field of media economics by examining key approaches and perspectives guiding research, the primary theoretical domains, and methodological approaches. The second section examines issues involved in media ownership, centering on the impact of regulation, consolidation, capital and financing, and new technologies.

The Field of Media Economics

Economics is studied in terms of *macroeconomics* and *microeconomics*, and the field of media economics follows suit. Macroeconomics examines the aggregate economic system and is usually studied at a national or global level. Macroeconomics includes topics such as economic indices (interest rates, the supply of money, and employment) and

national production and consumption (GDP or GNP). Most of the media economics studies in the macroeconomics tradition are policy and regulatory studies analyzing the impact of specific regulations and policies on media markets and industries. For example, studies investigate topics such as the impact of deregulation of media ownership on concentration of local television markets, the impact of international deregulation on transnational media corporations, and the impact of the Telecommunications Act of 1996 on consolidation of media industries.

Microeconomics examines specific aspects of the economic system, including individual markets, firms, or consumers. Many media economics studies apply a microeconomics approach to examine market structure and firm conduct and behavior. Such research has focused on the structure, conduct, and performance of the agricultural trade journal market; the structure of the cable television market; and an analysis of market competition in the television syndication industry.

A third approach to studying media economics is the critical perspective. This area of study is related to media economics but uses different theoretical domains and methodologies. Today, this field is known as political economy. Initially drawing on a Marxist orientation, contemporary critical scholars in the political economy of the media are concerned about topics such as media hegemony, technological determinism, political power over media enterprises, and the impact on social policy.

Media economics research is dominated by studies involving microeconomic perspectives. There is a much smaller group of literature that follows a macroeconomic perspective, although globalization has been a catalyst for

a growing body of macroeconomic research. Both macro and micro perspectives are used in conjunction with a theoretical foundation to examine research questions and hypotheses posed by researchers.

Primary Theoretical Domains in Media Economics

Much of the literature in the field of media economics has traditionally followed neoclassical approaches, which are led by the industrial organization model (the I/O model). The “old” I/O model, or the Bainsian I/O framework of analysis, is based on the assumption that there is a causal link from market structure to firm conduct to firm performance. The structure-conduct-performance paradigm (the SCP paradigm) first proposed by Bain (1968) is the most representative of the old I/O model and is a commonly used analytical framework in media economics studies. Analyzing media industries using the SCP paradigm often involves three factors: market structure, market conduct, and market performance. The majority of the studies of media firms and markets in the old I/O tradition focus on the analysis of market structure, which refers to the number and size distribution of firms in a market.

An important emphasis of the studies in the old I/O tradition had been empirical testing of the SCP hypothesis. These studies focus on the impact of industry structure on industry performance. As a consequence, initial I/O analyses did not pay too much attention to firm conduct. On the contrary, the “new” I/O model developed through the 1980s and the 1990s views the once assumed causal relationship between market structure and performance as a relationship influenced by strategic interaction among firms and thus pays more attention to firm decisions, conduct, and strategic interaction in markets. The new I/O model is especially useful for understanding firm behavior in conditions of oligopoly, where a market is dominated by a small number of sellers offering either homogeneous or heterogeneous products.

Scholars continue to extend the I/O model to media economics research. Some studies look into a single component of the I/O model, market structure, firm conduct, or firm performance. Using the I/O model, researchers examine the changes in the market structure of local broadcast television, radio, and newspaper markets; the structure of the electronic newspaper market; and structure of the multichannel video programming market. Additional studies focus on the structural relationships among market structure, firm conduct, and firm performance. For example, researchers examine the relationship between market structure, conduct, and performance in the newspaper industry and the effect of increased competition on the conduct and performance of local television news departments.

Other theoretical domains are also found in media economics research. Concentration studies look at the levels of concentration among media markets and industries. Concentration of media is problematic because media markets

are not only a marketplace for media products and services but also a marketplace for information and ideas. Concentration of market share refers to the proportion of a particular market controlled by the major players operating in that market. Commonly used measures of concentration of market share include concentration ratios and the Herfindahl-Hirschman Index (the HHI). Researchers employ these measures to evaluate concentration of media markets. For example, concentration ratios and the HHI are used to investigate concentration of the advertising market for agricultural magazines; concentration ratios are used to examine concentration in the U.S. daily newspaper industry at the national and local levels; and the HHI is used to assess concentration in the U.S. book publishing industry from 1989 to 1994. The HHI has also been used to evaluate concentration in local television markets based on measures of audience shares.

Niche theory has been used to study competition among the media industries, especially between traditional media and new media. Niche theory is based on the assumption that a new medium competes with traditional media for audience and advertiser spending. For example, researchers examine the impact of the Internet as a new medium on traditional media in the daily news markets, the competition between cable as a new medium and broadcast media in the advertising market in the 1980s, how cable networks use branding strategies to attract cable system operators and national advertisers, and the survival rates of new magazines.

The principle of relative constancy (the PRC) is another theoretical domain that examines audience and advertiser spending on mass media over time. According to the PRC, a relatively constant proportion of the available wealth of audiences and advertisers is devoted to the mass media. The PRC asserts that introduction of new media cannot increase audience and advertiser spending on mass media. As a result, new media grow by competing with traditional media for audience and advertiser spending or from the growth in the general economy of a nation, which decides the amount of audience and advertiser spending available on the mass media. Researchers found support for the PRC by providing evidence on the constancy in audience spending on mass media over time using a longitudinal approach.

In media economics, one can find demand studies, based on audiences, advertisers, or those desiring to own media properties. Many media companies serve a dual market—offering content to audiences in the consumer market and selling access to audiences in the advertising markets. The majority of media demand studies focus on audience demand for content. Examples of audience-based studies include studies that examine factors determining demand for international films, the impact of audiences’ willingness to pay high subscription prices for business magazines on publishers’ differentiation strategies, the relationship between newspaper price and circulation demand, and factors determining household demand for basic or pay cable television services. In the literature, there are also studies examining advertiser demand and demand for media properties. For example, studies investigate advertiser spending

on mass media over the years, the dramatic increase in investment in media industries in the immediate years following the passage of the Telecommunications Act of 1996, and a method of pooling equity for purchasing a portfolio of media properties.

The theories and frameworks reviewed above are among the most commonly used in the field of media economics. In addition, in the media economics literature, one can also find studies that use policy analysis to gauge and analyze regulatory actions, especially the impact of regulation on the structure of media markets and on welfare, and studies that use game theory, information economics, behavioral economics, and transaction cost economics.

Methodological Approaches in Media Economics

There are many methodological approaches used in media economics research, encompassing both quantitative and qualitative applications. Some of the more common methodological approaches found in the literature are detailed in the following paragraphs.

Trend Studies

Researchers use trend studies to identify patterns among media firms and industries. Trend studies are used to track things such as advertising expenditures, ownership transactions, financial data, and demand. Trend studies tend to be descriptive in nature and visual in their presentation through the use of charts and graphs. Trend studies have been extensively used by the Federal Communications Commission (FCC). Trend studies conducted by the FCC include the Annual Report on Competition in Video Markets, Cable Industry Prices, Review of the Radio Industry, and others. Scholars use trend studies to investigate changes in media markets and industries over time. Some examples include a trend analysis of the revenues of the U.S. media industries between the 1980s and the 1990s, analysis of the change in consolidation of media industries before and after the passage of the Telecommunications Act of 1996, and a trend analysis of the adoption rate of the VCR among audiences in the early 1990s.

Survey Research

Survey research is a means of gathering information by asking a set of questions to a sample of respondents who represent a population with specific characteristics. Survey research is a relatively cost-effective way to collect a large amount of information. Implementations of survey research methods include mail surveys, telephone surveys, personal interviews, and Internet surveys. Surveys have been employed to investigate a variety of media economics topics, such as news managers' attitudes toward partnerships between newspapers and television stations; the

relationship between corporate newspaper structure, profits, and organizational goals; the influence of owners or advertisers on news correspondents' news reporting; factors affecting audiences' willingness to pay for content; factors leading to audiences' adoption of new media technologies; audiences' satisfaction with multichannel video programming services; and advertising decision makers' perception of media effectiveness and substitutability.

Content Analysis

Content analysis is a research method for a systematic analysis of content. Content analysis can take on two different forms. One is conceptual analysis, which identifies concepts for examination and then quantifies and tallies their presence, and the other is relational analysis, which identifies concepts present in some given content and further explores the relationships between the concepts identified—strength, sign, and direction of relationships. In media economics, content analyses have mostly been conducted on newspaper and television content. For example, researchers use content analysis to examine the effects of group ownership on daily newspaper content and to investigate the relationship between market size and local television news content.

Intensive Interviews

Intensive interviews are used by researchers to collect information from a small number of respondents who are hard to reach by other means, such as top executives of media firms. Intensive interviews can be structured, semi-structured, or unstructured, and which form to use is decided by factors such as the nature of the study, characteristics of the interviewees, and whether comparative analysis is involved. Semistructured interviews are more often used with media executives in organizational research, because this form gives interviewers more flexibility in deciding the choice of questions and the order of questions during the interview process and also allows comparability across different respondents in data analysis. The application of intensive interviews in media economics research includes interviews with cable system operators to investigate their perception of the competitiveness of the cable television markets, interviews with book wholesalers to study the transformation of the wholesale sector in the U.S. book-publishing industry, and interviews with media professionals to understand the economics of buying and selling audiences in the television advertising market.

Case Study Approach

The case study approach has been widely applied to examine the economics of media firms and industries. In case studies, multiple research methods are used to investigate a phenomenon embedded in its real-life context.

In media economics studies, cases or units of analysis can be media firms, industries, markets, advertisers, audiences or others entities, depending on the nature of inquiry. Case studies can be classified into two types by the number of cases included in one case study—single-case studies or multiple-case studies. Although multiple-case studies may be more time-consuming and costly to conduct, this research method has been employed in a number of media economics studies due to its advantages such as providing more compelling evidence and improving the robustness of the study. Examples of single-case studies include the book-publishing industry's transition to the BookScan system of measuring book sales, the merger of U.S. West and Continental Cablevision Inc., and Nielsen in the TV ratings history from 1984 to 1999. Examples of multiple-case studies include the impact of intra-industry and interindustry competition in the evolution of satellite broadcasting in the United States, Japan, England, and France and the competitive strategies employed by two all-news channels—CNN and BBC—in Asia.

Secondary Data Analysis

In media economics, secondary data refer to data previously collected by individuals or organizations for purposes other than those of a particular media economics research project. There are a variety of secondary data sources on media firms, industries, and markets available to researchers. A number of databases such as Thomson One Banker (Thomson Analytics), Hoover's Online, and Standard and Poor's provide comprehensive business and investment information, including industry surveys; corporation records; and key financials, ratios, and growth rates for companies worldwide. Industry-specific directories such as the *Cable & Television Factbook*, the *Broadcasting & Cable Yearbook*, and the *Editor and Publisher International Year Book* provide comprehensive information on specific media industries.

Trade organizations such as the Radio Advertising Bureau (RAB), the Television Bureau of Advertising (TVB), the Interactive Advertising Bureau (IAB), the National Cable & Telecommunications Association (NCTA), the Recording Industry Association of America (RIAA), the Motion Picture Association of America (MPAA), the Satellite Broadcasting and Communications Association (SBCA) of America, the Newspaper Association of America (NAA), and the Magazine Publishers of America (MPA) provide continually updated industry statistics, including annual revenues (e.g., advertising revenues and subscription revenues), audience-size statistics (e.g., ratings, the number of service subscribers, circulations, or box-office sales), and industry trends such as the changes in annual revenue or audience size over the years.

It is usually less expensive to collect secondary data than primary data, and the time required for searching secondary data sources is much less than for collecting

primary data. Media economists have taken advantage of a variety of secondary data sources. Examples of secondary data sources used in media economics studies include programming schedules of broadcast television stations, syndication industry reports on programming, the database on corporate transactions compiled by the Securities Data Company, data on box-office sales provided by the online movie information service IMDb, the report of the Follow-Up National Survey of Cable Television Rates and Services compiled by the U.S. General Accounting Office, and data on mass media expenditures by categories collected by the Central Statistical Office of the United Kingdom.

Issues in Media Ownership

Media ownership is one of the most important areas of media economics, and it has been extensively researched. In this section, issues including media ownership regulation, concentration of media ownership, and capital and financing of media firms are discussed.

Media Ownership Regulation

The goals of media ownership regulation are to promote diversity of ownership, and thus diversity of voices, as well as to prevent concentration of economic power. Many jurisdictions have specific regulations for media ownership rather than leaving it to general competition law, from the concern that these goals may not be adequately addressed by market competition. The U.S. media ownership rules are designed to promote the FCC's policies of competition, diversity, and localism. The U.S. media ownership rules restrict concentration of media ownership at both local and national levels by setting up ownership caps, either on the total number of media outlets that can be owned in local markets or nationally by a media firm or on the maximum percentage of households that can be reached nationally by a media firm.

When an ownership regulation is relaxed or lifted, it has immediate influence on the status of concentration of media ownership, or media consolidation, which refers to the control of the majority of the media outlets by a small number of media conglomerates. According to an FCC media ownership study released in 2002, there was substantial consolidation across most forms of media, including television, radio, newspaper, cable, and satellite in the 1990s, especially following the passage of the Telecommunications Act of 1996, which relaxed or eliminated some local and national ownership limitations on television, radio, and cable as well as some cross-ownership limitations (Duwadi, Roberts, & Wise, 2007).

Some jurisdictions have a long history of regulating media ownership from an industry-specific approach. This approach is under pressure due to the development in

communication technologies and industry expansion across traditional industry boundaries. The media industries have been advocating deregulation of this industry-specific regulatory approach. The trend toward media ownership deregulation is detectable in some countries. For example, the FCC amended the ban on common ownership of a broadcast station and a daily newspaper in the same market in 2007. This amendment would allow a newspaper to own one television station or one radio station in the 20 largest markets in the United States (FCC, 2007, December 17).

Another emerging issue in media ownership regulation is whether and how the Internet should be subject to media ownership regulation. Media conglomerates can expand their success from traditional media to new media such as the Internet. The Internet as a new content distribution platform is dominated by the same group of media conglomerates that dominate traditional media. These media conglomerates have the majority of the traffic on the Internet. However, no regulation on Internet ownership exists yet.

Concentration of Media Ownership

The U.S. media markets are controlled by a number of top media conglomerates, such as Time Warner, Comcast Corp., Walt Disney Co., News Corp., NBC Universal, CBS Corp., Cox Enterprises, Echostar Communications Corp., and Viacom. These media conglomerates have concentrated ownership over the U.S. media—they control more than half of the total U.S. media revenue. As a result, these media conglomerates together have a great impact on what audiences listen to, watch, and read via different media platforms, including radio, television, newspapers, the Internet, and others.

Some media conglomerates are vertically integrated, having control over media outlets at various levels of media products (i.e., production, distribution, packaging, and exhibition). For example, Time Warner, the largest media conglomerate in the world, has operations in various forms of information and entertainment, from magazines, comic books, motion pictures, television, and home entertainment production, cinemas, to broadcasting, and others. There are also horizontally integrated media conglomerates; that is, they have control over more than one media outlet at one single level of media products. Comcast Corporation, for example, operates more than 1,000 cable systems in the United States, providing multichannel video programming services to about 24 million subscribers.

Concentration of media ownership, including vertical integration and horizontal integration, can help media firms improve economic efficiencies. For horizontally integrated media firms, the primary advantage of having concentrated ownership is economies of scale, which refers to the reduction in cost per unit as more units are

produced. One of the basic economic characteristics of the media business is high fixed costs and low variable costs. Horizontally integrated media firms such as radio and television groups can achieve economies of scale by spreading fixed costs over a larger number of stations. For vertically integrated media firms, the primary advantage of having concentrated ownership is economies of scope, which exist when the cost of joint production of several products is lower than the total cost of producing each product separately. The benefits for vertically integrated media conglomerates with multiple products in multiple markets include improvement in profitability, reduction in financial risk, and increase in market power.

One of the assumptions of media ownership regulation is that there is a link between the number of different media outlets in a market and the diversity of voices. Increasing concentration of media ownership has raised concerns of the public and the academic community due to the belief that source diversity influences programming diversity. A number of studies show that diversity of the media marketplace has been declining, and concentration of ownership is one of the key factors that led to this decline. According to studies on broadcast radio and television ownership conducted by Free Press in 2006 and 2007, women ownership and minority ownership are at extremely low levels in the broadcast radio and television industries (Turner & Cooper, 2007).

When the marketplace of ideas is controlled by a handful of media conglomerates, localism and public interest may be hindered. Due to the relaxation of media ownership rules at both local and national levels, radio and television station groups and newspaper chains were able to acquire more outlets. In many local markets, there are fewer and fewer locally owned radio and television stations or newspapers. Corporate owners are mostly profit driven, and centralizing operations is one of their common practices for the purpose of cost saving. Therefore, interest in local matters and public interest may not be incorporated in the station group or newspaper chains' daily operation.

The development in communication technologies made it technologically possible and economically feasible for media conglomerates to establish distribution and production networks across continents. A number of U.S. media conglomerates that dominate the U.S. media markets, along with a few Asian and European media conglomerates such as Sony Corp., Bertelsmann, Vivendi, and Pearson, dominate the global media landscape. These media conglomerates have operations worldwide and distribute their content or provide services to a world audience.

Different countries have different approaches to foreign ownership in media. Some countries encourage foreign ownership for the sake of cultural diversity. The United Kingdom allows foreign companies, especially non-European companies, to invest in media in order to introduce

new perspectives to the British media. On the contrary, some countries have passed regulations to limit foreign companies' equity of media to a minority role and thus to control foreign ownership in media in their countries. For example, the Chinese government only allows foreign companies to provide certain media services via joint ventures with Chinese companies and has passed regulations to restrict foreign companies to minority equity holders.

Capital and Financing of Media Firms

Most media firms need to raise capital to support daily operations, purchase equipment and facilities, and acquire other media properties. The process of raising capital is different for privately owned media firms and publicly traded media firms. Capital can be directly invested in privately owned media firms, whereas capital can only be invested in publicly traded media firms in stock markets. For example, investors cannot invest directly in Hearst Corporation, which is a private company, but can invest in the publicly traded McClatchy Company through share purchase in a stock market. Capital markets play a critical role in media firms' growth and expansion due to the large amount of capital required for media start-ups and for acquiring media properties. Capital markets are essential for media firms that intend to acquire other media properties. Without capital markets, it would be impossible for media companies to grow.

Media firms use a variety of financial agreements, such as mergers, acquisitions, leveraged buyouts, spin-offs, and others. Media firms employ these financial agreements to improve performance and pursue growth opportunities. Mergers and acquisitions are very commonly used by large media firms seeking growth and expansion. A merger refers to the combination of two companies. In a merger, two companies agree to combine, and the new entity retains all the assets and liabilities of both companies when the transaction is completed. In an acquisition, one company acquires the operating assets of another.

Liberalizing media ownership regulation has removed some of the conventional regulatory barriers for mergers and acquisitions. Since the passage of the Telecommunications Act of 1996, the number of mergers and acquisitions in media industries has increased, and the average value for these transactions has been increasing too. Capital markets make mergers and acquisitions possible for media firms—media firms use capital borrowed from capital markets to acquire other media firms. The influx of capital into the media markets, and therefore a large scale of mergers and acquisitions in media industries, led to the increasing concentration of media ownership.

Characteristics of media markets, such as strong cash flow dynamics, relatively low capital expense, and high growth rate are appealing to investors. Private equity firms showed an increasing interest in media markets and invested in a number of billion-dollar deals involving media firms since the late 1990s. For example, the buyout

of Tribune Co. by the private investor Sam Zell, completed in December 2007, was valued at \$4.3 billion; the buyout of Cengage Learning Inc. by an investor group, announced in July 2007, was valued at \$7.8 billion. Private equity firms eventually sell off their investments. This is one of the factors that contributed to the increase in change of hands of media properties.

Conclusion

The first section of this chapter described the three key approaches to studying media economics, including microeconomics, macroeconomics, and critical perspective. Microeconomics, which examines specific aspects of the economic system, including individual markets, firms, or consumers, is the approach guiding the majority of media economics studies. The SCP paradigm is the most commonly used analytical framework in media economics. The fundamental assumption of this framework is that there is a causal link from market structure to firm conduct to firm performance. Market structure is the focus of most media economics studies in the I/O tradition. Other theoretical domains applied in media economics include concentration studies, niche theory, relative constancy, demand studies, and others.

The majority of media economics studies are empirical research. With different theoretical domains, media researchers use a variety of quantitative and qualitative research methods to examine research questions and hypotheses. Some of the common research methods employed in media economics studies include trend analysis, survey, content analysis, intensive interviews, case study, and secondary data research. Media researchers use these methodological approaches to investigate media firms, industries and markets, audiences, and advertisers.

In the second section, media ownership issues were discussed, including media ownership regulation, concentration of media ownership, and capital and financing of media firms. Media ownership regulation restricts media ownership at both local and national levels to prevent concentration of economic power and to promote diversity of voices. Emerging issues in media ownership regulation include whether or not the industry-specific regulatory approach is still appropriate in the convergence of media industries and whether and how the Internet should be subject to media ownership regulation.

The relaxation of media ownership regulation, combined with development in communication technologies and the increase in investments in media markets, led to more mergers and acquisitions in media industries and thus media consolidation, in the form of horizontal integration or vertical integration. On the one hand, media consolidation can improve the economic efficiencies of media firms due to economies of scale or economies of scope; on the other hand, it can hinder competition, diversity of voices, and localism.

This article concludes that firms operating in monopolistically competitive industries tend to underinvest in product quality.

Waterman, D. (1993). A model of vertical integration and economies of scale in information product distribution. *Journal of Media Economics*, 6(3), 23–35.

In this article, the author proposes a model for the analysis of vertical integration and economies of scale in information product distribution. The author notes that this model can be applied to any industry with differentiated products having the characteristic of economies of scale.

Wimmer, R. D., & Dominick, J. R. (2006). *Mass media research: An introduction* (8th ed.). Belmont, CA: Wadsworth.

This book explains in detail the process and approaches involved in conducting qualitative research, content analysis, survey research, longitudinal research and experimental research, data analysis, and applications of mass media research.

Wirth, M., & Bloch, H. (1995). Industrial organization theory and media industry analysis. *Journal of Media Economics*, 8(2), 15.

This article reviews the basics and development of industrial organization theory and suggests more application of the theory in future media economics research.

Young, D. P. T. (2000). Modeling media market: How important is structure. *Journal of Media Economics*, 13(1), 27–44.

The article provides an overview of the development of industrial organization theory and its implications for empirical research and policy analysis in media economics.

MEDIA POLICY AND REGULATION

JOHN ALLEN HENDRICKS

Southeastern Oklahoma State University

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

First Amendment

The purpose of this chapter is to provide (a) an overview and understanding of the policies that serve as a foundation for media regulation in the United States, (b) an overview of regulatory oversight bodies in the United States, (c) an overview of regulatory policies with 21st-century implications, (d) an overview of policy development for the Internet and future directions for Internet regulation, (e) an overview of the robust debate surrounding the role that marketplace forces versus government forces should play in the development of and oversight of media policy, and (f) a synopsis of the future of 21st-century policy and regulation as it develops domestically and globally.

Despite having been created in the early 20th century, it is essential to examine the past regulatory policies as numerous sections of those policies remain in effect today and are still being enforced by the federal government. Moreover, not only do the policies continue to play a significant role in the day-to-day operations of media outlets, but they also have a significant influential role in the future development of the telecommunications industry in the 21st century. In 2007, Case stated, “The year looks to be business as usual when it comes to government regulation over the media, with perennial issues like media ownership, indecency and the battle between the telcos and cable companies still on the agenda” (p. 16).

The rationale for regulating mass communication has been supported by the scarcity theory, which asserts that there are limited frequency allocations for radio and television stations on the electromagnetic spectrum. Accordingly, broadcasters who are privileged enough to be granted access to the nation’s limited radio and television frequencies, considered a scarce national resource, should attempt to serve the interests of the public in the geographic region to which they are licensed. As a result of the scarcity theory, broadcasters are required through media policy to serve the “public convenience, interest and necessity” within their respective communities. Broadcasters refer to this as the “public interest” standard.

Media Policy and Regulatory Foundations

Radio Act of 1927 (Public Law Number 632 by the 69th Congress)

In the United States, media policy has paralleled the development of media technology. The first notable piece of media policy that was designed to regulate the broadcasting industry was the Radio Act of 1927. The Radio Act

of 1927 was signed into law by President Calvin Coolidge in February 1927 and was designed to eliminate deficiencies in the Radio Act of 1912. The specific objective of the 1927 act was to provide stability to a rapidly proliferating radio industry.

The Radio Act of 1912 was deficient in a number of ways. Notably, it did not provide the Department of Commerce the full authority to regulate the radio industry. The 1912 act did not permit a governmental regulatory agency the ability to regulate the power or hours of radio transmission, allocate frequencies, and deny radio licenses—all of which, were needed at the time to stabilize the new industry.

The radio industry experienced exponential growth during the early to mid-1920s due to the popularity of commercial programming. The development of commercial programming enabled radio stations to generate profits. As is natural in a capitalist society, the profits served as the impetus for the rapid growth of radio. Beginning in 1922, the radio industry made several attempts to impose rules and regulations on its own industry. This attempt at self-regulation failed after several years of annual conferences to work out the details.

After the failed attempts at self-regulation, the Radio Act of 1927 replaced the Radio Act of 1912. The new act contained several important initiatives that allowed for needed regulation of radio to stabilize the industry and reduce chaos over frequency allocations. The 1927 act created the Federal Radio Commission (FRC) to serve as the government's agency to regulate the medium of radio.

The new regulatory agency usurped authority from the Department of Commerce and the Secretary of Commerce and Labor. The president appointed five individuals, or commissioners, to the FRC from five geographic zones in the nation. Those individuals were required to go through the Senate confirmation process. Importantly, the FRC was provided with the authority to allocate radio frequencies and licenses. The Davis Amendment provided that the allocation of radio frequencies, radio licenses, times of operation, station wattage, and wavelength be equally distributed across the designated geographic zones from which the commissioners were appointed.

The “public interest” standard was a component of the 1927 act and, as already noted, is based on the belief that the public at large owns the electromagnetic spectrum, or the radio spectrum, and that individuals should be provided the authority, through licensing, to use a portion of the radio spectrum via radio frequencies. Since applications for radio frequencies outnumber the available frequencies, the individuals who are granted a frequency license must agree to serve the “public interest, convenience, and necessity” of the community in which they are licensed. This requirement by the government to serve the public's interest was not new to the federal government as it had already used the “public interest” approach in earlier legislation that was designed to regulate the nation's public utilities.

Each radio licensee was, and still is, required to document how the broadcast station is serving the public

interest. Although the Radio Act of 1927 provided First Amendment protection, radio programming was not permitted to contain obscene, indecent, or profane language. The courts have ruled that the mass medium of broadcasting is too pervasive to permit questionable programming during times of the day when minors are likely to be present. The FRC was not granted the authority to regulate radio advertising, however. The Federal Trade Commission (FTC) has been assigned that authority.

Communications Act of 1934 (47 U.S.C. 609) (Title 47 of the U.S. Code)

In 1933, President Franklin D. Roosevelt directed Daniel Roper, the Secretary of Commerce, to establish a committee to conduct a study examining the issues of regulating the radio industry and auxiliary communication industries such as telephone and telegraph. The Department of Commerce's report asserted that there was an inadequate regulatory structure in place, thus causing the president and Congress to modify the regulatory structure that had been created by the Radio Act of 1927.

In the Department of Commerce report, it highlighted the fact that the FRC only had authority to regulate wireless communications and needed additional regulatory powers to provide oversight to all communication industries. Accordingly, it was recommended that regulation of both wire and wireless communications be combined under one regulatory agency. Previously, the Interstate Commerce Commission (ICC) provided regulatory oversight to the telephone and telegraph industries. Hence, Congress began the process of drafting a new policy to address the deficiencies. Once the Communications Act of 1934 was crafted, it completely replaced the Radio Act of 1927. The Communications Act of 1934 was signed into law in June 1934 by President Franklin D. Roosevelt.

During the years following the enactment of the act, numerous amendments were made to the Communications Act of 1934 to keep it current with technological advancements. Most notably, amendments to the act were made to address satellite technology, public broadcasting, and cable television. The 1934 act replaced the FRC, whose existence needed to be approved annually by Congress, with the permanent Federal Communications Commission (FCC). The FCC was assigned the authority to grant licenses for telecommunications operators and ensure that rules created by the 1934 act are followed by the licensees. Like its predecessor, the 1934 act also required that broadcasters continue to serve the “public interest,” and they were required to provide documentation of such programming.

The Communications Act of 1934 prevents the FCC from censoring the content of programming. However, the FCC does have the ability to levy huge financial penalties against broadcasters who violate policies regarding profanity, indecency, or obscenity. Observers of the telecommunications industry argue that financial penalties create a chilling effect on free speech and First Amendment

rights. Although indecent programming is protected by the First Amendment, it can only be broadcast during times of the day when children are least likely to hear or see the program.

As already noted, the Communications Act of 1934 was amended as technology advanced. This was especially true in relation to the cable television industry. The FCC asserted in 1962 that it had regulatory authority over the cable television industry since channels were being sent using microwave transmission. The cable television industry challenged this assertion. In 1968, in *United States v. Southwestern Cable Company*, the U.S. Supreme Court upheld the FCC's right to regulate the cable television industry citing its ability to influence the traditional broadcasting industry.

In 1984, the Cable Communications Policy Act was passed by Congress and was an attempt to deregulate the cable industry. This act also gave cities and counties the ability to play a role in cable television regulation by being able to grant franchise licenses to cable operators on entry into local communities. In 1992, Congress passed the Cable Television Consumer Protection and Competition Act, which was designed to regulate rates that cable operators could charge consumers. The 1992 act was also an attempt to create a more competitive marketplace for the cable industry by allowing for more than one cable system per community to operate. In the Telecommunications Act of 1996, cable rates were further deregulated, and policies were designed that encouraged telephone companies to offer cable television services. The 1996 act also permitted cable companies to offer phone service to consumers. This cross-platform approach to encouraging competition was a new philosophy.

**Telecommunications Act of 1996
(47 U.S.C. § 101 et seq., Pub. L.A.
No. 104–104, 110 Stat. 56)**

Although there had been numerous amendments and revisions made to the Communications Act of 1934, Congress found the legislation to be antiquated and in need of attention due to rapid technological advancements. Moreover, Congress wanted to deregulate the communications industry in order to stimulate competition in the marketplace. Thus, the Telecommunications Act of 1996 was passed by Congress and signed into law by President William J. Clinton in February 1996.

The Telecommunications Act of 1996 supersedes the Communications Act of 1934 and is very complex. But there are some key initiatives in the 1996 act that affect 21st-century communications policy and regulation. The basic underpinnings of the Telecommunications Act remain based on the “public interest, convenience, and necessity” standard. Again, it requires broadcasters to serve the interests of the community in which they are licensed.

An important, and controversial, aspect of the 1996 act allowed corporations to own up to 35% of the nation's television viewing households. It was controversial due to concerns of creating an environment where only a few

conglomerates possessed access to the majority of the broadcast frequencies, thus limiting multiple perspectives and opinions. The act eliminated all national radio ownership limits and allowed for corporations to own more stations within each media market. The duopoly rule for radio was repealed, allowing for the ownership of up to eight radio stations in the larger media markets and five stations in the smaller media markets. Critics have argued that rather than create a competitive environment, the 1996 act promotes concentration of power and conglomerate mergers.

The 1996 Telecommunications Act also allows for cross-ownership between media platforms. Telephone companies can now offer cable television service, and cable television companies can offer telephone service. Specifically, telephone companies are permitted to offer video service as an over-the-air provider, as a common carrier, as a cable television system, and as an open video service that is a hybrid cable system and common carrier. To avoid paying franchise fees to local cities and counties, cable television companies are permitted to provide video service as an open video system. The 1996 act permits consumers to purchase their own set-top boxes to acquire programs. Before the 1996 act, consumers were required to pay monthly fees to cable television companies for set-top boxes. The 1996 act also permits consumers complete access to direct broadcast systems (DBS) and prevents any local entities from banning satellite dishes.

The Communications Act of 1934 required that licenses for television stations be renewed every 5 years, whereas radio stations had to go through licensure every 7 years. In contrast, the Telecommunications Act of 1996 changed the licensing periods for both television and radio to 8 years and simplified the renewal process. The FCC will automatically renew a station's license for an additional 8-year period if during the previous 8 years, (a) the station has demonstrated no patterns of abuse, (b) the station has no serious regulatory violations, and (c) the station has served the public interest.

The Telecommunications Act of 1996 also assigned a digital television channel to all existing analog television channels at no cost to the existing channel licensee. Initially, all television analog channels were scheduled to be phased out by February 2009. But, Congress approved a request by President Barak Obama to move the date of the analog-to-digital transition from February to June 2009. The Obama administration was concerned that rural residents were not prepared for the transition. To assist with this monumental transition, Congress passed the Digital Television Transition and Public Safety Act of 2005, which included a provision designed to help consumers make an affordable transition to high-definition, or digital, television. It provides coupons to offset the cost of set-top boxes to convert the digital signals back to analog signals since many consumers still own analog television sets at the time of the conversion. The 2005 act allows all

U.S. households to obtain a maximum of two \$40 coupons to offset the cost of the converter boxes. Only consumers whose television set is analog and channels are received over the air will need the converter box.

The 1996 act focused on programming content regulation. It established fines for programming that transmitted obscene, lewd, or indecent material with the intent to harass another individual. The Communications Decency Act (CDA) was included in the 1996 act; however, in *Reno v. ACLU* (1997), the U.S. Supreme Court ruled that the CDA was unconstitutional. The act also required cable television systems to scramble all audio and video of any indecent programming at no cost to the consumer.

Furthermore, the act required that all new television sets include a V-chip to allow parents to block violent or other inappropriate programs to prevent children from being exposed to them. All programs would include ratings that were assigned based on the content of the programs. Interestingly, a much noted weakness of the 1996 act is that it did not anticipate the rapid rise of the Internet. Maxwell (2005) stated, “Tellingly, the 1996 Act mentions the Internet in only two sections—those dealing with ‘communications decency’ and universal service support for providing Internet access to schools and libraries” (p. 15). And the communications decency portion of the legislation was deemed unconstitutional by the U.S. Supreme Court.

Regulatory Oversight and the 21st Century

Communications policy is created by, and regulated by, several federal agencies. They include (a) the FCC, (b) the FTC, and (c) the Internet Corporation for Assigned Names and Numbers (ICANN).

Federal Communications Commission

Before examining the structure of the FCC, it is important to review its predecessor. The Federal Radio Commission (FRC) was created as a result of the Radio Act of 1927, and its primary role was to establish policy and regulations for the burgeoning radio industry, which included assigning frequencies and issuing licenses. The proliferation of new radio stations and the emergence of television created a need to modify the oversight structure. Accordingly, the Communications Act of 1934 replaced the FRC with the FCC. The FCC’s first day of operation was July 11, 1934, and it has remained in operation since that time as the federal agency responsible for providing regulatory oversight to the telecommunications industry.

Specifically, the role of the FCC is to regulate the telecommunications industry, which includes telephone, telegraph, radio, television, cable, satellite, and video-programming distribution. Notably, the FCC does not have

regulatory powers over the Internet. Individuals, known as commissioners, serve on the FCC. In 1982, as a result of political partisanship, Congress changed the membership from seven commissioners to five commissioners. The commissioners are all appointed to 5-year terms by the president and go through Senate confirmation prior to serving. There can be no more than three members from any one political party. The president gets to designate one of the five members to serve as chair of the FCC, and this individual serves as the commission’s leader.

Federal Trade Commission

The FTC was created by Congress in 1914 to establish policy and regulations for the advertising industry. There are five commissioners of the FTC who are appointed to 7-year terms by the president and must go through Senate confirmation prior to serving. Like the FCC, there can be no more than three commissioners from the same political party on the FTC at the same time. Hence, the president’s political party most always controls the majority of the membership of the FTC. The responsibility of the FTC is to identify unfair and deceptive advertising practices.

Internet Corporation for Assigned Names and Numbers

The ICANN was created, in 1998, by a Memorandum of Understanding between the U.S. Department of Commerce and the ICANN to provide oversight of the Internet’s unique system of identifiers to the global community. Although the ICANN is not responsible for creating or enforcing any Internet regulatory policy, it does, however, play an essential role in the oversight of the Internet.

Specifically, the ICANN globally coordinates (a) the allocation and assignment of all Internet domain names, (b) Internet protocol and autonomous system numbers, and (c) protocol ports and parameter numbers. The ICANN also coordinates the operation and evolution of the domain name system, root name server system, and it coordinates all policy development related to these technical functions. The ICANN replaced the Internet Assigned Numbers Authority (IANA), which was operated at the University of Southern California through a contract with the Department of Defense. The ICANN maintains a 5-year contract to oversee the Internet, consisting of 1-year renewals.

Regulatory Policies With 21st-Century Implications

Fairness Doctrine

In 1949, in the *Report on Editorializing by Broadcast Licensees*, the FCC created the Fairness Doctrine. Its objective was to ensure coverage of controversial issues as

well as to ensure that multiple viewpoints were provided. The doctrine was modified by Congress in 1959 with Chapter 315(a) of the Communications Act of 1934, by requiring broadcasters not only to provide coverage of controversial issues within the communities to which they were licensed but also to specifically provide multiple viewpoints of the controversial issues through (a) public affairs programming, (b) editorials, and (c) news coverage.

Fairness Doctrine rules also applied to political editorializing. For example, if broadcasters endorsed political candidates, then the opposing candidates were allowed an opportunity to respond to the radio or television station's political viewpoint. There was much debate about the Fairness Doctrine's constitutionality. However, in 1969, the U.S. Supreme Court upheld the constitutionality of the Fairness Doctrine in *Red Lion Broadcasting Company v. Federal Communications Commission*. The Red Lion decision discredited the arguments that the Fairness Doctrine violated First Amendment rights.

Despite the Supreme Court's decision, the Fairness Doctrine remained a controversial policy. In 1987, the FCC abolished the Fairness Doctrine. Through the Syracuse Peace Council decision, the FCC repealed the Fairness Doctrine on the grounds that it infringed on the First Amendment rights of broadcasters by creating a chilling effect pertaining to coverage of controversial issues. Moreover, the FCC believed that the proliferation of new media had provided adequate additional avenues for expressing contrasting viewpoints.

In an attempt to reinstate the Fairness Doctrine, Congress passed the Fairness in Broadcasting Act of 1987, but President Ronald Reagan vetoed the act. Despite its demise, there is robust debate as to whether the Fairness Doctrine should be reinstated. In 2007, Congress considered reinstating the Fairness Doctrine, but the attempt failed. The political editorial rule remained in effect until 2000, and that aspect of the Fairness Doctrine has not been revisited.

Indecency and Obscenity

Indecent material is legal and is protected by the First Amendment. The U.S. Supreme Court defined indecency in the *FCC v. Pacifica Foundation* case in 1978. In the *Pacifica* case, the Court asserted that material was indecent if (a) sexual or excretory organs or activities are depicted and (b) community standards would deem the work to be patently offensive. To further clarify the definition of indecency, the FCC considers the context in which the material was broadcast. The FCC considers (a) how explicit or graphic the material is, (b) if the material only focuses on sexual activity, and (c) if the material is designed to disturb or sexually excite the audience. Due to its subjective nature, both courts and broadcasters have a difficult time determining whether programming falls within the legal parameters.

Media policies have prevented broadcasters from airing obscene, indecent, or profane language since the Radio Act of 1927. The FCC has established hours during the day when indecent material may be aired. These hours are referred to as "safe harbor" hours since they are times when children are least likely to be listening to the radio or watching television. The safe harbor hours are from 10:00 p.m. to 6:00 a.m.

Obscene material is not legal and has no First Amendment protection. One of the first attempts to regulate obscene material took place in 1873, when Congress passed the Comstock Act, which prohibited the mailing of obscene, lewd, or lascivious items relating to contraception and abortion. The act was named after Anthony Comstock, who lobbied Congress to pass the legislation. In 1876, the act was amended to include pornography. Anthony Comstock was appointed as a postal inspector to enforce the act and held the position for 42 years. Even today, it is still against the law to mail any materials deemed obscene.

As courts ruled on obscenity violations, it became clear that there were different applications of the law being applied. Accordingly, the U.S. Supreme Court made a landmark ruling in 1973 that defined whether a material was obscene or indecent. In *Miller v. California*, the Court asserted that a material is obscene if (a) an average person, applying local community standards, found that the material as a whole appealed to prurient interests, or morbid and shameful sexual thoughts; (b) the material depicts, in a patently offensive manner, sexual conduct; and (c) the material has no literary, artistic, political, or scientific value whatsoever. All three parts must be met before an item is deemed obscene. Again, obscene material does not have First Amendment protection.

Despite the U.S. Supreme Court's three-pronged definition of obscenity, there still remain confusion and challenges in the legal system regarding whether a material is obscene or not. Moreover, when 21st-century technology is added, things become even more unclear. In 1996, in *United States v. Thomas*, a federal appellate court upheld the local community standards prong of the Miller test. In this specific situation, a U.S. postal inspector ordered videotapes containing sexually explicit material from an Internet bulletin board.

The Internet bulletin board was based in California, while the postal inspector who ordered the videotape was in Tennessee. As a result of mailing the videotape across state lines, the Internet bulletin board operator was charged in Memphis, Tennessee, and found guilty of distributing obscene material. The Internet bulletin board operator appealed the conviction, asserting that local community standards cannot be applied in this situation since the Internet is not defined to any specific geographic area. The appeals court rejected the argument and reiterated that local community standards apply to obscene materials regardless of the Internet's uniqueness. Interestingly,

although obscene material is illegal to make, sell, exhibit, and distribute, it is not illegal to have obscene material in private possession. Of course, this provision excludes child pornography. The assumption is that the federal government cannot tell people what to watch or read.

Copyright Law

The proliferation of new media in the late 20th and early 21st centuries has created situations where regulation and policy have been developed to address specific needs arising from these technological advancements. In 1790, the first U.S. Congress created a copyright, and it has been modified many times since its original draft. In 1870, the U.S. Congress created the Library of Congress and provided it with the responsibility of serving as archivist and depository of copyrighted materials. There were slight modifications made to the Copyright Act in 1909 that extended the length of time that a material can have copyright laws applied.

In 1976, the Copyright Revision Act was passed by Congress to address the special needs of new technology. However, due to the rapid proliferation of technology, the copyright law eventually faced some shortcomings. New technology such as the Internet required that Congress take another look at modifying the law. In 1998, Congress passed the Digital Millennium Copyright Act (DMCA), which was designed to address the new copyright problems associated with the proliferation of 21st-century media. It was designed to address the copyright issues surrounding digital media and the Internet. The DMCA protects Internet Service Providers (ISPs) from being prosecuted for copyright infringement if subscribers violate the law. Instead, the individual subscriber is held responsible.

With regard to Internet copyright infringement, peer-to-peer file sharing of copyrighted material has been found by the U.S. Supreme Court to be a violation of the law. In previous court decisions, peer-to-peer file-sharing networks such as Napster, Grokster, and Morpheus were found liable for copyright infringement since they knowingly provided a forum for the sole purpose of copyright infringement. Interestingly, the Supreme Court differentiated these peer-to-peer file-sharing networks from Sony's Video Cassette Recorder (VCR), arguing that the VCR had the ability to offer users options other than just copyright infringement.

Future Directions: 21st-Century Policy Considerations for the Internet

Like the print media, the Internet has full First Amendment rights and remains unregulated by the FCC. The ICANN is responsible for assigning domain names and providing some standardization to the Internet for the

global multitude of computers to communicate with each other creating networks.

Although the Telecommunications Act of 1996 contained the CDA, which prohibited the distribution of obscene, indecent, or patently offensive material to children, as noted earlier, the U.S. Supreme Court reviewed the constitutionality of the CDA and found it to be an infringement on First Amendment rights. In *Reno v. ACLU* (1997), the U.S. Supreme Court noted that the Internet is not a scarce commodity such as broadcast frequencies. Instead, the Supreme Court noted that parents had an option to not subscribe to Internet services if they did not want their children to be exposed to indecent material. The Supreme Court asserted the Internet was not as invasive as broadcasting.

In 2005, in *National Cable & Telecommunications Association v. Brand X Internet Services* (125 S. Ct. 2688), the U.S. Supreme Court ruled that the ISPs are not regulated by the FCC. Despite efforts by the Telecommunications Act of 1996 to deregulate the communications industry and encourage marketplace competition to lower prices for consumers, the U.S. Supreme Court ruled this aspect of the act unconstitutional. With regard to an ISP and a cable television company, the Court ruled that the FCC cannot require cable television companies to lease their cable lines to external ISPs in order to offer consumers additional Internet service options via cable modems. The FCC initially reasoned that additional competition would produce competitive rates.

Internet advertising has limited regulation. The FCC and the FTC provide regulatory oversight to both the Internet and broadcast advertising industries. Several policies have been passed by Congress to help regulate Internet advertising. In 2003, Congress passed the Controlling the Assault of Non-Solicited Pornography and Marketing (CAN-SPAM) Act, which was designed to prevent unwanted electronic mail advertising, referred to as spam. The CAN-SPAM Act prohibits false identity headers in electronic mail and requires that electronic mail advertisements have unsubscribe, or opt out, options available to consumers. Unlabeled pornographic material was also prohibited from being sent to consumers under the CAN-SPAM Act.

In 2005, several states passed legislation that prohibited Internet advertisers from embedding spyware software on consumer computers. Spyware is software that remotely attaches itself to consumer computers and obtains personal information about the Internet habits of consumers in an effort to target advertising that might interest consumers based on previous Internet usage patterns. Spyware software also has the potential to allow for theft of personal information from computer hard drives. Accordingly, most states have passed legislation prohibiting spyware software from attaching itself to computers without the consumer's knowledge and permission.

To protect intellectual property, or copyrights, there was a global, multilateral approach to regulating this aspect of

the Internet. The World Intellectual Property Organization (WIPO) Performances and Phonograms Treaty of 1996 was adopted by 171 countries around the world. The WIPO was designed to enforce copyright laws around the globe and officially applied international copyright law to the Internet. Although this was an important first step in enforcing copyright law on the Internet, Eko (2001) stated that “given the fundamental cultural and legal differences among nations with respect to certain aspects of intellectual property and moral rights, the harmonization of different, even conflicting intellectual property law regimes on the Internet is still a work in progress” (p. 456).

Global Comparison

The United Nations is examining the manner in which the United States regulates the Internet in a way that might encroach on Internet usage in other countries around the world. McChesney (2004) asserted, “Linked closely with the tempestuous negotiations surrounding global and regional trade deals and economic agreements, the future of the Internet is anything but certain” (p. 220). In 2005, at the World Summit on the Information Society, nations discussed the governance of the Internet and whether the United States should remain in charge of key Internet governance issues.

The European Union was not comfortable with the United States having unilateral control of the Internet through the ICANN and instead preferred a more multilateral approach to Internet governance. Geist (2005) stated,

It is difficult to fault the European Union and other foreign governments for expressing discomfort with a system that grants ultimate control over the Internet to a single government. Dozens of countries, including Canada, have identified the Internet as a critical public resource that plays an essential role in commerce, communication, and delivery of social services. While it is unlikely the U.S. would shut down the domain name system of another country, the threat that such a power exists is justifiably worrisome to many government leaders. (p. D03)

Despite the controversy surrounding Internet policy development and regulation on a global scale, Eko (2001) stated,

The nations of the world find themselves struggling to develop regulations and policies for a medium that has been so successful in inter-connecting computer networks around the world in such a short time that policy makers have not had the time to think through the complex implications of the technology on international communication, commerce, economic development and cultural exchanges. (p. 447)

Thus, the basic foundation for a regulatory structure and ancillary policies for the Internet in the 21st century remains a work in progress.

21st Century Regulation: Marketplace Forces Versus Government Oversight

In the 1920s, when the radio industry requested the government to intervene and provide regulatory oversight to minimize the confusion of frequency crowding, it was indeed an unprecedented move by a market-driven, commercial industry. What started as an unbiased mediator for broadcasters in the 1920s has blossomed into a juggernaut with an established regulatory agency, known as the FCC, which wields an enormous amount of regulatory influence and oversight.

There have been cycles of increased regulation and cycles of deregulation by the FCC. There has been, and remains, a very robust debate surrounding the continued need for government regulation of the telecommunications industry in the 21st century. Although the mid-1990s brought deregulation to the telecommunications industry in a major new policy, some observers believe that additional policies to deregulate are still needed. Maxwell (2005) asserted,

The 1996 Act made positive contributions to the telecommunications industry, particularly by facilitating competition in local telecommunications. But it was built on a foundation of legal and regulatory categories created over the preceding 60 years that have grown increasingly inconsistent with today’s marketplace. These inconsistencies now stand as a barrier to even more competition and even greater innovation. And while the Act was avowedly deregulatory, the FCC created more regulations than it eliminated, in effect attempting to stimulate competition while, at the same time, managing it. (p. 5)

McChesney (2004) observed that media policy is very important in the development of media industries and argues that policy created by and implemented by the federal government is what creates and perpetuates technological advancements. For example, the government created radio, satellite, and Internet technologies and then gave those innovations to the commercial industry. To illustrate the important role media policy plays in the development of new technology, the development of high-definition television, or digital television, is used as an example. McChesney suggested that high-definition television channels could have doubled the number of channels from which the public could choose; instead, the National Association of Broadcasters (NAB) successfully lobbied Congress to give the digital channels to existing television station owners to broadcast existing analog content side by side, thus reducing competition and reducing additional options for consumers.

Even though the government created the new technologies and stabilized them before handing them over to media industry leaders, McChesney (2004) further asserted that “any future efforts to exact public service from the

huge firms granted all these privileges will be dismissed as a callous attempt by the government to interfere with the free market” (p. 215).

McChesney (2004) suggested that despite regulatory attempts to create a media environment that encourages competition and promotes more options for consumers, an oligopoly has been created instead where only a few conglomerates control the media. Accordingly, this environment reduces competition and reduces more options for consumers. McChesney stated,

It means that media markets may “give the people what they want,” but will do so strictly within the limited range of fare that can generate the greatest profits. The more competitive the market, in economic theory, the more control consumers have over expanding that range. The argument in oligopolistic markets becomes circular: people consume from a relatively narrow range of what media firms find most lucrative to produce; then when consumers select from these options, the firms say, “See, we must be giving you what you want.” (p. 199)

In contrast, Maxwell (2005) stated,

Anti-competitive acts should be prevented, and the industry should draw upon the lessons of the Internet in promoting open systems, such as ensuring that all of the disparate platforms can be interconnected. A key component of policy in the new era of telecommunications will be the principles of openness—openness regarding platforms, network attachments, applications, and content—and the prevention of unreasonable discrimination that reduces openness. (p. 33)

Conclusion

From a policy and regulatory perspective, the Internet has become and will remain a major force in the 21st century. Every policy developed and every regulatory action taken both within the United States and by other nations around the globe must account for the Internet. The Internet and ancillary technological advancements of new media have altered the traditional manner in which media policies and regulations occur.

Past regulatory efforts have focused on media that were confined to specific geographic regions or nations. The Internet has completely changed this paradigm of media policy development and media regulatory attempts. The Internet has no geographic boundaries, and enforcing policies is oftentimes difficult, if not impossible. Due to the global nature of the Internet and its lack of geographic boundaries, nations are changing the way in which regulatory policy development is approached. Regarding global Internet regulatory attempts, May, Chen, and Wen (2004) noted that the “movement toward global regulation of Internet activity is not an easy task. Rooted in each state are cultural, political, social and economic differences that impact approaches and perspectives on regulation and regulatory methods” (p. 260).

The proliferation of new media and the rapid advancements of technology are changing the way in which consumers obtain news, listen to music, and even watch television. In 2007, the Internet World Usage Stats reported that more than 1.1 billion people worldwide were accessing the Internet and the worldwide Internet penetration is at 16%. Although the United States has the largest number of Internet users, there are still significant numbers of users from every corner of the globe who are quickly adopting new technologies, and these new Internet users bring cultural and language barriers to the policy table for consideration. These numbers and demographics are expected to continue to increase as technology becomes more affordable and even more user-friendly. Thus, there will be a need for a multilateral approach to regulation and policy development of the Internet in the 21st century. Some nations argue that non-governmental regulatory agencies such as the ICANN should not have complete authority to oversee the Internet outside the United States. Some nations have challenged its mission.

In 1999, William E. Kennard, the chairman of the FCC at the time, delivered a report to Congress titled *A New Federal Communications Commission for the 21st Century*. The report noted that technological advancements had changed the landscape of media regulation and policy development and that the FCC needed to modify the manner in which it approaches its mission in the 21st century. The report stated that those core functions included (a) providing universal service and access to all citizens, (b) consumer protection and privacy, (c) promotion of pro-competitive goals both domestically and globally, and (d) oversight of the electromagnetic spectrum. The report stated, “In the [media] marketplace of tomorrow, it is expected that traditional industry structures will cease to exist” (p. 3).

RADIO AND TELEVISION PROGRAMMING

LYNNE SCHAFFER GROSS

California State University, Fullerton

Programming is at the heart of radio and television operations. Various distribution techniques (terrestrial broadcast, cable TV, subscription TV, satellite radio, Internet, etc.) come and go. But one thing remains constant: the need for desirable content. This need is constantly increasing. In the 1920s, there were fewer than 400 radio stations (White, 2003), and today there are more than 13,000 AM and FM stations (Regents, 2003), most of them operating on a 24-hour basis. In addition, there is satellite radio, cable radio, Internet radio, and podcasting, all of which need audio content. In the television realm, NBC aired 601 hours of programming during 1939, its first year of broadcast (Shanks, 1976, p. 65). By 1979 it was airing 7,000 hours per year (Auletta, 1991, p. 93). Add to that the many hundreds of broadcast and cable networks, satellite television, Web sites, and other forms of distribution, and it is easy to see that the appetite for program material is insatiable.

People involved with programming are the ones who initiate content ideas or solicit them from others. From the idea stage, they develop the concept into a workable product that people will want to watch or listen to. They then decide how best to make the program available by planning its scheduling and distribution. At some point, they evaluate the effectiveness of their work and make changes, if necessary. Meanwhile, of course, they are initiating, developing, and scheduling new programming projects.

This chapter will discuss these various processes related to programming, pointing out similarities and differences among the various distribution channels. It will describe where programming comes from, how it finds its way to an increasingly elusive and fragmented audience, and how the

programming process might change in the future. But first, to set the stage, here is a short history of programming.

A Short History of Programming

The concept of programming did not exist when radio first started in the 1920s. The novelty of radio was such that people would stay glued to the earphones of their huge battery-operated sets just to hear someone reciting call letters from an early radio station. Free talent wandered into stations to sing, recite poetry, or play musical instruments, but eventually the novelty wore off, and performers wanted to be paid. After stumbling through several experiments, radio practitioners settled on advertising as a means of raising money, despite the fact that the then–Secretary of Commerce Herbert Hoover opposed advertising saying, “It is inconceivable that we should allow so great a possibility for service to be drowned in advertising chatter” (Barnouw, 1966, p. 96).

Advertising chatter, however, prevailed, and in the 1930s, most of the programming was undertaken by advertising agencies. Several networks (NBC, CBS, ABC) had been formed to distribute programs to stations throughout the country, and advertising agencies bought blocks of time and filled the time with programming and mentions of the sponsor and its product line. Often the product became part of the story line—the show’s announcer would visit Fibber McGee and Molly and talk about waxing the floor with Johnson’s Wax. The advertisers came up with concepts, hired the talent, and oversaw production. They paid the networks to distribute the programming, but the networks

did little programming decision making. As long as the advertiser was happy with the program and its time slot, it was left alone. As a result, many programs aired on radio for years. For example, Jack Benny was on radio from 1932 to the mid-1950s at 7:30 p.m., Sunday, sponsored primarily by Jell-O.

When television started in earnest in the late 1940s, it adopted the same model. Advertising agencies provided the networks with *Texaco Star Theater*, *Kraft Television Theater*, *Alcoa Hour*, and many other similarly named shows. But television production proved more expensive than radio production, so it was difficult for one sponsor to pay all the costs associated with a weekly series. The old advertising-agency-dominated programming model started to fray. In some instances, several companies would share the costs, and the program would be “brought to you by Buick, Lucky Strike cigarettes, and Ivory soap.” The downside of this was that viewers did not identify the program with the product as they had during radio’s heyday (Sterling & Kittross, 1990, p. 161).

Then came the quiz show scandals of the late 1950s. Quiz shows, where contestants locked in soundproof booths agonized as they tried to answer difficult questions, were big moneymakers for advertisers. Audiences were large and engaged to the extent that products from Revlon, which sponsored *The \$64,000 Question*, sold out nationwide. When it was discovered that popular contestants had been coached to keep them on the air, Americans’ trust of television plummeted. There were many speculations about who knew about this coaching—advertisers, agency executives, TV network programmers, but the end result was that television executives decided to take charge of their programming rather than depending on the advertising agencies to supply it to them (Goodwin, 1989, pp. 51–52).

Actually, the trend toward broadcaster control of programming had started before the late 1950s. When television became popular in the late 1940s, it took away most of radio’s prime network shows and the talent associated with them. Radio had to reinvent itself and did so mainly by programming music hosted by local disc jockeys who appealed to the new radio audience—teenagers. Radio became a locally based medium, with different stations emphasizing formats of music rather than individual programs. This style of programming was not conducive to sponsorship by individual advertisers. Rather, the stations began selling ads (called spots) for insertion within their programming. The programming decisions rested with local program managers and station managers.

In the television of the mid-1950s, there were strong-minded executives who wanted to control their own programming. One was Sylvester L. “Pat” Weaver who, while president of the NBC from 1953 to 1955, devised what he called the magazine concept. Advertisers bought commercial insertions in programs such as “Today” or “Tonight” and had no say about content. But it was the quiz scandals

that pushed program decision making from the ad agencies to the TV executives (Peysner, 1979).

Network executives now began to consider their programming schedule as an overall entity. They developed strategies—some to keep the audience watching their particular network throughout the evening, some to get viewers to sample programming, all to increase their revenue and recognition. Audience measurement became important, and executives canceled shows that did not have adequate ratings. They created broadcast standards and practices departments to function as internal censors to keep off objectionable programming with the intent of reassuring the public that responsible people were minding the store. Networks and stations still worked with advertising agencies to obtain ads, but it was the broadcasters who were in the programming driver’s seat. Throughout the 1960s, this was a very lucrative driver’s seat, not only for ABC, CBS, and NBC but also for local TV stations, because most of them were affiliated with a network.

Then several things happened that complicated programming decision making for network executives. In 1970, the Federal Communications Commission (FCC) took a look at TV network programming practices and decided that the networks had too much power. Not only did they produce and own much of the programming, but when they did buy programs from independent sources (such as Norman Lear’s Tandem-TAT or Aaron Spelling Productions), they usually established financial interest in that programming and received part of the profit when the show was sold in syndication for reruns. The FCC thought that this gave the networks too much power, and so it instituted financial interest and domestic syndication (fin-syn) rules that barred networks from having a financial interest in programs produced by outside companies and forbade the networks from receiving money from syndication. The FCC also imposed limits on how much of their own programming networks could produce themselves. All this led to a healthy independent production landscape, wherein proprietors of small companies could pitch ideas to network programming executives and make substantial money when the programs were aired and rerun, but the networks’ profits declined (Vane & Gross, 1994, pp. 55–57).

Something else that happened in the 1970s was that the number of independent television stations grew. Prior to the 1970s, most of the TV stations had been affiliated with ABC, CBS, or NBC, and those that weren’t aired primarily network reruns. The FCC, mainly because technology had improved, authorized many additional TV stations in the early 1970s. These stations strived to do something new that was not on the networks. Some of them capitalized on movies or local interests, and many bought “first-run” programs—ones sold by independent production companies and syndicators who produced the shows with the idea that they would be shown on stations as opposed to the networks. Independent stations grew from 28 in 1961 to 103

in 1979 and to 339 in 1989 (INTV, 1990). This growth further fueled the independent production companies and also cut down, to some degree, network viewership.

Public television and radio came to the fore after the Public Broadcasting Act of 1967 made them viable entities (Avery & Pepper, 1980). This further increased viewing and listening options, but it also enabled the networks and stations to try to reduce their public service programming, stating that public broadcasting was there to fill that need. Also, several new broadcast commercial networks (Fox, then UPN and WB, which merged into CW) emerged to further erode the TV audience of the original three networks.

The real force to fragment viewing, however, was cable TV, which exploded during the 1980s. Once a sleepy form of distribution meant to extend the range of TV stations' signals, it came into its own after satellites were developed. These satellites were able to transmit multiple networks (HBO, Showtime, ESPN, CNN, etc.) to cable TV head-ends, and from there they were sent by wire to subscribers' homes. The number of cable TV networks rose from 8 in 1980 to 290 in 2003 (Hofmeister, 2003). Program decision making at these networks differed from that of the broadcast networks. Rather than trying to obtain the largest possible audience like the networks did, the cable networks went after niche audiences—children, sports fans, adherents to a particular religion. Cable networks adopted or revised some of the broadcast network programming strategies and created some of their own.

One of the offshoots of cable TV's popularity was that the broadcast networks were able to convince the FCC that they were no longer the powerful forces they had been in the 1960s. They pointed out that they were being hamstrung by the fin-syn rules because they were not able to produce and profit from the programs they aired, whereas the cable networks had no such restrictions. In 1995, the FCC agreed with the broadcast networks and abolished fin-syn (Bielby & Bielby, 2003). What happened, of course, was that the broadcast networks began producing much of their own programming, cutting down the amount of work available for independent production companies.

Meanwhile radio was slowly changing from a local medium to a national one, but one that was very different from original radio. Congress passed the Telecommunication Act of 1996, allowing companies to own more radio and TV stations than in the past. Several companies started on a radio-station-buying spree and wound up programming many stations but still giving them a local feel. Among other tactics, they developed voice tracking, wherein one announcer would, at one sitting, read material for many stations, making it sound local with local weather forecasts and the like. This material would be interspersed with music played on all the stations. The whole radio network and syndication market grew as the demand for programs that were not truly locally produced expanded (Perebinosoff, Gross, & Gross, 2005, p. 16).

The 21st century has seen a variety of distribution forms emerge—satellite TV, satellite radio, the Internet, cell phones, iPods. With digital video recorders, CDs, DVDs, and various other consumer goods, people can “program” for themselves, deciding when they want to watch or listen to particular material. Ordinary individuals can also participate as sources of programming to a much greater extent. But content is still king; people must come up with ideas that interest others, and these ideas must be taken through a process so that they can reach an audience. That is what programming is all about.

Sources for Program Ideas

Program ideas can come from just about anywhere—a newspaper story, a dream a TV executive has, something overheard in an elevator, a best-selling book. However, simply having a good idea does not make a TV series. Most ideas must be funneled through an organized structure of suppliers that provide the money and technical and production know-how to make programming a reality. Yes, several friends can shoot and edit a 2-minute production starring their dogs and put it on YouTube, but that is not likely to be financially rewarding. It takes companies with “deep pockets” to withstand the many programming failures while awaiting the next big hit.

In the media business, the people in stations and networks (both cable and broadcast) come up with ideas for much of their own programming. ESPN executives, for example, decide which sports events they want to telecast and then bid against other networks for the rights to cablecast the event. Producers on the staff at NBC decide what items will be included in each *Today* show. In the same manner, local TV station employees decide what will be aired on their 5:00 p.m. newscast, and radio station programmers select music to play. Sometimes a network executive will come up with an idea (e.g., a reality show featuring ex-cops) and then hire someone from the outside who has a successful track record to actually execute the idea. In recent years, networks have merged with movie studios (ABC/Disney, CBS/Paramount, NBC/Universal, CW/Warner). In a symbiotic relationship, the network executives use the studios to produce programs, and executives at the studios take their ideas to the network.

Television outlets also get ideas and programs from independent production companies. Known as “indies,” these are usually small companies whose owners function as the chief creative contributors—Steven Bocho, Robert Greenwald, Jerry Bruckheimer, David E. Kelley. These people come up with ideas and pitch them to the network executives, who then decide whether or not they like the idea. Since the abolishment of fin-syn, these indies get less work from the broadcast networks than they used to, but they are still hired for some projects, and they pitch to cable networks and other forms of distribution. Sometimes

these indie companies have umbrella deals with the larger major movie production studios. They are housed on the studio lot, and the studio helps finance and sell the indie products in return for sharing in any financial success. For example, John Wells's company (*ER*, *The West Wing*) is housed on the Warner lot, and Dick Wolf (*Law & Order*) is with Universal (Perebinosoff et al., 2005, p. 30).

The major studios and the indies sell the program to whoever will buy it. It helps to have an ownership relationship with a particular network, but there is nothing to keep Universal from selling an idea to ABC, even though it is part of NBC Universal. In addition, the movie studios supply their theatrical movies to whichever entities will buy them—CBS, Lifetime, Showtime, Netflix, and so on.

There are many other sources stations and networks can look to as they are trying to fill all their hours with programming. A number of them research and use programming from other countries. Public radio and television have aired a great deal from England, as has A&E, and there are cable channels and radio stations that program material specifically from another country. In addition, American companies often coproduce with other countries, in part so that the program or series will have a good chance of airing in all the participating countries.

Syndicators are also a source of programming material. These are companies that package material from other sources and create some themselves. They may, for example, purchase rights to 10 movies from Paramount and package them as “adventure movies” to be run on TV stations. The programs that are produced for TV syndication tend to be game shows, talk shows, and tabloid news such as *Wheel of Fortune*, *The Oprah Winfrey Show*, and *Entertainment Tonight*. For radio, many talk shows, such as Rush Limbaugh and Dr. Laura, are syndicated. The line between network and syndicator is blurred in radio in that both offer programs that radio stations can cherry-pick (Keith, 2004, pp. 330–333).

On occasion, advertisers still come up with programming ideas, such as Hallmark Hall of Fame. In fact, some stations and networks choose to air infomercials, which are really 30-minute advertisements that appear to be information shows because they include interviews and demonstrations related to a particular product.

Companies that own many TV or radio stations sometimes come up with a programming idea and try it on one station. If it is successful, it becomes a programming idea for all the other owned stations.

The Internet is awash with ideas for programs. Every computer has the potential to be a source for program material. Many conventional distribution forms such as networks and syndicators are putting programs or parts of programs on the Internet (and cell phones, iPods, and other electronic gadgets), as well as their usual channels. Hundreds of individuals have established Internet-only radio stations and programming on YouTube, which would have been unheard of in the past. Just where all this will

lead in terms of idea generation is yet to be determined. But new ideas are always welcome. Anyone who has had a programming job that involves coming up with material to fill a channel 24 hours a day 365 days a year will attest to that.

The Development Process

Once programmers feel that they have found a good idea, be it one of their own or one pitched by someone else, they must shape, fine-tune, and perfect it so that it is ready for public consumption. This process is called development—sometimes referred to as “development hell.” Many people find it hellish because it is time intensive and very costly and the odds for success are exceedingly slim. It is difficult to develop a TV series that has the potential to make millions of dollars in syndication, a radio format that will bring a station from Number 10 in the ratings to Number 1, or a new reality show that will be first in its time period.

Development differs from medium to medium and project to project, but there are a number of steps commonly taken. One of these is obtaining rights, especially if the idea is based on a book or a person's life. This step should definitely involve legal counsel that can draw up a contract stipulating the nature and duration of the agreement, any compensation that will be given and how it will be distributed, how the credits will read, whether the purchaser can assign rights to another party, and other important stipulations. One tricky decision involves when to ask for the rights. Ideally, the person with the idea should have rights even before pitching the idea so that securing rights does not slow down the development process. But obtaining even tentative rights usually costs money, and then if the project goes nowhere, that money is lost.

To help move some projects through development, it is wise to attach a well-known star, writer, director, or executive. The downside is that the well-known people attached may not be right for the idea, and once they have been attached they are hard to get rid of. Sometimes it is better (and cheaper) to go with unknowns who can become stars, such as happened with the cast of *Friends*.

The pitch that is made for a project is very important and sets the stage for many other factors related to development. Whether the pitch is coming from an independent production company, a radio station disc jockey, a programming vice president trying to convince a network president, or anyone else, it should have an easily understood concept. Sometimes this concept is referred to as a log line because it is often what winds up on various program guides that describe a show in 25 words or less. It must be attention getting, informative, pithy, and short—something that both a busy executive and a potential audience member can grasp easily. Many successful log lines start with “when” or “after”—“When a stockbroker's life is threatened, he . . .” or “After the woman has been jilted

by her long-time lover, she . . .” Other things people should think of before pitching an idea to someone else include the following: Who are the main characters? What are the conflicts? How are the conflicts resolved? What is the opening scene? How can the show (or series, or format) be promoted?

It is difficult for a newcomer to get a pitch meeting with a high-level network executive (Koch, Kosberg, & Norman, 2004, pp. 81–88). Usually, executives want to deal with well-established people. Those without a well-established track record are apt to meet with low-level executives who then pitch the idea to their bosses. Often it takes a telephone prepitch to get into the door. The seller gives a very brief rundown after which the programming executive may tell the seller that there is no interest in the idea or may invite the person in for a more detailed pitch. On the other hand, some programming executives demand that their staff members come up with frequent program ideas—in essence, doing an internal pitch as often as once a week.

If the pitch is from an external production company, there will usually be a number of sellers present—perhaps the company owner, a writer, and a producer—and there may be one or several people listening to the pitch. After the initial small talk, the sellers have about 5 minutes to lay out their characters, sample scenes, and other elements that show that they have a solid proposal. The buyers ask questions for which the sellers should have answers. If all goes well, the buyers will ask for more information, perhaps a treatment that further outlines the idea or even a sample script. The buyer’s and seller’s lawyers will draw up a contract, and the development process will move along with the buyer picking up much, but not all, of the cost. The project can be axed at many points, but if it makes it through several paper-based stages, the seller will probably be asked to produce a pilot consisting of one produced show that is supposed to be representative of the series.

Once a pilot is produced, it is tested, usually in a small auditorium. A group of people are shown the program and asked to fill out questionnaires or in other ways give their opinions. The ideal audience for testing most programs is a cross-section of Americans, so testing sites are often set up at places where tourists from all over the country are likely to congregate—Las Vegas, Universal Studios, Hollywood Boulevard. Testing is a nervous time for the project creators because a bad test can kill their dreams. Sometimes a test will show that the concept is sound but the idea needs some tweaking. The network will ask the show creator (which may be itself) to make some changes and then test the program again (Perebinossoff et al., 2005, pp. 99–121).

The type of development just described is common for broadcast and cable TV series and for some radio programs. There are variations for other types of programs and distribution outlets; for example, a network movie of the week would not have a pilot because it is not a series. Radio is more concerned with developing format ideas

rather than developing individual programs. Syndicators often pitch material that has already been produced but that they have packaged in an original manner. The main form of testing for radio involves having people who are regular listeners assess music to help the station programmers decide what music to include and when it is time to stop playing certain selections because people are tired of them. The Internet is still the “Wild West”; on the one hand, individuals can put up programs that exhibit self-expression while on the other, traditional program providers are using methods similar to what they have used in the past for broadcast and cable networks.

The end result of conventional development, however, is a decision, usually made by high-level executives from programming, sales, research, promotion, and other areas. They consider all the programs that made it to the pilot stage (or all the possible formats or syndicated packages) with an eye to their quality and the needs of the particular media outlet they are programming. They decide which programs are worthy of being put on the air, which might be held in abeyance so that they can be replacements for shows that fail, and which should be dropped all together. For many networks, the most intense decision-making time is in the spring, when they are deciding programs for the fall schedule, but nowadays programming decisions are made year round. Often executives work with a large chart that shows all the time periods they need to program. The names of all the shows, both proposed new programs and series from the past that are being considered for continuation, are often on magnetic cards, and the executives move them around the chart until they are happy with the overall schedule. Sometimes a program will be eliminated, not because it is a weak show but because it does not fit the scheduling needs of the network (Adams, 1993).

In this manner, the development process is tied to and flows into scheduling. New programs have ostensibly been shaped and perfected and are ready for public consumption. Now the executives must decide the best way for all their programs to find their audience.

Scheduling Strategies

Most scheduling strategies are designed to attract and keep an audience. They are undertaken in an attempt to beat the competition and also pair segments of the public with the type of entertainment and information they will enjoy. As scheduling strategies have evolved, they have been given interesting names, such as dayparting, counterprogramming, hammocking, tentpoling, bridging, supersizing, blunting, stacking, stunting, crossprogramming, stripping, and repurposing (see Figure 96.1).

Dayparting is undertaken by many media programmers. People’s needs, activities, and moods change throughout the day, and dayparting takes this into account by changing what is programmed and how it is presented (Blumenthal & Goodenough, 1991, p. 111).

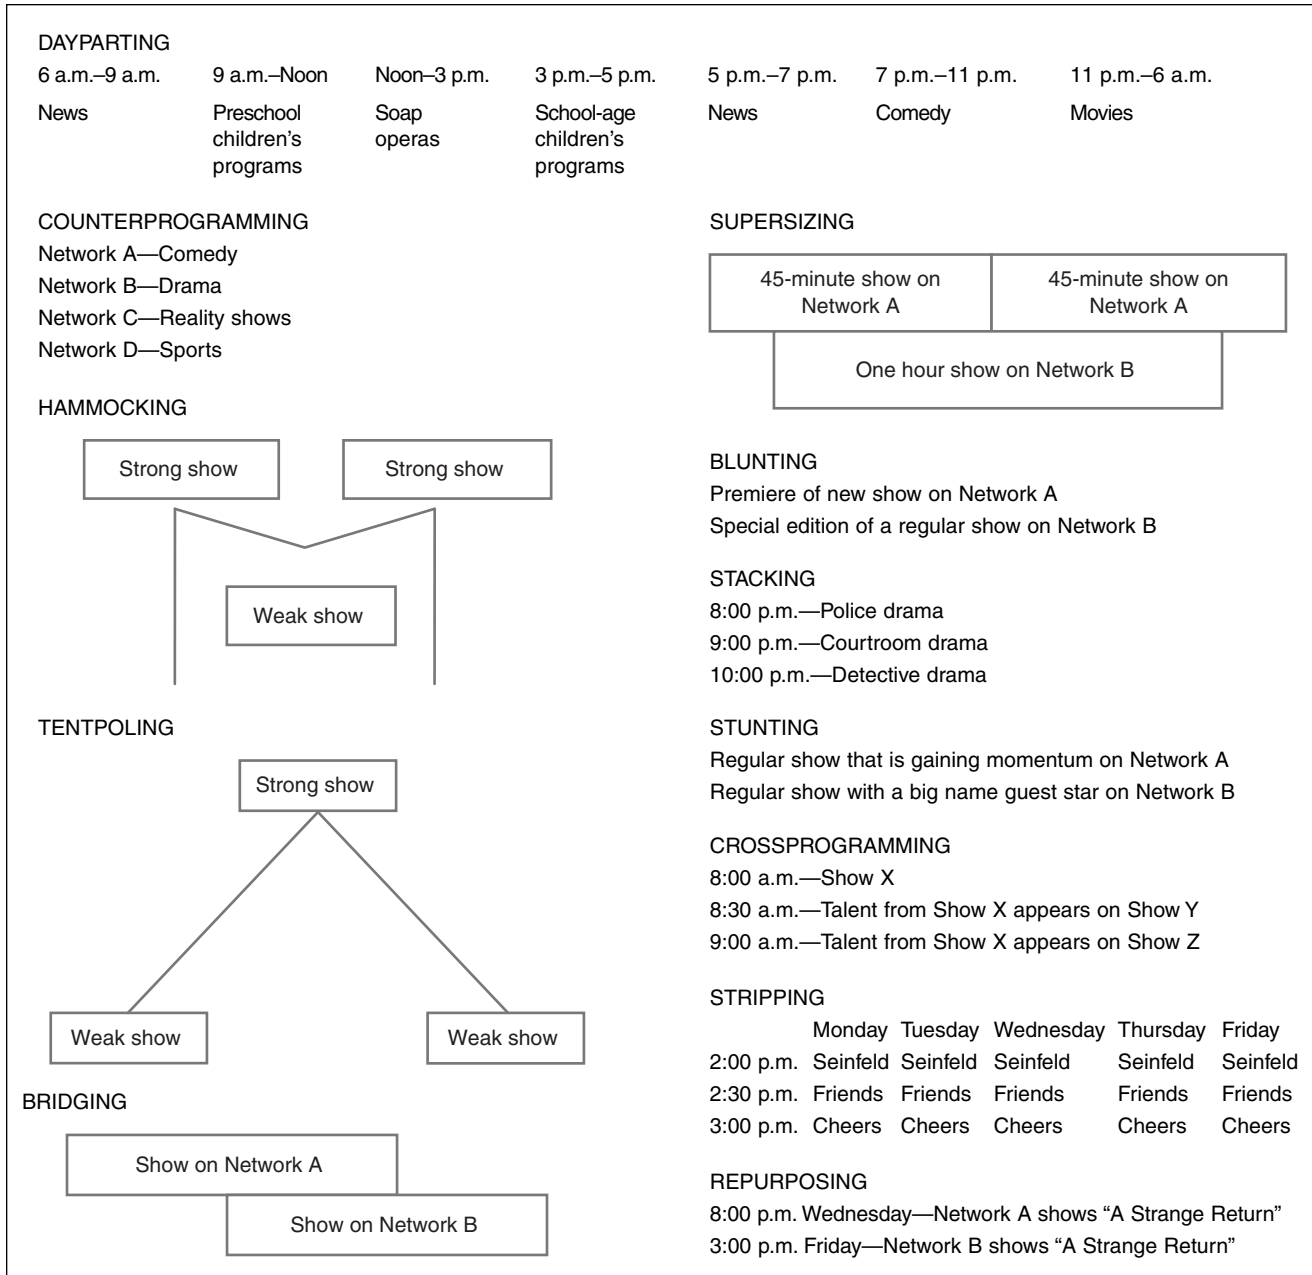

Figure 96.1 Scheduling Strategies

When people first wake up in the morning, they want information to help them plan the day. As a result, radio stations air more news, weather, and traffic in the morning than during other parts of the day. Because most people go to work, they do not have a great deal of time to spend with media. So early-morning TV shows are divided into short segments. Early morning is also a good time to program for children as they often watch TV while their parents get ready for work. As the morning wears on, people who spend time with the media can do so in a more leisurely fashion, so radio is heavier on music, while game shows, talk shows, and soaps dominate TV. Late-afternoon is

another good time to program for children, and radio's evening drive time has modest increases in news and traffic information. Evening is the main time for leisurely TV viewing, and segmented talk shows are popular as people are getting ready for bed. Weekend programming is different from weekday programming, generally containing more sports. Of course, some channels don't daypart as much as others. Children's channels such as Disney and Nickelodeon program to children all day long, but they daypart to some extent in that they program to different ages at different times. For example, they target preschoolers during the time that other children are in school.

Counterprogramming involves airing a form or genre of programming that has a different appeal than what the competition is airing. For example, if NBC is airing dramas on Tuesday nights, CBS might offer comedies, ABC sports, and Fox reality shows. In the days of three or four networks, counterprogramming was fairly easy, and although certain blockbusters such as *I Love Lucy*, *The Cosby Show*, and *Dallas* tended to attract large portions of the audience, in general each network was able to attract a different group of viewers. Today, it is impossible to counterprogram all the networks that exist, but the broadcast networks still tend to counterprogram each other, and some of the niche cable channels that are similar (i.e., Discovery and A&E) have periods of counterprogramming.

Hammocking involves placing a new or weak program between two strong programs in the hope of strengthening the audience of the middle program because it gets pass-along viewing from the preceding program and anticipated entertainment from the following program. For example, when NBC introduced *A Different World*, it hammocked it between *The Cosby Show* and *Cheers*.

Tentpoling is similar, except that the new or weak program has only one hit program assisting it—usually the program preceding it. For example, in 1976, ABC had the smash hit *Happy Days* at 8:00 p.m. on Tuesdays. When it introduced the spinoff *Laverne and Shirley*, it placed the program at 8:30 p.m. on Tuesdays. Both hammocking and tentpoling are still valid strategies. People are likely to be tempted to watch something that is scheduled close to a favorite show. Even people with digital video recorders (DVRs) get to see teasers for the next show that might entice them to set their DVR to record it the next week.

Bridging is a technique used by one network to keep audience members from sampling a program on another network. The most effective way is to have something exciting under way when the competitor's program starts. If one network starts an hour program at 8:30 p.m., knowing that the competition is starting a strong program at 9:00 p.m., the first network may be able to have people so involved in its program that they do not switch networks.

Supersizing is a more recent version of bridging that involves adding 10 or 15 minutes to a show in order to bridge the start of a competitor's show. In 2003, NBC aired supersized versions of *Friends* and *Will & Grace* in an effort to cut into CBS's *Survivor* audience.

Blunting is a cousin of bridging and supersizing in that its purpose is to keep people from sampling the fare of the competition. When one network knows that another is planning to launch an important series, the first network can blunt the introduction by having a particularly attractive element in its own programming. For example, in 2001, NBC programmed a special edition of *Fear Factor* to try to hurt the premier of CBS's *The Amazing Race*.

Stacking is a tactic used to try to establish audience flow—keeping audience members from one program to another (Webster, 2006). Usually, it is undertaken by

programming shows that will attract people with a particular interest for a considerable block of time. PBS has frequently stacked three cooking shows in a row on a Saturday.

Stunting involves inserting entertainment elements not normally associated with a series into a show to obtain a ratings spike. Sometimes this is undertaken to blunt a competitive show, but it may also be done because competition is picking up momentum, because it is a major ratings period, or because, for whatever reason, the show needs an injection of audience appeal. One way to stunt is to have a big name movie personality, sports star, or other celebrity appear in the show. Another is to program a multipart program with cliffhangers at the end of each episode. Weddings on TV are always popular and good fodder for stunting. A major stunt occurred in March of 1980, when, in the last episode of the season, J. R. Ewing, the unscrupulous oil magnate of *Dallas*, was shot by an unknown assailant and rushed to the hospital. For many months, fans wondered who had shot J. R. The first episode of the fall season, the one that revealed the shooter, was not shown until November 1980, and the fervor was such that it had one of the highest ratings in TV history (Garner, 2002, pp. 34–37).

Crossprogramming is an interconnection of two shows for mutual benefit, generally involving shows produced by the same production company or network. Usually, it involves a storyline that starts on one show and ends on another. For example, in November 1991, NBC's *The Golden Girls* opened the Saturday evening programming with an episode about a hurricane that was about to hit Miami, where the Golden Girls characters lived. The show after *The Golden Girls* was *Empty Nest*, and one of the Golden Girls cast members dropped in on that show to warn the characters about the hurricane. During the third show of the night, *Nurses*, another Golden Girls cast member volunteered to help at a local hospital. All three programs were produced by Witt/Thomas/Harris, making the interconnection possible.

Stripping is a strategy used mostly by local stations and cable networks wherein episodes of the same program are shown at the same time every weekday and sometimes also during the weekend. It is particularly common when a station or network shows reruns of a series that has been shown before, on either a broadcast or a cable network. An example would be USA network's stripping reruns of *Law & Order: Criminal Intent* at 7:00 p.m. each evening. It is a useful strategy because audience members know when and where to find a favorite program.

Repurposing is a glorified method of rerunning. Rerunning usually refers to repeating a program on the same network where it was originally shown or reshowing it much later when it is syndicated. Repurposing involves rerunning a show on a different outlet shortly after its initial airing to maximize the show's worth. For example, in 1999, ABC's *Once and Again* was aired on Lifetime just a couple of days after its ABC airing. The term *repurposing*

is used when programs are streamed on the Internet shortly after being aired on a network or station.

This list certainly does not exhaust possible programming strategies. Many new programming ideas are surfacing as a result of media forms (the Internet, iPods, cell phones) that allow people to access programs when they want to see them, sometimes referred to as video-on-demand. In part, conventional media must develop programming strategies to compete with these newer media, and in part, they must join in with the new distribution forms and be part of devising strategies to bring product to people in new ways.

Evaluating Programming

Part of a programmer's job is evaluating programs and scheduling strategies. If a program is not obtaining an audience, is it because of inherent flaws within the program, or is it because the program is running at a bad time? What should a programmer do when a particular show or time period is not measuring up to expectations?

Historically, the most prevalent form of evaluation has been a body count in the form of TV audience measurement data from Nielsen (2007) and radio data from Arbitron (2007). These companies, which operate independently from stations and networks, use sampling methodology to determine how many people are watching or listening to particular programs or dayparts. A series that does not score well in the Nielsen or Arbitron ratings will be scrutinized carefully.

The series, whether new or old, will be examined to see if it lacks focus. Sometimes producers of shows get wrapped up in new projects and don't keep a close eye on previous shows, which then begin to drift off course. Internal bickering and story lines that are too convoluted can also lead to lack of focus. Sometimes all the programmer needs to do is sit down with the principals and discuss the problem openly so they can rectify it.

In a similar vein, there can be particular elements of a show, such as the demeanor of the lead actor, which are turning people off. Sending the show out for more testing often pinpoints the problem, and it can then be addressed. This is true not only for comedies and dramas but also for news shows where a particular anchor may be dragging down the show or for radio where the audience does not respond well to a certain disc jockey or talk show host.

Exhaustion is another reason that a series might fall in the ratings. Some series that have been on for many years simply run out of fresh ideas. Adding a new character (such as a grouchy uncle) to the series might help, as might bringing on some new writers. But sometimes a series has simply run its course, and it is time for programmers to let it bow out gracefully, as was done with many shows ranging from *M*A*S*H* to *Sex and the City* (Garner, 2002, pp. 38–43).

Yielding to exhaustion is particularly appropriate if the show is no longer in tune with social changes. *The Brady*

Bunch, with its traditional family values and lightweight adventures appealed to audiences when it was launched in 1969. But during the 1970s, networks, in line with social changes, began programming grittier programs with more adult themes, such as *All in the Family*. Audiences lost their appetite for *The Brady Bunch*, and it was retired from network TV in 1974 (Garner, 2002, pp. 20–27).

Sometimes a show can have high ratings, but they are the wrong demographics—not the coveted 18 to 34 that advertisers prefer. This is likely to happen with a series that is on for a long time. The original audience members would have been the desirable demographic, but as they stick with the show they grow older and younger people are not attracted to the show. Sometimes, adding elements that will appeal to younger viewers helps. If not, a programmer needs to make a decision whether to cancel the series or whether to stay with it and try to attract advertisers who target the older demographic (Mares & Woodard, 2007).

A show can be aired in the wrong time period. Certainly, trying out a children's show at midnight would not yield valid results, but airing a new, unknown series against a very popular series can lead to low ratings that have nothing to do with the content of the show. For example, Fox scheduled *Family Guy* on Thursday nights against *Friends*, where it understandably garnered abysmal ratings. Fox took the show off the air in 2000 and then put it back on Tuesday nights but coupled it with *Greg the Bunny*, and it did not do well. So Fox canceled it once again in 2002. It was the loyalty of its fans and its high DVD sales that made Fox reconsider, finally bring it back in 2005 and resting it peacefully before *King of the Hill*. Common sense would say that if a show is on at the wrong time period, a programmer should change the time period. However, that's not always possible without damaging some other show or disrupting the entire schedule. It is not a good idea to relocate shows frequently because the audience loses track of them and only die-hard fans will make the effort to find them.

A new program may fail to gain an audience because it was not properly promoted and people are not aware of it. If the programmer feels that this is the case, the network or station can institute a strong promotion campaign (Walker & Eastman, 2000). However, if the real problem is something inherently wrong with the program, the promotion campaign will amount to nothing more than a costly expense that does no good.

Evaluation is an ongoing process. Although ratings are the most important factor, the awards (especially Emmys) that a show wins can figure into the evaluation process, as can faith in the show creator, feelings that the show is filling a useful social purpose, and other gut reactions of the programming team. In fact, gut reactions of programmers have been responsible for many successes on radio and TV. Good programmers keep an ear to the ground, an eye on the future, a shoulder to the wheel, a finger on the pulse of the public, and their feet on the ground. Dealing with all those

contortions is one reason programmers turn over rather rapidly. But it is an exciting job and one that can have many visible positive ramifications.

MEDIA CONVERGENCE

BRAD MELLO

National Communication Association

People stood, pushed up against an outdoor stage among a crowd of rowdy fans on the Portland, Oregon, waterfront waiting for the Lady Miss Kirby to appear (the former lead singer of the late '80s to early '90s pop disco group Deee-Lite). The audience probably did not expect to be confronted with a moment of media convergence, if they even knew of that term. It was summer, it was a street festival, and friends were celebrating and enjoying the beautiful evening. And there it was, the Lady and the Mac.

Situated center stage sat a Mac laptop that controlled the entire performance. Through that computer, Kirby told the band when to start, added additional sound effects, and managed the playlist for the evening. She also recorded the live show for potential future distribution via multiple social networking sites. Kirby promised that she had rehearsed and practiced with the contraption, but she encountered several glitches, and some sound-tech support raced to the stage, worked their magic, and got the system up and running. With the electronics functioning, Kirby finally mustered the requisite computer skills apparently demanded of a modern pop diva trying to make a comeback and belted out a stellar performance for her rowdy fans.

The convergence of computers, music, and live performance did not end there. While prancing about the stage in her true diva style, Kirby told her fans that all the new songs she would perform that evening were already available on her MySpace page. People in the crowd with iPhones or other similar devices called up her page during breaks between songs to check out what was available. She also gave a shout out to all the camcorder operators she spied in the audience, challenging each of them to post their recordings to YouTube

as soon as possible. No longer did Kirby seek traditional routes to publicize her work. In an age of media convergence, she did not need traditional record labels to reach her fans. Given her outlandish outfits and the risqué direction her music had taken, one could assume that being free of traditional outlets, she could let her creative juices take her in whatever direction she wished, even if it included a song about oral sex titled "Baby go down on me." In a more controlled, regulated industry where the Federal Communication Commission deems wardrobe malfunctions that reveal a nipple for a half a second obscene, such a risqué and adult-themed song might not be possible for a pop diva. In a world where that diva can bypass studio executives, much more is possible.

While this simple vignette may seem odd and uninteresting to nonfans of Deee-Lite and the Lady Miss Kirby, it illustrates much of what media convergence brings to the media landscape. First, computers are infiltrating all forms of media, including live music performances. Second, many artists, not just musicians and singers, are using computers to sidestep traditional venues to get their wares out. Third, consumers use easily obtainable electronics to produce their own content, and finally, all this is easily distributable via inexpensive outlets facilitated by the World Wide Web.

This opening example, too, may seem frivolous, but what it helps illustrate is that in an atmosphere of convergence, fans and artists are feeling much more powerful. Each has the tools to go around traditional gatekeepers to produce or seek out content suited to their own specific needs and interests. Conversely though, convergence imposes limitations and steep learning curves on content producers and consumers in terms of mastering new technology and new distribution outlets. Kirby's miscues with

using a computer to run her show highlight this problem. Combine these limitations with a well-healed media industry that desires to cash in with new users and producers who seek to entertain and be entertained, to inform and be informed, and a frenzy of consumer, producer, and corporate issues ensue. Another concern is that the term *convergence* may be so overused that it has little meaning. Gordon (2003) argues that the term is being overused in so many different contexts that it has “lost its value in focusing discussions on journalism and the news media” (p. 60). Still, the metaphorical power of the term allows observers and critics the ability to understand the intersections between new and old media and how those intersections are changing the media landscape.

This chapter will tackle the admittedly fuzzy concept of media convergence. First, it is important to examine the various definitions of the concept. After defining convergence, the above example of Miss Kirby reveals three important areas to examine in relation to convergence. First, how are consumers and artists or content producers faring in an atmosphere of convergence? Next, how are media companies responding, and finally, how do educators prepare their students for a rapidly changing media world from both a consumer and critically aware citizen perspective and the perspective of students who hope to make a living working in the media in a convergent environment?

Defining Convergence

There is no one singular definition of convergence. According to Gordon (2003), the term had its origins in math and science. Gordon indicates that it is unlikely that we will ever know for sure who first applied the term with regard to media, but what seems to be a very early occurrence came in Pool's 1983 book, *Technologies of Freedom*, where he discussed convergence modes. Convergence modes were the coming together of conversations, entertainment, news, and other media, all delivered electronically. Since then, prolific use of the term has made a single definition of the concept difficult. Instead, most scholars and media critics writing about convergence parse the term into a variety of smaller ideas that are more easily defined.

Henry Jenkins (2001) highlights the difficulty in defining convergence when he wrote, “Part of the confusion about media convergence stems from the fact that when people talk about it, they're actually describing at least five processes” (p. 93). Those processes according to Jenkins are (1) technological convergence, where various forms of media find their way into digital formats; (2) economic convergence, which is highlighted by vertical and horizontal integration among media companies; (3) social or organic convergence, defined as what's happening inside a user's head as he or she learns to navigate new technological and information environments; (4) cultural convergence,

which emerges as new forms of storytelling develop from the intersection of various media; and (5) global convergence, as various cultures' media making collide to create a new sense of McLuhan's “global village.” Jenkins, in his text *Convergence Culture* (2006), focuses mostly on the new storytelling abilities we are discovering and the newly empowered consumer in convergence culture. Others tend to define convergence more narrowly and focus solely on journalism and newsgathering or on the media corporation consolidation happening among once separate media organizations.

Gordon offers two views of the term. First, he focuses on technology convergence in terms of content creation, distribution, and consumption. In each of these areas, the digital revolution influences how the media operate. Most content is now produced with computers, distributed and consumed in digital forms, such as being able to view last night's episode of your favorite ABC sitcom via the Internet and your personal computer. Gordon's other view is similar to Jenkins's. Gordon speaks of five areas of convergence: ownership, tactics, structure, information gathering, and presentation or storytelling. Ownership convergence is one most consumers and media scholars are aware of because it concerns the rash of media mergers in the industry. Companies are merging in both a horizontal and a vertical manner. They are acquiring more production outlets while also acquiring more distribution outlets, many of which are digitally based. Tactical convergence involves partnerships between two previously separate media organizations, such as a newspaper and a television station, while remaining separately owned. This form of convergence has the potential to benefit both entities in terms of sharing resources and information as well as opening up new ways to sell multiple advertising packages across different media platforms. But employees stay focused primarily on the main media format in which they work. Structural convergence takes tactical convergence one step further by actually creating merged jobs that require employees to cross into different mediums, such as having a print reporter actually produce a video piece to be aired or posted on a Web site. Information-gathering convergence brings together the tools of the trade from various mediums, where now a print reporter might carry along a digital camera or a digital video camera in addition to a notebook and pen to gather information for a story. The purpose is for journalists or information gatherers to obtain multiple types of content for multiple uses. Finally, with the almost unlimited space that digital storytelling offers, new forms of storytelling are likely to emerge in order to take advantage of this extra space. With the limit of space in print, the inverted pyramid dominates the way a story is told, but that might change in a digital environment when space is limited only by storage and bandwidth, when a written story can encompass thousands of words rather than a few hundred typical of a *USA TODAY* story and

could also be accompanied by a video clip that does not conform to a standard short broadcast news story. Instead of a quick lead-in by a talking head and a 90-second explanation, short videos lasting 5 minutes and longer are possible. New storytelling formats will emerge, and consumers could benefit in terms of becoming better informed. Alternatively, consumers may not be able to keep up with the growing demands on their time and may skip new formats in favor of a quick digital form of something like *USA TODAY* that is delivered to their e-mail inbox every morning.

Dupagne and Garrison (2006) offer a model of convergence that differs from the previous approaches discussed. The authors break convergence into four areas that have varying degrees of influence on each other and on the process of convergence: economic convergence, technological convergence, regulatory convergence, and convergence effects. According to the visual/graphic model of convergence offered, effects are produced by all three of the other categories, yet the model indicates that convergence effects have no influence over the others. This may be the case now, but as consumers take advantage of the opportunities that convergence provides, they will certainly influence economics and regulations, and with their purchasing and usage power, consumers will have a hand in which technologies thrive and which go the way of the 8-track. The model demonstrates that while there is no simple way to define convergence, there are many interrelated components that help understand convergence.

Menon (2006) offers one final example of how convergence has been defined by focusing simply on the technological aspect of convergence. Digitalization and integration of platforms, contents, and production processes in a global context are examined. Menon concludes that while convergence may be on the minds of many, in reality the convergence process on a global scale is only in its infancy. Developed countries have access to a wealth of technology and resources, but many other countries do not. Furthermore, no one standard for compatibility exists, making it difficult to bring many media elements and technologies together. Much more work in terms of technological access and compatibility needs to be done in order to realize convergence throughout the world.

Jenkins, Gordon, Dupagne and Garrison, and Menon offer comprehensive and overlapping definitions of the term *convergence*. Jenkins focuses most on entertainment and storytelling, particularly among fan cultures and the benefits convergence brings, while Gordon focuses more specifically on journalism and how convergence requires new skills for reporters and new opportunities for consumers to stay informed. Dupagne and Garrison offer a visual model that depicts the interrelations among various aspects of convergence, and Menon, with an eye toward technology as the backbone of convergence, indicates that whatever convergence might mean, we are far from living in a technologically converged global world.

There are many competing definitions of the term *convergence*, but most important to consider is how consumers are faring in an atmosphere of convergence. With the need to be informed more important than ever, are media consumers, are citizens, getting what they need? Or, as McChesney (2007) argues in *Communication Revolution*, are consumers poorly served by an increasingly consolidated media environment where good political journalism suffers and an age of infotainment rules? Can we take advantage of this moment, this “critical juncture” or “communication revolution” of changes in our public communication systems, to build a better, more robust democratic society? Consumers may not always be creating or be drawn to highbrow intellectual content, but the newfound ability that convergence provides, of consumers becoming more active creators of content, is encouraging.

The Consumer Turns Producer

Many argue that the consolidation convergence brings limits consumers and consumer choice, but lower entry costs and creatively active citizens and consumers are bringing much diversity to media content. Weblogs, or simply blogs, are here to stay and are perfect examples of how beneficial convergence can be for a community.

Take Steve Patterson's *Urban Review* (www.urbanreviewstl.com), a development-minded urban-oriented blog in St. Louis, Missouri, as an example. There are likely many community blogs to consider, but your author has witnessed *Urban Review's* popularity firsthand while attending a Media Forum conference held in St. Louis. First and foremost, Patterson has become a citizen journalist covering city hall, with a particular interest in development and zoning, in ways that local news outlets used to do. The buyout of local independent papers by large chains hurts local news coverage. Although the chains usually promised before taking over control of local papers that there would be little change, they usually cut expensive local staff and replaced local content with cheaper, nationally syndicated columns and more advertising. It was simply cheaper and more profitable to run a local paper in this manner, which made stockholders and Wall Street happy, but did not necessarily serve the local community well. Of course, citizen journalism has its limitations in comparison with typical objective journalism standards, but Patterson's contribution to community knowledge is vast, and he has been recognized by a variety of more traditional media outlets for his good work. *St. Louis Magazine* has recognized the blog on various occasions, including naming Patterson the best blogger in 2008. A local St. Louis alternative weekly paper, *The Riverfront Times*, named the blog the best civic-minded blog in 2005, and the blog won readers' choice for best blog in 2006 and 2007. The free benefit that Patterson provides to the community creates an easily searchable visual and

verbal archive and history of significant events regarding progress and development in St. Louis.

One limitation clearly is the potential for biased interpretation of events and ideas. Patterson reveals up front to readers of his blog the lens he uses to guide his posts. He is a new urbanist, who among other things predicts the end of *suburbia* (a term he borrows from a documentary of the same name) sooner rather than later. Regular followers of his blog know his bias up front. What they get in return is someone passionate about development and city politics, who bothers to attend as many council meetings as he can, makes sunshine requests, and then provides that information to the community. Patterson makes a very small amount of money via advertising on his site, and the greatest cost to him is his time in terms of attending meetings and following important project proposals in the community, time that he would give anyway.

When Patterson took on the local Alderwoman Jennifer Florida (D-15) over the approval of a very suburban-styled fast-food restaurant in a distinctly urban neighborhood, he shook up the political structure and demonstrated how what happens in the blogosphere often makes its way into more traditional outlets. *St. Louis Magazine* covered Patterson with a short article about the flap with Alderwoman Florida, complete with a creative graphic depicting Florida and Patterson as characters in a rock-'em-sock-'em robot game, a game Patterson eventually won, as the fast-food restaurant was never built. Many in the community post reactions and alternative viewpoints to his blog, a blog where he only edits posts for obscenity and the like. During the conflict with Alderwoman Florida, many posted that he was no journalist and he had no right to be harping on the story. He was invited on local talk radio to discuss the issue, and he made it clear that of course he wasn't a journalist, he was a concerned citizen with a wonderful new tool for free speech—a blog. These new tools provided Patterson and fellow concerned citizens the ability to stand up to politicians and corporations and be heard. Previous avenues of attending meetings and voicing opposition, while helpful, pale in comparison with the publicity and reach that a blog provides.

Patterson crossed over into two other mediums, radio and print, from his popular *Urban Review* blog, which gets an average of over 80,000 hits a month. His prolific posting before and after a stroke keeps regular viewers of his site well-informed about the happenings at city hall regarding development in a way that the local paper does not, and since most do not have the time or the passion to attend often long and boring council meetings, his blog clearly provides a service to the community. Furthermore, because space limitations are much less pressing, he can provide detail that other media simply cannot. His blog also demonstrates the synergy that often occurs between blogs and more traditional forms of media, such as radio and print. And having joined the board of the St. Louis chapter

of the Society of Professional Journalists, Patterson will certainly learn about journalism while also influencing how we define journalism and journalists in the future.

Patterson has become handy with a digital video camera. With that camera and the advent of YouTube, he has been able to illustrate many problems and opportunities in St. Louis. His videography may not be of broadcast quality, but the images he captures reveal problems such as lack of handicap ramps and access, unfriendly pedestrian environments, and ill-planned development. He has also posted at least two “gotchas.” First, he taped a restaurant owner shouting obscenities at him as he complained about all the street parking near a restaurant taken up with valet parking cones, and second, he caught on tape a city official parking illegally on several occasions to do business more conveniently.

The *River Front Times* has called him a town gadfly, and perhaps he is. Patterson has gained a much enjoyed local notoriety that brings more attention to his Web site and his point of view. Some reader posts to his blog criticize Patterson for fueling controversy when compromise might work better. But what he does illustrate is that concerned citizens have access to the tools to get messages to the public in ways that they never have before. However, what has not changed is that those concerned citizens must still be active citizens, significantly involved in the community, if they are to have a message at all. Patterson must take the time to attend council and community meetings, to stay abreast of proposed development and zoning regulations, and to keep up with the local political climate if he is to maintain a blog that attracts the numbers that he does.

Patterson's blog is but one example in many of how consumers are becoming producers of content. Civic mindedness is not the only impetus that energizes consumers' creative juices. Jenkins (2006), in his text *Convergence Culture*, highlights a variety of other avenues that various fan cultures and media consumers are taking advantage of, including inexpensive audio and video production and easy distribution methods such as YouTube and other Internet sites. Jenkins outlines how fans of reality shows used the social networking capability of the Internet to spoil the popular reality show *Survivor*. In addition, fan cultures of many different films and shows, most notably *Star Wars*, have produced alternative takes on well-known stories as well as clever spoofs such as Chad Vader or, though perhaps more mainstream, *Family Guy's* “Blue Harvest” episode.

According to an interview on the DVD edition, *Family Guy's* episode was sanctioned by the *Star Wars* franchise, and there is an interview conducted by the creator of *Family Guy* with the *Star Wars* guru, George Lucas. Not all spoofs are sanctioned though, and many media companies, including Lucas's media enterprises, explore ways in which they can maintain control over their intellectual property while still encouraging fan participation. At times, media companies have used their deep pockets and

media lawyers to threaten consumers with law suits if they infringe on copyrighted works, even if the infringement is only intended as spoof or homage.

There are countless examples on a local or national scale that illustrate similar concepts, but a local civic-minded example was chosen purposely to highlight the benefits to local communities that blogs provide. The blogosphere, when attended to by savvy users, provides information outlets with great benefits. From the bloggers' side, they find a way to express themselves and their passions in ways unavailable just a few years ago. And a personal benefit to Patterson was the outpouring of community support after his stroke. Patterson truly has become a fixture in the local community, and his recent accolade of best blog of the year according to *St. Louis Magazine* demonstrates clearly that the new and old media are not just colliding but mixing in terms of function and content.

Cable television arguably began an era of narrowcasting, where the audience was segmented into specific taste groups. Viewers could tune into music videos, BET (Black Entertainment Television), Spanish-language channels, cooking shows, sports, and politics—the options are endless. Corporate media producers, however, select the options that viewers encounter. With the advent of digital media, consumers are further segmented into different taste groups. Academics can tune into podcasts of lectures at scholarly conferences that they are unable to attend; editorial cartoonists, such as the creative team behind *JibJab*, can animate and distribute their work with limited obstacles; and everyone via social networking sites such as Facebook and MySpace can make friends across the world and learn of different cultures and different viewpoints with a few simple clicks of the mouse on the computer.

Certainly, the other examples of fan participation are not as beneficial from a civic-minded point of view, but they are examples of media consumers becoming media producers. No longer are consumers relegated to being passively perched on their couches at home letting the latest entertainment offerings wash over them. No longer must consumers restrict their participation in community affairs to reading the local newspaper and perhaps writing a letter to the editor—they can now participate much more actively and contribute to the public dialogue on countless topics. Unfortunately, countering such good examples of new media converging with old, such new opportunity for media consumers are corporations that seek to co-opt the process and profit.

Corporate Convergence

Ben Bagdikian, in the latest revision of his now classic work *The New Media Monopoly* (2004), argues that the consistent movement toward more and more corporate media mergers hurts consumers by limiting the options they have for obtaining information. Mergers and corporatization also

damage the media business in general by limiting competition that might improve the overall quality of media. Bagdikian's text is a classic, having been updated multiple times as new information and mergers come to light. Bagdikian chronicles how media mergers reduce options for consumers and inhibit honest reporting. The text provides countless examples to support the claim that consumers and democracy are not served well by a growing conglomerated corporate media. Many corporations whose main business is not media are beginning to own the media companies that should be investigating unfair corporate practices. As Bagdikian argues, these multitiered corporations are often able to squash negative coverage before it blossoms. Although the text is not specifically convergence focused, it provides an important perspective on the current state of the media business. Croteau and Hoynes's *The Business of Media: Corporate Media and the Public Interest* (2001) builds on Bagdikian's argument. The authors examine corporate media through the lens of a market model versus a public sphere model of mass communication. In the market model, mass communication is guided by the overwhelming drive to deliver large audiences to advertisers via programming, including news programming. The public sphere model is guided by the general notion of "public interest," with the underlying assumption that having an informed citizenry is better for democracy overall. Croteau and Hoynes's belief is that the corporate media business environment fueled by media mergers values the market model over the public sphere model and in turn does a disservice to citizens by not serving the public interest. The question being asked is "Does Wall Street's demand for profits trump the need for a well-informed public in a democracy?"

Stephen Quinn (2005) views the conflict between market and public interest differently. The competing interests, he argues, are between a business model and a journalistic model. The business model sees convergence as a great opportunity to cross into multiplatform publishing and broadcasting, allowing for a repurposing of content from different media, a savings in resources, and a greater audience reach, which turns into greater advertising revenues and potential savings in terms of being able to reduce staff. Staff reductions may not be good for the journalism employment market, but proponents of the business model argue that they are better able to serve their customers and the public by providing multiple options for accessing information to consumers. The journalistic model sees convergence as a chance for reporters and other content providers to perform their craft better by giving them access to multiple storytelling methods and venues. Multimedia formats engage viewers more, allowing journalists and storytellers to more creatively approach their craft while providing better service and better stories.

Convergence, be it via horizontal or vertical media mergers or via multiplatform storytelling, has not always produced positive results, from either a market or a public sphere perspective. Gracie Lawson-Borders (2006) in

Media Organizations and Convergence: Case Studies of Media Convergence Pioneers indicates that “convergence pioneers” struggle to operate in a converged media environment and that the benefits of convergence are not always equal for the different converging groups. Differing cultures in the various news-gathering environments created conflicts and confusion as different news cycles and deadline structures clashed. Another case study on what is believed to be the first occurrence in the nation of convergence between a newspaper and a television station, both located in Oklahoma City, revealed little benefit for either entity. The authors of the case study, Stan Ketterer Weir, Smethers, and Back (2004), indicate that there was some useful collaboration between print and television journalists but collaboration was often difficult because previously these journalists were in competition for stories, scoops, and sources. Most helpful in the collaboration was the ability of television new stories to be able to point viewers to the newspaper for further information on a story. Such a result, given the time limitations of the broadcast medium and the relatively greater space availability of print, is predictable but also a clear theme within the convergence that consumers should expect. A video news package can only accomplish so much in 2 minutes, but the benefit of convergence may be in making it easier for news consumers to find additional information on topics of interest.

Television, according to John Caldwell (2004), has always been well positioned for convergence because of its well-developed infrastructure and networks. NBC, for example, was foresighted enough to invest in Tivo-style technology in order to have a hand in and understand a potential threat to their industry. Furthermore, television’s foray into the Web world succeeds by amplifying viewer interest in programming well after an episode of a favored series has been aired. Peruse any popular series Web site, and you can learn countless tidbits about the various characters and the actors who play them. Additional detail and backstory are often available, and if you missed an episode of a popular series, you can view it online at your own convenience, with limited commercial interruptions. ABC even provides ready-made widgets for free that viewers can add to their own blog, MySpace page, or Web site. These widgets may be free to viewers, but they also provide free advertising and linkage to what ABC is trying to sell. Television’s approach to convergence is increasingly sophisticated and demands a much more educated and critical consumer to respond critically and to participate actively in the process.

The one wild card for media corporations is regulation. The rules for cross ownership have been relaxed significantly recently, which fueled mergers and various forms of convergence. Consumers can now get television from their phone company or phone service from their cable provider, and satellite television companies are now offering Internet service. High-definition digital television is increasing in popularity and availability, and which companies are able

to own and offer the array of services consumers demand is in flux. Content regulation continues to be of concern. Janet Jackson’s wardrobe malfunction at the 2004 Super Bowl garnered a steep fine that, as of this writing, was reversed in court, but with a Federal Communications Commission (FCC) that finds a half-a-second view of a breast indecent, what might be on the horizon for all the new home-grown media producers who show much more skin and deal with more adult content? Will the corporations that provide the Internet services that allow content to be distributed be liable for content that the FCC deems obscene? CBS argued that they did not know that the artists would be performing as they did, but the FCC still found them liable. The court that overturned the fine indicated that the FCC was being inconsistent and arbitrary, but the issue is not settled. Regulating a converged media environment will present significant challenges moving forward.

Teaching for Convergence

Educators in journalism, broadcasting, and communication programs face a challenge in preparing their students for careers in the industry. First, considering the rapid changes that convergence brings, keeping up with the pace in academic institutions that are programmed to move more slowly and deliberately is problematic. Second, making room for new courses and new technologies in already packed curricula is painstaking, and finally, in a more general sense, how do educators prepare the students of today and tomorrow to approach a converged media environment in a critical and thoughtful manner?

Traditionally, journalism curriculums are broken into tracks. There are print and broadcasting tracks, and perhaps photojournalism. As Elizabeth Birge (2004) points out, with the advent of the World Wide Web, individuals who graduated with multimedia skills were considered to have a leg up on their competition in the job market. For example, a previous student of the author who graduated in the early 2000s landed a job at ABC News in Washington, D.C., in part because, in the words of her supervisor, “She could write, and she had the technological skills to get some audio and video and edit a complete small story package.” No longer is the ability to write well necessarily sufficient to landing a job out of journalism school. The problem becomes then, in curricula that are already packed with course requirements, where do the multimedia courses fit? Some programs are creating multimedia tracks, and most programs are offering some form of converged writing programs and courses that teach students how to write for print, the Web, and broadcast. The need for quality writing will not vanish, but added into the mix now is a host of digital abilities that successful students (job seekers) must master.

A popular phrase in academia currently is “teaching and learning.” The phrase seems to presume that teaching

does not lead to learning, but in an age of convergence, how students learn has morphed significantly. A trip to the library today is markedly different from just a few years ago. Students are just as likely to be scouring Internet databases for articles, information, maps, and data than they are to be found trudging through dusty stacks of journals, books, and documents. Collections are increasingly more digitized and available to a much broader audience than just those who can travel to a particular library to peruse the collection in person. The Library of Congress serves as an exemplar of this phenomenon. Their collections of documents and images, from historical documents to photographs to editorial cartoons, are increasingly available in digital form via the library's Web site (www.loc.gov). Downloading them at your home office desk computer may not be the same experience as having a librarian bringing them to your desk in the stately Jefferson Reading Room in Washington, D.C., but the convenience and the increased access to multiple collections for a broader audience has great potential to produce better learning experiences for students and scholars who have the technology and the training to gain access to these collections. Access may not be available to all though, as many cannot afford the cost of the new digital world, and this fact raises issues of fairness and economic equality. POTS (plain ol' telephone service) was a standard that made telephony cheap and available to everyone to have a level technological playing field, but in a converged digital world, such a standard may be more difficult to achieve.

Conclusion

At the time of this writing, otherwise sane individuals were lining up at Apple stores across the country for the privilege of being one of the first to fork over \$199 for the new iPhone G3. One store in a suburban neighborhood in the Washington, D.C., area that is located in a small open-air shopping area with wide sidewalks and nice parks dealt with people lining up the day before. Many soon-to-be-proud owners of this new gadget spent the night camped out on the sidewalk on a hot July evening, waiting. In a Washingtonpost.com online video report the day the sale began (a perfect example of new storytelling methods), a camper was quoted as saying that he had to be among the first to have the "one little convergence device that does it all." Perhaps Jenkin's admonition that there will not be one little black box that does it all is not quite right. While the iPhone and similar devices cannot do it all yet, they can provide TV, music, movies, Internet, gaming, and phone service, and that seems as close to doing it all as you can get. Having a device that does it all, though, still does not solve what John Durham Peters terms the "intractable problem of communication." New techniques for human communication, be it writing,

the telegraph, or the latest convergence-driven electronic device, do not necessarily improve human communication. Peters (1999) writes,

Communication, in the deeper sense of establishing ways to share one's hours meaningfully with others, is sooner a matter of faith and risk than of technique and method. In the thinner sense of tuning to the same frequency, the concept is ultimately unhelpful as a solution to our most vexing puzzles. It makes knowing into the governor of our dealings with others. It puts the burden on husbands and wives, diplomats and colleagues to dial in: yet once the parties face each other in the same language, the adventure has not ended, but only begun. The dream of communication stops short of all the hard stuff. Sending clear messages might not make for better relations; we might like each other less the more we understood about each other. (p. 30)

Peters is not a Luddite, though. He does believe that new technologies can help:

Certainly people can improve in suaveness, coping and sensitivity. But the conceit that techniques can correct the painful and happy act of our mutual difference not only is misguided, it is based on rare scenarios in which the ambiguity of signs can be fatal. Most of the time we understand each other quite well; we just don't agree. (p. 269)

New communication technologies in a converged media environment provide multiple new avenues for citizens to be informed, for consumers to participate and be entertained and for corporate media to make greater profits, but these new techniques, in Peters words, stop short of the hard stuff. Patterson's blog might provide more information to St. Louis citizens and perhaps keep elected officials more honest; fan cultures and significantly reduced production and distribution costs may provide opportunities for individual participation in mass media in unprecedented ways, and new corporate media conglomerates may garner significant power to profit in this convergent environment, but all these new techniques will not magically fix or improve the age-old process of humans learning to live together.
