Idiographic explanation is closely aligned with *verstehen*, a method that stresses empathetic understanding with others. To carry out this kind of project, the researcher often follows a long-term, participatory path which may culminate in an ethnography, case study, or life history. Like its counterparts in history and other humanities, the value of such studies depends in large part on their insightful descriptions of local scenes. It should be noted, however, that idiographic studies are not exclusively qualitative (→ Qualitative Methodology). For example, inferences about just one person or one group can be drawn from multi-method studies, or through the use of ipsative techniques like Q methodology. Regardless of the methods chosen, the process of idiographic research unfolds inductively, moving from closely observed particulars toward an interpretation.

Whereas the application of the nomothetic approach in the social sciences faces both logical and practical challenges, the idiographic approach mostly encounters questions about its value. *Case studies*, for example, are sometimes thought to be “pre-scientific” (→ Case Studies). That is, they are seen as a preliminary (or formative) step in the design of controlled experiments or surveys, or a pedagogical aid for learning how to conceptualize research problems. Idiographic studies are also criticized for focusing on rare or “deviant” cases, and for not being sufficiently concerned with the frequency of behavior. The most common criticism, however, is that idiographic research cannot generalize to a larger population (→ Generalizability). The utility of knowing a lot about one case seems questionable to scholars who prefer knowledge of wide, if not universal, scope.

Advocates of the idiographic approach answer these criticisms with several arguments. The understanding of a whole entity, it is claimed, has its own inherent value. Collectively, idiographic studies reveal some of the great diversity of humanity's customs, moralities, and ideologies, thus serving as a corrective to cultural misunderstandings. The problem of nongeneralizability, some argue, can be solved within the logic of idiographic explanation. For example, a thickly described case can sometimes enable people to decide whether the findings apply in their own contexts (Lincoln & Guba 1985). Moreover, a number of analytic tools, such as negative case analysis (Lincoln & Guba 1985) and cross-case analysis (Eisenhardt 1989), are used to extend knowledge claims. However, a recent review of the generalizability issue in ethnography (Williams 2000) concludes that *moderatum* claims about the "cultural consistency" in a social world is as far as one can go in the idiographic dimension. Ultimately, idiographic explanation provides the kind of holistic, "experience-near" knowledge that is typically missing from nomothetic research.

# Illustrated Newspapers

*Michèle Martin*

*Carleton University*

*Jean-Pierre Bacot*

*University of Burgundy*

The *first illustrated* → *magazine* to be published in the world, according to Jackson (1885), was the *Penny Magazine* of Charles Knight, launched in London in 1832. This publication was promoted by the Society for the Development of Useful Knowledge, of which Knight was a founder. Inspired by encyclopedism, its content mainly concerned “useful knowledge,” namely, information that aimed at educating the public (→ *Magazine, History of*). Each issue of the magazine comprised dozens of wood engravings that contributed to the explosion of the market for papers, which, until then, had not been illustrated. The engravings also immediately boosted the publishing industry and the occupation of wood engravers. Engravers trained by Thomas Bewick were responsible for the prevalence of the English model in other countries. The French *Magasin pittoresque* and the German *Pfennig Magazin* had to hire English engravers for years before they could train their own. Consequently, they often published illustrations with English topics, which intensely annoyed their readers!

The importance of wood engraving increased even more in the *second generation* of the illustrated press (Bacot 2006), which began with the *Illustrated London News* in 1842. Doubling the size of the earlier format with the help of newly developed print technologies, this paper’s 16 pages included various sizes of illustrations, some of them even double-page spreads. It sold at a high price and exclusively on subscription, and became a model for many other illustrated periodicals, which sprang up in other countries. Among them, both *L’Illustration* in Paris and the *Illustrierte Zeitung* in Leipzig appeared in 1843. These papers offered a mixture of diverse subjects (news, novels, etc.). Progressively, however, they were transformed into *illustrated* → *newspapers* as their content was dedicated to reports on current events, thereby modifying the press industry once again. For instance, the European revolutions of 1848 forced these papers to create an illustrated news reporting service, with sketchers and draughtsmen working in the field, and a team of engravers handling the production process. Later, coverage of the Crimean War (1853–1856) reshaped the nature of reporting and, by extension, the structure of occupations in the publishing industry (→ *Newspaper, History of*; *Journalism, History of*).

Reporters producing illustrations worked in peculiar conditions. Pressed by time, they often simply sketched a scene roughly, as the assignment deadline did not allow them to finish the drawing. Hence, even the most accomplished artists were little more than journalists on the front, aiming at a literal representation of what they saw, which was more or less faithfully reproduced in the engravings published in the papers. The production of illustration in newspapers relied entirely on engravings. For papers such as *The Illustrated London News* or *L’Illustration*, large teams of draughtsmen and engravers worked on the

same picture at the same time. As soon as one section of the drawing was reproduced on wood, it was sent to the workshop, where it was engraved, while the draughtsman drew another section. At the end of this process the engraver-in-chief set all the pieces together and engraved the lines to make the parts of the picture look like a whole (Martin 2006). This type of assembly line did not produce the most artistic engravings but had the advantage of being very quick, which was of prime importance for a newspaper. It was the source of the progressive proletarianization of the occupation of engraver.

From the 1850s the *rise of nationalism* transformed the illustrated newspaper into a means of constructing national imaginaries, using stereotyped images representing “us” and “others” (→ Stereotypes). This was crucial during the Franco-Prussian war of 1870–1871 (Martin 2006), especially due to the growth of competition from cheaper papers in the early 1860s. Although few papers belonged to this *third generation*, these often had a very large circulation. Once again, London was the first to launch such papers, with the *Penny Illustrated Paper* in 1861, imitated by the Parisian *Journal illustré* in 1864 and the *Presse illustrée* in 1867 (both sold for 10 centimes; → Penny Press). These generously illustrated newspapers were barely less luxurious than their predecessors and much cheaper, which made them accessible to a popular mass readership. As a result, however, their workers gradually fell into anonymity.

Finally, in the 1890s, a *fourth generation* was born in France, that of the daily papers’ weekly *supplements*, especially the *Petit Journal* and the *Petit Parisien*. Sold for one *sous*, they attained a circulation of over three million. Despite the huge circulation of these publications, this should by no means be seen as the democratization of the press. It must be remembered that all of these papers were owned and edited by members of the middle classes, if not the bourgeoisie. The knowledge/information offered to their readers was undoubtedly top-down, and working class interests had little to do with the content, although people had to be satisfied enough to buy it regularly. Yet these newspapers did much to spread information in everyday culture by offering high-quality illustrations on current events. The intentions of the owner-editors generally went further than profits alone, as they were willing to offer a content that would “educate/inform” their readers. As such, these papers mostly promoted the interests of those who held the social, economic, and political power, but that did not prevent them from occasionally publishing “radical” ideas promoting actions for improving the well-being of the less fortunate classes.

While the distribution of illustrated newspapers mushroomed over the following decades, it took some time before engravings were replaced by photographs in periodicals. This was particularly true of popular papers, which tended to focus on violent events until World War I. It was only in 1936 that *Life* launched a new model from the United States, the news magazine, in which → photography was the only means of illustration (→ News Magazine, History of).

## **Image**

*William L. Benoit*

*University of Missouri-Columbia*

One's image is a very important factor. For example, the oil industry came under fire in 2006 as profits rose along with gasoline prices. Actor and director Mel Gibson was roundly criticized for making anti-Semitic comments while intoxicated. Athletes such as track star Justin Gatlin and cyclist Floyd Landis came under fire for alleged use of illegal performance-enhancing drugs. First, the nature of our image influences our self-esteem; if we believe we have created an undesirable image, that can be an embarrassing and unpleasant experience for us. Second, our image can influence our relations with others. Our reputation influences our persuasiveness; people are less likely to be persuaded by those whom they believe to have undesirable images. For us to be persuasive, our audience must believe that we are knowledgeable about our topic (expertise) and they must have faith that we will provide them with unbiased information (trustworthiness) (→ Credibility Effects; Credibility of Content). Third, others may shun us and treat us badly when they form undesirable impressions of us. It is clear that a desirable image is important to create, maintain, and repair when tarnished (→ Self-Presentation; Image Restoration Theory).

It is not only people who need favorable images and suffer from image problems: groups and organizations, including businesses and countries, have images. Consider the reputations of Enron after the scandal, of the Catholic church following accusations of pedophile priests, of the US Federal Emergency Management Agency (FEMA) in the wake of Hurricane Katrina, of the United States in some parts of the world after the invasion of Iraq (and no weapons of mass destruction were found), or of Iran and North Korea (→ Corporate Reputation). Company officers, employees, stockholders as well as government officials and citizens can become disaffected by a poor image. Furthermore, companies have more difficulty persuading people to buy their goods and services when they suffer from undesirable images. Other companies may be less likely to sell supplies to companies with poor reputations (or may charge a premium to do so). Governmental regulators may create problems for companies with unfavorable images depending on the nature of the image problem. One country may have difficulty obtaining cooperation from other countries. Thus, creating and maintaining a positive image is an extremely important consideration, whether one is an individual, an organization, a company, or a country.

An image is a → *perception* that others have of a person or organization (Benoit 2000; Moffitt 1994). That images are perceptions means that they are not objective and may not accurately reflect reality; although, of course, what “reality” is and our understanding of whether that “reality” is good or bad are open to interpretation because reality is socially constructed (see Berger & Luckmann 1966; → Media and Perceptions of Reality; Perceived Reality as a Communication Process). The “facts” of the matter can help repair a damaged image, but the audience may not necessarily accept the accused’s version of the truth. Some images are very strongly held, but that images are perceptions, not objective parts of reality, means that we can alter images through communication.

Furthermore, that images are perceptions means that different people often have different impressions of the same person or organization. A clear example occurred during the 2004 US presidential election as Republicans and Democrats had distinctly different impressions of President Bush: 91 percent of Republicans but only 17 percent of Democrats approved of the job Bush was doing (Benedetto & Keen 2004). In this case one person gave rise to highly conflicted images in different audiences. However, we need to know how images are formed to have a good chance of predictably altering them.

Images are developed from messages about, messages from, and actions by a person or organization. That is, our impressions of, say, the United Nations arise out of things said about the UN, things said by UN officials, and actions taken by the UN. Of course, an image can be shaped only by information we have. One reason images vary from person to person is that we do not all hear the same messages or see the same actions. Another reason for varied images is that people have different values. For example, voters who thought terrorism was more important than unemployment were more likely to have favorable images of President Bush, compared with voters who thought unemployment mattered more than terrorism. Understanding the nature of image is essential to creating, maintaining, and, when necessary, repairing an image.

## Image Ethics

Paul Martin Lester

California State University, Fullerton

Image ethics has never before been the subject of so much media criticism as at the present time. The use of violent images is questioned. Photographers that hound celebrities beyond propriety are criticized. Pictures that are manipulated and present misleading views damage the media’s credibility. Images that perpetuate negative stereotypes of individuals from various multicultural groups are noticed. Pictures that blur the distinction between advertising and journalism undercut journalism’s legitimacy. Visual messages can have tremendous emotional impact upon viewers. With proper contextualization, they can serve to inform and educate, as well as entertain and persuade. But used thoughtlessly or superficially, images can also offend, shock, mislead, stereotype, and confuse.

The apparent veracity of pictures, the sense in which they seem to simply reflect reality, often obscures the ethical choices involved in their creation. Yet the fact that images routinely employ visual metaphors means that media production is always subject to ethical considerations (Messaris 1996). Visual messages make rhetorical claims about the world, whether intentional or not, as part of → journalism, → advertising, and entertainment, and other fields. Image ethics attempts to foster accountability for visual messages (→ Rhetoric and Visuality; Ethics of Media Content; Accountability of the Media).

When a violent picture of a dead victim of a tragic event is presented to the public in either the print or screen media, many are repulsed and offended. Nevertheless, violence and tragedy are staples of the media. Published, posted, or broadcast images are expected as part of a media system that professes to cover and reflect the world we inhabit (→ Violence as Media Content). Visual journalists often defend such images as a way to warn others of the dangers of modern living – for instance, to urge drivers to wear seat belts. Yet despite such explanations, sensational images of violence and victims are shown as much for economic as utilitarian reasons. Ethical considerations require active consideration of, and debate over, the purposes of images in media presentations and what motivates their use (→ Ethics in Journalism).

An oft-debated area of image ethics involves determining appropriate divisions between public and private life. Ordinary citizens or celebrities who are suddenly thrust in front of the unblinking lens of a camera almost always voice privacy concerns. Since the nineteenth century → photography has been employed in police and government surveillance,

as well as by the tabloid press to expose the private lives of public figures (→ Photojournalism; Tabloid Press; Tabloidization; Voyeurism). In some nations private citizens have more strictly enforced rights to → privacy than celebrities or political figures, but this is not so in other countries (→ Communication and Law). France explicitly protects privacy in its constitution, and the EU directive 95/46/EC clearly regulates the collection and processing of personal data on individuals, but in the US the limits of privacy continue to be debated in the courts. Inconsistent concepts of personal privacy from culture to culture are but one example of the complicated and often relative nature of ethical determinations and the difficulty of establishing unemotional, objective, and reasoned journalism principles.

Another prominent area of ethical debate involves stereotypical or offensive portrayals of social or cultural groups, whether distinguished by ethnicity, gender, religion, sexual preference, physical characteristics, age, class, or occupation (→ Stereotypes; Stereotyping and the Media; Social Stereotyping and Communication; Sex Role Stereotypes in the Media; Women in the Media, Images of). The concern for stereotyping relates to images in entertainment and advertising as much as journalism (→ Television, Visual Characteristics of; Television News, Visual Components of). The globalization of communication networks and → media conglomerates has increased cultural friction over the propriety of public imagery (→ Concentration in Media Systems; Globalization of the Media). Examples of recent ethical controversies in this regard include the case of the Danish editorial cartoons caricaturing Muslims and the prophet Muhammad. In this case, ethical considerations pitted principles of religious and ethnic respect against ideals of freedom of expression (→ Freedom of Communication).

In other cases, the popular misunderstanding that photographic media simply record the way things are often complicates image ethics. For example, US magazines and newspapers publish few photographs of African-Americans, but when they do, those shown are disproportionately depicted as athletes, entertainers, or people charged with crimes (Lester 1994). Because published pictures are inevitably a small selection of all available images, every pictorial selection by a photographer and an editor involves a potential stereotype with an ethical dilemma.

Advertising relies as much as journalism on the credibility of visual messages to persuade viewers of the legitimacy of its claims. Entertainment utilizes the → realism of visual media to construct convincing simulated worlds from its stories (→ Advertisement, Visual Characteristics of; Film Theory). With names such as “advertorials” and “infomercials,” advertisers mimic the production cues of print and screen journalists to present appeals as information (→ Public Relations Ethics). In advertising of all types, commercial and political (→ Political Advertising), images are often intentionally constructed to be misleading. Through art direction, staging, and photo manipulation, they easily and purposefully lead readers or viewers to draw false or irrelevant inferences and connotations. When public relations directors or news editors use flashy covers and front-page layouts as advertisements for the news, they easily fall into the same practices. The inherently ambiguous nature of pictures in such mass media contexts make image ethics a daily concern.

Digital technology has added yet another layer of complexity to the ethical use of visual messages (→ Digital Imagery). Image manipulation did not begin with computer

technology, but digitalization has greatly expanded the speed and power with which alterations can be made. Digital manipulations are relatively easy to accomplish, are hard to detect, and can change the original image so that verification of authenticity becomes impossible. Only a serious commitment to ethical standards prevents the wholesale fabrication of pictures (→ Visual Representation). Few would argue that images used in journalism contexts should have the same low level of credibility as those pictures used in advertising. However, without close attention to image ethics, such a situation may become the norm.

## **Image Restoration Theory**

*William L. Benoit*

*University of Missouri-Columbia*

Image restoration theory – referred to as “image repair theory” in recent literature, to imply that an image might be improved but not completely *restored* – addresses the question of what a person or organization can say when accused or suspected of wrongdoing. Our reputation is vital both for our self-esteem and because reputation influences how others

will treat us. Ken Lay (Enron) and Congressman Gary Condit (who appeared uncooperative in the search for missing intern Chandra Levy) failed to repair their images. Tylenol, on the other hand, did repair its image after its capsules were poisoned. Countries also engage in image repair: Saudi Arabia placed a series of advertisements attempting to distance itself from the 9/11 tragedy (many of the terrorists were from Saudi Arabia, including Osama bin Laden). Clearly, a favorable → image is desirable, and tarnished images need repair.

Image restoration theory begins by noting that accusations or suspicions have two components: responsibility (blame) and offensiveness. An image is at risk only when an offensive act has occurred and one is believed to be responsible for that act (→ Crisis Communication). Those accused or suspected of wrongdoing have five general options, which are related to responsibility and offensiveness. *Denial* argues that the accused is not responsible for the offensive act. A second general option is to *evade responsibility* (partially reducing blame), with strategies such as claiming the offensive act was an accident, that one was provoked into performing the act, or that one lacked the ability or information necessary to prevent the offensive act. A third group of strategies address the second component, attempting to *reduce offensiveness* by minimizing the damage or attempting to justify the offensive action (e.g., I stole to feed my starving family). *Corrective action* attempts to fix the problem (or prevent it from happening again), addressing offensiveness. Finally, *mortification* admits responsibility and asks for forgiveness (→ Apologies and Remedial Episodes). Altogether image restoration theory identifies 14 strategies, which are individually defined and illustrated in Benoit (1995; 1997).

Those who want to repair tarnished images should begin by identifying the key target audience. For example, a company accused of polluting the environment faces many potential audiences, including local residents, environmental activists, customers, reporters, governmental regulations, and stockholders. These groups have different interests and most likely would not respond equally well to the same message, for example, local residents would like to hear that a company will spend whatever it takes to stop all pollution, but the same message might not bring joy to its stockholders. Second, the accused must identify the specific accusations or suspicions. One may choose to ignore an accusation that is unimportant to the target audience, but it is a serious mistake to accidentally overlook an important accusation. Third, one must understand the target audience: What do they know (or think they know) about the accusations? What needs and interests matter to them concerning the accusations (what things do they value most)?

The persuader should select from among the 14 image repair strategies with the accusations, the target audience, and the facts of the case in mind. It is not necessary to use all 14 strategies (indeed, some options, such as provocation, have not been found to be very persuasive). Some strategies go together well, for example, “I apologize” (mortification) and “I will fix the problem” (corrective action). On the other hand, some strategies do not work well together, for example, “I did not steal” (denial) and “I stole for my starving family” (justification, or transcendence). Finally, it is important to realize that the “facts” matter in image repair. One who is innocent probably should use denial (although, unfortunately, not all genuine denials are believed). One who is guilty probably should confess. Telling the truth is, of course, the right thing to do; however, the two main considerations of corporations are often the best way to repair their image, and how they can avoid costly lawsuits. Furthermore, not all denials are equally effective. One

must implement the selected strategies in a message using the “facts” (evidence, such as statistics or examples) that are likely to be persuasive to the audience.

One important tension often arises. In general, people do not like to admit wrongdoing: confession threatens one’s face. On the other hand, audiences usually want wrongdoers to admit their mistakes (and clean up their mess). So, the option that is most likely to persuade audiences – mortification – tends to be shunned by those accused of wrongdoing. However, we must keep in mind that a false denial is often found out, at which point the offender will have committed two wrongs: the original offensive act and then the lie.

## **Imagined Interactions**

*James M. Honeycutt*

*Louisiana State University*

Imagined interactions are a type of social cognition and mental imagery (→ Cognition; Information Processing), theoretically grounded in symbolic interactionism (→ Symbolic Interaction), in which individuals imagine conversations with significant others for a variety of purposes (Honeycutt 2003). The imagined interaction construct has provided

a beneficial mechanism for studying intrapersonal and interpersonal communication (→ Interpersonal Communication). Imagined interactions are a type of daydreaming that has definitive characteristics and serves a number of functions including rehearsal, self-understanding, relational maintenance, managing conflict, catharsis, and compensation. They often concentrate on ongoing or important events in individuals' daily lives and are associated with a variety of emotions (Klinger 1990).

Imagined interactions are mindful activities (Honeycutt & Ford 2001). Langer et al. (1978) showed how people sometimes process information by not attending carefully to information in their immediate environment. Mindlessness occurs when individuals rely on routine ways of thinking and use scripts such as saying "Hi" as a greeting ritual. Honeycutt and Cantrill (2001) have discussed how scripts (→ Schemas) are a type of automatic pilot providing guidelines for how to act when encountering new situations. Scripts are activated mindlessly and created through imagined interactions, as people envision contingency plans for actions. In contrast to mindless processing, engaging in imagined interaction requires conscious cognitive processing.

### THEORETICAL CONCEPTS

Imagined interactions are different from instances of self-talk and private speech. A common example of internal monologue is an individual practicing a speech who only envisions what he or she will say while ignoring feedback or audience reactions. Internal monologues are speech directed toward the self from the self while imagined interactions are directed toward someone else. Private speech occurs when an individual speaks aloud to himself or herself. Roloff and Ifert (1998) discuss how private speech may occur in isolation as well as in the presence of others. When enacted in the presence of others, private speech may not elicit a response from an interaction partner because the partner perceives the speech is not directed toward himself or herself.

Honeycutt (2003) distinguishes imagined interactions from fantasy. He clarifies the difference by stating that imagined interactions simulate communication encounters that a person expects to experience or has experienced during his or her interpersonal life. Fantasies involve highly improbable or even impossible communicative encounters. For example, imagining chatting with an idolized movie star would be quite unlikely to occur, and thus would qualify as pure fantasy. These imagined encounters would not, or at least would rarely, serve as the basis for actual communication. Research supports the notion that imagined interactions do not occur with strangers or celebrities but with real-life significant others. Honeycutt (2003) cites studies indicating that college students had most of their imagined interactions with romantic partners (33 percent), followed by friends (16 percent), family members (12 percent), authority figures (9.4 percent), co-workers (8 percent), ex-relational partners (6 percent), and prospective partners (4 percent). Imagined interactions with rivals occur sparingly.

### FUNCTIONAL THEORY OF IMAGINED INTERACTIONS

A functional theory of imagined interactions explains their purpose in everyday encounters. When assuming a functional approach to analyzing imagined interactions, it

is assumed that there may be therapeutic benefits at some level, whether it is increased self-awareness, relief of tension, or having pleasant thoughts about the imagined interaction. Support for this assumption is available in studies reviewed by Honeycutt (2003), particularly in the use of mental imagery to alleviate depression.

There are six functions of imagined interactions. First, they *maintain relationships*, as intrusive thinking occurs in which the partner is thought about outside of his or her physical presence. It has been found that they occur with friends, family members, intimate partners, roommates, and co-workers (Honeycutt 2003). They also occur among geographically separated couples.

A second function of imagined interactions is *rehearsing and planning messages* (→ Strategic Communication). Individuals report how they prepare for important encounters and even think of various messages depending on their interaction partner's responses. Except for lonely people, rehearsal is often helpful even when there are discrepancies with actual conversations. Rehearsal allows people to develop rapid response contingencies more quickly compared to no-rehearsal. It is helpful in preparing for job interviews and in stress situations such as having to tell someone bad news. The rehearsal function acknowledges the vital role communication plays in converting plans to action. Berger (1997) notes that when individuals engage in the planning process by themselves, they likely engage in internal dialogue as a means of testing out several alternatives before enactment. In essence, the individual can rehearse the plan(s) mentally prior to activation.

A third function of imagined interactions is *self-understanding*, as imagined interactions allow people to clarify their own thoughts and promote understanding of their own views. Imagined interactions' role in bettering self-understanding has been revealed in research assessing their use by couples experiencing geographical separation. Geographically separated couples indicate they experience imagined interactions as a means for increasing self-understanding compared to couples that are not geographically separated (Honeycutt 2003). These results suggest that such couples have a greater need to develop better understanding prior to interaction because of the limit on interaction time due to their geographic circumstances.

The fourth function, *catharsis*, allows people to release emotions and vent feelings of frustration or joy. There is tension relief and anxiety reduction. This often occurs in conjunction with the fifth, *compensation*, function, in which individuals compensate for the lack of actual conversations. For example, a person may imagine giving his or her supervisor a "piece of their mind," which momentarily relaxes them. Yet, they realize to do this may result in reprisal or sanctions; hence, both compensation and catharsis are used. For example, compensating for the lack of real interaction in long-distance relationships may be used to keep the relationship alive as well as rehearsing what will be said at the next telephone conversation.

The final function is *conflict management*. Individuals may relive old disagreements and arguments while simultaneously imagining statements for ensuing encounters. Hence, disagreements may pick up where they left off from prior interactions. The study of imagined interactions explains why there may be long-term, recurrent conflict and particular themes that characterize encounters between relational partners. Imagined interactions link a series of encounters together, as individuals replay what was previously said and anticipate what may be said in the future. Conflict is maintained by reliving old

arguments and imagining future conversations so that subsequent encounters may become self-fulfilling prophecies as interaction expectancies are enacted (Honeycutt 2003). More specifically, conflict is managed for productive outcomes by having positive imagined interactions in which positive thinking overwhelms pessimism.

The conflict management function of imagined interactions explains recurring conflict in personal relationships. Honeycutt (2003) has presented three axioms and nine theorems for managing conflict, with numerous studies supporting them. Some therapists lament how counseling and intervention may not result in longitudinal benefits in getting couples to communicate constructively. Conflict may be maintained through retro- and proactive imagined interactions that link a series of interactions (Honeycutt 1995). People may experience negative emotions as they “replay” such encounters. The conflict management function of imagined interactions helps explain why instruction on rational models for conflict resolution often fail, as people regress to old ways for resolving conflict (e.g., “I win, you lose”). Old interaction scripts that are nonproductive may be mindlessly retrieved from long-term memory. Thus, conflict episodes may pick up where they last left off, despite a period of physical separation. In the meantime, conflict is maintained in the mind using the retro- and proactive (rehearsal) features of imagined interactions. In this regard, imagined interaction conflict management theory explains why popular “time-out” strategies advocated by educational interventionists may fail regularly.

## MEASUREMENT AND FINDINGS

The study of imagined interactions presents researchers with several problems. As is true of cognitive research in general, investigators of imagined interactions must largely infer the existence of internal cognitive states from external behavior (Ericsson & Simon 1980). While physiological measures may allow researchers to document the occurrence of mental states, they tell us little about these states beyond the physiological level. The *Survey of Imagined Interaction* is used to measure the characteristics and functions of imagined interactions, and journal accounts and interviews have also been used to study imagined interactions.

Individuals describing their imagined interactions utilize verbal, visual, or mixed imagery. Verbal imagery concerns the content of messages. Visual imagery involves “seeing” the scene of the interaction. Those reporting a mixed mode also indicated more pleasantness than did those reporting primarily verbal modes (Honeycutt 2003).

The Survey of Imagined Interactions has proved to be a reliable measure of imagined interactions. When assessing imagined interactions in various situations, it is important for researchers to contextualize or reword the items to reflect the context of interest. For example, if someone is interested in how often imagined interactions occur in an organizational setting with a co-worker, the survey participants need to be explicitly told who is being referred to, such as a supervisor, co-worker, or subordinate.

“Talk-out-loud” procedures, in which individuals role-play what they would say to a relational partner about an important relational issue (e.g., financial management, sexual relations) that they have chosen as problematic in their relationship, have been used in imagined interaction research. Using interviews as a means of studying marital couples

and their use of imagined interactions, Honeycutt (1995) found that couples recall old arguments that are experienced as retroactive imagined interactions, and these have just as much meaning to them as actual conversations. However, other couples reported that the imagined interactions serve as a mechanism for dealing with suppressed conflict that is not being discussed openly. Individuals have a better memory for imagined interactions involving conflict (Honeycutt 2003).

Research suggests lonely individuals have imagined interactions that are discrepant from real conversations (Edwards et al. 1988). Imagined interactions may perpetuate their lonely state because of limited access to conversational scripts. Discrepancy is negatively correlated with communication competence (Honeycutt et al. 1992–1993).

*Physiological responses* while experiencing imagined interactions related to aggressive driving are being studied through the analysis of blood pressure, heart rate per minute, inter-beat interval, and somatic activity. Persons report on their imagined interactions before engaging in a motivated driving task on driving simulators that state troopers use to train themselves for a variety of traffic conditions. Physiological responses are measured while persons imagine arguments with partners and while they actually argue with them. Results reveal some relationships between heart rate variability and imagined interaction conflict management.

# Impersonal Effects

*Yariv Tsfati*

*University of Haifa*

Impersonal effects is an increasingly influential paradigm in media effects research (→ Media Effects). It argues that media are powerful in shaping our → perceptions of what anonymous others are feeling and experiencing, and that such perceptions, in turn, influence our → attitudes and behaviors in a variety of areas. The effect suggested by the theory is, thus, indirect: exposure to media affects the audience's perception of the collective conditions or the opinions and attitudes of people they do not know personally (→ Media Effects: Direct and Indirect Effects). Cognitive and attitudinal responses to these perceptions are the measurable changes constituting the effects.

## ORIGINS

Claims and speculations regarding impersonal effects date back to De Tocqueville (1956, 1st pub. 1835), who argued that newspapers help isolated audiences see and feel each other, and facilitate the perception that single, individual experiences are sometimes collective, and thus political. However, conceptualization and empirical investigation of impersonal effects are relatively recent (Brosius & Bathelt 1994; Mutz 1998; Gunther & Storey 2003).

The term “impersonal influence” was coined by Diana Mutz (1998), who demonstrated significant differences between people's perceptions of their own conditions and their assessments regarding the collective conditions. People tend to perceive that they are better off than others and that the collective conditions are worse than they are in reality (as documented by statistical indicators). According to Mutz, these perceptions are affected by media coverage. For example, an impersonal influence occurs when media coverage causes people to think that crime is rising, even when public records show that there has been no increase in the crime rate. Impersonal influence theory argues that, in their behaviors, “people are responding to a media constructed pseudo-environment rather than their immediate personal experiences or those of friends and acquaintances” (1998, 6).

Mutz demonstrates, for example, that exposure to newspaper coverage of unemployment trends and to media reports about unemployment rates are associated with audience perceptions of unemployment at the collective (state and national) level (→ Media and Perceptions of Reality; Social Perception). The methodology used to demonstrate such impersonal influence effects is correlational, but also experimental and quasi-experimental (→ Correlation Analysis; Experimental Design). Evidence further demonstrates that media-facilitated perceptions regarding collective-level conditions are more important for political decision-making than people's perception of their individual-level conditions. Furthermore, when media coverage of impersonal, collective-level conditions in a certain area is heavy, and when the coverage coincides with personal-level judgments, the weight of these experiences in shaping political attitudes, such as presidential approval, increases.

## THEORY

The theory of impersonal influence shares several assumptions with other theories of the mass society. Audiences are perceived as relatively disconnected from each other, and media replace traditional mediating mechanisms in providing people with information about their surroundings (→ Audience). Developments in the content of → news over the past century have increased the frequency with which people encounter information about remote and generalized others. Thus, impersonal influence theory also corresponds with technological theories: mass media provide the technology through which indirect associations can be established and impersonal collective information can be obtained.

Much of the effect of media on audience perceptions of what others are feeling and experiencing takes place because of the perception that media are influential. Impersonal influence encompasses what is known as the → *third-person effect* (Davison 1983) or “the influence of presumed media influence” (Gunther & Storey 2003). According to this line of research, people’s perceptions of media influence lead them to adjust their attitudes and behaviors in accordance with the perceived effect.

In a landmark article, Davison (1983) discussed the possibility that the perceived influence of Japanese → propaganda materials in World War II, targeted at Afro-American soldiers, had an impact on the white officers’ decision to withdraw the Afro-American unit from the front. He also speculated that perceptions regarding media impact underlie the association between news reports and fluctuations in the stock markets: that such reports are perceived by investors to cause others to sell (or buy) certain categories of shares; therefore they themselves sell (or buy) in anticipation of the others’ action. In addition, Davison suspected that when media report about irregularities in the supply of consumer goods, some people rush to the stores because they believe the media reports will influence others who will try to stock up “before the hordes remove all goods from the shelves” (1983, 13; see Tewksbury et al. 2004 for a test of this hypothesis in the context of media reports about the millennium bug panic).

The consequences of believing that media have a strong impact on others could lead to several generalized outcomes (Gunther et al. 2006). *Prevention* refers to the impulse to thwart an apparently harmful message. For example, it is well established that people who believe that harmful media content (e.g., violence or pornography) exerts an influence on audiences are more inclined than others to espouse censorship (Perloff 2002; → Violence as Media Content, Effects of; Sex and Pornography as Media Content, Effects of).

*Accommodation reactions* refer to any other behavioral adjustment, including compliance with or defiance of perceived → social norms that are presumably shaped by media. One example of the compliance category would be adolescents who, believing that pro-smoking messages make their peers regard smoking in a more positive light, start to smoke themselves (Gunther et al. 2006). In this case, as in other compliance cases, individuals engage in an activity because they feel that media cause other people to view the activity in a positive way (→ Compliance Gaining). Defiance, the second category of accommodation, describes a situation in which individuals who believe that media influence the opinions and behaviors of others react *against* those perceived trends (Tsfati & Cohen 2005). When survey respondents felt that political advertising might persuade others to vote for the wrong candidates, they were more likely to report they intended to vote,

supposedly to mitigate the negative influences by trying to sway the election in favor of their preferred candidates (→ Communication Accommodation Theory).

*Withdrawal* is the third type of response. In this case, believing that media foster a social norm can cause people *not* to do something they would have done otherwise because they think other people would *not* like it. Noelle-Neumann's (1993) "spiral of silence" process falls into this type of behavioral consequence of the presumed media influence. Her theory describes people *not* speaking their mind because they feel that media influence *others* to have divergent opinions.

*Oblige*, the fourth and final type of behavioral consequence of perceived media influence, takes place when people feel obligated to respond to the fact that others are affected, regardless of their personal compliance or noncompliance with the norm. Such an effect occurs especially when these individuals are serving or protecting dependent others. For example, doctors who perceived that direct-to-consumer (DTC) prescription drug advertising had negative effects on their clients were more likely to refuse to prescribe these DTC drugs (→ Health Communication; Doctor–Patient Talk).

While the theory of impersonal influence offers an innovative pathway to investigating indirect media effects, there are still doubts about the causal direction implied in the theory. Perhaps people's attitudes and behaviors shape their perceptions of the collective conditions or of media impact, not the other way around. Yet another theoretical shortcoming relates to the fact that the theory sometimes provides conflicting predictions. We cannot predict exactly what kind of perceived effects will lead people to defy or comply with perceived social norms. Theories of normative influence on behavior should probably be useful in clarifying this issue and the theoretical mechanism underlying impersonal influence.

## Implicit Personality Theories

Elizabeth Lindsey

New Mexico State University

Considered by many scholars to be a historically significant conceptual development in the study of → social cognition, implicit personality theories are cognitive structures utilized during → social perception and in social interaction. The knowledge contained in these structures specifies sets of personality traits perceived to be interrelated. Applied during social perception, implicit personality theories are key to impression formation, allowing a perceiver to make trait inferences, or, infer from a few, initially observed traits that a person will probably have a number of additional, implicated traits. Applied in social interaction, implicit personality theories are a source of person knowledge, a type of knowledge seen as essential to communication skills and achieving communication goals (→ Goals, Social Aspects of; Interpersonal Communication), as is knowledge of the self, roles, contexts, emotions, and how to put together one's messages (→ Schemas, Knowledge Structures, and Social Interaction).

Gestalt psychologist Solomon Asch introduced the precedent to implicit personality theories in 1946, the year he published experiments testing his *configurational model of impression formation*. Asch proposed that given the observation of several initial or stimulus traits, a perceiver would configure the traits to form a gestalt impression of another's personality. Some traits, particularly those with strong positive or negative connotations, would be more central to the configuration than others, thus dominating both the impression and a perceiver's inferences of additional traits. A few years after Asch published his → paradigmatic experiments, Bruner & Tagiuri (1954) offered an alternative to the idea of trait configuration during impression formation. They proposed that impressions and trait inferences might proceed more immediately from naïve "implicit theories of personality," or from already developed, organized ideas of the possible interrelationships among personality traits.

Ensuing efforts to examine perceived interrelationships have, to some degree, clarified the possible content and organization of implicit personality theories. According to Sedikides & Anderson (1994), investigations of implicit personality theories usually represent one of three views: the associationistic view, the dimensional view, or the person types view.

*Associationistic scholars* view the interrelationships as a simple perceived co-variance among certain traits. Correlational analyses of traits perceived across different stimulus persons and by different perceivers have provided some evidence of perceived co-variation, although according to Anderson (1977) there are considerable weaknesses to using correlational measures for estimating the interrelationships (→ Correlation Analysis).

Scholars advocating a *dimensional view* maintain that the perceived co-variances represent underlying dimensions of personality that may be organized hierarchically in relation to each other. Dimensions are obtained using → factor analysis or other multidimensional scaling techniques on intertrait correlations. Using a multidimensional scaling procedure, for example, Rosenberg & Sedlack (1972) located two dimensions – “intellectual” and “social” – underlying study participants’ perceived co-variations among traits. The poles of each dimension reflected valued or good traits versus nonvalued or bad traits. Traits such as skillful, industrious, and intelligent, perceived by participants to be co-varying, were located dimensionally as being highly intellectual and good. Traits such as honest, modest, and tolerant were clustered closely together as social and good. Traits such as warm were perceived by participants to be good socially but bad intellectually, with the trait of cold perceived oppositely, i.e. as bad socially but good intellectually.

Scholars from the *person types view* generally use → cluster analyses of participant ratings of others’ personalities to determine the interrelations. According to Anderson & Sedikides (1991), cluster analysis is able to detect clusters of traits not identified by either correlational analysis or multidimensional scaling techniques. In addition, these authors have provided some evidence that certain interrelationships among traits are causal and bidirectional. Study participants may perceive, for example, that being depressed creates the traits “unhappy” and “pessimistic,” while unhappiness and pessimism are, in turn, traits leading to loneliness. Of the three views, the most recent is the person types view, and to some extent implicit personality theories have been replaced conceptually by other cognitive structures such as person prototypes and stereotypes (→ Information Processing: Stereotypes). Both person prototypes and stereotypes represent prototypical knowledge of person types and have an advantage over implicit personality theories in that they contain knowledge of typical behaviors and typical features of appearance in addition to typical traits. Unlike implicit personality theories, person prototypes and stereotypes are able to explain the initial inference of traits from a person’s behavior and appearance.

Irrespective of their view as to whether implicit personality theories are organized (1) as sets of co-varying traits, (2) as traits arranged according to dimensions, or (3) as traits organized as person types, some scholars are still debating whether the perceived interrelationships among traits are “real” or “ideal.” *Realists* maintain that the perceived interrelationships originate from people’s experience of actually co-occurring traits. *Idealists* propose that the interrelationships are affected by people’s tendencies toward illusory correlations or even semantic relationships among trait labels, as illustrated by Thorndike’s (1920) halo effect.

According to Schneider et al. (1979), research evidence primarily supports a middle ground between the realist and idealist positions. While at least one study has found that people are sensitive to and can recognize actually co-varying traits, other studies suggest that the strength of the co-variation is most likely to be exaggerated. Thus, while implicit personality theories may be an important source of person knowledge during interaction,

this knowledge introduces at least some degree of bias in our perceptions and inferences of others' personalities.

## **Impression Management**

*Eun Joo Kim*

*Yonsei University*

As a fundamental interpersonal process, impression management is an important concept in any communication context. Impression management refers to the process of editing, packaging, and communicating information to control one's own images as perceived by other people. Studies have shown that people use impression management to influence others, and that it eventually affects the overall quality of one's life. Even when people have no direct reason to influence others' behaviors, people are motivated to impression-manage for the following two reasons. First, impression management influences

their own self-esteem and reduces negative emotions. Second, it enables people to construct and maintain their private identities. Impression management has been used to define diverse interpersonal communication phenomena, including encounters between strangers, job interviews, friend relationships, romantic relationships, and doctor–patient relationships. The term “impression management” is commonly used interchangeably with → “self-presentation,” although some studies differentiate between the two with regard to intended goal direction and authenticity. While impression management focuses on goal-directed social activity to enhance one’s own image and power, self-presentation focuses on self-relevant or authentic presentation (Leary & Kowalski 1990).

### **EMERGENCE OF IMPRESSION MANAGEMENT AND THEORETICAL CONCEPTS**

The origin of scientific interest in impression management began with the book *The presentation of self in everyday life* (Goffman 1959). Goffman’s basic assertion was that social behaviors should be understood through the overt appearances people create for others. Hence, the original focus was on public images attained from others’ judgments and reactions in social life. Jones (1964) focused on how we control others’ impressions of our personal characteristics, sparking psychologists’ interest in impression management. During the 1960s and 1970s, studies of impression management remained relatively peripheral in social psychology, although the topic had been steadily adopted by interpersonal communication researchers. With respect to research methodology, Goffman, as a sociologist, used anthropological field observations. On the other hand, Jones, as a social psychologist, investigated specific factors affecting impression management processes in designed laboratory experiments. Over time, an increasing number of studies reported that a wide range of human behaviors are governed by one’s desire and tactics to control others’ perceptions of one’s self. By the 1980s, impression management had become one of the main research agendas in the field of interpersonal communication.

Scholars have developed various typologies and strategies to analyze impression management styles. A taxonomy of self-presentation strategies, including self-promotion, ingratiation, exemplification, intimidation, and supplication, was suggested. Others suggested two distinct self-presentation tactics – defensive and assertive. Studies have expanded this taxonomy by identifying a number of tactics including excuse, justification, disclaimers, self-handicapping and apology, ingratiation, intimidation, supplication, entitlement, sandbagging, enhancement, and blasting. Three aspects of perfectionistic self-presentation namely perfectionistic self-promotion, nondisplay of imperfection, and nondisclosure of imperfection, were also suggested. Schlenker and Britt (1999) suggested beneficial impression management, where the presenters focus on others as well as themselves. Beneficial impression implies strategic control of information to help close friends make desired impressions on significant audiences. The researchers assert that the success of a close relationship is associated with the use of other-benefiting impression management. While various typologies have been developed, self-enhancement and self-effacement are the most commonly discussed. Some studies have focused on what is termed bragging and on positive and negative self-presentation (Kim et al. 2003).

## FINDINGS AND MEASUREMENT

People have an inherent predisposition to be concerned about how others perceive them. Whenever people are in the presence of others, usually it is in their best interest to convey particular types of impressions. Generally, people are motivated to manage their image in order to maximize rewards and minimize punishments. Situational, dispositional, and audience factors affect the motivation to manage impression and in turn affect social anxiety (Schlenker & Leary 1982). The size of the audience increases the motivation to impress others, and people are more likely to become motivated to impress an audience that is perceived to have more authority. However, a discrepancy can exist between the desired image and reality, with the result that social anxiety will occur when impression-relevant outcomes are lower than expected. As such, impression motivation is closely related with, and is considered a necessary condition for, social anxiety (Leary 1995).

How people present themselves to others is influenced by the private self, specifically the self-concept, self-esteem, and desired and undesired self. Self-concept – the set of beliefs about oneself – is the composite of ideas, feelings, and attitudes people have about themselves. The self-concept influences people's behavior primarily through the phenomenal self and conscious self-awareness. Phenomenal self implies the portion of one's self-beliefs in conscious awareness at any particular time. The most common dilemma in impression management occurs when desired image differs from one's own self-concept. People usually use authentic, deceptive, and exclusionary impression management to respond in such dilemmas. Baumeister et al. (1989) reported that people use different styles of impression management according to their impression management motivation as determined by their self-esteem. In other words, people with high self-esteem are motivated to make favorable impressions and show acquisitive impression management. In contrast, people with low self-esteem are motivated to avoid failure and show protective impression management.

People consciously or unconsciously pursue various styles of impression management to elicit socially desirable responses (→ Social Desirability). Among diverse positive responses, people have a strong and pervasive desire to be liked and respected by others. Jones and Pittman (1982) suggested that self-presentation is a twofold process of ingratiation, where one wants to be liked, and self-promotion, where one wants to be evaluated as competent. Being liked is the most basic and general impression people want to make because it garners them diverse social rewards such as friendship, social support, companionship, romance, and status. Attributions of likeability include being perceived as friendly, intelligent, attractive, fun, outgoing, and easy to talk to (Leary & Kowalski 1990).

Receiving respect, or being judged competent, is also the most basic impression people want to make because "being perceived as competent" can mean higher status, more influence on others, and better jobs. Being perceived as competent is more complicated than being liked, and it may include such diverse attributes as past achievements and self-confidence. With regard to perceived competence, the following two phenomena are especially important. The first is the so-called "self-promoter's paradox," which suggests that when people excessively claim their own strengths, they may in fact be perceived as

less competent than without the claims. The second is that there could be a negative correlation between being liked and being perceived as competent. That is, when people emphasize their own strengths, they are likely to be seen as “arrogant and conceited,” which are unfavorable traits. As such, self-presentation may face “a constant trade-off between favorability and plausibility” (Tice et al. 1995, 1120).

Some studies have shown that positive self-presentation is more favorably perceived than bragging; a negative presentation of oneself tends to be the least favorably perceived. Also, bragging and positive presentations are considered signs of competence, unlike negative presentations. Researchers have concluded that the effects of different impression management styles are usually influenced by people’s own designed self-image, people’s social role, audience’s characteristics, other people’s existing impressions of the people, the context in which self-presentation is implemented, and presenter’s and audience’s gender.

Several studies have developed measurements for impression management. For example, Roth et al. (1988) reported a scale for indicating negative characteristics (repudiative tactics) and affirming positive characteristics (attributive tactics). A self-presentation tactics scale measuring individual differences in proclivity for using 12 self-presentation tactics was also developed. In this model, a two-component model of defensive and assertive self-presentation was suggested and 12 tactics such as excuse, justification, and ingratiation were developed. Scales measuring the tendency for respondents to engage in impression management include the self-monitoring scale, the social desirability scale, and the public–private self-consciousness scale. While these scales analyze some aspects of the proclivity to engage in impression management, they are not adequate to measure the construct of impression management.

## **CULTURE AND IMPRESSION MANAGEMENT**

Cultural psychologists assert that different cultures shape different values in achievement, power, hedonism, respect for tradition, conformity, and contents of self (Schwartz & Bilsky 1987). Recognizing significant weakness in the culture-level approach, researchers have advocated an individual-level approach to explain cross-cultural differences (Kitayama et al. 1997). The self-construal concept was originally developed to explain cultural differences in behaviors and attitudes in individual levels. According to Markus and Kitayama (1991), the central difference between the two self-construals of independence and interdependence is the belief one maintains regarding how the self is related to others. Those who construe themselves as independent see themselves as separate from others and emphasize autonomy, whereas those who see themselves as interdependent perceive that they are connected with others and emphasize conformity. People from western cultures tend to have higher levels of independence, while those of Asian cultures have higher levels of interdependence. Asian people tend to evaluate modesty and self-effacement more highly and have less tolerance toward bragging than those of western cultures. The impact of culture on impression management has been inadequately explored. Increased globalization will drive the need for more studies comparing impression management processes across cultures.

## Independent Media Centers Network

Lisa Brooten

Southern Illinois University

The global network of Independent Media Centers (IMCs), or “Indymedia,” is a groundbreaking example of the power of an online, multimedia network providing for instantaneous, decentralized global communication, unique in that it involves a network of nonprofit, autonomous media collectives. These new technological capacities are shifting the nature of news consumption and provoking debates about the nature of → news, its construction, and what constitutes a newsmaker. In addition, IMCs have been experimenting with hierarchy-leveling organizational processes and interactive software in the interests of furthering democratic goals and providing a more diverse set of discussions than

corporate media currently offer (→ Media Democracy Movement). Indymedia discussions also critique the global hegemony of the neo-liberal and unilateral policies of the United States and its allies.

## **FOUNDATION AND DEVELOPMENT**

The network was pioneered by activists wanting an alternative to corporate news coverage of the protests against the World Trade Organization in November 1999 (→ Activist Media). Activists provided up-to-the-minute accounts with text, photographs, streaming audio and video, and hyperlinks to alternative information sources with few gatekeepers. Their turnaround time often directly challenged mainstream media coverage (Downing 2001; Kidd 2003a), and even Reuters and → CNN linked to the Seattle IMC site, which received about 1.5 million hits over four days (Kitaeff 2003).

Since its inception, the network grew quickly, and became the primary organizing mechanism and news source for the global social justice and antiwar movements. Local IMC chapters worldwide operate in most cases as an alternative → public sphere loosely affiliated with politically progressive social movements (Downing 2003). The network also became a source of information for the wire services, especially during meetings of the IMF, G8, and other global organizations, and the protests accompanying them (→ News Agencies).

Indymedia in the mid-2000s consisted of over 160 nonprofit collectives forming IMC chapters, some regional in nature, publishing in more than 20 languages throughout Europe, North America, Latin America, Asia, Oceania, and Africa. The chapters were still concentrated primarily in the United States, Canada, and Europe, but Latin America and Oceania each had a strong showing, and new chapters continued to form worldwide. Each IMC collective was autonomous, controlling its own mission statement, finances, and decision-making processes. Network decisions were made through virtual working groups using a consensus decision-making process. Some IMC chapters were primarily websites maintained by a few people, while others involved many volunteers in a variety of projects and media. And although Indymedia was entirely volunteer-run, with no headquarters, formal governing structure, or regular funding sources, its size and reach outstripped even the largest news organizations, both geographically and in terms of labor.

While each IMC was different and the network provided for a wide variety of political opinions, Indymedia generally challenged the neo-liberal paradigm championed by western governments, and was committed to the nonhierarchical, nonsexist, and nonracist practices emphasized in the network's Principles of Unity (Indymedia Documentation Project 2000) and Draft of Membership Criteria. Indymedia was also committed to open publishing and consensus-based processes of decision-making intended to be inclusive and to provide for multiple voices (Indymedia Documentation Project 2002). In open publishing, anyone with → Internet access can post a story, and the process of creating news is transparent to the readers, making it easier for them to get involved. To increase participation, Indymedia used both electronic mailing lists and wikis (websites that anyone can access and edit), and all were linked through the network's global site, [indymedia.org](http://indymedia.org).

## **INDYMEDIA.ORG AND ITS MAJOR FEATURES**

As Indymedia's virtual headquarters, [www.indymedia.org](http://www.indymedia.org) showcased feature stories culled from local IMC websites worldwide, each linked to the global site. Features usually consisted of a short summary text with a series of links, and ended with the option to "add your own comment," often provoking lengthy discussions. Local IMC groups drew many of the features they posted from writings posted to the open-publishing newswire, usually to the right of the features on local IMC sites. Local features then fed into the global newswire, from which a global editorial group determined which stories would become global features. According to the global website, the Indymedia network as a whole received an estimated 500,000 to 2 million hits per day, depending on what was occurring worldwide. During the first few days of the invasion of Iraq in March 2003, for example, some local IMC sites (such as IMC Italy) were receiving about half a million page hits a day. While a wide variety of local, national, and international events were reported on and debated, some common themes throughout the network included the consequences of neo-liberalism worldwide, local labor, human rights and environmental issues, and the limitations of corporate media and their approach to → journalism.

### **Connecting the Local and Global**

Different IMCs connected local and global events to varying degrees, perhaps most obviously when the visceral realities of protest fueled the virtual information mill. Even in the chaotic midst of police raids or protests, activists posted information about ongoing actions of police, paramilitary, and military groups, and made connections between these actions at the local and global levels. Indymedia faced harassment, arrests of its journalists, legal challenges, and confiscation of its materials and tools (Morris 2004). It was a target of hate mail and spammers, but also national and international security agencies; several IMC sites were shut down, and others systematically hacked (Kidd 2003a, c; Free Press 2004). After the terrorist attacks of September 11, 2001, there were also attempts to define more radical elements of the global justice movement as terrorists (Morris 2004). For IMC activists, daily events, ranging from their own lifestyle choices to the operations of locally based businesses, connected in important ways with the global maneuvers of governments and multinational corporations, a prime example being the war in Iraq (Brooten 2004a, b, 2006). Indymedia's emphasis on local-to-global analysis remained virtually invisible in corporate media news.

### **Challenging Corporate Media and Journalism**

IMC online discussions often refer to the military–industrial–*media* complex and to a lack of open, democratic discussion both in the US and between the US and "the rest," due directly to the limitations of corporate media coverage (Brooten 2004a, b). Indymedia challenged corporate media hegemony through the use of open publishing, made possible by the efforts of the free software or → open source movement, which aims to keep software free and source code open for collective development and use (Stallman 2002;

Pickard 2006). Many members of the Indymedia technical staff were associated with this movement (Arnison 2001; Kidd 2003a). As the Internet became dominated by private interests, the open source movement was as much an effort to keep the net open and navigable by as many as possible, as a software development process (Kidd 2003a). This struggle was seen as key to determining who controls the stories the public is able to tell and is told.

Many IMCs openly challenged the concept of “objectivity,” arguing that it is better to be honest about one’s biases (→ Bias in the News; Objectivity in Reporting). A page on the IMC global site suggested to readers that “You should look at all reports you read on the Indymedia site with a critical eye, just as you should look at all media before you in a discerning manner.” Nevertheless, there are many IMC activists who do subscribe to the ideal of journalistic objectivity, but argue that credible writing must go beyond the airing of the different “sides” of an issue. Textual analysis of IMC websites suggests that writers gained credibility in features and discussions when they presented ample evidence to back up the claims they made, in the form of links and citations, and when they had had direct experience with an issue, often by being an eyewitness (Brooten 2004a, b). Many participants called on reporters to contextualize their stories and provide the historical perspective they felt lacking in corporate media reporting.

### **Indymedia as a Process of Collective Critique**

Indymedia became a tool for exploring the process of media representation itself, encouraging a collective public process of both textual and visual analysis (Brooten 2004a, b). IMC sites offered readers alternative sources of information and a means to track and critique that information, add to it, or reject it, and to do so collectively and on a global scale. The process as well as the information became the focus of the collective, unfolding story, which attended to how and why the story got told. This called for an unusually sophisticated engagement with media. In this way, Indymedia offered a model for others, and supported the claim that web use can encourage a collective process of critique in which “the sum of connections makes a content greater than the sum of its parts” (Jones 2000, 178).

### **CHALLENGES FACING INDYMEDIA**

Indymedia faced several significant challenges, including uneven participation, north-south tensions, overemphasis on technical work, and English dominance. Despite Indymedia’s focus on inclusion, those capable of volunteering for significant periods of time tended to be young, white, mostly male North Americans and Europeans (Kidd 2003a; Pickard 2006). This, in tandem with unequal global access to the Internet, limited participation in specific gendered, class, and racialized ways, including the male-dominated nature of tech work, problematic meeting dynamics, and an online rhetoric of harassment. Tensions also emerged between freedom of expression and the need to maintain safe and respectful online spaces. And while the consensus process is ideally nonhierarchical, some argued it tends to further silence those already marginalized (Ballowe 2002; Brooten & Hadl in press).

Indymedia had to rethink its policy of open publishing in the face of a slew of hateful, sexist, and racist postings throughout the network (Kidd 2003b; Pickard 2006; Brooten & Hadl in press). Individual IMCs adopted a range of editorial policies to help counter such postings (Langlois 2004). Some argued Indymedia should provide a space for such discussions, however contentious, while others argued that where power is unequally distributed, open publishing tends to extend it to those who already wield it.

## India: Media System

*K. M. Shrivastava*

*Indian Institute of Mass Communication*

India, with a population of more than a billion, is a multiethnic, multilingual, multi-religious, pluralistic society. Politically it is a union of states (28 states and 7 union territories) and a sovereign, secular, democratic republic with a bicameral, multi-party, parliamentary system of government based on a universal adult franchise. It is governed by a written constitution, adopted by the Constituent Assembly on November 26, 1949, which came into force on January 26, 1950.

### HISTORICAL STAGES

India is an ancient civilization. There is evidence of human activity in India at least from 20,000 BCE (Bhimbetka Rock paintings); of farming from 7000 BCE; and of city life from 2700 BCE (Harappa). Alexander the Great was in India 326–325 BCE. South Indian empires began in 200 CE, with the Gupta Empire 320–467, the Harshvardhan 606–647, and the Mughal 1526–1757, followed after the battle of Plassey by East India Company rule 1757–1858. India was under the British crown 1858–1947; independence and partition into India and Pakistan came in 1947. In terms of public writings, India had the Rock Edicts of Emperor Asoka (c.273–236 BCE), writings on leaves and barks mentioned by Uzbek scholar Al-Biruni (973–1049 CE) in his book *Kitabu'l Hind* (1030 CE), and newsletters (“akhbar”) mentioned by Emperor Zahiruddin Muhammad Babur in 1527, before the modern printing press landed in India on September 6, 1556.

When James Augustus Hicky started his *Bengal Gazette or Calcutta General Advertiser* on January 29, 1780, there was no law or regulation governing the press in India. When Hicky criticized Warren Hastings, the governor-general, the first known order against the press was issued in India from Fort William, Calcutta, on November 14, 1780, which stopped circulation of Hicky’s *Bengal Gazette* “through the channel of the General Post Office.”

*Pre-censorship* (→ Censorship, History of) was first introduced in Madras (now Chennai) in 1795. When newspaper publishing was confined to Europeans, deportation was often the ultimate punishment. Licensing was introduced in Bengal in 1823 but was replaced by the Metcalfe Act of 1835, which applied to the entire territory of the East

India Company and required that the printer and publisher of every newspaper declare the location of the premises of its publication. Licensing was, however, reintroduced in 1857 by Lord Canning and was applied to all kinds of publications. This was the year when Indians fought their war of independence against the East India Company, after which the British crown took over the territories of the Company.

In 1860 the Indian Penal Code passed into law. Among more general matters, this laid down offenses that any writer, editor, or publisher must avoid – those of defamation and obscenity. The Code was amended in 1870 to introduce the offense of sedition, giving convenient grounds for sending many freedom fighters to jail for their writings in newspapers, including political heavyweights like Lokmanya Bal Gangadhar Tilak and Mahatma Mohandas Karamchand Gandhi. The Press and Registration of Books Act passed in 1867, a regulatory measure, still survives after some amendments. The Official Secrets Act of 1923 is another old law still surviving, though now diluted by the Right to Information Act of 2005. During the British period there were many repressive laws directed specially at the press from time to time, like the Vernacular Press Act of 1878, the Newspaper (Incitement of Offences) Act of 1908, and the Indian Press Act of 1910. In 1922, these Acts of 1908 and 1910 were repealed, but the provisions of seizure and confiscation of seditious publications were incorporated into the Sea Customs Act and the Post Office Act. Civil disobedience in 1931 provoked the government to issue an ordinance to control the press, which was replaced by the Press Emergency Powers Act of 1931. Originally a temporary law, it was made permanent in 1935.

The British passed the *Indian Telegraph Act* in 1885 and took all the powers necessary to operate and control Indian telegraphy. The government had exclusive privileges under this Act in respect of telegraphy, among them the power to grant licenses. The definition of telegraphy in this Act is very wide, as it later covered all other means of communication depending on electromagnetic waves, thus including telephone, fax, radio, and television.

*Radio* came to India in 1921 and was initially in private hands. It was mainly enjoyed by the European community as a means of entertainment (→ Radio; Radio: Social History). First there were Radio Clubs and then the Indian Broadcasting Company, which went into liquidation in 1930. There was public pressure to which the government bowed by starting the Indian State Broadcasting Service, which was rechristened All India Radio (AIR) in 1935. Meanwhile, the princely states of Baroda, Hyderabad, Jodhpur, Mysore, and Travancore set up their own radio stations with authorization from the government of India.

Before the creation of Pakistan, pre-partition India in 1947 had nine radio stations and a dozen transmitters, with 275,955 radio sets for a population of over 300 million. Radio broadcasts covered less than 10 percent of the area with medium wave. After partition, AIR had a network of six stations and a complement of 18 transmitters. The coverage was 2.5 percent of the area and just 11 percent of the population. Television came to India in September 1959 as an educational experiment involving → UNESCO (→ Television; Television: Social History).

## NORMATIVE AND LEGAL FRAMEWORK

Article 19 (1) (a) of the Constitution of India provides that all citizens shall have the right “to freedom of speech and expression,” and the courts have interpreted this as including

freedom of the press. The Press Law Enquiry Committee was appointed to examine the existing laws at the time of independence in relation to fundamental rights. After the report of this committee the Press Emergency Powers Act of 1931 was replaced by the Press (Objectionable Matter) Act of 1951. However, the mood was so much in support of freedom of the press that this Act was allowed to lapse in February 1956 and repealed in 1957. There is a statutory Press Council of India, which is toothless against newspapers but has been used by the press against the government in cases of discrimination in advertising etc. With the exception of the Internal Emergency of June 26, 1975, to March 21, 1977, there has been no → censorship (→ Freedom of the Press, Concept of; Freedom of Communication).

Broadcasting remained a government monopoly after independence until September 15, 1997, when Prasar Bharti, an autonomous corporation, came into existence to run AIR and national television (Doordarshan). Satellite television, which entered Indian skies in 1991, was left unregulated (→ Satellite Television; Satellite Communication, Regulation of). The Supreme Court, in the Cricket Association of Bengal case in 1995, declared that the “airwaves are public property.” The issue of broadcast regulation has emerged since then. The Broadcasting Bill of 1997 and the Communication Convergence Bill of 2001 were introduced in Parliament but did not become law. Meanwhile, in 1995 the Cable Television Networks Act was brought in to regulate the cable business and its operations, and guidelines were issued for uplinking TV channels, direct-to-home (DTH), FM radio, community radio, etc. (→ Cable Television). Drawing lessons from the experiences of the → Federal Communications Commission (FCC) in the US and OFCOM in the UK (→ United Kingdom: Media System), the Ministry of Information and Broadcasting has put up a draft of the proposed Broadcasting Services Regulation Bill on its website.

## PRINTED PRESS

The Indian press, serving a multilingual, diverse society, is independent and competitive, with various forms of ownership ranging from individuals, firms, and joint-stock companies to trusts. Distribution is dominated by hawkers and agents delivering press products to homes, though it also includes newsstands, street sales, and postal subscriptions. In 1950 there were 214 daily → newspapers, with 44 in English and the rest in Indian languages. The number of dailies has since increased to 1,834, with 799 in Hindi and 181 in English. On March 31, 2005, there were 60,413 registered newspapers and periodicals on the record of the Registrar of Newspapers for India. The Gujarati daily *Mumbai Samachar* (also called *Bombay Samachar*), which started in 1822 as a weekly and became daily in 1855, is the oldest surviving newspaper. The *Bombay Times*, which started in 1838, became the *Times of India* in 1861. Other nineteenth-century papers surviving today include the *Pioneer* (1864), the *Statesman* (1875), the *Hindu* (1878), the *Tribune* (1881), and *Malayala Manorama* (1890). Many newspapers have a web presence and regional or even district editions, and some offer a franchise.

The National Readership Study (NRS) of 2006 (NRSC 2006) noted that over the preceding three years the number of readers of dailies and → magazines put together among those aged 12 years and above had grown from 216 million to 222 million. Two

Hindi dailies had more than 20 million readers each: *Dainik Jagran* (21.2 million) and *Dainik Bhaskar* (21 million). The *Times of India* was the most read English daily, with 7.4 million readers, but the *Hindu* had taken the second spot with 4.05 million readers, pushing the *Hindustan Times* into the third spot with an estimated readership of 3.85 million. While no single newspaper accounted for even 2 percent of all-India copy sales, there was dominance in specific sub-markets (→ Readership Research).

Though under discussion, there is no cross-media ownership restriction yet, and foreign investment has been allowed to differing degrees according to the nature of the media product. For example, Bennett and Coleman owns the *Times of India*, the *Economic Times* (a financial daily), Radio Mirchi (an FM radio network), Planet M (a chain of music stores), Zoom (a lifestyle television channel), Times Now (a television news channel with Reuters), and Internet portal Indiatimes. Its magazines *Femina* and *Filmfare* are now published in association with the BBC.

## RADIO AND TELEVISION

AIR, the public radio network run by Prasar Bharti Corporation, has 233 broadcasting centers, with 143 medium frequency (MW), 54 high frequency (SW), and 161 FM transmitters covering 91.42 percent of the area and 99.13 percent of the population of the country. AIR uses 24 languages and 146 dialects in home services. In external services, it broadcasts in 17 Indian and 10 foreign languages.

AIR remained a monopoly until May 2000, when the government opened the sector for participation by private FM broadcasters and offered 108 frequencies in 40 cities for open bidding. Of these, 21 private FM stations are now on the air in 12 cities. In 2005, another 336 channels in 90 cities were offered for bidding to private companies. Community radio stations have been allowed, to be run by educational institutions. Private and community stations cannot broadcast news as yet.

Doordarshan, the public TV network run by Prasar Bharti, has a monopoly of terrestrial broadcasting, with 64 studio centers and 1,400 transmitters, and operates 24 channels: four national channels (DD-1, DD-News, DD-Sports, and DD-Bharati), eleven regional language satellite channels, eight state networks, and one international channel. The flagship DD1 channel reaches some 400 million viewers. There are over 250 private and foreign channels available in India. The National Readership Studies Council (NRSC 2006) puts the number of homes in India with TV at 112 million, those with cable and satellite (C&S) at 68 million, and satellite TV viewers at 230 million.

Indian media companies are also expanding in foreign markets. For example, Zee claims to serve more than 300 million viewers in more than 120 countries across the globe in seven different languages. Direct-to-home (DTH) was cleared by the government in 2000 and currently there three players: Doordarshan's DD Direct +, Dish TV from Zee network, and Tata Sky, an 80:20 joint venture between TATA and STAR.

## THE INTERNET

Despite being a software superpower, India is still on the wrong side of the → digital divide. Important traditional media outlets have an → Internet presence, but the growth

of new media is limited by access. According to NRS 2006 data (NRSC 2006), 13 million persons have access to the Internet and of these only 1.8 million reside in rural India. The number of Internet users in urban India grew by 35 percent over the preceding year, while in rural India it stagnated. However, the office was no longer the main place of access, as 34 percent of users surfed from cyber-café and 30 percent from home. Mobile phone companies have also introduced the Internet, and broadband connectivity is expanding.

E-governance initiatives are in full swing, but there is a long way to go before Indian print media enjoy a level of freedom comparable to that in any liberal democracy. Though there are large numbers of private TV news channels that are aggressively independent, like the newspapers, private and community radio stations are not allowed to broadcast news yet. Terrestrial television is under a public corporation still, though the decks are being cleared to allow private players as well. In DTH, public and private are competing and cooperating. There are still limits to foreign investment in news channels and newspapers. Thus, in the typology developed by Hallin and Mancini (2004), the Indian media system is close to a “liberal model,” as there is a relative dominance of market mechanisms and of commercial media.

# **Individual Differences and Information Processing**

*Tomas Chamorro-Premuzic*

*Goldsmiths College, University of London*

“Individual differences” (also known as “differential psychology”) is the area of psychology concerned with the scientific understanding of how, why, and to what degree

people differ. Its two major objects of study are personality and intelligence, though → emotion, motivation, vocational interests, and creativity also represent important, and increasingly researched, topics. Thus, individual difference factors attempt to describe and explain the nature, causes, and consequences of any psychological differences between individuals. Typically, such differences are quantified and measured or assessed via psychometric tests (Chamorro-Premuzic & Furnham 2005).

“Information processing” is a paradigm that originated within the cognitive psychology movement of the 1940s to explain human thinking via a series of mainly computational or cybernetic metaphors (e.g., human brain acting as hardware vs human mind acting as software). More generically, → information processing refers to the psychological mechanisms by which humans perceive, encode, decode, acquire, retain, and retrieve information; in simple terms, how we make sense of the perceptual and symbolic world around us.

While the core aspects of information processing are, by definition, ubiquitous in the human species (this is largely the premise of cognitive and experimental psychologists), individuals do differ in their processing of information. In fact, differential psychologists have attempted to link specific patterns of behavior, thought, and emotionality to different aspects, and modalities, of information processing. Thus, individual differences in information processing explain and *highlight variability*, rather than similarities, between people, or the psychological causes that make information processing different in different individuals.

Affect – whether its ephemeral and object-based version of emotion, or its longer-lasting, object-free version of mood – and cognition are known to be influenced by individual differences. For instance, information processing is very different under positive and negative affects.

Crucially, people differ in their likelihood and predisposition to experience both positive and negative affect (Watson & Tellegen 1985). Some individuals are more likely to be happy or cheerful, while others seem sad and pessimistic most of the time and quite irrespective of the situation. These two, opposite, types of individuals will also differ in their characteristic patterns of information processing: one may interpret a situation as positive, while the other interprets the same situation as negative.

Individual differences in stable personality traits influence people’s patterns of behavior, thought, and emotionality. In particular, neuroticism seems to exert a strong influence on individuals’ tendency to experience negative affect, whereas extraversion predisposes people to experience positive affect (Costa & McCrae 1992).

The interaction between individual differences and information processing is often complex. *Appraisal theory*, one of the dominant psychological approaches to the study of stress, postulates that emotions are largely a function of an individual’s interpretation of (1) the event (in the case of stress, the level of threat posed by it), as well as (2) their capacity to handle that event (e.g., cope with the threat; → Appraisal Theory). As such, stress is more influenced by individuals’ subjective evaluations (appraisals) of an event than the event itself. This explains why certain individuals may experience high levels of stress in situations that are experienced as pleasant by others (see Lazarus 1999).

*Traits*, such as neuroticism and extraversion, “distort” (bias) individuals’ interpretations of events and, in turn, lead to individual differences in vulnerability to experiencing stress. While the experience of stress itself produces similar information processing patterns

in all individuals, the vulnerability to experiencing stress is a function of individual difference factors (Matthews et al. 2003).

Another example of the interplay between individual differences and information processing is reflected in so-called “cold” tasks (e.g., math problems, IQ test performance, and target detection). When individuals complete such tasks, their performance is affected by a variety of cognitive and affective states. Many of these states are “task-irrelevant” in that they do not advance or help, but actually hinder, task execution, diverting attention away from the target stimuli and taxing working memory (see Szalma & Hancock 2005 for a recent review).

Cognitive approaches to individual differences in information processing tend to investigate *intellectual abilities*, particularly the biological or “fluid” aspects of intelligence (→ Communibiology). This line of research dates back to the very beginnings of ability testing, notably to J. M. Cattell’s (1890) attempts to quantify individual differences in tactile, weight, and hearing discrimination. More than a century later, there is wide consensus among mainstream IQ researchers that these aspects of information processing represent the very essence of individual differences in intelligence, serving as “raw” and universal measures of brain efficiency.

Indeed, intelligence researchers have long speculated on the possibility of IQ being ultimately a measure of neural efficiency or neural speed (Jensen 1998). The idea underlying this approach is that more efficient brains should be capable of faster and more accurate processing, which, in turn, is advantageous for information acquisition. However, measures of reaction time, information processing, perceptual speed, or inspection time, as measures of neurophysiological activity, are poorer predictors of learning ability and educational/occupational outcomes than are broader intelligence tests, such as those including verbal, mathematical, and logical problems.

# Infographics

David Cabianna

York University

An infographic (or information graphic) is a visual explanation – for example, a chart, map, or diagram – that aids in the comprehension of text-based content. The infographic designer does not merely illustrate given information, but must actively interpret given content in order to present it in a manner that effectively visually communicates to the viewer. A designer does this by progressing through a number of steps, each time further processing and refining information (→ Design; Graphic Design).

Rajamanickam (2005) identifies *three steps in the design of infographics*: first, the designer must clearly understand what type of information is being communicated (spatial, chronological, quantitative, or a combination of all three); second, the designer must conceive of a suitable representation for that information as a cohesive whole (a whole that is more than the sum of its constituent parts, such as charts, diagrams, maps, timelines, etc.); and third, the designer must choose an appropriate medium for presentation (static, moving, or interactive). For example, this information may be a set of instructions, e.g., how to exit a building; it may be the visual explanation of a complex verbal concept, e.g., the science of how light is reflected by a mirror; it may be the visual companion of verbal content, e.g., a map of a country displaying the distribution of votes for different candidates; or any number of other visual devices that are used to convey meaning.

One *distinguishing characteristic of infographics* is their attempt to communicate a specific → meaning or content via the conscious, rational effort to provide an exchange of information using any number of visual techniques. There are some concepts that cannot be communicated through pictures, and others that can be said only with great and lengthy difficulty through language. But in certain situations, pictures, or a combination of pictures, words, and numbers, can speak more clearly and with a greater chance of a message being understood and remembered than solely with numbers or words. Because the images used in infographics tend to be simplified to essential or general characteristics, they tend to be universal in their interpretive qualities – they are stripped of cultural and realistic representation in favor of abstraction. This culturally neutral or universal aspect of information graphics makes them particularly effective for use in large-circulation media like newspapers, weekly news magazines, and news television, where a heterogeneous, culturally diverse public all expect to receive a shared clear and concise message.

The twentieth century saw the greatest degree of development in the *evolution of information graphics*. Two examples are of particular note: Otto Neurath (1882–1945) was a pioneering innovator in the development of visual education. Neurath founded Isotype (International System of Typographic Picture Education) in 1934 alongside illustrator Gerd Arntz (1900–1988) and his future wife Marie Reidemeister (1898–1959). The Isotype group promoted the use of simple pictographs to convey information (→ Symbolism). Living in Vienna after World War I, his “Vienna Method,” as it was originally called, was a way to effectively communicate social and economic information to a postwar

public, many of whom were illiterate. Neurath's rigorous methods of graphically presenting information had a profound influence on the design of statistically based information.

A second significant development was made by British engineering draftsman Henry C. Beck (1903–1974) in 1933. Beck redesigned the London Underground railway map and in so doing simplified a complex map by eliminating all extraneous details (→ Cartography). Focusing on the fact that a commuter's main concern is the destination and how to get there, Beck divorced above-ground geographic information from the Underground lines, station stops, and transfer points. The map capitalizes on the fact that the system operates underground and therefore the commuters need not be burdened with faithful adherence to topography: Beck eliminated a true representation of distance between station stops and simply listed the stations as they are encountered along their respective lines. The only surface feature to be included on the revised map was the River Thames. Beck designed the map using only simple vertical, horizontal, and 45-degree lines (which ensure an uncluttered layout), color (which differentiates the lines), clear typography (which makes text easy to read), and symbols (which differentiate stations from interchanges; Rajamanickam 2005).

Other prominent infographic designers include Katsumie Masaru, whose groundbreaking abstract technique for the design of different pictograms for the athletic events of the 1964 Tokyo Olympics became part of the standard signage technique for subsequent Olympics; Otl Aicher, symbol designer for the 1972 Munich Olympics and 1976 Montreal Olympics; Nigel Holmes, former designer for the American news weekly *Time Magazine*, who coined the term “explanation graphics” to describe the function of his profession; Paul Mijksenaar, designer of wayfinding signage systems for airports, railway stations, and hospitals (→ Sign Systems); Edward Tufte, former Yale professor and prolific writer on the subject; and Richard Saul Wurman, who coined the term “information architect” to describe his practice.

As graphic design splinters into ever-increasingly specialized forms of knowledge, information design itself is quickly becoming a leading discipline in its own right, complete with its own techniques, language, and thought processes. Infographics are one such specialized tool used by the visual communication and information designer.

# Information

*Klaus Krippendorff*

*University of Pennsylvania*

Common linguistic habits render information as an attribute of messages or data, or as the purpose of human communication – as if information were an objective entity that could be carried from one place to another, purchased, or owned. This conception is seriously misleading. Gregory Bateson (1972, 381) defined information as “any difference which makes a difference in some later event.” Acknowledging that differences do not reside in nature, but are the product of distinctions, leads to the following definition: information is the difference that drawing distinctions in one domain makes in another.

Written messages, for example, vary in very many dimensions – the size and quality of the paper, typefaces, typography, vocabulary use, grammatical constructions, and time of arrival. The number of distinctions that one could possibly draw among these features (and the differences they could possibly make elsewhere) may well be innumerable large. However, psychological, situational, linguistic (→ Linguistics), and cultural contingencies tend to render only some distinctions meaningful and others irrelevant. This keeps the amount of information that readers actually consider within manageable limits.

Information operates in an empirical domain other than where the distinguishable features reside. Bridging these domains is a matter of abduction, an inference relating data to conclusions. For instance, tree rings inform the forester of the age of a tree. Tree rings become meaningful (→ Meaning) only when one knows how trees grow rings and informative only when the number of rings correlates with a tree’s age. Abduction is informative; deduction and induction, however, say nothing new (→ Deduction vs Induction vs Abduction).

The paradigm case of conveying information is answering questions. A question implies several answers. Knowledgeable respondents select the most appropriate one among them, which resolves some or all of the uncertainties that prompted the question.

Information “in-forms” – literally – by making a difference within the circularity of → cognition and action. Information is not a message effect (→ Message Effects, Structure of). It can be sought or ignored. It involves active reading, deciphering, and inferring, which are intentional acts. Receiving something a second time does not add information to the first, but is redundant, save for what had been forgotten. Information may qualify

information from previous communications, for example by discrediting its source (→ Credibility Effects), revealing overlooked inconsistencies, or rearticulating its context. Information is situation- or context-specific. What provides information at one time may be irrelevant at another. What is information for a stockbroker may not be information for an engineer. Talking about one thing excludes talking about something else.

Information is always tied to human agency, to the ability to vary something and make sense of variability. It is absent when one cannot draw distinctions or recognize choices made by others.

## INFORMATION THEORY

No theory can accommodate all intuitive uses of the word “information.” Early measures of information include Harry Nyquist and R. V. L. Hartley’s effort in the 1920s to quantify the capacity of telephone cables, and the statistician Sir Ronald Fisher’s proposal in the 1930s of a measure of information in data. In 1948, Claude E. Shannon published several measures and a widely applicable calculus involving these. To avoid the diverse associations that the word “information” carried, he titled his work “A mathematical theory of communication.” “Information theory” is what others call his theory.

*Shannon’s theory*, subsequently published with a popular commentary by Warren Weaver (Shannon & Weaver 1949), provided the seed and scientific justification for communication studies to emerge in universities, often consolidating journalism, mass media studies, rhetoric (→ Rhetorical Studies), social psychology, and speech communication (→ Speech Communication, History of) into single departments (→ Communication as a Field and Discipline). Shannon’s work was instrumental in ushering in the information society we are witnessing, characterized by digital communication, massive electronic data storage, and computation. Today, information theory is a wide-ranging discipline in applied mathematics.

In his second theorem, Shannon proved that the logarithm is the only function by which two multiplicatively related quantities become additive. This formalizes the intuition that two compact disks (CDs) can store twice as much data as one and that the capacities of separate communication channels or computers can be added.

While the base of a logarithm is arbitrary, Shannon chose the smallest sensible base of 2,  $\log_2$ , as the unit of his calculus. This unit enumerates the number of yes-and-no answers to questions, the number of 0s or 1s needed to store data in a computer, or the number of distinctions or binary choices required to locate something in a finite space of possible locations. Shannon called that unit of enumeration “*binary digit*” or “bit” for short:

1 bit			$= 2^1$	$= 2$ possibilities
1 byte		$= 8$ bits	$= 2^8$	$= 256$ possibilities
1 decabit	$= 10$ bits	$= 10^1$ bits	$= 2^{10}$	$= 1,024$ possibilities
1 hectobit	$= 100$ bits	$= 10^2$ bits	$= 2^{100}$	$= 10^{30}$ possibilities
1 kilobit	$= 1,000$ bits	$= 10^3$ bits	$= 2^{1000}$	$= 10^{301}$ possibilities
1 megabit	$= 1,000$ Kbits	$= 10^6$ bits	$= 2^{1000000}$	$= 10^{301029}$ possibilities
1 gigabit	$= 1,000$ Mbits	$= 10^9$ bits	$= 2^{1000000000}$	$= 10^{301029995}$ possibilities
1 terabit	$= 1,000$ Gbits	$= 10^{12}$ bits	$= 2^{1000000000000}$	$= 10^{301029995664}$ possibilities

To exemplify, the well-known party game “20 questions” can exhaust  $2^{20} = 1,048,576$  or over a million conceptual alternatives. With an array of 20-by-20 light bulbs, one can display  $2^{400}$  or  $10^{120}$  distinct patterns. The human retina has not 400 but about a million independently responsive receptors. Contemporary laptop computers have in the neighborhood of one gigabyte of memory.

The following sketches three concepts of information – logical, statistical, and algorithmic. While Shannon’s original work developed statistical conceptions only, all three acknowledge his second theorem and use bits as units of measurement.

### THE LOGICAL THEORY OF INFORMATION

This theory (Krippendorff 1967) concerns the logical possibilities of moving on, which depend on the situation S in which one finds oneself. Let U measure the uncertainty one is facing:

$$U(S) = \log_2(\text{Number of uncertain possibilities in } S)$$

Information I, the difference made by drawing distinctions D, can be expressed as the difference between two uncertainties – before a message was received and after drawing distinctions in it:

$$I(D:S) = U(S) - U_D(S)$$

Accordingly, information I is not an entity or thing, but a change in two states of knowing. It measures the difference between two uncertainties of a situation, as Figure 1 suggests. Information is positive when the distinctions drawn in the domain of a message reduce the uncertainty in the situation. It is zero when either no distinction was made, or the distinctions did not make a difference in the domain of interest, be it because the message did not make sense, was already known, or pertained to something irrelevant to the current situation.

Yehoshua Bar-Hillel (1964) took this to be a semantic theory, as the drawing of distinctions among possible patterns in a message makes a difference in a domain other than the message itself, whether that difference concerns references, connotations, decisions, or actions. For example, the driver of a car who is uncertain about where to turn will be looking for signs that reduce this uncertainty. Typically, drivers face numerous patterns, most of which are irrelevant, perhaps even distracting, and therefore are ignored.

**Figure 1** Information as the difference in situation S made by distinguishing D

Extreme fog prevents making distinctions and information is unobtainable. The latter suggests an important information-theoretical limit to human communication: *The information that a message can provide is limited by the number of distinctions one can draw concerning it* – the most basic one being the presence or absence of a message. Moreover, both quantities are limited by the uncertainty of the situation, on the one side, and the uncertainty of all identifiable patterns in the message, on the other side:

$$U(S) \geq I(D:S) \leq U(\text{Message})$$

In human communication, information is largely acquired sequentially, in small, comprehensible doses. For example, each scene in a movie adds something toward its conclusion. For any set of messages,  $M_1, M_2, \dots, M_z$ , the total amount of information is:

$$I(M_1 \& M_2 \& \dots \& M_z : S) = U(S) - U_{M_1, M_2, \dots, M_z}(S).$$

It can be expressed as the sum of sequentially available quantities of information:

$$I(M_1 \& M_2 \& \dots \& M_z : S) = I(M_1 : S) + I_{M_1}(M_2 : S) + I_{M_1, M_2}(M_3 : S) + I_{M_1, M_2, M_3, \dots}(M_z : S)$$

Two messages are logically independent of each other if their separate information quantities add to what they inform jointly:

$$I(M_a \& M_b : S) = I(M_a : S) + I(M_b : S)$$

Two messages are redundant to the extent they jointly convey what each would convey separately:

$$R(M_a, M_b) = I(M_a : S) + I(M_b : S) - I(M_a \& M_b : S)$$

Information can also be expressed in terms of logical probabilities. If  $N$  is the number of uncertain possibilities before drawing distinctions  $D$ , and  $N_D$  after  $D$  were drawn:

$$I(D:S) = U(S) - U_D(S) = \log_2 N - \log_2 N_D = -\log_2 \frac{N_D}{N}$$

As a function of the logical probability  $N_D/N$ , the amount of information is upwardly limited by  $1/N$ .

## **SHANNON'S STATISTICAL THEORY OF INFORMATION**

For Shannon, “the fundamental problem of communication is that of reproducing at one point, either exactly or approximately, a message selected at another point” (Shannon & Weaver 1949, 3). While this does not address meaning, reliable reproduction of messages at distant points is a prerequisite for all meaningful use of information and communication technology, whether using letters, telephone, fax, or electronic messaging.

Unlike the logical or semantic theory, Shannon's theory is a statistical one and concerns itself with averages, with how observed probabilities in one domain relate to observed

probabilities in another domain. Shannon called the statistical uncertainty “entropy” and defined it for a particular distribution of probabilities  $p_a$  in a variable A by:

$$H(A) = -\sum_{a \in A} p_a \log_2 p_a$$

The possibilistic uncertainty  $U$  is that special case of the entropy  $H$  in which all probabilities  $p_a$  are the same, i.e.,  $1/N_A$ .

Applied to the simplest case of a channel of communication between just two communicators A and B, Shannon’s basic quantities are the entropies  $H(A)$  and  $H(B)$  for each variable separately, and the entropy  $H(A,B)$  when observing them together:

$$H(A,B) = -\sum_{a \in A} \sum_{b \in B} p_{ab} \log_2 p_{ab}$$

wherein  $p_{ab}$  is the probability of a and b co-occurring, say, in a cross-tabulation of a sender’s and a receiver’s distinctions. From these entropies, the amount of information transmitted between A and B becomes:

$$T(A:B) = H(A) + H(B) - H(A,B),$$

which expresses the degree to which a sender’s choices determine the receiver’s choices.

If this amount is zero, then, the sender’s choices do not affect the receiver’s – regardless of the existence of a physical channel between them. When the quantity of transmission equals the entropy of the receiver, then the sender’s choices fully determine what the receiver can see. Otherwise, noise can enter or equivocation can leave a communication channel. Noise provides the receiver with choices that are unrelated to the sender’s choices. The amount of noise is:

$$H_A(B) = H(A,B) - H(A),$$

which is the entropy that remains in the receiver when the sender’s choices are known. Equivocation, by contrast, is the entropy in the sender when the receiver’s choices are known:

$$H_B(A) = H(A,B) - H(B)$$

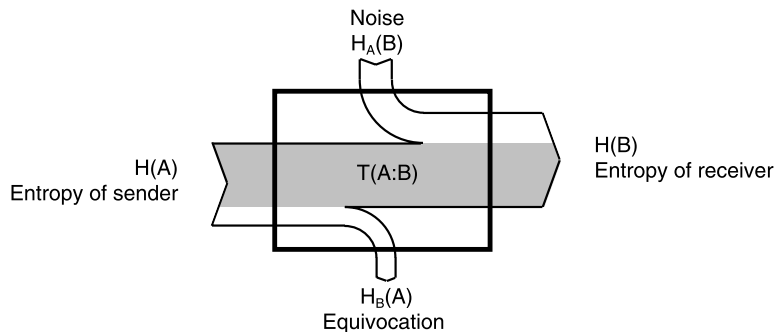

Noise and equivocation relate to transmission by:

$$T(A:B) = H(B) - H_A(B) = H(A) - H_B(A)$$

Accordingly, the number of bits transmitted is the entropy in the receiver not due to noise, or the entropy in the sender not lost by equivocation. Figure 2 depicts these entropies.

The capacity  $C$  of a channel of communication is:

$$C = \min[U(A), U(B)] \geq T(A:B)$$

**Figure 2** Transmission, noise, and equivocation in a communication channel

In serial transmissions from A to Z, noises always add up:

$$T(A: \dots :Z) = H(Z) - H_A(B) - H_{AB}(C) - H_{ABC}(D) - \dots - H_{ABCD\dots Y}(Z)$$

That increase cannot be reversed, as illustrated by repeated copying of documents: copies of copies become worse. Here, Shannon's theory corresponds with the second law of thermodynamics, according to which entropy always increases over time. In fact, it has been suggested that thermodynamics is a special case of Shannon's statistical theory of communication.

Shannon's eleventh theorem addresses the possibility of designing error-correcting codes making use of unused capacities for communication, called redundancy:

$$R = \min[U(A), U(B)] - T(A:B)$$

Redundancy is evident in repeatedly saying the same thing, avoiding words otherwise available, transmitting images with large continuous areas, and communicating the same message over several channels of communication. In human communication, redundancy protects communication from disturbances; examples are postal addresses with personal names, streets, cities, and states, as opposed to telephone numbers and zip codes, where any one incorrect digit is not correctable. Natural language is said to be 70 percent redundant, allowing the detection of spelling errors, for example.

Shannon's twenty-first theorem concerns communication in continuous channels. The approach taken is to digitize them. Tolerating an arbitrarily small error makes digitized media less susceptible to noise. This has revolutionized contemporary communication technology ( $\rightarrow$  Cybernetics).

## KOLMOGOROV'S ALGORITHMIC THEORY OF INFORMATION

Examining the complexity of computation in the 1960s, the Russian statistician Andrei Nikolaevich Kolmogorov (1965) came to conclusions similar to Shannon's. He equated the descriptive complexity or algorithmic entropy of an object, such as a text or an

Instead, he wrote of entropies, theorized communication, carefully avoiding issues of meaning, and refusing to name his theory “information theory.”

Another misconception stems from reading a “schematic diagram” (Shannon & Weaver 1949, 5) that Shannon used in his introduction to contextualize his theory, showing unidirectional arrows from a sender through a channel to a receiver, as “the Shannon model of communication” (→ Models of Communication) However, this diagram is certainly not a model of his theory. At Bell Laboratories, where Shannon worked, nobody could have failed to see the two-way nature of telephone communication, and Shannon’s concept of a channel is perfectly symmetrical. Critics of linearity have a point, though not the one they are making: Shannon’s calculus, grounded in probability theory, blinded him to circular communication, e.g., from A to B to C to A. However, Klaus Krippendorff (1986, 57ff.) extended Shannon’s theory to include such and more elaborate recursive communication structures.

Other critics impute underlying purposes: the intention of senders to control receivers. However, Shannon’s theory concerns reproducibility in the face of interferences and breakdowns, not control. Reliable communication technology is the foundation of contemporary information society. Its capacity to store, compute, and communicate is measured in bits or bytes and paid for accordingly, and has expanded ever since.

The failure of communication researchers to differentiate engineering and everyday distinctions in human interfaces with communication technologies has created a false barrier against Shannon-type theories. The fact that the number of bits transmitted to television images far exceeds the number of concepts that ordinary viewers have at their disposal to see these images is no justification for privileging the former as objective quantities and dismissing the latter as subjective phenomena. The difference is due to meaningful equivocation, which can be studied.

A more reasonable complaint concerns the conception of uncertainty. Mathematical theories can be quite rigid whereas the uncertainties that people experience are fluid. Nevertheless, human information processing has been examined in communication research, for example, by → uncertainty reduction theory, which received its impetus from information theory.

Finally, information theory is not meant to predict behaviors. It theorizes limits to what can be done – just as thermodynamics does. Whereas the logical theory addresses possible distinctions and explores the differences they could make elsewhere the statistical theory concerns capacities of communication media and investigates ways to improve their reliability, and the algorithmic theory concerns computations and examines their efficiencies. Their common unit of measurement concerns essential human activities: distinguishing, conceptualizing, inferring, and deciding among alternatives.

*Shane Greenstein*

*Northwestern University*

The commercial information and communication technology (ICT) industry accounts for a large fraction of economic activity. It has spread to include an extraordinary range of economic undertakings. What drives economic change in this market? A variety of market-driven incentives play a salient role.

## **TECHNOLOGY PUSH**

The invention of the transistor did not lead in a linear way to the invention of computing and related ICTs. However, the invention of the transistor, and then the integrated circuit, did alter what equipment makers could build cheaply and what users could operate reliably. In popular discussion, advances in ICTs have become almost synonymous with advances in microprocessors. This is due to an observation by Gordon Moore, who co-founded and eventually became chairman at Intel. In 1965, he foresaw a doubling of circuits per chip every two years. This prediction about the rate of technical advance later became known as “Moore’s Law.” In fact, microprocessors and dynamic random access memory (DRAM) have been doubling in capability every 18 months over the last three decades.

A similar pattern of improvement – though with variation in the rate – characterizes many other electronic components that go into producing a computer, server, or other equipment complementary to ICTs in many standard uses. This holds for disk drives, display screens, routing equipment, and data-transmission capacity, to name a few (Flamm 2003). In the majority of these technologies, economic motives intermingle with

many others to produce frontier-stretching inventions (Greenstein 2006). For example, in the late 1940s the transistor came out of Bell Laboratories, which at that point was among the best-funded private laboratories where researchers examined cutting-edge issues in electronics. The majority of advances thereafter came from an array of firms, such as Motorola, Texas Instruments, IBM, and notably the numerous “descendents” of Shockley Instruments in Santa Clara, California, such as Fairchild, National Semiconductor, and Intel. Economic motives played a role, but so did the inventors’ desires for fame or professional respect, and the aspiration to build an intellectually satisfying work environment that addressed frontier issues in solid state physics and material science.

The pathway from invention to commercialization also shaped developments in the technical boundary of ICT equipment for sale. For example, Ethernet built on years of university research in data communications. It was nurtured at the Palo Alto Research Center, a private lab funded by Xerox, which chose not to commercialize the technology. It received an endorsement from the standard-setting organization, the Institute of Electrical and Electronics Engineers (IEEE), a nonprofit consortium with representation from industry (whose committees also endorsed two competing technologies at the same time). Ethernet eventually became part of a suite of commercial products sold by many firms, including 3Com, a company founded by Bob Metcalfe, inventor of Ethernet, and which competed against alternative specifications developed by other firms, such as IBM.

Another example illustrates how new inventions take multiple pathways into use. The Uniform Resource Locator (URL) originated in Tim Berners-Lee’s labs at the Organisation européenne pour la recherche nucléaire (CERN) in Switzerland, labs whose primary mission involves research in high-energy physics. The URL’s use was popularized in the first widely used browser, Mosaic. The programmers founded the company Netscape, an event that motivated a wave of investment in Internet-related applications. Simultaneously, the browser was licensed to many firms, including Microsoft, which developed Internet Explorer to compete against Netscape’s products (→ Media Economics).

## DEMAND PULL

ICTs aid the automated tracking of transactions, a function that is used, e.g., in automating billing, managing the pricing of inventories of airline seating, and restocking retail outlets in a geographically dispersed organization. It also facilitates the coordination of information-intensive tasks, such as the dispatching of time-sensitive deliveries or emergency services. Moreover, computer-based applications enable the improved performance of advanced mathematical calculations, useful in such diverse activities as calculating interest on loans and generating estimates of underground geologic deposits. Computer-aided precision improves the efficiency of processes such as manufacturing metal shapes or the automation of communication switches.

Such widespread use has supported an extensive search for innovative activities to generate additional revenue. Historically, the demand for *military applications* was quite important for the direction of early inventions. In ICT markets today, however, incentives are greatly shaped by market-oriented incentives (Jorgenson and Wessner 2005). These demand-oriented incentives must be understood in the context of the dispersion of technical knowledge across a wide set of firms. Firms devote considerable resources to

resisting becoming a supplier of a commodity available from many vendors without distinction. Pricing at multiples above unit cost requires something special. That induces the search for, and creation of, useful and profitable assets. Firms take a variety of approaches to developing these assets in technology markets, even if they remain unique only for a short period.

For example, one strategy relies on marketing a novel approach or a fad among fanatics. Many of the software gaming firms have tried this, and the Palm also started this way. A second strategy is to expand beyond a niche into a broad product line. Hewlett-Packard (HP) has accomplished this in its laser printer line of products. HP has kept its lead for over a decade and a half and remains very profitable. A third strategy requires the lowest cost and highest volume. Dell computer accomplished this in the 1990s through a combination of volume manufacturing, low distribution costs, and customization to user niche needs.

### PLATFORM COMPETITION

In any given era, ICT markets are organized around platforms – a cluster of technically standardized components that buyers use together to make the aforementioned wide range of applications (Bresnahan and Greenstein 1999). Such platforms involve long-lived assets, both components sold in markets (i.e., hardware and some software) and components made by buyers (i.e., training and most software). Important computing platforms historically include the UNIVAC, the IBM 360 and its descendents, the Wang minicomputers, IBM AS/400, DEC VAX, Sun SPARC, Intel/Windows PC, Linux, and, recently, TCP/IP-based client-server platforms linked together.

Vendors tend to sell groups of compatible products under umbrella strategies aimed at the users of particular platforms. In the earliest eras of ICT markets, the leading firms integrated all facets of computing and offered a supply of goods and services from a centralized source. In later eras, the largest and most popular platforms historically included many different computing, communications, and peripheral equipment firms, software tool developers, application software writers, consultants, system integrators, distributors, user groups, news publications, and service providers.

Until the early 1990s, platforms helped define most market segments. These were distinguished by the size of tasks to be undertaken and by the technical sophistication of the typical user. These segments stood in for clusters of technical skills at firms and clusters of operations at users. Mainframes, minicomputers, workstations, and personal computers (in decreasing order of size of installation needed to effectively use the computer) constituted different size-based market segments. Trained engineers or programmers made up the technical user base, while the commercial market was geared more toward administrators, secretaries, and office assistants.

The most popular platform in the late 1980s and 1990s differed from the prominent platforms of earlier years. The *personal computer* (PC) began in the mid-1970s as an object of curiosity among technically skilled hobbyists, but became a common office tool after the entry of IBM's design. Unlike prior computing platforms, this one has diffused into both home and business use. From the beginning, this platform involved thousands of large and small software developers, third-party peripheral equipment and card developers, and a few major players.

The networking and Internet revolution in the late 1990s is responsible for blurring familiar distinctions. These new technologies have made it feasible to build client-server systems within large enterprises and across ownership boundaries. Today such networking employs Internet-based computing systems networked across potentially vast geographic distances, supporting the emergence of a “network of networks.” Proprietary network providers, sponsored by firms such as Microsoft, SAP, and Oracle, compete with each other and with software built around open source, such as Linux, Apache, and MySQL.

### **CHANGES IN COMMERCIAL LEADERSHIP**

Why do incumbents or entrants take advantage of technological opportunity sometimes and not others? Sometimes incumbents either cannot or will not do the same as entrants. Why? There is a seemingly anomalous pattern. Despite frequent and sometimes dramatic technical improvements in specific areas of technology, many features of the most common platforms in use tend to persist or change very slowly. This is because many durable components make up platforms. Though they lose their market value as they become obsolete in comparison to frontier products, they do not as quickly lose their ability to provide a flow of services to users. Consequently, new technology tends to be most successful when new components enhance and preserve the value of previous investments, a factor that creates demand for “backward-compatible” upgrades or improvements. It also creates a demand for support and service activities to reduce the costs of making the transition from old to new.

*Control* over changes to design and other aspects of technical standards shapes the backward compatibility for key components. Control of these decisions is coincident with platform leadership – determining the rate and direction of change in the technical features of components around which other firms build their businesses. In each platform, it is very rare to observe more than a small number of firms acquiring leadership positions. In more recent experience, control over the standard has completely passed from IBM to Microsoft and Intel. Microsoft produces the Windows operating system and Intel produces the most commonly used microprocessor. For this reason the platform is often called Wintel. Other firms, such as SAP, Oracle, and Cisco, also have dominant positions in other areas of the most common platforms in use.

### **FINANCIAL INSTITUTIONS SUPPORTING INNOVATION**

In technologically intensive markets, forward-looking firms cannot (or do not) presume that they are certain about the source of market value. Incumbent firms and new entrants get a high rate of return from learning about future technical and market opportunities. A number of institutions, such as venture capitalists, support innovative activities by entrants, often in contraposition to an incumbent firm that has failed to learn to take advantage of new commercial opportunities.

Leading firms have developed numerous mechanisms to elicit cooperation from innovative entrants, even when innovation takes place outside the organizational boundaries of an incumbent. With similar assessments of market opportunities, incumbents and entrants are likely to jointly pursue these opportunities in a manner which reinforces the

incumbent's position. Cisco's repeated acquisition of small firms during the Internet boom was one such example.

While the spawning of new ICT businesses in North America has tended to be concentrated in a small number of locations, other facets of the supply chain for ICTs involve firms headquartered and operating in a much wider set of locations. Entry into facets of the ICT market has become an important phenomenon world wide. The supply chain for many complementary components has also been associated with firms in western Europe as well as in India, Israel, South Korea, Singapore, Taiwan, and China (Bresnahan and Malerba 1999). Even more widespread are computing service firms, which follow business and home users dispersed across the globe.

*Francesco Quatraro*

*University of Turin*

Information and communication technology or technologies (ICT, ICTs) may be considered as a clear exemplar of the salient features and ingredients of a path-dependent and complex process based upon an array of complementary localized technological changes. Indeed,

the path leading to the generation and adoption of ICT emerged out of a collective and interactive process induced by relevant changes in the economic environment. This stimulated the creative reaction of an array of learning agents based in a fertile context characterized by effective knowledge governance mechanisms and positive feedback magnified by local externalities.

### **DETERMINANTS**

Beginning in the late 1960s, 20 years after World War II, the US experienced a progressive erosion of its economic and technological leadership. The combined effect of the convergent catching up of competing countries, the international diffusion of mass production and science-based technologies (Nelson & Wright 1992), and the exhaustion of technological opportunities in the chemical and engineering technologies resulted in a strong decline of US international competitive advantage and a productivity slowdown (Griliches 1980; → Diffusion of Information and Innovation). This decline in performance induced a myriad of interdependent, sequential, and creative efforts directed toward the introduction of complementary technological innovations. These were based upon the exploitation of locally abundant production factors, favorable conditions of use, and access to a large knowledge commons and localized learning processes (Antonelli 1999).

The main result of these developments has been the creation of a new technological system with a strong skill bias (Acemoglu 1998). In the decades following their introduction, ICTs have improved considerably, and have slowly acquired the features of a general-purpose technology (GPT). These technologies have a high degree of fungibility, that is, usability in many different contexts, strong complementarities, and considerable spillover effects. Along with the improvements, the diffusion of ICT across US firms stemmed from a process of sequential, creative adoption (Lipsey et al. 2005). The full exploitation of the benefits of the introduction of ICTs, for instance in terms of higher firm productivity, is possible, however, only in those contexts that are able to replicate the specific endowment of production factors in which the new technologies originate, such as the strength of the academic skills in the US economy.

### **CHARACTERISTICS**

The development of ICTs is typical of a Schumpeterian gale of innovation characterized by increasing convergence between and integration of a variety of localized innovations, generated in a wide range of industries and firms. *Technological convergence* is driven by the introduction of a number of innovations, such as Internet services, enhanced broadband fiber optics, Asynchronous Digital Subscriber Lines, digital television, and the Universal Mobile Telecommunications System, opening up the possibility of integrating a variety of content, services, technologies, and applications (Fransman 2002). As a result, ICTs, and the related technological knowledge, are both composite and fungible. ICTs embody the outcome of the recombination of a variety of knowledge modules that cannot be fully confined internally by the firm and that require the coordination of technological complementarities within the broad ICT technological system (Antonelli 1999; → Communication Infrastructure).

The integration of the array of interdependent, localized, and sequential innovations, characterized by substantial indivisibility, has been shaped by the implementation of: (1) economies of localized learning due to the increasing specialization in specific technological areas, the advantages of the growth in the number of users (network externalities), and the gains from the accumulation of know-how in complementary technologies (knowledge externalities); (2) qualified user–producer and business–academic interactions; and (3) organizational innovations, such as standardization committees (→ Communication Technology Standards), technological platforms, and technological clubs and alliances, to improve the dynamic coordination of the wide range of actors, products, and technologies into a single working system. This has resulted in the complementarity, compatibility, and interoperability of a variety of new localized technologies (David & Steinmueller 1994; Shapiro & Varian 1999; Antonelli 2001).

### EFFECTS

The effects of the introduction of ICT have been powerful. The US economy has been enjoying a new surge in productivity since 1995. The ICT industry has played a key role in this as a result of the rapid technological developments in the semiconductor industry. The persistent and steep decline in the price of semiconductors has been transmitted downward in the value chain, affecting the semiconductor user sectors, and especially the producers of telecommunication equipment and software (Jorgenson 2001). The productivity gains stemming from the spread of ICTs are due both to increases in efficiency in upstream industries and to the flows of creative adoptions of ICTs in downstream sectors. These technologies have enabled knowledge spillovers to the rest of the system, and as a result of intense competition, the new upstream industries have been unable to retain the full stream of benefits stemming from the new technology. This has engendered a flow of pecuniary externalities (David 2001a).

Strong US technological leadership encouraged a new *international division of labor*, which reversed the situation that prevailed in the 1980s. The US quickly became the main producer and user of ICTs, while the rest of the advanced countries engaged in creative adoption involving adapting the technology to the idiosyncratic conditions of their markets and industrial structures.

Because of the strong directional skill bias of ICTs, a → *digital divide* is emerging between countries that are “properly” endowed, that is, that have the “right” amount of human capital and access to the knowledge commons. These “properly” endowed countries are able to participate in the process of cumulative technological change and creative adoption. Other countries can, at best, adopt ICTs passively and enjoy fewer chances to take advantage of the new opportunities for productivity growth. ICTs are global in character because they bring about increases in productivity and efficiency, such that their adoption is profitable across a great array of products and processes, and regions. Nevertheless, asymmetric effects stemming from the strong skill bias and the different endowments of human capital must be accounted for in examining these effects (Antonelli 2003).

Since the early 1990s the adoption of ICTs has made possible the emergence of *global corporations* based on distributed coordination processes, selling worldwide customized products, manufactured and assembled in a variety of regions, while retaining the

skill-intensive activities in their home countries. This trend is especially evident in the new service industry and, in particular, in the new knowledge-intensive-business service sector (Dunning 1993; → Technology and Globalization).

Specialization in *new knowledge-based services* that rely heavily on the quality and variety of advanced digital communication characterizes the transition to the new knowledge economy in advanced countries (→ Knowledge Management). ICTs are increasingly important for a wide scope of knowledge services that range from entertainment to health and financial services to education and logistics. The advent of digital technologies changes the context in which knowledge-based services were traditionally supplied. ICTs allow remote interaction between different actors, while in traditional services, any interaction implied physical proximity. ICTs change the way in which services are delivered and used, and the way in which services are provided to final users. ICTs are crucial also to changes in the way new knowledge services are utilized and contributed to by final and intermediary users (→ Virtual Communities; Network Organizations through Communication Technology). Significantly, the development of open source software is the result of online interactions within the community of users who create and implement new modules of the software (Von Hippel 2005).

The complex nature of ICT, and the complementarity among different physical devices and platforms, has led to the identification of two notions. First, the notion of “essential facility” defines telecommunication networks as essential resources that are fundamental to economic development and thus need to be freed up and accessed by the largest possible share of firms and citizens. Second, according to the notion of “economies of density,” production and distribution costs of telecommunication services decline with an increase in the number of users, leading to a steep reduction in the price of telecommunication services for both firms and citizens. The application of these notions in antitrust law has led in some countries to the splitting up of monopolies, for example, in the telecommunication industry (→ Antitrust Regulation). The separation between property and use rights is necessary when a facility, essential to other competitors, is owned by a monopolist. In this case the monopolist must provide reasonable access to the facility, if its duplication is not possible. Dedicated authorities have been established since the late 1980s to implement the right to interconnection, and mandatory access has become well established in antitrust law (Baumol & Sidak 1994).

The introduction of ICT can be viewed as both the cause and the consequence of the emergence of new financial institutions, like venture capitalists and the related creation of markets dedicated to the transaction of knowledge-intensive property rights. Empirical evidence shows that the spread of venture capitalism took place during the 1970s and 1980s in parallel with the ICT revolution. The wide scope for improvements and the large range of new technological opportunities engendered a strong increase in the birth of new high-tech companies based on venture capital to mitigate the traditional problems of credit rationing for innovative ventures. The strong demand for investment in ICT-based start-ups favored the development of the new venture capital industry (Gompers & Lerner 2001).

## EVALUATION

The emergence and evolution of the new ICT system can be seen as the result of the interplay between the strong idiosyncratic features of the context in which firms are

embedded and the firms' innovative strategies. Firms characterized by limited and specific technological abilities and by irreversibility in their productive choices can face up to the mismatch between expectations and their performance by means of a creative reaction, building on their own localized learning processes. However, this occurs only when the structural characteristics of their environment are fertile and able to provide access to a complementary knowledge commons.

In systems such as those of the US, and to a lesser extent the European Union, where human and technological capital, financial resources, and high-skilled labor have been abundant and accessible, firms were able to address their declining performance in the late 1970s and 1980s with the introduction of an array of new technologies. The convergence of the localized efforts of a myriad of innovating firms led to the emergence of a radical innovation in a cumulative and self-reinforcing way. When those systemic conditions are more difficult to find, such as in many developing countries, firms are more likely to be passive adopters of ICT, rather than innovators (Antonelli 2008).

ICTs represent a clear case of a path-dependent complex process based upon the complementarity of a myriad of localized technological changes. At any point in time the structure of the existing endowments, industries, and regions, and the networks of communication flows in place among innovative agents, exert strong effects on their creative efforts so as to shape the direction and the rate of technological change. When effective knowledge governance mechanisms are in place, the result may be a sweeping gale of innovations (David 2000, 2001b).

## Information Literacy

*Sonia Livingstone*

*London School of Economics and Political Science*

*Elizabeth Van Couvering*

*London School of Economics and Political Science*

New information and communication technologies (ICTs) pose significant challenges for their users. They require the rapid development and continual updating of diverse skills, competences, and knowledge, from the most familiar to the brand new, and from the most basic to the highly sophisticated. In academic research, these skills and knowledge requirements are increasingly brought together under the rubric of information literacy. By using the term “literacy,” the skills needed to operate ICTs are related to the ability to read and write, although the concept is still being developed (→ Human–Computer Interaction).

The specific nature of key information literacy skills is still under debate. However, at a minimum these skills include the abilities to access, navigate, critique, and create the content and services available via ICTs. As these abilities become ever more critical to effective participation in employment, education, and society, both governments and researchers are finding that understanding, tracking, and enhancing them are of growing importance.

### KEY CONCEPTS

The study of information literacy has developed separately from the study of → media literacy, but the two traditions are beginning to converge. The information literacy

tradition emphasizes the access, identification, location, evaluation, and use of information materials while the media literacy tradition generally stresses the understanding, comprehension, critique, and creation of media materials. These are similar but not identical definitions. One reason for the difference in emphasis is that ICT-based information sources have been less accessible, both because they are unequally distributed in society (→ Digital Divide) and because these information sources are more complex to find and use than the typical content of television or radio (→ Exposure to Communication Content; Exposure to the Internet). Another reason is that, since media materials are largely commercially produced, there has been greater emphasis in media literacy on critique than there has been in relation to information literacy. As the natures of information and media materials diversify and converge, it is useful to address both definitions by focusing on four key concepts: access, navigation, critique, and creation.

The first key element of information literacy is *access*. Access seems simple, but in fact it is a complex concept. First, it includes the physical possession of a piece of hardware, such as a computer or mobile phone, as well as the time to use it. Next, and equally importantly, it includes a range of the skills and competences required by the public to sustain and update their access to fast-changing media and communication technologies, to regulate the information accessible to them, and to manage the information available to others about individuals.

The second key element of information literacy is *navigation* – the ability to find relevant content. Information literacy researchers are coming to recognize that navigation and understanding are fundamentally linked in the online atmosphere of media plenty. In this, the → Internet differs from print and audiovisual texts. These texts were traditionally produced in a context of scarcity, with few people having access to the systems of production and distribution. This maintained a strong distinction between producers and consumers, with key filters operating to select material to be distributed in accordance with criteria of cultural quality, editorial values, professional production conventions, and political or market pressures. While this pre-filtering and organization of written information placed fewer demands on the individual's critical/information skills in terms of locating an authoritative source, information literacy instead centers on understanding the operation and consequences of these filters.

*Critical literacy* is the third key element of information literacy. Almost anyone can produce and disseminate Internet content, with fewer and different kinds of filters, so critical literacy, or the ability to evaluate and assess content for oneself, is fundamental to the ability to “read” the Internet. On the Internet, the information-literate person must be able to find the information he or she wants by searching among a wide range of relatively disorganized sources and be able to compare and evaluate them, sorting authoritative from non-authoritative and relevant from irrelevant documents. A less information-literate person faces difficulties in navigating online, even if he or she has some technical skills, precisely because of a lack of skills for comparing and evaluating information. For example, adults using the web face challenges to the values they have learned to associate with (printed) texts in school. Instead of the authoritative and carefully selected texts that one might find in a library, a huge variety of primary sources confronts the often under-prepared user online. In addition, people's rather broad searching strategies, which

work well in a closely monitored database such as a school library, for example, are unsuitable for large-scale → search engines, which return a vast number of irrelevant results.

The fourth element of information literacy is *creation*. Print literacy has always included both reading and writing skills. However, examination of content creation skills is just beginning to be included in research on information literacy. With the rapid growth of peer-to-peer networking, the creation of information (as “user-generated content” of various kinds) is transforming the range of information available online (→ Personal Publishing). This sets new challenges for research and policy, raising questions about the quality or originality of people’s information creation. With a burgeoning of multimedia artwork, music, and moving images, it also raises questions regarding the ethical or, conversely, harmful, nature of some material (as in the growth of racist or hostile material, as well as in the expansion in peer-to-peer advice and support). Information creation also opens up new possibilities for civic or political processes of deliberation, transparency, and organizing.

### MAIN AREAS OF RESEARCH

The conceptual foundations of information literacy lie in → information processing, the study of how symbols become information and how information, in turn, becomes knowledge. Drawing on this approach, which is based in cognitive psychology, a range of experimental studies has been conducted in which tasks are performed and user reactions are tested and tracked. These studies investigate users’ attitudes and beliefs, and researchers have attempted to develop psychological instruments to measure literacy.

Information literacy is linked historically to computer skills (sometimes called computer literacy), and so research also examines people’s (generally, adults’) ability to manipulate hardware and software in order to find information efficiently and effectively. The related field of human–computer interaction, although it may not mention the concept of information literacy explicitly, treats literacy as an interaction between skilled users and well-designed interfaces.

Researchers in the fields of education and library studies have been instrumental in distinguishing technical skills (for example, the ability to open a web browser on a computer) from information skills (for example, the ability to assess whether the information on a web page is reliable). These researchers have focused on motivation and the appropriateness of content as key barriers to use, rather than attributing poor usage to deficient technical skills. Other researchers in this tradition focus on problems of comprehension, understanding, and the evaluation of information.

These areas of information literacy studies overlap in practice. Many of the studies that have been conducted are couched in a context of work and competitiveness, either personal or national. The implication is that the information-literate person is able to participate fully in the world of work, for example, by being an “information worker” or a “knowledge worker.” Conversely, the person who lacks information literacy risks being undervalued by or excluded from an increasingly competitive, information-oriented labor market.

## MEASURING INFORMATION LITERACY

Literacy has never been easy to measure. However, practitioners in information science have worked to develop *literacy standards* to help assess the levels of competence, typically of adult learners. For example, the Association of College and Research Libraries (ACRL) in the USA has developed a series of standards, performance indicators, and outcomes for information literacy in higher education. Each level is associated with performance indicators and outcomes, and specifies that the information-literate student should be able to determine the nature and extent of the information needed (level 1); access required information effectively and efficiently (level 2); evaluate information and its sources critically and incorporate selected information into his or her knowledge base and value system (level 3); use information effectively, individually or as a member of a group, to accomplish a specific purpose (level 4); and understand many of the economic, legal, and social issues surrounding the use of information, and use the information appropriately (level 5).

In the UK, the Society of College, National and University Libraries (SCONUL) has formulated an alternative model based on *seven pillars of information literacy*. In this model, information literacy consists of the following skills, on each of which performance can be graded at levels from novice to advanced beginner, competent, proficient or expert: (1) recognize information needs, (2) distinguish ways of addressing gaps, (3) construct strategies for locating information, (4) locate and access information, (5) compare and evaluate information, (6) organize, apply, and communicate information; and (7) synthesize and create information. This model differs from the ACRL model by including basic library and ICT skills as foundational elements, and also by stressing strategies for the location of information and for enhancing the creative dimension of information literacy.

This specification of standards is clearly crucial if education, skills, and training programs are to be developed and evaluated (NIACE 2004). While several standardized measures of computer literacy have been proposed, basic library skills – the other set of foundational skills in the SCONUL model – have not been adequately assessed in the adult population.

## POLICY DEVELOPMENT AND INFORMATION LITERACY

A UNESCO-funded multinational gathering of experts organized by the US National Commission on Libraries and Information Science and the National Forum on Information Literacy (Information Literacy Meeting of Experts 2003) describes information literacy as “a prerequisite for participating effectively in the Information Society” and “part of the basic human right of life long learning.” This strong language is echoed in policy papers in several countries. For example, in the UK, the White Paper, *21st century skills: Realising our potential* (Department for Education and Skills 2003), makes a similar commitment to help adults gain ICT skills as a third skill for life alongside literacy and numeracy, in order to “learn effectively online, become active citizens in the information age and . . . contribute productively to the economy” (Office of the e-Envoy 2003, 11).

Information literacy is primarily promoted and supported for its benefits in the training of a highly skilled workforce, thereby advancing employment and economic

competitiveness. While funding is plentiful for this work, how people critically understand texts, crucial to the ideal of the “informed citizen” (prominent in media literacy research), receives a low priority in relation to information literacy initiatives.

## **Information Overload**

*David J. Grimshaw*

*Practical Action*

Information overload is a term first used in the early 1960s to indicate limits to human information handling capacity (Meier 1962) and later by Toffler (1970) as one dimension

of “future shock,” by which he broadly meant too much change in too short a time. Computer communications and the → Internet have contributed to the realization of this “shock,” sometimes also referred to as “techno-stress” (Weil & Rosen 1997). The term “information overload” has its roots in the context of computer-mediated communications (→ Human–Computer Interaction), where it might typically be applied to an individual who receives a large number of emails per day and who experiences some difficulty in processing the volume of information. Lest one is tempted to think of information overload as a new problem, let us recall the words of T. S. Eliot (1934), “where is the wisdom we have lost in knowledge? Where is the knowledge we have lost in information?”

### DIMENSIONS IN INFORMATION AND INFORMATION OVERLOAD

Eliot reminds us that turning information into knowledge is not easy and is far from automatic (→ Information Processing). It is important to understand the process by which data is or can be transformed into knowledge. Since the advent of computer-based data processing there has been a vast increase in the capacity and capability for storing data and transforming it into information that can be used in decision-making (→ Information Society). The definition suggested by Ackoff (1989, 4) that “information is data that has been given meaning by way of relational connection” is confirmation that information contains meaning. A further way of looking at this is to suggest that the processing of data into information helps to answer questions of “who,” “what,” “where,” and “when.” Knowledge is used to answer “how” questions. Wisdom is, according to the *Oxford English Dictionary*, “experience and knowledge together with power of applying them.”

The very possibility of information overload appears paradoxical in the sense that conventional wisdom has it that more information leads to improved decision-making. So just what are the dimensions of the problem of information overload? One perspective is to examine the *growth of information*. A study by Lyman and Varian (2003, 1) at the University of California at Berkeley found that “print, film, magnetic, and optical storage media produced about 5 exabytes of new information in 2002. Ninety-two percent of the new information was stored on magnetic media, mostly in hard disks. . . . If digitized with full formatting, the seventeen million books in the Library of Congress contain about 136 terabytes of information; five exabytes of information is equivalent in size to the information contained in 37,000 new libraries the size of the Library of Congress book collections.”

This quantitative perspective on information overload needs to be complemented with a qualitative viewpoint. Is there some confusion about data and information? What is the *quality of the information received*? Was the information relevant, timely, accurate, and complete? Some manifestations of information overload could be due to irrelevant, incomplete, or inaccurate information. In other words, some information overload could more properly be classified as information pollution (Nielsen 2003).

A further perspective is to consider the *reach of information overload*, in other words, as between people who have access to digital technologies and those who do not. This can be considered from either a national or an international perspective. The former tends to be based on socio-economic issues and the latter on geographical boundaries, with a very low

proportion of the population of developing countries having access to information and communication technologies. Information overload tends to be a problem for those living in relatively prosperous countries who work in knowledge-based sectors of the economy.

Finally, there is a sense in which overload can be a symptom of *too many information channels* open at any one time. For example, in an office environment email, telephone, mobile phone, instant messaging, VoIP, and SMS all compete for our attention. Recent research suggests that it takes several minutes to recover from an interruption. This phenomenon has been called interruption overload (Rigby 2006). Potentially there is a sense in which the presenting problem of information overload could be a symptom of either information pollution or interruption overload.

### CONSEQUENCES OF INFORMATION OVERLOAD

Saying less often communicates more. There is a tendency with electronic communications for there to be more detail, from which users have to extract useful information. The danger is that some users may “tune out” and thereby miss important information contained in the mess (Nielsen 2003).

For human-to-human communication (→ Interpersonal Communication) to be successful there is a need to supply a context to transform the data into information (Kimble et al. 1998). In face-to-face communication, this happens quite naturally. However, in electronic communication many contextual clues are missing. Grimshaw et al. (1997) focus on the concept of context as a key to transforming machine data into human information. Taking Wilson’s (1984) definition of information as data plus context, we can conclude that meaning is conferred in a particular context. Here, context is discussed in relation to meaning, highlighting problems where failures in communication or “breakdowns” occur.

Another way of dealing with information overload may involve, in the future, notions of *pervasive computing* (Kenny 2006; → Ubiquitous Computing). A possible scenario for the future is one where computer technology becomes so pervasive that it is embedded in everyday objects such as clothing, traffic signals, passports, etc. There would then be so-called “traces” left by people who move around undertaking transactions. Profiles of activities and individuals could thereby be drawn up much more easily. The notion is that greater contextual knowledge of activities would lead to information that could be assimilated and used more effectively. In this way information overload would be reduced. Or, in other words, an increase in information would not lead to indigestion; rather it would lead to enlightenment.

However, the above approach might be perceived to involve threats to the → privacy of individuals. As more information about individuals, especially related to their transactions and movements, is captured there is a danger that such information could be abused.

### KEY RESEARCH QUESTIONS

One of the key research issues in this area is the development of → *search engines* that can be sensitive to context, meaning, and validity. As we produce more information there is a

corresponding need to search, find, and evaluate the results of searches. Arthur (2006) points out that the Google search facility will often lead to a Wikipedia page. Since the top of the results list gets 42 percent of the click-throughs, this raises important questions for the validity of the results. Academic research, for example Montebello (1998), argues that information overload is essentially an information retrieval problem. However, there are two parts to this issue: first, an effective search strategy, and, second, a means of discriminating between the results on the basis of relevance, timeliness, and accuracy.

Some authors, including Maes (1994), have suggested that using *intelligent agents* will be the solution to information overload. This is essentially the application of artificial intelligence to help the user search through information. The key issues here revolve around the need to be able to know when to trust the agent and the agent itself being able to acquire the knowledge needed to interpret the information.

A further question to ask is: do some media lead to more information overload than others? For example, it might be that the use of email, compared to an intranet, leads to higher levels of overload. This might be because, in general, most people prefer to “pull” information rather than have it “pushed” to them.

Information overload has been a recognized feature of computer-mediated communications for the past 30 years. With clear evidence that more information is being held on computers each year, will information overload continue to be a problem or will the increasing power of computing bring with it techniques and methods that begin to reduce overload? Whatever the answer to that question might be, we can begin to manage our own individual information overload by ensuring that we filter for quality, relevance, timeliness, and accuracy. The ultimate goal of reaching wisdom depends on how each of us manages information in relation to our experiences in life.

## Information Processing

*John O. Greene*

*Purdue University*

Information processing is an approach to the study of behavior which seeks to explain what people think, say, and do by describing the mental systems that give rise to those phenomena. At the heart of the information-processing perspective is the conception of the mind as a representational system. That is, the mind is viewed as a system that (1) holds information in some form, and (2) processes (i.e., utilizes, transforms, manipulates) that information in some way in carrying out its input-processing and behavioral-production activities. To be more precise, the mind is viewed not as a single representational system, but as a collection of subsystems, each coding information in its own way, and each carrying out its own particular operations on that information. The basic idea, then, is to describe how information is held in one or more subsystems, and how that information is processed in those subsystems, in order to explain the perceptual, mental, and behavioral phenomena of interest. The goal of the information-processing approach is to explain the link between what a person hears, sees, tastes, feels, and smells and what he or she thinks, says, and does.

The information-processing perspective has proven to be enormously important in advancing our understanding of a wide range of phenomena of interest to communication scholars. In part this is because so much of what is involved in fundamental processes of meaning-giving and message-making transpires in the mind. As the entries in the "Information Processing and Cognitions" area of this encyclopedia illustrate, this approach has touched virtually every corner of the field. The list of the phenomena and processes encompassed by information processing is a long one, indeed, but, just as examples, it includes the following: → attention, → listening, → comprehension, → memory, learning, planning, decision-making, → emotion, language acquisition (→ Language Acquisition in Childhood), skill acquisition, → message production, and creativity.

## INTELLECTUAL FOUNDATIONS

Philosophers have concerned themselves with the nature of knowledge and thought since ancient times – a tradition of inquiry that reached full flower during the Enlightenment of the seventeenth and eighteenth centuries in the work of philosophers such as Descartes, Hume, and Kant. Systematic, empirical investigations of mental processes date as far back as the late 1800s, most notably with the seminal studies of Wilhelm Wundt, who founded the first experimental psychology laboratory in 1879 (→ Experimental Design). In the United States, William James’s two-volume *Principles of psychology*, published in 1890, addressed numerous topics that remain of keen interest today, including localization of specific functions in various brain systems, consciousness, and the nature of the self.

Beginning in the period 1915–1925, experimental psychology came to be dominated by *behaviorism*, a stance most closely identified with John Watson. The desire to pursue a purely objective science of behavior, based solely on observable stimulus–response relationships, led Watson to argue that appeals to mentalistic concepts had no place in psychology (→ Objectivity in Science). A successive generation of scholars, the *radical behaviorists*, including most notably B. F. Skinner, were willing to admit mental states and processes, but deemed such internal events tangential and ultimately unnecessary to understanding human behavior. Even during the heyday of behaviorism (c. 1920–1950), however, there were other prominent voices that were not so willing to dismiss appeals to internal states and processes. Among their ranks were the *Gestalt psychologists* like Wolfgang Kohler, and the eminent developmental psychologist Jean Piaget. Similarly, *social psychologists* from the 1930s on accorded a central role in their theorizing to the individual’s construal of the environment and conceptions of attitudes and attitude-change processes. And, as a final example, during the 1940s, scholars who came to be identified with the nascent discipline of mass communication made ready use of cognitive conceptions such as attention, perception, and message memory (Dennis & Wartella 1996; Rogers & Chaffee 1997).

The period between 1950 and 1970 witnessed the emergence of a new experimental psychology, one that, in contrast to behaviorism, accorded central prominence to mentalistic structures and processes. This *cognitive psychology* drew from an array of disciplines, including → linguistics, → information theory, and artificial intelligence, in advancing a view of the mind as an information-processing system, i.e., one in which stimulus inputs were subjected to a series of processing stages, culminating in overt responses. Thus, a rudimentary information-processing model might propose that inputs pass through stages of “attention,” “pattern recognition,” “working memory,” “long-term memory,” and “response formulation” (see below). Central to the approach were issues of *representation* and *processing* – at each stage, information represented in some way was assumed to be manipulated or transformed via processes that both made that information available for subsequent stages and left a “footprint” of their presence and operation which was discernible in overt responses. Measures of reaction time, memory recognition and recall, response errors, verbal reports, and so on were examined, then, in order to shed light on the nature of these intervening processing steps.

The notion of the mind as an information processing system came to exert considerable influence on thinking in communication and cognate disciplines such as organizational behavior, anthropology, and educational and social psychology. But the disciplinary influences have not been unidirectional. Two trends are particularly noteworthy. Rather than a lone subject responding to laboratory stimuli, scholars have increasingly come to embrace conceptions of the socially embedded information processor – one whose cognitive processing reflects interpersonal and cultural influences. Second, advances in real-time neurophysiological assessment have opened new avenues for understanding what transpires between inputs and responses. These and other influences have given rise on one hand to a *cognitive science* that draws from numerous traditional disciplines, and on the other to a broad intellectual landscape, extending well beyond the boundaries of cognitive science, that is permeated by concerns with information processing and cognition.

### INTENTIONAL, DESIGN, AND PHYSICAL STANCES

The domain of information processing and → cognition is enormously heterogeneous, reflecting a wide array of both general conceptual approaches and specific characterizations of theoretical mechanisms, aimed at explicating a near limitless list of behavioral and mental phenomena, and drawing upon a variety of sources and types of data. No single overarching conceptual framework is likely to encompass the breadth of the domain, but, at least with respect to conceptual approaches and theoretical mechanisms, it may be possible to develop a rudimentary organizational framework that can accommodate many of the most important contributions by drawing upon the work of Daniel Dennett (e.g., 1987).

Dennett distinguishes three approaches for *apprehending and predicting the behavior of complex systems* like chess-playing computers, or human beings. The “physical stance” seeks to understand the behavior of such systems by recourse to their physical constitution, i.e., the solid-state electronics of the computer or, for people, their neurophysiology. A second approach, the “design stance,” seeks to apprehend a system’s behavior in terms of functional (rather than physical) mechanisms. That is, in order to behave as it does, the system must carry out various functions, and the task is one of characterizing the nature of the mechanisms by which those functions are executed. And, importantly, the same function can be carried out in two systems with very different physical constitution, a fact that makes the physical character of a system of secondary concern to theorists pursuing design stance accounts. Finally, the “intentional stance” seeks to understand and predict a system’s behavior by ascribing to that system various beliefs, goals, expectations, and so on. Thus, the system’s behavior is seen to reflect choices made in order to accomplish goals in light of information at the system’s disposal.

These three approaches, then, suggest a framework for organizing a survey of key conceptual and theoretical developments in the domain of information processing and cognitions, but with the important caveat that it is probably best to think of Dennett’s three stances as “pure types,” and in practice it is possible to identify numerous hybrid approaches that combine elements of two, or even all three, of these perspectives.

## THE INTENTIONAL STANCE AND “ORDINARY MENTAL CONCEPTS”

As noted above, the intentional stance seeks to apprehend a system's behavior in terms of its goals and beliefs. Fundamental to this approach is an assumption of rationality, i.e., goals and beliefs are useful in explaining and predicting behavior only as long as the system does what it *should*, given its objectives and knowledge. Intentional stance accounts of human behavior typically reflect a corollary assumption of self-awareness: the individual is assumed to be aware of his or her own mental states and activities. So, people know what they are trying to accomplish; they are aware of the information that they are able to bring to bear on those goals; they are conscious of their expectations, deliberations, and decision-making. Following from this assumption, the terms of intentional accounts tend to be the sort of mental states and contents that are (presumably) consciously available to the individual. Intentional accounts, then, make ready use of ordinary mental concepts, or “folk psychology” – concepts and terms afforded by everyday language and central to people's lay understanding of their own behavior and that of others (Churchland 1988; Flanagan 1991). To illustrate, consider just three examples of intentional stance constructs: attitudes, goals, and plans.

Among the most prominent of ordinary mental concepts is that of → *attitudes*. As an element of folk psychology, people commonly rely on inferred attitudes to explain and predict the behavior of others and to give accounts of their own behavior. But beyond this, the attitude construct has held a central place in social scientific study of human behavior for the better part of a century (Eagly & Chaiken 1993). Precise definitions of “attitude” are numerous and varied, but in general they have in common the notion of an evaluation of a person, thing, etc. that typically carries with it behavioral implications.

A second example of an intentional stance construct with both widespread folk and social scientific application is that of *goals* (along with attendant notions of desire, objectives, etc.; → Goals, Cognitive Aspects of; Goals, Social Aspects of). On one hand, as a motivational construct, goals are seen to play a key role in output processes such as decision-making, behavioral regulation, and emotion (Austin & Vancouver 1996). Moreover, imputing goals to others is central to input processes such as attribution, interpersonal uncertainty reduction, and comprehension (Schank & Abelson 1977; → Attribution Processes; Discourse Comprehension; Uncertainty Reduction Theory).

Finally, closely related to conceptions of goals is that of *plans* (and planning) – a series of projected steps leading to accomplishment of some end. As with other ordinary mental concepts, lay persons have phenomenal experience of their own plans and also readily ascribe plans to others. And, in advancing intentional stance accounts of human behavior, social scientists often resort to conceptions of plans and planning (Berger 1997). One particularly prominent application in the field of communication has been the goals–plan–action (GPA) framework wherein goals are held to give rise to plans, which in turn guide a person's behavior (Wilson 2002).

Because the constructs of intentional stance theories are generally assumed to be phenomenally available to the individual (i.e., the person presumably knows his or her attitude toward some object, is aware of his or her goals, can articulate his or her plans), the most common method of intentional stance approaches is simply to ask people to report on their thoughts, using paper-and-pencil assessment instruments (e.g., attitude

scales), think-aloud protocols, etc. The reliance on such self-report techniques has prompted scrutiny of the conditions under which such data are likely to be more or less accurate (Ericsson & Simon 1984).

## DESIGN AND HYBRID INTENTIONAL/DESIGN STANCE APPROACHES

### Method, Data, and Domain

As noted above, while intentional stance accounts seek to explain a system's behavior in terms of beliefs, goals, etc. ascribed to that system, the aim of design stance approaches is to explain behavior by recourse to the functional design of systems assumed to give rise to the behavioral phenomena of interest. So, for example, if people exhibit the ability to remember, many years later, events from their college days, then there must be some mental system that preserves these episodes over extended periods of time; if people can recall the general plot of the last novel they read, but not the book's exact sentences and their order, there must be some memory system that preserves the gist of a narrative, but not its surface form; if people's ability to monitor the road and other traffic is diminished while talking on a cell phone, then there must be some system that limits the number of activities a person can execute at one time. And importantly, on the design stance, explanation and prediction do not depend upon the assumption of rationality, nor are the mental processes of interest necessarily consciously available to the individual.

The fundamental *method* of design stance approaches has been characterized as that of "transcendental deduction" (Flanagan 1991). This simply means that the theorist observes some input-output regularity and posits the nature of the system that would produce such a regularity. For example, to observe that people get faster in executing a skill as they continue to practice that activity might lead the theorist to posit some sort of memory structures that are "strengthened" with repeated use. As noted above, the theoretical terms of pure design stance approaches are cast at the level of mind rather than brain. Thus, rather than talking about neuroanatomical structures and neurochemical control systems, the theorist pursuing design stance accounts invokes conceptions of working memory, associative networks, → scripts, and so on – structures and processes that have some instantiation in the hardware of the brain, but that are not identified with specific neural structures.

The *data* from which design stance theorizing proceeds include self-reports like those employed in intentional stance approaches, but because the contents and operations of functional systems may not be consciously available to the individual, other types of data are critical (Greene 1988). Among these are measures of memory recognition and recall, which in the field of communication have proven particularly important in studies of mass media processing (→ Memory, Message; News Processing and Retention) and interpersonal communication (→ Implicit Personality Theories; Memory, Person). Because cognitive processes unfold over time, measures of reaction time (i.e., how long it takes a person to produce a response) are held to yield essential cues about the nature of those processes. And, by extension, assessments of speech-onset latency, speech rate, and so forth provide insights about the temporal characteristics of message production processes (→ Speech Fluency and Speech Errors). Most (though not all) cognitive models assume a

finite pool of processing resources that can be flexibly allocated to various processing tasks, but that limits performance when demands on resources exceed what is available (→ Limited Capacity Model). Assessments of slowed responses and performance decrements, then, can be used to shed light on the processing demands of various tasks. A final example of data plumbed in design stance approaches is performance errors (Fromkin 1980). The mechanisms at work in human perception, memory, and behavioral production tend to produce errors that are recurrent, even predictable (as in familiar visual illusions); conversely, there are other sorts of errors that, though conceivable, virtually never occur. As a result, phenomena such as memory intrusions and speech errors provide important clues to understanding underlying mental processes.

One implication of the method of transcendental deduction is that virtually any sort of mental or overt behavioral phenomenon is seen to be amenable to study from the design stance. In other words, because the essential task is that of positing a model of the mechanisms linking inputs to outputs, almost anything people can think and do falls within the purview of this approach (although, in the main, work conducted within this framework has been concerned with the behavior of so-called “normal” populations and has not focused on groups with various neurological and mental disorders). So, for example, theorists study mental operations like attention, listening, manipulation of mental images, imagining interactions, reasoning, and creating novel thoughts. And, in the realm of overt behavior, they examine phenomena such as language acquisition, speech production, skill development, and problem-solving. Moreover, as is developed in greater detail below, the terms of folk psychology (e.g., attitudes, beliefs, goals, plans, etc.) common to the intentional stance can be explicated by recourse to design stance mechanisms.

Two additional points concerning the method of transcendental deduction merit mention. First, because the theorist’s objective is to posit some mental mechanism that gives rise to particular input–output regularities, it is possible to develop multiple, alternative models, each equally capable of accounting for the phenomena of interest. Second, in seeking to understand a design stance model, it is important to distinguish the “data” from the “domain” – that is, to distinguish the measures made to test a theory from the mental and behavioral phenomena that the theory purports to explain (Greene & Graves 2007). To illustrate, a theorist might posit a model of the processes involved in recognizing facial expressions of emotion, and in order to test the model, assess reaction times to make judgments about the emotional expressions of strangers presented via computer display. In this case, the domain of the theory (i.e., what the theory seeks to explain) is emotion recognition processes, and the data are the reaction time measures collected to test the theory.

### **Systems and Mechanisms**

Central to the information-processing perspective are the interrelated conceptions of the mind as a series of stages linking inputs to outputs and the mind as a representational system in which information, held in some form, is processed at each of these stages. Within this perspective, models can be developed at varying levels of detail and sophistication. At the most rudimentary level are those models which simply specify a series of

stages or systems that information passes through between input and output with little attempt to specify in detail the nature of the mechanisms operating at each stage. Such an approach, sometimes termed “white boxology” or a “box and arrow model,” provides a general framework of the mind, and there is some consensus about the major systems comprising such models, as the following:

- *Sensory registers* (including echoic and iconic memory systems): buffers that hold sensory information for very brief periods of time before it is passed on to subsequent processing stages.
- *Pattern recognition system*: integrates sensory information with previously acquired knowledge to permit stimulus identification, as, for example, in the case of letter recognition.
- *Working memory* (or short-term memory): a limited-capacity system in which a relatively small amount of information can be held and manipulated (Miyake & Shah 1999). Working memory is the site of planning, decision-making, message editing, and so on, and the contents of working memory are generally thought to be available to conscious awareness.
- *Long-term memory*: a very large repository where information is held virtually indefinitely. Long-term memory is typically partitioned into various subsystems, including *declarative* versus *procedural* memory. Declarative memory is *knowledge that* – i.e., the factual information one has acquired. In contrast, procedural memory is *knowledge how* – i.e., information used in executing skills such as riding a bicycle, swimming, or tying one’s shoes. The declarative memory system can be further partitioned into *episodic* and *semantic* memory stores. As the name suggests, the episodic memory system is memory for the episodes or events of one’s life; it is essentially autobiographical – the store of information about what one has experienced (although these memories need not be veridical). The semantic memory system, in contrast, contains information abstracted from specific experiences – such as one’s knowledge of the capital cities of the world, the boiling point of water, and, especially, words and their meanings.
- *Effector system*: the system responsible for the preparation and execution of motor programs. On balance, design stance theorists have given less attention to this component of the mind, but it has been the subject of considerable scrutiny from those interested in mechanisms of speech production (Rosenbaum 2005).

Again, there are insights to be gleaned from such general characterizations of the information-processing system, but the real strength of the design stance comes from specification of the mechanisms by which the operations at each stage are carried out. Describing these mechanisms involves addressing issues of *structure*, *content*, and *process*. Following from the basic conception of the mind as a representational system, concerns with structure and content involve *how* and *what* information, respectively, is represented in the mind. And, on the assumption that the mind is an information-processing system, issues of process concern how information is transformed and used. To illustrate, consider the familiar conception of “scripts.” A script is a long-term memory structure that consists of a series of scenes representing familiar events. Moreover, a particular script (e.g., eating in a restaurant, going through airport security) represents specific

content relevant to that type of event. Processes pertaining to memory structures like scripts would include operations such as activation (i.e., retrieving the script from memory), implementation (e.g., using the script to generate expectations for what will happen next), and alteration (e.g., learning new scenes for the script).

As noted above, the methods and data of the design stance permit (at least hypothetically) a nearly limitless range of specifications of mechanisms to account for mental and behavioral phenomena, and theorists have, indeed, proven enormously imaginative in developing structure–process–content descriptions. Nevertheless, there are certain conceptions of underlying cognitive mechanisms that have found widespread acceptance and application, and, partly for this reason, they provide useful examples of design stance theorizing.

*Productions* are elements of the long-term procedural memory system that preserve knowledge of situation–action relationships in an IF–THEN format. For example, a production for properly addressing another person might be:

IF: You are greeting a person of higher status

THEN: Use his/her title plus last name.

Production systems have found widespread application in psychology (Klahr et al. 1987), but have been less prominent in the field of communication. At the same time, various communication theories have relied upon production-like structures, as in the conception of *procedural records* in Greene’s original formulation of → action assembly theory, and in Wilson’s (1995) and Meyer’s (1997) models of communication goal generation.

*Schemas*: a number of different specific conceptions of → schemas have been developed, but in general the term refers to knowledge structures, typically of declarative memory, but in some cases in procedural memory, that have been abstracted from past experiences. Schemas are held to be general representations in the sense that they apply to entire categories of similar persons, objects, etc. As such, schemas are similar to the aforementioned conception of scripts, and, indeed, in some treatments scripts are viewed simply as a special case of schemas, i.e., those that pertain to familiar sequences of events (→ Schemas, Knowledge Structures, and Social Interaction; Relational Schemas).

*Associative networks*: as with schemas, a number of distinct conceptions of associative networks have been advanced, but they have in common the idea that long-term memory (either declarative or procedural) consists of nodes, corresponding to some sort of conceptual entities, and links, or associations, between those nodes. In some theories, in addition to relatively abstract symbolic representations, nodes may also correspond to low-level perceptual or motoric features. Associative links between nodes are established when the individual processes some relationship between nodes, as, for example, when the concept “dog” becomes linked to “barks.” In most models, links between nodes are held to vary in strength, where strength is a function of the recency and frequency with which that link has been accessed. *Activation*, a kind of energizing force, can spread along associative links such that activating one node will cause other linked nodes to become activated as well.

As previously noted, mechanisms described in design stance models can be unpacked at successively more fine-grained levels of specification. Thus, for example, the IF–THEN relations represented in productions can be recast in associative network terms, and,

indeed, both the Meyer (1997) and Wilson (1995) models mentioned above are formulated in this way. Similarly, macro-structures like schemas and scripts can be conceived as networks of nodes and links.

*Connectionist models* (or *neural networks*, or *parallel distributed processing models*): an alternative (or still deeper) explication of long-term memory structures proposes that memory consists of elemental units and connections, but unlike associative network models, the units of connectionist models do not correspond to symbolic entities. Instead, rather than being represented in a single node, a symbolic entity (e.g., “dog”) is represented as a *pattern of activation* over a large set of units. Learning, or concept acquisition, in such models involves adjusting the weights of the connections on the basis of feedback. Connectionist models have found a wide range of applications in psychology (Rumelhart & McClelland 1986a, b), including analyses of language perception and production, but to date, their use in the field of communication has been somewhat limited (but see, for example, O’Keefe & Lambert 1995).

### **Hybrid Intentional/Design Approaches**

Distinguishing “intentional,” “design,” and “physical” stance approaches is a useful convenience, but, as was noted above, these categories represent “pure types,” and, in practice, it is common to encounter hybrids that combine elements of multiple approaches. This is particularly true in studies of social cognition and communication, where hybrid intentional/design models are numerous. Typically, the thrust of these models is to explicate the nature and dynamics of intentional stance terms by recourse to “deeper” design stance mechanisms (in much the same way that, as discussed above, design stance formulations may be unpacked in successively more detailed ways). The example of approaching “goals” from the design stance has already been mentioned, and examples such as “self-concept” and “attitudes” can be used to further illustrate the point.

As a typical term of ordinary folk psychology, people possess a commonsense conception of “self-concept” as one’s collection of beliefs about one’s personal attributes, social roles, and so on (→ Information Processing: Self-Concept). And we commonly perceive that elements of self-concept play a role both in input processing of information and in guiding behavioral responses. An important conceptual advance, however, came with the development of design stance models of the representation and processing of self-relevant information in long-term memory (Baumeister 1998). In this vein, Markus and her associates proposed that the self is essentially schema-like, organizing an individual’s knowledge of him- or herself in various domains (Markus 1977). Such design stance formulations gave rise to numerous experimental investigations that shed light on phenomena such as people’s memory for self-relevant events, their ability to maintain seemingly inconsistent perceptions of themselves, and conditions under which people are more likely to rely upon their beliefs and attitudes in making behavioral decisions.

In much the same way as commonsense conceptions of self-concept, theorists have explicated “attitude” in design stance terms. One prominent example is found in the work of Fazio and his associates (Fazio & Roskos-Ewoldsen 2005), who proposed that attitudes can be understood as associative networks linking an attitude object (e.g., “roller coasters”) with an evaluation (“fun”). And again, pursuing an explication of attitude

structure and processing from a design stance perspective, which in this case emphasizes strengthening of associative relations with repetition, has given rise to examinations of the role of attitudes in guiding perception, interpretation, and behavior that were not suggested by lay conceptions of the attitude construct (→ Attitude Accessibility).

## THE PHYSICAL STANCE

As previously noted, design stance approaches seek to explicate the functional architecture of the mind, and such models typically accord little consideration to the physical architecture of the brain. In contrast, physical stance theories and models pursue explanations cast at the level of neuroanatomical systems and processes. The physical stance, then, is characteristic of fields such as neurophysiology and neuropsychology, and especially, *cognitive neuroscience* (Gazzaniga 1995). Cognitive neuroscience maintains the essential conception of the mind as an information-processing system, but seeks to explicate the functional architecture of that system in physical terms. In essence, cognitive neuroscience is an attempt to bridge the gap between the physical and the mental; that is, to understand how the brain gives rise to the mind.

The data that theorists in this tradition draw upon include studies of individuals who have suffered damage to specific regions of the brain – on the assumption that examination of corresponding functional deficits will shed light on the plausibility of possible functional systems and on functional/physical interfaces (Rapp 2001). Similarly, in light of neurophysiological changes occurring during development and old age, investigations of perceptual, memory, and behavioral performance by infants, children, and the elderly are employed (Nelson & Luciana 2001; Hedden & Gabrieli 2004). Most prominently, functional neuroimaging, by use of positron emission tomography (PET), and, more recently, functional magnetic resonance imaging (fMRI) are used to examine brain metabolism under various sorts of experimental tasks and conditions.

At this point, studies of phenomena traditionally of interest to scholars in the field of communication from the perspective of cognitive neuroscience are only beginning to emerge. For example, researchers have begun to examine brain activity while viewing media violence (Anderson & Murray 2006). Other avenues of research have applied neuroimaging techniques in studies of processing facial expressions of emotion (Phelps 2006) and in investigations of language production and processing (Gernsbacher & Kaschak 2003; Beatty & Heisel 2007).

## Information Processing: Self-Concept

Renee Edwards

Louisiana State University

Self-concept plays an important role in → information processing by facilitating the processing of self-relevant information, enhancing retrieval of relevant information, and influencing interpretations of information. As the more comprehensive construct, “self” includes identity, relationships, roles, personality (→ Personality and Exposure to Communication; Personality Development and Communication), and the physical body, as well as notions of agency and consciousness. “Self-concept” refers to one’s personal identity or the body of knowledge that an individual holds about himself or herself, including self-esteem or self-evaluation. Varying attributes and conceptions of the self can explain differing responses in social situations.

### ORIGINS

Concern with the self and self-concept is generally traced to the symbolic interactionists of the early 1900s (→ Symbolic Interaction). In *Human nature and the social order*, Cooley (1902) introduced the notion of the “looking glass self,” which arises in response to the opinions of others about the self. In constructing a self, the individual imagines his or her → image in the mind of another person, imagines the other’s judgment of the self, and responds emotionally in a positive or negative way. George Herbert Mead, author of

*Mind, self, and society* (1934), argued that the structure of the self is a reflection of social processes. Each interaction partner calls forth a different “self” as a result of the unique responses that are communicated by the other (→ Self-Presentation). An individual’s self-concept is, at least in part, a function of how the individual believes that others view him or her. In *Identities and interactions* (1966), McCall & Simmons distinguished between personal and social identities. They highlighted the role of the social actor in devising a role-identity, which has a conventional dimension (the role) and an idiosyncratic dimension (identity). The conventional dimension is tied to generic expectations of social roles whereas the idiosyncratic dimension is the actor’s unique interpretation of the role.

The self and self-concept are important concepts for communication researchers. In the 1970s and 1980s, theorists recognized the role of individuals in the communication process. The self-concept was identified as a mechanism that gives regularity to interpersonal communication. Research investigated self-concept and self-esteem in public-speaking situations, ethnic identities, self and the use of technology, individual-level variables such as communication apprehension, and the role of speech in the development of self-concept. This research and theorizing revealed that variables related to the self and self-concept mediate communication and information processing.

### **INFLUENCE OF THE SELF ON INFORMATION PROCESSING**

The self and self-concept influence information processing in several specific ways. First, information that is relevant to the self-concept is retrieved more rapidly and successfully than other information (→ Memory; Memory, Message). Second, the self-concept is used as a frame in person → perception. Traits that are important to the self are used in judging others. Third, individuals actively seek situations and relational partners who provide feedback consistent with their self-concepts (→ Consistency Theories). Fourth, individuals interpret information in a way that is consistent with their self-concepts and personalities (→ Individual Differences and Information Processing).

Individuals are motivated to maintain their self-concepts because the self is central to their understanding of the world. They do so using a combination of behaviors and cognitions called self-verification processes (Swann 2005). Research on self-verification reveals that social actors maintain their sense of self by seeking out interaction partners who perceive them the way they perceive themselves. For example, individuals with negative self-views prefer partners who give them negative feedback. When their interaction partners do not confirm their sense of self, individuals engage in behaviors designed to shape the perceptions of the partners so that those perceptions will be consistent with the social actor’s own view of self. Finally, if social actors are unsuccessful at conveying their self-concepts to their interaction partners, they may withdraw from the situation. College students, for example, are more likely to leave roommates who do not validate their self-conceptions.

### **THE ROLE OF SELF-ESTEEM**

Self-esteem is one of the most highly investigated components of the self-concept. Self-esteem refers to an individual’s affective evaluation of the self as positive (high self-esteem)

or negative (low self-esteem) (Baumeister et al. 2003). Self-esteem is relatively stable (a trait dimension) but fluctuates around a baseline in response to success and failure (a state dimension). Self-esteem is *positively related* to self-reported communication competence. Individuals with higher self-esteem are happier and more satisfied with their lives than those with low self-esteem, who experience more depression. Individuals with high self-esteem report better interpersonal relationships than individuals with low self-esteem, but objective measures do not provide evidence for their assessments. Self-esteem is positively related to academic success; it appears to be a consequence of success rather than a cause of it. Individuals seek out relational partners and contexts consistent with their self-evaluations.

Psychological research reveals that high self-esteem can have *negative consequences*, such as a greater susceptibility to ego threats. Individuals with high self-esteem become less likeable when threatened, seemingly because they become more independent. High self-esteem is also associated with higher levels of prejudice and derogation of outgroup members. In response to ego-threats, individuals with low self-esteem become more likeable, perhaps because they become more interdependent following a threat.

Research on self-esteem is complicated by the diversity of individuals with high self-esteem. The category includes narcissists and individuals with defensive self-esteem as well as those who genuinely accept their shortcomings as well as their strengths. In addition, the effects of self-esteem on ego threats may depend on the bases for self-esteem. One approach to the bases of self-esteem suggests that individuals with contingent self-esteem ground their appraisals on meeting external expectations or standards; their self-esteem is fragile and associated with conflict and anxiety. Noncontingent self-esteem reflects unconditional self-acceptance and is associated with intrinsic motivation and effective coping following failure.

Another approach to the bases of self-esteem suggests that individuals base their appraisals on specific domains or contingencies of self-worth (e.g., on academic competence or God's love), and that these contingencies vary from internal (e.g., virtue) to external (e.g., approval from others) (Crocker et al. 2006). Individuals are motivated to validate themselves in the domains or contingencies of their self-worth, but the motivation may also be a source of stress and actually undermine their success. Communication research examining self-esteem has not incorporated concerns with negative consequences or explored the complex nature of self-esteem.

## SELF-SCHEMAS AND SELF-CATEGORIZATIONS

Two competing views of self-concept are self-schemas and self-categorizations. The concept of self-schema is rooted in schema theory ( $\rightarrow$  Schemas); a *self-schema* is a collection of memories or a knowledge structure about the self that allows individuals to understand their social experiences (Markus 1977). Individuals are "schematic" with respect to a trait if they perceive the characteristic to be true of them and important to their self-definition. Thus, a self-schema is a relatively stable structure composed of characteristics that are most important to an individual's self-definition. More recent formulations of the self-schema incorporate a working self-concept in addition to the self-schema. The working self-concept is more variable and influenced by situational constraints whereas the self-schema is a more stable and chronically accessible self-definition.

In contrast to the self-schema approach, the *self-categorization approach* (Turner 1987) draws a distinction between personal identity and social identity. Personal identity refers to the characteristics that define an individual when compared to other members of the same group (e.g., a woman perceives herself as competitive compared to other women). Social identity refers to the characteristics that define an individual when compared to members of a relevant “outgroup” (e.g., as a woman, she sees herself as less competitive than men). According to this formulation, self-concept is the identity (personal or social) that is salient at any given time; it is dependent on situational cues rather than simply a function of a stable knowledge structure about the self. The self-categorization approach has roots in → social identity theory, which assumes that individuals strive to evaluate themselves positively. Because individuals are members of groups, they generally assign positive values to their groups in order to achieve a positive social identity. Individuals are inclined to favor their own group and, under certain conditions, discriminate against outgroups.

*Self-construal* (Markus & Kitayama 1991) is another dimension of the self that may be implicated in information processing. Underlying the concept of self-construal is the idea that individuals have multiple selves that concern their relationships with others and their individuality. According to this approach, the cultural dimension of individualism–collectivism is manifested in the self-construals of independence and interdependence. Individuals with independent self-construals view themselves as unique and autonomous. These self-construals are associated with individualistic cultures, such as that of the US. In contrast, individuals with interdependent self-construals define themselves in terms of their reference groups. Interdependent self-construals are associated with collective cultures, such as those in Asia. Research examining this concept has provided mixed results, most likely because of problems with measuring self-construals (Levine et al. 2003).

Whereas much research on self-concept focuses on the content of the self-definition (e.g., as outgoing or a member of a particular group), the concept of self-complexity is concerned with the structure of the self-concept. Self-complexity refers to the extensiveness of the self-concept, conceptualized as the number of unique characteristics used to define the self. Individuals who are more sensitive to feedback are higher in self-complexity (Edwards 1990), and most groups of teenagers who watch high levels of television are lower in self-complexity (Harrison 2006). Self-complexity is implicated in information processing by serving as a buffer against stressful events (Linville 1987).

## Information Processing: Stereotypes

Valerie Manusov

University of Washington

Anastacia Kurylo

Marymount Manhattan College

Stereotypes are typically conceived of as cognitive categorizations of people into groups that are accompanied by descriptors of group members (→ Stereotypes). Early discussions of stereotypes referenced them as “pictures” of groups or “types” of people (Lippmann 1922/1965). According to researchers, many attributes are used as a basis of stereotype-based categorization, including race, sex, age, class, religion, and body type (see, e.g., Schneider 2004). Stereotypes provide cognitive benefits, much like other schemas (Fiske & Taylor 1984). As a form of categorization, for example, stereotypes function as energy-saving devices (Macrae et al. 1994) and cognitive tools (Gilbert & Hixon 1991) that preserve → information-processing resources, because they allow people to “chunk” information into familiar and, therefore, meaningful units (Hamilton & Sherman 1994).

### FUNCTION OF STEREOTYPES

Although valuable because of their cognitive efficiency, stereotypes become detrimental when they have undesirable consequences for those who use the stereotypes or for members of the groups they target. These consequences may occur when stereotypes provide an inaccurate or false basis for judgment or when they lead to unwarranted prejudice and

discrimination. Stereotypes facilitate prejudice when they foster “an averted or hostile attitude toward a person who belongs to a group, simply because he belongs to that group, and is therefore presumed to have the objectionable qualities ascribed to the group” (Allport 1954/1979, 7). Stereotypes are discriminatory when they extend prejudice into behavior (→ Social Stereotyping and Communication; Intercultural and Intergroup Communication). Thus, whereas stereotypes as a cognitive structure are neutral, stereotypes-in-use may have more tangible social consequences (Fiske 1998).

Additionally, stereotype-based information processing itself may be biased in some ways. For example, Hamilton and Gifford (1976) asserted that some stereotypic judgments may be explained by *illusory correlation* (i.e., erroneous inferences made about the relationship between two categories on the basis of their perceived common co-occurrence). To test the illusory correlation, Hamilton and Gifford provided participants with considerably more information about “Group A” than about “Group B.” Moreover, the information they provided about Group A was commonly associated with desirable characteristics. The results suggested that when an association occurs frequently (i.e., Group A often has desirable characteristics), it is likely to be more recognizable than other associations. Moreover, once recognized, this association (and not others) is used as a basis of comparison. In Hamilton and Gifford’s study, participants polarized Group A and Group B by attributing desirable and undesirable characteristics to each group respectively. The authors argued that this polarization was based on an illusory correlation produced by participants in that it was not supported by the initial information their participants had about these groups.

Researchers have also found other types of bias in information processing. For instance, stereotype-consistent information is more likely to be remembered than stereotype-inconsistent information, unless the inconsistent information is especially salient (i.e., stands out as noticeable; Lyons & Kashima 2003). Similarly, negative content is more notable than positive content, and is therefore more likely to be part of stereotypes (Schaller & Conway 1999).

## **INTEGRATING STEREOTYPED COGNITIONS AND COMMUNICATION**

As forms of (sometimes biased) information processing, stereotypes are directly integrated with communication in several ways. First, they affect the ways we communicate. Second, we communicate about stereotypes (i.e., they may be the content of our talk) as part of interaction. Third, communication about stereotypes works to teach, perpetuate, and change stereotypic beliefs. Each of these is discussed briefly in the following paragraphs.

*First*, stereotypes may *affect the ways in which we communicate* with others. In some cases, the manner in which this occurs can be construed as beneficial. Manusov, Winchitz, and Manning (1997), for example, conducted a study in which US students interacted with students from other countries. Prior to their interactions, each student’s attitude toward the other students’ nationality was assessed. Coding of behaviors from the video tapes of the subsequent interactions showed that US participants who had more positive stereotypes of their interaction-partner’s nationality tended to gaze at their partner more (→ Gaze in Interaction) and use more direct body orientation than those who held less positive stereotypes (→ Nonverbal Communication and Culture). Overall,

more positive stereotypes appeared to play out in relatively affirming – if biased – communicative ways. Likewise, positive behaviors resulting from stereotypes appear to affect other judgments, also in a manner that seems to benefit the interaction. Le Poire and Yoshimura (1999), for example, found that participants who smiled more with female than with male confederates perceived the former as more pleasant than the latter. This occurred although both confederates were instructed to show the same facial expressions and demeanor. The researchers concluded that gender stereotypes predicting that women are friendlier and smile more often than men explained these findings.

Other times, however, the link between stereotypes and communication may be much more problematic. For example, Olaniran and Williams (1995) showed that visa-application interviewers use stereotypic expectations to determine whether an applicant should be approved for a requested visa. In one instance, an interviewer's interpretation of averted eye gaze as indicative of lying, exacerbated by stereotypes of Africans as "sneaky," was consequential for a West African applicant whose own cultural norms prescribed that he show respect for authority precisely through averted eye gaze. In conjunction with other cues from the application process, the interviewer denied the applicant's request for a visa.

A *second integration* between stereotype-based cognitions and communication occurs whenever people hear others talk about stereotypic beliefs and observe stereotypes embedded in others' actions. One application of this form of connection between stereotypes and communication comes from researchers who study *ethnophaulisms*, which are terms that malign racial or ethnic groups and become part of the cultural lexicon (see, e.g., Mullen 2001; Tracy 2002). More generally, researchers have begun to explore the myriad ways that communication about stereotypes is situated within interaction. Mokros, for example, explored how stereotypes communicated in everyday interaction may help to negotiate and construct identity and, more generally, → meaning (→ Social Identity Theory). He used video-taped ethnographic research data (→ Ethnography of Communication) to gain insight into "how otherness [in the form of stereotypes-in-talk] is employed to resolve practical problems of identity within interaction" (Mokros 2003, 255).

The *third form of integration* between stereotypes and communication discussed here involves the processes through which stereotypes are *learned through communication*. Communicating about stereotypes works to create and maintain those categorizations within a larger social system making them "publicly accessible situated knowledge structures" (Semin 2000, 603). We even learn values about the stereotyping process itself through communication. For example, in many cultures, stereotyping is considered "an unsavory practice to be avoided or concealed" (Bodenhausen & Macrae 1996, 232), and this value is taught through communicative means. The general term given to the reproduction of stereotypic knowledge over time through communication processes is *stereotype maintenance* (Kenrick et al. 2002). Research in this area has focused largely on the cognitive processes that underlie this reproduction.

More recently, however, Kurylo (2006) emphasized the role that → interaction plays in this reproduction. For example, in addition to more obvious forms of talk that involve stereotypic beliefs, Kurylo found that stereotypes may be communicated in an implicit form when the group, descriptors referenced by the stereotype, or both are omitted (e.g., "You know what they're like"). This finding provides support for Boss (1979) who argued

that, when communicated, stereotypes often require others to interpret their meaning in order to make sense of the stereotype. Those who witness a stereotype communicated become complicit in the stereotyping process if they acknowledge they have understood the stereotype. This is one means through which we work together to reproduce stereotypic knowledge as meaningful, regardless of whether we communicate the stereotypes ourselves.

Whereas stereotyping is conceptualized primarily as a form of information processing, it is linked with communication in several ways. In itself, the process of stereotyping is benign. But given its ties to cultural mores, problematic associations, and prejudicial behavior, stereotyping-in-use is best understood within its larger social framework.

## Information Scanning

*Robert Hornik*

*University of Pennsylvania*

*Jeff Niederdeppe*

*University of Wisconsin*

Information scanning concerns information acquisition from routine patterns of exposure to mediated and interpersonal sources. The essential idea is that even when individuals are not actively seeking information on a specific topic, routine use of media and interactions with other people yield exposures to information that affect knowledge, beliefs, and behavior. For many issues and behaviors, scanning may be far more frequent than active information seeking. While influence per scanned exposure may be less than for each instance of sought exposure, the cumulative effects of scanning may often be greater, given their greater volume (→ Exposure to Communication Content; Selective Exposure; Information Processing).

### CONCEPTUALIZATION

Information scanning studies stand in juxtaposition to two related topics: → information seeking and → media effects. Models of information seeking typically assume that an individual has uncertainty ('should I obtain a mammogram?') and engages in active seeking of information to reduce or resolve that uncertainty. The information scanning perspective asserts that often uncertainty is not salient enough to drive active seeking, but an individual has enough foundational knowledge and interest to produce → attention and retention when information flows by. Routine exposure to a magazine article, for

example, may provide relevant information about benefits (or costs) of mammograms, or it may affect whether a woman thinks about the issue. It then may influence whether a woman asks her physician about getting a mammogram or is willing to comply with a recommendation that she obtain one.

Information scanning is also *related to the media effects tradition* (→ Media Effects, History of). Media effects studies are concerned with the effects of particular content, such as portrayals of violence or unrealistic body images. Like media effects research, information scanning is concerned with what people learn about the world from their use of media and how that affects their behavior. However, scanning research often starts with a behavior, like getting a mammogram, and asks whether routine exposure to information sources affects it. Media effects research, in contrast, often starts with the content of media (e.g., the frequent portrayal of violence; → Violence as Media Content) and then considers what its effects might be (→ Violence as Media Content, Effects of). In addition, scanning research is not concerned solely with media effects, but considers the influence of information scanned from both mediated and interpersonal sources (such as friends, family, or doctors). Nevertheless, the distinction between the media element of scanning and other areas of media effects can be overstated – there is clearly overlap in both the basic questions addressed and the research methods used.

There is a literature directly related to information scanning, sometimes using other terms (Case 2002; Niederdeppe et al. in press.) Related concepts include incidental or mere exposure (Shapiro 1999), casual seeking (Johnson 1997), browsing (Dutta-Bergman 2004), passive information acquisition (Berger 2002), routine information acquisition (Griffin et al. 1999), and prior use of the term “information scanning” (Kosicki & McLeod 1990; Slater 1997).

The distinction between seeking and scanning is not identical to that between active and passive use of sources. While seeking is defined by activity, scanning may not be passive. Scanning includes reading newspaper articles because a headline catches a reader’s eye, staying tuned for the health minute on the local → television news when a promo for it mentions a topic of interest, or asking a follow-up question to a friend who describes a colonoscopy. In each case there is an active decision to engage with a source. These activities are considered scanning because they occur in the context of routine exposure to sources, not because the individual is completely passive in the process.

The intrinsic nature of a source may not determine whether it is used for seeking or for scanning; It is not invariable that, for example, people will seek from the → Internet and scan television news. Casual Internet surfing may produce scanned information acquisition, while planned television viewing of personally relevant programs (e.g., a public television documentary about cancer survival) would be classified as seeking.

*Information-processing theories* are also relevant to scanning. Those models differentiate high-effort and low-effort processing (→ Elaboration Likelihood Model), with effortful processing seen as more likely to result in → persuasion. This is one basis for the expectation that sought information may be more persuasive than scanned information. Nonetheless, these models recognize that learning and persuasion can result when processing effort is low. For example, information that results from scanning may gain credibility because of its link to a trusted media source, and might be absorbed without elaboration of counterarguments because it comes from the routine use of media.

Scanning can be detailed in terms of its breadth (the number of different sources from which information was acquired), depth (the richness of information gleaned), and frequency of exposure. A story with broad coverage might signal the topic's importance and suggest substantial social support for the behavior; a story with depth might encourage careful balancing of benefits and costs; a story with high frequency over time might signal importance and social support for the behavior, and, because of its continuing availability, remain salient for people whenever they were making a decision. These distinctions are critical for efforts to assess the influence of information scanning on cognitions and behavior.

## RESEARCH QUESTIONS AND METHODOLOGICAL ISSUES

There are two fundamental research questions for information scanning research: "What influences whether people will gain relevant information from scanning behavior?" and "What effects does information gained from scanning have on behavior?" There are five types of hypotheses about the possible determinants of how much information on a particular topic comes from scanning. (1) *Intrinsic characteristics of the topic*: information about some topics and not others may be readily assimilated without effortful processing. Information that aspirin use by children is risky is easy to absorb, but detailed information about the alternative methods to help quitting smoking may not be absorbed without active seeking. (2) *Sheer availability of information*: information about some behaviors is much more likely to be available from sources that are routinely used. Information about mammograms and dieting to lose weight may appear in media and in personal conversations more often than information about genetic tests for rare diseases. (3) *Enduring individual differences*: education, gender, and other enduring personal characteristics may be associated with varying patterns of information use. Some people have styles of processing information which make them likely to attend to and retain information, across topics. (4) *Topic-specific individual differences*: some people bring substantial interests and background to particular issues. They have prior cognitions that make them likely to notice and engage with information as it flows by. (5) *Access to and habitual use of sources*: people who watch television news or read health magazines have more opportunities to scan information. People who have social links with many people have more opportunities to discuss a topic, particularly if the topic is relevant for the network.

There is a substantial conceptual basis for the expectation that information scanning will have *effects on behavior*. If one follows the logic of expectancy value theories (→ Reasoned Action, Theory of; Expectancy Value Model), information learned from scanning may affect beliefs about the benefits and costs of behaviors. Scanning may affect the perception of injunctive norms (the level of social support for behaviors) or descriptive norms (perceived frequency of others' behavior). Scanning may likewise influence self-efficacy if people see others successfully engaging in a behavior (→ Bandura, Albert; Social Cognitive Theory). Scanned exposure to media content may also *affect the salience*, or cognitive accessibility, of a topic. That information would then be more likely to be called on in making decisions. Agenda-setting theory also argues that repeated exposure to media content can make an issue more salient, and thus lead to higher salience for it in making decisions (→ Agenda-Setting Effects.)

There is no guarantee that scanning will lead toward adoption of a behavior. Scanners may note only information consistent with a prior decision, may miss essential information, or may be exposed to such a welter of information that they are left more confused than well-informed. Still, it is reasonable to hypothesize that the intensive scanner will make a different decision than the non-scanner.

Conceptualization of scanning is relatively straightforward compared to its measurement. At least four issues are relevant to choosing *appropriate measures* of information scanning (or scanned information exposure). First, scanning suggests that routine media and interpersonal exposures provide information relevant to subsequent decisions about other behaviors. Then scanned information would need to be minimally encoded in memory and made accessible for recall at a later time. If assessment of individual scanning behavior relies on self-report, it will vary with individual ability to recall and articulate encoded information. Second, scanned information is specific to a particular decision. As such, general questions about exposure to overall sources (e.g., television) or to a broad topic (e.g., health) may not capture exposure to information relevant to a particular decision. Third, information can be scanned from multiple sources (mediated and personal – breadth); sources can offer detailed or superficial knowledge (depth); and sources can be scanned once or multiple times (frequency). If breadth, depth, and frequency of scanning make some difference in the effects, measures should differentiate these dimensions. Fourth, scanned exposure, by its nature, may not stand out in → memory. It may be difficult for individuals to report specific sources and specific times, even though they may recall having generally heard about an issue from the media or from discussion with others.

Scanning measurement and analysis of effects has much in common with the measurement of media exposure for media effects studies. *Three approaches dominate.* (1) Measuring availability of specific content in heavily used media, and assuming that people are exposed to that content (both through direct exposure to these sources and through the diffusion of information through interpersonal sources). Variation in availability of content can be compared to variation in outcomes of interest across time or between geographical units. (2) Measurement of individual differences in exposure to known relevant sources (e.g., television, the Internet). Comparisons on outcomes can be made between individuals more or less likely to use those sources. (3) Measurement of individual differences in recall of exposure to specific information from specific sources. Individual differences in level of recall can be associated with matched outcome behaviors.

Only the third approach captures all of the requirements of the construct of scanning. However, it faces the difficult issue of the ability of individuals to recall and report scanning exposure in detail. In all three approaches, analyses of scanning effects depend on eliminating typical rival hypotheses concerning influences of potential confounders and the possibility of reverse causation. Scanning conceptualization, measurement, and effects analyses are in the early phases of their development.

## **Information Science**

*Peter Ingwersen*

*Royal School of Library and Information Science*

Information science (IS) is a multidisciplinary field concerned with “facilitating the effective communication of desired information between human generator and human user” (Belkin 1978, 58). IS became established as an academic discipline with the creation of the American Society for Information Science in 1937 (now abbreviated ASIS&T) and the UK Institute of Information Scientists in 1958.

Previously, work on scientific and technological → information had been called *documentation*, and had its roots in French and US universities at the beginning of the twentieth century. The foundation for quantitative analyses of scholarly communication (scientometrics, bibliometrics) was laid in studies by pioneers like A. J. Lotka (on scientific productivity and publication ratios, 1926), G. K. Zippf (on rank and frequency

of terms in large text corpora, 1932 – later applied to automatic indexing in information retrieval research), and S. C. Bradford (on the distribution of academic articles about a scientific topic across journals, 1934). These pioneering efforts were accelerated by the digital computer. From the 1950s, former laboratory scientists began, as information scientists, to develop, manage, and evaluate systems for the retrieval and use of technical and scientific information, as well as to analyze the impact of information and information technologies (IT) on scientific communication. The invention by the chemist E. Garfield of global citation databases for the sciences is typical of this period, as are the works by Derek De Solla Price and Robert K. Merton on the communication of scientific knowledge.

Throughout its history, IS has witnessed a struggle between technological and human-centered perspectives on communication. For almost two decades (roughly 1960–1980), an *identity crisis* of sorts followed from the awareness that theories of IS are not founded on mathematical or natural laws. Several attempts were made to construct a foundation, drawing on, for example, computer science or communication theory. In the former approach, IS became IT-driven, designing and maintaining abstract or full-text databases or, more recently, developing web retrieval systems. However, since the end of the 1970s, IS increasingly has been regarded as a social science discipline affiliated with communication research, as evidenced by a growth in user-oriented approaches attempting to have IT “fit humans.”

This shift of focus coincided with a new generation of IS researchers who originated not from the sciences, but from IS departments established by the pioneers. Today, the communication approach is predominant especially in Anglo American and Scandinavian university IS departments and schools. Since the 1970s, research and education in IS has also been concerned with librarianship, information studies, and library and information science (LIS). In the US, a recent phenomenon is *I*-schools, i.e., university departments merging communication, IT, and LIS into information schools.

There are several central research areas in IS. *Information retrieval* (IR) is the mainstream R&D area of IS. It addresses algorithmic retrieval and evaluation experiments regarding performance in retrieving document contents, including unstructured texts, images, sound, speech, music, and multimedia. It also undertakes search engine development, interface usability, and field investigations of interaction between information searchers and knowledge sources in context. *Knowledge organization* concerns epistemological (macro-level) and applied (micro-level) ways of representing documents by (algorithmic and/or human) indexing. It also works with classification methods and systems, and thesaurus/ontology architectures, across genres, media, and scientific as well as other social domains of application. *Bibliometrics and informetrics* covers quantitative studies of both scientific and everyday communication, and of technological innovation (e.g., patents), including citation analyses and research evaluation (scientometrics) and analyses of such Internet structures as links (webometrics). *Information seeking behavior* studies the search for and use of (informal) information sources and communication channels. *Library research* examines the role and impact of public, university, or digital libraries, open access journals and repositories, and other knowledge centers in local communities and wider society, including information literacy and studies of selected user groups. *Knowledge management* addresses economic and organizational techniques

for managing information resources and (tacit) knowledge sources and sharing in institutional contexts (→ Knowledge Management; Information Literacy).

*Information* is one of the key concepts of IS and is commonly understood as an intentional transformation of certain actors' → cognitions, presented as a message in the form of signs that transforms the recipients' state of knowledge. Information, thus, becomes an increment of knowledge, always situated in a context, as the message is perceived and interpreted by particular recipients. In a semantic sense, a message can provide the same information to many recipients. In a pragmatic sense, information is the result of individual interpretations in context.

*Information need development* refers to both individual and collective information needs. In order to solve a perceived task (at work or in daily life), actor(s) may require information. If they do not acquire information, they will encounter cognitive-emotional problems, developing a state of uncertainty that is associated with an information gap or need. When actors have a loose understanding of their tasks or problem situations, or a low awareness of their information needs, they tend not to take full advantage of IR systems, e.g., by communicating very few or broad search keys to the systems or by replacing systems entirely by human knowledge sources.

*Relevance* is intuitively familiar, but difficult to measure during IR experiments. One relevance typology (Borlund 2003) distinguishes subjective, intangible relevance from objective, tangible relevance. Objective relevance is defined either through an algorithmic calculation of the best fit within the IR system for a searcher's request, or by so-called socio-cognitive relevance. Over time, collective assessments are made of the value of an item, e.g., via citations or links to recognized work. Subjective relevance is established through assessments of topicality, pertinence, and situational applicability. Topicality considers the correlation between the contents of available documents and what the searcher asked for (their common "about-ness"); pertinence concerns the relationship between document contents and the searcher's intrinsic information need; and situational relevance captures the association between the meaning of the document contents and the perceived underlying task of the actor.

# Information Seeking

*Silvia Knobloch-Westerwick*

*Ohio State University*

Information seeking may be considered as at the heart of much communication. It includes deliberate, intentional pursuit of further knowledge, as well as the more casual skimming of messages and accidental observations and encounters. Scholars in communication research have employed the term in a variety of contexts – for instance, interpersonal relationships, → organizational communication, personal health issues, mass communication, → political communication, or database and Internet use (→ Interpersonal Communication; Health Communication; Internet; Exposure to the Internet). The following overview is structured by these areas. An overarching methodological problem in information-seeking research is that individuals may often be unable or not willing to report their information-seeking behavior with the accuracy and precision required. Fortunately, new communication technologies have provided not only new forms of information seeking but also new ways to observe and measure it, for example through log files (→ Log-File Analysis).

## **INTERPERSONAL COMMUNICATION CONTEXT**

A research domain that has examined information-seeking behaviors is interpersonal communication. Information seeking in this context has been categorized into using passive, active, and interactive strategies to gain information about others, in particular in episodes of initial interaction between strangers (Berger 2002). In short, passive strategies involve no interactions between those who seek information about others and these targeted individuals. The information seeker simply engages in unobtrusive observation of the target person. Active strategies include indirect gathering of information without interaction with the target individual. Lastly, interactive information seeking happens through face-to-face communication between information seeker and target individual. However, not all information acquisition happens intentionally, and even information about others that the individual intended to avoid may be picked up accidentally. The extent of information-seeking behavior has been hypothesized to be a function of the uncertainty about the target individual. This assumption is included in → uncertainty reduction theory (Berger & Calabrese 1975). In general, people seek to increase their ability to predict their partner's and their own behavior in situations. One other factor which reduces uncertainty between communicators is the degree of similarity individuals perceive in each other (in background, attitudes, and appearance). More recently, information-seeking behaviors in close relationships have also been examined more closely.

## **ORGANIZATIONAL COMMUNICATION CONTEXT**

Predictors and effectiveness of information seeking in organizational settings have also been studied (e.g., Morrison 2002). Obviously, newcomers who have just entered an organization need to acquire a lot of information to perform adequately. Organizations

typically aim to provide the needed information. However, the information provided is often incomplete, and uncertainties may exist regarding role expectations, co-workers, organizational matters, and own performance. Furthermore, individuals differ in their information needs, and also in their tactics and use of sources when seeking information. Information-seeking behaviors vary depending on type of sought information, as task- and performance-related information is more likely to be sought from supervisors, whereas social and normative information is more often sought from peers. Apparently, while trying to reduce uncertainty through information seeking, the newcomers also weigh the potential costs of effort and for self-presentation. With regard to all members of an organization, research has also examined factors affecting the seeking of feedback information (→ Feedback Processes in Organizations; Knowledge Management). It is fostered by concerns about goal attainment and own development, by perceived credibility and expertise of the feedback source, as well by expectations of positive feedback. Thus not only do rational goals of reducing uncertainty and improving own performance govern the seeking of feedback information, but considerations about ego threats and social image also play into these processes (Morrison 2002).

### **HEALTH COMMUNICATION CONTEXT**

Seeking of health information is generally viewed as a highly desirable behavior. The informed patient should be in a better position to understand diagnosis and to decide on and support treatments, as well as to prevent health problems. For many complex diseases such as cancer or diabetes, gathering information beyond what is offered by the physician should often be advantageous for the patient. Health campaigns aim to increase knowledge levels and to instigate further information seeking. Individuals differ strongly in their interest in health information, and as a consequence gain information from different sources. Health-oriented people seek information from interpersonal communication, print media, and the Internet, whereas low interest in health is associated with citing → television and → radio as primary sources for a more accidental health information exposure (Dutta-Bergman 2004; → Health Communication and Journalism). Research about factors influencing health-information seeking has shown that a key barrier to information seeking is that health information is often perceived to be distressing. Especially when the information relates to a severe health threat for which prevention or treatment appears difficult, the individual is said to rather avoid information about the issue (Witte 1992). For example, an obese person who has failed to achieve permanent weight loss in the past may find information about the combined health threats resulting from obesity very distressing and should be motivated to avoid it, if weight loss seems out of reach. Overall, the research suggests that an enormous variety of factors influence health-information seeking, which has produced inconsistent findings.

### **MASS COMMUNICATION AND POLITICAL COMMUNICATION CONTEXT**

A key function of the mass media in a democracy is to provide information about public affairs and issues to citizens. The → audience, on the other hand, is confronted with an overwhelming amount of content in diverse channels and formats and thus must be

selective in attending to the available information (→ Information Overload; Selective Attention). Determinants of individuals' overall information exposure are rarely examined, aside from the socio-demographic characteristics known to be associated with higher information consumption (high education, male biological sex, older age group, → news audience). A key research question is why people attend to certain kinds of media information while avoiding others, and furthermore what factors produce situational and interpersonal differences in this information-seeking processes.

Explication of the term → information in this research area is scarce; it usually refers to → news and political content in the mass media (→ Political News), excluding fictional content and entertainment genres (→ Fiction; Enjoyment/Entertainment Seeking). Information seeking includes a great variety of media-use behaviors, which can be categorized in two broad types: information receptivity and information search. The former is an openness to a question resulting from encountering cues during habitual → information scanning of media messages; if the message-induced question arouses cognitive uncertainty, selection of detailed information occurs (Atkin 1973). The latter characterizes deliberate, intentional seeking of information that is potentially capable of reducing uncertainty, of satisfying curiosity, and of problem-solving (→ Information Processing).

Uncertainty is construed as a lack of knowledge about events, situations, and issues (→ Uncertainty and Communication). Such a lack of knowledge is assumed to impede formation of the → attitudes needed for appropriate behavior (→ Attitude–Behavior Consistency). Acquisition of further information does not always reduce uncertainty, because it can increase issue complexity and render the formation of attitudes more difficult. Uncertainty reduction thus may only be expected for information that improves comprehension of issues and that can support the construction of attitudes for effective action in the particular context.

Much of the research on information seeking from the mass media has focused on information *neglect*. The initial research on → selective exposure to information was guided by Festinger's (1954) → cognitive dissonance theory. The theory predicts that messages that contradict the currently held attitudes instigate an unpleasant state of cognitive inconsistency, labeled dissonance; in turn, the individual is motivated to avoid exposure to such dissonance-arousing content. In this area of research, emphasis was thus placed on the avoidance of information rather than on the active pursuit thereof. Of the available research, only a small portion actually examined information seeking from the mass media and, overall, the findings were inconsistent. In communication textbooks, the notion that dissonance avoidance governs information seeking is nonetheless discussed with regularity, but usually dismissed because of the ambiguous research findings.

Early dissonance research produced results that showed → informational utility to foster selective exposure despite the dissonance-evoking capacity of messages. Accordingly, the concept of informational utility was introduced (Atkin 1973) to describe the characteristics of information that potentially and primarily serves to improve comprehension of happenings of interest. Knobloch-Westerwick and collaborators (e.g., Knobloch-Westerwick et al. 2005) explicated the construct of informational utility by suggesting the sub-dimensions of magnitude, likelihood, immediacy, and efficacy, which foster more information exposure the more the aspect applies. Information about events with strong and important impacts is said to have high magnitude. If the individual is likely to be

affected by them, the likelihood dimension is high. If the events and their consequences appear to materialize in the near future, immediacy is high. Furthermore, if the individual perceives his or her own influence as strong, the information provided also carries more utility and will thus instigate longer exposure. For example, if a campus newspaper reports that the university will increase tuition substantially (high magnitude) for all students (high likelihood for student readers) for the next term (high immediacy) but that students' veto can prevent the tuition increase (high efficacy), the students on this campus should spend more time reading this news story compared to a story about a small, remote, and unavoidable tuition increase.

In the context of political communication research, the concept of  $\rightarrow$  opinion leaders (Weimann 1994) is of interest for information seeking. Some individuals, the so-called opinion leaders, are more likely to influence others, and their opinions are also often sought as advice. They function as information brokers in their  $\rightarrow$  social network, and thus both information seeking and giving are key aspects of this social role. Opinion leaders generally seek more information from the media and follow news and print media in particular, but they are also more likely to be involved in interpersonal discussions about political issues. In a two-step flow process ( $\rightarrow$  Two-Step Flow of Communication), opinion leaders disseminate information sought from the media to others who pursue their insights. However, in the modern media-saturated environment, direct seeking of political information may have become more convenient, and exposure to political content online has emerged as a research topic ( $\rightarrow$  Internet News).

## INFORMATION SCIENCES CONTEXT

Research about information seeking goes beyond communication research. In  $\rightarrow$  information science and library science, as well as in computer and  $\rightarrow$  human-computer interaction research ( $\rightarrow$  Computer-User Interaction), ample theories and studies about information-seeking behaviors are to be found (e.g., Marchionini 1995).

## Information Society

*Frank Webster*

*City University London*

The designation “information society” presupposes that → information plays a defining role in the way we live today. For many commentators it is because information is more pervasive than hitherto that it is appropriate to characterize the present as self-evidently an information society. There is obviously more media output, more education available, more information and communications technologies about, more information occupations than before. Accordingly, it is obvious that we live in an information society. Such thinking is tautologous.

### INCREASING QUANTITY OF INFORMATION

It cannot be doubted that there is a great deal more information than ever before. But so too is there an enormously increased amount of food available, yet we do not designate ours as the “food society.” In terms of expenditure, families now spend a small proportion of their incomes on food, whereas 50 years ago it was the major item of expenditure after rent. Food is cheaper than ever, much more plentiful, and there is a hugely increased range of foods available. Indubitably, food is essential to how we live, and it is cheap and available in ways that even our recent predecessors could scarcely dream about. Indeed, excess of food is now a major health hazard – obesity and associated morbidities such as heart disease and diabetes are well known to be tied to abuse of food. Yet no one seems to want to define our times as the “food society.”

This undeniably serious issue allows one to propose that, just because there is more of something, this does not mean that one should conclude that, by virtue of this increase, the phenomenon itself comes to define the society. Quantitative increases do not necessarily indicate the qualitative change that is intended in designating a distinctly new type of society. In fact, it is possible to argue plausibly that relatively small quantitative changes can lead to major transformations such as the arrival of an information society. For instance, it might be mooted that expert knowledge has become central to the functioning of the modern world, that only a small minority of such experts is required to maintain the system though they command axes of change, while the vast majority of people are surplus to requirements. This is a theme of many scientifically educated authors such as Aldous Huxley, H. G. Wells and Isaac Asimov, as well as of theorists such as J. K. Galbraith (1972), who identified the emergence of an advanced society where a “technocracy” exercises power by virtue of its command of knowledge.

We might get to a similar point by observing that information refers to the record or communication of an event, subject or fact. This neutral meaning has almost, but not quite, superseded an older notion of information, which involves the formation of mind or character, as in the novice becoming instructed in information necessary for entry into the professions such as the law or the clergy. This sense of information connotes a superior condition, as in someone being *informed*. Between the widespread use of the word “information” as a noun, and the less common but still recognizable use of the term “informed” as an adjective, is the gulf between quantitative and qualitative measurements.

It is possible to designate a society as having vastly increased information, but for the people in that society to be poorly informed. Neil Postman (1931–2003), argued this in his critique of television, *Amusing ourselves to death* (1985). The proposition that we are informationally saturated but uninformed is often advanced. For instance, in 2003 a survey for *Whitaker’s almanack* found that 47 percent of the people in Great Britain could not identify the Deputy Prime Minister, while the majority could name several characters from the TV soap *EastEnders* (Ezard 2003). Similarly, the United States, informationally the most generously endowed nation, has enormous numbers of citizens incapable of locating France or Italy on a map of the world while being knowledgeable about Homer Simpson’s escapades. It is a moot point whether these societies have been “dumbed down” by modern media, but one may be assured that many of their citizens lack the quality of being informed about major spheres of life while they are immersed in information about personalities, celebrities, and sports fixtures (→ Political Knowledge).

## DEFINITIONS OF THE INFORMATION SOCIETY

Almost all commentators adopt a quantitative measure when considering the phenomenon of the information society. They move on from that to the assertion that we have entered a new type of society because of the expansion of information in its various guises. This implies that a qualitative change should follow from the quantitative increase in information, an argument that does not necessarily follow.

Far and away the most common form of definition of an information society is the one that takes *technologies* as the marker of informational increase (→ Technology and Communication). What this means precisely changes over time, but there can be no doubt

that, since the mid-1990s, it has been information and communications technologies (ICTs), and the Internet especially, that are taken to identify the coming of the information society. Other observers might add to this digitalization of television and other new media such as the iPod and mobile telephone (→ Mobility, Technology for). Technology does appear to be a robust measure of the information society, not least because it is obvious that technological innovations are occurring at a rapid rate and their diffusion is remarkable. Indeed, their presence is so palpable that many observers do not bother to argue that ICTs might bring into being an information society. Rather, their analyses presume that this is so, that technological change announces the new epoch.

There are several difficulties with this. One is the reminder that prior to the Internet others announced an information society on the basis of rather different technologies. In the early 1980s the defining technologies were microelectronic devices and the personal computer. Later, when access to the Internet set wireless and wired methods against one another, a key concern came to be technologies of communication. The question arises, which technologies ought we to privilege in our accounts? A second problem is the *lack of causal analysis* of the actual relation between technology and the coming of the information society. We need to know clearly how, if at all, technologies have ushered in the information society. A third problem is the challenge of *technological determinism* that is evident in such accounts. A technology is introduced and it then *impacts* on society to change things radically (→ Technology, Social Construction of). This approach is routinely criticized by social scientists for its linear causal logic (it can be plausibly suggested that social factors influence technological development, e.g., military imperatives and market factors) and its presumption that technology impacts on society as an extra-social force (Dickson 1974; Webster & Erickson 2004).

We might also see problems with a technological conception of the information society by considering the *economic* argument. This suggests that an information society arrives when the significance of information in an economic sense becomes of major consequence. Analysts would calculate the economic *value of information businesses* such as education, entertainment, and publishing and compare them over time. The identification of the value of information here will include businesses that are involved in the information technology realm, but the economic measurement is not a technological one (Porat 1977) but rather a measure of the business of information. It requires an estimation of the proportion of gross domestic production that goes toward information. Thus, as steel and engineering decline in comparison to, say, education and the City of London's activities in finance, banking, and insurance, then so there develops a case for suggesting that an information society is being brought into being as the relative value of the latter increases. This is different from a technological measure, but *prima facie* equally legitimate.

A third definition is the *occupational* one. This suggests that as jobs in information increase while those in industry and agriculture decline, then so emerges an information society because it is in the information domain that most people find work. This appeals to sociologists, who point to the radical changes in occupations. It was pioneered by one of the earliest conceivers of the information society, Daniel Bell (1919–), in his theory of postindustrialism. Over recent decades we have seen a transition from male-dominated manual occupations to feminized and information-saturated occupations. The expansion of white-collar occupations and the diminishment of manual labor (though by no means

its disappearance) means that we are witnessing the dominance of jobs that function with information as their key resource (Bell 1973). In this sense we have an information society because *information work* predominates. This theorization, presented somewhat conservatively by Daniel Bell, was given a left-wing slant by Alain Touraine (1971). It remains a popular conception, where emphasis is now placed on phenomena such as the “creative industries” (media, design, the arts) and “weightless” occupations such as found in finance, law, and business consultancy (Coyne 1997).

This is neither a technological nor an economic measure of information. Most white-collar workers do use computer terminals, but this is by no means the most important element of their work, since relations with clients and customers and the knowledge developed by extensive education will probably be more consequential. Moreover, in the most important white-collar occupations, the upper professionals, it is likely that practitioners will have subordinates who undertake the “merely technical” aspects of their work. It should also be noted that information occupation growth cannot be regarded as synonymous with increases in the economic import of information since some domains are information-occupation-intensive yet economically of limited significance (e.g., counseling services, teaching) while others are economically important yet involve relatively few information jobs (e.g., foreign exchange dealing). This occupational index of the emergence of the information society operates with a quantitative definition: as information occupations grow in number, so does there emerge a new society, the information society.

A fourth definition focuses on *networks* to emphasize the flows of information between people and places. This comes close to a technological measure since an ICT infrastructure is essential for the operation of networks, but much more is needed (e.g., competencies on the network and soft skills such as problem solving and communicative abilities). A core notion here is that networks enable the transformation of time and space, allow the acceleration of activities, and mean that processes of globalization are encouraged (→ Technology and Globalization). It is an approach closely associated with the work of Manuel Castells, whose trilogy *The information age* (1996–1998) detailed the heightened significance of networks and ways in which they transform business, politics, and culture. This is also a quantitative measure, one that insists that the growth of networks signals the coming of the information age. It too is subject to sharp criticism (Garnham 1998).

A final definition involves the increase in *culture*, broadly conceived (→ Culture: Definitions and Concepts). This centers on the massive increase in symbols, from fashion to media, to emphasize that we inhabit nowadays a world in which we are saturated in signs – from the architecture of cities to the decoration of the body, from round-the-clock television to always-on broadband Internet services (→ Popular Communication). It is an approach to the information society that has appeal especially to postmodern adherents, who may envisage a bounty of signs accompanied by a collapse of meaning precisely because they are ubiquitous, variable, and fast changing (Poster 1990). Living in a global city such as London, one recognizes this easily: signs everywhere, but little sense of coherence or comprehension. We recognize too that this is a quantitative measure, even if the measure is never actually made. It is simply asserted that the expansion of culture signals that we now inhabit a new world. To repeat: quite why this should be so is not demonstrated.

Reviewing these varying definitions of the information society, what becomes clear is that they are either underdeveloped or imprecise or both. Whether it is a technological, economic, occupational, spatial, or cultural conception, we are left with highly problematical notions of what constitutes, and how to distinguish, an information society, in spite of the fact that large numbers of commentators offer the concept as a means of understanding the world today.

It is important that we remain aware of these difficulties of definition. Though as a heuristic device the term “information society” has some value in helping us to explore features of the contemporary world, it is far too inexact to be acceptable as a definitive term. For this reason, though one may readily acknowledge that information plays a critical role in the present age, one has to remain suspicious as regards information society scenarios and maintain skepticism toward the view that information has become the chief distinguishing feature of our times. The term “information society” may have its *uses as a metaphor*, insofar as it helps us to think more intensively about the salient features of our times, but we ought not to succumb too readily to the belief that information is the defining feature of the world today.

# Informational Utility

*Silvia Knobloch-Westerwick*

*Ohio State University*

In the context of → information seeking through mass media use, the concept of informational utility has been developed to predict which information items an individual will attend to and which will be ignored. The concept of utility of information emerged in the discussion about cognitive dissonance (→ Cognitive Dissonance Theory), and related predictions were corroborated in a few empirical investigations as early as the 1960s (e.g., Canon 1964; Freedman 1965). A more detailed elaboration of informational utility, though without specific empirical exploration, was provided by Atkin (1973). He suggested four domains of informational utility and conceptualized information to potentially meet needs of surveillance, performance, guidance, and reinforcement. Information needs were taken to result from uncertainties in how to respond to everyday environmental requirements. Thus, information is needed for adaptation to the environment, cognitive adaptation (surveillance), behavioral adaptation (performance), affective adaptation (guidance), and sometimes defensive adaptation (reinforcement). Cognitive adaptation (surveillance) has attracted most attention in subsequent research.

On surveillance as an informational utility facet, Atkin stated that the individual “maintains surveillance over potential changes that may require adaptive adjustments, monitoring threats or opportunities and forming cognitive orientations such as comprehension, expectations, and beliefs” (Atkin 1973, 212; → Cognition). More specific predictions on surveillance needs, as they may guide selective exposure to information, can be derived from a more detailed model of informational utility (e.g., Knobloch et al. 2003; most recently, Knobloch-Westerwick et al. 2005) that projects information relating to individuals’ immediate and prospective encounter of threats or opportunities to have utility for these individuals, the degree of which increases with (1) the perceived *magnitude* of challenges or gratifications, (2) the perceived *likelihood* of their materialization, (3) their perceived proximity in time or *immediacy*, and (4) their perceived *efficacy* to influence the suggested events or consequences. Hence, depending on the extent to which these dimensions characterize reported events, the news report carries utility for the recipient. The increased utility of messages, in turn, fosters longer exposure to information. Hence, it is the perceived utility of information that motivates exposure; low-utility material is passed over in favor of attention to material of higher utility. Drawing on the classic approach/avoidance dichotomy, these impacts are suggested for both negative and positive news reports, as information on both threats and opportunities should carry utility. (For comparisons of the informational utility model with other approaches, such as the → elaboration likelihood model and other models and concepts such as salience, involvement, or relevance, see also Knobloch et al. 2002, 2003.)

An example may serve to illustrate these dimensions. (1) News about a new and deadly disease holds more utility than a message about an illness that causes just a minor indisposition because the former indicates consequences of higher magnitude. (2) If the

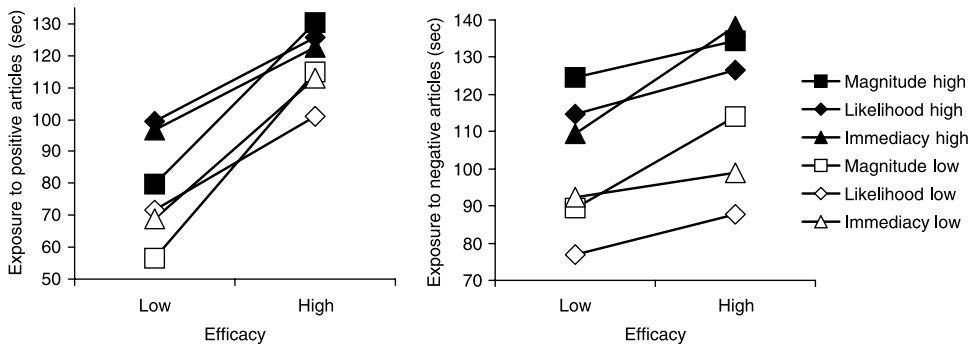

disease spreads on the US east coast, related media messages have more utility for news consumers living on the east coast than for those living on the west coast, as their likelihood of being affected is higher. (3) If the disease is spreading very quickly, consequences of reported events evolve in the very near future, and being in the know has more instant value and thus higher utility due to this immediacy. (4) Options to prevent infection that are highly effective will suggest the information has higher utility than will indications that no prevention means are available. Whenever media messages feature high levels of these dimensions of informational utility, news consumers should be more prone to expose themselves to the information, as it carries higher utility for them and helps them to adapt to environmental requirements.

### RELATED CONCEPTS

*Persuasion theories* have also incorporated dimensions largely in line with elements of the informational utility model ( $\rightarrow$  Persuasion). Several persuasion researchers (most recently, Roskos-Ewoldsen et al. 2004) have included magnitude and likelihood dimensions in their model and also postulated efficacy as an additional dimension. For instance, Rogers (1975) suggested in his protection motivation theory that (1) probability of occurrence descriptions in a message lead to perceived susceptibility (parallel to the informational utility dimension of likelihood); (2) magnitude of noxiousness in the appeal produces perceived severity (magnitude); and (3) depictions of the effectiveness of the recommended response and characterizations of an individual's ability to perform the recommended response result in perceived efficacy (efficacy) to cause cognitive mediation in processing fear appeals.

The dimensions in approaches related to *protection motivation theory* are in part parallel to the informational utility model. However, the former approach was formulated to predict the effects of persuasive messages on cognitive processes and, more importantly, on protection behavior, whereas the latter was formulated to predict selective exposure to media. Protection motivation theory (Rogers 1975) and related communication models such as the  $\rightarrow$  extended parallel process model imply that individuals' perceived efficacy to combat a threat would result either in danger-control behavior to prevent risks when efficacy is high, or in fear-control behavior to deny risks when efficacy is low. Whereas this logic was initially applied to information processing, an extension to information-seeking behavior appears highly appropriate: individuals' perceived efficacy to combat a threat results either in seeking out further information about the risk, when efficacy is high, or in avoiding further information on the threat, when efficacy is low. In the former case, information may be construed as useful; in the latter, the same information may only seem distressing.

Predictions of *selective exposure* to information derived from the dimensions of this model have been supported by empirical evidence, as explained below. In these studies, selective exposure was operationalized as time spent on information, although selectivity has been discussed on various levels ( $\rightarrow$  Selective Attention; Selective Exposure; Selective Perception and Selective Retention). This approach is in line with that of Atkin (1973, 209), who suggests that "amount of exposure [is] simply defined as number of messages and the length of exposure."

**Figure 1** Impacts of efficacy and intensity of magnitude, likelihood, and immediacy as informational utility dimensions on observed selective exposure to positive and negative online news

Source: Knobloch-Westerwick et al. (2005)

## EMPIRICAL RESEARCH

Two experiments (Knobloch et al. 2003) using negatively valenced stimuli supported the suggested impacts of the first three utility facets. These effects were also observed to be additive, as no interactions emerged. News readers indeed devoted more exposure time to negative news reports that were linked to higher levels of magnitude, of likelihood of being affected, and of immediacy of consequences of covered events than to articles featuring lower utility levels on these facets. Investigations by Knobloch et al. (2002) provided initial explorations into these informational utility dimensions as they impact selective exposure to positively valenced news. In these studies, German high-school students were to sample from either positive or negative reports that varied along utility dimensions. The findings demonstrated that likelihood and immediacy affected selective exposure to positive articles significantly, and magnitude and immediacy influenced self-guided exposure to negative articles. More recently, a cross-cultural experiment in the US and in Germany demonstrated the robustness of predictions derived from the informational utility model, as hypotheses about selective exposure to both positive and negative news were fully supported in both cultural settings (Knobloch-Westerwick 2005). Finally, Knobloch-Westerwick et al. (2005) corroborated the positive impact of higher efficacy as utility dimension for selective news exposure, both for positive and negative news and in interplay with the first three utility dimensions, as illustrated in Figure 1.

While selective exposure to information can be investigated on various levels (e.g., choosing between media consumption and alternative activities, choosing between different media channels), the summarized investigations looked at selections on the level of specific messages consisting of news reports. More specifically, selective exposure time was measured by software to serve as key dependent variable. As media users will oftentimes not be aware of their reasons for selecting some content while avoiding other messages and may furthermore not remember their selections correctly, observations of actual selection behavior are preferable in comparison to other measures to study selective exposure to information.

## **Infotainment**

*Geoffrey Baym*

*University of North Carolina at Greensboro*

The term *infotainment* refers to a cluster of program types that blur traditional distinctions between information-oriented and entertainment-based genres of television programming. Primarily a pejorative term, infotainment is often used to denote the decline of hard news and public affairs discussion programs and the corresponding development of a variety of entertainment shows that mimic the style of news. At the same time, however, the early years of the twenty-first century have seen the increasing emergence of programs that more thoroughly blend the content and form of various genres of public affairs and entertainment. This has created a complex spectrum of hybrid programming with a potentially wide range of implications for public information, political communication, and democratic discourse.

Much scholarly concern with the phenomenon of infotainment has focused on the encroachment of entertainment on the domain of news. In his seminal work, Postman

(1985) feared that we were “amusing ourselves to death” by forsaking print-based, rational-critical information in favor of entertaining televisual spectacle with its short attention span and dramatic storylines. Altheide (2004) has argued that news and politics must now conform to an entertainment-driven → “media logic” and are disseminated to the public through an “infotainment news perspective” that packages events and issues into narrative form. Graber (1994) has identified several dramatic elements that have become common to routine news, including an emphasis on conflict, emotion, evocative visual imagery, and interpersonal interaction. The conflation of news with entertainment – what Graber called the “infotainment quotient” in television news – also is indicated by news producers’ frequent use of music, fast-paced editing, and a variety of visual and aural effects to build a sense of drama in the news story; a disproportionate interest in celebrity, sports, and lifestyle topics; and a celebration of individual newscasters as marketable personalities.

Recently, scholarly attention has turned to the other side of infotainment: the increasing penetration of news form and content into entertainment programming. A number of factually based entertainment shows now *look like* news, featuring “anchors” who read voice-over copy and introduce reporter packages, often with the ubiquitous graphic box over the shoulder. Further, a range of fictional programs construct storylines that refer to, draw from, or dramatize politics, current events, or issues of contemporary social importance. Delli Carpini and Williams (1994, 2001) argue that such programming challenges the familiar dichotomy that sees news and entertainment as oppositional terms, offering both entertainment and an alternative location for informational content and political discourse. They suggest infotainment is best understood as a phenomenon of border-crossing that problematizes common assumptions that news is necessarily serious and that entertainment shows contain little in the way of socio-political significance. Further, they and others argue that infotainment calls into question a number of other traditional distinctions, including those between politics and show business, public affairs and popular culture, and even factual and fictional media forms.

## EMERGENCE

The emergence of infotainment has been enabled by a confluence of technological, economic, and cultural changes that have created a media landscape structured by the competing forces of fragmentation and integration. In terms of technology, the large-scale adoption of → cable television, the development of satellite and digital delivery systems, and the continued expansion of the → Internet have led to an unprecedented multiplicity of channels and informational sources. Further, advances in personal computer-based technologies of media production have significantly lowered barriers to entry, in terms of both the capital and expertise required to create and distribute informational content. This has resulted in a diverse communicative sphere marked by the segmentation of the audience, the circulation of a potentially infinite range of text, images, and video, and the fracturing of the hegemony of US network television and European public service broadcasting systems over the informational environment.

Economically, the turn toward source multiplicity and audience fragmentation has been countered by the consolidation of ownership into the hands of a small number of giant corporate conglomerates (→ Media Conglomerates). Driven by the interest of increasing

shareholder value, conglomeration has been accompanied by widespread commercialization – the reconceptualization of all media forms not as public service, but as for-profit products (→ Commercialization of the Media). Owning a wide variety of previously distinct media outlets, contemporary media companies further seek to maximize economic efficiencies through the sharing of resources, personnel, and approaches to content across what were once considered to be incompatible forms. The line between informational and entertainment programming, once a hallmark of media practice, has been obscured by the synergistic interweaving of content across multiple channels and genres.

All of this has occurred within a wider cultural context defined by multicultural diversity and a recognition of the relativism of many cultural traditions and standards. Contemporary media function in a cultural environment marked by disagreement over the modernist ideals of objective inquiry and dispassionate expertise that once authorized the serious national news broadcast. So too have many become wary of the paternalism of public service broadcasting and its assessment not just of *what* the public needs to know, but also of *how* they should know it. The conventions governing public discourse have become porous, with the logic of “hard” news no longer assumed to be the privileged way of talking about and making sense of social and political reality. Instead, television programming and public discourse have become shaped by hybridization: the thorough melding of once-differentiated discourses of news, politics, show business, and marketing in a media landscape defined by the permeability of form and the fluidity of content.

### INFOTAINMENT SCALE

It is difficult to consider infotainment a singular, clearly definable → genre. Brants (1998) instead suggests an “infotainment scale” that takes into account the topical focus of a given program as well as its format and style. On one end of the continuum are those programs that contain factual content about policy matters packaged within a serious format that makes minimal use of televisual style. On the opposite end are shows that emphasize dramatic, personalized content within an informal and heavily stylistic format. Those two poles, however, are idealized types, with various infotainment programs occupying a wide range of positions in between. In US media, these include, among others, the “news lite” offered by network television and 24-hour cable; talk radio; local, tabloid, and other forms of → “soft” news (→ Tabloidization); contemporary documentary such as Michael Moore’s *Fahrenheit 9/11*; daytime talk shows; late-night comedy news such as *The Daily Show*; and issue-oriented prime-time dramas such as *The West Wing*. Any typology – including this one – inevitably is incomplete, however. The integration of news and entertainment varies across national media systems and continually shifts with each new programmatic innovation. Even similar program types (e.g., late-night comedy) can articulate the conjunction of information and entertainment in markedly different ways.

### SIGNIFICANCE

The difficulties in precisely defining infotainment likewise render it a challenging object of study. Scholarly approaches to infotainment can be grouped broadly into two camps,

which vary in methodology but share the goal of identifying the significance of the phenomenon for public information, political communication, and the democratic process. Scholars working within the domain of media effects are interested in the outcomes of exposure to various types of infotainment content. Specifically, empirical studies have examined the effects of infotainment consumption on factual political knowledge, candidate evaluation, issue salience, and political engagement, the last including voting, volunteering in campaigns, and discussing politics with family and friends. Findings have been relatively consistent: that infotainment does have the potential to reach people who otherwise would pay little or no attention to news and political information, that exposure can result in increased factual knowledge among the otherwise politically disengaged (e.g., Baum 2003), and that consumption can correlate with increased levels of political engagement among certain types of audiences (Moy et al. 2005). However, studies equally show that any direct effects are moderated by prior levels of political sophistication, partisanship, and individual-level differences. Further, the wide diversity of infotainment programming resists efforts to generalize effects across specific programs.

The second scholarly approach turns from a focus on individual effects to a concern for political culture: to popular understandings of the democratic system, political authority, and the nature of citizenship as constructed through various discourses of infotainment. A number of scholars have argued that infotainment is incompatible with the needs of a democracy, degrading the *quality* of public information, dissuading from critical inquiry, and transforming rational argument into emotive spectacle. The result, some argue, is a “crisis of public communication” (Blumler & Gurevitch 1995) – a citizenry that lacks both the discursive resources to functionally participate in the political process and any interest in doing so.

An expanding body of scholarship, however, is developing the counterargument: that infotainment is not just good for democracy, but perhaps necessary. Various forms of this argument suggest that infotainment is democratizing political discourse by legitimizing narrative and affective forms of reasoning, acknowledging the irreversible interconnection between politics and popular culture, and drawing linkages between politics and the audience’s everyday lives (Corner & Pels 2003). Here infotainment is seen as a counterweight to traditional expert- and insider-dominated forms of political talk that have little apparent relevance to the life-world of the audience (Jones 2005; van Zoonen 2005). Others suggest that particular forms of infotainment are offering a corrective to a news discourse that has become co-opted by political communication professionals and seeded with scripted sound bites and spin (Baym 2005). Finally, infotainment is argued to have the potential to make news and politics pleasurable, which itself may be a prerequisite for political participation.

Despite uncertainty about its effects and disagreement about its significance, it is clear that infotainment is becoming an increasingly important phenomenon for democratic politics and public information. Informative and entertaining formats continue to become more deeply integrated; politicians have embraced such hybrid programming in their efforts to influence the citizenry; and for their part, members of the public continue to turn to the full range of program types in their efforts to learn about the world around them and to make political decisions. In turn, communication scholars increasingly are

recognizing the need to develop sophisticated theoretical and methodological approaches to grapple with the fundamentally changing nature of mediated information.

## **Ingratiation and Affinity Seeking**

*John Daly*

*University of Texas at Austin*

People often try to get others to like them when initiating and intensifying romances, friendships, and even brief encounters. When they do this they are engaging in affinity seeking (→ Interpersonal Communication).

For decades, scholars interested in relationships focused primarily on static variables associated with liking. For instance, research has long demonstrated that people who share similar attitudes and values like each other more than those who do not (→ Interpersonal Attraction). Studies also demonstrate that people are attracted to better-looking individuals. (Of course, there are exceptions to this focus on static variables – ingratiation comes to mind immediately.)

The affinity-seeking construct (Bell & Daly 1984) highlighted a more dynamic and strategic notion suggesting that people intentionally engage in certain behaviors in hopes of engendering liking. For instance, people might systematically highlight their similarity on some attitudes with someone to make the other person see them positively. Or, they might dress up, fix their hair, and even exercise hoping to get another person's attention (Daly et al. 1983). The key move made in the affinity-seeking construct was emphasizing the strategic intentionality of behaviors that people use to ingratiate themselves to others.

### CONCEPTUALIZING AFFINITY SEEKING

Affinity seeking falls under the broader rubric of → impression management (→ Self-Presentation). In Bell and Daly's (1984) framework, affinity seeking has four major components: (1) antecedent factors such as people's goals (e.g., to persuade, to generate liking) and the degree to which people are aware they are ingratiating themselves to others; (2) constraints that affect affinity seeking such as personality characteristics, social skills, and various contextual characteristics; (3) specific affinity-seeking strategies; and (4) the responses of others that are the outcomes of individuals' attempts to generate affinity.

In early research on affinity seeking, Bell and Daly (1984) found 25 *major strategies people typically use* when they engage in ingratiation. These strategies fall into seven more general clusters: (1) control and visibility (e.g., presenting an interesting self, being dynamic), (2) mutual trust (e.g., being open, appearing trustworthy), (3) politeness (e.g., following conversational rules, conceding control), (4) concern and caring (e.g., listening, confirming the other's sense of self), (5) other involvement (e.g., including the other, engaging in nonverbal immediacy), (6) self-involvement (e.g., including oneself, influencing perceptions of closeness), and (7) commonalities (e.g., highlighting similarities, assuming equality).

These seven clusters fall along *three dimensions*: (1) activity: active/passive (e.g., being dynamic is active, listening is passive); (2) aggressiveness: aggressive/nonaggressive (e.g., physical attractiveness is aggressive, being supportive is nonaggressive); and (3) orientation: self-oriented/other-oriented (e.g., assuming control is self-oriented, including others is other-oriented).

### ASSESSING AFFINITY-SEEKING SKILLS

Affinity-seeking skills and competency are assessed via observation, peer ratings, and self-ratings (→ Research Methods; Scales and Indices). The majority of research on the construct has used a single composite measure of affinity seeking – either self-report (Bell et al. 1987b) or other-perceived. Studies conducted using the composite measure have demonstrated, for example, that people who report using more ingratiation strategies are

better liked by others, seen as better conversationalists, and have greater potential as friends.

Rather than employ the composite measure, some research has examined individual affinity-seeking moves. These studies have found, for instance, that people who engage in active trust-building behaviors are more successful in developing relationships than those who do not. Yet another strand of research has looked at the variety of ingratiation strategies people use. This work has indicated that people who employ a wider assortment of strategies are better liked than individuals who latch onto only one or two strategies and use those in every exchange.

### **CORRELATES OF AFFINITY SEEKING**

Using a number of different measures and methods, researchers have found that successful affinity seeking typically has positive consequences in relationships (e.g., affinity seeking is correlated with greater relationship quality) and interactions (e.g., affinity seeking is correlated with how satisfied people are in conversations). Affinity seeking, done well, works – people like you more. Scholars have also found that ingratiation takes place in a variety of contexts.

For example, *in the workplace*, the affinity-seeking skills of supervisors are positively and significantly correlated with subordinates' satisfaction with both supervisors and work. In classrooms, students' abilities to engage in ingratiation are positively and significantly related to teachers' judgments of their academic and social performance. Similarly, teachers who are better at affinity seeking receive higher evaluations from students, are seen as more credible and competent, have better classroom climates, and have students who voluntarily attend their classes more often and do better academically in their classes.

Affinity seeking is also correlated with many *personality traits*. It is positively and significantly associated with variables such as extroversion, assertiveness, and interaction involvement, and inversely and significantly related to constructs such as communication apprehension, loneliness, and neuroticism. When individual ingratiation strategies are correlated with various personality characteristics the picture is quite interesting. For instance, assertiveness is positively associated with more active affinity-seeking strategies (e.g., assuming control, dynamism) and inversely correlated with more passive moves (e.g., supportiveness, conceding control). People who are more cognitively flexible have a greater repertoire of ingratiation strategies, and people who manifest secure and clingy love styles demonstrate more affinity-seeking behaviors than do those with casual, uninterested, and skittish love styles.

Other research has found that, as Bell and Daly (1984) suggested, there are *constraints that affect ingratiation*. For instance, Flint (1992) found that teenagers varied their use of different affinity-seeking strategies as a function of their age as well as the person with whom they were interacting (mother vs father). Some research has revealed gender differences in the use of specific strategies (e.g., females report using listening, physical attraction, sensitivity, and elicitation of other's disclosure more than do males; males more often report using assuming control and presenting an interesting self). Studies have also hinted that each gender may not be particularly good at judging what the other

gender does to engage in ingratiation (Daly 1994). Tolhuizen (1989) found that people use different strategies at different stages of their romantic relationships.

Other related work has examined the *affinity-testing function* – what people do to determine if someone else is interested in them as a potential romantic partner (→ Initial Interaction). This research (Douglas 1987) identified eight moves people use to test others' affinity: confronting, withdrawing, sustaining, hazing, diminishing self, approaching, offering, and networking. These strategies fall along two dimensions: social appropriateness and efficiency.

Some research has expanded upon the original 25 strategies specified by Bell and Daly (1984). For instance, Ganong et al. (1999) examined affinity seeking among stepparents and their stepchildren and found 31 strategies. They also raised the important issue of when and how people recognize ingratiation moves. Sometimes stepchildren failed to recognize stepparents' attempts to build affinity. Later studies have continued to use the affinity-seeking construct in stepfamilies and have found evidence that when stepparents are perceived by their stepchildren to engage in active affinity seeking, their relationship and marital quality between parents, is better.

Soon after the affinity-seeking concept was introduced, Bell et al. (1987a) proffered the related concept of *affinity maintenance* (→ Relational Maintenance). Affinity maintenance behaviors are strategies people actively use to maintain, as opposed to establish, positive relationships with others. Bell et al. asked married individuals to describe how they maintain positive feelings in their relationships. Twenty-eight strategies emerged and most were similar to those found in the affinity-seeking research. Four affinity-seeking strategies were not reported by married individuals – assuming control, personal autonomy, comfortable self, and nonverbal immediacy. In addition, the following strategies appeared in the affinity maintenance project that were not part of the affinity-seeking work: faithfulness, honesty, physical affection, self-improvement, and third-party relations. In contrast to the strategies that were not reported, this latter group of strategies are clearly more relevant in established relationships than in initial interactions. All 28 moves were individually, and as a whole, positively correlated with marital quality (the strongest correlations with relational quality were with openness, sensitivity, and verbal affection). Further, women in the study felt they engaged in significantly more affinity maintenance than did their spouses. A closely related construct – labeled relational maintenance – appeared almost simultaneously with Bell et al.'s work and scholars have focused most of their attention on that construct in work since 1990 (Weigel & Ballard-Roach 1999; Stafford et al. 2000).

## Initial Interaction

*William Douglas*

*University of Houston*

When people first meet, → interaction is likely to be guided by issues associated with uncertainty and → self-presentation. Both mutual uncertainty reduction and effective presentational management are seen to be necessary but not sufficient conditions for relational growth. Significantly, these goals may become mutually exclusive when, for example, social actors seek to hide negative or intimate aspects of the self from another, thereby remaining opaque.

Because uncertainty is seen to undermine relationship development, persons are posited as using a variety of *strategies to reduce their uncertainty* about each other and so increase the predictability and fluency of the interaction (→ Uncertainty Reduction Theory). Outside of face-to-face meetings, persons may observe others and/or ask third parties about future interaction partners. However, during conversation, interlocutors are seen to rely upon two primary strategies: question-asking and disclosure. The rate of *question-asking* is highest at the very outset of interaction and decays rapidly as the interaction progresses. Preliminary question-asking generally focuses on non-personal issues, such as name, place of work, knowledge of others in the situation (e.g., at a party), and so on, so that information exchange is both symmetrical (i.e., partners seek and provide the same information) and synchronous (i.e., partners provide the information across contiguous talking turns).

As conversation continues, question-asking gives way to *self-disclosure* as persons begin to provide more personal information, including their likes and dislikes, their experiences, their ambitions, and their opinions. Although this information is generally more personal than that accrued from question-asking, talk typically remains noncontroversial. As well, because disclosure is often diffuse and imprecise, talk turns usually become more extended and the exchange of information may become asymmetrical and asynchronous (→ Disclosure in Interpersonal Communication).

Both question-asking and disclosure are likely to be more effective to the extent that interlocutors feel at ease. Hence, conversation partners may invoke tactics designed to relax each other. For example, they may enact behaviors intended to make them appear friendly, approachable, receptive, and/or non-threatening. Such behaviors may be both verbal (e.g., identifying and extending mutually engaging conversation topics) and nonverbal (e.g., direct eye gaze; → Gaze in Interaction).

When persons first meet, uncertainty may vary for a variety of reasons. First, levels of *global uncertainty* (i.e., the level of uncertainty persons bring to the encounter) vary. Perhaps as a function of recent or otherwise salient first encounters, some persons are more uncertain than others. For example, persons who have experienced substantial negative outcomes during past first meetings, especially to the extent they are salient in memory, may be expected to be both more attributionally uncertain and more behaviorally uncertain than persons who have experienced generally positive outcomes. Similarly, persons unused to first meetings with potential romantic partners (such as persons recently divorced) are likely to be more uncertain about such encounters than persons for whom such meetings are a relatively common feature of social life. Of course, because of the variability of initial interaction, global uncertainty varies within as well as across individuals.

Uncertainty may also vary across *interaction contexts*. For example, a person may participate frequently and successfully in first meetings with business contacts and so feel minimally uncertain in those situations. In contrast, the same person may be considerably more uncertain during social encounters, not only because they may be less practiced but because social interaction is typically less conversationally circumscribed than business-related meetings.

Likewise, persons' uncertainty is seen to vary as a consequence of whether or not they expect to *meet a conversation partner again*. When future interaction is anticipated, actors appear to feel an increased need to "get to know" each other and so engage in relatively high levels of information seeking. Conversation lasts longer than when strangers expect not to meet again, although persons continue to exchange relatively non-personal information. At the same time, interactants exhibit higher levels of cooperation and are more likely to temper their own opinions than when they expect not to meet again, suggesting both increased salience of self-presentation goals and a subsequent tradeoff between information seeking and social appropriateness.

A similar tradeoff may occur when persons interact with another who has the *ability to reward or punish* them. Such power can accrue from another's status (as in job interviews) or, more informally, from another's perceived reward value (as in emergent romantic relationships or when interacting with a target who has a significantly more extensive friendship network). In these situations, it is likely that self-presentational goals compete

with those associated with uncertainty reduction so that, again, actors' levels of question-asking and disclosure are relatively suppressed.

Finally, persons are likely to become increasingly uncertain during conversation to the extent that others behave in ways that are perceived as *deviant*. Such deviance may occur as a function of interlocutors violating rules governing conversation content (e.g., making personal disclosures) and/or process (e.g., monopolizing conversation) and elevates the unpredictability of interaction. Because this occurs during rather than prior to interaction, co-interlocutors may withdraw from the conversation rather than elevate their efforts to "get to know" the partner.

In sum, initial interactants typically pursue two sets of objectives: those associated with uncertainty reduction and those associated with self-presentation. Generally, persons behave in ways that allow mutual fulfillment of conversation goals, although, under some circumstances, this may not be possible.

## **Innis, Harold**

*Menahem Blondheim*

*Hebrew University of Jerusalem*

Harold Adams Innis (1894–1952) was a Canadian economic historian turned communication theorist, whose research focused on the role of the *medium* in communication processes. His work – historical in method (→ Media History) and ecumenical in scope – demonstrated the centrality of communications in social, political, and cultural development. Together with his junior colleague, → Marshall McLuhan, he is considered a founding father of a medium-focused school of communication theory, variously known as the "Toronto School," → "media ecology," or → "medium theory." It holds that communications media are the key to understanding the co-development of mind, culture, and society.

Born in 1894 and raised on an Ontario farm, Innis earned his BA and MA degrees from McMaster University. After recuperating from an injury suffered in World War I, he completed a doctorate in economics, on the Canadian Pacific Railroad, at the University of Chicago in 1920, and began teaching at the University of Toronto. He would spend his entire academic career there, first as professor of political economy, then as chair of the department, and later as dean of the graduate school. Widely hailed as Canada's foremost economic historian and political economist, he was active, as royal commissioner, in shaping Canada's transportation and economic policy. Innis passed away in his prime, in 1952, while working on "History of Communication" – a monumental study that recast world history as a story of civilizations and their media.

Innis's turn, late in his career, to the study of communication can be seen as an extension of his major contribution to Canadian economic history, the "*staple theory*." In detailed studies of Canada's major staples – from furs and codfish to wood pulp – Innis traced their role in the broader frame of the intercontinental economy. He found that the flow of staples could chart political, economic, social, and even cultural links. He then switched his perspective: rather than focusing on the staples, he zeroed in on the *networks and interfaces* themselves. Innis's scholarly background left its traces on his thinking about communications. The most distinctive was the residual presence of the staple: he, and following him the rest of the world, call it the "medium." Whether a pyramid, a papyrus, or a mobile handset, the process of communicating, according to Innis, is anchored in a staple – just as staples are moved in a field mapped by communications. And media obey economic principles, such as the dynamic of oligopoly.

According to Innis, particular technological attributes of a dominant medium (→ Technology and Communication), or a mix of media prevalent in a given society, condition the practice of communication in that society, the institutions and socio-cultural arrangements associated with those practices, and further afield affect its political, economic, social, and cultural portrait. Although this is occasionally misunderstood as simplistic technological determinism, Innis was in fact suggesting "inverted determinism," namely, that societies develop, reshape, and adopt particular media according to their perceived needs and goals.

Innis suggested that media serve to enhance the development of society in one of two general orientations, or "biases": an *emphasis on time or on space*. A time bias would characterize a society oriented to its past, to religion, magic, ascribed status, hereditary rule, primary occupations, and so forth. A space bias would imply an orientation to commercial and military power, science, achieved social status, bureaucracy etc. He believed that a balance between these biases optimized the social good, but was seldom achieved in history, with classical Greece as an outstanding exception.

According to Innis, media technologies paralleled and affected societies' time or space bias. He observed that there is an inverse relation between the durability and transportability of media. For instance, a pyramid can maintain knowledge for millennia but is not suited for transportation, while a papyrus is easily transportable but is not durable. The time-binding potential of media and their space-binding capability are complementary variables. Society can only balance its communicative act by consciously blending a variety of media into a stable media ecology.

Related to this notion, and one of the most broadly applied of Innis's ideas, was his analysis of *monopoly of knowledge*. He found that when certain media, knowledge

products, or communicative skills dominate society's communication environment, the peculiar dynamics of oligopoly make for amplifying and perpetuating the hold on society of those media and the bodies of knowledge associated with them. Since media affect ideology and consciousness, a communication environment biased by monopoly will be resistant to change, and hence cannot endure.

Innis provided one of the richest bodies of thinking on the *meaning of communication media and society*, and one of the most broadly construed attempts at understanding the dynamics of their historical co-evolution. Still, Innis's legacy has yet to be meaningfully seized on. One reason for this relative neglect is the complexity and difficulty of his writings. Further, until quite recently his ecumenical level of analysis did not fit the prevalent trends in communication research. Finally, his historicity has represented a barrier. It did not find a significant following among social scientists interested in communication. Yet Innis's pioneering work has the potential of reorientation, from looking backward to understanding the present and future.

## **Institutional Theory**

*Thomas B. Lawrence*

*Simon Fraser University*

*Masoud Shadnam*

*Simon Fraser University*

Institutional theory is a theoretical framework for analyzing social (particularly organizational) phenomena, which views the social world as significantly comprised of

institutions – enduring rules, practices, and structures that set conditions on action. Institutions are fundamental in explaining the social world because they are built into the social order, and direct the flow of social life. They are the constants that determine the rules of variation. Institutions condition action because departures from them are automatically counteracted by social controls that make deviation from the social order costly. These controls associate nonconformity with increased costs, through an increase in risk, greater cognitive demands, or a reduction in legitimacy and the resources that accompany it.

Institutions are not everywhere and for everyone; rather, they are situated within specific social contexts and condition action within those contexts. Consequently, institutional research typically focuses on the *institutional context* – sets of institutions and their relationships and effects that are relevant in a situation. Institutional contexts provide cognitive frameworks for social actors, and these frameworks both constrain and enable action. Institutional contexts constrain action by enacting rules that are often invisible, having a taken-for-granted status among actors in that context. At the same time, these contexts enable action by making the world understandable and actions meaningful.

The resurgence of institutional theory in the 1970s began with investigations of the effects of institutional contexts on the structures of organizations (Meyer & Rowan 1977) (→ Organizational Structure). Over time, researchers began to theorize the dynamics of the institutional context itself. For instance, they examined how a social fact can reach the status of an institution, i.e., become institutionalized. They also addressed many fresh questions, e.g., how institutions die, how they change, how they relate to each other, how social actors can affect their institutional context. These efforts have expanded institutional theory to constitute a wide range of social research.

## EARLY HISTORY AND FOUNDATIONS

The effects of great institutions such as language, government, religion, laws, and family are so clear and widespread that one can hardly imagine social research that would not attend to them. Consequently, the history of institutional theory is as long as the history of social theory. The first systematic attempts to theorize what institutions are and how they influence action and structure, however, are found in the writings of two classical scholars: Max Weber and Emile Durkheim. Although *Weber* did not use the term institution, his notion of cultural rules or systems is close to our present understanding of the concept of institution. The interpretive approach of Weber highlighted the idea that action is social in the sense that the actor attaches a subjective meaning to it. So meanings always mediate social action. Therefore, the role of beliefs or cultural systems becomes clear: they provide a set of meanings required to interpret actions.

For *Durkheim*, institutions are symbolic systems: systems of knowledge, belief, and moral authority (→ Meaning). He highlights the idea that these symbolic systems are subjective products of human interaction, but experienced by people as objective. So institutions exist and play a role in people's lives in the same way as external facts. Moreover, institutions possess moral authority and are backed by religion-like sanctions. For instance, collective representation is vital to institutions in the same sense that rituals and ceremonies are vital to religious systems, because action enacts belief.

The study of institutions and their origins and effects continued gradually until the foundations for dramatic progress in institutional theory were laid down by two academic movements: → phenomenology and → ethnomethodology. The seminal work of Berger and Luckmann (1966) in *phenomenology* revealed the structures of meaning shaped in social interactions. They argue that it is through linguistic processes that common definitions of reality are constituted, accepted, and legitimated. Institutions, as constituted by reciprocal typifications of habitualized action, are essentially cognitive constructions that control social action independent of any form of sanction.

*Ethnomethodology* investigates the nature of practical knowledge, the tacit background knowledge people employ in daily interactions. Garfinkel (1967) showed that the cognition used in everyday interactions is not a rational quasi-scientific process but a routine that relies on conventional practical reason that functions beneath the level of consciousness. Garfinkel also argues that norms are cognitive guidance systems, and actors employ them flexibly with a great capacity for negotiation and innovation. Together, phenomenology and ethnomethodology paved the way for institutional researchers to theorize how action is influenced by institutional context.

### LATE HISTORY AND DEBATES

The new wave of academic interest and attention to what became known as *neo-institutional theory* started with two seminal works in the area of organization theory. First, Meyer and Rowan (1977) argued that, in modern societies, organizations are in a highly institutionalized context of various professions, policies, and programs, which serve as powerful myths. Many organizations ceremonially incorporate these products, services, techniques, policies, and programs, because they are understood to produce rationality. In this way, organizations do not necessarily make their structures more efficient in terms of task-performing functions. Rather, organizations align their structures with the institutional context, and in so doing gain legitimacy, resources, stability, and better survival chances. The key idea established in this work was that the formal organizational structure has a symbolic aspect in addition to its functional aspect, and this symbolic aspect is influential both in the decision to adopt a structure and in gaining legitimacy and better survival chances for organizations.

The second key work that established neo-institutional theory was DiMaggio and Powell's (1983) analysis of the institutional processes by means of which the institutional context forces organizations to be *isomorphic* – similar to each other, in form and practice. The article introduces three isomorphic processes: *coercive*, *mimetic*, and *normative*. Coercive isomorphism results from formal or informal pressures exerted on the organization by the government, other organizations, or the cultural expectations of the environment. Mimetic isomorphism is associated with uncertainty in goals, technology, or market dynamics, which leads organizational decision-makers to adopt structures and practices that model other leading organizations in their fields. Normative isomorphism results from the standards and cognitive frameworks that are created and controlled by professions and other moral standards-making bodies. By means of these three processes, DiMaggio and Powell (1983) argue that rational actors of institutionalized fields make their organizations more similar.

Since these seminal works in the neo-institutional movement, extensive work has been published under the banner of institutional theory, particularly in the area of organization studies. Within this tradition, researchers have challenged the classic themes of study by introducing new concepts and units for analysis. Most critically, the *concept of a field* – as the set of all the organizations that form a recognized area of institutional life, including key suppliers, resource and product consumers, regulatory agencies, organizations with similar products or services, etc. – has become perhaps the central focus of analysis in neo-institutional theory (e.g., DiMaggio 1991; Fligstein 2001; Greenwood et al. 2002). Other key concepts include institutional logics (Friedland & Alford 1991; Thornton & Ocasio 1999), institutional change (Greenwood & Hinings 1996; Seo & Creed 2002), and institutional entrepreneurship (Eisenstadt 1980; Fligstein 1997; Greenwood & Suddaby 2006).

Although it springs from largely interpretivist roots, institutional theory has been employed in many areas with a variety of methodological and epistemological approaches. Researchers from both realist and social constructionist traditions (→ Constructivism) now locate their work within the institutional theory umbrella, creating two quite distinct styles of institutional theory and two different lines of inquiry. The realist researchers tend to see the world as stable and try to find an explanation when they confront a change. In contrast, social constructionist research tends to expect change everywhere and tries to find an explanation when it confronts stability. Likewise, researchers with both quantitative and qualitative methods have employed institutional theory. As a result, institutional theory is understood as compatible with many different perspectives and research questions, and has no common set of constructs or methods.

Despite, or perhaps because of, its wide acceptance, institutional theory is associated with intense, unresolved debates around key constructs and issues. The meaning of the concept of an institution, for instance, is considered by many researchers, particularly from realist traditions, to be overly ambiguous and thus lacking in terms of being a reasonable construct for research. Those researchers argue that this ambiguity is the result of lack of both theoretical and methodological elaboration on the process of institutionalization. Other researchers doubt if phenomenology and ethnomethodology can provide a useful micro-sociological foundation for institutional theory. While some researchers are attempting to find a better micro-foundation drawing on the works of Pierre Bourdieu, others argue that institutional theory is basically a macro-perspective and there is no need to elaborate much on the micro-level. Finally, there is debate with respect to the intellectual boundaries of institutional theory, with some researchers arguing that institutional theory has expanded beyond its proper domain.

## FUTURE DIRECTIONS

Two new directions have been proposed for the development of institutional theory, and provide promising avenues of development for both theory and empirical research. The first addresses the question of how social actors may purposively influence their institutional context. This line of research was initiated by the introduction of the concept of *institutional entrepreneurship* and has attracted a great deal of attention in recent years. Organizational researchers are particularly attracted to the concept because of their

interest in power and agency – the ability of organizations to strategically alter the institutional context could undoubtedly be a source of power and superiority for organizations. This issue has recently been developed as the more general concept of *institutional work* – purposive action aimed at creating, maintaining, or disrupting institutions (Lawrence & Suddaby 2006).

The second direction for future research focuses on the development of *endogenous explanations for institutional phenomena*. In contrast to much of the earlier work, which emphasized exogenous shocks as underlying institutional change, researchers in this new tradition argue for the need to explain institutional dynamics in terms of closed causal loops. Some primary attempts in this direction have begun and are focusing on the development of endogenous understandings of rationalization (Meyer & Jepperson 2000).

It should also be noted that as a future direction for the literature of organizational communication, researchers have just started to employ institutional theory for their explanations of *macro-phenomena*. The underlying idea for this direction of research is that both institutional effects on organizations and the organizing processes of institutions are mediated by communication processes. Therefore, organizational communication researchers are increasingly recognizing the institutional context of organizations because that is where the communication processes are situated (Lammers & Barbour 2006).

## Instructional Television

*Robert K. Avery*

*University of Utah*

The term “instructional television” (ITV) is multidimensional, with definitions varying widely, depending on context, time period examined, and other factors. The term is frequently related or used interchangeably with other terms in this encyclopedia, including → Classroom Instructional Technology, → Distance Education, and → Educational Media, among others. At the most basic level, ITV refers to the use of the medium of → television to deliver instructional content to one or more viewers, but the multiple interpretations of the term are tied directly to delivery/reception variables, content variables, and viewer variables.

ITV has existed as long as the medium of television itself, since some of the earliest experimental demonstrations of the medium in both Great Britain and the United States were for the purpose of instruction. When the → Federal Communications Commission (FCC) in the US (→ United States of America: Media System) authorized noncommercial educational television in 1952, a number of the licenses subsequently awarded were assigned to boards of education, school districts, and other instructional agencies that developed the medium of television for direct formal instruction in the classroom setting. Even community licensees that were generally referred to as “educational television stations” devoted their daytime schedules to delivering “in-school services,” another term for ITV programming.

ITV programs ranged from hour-long courses that ran daily for an entire semester to a single instructional program that was broadcast in conjunction with the commemoration

of an historical event (→ Historic Key Events and the Media) or as an instructional supplement to a current happening, such as the inauguration of a president. In some situations the utilization of ITV was almost incidental to the regular, teacher-delivered classroom curriculum, whereas in other situations ITV played a far more dominant role. For example, the use of ITV in American Samoa, South Africa, and Bogotá, Colombia, led to a major restructuring of the entire public school curriculum. The impact of ITV as a contributor to formal instruction has been felt from kindergarten through high school and college to adult education. ITV has been credited with teaching youngsters how to cope with life-threatening illnesses while bedridden in hospitals, with helping prison inmates earn their high-school diplomas, and with teaching immigrants to learn English and prepare for their citizenship examination.

While some ITV programming has been broadcast over the airwaves, much of the ITV coursework on college and university campuses utilizes a “closed circuit” delivery system, in which a number of television channels are fed from a central control room or “head end” to multiple classrooms through the use of coaxial cable or fiber optics (→ Television Technology). One well-known ITV project in the midwestern US during the 1960s – Midwest Program on Airborne Television Instruction – actually used airplanes to transmit courses to more than 2,000 elementary and secondary schools over a six-state area. Video tapes of ITV programs have been distributed internationally by such organizations as the Great Plains National Instructional Television Library. Today, ITV programs may reach the viewer via the → Internet, world wide web, DVD, or video cassette (→ Video), as well as by closed circuit, instructional television fixed service (ITFS), broadcast, or satellite transmission. Viewing of so-called “telecourses” or other ITV programming may take place in a regular classroom, in a dormitory room, at home, or under a tree in a public park via a wireless laptop computer.

ITV in one form or another is an important part of the curricular offerings of virtually every modern school, college, and university in the world today. Research established early on that television was an effective means of delivering information to students, and that when content was properly designed, viewers could learn as much from ITV as from a classroom teacher. The classroom of the twenty-first century is rich in media resources, regardless of the grade level or subject area. The fundamental production principles developed by ITV pioneers continue to be utilized today, as visual and auditory content or “videos” pervade the seemingly countless delivery and reception platforms of our mediated instructional environment.

## Instrumental Actualization

*Uwe Hartung*

*Dresden University of Technology and University of Lugano*

Instrumental actualization is first and foremost an approach to journalists' news selection. The notion was formulated by Hans Mathias Kepplinger to explain the effect of journalists' (political) opinions on news content. As an approach to news selection, instrumental actualization continues and complements approaches such as → gate-keeping, → news factors, and → news values.

The theory of instrumental actualization makes *four basic assumptions*. First, it assumes that journalists hold opinions, share values, and advocate positions. Second, it holds that all (or most) events have inherent in them a political or conflict-related valence. That is to say, they are helpful for one side of a political issue, and bad for the other. For example, a news story on the failure of an educational program issued by an administration would provide the critics of this administration with arguments and be considered a challenge for its supporters. In other words, the central object of a conflict is linked to any number of events that have different instrumental qualities related (objectively or subjectively) to the central object. Thus, the instrumental quality of a news story is to be distinguished from its evaluation. Third, consciously or (much more often) subconsciously, journalists will ascribe a higher news value to stories that support their worldviews and conflict positions. According to the fourth assumption, the differential news values will show in the journalists' news selection.

The approach explains bias in the news on different levels: the individual journalist's news selection, the selection decisions of a particular medium (if the journalists employed there share certain worldviews), and even the new content of a whole media system (if worldviews are not distributed evenly among a country's news journalists). Rejecting the separation of news and commentary, this approach holds that the opinions of a newspaper's writers will affect its news selection (→ Separation of News and Comments).

The development of the approach was inspired by Klaus Schönbach's (1977) work on the synchronization of news and commentary (→ Synchronization of the News). Other inspiration came from → consistency theories, especially Milton Rosenberg's (1956) variant, from earlier work on how the news media covered political conflicts (→ Conflict

as Media Content), and from work on the effects of journalists' opinions on media content.

Instrumental actualization was developed in the 1980s by Hans Mathias Kepplinger. The author used representative → surveys among news journalists and quantitative content analyses of media content to prove his hypotheses (→ Content Analysis, Quantitative). The surveys corroborated the hypothesis that the journalists' own position on a political issue influenced the news value of issue-related news items. When presented with news items speaking either in favor of or against a certain issue position, the respondents significantly attributed a higher news value to those news items that were in line with their own issue position.

Content analyses of real media content, comparing editorials and news, showed that each newspaper tended to prefer news that was in line with its editorial position as expressed in the commentaries ("synchronization"). The newspapers also tended to prefer stories that were harmful to the issue position they did *not* share, rather than stories that were beneficial for their side in the issue. This latter finding contributes to media negativism and can be explained by the higher news value and higher credibility of negative stories, and by lower selectivity with regard to them (→ Negativity; Credibility of Content; Credibility Effects; Selective Perception and Selective Retention; Selective Attention).

According to these findings, different media positions on political issues and conflicts are thus created by giving different weight to them in the news, rather than by differently evaluating more or less similar events. Instrumental actualization thus becomes a strategy in efforts to affect the media coverage of a subject: Activists can get the media either to evaluate matters differently (strategy of reevaluation) or to put matters more beneficial to the advocated position in the spotlight (strategy of instrumental actualization; → Political Marketing; Public Relations).

Several other results from content analyses that were not conducted in the framework of the theory of instrumental actualization can nevertheless be explained by this theory. An example is the instrumental use of experts in the news, that is, the tendency of media to give space and airtime to experts who share their views in conflicts (Lichter et al. 1986; Hagen 1992).

## Integrated Marketing Communications

*Michael A. Belch*

*San Diego State University*

*George E. Belch*

*San Diego State University*

In the 1960s, Chevrolet spent almost its entire US television media budget on one program – the *Dinah Shore Show*. At that time prime-time viewers had only three network channels to choose from and an advertiser could reach 80 percent of US households on any given evening by running commercials on CBS, NBC, and ABC programs (→ Television Networks). Newspapers were a primary source of information, and → cable television and the → Internet were decades away from development.

Currently there are over 400 cable TV channels in the US, TV audiences have declined at the rate of approximately 2 percent over the past decade, and cable now commands a larger audience than networks. The Internet has experienced unprecedented growth, and → advertising can be seen on one's mobile phone, in bathrooms, and almost every conceivable (or inconceivable) location imaginable. Product placements and integrations have increased dramatically. Erwin Ephron – a media consultant – estimates that in the 1980s a media planner had nearly 1,250 scheduling options on television alone. In the 1990s, with 100 broadcast and cable channels to choose from, the number of options rose to 1.25 quadrillion. With over 400 channels, the number of options is incalculable (Mandese 2005).

Now add to this the fact that there has been a proliferation of new media including the Internet, interactive wireless, podcasts, video on demand, blogs (→ Blogger), and more. Traditional media, like → public relations, sponsorships, event marketing, and product placements, have taken on a new perspective. Advertising is no longer king, as some of the largest TV advertisers (GM, P & G, American Express, among others) are shifting more and more dollars to the “new” media. In 2006, Pontiac introduced its new G-6 using only Internet advertising. Many others initiate their new product launches with an emphasis

on public relations. Still more use sponsorships, guerilla marketing tactics, and other nontraditional approaches.

As a result of these factors – as well as other changes in consumers' lifestyles, technology, etc. – marketers have had to dramatically change the way they attempt to communicate with their existing and potential customers. Communications programs now require the use of a variety of media to reach markets, as well as the integration of these media to put forth a unified and consistent message. It is now obvious to marketers that it is no longer “business as usual,” and that a new and different way of managing the communications environment is required. Integrated marketing communications addresses the issues involved in managing this changing media environment, while at the same time providing a framework for establishing communications objectives to be used to guide the communications program and assess its effects (→ Marketing; Marketing: Communication Tools).

### **INTEGRATED MARKETING COMMUNICATIONS (IMC)**

The changing communications landscape has led to the adoption and growth of integrated marketing communications (IMC). As noted by the American Association of Advertising Agencies, IMC is: “A concept of marketing communications planning that recognizes the added value of a comprehensive plan that evaluates the strategic roles of a variety of communications disciplines – for example, general advertising, direct response, sales promotion, and public relations – and combines these disciplines to provide clarity, consistency, and maximum communications impact” (Belch & Belch 2007, 10).

As can be seen, this definition – now over a decade old – notes the integration of what might be considered “traditional” media, with no mention of the myriad of channels that have surfaced since its inception. Nevertheless, the point is that the strategy calls for a comprehensive plan, specific roles for each medium, and the integration of these media to maximize communications impact. IMC is based on the expectation that the whole is greater than the sum of its parts, with the synergy of multiple media increasing the communications effects of the overall program.

IMC combines and coordinates a variety of marketing communication tools and techniques to reach the customer and present the product or service in a favorable manner. It also emphasizes the need for all of a company's marketing promotional activities to project a consistent and unified image. All forms of marketing communication must strive to present the same brand message and convey that message consistently across all points of contact with customers (→ Brands; Branding). All marketing communications must, in other words, “speak with a single voice,” whether they be new or traditional forms.

### **THE GROWTH OF IMC**

Kitchen (2005) has referred to the growth of IMC as the major communications development of the last decade of the twentieth century. While some academicians may disagree with this perspective, practitioners have completely embraced the concept. There are very few, if any, large-scale communications programs that do not involve the use of multiple media, leading to the rapid adoption of the IMC approach. In his book *The end of marketing as we know it*, Sergio Zyman, the former head of marketing for Coca-Cola,

declares that traditional marketing “is not dying, but dead” (1999, 1). Jim Stengel, global marketing director for Procter & Gamble, notes that “There must be – and is – life beyond the 30-second commercial”(Zyman 1999, 13), calling for the advertising industry to embrace and develop new media to reach their audiences. These are but a few of many examples of the new perspective required.

In addition to the previously mentioned changes in the communications environment, a number of other factors have also contributed to the rapid growth of IMC. There has been *a shift in marketplace power from manufacturers to retailers*: large retailers such as Wal-Mart are using their clout to demand larger promotional fees and allowances, which siphons off monies from advertising and increases the focus on short-term promotions. *Database marketing has grown*: marketers are increasing their use of databases. These are then used to target specific consumers through telemarketing, direct mail, and other forms of direct response. Companies develop customer relationship management (CRM) programs to reward their most loyal customers through sales promotions, discounts, and other tools, all of which increase costs. There have been *demands for greater accountability*: an increased demand for accountability and focus on return on investment (ROI) have led advertisers to consider a variety of tools that may enhance the cost–benefit relationship. It is no longer acceptable to say that one does not know how well the advertising program is working, as too many other options for the use of these dollars now exist. *The Internet has grown rapidly*: as previously noted, the Internet is just one of the numerous new media to become available to marketers. Perhaps no other medium since television has had such a dramatic impact on the media landscape. The Internet continues to evolve, becoming more and more like television. Combining this with the advent of interactive TV, wireless, podcasts, and other new media, marketers have had to rethink their traditional media strategies.

## REQUIREMENTS FOR SUCCESSFUL IMPLEMENTATION OF IMC

The adoption of an IMC perspective necessitates a new way of thinking. Traditional means of conducting business must give way to adapting to the new communications environment. One of the most critical requirements is to recognize that consumers’ exposures to media and messages are now under their control – not that of the sender. Technological changes leading to the development of new media are just one of the factors that have enabled receivers to obtain information when *they* want it, not when the marketer sends it.

Second, marketers must recognize and accept the dramatic shift in media usage that has occurred – particularly among younger demographic segments (→ Audience Segmentation). Besides watching less TV, younger demographics subscribe to fewer magazines (most of which are specialty magazines as opposed to general news), rarely read the newspapers, and rely religiously on the Internet for music, news, and information for everything from phone numbers to the announcement of sales, comparative-price shopping, and upcoming events.

To successfully adopt an IMC orientation, companies must accomplish the following tasks. They must recognize that consumer perceptions of a company and its brands are a *synthesis of all the messages* consumers receive or contacts they have with the company. The advertising messages sent, the media in which they appear, interactions with the sales

force, the website, public relations, and publicity all help shape the perceptions of the company, its products, and its brand image. Companies must *identify all of the sources of contacts* that a customer or prospect has with the company. These contacts can include media advertisements, websites, articles and stories in → newspapers and → magazines or on → television or → radio stations, word of mouth, sponsorships and/or events, and product placements, among others. The IMC process starts with the customer or prospect and then works back to determine the best ways to reach them.

Companies also must consider the *strengths and weakness* of the various communication channels and of the marketing communication tools that form an effective IMC program. For example, mass media advertising – such as television – works well for building overall awareness but is less effective for communicating detailed information. Publicity lends credibility to a communication but is not always under the marketer's control. The Internet, while excellent for providing information, is less effective than other media for achieving reach. Selecting the appropriate media is critical to IMC success. Companies must create a *consistent unified message* to current and potential customers. All forms of marketing communication should focus on the same key selling points, theme, and positioning platform, and strive to have one look and one voice.

Companies also have to focus attention on the *achievement of communications objectives*, which will ultimately lead to the attainment of marketing goals. After years of discussion and research, marketers are only slightly further along in determining the ROI of various media in sales, market share, or other market objectives than they were decades ago. It is time to recognize the specific objectives communications are designed to accomplish, and to understand how achievement of these objectives will lead to the attainment of marketing goals. Companies must develop new ways to *evaluate the effectiveness* of IMC programs in producing outcomes. New metrics must be developed and used. These metrics must be validated and consistent to allow for proper measurement. The outcomes should include traditional measures such as recall and recognition, but must also incorporate new criteria such as increasing website traffic, or other media-specific measures.

Finally, companies have to *reorganize the department or agency* responsible for communications. In most companies and agencies today, communications silos continue to exist. Those responsible for advertising and media buying often compete, rather than cooperate with, those in public relations, promotions, and/or new media. Rather than working toward a unified goal, these departments continue turf battles to compete for budgetary dollars, inadequately communicate internally, and do not understand the specific roles each should assume to contribute to the overall effort. The education and training of specialists in integrating marketing communications and the integration and/or elimination of these silos will be critical to the success of the program.

## THE FUTURE FOR IMC

The debate as to the merits of IMC, whether it is a marketing fad or viable management strategy, etc., has given way to acceptance of it as a required means of developing effective communications programs. As consumers' needs and media habits continue to change, media continue to proliferate and evolve, and clients continue to demand accountability, the need for an integrated approach will increase accordingly. The

degree to which IMC advances, however, will be dependent upon acceptance by those involved in the communications arena. This acceptance, itself, will be predicated on changes in internal and external management thinking, the development of new metrics for assessing communications effectiveness, and continual adaptation to changing marketing conditions.

There is no doubt that integrating marketing communications is here to stay. There is also no doubt that those who adopt this approach will achieve a competitive advantage over those pursuing a more traditional approach.

# **Intellectual Property Law**

*Robert L. Kerr*

*University of Oklahoma*

Today, the law of intellectual property encompasses the legal concerns represented by → copyrights, trademarks, patents, design rights, trade secrets, and related concerns. This area of law focuses on protecting the rights of the owners of intellectual property to control when and if a work is reproduced, related adaptations of the work, and distribution and performance of the work.

Intellectual property law is in a more dynamic state of tension than ever before. The situation is driven by two historic and interrelated phenomena of the late twentieth and early twenty-first centuries. The fact that most intellectual property has been both internationalized and digitalized is transforming the field dramatically and rapidly. The works of any nation's creators are now marketed worldwide like never before. And most of those works can be digitally copied and distributed anywhere in the world, in unlimited numbers and virtually instantly via the → Internet, satellite transmission, and other media (→ Information and Communication Technology, Development of; Digital Media, History of).

Those two factors represent agents of change with incalculable impact. They offer both opportunities and challenges of staggering proportion to the owners of intellectual property and to the industries built upon its marketing. Intellectual property law today races to keep pace with an epic clash between modes of access. The deeply entrenched and immensely profitable business model in which mass-produced works were relatively easily protected from unauthorized copying battles to survive in an electronic economy in which digital technology makes such protection a sharply escalating and far more expensive proposition. Thus, an age-old struggle over what rights creators shall have in relation to their works has reached a point of unprecedented conflict over the direction intellectual property law should evolve in response to the revolutionary technological changes of the age.

### INTERNATIONAL DEVELOPMENT

Since the earliest days of mass production, authors, inventors, and the industries that capitalized on their works have sought to prevent unauthorized replication of their creations. Quite simply, profitability is critically linked to the degree of control one has over the production and distribution of creative works. And the idea of rewarding a creator for providing society with something new and useful is an ancient one. It has been grounded in two main schools of legal thought. *Natural law* maintains a concept of creators having a moral right to their intellectual property, and thus the taking of it without compensation is wrongful. The other main philosophical basis for intellectual property rights has been the utilitarian concept that such rights are rewards for the effort involved in creating original works, providing incentives for such creation and thus benefiting the greater society through pursuit of those incentives. That is not to say, however, that other concepts related to the ownership of ideas have not been historically and culturally important in some parts of the world. Even today, many arguments that strict intellectual property rights create monopolies that encroach upon mankind's common heritage of knowledge focus on the tendency for such regimes to disproportionately benefit developed societies while slowing progress in developing nations (→ Communication Technology and Development).

The United States produces and consumes more intellectual property than any other nation, and has pushed the development of related law in the United States and internationally. But the production and consumption of creative works are increasingly matters of global concern. Most nations now have established their own bodies of intellectual property law and have joined treaties that protect the intellectual property rights of all who are parties to the agreements beyond their own national borders. The process has yet to realize a seamless, universal system, and variations in enforcement mean that international → piracy of creative works remains commonplace in many parts of the world. But the process continues intensely, because the financial considerations at stake are immense.

Multinational efforts to work out *arrangements for protection of intellectual property* began more than a century ago. But those efforts have been vastly advanced in recent years. The *Berne Convention for the Protection of Literary and Artistic Works*, an international copyright agreement first instituted in 1886, is the oldest and most important

international copyright treaty. Its provisions and membership have evolved substantially since its beginning, with some 160 nations now committed to protecting the copyrights of each other's creators. The *Madrid Agreement concerning the International Registration of Marks* (known as the Madrid Protocol) has standardized international systems of trademark across the borders of more than 60 signatory nations. The *Paris Convention on Industrial Property and the Patent Cooperation Treaty* establish international rules on patents. As part of the Uruguay Round of General Agreement on Tariffs and Trade (GATT) negotiations of 1994, the Agreement on Trade-Related Intellectual Property (TRIPS) was adopted. It requires developing nations to recognize and enforce intellectual property rights, though the enforcement provisions are subject to national laws and judicial systems. Nevertheless, TRIPS is considered the most significant strengthening of international norms in intellectual property law to date.

### BASIC ELEMENTS

Copyright protects creative expression in many forms, including literary, musical, dramatic, audiovisual, pictorial, graphic, sculptural, etc. It does not protect facts or ideas, but rather the way in which they are fixed in a tangible medium of expression from which they can be perceived, reproduced, or otherwise communicated. Examples include → books, → newspapers, → magazines, movies, song compositions and recordings, artworks, computer software, architectural drawings, advertisements, etc. The copyright owner can be the creator of the work, or ownership can be transferred contractually. Intellectual property rights in works created by regular employees within the scope of their employment in most cases belong to their employers. Intellectual property rights in works created by freelance or contract employees in most cases belong to the freelancer unless a work-for-hire agreement contractually assigns the rights to the employer. Registration provides additional protections for the copyright owner, but is not required in order to own a copyright. Copyright today begins when expression is fixed in a tangible medium, and lasts for a specified period of time. However, it has become common to repeatedly expand the length of that period by statute. The life of the author plus several decades (a minimum of 50 years under the Berne Convention, though it is longer in many nations) is a typical standard today. A work on which the copyright has expired is considered to be in the public domain, and is free of copyright restrictions.

*Trademark law* is concerned with the many permutations of the phenomenon broadly referred to today as → “branding” – symbols, logos, shapes, slogans, jingles, sounds, smells, etc. Their use enhances the commercial value of the products and services they distinguish from those of others. Trademark protects not original expressions, but rather marks established in commerce as distinctive. Trademark law is focused on preventing competitors from unfairly capitalizing on the investment that mark holders have made to associate marks with products and services. Critical issues in assessing alleged infringement of marks are the likelihood of confusion and the dilution of distinctiveness related to the unauthorized use. Marks last as long as they are used commercially, but can be lost if companies fail to maintain their use over time or allow generic use by others.

Broadly speaking, copyright and trademark law are concerned with how things look, while patent law deals with how things work. In that context, patents are less directly

related to communication law, and therefore are not included as a significant topic of this discussion. But it should be noted that patent law today deals with a tremendous range of entities, including machines, processes, and compositions of matter (as well as new uses of all those); the ornamental and/or esthetic design elements of inventions/products; and even plant organisms (in bio-engineering, for example).

The concept of *fair use* in US intellectual property law has sought to permit some exceptions for limited copying of protected expression for comment and criticism, without permission or payment. A core principle has been that in order to qualify as fair use, the copying must add something new – an original contribution of transformative expression, meaning, or message – to that which is copied. To that end, statutory and judicial assessments concerning fair use have focused on the purpose and character of the use, the nature of the protected work that has been copied, the amount and substantiality of the portion used, and the effect upon the work's potential market value. Although the measures tend to be subjective, fair use has generally been more likely when it is for reporting, criticism, commentary, teaching, scholarly or technical research; when only a small part of the overall work is copied, and when the use does not have a negative impact on the copied work's potential market value.

### **CONTINUING CONFLICTS**

The great many recent legislative efforts to toughen intellectual property protections in recent years have generated considerable criticism that corporate commercial interests are locking away too much of the world's creative capital. Although it was once relatively common for creative works to fall into the public domain over time, lengthened copyright terms and other protections have slowed that process. The argument goes that recent trends are undermining the traditional balance between encouraging creators to produce by protecting their work in limited ways and encouraging further creativity through sharing of common cultural stock. That is, rather than a tradition in which ideas are passed along freely enough so as to maintain their ongoing evolution through common access to them, society is shifting to a new system in which so much creative expression is owned and tightly controlled that most people can participate in the culture only through the permission of those who own it.

Owners of protected works, however, increasingly argue that the value of their intellectual property rights can be dramatically diminished by technologies that make possible virtually unlimited copying and distribution of their works without permission or compensation. The music and motion picture industry reports they have lost several billion dollars annually in recent years through unauthorized copying of their works (→ P2P Networking; Open Source). Estimates of worldwide piracy of all intellectual property have calculated losses many times larger than that. The music and motion picture industries have increasingly initiated aggressive legal actions against individuals engaged in, for example, unauthorized downloading of music and films via the Internet, as well as against the providers of software that enables such practices.

The law of intellectual property will continue to evolve in relation to technological developments, and conflicts will continue between those who seek to protect their rights

in such property and those who strive to maintain wide access to society's common heritage of culture and ideas.

## **Interaction**

*W. Russell Neuman*

*University of Michigan*

The term *interaction* is used in diverse social-scientific as well as natural-scientific fields of inquiry to identify a pattern of reciprocal influence or exchange among two or more entities. In physics, scientists have identified such fundamental mechanisms as gravity and magnetism by which particles exert mutual influence on one another. In communication studies and textbooks, perhaps surprisingly, the term is found rather

infrequently. While the core idea of interaction is very close to the concept of communication, a terminology of interaction tends to suggest a particular set of preferred epistemologies, methodologies, and analytical objects in communication research.

### INTERACTION AS EPISTEMOLOGICAL ORIENTATION

Interaction in communication scholarship most often signals a counterpoint to what is still widely perceived as a dominant one-way transmission model of communication effects, typically associated with such early researchers as → Harold D. Lasswell and Claude Shannon. In comparison, → cultural studies scholars, for instance, frequently emphasize the way in which audience members interact with – actively interpret and appropriate – the symbols and ideas that are prevalent in popular culture, rather than simply being influenced by them (→ Interactivity in Reception).

The understanding of interpretation as interaction within communication theory resonates with a much older recognition in philosophy, namely, that symbolic exchange among humans invariably involves a great deal of *ambiguity*. As John Locke put it in introducing a modern conception of human communication, “Words in their primary or immediate Signification, stand for nothing, but the Ideas in the Mind of him that uses them . . . Every man has so inviolable a Liberty, to make Words stand for what Ideas he pleases, that no one hath the Power to make others have the same Ideas in their minds that he has” (quoted in Peters 1999, 84). The analytical attention to ambiguity has been elaborated and systematized, first, in semiotic approaches to communication study (→ Semiotics), exploring the contextualized and fragile character of the semantic meaning that is established in the interaction between signs and interpreters (Leeds-Hurwitz 1993). Second, an interactive perspective is at the forefront of hermeneutic epistemology, which has been drawn into communication research from literary theory and criticism (→ Hermeneutics). Hermeneutic and interpretive terminologies have served to organize reviews of the field of communication theory by, for example, Anderson (1996).

The idea of interaction has also influenced communication research at a social-systemic level. Because interaction is critical to the frameworks of some of the most distinguished social and cultural theorists, especially those with an interest in the cultural reproduction of inequality, several of these have developed neologisms to capture the specific role of interaction processes in their theory-building. In each case, however, the motivation has been to reject a simple one-way causality and to acknowledge a multi-directional behavioral phenomenon. Anthony Giddens (1984), for one, with his influential notion of *structuration*, emphasized what he calls a duality of structure. Society and culture, accordingly, do not simplistically determine individual perception or behavior. But, if cultural traditions resonate with a freely initiated human agency, they function to reproduce the social structure, which survives and evolves in interaction with successive generations of human actors. Jensen (1995) summarized this complex idea in noting that human agency and social structure are enabling conditions for each other. Similarly, Pierre Bourdieu’s (1991) reflexive sociology extended the concept of *habitus* from anthropology to contemporary social theory in an effort to capture the subtle

interaction of social subjects' perceptions and actions in concrete contexts. And Niklas Luhmann (1995) adapted the concept of *autopoiesis* from cybernetics to suggest how the culturally significant selections that are made by individuals out of a wide variety of phenomena in their environment gives a particular social structure its defining character.

## INTERACTION AS DIALOGUE

When communication scholars do refer to interaction, it is frequently in the tradition studying → interpersonal communication, i.e., the micro-analysis of routinized, contextualized, and usually dyadic exchanges between individuals (→ Language and Social Interaction). Everett Rogers (1973) noted that there is a gaping cultural divide between interpersonal and mass communication scholarship, suggesting that perhaps both areas are less well off as a result.

In the tradition of interpersonal communication, researchers typically draw on models such as Giles et al.'s (1991) → communication accommodation theory, which tracks how individuals continuously adjust their speed and style of speaking as well as associated physical postures in conversation as a response to others. Also influential has been Burgoon et al.'s (1995) → interaction adaptation theory, which notes how a speaker may either mirror or compensate for the behaviors of other speakers.

In the 1950s, Gregory Bateson initiated what was to become known as the Palo Alto School, an unusually far-reaching, interdisciplinary group of medical and social researchers. The aim was to develop an elaborate theory of communication as interaction, drawing on cybernetics, systems theory, cultural anthropology, and psychiatry. Its influence is still felt in studies of the psychology of communication and in linguistics.

## SYMBOLIC INTERACTION

A specific position, in the study of communication as well as other research fields, is the symbolic interactionist perspective (→ Symbolic Interaction). The term was coined and popularized by sociologist Herbert Blumer as a tribute to the insights of his mentor, George Herbert Mead. Mead's *Mind, self, and society* (1934) was a highly influential, philosophically grounded book which inspired a generation of social scientists at the University of Chicago and elsewhere. But it was Blumer's essays on methods and his critique of deterministic behaviorism that concretely affected the practice of research. The perspective continues to inform a small but vigorous community of researchers with several journals, perhaps most closely associated with sociology, even if it carries a family resemblance with the understanding of communication as a multidirectional process.

Further, → Erving Goffman's dramaturgical sociology emphasized the micro-analysis of situated human interaction. Although Goffman did not himself use the term "symbolic interaction," his notion of frame analysis continues to influence students of communication who practice observational research of interaction in its social and cultural frames or contexts. Likewise, → ethnomethodology covers a related tradition of research that emphasizes the importance of examining how people rely on mundane "methods" to accomplish communication in everyday contexts.

## STATISTICAL INTERACTION

Statistical interaction refers to a set of research techniques that, except for the terminology of interaction, has been entirely independent of the theoretical and analytical traditions noted above. In fact, these techniques enter into the kind of quantitative analyses of communication effects that, from an interactionist perspective, would typically be characterized as insensitive to the complexity of how humans negotiate meaning with each other and within their environment. Still, statistical interaction may in time provide one methodological bridge between two currently separate scholarly worlds.

Statistical interaction refers to a phenomenon in which the value of a third variable appears to influence the relationship between two other variables. To exemplify, if it is evident that young children are likely to purchase a particular product in response to repeated exposure to an advertisement, while older children are not, then age would be identified as an “interactive variable” modifying the apparent impact of the advertisement.

A reliance on statistical interaction could be considered in the spirit of an interactionist perspective. Because more sophisticated structural models address issues of nonlinearity, they, in turn, become more contextually sensitive. Asking the research question – under what conditions do any observed patterns of correlation appear to hold – it becomes possible to specify more of the constituents of human communication, including those constituents of meaningful interaction that do not necessarily lend themselves to verbalization or explication by participants (→ Statistics, Explanatory).

## THE SIGNIFICANCE OF INTERACTIVITY

The systematic study of how humans interact through the exchange of symbols and reciprocal interpretation predates modern scholarship by centuries – from classical rhetoric to the modern conception of communication by Locke and others. Yet, as noted, the term *interaction* appears only irregularly in current communication scholarship. That seems likely to change in the decades ahead, as new interactive technologies of mediated communication, including the Internet, digital information retrieval and control systems, and video games, grow and spread (→ Human–Computer Interaction; Interactivity, Concept of). As the traditional divide between the micro-level analysis of dialogic human conversation and the macro-level study of mass-mediated technologies in the public sphere increasingly collapses or is reconfigured, interaction may serve as a common denominator for what people do with various types of media.

## Interaction Adaptation Theory

Judee K. Burgoon

University of Arizona

In interpersonal encounters, people are usually responsive and adaptive to others (→ Interpersonal Communication). Their gestures, voices, and words take on the quality of a dance as they mesh with one another to create a coordinated interaction. Interaction adaptation theory (IAT; Burgoon et al. 1995b) predicts and explains how, when, and why people adapt to another's verbal and nonverbal communication (→ Nonverbal Communication and Culture) in similar or dissimilar ways. It focuses on how pairs of communicators – actors and their partners – coordinate their communication styles with one another in ongoing conversations.

### DEFINITIONS OF ADAPTATION AND RELATED PROCESSES

The process of interaction adaptation is complex, nonobvious, and at times invisible. It can take a variety of forms, some of which are defined in Table 1 (see also Bernieri & Rosenthal 1991).

Matching need not be adaptation if people are responding to the same external factor. For example, two people may both have the jitters because they are seated in a very cold room or are nervously waiting for medical test results. Reciprocity and compensation

**Table 1** Forms and examples of adaptation

Term	Definition	Example
Matching	Verbal or nonverbal behavioral similarity between two or more people	A and B both speak loudly
Mirroring	Visual nonverbal similarity between two or more people	A and B both sit with their arms crossed
Complementarity	One person's verbal or nonverbal behavior is the opposite of the other's	A speaks loudly and B speaks softly
Convergence	One person's verbal or nonverbal behavior becomes more like another's over time	A uses formal language and B uses informal language at time 1; A becomes increasingly informal by time 2
Reciprocity	Changes in one person's verbal and/or nonverbal behaviors are met with similar behavioral changes of comparable functional value by the other(s)	Person A makes affiliative overtures by increasing gaze; Person B reciprocates by leaning forward
Compensation	Changes by one person's verbal and/or nonverbal behaviors are met with opposite behaviors of comparable functional value by the other(s)	Person A makes affiliative overtures by increasing gaze; Person B compensates by leaning backward
Interactional coordination/synchrony	Degree to which behaviors in an interaction are nonrandom, patterned, or synchronized in both timing and form	Person A's and Person B's gestures beat in time with Person A's verbal-vocal stream
Nonaccommodation/nonmatching	A communicator makes no change in his or her communication behavior in response to changes by another	Person A shifts from dialect-free speech to using a southern accent; Person B maintains dialect-free speech

(→ Reciprocity and Compensation in Interaction), which are the two patterns of greatest interest to IAT, are adaptive in that one or both parties are directing their actions toward the other person and responsive to what the other is doing. Behaviors that are interchangeable or substitutable (e.g., smiling and warm voices to signal liking) can be used to reciprocate or compensate for one another as long as they are part of the same collection of behaviors that signal the same general meaning or serve a particular purpose, such as signaling attraction (→ Interpersonal Attraction) or expressing an emotional state (→ Emotion).

## FOUNDATIONS OF INTERACTION ADAPTATION THEORY

IAT draws upon assumptions about interpersonal communication from other theories (Burgoon & White 1997). It assumes that humans are biologically programmed to attune (→ Attention) to other members of the same species and that adaptation has survival value. Infants, for example, synchronize their own biological systems to a mother's heartbeat; courting couples exhibit intricate, hidden patterns of flirtatious actions and reactions to one another (Grammer et al. 1998). Communication is made possible by

humans calibrating their messages to one another, and human social organization is thought to depend on a “norm of reciprocity” whereby society’s members are expected to trade good for good and avoid doing harm in exchange for safety from harm. All of these perspectives point to humans adapting in reciprocal ways.

Other biopsychological perspectives lead to predictions that humans will sometimes respond with compensation rather than reciprocity. Like other species, humans are equipped with reflexive fight–flight and approach–avoidance tendencies that may lead to withdrawal in response to another’s approach. An aggressive move forward may be met, for instance, with a submissive step backward or a threat stare may be responded to with downcast eyes. As proposed by → communication accommodation theory, yet other compensatory actions may be deliberate and strategic rather than reactive. Responding to another’s casual language with hyper-formal language may be intended to create social distance. IAT predicts the conditions under which compensatory versus reciprocal responses are expected.

### COMPONENTS AND PRINCIPLES OF IAT

Adaptation patterns depend on three classes of communication-relevant factors that comprise what is called an actor’s *interaction position* (IP). These factors are an actor’s (1) requirements, (2) expectations, and (3) desires. *Requirements* are basic needs or drive states such as refuge, sustenance, comfort, privacy, and insulation from overstimulation. *Expectations* are the verbal and nonverbal communication patterns that people anticipate from others based on what is typical for a given context, setting, or social roles. General expectations (e.g., people should be generally pleasant and involved during social conversations) can be adjusted for knowledge of individual differences (e.g., knowing that a friend is usually shy and subdued). *Desires* refer to communicators’ own goals, plans, and personal preferences; they are the “valence” or evaluative component of IAT. They are what people want as opposed to what they expect. Job applicants may want a relaxed and light-hearted environment for a job interview yet expect it to be a formal and sober occasion.

An actor’s requirements, expectations, and desires – RED for short – together form the net index or quotient called the IP. The IP is a summary estimation of how an interactant (usually self) is projected to behave at any given point in an interaction. IAT spells out circumstances under which requirements supersede other factors, and expectations supersede desires. For example, if someone is extremely tired, the requirement for sleep will override that person’s ability to show expected levels of interest and energy. Or, if a situation calls for formal decorum, that expectation will override one’s desire to show exuberance. When there are no pressing requirements to distract someone, then expectations and desires prevail.

The IP is compared to the actual behavior (A) exhibited by the partner on some behavioral continuum such as conversational interest or pleasantness. Suppose that a behavioral continuum ranges from a low end of complete detachment and disinterest to high involvement and interest. IAT predicts that if the partner’s A exceeds the actor’s IP (i.e., is located closer to the positive end of the continuum), the actor will reciprocate the partner’s behavior. If the partner shows higher interest (A) than what the actor expects

(IP), the actor is predicted to reciprocate the partner's higher interest level. Conversely, if the IP exceeds the A – the actor expects moderately high interest but the partner is detached and disinterested, IAT predicts that the actor will compensate by displaying the behavior expected and desired of the partner (higher engagement). Another example: if the actor desires a pleasant conversation (IP) but the partner appears to be in a bad mood (A), the actor will attempt to change the partner's bad mood by becoming even more pleasant. If the partner responds in the desired fashion, both parties are predicted to converge toward the other's behavior and arrive at a point where the IP and A are essentially the same.

Where it is infeasible for actors to change their behavior, IAT predicts that actors will use nonaccommodation (maintaining their current behavior) as a way to resist the partner's undesired or unexpected demeanor. Over time, however, if compensation fails to bring about the desired level of behavior from the partner, IAT predicts actors will adjust their RED factors and with it, the IP. For example, a person should eventually lose the desire to have a pleasant interaction with someone who is unpleasant and should eventually reciprocate the partner's negativity. Thus, interactions are expected to be dynamic, cyclic, and evolving events with requirements, expectations, and desires both guiding and responding to what transpires in the interaction.

IAT also takes into account people's individual communication abilities and behavioral repertoires (→ Communicator Style; Interpersonal Communication Competence and Social Skills) as well as environmental constraints that may limit the extent to which adaptation is possible. Stated formally, a person's degree of adaptation is predicted to be a function of (1) own current behavior, (2) own social skills and behavioral repertoire, (3) own previous behavior (which results in some consistency over time), (4) partner's current behavior, and (5) environmental constraints.

## TESTS OF IAT

Tests of IAT have taken a variety of forms and have considered adaptation in such varied circumstances as interactions among dating partners, deceptive interactions (→ Deception in Discourse; Deceptive Message Production), and simulated medical interviews. Floyd and Burgoon (1999) experimentally manipulated expectations to create different IPs related to liking and then had participants interact with a confederate who showed liking or disliking. Participants who expected, desired, and received liking displayed more liking toward their partner than those who expected, desired, and received disliking. Those whose IP exceeded the A – they expected and desired liking but received disliking, or expected and desired disliking but received liking – compensated relative to those for whom A equaled or exceeded the IP. Thus, results provided consistent and strong support for IAT.

Other experiments (e.g., Burgoon et al., 1995a, 1995b; Le Poire & Yoshimura (1999) have produced a preponderance of reciprocity but also compensation or nonaccommodation under conditions that could be interpreted as creating negative arousal and discomfort. For example, people interacting with an uninvolved, unpleasant partner showed an average dampening of their own involvement, i.e., they reciprocated, but over time they compensated by increasing their own involvement. Thus, pleasant and desirable behavior

generally begets responses in kind whereas unpleasant and undesirable behavior begets a mix of responses (→ Nonverbal Signals, Effects of).

Guerrero and Burgoon (1996) examined how people's various forms of attachment to caregivers or significant others affect adaptation patterns. The majority reciprocated their romantic partner's increased involvement and compensated for decreased involvement, but, as predicted, patterns varied according to attachment style. Those who were preoccupied with their romantic relationship conformed the most to these reciprocity and compensation patterns; those who had ambivalent feelings about their relationships were the most variable. Other individual differences and contexts for interaction have yet to be tested.

# Interactional Sociolinguistics

*Benjamin Bailey*

*University of Massachusetts Amherst*

Interactional sociolinguistics is concerned with how speakers signal and interpret meaning in social interaction. The term and the perspective are grounded in the work of John Gumperz (1982a, 1982b), who blended insights and tools from anthropology, linguistics, pragmatics, and conversation analysis into an interpretive framework for analyzing such meanings. Interactional sociolinguistics attempts to bridge the gulf between empirical communicative forms – e.g., words, prosody, register shifts – and what speakers and listeners take themselves to be doing with these forms. Methodologically, it relies on close → discourse analysis of audio- or video-recorded interaction. Such methodology is central to uncovering meaning-making processes because many conventions for signaling and interpreting meaning in talk are fleeting, unconscious, and culturally variable.

## ORIGIN AND THEORY

Interactional sociolinguistics was developed in an anthropological context of cross-cultural comparison, and the seminal work that defined interactional sociolinguistics focused largely on contexts of intercultural miscommunication (→ Intercultural and Inter-group Communication; Comparative Research). It is in such contexts – where unconscious cultural expectations and practices are not shared – that the perspective has the most salient explanatory value. The perspective has been extended to cross-gender communication, most notably by Deborah Tannen (1990), and it has also been applied to the performance of social identity through talk. The framework can be applied to any interaction, however, and much of the empirical work that falls under the rubric “discourse analysis” in communication, linguistic anthropology, sociology, discursive psychology, and socially oriented linguistics owes a debt to this perspective.

The key *theoretical contribution* of interactional sociolinguistics is to illustrate a way in which social background knowledge is implicated in the signaling and interpreting of meaning. While ethnographers of communication have long emphasized that talk is contextually and culturally embedded, they have not specified how sociocultural and linguistic knowledge are systematically linked in the communication of meaning (→ Ethnography of Communication). Gumperz’s interactional sociolinguistics operationalizes a dimension of this relationship. His program shows that socio-cultural knowledge is not just beliefs and judgments external to interaction, but rather is embedded within the talk and behavior of interaction itself. At a theoretical level, this undermines a “conduit metaphor” or “information theory” notion of communication, in which context is presumed to be discrete and separate from communicative content.

Gumperz argued that we communicate rapidly shifting interpretive frames through conventionalized surface forms, which he calls *contextualization cues*. These contextualization cues – “constellations of surface features of message form” – are “the means by which speakers signal and listeners interpret what the activity is, how semantic content is

to be understood and *how* each sentence relates to what precedes or follows” (1982a, 131). These surface forms range across semiotic modes, including such varied phenomena as prosody, code and lexical choice, formulaic expressions, sequencing choices, and visual and gestural phenomena. They are united in a common, functional category by their use, commonly in constellations of multiple features. They cue interpretive frameworks in which to interpret the propositional content of utterances, which can otherwise be ambiguous.

An example can illustrate the dual functioning of the communicative stream as both referential content and a context in which to interpret that very referential content. In American English, the utterance “Nice tie!” can represent a sincere compliment, or it can represent a joking insult, i.e., that the speaker finds the tie somehow inappropriate. Contextualization cues within the performance of the utterance can suggest the frame in which the utterance is to be interpreted. A broad smile and marked intonation accompanying the words “Nice tie!” can serve as contextualization cues that channel inferential processes toward a particular interpretation. Contextualization cues do not *directly* index or refer to a specific interpretive frame, but rather serve as prods to inferential processes. A smile, for example, does not always indicate a joking insult frame for the talk that it accompanies. The functioning of a given cue is made even more ambiguous by the fact that such cues typically occur in constellations of features, e.g., a smile *and* a marked intonation contour, in which the constellation of features channels inferential processes differently than any one feature, in isolation, might.

The functioning of such cues also depends on the broader *socio-cultural context*. A “joking insult frame” is more likely to occur in some US settings than in others, e.g., in informal interaction between male friends. Inferring a “joking insult” meaning of the utterance “Nice tie!” thus involves interpreting both the external, socio-cultural context of the interaction and the moment-to-moment interpretive contexts created within the stream of communicative behavior itself. Such cues and inferential patterns are acquired through prolonged and intensive face-to-face interaction in particular cultural settings, typically as part of one’s primary language socialization. Contextualization conventions vary across cultures and sub-cultures, just as languages and accents vary across social groupings. They thus form part of one’s socio-cultural background, just as other cultural practices and beliefs do.

## CULTURAL DIFFERENCES

Cultural differences in contextualization conventions can undermine intergroup communication insidiously because individuals tend to be unconscious of this dimension of interaction. Contextualization cues have several characteristics that make them difficult to recognize. They tend to be scalar, i.e., they vary along a continuum, such as pitch, rather than existing as discrete forms, such as individual lexical items. Most such cues are nonreferential, i.e., they carry no direct propositional information, but rather serve meta-communicative framing functions. Finally, their meanings are a function of the context of their use, so that individual cues cannot be analyzed in isolation from their use or assigned a single, stable function or meaning. It is thus very difficult for individuals to recognize these cues or the roles that they are playing in communication. While individuals from different

cultures may well be aware of speaking different languages or dressing differently, they are seldom aware of the ways in which slight differences in contextualization conventions can create interactional difficulties.

Gumperz (1982a, 173) reports, e.g., how intonation in uttering a single word led to misunderstandings that damaged relations between South Asian immigrant cafeteria workers and Anglo British workers at a British airport. When an Anglo British cafeteria server in this workplace offered gravy to a person in line, she would say “Gravy?” with a rising intonation contour. Anglo British workers used this prosodic information to interpret the utterance as an offer or question: “Would you like gravy?” In contrast, when recently-immigrated South Asian cafeteria workers asked employees if they wanted gravy, they said “Gravy” with falling intonation. Anglo British workers interpreted the falling intonation as contextualizing a statement (akin to “This is gravy – take it or leave it”), which they found redundant and rude. Neither Anglo British nor South Asian workers were able to articulate the role that intonation played in their problematic interactions until it was pointed out by outside trainers. Thus, while two groups may “speak the same language,” i.e., share syntax, phonology, and vocabulary, they may differ in the ways they meta-communicatively define the moment-to-moment activities in which they are engaging.

Because socio-cultural differences in contextualization conventions are unconscious, they are not a readily available explanation to participants for breakdowns in communication or stilted, asynchronous interactions. When a person recognizes an apparent communicative breakdown or disjuncture in interaction, a psychological idiom is readily available to explain an interlocutor’s behavior, i.e., the other’s behavior can be accounted for in terms of rudeness, insensitivity, selfishness, or some other personality trait. When such problematic interactions come to be associated with interaction across ethnic or cultural lines, it can result in pejorative stereotyping of entire groups and the reinforcement of intergroup boundaries.

## METHODOLOGY AND LIMITATIONS

Isolating and defining the functions of contextualization cues requires the use of electronic recordings and systematic elicitation techniques to recover native speakers’ perceptual and inferential processes. In the example of “Nice tie!,” native consultants can be asked such questions as: “How do you know that this was meant as a joking insult rather than a compliment? What was it about the way that Speaker A said it that makes you think it is an insult? Can you say it to me in a way that would be an insult and then say it to me in a way that would be a compliment?” Such techniques allow one to link specific surface forms of discourse (prosodic patterns, code switches, visual phenomena, etc.) to communicative effects and interpretive patterns. When consultants from a given social group provide consistent interpretations of a communicative sequence and consistently draw attention to the same empirical communicative features as bases for that interpretation, it provides evidence for socio-culturally specific contextualization conventions.

The tools, methods, and implicit theory of interactional sociolinguistics are eclectic. It shares with → conversation analysis an insistence on careful, line-by-line analysis of recorded, naturally occurring talk, but it diverges from conversation analysis in exploring

inferential processes and social and cultural worlds outside of that talk. With anthropology it shares a focus on cultural variation and the meanings that participants themselves attribute to their lives and actions. From philosophy of language and linguistics it borrows such notions as implicature and speech acts, but it attends to real people in their actual, messy interactions. With research in communication, it shares an interest in actors' apparent strategies and intended meanings in talk, and it overlaps with strands in many of these disciplines that attend to communicative frames and meta-discursivity in talk and interaction.

Some scholars have criticized interactional sociolinguistic accounts of intercultural miscommunication, arguing that apparent miscommunication is more a function of social and political inequality than of divergent patterns for linking surface communicative forms and meanings. Problematic interactions are thus seen not as "misunderstandings," but as a form of communication that highlights ongoing differences in perspective and socio-political interests. Many studies of intercultural miscommunication *have* failed to attend to the role of inequality in such interactions. This is not a shortcoming in the perspective of interactional sociolinguistics per se, but a limitation of such studies themselves. Interactional sociolinguistics is first and foremost a method for analyzing how social knowledge and linguistic knowledge intersect in creating meaning in talk. Such a method can be used to show how inequality and conflicting interests are negotiated in talk just as it can be used to show how cultural and linguistic differences can play out in such interaction.

Interactional sociolinguistics, with its notions of contextualization cues and conversational inferencing, provides a powerful framework for examining meaning-making at the intersection of talk and culture. Like other perspectives, such as indexicality, that focus on the intersection of talk, culture, and meaning, interactional sociolinguistics is fundamentally interpretive, rather than predictive. With its eclectic toolbox and unabashedly functional orientation, interactional sociolinguistics lacks the theoretical austerity of many approaches to interaction and meaning. However, it makes up for this lack of theoretical elegance with its usefulness and its insights into the social and cultural nature of communicative action. It helps to account for how different dimensions of communicative behavior are related, e.g., prosody and words, and to explain the achievement, or lack of achievement, of intersubjective understanding in particular instances of interaction.

## Interactivity, Concept of

W. Russell Neuman

University of Michigan

Interactivity is a relatively new, evolving, and still elusive concept in the study of communication, most frequently associated with new digital media technologies (→ Digital Media, History of). The concept's elusiveness may result from the common use of the term to identify a loosely defined bundle of attributes rather than a single attribute or phenomenon. At its core, interactivity refers to the phenomenon of mutual adaptation, usually between a communication medium such as the Internet or a video game and a human user of that medium.

A seminal, if somewhat *technical, definition* of interactivity was offered by Rafaeli (1988, 111): "Formally stated, interactivity is an expression of the extent that in a given series of communication exchanges, any third (or later) transmission (or message) is related to the degree to which previous exchanges referred to even earlier transmissions." The key element is *responsiveness* – what one says or does depends on another – a notion clearly rooted in human face-to-face conversation. However, given the rich possibilities of human-machine communication, Rafaeli warned that a model narrowly based on dyadic human conversation would be too simplistic and reductive. Interactivity, to Rafaeli, is a quintessential concept regarding the nature of communication.

In his original account of interactivity, Rafaeli considered the term "intuitively appealing but underdefined." Similarly, Jensen (1998) found it "frequently used but seldom understood" and "outrageously complex," while Sundar (2004) characterized it as "much touted but undertheorized." In a review of the literature, Bucy (2004, 373) concluded that "interactivity has been identified as a core concept of new media, yet despite nearly three decades of study and analysis, we scarcely know what interactivity is, let alone what it does, and have scant insight into the conditions in which interactive processes are likely to be consequential for members of a social system."

### KEY CRITERIA OF INTERACTIVITY

From more than a dozen published typologies of interactivity, one can derive four common themes, even as terminologies vary. The first and perhaps most straightforward criterion is the *directionality* of communication. Throughout most of the late agricultural

and industrialized eras, mass communication was a distinctly one-way process with centralized and usually elite-dominated publishing and later broadcasting from the few to the many. Newspapers, for example, will publish occasional letters from readers, but the limited technology and large number of readers make feedback from audience to source extremely constrained (→ Newspaper, History of). Broadcast spectrum scarcity imposed even more severe constraints on the number of broadcasters through government licensing. Citizens' Band and amateur radio represented fascinating, but marginal, exceptions to the one-way flow (→ Radio: Social History). Advanced digital systems and the Internet changed these conditions fundamentally, as every audience member was empowered to send as well as receive data, text, audio, and video (→ Internet). The propensity for average users to download more than they upload generally is the result of individuals' limited cognitive and social resources, rather than an outcome of the technology itself.

The second criterion is *selectivity* – the breadth of choice that is available to the user in terms of both types and formats of information and entertainment. Selectivity depends on the quantity of material on offer, but also on the quality of its structure and, hence, the ease with which it can be accessed.

The third criterion is *responsiveness* – the rapidity with which and extent to which a medium responds to user input. Some analysts emphasize the speed of response, notably with video games. Others focus on the frequency or flexibility of an interaction, i.e., the interruptibility of a given stream of communication content.

The fourth criterion is *awareness*, defined as the degree of reciprocal awareness of system states and user reactions. As specified by Rafaeli (1988), later interactions of an exchange can reflect an awareness of earlier ones, as typified by human conversation. Heeter labeled this phenomenon self-monitoring (1989). Describing awareness as “actions and reactions with an understanding of context and meaning,” van Dijk (1999) noted that such a genuinely reciprocal awareness on behalf of both user and system is still relatively rare at the current level of technology.

## INTERACTIVITY, HUMAN INTERACTION, AND TEXTUAL INFORMATION

Most analysts acknowledge that the evolving interactive media are implicitly and often explicitly modeled on human social interaction. The *Turing test of machine intelligence* from 1950, for example, proposed to determine if a human conversing with a remote computer via a keyboard could determine whether the answering entity was another human being at a keyboard. If the questioner cannot determine this, the machine could be said to have passed the test of having “human intelligence.” In the following decades, a variety of so-called chatterbot programs, notably Weizenbaum's Eliza program, proved successful in posing as human communicators (→ Avatars and Agents). Reeves and Nass (1996), more recently, documented experimentally people's propensity to assign human qualities to media technologies in the course of interaction (→ Media Equation Theory). And computer games now routinely permit players to select human traits such as strength, bravery, and agility in building identities for themselves as well as their on-screen allies or adversaries (→ Video Games).

Also, *one-directional mass communication*, for example, broadcast television, can produce an experience of interacting with other humans on-screen. In the phenomenon

of parasocial interaction, audience members may derive comfort and pleasure from the sense of having familiarity or even a personal relationship with fictional characters and media celebrities (→ Parasocial Interactions and Relationships). First identified in 1950s research, such mediated “intimacy at a distance” has remained a staple of communication studies.

Even the process of *reading traditional texts* might be understood as active human communication, paralleling human conversation and anticipating human–computer interactivity (→ Interactivity in Reception). Hermeneutic and semiotic traditions have drawn attention to the subtleties of interpretation and anticipation as a reader progresses through the elements of a narrative. Reading is not a one-way flow even if there is no explicit feedback loop from reader to author. The conception of interactivity as an entirely new phenomenon in computer media, thus, may reflect an incomplete understanding of how users interact dynamically with both old and new media.

### **TOWARD AN OPERATIONALIZATION OF INTERACTIVITY**

Researchers have debated whether interactivity is best studied as a property of a media system or, instead, as a human user’s psychological perception of the responsiveness of the medium. Bucy (2004), among others, made the case that interactivity should be conceptualized exclusively as a *perceptual variable*, arguing that the perceived reality of participating is more important than the technical reality of users’ actual input or control: “Routinizing interactivity by designating it as a perceptual variable (albeit with social, behavioral and technological correlates) should encourage the concept’s theoretical development by enabling empirical measurement through attitudinal and emotional scales and qualitative elaboration through focus groups research and open-ended questions, allowing systematic knowledge about interactivity to accumulate” (Bucy 2004, 377). Sundar (2004) and others, in contrast, have insisted that the perceptual variable approach is a tactical mistake. They argue that the vagaries of psychological perception and misperception will muddy the conceptual waters, and that it is at least necessary analytically to separate user inclinations and skills from the technical capacities of systems.

Perhaps in time communication research will acknowledge several components of interactivity in a multilayered model: (1) the technical affordance of interactivity (or components thereof), (2) the user’s perception of an interactive potential, (3) the actual use of the affordance, and (4) behavioral outcomes resulting from either perception or use. The potential importance of examining these levels independently was suggested by a study that revealed, surprisingly, no correlation between the affordance and perception of interactivity (McMillan 2002).

### **THE DESIGN AND EFFECTS OF INTERACTIVITY**

The literature on interactivity has been more utopian than dystopian, tending to celebrate the benefits of presumed higher levels of attention, engagement, learning, and satisfaction. In historical perspective, however, this might be akin to arguing that if there are more books in libraries, the populace will be better informed. The interactive affordances of new media systems may indeed contribute significantly to positive outcomes, but only under certain conditions of expectation and motivation, with appropriate designs, and

for certain types of users. Overly complex designs and overwhelming choice opportunities generally have proven frustrating. Some forms of narrative interactivity show themselves to be engaging and enjoyable to users with high cognitive capacities, but not to those with lower capacities (Vorderer et al. 2001).

Future research might even establish a curvilinear pattern identifying an optimum level of interactive affordances under specified conditions for specified types of users (Bucy 2004). In order to understand interactivity in practice, it is important to study the motivations of and constraints on information providers as well. In the socially important area of political communication, Stromer-Galley (2000) found that not only did the campaign staffs managing political candidates' websites have limited resources to respond to every query, but they also expressed significant ambivalence concerning how much information might be in the candidate's best interest to convey.

Increasingly, what was once a narrow technical sub-field of computer science – → human–computer interaction addressing the design of graphical and textual interfaces – has come to draw from and contribute to the understanding of human communication more broadly defined. The practical need to improve interface designs in new media provides problems, funding, and intellectual energy to the broader practice of communication research. It is widely recognized that a better general understanding of human attention, perception, and memory – as they affect, for instance, interactivity – is required for the field to progress (Nardi 1995).

# Interactivity in Reception

*Kwan Min Lee*

*University of Southern California*

*Interactivity* is regarded as one of the most critical concepts in new media theories due to the increasing popularity of interactive media such as the → Internet, computer games, and computer-mediated communication (CMC) media (→ Video Games; Human-Computer Interaction). Despite the explosion of theoretical discussions on the concept of interactivity, a precise explication of the concept is yet to be accomplished. As a result, this concept often implies different things to different people in different contexts.

## PREVIOUS DEFINITIONS

Three main views of interactivity – technology-oriented, communication-setting-oriented, and individual-oriented views – can be categorized from the previous literature. First, *technology-oriented* views regard interactivity as a characteristic of new technologies (usually containing a computer as a component) that makes an individual's participation in a communication setting possible and efficient. For example, Steuer (1992, 84) defines interactivity as “the extent to which users can participate in modifying the form and content of a mediated environment in real time,” and argues that interactivity is a stimulus-driven variable determined by three technological structures of the medium: speed (the rate at which input can be assimilated into the mediated environment), range (the number of possibilities for action at any given time); and mapping (the ability of a system to map its controls to changes in the mediated environment in a natural and

predictable manner). Similarly, Heeter (1989) proposes six dimensions of the technological structure of interactive media determining the level of interactivity: complexity of choice available; effort users must exert; responsiveness to the user; monitoring information use; ease of adding information; and facilitation of interpersonal communication. Although technology-oriented approaches have been most popular in academic discussions, they have inherent problems in that even the same medium can be considered as having a different degree of interactivity according to the way it is actually used by an individual. For example, if a user has competence in using every command of a computer game, the user may feel much more interactivity in playing the game than a novice user. Therefore, the notion of interactivity as a characteristic of a particular medium is null in that a medium itself cannot have a fixed degree of interactivity.

Second, *communication-setting-oriented* views consider interactivity as a process-related characteristic of a communication setting. Rafaeli (1988, 111) defines interactivity as “an expression of the extent that in a given series of communication exchanges, any third (or later) transmission (or message) is related to the degree to which previous exchanges referred to even earlier transmissions.” Focusing on the diverse content styles of communicated messages, Chaffee and his colleagues (1985) propose seven dimensions of interactivity according to which the level of interactivity varies: acknowledgment (simple acknowledging of previous message); monitoring (keeping track of all previous messages); processing (paraphrasing and summarizing); interpreting; evaluating; challenging (response in opposition to previous messages, or suggesting alternatives); and eliciting general affect (moving beyond the specific topics and giving a general statement). Communication-setting-oriented definitions, which emphasize mutual exchanges of information, also contain problems in that they make unrealistic assumptions that every participant of a communication setting wants the same level of information exchange and that the actual exchange of information is the first condition for interactivity. However, a symmetrical flow of information is rare and interactivity can occur without the actual exchange of information. For example, in a massive multi-player game, a participant may feel a high level of interactivity by merely observing and reading other players’ behaviors and text messages, even when she or he is not actively participating in virtual social interaction. Most fundamentally, these definitions cannot explain the fact that interacting participants in the same communication setting could have different levels of interactivity. That is, these definitions cannot explain why players of the same computer game can feel different levels of interactivity even when they are part of the same communication setting.

Finally, *individual-oriented* views define interactivity from a technology user’s perspective. Emphasizing individual differences in communication needs, Ha and James (1998, 461) define interactivity as “the extent to which the communicator and the audience respond to, or are willing to facilitate, each other’s communication needs,” and propose five dimensions of interactivity according to five fundamental communication needs: playfulness (entertainment experience); choice (availability of choice and freedom from restrictions); connectedness (feeling of connection to the world); information collection (data gathering); and reciprocal communication (two-way communication). This shift of attention from technology to individual users opens a space in which to generate theories that can cut across different technologies. Existing individual-oriented

views of interactivity, however, cannot be successfully applied to human–machine (or human–computer) interaction settings, because they were made in the context of human-to-human communication settings (i.e., mediated interpersonal communications) in which at least two interacting humans are required. Therefore, a possible human–machine interaction, such as that between a game player and an autonomous software agent in a game world, cannot be easily explained by existing individual-oriented definitions.

### CONCEPT EXPLICATION

In order to solve the various problems of the early definitions, interactivity should be regarded as a perceived characteristic of a communication act, which varies according to a communicating actor's perception. That is, interactivity is not just a given characteristic of a particular medium or a communication setting, but a constructed characteristic of a communication act according to an individual's perception (Vorderer 2000).

Interactivity has two Latin roots – “*inter*,” which broadly means “between or among” and “mutual or reciprocal,” and “*act*,” which means “do.” Together, “interact” means to act upon each other and to have → reciprocal effects or influences. Therefore, interactivity can mean “the state of acting upon each other and having reciprocal effect or influence.” This nominal definition makes it clear that interactivity requires two fundamental conditions: at least two interacting partners (usually two persons, or in the case of human–machine interaction, a person and an artifact), and reciprocal effects of an interacting participant's act on the communication process. Based on the two fundamental conditions raised above, the conceptual meaning of interactivity can be defined as a perceived degree to which a person in a communication process with at least one more interacting partners can bring a reciprocal effect to other participants of the communication process by turn-taking, feedback, and choice behaviors (Lee et al. 2006).

The term “perceived” means that the interactivity defined here is more concerned with the individual's subjective perception than with objective technology characteristics. “Communication process” means a type of communication act such as interpersonal conversation, TV watching, playing computer games, using a computer, and so forth. “Interacting partner” can be a person or an artifact such as an avatar, a software agent, or a robot. “Reciprocal effect” means that an act by an interacting partner should bring a result in the form of visible changes to the acts of other interacting partners in that communication process. “Turn-taking” means the change of role between and among interacting partners. It is different from feedback in that it is over a longer time period and requires interacting partners to formally take the other's role. “Feedback” means interacting partners' reactions to the other interacting partners' messages or behaviors. “Choice” means interacting partners' selection from various sets of available options or possibilities provided by technologies.

This definition of interactivity can be applied to broad areas of communication settings, including interpersonal, mediated, and even human–machine interaction situations. It assumes that the level of interactivity varies quantitatively across individuals and each given communication process. Therefore, using the same technology or being in the same communication setting does not guarantee the same level of interactivity. For instance, computer game players can feel different levels of interactivity depending on their experience

and behaviors during the game. The level of interactivity becomes higher as players acquire more confidence about the process through their own efforts and experiences.

## MEASUREMENT AND FINDINGS

Reflecting the three approaches to concept explication, there have been three major methods of concept measurement (Kioussis 2002). Measurements based on *technology-oriented* views try to objectively examine the technological properties of a system (or a medium) on the basis of key technological dimensions such as speed, range, mapping, modality, and usability or easiness of the system. Studies in this tradition tend to manipulate the objective level of interactivity by changing the technological features of a system (e.g., the length of delay in feedback, the number of available channels for interpersonal communication, the number of options available for maneuvering a virtual world). Measurements based on *communication-setting-oriented* views focus on the flow and changes of communicated messages, and examine processes of joint actions between and among interacting partners. For example, through content analyses (→ Content Analysis, Quantitative), researchers identify the level of spontaneity, patterns of turn-taking, degree of reflection on prior messages in overall messages, level of agreement among interacting partners, and pattern of changes in message content (Rafaeli & Sudweeks 1997). The third set of measurements emphasizes *user experience*, and tries to measure perceived level of interactivity. Through → interview and questionnaire, researchers ask how users evaluate the interactivity of a particular communication system or a → medium. Usually, items for measuring perceived interactivity are about the degree of similarity between nonmediated and mediated interaction, level of psychological proximity among interacting partners, and subjective evaluations of a system's interactive features (e.g., speed, range, and mapping of the system) and usability. In some cases, the perceived level of interactivity can be objectively and indirectly measured by physiological symptoms of psychological involvement such as heart rate, skin conductance, and blood pressure. Extra caution should be observed in interpreting physiological measures because they are only proxy (→ Physiological Measurement).

Prior studies indicate three general effects of interactivity: attitudinal, cognitive, and behavioral (Sundar 2004; → Attitudes; Cognition). The attitudinal effects of interactivity are more feelings of → presence, social responses to systems or media (→ Media Equation Theory), more intense involvement in communication process and message, and positive attitudes toward advertised products (→ Advertising) and political candidates (→ Election Campaign Communication). Some findings on threshold effects of interactivity, however, suggest that the relationship between the level of interactivity and positive attitudes toward advertised products or political candidates might not be linear (Sundar et al. 2003). Cognitive effects are more attention to and memory of communication content, enhanced cognitive processing of messages, and more learning in an educational context (→ Educational Communication; Learning and Communication). Too much interactivity, however, can cause cognitive overload and disorientation, and eventually hinders learning (Ariely 2000). The behavioral effects of interactivity are heightened interactions among interacting partners, physiological excitation, elimination of unnecessary communication caused by misunderstanding, and even more buying in commercial websites.

## **Inter-American Court of Human Rights**

*Toby Mendel*

*Article 19, Global Campaign for Free Expression*

The Inter-American Court of Human Rights, established by the → American Convention on Human Rights (ACHR), is the leading regional human rights court in the Americas. The Court consists of seven judges, elected by secret ballot by member states of the Organization of American States (OAS).

Cases may be referred to the Court only by the Inter-American Commission on Human Rights or a member state and only where the state in question has voluntarily

submitted itself to the Court's jurisdiction. Cases may be contentious individual or group complaints of a violation of a right, complaints by a state that another state has violated a right, or a request by a state for an interpretation by the Court of the ACHR, outside of the context of a contentious dispute (known as *advisory opinions*). Most contentious individual cases are referred to the Court by the Commission, which may do so only after it has itself received and processed an individual or group complaint and the state in question has not taken the necessary steps to remedy the violation.

Where it finds a violation, the Court may order such measures as are necessary to restore respect for human rights, and may also order compensation to be paid to the victim. The decisions of the Court are legally binding and, under the ACHR, states formally undertake to comply with them, although there is little the Court can do if states refuse to comply. For the most part, however, states do respect the decisions of the Court.

The ACHR provides, among other things, a very strong guarantee for freedom of expression. The Court has issued a number of significant rulings in freedom of expression cases. Perhaps the most significant case decided by the Court, and also one of its earliest, was an advisory opinion referred to it by Costa Rica to determine whether a law requiring journalists to be licensed was compatible with the guarantee of freedom of expression. This case has been referred to frequently in the Court's later jurisprudence.

In its 1985 decision, the Court made a number of important general observations about the ACHR guarantee of freedom of expression. It described freedom of expression as a "cornerstone" of democracy. It also held that the right has a dual nature, protecting not only the right of individuals to express themselves, signaled by the term "impart" in the guarantee, but also the right of others to receive information and ideas, signaled by the term "seek, and receive." Specifically, the Court stated: "Its second aspect, on the other hand, implies a collective right to receive any information whatsoever and to have access to the thoughts expressed by others." The Court also noted the particular importance of the mass media in making "freedom of expression a reality" and of the need for the media to be pluralistic to achieve this goal.

The Court rejected claims by the government that the licensing of journalists was necessary for the protection of public order and to maintain professional standards, holding instead that respect for freedom of expression was the best guarantor of public order. Importantly, the Court held that the practice of journalism is the "primary and principal manifestation of freedom of expression" and that, as such, it could not be treated in the same way as other professions. The licensing system represented a serious limitation on freedom of expression that could not be justified by reference to an overriding public or private interest.

In another important case, decided in 2001, the Court provided a strong interpretation of the ACHR's rule against prior censorship, holding that the refusal of the authorities to permit the airing of a movie – *The Last Temptation of Christ* – on religious grounds was a form of prior censorship and hence a breach of the right to freedom of expression. Although limited prior censorship to protect children was permitted under the ACHR, the religious grounds invoked by the authorities in this case did not bring it within the scope of that permission.

In two cases decided in 2004, the Court took a strong stand against criminal defamation laws, while stopping short of ruling outright that they breach the right to

freedom of expression. In both cases, the Court held that the statements on which the national criminal defamation convictions were based related to matters of public interest. These decisions make it clear that, in the case of such statements, it will be very difficult, if not impossible, to justify a criminal defamation conviction. In the first case, the Court also made it clear that a journalist should not be expected to prove the truth of statements that were originally reported in respected foreign newspapers.

Finally, in a seminal case decided late in 2006, the Court held that the right to freedom of expression as guaranteed under the ACHR includes a right of everyone to access to information held by public bodies. This decision represents a significant breakthrough in this area, going beyond what has been decided by other international courts. In its decision, the Court noted the close relationship between access to information and expression, holding that both are essential for effective participation in governance. Restrictions on access to information may be imposed, subject to the same conditions as apply to restrictions on imparting information, and the state bears the burden of showing that any such restrictions are legitimate.

# Intercultural Communication in Health-Care

*Bernadette M. Watson*

*University of Queensland*

In the twenty-first century mankind lives in a more multicultural environment than ever before. For many health practitioners this means they have to interact with people from different cultures. Good communication is vital to effective health-care, so communication problems in intercultural encounters have the potential to lead to patient misdiagnosis. In such encounters health practitioners not only face the natural barriers of communicating with patients who may be unfamiliar with the health practitioners' language, but they may face an extra challenge when patients have culturally different health belief systems (→ Health Communication; Doctor–Patient Talk).

Researchers have noted that much research on health-care communication has been atheoretical (e.g., Thompson 2003). Research into intercultural communication and health-care is no exception. Thus, one approach adopted by researchers of intercultural communication and health-care is to focus on the development of skills. When health-care professionals achieve good communication skills and intercultural understanding, *intercultural communication competence* (ICC) follows. The underlying assumption of ICC is that communication predominantly occurs at the interpersonal level and through training individuals gain knowledge and appreciation of other cultures, and *cultural sensitivity* develops (→ Intercultural Communication Training). A second approach, which is less commonly adopted in health-care, takes as its starting point the notion that intercultural communication is essentially intergroup rather than interpersonal; this tradition comes from a socio-psychological perspective and is referred to as *intergroup communication* (→ Intergroup Contact and Communication).

## INTERCULTURAL COMMUNICATION COMPETENCE

ICC researchers see a need for individuals to move beyond *ethnocentrism* in order to improve their intercultural communication (for a discussion, see Kreps & Kunimoto 1994). Through training, health professionals can acquire the appropriate intercultural communication skills to achieve effective patient interactions regardless of cultural backgrounds.

Researchers have identified the key cultural differences that health practitioners need to take into account when treating patients from cultures other than their own (Kleinman 1980; Brislin 1993; Kreps & Kunimoto 1994; Davis 2006). Health providers need to be cognizant of both *culture-general* and *culture-specific* concepts. While there may be general health expectations across populations regardless of nationality (e.g., the ability for individuals to perform their day-to-day tasks), different cultures attach different meanings to these common concepts. In their concept of “health,” for example, Brislin noted that western cultures may be more concerned with the absence of bacteria or viruses while eastern cultures may concentrate on harmony and balance – each culture believing that

the opposite of their definition brings ill health. Such differences may lead to health practitioners' best practice recommendations being resisted or misunderstood by patients. Related to cultural-specific beliefs is the way that people of different cultures may show different symptoms for the same illness. Health providers need an understanding of how *somatization* manifests in different cultures (Kreps & Kunimoto 1994; Davis 2006).

Relatedly, Davis (2006) discusses the implications of *collectivist* and *individualistic* cultures. Such cultures have respectively high and low context styles of communication. Davis notes that because most health professionals are trained in the western individualistic tradition, they need to be aware of the importance that many eastern collectivist cultures place on developing a trusting relationship over time. Modern curricula now teach health practitioners to consider issues such as those raised above (e.g., Carrillo et al. 1999).

### INTERGROUP COMMUNICATION

This second tradition focuses on each group's socio-historical context and the relationships that exist between groups. Researchers from this tradition argue that skills training without an understanding of the dynamics that underpin *intergroup communication* is insufficient.

Intercultural communication can refer not only to interactions between individuals from different nations and ethnic groups but also between people who come to the interaction from a different cultural experience (Kreps & Kunimoto 1994; Gudykunst & Mody 2002). In the health context, "intercultural" may thus refer to communication between individuals from different social groups (e.g., nurse, physician, physiotherapist, and patient) who interact with each other from different "role" experiences (→ Disability and Communication; Social Stereotyping and Communication).

Communication accommodation theory (CAT) is a theory of communication that can be applied to intercultural communication in health-care (→ Communication Accommodation Theory; Intergroup Accommodative Processes). In CAT, interactions between health providers from different social groups, or between health providers and their patients, are understood as intergroup encounters that occur at the interpersonal level. The theory makes explicit how constructs such as health professionals' understanding of their professional role, status, and cultural values influence their interactions with other health professionals, who have their own values. Similarly, patients' previous positive or negative health experiences will serve to shape their perceptions of interactions with health professionals. Thus, using CAT, health communication researchers take account of how interactions are driven by interactants' motivations and cognitions, which, if not acknowledged, can undermine an approach that focuses only on skills training. CAT provides a model of communication that explains and predicts effective communication both between health professionals and between patients and health professionals.

# **Intercultural Communication Training**

*Richard W. Brislin*

*University of Hawaii*

Major social changes of the twentieth century include international air travel, global business expansion, increased migration across national boundaries, and recognition of the civil rights of various minority groups. This means that individuals will frequently come into contact with people from other nations and from other cultural groups within a large and diverse nation such as the United States or Canada. When people consciously prepare for such contact, they may benefit from intercultural communication training programs.

Intercultural training programs are planned efforts that have the goal of preparing people to interact effectively with culturally different others (Brislin & Yoshida 1994; Bhawuk 2001; Landis et al. 2004). *Programs are:* budgeted, staffed by experts, sensitive to the needs and prior experiences of participants, scheduled for a time and place, and evaluated to determine if program goals have been met. Planned programs can be contrasted with an alternative, unfortunately still in existence. This is the “sink or swim” approach, where people are simply given international assignments, presented with an airplane ticket, and then have to survive in another country on their own.

There are four goals in an intercultural communication training program. The same goals apply to international assignments (e.g., overseas business in Japan) and to intercultural assignments within a large country (e.g., teachers assigned to communities with large numbers of Spanish speakers in the United States). For convenience only, examples will be drawn from international assignments and people on such assignments will be referred to as “sojourners.” The first goal is that people *enjoy and benefit* from their experiences with people from other cultures (→ Cultural Patterns and Communication). They can increase their chances of doing this if they understand culture, cultural differences, and culturally guided behaviors (Hofstede 2001). The second goal is that these positive

feelings be *reciprocated by host nationals* with whom sojourners work. Sojourners, then, must learn to be sensitive to the reactions of others and to learn culturally appropriate behaviors that allow smooth interactions with hosts (→ Nonverbal Communication and Culture).

The third goal is that sojourners be able to *manage the stress* that is inherent in overseas assignments. Most often called “culture shock” when applied to extensive intercultural interactions, stress accumulates due to the many unfamiliar behaviors sojourners must learn in a very short time. Overseas businesspeople, for example, must adjust their leadership style, make sure their family is provided for, fit their work into organizational goals, and so forth. These and other tasks become overwhelming, leading to the frustration and helplessness that are the hallmarks of culture shock.

The fourth goal of training is that people *accomplish the tasks* called for in their work assignments. International students should complete their degree work on schedule, diplomats should make progress on intergovernmental treaties, and businesspeople should establish joint trade agreements.

*Five basic training methods* have received extensive attention (Brislin & Yoshida 1994; Bhawuk 2001). Most actual programs use a combination of the five approaches. The first approach is called *cognitive*, and it refers to the formal presentation of information that should be useful in assisting sojourners with their adjustment (→ Cognition). International students in the United States, for example, should be told that they will be expected to “speak up” in class and especially in seminars, and that silent note taking will not insure success. The second approach, *attribution*, refers to conclusions that people in different cultures make about similar behaviors. Using the same example of international students, American professors often view silent note takers as unimaginative. The students might view their own behavior as showing respect for the professor’s greater wisdom.

The third approach, *behavioral*, starts with the premise that people seek out rewards and avoid punishments. They are asked to list behaviors they find rewarding in their own culture and also to list behaviors they avoid. Then, with the help of the training staff, they are encouraged to think through how they can carry out and avoid the behaviors, as appropriate, in the culture to which they are assigned. Culturally specific information can be integrated. People might want to make new friends quickly, but the training staff can alert them to the fact that, in many countries, relationships develop slowly and that people should be patient and wait for overtures from the host nationals. The fourth approach is *role-playing*, where people act out short scenes that are likely to occur on their actual assignments. Some scenes can be quite structured, as with typical patterns of exchanging business cards in Japan or Korea. Others can be unstructured, as with businesswomen making sure they are taken seriously during business negotiations in countries where almost all executives are men.

The fifth approach is called *experiential*, and it builds on role-playing to incorporate many aspects of life in the other culture that occur simultaneously. In a long training program of two weeks or more, an entire day might be devoted to behaving as if the sojourners are actually on assignment (→ Intercultural and Intergroup Communication). They must use the host national language, eat the food, interact with others in socially appropriate ways, figure out ways around bureaucratic hurdles, carry out a teacher–parent conference according to host norms, and so forth (→ Intercultural Norms). The

experience can be frustrating, but staff members can point out that it is better to go through these multiple experiences in the presence of supportive trainers than it is to stumble through them unprepared on actual assignments.

## **Intercultural Conflict Styles and Facework**

*Stella Ting-Toomey*

*California State University, Fullerton*

Competent intercultural conflict management depends on many factors. One of the key factors is to increase our awareness and knowledge concerning diverse conflict styles and facework issues. Intercultural conflict can be defined as any implicit or explicit antagonistic struggle between persons of different cultures due, in part, to cultural or ethnic group membership differences. Beyond cultural group membership differences and intergroup historical grievances, differences in situational expectations, goal orientations, conflict styles, facework tendencies, and perceived scarce resources (e.g., time, power currencies) may further complicate an already complex conflict situation.

Some prominent sources of intercultural conflict include cultural/ethnic value clashes, communication decoding problems, and identity inattention issues. Cultural value clash issues can involve the clash of individualistic “I-identity” values with collectivistic “we-identity” values (Triandis 1995), with one party emphasizing “self-face-saving” and the other party valuing “relational-face-compromising” (→ Intercultural and Intergroup Communication). In connecting national cultures with face concerns, for example, research reveals that while individualists (e.g., US respondents) tend to use more direct, self-face concern conflict behaviors (e.g., dominating/competing style), collectivists (e.g., Taiwanese and Chinese respondents) tend to use more indirect, other-face concern conflict behaviors (e.g., avoiding and obliging styles) (Ting-Toomey et al. 1991; Cai & Fink 2002). In addition, *self-face concern* has been associated positively with dominating and emotionally

expressive conflict styles. *Other-face/mutual-face concern* has been associated positively with integrating, obliging, and compromising styles.

*Self-face concern* is the protective concern for one's own identity image when one's own face is threatened in the conflict episode. *Other-face concern* is the concern for accommodating the other conflict party's identity image in the conflict situation. *Mutual-face concern* is the concern for both parties' images and for the image of the relationship (Ting-Toomey & Oetzel 2001). Conflict style is defined as the broad-based verbal and nonverbal responses to conflict in a variety of frustrating conflict situations. Whether we choose to engage in or disengage from a conflict process often depends on our ingrained cultural conflict habits and how we negotiate various *face concerns*. *Face* is really about identity respect and other-identity consideration issues within and beyond the actual conflict encounter. It is tied to the emotional significance and estimated appraisals that we attach to our own social self-worth and the social self-worth of others (Ting-Toomey & Kurogi 1998).

### **INTERCULTURAL CONFLICT: A FACE-THREATENING COMMUNICATION PROCESS**

When our face image is being threatened in a conflict situation, we are likely to experience identity-based frustration, emotional vulnerability, guilt, shame, hurt, resentment, anger, or even the desire for vengeance. The threats to face can be on the group membership level or the individual level. The *conditions of an intercultural face-threatening process (FTP)* can include the following. First, the greater the importance of the culturally appropriate facework rule that is violated, the more severe is the perceived FTP. Second, the larger the cultural distance is between the conflict parties, the more mistrust or misunderstanding cumulates in the FTP. Third, the more important the conflict topic or imposition of the conflict demand, as interpreted from distinctive cultural angles, the more severe is the perceived FTP. Fourth, the more power the conflict initiator has over the conflict recipient, the more severe is the FTP perceived to be by the recipient. Fifth, the more harm or hurt the FTP produces, the more time and effort is needed to repair the FTP. Sixth, the more the actor is perceived as being directly responsible for initiating the conflict cycle, the more that person is held accountable for the FTP. Finally, the more the actor is viewed as an outgroup member, the more severe is the perceived FTP (Ting-Toomey & Takai 2006). Face concern becomes incrementally more salient if several of these conditions are present in a face-threatening communication process (→ Language and Social Interaction).

For example, individuals are likely to move toward self-face saving emphasis as they perceive the escalation of the various face-threatening conditions directed at them. However, cultural factors come into play in terms of which strategies count as self-face saving or other-face saving. For individualists, self-face saving responses can include strategies such as verbal aggression and verbal defensive mode; other-face saving responses can include remaining calm and sharing personal viewpoints. For collectivists, self-face saving responses can include pretending the conflict does not exist and verbally sidestepping the conflict issue, while other-face/mutual-face saving responses can include giving in or seeking help from a high-status third party (→ Strategic Communication). In response to the heavy reliance on the individualistic western perspective in framing

various conflict approaches, Ting-Toomey (1988) developed an intercultural conflict theory, the *conflict face-negotiation theory*, to include a collectivistic Asian perspective to broaden the theorizing process of various conflict orientations.

### CONFLICT FACE-NEGOTIATION THEORY: KEY RESEARCH FINDINGS

In a nutshell, Ting-Toomey's (1988, 2005) conflict face-negotiation theory assumes that: (1) people in all cultures try to maintain and negotiate face in all communication situations; (2) the concept of face is especially problematic in emotionally threatening or identity vulnerable situations when the situated identities of the communicators are called into question; (3) the cultural value spectrums of individualism–collectivism and small/large power distance shape facework concerns and styles; (4) individualist and collectivist value patterns shape members' preferences for self-oriented facework versus other-oriented facework; (5) small and large power-distance value patterns shape members' preferences for horizontal-based facework versus vertical-based facework; (6) the value dimensions, in conjunction with individual, relational, and situational factors, influence the use of particular facework behaviors in particular cultural scenes; and (7) intercultural facework competence refers to the optimal integration of knowledge, mindfulness, and communication skills in managing vulnerable identity-based conflict situations appropriately, effectively, and adaptively (→ Interpersonal Communication).

In a direct *empirical test of the theory* (Oetzel et al. 2001; Oetzel & Ting-Toomey 2003), the research program tested the underlying assumption of the face-negotiation theory that face is an explanatory mechanism for the influence of cultural membership on conflict behavior. A questionnaire was administered to 768 participants in four national cultures (China, Germany, Japan, and the US) in their respective languages asking them to recall and describe a recent interpersonal conflict. The major findings of the study are as follows. First, cultural individualism–collectivism had direct effects on conflict styles, as well as mediated effects through self-construal and face concerns. Second, *self-face concern* was associated positively with dominating style and *other-face concern* was associated positively with avoiding and integrating styles. Third, *face concerns* accounted for all of the total variance explained in the dominating style and some of the total variance explained in the integrating and avoiding styles. Fourth, German respondents reported the frequent use of direct, confrontational facework strategies and did not care much for avoidance facework tactics; Japanese respondents reported the use of different pretending strategies to act as if the conflict situation did not exist; Chinese respondents engaged in a variety of avoiding, obliging, and also passive aggressive facework tactics; and Americans reported the use of upfront expression of feelings and remaining calm as facework strategies to handle problematic conflict situations (→ International Communication).

While past conflict studies have consistently conceptualized the “avoidance” conflict style as low concern for self/low concern for other-interest in individualistic western cultures, studies conducted under the face-negotiation umbrella have consistently found that the avoidance style is related to other-face identity consideration issues and mediated by situational factors. Furthermore, emotionally expressive style, passive aggressive style, and third-party help-seeking style emerged as additional styles that need further research testing. It is evident that different conflict styles have different culturally based and

individually based meanings and interpretations in different conflict situations and in different cultural communities. Current research (Merkin 2006) has also started to integrate the small/large power-distance value dimension with the individualism–collectivism value dimension in explaining face-threatening response messages and conflict styles. For example, Kaushal and Kwantes (2006) uncovered that “high concern for self/low concern for others” (i.e., the dominating conflict style) was positively associated with both vertical individualism and vertical collectivism. The methodological technique of Imagined Interactions (II) may also be a fruitful direction for future research into intercultural facework interactions (McCann & Honeycutt 2006).

Ting-Toomey et al. (2000) also examined the influence of *ethnic background factors* on conflict styles among four US ethnic groups. Major findings include: (1) Asian- and Latino Americans tend to use avoiding and third-party conflict styles more than African-Americans; (2) Asian-Americans tend to use more avoidance conflict tactics than European Americans; additionally, (3) individuals with strong ethnic identities (i.e., identifying with their ethnic ingroup memberships) tend to use more integrating conflict strategies than individuals with weak ethnic identities; and (4) individuals with bicultural, ethnic, and assimilated identities tend to use more compromising conflict tactics than individuals with marginal identities. It is critical that the role of ethnic diversity issues in a culturally pluralistic society be taken into serious consideration in future facework theorizing efforts.

Ting-Toomey et al. also found that the *personality trait* of independent self-construal was associated positively with self-face conflict concern. The personality trait of interdependent self-construal was associated positively with other-face conflict concern. Situational and relational features such as time constraints and the cultural identity of the other were found to moderate the conflict style choices as predicted by cultural or ethnic membership, in a study of Australian expatriates working in east Asia (Brew & Cairns 2004). For example, the east Asians only managed conflict more indirectly than the Australians when dealing with a superior, particularly a western superior. Current face-negotiation theory effort has been directed to testing family socialization processes and situational features in explaining cross-cultural face concerns, conflict styles, and particular facework strategies.

## **Intercultural and Intergroup Communication**

*Howard Giles*

*University of California, Santa Barbara*

*Bernadette Watson*

*University of Queensland*

Social groups, such as adolescents, police, and ethnic groups, very often have their own distinctive cultures that include such ingredients as specialized foods and utensils, customs and rituals, dress styles, art, music, dance, rituals, literature, and so forth, while other intergroup situations (e.g., artificially constructed laboratory groups) constitute social categories that cannot claim such cultural artifacts (Fortman & Giles 2006). Reading, thinking, and research are needed at interfaces between the all too independent fields of intercultural communication on the one hand, and intergroup communication on the other (see, however, Gudykunst et al. 1988). Intercultural communication is not subsumed under, or even a special case of, intergroup communication, but rather the two are parallel traditions capable of significant coalescence.

As just indicated, when comparing many cultures and social groups with relevant and contrastive others, we see that they vary from each other in a plethora of important ways, many of them inherently communicative. Prime among these are their social values, norms, nonverbal behaviors, and negotiating styles, as well as their attitudes toward each other's communicative practices (→ Cultural Patterns and Communication; Intercultural Conflict Styles and Facework; Intercultural Norms; Language Attitudes in Intergroup Contexts). In fact, perhaps the most general and essential attribute of culture *is* communication, since cultures could not adapt, develop, survive, change, or flourish without it (McQuail 1992).

The way a group or culture – knowingly or not – expresses its unique identity through a language, distinctive dialect, specialized jargon, argot, nonverbal demeanor, or posture and gait is fundamental to a healthy social identity (Giles 1977), and to one (under differing conditions) that group members can vigorously and creatively sustain, protect, promote, and proliferate (→ Disability and Communication; Collective Action and Communication). Indeed, the successful movement of an individual from one culture or group *into* another is accomplished not only by accessing the other's media and communicative networks, but by being able to consistently and authentically adopt the other community's communicative habits (→ Acculturation Processes and Communication; Bi- and Multilingualism). In this regard, one of us has been frequently told by locals that, despite being naturalized (an interesting term in and of itself) as a US citizen, he can never be regarded as a true American until he *speaks like one!*

Not infrequently, some of us are referred to in terms of larger-scale category labels like “Caucasian” or “Middle Eastern” that themselves encapsulate and camouflage a wide range of competing social entities (→ Communication Modes: African; Communication Modes: Asian; Communication Modes: Hispanic; Communication Modes: Muslim; Communication Modes: Western). Indeed, as we know from ethno-religious rivalries in Iraq, Rwanda, Northern Ireland, and elsewhere, conflict can be exceedingly intense between (to an outsider) apparently similar groups subsumed under such superordinate labels. Often these cultural groups possess different resources in terms of their numbers and are variously represented in political arenas, the media, written histories, and so forth (→ Ethnolinguistic Vitality and Communication; Media and Group Representations). The disparities in existing institutional support usually reflect power differentials between the groups that are often the nexus of intergroup conflict (→ Power in Intergroup Settings). Yet intergroup research has shown that the distribution of socio-economic resources is not the only or even a necessary cause of conflict. Merely and immediately creating meaningful social categories with which people can identify (e.g., being a “Mac user” versus a “PC-er”) can by itself give rise to social discrimination (Tajfel 1978). Highlighting but one popular culture example: in the movie *The Life of Brian*, observe the (admittedly tongue-in-cheek) antipathy between the so-called People's Front of Judea and the Judean People's Front, disunited even in the face of a despised colonial presence.

In other words, although cultural diversity is often held out as a valued goal in many societies, anxiety, uncertainty, stigma, and stereotyping can be regular concomitants of intercultural and intergroup relations, with harmful communications being ubiquitous and pernicious characteristics of these (→ Diversity in the Workplace; Anxiety Uncertainty Management Theory; Marginality, Stigma, and Communication; Prejudiced and Discriminatory Communication; Social Stereotyping and Communication; Hate Speech and

Ethnophaulisms). For instance, opening up cultural and national boundaries within the European Union has, arguably, caused more social problems and strife than it has garnered any common group identity. Indeed, difficulties with and barriers to the acculturation of immigrants are evident in these and many other societies (→ Migration and Immigration). Hence, while encouraging education about, training with, and communication between members of different cultures and groups clearly can work under certain circumstances, it can also yield zero effects on improving relations in some cases – and even boomerang by undermining them in yet others (see Fox & Giles, 1993; → Intergroup Contact and Communication). Even promoting bilingualism and bilingual education has been disparaged by some influential public figures in the American media. “Former House Speaker Newt Gingrich equated bilingual education . . . with ‘the language of living in a ghetto’ and mocked requirements that ballots be printed in multiple languages . . . In 1995, for example, he said bilingualism poses long-term dangers to the fabric of our nation” (Hunt 2007). Strong words indeed.

All this notwithstanding, social gains are gratifyingly evident from current increases in interracial dating and friendships, especially among the youth of today (Britt-Gibson 2007; → Interethnic Relationships in Families) and the growing ways in which some social categories are becoming sensitive to, adjusting toward, and respecting each other (→ Intergroup Accommodative Processes). Understanding the highly complex and changing dynamics of intercultural and intergroup relations is of the utmost societal importance for maintaining public safety and security, encouraging responsible tourism, prolonging health and occupational productivity, enjoying and learning from old and new media, to name but a few (→ Ethnic Media and their Influence; Intercultural Communication in Health-Care; Intergroup Dimensions of Organizational Life). The potential that intercultural and intergroup communication theories can have for understanding, and in the long run alleviating, intractable interethnic conflicts is obvious, albeit rarely studied (Ellis 2006; Nagda 2006).

The 33 other entries in the “intercultural and intergroup” area of this Encyclopedia are necessarily diverse, thematically and methodologically (→ Culture and Communication, Ethnographic Perspectives on; Intergroup Communication and Discursive Psychology). They demonstrate well how far *communication* research in this domain has advanced over the past 25 years, both empirically and theoretically. Despite their diversity, however, the choice of the particular entries in this research area indicates that there is some synergy for them under a common rubric of intercultural and intergroup communication research.

## THE HISTORY OF INTERCULTURAL COMMUNICATION

Intercultural communication (ICC) has been studied for over 50 years and Leeds-Hurwitz (1990) has provided a synopsis of its early development. She describes the work of E. T. Hall and noted that he focused on practical and applied intercultural training and not on theory and research development. Hall worked with the American Foreign Service Institute (FSI) after World War II. He explored the micro communication behaviors that distinguish cultures and coined the term *proxemics* to describe how people from different cultures vary in their management of personal space and their levels of tolerance for physical closeness. Hall argued that much could be learned by concentrating on face-to-face

interactions, where tone, gestures, and proxemics by each speech partner were critical to effective communication (→ Nonverbal Communication and Culture).

The work conducted at the FSI, led by anthropologists and linguists, concentrated on training diplomats to communicate with the different cultures they met outside of the USA. This practical training component remains a central tenet of intercultural communication research today. Following on from this early work, Wiseman (2002) detailed the far reaching applications of ICC competence to assist individuals from differing cultures to communicate effectively with one another. Much of the current ICC literature embraces a skills training approach and, as was underscored by Gudykunst (2002), is dominated by American positivistic stances (see, however, Kim 2002). Incorporated in the training is the notion that individuals must have knowledge of the culture with which they engage, the motivation to effectively communicate (including intercultural sensitivity and empathy), and appropriate communication skills. A guiding principle of ICC is that individuals engage with each other for the purpose of achieving meaningful and mutual understanding. Importantly, interactions are viewed as activities that occur at the interpersonal level (see also Rogers & Hart 2002).

Cargile & Giles (1996) examined the extant intercultural training literature and, without decrying the enormous importance of this perspective, proposed a new theoretical framework for trainers. They raised a number of questions about these training programs (→ Intercultural Communication Training). Some of their comments suggest that the two perspectives of intercultural and intergroup communication can combine to create a more robust position. First and foremost, Cargile & Giles noted the neglect by trainers of the intergroup dynamics that exist between some cultures. While ICC competence highlights an interpersonal focus, it paradoxically emphasizes the importance of understanding the mores of intercultural groups. Its focus also begs the question of whether individuals who engage in conversation with others from a different culture see themselves as talking to an individual or a representative of that culture. Investigating how individuals differ according to one disposition or the other has not been a key research question for ICC theorists.

Cargile & Giles argued that eclectic training programs may have limited value, to the extent that they do not take sufficient notice of trainees' attitudes to other cultures as well as their beliefs about the historical relationships existing between them. In simplest terms, if trainees harbor negative attitudes toward individuals from another culture, this can impede interaction outcomes. Cargile & Giles proposed a model of cross-cultural training that recognized the critical role that attitudes and stereotypes play in engagements with members of intercultural groups. They pinpointed the fact that individuals have a tendency to avoid counter-attitudinal, counter-stereotypical, and counter-affective information, and often lack the capacity to see beyond the cultural prototype to the individual characteristics of someone from another culture. Thus, providing new cultural knowledge about an outgroup to trainees does not guarantee acceptance of this information, especially if it violates previously held assumptions and if there is an imbalance of power between the groups.

## **THE HISTORY OF INTERGROUP COMMUNICATION**

In contrast to ICC, intergroup communication (IGC) evolved from a focus on group relations, discrimination, prejudice, and conflict. It is a much younger field of research,

and only in the last few years has the → International Communication Association (ICA) recognized intergroup communication as a distinct research interest area in its own right (Giles & Reid 2003). To understand the evolution of intergroup communication (see Harwood & Giles 2005; Reid & Giles 2005), it is necessary to describe the work of social psychologists interested in group processes.

The development of social identity theory (SIT) by Henri Tajfel (1978) was a watershed for social psychology and intergroup processes (→ Social Identity Theory). Drawing on Festinger's (1954) theory of social comparison, Tajfel argued that social comparison connects the process of categorization with social identity. However, whereas Festinger argued that only when an opinion or characteristic could not be objectively tested did one rely on social consensus, Tajfel proposed that social consensus was always a valid method for testing one's beliefs. Both theories have in common the basic assumption that individuals use social comparison to fulfill a need to view themselves positively. In sum, SIT states that individuals categorize themselves and others into social groups and have a need to compare themselves with others, as a way of attaining a positive self-concept.

By its own definition, SIT is more concerned with social identity (or identity derived from group membership) than from personal identity (or identity based on individual characteristics and relationships). However, the theory recognizes that, at times, one's self-image is more personally defined (and correspondingly group comparisons are less salient) than at others. Tajfel and Turner (1979) suggested that interpersonal and intergroup salience may be considered as two ends of a single continuum. Later, scholars have proposed that interpersonal and intergroup are two correlated dimensions comprising high and low gradations along the two continua (e.g., Hewstone & Giles 1986).

In tandem with SIT, self-categorization theory (SCT) explores the underlying mechanisms (and cognitions) for categorizing ourselves and others into particular social groups (Turner et al. 1987). Once an individual categorizes another person in this way, that other is to some extent depersonalized; that is, the other takes on the core facets of what it means to belong to that group. SCT proposes that there exist prototypical group members, and that an individual can possess varying degrees of the characteristics and traits that define such prototypicality. The individual makes these judgments through an understanding of what it means to be a member of a particular group. Individuals are depersonalized as their group identity becomes salient. SIT and SCT, however, are not communication theories but, rather, represent theories of intergroup behavior and cognitions. SIT has proved to be a useful framework for understanding very different kinds of intergroup communication (Harwood & Giles 2005).

We seek to favor our own groups (ingroups) compared to groups to which we do not belong (outgroups). If we wish to become a member of an outgroup, we communicate with outgroup members in ways that may gain us membership to that group. In this way we may seek to use the strategy of social mobility, in order to "pass" into the privileged group. If this strategy is not open to us, then we can reinvent the identity of our group and, through intergroup comparisons, construct new positive aspects to our group. A third option is to socially compete against a privileged group to improve status and/or power. These strategies have linguistic and communicative implications for managing our communication with outgroups (Giles 1977), such as when individuals might emphasize,

say, their gay or straight identities and or at the more macro level when a group, such as Catalonians, resoundingly elevate the visibility and influence of their language in Spain. Not only have communication theories – for example, → communication accommodation theory – attended to the above-mentioned cognitive processes to explain behavioral outcomes, they have also begun to articulate the ways in which communication in discourse can determine and reshape these very psychological constructs in the first place (see Abrams et al. 2002).

Because this research area in communication is very young, it is still of course developing. Gallois et al. (2005) note that its strength will lie in its ability to take account of *multiple* identities in intergroup contexts, and particularly when those identities can sometimes be conflictual for incumbents (as, for example, in the case of some British Muslims). How we manage our different identities – be they cultural, generational, gender, or whatever – as we move through interactions with others requires considerably more research attention. For instance, during an interaction between two health providers (each a physician from a different speciality), the interactants may make salient their shared identities such as (general) health provider or specialist physician, as well as team coordinator (another medical role each has). In addition, they may have different personal identities based on their own idiosyncrasies. How they manage and negotiate these identities through discourse, and how the identities interact, requires detailed mapping of actual communication behavior (Hecht et al. 2005).

### **MUTUALLY EXPANDING ICC AND IGC**

From an intergroup perspective, Brabant et al. (2007) note some *common factors* that are assumptions within ICC theories that are not held in IGC. These are: that strangers to a new culture will take on an ethno-relativist position; that strangers need to be educated in the new culture and its values and norms; and finally, that when strangers possess knowledge of the culture and use expedient communication skills, effective communication will prevail. Brabant et al. note that there is no extension within ICC theories to predict and explain when *misunderstanding* could in some cases be inevitable, despite any one individual's excellent skills and cultural knowledge. Socio-psychological theories that emphasize the intergroup nature of intercultural communication, rather than only its interpersonal aspects, directly address miscommunication with the attendant issues of prejudice and intercultural tensions. The challenge is to move toward bringing these two theoretical viewpoints together in order to explain and predict the variables that determine effective and ineffective interactions. We need to untangle situations where individuals interact in intercultural situations as individuals qua individuals or as individuals representing cultural groups.

IGC is highly cognizant of how *status and power differentials* impact communication behavior. As noted earlier, power is not a key consideration in ICC, so its effects on interactions are not emphasized and the implicit overarching assumption is that competent communication is the main communication goal. However, when two individuals from different cultures with a history of power differentials and consequent perceived injustice come together for a meeting, effective and competent communication may not be their mutual goal. Relatedly, a focus on training and skills to achieve effective communication

does not take account of the fact that culturally salient power differentials may dictate what is appropriate communication. For example, in a ward round where a consultant is providing diagnosis and treatment plans and a more junior doctor is taking notes, “effective” communication, such as checking the consultant’s meaning through paraphrasing, may not be accessible to the junior doctor because such behavior is viewed as inappropriate. Other researchers have noted that it is often nurses who act as intermediaries for patients when they translate the doctor’s “medical language” into “everyday language” that the patient can understand (Bourhis et al. 1989).

That said, an interaction where intergroup salience is patently evident need not be a negative experience. In a clinical context where the health professional is perceived by a patient as the “expert,” the heightened intergroup salience may be comforting to the patient (Watson & Gallois 2007). In an interview context, the interviewer, who has the greater power, may speak slowly and for only short durations. The interviewee, with less power and wishing to appear competent and knowledgeable, may speak more quickly and for longer durations (Street 1991). This strategy, known as *speech complementarity*, highlights the individual’s awareness and acceptance through speech and behavior of the social norms concerning power and status (Giles et al. 1991). The subtleties in behavior that emerge when power relations are highlighted demonstrate the value of applying an IGC focus. However, understanding that these subtleties exist is but one part of understanding power relationships; we must also focus on the wealth of skills training knowledge that comes out of the ICC perspective. Combining these two perspectives would provide a model of intercultural and intergroup communication that is incisive, applied, and theoretically sound.

The *socio-historical context* of any given group can be a key activator that guides individuals’ initial and ongoing discourse with a group, but it is not commonly featured in ICC (see, however, Martin & Nakayama 2007). While cultural norms and values are acknowledged, historical relationships between cultures are seen as relevant only insofar as they guide behavior. It is this relational history that ultimately may predict competent and effective communication. There is an important distinction here: the macro-history, or the organizing historical relationships that actually existed between two cultures, and the micro-history, an individual’s understanding and experience of the other group/culture. In this sense, it is important to recognize that two groups can, of course, afford very different meanings to the same events. Witness here how many Estonians now construe the end of World War II differently from Russians and wish to move monuments depicting the latter’s war heroes to more peripheral physical settings. Many other incongruities are apparent elsewhere as in the disputes of what happened in the Holocaust and about comfort women in Asia.

Not to take account of social history and the contexts within which it is given meaning is to seriously undermine opportunities for effective communication. For instance, in the mid-1980s, there was a very public awareness of homosexuality because of the emergence of AIDS; some heterosexuals who may have been indifferent to homosexuals began to see them as a threat. Heterosexual relations were not immune from this homosexual illness, because homosexuals were potentially HIV carriers and to be avoided. Where this kind of fear and bias exists before individual heterosexuals and homosexuals meet, the basis for effective communication is severely compromised. Relatedly, Iwakuma & Nussbaum (2000)

discuss intercultural views on disability and, in so doing, make explicit the importance of the socio-historical context. They depict how cultural attitudes lead to group stigma and discriminatory communication. For example, in Thailand it is shameful for disability to exist in the family. Thus, communication between disabled and nondisabled people has its own socio-historical baggage that influences the way an interaction unfolds.

At the outset, we alluded to the fact that ICC – beyond national and ethnic groups – can truly embrace an array of different categories including older people, homosexuals, bisexuals, or academicians from different disciplines, as well as those embedded in youth, gang, religious, political, drug, sports, or organizational cultures (see Harwood & Giles 2005). They may all represent different cultural groups, because they have characteristics that include values and social norms that place them in a particular “set.” Importantly, their members may view themselves as belonging to a group that owns specific characteristics and traits that set them apart from others. IGC theories distinguish between “me” in an interaction as an individual and “us” as a representative of a group. While intercultural as well as intergroup perspectives have sometimes been infused into studies in such contexts, there is much more room for invoking each other’s positions.

This brings us to a final and critical issue. Thus far, we have focused on how IGC could beneficially impact ICC theory and practice. However, *the relationship and resources are really symbiotic*. Given that culture is “a blueprint for all life’s activities” (Porter & Samovar 1998, 456), it is curious that IGC rarely addresses, in its analyses of bona fide groups, the *cultural* parameters involved. In this respect, Fortman & Giles (2006) pointed to various dimensions of so-called cultural vibrance (e.g., the extent to which you display cultural artifacts in your home and have the smells of ethnic food pervade it) that could be orthogonal to group identification but that can have the potential to underlie intergroup communication strategies. For instance, high cultural vibrance would be indicated by a group having a long documented and rich cultural past and one that has adapted successfully to social and technological changes, be they modernization or colonialization. In addition, having a visible presence in the community where the group’s language (as in Chinatowns in the USA and elsewhere) is reflected ubiquitously on road signs and in shop windows (Landry & Bourhis 1997), a culture can display its unique style of fashion and dress as well. In addition, individuals who perceive a close connection with other members of their group as being a *community* in terms of mutual care, long-term security, and “give and take” will likely be very different contributors to intergroup communication from those who feel low on such features, irrespective of how strongly they report affiliating with their group. As Fortman & Giles (2006, 100) argued: “Just because a person self-identifies with a group strongly does not mean that person embraces its culture. Indeed, the group may not even have evolved one yet. Correspondingly, just because certain people do not publicly espouse strong affiliations with a social group, does not necessarily imply that they do not have any commerce with that group’s culture (through cuisine, aesthetic preferences, and so forth). Indeed, such inclinations may contribute to the person’s attributed individuality. Until we separate these dimensions empirically, it is possible that our predictive power in terms of communicative outcomes . . . could be unreliable and insufficient.”

Not only has the study of intergroup communication, for the most part, seemingly neglected such cultural buoyancies, it has also ignored occasions when attributions about

cultural complexity (or its absence) could be socially important. Take, for instance, parents who interpret their teenage child's peculiar behaviors as a reflection merely of a transitory development stage, compared to others who judge these behaviors to be a manifestation of an inaccessible and legitimate *culture*. Our guess would be that the parents' reactions to the teen would be very different and have quite an impact not only on the teens' respect for them, but also be a significant component of how they negotiate their relationships together.

In line with other scholars, Wiseman (2002) acknowledges that we need to be clear about what we mean by the term "culture." The traditional view of culture was based on geographic or ethnic differences. Nontraditional approaches have a broader understanding of what a cultural group might be (Hecht et al. 2005). Thus, while I may not see my nationality as ever being important, and so would never invoke my national identity, my professional role may represent a crucial dimension of who I am and be highly salient in my workplace. Similarly, a person's identity as "someone who is deaf" may overlap across their work and personal life; research on the culture of deaf people makes clear that such groups and cultures coexist (Reagan 1995). In any case, IGC could draw on notions such as the cultural vibrance of a group for its members as an important ingredient to the social meanings of ingroup identity and salience. IGC could gain further momentum by recourse to notions of intercultural competence, awareness, and sensitivity. IGC could also redress its relative lack of investment in exploring the social consequences when personal and relational identities assume interactional predominance in potentially volatile intercultural settings (see Gallois 2003; Wright et al. 2005). Indeed, the commonly found situation where *both* personal and social identities are salient in an interaction has yet to be fully explored in terms of its implications for communication. For instance, a student unexpectedly meeting her professor in a bar one evening and briefly talking about their love of wine; although the chat is highly personal, there are the pushes and pulls of knowing they belong to social categories with differential powers in other contexts.

From the ICC perspective, when an individual recognizes that he is engaged in an intercultural interaction, the focus remains on competent interpersonal communication. Specifically, an interactant's psychological response is focused on communication with an individual from a different culture, rather than on communication between two intercultural representatives. In contrast, IGC provides for a focus on interactants as individuals, as well as representatives of their respective cultures. This explicit acknowledgment that at times our intergroup identities take precedence has important implications for any interaction. Individuals who perceive that their personal identity is salient may engage in different communications strategies from those who believe they are representative of a particular group. Whether individual or group identities, or both, are made salient will shape the communication process in different ways which, in turn, can reconstruct the very nature of those identities. Indeed, how we come to subjectively define a situation in the first place as interpersonal or intercultural (or both) doubtless comes about by negotiating, perceiving, and interpreting *communicative* cues in interaction.

## Intercultural Media Effects

*Michael G. Elasmr*

*Boston University*

In the 1940s, → Paul F. Lazarsfeld defined international communication as a study of the “processes by which various cultures influence each other” (Lazarsfeld 1976, 485). The term culture has been defined in a variety of ways over the years. An all-encompassing definition of culture was given by Kroeber: culture “is a way of habitual acting, feeling and thinking channeled by a society out of an infinite number and variety of potential ways of living” (Kroeber 1952, 136; → Culture: Definitions and Concepts).

Intercultural media effects denotes the idea of change or modification to the culture of individuals living in a given society induced as a result of their exposure to media content produced in another society. Since → television is still the most popular and prevalent form of entertainment media around the world, this entry will be confined in scope to the cross-cultural impact of entertainment television (→ Television: Social History; Entertainment, Effects of). The question here is: Can the culture of individuals in a given society be changed or modified as a result of their exposure to entertainment television programs produced in another society (→ Intercultural and Intergroup Communication)?

### STRONG EFFECT PARADIGM

The various perspectives about this topic that have emerged during the last 40 years can be categorized according to their assumed strength of impact: strong impact and contingent impact. When critics of imported television discuss its influence, they do so within the framework of *cultural imperialism* (CI; Schiller 1969; 1991). According to its proponents, CI is “a verifiable process of social influence by which a nation imposes on other countries its set of beliefs, values, knowledge and behavioral norms as well as its overall style of life” (Beltran 1978, 184; → Cultural Imperialism Theories).

Television is seen by CI proponents as the means through which powerful states influence weaker states. CI advocates utilize an inductive process for drawing conclusions about the contemporary international intentions and behaviors of states using conspiracy

theory as their premise (see Schiller 1976). CI proponents set out to document the presumed conspiracy that underlies the behavior of powerful states in their quest to dominate weaker states. The conspiracy assumption itself is most probably a projection of the historical motivations of rulers (i.e., kings, princes, emperors, and governments) as observed via their documented predatory behaviors throughout human history. CI draws especially on the economic dependencies that existed between European colonizers and their colonies. Colonialism is seen as a direct antecedent of the economic dependency that characterized the relationship between colonies and colonizers with the former depending on the latter. The economic inequities among states observed in the postcolonial era that followed World War II are seen as a direct effect of the desire of more powerful states to maintain their control over weaker states. Assuming conspiracy and aiming to uncover it in the postcolonial era, CI advocates perceive stronger states as intending to perpetuate the economic dependency of weaker states that prevailed during colonial times (→ Postcolonial Theory). They believe that the mass media (including television) are the remote-control tools with which more powerful countries dominate the populations of weaker countries. According to this perspective, the specific role of the mass media is to alter the culture of the local inhabitants of weaker countries and modify their behaviors in ways that benefit the more powerful countries (→ Dependency Theories).

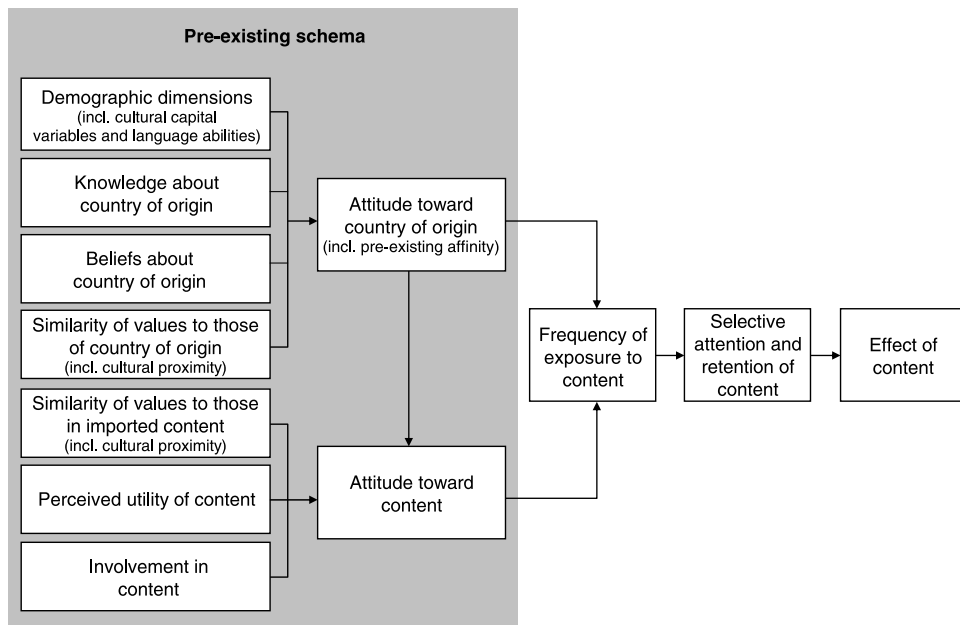

The advocates of this perspective claim that CI is an effect that stems from the documented flow of television programs from western countries and the mere presence of these programs in the television schedules of developing countries. According to Elasmir and Bennett (2003), with respect to the influence of imported television, the implicit assumptions of the CI process are: (1) the presence of foreign programs in domestic TV schedules will lead domestic audience members to watch these programs; (2) imported television content will be similarly processed by all audience members who are exposed to it; and (3) exposure to imported television programs will result in strong and homogeneous effects across audience members (→ International Communication; Americanization of the Media; Cultivation Effects).

### CONTINGENT IMPACT PARADIGM

Several perspectives that challenge the CI framework have emerged over the years. Each addresses one or more of the implicit CI assumptions noted earlier. In the *hybridization approach*, researchers take a macro approach to the topic of imported media effect. Pieterse defines structural hybridization as “the emergence of new practices of social co-operation and competition” and cultural hybridization as “new translocal cultural expressions” (Pieterse 1995, 64). The implicit argument here is that imported media do not have a homogeneous impact on their viewers. In lieu of the cultural domination and destruction arguments made by cultural imperialism advocates, proponents of the hybridization perspective believe that the likely impact of imported media is the creation of hybrid cultures among its consumers (→ Hybridity Theories).

The *cultural proximity perspective* focuses on the audience’s active decision to select and consume imported television content. Straubhaar advances the notion that, when given a choice, audience members are more likely to select imported TV programming that is embedded with values more similar to their own: “Audiences in many countries are . . .

**Figure 1** The susceptibility to imported media (SIM) model (Elasmar 2003)

clearly expressing a preference for both national production and, particularly in smaller countries, for intraregional exports, seeking great cultural proximity at both levels” (Straubhaar 1991, 55). Thus, the cultural proximity perspective focuses on the barriers that prevent imported media from having a wide-ranging and homogeneous effect on its viewers. The implicit argument here is that strong effects are impossible since the content that is chosen is embedded with values similar to one’s own.

The *susceptibility to imported media (SIM) perspective* focuses specifically on the variation that exists among individual audience members of imported television programs (Elasmar 2003). The SIM model is designed to: (1) illustrate the process of imported media influence, (2) understand the conditions under which imported media can be influential, and (3) identify the type of effect (i.e., affective, behavioral, etc.) that imported media are most likely to achieve. The idea here is that some viewers are going to be less susceptible while others more susceptible to being influenced by imported TV programs (→ Selective Exposure). The viewers’ susceptibility will depend on their pre-existing beliefs and attitudes and on the interrelationships that exist among specific cognitive components (see Fig. 1).

The term → “schema” is commonly used in the field of social cognition to denote the set of cognitive components that are activated in response to a specific social stimulus. According to the SIM model, one needs to understand the interrelationships among specific cognitive components present in a viewer’s schema in order to determine whether this viewer will be affected when exposed to specific imported entertainment media content. With respect to the type of effect likely to occur as a result of a viewer’s exposure to imported television content, the SIM model ranks effect types from those most likely

to occur to those least likely to occur as follows: knowledge, beliefs, attitudes, behaviors, and values (→ Attitudes; Information Processing). For all these effect types, the literature suggests that the most likely impact of imported television programs would be that of reinforcing pre-existing states. The least likely impact would be to radically change these pre-existing states.

The perspective of *media-accelerated cultural diffusion* focuses on a conspiracy-free label that ought to be given to the influence that might result from a viewer's exposure to imported media content. Elasmr (2003) proposes the term "media-accelerated cultural diffusion" when such an impact is detected. This notion is an extension of the cultural diffusion perspective that existed in anthropology in the early 1900s. Cultural diffusion or borrowing occurs when an individual "faced with a situation in which the shared habits of his own society are not fully satisfactory, copies behavior which he has observed in members of another society" (Murdoch 1971, 325).

How frequently does cultural diffusion occur? Smith contends that "in almost everything we use in our daily life and in most of the things we do . . . we display our indebtedness to the world's civilization in its full range" (Smith 1933, 8). Writing in the early 1900s, long before the advent of worldwide electronic communication networks, Smith aptly states that: "The diffusion of culture is not a mere mechanical process such as the simple exchange of material objects. It is a vital process involving the unpredictable behavior of the human beings who are the transmitters and those who are the receivers of the borrowed and inevitably modified elements of culture. Of the ideas and information submitted to any individual only parts are adopted: the choice is determined by the personal feelings and circumstances of the receiver" (Smith 1933, 10). He adds that the ideas that are borrowed are transformed by the receiving communities as they adapt them to fit their particular needs (→ Diffusion of Information and Innovation). While throughout history humans have interpersonally channeled cultural diffusion, today electronic media that span the globe at tremendous speeds can potentially contribute to the diffusion of culture. When exposure to imported television programs is found to influence some aspect of a local viewer's culture, an appropriate label for this effect is media-accelerated culture diffusion (MACD).

## Intercultural Norms

*Min-Sun Kim*

*University of Hawaii at Manoa*

Normative conduct is a major component of systems of culture. Each culture has its specific norms for everyday social interaction. Differences in norms and cultural expectations often become grounds for intercultural miscommunication and misunderstanding (→ Cultural Patterns and Communication; Nonverbal Communication and Culture). There are innumerable definitions of norms in the social science literature. For example, norms are defined as “rules of conduct,” “blueprints for behavior,” and “cultural expectations.” Comparing existing definitions, Gibbs (1965) finds three attributes of a norm: “(1) a collective evaluation of behavior in terms of what ought to be; (2) a collective expectation as to what behavior will be; and (3) particular reactions to behavior including attempts to apply sanctions or otherwise induce a particular kind of behavior” (→ Intercultural Norms; Social Norms).

Sumner (1906) divides norms into *three categories*: folkways, mores, and laws. *Folkways* are those pervasive everyday activities widely accepted by the people of a culture. Folkways include such actions as the way we greet others, the way we eat, and other such actions. *Mores* are those norms placing strong moral demands on an individual’s behavior. Examples of mores include commandments derived from religious doctrine, incest taboos, and rules about what is acceptable to eat (e.g., in the United States it is unacceptable to eat the meat of dogs and cats). *Laws* are norms codified by a political entity such as a country, province, or city. A law may be derived from the folkways or the mores of a culture.

The existence of a norm becomes most evident when it is *ignored or violated*. Individuals who find themselves in a foreign environment, dealing with an unfamiliar culture, are likely to have this experience involuntarily. Such missteps are often milestones along the way toward becoming socialized to a new environment. The violation of any norm may bring down some form of sanction against the person committing the violation. The sanctions may range from a disapproving glance to loss of life. The sanctions imposed for violation of a folkway are through interpersonal channels. For example, if you were to “slurp” your soup in public in the United States, you probably would receive only disapproving glances from the people who heard you. On the other hand, if you do not slurp your soup in some cultures, you may receive disapproving glances (Gudykunst & Kim 1984).

The violation of mores, in contrast to that of folkways, attracts more severe sanctions. An example in the United States is that men do not hold hands. If you do, the response may range from surprise to ostracism to, in extreme cases, homophobic lynching. On the other hand, it is acceptable, though not customary, for men in India who are merely friends to hold hands. Violations of laws, obviously, bring about legal sanctions. These legal sanctions can range from a verbal reprimand to the death penalty.

Most popular books on intercultural norms take a direct approach to cultural adaptation: we ask the local people and/or other expatriates how a foreigner is supposed to behave. We ask, in other words, to be taught the dos and don'ts of the culture. The “dos and don'ts” approach is necessarily situational. Only a fixed number of situations can be presented, and then only in the most general manner. “Don't start talking business with a Saudi,” we may be told, “until you've first made considerable small talk, and otherwise spent ten to fifteen minutes exchanging pleasantries.” But what if this is the second or third meeting we have had with that person that day? (Storti 2002). The same action may have different meanings in different situations. Relying solely on this strategy is not effective since the number of possible events is unlimited. Effective behavior in a cross-cultural situation is best achieved from a position of sound cross-cultural understanding. Norms are relevant only to specific situations, and, therefore, have limited explanatory power (Kim 1994).

That said, confronting normative differences offers the possibility of personal growth or cultural change. Generally, when we interact with people from the same culture, our expectations are not often violated, because people of the same culture share similar expectations. When we communicate with “outsiders,” however, our behavioral expectations may be violated with greater frequency because those strangers probably learned a different set of norms in their culture (→ Intergroup Contact and Communication). When our expectations are violated, we can gain tremendous insight into the norms of our own culture, and how those norms influence our behavior. In addition, we are confronted with alternative behavioral patterns, which we might actually come to prefer (Gudykunst & Kim 1984).

Ethical relativism is an approach that holds that morality is relative to the norms of a given culture. The same action may be morally right in one society, but morally wrong in another. For the ethical relativist, there are no universal moral standards, i.e., standards that can be universally applied to all peoples at all times. The only moral standards against which a society's practices can be judged are its own (Herskovits 1973). Even if we do not

accept this relativist approach, it must be acknowledged that it raises important issues. Ethical relativism reminds us that our sense of right and wrong is deeply influenced by our culture. It also encourages us to explore the justifications underlying norms that differ from our own, while challenging us to examine the reasons for subscribing to our own norms.

## **Intereffication Approach in Public Relations**

*Stefan Wehmeier*

*University of Greifswald*

The intereffication model focuses on the relationship between → public relations (PR) and → journalism (Bentele et al. 1997). It was designed in a research project in 1996–1997 that focused on the PR activities of two East German cities, Leipzig and Halle. Unlike the *determination hypothesis*, the intereffication model stresses the interconnectedness of PR and journalism (→ Determination Theory in Public Relations). The authors describe the model as a complex relationship of mutual influence, mutual orientation, and mutual dependence. Intereffication means that neither PR nor journalism would be able to function properly without the existence of the other (Latin *efficare* = to make possible). The authors invented the word intereffication in order to create a neutral term, one free of the connotations associated with more metaphorical terms like symbiosis and Siamese twins.

### **THE MODEL**

The model describes the mutual processes going on between PR and journalism as “adaptation” and “induction.” *Adaptation*, on the one hand, means that one system

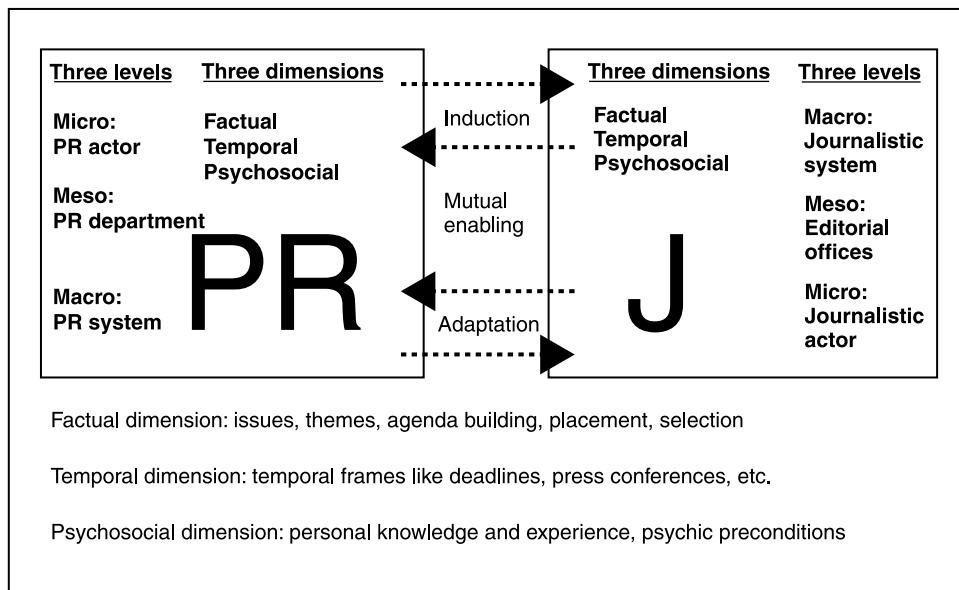

orients its activities and routines toward the other system in order to successfully place its messages. Adaptation can be defined as “communicative and organizational processes of adjustment” (Bentele & Nothhaft 2007). In order to be more successful in placing topics, actors like PR practitioners or entire PR departments adapt themselves to environmental constraints. Processes, on the other hand, that are able to influence the other system are called induction. *Inductions* are defined as “intended and directed communicative stimuli which result in observable *resonances* in the respective other system” (Bentele et al. 1997, 241). Resonances can be observed and partly measured as, for instance, media coverage (PR-induced coverage).

Both induction and adaptation happen in three dimensions: factual, temporal, and psychosocial. The *psychosocial dimension* consists of journalists’ and PR practitioners’ personal relationships. From a micro-perspective, it is important for both journalists and PR practitioners to know each other personally so that each can anticipate how the other will react to specific messages or questions. Gaining trust is another process in this dimension. Gaining trust is possible through a continuous flow of correct → information and → interaction only. If, on the one hand, PR managers lie, their trustworthiness is lost. Betrayed journalists will no longer believe them. On the other hand, journalists lose their trustworthiness if they do not report the entire story but pick up only a certain part that looks sensational.

In the *temporal dimension*, PR practitioners orient their timing toward the routines of journalism (→ News Routines). For example, knowing the editorial deadline is important for sending out press releases and for arranging press conferences. This example shows that adaptations and inductions form two sides of the same coin: according to the model, the deadline itself is a journalistic induction, while keeping this deadline in mind and acting in line with journalistic routines are processes of adaptation. Journalists, in return, are more successful at getting information if they know the daily routines of PR managers. If a journalist knows that the PR manager of the biggest company in town usually has internal conferences from 9 to 11 a.m. and usually takes a lunch break from 1 to 2 p.m., then the journalist can anticipate the best time to call the manager.

In the *factual dimension*, sending out press releases is an inductive activity designed to influence the journalistic system. Press releases represent mainly thematic inductions. However, there are a lot more PR inductions in the factual dimension: press releases issued at conferences, facts and figures from annual reports, personal dialogues between PR practitioners and journalists, etc. Journalistic induction occurs when journalists select, place, assess, and comment on information. Another example of journalistic induction is when journalists force companies to hold an ad hoc press conference.

A great many adaptive processes go on in the factual dimension. Again, press releases are a good example: professional PR people write releases in a journalistic style according to routines like → news factors or the “SIN” rule (the topic must be significant, interesting, and new), the inverted pyramid etc. Bentele and Nothhaft (2007) give an illustrative example of journalistic adaptation to PR routines and rules: journalists not only have to adapt to rules of accreditation and professional codes of conduct but also to the rules of war reporting such as the “embedding” of journalists into the operation “Iraqi Freedom” (→ Embedded Journalists).

**Figure 1** The intereffication model

According to the model, processes of adaptation and induction take place not only in three dimensions (psychosocial, temporal, factual) but also on three levels (Fig. 1). By looking at the mutual processes that go on between a journalist and a PR practitioner, the model describes the relationship of journalism and PR on the *micro level*, the level of individual actors. By focusing more on the level of PR departments' editorial offices or entire media organizations, one switches to the *meso* level. The model also claims to be a sufficient framework on the *macro* level of functional social systems, but it is not necessarily in line with the latest macro models of systems theory (Schantel 2000).

## MEASUREMENT AND FINDINGS

In recent years, the model has been employed in a number of research projects, mostly dissertations or master's theses. Bentele and Nothhaft (2004, 2007) have summarized the major findings. The model was initially tested in the field of local politics. Subsequent studies applied the model in regional politics (Donsbach & Wenzel 2002) as well as in the fields of business and of labor unions (→ Labor Unions in the Media). Unfortunately this research does not cover all of the model's dimensions. As with the empirical research in the tradition of the determination hypothesis, these projects – as well as the master's theses summarized by Bentele and Nothhaft (2004, 2007) – operate from a PR-centered perspective. They analyze the relation of PR-induced coverage to editorially induced coverage (input–output studies) with regard to single organizations (such as the regional German broadcasting station MDR) or certain areas of interest (such as politics in

Saxony). Like Baerns' (1979) study (the determination hypothesis), most of the studies show that roughly two-thirds of the analyzed articles are PR-induced. However, more than half of these PR-induced articles are not induced by press releases but by other PR activity. Other PR activity means, for example, a reference to a press conference in the text of the article. It is obvious that the data here are not unambiguous. Given that uncertain cases were treated as not induced by PR, there is evidence for a substantial influence of PR on journalism. However, this research tradition shows that the design of the research has a major impact on the results.

As Baerns's determination thesis postulates that PR determines not only the topics but also the timing of media coverage (Baerns 1991, 98), most of the empirical research projects also analyzed the *temporal dimension*. To determine whether PR is able to influence the timing of media coverage, one has to measure the time between the PR activity and the media coverage. The data show that daily → newspapers utilize the majority of press releases within three days of receiving them.

## CRITIQUES

There is still a lack of empirical research that covers the full range of the model. By using a PR-centered operationalization, most research labeled as intereffication is little more than modern determination research. Furthermore, personal or social factors that are the core of the psychosocial dimension are rarely analyzed. This lack of analysis is as much regrettable as it is understandable given the difficulties of measuring this dimension. Complex personal observation studies would be needed to gather data on this dimension. Research that focuses on journalistic induction and adaptation is also missing. The model should be broadened in three dimensions. First, the recipient should be included. This could improve the model through describing the entire process of agenda building and agenda setting. Second, the economic impact of the relationship between journalism and PR, which can affect inductions and adaptations in all dimensions of the model, should be integrated. Third, the model could be linked with frame analysis: shared frames or conflicting frames would suggest how the data/information might be interpreted and reported differently, and might even cause relationships to deteriorate (→ Framing of the News).

## Interethnic Relationships in Families

Jordan Soliz

University of Nebraska-Lincoln

Historically, family scholarship has been guided by a Eurocentric perspective including the notion that families are ethnically homogeneous. Over the last few decades, a shift in social acceptance of interethnic relationships coupled with changes in national laws (e.g., a 1967 US Supreme Court ruling abolished the last legal barrier to interracial marriages) has resulted in an increase in interethnic families. Ethnic identity is a sense of affiliation with a specific ethnic group manifested in communication patterns, cultural and religious traditions, political ideologies, peer networks, or family roles (Phinney 1990). Thus, interethnic families are family systems where partners and/or children *identify* with different ethnic groups.

### ETHNICITY AND MULTIETHNIC FAMILIES

Specific demographic information or historical comparisons on interethnic families can vary due to the national practices of documenting race and ethnicity. Yet, many countries still do not document interethnic marriages or multiethnic identity. However, data from national census reports indicate the prevalence of these relationships. For example, according to the 2000 US Census, 7.4 percent of marriages are interethnic relationships with African-American/Euro-American and Hispanic/Non-Hispanic as the most common type of relationship. However, other sources have estimated this to be from 5 percent to

10 percent of the married population. Likewise, the Office of National Statistics reports a multiethnic population exceeding 675,000 in the United Kingdom. Further, interethnic families are more common in regions with diverse populations. For example, an estimated 36 percent of the married population in Hawaii is comprised of interethnic couples and, overall, interethnic families are more common in the western United States (e.g., California). Likewise, western Europe has larger populations of interethnic families compared to eastern Europe. In these national regions, the increase in interethnic families over the last decade is well documented.

The terms *interracial*, *intercultural*, and *interethnic* have been used interchangeably to describe relationships in which the different racial/ethnic identities can create unique experiences and challenges. However, the term *intercultural* may be too broad as it can refer to a variety of contexts where divergent orientations other than race/ethnicity (e.g., nationality) influence interactions. Conversely, employing the term *interracial* can be limiting in that it may fail to capture the breadth of these relationships. Whereas many people perceive race to be socially constructed, race can also imply strict biological and physiological constraints. For example, the US Census allows for 57 interracial combinations based on five specific racial categorizations. However, these combinations do not account for Hispanic/non-Hispanic families or interethnic families within one race (e.g., Japanese-American/Chinese-American). Hence, the term *interethnic* is more inclusive as it highlights ethnic variations in both interracial and intraracial relationships.

As Gudykunst & Lee (2001) suggest, ethnic identity (e.g., Chinese-American) should not be confused with panethnic identity (e.g., Asian-American) because doing so would minimize the importance of the heterogeneity of ethnic groups. Moreover, cultural identity should refer to identification with the dominant culture in which they live. Hence, communication in interethnic families is characterized by various “layers” of influence: the idiosyncratic personal characteristics of the individual family member, salience of the ethnic identity of the family members, and the macro-cultural influence.

The primary *method of inquiry* for research on interethnic families has been in-depth interviews with small samples due to availability and willingness of family members to participate in research (→ Interview, Qualitative). Further, a majority of the research has focused on African-American/Euro-American relationships as these are common interethnic relationships and the most socially scrutinized relationships. However, more recent scholarship is being conducted with larger, survey-based studies, which also include more diverse samples of interethnic couples or families (→ Survey).

A common perception of interethnic families is that they face unique challenges that make it difficult to achieve harmonious relationships. Whereas interethnic families obviously have unique experiences, they are not inherently problematic. The nature of family communication is what differentiates positive and negative family functioning. In fact, research has shifted from a focus on demography and challenges of interethnic families to an emphasis on *communication* and the multiethnic family experience (Socha & Diggs 1999).

## COMMUNICATION IN THE MULTIETHNIC FAMILY SYSTEM

Communication goes well beyond issues of language differences that may impede proper family functioning. Intergroup and interpersonal factors may affect communication in

interethnic families (Gaines & Liu 2000). In one sense, interactions may be influenced by norms and modes of communication characteristic of an ethnic identity. Alternatively, interactions may be influenced by the shared family communication practices and standards reflective of a more interpersonal orientation (→ Family Communication Patterns). Hence, a common ingroup identity of family may supplant the potential conflict associated with separate ethnic identities.

Because family members' *communication modes* may be influenced by their ethnic identity, the extent to which couples accommodate the communicative needs and desires of family members may be associated with a shared family identity (→ Communication Modes, Western; Communication Modes, African; Communication Modes, Asian; Communication Modes, Hispanic; Communication Accommodation Theory; Intergroup Accommodative Processes). For example, adapting communication to a partner's preferences may transcend differences stemming from divergent ethnic identities which, in turn, could highlight the common family identity as the interactions are more personalized. Conversely, failing to adapt communication behavior may accentuate differences. At times, this behavior may be a strategy for intentionally highlighting one's ethnic identity. Hence, creating and maintaining a shared family identity by recognizing and/or transcending ethnic difference is an important aspect of positive family functioning. Yet, in doing so, family members may experience a shift in their ingroup/outgroup communication practices outside of the family as the shared family identity blurs the boundaries of what constitutes an ethnic ingroup/outgroup (Foeman & Nance 2002).

Because ethnic identification includes a sense of shared histories and experiences, recurring discussions may center on these divergent worldviews which can create challenges when discussing issues such as discrimination, historical oppression, and segregation. In fact, early stages of relational development for interethnic couples often include discussions of societal perceptions of racial/ethnic groups and the partner's experiences (Foeman & Nance 2002). The process of negotiating and maintaining a family identity includes overcoming these challenges, although research does not point to a single, prescriptive method for achieving this goal. Some couples have open discussions in an attempt to compromise on these issues whereas other couples may explicitly recognize and accept these differences, realizing that they may not be understood or validated by their partner (Killian 2001).

In addition to the everyday talk and recurring discussions, *family rituals and narratives* serve as communicative acts that can create a shared family identity and/or maintain individual ethnic identity (→ Storytelling and Narration). For example, creation of new, unique family rituals or sharing "origin of family" narratives may transcend ethnic difference by highlighting the couple/family identity (Killian 2001). Conversely, family members may choose to maintain individual ethnic identity by highlighting specific cultural rituals in important events (e.g., wedding customs) or sharing stories of history and experiences relevant to a particular ethnic group.

Communication with the larger family system (e.g., parents, siblings, grandparents) can also create unique challenges, as lack of support or explicit disapproval from the larger family can act as a relational stressor (Negy & Snyder 2000). For couples, disclosing the relationship to family members is an important aspect of relational development (Foeman & Nance 2002) and, obviously, contains elements not present in intraethnic relationships. For example, a couple must not only disclose the relationship, but also communicate the importance of their different ethnic identities as a way of establishing their couple/

family identity. The reaction of the larger family and peers creates one of the more common challenges for maintaining the relationship, but can also serve as a catalyst for bonding between the couple or family.

### **PARENT–CHILD COMMUNICATION IN MULTIETHNIC FAMILIES**

As a means of transmitting cultural ideals from one generation to another, family communication plays an integral role in ethnic socialization and identity development of children. Although identity is influenced by social class, ethnic makeup of peers, physical appearance, and our societal expectations for possessing a monoethnic identity, family communication plays the major role in identity development. For multiethnic children, this process may be more complex since their identity can be influenced by various ethnicities. The extent and nature (i.e., positive versus negative) of a parent's discussion about their ethnic heritage as well as the partner's heritage is influential in a child's identity formation. Rockquemore's (1999) discussion on identity "options" for biracial persons is relevant to multiethnic individuals. Specifically, individuals can identify with one specific ethnic/racial group, embrace their multiethnicity, shift ethnic identity based on context, or transcend ethnic identification. Hence, multiethnic children may have an ethnic identity that differs from one or both parents (i.e., identifying as multiethnic). Thus, in family interactions, multiethnic individuals negotiate and/or maintain their own ethnic identity. Therefore, it is not simply a matter of how children identify, but how they *communicate* their identity to their family, peers, and community.

Historically, it has been assumed that there were negative consequences for the emotional well-being of multiethnic individuals. Specifically, family counselors and scholars claimed that the lack of a specific, singular ethnic identity frame of reference results in a lack of affiliation or sense of belonging. Although this is still the case for some, multiethnicity can also be a positive attribute in that individuals may be better able to adapt to intercultural interactions, have greater intercultural competence, and have lower tendencies to express ingroup favoritism, for example, discrimination (Navarrete-Vivero & Jenkins 1999). In fact, while some interethnic couples may be concerned about their children's well-being, many view the children's experience with various ethnic influences as a positive aspect of their relationship (Negy & Snyder 2000). Still, depending on the norms of the maternal and paternal families, children may experience complicated and, hence, confusing, expectations of communication. Although language may be the most obvious example, even cultural norms of verbal and nonverbal communication may differ depending on the family member with whom the child interacts. The extent to which a child feels "trapped" or forced to choose a singular identity may be associated with a loss of ethnic identity which is related to negative well-being. Therefore, for the well-being of children and to foster an environment for development of a multiethnic identity, ethnic socialization involves clearly transmitting communicative norms and expectations as well as customs and traditions related to the socio-cultural heritage of the paternal and maternal family (Navarrete-Vivero & Jenkins 1999).

The limited scholarship on children in multiethnic families has focused on biological children of interethnic couples. However, families formed through international and transracial adoption also create a context where communication about family, ethnic, and cultural identity are important in the identity development process for the children. For

example, sharing adoption stories, creating and maintaining the family identity, discussing ethnic/racial identity, and socializing to cultural norms are all important in the development of the family and children's identity (Galvin 2003).

Whether formed through the union of individuals with divergent ethnic identities or through adoption, interethnic families exemplify the diversity in family forms common today and illustrate the constitutive nature of communication in creating and maintaining personal, ethnic, and family identities.

## **Intergenerational Communication**

*Mary Lee Hummert*

*University of Kansas*

The term “intergenerational communication” applies to interactions involving individuals who are from different age cohorts or age groups. Families provide ready examples of

individuals whose communication would be classified as intergenerational: parent and child, grandparent and grandchild, aunt and niece, to name a few. These interactions stand in contrast to intragenerational communication or communication between individuals from the same generation or age cohort, such as siblings. Intergenerational communication occurs outside the family context as well. Any interaction between a child and an adult, a young person and one who is middle-aged or older, or a middle-aged person and an older person, fits the definition of intergenerational communication. As a result, much communication in daily life – in the workplace, social settings, and the home – is intergenerational in nature.

Although common, intergenerational communication carries a strong potential for miscommunication and unsatisfying interpersonal interactions. This occurs not only because people from different age cohorts vary in their life experiences, but also because people at different points in the life-span vary in their communication goals, needs, and behaviors (Williams & Nussbaum 2001). Other challenges to satisfying intergenerational communication come from age stereotypes and social role expectations (Hummert et al. 2004), which can also vary across cultures (Zhang & Hummert 2001; → Social Stereotyping and Communication).

### **AGE AND COMMUNICATION GOALS, NEEDS, AND BEHAVIORS**

Individuals belong to age cohorts and age groups. Age cohorts are defined by shared experience of historical events during youth and young adulthood that are viewed as formative of shared values (Williams & Nussbaum 2001). Examples include the “greatest generation,” which came of age during the Great Depression and World War II; baby boomers, who experienced the Cold War and the Vietnam War; generation X, or the children of the baby boomers who saw the end of the Cold War and the space shuttle *Challenger* explosion; and generation Y, who are currently young adults and whose experience may be shaped by the terrorist attacks of September 11 and the events following them. Age cohorts map onto human history. In contrast, age groups map onto the human life-span: child, adolescent, young adult, middle-aged adult, and older adult. Although the exact boundaries between age groups are difficult to specify, childhood is generally associated with the pre-teen years, adolescence with the teenage years, young adulthood with the twenties and early thirties, middle age with the late thirties through the fifties (and even the early sixties), and older adulthood with age 65 and beyond (Williams & Harwood 2004).

Some intergenerational communication problems, even conflicts (→ Conflict and Cooperation across the Life-Span), can be tied to the participants’ being from different age cohorts. Examples include the divergent life experiences reflected in the differing value placed on thriftiness by members of the greatest generation and baby boomers, or the importance placed on political activism by baby boomers versus generation Xers. Focusing on these cohort differences can be informative in understanding some aspects of intergenerational communication. A counselor, for instance, might use knowledge of cohort differences to mediate an intergenerational conflict within a family or organization. The *cohort approach* to understanding intergenerational communication has a critical limitation, however. It presumes that individuals are, to an extent, prisoners of their

history, and therefore does not consider the role of individual development across the life-span as an influence on intergenerational communication.

The *life-span developmental approach* offers an alternative to the age cohort approach to intergenerational communication. The developmental approach recognizes that communication needs, goals, and skills change as individuals move through the various age groups from childhood to older adulthood (Williams & Nussbaum 2001; → Developmental Communication). Laura Carstensen's *socio-emotional selectivity theory* illustrates how communication needs and goals differ for those early and late in the life-span (Carstensen et al. 1999). According to socio-emotional selectivity theory, young adults face life tasks (e.g., choosing a career, finding a mate) that make new experiences and new communication partners their primary communication goals. They seek variety and novelty in communication, which increases their risk of experiencing some encounters with negative emotional consequences (→ Emotion). Older individuals, in contrast, seek to maximize their positive emotional experiences through an emphasis on interactions with a few well-known communication partners. Socio-emotional selectivity research shows that this drive toward positive emotional experiences reflects awareness of the approaching end of the life-span, which occurs most often, though not exclusively, among those in the older adult age group (→ Death, Dying, and Communication). These differing communication goals of young and older persons can also lead to misunderstanding and intergenerational conflict, especially within families as they negotiate the amount of time spent together, topics of conversation, etc.

Two communication behaviors have been especially associated with advancing age: reminiscence (Bluck & Aleia 2002) and painful self-disclosures (Coupland et al. 1988; → Disclosure in Interpersonal Communication). Both may reflect developmental processes. *Reminiscence* involves recalling and describing past life events. Usually reminiscence focuses on significant events in the speaker's childhood, youth, and adulthood, and often takes the form of a long, well-practiced narrative delivered to friends or family intimates. *Painful self-disclosures* involve revealing personal information about a problem or negative life event in conversation with a relative stranger. Examples include the death of a spouse or child, personal illness, financial difficulty, etc. Such self-disclosures could be considered a specific form of reminiscence distinguished by their *painful* topics, tangential relationship to the ongoing conversation, and the lack of intimacy between the speakers and the recipients. Both reminiscence and painful self-disclosures may serve developmental functions. Reminiscences can be part of a life review that would help older individuals achieve Erikson's ideal of ego integrity (Erikson et al. 1986). Painful self-disclosures may be used by older speakers to establish their status as individuals, perhaps to reveal to listeners critical events that have shaped their identities or as a means of coming to terms with their identities (Coupland et al. 1988; → Age Identity and Communication).

Although these two communication behaviors may share developmental origins, they have different effects on intergenerational communication. Reminiscences are more likely to be associated with wisdom and satisfying intergenerational conversations than are painful self-disclosures (Williams & Giles 1996). In fact, Coupland et al. (1988) labeled these self-disclosures *painful* because they caused discomfort to listeners, not because they were necessarily causing distress to the disclosers at the time of the conversation.

## AGE STEREOTYPES AND INTERGENERATIONAL COMMUNICATION

Because age groups are social groups, intergenerational communication can also be examined from an intergroup perspective (Williams & Harwood 2004). Communication accommodation theory (Giles et al. 1991) provides a framework for understanding how → stereotypes about members of other age groups lead to expectations about appropriate communication behaviors in intergenerational interactions (→ Communication Accommodation Theory). The communication predicament of aging model (CPA; Ryan et al. 1986) and the age stereotypes in interactions model (Hummert 1994) illustrate how young individuals may adapt their communication to negative age stereotypes of decline by speaking more slowly, more loudly, and/or more simply to older people than they would to other young people. That is, they *over-accommodate* their communication to the negative stereotype, whether or not the older person needs that accommodation (→ Intergroup Accommodative Processes). In other cases they might *under-accommodate* to older listeners by ignoring their wishes or by directing them to behave in a particular way. These forms of communication have been termed *patronizing* (Hummert 1994) because they imply that older people are less competent than younger ones (→ Communication Skills across the Life-Span). Within the CPA model, these forms of talk are linked to dissatisfying intergenerational communication and the promotion of age stereotypes, with the potential to encourage older people to conform to negative age stereotypes in their behavior. Patronizing communication to older people has been observed in many different intergenerational contexts, including not only nursing homes and hospitals but also family and social settings (Hummert et al. 2004). It can even emerge in the workplace as younger workers underestimate the communication abilities of their older colleagues (McCann & Giles 2002).

Although the link between negative stereotypes of older people and patronizing communication has received the most research attention, age stereotypes of young people appear to be associated with patronizing communication from older people as well (Williams & Nussbaum 2001). Young people report that older people commonly speak to them in ways that they view as patronizing, primarily by being *under-accommodative* to the desires of the young people. Those behaviors include offering unsolicited advice, ignoring their viewpoints, and making negative comparisons between the younger generation and their own.

## SOCIAL ROLES AND INTERGENERATIONAL COMMUNICATION

Just as stereotypes can affect intergenerational communication, so can communication expectations for social roles. First, social role expectations may conflict with age role expectations. Second, long-term role relationships may evolve over the life-span. Both can contribute to problematic intergenerational communication.

As an example of the first case, supervisors are expected to provide instructions to their staff and to give feedback on staff performance. When the supervisor is from an older age group than the staff, this relationship fits cultural notions of age hierarchy. That is, supervisors' authority to provide instruction/evaluation derives not only from their position in the organizational hierarchy but also from their expert knowledge gained

through experience (→ Power in Intergroup Settings). When the supervisor is from a younger age group than some (or all) of the staff, the mismatch between the organizational hierarchy and the age hierarchy may be reflected in workplace communication to the extent that the mismatch is salient to either supervisor or staff. Consequences could include tentative communication behaviors on the part of younger supervisors, which would further undermine their legitimate authority, or confrontational communication between supervisor and staff (→ Organizational Communication).

The parent–child relationship illustrates the second case. The nominal familial roles stay the same across the life-span. That is, the parent is always the parent and the child is always the child, whether the parent is 40 and the child is 10 or the parent is 80 and the child is 50. On the other hand, the nature of the intergenerational communication changes as the relationship between parent and child evolves across the life-span (Hummert & Morgan 2001). There can be many transitions for parents and children that affect their relationship and play out in their communication, including the child becoming an adult, parenthood for the child (and grandparenthood for the parent), death of another family member, retirement of the parent, and advancing age and frailty of the parent, to name a few. Two of these are noteworthy because they require a redefinition of normative expectations for parent and child roles, represent profound disruptions to the established parent–child relationship, and demand new ways of interacting to maintain satisfactory intergenerational relationships: the transition that occurs when the child moves through adolescence to adulthood and that which occurs as the parent becomes frail with advancing age. In the first transition, the parent must relinquish authority to the developing autonomy of the adult child, resulting in a more egalitarian relationship than had existed when the child was younger. In the second transition, the parent and child must negotiate how to maintain the autonomy of the parent as the parent's need for assistance grows. Both require balancing competing needs for independence and dependence through appropriate intergenerational communication (Hummert & Morgan 2001). Intergenerational ambivalence (Pillemer & Luscher 2004) about normative behaviors in the parent and child roles can lead to intergenerational conflict during these transitions. However, conflict and ambivalence may be minimized in families that have developed a conversational family communication style (Koerner & Fitzpatrick 2002), i.e., one that embraces nonjudgmental and open discussion of sensitive topics (→ Family Communication Patterns).

### **CULTURAL INFLUENCES ON INTERGENERATIONAL COMMUNICATION**

To the extent that cultures differ in their values, they can also have different age stereotypes, norms for social roles, and standards for acceptable intergenerational communication behaviors (→ Culture: Definitions and Concepts; Social Norms). East Asian cultures place greater emphasis on harmony, age hierarchy, and filial piety (i.e., the obligation of young people to respect and support older people) than do western cultures (Zhang & Hummert 2001; → Intercultural and Intergroup Communication; Communication Modes, Asian; Communication Modes, Western). These values might be expected to result in more satisfactory intergenerational communication than in western societies. However,

research shows that intergenerational communication problems are not only found in eastern cultures, but they are at times perceived as more dissatisfying by those in eastern cultures than by those in the west (Williams & Harwood 2004). One explanation offered is that young people in the east feel compelled by their cultural values to act politely toward their elders, but do so reluctantly, perhaps because of the influx of egalitarian western values into Asian cultures. In addition, Zhang and Hummert (2001) point out that the same intergenerational communication behavior may be dissatisfying or satisfying within western and eastern cultures, but for different reasons. They offer as an example older people's reaction to being addressed in familiar terms by young people. While older participants from western cultures find this behavior patronizing because it indicates over-accommodation to negative age stereotypes of weakness and dependence, older participants in China view it as patronizing because it is under-accommodative to the positive age stereotype of experience and high status that underlies the cultural values of filial piety and age hierarchy. These findings illustrate the role of cultural values in standards for intergenerational communication.

## Intergroup Accommodative Processes

Cindy Gallois

University of Queensland

We constantly interact with people from different social groups to our own: cultures, ethnic groups, genders, ages, occupations, organizations, even clubs (→ Intercultural and Intergroup Communication). We may wish to affiliate with another person or group, or to distinguish ourselves from them. We express this motivation through language and communication, and through our interpretation of others' communication. The main communication dimensions considered here are intergroup (versus interpersonal) and accommodation (versus nonaccommodation). The main theory describing and explaining them is → Communication Accommodation Theory (CAT: Giles 1973; see Gallois et al. 2005, for a review).

### DEVELOPMENT OF RESEARCH INTEREST

Interest in intergroup processes originated in cross-cultural communication studies by linguists, sociologists, and psychologists. Most people in the world speak two or more

languages, many using different languages for different purposes (*diglossia*). Even monolingual people change accent or communication style in different social contexts. Language and style change to signal important group memberships.

For example, a French–English bilingual in Canada may switch from English to French to signal the importance of being French Canadian, and may even refuse to speak English to an English Canadian. Other choices include changing accent, using more or less formal language, jargon or slang, or particular nonverbal behavior. Similarly, people making changes may be judged by members of their own group (*ingroup*) or another (*outgroup*) as friendly, ingratiating, hostile, arrogant, or stubborn, depending on the context.

Sociologists and sociolinguists have long been interested in the ways that people use language and communication to mark group memberships, and how these change depending on the situation: who, what topic, where, when (Fishman 1971; → Language Varieties). These scholars describe the subtle markers of group and social networks in language. The concept of accommodative intergroup processes, in contrast, derives from the social psychology of language, where there is a stronger emphasis on motivation and perception. Thus, instead of detailing actual language features, social psychologists of language explore the impact of identity, goals, interpersonal and intergroup history, and perceptions on communication. This work is linked to language attitudes (→ Language Attitudes in Intergroup Contexts).

## INTERGROUP PROCESSES AND IDENTITY

Intergroup processes include all aspects of social behavior, including communication, in interactions between members of different groups. They are contrasted with interpersonal processes, or social behavior between people where group membership is not salient or important. Intergroup processes – social judgments, decisions, attributions, and particularly communication – are closely tied to *social identity*, or a person's sense of self as a group member, with the accompanying norms, values, and characteristics (Tajfel & Turner 1979; → Social Identity Theory). People differ in the strength of their social identifications; for one person, gender may be the most important identity, whereas for another gender may matter little but occupation be very important. Salience, or how close and influential an identity is to awareness and behavior, varies across situations. Social identity is salient whenever groups are in conflict or rivalry, whereas personal identity and interpersonal processes tend to be salient in friendly or ingroup contexts.

*Social categories* range from relatively fixed groups like culture, ethnicity, gender, social class, or age to relatively unstable ones like club or organization. Social identity is flexible depending on the intergroup history and its salience in a given context. For example, we may be very aware of cultural membership at the Olympics, but more aware of age in a discussion of retirement planning, and health in a discussion of disability. Likewise, we may be motivated to show identification with another group in one context (e.g., a potential employer during a job interview) and hostility toward that group in another (e.g., a dispute between union and management).

*Accommodative processes* refer to the ways we reflect our attitude and identity through language and communication. We may use expressive language and communication to show friendliness, identification, or solidarity, and thus to bring another person psychologically

closer to us (accommodation). Alternatively, we may communicate hostility, disliking, or rivalry (counter-accommodation), reflect a (perhaps unintentional) patronizing or ingratiating attitude (over-accommodation), or mark our own social identity distinctly from another's (under-accommodation). These three processes indicate *nonaccommodation*. Motivation and perception start the process. Nevertheless, the communication process from motivation through expression to perception and interpretation is not one-way or linear, as these psychological variables change with little conscious awareness. Indeed, social identities are negotiated through the course of intergroup interactions.

Originally (Giles 1973), CAT was called Speech Accommodation Theory (SAT). It described intergroup processes, particularly interethnic or interclass contexts, where people signaled liking for and identification with another by making aspects of speech (e.g., accent) more similar to the other person's. This process is called *convergence*. On the other hand, to signal hostility, rivalry, or dislike, people can make their speech as different as possible from the other's (*divergence*). One common form of divergence is to maintain key markers of one's own group (*maintenance*).

SAT involved a model, related to similarity-attraction theory (Byrne 1971), where liking leads to convergence and disliking to divergence at an interpersonal or intergroup level. Experimental research showed that listeners judge the language and accents of their ingroups more positively than salient outgroups, and prefer members of outgroups who converge to ingroup language or accent. They are likely to diverge when outgroup members make derogatory or hostile remarks about their group. Norms are important, so that people appreciate convergence to the accent and style of a higher social class in job interviews but not in some other situations.

It soon became clear, however, that often communication as measured by outsiders did not reflect communicators' perceptions. For example, in mixed-gender conversations, men and women may adopt exaggerated versions of their own gender's behavior, but perceive themselves as converging to the other gender. Gender-based norms prescribe accommodation through behavior that is objectively divergent. In other cases, people believe they are converging, but lack the linguistic or communicative skills to do so. SAT (and later CAT) distinguished between objective (measurable) and subjective (perceived) accommodation, as well as between linguistic and psychological accommodation, positing that subjective and psychological accommodation are the better predictors of behavior (Giles et al. 1991).

As SAT took more account of contextual subtleties, norms, and perceived behavior, it also expanded beyond intercultural and interclass encounters to include other intergroup interactions. One of the first was *gender*. Later, communication in intergenerational encounters came under scrutiny, and age-related attitudes were found to be signaled by a wide array of linguistic, nonverbal, and discursive moves (Coupland et al. 1988). In this extension, accommodative strategies were expanded beyond convergence, divergence, and maintenance to *nonapproximation strategies* (see below). Contexts examined include health, disabled or able-bodied status, organization and occupation, and cross-institutional encounters. In 1987, to indicate its expansion to diverse intergroup contexts and behaviors, SAT was renamed CAT. CAT then underwent a process of expansion in comprehensiveness and complexity. In 2005, a new version of CAT aimed to retain comprehensiveness with a simpler explanatory framework and propositions (Gallois et al. 2005).

## ACCOMMODATION IN INTERGROUP ENCOUNTERS

Communication accommodation in intergroup contexts is described as a dynamic process between interactants. It begins with *socio-historical context*, including intergroup and interpersonal history along with the larger society's norms and values (→ Intercultural Norms). Socio-historical context mainly characterizes long-term, relatively stable intergroup relations. At the individual level, it is reflected in *initial orientation*, both intergroup and interpersonal, including strength and salience of social identity. Initial orientation is short term and changes from one situation to another. These aspects lead to each person's *accommodative stance*, or motivation to accommodate (or not) to the communicative needs and desires of the other person.

Accommodative stance is expressed in *accommodative strategies*, which each person plans and employs. These include *approximation* – changing communication to be more like the other person (convergence) or emphasizing one's own group markers (divergence or maintenance; see above); *interpretability* – communicative behaviors intended to make the encounter easier or harder for the other person to participate in (e.g., simple language or technical jargon, familiar or unfamiliar topics for the other person); *discourse management* – whether each person communicates to share the conversation (e.g., equal talk or domination, formal or informal language); *interpersonal control* – whether each person treats the other as an individual of equal status (e.g., use of role-bound titles); and *relational expression* – intended to maintain or threaten the relationship or another's status and face (e.g., reassuring language, attacks on face). Overall, stance is aimed toward a more or less intergroup interaction.

Strategies are translated into behavior and tactics, which change across the interaction. There is no one-to-one correspondence between strategies and tactics, or between them and specific behaviors (Jones et al. 1999). Indeed, the same behavior (e.g., smiling or gaze) can indicate accommodation or nonaccommodation, depending on what else is happening in the interaction. In interaction, behavior is perceived and labeled by other interactants, and people make attributions about each other's motives and goals. Finally, these attributions result in intentions about whether and how to interact with the other person or the person's group in the future.

In the twenty-first century, the study of accommodative intergroup processes has moved to close examination of encounters, particularly organizational behavior. One of the most interesting developments examines accommodative processes between police officers and members of the public (e.g., Giles et al. 2007). A key finding is that accommodation by police is likely the strongest predictor of attitudes toward police by people in different cultures and social classes. A challenge for CAT, and for understanding intergroup communication, is the complexity of the theory and whether it can be fully tested. CAT has recently been streamlined, but intergroup communication is a complex and complicated domain that does not lend itself to simple models. In the future, research will need closer links with qualitative approaches to identity and intergroup relations, particularly involving discourse analysis (→ Discourse Analysis). The fascinating area of intergroup accommodation has generated much research over the past three decades, and will generate much more over the next 30 years.

## **Intergroup Communication and Discursive Psychology**

*Jonathan Potter*

*Loughborough University*

Relationships and communication between social groups of all kinds is an increasingly pressing topic in a globalized world in which there are conflicts of resources, religions, and ideologies. Discursive psychology's distinct contribution is to try to understand this topic through studying how discourse works in the practical settings in which intergroup issues become live (→ Discursive Psychology). These might include major public events such as a parliamentary debate on migration and asylum, institutional interaction such as where the police interview a suspect who has been accused of racist violence, and everyday talk, such as conversations about politics and nationality over a family meal.

A key point of this tradition of work is that social groups often do not communicate and understand one another directly; instead, social groups become live entities as they are invoked in practical settings through the telling of stories, descriptions, and other constructions in talk and texts. This means that if we are to fully understand conflict and racism we need to understand these discourse processes. That is, we need to describe the building blocks which people draw on to assemble their talk and texts as well as the practices through which the building is done in specific settings. The resources are at their simplest words (“immigrant,” “asylum seeker”), but they can also be broader explanatory units such as the “interpretative repertoires” that Potter and Wetherell describe (1987).

### **DISCOURSE AND RACISM**

A foundational study in this tradition (Wetherell & Potter 1992) studied the talk of professional members of the white majority group in New Zealand (bankers, teachers, and so on) in open-ended interviews, newspaper editorials, and parliamentary debates. These are people who had flown below the radar of traditional research on racism because of its focus on working class authoritarians, yet they are people with power in a society as they are key figures in educational and legal institutions (→ Prejudiced and Discriminatory Communication). These people are often caught in a dilemma. They do not wish to support social changes that will transfer power, money or privileges to minority groups (Maori, Polynesian Islanders), yet they do not wish to be heard as bigoted. The study looked at the way these people managed this dilemma using a weave of symbolic resources that Billig (1992) has called the kaleidoscope of common sense.

For example, the members of the white majority group would draw on varied repertoires of culture. At times, a “culture-as-heritage” repertoire could be used to discount Maori political critique as a product of cultural dissatisfaction. At other times, majority group members would draw on a “culture-as-therapy” repertoire to represent young urban Maoris as deficient as Maoris, and in this way they undercut legitimate protests about sovereignty and land as mere psychological disturbance. What this study shows is that although culture discourses can be publicly spoken and treated as positive and sensitive to minority groups, they can nevertheless be used like more traditional racist discourse to maintain notions of natural group differences and to privilege in-group explanations of inequality over intergroup ones.

Billig (1996) has pointed out that in any social group, at a particular time in history, certain phrases or commonplaces have a taken-for-granted quality. They can be spoken with little chance of contradiction. Wetherell and Potter mapped the use of these “maxims of practical politics” across their corpus of interviews, editorials, and debates. They found recurrent uses of phrases like:

Everyone should be treated equally.  
You can't turn the clock backwards.  
Injustices should be righted.  
You have to live in the modern world.  
You have to be practical.

Who could disagree? Who would wish to argue that you need to live in the past or strive for impracticality? Yet the study showed that in practical settings this tissue of maxims was flexibly used in arguments against radical social change and advancement for Maoris. This research highlights how hard it is for anyone who wishes to combat arguments using these resources. Attacking these commonplaces directly risks appearing to attack common sense itself!

### **CONTACT AND DESEGREGATION**

Discursive psychology provides a different way in to considering classic issues of contact, segregation, and integration. Durrheim and Dixon (2005) did extensive work in postapartheid South Africa, combining observational work (→ Observation) in public settings with interviews (→ Interview, Qualitative). In the observational studies they found that there was extensive de facto physical segregation between ethnic groups even without the legal and political framework of apartheid to support it. They interviewed members of the different groups and looked in particular at the way they explained and justified segregation. What was striking was that the white participants still drew on crude racist stereotypes, but in an oblique manner. At the same time they expressed strong support for the principle of desegregation; however, they opposed the manner of its practical implementation. These contrary conversational moves blended together progressive and traditionally racist elements. This is an example of a more general pattern identified in discursive psychological work where egalitarian social arrangements (based around race, gender or age) are strongly supported in principle while their practical implementation is criticized.

Durrheim and Dixon (2005) studied what they called the “lay ontologizing” of their research participants. This involved the justification of segregation through building specific versions of the nature of ethnic groups. Segregation was presented as an unfortunate but inevitable consequence of the basic nature of ethnic groups rather than an irrational outcome of racist thinking. In the course of particular arguments, interviewees drew on what they presented as “anthropological universals” about the way cultures operate to validate segregation. Although this work was carried out in South Africa, similar conclusions have been drawn from American work. Buttny (1999) found that US college students who watched the documentary *Racism 101* about segregation and racism on campus offered a weave of accounts of segregation to make their separateness appear rational and sensible.

### **THE ISSUE OF ESSENTIAL GROUP PROPERTIES**

One of the key issues for social scientists over the past 100 years has been what makes up a social group. Discursive psychologists emphasize a rather different aspect of this question. For them, a key issue is how participants *construct social groups*. How do they treat group members as the same and how do they accentuate differences within the group (Billig 1985)? Another key question is: how are groups treated as having some kind of natural and timeless essence? Indeed, when we talk about “intergroup communication”

it is very hard to do so without assuming a notion of distinct groups that can communicate with one another.

While for social identity theorists the key issue is the cognitive salience of group memberships, for discursive psychologists the issue is how category terms are used in conversations and texts, and how they are made relevant to whatever interaction is happening (Edwards 1998; → Social Identity Theory). That is, how are social groups described in ways that are relevant to actions (justifying segregation, say) and how is an individual's membership of one social group rather than another made something that is relevant to the interaction (→ Identities and Discourse)? For example, when a police officer is interrogating a suspect, when and how does the identity "Muslim" become relevant, say, or "male," or "foreign" (for either the police officer or the suspect)? These are delicate issues to explicate. Edwards (1998) did so in a study of talk in relationship counseling sessions. He tracked the use of categories such as "girls" and "married women" through the material, and identified the way they were invoked very differently by different parties as elements in different actions.

In a different approach to this issue, Verkuyten (2003) studied the way in which Dutch interviewees (from majority and minority groups) drew on ideas about social groups that treated them as having essential and timeless properties. He found that there was a complex relationship between this kind of "essentialist" talking and other kinds of constructions that suggested changing characteristics of social groups, and changing relationships between culture and ethnicity. Speakers drew selectively on these very different ways of treating social groups as they addressed questions of assimilation, group provision, and cultural rights (→ Accounting Research).

Condor (2006) has considered these issues in relationship to nations and nationalism. One important arena for intergroup communication is *communication between nations*. She studied vernacular constructions of nationhood in an English sample. She found that participants could construct the nation as a set of persons, as an object or a geographical location, or as some mix of these things. This mix allowed participants to manage the potential to be heard as assuming national stereotypes by making a distinction, for example, between the past national characteristics and current state structures and policies. Condor's research in particular highlights the subtlety and sophistication of lay reasoning about social groups, while showing also, like Verkuyten, that this complexity can be used in both relatively negative and relatively progressive ways (promoting or impeding social change, for example).

### **GROUP ACTIONS**

One of the characteristics of much of the discursive psychological research on intergroup communication is that it has worked primarily with interview material. This has been particularly effective for uncovering ideological organizations of discourse, notably the way particular constructions of groups, say, are used to legitimize inequality or, in Billig's (1992) metaphor, used to "settle" the populous into particular social relations. However, there is an increasing interest in exploring how these themes are played out in actual interaction (→ Conversation Analysis).

For example, Eriksson and Aronsson (2005) studied classroom lessons in a Swedish schoolroom, where “booktalk” was used to raise cultural issues. This is a formative arena of intercultural socialization, where cultural identities are constructed through a series of more or less implicit contrasts between “us” and “others.” As a final illustration, Augoustinos et al. (2007) studied both the controversy about, and the (failed) enactment of, the Australian government’s apology to indigenous Australians for the forced removal of their children in the 1950s. They showed how the then Australian prime minister, John Howard, mobilized a range of interpretative repertoires emphasizing “togetherness,” “culture,” and “nation,” combined with a number of self-sufficient arguments about practicality, equality, and justice to develop a version of reconciliation that sustained rather than reduced existing inequalities between indigenous and non-indigenous Australians.

From a discursive psychological perspective, issues of intergroup communication are not sufficiently understood using the apparatus of social cognition, prejudice, and attitude theory (→ Attitudes; Social Cognitive Theory). Rather, it is necessary to study both the sets of discursive resources that underpin such communication and the flexible and contradictory use of those resources in practical settings.

Intergroup contact occurs when a member or members of one social group come into contact with member(s) of another social group. Research has focused on whether such contact can influence attitudes about social groups, and whether certain types of contact yield the most positive prejudice-reduction outcomes (→ Attitudes; Stereotypes). Typically, the specific group memberships have significance in the local social milieu (e.g., in North America, race and sex would constitute meaningful dimensions for intergroup contact, whereas hair color would not).

To qualify as “intergroup,” the contact event generally requires at least minimal awareness of group difference among the participants (see “Typicality/Salience,” below). An interaction between a Catholic and a Protestant in Northern Ireland in which both were *completely* unaware of the other’s religious affiliation would not constitute intergroup contact (unless/until they became aware). Work in this area typically makes reference to ingroups and outgroups. Ingroups are the groups in which individuals would categorize themselves, or into which they might legitimately be categorized by others. Outgroups are those to which the individual does not belong (e.g., for a Muslim man, outgroups might include Hindus, women, or children). The primary focus of this entry is on the implications of intergroup contact for intergroup attitudes: does having contact with members of an outgroup change how someone feels about that outgroup (→ Intercultural and Intergroup Communication)?

## INTERGROUP CONTACT THEORY

The organizing framework for answering this question has been intergroup contact theory, initially elaborated by Allport (1954; for review see Brown & Hewstone 2005). Allport claimed that intergroup contact did indeed have the potential to improve attitudes toward the outgroup, but that facilitating conditions had to be in place: group members should have equal status in the contact situation, they should be cooperating and working toward common goals, their contact should have the support of relevant authorities. This list of *facilitating conditions* was supported by extensive (largely socio-psychological) research over the decades following the publication of Allport’s work. Recent meta-analysis appears to have put the central question to rest: contact *can* change attitudes in a positive direction (Pettigrew & Tropp 2000).

For instance, individuals with more positive relationships with their grandparents tend to have more positive attitudes about older adults in general (Harwood et al. 2005). Various theoretical perspectives have developed under the umbrella of contact theory. Miller (2002) has focused on the extent to which dealing with others as individuals facilitates contact; simply ignoring social categorizations can have positive effects, at least temporarily. Gaertner and Dovidio (2000) have focused on the role of superordinate identification in overcoming intergroup hostilities – moving to a higher level of categorization can shift the focus of an encounter from intergroup to intragroup (e.g., “we’re all

humans"). This same effect can be achieved with cross-cutting categorizations (Brewer 1996); most intergroup situations can be reframed as *intragroup* (e.g., a Muslim man and a Christian man might overcome religious tensions by focusing on their shared gender).

### THE ROLE OF COMMUNICATION

*Communication* processes have received relatively little attention in intergroup contact research. As noted above, some types of contact are clearly more likely to yield positive outcomes than others. At a most basic level, satisfying, friendly contact should have more positive outcomes than hostile contact, and indeed contact within close relationships (e.g., friendships) is gaining attention as a crucial area for contact theory research (Pettigrew 1998). The socio-psychological work has tended to focus on structural features of the situation (cooperative task, equal status, potential for future contact, equal numbers of ingroup and outgroup members, etc.), but intergroup contact is by definition a communicative event, and specific communication processes might yield different outcomes.

For example, recent work has examined *self-disclosure* as an important communication variable in this context (→ Disclosure in Interpersonal Communication). Individuals whose intergroup relationships are high in self-disclosure have less negative attitudes about outgroup members than those with more superficial intergroup relationships (Ensari & Miller 2002; Soliz & Harwood 2006). Self-disclosure develops *depth* in relationships, and reveals more detailed information about the outgroup member. Presumably, this increased information refutes simplistic stereotyped notions concerning the outgroup, thus making it unlikely that straightforward negative perceptions of the outgroup can be maintained (→ Social Stereotyping and Communication).

Related work shows that self-disclosure is associated with perceptions that the outgroup is more heterogeneous (diverse). That is, individuals who engage in extensive reciprocal self-disclosure with an outgroup member find it more difficult to maintain the idea that all members of the outgroup are the same as one another (Harwood et al. 2005). Little work has examined other specific communication processes, but practices such as social support, direct expressions of affection, and accommodation processes would seem ripe for examination as determinants of attitudinal change (→ Intergroup Accommodative Processes). Examining communication will provide one means of specifying the *process* by which contact influences attitudes. As noted by Pettigrew (1998), contact research has done little to specify exactly how it is that contact influences attitudes.

### TYPICALITY/SALIENCE

As discussed in the introductory paragraph, some level of awareness of group memberships is a defining feature of intergroup contact. However, the *extent and nature* of that awareness has been the focus of considerable theorizing and research in recent years. Hewstone and Brown (1986) and Rothbart and John (1985) both presented perspectives arguing that group awareness needed to be relatively high for attitudes about an outgroup member to translate to attitudes about the outgroup as a whole (*generalization*). In addition, much of this work suggests that the specific outgroup member must be seen as

in some way typical or representative of the group for generalization to occur. When outgroup members are perceived as *atypical* of their group, they are likely to be treated as exceptions, and hence will not be influential in determining more general intergroup attitudes (“How *remarkable* that he’s *still* running marathons at age 83!”). This phenomenon is known as subtyping (Brown & Hewstone 2005).

Similarly, when group memberships are not salient, there is little likelihood of a cognitive association developing between the affect induced by the outgroup *individual* and the affect associated with the outgroup *more generally*. Unfortunately, group salience/typicality is often associated with more negative contact experiences, a fact often explained in terms of the anxiety that can be engendered in intergroup situations (Gudykunst 1995; → Anxiety Uncertainty Management Theory). Thus, the contact that is most likely to generalize is not the contact that is most likely to yield positive attitudinal outcomes. This seeming paradox has yielded interesting theoretical and empirical developments in recent years, and has been the focus of communication research aimed at uncovering interaction patterns that might yield positive, yet group-salient, contact (Harwood et al. 2006). Unfortunately, research suggests that negative communication may *causally* raise group salience, thus rendering positive outcomes of intergroup contact less likely (Greenland & Brown 1999; Paolini et al. 2006). This work suggests that the positive conclusions of previous contact theory researchers may only occur when contact is defined as “positive” contact (or manipulated to be positive). Real-world intergroup contact, on the other hand, may tend to have negative effects because it is predominantly negative, and negative contact enhances the salience of categories (thus affecting attitudes, but in a negative direction).

### INDIRECT CONTACT

The issue of indirect contact covers three diverse areas of research. First, Wright et al. (1997) showed that knowledge of an ingroup friend’s intergroup relationships can contribute to positive attitudes (the “extended contact effect”). Thus, it is not essential to have intergroup contact oneself. If one’s friends or family have close relationships with outgroup members, the positive affect from one’s knowledge of those relationships appears to extend to the outgroup. Second, Schiappa et al. (2005) have demonstrated a media contact effect, whereby exposure to outgroup members in the media (e.g., Will, a gay character on the show *Will and Grace*) can have positive implications for outgroup attitudes (homophobia). Schiappa et al. provide an explanation for this effect that is focused on the learning about the outgroup that media portrayals can provide. Ortiz and Harwood (2006) provide supporting data for the effects of viewing *Will and Grace* on homophobia, as well as data supporting a different process for the effects which is grounded in social learning theory (→ Media and Group Representations; Social Cognitive Theory).

Third, research has examined broader cultural contact. For instance, Wright and Tropp (2005) demonstrate that bilingual education reduces prejudice, even controlling for other aspects of intergroup contact (→ Prejudiced and Discriminatory Communication). In other words, contact with other groups’ cultures can improve attitudes, even when that contact does not include actual people. All these effects are important because *indirect*

contact can maintain relatively high levels of group salience while avoiding intergroup anxiety (precisely because no direct contact is occurring). The media effects are particularly compelling for mass communication scholars, and they also have resonance for those interested in broad social change, given the media's power to reach massive numbers of people.

## **Intergroup Dimensions of Organizational Life**

*Victor J. Callan*

*University of Queensland*

Organizations are intergroup in nature in that they are collections of people working together to achieve a common set of objectives. These objectives are typically around the creation of innovative products and services that meet the needs of customers, and organizations are always searching for new ways to deliver products and services that offer better quality, more innovation, and higher value than do their competitors. Communication within and across the organization is the central means by which individual and group activities in organizations are coordinated to devise, disseminate and pursue such objectives (→ Bureaucracy and Communication; Control and Authority in Organizations).

Organizational communication involves the sharing of ideas, knowledge, feelings, and perceptions between employees from different parts of the business (→ Organizational Communication). It is even argued that organizations do not exist independently of their employees, but rather they are created and recreated each day by the acts of communication by their members (Jones et al. 2004). Given these key roles of communication, the leaders and managers of organizations are highly focused upon reducing any barriers to effective communication both within the organization and with other companies and their customers (→ Leadership in Organizations). Assisting managers are the efforts of organization and communication researchers who are examining the ways in which organizational structures and their internal environments influence communication.

### **THE INTERGROUP NATURE OF ORGANIZATIONS**

The intergroup nature of organizational life is reflected especially in their structures and cultures. These structures and cultures facilitate but also hinder effective organizational communication (→ Organizational Structure). The major *challenge for managers* is to devise communication strategies and channels that work best in these different structures and cultures so that employees and work teams can achieve corporate goals. Their further challenge is that the process of communication is itself inherently constrained, inefficient,

and flawed (Coupland et al. 1991). The most common organizational structures are the organization of employees into work groups according to their specializations (e.g., in hospitals, such specializations include nurses, doctors, allied health professionals), around departments that bring the various specializations together to deliver various services (e.g., outpatients, surgery, emergency); these departments are often organized as larger collectives known as divisions (e.g., Divisions of Medicine, Surgery, Mental Health, and Clinical Support Services). To produce the integrated services and products that customers increasingly demand, modern organizations use a wide range of formal and informal mechanisms to create horizontal and vertical flows of communication between individuals, teams, departments, and larger divisions (→ Diversity in the Workplace; Learning Organizations).

The other intergroup feature of organizational life is that each work group, department or division has its *own organizational culture* that influences how employees perceive the communication from their managers, supervisors, suppliers, and customers. According to Schein (1990), an organizational culture is a system of shared beliefs and values that develops within an organization or within its sub-units, which influences the behavior and performance of its members. Organizational cultures can be strong socializers of employee behavior, and in turn, employees identify with the cultural roles and rules that influence a wide range of behaviors, including the timing, methods, and styles of communication from superiors, co-workers, and customers.

Studies of *higher performing organizations* (Gulati & Kletter 2005; Pfeffer & Veiga 1999) reveal that they are more adept at creating structures and associated organizational cultures that motivate employees to communicate and to work in more efficient and cooperative ways than the employees of their competitors. High-performing organizations recognize the intergroup nature of organizational life and facilitate communication through policies, structures, and communication technologies that encourage employees to work across boundaries. According to Pfeffer (2005), such organizations use self-managed teams and decentralization as basic elements of organizational design. In addition, in order to make all employees feel important and committed, they attempt to reduce the status differences that separate individuals and groups (→ Organizational Conflict). Communication is enhanced by making opportunities for employees from different parts of the organization and of different status to interact and to meet in less formal settings. Importantly, there are a number of theoretical concepts that can assist organizations in designing communication strategies and policies that operate across this variety of organizational categories and memberships.

## THEORETICAL CONCEPTS

To describe how communication is influenced by the intergroup nature of organizations, communication and organizational researchers have developed a range of concepts that highlight what needs to be identified, and what needs to be managed if organizations are to achieve their stated financial and other objectives. A key concept is *social identity*, the part of the individual concept which derives from our membership of social groups such as families, communities, clubs, and organizations (Tajfel & Turner 1986). Social identity is a fundamental psychological variable that shapes individuals' attitudes and behaviors.

In the workplace, employees can hold multiple identifications with social groups that include being members of teams, departments, and the organization (→ Social Identity Theory).

The targets of this identification for most organizational members are the individual (e.g., personal interest), one's occupation, the work group, and the organization. Based on categorization principles, when people define or categorize themselves as a member of a self-inclusive group (e.g., a work team), distinctions between the *ingroup* and *outgroup* members are accentuated, and differences among ingroup members are minimized. In particular, as a consequence of the motivation to enhance their self-esteem, employees aspire to belong to groups at work that are judged to be better in terms of valued attributes like status or their role in the organization (Amiot et al. 2006; Hogg & Terry 2001). This motivation to enhance the reputation of one's ingroup can result in employees favoring the attributes, behaviors, and activities of their ingroup over outgroups. At worst, such strong memberships and ingroup bias can completely disrupt and distort communicative relationships.

Significantly, these theoretical concepts around social identity and intergroup processes help us to understand the problematic nature of communication in organizations, and the role of employee identities in explaining why different meanings are attached to the same communication from a manager or supervisor. A number of broad *integrative models and studies* (Scott et al. 1998; Hogg & Terry 2001; Jimmieson et al. 2004) show that levels and targets of employee identification are linked to employee perceptions of organizational communication, perceptions of threat to them and their groups, their choice of coping strategies, and outcomes such as employee well-being, job satisfaction, and commitment. In particular, the application of social identity concepts to communication at work reveals that employees judge the effectiveness and quality of communication during times of organizational change differently depending upon the groups they identify with, and their perceptions of the negative impacts of change upon the status and well-being of their group memberships (→ Change Management and Communication; Organizational Change Processes). In turn, these perceptions of threat and communication influence employees' choice of coping strategies, and also impact upon their levels of job satisfaction and intentions to stay in their jobs.

Despite such evidence, according to Jones et al. (2004), research into organizational processes from an intergroup perspective is still modest. Conceptually, the research area still lacks a theory of intergroup communication that underpins the field, and the field of intergroup communication in organizational settings relies heavily at present upon the use of aspects of social identity theory (Tajfel & Turner 1986). However, this theory is concerned with intergroup relations and not intergroup *communication* per se. One result is an imbalance in favor of interpersonal and intragroup studies over investigations of intergroup communication.

In terms of the *methods* used to investigate the intergroup nature of organizational communication, the vast majority of studies use → surveys completed by lower- to middle-level employees (→ Research Methods; Interview, Quantitative). These self-administered questionnaires using multi-item rating → scales ask employees to report upon their perceptions of the organization, their identification with various groups and aspects of the organizational culture, and their levels of job satisfaction, organizational commitment, and turnover intentions. Criticisms of this field also point to the need for more longitudinal studies, as well as a greater use of multiple methods to collect employee

opinions, including the application of interviews, observational studies (→ Observation), → discourse analysis, and action research methods to investigate the opinions of more diverse groups of employees than at present. In particular, more interpretative and empirical work is needed into the examination of communicative expressions of identification, and the social processes in organizations through which employees build and manage multiple and shifting identities, especially in response to structural and cultural change to organizations.

### **IMPLICATIONS FOR COMMUNICATION PRACTICES IN THE WORKPLACE**

There are a number of *key messages* for managers and supervisors in how to design the nature of their communication to their employees. Employees' levels of identification with various groups like their teams and professions, or with the organization itself, do influence their perceptions of organizational communication, and outcomes for employees such as their levels of job satisfaction and their intentions to stay or leave. Identification with groups at work is related to employees' attitudes toward communication, organizational change, the likelihood of intergroup conflict, and the psychological well-being of employees. Well-designed organization-wide communication strategies that use a broad range of communication channels are more likely to reinforce employees' feelings of organizational identification, increasing their commitment to the organization and their intentions to stay (Jablin 1987).

In addition, feelings of workplace uncertainty today that are often associated with continuous change are reduced by providing employees with timely and accurate information concerning the likely impact of changes to them as well as to their groups, either through formal or informal communication channels. Employees who receive higher levels of change-related information report higher levels of psychological well-being, client engagement, and job satisfaction (Jimmieson et al. 2004). This provision of communication is especially important to lower-status groups of employees, who feel more threatened by any announcement of change and who show more heightened sensitivity to conditions that alter the status relationships in their workplaces (Terry et al. 2001).

## Intermediality

*Klaus Bruhn Jensen*

*University of Copenhagen*

Intermediality refers to the interconnectedness of modern media of communication. As means of expression and exchange, the different media depend on and refer to each other, both explicitly and implicitly; they interact as elements of particular communicative strategies; and they are constituents of a wider cultural environment.

Three conceptions of intermediality may be identified in communication research, deriving from three notions of what is a medium (→ Media). First, and most concretely, intermediality is the combination and adaptation of separate *material vehicles* of representation and reproduction, sometimes called *multimedia*, as exemplified by sound-and-slide shows or by the audio and video channels of television. Second, the term denotes communication through several *sensory modalities* at once, for instance, music and moving images. Third, intermediality concerns the interrelations between media as *institutions* in society, as addressed in technological and economic terms such as convergence and conglomeration.

As a term and an explicit theoretical concept, intermediality has perhaps been most widely used in reference to multiple modalities of experience (→ Modality and Multimodality), as examined in aesthetic and other humanistic traditions of communication research (→ Aesthetics). Crediting an 1812 use of “intermedium” by the British poet Samuel Taylor Coleridge, in 1965 Dick Higgins reintroduced “intermedia” to art theory in the context of the Fluxus movement (Higgins 2001). In accordance with an avant-garde orientation, the intermedia terminology has been employed to stress the innovative or transgressive potential of artworks that articulate their message in the interstices of two media forms. In comparison, *mixed media* suggests a more neutral, instrumental combination, whereas *Gesamtkunstwerk*, attributed to the composer Richard Wagner, holds out the promise of reintegrating, originally, the theater, music, and visual arts of ancient Greek drama. In media studies, an aesthetic focus on intermedia relations has been placed in historical perspective by research on how a given medium “remediates” other media (Bolter & Grusin, 1999; → Remediation).

The interrelations between media as material vehicles of social interaction have been explored, to a degree, in empirical media history, even if single-media histories may still be more common than broad-based cultural histories centered in the media (→ Media History). Instead, the differences, similarities, and complementarities between historically shifting media have been the focus of so-called medium theory since the foundational work by Harold Innis and Marshall McLuhan (Meyrowitz 1994; → Medium Theory). This tradition seeks to account for the distinctive characteristics of various media, simultaneously as physical resources, sources of psychological experience, and means of social organization across space and time, including the interplay between face-to-face and technologically mediated communication.

As institutions, the modern media are evidently interrelated, both with each other and with other key social entities. The news media, arguably, make up a fourth estate and a common forum of debate regarding other institutions of power; entertainment media provide packages of content, rather than single messages, as illustrated by feature films that become television series, books, and computer games. Just as media texts enter into a cultural web of intertextuality (→ Text and Intertextuality), the media can be said to jointly constitute a social infrastructure of intermediality.

The various “inter” structures of media are currently being reshaped as part of an open-ended process of digitization. What used to be understood as separate media – at least in terms of their technological bases – might, in the future, be produced, distributed, and consumed as one (inter)medium. Current forms of *hypertext* and *hypermedia* (Nelson 1965) indicate how the interrelations between texts and media may increasingly constitute explicit and operational means of navigation, rather than being primarily matters of audience interpretation and use. At the institutional level, however, the jury is still out on the wider tendencies towards a *convergence* or *divergence* of media in terms of their technological development and social applications (Gordon 2003). Also, the potential combination and interchangeability of different sensory modalities in various forms of technologically mediated communication are unresolved.

While it has become almost common sense to think of society as a mediated network of information and communication – an information (Porat 1977), control (Beniger 1986), or network (Castells 1996) society – the specific status of the “media” category

remains in question. Historical developments continue to challenge theoretical systematics. The 1960s witnessed the coming of a general media concept as well as early considerations about intermedia relations. Digitization represents an opportunity for research to revisit past, present, and future definitions of media.

# **International Association for Media and Communication Research (IAMCR)**

*Cees J. Hamelink*  
*University of Amsterdam*

The International Association for Media and Communication Research (IAMCR) is an international professional organization in the field of media and communication research. Its aims are to promote global inclusiveness and excellence in research, to stimulate interest in media and communication research, to disseminate information about research results, and to provide a forum where researchers can meet to exchange information about their work.

## **HISTORY**

The history of the IAMCR is closely linked to the development of a proposal first initiated by the → UNESCO Committee on Technical Needs in the Mass Media in 1946.

This committee drafted a constitution for an “International Institute of the Press and Information, designed to promote the training of journalists and the study of press problems throughout the world.” The United Nations Conference on Freedom of Information (held in 1948 at Geneva), in its resolution no. 34, took note of the proposal submitted by UNESCO to establish under the auspices of that agency an International Institute of Press and Information, and, considering that such an institute could be conducive to the improvement of the quality of information, requested “the Economic and Social Council to invite Governments and professional organizations, national and international, to examine together the possibility of implementing this proposal and, if it is found practicable, to co-operate in carrying it out” (United Nations 1948; Wells 1987, 59–80).

Actively involved in this 1948 conference were Fernand Terrou (who became the first president of the IAMCR, Jacques Kayser (the first vice president), and Jacques Bourquin (IAMCR president from 1964 to 1972). All three played an important role in the drafting of article 19 (on freedom of information) of the *Universal Declaration of Human Rights*. Fernand Terrou, director of the Institut Français de Presse, was the leading advocate of the idea that an international association should be created, “responsible for promoting throughout the world the development of the scientific study of problems relating to the important sources of information (press, cinema, radio, TV, etc.)” (quoted in Santoro 1992). In the view of Terrou no scientific progress was possible without extensive international exchange and collaboration.

The 1952 UNESCO General Conference authorized the director general to proceed with the proposal, and two lines of action were developed as a result. One culminated in the establishment of *training centers for journalists*, the first being established in Strasbourg in 1956. The other development led to the establishment of a separate international organization for the promotion and exchange of scientific research (→ Journalism Education). In 1953 a UNESCO expert meeting began the compilation of a list of *projects in mass communication research* around the world, and in 1955 a study entitled *Current Mass Communication Research* was published. In November 1956 the UNESCO General Conference authorized the director general “to promote coordination of activities of national research institutes in the field of mass communication in particular by encouraging the establishment of an international association of such institutes” (UNESCO 1956). In December of that year an international conference took place at Strasbourg where a committee (with Mieczyslaw Kafel from Poland, Marcel Stijns from Belgium, and David Manning White from the US) was formed that prepared the constituent assembly of what was to become the IAMCR. This constituent assembly took place on December 18 and 19, 1957, at UNESCO headquarters. Fernand Terrou of France was elected as the first president with Jacques Kayser (France), Jacques Bourquin (Switzerland), and Raymond Nixon (US) as vice presidents. It is remarkable that, at the height of the East–West ideological confrontation, colleagues from both western and eastern Europe were involved in the establishment of this international research organization, in which academics from developing countries also participated. The main aim of the association was to facilitate the exchange of methods and findings between research institutes, and to promote personal contacts among individual members. A related objective was to seek recognition for mass communication as a subject for independent scientific investigation.

The first general assembly was held in October 1959 in Milan, where Raymond Nixon (US) became president. The first leaders of the association came mainly from journalism, journalism training, and the print media, and particularly from European countries. The first priorities became the enrolment of researchers from various disciplines, the broadening of the geographical distribution of members to 60 countries, and the increase of numbers to 1000 members. In the course of the 1990s this expanded further to the representation of some 80 countries through some 2000 individual and institutional members.

## **RELATIONSHIP WITH UNESCO AND OTHER ASSOCIATIONS**

From its constituent assembly onwards the IAMCR has maintained a close consultative affiliation with UNESCO. This relationship includes active contributions to expert meetings, to the production of key documents such as the 1968 “Media and Society” study (Halloran 1970), providing consultative services for the MacBride Commission, among others, participation in meetings of the General Conference and in programs such as the International Program for the Development of Communication (IPDC).

At most IAMCR meetings representatives of UNESCO are present as observers. In the 1980s and 1990s the IAMCR also developed working relations with other UN bodies, such as the ECOSOC and WIPO. In the 1990s links were established with regional research and education associations such as the Asian Media and Information and Communication Centre (AMIC), the Latin American Association of Communication Researchers (ALAIIC), the African Council for Communication Education (ACCE), the Caribbean Communication Association (CARICOM), and the European Communication Research and Education Research Association (ECREA). Associate memberships were established with, among others, the → International Communication Association (ICA), the World Association for Christian Communication (WACC), the International Federation for Information and Documentation (FID), and the International Federation of Journalists (IFJ).

In the early 1990s the name of the association was changed to the International Association for Media and Communication Research. This change of name reflected the widening scope of the association’s research interests.

## **ACTIVITIES**

Over the fifty years of its existence the aims and scope of the association have remained focused on the creation of a global forum where researchers and others involved in media and communication can meet and exchange information about their work. The association wants to stimulate interest in media and communication research, to disseminate information about research, and to create a broad constituency of researchers, practitioners, and policymakers (→ Communication Research and Politics).

The association has organized biannual *scientific conferences* and in the intermittent years smaller conferences. Due to its global commitment conferences were successively held in western Europe, the third world, and eastern Europe, e.g., in Leicester, Buenos Aires, and Prague. Among the key themes of the biannual conferences were: information

and national development, mass media and the individual, information and social integration, communication and development, peace and communication, intercultural communication, communication and democracy, mass communication and cultural identity, communication technology, and mass media and international understanding.

The leading decision-making organ of the association is the representative body of the membership at large, the general assembly that meets biannually. Decisions for the general assembly are prepared and executed by an international council (that meets annually) under the leadership of the president and the vice presidents. From its beginning the IAMCR has been linked with the *protection of freedom of expression and opinion* (→ Freedom of Communication; Freedom of Information; Freedom of the Press, Concept of). The first IAMCR president, Fernand Terrou (the French delegate to the UN conference on Freedom of Information in 1948), and the third president, Jacques Bourquin, made important contributions to the definition and later codification of the international right to freedom of information. During the first General Assembly at Milan in 1959 President Terrou addressed the need to review the basic right to freedom of information and put it in the context of real-life social conditions within which this right has to be realized.

Throughout its history the association has at different moments adopted public statements on such issues as the protection of journalists, the right to communicate, freedom of research, support for international communication policies in the service of democratic development, and the need to overcome underdevelopment of communication facilities in the third world (→ Development Communication). The concern about the public presence of communication research and its role in public life has been a leading motive throughout the years. This became very concrete in the contributions the IAMCR made to the United Nations World Summit on the Information Society (WSIS) in 2003 (Geneva) and in 2005 (Tunis) (→ Information Society).

The public presence of the IAMCR has, over the years, given rise to controversial *debates on the politicization of research*. Two intellectual positions clashed. On the one hand there was the position that demanded explicit political choices, and on the other hand the position of those who feared that taking public political positions would threaten the independence of academic research.

The *identifying characteristics of the association* can be summed up as its ecumenical nature (in the sense of interdisciplinary and multi-method approaches to research topics), its global inclusiveness, which is reflected in its use of three official languages (English, French, and Spanish), and the active encouragement of the participation of young scholars, women, and researchers from economically disadvantaged regions of the world.

## **International Communication**

*John D. H. Downing*

*Southern Illinois University*

The definition of “international communication” is constantly in flux. Whether we have in view sociologist Émile Durkheim’s suggestion in his classic work *Elementary forms of religious life* (1917) that relations between different Aboriginal tribes constituted international communication, or historians’ and political scientists’ studies of diplomacy among modern nation-states, or the rush of contemporary theorizing on globalization processes and the roles of communication media within them (→ Globalization Theories), it is wise to be cautious before consecrating our assumptions as to how this field of study should be framed. In order to try to avoid that trap, this entry begins with a brief history of this research area. It will mainly focus on more recent research, which arguably has been conducted within ten categories. At the end, brief pointers will be thrown up to suggest some ongoing problems.

The ten proposed categories are: (1) theories of international communication; (2) core international communication processes; (3) global media firms; (4) global media policies; (5) global news flows; (6) world cinema; (7) → development communication; (8) the → Internet; (9) → intellectual property law; and (10) nonhegemonic communication flows. Items 6–9 in this list have been organized under separate editorial categories, so will receive only passing attention here. Analysis of intercultural interpersonal communication is also highly relevant, but to date mostly takes place under the heading of nonmediated communication, so is reserved for entries under that aegis (→ Intercultural and Intergroup Communication; Interpersonal Communication).

These categories are of course permeable. For example, → Arab satellite TV news, the emergence of → China's Central Television Channel 9 (CCTV-9) global English-language TV news services, and the attempt to create a regional Latin American satellite service (→ TeleSur) have implications both for the study of global news flows and processes, and for analyses that argue American cultural influence is saturating the globe. The global advertising industry has profound implications for the future of most media (→ Advertising: Global Industry), over and above its intrinsic cultural influences (themselves almost infinitely disputable).

A critical issue requires flagging immediately, namely the distinction between "international" in the comparative sense (e.g., different national media systems), and in the rigorously global sense (e.g., global media firms such as → Disney, or diasporic media that serve migrant communities; → Migrant Community Media). The distinction is useful, but may dissolve somewhat in the process of analyzing actual cases (Downing 1996). Do the global music industry, global → public relations firms, and global tourism firms (→ Tourism Industry) operate homogeneously because they are global, or is it essential for their success to have their operations molded by specific regional and local cultural realities? Comparative research might productively be conducted not only between nation-states or among minority-ethnic media projects in different places, but also within a single global media corporation (→ Comparative Research).

## **A BRIEF HISTORY OF INTERNATIONAL COMMUNICATION RESEARCH**

In terms of a concerted wave of interest in international communication, it would be fair to say that the propaganda operations of the great powers in the twentieth century's two world wars were mostly responsible for generating sustained interest in this field.

### **Earlier Research Decades in the USA**

Some of the best-known US founding names in communication research, such as political scientist → Harold Lasswell, first addressed the → propaganda issue early in the 1920s. The rise of dictatorships after World War I, their successful deployment of then-new media, and the emergence of the long Cold War after World War II entrenched this issue in government-funded research priorities. At that juncture, the research term of choice was "psychological warfare" rather than "propaganda," because of its seemingly scientific and less biased connotation (→ War Propaganda). Wilbur Schramm, another major US figure in the earlier history of communication research, was one of a number of individuals, including → Daniel Lerner and Lucian Pye, who contributed many studies to this area, most of them government-classified at the time (Simpson 1994; → Schramm, Wilbur).

Comparative media systems analysis received its first major book-length study in the USA in the shape of *Four theories of the press* (Siebert et al. 1956). The theories in question were normative, representing the supposedly official views of what media should strive to achieve in four contrasting polities: authoritarian, libertarian, Soviet, and "social responsibility." "Authoritarian" and "Soviet" were distinguished from each other in terms of the readiness of sovietized dictatorships to harness media for political goals, rather than simply

keep them from disturbing the political order, alleged to be their typical role in non-Soviet dictatorships. “Libertarian” meant a parallel free market in goods and ideas (not the rigorously free market philosophy of contemporary Libertarians). “Social responsibility” signified media, rather than simply being commercial enterprises or a state monopoly, as a public trust. Much critiqued in later decades for its Cold War and other assumptions, the book nonetheless provided a beginning for further comparative media research (→ Political Communication Systems).

Given the competitive dynamic of the Cold War for global leadership, and perhaps especially the long furor within the political class in the west following China’s 1949 adhesion to the Soviet bloc, a third major stimulus to international communication research was “third world” development, often framed at the time, as Escobar has vitally demonstrated, by the → “modernization” schema (Escobar 1994). Unless the west could assure “modernization,” the presumption went, more and more nations might fall under the Soviet–Chinese spell and risk being lost to the west. The most influential international media study proceeding from this assumption was Daniel Lerner’s 1958 analysis of Turkey and five Arab states, *The passing of traditional society* (Lerner 1958). Lerner defined media as pivotal to successful “modernization.” In 1962 his book was followed by → Everett Rogers’ *Diffusion of innovations*, currently in its 5th edition (Rogers 1962/2003), which became virtually the “bible” of American foreign aid projects involving development communication on how to propagate “modernization” in practice in so-called underdeveloped societies (→ Diffusion of Information and Innovation).

### Established Paradigms Attacked

Challenges to these international communication paradigms began to emerge at the close of the 1960s. The first was Herbert Schiller’s *Mass communications and American empire* (1969/1992), the first in a series of publications presenting a radically different perspective that culminated in his much-cited essay “Not yet a post-imperialist order” (Schiller 1991). In the 1980s Schiller’s work turned to the newly developing international circuits enabled by information technologies, adding to his earlier mass-oriented research. As opposed to the authors already cited, who saw US global involvement as fundamentally benign, Schiller argued that mass-exported US culture and new information technologies were part and parcel of US – later, transnational – global corporate hegemony and military interventionism.

A second challenge to the then-dominant paradigm came from research by Belgian sociologist Armand Mattelart. Living in Chile since 1962 as representative of a Vatican project for development, he co-authored with his wife Michèle Mattelart an analysis of US-funded mainstream and local oppositional media during the 1970–1973 experiment in Marxist social democracy undertaken by Chile’s Popular Unity government. It was published first in Spanish (1973), then in French (1974), and finally in English (Mattelart & Mattelart 1980). It raised very basic issues, regarding the international politics of media communication in a situation of extreme crisis, which were far removed from the assumptions of political stability and economic affluence implicitly underpinning mainstream media research in the USA and western Europe.

Armand Mattelart's and Chilean novelist Ariel Dorfman's *Como leer al Pato Donald* ("How to read Donald Duck"; 1971), an analysis of underlying conservative ideologies in Disney comic books published in Latin America, was another notable intervention from outside the globally dominant US communication research establishment. This book, despite the difficulty of its conceptual language, aroused deep passions. While the Chilean dictator who overthrew the Popular Unity government had all Spanish-language copies burned, the Disney Corporation nearly succeeded in getting the US Customs to ban the import of the English-language version, arguing it infringed their copyright. It was, nonetheless, translated into a dozen languages.

Schiller's work was frequently dismissed by leading US communication researchers as either conspiratorial or implicitly pro-Soviet or both, but his analyses penetrated far and wide internationally, even among those who disagreed with them. Mattelart's work, either singly or in combination with Michèle Mattelart, and heir to a Catholic social justice tradition, took longer to penetrate the Anglophone research community because of translation issues, but much of it is now translated into English. It is substantial, including studies of international advertising, Nicaraguan media during the Sandinista period (1979–1989), the history of international communication, and communication and multicultural policies. His work pays much more attention to cultural dimensions than Schiller's, which restricted itself to political economy (→ Political Economy of the Media). In many countries outside the USA at present, Schiller and Mattelart are at least as well known as, and often more highly regarded than, Lerner, Siebert et al., Schramm, or Rogers.

### **Results and Newer Trends**

Whatever position may be taken on the respective merits of these competing paradigms, there can be little doubt that the clash opened up the field of international communication to a much wider set of perspectives and arguments. Since then, and as an additional result of scholarly reflection and research on the momentous international potential of satellite communications and computer networks, the field has continued to grow apace (→ Satellite Communication, Global).

Global communication policy initiatives, often targeted in some fashion on the ongoing crises of development around the planet, have further underscored the importance of international communication to the contemporary world (→ Free Flow of Information; International Communication Agencies; New World Information and Communication Order [NWICO]; UNESCO). The rise of the global Internet and the spectacular global explosion of intellectual property issues in the digital communication era have equally pushed international communication issues increasingly to the top of the research agenda (→ Cultural Products as Tradable Services; Internet: International Regulation).

### **World Cinema**

A paradox remains: world → cinema, although perhaps the aspect of international communication to be studied earliest along with foreign diplomacy, was analyzed within a very singular framework in the west, at least until quite recently – one dominated by

specialists trained in literary method. Thus, textual analysis of national cinemas or of individual film directors' works was the primary focus. The political economy of global distribution and empirical studies of reception have only recently come to get the attention they equally deserved.

Indeed, the field long followed a certain global pecking order, with Hollywood center frame, along with the art cinemas of Europe, the Soviet bloc in its heyday, and Japan, whereas Indian, Latin American, Chinese, Arab, and African cinemas were barely recognized (some Iranian cinema work has recently been admitted to the canon). Cinema was frequently studied out of relationship to television, befitting its western-university definition as an art, in contradistinction to television, which was defined as a mass commercial product. For all these reasons, it is only with the emergence of → cultural studies approaches, and the more recent revival of interest in cultural economy and the political economy of culture, that global cinema is coming to be integrated within the general flow of international communication research (e.g., Miller et al. 2005; Badley et al. 2006; → Bollywood; Hong Kong Cinema).

## RECENT INTERNATIONAL COMMUNICATION SCHOLARSHIP

### Theories of International Communication

The three major “lenses” through which recent scholarship has sought to analyze international communication processes are cultural imperialism, cultural hybridization, and globalization (→ Cultural Imperialism Theories; Hybridity Theories).

The first of these three was central to the rather binary debates between mainstream US communication researchers summarized above. It came in different forms, with “media imperialism” being a perhaps more cautious subset of the larger term “cultural imperialism.” The latter could cover education, religion, business practice, consumerism, law, governmentality, dress, marriage customs, and still other cultural dimensions as well as media. The fundamental argument was that cultural transmission was an integral component of colonialism along with military conquest and economic exploitation, so that even after the demise of formal colonial rule in the post-World War II decades, the cultural impact established during colonial days was both intact and continually refreshed. The argument also incorporated the rise of the US as a global superpower, and proposed that it had followed in the footsteps of Britain and France in pursuing cultural domination. The roles of media for the US imperial project were argued to be all the more paramount as the twentieth century proceeded, and a media-saturated environment began to emerge (→ Americanization of the Media). Nonetheless, it was possible, by using the term “media imperialism” as a metaphor for US global media influence, to acknowledge that reality without necessarily linking it to the larger claim that the USA is an empire.

The approach began to come under serious fire with John Tomlinson's *Cultural imperialism* (1991). Tomlinson argued that the concept of cultural imperialism required two assumptions, the first being a directing center, a cultural imperialism planning agency so to speak, and the second that “third world” audiences and readers were peculiarly malleable and gullible, incapable of interpreting western media fare in their

own ways in the light of their own cultural formations. Since these two assumptions were very far from proven, he proposed instead that discourses of cultural imperialism were a form of expressing discontent at the juggernaut of modernity and the widespread sense of impotence in its path. A detailed case study of a two-decade-long US cultural propaganda endeavor in western Europe provides a nuanced and highly illuminating counterpoint to both cultural imperialism theories and to Tomlinson's critique (Saunders 1999).

The hybridization metaphor represented a different approach to critiquing the notion that western or US cultural imperialism was busy flattening all in its path, homogenizing everything, so-called McDonaldization. Instead, it insisted on a degree of agency among global audiences, not simply in Tomlinson's sense of disputing global passivity in principle, but much more in researching just how global audiences massaged foreign cultural products and perspectives and hybridized them (Kraidy 2005). Argentinean sociologist Néstor García Canclini (1989/1995) is only one of a number of Latin American scholars to emphasize the forms of hybridization and cultural challenge evident in everyday life, derived from Latin America's own long cultural history of Aboriginal, European, and African exchange, as well as more recent US cultural penetration. This is one of many instances that could be cited of how immersion in a non-western culture helps to frame scholarly research on international communication in important ways.

At the same time, both Kraidy and García Canclini stress how cultural hybridization does not evacuate asymmetrical power in a happy balance. Straubhaar (1991), in a much-cited article, argued fairly similarly that "cultural proximity" often counterbalanced the weight of US cultural exports in determining audience TV rankings, and defined Latin American media culture as one of asymmetrical interdependence with the USA. Sinclair, likewise, has developed arguments based upon the success or failure of television exports in particular geolinguistic regions, which may or may not be contiguous, as in the case of the Anglophone countries (Sinclair 1999). Overall, analysis of global television flows tends strongly to confirm these perspectives (→ International Television).

"Globalization" became a tremendous "buzzword" in the later 1990s and into the next decade, a sure sign that it meant different things to different scholars. For some it was virtually a synonym for cultural imperialism, for others for the spread of → modernity or "postmodernity," and for others its primary referent was economic, the spread either of free markets, or of fundamentalist free-market economic doctrine (→ Postmodernism and Communication). However the term was defined, the roles of computer networks, satellites, and global media firms were plainly central to the processes under review, as was the growth of major cities as global communication nodes, "technopoles" (Castells 1996–1998). At this point, too, contemporary urban geography and international communication scholarship frequently found themselves face to face. At the same time, some critics continued vigorously to dispute the utility of the term, especially as applied to the media and information sectors (Sparks 2007).

### **Core International Communication Processes**

The overall fabric that recent international communication research has focused upon involves its historical antecedents, the growth of communication satellite uses, the advertising industry, public relations (→ Public Relations: Global Firms), the → music

industry, the tourism industry, international radio and television (→ International Radio), global surveillance (→ Security and Surveillance Agencies), and the thesis of Americanization. War propaganda closes the list.

The first entry noted is significant in relation to “*globalization*” theories, in the sense that rather too many discussions of the term presume it is self-evidently a very recent phenomenon. Its analysis of the initial phase in the latter nineteenth century of laying submarine oceanic cables for telegraphy, and later for telephony, is an important corrective to ahistorical analyses (→ Telegraph, History of). Optical fiber oceanic cables continue to serve crucial roles alongside satellites. The entry also references recent historical scholarship that calls into question the notion of competitive colonialism as the driving force in the ocean cable-laying process.

The next four entries listed above – advertising, public relations, music, and tourism – are important correctives to conventional discussions of international communication in a different way. While considerable attention is almost always paid to television, then radio, and then satellites and cable, and more recently to the Internet, it is curious that advertising, in particular, with its centrality to media finance in most countries, is so often omitted. Public relations firms, commercial and political, are also crucial sources of global news as well as of the technology of winning elections (or attempting to) that is spreading across the planet (→ Election Campaign Communication).

The *global music industry* is often marginalized by older scholars as a youth culture phenomenon, which in significant part it is, but the question of precisely who is marginalizing whom in this process is worth considering carefully. The global tourism industry is on one level the point at which individuals and groups from different nations meet physically and in certain senses communicate with each other, though generally the communication is narrowly structured in terms of specific services, and often the construction of tourist enclaves is sharply different from life in general for local inhabitants. In all four cases, however, the concepts of cultural imperialism, hybridization, and globalization raise interesting questions about the international communication processes involved.

*International radio broadcasting* may look to some eyes rather passé in the twenty-first century, but that would likely signify the usual geographical location of the reader. Radio continued to be, at the latter end of the 2000s, the communication medium par excellence in most parts of the world and for much of the world’s public. Its relative cheapness, portability, and lack of literacy requirement would continue to keep it a very live option for many. Only in commercially advanced nations is radio basically an adjunct of the recorded music industry. Furthermore, in order to understand the twentieth century, never mind the twenty-first, omitting the international radio broadcasters, whether the → BBC World Service, → Voice of America, → Radio France Internationale. or still others, would seriously distort our grasp of global communication processes.

On a more somber note, international communication also involves *mass surveillance*, which digital technologies have made ever more sophisticated. Voice recognition and filtering software for telephony has progressed in leaps and bounds in recent decades, and email is very hard to protect against the really advanced decrypting devices available to security services (Bamford 2001). Closed circuit TV in public places has become routine in commercially advanced nations. The legitimation for this dramatic expansion has

rested upon crime, undocumented immigration, and terrorism, all of them real, but policy debates continue to reverberate, with claims and counterclaims about the dividing line between protection and privacy (Lyon 2007).

*War propaganda* is hardly a new phenomenon (Knightley 2004), but most would concur that it developed newly exigent requirements during the two twentieth-century world wars and the Cold War. It took two forms, one the projection of external propaganda to the enemy nation, both to its general public and to its troops in combat, the other domestic propaganda, typically representing the enemy as subhuman and unnervingly aggressive. Dower's remarkable study of the domestic propaganda processes in both the USA and Japan in the Pacific war confirms this (Dower 1986). The US propaganda apparatus represented the Japanese as rats, apes, and insects, and the Japanese apparatus portrayed the Americans as both vicious and effete.

### **Global Media Firms**

The leading global players (→ Bertelsmann Corporation; News Corporation; Samsung Corporation; Sony Corporation; Time Warner Inc.) operate in multiple countries, even if they maintain head offices in one, and usually have a considerable variety of media interests (e.g., cinema, publishing, music, video games, theme parks), not only one (→ Global Media, History of). Contrasted with firms outside the media and information sector such as General Motors or ExxonMobil, these companies, though very large, are considerably smaller in financial terms. Nonetheless, although media products are tradable commodities, it would be conceptually sloppy even to try to establish a ratio of cultural impact to the quantity of money spent on producing, distributing, or using them.

These are not the only major global media firms, a number of which are discussed in other entries. Some Internet firms, notably Google at the time of writing, and computer firms (Microsoft, Intel, Oracle, Sun Microsystems) play huge and seemingly ever-growing roles as well. Taken together, these corporations represent the leading players in the cultural and information industries sector worldwide. This marks a sea change from some decades earlier, when in many nations cultural and media policies were the province of Ministries of Information, Culture, and/or Communication.

The crucial question, almost certainly due to be debated for a considerable time to come, is how far this shift of communication power toward very large corporate enterprises on the international as well as national scale represents an expansion of citizenship options, or their decline. An effective answer to this question will require a careful disaggregation of the issues involved. From arguments summarized already, it is clear that many would dispute the argument that planetary cultural homogenization, whether commercial, consumerist, or Americanized, is overwhelmingly in process. The Korean cultural wave phenomenon is testimony to this (→ Korean Cultural Influence), as are the dynamics of cultural exchange among Japan, Taiwan, and Hong Kong (Iwabuchi 2002). That, however, is not likely to be the end of the debate, since there are multiple other dimensions to citizenship and media than cultural flattening. In the end, the debate is likely to revolve around some version of the "social responsibility" thesis, namely are media suitably defined purely as commercial entities, or does the → "public goods" argument rightly complicate their standing for democratic polities?

### Global Media Policies

In the years before and since World War II, the US government worked in a sustained manner to promote the “*free flow of information*” policy. This was an attempt to challenge British domination of ocean cable traffic in particular, but also the ascendancy of Britain’s Reuters news agency. Then, over the 1970s, and again over the early 2000s, attempts were made to forge partly noncommercial global communication policies in the form of the New World Information and Communication Order proposals, and the 2003 and 2005 World Summits on the Information Society (WSIS).

There are also now a number of *trade regimes and international agencies* that have some influence, or the potential for it, over international and national communication policies, such as the World Trade Organization, the North American Free Trade Agreement, the European Union, UNESCO, the World Intellectual Property Organization (WIPO), the International Telecommunication Union (ITU), and the Internet Corporation for Assigned Names and Numbers (ICANN) (→ Francophonie; NAFTA and International Communication). Of these, a number have historically served as forums for negotiating national economic priorities, and thus have been substantially influenced by major corporate lobbies. Others, such as UNESCO, ITU, WIPO, and ICANN, have a more mixed history, representing to a certain degree the concerns of transnational publics and social movements (→ Transnational Civil Society).

Within this context, the European Union is a uniquely ambitious experiment in *multinational integration*. The question of media and collective identity, whether “European,” national, or sub-national (e.g., Scotland, Catalunya), has continued to exercise EU communication policy discourses. Within Europe, France has provided a militant lead in favor of exempting cultural products from routine trade criteria (the so-called “cultural exception”), while the UK has actively supported the contrary position, in line with the US government. The results to date have been mixed and mostly tentative, often confused through being based upon political shibboleths rather than clear-headed analysis, and inevitably complicated by the continuing expansion of membership (Schlesinger 1997, 1999). NAFTA represents a very different case.

*Francophonie* consists of a cluster of sustained attempts over nearly 50 years by France, as a former colonial power, to combine defense of the French language and culture against the dominance of US culture. At the same time, the project was energetically supported in its earlier years by certain postcolonial leaders of newly independent states, notably by Léopold Senghor, first President of Senegal in 1960. Some have argued Francophonie to be Janus-faced, insistently resisting the tidal wave of US cultural products while content to oil the wheels of France’s neo-colonialist African policy. However, the organization’s recent overtures to Arabophone, Hispanophone, and Lusophone nations to encourage their involvement in projects to defend their own linguistic and cultural heritages may yet prove to be a significant vector in the global politics of culture and communication.

Thus, global media and information policy, like public policies of all types, has been marked by clashing agendas (Raboy 2002). Up through the early 1970s, it would be fair to say that the clashes were primarily those of national economic interest among those states with financial muscle, or the Cold War, or sometimes a combination of the two. In that

decade, however, prompted by calls for a New International Economic Order to address the vast disparities between commercially advanced nations and the rest, pressure began to be voiced in international assemblies for a comparable restructuring of global media communications of all kinds. The digital technology era was at the doors, and the potential of new information and communication technologies for the global south's development was already being debated. The chasm between the profusion of all forms of communication technology in the global north and their feeble distribution in the global south was, and remains, a major development issue.

After some time, a package of proposed communication policy shifts in favor of the global south was assembled by an international task force convened by UNESCO. They were presented in the 1980 MacBride Report, *Many voices, one world* (MacBride Commission 1980). The policy proposals came to be entitled the New World Information and Communication Order. They fell hostage, however, to a concerted hostile press campaign in the USA and the UK, whose governments withdrew from UNESCO in the mid-1980s, publicly citing the Report as a primary reason for doing so. There were internal weaknesses in the Report, notably its assumption that communication policy was exclusively a matter for national governments. Paradoxically, however, there was no proposal whatsoever in it for government licensing of journalists (a serious risk for press freedom), even though the hostile news media campaign in the USA assiduously asserted this to be one of its main planks. Nonetheless, the UNESCO process was a first step toward global public discussion of citizens' communication needs and entitlements.

In the World Summits on the Information Society in Geneva (2003) and Tunis (2005), initiated by the United Nations and convened this time by the ITU, issues of global communication inequities resurfaced in the first fully international forums addressing them since the UNESCO debacle. This time, there emerged a very slight change, albeit resisted by a number of governments and corporations. The ITU at that point had but recently opened its doors to communication corporations as official participants, rather than only to states, for the first time in its over 100-year history. But the UN charge to the ITU had also signaled that "civil society" organizations should also have a voice in the WSIS deliberations. In a very small and often grudging way, this was conceded at the Summits.

All this could, no doubt, be read as simply an obscure exercise in acronym juggling. Notwithstanding, however, the impracticalities of global representation of the public interest outside of the conventional system of states (a process itself marked by considerable deficiencies), this could also be read as a first tentative step toward inclusive global policymaking for international communication. It remained to be seen what might be the next moves.

### **Global News Flows**

These were one of the many global communication disparities articulated in the MacBride Report. The pattern was rather clear: most international news coverage emanated within the global north and reported on its doings. International news about the global south, when available at all, strongly tended to focus on disasters, natural or political (→ International News Reporting). This made for an under-informed citizenry across the planet,

paradoxically at a point in history when the world was becoming ever more economically and politically interconnected (Boyd-Barrett & Rantanen 1998).

However, the turn of the millennium witnessed new international broadcasting interventions. Established stalwarts, such as the BBC World Service, Voice of America, → CNN International, → Deutsche Welle, Radio France Internationale, and → Vatican Radio, were joined by Arab satellite news, China's English-language global TV channel CCTV-9, and Latin America's fledgling experiment, TeleSur.

These varied international projects raised challenging questions for conventional professional journalistic claims to objectivity (→ Objectivity in Reporting), especially when the mission of a given broadcasting project was officially defined as → "public diplomacy" on behalf of a nation-state. The differences in their news agendas were significant. Sometimes they were even visible within one and the same organization: following a basic editorial decision some months previously, CNN International broadcast pictures of wounded and dead Iraqi civilians following the US invasion in 2003, while CNN Domestic avoided doing so. On the face of it, however, the international sources of supply of broadcast news were expanding. It remained to be seen whether the public would take the trouble on a regular basis to compare more than one such source.

### **Nonhegemonic International Communication Flows**

So far the focus has been on mainstream channels of international communication. The picture would be seriously incomplete without reviewing other media projects outside these conventional channels. In the twenty-first century mediascape, and given the increasing activity of global social movements of many kinds, it appeared likely that smaller media would not only continue to operate, but would become a growing force.

Already there was evidence of the intensification of women's participation in these nonhegemonic projects, a vector that sharply distinguished this zone of the mediascape from mainstream media (→ Social Movement Media, Transnational). The tremendous increase in global labor migration across borders over recent decades, and the widespread emergence of settled diasporic communities, had as one effect the creation of many media projects linking them with their countries of origin as well as engaging with their new locations. The Kurds, mostly settled in eastern Turkey, but with significant enclaves in Syria, Iraq, and Iran, had a conflicted history of trying to use satellite broadcasting to connect with their migrant communities in western Europe as well as to combat the Turkish state's long ban on the use of Kurdish in broadcasting inside Turkey.

The emergence of the Qatar-based news broadcaster Al-Jazeera was a further example of nonhegemonic international communication, in two senses: it challenged the conventional and deferential state broadcast news services of the Arabic-speaking world, and it also challenged official US government definitions of Middle Eastern affairs. The TeleSur project, originating in Venezuela, sought to fulfill a somewhat analogous role in the Latin American region.

Radio Free Europe and Radio Liberty, the latter now defunct, served a distinct role during the postwar decades up to the end of the Cold War. In both cases, the commitment was absent to a neutral and bland style of news reporting that largely characterized the BBC World Service and Deutsche Welle. Both stations set themselves the particular task

of functioning, not as the Voice of America – even though they were largely CIA-funded – but as though they were domestic news services inside the Soviet bloc nations, yet operating without Soviet censorship. They quite often broadcast underground texts from the clandestine opposition. Thus, their style often was highly confrontational, and sometimes appreciated more inside the Soviet bloc than the careful cadences of the BBC World Service (→ Radio Free Europe/Radio Liberty).

Two more examples will suffice of the nonhegemonic international media sector. First, → *Le Monde Diplomatique* is a French monthly world affairs magazine some 50 years old, which today appears in 26 languages, has a global readership of some 2 million, and appears in some countries on paper, in others digitally. Its contents are in-depth feature articles on countries and issues around the world, written partly by its very highly educated editorial staff, and partly by university specialists in a variety of countries. Over the past 30 years, “*Diplo*” has provided a consistent location in which the inequalities and inequities between global north and south are at center stage and exhaustively analyzed. It has served over the past decade and more as the global social justice movement’s *foreign affairs or foreign policy* magazine.

The second example is the Independent Media Centers movement (→ Independent Media Centers Network). Emerging at the 1999 WTO confrontations in Seattle, by 2007 it had grown to number toward 200 hyperlinked nodes of social justice activists around the world, though mostly concentrated in North America and western Europe. Sites varied in productivity, but normally ran frequently updated and interlinked news stories on challenges to global and national capitalist institutions, and very often on the repression these met. Photo, audio, and video files were routinely used. English was the predominant language, but national and in some cases sub-national languages were also visible on a number of sites. Each site was independent, and only if taken over by a group radically hostile to its global social justice mission, or engaging in campaigning on behalf of a particular political organization, would the site be de-linked from the others.

International communication research continues to be hampered by the monolingualism of many researchers, especially in Anglophone universities. This means that research achievements and insights from many countries do not enrich multinational scholarly dialogue to the degree they should. It is also a field poorly represented or not at all, to the time of writing, in most standard undergraduate communication textbooks used in the USA, which discourages the flow of future US researchers to this area in a field the USA has not ceased to dominate. Its importance in our shrinking planet, for good or for ill, remains unabated.

## **International Communication Agencies**

*Marc Raboy*

*McGill University*

*Aysha Mawani*

*McGill University*

Several emerging and existing international communication agencies spearhead the governance of the global media and communications environment. International communication agencies have both specialized and collective responsibilities to advance multilateral and multi-stakeholder cooperation and collaboration on the broad issues of global media governance, including the development of regulation instruments and guidelines for intellectual property, media concentration and ownership, communication

and network infrastructure, as well as promoting communication in the interests of human rights and economic, social and cultural development objectives (→ Copyright; Concentration in Media Systems; Ownership in the Media; Development Communication; Development Support Communication). International communication agencies either fall under the aegis of the United Nations, or emerge as independent, international authorities, entities in and of themselves (→ United Nations, Communication Policies of).

The multilateral jurisdiction for many of these agencies has evolved alongside the globalization of media and communications, which is now a complex terrain where management, ownership, commercialization, and consumption of media collectively challenge traditional models of regulation and governance (→ Commercialization of the Media). Radio and television, for example, have traditionally been governed under national broadcasting policies (→ Radio Broadcasting, Regulation of; Television Broadcasting, Regulation of). Today, however, the landscape for both radio and television is complicated by → satellite television and the → Internet, the growing concentration in media cross-ownership, and the technological convergence of media communications (→ Media Conglomerates; Digitization and Media Convergence). In this complex environment, international communication agencies find their mandates to develop laws and rules on issues such as copyright, ownership, and the promotion of diversity of media (Ó Siochrú & Girard 2002; Raboy 2002a; 2002b; → Plurality). The emerging framework for these agencies is one that brings together multiple stakeholders, including governments, the private sector and civil society, to influence, inform, and direct decision-making for relevant policy matters.

International efforts to formalize the regulation of cross-border communication date to a series of conferences in the 1860s, called to deal, first, with postal services and, soon after, with the new technology of telegraphy (→ Postal Service, History of; Telegraph, History of). A conference in Paris in 1863 laid the foundation for an international postal system and, soon after, the world's first permanent intergovernmental organization, the International Telegraph Union (ITU), was set up in 1865 to provide a framework for development of international telegraph and telegram services. The Treaty of Berne (1875) created the General Postal Union (now the Universal Postal Union, UPU, a specialized UN agency), and an international convention on copyright was also adopted in Berne in 1886. With the emergence of point-to-point and point-to-mass sound communication in the early twentieth century, a whole new range of issues arose that required international agreement. In 1927, the Washington Radio Conference drafted a set of international regulations on radio and this was followed by a second conference in Madrid in 1932, at which the convergence of telegraph and radio technologies was recognized in the broadening of the ITU, renamed the International Telecommunication Union.

## **THE UNITED NATIONS SYSTEM AND INTERNATIONAL COMMUNICATION POLICIES**

The creation of the United Nations Organization in 1945 opened a new era in international communication. The United Nations Education, Scientific and Cultural Organization (→ UNESCO) was established the same year. In 1948, the UN adopted the Universal Declaration of Human Rights, which included the standard-setting Article 19 establishing freedom of expression as a fundamental human right. Communication issues

were also present on the periphery of the Bretton Woods agreements, which created institutions such as the World Bank and the International Monetary Fund. In the commercial sphere, the 1947 General Agreement on Tariffs and Trade (GATT) after much debate, accepted the legitimacy of foreign film import quotas (the GATT is now managed by the World Trade Organization, created in 1995). While the politics of the Cold War set the tone for much of the debate within international communication agencies between 1945 and 1989 (→ Free Flow of Information; New World Information and Communication Order [NWICO]), the tension between culture and commerce has since become the dominant theme (→ Cultural Products as Tradable Services; Culture: Definitions and Concepts).

The ITU, UNESCO, UPU, and the World Intellectual Property Organization (WIPO) are specialized international communication agencies within the United Nations. Each of these institutional bodies provides leadership and guidance on a specific mandate related to international communication, and each has evolved both institutionally and programmatically alongside the dynamic shifts occurring in the global media and communications environment. Moreover, in recent years, the inextricable link between communication and development has been aggressively pursued as an important mechanism that can help achieve internationally recognized aims such as the Millennium Development Goals, and broader sustainable development and poverty reduction agendas. In this regard, communication is considered a tool for capacity building, advocacy and awareness-raising, empowerment, accessibility and outreach, and local knowledge promotion and protection. The ITU, UNESCO, and WIPO are all involved in international development cooperation activities that aim – at least nominally – to reduce the → digital divide and eliminate disparities in access to information and communication technologies (→ Access to the Media).

## OVERVIEW OF INDIVIDUAL AGENCIES

The *ITU* is the only UN agency that deals exclusively with issues of communication and is considered the first ever international communication agency (Ó Siochrú & Girard 2002). The ITU was developed as a collaborative platform where government and private sector representatives could discuss, negotiate, and coordinate the development of communication technologies. This became increasingly vital as tele- and radio communication systems became more sophisticated, and as the basis for the multifaceted operation of global telecommunications grew more complex. The ITU currently consists of 191 member states and over 600 sector members. Sector members include industry representatives, research and development organizations, manufacturers, and others (ITU 2004).

*UNESCO* has a rich and textured history in international communication. UNESCO's mission is to promote international collaboration in education, the natural and social sciences, culture, and communication. Together, these domains of activity create the basis and serve as a catalyst for UNESCO's "culture of peace." The rise of multilateral involvement in global media and communications was marked by a historic debate that took shape in UNESCO's corridors between the mid-1970s and the mid-1980s. It was spearheaded by the Non-Aligned Movement (NAM), a group of UN countries that called for a New World Information and Communication Order (NWICO). The NWICO debate was never fully resolved, but was significant in that it brought the agenda of

international communication to the forefront of multilateral diplomacy and politics. The work of UNESCO's communication and information sector is grounded in UNESCO's constitution and is driven by three principal objectives: promoting the free flow of ideas, promoting expressions of pluralism and cultural diversity, and promoting access to information and communication technologies (UNESCO 2005). UNESCO has developed a number of normative instruments, including conventions, declarations, and recommendations in support of these principal objectives.

WIPO was established in 1967. It is the sole UN agency dedicated to the promotion and protection of intellectual property worldwide (→ Intellectual Property Law). Intellectual property consists of two broad categories: industrial property, such as patents and trademarks, and copyright, which protects creative endeavors like film, music, novels, and visual art. An idea alone does not need copyright. However, in a digitized media environment, the specific expression of an idea (e.g., through film or television) is subject to the terms and conditions of copyright (Ó Siochrú & Girard 2002). WIPO upholds 21 different conventions and treaties in support of intellectual property rights. These instruments provide the overall framework for WIPO's service, resource, and program activities. While WIPO is the central international authority for intellectual property, it does not have a mandate for treaty or convention enforcement. WIPO is currently governed by 184 member states. Civil society and industry groups can apply for observer status in WIPO meetings. As of the mid-2000s, there were 250 stakeholders with observer status (WIPO 2004).

The World Summit on the Information Society (WSIS) was initiated by the UN General Assembly. It marked the most important global gathering to date, concerned specifically with information and communication. WSIS was held in two phases: the first took place in Geneva, December 10–12, 2003, and the second in Tunis, November 16–18, 2005. Each phase was preceded by a lengthy preparatory process that mobilized a diverse array of stakeholders, including governments, the private sector, civil society, and other international communication agencies. The objective of the first WSIS phase was to develop a statement of political will and to address the most pressing issues arising from the establishment of a global information society, while at the same time respecting divergent interests. The first phase resulted in two documents: the Geneva Declaration of Principles and the Geneva Plan of Action. Over 11,000 participants from 175 countries participated in this first phase. During the second phase, participants were tasked with committing to the steps necessary for the implementation of the Geneva Plan of Action as well as pursuing discussion and reaching agreement on a range of other issues, most notably Internet governance. The outcomes of the second phase are outlined in the Tunis Commitment and the Tunis Agenda for the Information Society (WSIS 2006).

In April 2006, the United Nations chief executive board instituted the UN Group on the Information Society (UNGIS). This inter-agency mechanism has as its objective to promote policy and program coordination within the UN regarding the implementation of WSIS outcomes (UNGIS 2006). Advancing the platform for communication and development was also a major theme at WSIS and catalyzed the establishment of the Global Alliance for Information and Communication Technologies and Development (GAID). The Alliance is considered a multi-stakeholder global forum and platform for policy dialogue on the use of ICTs for poverty reduction and development goals (GAID 2006). Another direct outcome of WSIS activities, and specifically the Tunis Agenda, is the

Internet Governance Forum (*IGF*). The IGF was conceived in Tunis as a platform for multilateral and multi-stakeholder policy dialogue on timely and emerging issues pertaining to the Internet. The first IGF was held in Athens in 2006. In support of the format and intent of the IGF, a number of “dynamic coalitions” formed on issues such as privacy, open standards, access to knowledge, and an Internet bill of rights (IGF 2006). The IGF will meet annually for five years, after which time its status will be reassessed.

Other international agencies that devote some energy to international communication include the UN Research Institute for Social Development (*UNRISD*). UNRISD is an autonomous UN agency that undertakes multidisciplinary research on global development issues to foster dialogue and debate on contemporary policy matters (→ Transnational Civil Society). Created in 1963, UNRISD identifies a set of broad program areas to guide its research. The program in the mid-2000s included six research areas and special events: social policy and development; democracy, governance, and well-being; civil society and social movements; markets, business, and regulation; identities, conflict, and cohesion; gender and development (UNRISD 2005).

The International Telecommunications Satellite Consortium (*INTELSAT*), is the only international communication agency that started as part of the UN, but was later privatized. INTELSAT was established in 1961 after the UN General Assembly introduced a resolution stating that global satellite communications should be made available on a nondiscriminatory basis (→ Satellite Communication, Global). Satellite communications would be developed in collaboration and in cooperation with nations around the world. In 1965, INTELSAT established the first commercial satellite communication system. Today, INTELSAT provides media, telecom, and government satellite services and has the most extensive satellite network worldwide. In 2001, INTELSAT became a private company (Intelsat 2007).

International communication agencies have also emerged outside of the UN system. The Internet Corporation for Assigned Names and Numbers (*ICANN*) is an international, nonprofit corporation that is responsible for various functions of Internet protocol, including the technical coordination of address space allocation on the web (→ Internet: International Regulation; Domain Names). ICANN also undertakes the allocation of generic and top-level domain country codes, which facilitate Internet navigation as well as domain name system management (Ó Siochrú & Girard 2002). These responsibilities were initially carried out by the US government under the aegis of the Internet Assigned Numbers Authority (IANA).

A robust global media governance environment has taken shape, with international communication agencies assuming a significant role therein. What invigorates and challenges this environment all at once is the need to balance sector-specific interests and transparent decision-making processes, with efficient governance for the global public’s interests in information accessibility and dialogic communication.

# **International Communication Association (ICA)**

*Michael L. Haley*

*International Communication Association*

*Barbara Stooksberry*

*Texas State Board of Public Accountancy*

The International Communication Association (ICA) began more than 50 years ago as a small association of US researchers and is now a truly international association with more

than 4,000 members in 76 countries. With its headquarters in Washington, DC, the ICA publishes four refereed journals (a fifth will begin in 2008), a yearbook, and a monthly online newsletter; sponsors a book series; and holds regional conferences and an annual conference. The annual conference meets around the world on a geographical rotation in the Americas, Asia, and Europe. The ICA's diverse structure of 21 divisions and special interest groups represent sub-fields of communication research (→ Communication as a Field and Discipline). Since 2003, the ICA has been officially associated with the United Nations as a nongovernmental association (NGO).

The overall purposes of the ICA are to advance the scholarly study of human communication and to facilitate the implementation of such study in order to be of maximum benefit to humankind by: (1) encouraging the systematic study of theories, processes, and skills of human communication, and (2) facilitating the dissemination of research through an organizational structure responsive to communication study areas, a program of organizational affiliates, regular sponsorship of international meetings, and a commitment to a program of scholarly publication.

Because of its complexity, the ICA does not lend itself well to the typical “names, dates, and times” model when relating its history. Organizational development models provide a more useful way of understanding its history (→ Organizational Change Processes). Specifically, the Weick & Quinn (1999) approach of considering both episodic and continuous change within the same organization is most relevant. The ICA clearly exemplifies both change that is intentional and change that is unintentional or a product of forces outside the organization's control.

## **EMERGENCE**

Organizations emerge, change is constant, and the organization evolves. The ICA officially emerged in the US on January 1, 1950 as the National Society for the Study of Communication (NSSC). Like many births, this was the result of a long labor, a few complications, and some confusion as to what was actually occurring at any given moment. A review of letters, notes, and meeting minutes clearly reveals that several members of the parent organization, the Speech Association of America (SAA, now the National Communication Association), had concluded that committees within the SAA were about to recommend against the inclusion of basic communication in SAA, keeping its resources focused on rhetoric (→ Speech Communication, History of; Rhetorical Studies). The founders of the NSSC, led by such individuals as Elwood Murray, Paul Bagwell, Ralph Nichols, and Wesley Wiksell, not only saw the beginnings of growth in basic communication at universities and colleges throughout the United States, but also led the way in conducting, presenting, and publishing some of the initial research in the discipline. They were active in encouraging speech departments to embrace, rather than avoid, the new trend of communication.

The founding core of scholars identified the *objective of the new organization* as “fostering methodologies, philosophies, courses and curricula in so-called basic communication, speech, journalism, radio and other mass media (including English, etc.) which would implement training more directly for the needs of human relations at all levels” (Weaver 1977, 608).

With this objective, the NSSC began what has thus far been a 57-year process of modification and change, which on many levels continues today. The key objective of the new society was to study communication. The NSSC was also unique in that it would do original research through a committee structure while supporting the research of individual members through publishing, conferences, and networking. Ultimately this structure collapsed under its own weight. Too many committees were established initially with too many rules and regulations, and, rather than researching problems or questions already posed, the committees were to develop new questions or problems, some of which may not have had any intrinsic value nor piqued enough interest in the committees or in individual researchers. The struggle, described by Weaver (1977, 610) as “furious battles in the National Council” with the committees and their various charges continued for over 13 years and consumed the energy of the leadership. Basic functions continued but the organization showed little growth.

### **REORGANIZATION IN THE 1960S**

In 1967 the society engaged in an intentional, episodic organizational development stage: It began discussions on changing its name and formally separated from the SAA. This separation, coupled with the general feeling that the primary focus of the NSSC had changed, led to numerous discussions about a new name for the organization. In 1969 the group coalesced around the moniker of the International Communication Association. “At that time, the organization had more than 150 members from 27 foreign nations” (Weaver 1973, 615). Membership began to grow and with increased numbers came new leadership ideas. New scholars began to assert their influence and, in the words of past President Frank Dance, “there indeed was the beginning of the changing of the guard” (Weaver 1973, 372).

With increased membership, the ICA continued to evolve. The membership diversified and for the first time achieved an early goal of the old NSSC, that of being an *interdisciplinary society*. To reflect this new, broader makeup, ICA’s by-laws called for the creation of divisions based on more narrowly defined research interests. This was to be a renewal mechanism for the association and provide a place for like-minded scholars to gather. Unlike the NSSC structure, committees would be generated by the divisions only if they were needed to solve specific issues. Guidelines, such as those requiring divisions to maintain a certain level of membership, were designed to prevent a proliferation of divisions and a loss of focus. The debate on this issue continues as the original 4 divisions have increased to 21 divisions and special interest groups as of 2007. This growth reflects the complexity of the world in which the association finds itself today, as well as the global nature of much of communication study and research.

### **PUBLICATIONS**

A healthy and vibrant association requires both episodic and continuous change and the ICA has experienced both. For an academic, scholarly society, one measure of such changes is its publication program. The International Communication Association (still as the NSSC) produced the first issue of the *Journal of Communication* in 1951. Initially

published in-house, the journal grew with the association such that, by 1967, submission rates had increased and the acceptance rate had declined. Historical documents draw correlations between the prestige of the journal and the prestige of being a member of the association. As the membership developed and the research interests of its members broadened, so did the publishing program. The association has added journals and other publications to address the ever-changing field of communication and the research being done by scholars in the field. The addition of new journals, and of editorial boards representing more diverse research interests, offers more publication opportunities for varying points of view and the different areas and types of scholarship being produced by the membership.

In 1973 the ICA launched *Human Communication Research* to focus on “quality research and scholarship in human communication” (Weaver 1977, 614). *Communication Yearbook* began in 1977 as a combination of selected conference proceedings and annual reviews from within the field. It was intended to address the state of the art of the discipline of communication. *Communication Theory*, begun in 1991, was to provide a forum, both interdisciplinary and international, for original theoretical contributions to the discipline. According to the founding editor, Robert T. Craig (1991, 1), “the appearance of *Communication Theory* [marked] the coming of age of an academic field.” In 2003, the ICA acquired the *Journal of Computer Mediated Communication*, an online journal. This marked the association’s entry into online, open-access journal publishing. The ICA continues to expand its publication program as the need dictates.

## **DEBATES ABOUT STRUCTURE**

Questions and debates continue to challenge the ICA leadership – and create the probability of future change. One such question regards whether the association structure should allow for the proliferation of special interest groups and divisions or maintain fewer but broader areas of scholarship interest. Another centers on the size and structure of the annual conference. Clearly, a primary goal of the association is to provide opportunities for members to present research for the dual purposes of receiving feedback on the research and of enhancing and advancing a member’s academic career. Yet, the ICA has retained a smaller, more intimate association than some others in the field. After four decades, the perception of the ICA as having a narrow empirical social science scope has given way to a perception of being open to a broader range of research approaches. Again, this is evocative of an organization for which change has been constant, evolving, and cumulative.

During the 1980s and 1990s the *membership* remained constant overall but developed a cyclical pattern. Membership, and to some degree the financial health of the organization, rose and fell as members flowed in and out depending on whether or not they had a paper or panel accepted for the annual conference. Any conferences held outside North America had a ripple effect, drew fewer scholars submitting and presenting, and membership numbers declined significantly when conference attendance was lower. The ICA had entered a practical phase of its history. Attending a conference and presenting a paper required funding from the members’ institutions, many of which had policies that severely limited funding for conferences held outside the US. In the past two decades, the

membership has remained largely US-based. As the ICA entered the twenty-first century, however, this pattern no longer held.

## **INTERNATIONALIZATION**

The international identity of the ICA has been a key issue since the name change in 1969. Several debates about what it means to be international – or how to put the *I* in ICA – have been documented in board and committee minutes. The most significant change began in the late 1990s when the ICA purposefully set about to change itself from a US-based organization that happened to have international members to a truly international organization that happened to be based in the US. In the mid-1990s, the ICA board of directors established a global connections committee (later renamed the internationalization committee) to consider this objective. Four significant initiatives originated in this committee and, with implementation of these initiatives, the association continued on its evolutionary path.

The most significant innovation was to change the composition of the *board of directors* to reflect the international mission of the association. The ICA needed to look international on all of its public faces, which meant that members of the board, of committees, and of editorial boards needed to have representation and active participation from all areas of the globe. As it did with many of its decisions on internationalizing, the organization searched for a foundation and rationale as the basis of its decisions. The United Nations and World Bank classifications became the basis for the structural evolution of ICA.

In 2000 a change in by-laws established five *regional at-large board seats*. Discussions reported in committee and board minutes indicate that these positions were created with no specific charge assigned to them. As a group, the regional at-large members have struggled to define their role and have been inconsistent in representing their geographic areas. They now constitute some of the membership of the internationalization committee, the descendant of the global connections committee. A review of governance documents demonstrates as well a concerted, purposeful effort to have at least one non-North American on every committee and subcommittee. Beginning with the election of division officers in 2003, almost half the board of directors were from countries other than the US, a strong indication that the ICA's stated objective of becoming truly international was being realized. The turn of this century also saw a second episodic change aimed at specifically addressing the international image of the association. Three decades ago, the association settled into offices in Austin, Texas with a paid staff of one. This arrangement met the needs of the organization for many years but did not present an international image or allow the degree of interaction with relevant agencies and other scholarly associations that the board felt was needed. The ICA relocated to rented office space in Washington, DC in 2001, and shortly thereafter began searching for permanent central offices to manage the growing association and provide long-term stability for the organization. In 2006, the association realized another goal with the purchase of an office building in Washington, DC, which will provide a *permanent home for the organization* and its records. With this move, the association evolved from one that, like many professional associations in their early history, required each president personally to store and maintain association documents to one that had "arrived," with a home of its own and the visibility that comes with it.

With its new emphasis on internationalization, the board also restructured membership in 2002 with two purposes in mind. The first was to stabilize the membership by aligning the membership year with the fiscal year. This began to move the organization beyond one directly tied to conference presentation to one that provided a number of consistent services and benefits in addition to those centering on the conference. By 2004, membership in ICA had grown to over 4,000 scholars in 76 countries, and the cyclical pattern ceased to be the focus of governance meetings.

The second purpose was to recognize the differing resources of scholars around the world. Using the World Bank ranking of national economies, the ICA developed a tiered dues and conference registration structure. With these changes, the membership again demonstrated a significant increase, largely from non-US countries. Other outreach activities began at approximately the same time. ICA newsletters published columns that addressed international issues and profiled communication scholarship in various regions of the world.

### **EXPANDING PUBLICATIONS**

With greater diversification in membership, scholarly focus, and research methodologies has come the search for meaningful participation and discourse. Once again, the focus was on the publication program. As in the early 1970s, the organization experienced increased criticism about a perceived narrowness in editorial decisions and responsiveness to alternative methods of research deemed acceptable for publication. A review of newsletter articles, meeting minutes, and personal memory of conversations suggested that ICA publications were open to all scholarship with no inherent bias or discrimination toward any scholar, group of scholars, or research methodology. A look at the annual reports of each of the journals and the yearbook would lead one to the same conclusion. Yet, there was clear disagreement from some scholars about the extent to which editorial decisions were biased against methodologies and international work generally.

In its drive to take on an international face, the ICA focused on committees, task forces, and the composition of the board, but failed to look at the areas that fell outside the typical organizational structure. The editorial boards of the various journals were neglected. When scholars look to publish their research, it is natural to look for “like-minded” individuals on a review panel or editorial board. The ICA’s publications did not have the international look and therefore received relatively few submissions from outside of North America. Those that were received often had difficulty finding reviewers who understood or accepted the methodology utilized.

To address this issue and others, beginning in 2005, the association embarked on its largest expansion of the publication program. It began by selecting an entrepreneurial publisher for its journals, which gave the organization better press coverage and more financial resources to develop other projects and programs. It revised its *Guide to Publishing* and launched a handbook series and a book series on communication in the public interest. An ad hoc task force studying specific criticisms suggested creating a new journal, *Communication, Culture, and Critique*, to provide an “international forum for critical, feminist interpretive, and qualitative research examining the role of communication from a cultural and historical perspective.” The ICA board of directors adopted this recommendation and the new journal was scheduled to be launched in 2008.

As an organization, the ICA was, and continues to be, one that fully demonstrates Weick and Quinn's (1999) theory of organizational change. It is an organization of continuous change that highlights the fluid nature, improvisation, and cyclical process without any seeming end state. At the same time, it continues to engage in the clearly purposeful, infrequent, and divergent behavior that is symptomatic of episodic change. The two processes have served the organization in complementary fashion. The history of the International Communication Association will continue to be a good story, and will continue to reflect the nature of those who call it their scholarly home.

## **International News Reporting**

*Chris Paterson*

*University of Leeds*

International news reporting evolved with the advent of the telegraph in the mid-1800s (→ Telegraph, History of). The explosion of foreign news that followed largely supported the colonial empires; it also focused on international conflicts involving them (while all but ignoring others).

The concept of international reporting is itself contentious, beginning with the definition of → “news.” Galtung and Ruge conducted a study in 1965, which remains influential, for it succinctly described what international news is, and is not, for leading news organizations. They described numerous news priorities, but most crucially observed that the more the event concerns elite nations, the more the event concerns elite people, the more the event can be seen in personal terms, as due to the action of specific individuals, the more probable it is that it will become a news item. And the more negative an event is in its consequences, the more probable that it will become a news

item (→ News Factors; News Values). These findings have been routinely replicated in research (Galtung & Ruge 1970).

### **MEDIA ORGANIZATIONS IN INTERNATIONAL NEWS REPORTING**

Only a relatively small number of large media organizations routinely engage in international reporting. These include the global news services such as the → BBC, → CNN International, and → news agencies (Reuters, Associated Press, Agence France-Presse), and large newspapers and broadcasters from the world's wealthiest countries, such as the *New York Times*, *Le Monde*, NHK, and the Canadian Broadcasting Corporation. Until the 1990s, the US broadcast networks ABC, CBS, and NBC were vital in drawing American and global attention to international issues, but their foreign operations were scaled back in the 1990s (→ Television Networks). An exception among news → magazines is the multilanguage monthly → *Le Monde Diplomatique*.

Where the largest news organizations once provided occasional (even if mostly negative; → negativity) coverage from developing countries and infrequently covered nations, since the 1990s even this has declined as those organizations concentrated their diminishing allocation of resources on hard-to-cover mega-stories like conflicts in the former Yugoslavia, Kosovo, and the Middle East. News agencies, especially, pulled staff from the rest of the world to establish huge semi-permanent reporting teams for these stories. Thus, they became the leading international story day after day, whether anything significant was happening or not, because nobody was left to provide news from elsewhere, and the big investment had to be justified.

Surveys indicated that foreign editors saw little need to increase international coverage, even as other research pointed to public demand for it (Utley 1997; Parks 2002; Pew Research Center 2002; Philo 2004; → Survey). Foreign coverage is most often provided, if at all, through news agency subscriptions or the purchase of syndicated stories from larger organizations. Only the rare international journey is undertaken, usually to find a “local angle” on a massive story receiving saturation coverage by the global press, like the Iraq war of 2003. Both editors and journalists from wealthy nations still typically regard with suspicion reporting from local journalists in developing countries, even as they grow increasingly dependent upon it when their own budgets are cut.

### **FORMS AND STYLES**

A classic critique of international reporting bore the label “parachute journalism,” signifying the practice of jetting correspondents into breaking stories around the world, where they would spend just hours or days before moving on to the next. They had no access to local languages, no opportunity to develop expertise on the stories they were reporting, and would usually rely on the most accessible sources for information and interviews – often professional peers or their own national embassy staff. Some news organizations have offered a partial counter to such critiques by having specialists cover vast regions, like all of Latin America or Africa. While this might somewhat offset the previous invisibility of those regions, the “parachute” approach necessarily remains.

However, as international coverage increasingly became conflict reporting, especially conflicts involving the US, parachute journalism evolved into “rooftop” journalism, where inaccessible military action a great distance away was described to international television audiences by correspondents encamped on the roofs of luxury hotels, where their cameras and satellite dishes could be safely stationed (→ Conflict as Media Content). It provided an illusion of live coverage, but “on-scene” reporters knew only what the military and local journalists would tell them (Van Ginneken 1998; Allan & Zelizer 2004; Paterson & Sreberny 2004; → Embedded Journalists; War Correspondents).

In his research on the culture of news production in the US, Gans observed that American international correspondents tended to judge “other countries by the extent to which they live up to or imitate American practices and values” (Gans 1979, 42). Dahlgren and Chakrapani (1982) described western ways of seeing the “other,” finding reports about developing countries tended to display prominently the “definitive motifs” of social disorder, flawed development, and primitivism. These authors argued that western news readers contentedly see themselves as the opposite of these things, providing, in the commercial marketplace, an incentive for such stereotypes to persist (Said 1978; Dahlgren & Chakrapani 1982).

Foreign correspondents were once regarded as the nobility of → journalism – what journalists and journalism students aspired to be. The best international reporters still exhibit broad knowledge of the politics and cultures of other nations (often specializing in particular nations or regions), are linguistically adept, empathize with people different from themselves, and often possess a taste for adventure, if not outright danger. But such professionals are increasingly rare, given contemporary media corporations’ financial priorities. There remains no shortage of freelance journalists willing to risk all to bring interesting stories from abroad. BBC journalist David Loyn described the exploits of some prominent and influential freelance journalists of the 1990s in his book *Frontline*. In the process he provided a trenchant critique of current mainstream, television-driven, international reporting (→ Television News).

## **REPRESSION OF MEDIA: VIOLENCE AGAINST JOURNALISTS**

Journalists acknowledge the critiques, but point out that their work often displeases people, and at times of conflict may be especially dangerous. Numerous journalists have been expelled from countries by having their visas or work permits revoked, but given the high numbers of journalists killed in recent years, this is now regarded as a mild penalty – if not a badge of honor (→ Violence against Journalists). A number of nongovernmental organizations – many sponsored by major media outlets – work to document repression of both foreign and local reporters by governments and others, to free imprisoned journalists, to independently investigate casualties among journalists, and to lobby for greater press freedom and protection (see for example, [www.newssafety.com](http://www.newssafety.com), [www.rsf.org](http://www.rsf.org), [www.ifj.org](http://www.ifj.org), [cpj.org](http://cpj.org), and [article19.org](http://article19.org)).

As the number of journalists killed continues to escalate in the 2000s, safety has become an increasingly pressing concern, and a small industry of safety training courses for journalists has developed. Government involvement in the murder of journalists is often suspected, but can rarely be proven. When Russian human rights journalist Anna

Politkovskaia was murdered in 2006 after covering very extensive human rights violations in Chechnya, many feared the return of Soviet-style repression. In other parts of the world attacks on journalists also grew worse, as when Zimbabwean television cameraman Edward Chikombo was murdered after photographing the opposition leader's injuries following a beating by police. Foreign journalists had been banned from Zimbabwe, but days after this local photographer's images reached the international media, he was dead.

Over 1999–2007, an even more disturbing trend in news media repression began as the US government – long a leading advocate of press freedom – began accumulating in other countries an extensive record of arrests and killings of media professionals. Over those years, as many as 40 media professionals were killed by the US military in Serbia, Afghanistan, and Iraq, and dozens were detained without charge in Afghanistan and Iraq. Reuters reported some of its staff had been tortured by US forces, and at the time of this writing a cameraman for Al-Jazeera television (→ Arab Satellite TV News) had been held in the US prison at Guantánamo Bay, Cuba, for six years. As of 2007, no US troops had been held to account (Paterson 2005; International News Safety Institute 2007).

### **TECHNOLOGICAL CHANGE**

Crucial technological change in international reporting has come about since the mid-1990s, driven mostly by the ability to compress, and therefore transmit more cheaply, streams of digital information, including high quality television pictures (→ Television Technology; News Production and Technology). In the 1980s, a few minutes of transmission of television pictures from the scene of a remote news event might have cost thousands of dollars and required massive satellite dishes, but by the mid-2000s, the same transmission cost well below 100 dollars and required equipment no larger than a briefcase.

Smaller and better cameras, satellite telephones capable of transmitting video, and laptop computers enabling the writing of stories and editing of pictures in the field have revolutionized the logistics of news gathering, and allowed journalists to provide video, sound, and text (allowing distribution by → television, → radio, → newspaper, → Internet, and, increasingly, mobile phone) from nearly anywhere on earth. But it still costs a great deal to get media personnel to most parts of the globe (those any distance from an airport), and to keep them there for any length of time – and that still significantly constrains what is defined as international news.

### **OUTLOOK**

As the first decade of the new millennium draws to a close, international news reporting seems more important than ever in an increasingly interconnected but polarized world. With the Korean news organization OhmyNews in the lead, nonprofessional journalists are proving that global reporting does not require global news organizations (→ Citizen Journalism); and those global organizations are struggling to cover the largest stories as their personnel are targeted. Some journalists have been influential in calling for fresh approaches to reporting, such as Bell's journalism of attachment or Lynch's → peace journalism, which challenge journalists to focus on, respectively, the human toll of

conflict and solutions to conflict (Bell 1998; Lynch 2004). For now, the stories of the world most people see and read are still determined by just a few international news services and from a very limited perspective.

## International Radio

*Per Jauert*

*University of Aarhus*

Since → radio broadcasting was launched shortly after World War I, it has served two culturally different, almost paradoxical, functions in relation to its distribution. On the one hand, it turned out to be one of the more effective instruments in the nation-building process, and on the other it was from its initial years distributed on a global scale. Benedict Anderson's concept of "imagined communities" would express the role of radio broadcasting not as a tool for national identity-shaping within a nationalist ideology, but more as a way to encircle a common feeling or a sense of "Englishness," "Danishness," etc. Although in public debate about the cultural role of the electronic media it is often claimed they dilute national culture, in a historical perspective it is clearly the other way round. Over the past century, radio in large part shaped a national sense of shared imaginations and frames of reference, and at the same time also maintained its position as an international medium.

### **POLITICAL INSTRUMENT AND DISSEMINATOR OF CULTURE**

During the 1930s radio was perceived as one of the most powerful media to influence → public opinion. The Nazis described it as "the most modern, the strongest and the most revolutionary weapon which we possess in the battle against an extinct world" (Hendy 2000, 21). American, British, and other European broadcasters – public, state, and private – shared the assessment of radio as an instrument of strong political influence. The counter-propaganda from BBC foreign-language services to occupied Europe during World War II was not only an instrument of → propaganda, but also served as a "secret messenger" for underground resistance groups (→ BBC World Service). During the Cold War there was a further expansion of radio as a global propaganda instrument, not least from the USA and the Soviet Union, the former running stations like → Radio Free Europe and Radio Liberty, and the latter constantly jamming western signals, but also broadcasting more than 2000 hours per week via Radio Moscow. The impact of these propagandist initiatives on the fall of the communist regimes in eastern Europe has been disputed, but in 1994 under the Clinton administration all America's overseas broadcasting was organized according to a new International Broadcasting Act, including

the veteran station → Voice of America, a new service called Radio Free Asia, followed in 1998 by a pan-African service entitled Radio Democracy for Africa, and the Middle East service Radio Free Iraq (Barnard 2000, 238).

Apart from this interventionist use of radio as a political instrument, often funded directly or indirectly by governments or their intelligence agencies, you will also find services related to areas closer to the export and dissemination of cultural values and commodities. In the mid-2000s, the BBC World Service, → Deutsche Welle, and → Radio France Internationale were mainly serving these functions. Radio Luxembourg was the most prominent example of a truly international station without any specific national flavor, introducing the American-style format of commercial pop music radio to Europe from the 1950s onwards, serving as an open window for European youth otherwise subjected to the music and taste restrictions of the European public service monopoly institutions, most of them not deregulated until the late 1970s or 1980s.

In his study of international broadcasting, Browne (1992) lists *eight goals*: instrument of foreign policy, advertisement for the national culture and civic values of the mother country, a symbolic presence (for example, as a symbol of a country's newly independent status), a force for converting beliefs (for example, on behalf of ideologically motivated regimes or religious movements), a force for coercing or intimidating people (for example, through threats of annihilation during wartime from clandestine stations), educator, entertainer, and a seller of goods and services, such as Bibles (Hendy 2000, 22).

### RADIO USES IN EVERYDAY LIFE

But going back to the early European days of radio broadcasting, radio was international in another sense. Due to the scarcity of stations and programs, many of the early radio adapters were taking in sounds, voices, and music from places far away, because the AM signal could travel hundreds of miles, and the shortwave band even further (→ Radio Technology). With the introduction of the FM band from around 1960, radio grew into a more defined position as a national medium. The FM band is limited to a range of 50 miles, but has a better hi-fi sound quality than AM, and thus was an excellent vehicle for the expanding popular music industry (→ Popular Music; Music Industry). With the growth of commercial radio, this national and local character was strengthened, not only because of the introduction of the FM band, but mainly because radio, compared to → television, has very low entry and running costs. Regional or local stations showed themselves able to survive with relatively low → advertising revenues and smaller → audience shares (Hendy 2000, 23; → Cost and Revenue Structures in the Media). A major change in the functions and social uses of radio at the same time was a result of the invention of the transistor. The radio set could now be moved out of the living room and be present in other rooms of the house, and it switched from a center for family attention to a companion for the individual as part of the routines of everyday life, in the garden or the car, or at the beach, to routines mainly connected to the immediate surroundings of the community, the locality, and the nation (Scannell 1996).

### **THE NEW DISTRIBUTION PLATFORMS: A REVIVAL OF INTERNATIONAL RADIO?**

During the late 1990s, the digital revolution reached radio broadcasting and opened up new means of production and distribution of radio, including a new opening for the international dissemination of radio (or rather, perhaps, of audio services). Three major platforms for radio distribution were now adopted, or announced as imminently available: *analog broadcast radio*, where the content provider still composes the program output (the well-known “flow” radio); *digital audio broadcasting*, where the electronic program guide offers a mixture of pull and push program deliveries and the listener is able to compose his or her own program menu during the day and combine radio output with written, supplementary information; and *radio on the Internet*, where the listener is able to compose different media elements from the website, often parallel “broadcasting” of the analog channels, streaming audio (music, jukebox function), supplementary written information, video clips, downloading of programs (podcasting), etc.

Radio on the → Internet offers new dimensions for radio production and consumption. Here the audience for any radio station is in principle global, whether its programs or content were originally produced for a local or a national audience. On the Internet, radio stations are able to establish a worldwide presence, and the commercial potential is obvious, for example through banner ads, sales promotions of music CDs, and direct, online sale of music tracks, etc. Public service radio broadcasters often use the Internet platform to promote their noncommercial functions, especially the participatory features for “user-generated content,” e.g., chat, blogs (→ Blogger), audio and video clips (→ Music Videos; Video), etc. (→ Public Broadcasting Systems). Grassroots and civic organizations have also included Internet radio both as a supplement to community activities and as a way to connect to peer organizations or movements on a global scale (→ Citizens’ Media; Community Media; Grassroots Media; Telecenters).

### **FROM RADIO BROADCASTING TO AUDIO DISTRIBUTION?**

The consequences for radio of the growing diversity in digital distribution platforms is not easy to foresee. What are the contemporary technological options for digitization of audio media and what would be the consequences of the different alternative paths of development? Will the future of radio be more in traditional-style, free-to-air broadcasting or will radio turn into a medium where people have to pay directly for what they want to listen to – and see?

Ten years ago, the future of radio seemed to be rather obvious. The European digital platform, digital audio broadcasting (DAB), was – at least in Europe – considered the radio technology of the digital age, which would extend radio media into new dimensions and provide answers to all the problems of analog radio, like the lack of spectrum for new services. However, this pan-European idea of digital radio was rejected by the US and Japan almost at the same time as the Internet made its breakthrough, and already by the end of the 1990s the digital future of radio had become much more complicated. Instead of one universal digital radio approach, there were now a few rival digital radio technologies, both terrestrial and satellite, while new radio-like services through the Internet,

combining audio and multimedia, were able to redeem the original promises of extending the radio experience (→ Digital Media, History of).

As of 2007, there were only a few clear and obvious things about the future of radio. First of all, the audio medium which we know as radio would not die, although it is currently getting into a period of major transition. Second, it seemed that at least a part of the future of radio was still analog, mostly because of the huge numbers of analog receivers and the good quality and low price of analog radio operations. However, in the long run, the future of radio would be digital, but this will probably mean also multiple simultaneous platforms of digital audio delivery. Besides DAB, there were other, alternative digital technologies for audio broadcasting, like Digital Radio Mondiale (DRM) and high definition (HD) radio. In addition, digital radio was already available also in a digital television network, DVB-T (Digital Video Broadcasting – Terrestrial), while the new mobile multimedia technologies like DVB-H (digital Video Broadcasting – Handheld) and DMB (Digital Multimedia Broadcasting) would bring digital broadcast television and radio into mobile hand-held devices. On the other hand, also the Internet and mobile phone networks provided a basis for new nonbroadcast or hybrid audio media services like web streaming, podcasting, or visual radio.

The increasing number of possible radio platforms and new radio and radio-like audio and music services were severely challenging the traditional business model of commercial broadcast radio. Since the 1950s, it had been based on creating audiences for the advertisers with free and open delivery of entertainment and playlist-controlled music. Now, when audiences are becoming more and more fragmented, digital music outside of the playlists can be easily obtained and managed for personal use with rather small cost, and direct advertising is increasingly easy to avoid in digital audio consumption, commercial operators are developing different strategies for charging their audiences, i.e., users. Some people were also willing to pay for radio, as the success of US satellite radio has proven. Moreover, mobile phone manufacturers and operators are interested in these new markets (Ala-Fossi & Jauert 2007).

# International Television

*Michael Curtin*

*University of Wisconsin-Madison*

During the latter half of the twentieth century, most discussions about international television tended to focus on national media systems and relations of exchange among those systems. Since the 1990s, however, television has increasingly been studied as a global phenomenon. Although national systems still figure prominently, research and policy debates now explore the ways in which television participates in broader processes of globalization (→ Globalization of the Media; Globalization Theories).

Originally, → television, like → radio before it, emerged as a quintessentially national medium. In almost every country, television was introduced in hopes of fostering national unity, social development, public enlightenment, and cultural preservation. Using their power to limit the number of broadcasters, governments carefully controlled access to the airwaves, either by creating public service broadcast systems or by licensing commercial systems that pledged to serve the national interest (→ Radio Broadcasting, Regulation of; Telecommunications: Law and Policy; Television Broadcasting, Regulation of). With the exception of the western hemisphere, most nations around the world opted for public service television during early years of the medium (→ Public Service Broadcasting: Law and Policy). In countries like France, the government organized centralized networks that focused on the promotion of national culture, while in poorer countries like India and China, television was adopted as a means to economic and social development. Whether a commercial or public service, audiences in most countries had few channels to choose from during this early period and broadcasters consequently placed their first priority on serving the national mass audience.

## PERIOD OF CHANGE

During the 1980s, however, economic reversals in Europe put pressure on the budgets of public service broadcasters, which coincided with emerging political challenges from groups that traditionally were marginalized by national TV services. Women's organizations, labor unions, peace groups, environmental advocates, and ethnic and regional movements all criticized public service media for focusing on mass audiences and failing to represent a diverse range of perspectives. This *crisis of legitimacy* was exacerbated by

growing competition from transnational satellite services that fell outside the domain of national broadcast regulation (→ Satellite Communication, Global; Satellite Television). Businesses supported these new technologies since they promised to expand the availability of television advertising time and diminish government control over the airwaves. Cable and satellite channels initially targeted two groups: *transnational niche viewers*, e.g., business executives, sports enthusiasts, and music video fans, and sub-national niche groups, e.g., regional, local, or ethnic audiences (→ Cable Television). These trends soon spread beyond Europe to countries such as India, Australia, and Indonesia. Meanwhile, in countries where national commercial systems had long prevailed, existing broadcasters likewise found themselves challenged by a growing number of niche competitors.

Changes in television were further stimulated by a new generation of corporate moguls – such as Rupert Murdoch (→ News Corporation), Ted Turner (→ CNN), and Akio Morita (→ Sony Corporation) – who aspired to build global media empires that integrated television, music, motion picture, → video games, and other media enterprises. These conglomerates aimed to serve a wide variety of mass and niche markets in both information and entertainment (→ Media Conglomerates). Although national audiences continued to play an important role in their calculations, companies such as News Corporation increasingly strategized about transnational and sub-national audiences, hoping to develop new market niches.

This “*neo-network era*” of multiple channels and flexible corporate structures has also fostered the growth of commercial media conglomerates outside the west, such as Zee TV in India and Phoenix TV in China. And it has forced western corporations, such as Viacom, to adapt their content to local and regional markets around the globe. For instance, MTV now operates more than a dozen distinctive channels in Asia alone, offering various mixes of global, regional, and local programming. Thus, globalization has paradoxically fostered the production and promotion of transnational media products as well as localized niche products aimed at sub-national audiences (→ Hybridity Theories). Unlike the classical network era when TV institutions tended to focus exclusively on national mass audiences, media conglomerates today are flexibly structured to accommodate marketing strategies aimed at a variety of audiences, sometimes without regard to national boundaries. The scale and competitive power of these new television institutions have seriously undermined public broadcasting in some countries, but not all. In India, for example, new competitors have encouraged Doordarshan – the public service broadcaster – to improve program quality, conduct systematic audience research, and diversify its services.

## GLOBALIZATION OF THE MEDIA

Television’s changing character worldwide is part of a broader process of globalization that has been unfolding for at least five hundred years. Globalization refers on the one hand to the increasing speed and density of interactions among people and institutions around the world, a trend that manifests itself in the dynamic interdependence of global financial markets, the transnational division of labor, the interlocking system of nation-states, and the interconnection of communication and transportation systems. On the other hand, globalization also refers to changing modes of consciousness, whereby people

increasingly think and talk about the world as one place. Sociologist Roland Robertson suggests that rather than the world just being itself, we increasingly imagine the world being “for itself.” We speak of global order, human rights, nuclear disarmament, and world ecology as shared experiences and collective projects. We reflect upon information from near and far and we often deliberate as if we have a stake in both local and global events. Not everyone joins in these conversations and certainly all voices are not equal, but these discussions nevertheless span greater terrain and include more people than ever before, and the outcomes of these interactions often have effects that transcend local and national boundaries.

Globalization has been facilitated over the past 150 years by electronic communication technologies like the telegraph, telephone, radio, cinema, television, and computer. Moreover, the deployment of these technologies has been linked to specific historical projects, such as European imperialism, Cold War struggle, and most recently neo-liberal, supra-national capitalism. This last project, which intensified after the end of the Cold War, is most centrally concerned with trade liberalization, as countries around the world are being pressed to eliminate restrictions on the transborder flow of goods and services, including cultural products (→ Cultural Products as Tradable Services). Consequently, no society today can confidently say that it stands outside the field of global commerce. A similar observation might be made about popular culture, since the commercial flow of goods and ideas around the world has escalated dramatically in recent times. Thus, the globalization of television is part of a longer historical trajectory. It builds upon related developments, yet it also has contributed significantly to the escalating pace of change.

Debates about transnational media flows began as early as the 1920s. In fact, most national broadcast systems, such as the British Broadcasting Corporation (BBC), were put in place as a bulwark against foreign media influences, particularly Hollywood films and US popular music. Throughout the twentieth century, preserving and promoting national culture over the airwaves was characterized as a key element of national sovereignty in Europe, Latin America, and especially in the newly independent states of the postcolonial world, such as Ghana, Pakistan, and Indonesia. Scholars such as Herbert I. Schiller, Dallas Smythe, and Armand Mattelart were especially strong critics of US TV exports, claiming that they played an important role in sustaining an international structure of economic and political domination (→ Political Economy of the Media). They furthermore contended that the huge flood of media messages exported from the core industrialized countries served the interests of a western ruling class by squeezing out authentic local voices and promoting a culture of consumption. This “media imperialism” thesis emerged in the 1960s and enjoyed widespread acceptance into the 1980s (→ Cultural Imperialism Theories).

### **NEW ATTRACTION TO DOMESTIC PROGRAMS**

Although many scholars still adhere to its central tenets, others, such as Joseph Straubhaar, began to notice the erosion of → Hollywood’s dominance as the productivity of local TV industries increased. For example, in Latin America, domestic programs generally tend to draw larger audiences than imported products. Scholars furthermore point to the increasing amount of television trade within Latin America and note that

when audiences tune to a foreign program, they generally prefer a show that has been imported from a country with a similar language and/or culture. In Venezuela, for example, viewers are most likely to prefer a show imported from Mexico's Televisa or Brazil's Globo rather than a Hollywood production. Likewise, Taiwanese audiences seem to prefer Japanese or Hong Kong serial dramas, and Kuwaiti audiences prefer programs from Cairo or Beirut. Consequently, the dominant power of Hollywood exporters has been attenuated by more complicated patterns of distribution (→ Francophonie; Korean Cultural Influence).

One indication of these new patterns of TV flow can be gleaned from the *emergence of global media capitals*, such as Bombay (now Mumbai), Cairo, and Hong Kong, each of them now competing for growing shares of the global media market (→ Bollywood; Hong Kong Cinema). Such locales have developed transnational logics of production and distribution, ones that do not necessarily correspond to the geography, interests, or policies of particular nation-states. For example, Hong Kong television is produced, distributed, and consumed in Taipei, Beijing, Amsterdam, Vancouver, Bangkok, and Kuala Lumpur. Similarly, Mumbai, once the home of the national Indian film industry, is now the center for transnational media enterprises that operate across the film, television, and music industries. For example, Zee TV – South Asia's most popular Hindi-language commercial satellite channel – also provides a satellite service to Europe, distributes music videos in Los Angeles, and mounts film productions targeted at audiences around the globe. As numerous critics have noted, Indian television services are going global, seeking out new audiences, new financing, and fresh sources of creative talent.

Finally, even in countries where the presence of US programs is pervasive, the *impact on viewers* remains a matter of speculation. Cultural studies researchers such as David Morley, Ien Ang, Marie Gillespie, and James Lull have shown how audiences make unanticipated uses of television programming, often reworking the meanings of transnational television texts to accommodate the circumstances of their local social context. Consequently, the homogenizing effect of transnational television flows has been called into question.

### NEW CRITICAL PERSPECTIVES

These challenges to the media imperialism thesis have formed the foundation of globalization studies of television and they have opened the door to new critical perspectives. John Tomlinson suggests, for example, that television scholars should shift their attention from the analysis of international television to a critique of global capitalist modernity. Such an approach would still be alert to questions of power and dominance, but it would no longer fetishize local cultures nor would it make sweeping assertions about the function of the medium as an unqualified tool of capitalist domination. Television studies should instead emphasize the ways in which electronic media alter our sense of connection to people, events, and institutions in distant locales. By fostering a web of complex connectivity, television participates in the production of new opportunities as well as new anxieties. Our increasingly “glocal” popular culture may, in fact, lay the foundations for nascent transnational political movements around issues such as labor, ecology, and human rights.

Similarly, Ien Ang points to the global/local dynamics of television, arguing that despite the growing prominence of media conglomerates, the actual uses that audiences make of popular texts is far more diverse than previously imagined. The play of power in global television is to be found in the ways that media conglomerates attempt to set structural limits on the production and circulation of meaning, and contrarily on the ways in which viewers both comply with and defy these semiotic limits. This play of power requires an understanding of industries and audiences, as well as the diverse social contexts in which the contest over meaning arises.

The study of international television today examines programming, audiences, and institutions, but it also encourages us to consider the role that electronic media have played for almost two centuries in the longer trajectory of globalization. Writing shortly before the first television satellite launch in 1962, → Marshall McLuhan hyperbolically heralded the arrival of a “global village.” Perhaps more modestly today, we might suggest that television facilitates processes whereby villages around the world increasingly perceive their circumstances in relation to global issues, forces, and institutions, as well as local and national ones.

# Internet

*Daniel G. McDonald*

*Ohio State University*

The Internet is a network of computer networks. In that sense, even though the content provided can often be similar to that offered by radio or television networks (→ Radio; Radio Networks; Television; Television Networks), a more appropriate structural analogy should probably be to telephone or telegraph networks (→ Telegraph, History of). The Internet, telephone, and telegraph networks all originated as electronic means of communicating in a point-to-point context. In relation to content, as well, early experiments with the telephone (in the 1880s and 1890s) connected performers and audiences in multiple locations and varied content, such as sports contests, musical programs, and vaudeville shows, and provided a kind of conceptual forerunner for what was to come with radio, television, and the Internet.

The Internet, though, owes its existence to developments in computers and communication between computers. The US military developed a number of precursors to the Internet, the best known of which is ARPANET. ARPANET use was restricted to military and scientific personnel. The National Science Foundation (NSF) originally provided administrative oversight of the Internet, but in 1995, the NSF ceased its administration of the Internet, and commercial use was permitted. The world wide web (WWW), developed by Tim Berners-Lee, soon replaced file transfer protocol as the most common application used on the Internet. The WWW is a program that allows the use of multimedia – graphics, audio, and video. As a result, the WWW offered a much more intuitive sense of being in a particular location, and of navigating from one site to another. By 2000, 80 percent of all traffic on the Internet came through the WWW (→ Internet, Technology of).

## CHALLENGES OF INTERNET RESEARCH

Today, Internet content is as diverse as those who use it. In broad categories, some of the more popular uses of the Internet are telecommuting (working at a distance from an office but using a computer and the Internet to perform one's job), electronic commerce (advertising, buying, selling, and even distributing via the Internet; → E-Commerce), customer service, → electronic mail (email), news reports (→ Internet News), file sharing, TV and motion picture distribution directly to homes, online chat, friendship sites (such as MySpace), dating services, weblogs or blogs (→ Blogger), online auctions, and video submission sites, such as YouTube.

Studying Internet content presents some of the same challenges as studying media content, except that some of the issues are exaggerated. As is typical in studying the media, the content that is most relevant for study is the content that is seen, heard, or read by an → audience. In the pre-cable days of television, virtually any program offered by major networks would attract millions of viewers, so nearly all broadcast content was relevant for sampling. With the Internet, the content has to be found, and a decision

needs to be made about how relevant the website is to the purposes of the study, regardless of how relevant the content of the website may be. That is, if no one visits the site, there is not much reason to study the content, even if it does exist (see McMillan 2000, for other issues in content analysis of Internet material; → Content Analysis, Qualitative; Content Analysis, Quantitative).

A different kind of problem exists with studying Internet content from the perspective of → interpersonal communication. Typically, interpersonal communication scholars make comparisons to face-to-face communication. However, some aspects of communication over the Internet simply do not exist in face-to-face communication (e.g., smiley faces or exclamation points), so some studies are simply trying to document the type of communication that is occurring (Waseleski 2006).

A couple of issues make studying Internet content a particular challenge over traditional media. One of these issues is a sampling limitation due to the size of the Internet and the commercial software used to search it. There are so many different websites that → search engines have to be employed to find particular kinds of content, and these only pick up a certain portion of the websites that might be available. Although search engines existed even before the commercialization of the Internet, advertisers and content providers have helped make search engines the most heavily used sites on the Internet (Hargittai 2007). Google and Yahoo! are the two most popular search engines as of this writing (2007). Because of the volume of traffic, search terms can be tracked and plotted over time, and most search engines today offer the opportunity to see the most popular searches. Google Trends, for example, provides a ranking of the top 100 search terms over the previous 24 hours. Typically, as one might expect, given the fairly short time frame, the most popular searches are related to current news events (especially entertainment-related news) and are a reflection of people trying to learn more about a certain topic (→ News).

Inevitably, the most popular search terms tend to be names from the entertainment or political world following a death, arrest, or scandal of some sort. However, even lists of search terms do not necessarily reflect what people are actually searching for, or what they actually visit. Due to links within sites, a particular searcher may find links that are not exactly what they are looking for, but one of those sites may have further links that are more relevant. In this way, a search term was able to help the person move to a site that linked to a site holding relevant content, but the search term was not an accurate description of what the person was looking for. In addition, because results are ranked based on a number of factors, results are not necessarily in order of most relevant to a user's query. Other considerations are that some websites are built with popular keywords embedded within them, some search engines accept payment for placement of results, and some provide special slots to those willing to pay for them, so that searchers may not visit the most relevant sites, but instead visit those with the greatest financial means.

A second biasing factor is that the Internet changes drastically each day. The things that make it most interesting – speed and currency – also make it extremely difficult to study in any way that generalizes beyond a particular day's results. Under such conditions, studies of Internet content can quickly lose relevance. Since much of the material available on the Internet has been made available by a person, rather than an organization, it can disappear without a trace. Some organizations have attempted to gather a historical archive (e.g., the Internet Archive's "Wayback Machine"), but, in addition to the

monumental task and storage problems, there are some legal issues involved and it is not certain how they will be resolved (→ Archiving of Internet Content).

### Subjects of Research

To combat such sampling problems, most studies of Internet content focus on particular types of content: political blogs, online computer games, online → newspapers, etc., and a particular time frame for that content (e.g., the 2004 US presidential election). Many of those studies examining news or political content compare online content to similar content in more traditional media (e.g., Bichard 2006; Hoffman 2006), but because the Internet is quite different from traditional media in how it is used, the content tends not to be directly comparable. Other studies take traditional research concerns and apply them to Internet content (e.g., Cho & Cheon 2005; Jha 2007). Studies of blogs, for instance, do not really have a counterpart in traditional media. Opinion pieces in a newspaper might be considered similar, but they are printed only after following particular editorial policies, and are surrounded by the credibility of a newspaper (→ Commentary). A blog does not have either of these aspects. One could consider that whatever was visited before the blog is “next to” it in perception, but no guiding editorial policy or human editor has had a hand in deciding whether it should be made available to the public. In light of these kinds of issues, Reese et al. (2007) studied relationships between blogs and “professional” news media to examine the place of blogs in the news and information landscape.

In some senses, the Internet has invigorated research on some older concepts in the field of communication, and may be bringing the study of interpersonal and mass communication closer together (Waseleski 2006). The Internet serves both as a point-to-point medium and a “broadcast” type medium, depending upon the site the user is visiting and the software he or she is using. Some studies attempt to use more traditional communication concepts to study how Internet content may fit within the broader area of communication content (→ Media Production and Content). Other studies have focused on the Internet as a particular setting for interpersonal communication or mass communication to take place. Interpersonal researchers have focused on the Internet in relation to friendship development, relationship maintenance, love, attraction, and a host of variables that focus on traditional interpersonal communication ideas (→ Communication: Relationship Rules; Relationship Development). While very few studies of media use were conducted by interpersonal communication scholars before the arrival of the Internet, hundreds have been conducted since that time. Mass communication scholars, who have been interested in the relationship between mass communication and interpersonal communication for many years, have now found a medium that seems to make the connections between them explicit.

## **Internet: International Regulation**

*Wolfgang Kleinwächter*

*University of Aarhus*

The first 25 years of → Internet governance began with technicians at the helm. The 1990s saw an emerging struggle over the US government's escalating attempts to dominate the Internet. Initial opposition came from the Internet's technical community, but later a number of national governments also began to challenge the US strategy. The European Union (EU) largely backed the US. While some issues were resolved by the mid-2000s, others were likely to stay contested for a considerable time. (Many acronyms, all explained below, were generated in this process.)

### **GOVERNANCE WITHOUT GOVERNMENTS**

When the term "Internet governance" was introduced in the 1980s, it was used mainly to describe the specific forms of the technical management of the global core resources of

the Internet: → domain names, IP addresses, Internet protocols, and the root server system. The term “governance,” rather than “government,” signaled the difference between Internet regulation, mainly technical in nature and self-organized, and the legal regulation of telecommunications and broadcasting (→ Information and Communication Technology, Development of; Internet, Technology of).

Internet pioneers rejected any government role in the emerging cyberspace. MIT’s Dave Clark proclaimed in 1992: “We believe in: rough consensus and running code.” Tim Berners-Lee (1998), world wide web inventor, insisted: “Our spiritual and social quest is for a set of rules which allow people to work together in harmony.” Many of these individuals had been shaped earlier by the 1960s. They feared government would restrict freedom of expression and the right to privacy, and would slow down or block Internet innovation (→ Freedom of the Press, Concept of). In the Internet’s first 20 years, regulation of codes, standards, and protocols was thrashed out among technicians in a bottom-up policy process (→ Internet Law and Regulation).

Although in 1979 the Pentagon’s Defense Advanced Research Projects Agency (DARPA) had initiated the “*Internet Configuration Control Board*” – later renamed “Internet Architecture Board” – to enable collaboration on technical development, DARPA kept a loose rein on the Board. The Board, however, oversaw several key civil society entities: the Internet Engineering Task Force (IETF), the main body for standardizing Internet protocols; the policy process (RFC Editor) server; and the Internet Research Task Force (IRTF). Mostly IETF activists created the Internet Society (ISOC) as a nonprofit in 1992 to fund the RFC Editor, and as a forum on the Internet’s social implications (→ Communication Technology Standards). The domain name system was managed until the early 1990s by a single person, Jon Postel, from the University of Southern California. He also allocated the blocks of IP addresses to the new private Regional Internet Registries, and delegated the management of Top Level Domains (TLDs), including country-code-based domains (ccTLDs).

In 1988 the US government encouraged Postel to bring more stability and security to the process. Thus, the “*Internet Assigned Numbers Authority*” (IANA) was established at Postel’s university institute. However, in 1990 oversight was switched from DARPA to the National Telecommunication and Information Administration (NTIA), a unit of the Department of Commerce (DoC). Postel’s institute continued to manage the system until the 1998 foundation of the *Internet Corporation for Assigned Names and Numbers* (ICANN).

In 1990, given the new world wide web, Postel proposed adding 150 new “generic Top Level Domains” (gTLDs) to the system. Network Solutions Inc. (NSI), a private company that managed .com, .net, and .org, as well as the A-root server, lobbied the US Congress and DoC in opposition. In 1992 the DoC contracted with NSI as sole domain name registrar for its three gTLDs. Postel then proposed to the International Telecommunication Union (ITU) to bring together technical organizations, private sector institutions, and intergovernmental organizations, launching a bottom-up Internet development process, and to create an “*Interim Ad Hoc Committee*” (IAHC), which was formed in 1996. Members were ISOC, IANA, the Internet Architecture Board (IAB), the International Trademark Association (INTA), and the World Intellectual Property Organization

(WIPO). By inviting the latter two, Postel wanted to address national governments' growing concerns about their role in Internet governance.

In 1997 IAHC members signed a Memorandum of Understanding proposing a *Policy Oversight Committee* (POC) to manage Internet core resources. A Policy Advisory Committee (PAC) would give other stakeholders an opportunity to provide advice to the POC. Within the POC, the technical community, with six representatives, could outvote the two governmental members (ITU and WIPO) and the three private sector members. The plan was to launch seven new generic domains (gTLDs), to license registrars for domain name registration in the gTLD name-space, and to move the A-root server from Virginia to Lake Geneva.

The US government and NSI were vigorously opposed. The Clinton administration invited proposals for a new private nonprofit corporation (NewCo) to manage Internet core resources. The EU supported this in principle, but criticized US-centrism. Ira Magaziner, US President Clinton's Internet adviser and ICANN's main architect, accepted the idea of an "international representative body" and proposed that the NewCo board of directors represent the Internet's diversity. This enabled EU Commissioner Martin Bangemann to support DNS privatization. In September 1998 Postel's draft by-laws for a NewCo, entitled Internet Assigned Names and Numbers Corporation, got a "green light" from the US Congress.

In November 1998 ICANN was formally incorporated under the "California Nonprofit Public Benefit Corporation Law for Charitable and Public Purposes." Simultaneously, ICANN signed a new Memorandum of Understanding with the DoC. (Postel's untimely death some days later abruptly ended his prominent role.) ICANN was designated as a multi-stakeholder organization. Initially the board of directors was to consist of nine private sector and technical community representatives, and nine from the At-Large membership (Internet users and civil society). Government representatives were ineligible, but the 190 UN member states were invited to form a "Governmental Advisory Committee" (GAC) to give the Board nonbinding advice.

### **ICANN, WSIS, AND WGIG**

ICANN started in spring 1999, with independence planned for the end of 2000. It rapidly opened up domain name registration, and a system to resolve domain name conflicts, but elsewhere progress was slow. There was confusion in particular on how to elect the nine At-Large directors. Furthermore, the relationship was tense between the ICANN board and the ccTLD managers. The majority operated under their countries' national jurisdiction, and only wanted ICANN's informal technical assistance. And out of nearly 100 proposals for new gTLDs, ICANN provisionally adopted just 7 (.info, .name, .biz, .coop, .museum, .pro, .aero). It was clear ICANN was not ready for independence. In October 2000 the Clinton administration passed on the issue to the next administration.

For the Bush administration, supported by established industrial interests rather than the Silicon Valley companies behind former vice president Gore, it was a low priority. Then 2001 saw the terrorist attacks on the USA, and ICANN, originally in part a "cyberdemocracy" project, now became a "cybersecurity" project. Within 12 months its

by-laws were rewritten. Now, if the ICANN board rejected GAC advice, it had to tell the GAC why. The GAC could then require “consultations.” If these failed, ICANN had to report the fact to the global Internet community. Moreover, governments reserved their right to act independently from ICANN’s decisions, effectively instituting a government veto.

The new by-laws eliminated the nine At-Large directors and grouped all Internet users into an “*At-Large Advisory Committee*” (ALAC), which could nominate just one nonvoting board director. The Internet Protocol Supporting Organization was retitled the “*Technical Liaison Group*” (TLG), which, like the new “*Stability and Security Advisory Committee*,” could nominate just one nonvoting director to the board. A new Nominating Committee (NomCom) was created with the right to select half the board.

However, in the run-up to the UN-sponsored World Summit on the Information Society (WSIS) in December 2003, more and more governments reviewed the political implications of these moves. A substantial number criticized ICANN for being under US government control and called for broader involvement in decision-making. The Chinese government, supported by a majority from developing countries, argued for an International Internet Treaty and the formation of an Intergovernmental Internet Organization (→ Censorship; China: Media System).

The governance issue dominated final preparations for the Geneva Summit, intensified by the unclear definition of Internet governance. Some meant by it the management of technical Internet core resources and wanted private sector leadership, while others included all public policy dimensions and urged enhancing the roles of the ITU and governments. Yet even purely technical questions affected market developments and Internet security and stability. The US and EU governments vigorously supported private sector leadership. China and the Group of 77 called for governmental leadership. Both groups officially agreed that all stakeholders – governments, the private sector, and civil society, as well as intergovernmental and nongovernmental organizations – should have a role, but not on which role.

The compromise was to ask the UN Secretary General to establish a “*Working Group on Internet Governance*” (WGIG) to define Internet governance, the public policy issues, and stakeholders’ roles and responsibilities. According to para. C6.13b of the Geneva Plan of Action, the group should be set up “in an open and inclusive process that ensures a mechanism for the full and active participation of governments, the private sector and civil society from both developing and developed countries, involving relevant intergovernmental and international organizations and forums” (WSIS 2003).

## THE WORKING GROUP ON INTERNET GOVERNANCE

WGIG stated that no single entity should govern the Internet, but that it needed better coordination and cooperation. WGIG recommended a high-level “Internet Governance Forum” (IGF) without any decision-making capacity, but could not agree about the oversight function and the specific role of the US government. The recommendations became the basis for the final negotiations during the third meeting of the WSIS Preparatory Committee (PrepCom3) in September 2005.

In advance of PrepCom3, the DoC reiterated *four basic principles*: “The United States Government intends to preserve the security and stability of the Internet’s Domain Name and Addressing System (DNS). Given the Internet’s importance to the world’s economy, it is essential that the underlying DNS of the Internet remain stable and secure. As such, the United States is committed to taking no action that would have the potential to adversely impact the effective and efficient operation of the DNS and will therefore maintain its historic role in authorizing changes or modifications to the authoritative root zone file.” While the DoC acknowledged other governments’ interests, it reasserted ICANN’s role as main manager of Internet core resources, but supported a continuation of dialogue on Internet governance.

The formal recognition of governments’ national sovereignty over domain name-space as defined by its ccTLD was crucial for the Chinese government and many third world governments, which feared the US government might interfere with their national Internet policies and even block the publication of the ccTLD zone file in the Internet root. The US government assurance that it had no such intention significantly eased subsequent negotiations.

During PrepCom3, China, Brazil, and India dropped or did not strongly pursue earlier positions. Only the EU proposed a “new cooperation model,” based on a public–private partnership concept (→ European Union: Communication Law). Day-to-day operations – previously ICANN’s job – should be the private sector’s responsibility, but governments should be more active on the “level of principle.” The US argued that this blurred “principle” and “day-to-day operations,” risking a silent mission creep by a new intergovernmental body leading to UN-style control over the Internet. This US–EU controversy quickly ascended to the highest levels in Washington and Brussels. The debate became overheated when some US senators announced they would reject any UN Internet takeover. In fact, neither WGIG nor the EU had proposed any such takeover. UN Secretary General Kofi Annan publicly rejected the idea, as did EU leaders. These declarations helped prepare for a compromise in the final negotiations before the November 2005 Tunis WSIS summit.

## **WORLD SUMMIT ON THE INFORMATION SOCIETY AND THEREAFTER**

Just hours before the Tunis summit, all parties agreed on some basic governance principles, as well as an Internet Governance Forum (IGF) to help launch enhanced cooperation. The principles recognized national sovereignty over ccTLD domain names, the involvement of the private sector, civil society, and governments in all Internet governance, especially “that all governments should have an equal role and responsibility for international Internet governance and for ensuring the stability, security and continuity of the Internet” (WSIS 2005, para 68). This statement was a victory for governments critical of US control over the Internet root and ICANN. However, there was no procedure to downsize the overall accretion of US power in Internet matters.

The IGF was constituted for five years, was designed as a multi-stakeholder forum with no decision-making capacity, and substituted for the proposed intergovernmental body. It was anticipated it would produce important input to official organizations, such as ICANN for domain names, the IETF for standards, the ITU for infrastructure, and

→ UNESCO for multilingualism, as they prepared projects and treaties. It would meet annually under the UN Secretary General's aegis. "Enhanced cooperation" was not defined and disguised fundamental dissent. The US government interpreted it simply as more effective collaboration among existing organizations (e.g., the ITU, WIPO, ICANN, IETF), but other governments saw it as leading to a "new cooperation model" as proposed by the EU.

After Tunis, a "Joint Project Agreement" (JPA) between ICANN and the US substituted for the Memorandum of Understanding, giving ICANN more independence from the DoC. It had to report annually to the global community, but no longer periodically to the DoC, only to "consult" with it regularly. The JPA would terminate in October 2009 and ICANN was expected to be fully independent beyond that date. The EU welcomed the JPA as a move to reducing government involvement in day-to-day management.

ICANN itself over 2006 and 2007 opened more regional offices and created a network of 13 regional liaisons. It also improved its ccTLD relationships with key ccTLD managers. It enlarged the At-Large membership through contracting Memoranda of Understanding with regional At-Large organizations from Latin America, Africa, Asia, and Europe. And it finalized policies for introducing new gTLDs and for internationalized domain names. Closer cooperation in working groups and task forces strengthened the relationship between the GAC and the ICANN board. However, the .xxx TLD, and the WHOIS database, the special register with domain name holders' contact details freely accessible (in particular to law enforcement and the music industry), remained controversial.

The first IGF took place successfully in November 2006. Over 1,500 experts, representing all stakeholder groups from developed and developing countries, discussed key issues such as openness, diversity, access, and security. The IGF's multi-stakeholder mechanism was seen as a real innovation in international politics. There were no special name badges, reserved seats or special speaking rights for the individual stakeholder groups. Governmental and nongovernmental experts debated on an equal footing. The decision not to draft a final document removed the pressure to agree on certain issues by the meeting's close. Another innovation was the voluntary "dynamic coalitions" among representatives from governments, private sector, and civil society on individual issues (e.g., spam, cybersecurity, privacy, freedom of expression).

Finally, enhanced cooperation started through informal consultations, mainly among governments. The ITU *Plenipotentiary Conference* in 2006 resolved to request the ITU Secretary General to ask member states and sector members about their approach to enhanced cooperation. While the Secretary General said the ITU had no intention to govern the Internet, he would host a "World Telecommunication Policy Forum" on Internet issues in 2009. In 2010 the Joint Project Agreement would terminate, the IGF mandate would end, and the ITU would hold its next Plenipotentiary Conference. Probably issues such as internationalized domain names, alternative roots, net neutrality, cyber-crime, e-commerce, and individual human rights will dominate discussion. Global debate on how the Internet should be managed will continue.

## **Internet Law and Regulation**

*Lyombe Eko*

*University of Iowa*

The → Internet is a global network of computer networks linked by various information and telecommunication infrastructures and technologies. The Internet and the technologies which transmit its rivers of information around the globe are conceptualized and regulated by all countries of the world within the framework of their political, economic, social, and cultural systems. Each country has an attitude toward the Internet, especially those parts of the Internet within its national territory. This multiplicity of regulatory approaches to the Internet essentially transforms cyberspace into a series of interconnected jurisdictions where each country attempts to apply its rules, regulations, and culture on the networks within its territorial jurisdiction. Internet law and regulation

is further complicated by the convergence of several media – information technology, telecommunications, print media, sound, still images, and motion pictures – which are regulated differently by different countries (→ Convergence of Media Systems; Communication and Law; Media Policy).

## HISTORY OF THE INTERNET

The Internet grew out of the communications network survivability concerns of the United States Department of Defense during the Cold War era. In effect, after the Soviet Union launched the first artificial satellite into orbit in 1957, the United States launched the Advanced Research Projects Agency (ARPA) in 1958 to compete with the Soviet Union in space technology. In 1969 ARPA developed ARPANET, a computer network that linked the Pentagon's global military resources through a redundant "system of systems," or network of computer networks, exchanging information in self-contained packets. This new technology increased the speed of digital transmissions by several orders of magnitude. As part of America's command, control, and communications network, ARPANET was designed to be redundant and capable of surviving a Soviet nuclear strike.

No other communication medium has had such an explosive growth in such a relatively short span of time. The lightning speed with which the Internet has grown and diffused around the world is due in part to the invention, in 1990, of the world wide web, at the European Center for Nuclear Research (CERN) in Geneva, Switzerland, and its release, free of charge, to the computer science community. The fall of the Berlin Wall in 1989, and the end of the Cold War, led to the transformation of the Internet into a global, technologically converged, multi-communication platform. The American government contracted the running of the Internet first to the Internet Assigned Numbers Authority (IANA), and eventually to the Internet Corporation for Assigned Names and Numbers (ICANN), a nonprofit corporation formed by stakeholders of the Internet community. ICANN handles Internet protocol address space allocation, protocol parameter assignment, and domain name and root server system management (→ Domain Names). Thus, governance of the infrastructure and protocols of the Internet does not fall under the ambit of international law. Indeed, the development of the architecture of the Internet, and control of Internet evolution and operation lies with the Internet Engineering Task Force (IETF), an international community of network designers, operators, vendors, and researchers (→ Internet, Technology of; Information and Communication Technology, Development of).

## INTERNET LAW AND POLICY TYPOLOGY

Since the Internet is a global multi-communication space on which information and communication technologies converge, its regulation is multilayered. The basic unit of Internet regulation is code, the programming software or logic that makes the Internet function. In his highly acclaimed book, *Code and other laws of cyberspace*, Lawrence Lessig conceptualized Internet regulation as space dominated by corporate commercial technologies and the logic of their underlying computer codes, operating within the framework of the rule of law. Indeed, by creating protocols such as those designed to protect children from

harmful content on the Internet and by setting standards for anything from HTML to peer-to-peer music exchange, the Internet community clearly regulates the Internet.

Additionally, through code, information and communication technologies are used to regulate the behavior of Internet users on a global scale, in accordance with the values, ideals, and ethics of manufacturers, controllers, and hardware and software designers. Additionally, regulators around the world employ architectural, software, and hardware solutions to address cyber-crime, network security, reliability, → privacy, and intellectual property issues.

Since the Internet became a global multi-communication medium in the 1990s, countries all over the world have enacted laws aimed at regulating the segments of the Internet within their jurisdictions, or at least bringing those parts of the network within the ambit of their systems and legal jurisdictions. The result is a range of Internet regulatory models at the international and national levels.

## **MULTILATERAL OR INTERNATIONAL REGULATIONS**

International regulation of the Internet consists of a “basket” of conventions, United Nations resolutions, declarations, and plans of action. International regulation of the Internet covers electronic commerce and electronic signatures, child pornography, and intellectual property.

### **Electronic Commerce**

The linkage of information and communication technologies led to the creation of a global information economy. According to the Global Information Infrastructure Commission, the infrastructure of the knowledge economy was set in place by a series of agreements: the International Telecommunication Union (ITU) World Telecommunications Policy Forum of 1996, which reached agreements on satellite development and inter-connection; the World Trade Organization (WTO) Ministerial Meeting of 1996, which committed countries to eliminate tariffs on information technology products; and the 1997 WTO Agreement on Basic Telecommunications Services, which called on nations to liberalize their telecommunications markets (→ E-Commerce).

Additionally, electronic commerce was officially endorsed by the United Nations, and globalized within the framework of the United Nations Commission on International Trade Law (UNCITRAL). The Commission set out to bring the multibillion-dollar global electronic commerce under international trade law through its Model Law on Electronic Commerce, and its Model Law on Electronic Signatures. UNCITRAL conceptualized its model laws as tools for harmonizing the disparate trade laws that obtain around the globe in order to facilitate electronic commerce.

### **Child Pornography**

Areas of Internet content that are covered by international law include child pornography, data protection, and intellectual property. The legal basis for the suppression of child pornography on the Internet is the United Nations Convention on the Rights of the Child.

As child pornography became prevalent on the Internet, the UN General Assembly adopted the Optional Protocol to the Convention on the Rights of the Child on the Sale of Children, Child Prostitution and Child Pornography. The United Nations called for worldwide criminalization of the production, distribution, exportation, transmission, importation, and intentional possession and advertising of child pornography. Additionally, the International Labour Organization (ILO) fights against child pornography on the Internet under the “Worst Forms of Labour Convention” of 1999 (→ Child Protection, Media Regulations for; Pornography, Media Law on; Sex and Pornography Online).

### **Intellectual Property and Domain Names**

One of the most significant multilateral Internet agreements was carried out within the framework of the World Intellectual Property Organization (WIPO), an organization with a membership of 171 countries. WIPO’s Internet Domain Name Process involves holding extensive international consultations with a view to making recommendations on the management of Internet domain names and addresses worldwide. The WIPO process also involves the settlement of disputes arising from intellectual property issues associated with domain names. The goal of the WIPO process is to apply multilaterally agreed standards of intellectual property protection to the Internet (→ Intellectual Property Law).

The WIPO Copyright Treaty and the WIPO Performances and Phonographs Treaty of 1996 made international copyright law applicable to the Internet and laid the groundwork for a multilateral approach to the resolution of intellectual property disputes. One of the most important provisions of the treaty is the criminalization of measures taken by hackers and other unauthorized persons, to circumvent digital anti-piracy counter-measures embedded by authors and copyright holders in intellectual property ranging from software to compact discs. Furthermore, the treaty calls on signatory countries to take legal actions against those who knowingly remove or alter electronic rights management information. To underscore the importance the United States attached to the WIPO treaties, the American Congress passed the Digital Millennium Copyright Act of 1998 to implement them.

## **THE NEO-MERCANTILIST MODEL**

### **Origin**

The American political and economic system is premised on the notion that the United States is a marketplace of ideas (→ Freedom of Communication; Freedom of the Press, Concept of). As such, except in the narrowest of circumstances, the government may not regulate speech on the basis of its content. These principles are the foundation of the country’s neo-mercantilist Internet law regime. Congress has funded supercomputers and networks in the United States based on the premise that computer infrastructures were similar to the American interstate highway system, which provided the infrastructure for transportation and communication but allowed the free market to determine the cities that would benefit the most from the system.

In 1997, the Clinton–Gore administration offered the world a framework for the expansion and regulation of electronic commerce. The administration conceptualized the Internet as a global capitalist marketplace, and appealed to governments to assume a minimalist regulatory posture toward electronic commerce. The Clinton–Gore framework favored self-government, decentralization, bottom-up governance, private-sector networks, public–private sector partnerships, and international agreements as values that should guide Internet regulation. The Clinton–Gore framework was aimed at creating a seamless global market economy with a fluid exchange of finance, goods, services, and information. It essentially globalized America’s libertarian principles (→ Americanization of the Media; Globalization of the Media): the marketplace of ideas, laissez-faire economics, free trade, and the free flow of information, goods, and services. The international Internet law regime promoted by the United Nations and the WTO adhere to these principles.

### **Child Pornography under American Internet Law**

The only exception to this global free market economy is child pornography. With the transformation of the Internet from an instrument of military and research communication to a general-purpose educational, cultural, social, and commercial platform, the medium soon became a magnet for pornography of all kinds, including child pornography. The accessibility of online adult pornography to children, as well as media stories of predators who sought unsuspecting children on the Internet, led to passage of the Communications Decency Act of 1996 in the United States.

This act was challenged in court, and in the ground-breaking case *Reno v. ACLU*, the Supreme Court of the United States ruled that the Internet has First Amendment protection comparable to that enjoyed by the print media. As a result, pornography involving adults has constitutional protection. However, obscenity (material that presents human sexual and toilet functions in a highly offensive manner without any redeeming value to society) is not protected. Some researchers claim that the United States Supreme Court’s decision in *Reno v. ACLU* essentially globalized the First Amendment. The Supreme Court of the United States has also held that a blanket ban on computer-generated images of children or adults who appear to look like children indulging in sexual activities is unconstitutional.

### **Regulation of Electronic Signatures**

Transformation of the Internet into a virtual multi-marketplace created a need for software and infrastructure that ensure the security, reliability, privacy, and authentication of online transactions. The most common method of Internet security and authentication is the electronic signature, which can range from typed email signatures to digital signatures (a unique string of numbers or characters, or a combination of both, that are linked to another series of numbers generated through complex mathematical algorithms or operations that are made possible by encryption technology).

In order to ensure the confidentiality, reliability, and security of Internet identification systems, the United States enacted the Electronic Signatures in Global and National Commerce, or E-Sign, Act of 2000. The Act was designed to promote global electronic

commerce. The E-sign Act does not oblige unwilling participants to accept electronic signatures. However, it stipulates that electronic signatures, contracts, or records may not be denied legal effect, validity, or enforceability just because they are in electronic form. Additionally, under the Act, the United States adopted a nondiscriminatory approach to electronic signatures and authentication methods from other countries.

### **Peer-to-Peer Music Exchange on the Internet**

One of the most contentious issues of the Internet age is online peer-to-peer exchange of copyrighted material. The first free music exchange company, Napster, was shut down when federal courts in the United States found that users who participated in the peer-to-peer music exchange promoted by the company infringed on the exclusive reproduction and distribution rights of musicians and record companies (→ P2P Networking).

The courts held that unauthorized use of copyrighted musical recordings within the framework of Napster's peer-to-peer music exchange business was not "fair use." In 2005, the Supreme Court of the United States held in *MGM v. Grokster* that companies whose free software allowed peer-to-peer distribution of lawful and unlawful copyrighted material on the Internet by third parties were liable for acts of infringement facilitated by the software.

### **THE CULTURALIST MODEL**

Many countries have the impression that their cultures are besieged by the globalization of American popular culture. Transformation of the Internet into an American-dominated commercial and multi-communication space, whose architecture closely mirrors America's socio-cultural and political logic, has caused concerns in many parts of the world. Some countries have enacted Internet laws that are designed to protect their national cultures.

France is an example of the culturalist state. The French government has always defended what communication scholar Armand Mattelart calls "cultural sovereignty." Under its ideology of *exception culturelle* ("cultural exception"), France does not want its culture subsumed within an undifferentiated "western" culture. Since the 1970s, French law has classified the French language and the French media and telecommunications infrastructure as part of its cultural heritage that should be jealously protected against Anglo-American domination. This culturalist perspective has also been applied to the Internet. France views the Internet as a cultural rather than a commercial platform, and regulates it within its protectionist framework.

The French view is expressed by Mattelart, who claims that over-commercialization of the Internet has led to a clash of two freedoms: the freedom of expression of citizens versus the freedom of commercial expression, a clash between human rights and commercial rights. Therefore, in France, laws mandate that websites located in the country be in French and that Internet content accessible to French citizens on French territory abide by the country's content-based free speech regime. An American company, Yahoo! was fined for violating French Internet content laws. In order to protect French national identity, language, and culture on the Internet, new terminology spawned by technology is systematically replaced with French neologisms. For example, in 2003, the General

Commission on Terminology and Neology officially approved replacement of the English word “email” with the French equivalent, *courier électronique* (→ Communication Law and Policy: Europe; France: Media System).

### **THE GATEWAY MODEL**

Under this model, a governmental agency serves as the de facto or de jure gateway to the Internet. Usually, the government creates a national intranet that insulates and isolates the country domain from the rest of the Internet. These intranets are often protected by firewalls and proxy servers that filter undesirable websites. Access to the Internet, or sections thereof, is thus granted or denied in the name of national security, culture, morality, or some other governmental interest (→ Access to the Media).

The gateway model of Internet regulation can be described as a “command and control” regulatory posture. This model is most evident in countries with authoritarian or semi-authoritarian regimes like Russia, China, Burma, Cuba, Vietnam, and Saudi Arabia (→ China: Media System; Communication Law and Policy: Asia; Russia: Media System). In these countries, the government is both the Internet operator and regulator. The thinking behind the gateway model is that the Internet is an electronic conveyor belt for western decadent culture and political subversion, which could potentially infect religions, political systems, and cultures.

### **THE DEVELOPMENTALIST MODEL**

With the diffusion of the Internet around the world in the 1990s, the World Bank and the International Monetary Fund (IMF), United Nations specialized agencies like → UNESCO and the ITU, and aid agencies like the United States Agency for International Development (USAID) and the Canadian International Development Agency (CIDA) conceptualized the Internet as a catalyst for economic and social development in the third world.

Kofi Annan, former Secretary General of the United Nations, said that by connecting to the Internet, African countries would become part of the global economy, leaving behind decades of stagnation and poverty. African countries were told that by connecting to the Internet, they would be able to bypass expensive information and telecommunications technologies. Most countries liberalized their telecommunications systems, and privatized state-owned telecommunications operators. While all African countries are now connected to the Internet, most of them do not have an adequate regulatory framework to deal with issues like online child pornography, Internet gambling, advance fee fraud, hackers, and phishing or identity theft. For example, in Nigeria, advance fee fraud solicitations through the mails are punishable under Decree No. 419. However, the Nigerian government has watched helplessly as this illegal activity has migrated to the Internet. Despite the legal vacuum in many African countries, regional economic groupings like the South African Development Community are taking steps to collectively regulate the Internet to suit the economic and cultural reality of the continent (→ Communication Law and Policy: Africa; Africa: Media Systems).

As the typology shows, global treaties, and conventions regulate the Internet at the international level while individual regions and countries have laws and policies that seek

to shape “their” respective sections of the network to reflect their cultures, socio-political, and legal realities.

## **Internet News**

*Mark Deuze*

*Indiana University and Leiden University*

Between the release of the world wide web (WWW) standard in 1991, the start of the first online news publications worldwide in the mid-1990s, the *Kidon Media-Link* international

database of 18,318 online news media in 2006, and the emergence of 70 million or more weblogs and podcasts, of which about one-tenth focus on news, one could say the web has become a widely accepted and used platform for the production and dissemination of news – by both professional reporters and amateurs (or “citizen journalists”). Not only thousands of professional news media have started websites, millions of individual users and special interest groups have used the web as an outlet for their news as well. Correspondingly, trade and scholarly publications have focused extensively on journalism as it is produced online, resulting in a sprawling field of research dealing with one or more aspects of Internet news. A particular focus on news as it is gathered on, produced for, and distributed via the Internet seeks to disconnect it from the hardware of personal computers, technological appliances, and digital networks, thus enabling a more specific focus on online journalism as a distinct social practice.

Journalism is and has always been dependent on technology. For the profession to achieve public status and reach a “mass” audience, it relies on technologies for the gathering, editing, production, and dissemination of information. Ever since the first newspapers appeared in Europe during the seventeenth century (→ Newspaper, History of), technology has enabled journalism to organize itself around its basic premise: to deliver relevant public information in a timely and usable manner. If one considers the history of technology in mass media journalism, one could argue that the nineteenth century belonged to (the rise and establishment of) print newspapers, the twentieth century belonged to broadcast media, and the twenty-first century belongs to (wireless) digital multimedia (→ Media History). Journalism has evolved and professionalized accordingly, developing specializations in print (newspaper and magazine) journalism, radio and television journalism, and online journalism (→ Journalism, History of). During the first years of the twenty-first century, a multimedia journalism has emerged – both in education and training programs, as well as in converged organizations’ newsrooms (Quinn 2006). The literature in the field of journalism studies is largely informed by the standards of research, education, and practices set by print journalism. Scholars from a variety of backgrounds – such as sociology, social and mass psychology, anthropology, political science, and economics – flocked to communication and media studies as mass media became ubiquitous and pervasive in society, and as the lives of many peoples around the world became saturated by media.

### **ONLINE JOURNALISM STUDIES**

Studies looking at → online journalism emerged since the mid-1990s, as the → Internet made its way into newsrooms and became both a reporting tool as well as a platform for news dissemination. Surveys among journalists in several countries show convincingly that a vast majority of journalists are now using the Internet regularly in their daily work. Several scholars have studied the effects of this adoption process, including the practices of computer-assisted reporting (CAR; defined here as using the Internet as a reporting tool), concluding that beyond benefits (more information, more sources, more checks and balances freely available), many reporters and editors feel nervous and concerned about the “omnipresence” of the Internet in daily reporting (Garrison 2000), as well as about the increasing “technization” or “cybernetization” of news work

(Heinonen 1999). Another aspect related to CAR which affects all journalists is distinctly ethical: how to deal with online communication such as email, posts in newsgroups and discussion forums, weblogs, and instant or chat messages (including SMS and MMS via cell phones) in an environment where the verification of information is extremely difficult due to the often anonymous, fast-paced (or instantaneous) communication involved (Deuze & Yeshua 2001). Credibility is seen by most media workers and researchers as a core issue when assessing the relevance and meaning of the role the Internet plays in journalism. Several studies also signal the worrisome fact, that the introduction of the Internet in reporting accelerated the news process, sometimes even causing journalists to spend more time at their computer instead of going “out on the street.” Such considerations contribute to an instrumental view on the role new media play in news. The focus is on established practices and ways of doing things in the average newsroom, thus ignoring or marginalizing the disruptive nature of new media such as the Internet.

Since the late 1990s, scholars have started to map the changes taking place in the way news companies are reorganizing to make room for online newsrooms (Singer 1998). Although most news outlets used the Internet as an outlet for their news from the mid-1990s, many did not consider their websites as much more than just an advertisement for the print or broadcast mother medium. With the decline and graying of traditional audiences, the preference for the web among global youths, and a growing interest among advertisers for cross-media marketing and online ads, significant investments were made in online journalism (Boczkowski 2004).

As a distinct professional practice – a fourth type of journalism – online journalism should be seen as journalism produced more or less exclusively for the world wide web (the graphic user interface of the Internet). Online journalism has been functionally differentiated from other kinds of journalism by using its technological component as a determining factor in terms of an operational definition – just like the fields of print, radio, and television journalism before it. The online journalist has to make decisions on which media format or formats best tell a certain story (multimediality), has to consider options for the public to respond, interact or even customize certain stories (interactivity), and thinks about ways to connect the story to other stories, archives, resources and so on through hyperlinks (hypertextuality). One can safely say the field of online journalism has achieved a separate status both in the profession and in academia, and furthermore is considered to be important by the institutions of the field: schools, universities, research centers, professional organizations, and news companies.

The field of online journalism studies has been informed largely by the distinctions made between the production, content, and consumption of news and information on the Internet. This has resulted in a sprawling field of research consisting mostly of surveys and in-depth interviews with online media professionals (reporters, editors, producers) and end-users, as well as large- and small-scale content analyses of websites and home pages. Theoretical discussions on the evolving relationships between new media and journalism generally consider the emerging formats, genres, and practices in online journalism in terms of how these challenge traditional functions and goals of (print) journalism, such as the gatekeeper role (→ Gatekeeping), the role of online journalism in shaping and sustaining community (for example by embracing the online genre of weblogs or “blogs”;

→ Blogger), digital elements of journalistic storytelling, or online journalists as a distinct professional group more or less in control of the production and dissemination of editorial news content. The field can thus be typified as a social scientific study of *practice*: it concerns people living and working in the context of existing and evolving structures, including emerging new technologies.

The research agenda of online journalism and Internet news studies traditionally focuses on how the production, content, and consumption of media messages evolves online. Pavlik (2001), for example, discusses the impact of new media on news and society in terms of four distinct implications: how it affects news content, how it affects newsroom and media industry structures, how it affects the way journalists do their work, and how it affects relationships between stakeholders in the news: media companies, journalists, publics, competitors, advertisers, and sources. These kinds of approaches fit in the wider field of (new) media and society research. This does not necessarily mean that applying “old” theories or paradigms is wrong when studying online journalism – it just means that researchers predominantly study and interpret the role of the Internet in journalism in terms of the role mass media have traditionally played in society (Hall 2001). In that particular context, the key characteristics of Internet news – its convergent, interactive, and networked nature – challenge an interpretation of online journalism as exclusively part of a “mass” media system.

### **A TYPOLOGY OF INTERNET NEWS**

Internet news comes in many shapes and sizes. Although news organizations tend to share certain conventions about the design and structure of their online presence, the way the online journalists in their daily work articulate the characteristics of the new medium differs widely. These differences and similarities can be considered across two dimensions. Journalism has traditionally been about providing content to audiences, whereas online, interactivity becomes a more salient feature of news work (→ Interactivity, Concept of). Research shows that online journalists are more likely than their offline colleagues to consider interactivity-related issues (such as providing a forum for public debate) among the most important aspects of their job. Internet news thus exists somewhere on a continuum between professionally produced content and the provision of public connectivity. In the latter case, journalists primarily act as facilitators of people telling each other stories – such as through comment boxes, discussion platforms, registered user blogs, or user-submitted news. The second dimension represents the level of participatory communication offered through a news site. Arguing from open to closed, a site can be considered to be “open” when it allows users to share comments and posts, and upload files without moderating or filtering intervention. At the other end of the spectrum, “closed” participatory communication can be defined as a site where users may participate but their communicative acts are subject to strict editorial moderation and control. Onto these dimensions it is possible to map four more or less distinct categories of Internet news, corresponding with a typology of four online journalisms: (1) mainstream news sites, (2) index and category sites, (3) meta- and comment sites, and (4) share and discussion sites (Deuze 2003). The most widespread form of Internet news is the mainstream news site, generally offering a selection of (aggregated) editorial content and a minimal, usually filtered or moderated,

form of participatory communication. Hyperlinks on sites like these tend to point inward, referring only to other pages under the umbrella of the same brand. Index and category sites are generally operated by net-based companies such as certain search engines, marketing firms, Internet service providers, or enterprising individuals. Here, online journalists offer (deep) links to existing news sites elsewhere on the world wide web. Those hyperlinks are sometimes categorized and even annotated by editorial teams, thus generally featuring more or less contextualized (or contextually presented), aggregated content. Meta- and comment sites contain numerous examples of Internet news that either serves as a platform for professionals and amateurs to exchange and discuss news published elsewhere online, or offer an outlet for so-called “alternative” and otherwise critical, non-mainstream or nonprofit news (→ Alternative Journalism). Share and discussion sites, finally, are places where any meaningful distinction between the producer and the user, the news professional and the amateur reporter, or between opinion and fact for that matter, is lost. In terms of concrete examples, this mapping exercise would start with the websites of daily newspapers (such as the *New York Times* or *O Globo*) and broadcast news organizations (as in the *BBC News* or *ABC News Online*), ending with collaborative communities and citizen journalism sites (such as *Nettavisen*, *OhmyNews*, *Wikinews*, and *JanJan*).

The degree of openness and connectivity-focus of Internet news is highest in types 3 and 4 news sites which are often net-native, whereas types 1 and 2 are most likely to be relatively closed, top-down news operations of mainstream media organizations. It is important to note that when adding public connectivity elements to a news site operating in closed participatory communication with its publics, the site as a whole changes. The same goes for when such a site relinquishes its editorial control over communicative interventions by (members of) the audience. Adding (or subtracting) certain elements has consequences for the typology of the news site *as a whole*, and subsequently for the way Internet news gets made. As most Internet news outlets are extensions of offline media companies, it is possible to suggest that the different kinds of journalism online are not necessarily exclusive or unique to the web – these journalisms are indeed part of an existing journalistic culture that finds various new ways to express itself in emerging professional identities online.

## Internet and Popular Culture

*Jacqueline Lambiase*

*University of North Texas*

Communication created and shared through the → Internet has proliferated since the mid-1990s, with more people adapting to the web's creative spaces through easy-to-use technology (→ Exposure to the Internet). Indeed, much popular communication today is likely also to be classified as computer-mediated communication. The Internet not only provides access to web spaces where people view or listen to digital video, photographs, music, and stories, but also allows people to produce and disseminate their creative materials to mass audiences (→ Photography; Popular Music). In this respect, the Internet serves as a literal "circuit of culture," a theory explaining human identity, production, consumption, regulation, and representation of the cultural objects of everyday life (→ Information Society).

In the mid-1990s when Internet access became more widely available, a cultural divide existed between those who understood Internet protocols and creative conventions, and those who were learning. As these so-called "newbies" flooded existing virtual communities, clashes occurred, prompting calls for patience and "netiquette" as more people participated in new online environments. The culture made possible by interactive technologies – sometimes called *cyberculture* or *technoculture* – at first appeared rigid and rule-bound, but new computer protocols soon leveled distinctions between long-time and newer users. At the same time, the global nature of Internet communication became more prominent, with more opportunities for cultural exchange of ideas and artifacts within a decentralized communication system (→ International Communication). Whether it is for discussion of international human rights or for participation in multi-user virtual worlds using alternate identities, people find variety, affinity, and personal satisfaction on the world wide web (→ Internet, Technology of; Information and Communication Technology, Development of).

The most common *popular communication software* for the Internet includes instant messaging, Internet chat, and → electronic mail messages. In the mid-1990s, with new technology, email attachments containing *computer-generated images* began to be exchanged among private individuals, with some attachments achieving incredible popularity. One such phenomenon, the animated "Dancing Baby" or "Baby Cha-Cha" in 1996, provides

an example of the Internet's circuit of culture. It was first produced as a computer-animation demonstration, sent as an email file to friends by its creator, and then disseminated throughout cyberspace by email and on websites. Other people mixed music or additional images with the file, and eventually the dancing baby appeared in early 1998 as a hallucination on *Ally McBeal*, a popular US television show.

*Networking web pages* – weblogs, message boards, and social websites such as Facebook.com or MySpace.com – allow users to share opinions within a community of interest while also displaying personal content (→ Blogger). *Weblogs*, or “blogs,” appear as a kind of reverse chronology public journal featuring entries that may be created by one or more participants. Blog sites such as Blogger.com and LiveJournal.com provide webpage templates to make postings easy for users. Social networking sites such as Facebook.com, started in 2004 by a Harvard University student, also provide templates for users, who create personal websites listed on a directory and are thereby linked to networks of real-world friends, academic peers, and ultimately new online acquaintances (→ Network Organizations through Communication Technology).

Personal and collaborative websites – where users are encouraged to upload their own digital art, music, photography, video, and written text through peer-to-peer file sharing – serve a variety of interests including mass media, religion, politics, education, and celebrity → fandom. In terms of electronic text, news media, and information technology websites served as some of the first spaces, or portals, allowing users to post letters to the editor or messages within topical online forums. Online literary efforts include hypertextual novels, websites that allow children to write more about their favorite characters from the *Harry Potter* series, and fan-written television scripts. Joke Hermes (2005) believes this synthesis of mass media and the computer screen “aids a more fluid sense of who we are,” and that individuals are working to build identity in these activities. In this sense, computer users oscillate between identities as consumers and as producers, a cycle in which fans' values are sold back to them (Hills 2002).

*Celebrity sites*, some operated by companies and others by dedicated fans, have become repositories of thousands of photographs submitted by fans and photographers worldwide or copied from other websites. Since replication and dissemination of these digital images are easy, copyright laws and privacy issues are often ignored. Producers of all digital creative products, whether photos, animation, video, or music, face similar challenges (→ Celebrity Culture).

*Peer-to-peer file sharing* has produced the most acrimonious debate among musicians, corporate music producers, and fans (→ P2P Networking). Sites such as Napster, which allows music fans to download audio files, often illegally, were forced for a time to cease operations. Yet these sites' existence forced musicians and music companies quickly to respond to fans' demand by providing the means for legal file sharing. Borrowing from the culture of rap and hip-hop music, fans also remix or “mash” tracks of existing popular music to produce their own music creations, sometimes adding video to these original mixes. Again, with fans leading the way, musicians and corporate producers expanded their products, releasing extra remixes of songs and other digital ingredients to meet this demand.

Cheaper and easier digital video capabilities have encouraged amateurs and professionals to post documentaries, films, promotional footage, and snippets of everyday life on sites

such as YouTube.com. This video-sharing site, started in 2005 with the tagline “Broadcast Yourself,” capitalizes on the culture of web cameras, voyeurism, reality television, tiny handheld video cameras, and ever-present camera phones.

When video, music, and more static art forms exist on websites, their essence is made similar, because genres blur and all are “subsumed to the universal medium of the bit” (Andrejevic 2004). At Rhizome.org, an electronic media arts site, artists have been uploading their own digital artworks since 1996. These artists have now been joined by digital musicians, videographers, and photographers who no longer have to wait to be discovered by corporate interests, but can try to build their own fan base via the Internet.

Copyright and control of intellectual property continue to be debated as file-sharing networks on the Internet continue to mutate and proliferate (→ Intellectual Property Law; Copyright). A political parody produced at JibJab.com about the 2004 US presidential election sparked legal action by another company claiming to own copyright to “This Land is Your Land,” a folk song used in the animated parody. While JibJab.com prepared its defense of the parody, millions of Internet users viewed the animation, and television shows broadcast the cartoon. Ultimately, the song was deemed to be in the public domain. Later, however, JibJab.com sued a private blog which had used a few seconds of the parody in a music video mix, forcing the blog’s author to remove the link to the digitized media product.

Other challenges involve balancing free speech rights with hate speech laws, when electronic messages, web postings, and digital art or music include potentially obscene, libelous, or threatening material.

# Internet Ratings Systems

Elizabeth Van Couvering

London School of Economics and Political Science

Internet ratings systems, such as those provided by Nielsen//NetRatings or comScore Media Metrix, measure and rank the popularity of different websites and are used extensively in setting online advertising rates (→ Internet; Exposure to the Internet). The three typical online metrics are *unique visitors*, *page views*, and *reach*. In theory, these are simple measures: *unique visitors* measures the number of visitors to a website (analogous to the “audience” of a television show), *page views* measures the number of times a web page has been seen, and *reach* represents the percentage of the audience who have visited the website during the period under question (typically monthly). In practice, each of these elements is subject to some controversy due to a lack of agreement about measuring methods and differing sources of data. In addition to the main variables of unique visitors, page views, and reach, ratings companies also report on the *demographic profile* (age, sex, race, location, occupation, education, income, etc.) of visitors for different websites. Ratings agencies may also report directly on the frequency and volume of advertising placed on different websites.

Rating data are of high *significance* for television and radio because they may determine whether shows are renewed or canceled (→ Nielsen Ratings). Online, this is rarely the case, although the use of Internet ratings data is widespread: media companies use online ratings to compare the popularity of their products to those of their competitors, and advertisers and advertising agencies use ratings to plan their advertising spending. Also, companies traditionally considered as advertisers (for example, manufacturers or retailers) use online ratings to assess their websites’ effectiveness as a direct means of customer communication. Thus, Ford may subscribe to Nielsen//NetRatings “Automotive” ratings group in order to assess its position against GM or Toyota.

Despite their widespread use, data from ratings agencies are not the only or even the primary source of information about website audiences. Every website also automatically generates a record of which pages are requested and by which computers, known as a *log file* (→ Log-File Analysis). By analyzing their own log files, publishers can develop their own picture of their audiences. Website publishers therefore have three potential sources of information about the size and composition of their audiences: their own log files, comScore numbers, and Nielsen numbers. These three figures rarely agree and, indeed, according to industry reports, are often extremely divergent. For example, the online magazine *Slate* reported that for the month of December 2005, Nielsen//NetRatings put its page views at 41 million, comScore at 27 million, and its own log files at 61 million. Discrepancies like these have led to the methods of the Internet ratings agencies being questioned by publishers. A satisfactory resolution has yet to be found, with publishers, advertisers, and ratings agencies continuing to debate the issues.

*Methodologically*, online ratings are based on a mix of two types of data, demographic data and behavioral data (→ Rating Methods; Research Methods). The ratings companies recruit a random sample (or *panel*) of volunteers (→ Sampling, Random). Panel members

are required to fill out questionnaires about demographic data. Panel members also install software on their computers, which monitors computer usage and sends data to the ratings agency via the Internet. Each time the computer is used, the panelist selects his or her name from a list of people in the household, so that different individuals' behavior is tracked separately. The panelist's behavior is then extrapolated to the population as a whole by matching the demographic profile of the panel to data derived from the census. This process is very similar to that used for television ratings (→ Nielsen Ratings).

There are, however, areas where the established methodology faces *challenges*. First, Internet traffic is not distributed on a normal or bell curve. Instead, a very few websites have the vast majority of the traffic while nearly all websites have very little traffic – this is known as a “*long tail*” *distribution*. The consequence of the long tail is that for any one website the number of panelists who visit and use the website is likely to be very small; in fact, probably small enough to be statistically insignificant. In order to overcome this problem, comScore has begun to create nonrandom samples to assess behavior on particular websites. These nonrandom samples are then weighted to resemble a random sample, but the methodology has yet to be widely accepted.

Second, in contrast to most other media, the Internet is used as much at work and at educational establishments as at home. This has led the ratings companies to establish “*at work*” and “*at home*” *panels*, and has also led to new issues in trying to quantify the level of duplication between the panels, so that a single panelist accessing the Internet both from work and from home is not counted as two people.

Third, Internet usage is not typically confined to a single national context. Internet ratings agencies are therefore struggling to develop panels that will allow them to provide accurate ratings on a *global scale*. Typically, US panels are the most robust and there are some questions about standardization globally, with different factors being used to extrapolate to the whole population for the US as opposed to other countries, and different methods for “at work” and “at home” panels in US versus non-US panels.

Finally, Internet ratings agencies by 2007 were not assessing traffic from platforms other than a personal computer – such as a mobile phone, gaming device, or handheld device, and this remains a methodological challenge for the industry.

While television and radio ratings have received a wide range of academic study, Internet ratings systems have yet to generate comparable discussion or critique. Many questions therefore remain to be answered. For example, how appropriate and accurate are the new methodologies with which these companies are experimenting? How much, and under what conditions, do publishers and advertisers rely on agency data versus internal sources? How much do these data influence publishing decisions? As the global online media market develops, it seems inevitable that ratings agencies will come under greater scrutiny by industry and academy alike.

## **Internet, Technology of**

*Mathias Klang*

*Göteborg University*

Internet technology has developed in a rapid series of leaps to become one of the most fundamental communications infrastructures in modern society. When referring to the → Internet as a communication infrastructure it is important to remember that the Internet is in reality a technological base upon which a multitude of software applications rely in order to provide users with the communication tools they desire. Despite this it is important to realize that the Internet is not a single thing. It is a name that collects a cluster of technological innovations, groups of infrastructure(s), applications, and social organizations, which we commonly refer to as the Internet. The Internet is not one innovation, but a rapid series of steps, innovations, and collaborations within the field of communication technology. In addition to this the Internet, as a phenomenon, is constantly technically evolving.

Among the reasons for the prominence of the Internet as a communication infrastructure is the multitude of design choices that have been made out of necessity and conviction by groups of developers over half a century. This entry provides an overview of these developments and some of their implications.

### **THE INTERNET AS A COMPLEX INNOVATION**

First it is important to clarify the difference between the Internet and the software applications that are used. Understanding this difference is important since the two levels of technology are regularly confused with each other. As early as 1998 Tim Berners-Lee, the father of the world wide web, realized that there was a need to make this distinction when he wrote (1998, n.p.):

The Web is an abstract (imaginary) space of information. On the Net, you find computers – on the Web, you find documents, sounds, videos . . . information. On the Net, the connections are cables between computers; on the Web, connections are hypertext links. The Web exists

because of programs that communicate between computers on the Net. The Web could not be without the Net.

Thus, the Internet is made up of the hardware (e.g., the computers, routers, cables, and modems) and the protocols required to enable communication between the machines. The Internet is therefore the base infrastructure used by software applications such as email, the world wide web, messaging, and file sharing (→ Communication Infrastructure).

The Internet is more than one technological system, artefact, or innovation; it is a whole range of technical, social, and organizational innovations in the field of information technology, which have erratically and drastically evolved into our present-day information and communication infrastructure (Castells 1996; 2001). The haphazard manner in which this information infrastructure (Hanseth 1996) has evolved plays a significant role in the way it is used, controlled, and developed.

In addition, the open nature and unplanned development (Ciborra 1992; Dahlbom & Janlert 1996; Hanseth 1996) has led to a haphazard development of a so-called autonomous technology (Winner 1978). In other words, the development of technology through open standards leads to a technology that lacks, or seems to lack, conscious control and definition. When we write about the Internet we indulge in a simplification or a convenient fiction (Kling et al. 2005) as we reduce the different aspects and complexities until we achieve a manageable subject.

The fundamental idea underpinning the Internet infrastructure is the creation of a nondiscriminatory mode of transportation. This is defined as the end-to-end principle of the Internet protocol (IP). It states that, whenever possible, communication-protocol operations should be defined to occur at the end points of a communication system (Saltzer et al. 1984). The development of this idea led to the creation of a communication system that was not concerned with the content of what was being transported as long as what was transported followed the correct transportation procedure. The effect of this is that social interaction that is conducted via the Internet is in some sense “freer” than many alternatives since it is not constrained by the technology. To put it another way, the constraints and enabling factors of the technology are nondiscriminatory with respect to the designs of the user (Lessig 1999). A helpful image is that of the freight container, which can be used to transport just about anything that fits into its standardized requirements.

Since the Internet provides for open, nondiscriminatory transportation of data it has the ability to be used as a platform for a seemingly endless array of content. With the addition of speed the exchanging of content becomes more or less instantaneous and this brings with it the appearance of computer-supported simultaneous interaction.

## HISTORICAL DEVELOPMENT

Computers were connected together prior to the Internet, but most computers had a limited ability to communicate to outside networks. In certain situations networks could be connected through gateways or bridges but these were often technically limited or built for a single use. A common networking method was linking terminals by leased lines to a central mainframe computer.

Researchers were aware that such technological constraints would be overcome in the future, as indicated by Licklider’s observations (1960, 7):

It seems reasonable to envision, for a time 10 or 15 years hence, a “thinking center” that will incorporate the functions of present-day libraries together with anticipated advances in information storage and retrieval and the symbiotic functions . . . The picture readily enlarges itself into a network of such centers, connected to one another by wide-band communication lines and to individual users . . . In such a system, the speed of the computers would be balanced, and the cost of the gigantic memories and the sophisticated programs would be divided by the number of users.

In 1962 Licklider was the head of the US Department of Defense’s information-processing office, the Advanced Research Projects Agency (DARPA). DARPA had access to three different computer networks, each with different user commands. In order to communicate across networks DARPA officials had to physically move to a different terminal and use the specific commands for that network. The need for inter-networking was evident. The solution was to create a terminal that would enable users to communicate with different networks without needing to physically change to another terminal or to implement network-specific commands.

An important component in resolving the inter-networking issue was the ability to connect the separate physical networks to form a logical network. In part this problem was solved in the 1960s by a group of researchers who developed and implemented the idea of packet switching. The origins of packet switching lie in theoretical ideas of advanced network decentralization. The purpose of this was to decrease network vulnerability by ensuring that communication networks functioned even if parts of the network were damaged (Baran 2002). This is the source of the persistent idea that the Internet was developed to survive a nuclear attack.

## **ARPANET**

The first implementation of Licklider’s idea of an inter-networking system was the ARPANET. An inter-networking system joined the University of California, Los Angeles, the Stanford Research Institute, University of Utah, and the University of California, Santa Barbara, in a four-node network by the end of 1969. This original four-node network developed into the ARPANET, and by 1981 the number of hosts was 213, with a new host being added approximately every 20 days (Hafner 1998).

## **Requests for Comments**

The ARPANET was to become the technical bed of what would eventually be the Internet. Its technical development was based upon a loose consensus among developers. This consensus was, and still is, put forward and discussed in a system of documents known as RFCs (Request for Comments). The focus of the RFCs is on proposing and distributing Internet protocols and systems.

## **Early International Networking**

Early international inter-networking was slow in developing, with Europeans focusing on developing the X.25 packet-switched networks. However, there was an international ARPANET collaboration in 1972 with the Norwegian Seismic Array (NORSAR), in 1973

with the Swedish Tanum Earth Station (via satellite links), and with University College London.

The International Telecommunication Union (ITU) further developed packet-switching network standards and incorporated them in the X.25 and related standards. By 1974, X.25 formed the basis for the SERCnet network between British academic and research sites (later to become JANET). In 1976 the ITU Standard on X.25, based on the concept of virtual circuits, was approved.

The British Post Office, Western Union International, and Tymnet collaborated to create the first international packet-switched network, referred to as the International Packet-Switched Service (IPSS) in 1978. This network grew beyond Europe and the US to cover Canada, Hong Kong, and Australia by 1981. By the 1990s it provided a worldwide networking infrastructure.

A major difference between X.25 and the ARPANET was that X.25 was open to commercial use. X.25 would be used in the first dial-in public-access networks (e.g., CompuServe and Tymnet). In 1979 CompuServe became the first to offer electronic mail capabilities and technical support to personal-computer users. The company broke new ground again in 1980 as the first to offer real-time chat with its CB Simulator. There were also the America Online (AOL) and Prodigy dial-in networks and many bulletin-board system (BBS) networks such as FidoNet.

### **Unifying Networks**

With the growth and development of many networks, a system was needed to unify them. The problems created by the many differences between the diverse network protocols were overcome by 1973 with the development of a common inter-network protocol, and instead of the network being responsible for reliability, as in the ARPANET, the hosts became responsible (Leiner et al. 2003).

The advantage of the inter-network protocol was that the role of the network was reduced and it became easier to join most networks together via this protocol. The TCP/IP protocol, a development of the 1974 TCP (Transmission-Control Protocol), was introduced by 1978. Three years later the associated standards were published as RFCs 791, 792, and 793, and adopted for use. On January 1, 1983, TCP/IP protocols became the only approved protocol on the ARPANET, replacing the earlier NCP (Network-Control Protocol; Postel 1981).

The first use of the term “Internet” was in the first TCP-related RFC (Cerf et al. 1974). The term soon came into more general use, with “an internet” meaning any network using TCP/IP. “The Internet” came to mean a global and large network using TCP/IP.

### **REGULATING THE INTERNET**

By creating an inter-networking system to enable collaboration across networks, the technological choices were based upon a model that transports data irrespective of the content of that data. This model ensured the rapid growth of the Internet since new networks could be connected to the Internet through the TCP/IP protocol.

The technological decisions made to facilitate inter-networking and the resulting rapid growth of the Internet created a digital environment with large potential for open and free forms of communication. This created an illusion that the Internet and the software applications built a virtual space free from conventional rules and regulations (Johnson & Post 1996).

The Internet was seen as being a technological creation that, through a deterministic evolutionary process, created an environment of liberalism. Early users experienced this freedom through the lack of regulation and primarily the lack of governmental intervention. However, this lack of governmental intervention was to be short lived, and soon regulations would threaten the perception of freedom online. The early users attempted to protest governmental involvement; the most famous of these attempts was the writing of *A declaration of the independence of cyberspace* (Barlow 1996).

The openness and freedom of the Internet was not deterministic, however. The lack of regulation was the result of the legal complexity created by the novelty of an open global-communications network and the legal questions it raised. Reflection on its history suggests that the Internet should not be seen as a deterministically defined technology moving toward ever-greater freedom, but as an example of autonomous technology (Winner 1978). This is a situation in which a technology has been built upon several small decisions, each driven by human choice, giving the overall impression of a technologically determined development (→ Technology, Social Construction of).

The Internet is not an inherently open, democratic technology. Technology itself is neutral and therefore can be used both for democratic and nondemocratic purposes. The desire to equate communication technology with democracy is not unique to the Internet (Winner 2005; → Communication Technology and Democracy). Many communication technologies have been celebrated as being democratic but it is important to remember that communication alone is an insufficient basis for a democracy (Winner 1986).

The discourse on Internet regulation has early roots in the technology though most researchers point to the seminal article by Johnson and Post (1996) as the start of the wider discussion on the regulation of the Internet. The issues that lie at the heart of this discussion are the ability of the state to regulate and the ability of users to circumvent regulation. This conflict raises a host of other questions such as the legitimacy of state regulation, the effects of regulation on users unwilling to be regulated, and the ability and cost of enforcing regulation that users can circumvent (→ Internet Law and Regulation; Communication and Law).

The technology brought into question one of the traditional pragmatic approaches to regulatory theory, i.e., the concept of *command and control* regulation, which can best be described as a system of statutory rules backed by sanctions (Black 1997). The fundamental idea is to create regulation that is “compliance oriented” (Baldwin 1995) with rules designed in such a manner as to promote the ease with which they can be adhered to.

The technology created an environment where the law, as expressed in the law book, may not be the most effective means of regulation (Lessig 1999; → Code as Law). The Internet is susceptible to control by other means and the greatest threat is the control of the computer code that constitutes the environment. By controlling the fundamental

infrastructure that creates the digital environments, i.e., the software or code, the regulator can ensure compliance to regulation.

The freedom experienced by the early Internet users has been replaced by a growing amount of regulation. Regulatory bodies have enacted regulations to cope with a diverse set of problems such as pornography, hate speech, computer viruses, and gambling (→ Crime and Communication Technology; Pornography, Media Law on). Yet with each regulatory step, the freedom and openness of the Internet are diminished slightly and many argue that aspects of the advantages of this communication technology are diminished.

The future role of the Internet as an open communication infrastructure is not in question. It is clear that this technology is being used for social interaction on a wide scale and that it will not cease to be even if the regulation of its use seriously curtails certain activities. Whether regulatory institutions will embrace the technology as an important source of interaction and development or whether the technology will become over-regulated is an open question. Embracing free and open communication technologies requires that the regulators become more tolerant of the technology and permit wide-scale use. Over-regulating the technology entails more limited use but fails to recognize the full potential of the Internet as an important agent of free and open communication.

## Internet Use across the Life-Span

*W. Timothy Coombs*

*Eastern Illinois University*

Internet usage refers primarily to the online activities of visiting web pages and using email (→ Electronic Mail). It is reasonable to expect differences in online activities between different age groups. However, international Internet data frequently excludes age as a variable, making age-based analyses more challenging (Findahl 2004). To accurately evaluate the data that does exist, both general and specific Internet usage needs to be considered when comparing age groups and Internet usage. General usage simply refers to going online. Specific usage refers to what activities are performed online (→ Internet).

### GENERAL PATTERNS OF AGE AND INTERNET USE

The biggest demographic difference in general online usage is between those aged 65+ and those under 65 (→ Exposure to the Internet). This pattern holds across a wide array of countries including those with high (e.g., South Korea and Sweden) and low penetration (e.g., China and Mexico) of Internet usage. The pattern in the US is typical, with only 34 percent of those 65 and older engaging in online activities. That number decreases as age increases. Only 26 percent of those aged 70 to 75 were online and only 17 percent of those 76 and older (Pew 2004). In Sweden, 24 percent of those aged 65 to 74 engage in online activities and the figure drops to 7 percent for those over 75 (Findahl 2004). In Germany, only 5 percent of those over 60 are online while in Japan the figure is 15 percent (Chen & Wellman 2003).

Those aged 50–64, the baby boomers who represent the next generation of seniors, typically report usage similar to the younger demographics but still represents a smaller percentage of users. Studies in Sweden, the UK, and the US provide the most detailed age-based data. General online usage for those aged 55–64 compared to those 35 and under is 49–72 percent in Sweden, 14–89 percent in the UK, and 73–80 percent in the US (Chen & Wellman 2003; Kaiser Family Foundation 2005). Internationally, the trend has been for the percentage of those aged 50–64 to move closer to the younger demographic percentages. One exception is South Korea. Data there shows an increasing gap between those under 50 and those under 35 (Soe 2002). Still, the number of users aged 50 and older continues to increase, but just not at the same rate as those aged under 35. Globally, the number of online users over the age of 50 continues to increase. In general usage, the difference between those aged under 35 and those aged 50–64 is shrinking globally.

### REASONS FOR AGE DIFFERENCES IN INTERNET USE

One possible reason for the age difference in Internet usage is that those aged 50–64 have used the Internet as part of their work. Around the world the percentage of people who report accessing the Internet at work has increased steadily (Chen & Wellman 2003). Moreover, those aged over 65 who have not been online say they have never learned how and that it's too complicated. These two reasons are found across data in different countries (Chen & Wellman 2003; Kaiser Family Foundation 2003).

The → *digital divide and physical access* issues complicate general online usage for those over 65. The digital divide holds that those with low incomes and less education will be unlikely to have and to use online access. An eight-country study found that socioeconomic factors did help to account for a digital divide in China, Germany, Italy, Germany, Mexico, South Korea, the UK, and the US. Education and income appeared to be the most important socio-demographic factors for explaining the global digital divide (Chen & Wellman 2003). The Kaiser study in the US examined online usage by age and both income and education. For those aged over 65, people whose income is below US\$20,000 a year are much less likely to go online (15 percent) than those whose income is above US\$20,000 (40 percent) or over US\$50,000 a year (65 percent). Seniors with a high school degree are far less likely to use the Internet (18 percent) than those who have been to college (45 percent) or have a college degree (60 percent) (Kaiser Family Foundation 2005). Physical access is another concern. Websites and computers are designed by the young and generally do not account for the effects of aging on usage. Keyboards can be difficult to use, small font sizes are an issue, and certain color contrasts are difficult for seniors to see (National Institute on Aging 2001).

Age does account for some differences in Internet activities but not for email use. Internationally, email usage for those online remains high regardless of age groups (Pew 2004; Soe 2002). However, teens are far more likely to add instant messaging (IM) and social network sites such as MySpace to their Internet activities than older Internet users (Noguchi 2006).

More pronounced differences emerge across age groups when *specific Internet activities* beyond email are examined. Younger Internet users, those aged 12–28, are more likely to engage in instant messaging (IM), online gaming, downloading music, and downloading

videos than those aged 29 and older. Younger Internet users around the world are entertainment-oriented (Dessewffy et al. 2003; Pew 2004; Soe 2002). Those aged 13–21 prefer IM to email even though they still use email. IM is not popular among older Internet users and decreases rapidly with age (Gonsalves 2005). Those aged 29–69 are more likely to use the Internet to engage in online activities that require some capital such as making travel reservations and banking online. Online banking appears frequently as a top online usage of older Internet users globally (Dessewffy et al. 2003; Pew 2004; Soe 2002).

## **INTERNET USE FOR HEALTH INFORMATION**

Research in the UK and the US has examined the use of health information online by age group. Those aged 50–64 and over 65 share an interest in online health information. The relevance of health information searches warrants further attention (→ Communication Skills across the Life-Span).

For those aged 50 and older, health information is the most searched topic online. Two studies in the US found that 69 percent of those 50 or older with Internet access have searched for health information (Merck Institute of Aging and Health 2005; Kaiser Family Foundation 2005). The top health topic searched was prescription drugs (37 percent) followed by nutrition or exercise (30 percent). Once again the age divide between those aged 50–64 and those 65 and older emerges. Those aged 50–64 trust Internet health information (58 percent), which for them is the number one source of health information, while those who are 65 and older do not trust online health information (46 percent), which for them is the fourth most used source of health information (Kaiser Family Foundation 2005). A UK study found similar results, as health was the top online topic for those aged 50 and over (50+ Health 2005). Information seeking in general is consistently near the top of the list of reasons people around the world give for going online. A closer look at the types of information being sought should reveal a similar pattern of older users centering their online searches on health information wherever the Internet is used (→ Information Seeking; Health Communication).

That older users seek health information online should be a special concern. Information providers need to make the information and searches as easy to access and use as possible for older users. A Merck study conducted with the American Federation of Aging Research found significant negative responses from those aged 50 and over who had searched for health information, and 70 percent wanted to learn more about finding reliable health information on the Internet (→ Health Communication and the Internet). The two groups have created the Health Compass, a website designed to help people find and assess the credibility of online health information (Merck Institute of Aging and Health 2005). This is one example of how older online users can be helped in their search for health information (→ Health Literacy).

Globally, those aged 50–64 have general online usage patterns similar to the younger age groups, but Internet usage drops dramatically for those aged 65 and older. As Internet users age, their specific usage shifts from entertainment (e.g., downloading music) to capital expenditures (e.g., banking and travel) and a concern for health. The emphasis on health information increases as a focus for Internet users as they age. According to

predictions, Internet usage by those aged 50 and over will continue to rise around the world and spread to the higher age brackets as more computer-literate people age. Internet content providers would be wise to do more to adapt content and page layout to older users. Internationally, those aged 50 and older are a growing audience and market for online information and services.

# Interorganizational Communication

Marya L. Doerfel

Rutgers University

Interorganizational communication (IOC) emphasizes relationships organizations have with external constituents as opposed to relationships that occur internally. IOC research considers issues like information flows, information sharing, reputation, cooperation, competition, coalition building, and power. IOC theoretical developments are substantially multidisciplinary. Communication researchers often emphasize the understanding of who communicates with whom and about what. Economists and sociologists tend to see linkages in terms of some exchange with limited interest in the content of communication within that exchange. This emphasis by communication scholars reflects the assumption that interorganizational relationships are enacted by individuals' communicative actions (→ Organizational Communication).

## RESEARCH FOCI

Much IOC research considers the interplay between micro-level processes (e.g., organizational representatives' actions) and macro-level structures (e.g., overall system qualities). Structure reveals qualities of the system and offers a context for understanding emergent patterns and systematic variation among its members. Regardless of whether macro-level or micro-level issues are in the foreground of the scholarship, research and theory development concerns itself with organizational roles within some social structure (created by some form of communication or exchange), and how that structure influences and, in turn, is influenced by organizational power, reputation, dependency on others, market share, social influence, and so on (→ Control and Authority in Organizations). Because of the emphasis on the structures that form as a result of organizations partnering, clustering, and/or remaining isolated, a substantial component to research about interorganizational communication involves understanding such relationships from a → social networks perspective (→ Communication Networks).

The interorganizational context is a space in which individual organizations act as well as an emergent manifestation of that action. Social → network analysis is a way to identify an overall system structure and within that context, the nature of the role of individual organizations within it. *Network concepts* such as "group member," "isolate," and "liaison" are roles that describe the extent to which each organization is connected to others in the system. Clusters of group members often indicate coalitions; organizations that are isolated are seen as relatively marginal to the system; liaisons are seen as the connectors or gatekeepers that have the power to enhance or thwart information flows throughout the system. Each of these roles is a way of categorizing the continuous *measure of centrality*. Highly central organizations are well connected in the system (e.g., group members and liaisons), whereas those at the low end of the centrality spectrum tend to be peripheral, on the fringe, or relatively isolated.

While centrality is seen as an operational concept that describes organizational roles in the network, it also contributes to theoretical developments in interorganizational communication.

Research across disciplines consistently confirms that centrality is positively related to power, influence, prestige, and reputation. It is theorized that having ongoing alliances with key others in the network is a way of obtaining social capital, which then relates to such ancillary benefits as having access to future potential exchange partners. For example, Flanagin et al. (2001) showed that creators of a Spanish federation were most central and had greater advantages than those members who “only” participated in the collective.

### **MACRO-LEVEL ISSUES AS THEORETICAL FOREGROUND**

Macro-level theory development involves analysis of the greater interorganizational contexts in the pursuit of uncovering idealized structures, understanding dynamics of inter-organizational systems, and investigating how collective systems are formed and maintained. Scholars consider topics such as the degree to which information sharing and linking with other organizations creates an efficient and effective information flow. Communication scholarship typically identifies individual *organizational actions* (who communicates with whom and what they communicate about) and their subsequent contribution to a greater context of relationships. Sydow and Windeler (1998) showed how → structuration theory can be used to explain how structures shape and reproduce processes and network effectiveness. Key theory development is in the area of organizational reputation, social influence, cooperative/competitive relationships, and evolutionary dynamics.

Overall network configurations (interorganizational structures) are assessed with a variety of *methodological approaches* and theory development is tightly coupled with such methodologies (→ Research Methods). Density, for example, is a way of identifying the percentage of actual links to possible links that can occur in a system. Dense networks of local organizations indicate substantial social capital. Borrowing from → evolutionary theories about ordered systems, some suggest that moderate density is an indicator that an emergent system is approaching order out of chaos.

Burt (1992) developed *structural holes theory*, arguing that a structural hole is a place in the social network where a tie that can potentially connect organizations or sets of organizations is absent. Structural holes theory contends that organizational systems are best when there is a balance of efficient and effective contacts. Stohl and Stohl (2005) showed that nongovernmental organizations (NGOs) that fill structural holes strengthen their respective positions in the global network, and in the process of filling structural holes NGOs simultaneously contribute to the quality of the entire network and the nation-state. The structural holes framework warns that an organization that attempts to fill all structural holes in a system may wipe out its resources in futile attempts to maintain those relationships. On the other hand, an organization that avoids filling structural holes puts itself at the mercy of its key partners. Strategically networking (i.e., selecting network partners that offer effective and efficient access to other system resources) to fill structural holes provides firms with informational resources and enhanced reputational power and influence.

### **MICRO-LEVEL ISSUES AS A THEORETICAL FOREGROUND**

In connecting micro-level action to macro-level dynamics, *alliance theories* suggest that organizations network with others in order to manage uncertainty and relationships.

Analyses of NGOs show that core functions of NGO networks include communication and information exchange. Extending the notion of information sharing to seemingly more altruistic intentions, *public goods theory* attempts to unravel the nature of organizational activities that contribute to overall collective benefits without necessarily offering instantly observable advantages to participating organizations. Examples of organizational-level activities include collaborative efforts such as coalitions, trade groups, and associations. Early developments reflect the underlying principle that interorganizational relationships are often marked by the simultaneous existence of cooperative–competitive relationships. Such studies showed the evolution of cooperation and communication activities that facilitated sharing resources without realizing instant reward for such behavior (e.g., Browning et al. 1995). Monge et al. (1998) more recently contributed to this theoretical framework by integrating communication technologies as a resource for supporting information sharing and collective action. Findings suggest that ongoing collaborative activities create a neutral “space” for information sharing, and that information sharing begins with small contributions with transformation toward more collective and cooperative ventures. Future research is directed toward understanding the IOC processes that facilitate such collaborative endeavors and result in collective advantages (→ Public Goods).

In emphasizing micro-level actions in the macro-level context, the term *cooperation–competition* is deliberately used to reflect the underlying tension that can exist in the formation of interorganizational relationships. Several studies demonstrate the importance of trusting relationships in developing consortia and coalitions. A consideration of cooperation–competition, then, is a way of describing the nature of the link between networking partners and also contributes to theory development about the tensions between needing to cooperate with others to sustain organizational viability yet having to (possibly) compete with the same partners for needed, and sometimes scarce, resources. Cooperation and competition tensions complement resource dependency theory.

*Resource dependency theory* attempts to explain the influence of organizations’ roles in their environment relative to the extent to which they are resource wielders or needy of resources. Research consistently shows that the organizations that are more reliant on others for resources are more likely to cooperate with others, comply with external demands, and engage in activities that aid in obtaining resources. Meanwhile, by virtue of their holdings, resource-wielding organizations reap additional benefits such as improved reputation, power, and social influence. Doerfel & Taylor (2005) showed that the extent to which an organization is seen as cooperative with other organizations relates to the extent to which the organization needs more key information and financial resources. Flanagan et al. (2001) demonstrated the advantages associated with early entrants to newly formed cooperative ventures in that founding members experienced greater reputational benefits and more social influence in the ongoing activities than later system entrants.

An analysis of interorganizational communication must also consider the *concept of stakeholders*. Stakeholders can be other organizations but can also be those who care about (“have a stake in”) the focal organization such as volunteers, internal employees, and external publics (→ Stakeholder Theory). Lewis et al. (2003) have integrated both stakeholder theory and resource dependency theory in understanding communication

strategies used by organizations in planned change scenarios (→ Organizational Change Processes).

Much of the afore-mentioned IOC research has a common link that consistently demonstrates the extent to which “history matters.” Cooperation–competition theory shows that past cooperative acts beget subsequent cooperation, while competitive acts often reap subsequent competition. Similarly, reputation and social influence emerge as a result of past contributions to the public good. New directions in IOC theory emphasize longitudinal and multilevel analyses. For example, evolutionary models of interorganizational dynamics borrow from Charles Darwin’s theory with an eye toward understanding the factors that drive the emergence, sustainability, and possible decay of an interorganizational system. Researchers also see interorganizational alliances as potentially evolving into knowledge networks. Recent theoretical essays and empirical analyses promote a multi-theoretical, multi-level model that attempts to advance knowledge about psychological, social, and communication theory (multi-theoretical) jointly with how individuals, groups, and organizations interact (multi-level) to develop and sustain knowledge networks.

# Interpersonal Attraction

Susanne M. Jones

University of Minnesota

Philosophical, empirical, and popular inquiries into what causes people to be attracted to one another are as old as humanity. As early as the fourth century BC Aristotle examined the forces of interpersonal attraction. Research on interpersonal attraction surged in the 1960s with two seminal publications (Berscheid & Walster 1969; Byrne 1971). Interpersonal attraction was conceptualized initially as a relatively stable attitude that leads to positive sentiments for another person and that serves as the catalyst for initiating interpersonal interaction. It is now viewed as a dynamic, affective force that draws people together and permeates all stages of interpersonal relationships (→ Dating Relationships; Initial Interaction; Ingratiation and Affinity Seeking; Relationship Development). McCroskey & McCain (1974) identified three types of interpersonal attraction. *Task attraction* refers to our desire to work with someone, whereas *physical attraction* occurs when we are drawn to a person's physical appearance. *Social attraction* reflects our desire to develop a friendship with that person. Other types of attraction include sexual attraction, which reflects the desire to engage in sexual activity; relational attraction, which refers to the desire to have an intimate relationship with that person; and fatal attraction, which occurs when the very qualities that initially drew us to a person eventually contribute to relational deterioration.

## DETERMINANTS OF INTERPERSONAL ATTRACTION

Judgments of *physical attractiveness*, particularly facial attractiveness, are one of the top predictors of interpersonal attraction. Apart from culturally idiosyncratic beauty norms, evolutionary researchers have detected several universal physical attractiveness features. Whereas body and facial symmetry are viewed as universally attractive in men and women, a strong jaw line, broad shoulders, and a waist-to-hip ratio of slightly less than 1.00 contribute to judgments of male physical attractiveness. A soft jaw line, full lips, and an hourglass figure are preferred female attractiveness features. These physical features are attractive presumably because they indicate fertility, health, and consequently genetic fitness.

Although men tend to view physical attractiveness as more important than women, both sexes are biased toward beauty and tend to perceive physically attractive people as more rewarding than physically unattractive people. There are several reasons for this *beauty bias*. The first is aesthetic appeal; beautiful people provide sheer viewing pleasure. A second reason for the beauty bias is that people tend to overgeneralize from beauty and assume that it is associated with positive personality characteristics and social skills. This bias is dubbed the “what is beautiful is good” stereotype or the “halo effect,” and is based on implicit personality theory. Not surprisingly, studies testing the veracity of this halo effect found that physically attractive people are *not* blessed with more virtuous personality characteristics than are less attractive people. However, attractive people might actually be more socially skilled than unattractive people, because attractive people

receive more attention and thus more opportunities to hone their skills. A final source for the beauty bias is the assumption that the mere association with a beautiful person will elevate one's own physical attractiveness and social status. This "rub-off effect" is partially supported, e.g., men are viewed as more attractive in the presence of beautiful women, whereas the same does not hold for women in the presence of attractive men.

A second factor that influences interpersonal attraction is *similarity*. As early as 1870 Sir Francis Galton postulated that spouses tend to be similar on a range of attitudes and socio-cultural characteristics, a principle he dubbed homogamy. Byrne's (1971) reinforcement-affect model explains this phenomenon and suggests that similar others are attractive because they serve as universal reinforcers of our worldview. With respect to similarities in levels of physical attractiveness in particular, Berscheid et al. (1971) speak of the matching hypothesis: people are attracted to others who match them in physical attractiveness. At first blush, the matching hypothesis seems to contradict the beauty bias, but the difference lies in what people ideally desire and what they can realistically attain: while we are attracted to beautiful people, in the end, we tend to seek out those who match us in physical attractiveness because these people are realistically attainable.

The association between attitude similarity and attraction has perhaps generated the fiercest debate among scholars. Byrne (1971) developed the "bogus stranger" experimental paradigm to test whether attitude similarity leads to attraction. In that experimental set-up participants first assessed their own attitudes. They were then presented with an attitude set of a bogus stranger and were asked to evaluate the extent to which they were attracted to that stranger. Byrne found that participants tended to be attracted to those who possessed similar attitudes. However, Sunnafrank & Miller noted that this design completely eliminates social interaction (see Sunnafrank 1991). In a modification of the bogus-stranger design, these researchers asked participants who varied in attitude similarity to talk with one another in a five-minute conversation prior to their attraction evaluations. Interestingly, the association between attitude similarity and attraction disappeared once people began to talk with one another. These findings have by no means resolved whether "birds of a feather flock together" or whether "opposites attract." Consistent with relational dialectical theory (→ Relational Dialectics), some scholars point to the importance of difference and novelty as sustaining features in close relationships.

Several *communication qualities* seem also to play a crucial role in interpersonal attraction; among them are warmth, sociability, and competent communication (→ Interpersonal Communication Competence and Social Skills). Warmth is communicated verbally through a positive attitude and concern for others, and nonverbally through smiling and direct eye contact (→ Eye Behavior). Sociability and competence are communicated through expressive behaviors, behavioral relaxation, and conversational dexterity. Aside from these positive qualities, there are several "darker" communication characteristics that influence interpersonal attraction, among them dominance, expressed as relaxed posture, showing a lack of interest, and talking loudly, quickly, and clearly. Women particularly seem to be drawn to men who show a certain degree of assertiveness and dominance, presumably because these men display strength and potentially genetic fitness.

*Proximity* and *familiarity* are two final predictors of attractiveness. Several studies found that people who live close to one another are more likely to become friends. The

power of proximity is stimulated by familiarity; we feel comfortable and secure around people who are close and familiar, and who provide us with repeated opportunities for social interaction. Byrne (1971) actually speculated that the “mere exposure” to another person breeds attraction.

## THEORETICAL APPROACHES

Integral to the vast majority of interpersonal attraction studies is the assumption that we find others attractive if we perceive them to be rewarding, an idea that has been drawn from *social exchange theories* (→ Social Exchange). Berger and Calabrese’s → Uncertainty Reduction Theory (URT) contends that it is not perceived reward value per se that causes attraction; rather it is the extent to which we are able to reduce our initial uncertainty about others that attracts us to others. People reduce uncertainty by gathering information that is initially superficial but becomes increasingly idiosyncratic and personal in nature in ongoing interactions. As the amount of verbal exchange increases, uncertainty tends to subsequently decrease and it is this decreased uncertainty that kindles interpersonal attraction. The need to reduce uncertainty might not always be the driving force of future interactions. Sunnafrank’s (1991) *predicted outcome value theory* (POV) proposes that the positive or negative information we receive, as well as the potential reward of future interactions (i.e., predicted outcome values), influence the extent to which we are attracted to others and subsequently increase or decrease communication.

The central tenet of all social exchange theories is that interpersonal attraction progresses in a linear fashion, but attraction levels might actually fluctuate over the course of a relationship. The relational turning-points model, itself grounded in relational dialectical theory captures this aspect and suggests that attraction evaluations rise and fall with positive and negative relational events people experience in interpersonal relationships.

A final theoretical approach that has been used to explain the causes and outcomes of attraction is *social evolutionary theory* (Buss 1994). The central idea of this theory is that humans, like all mammalian species, are driven to advance the species by mating with those who are most genetically fit. Genetic fitness is manifested in phenotypic features such as physical attractiveness and other personality characteristics. Consequently, people are drawn to those who possess advantageous phenotypic features because these features suggest strong genes and thus provide a survival advantage.

## MEASUREMENTS OF INTERPERSONAL ATTRACTION

Assessing interpersonal attraction is not as simple as it may seem. Several nonverbal indicators of interpersonal attraction have been explored (e.g., eye gaze, proximity, attention), but these measures tend to be contaminated by factors unrelated to attraction. Researchers have also frequently measured interpersonal attraction by summing two items taken from Byrne’s (1971) interpersonal judgment questionnaire, including the extent to which people (a) like a target person and (b) would enjoy working with that target person. A similar measure of interpersonal attraction is the simple question “How much do you like or dislike X?” that is usually answered on a semantic differential or bipolar scale.

However, this measure bears not only methodological problems common to single-item scales, but also does not take into account that positive and negative affect are relatively independent constructs. Thus, this measure cannot detect the ambivalence of the two emotional states when people evaluate the attraction of another person. McCroskey & McCain's (1974) interpersonal attraction scale (IAS) is perhaps the most extensively developed scale in interpersonal communication and assesses social attraction, physical attraction, and task attraction (described above).

*Future research* will undoubtedly continue to reveal additional attraction motives, as well as moderating influences among these motives, in the context of initial and ongoing interpersonal relationships. Fundamentally, two key issues will likely drive future research in interpersonal attraction. The first issue is conceptual in nature: while we know quite a bit about the determinants of interpersonal attraction, we have yet to examine how exactly attraction works. It is tacitly assumed that attraction is an interpersonal dynamic. Thus, future theoretical work will likely build on interpersonal communication theory to expand the conceptual definition of interpersonal attraction beyond current definitions that target attraction predominantly as a force that draws people together. Apart from clear conceptualizations of interpersonal attraction, a second research direction concerns methodological issues in assessing interpersonal attraction. Because interpersonal attraction has frequently been examined in initial encounters, another fruitful avenue of future research lies in the longitudinal study of interpersonal attraction in ongoing relationships.

# Interpersonal Communication

Charles R. Berger

University of California, Davis

Interpersonal communication concerns the study of social interaction between people. Interpersonal communication theory and research seeks to understand how individuals use verbal discourse and nonverbal actions, as well as written discourse, to achieve a variety of instrumental and communication goals such as informing, persuading, and providing emotional support to others. Although interpersonal communication has been traditionally conceived of as a process that occurs between people encountering each other face to face, increasingly social interaction is being accomplished through the use of such communication technologies as computers and mobile phones, thus adding a new dimension to this area of communication inquiry.

## RESEARCH HISTORY

The study of interpersonal communication developed during the years following World War II and grew out of two distinct areas of social-psychological research that appeared during and after the war. One of these areas concerned the role communication plays in the *exercise of persuasion and social influence*, while the other area, known as group dynamics, focused on social interaction within groups. Group dynamics sought to illuminate how group interaction processes influence conformity to group norms, group cohesion, the exercise of social power and the decisions that groups make. During the 1960s most interpersonal communication research addressed the role that various source, message, channel, and receiver factors play in changing audience members' attitudes and behavior; although studies of speech anxiety, communication apprehension, and group decision-making also appeared in the interpersonal communication literature of that era.

Most of the communication and persuasion research appearing during this time did not examine social influence in the context of ongoing social interaction; rather, experimental studies in which audience members were individually exposed to persuasive messages that systematically varied different source and message factors were used to investigate the effects of persuasive communication on recipients' attitudes and opinions. As elegant as this experimental approach to the study of persuasion was, in that it allowed for the experimental control of extraneous factors, unfortunately it did not allow researchers to investigate the reciprocal influence processes that occur when people engage in face-to-face interaction. In social encounters, social influence is not a one-way street; individuals who enter such encounters hoping to influence their co-interlocutors instead may encounter resistance or find themselves being influenced by their partners.

Beginning in the late 1960s and early 1970s, interpersonal communication research perspectives expanded beyond the communication and persuasion domain to include the role *social interaction* plays in the development, maintenance, and deterioration of personal relationships. Interpersonal communication and interpersonal attraction in romantic and friendship relationships began to become a focal point of study; at the same

time interpersonal communication researchers became interested in the study of self-disclosure (→ Disclosure in Interpersonal Communication). This period was also marked by a significant increase in attention to the study of nonverbal communication (→ Environment & Social Interaction; Eye Behavior; Facial Expressions; Gestures and Kinesics; Paralanguage; Proxemics), and during the latter part of the 1970s interpersonal communication research began to reflect a concern to understand the cognitive structure and processes that underlie social interaction with respect to both message production and message processing (Berger 2005). Deceptive communication was another research focus that emerged during this period. In the ensuing decades, each of these research areas has continued to attract considerable attention.

During the 1970s, communication researchers in general and the interpersonal communication researchers in particular expressed considerable frustration over the lack of original theories designed to explain various interpersonal communication phenomena. As a consequence, beginning in this decade, interpersonal communication scholars began to engage in dialogue about the *nature of communication theory*, and they increased their theory development efforts. Since that time, interpersonal communication researchers have proposed a variety of theories concerned with explaining such phenomena as relationship development, nonverbal communication, message production, interaction adaptation, and deceptive communication.

As the theoretical and research trends set in motion in the 1970s continued to play out during the 1980s, interpersonal communication researchers became increasingly interested in illuminating the *communication strategies* individuals use to achieve a wide variety of goals, such as acquiring information, gaining compliance, making requests, comforting others, and seeking affinity. In conjunction with this focus on the functions that social interaction serves in the strategic pursuit of such goals, some interpersonal communication researchers began to develop theories and models of message production for the purpose of explaining how such strategic interaction works. This theory development work continued through the 1990s and into the new millennium.

As a sub-field of the communication discipline, interpersonal communication can be divided into six unique but related *areas of study*, each representing a relatively coherent body of theory and research. These six areas are concerned with uncertainty, interpersonal adaptation, message production, relationship development, deceptive communication, and mediated social interaction. In addition to these theoretical domains, interpersonal communication researchers have addressed specific topics such as emotion and social interaction, although these specific topics are not as well developed as the six domains. Nevertheless, some of these specific topics will be considered as each of the six research areas is described below.

### **UNCERTAINTY IN INTERPERSONAL COMMUNICATION**

Few would disagree with the proposition that when individuals engage in social interaction with each other, they cannot be completely certain of their conversational partners' current emotional states, beliefs, attitudes, and future actions, even when their interaction partners are familiar and perhaps even well known to them. That is, it is impossible to predict accurately all of these internal states and potential future actions at any given point in time. Consequently, when individuals engage in social interaction they

do so under conditions of more or less uncertainty, but uncertainty is probably never completely absent. In addition, because individuals harbor uncertainties about co-interlocutors, they must, of necessity, have uncertainties about how they should act toward their partners; consequently, individuals experience uncertainty with respect both to themselves and to others. These uncertainties are maximal when strangers meet, but uncertainties can also arise in close relationships of long duration (Planalp & Honeycutt 1985). Uncertainty Reduction Theory (URT; Berger & Calabrese 1975; Berger & Gudykunst 1991) proposes that individuals must reduce their uncertainties to some degree in order to be able to fashion verbal discourse and actions that will allow them to achieve their interaction goals. The theory's propositions describe relationships between verbal and nonverbal communication and information seeking, self-disclosure and interpersonal attraction (→ Uncertainty Reduction Theory).

Berger (1979) identified three general classes of *strategies for reducing uncertainty*. Passive strategies do not entail social interaction between parties; rather, they involve the unobtrusive observation of others for the purpose of acquiring information about them. Active strategies also do not involve face-to-face social interaction between information seekers and their targets. Acquiring information from third parties about a target person falls into this category. Finally, interactive strategies such as asking questions, disclosing information about one's self, and relaxing the target may be used to acquire information when interaction occurs. These strategies vary with respect to their efficiency and social appropriateness.

For example, acquiring personal information from another by asking questions might be an efficient strategy, but it could become socially inappropriate if too many questions or excessively personal questions were to be asked. Conversely, relaxing the target person might be perceived to be highly appropriate socially but, at the same time, might be highly inefficient for acquiring specific pieces of information from the target. A person who is more comfortable might say more than one who is less so but still not reveal the desired information. Studies have also examined the strategies individuals use to resist revealing information about themselves to highly inquisitive co-interlocutors (Berger & Kellermann 1994). URT has been found to have some purchase in explaining social interaction in intercultural (Gudykunst 1995) and organizational (Kramer 2004) communication contexts. Moreover, some have argued that individuals not only harbor uncertainties about themselves and others as individuals, but also may experience uncertainty with respect to their relationship with each other (→ Relational Uncertainty).

Some researchers have argued that individuals may not necessarily be motivated to reduce their uncertainty when they anticipate experiencing negative outcomes by so doing. For example, individuals who have their blood tested for the presence of the HIV virus because they suspect that they may be HIV positive may choose not to obtain their test result, presumably because they are fearful of it. That is, they will maintain their uncertainty in the service of avoiding hearing bad news. Similarly, married people who suspect that their spouses are cheating on them may elect to avoid reducing their uncertainty in this regard in order to avoid projected negative consequences that might follow from this knowledge. According to this perspective, then, uncertainty is something to be managed rather than necessarily reduced (→ Uncertainty Management). Although there are a number of examples of situations in which some people might avoid reducing

their uncertainty, the degree to which these uncertainty reduction avoidance maneuvers portend optimal adaptation to the environment is open to question. In the long run, ignorance may not always be bliss (Berger 2005).

### INTERPERSONAL ADAPTATION

Students of social interaction have long recognized that when individuals converse, they show strong proclivities to reciprocate each other's verbal and nonverbal behaviors. The *norm of reciprocity*, which states that in the conduct of social intercourse people are obligated to help and not harm those who help them, provides a potential explanation for the ubiquity of reciprocity in social interaction. However, behavioral reciprocity has been observed between very young infants and their caregivers, suggesting a biological basis for reciprocal behavior (Burgoon et al. 1995).

Evidence for the operation of the norm of reciprocity was found in early studies of self-disclosure published in the 1950s and 1960s. This manifestation of the norm was labeled the "dyadic effect." When individuals disclose information about themselves at a particular intimacy level, their co-interlocutors are likely to disclose information about themselves at a similar intimacy level. Moreover, as individuals increase the intimacy of their self-disclosures, their co-interlocutors tend to increase the intimacy level of their self-disclosures (Burgoon et al. 1995). It is not that individuals reciprocate the same information about themselves; rather, individuals tend to match the intimacy level of their disclosures. In addition to reciprocity at the level of message content, early studies demonstrated reciprocity of nonverbal behaviors in interview situations. As interviewers purposively increased or decreased their speech rate or the number of pauses in their speech, interviewees were observed to respond by adjusting their speech or pause rate in the direction of the interviewers' (Burgoon et al. 1995).

Although the forces for reciprocity in social interaction are both highly pervasive and particularly strong, there are conditions under which interacting individuals will show compensation in response to each other's behaviors. Compensation occurs when a behavior displayed by one person is not matched in some way by another. For example, in the domain of nonverbal communication a smile by one person might be met with a frown by a conversational partner, or an attempt to begin a conversation by moving closer to an individual might be responded to with eye-gaze aversion, signaling an unwillingness to converse. In the smile–frown case, compensation occurs within the same nonverbal communication channel, facial expressions; in the second case, the compensatory behavior is expressed in a different channel than is the initiating behavior.

A number of *alternative theories* have been devised to illuminate the conditions under which reciprocity and compensation are likely to occur during social interactions, especially with respect to nonverbal behaviors. Although Expectancy Violations Theory, Arousal Labeling Theory, Discrepancy-Arousal Theory, and Cognitive Valence Theory differ in terms of their explanations for reciprocity/compensation, they share a common assumption that when expectations for nonverbal behavior are violated, individuals tend to experience arousal (→ Reciprocity and Compensation in Interaction). For instance, when people try to converse at inappropriately close conversational distances, they are likely to create arousal in their co-interlocutors. Arousal Labeling and Discrepancy

Arousal theories suggest that when the experience of this arousal is pleasant, reciprocity is likely to occur; however, when the arousal is experienced negatively, compensation is likely to follow.

Research comparing these theories has been inconclusive and has prompted the development of → Interaction Adaptation Theory (IAT) (Burgoon et al. 1995). This theory argues that when an individual's interaction position matches a co-interlocutor's behavior, reciprocity or matching is likely to occur, but when an individual's interaction position is discrepant from the other's behavior, compensation is likely to occur. Interaction position is determined by the individual's basic drives and needs, their cognitive expectations concerning social norms and behavior, and their goals and preferences. Although IAT offers a potentially more comprehensive explanation of interaction adaptation than do the other theories, its scope is quite ambitious, thus making it difficult to evaluate.

## **MESSAGE PRODUCTION**

The notion that language is a tool or an instrument for attaining everyday goals has enjoyed long acceptance among students of language and communication. Given the uncontroversial nature of this proposition, it is but a small step to contend that social interaction, like language, is a tool or an instrument for goal achievement (Berger 2003; Dillard et al. 2002; Wilson & Sabee 2003). Consistent with this proposition, beginning in the 1970s and continuing through the 1990s, constructivist researchers endeavored to determine the characteristics of messages deemed to be effective for achieving a variety of goals, most of them concerned with persuasion (→ Constructivism; Constructivism and Interpersonal Processes); although, a parallel line of research concerned with the goal of providing emotional support also developed within this tradition (Burleson 2003; → Comforting Communication).

A robust finding from this line of research is that when given the task of devising messages to achieve such goals, individuals with high levels of cognitive complexity tend to generate messages showing greater evidence of social perspective taking than do their less cognitively complex counterparts. Within this research perspective, cognitive complexity is indexed by the number of psychological constructs individuals typically used to construe other persons (cognitive differentiation) and the degree to which the constructs they use are abstract (construct abstractness). Greater numbers of highly abstract constructs contribute to higher cognitive complexity levels. Because highly differentiated individuals' messages take into account their co-interlocutors' goals, emotional states, and potential responses to their messages, their messages are, as a result, deemed to be potentially more effective than the more egocentric ones generated by their less cognitively complex counterparts.

Beginning in the 1980s, a more comprehensive and abstract message production theory labeled → Action Assembly Theory (Greene 1997) was developed to explain how individuals produce actions and discourse, and during the same period theories featuring such knowledge structures as scripts, plans, and memory organization packets (MOPS) were devised (Berger 1997; Kellermann 1995). In the case of these latter theories, sometimes referred to as Goal-Plan-Action (GPA) theories (Dillard et al. 2002), scripts,

plans, and MOPS are conceived of as hierarchically organized knowledge structures representing action sequences that will bring about the achievement of goals. Once goals are activated, these knowledge structures serve to guide actions toward their attainment. These knowledge structures vary with respect to their abstractness and level of detail, and they can be made more complex by including contingencies that anticipate points at which projected actions in them might fail (→ Relational Schemas; Schemas, Knowledge Structures, and Social Interaction). Individuals who plan ahead during conversations, anticipate their co-interlocutor's future conversational moves, and develop plan contingencies to meet these future actions are more likely to attain their social interaction goals than are individuals who do not engage in such planning activity while they converse (Waldron 1997).

A potential shortcoming of GPA theories is that they do not provide a detailed account of how goals arise in the first place; i.e., they begin with the assumption that social actors have a goal or goals to pursue. However, there are at least two examples of attempts to formulate and test theoretical explanations for how goals arise during social interaction (Meyer 1997; Wilson & Sabee 2003). Because much of everyday social interaction is aimed at satisfying recurring goals, much of everyday conversational interaction is routine (Berger 2005). Nonetheless, important questions can be asked about the conditions under which specific goals are activated and the consequences that follow from the disruption of these routines once they are undertaken. Interference with the completion of these routines should provoke annoyance and other negative emotions because it prevents the efficient achievement of recurring goals; however, there may be circumstances under which the disruption of social interaction routines provides relief from boredom or from an undesirable situation such as a routine conflict with another person.

People sometimes imagine social interactions with others (→ Imagined Interactions). These imagined interactions may occur before an encounter, as when employees imagine what they might say to their bosses, but imagined interactions can take place after a particular encounter is over. Under certain conditions, imagining what one might say to another person before an actual interaction with them takes place can reduce the amount of apprehension that the person who has imagined the interaction shows during the actual encounter. Moreover, imagining interactions may help those who imagine them cope with negative emotions they have experienced in their relationship with the person or persons with whom they imagine conversing (Honeycutt 2003). However, imagining interactions before they take place may have the effect of encouraging individuals to commit themselves prematurely to a particular plan for the actual interaction and, as a result, render them less inclined to recognize potential problems that arise during the actual conversation, and to consider contingent actions that might be undertaken to deal with these problems (Berger 2005).

## **RELATIONSHIP DEVELOPMENT**

The idea that interpersonal communication plays a critical role in the development, maintenance, and deterioration of social and personal relationships is one that has gained widespread acceptance over the past 35 years (→ Relationship Development). Although a great deal of research attention has been paid to the development of romantic

relationships during this period, probably because college students, who are frequently used as research participants, are likely to be involved in such relationships (→ Dating Relationships), researchers have also investigated relationships between friends, spouses, and family members.

A central question researchers have sought to answer is why some relationships become closer over time while others grow distant and perhaps end (→ Relational Maintenance). Social exchange theories have frequently been invoked to explain why relationship growth and deterioration occur (Rolloff 1981; → Social Exchange). In general, these theories suggest that individuals experience both rewards for and costs of being in relationships with each other, and not only assess their own rewards and costs, but estimate their partners' levels of rewards and costs. Rewards may be material (wealth) or emotional (emotional support), and costs may be similarly material (lack of money) or emotional (undesirable personality). Each individual puts these reward and cost estimates into ratio form (rewards/costs) and compares the two ratios (self: rewards/costs vs partner: rewards/costs).

Individuals will feel *equity* in their relationship to the degree that the reward/cost ratios match; however, if the self's ratio is less favorable than the partner's, the individual will feel inequity and thus dissatisfaction with the relationship. Dissatisfaction arising from felt inequity is sometimes expressed verbally when people say, e.g., "I am putting more into this relationship than I am getting out of it." In general, these theories suggest that favorable relative reward/cost ratios fuel relationship growth, whereas unfavorable ratios are associated with relationship deterioration. It is not the absolute levels of rewards and costs that determine equity but the degree to which the two ratios match. Individuals might perceive their partners to be receiving more rewards from their relationships than they are, but because their partners may be perceived to be incurring greater costs for being in the relationship, the fact that they are receiving greater rewards does not lead to feelings of inequity.

Some have argued that social exchange theories and other relationship development perspectives have made the processes of relationship development and deterioration appear to be much more continuous and linear than they actually are. These researchers contend that the development of relationships is fraught with dialectical tensions that may serve to pull individuals in opposite directions simultaneously (Baxter & Montgomery 1996; Montgomery & Baxter 1998; → Relational Dialectics; Friendship and Peer Interaction). For example, individuals may at once feel interdependent and autonomous with respect to their partners, and because the tension between these polarities shifts over time, relationships are in a constant state of flux. There are a number of possible dialectics such as predictability–novelty, openness–closeness, and autonomy–connection; thus, these contradictions can interact with each other through time. Given the dialectical nature of personal relationships and their dynamic interplay, proponents of this perspective contend that the complete merger of relationship partners is not possible.

Although social exchange theories and the relational dialectics perspective provide explanations for the growth and deterioration of relationships, they do not centrally address the effects of messages exchanged between people. That is, in the case of social exchange theories, individual's judgments about relative rewards and costs are presumed

to be residues of verbal and nonverbal interaction; similarly, the dialectical contradictions that individuals report experiencing in their relationships ostensibly arise from communicative exchanges with relationship partners; however, actual message exchanges between partners are generally not examined.

Nevertheless, although not necessarily strongly motivated by theory, there has been considerable research interest in → *interpersonal conflict* in general and *marital conflict* in particular, much of it based on direct observations of partners engaged in social interaction (→ Marital Communication; Relational Control). Such studies have found that couples who display a demand–withdraw pattern of message exchanges when interacting with each other, such that one person makes a demand of the other and the other person responds by withdrawing, report lower levels of relational satisfaction than do couples who acknowledge and respond to each other’s demands in a conciliatory way. In addition, because emotional communication plays an important role in many different types of relationships, there is increasing interest in how the regulation of → emotions affects relationship development (→ Emotion and Discourse).

### DECEPTIVE COMMUNICATION

Many interpersonal communication researchers subscribe to the view that deception is an integral part of social interaction. So called “white lies” are commonplace in everyday social commerce. Some researchers have gone so far as to argue that deception is an important lubricant that enables the smooth operation of the social interaction machine. Many times these lies are told to help co-interlocutors save face when potentially embarrassing circumstances arise in social situations. For example, dinner guests might tell a host that the food they have just consumed was “wonderful” when, in fact, it was utterly horrible, and persons might tell acquaintances that new articles of clothing the acquaintances are wearing “look good,” when their true evaluation of the new clothing is highly negative (→ Politeness Theory). *Deception by commission* occurs when proffered information is at variance with the “true” state of affairs, as in the previous examples; however, deception may also occur by omission; i.e., individuals may intentionally withhold critical information so that others will draw erroneous inferences, as when a used car salesperson fails to reveal known mechanical defects present in a car to a prospective car buyer. The prospective buyer is left to infer that the car is mechanically reliable.

Although interpersonal communication researchers have expended considerable research effort on examining deceptive communication, there are relatively few theories of deceptive social interaction (Berger 2005; Miller & Stiff 1993). Nonetheless, there are at least two enduring questions concerning deceptive communication that have attracted considerable research attention over the years. One of these questions concerns the degree to which engaging in deception alters nonverbal behaviors; i.e., do truth tellers’ nonverbal behaviors differ systematically from those of individuals who are telling lies? The research germane to this question has focused on nonverbal behaviors because it is generally assumed that when people engage in deceptive communication, they can carefully monitor what they are saying but cannot necessarily control their nonverbal behaviors in ways that will make them appear to be telling the truth while they are lying.

Those employed in such fields as law enforcement and the military, as well as those who perform psychological counseling, have a great deal of interest in knowing when individuals are providing truthful and deceitful answers to their questions. In general, research findings suggest that no one nonverbal behavior – e.g., eye-gaze aversion, excessive leg movements, fast or slow speech rate, or changes in body posture – can be used as an indicator of deceptive communication across all individuals (→ Deception Detection Accuracy; Deceptive Message Production). Specific behaviors may be diagnostic of deceptive communication in specific individuals; however, no universal nonverbal indicator of deceptive communication has yet been identified.

Another enduring question investigated by interpersonal communication researchers is the degree to which individuals are skilled at detecting deception as they interact with others. In this case research has generally shown that most individuals are not very adept at detecting deception, even those whose professions frequently require them to ascertain whether people are lying or telling the truth, e.g., judges, counselors, and law enforcement personnel. One explanation for the apparent inability of most individuals to detect deception is the pervasiveness of the “truth bias.” The *truth bias* arises from the fact that in the conduct of everyday interpersonal communication, individuals must routinely assume that their conversational partners are telling the truth.

For example, when one friend tells another, “I went to the movies alone last night,” under most conditions it would be quite odd for the friend to reply, “Can you provide me with evidence to support that assertion?” Individuals involved in social interactions must assume that others’ utterances are truthful; after all, requiring co-interlocutors to provide evidence for the truthfulness of every statement they make in most conversations would make even mundane social interaction a torturous activity. Consequently, because individuals routinely assume others are telling the truth, it is difficult for them to detect deceit when it is being perpetrated. There is some evidence that deception detection accuracy can be improved with practice, but these improvements appear to be confined to those specific individuals who are observed on repeated occasions; there is little evidence of generalized improvement beyond those individuals who are observed.

### **MEDIATED SOCIAL INTERACTION**

Increasingly, social interaction is being accomplished through such communication technologies as computers with email and chat-room capabilities and mobile phones with text messaging and other communication features. Teleconferencing has become a commonplace in business communication. As the use of these technologies has become progressively more widespread, there has been a concomitant increase in research aimed at understanding their potential individual and social effects (→ Mediated Social Interaction; Online Relationships). However, technologically mediated social interaction is hardly a new phenomenon, having been possible on a wide scale since the advent of the landline telephone.

As was the case after traditional mass media such as film, radio, and television were introduced, research has investigated the potential deleterious effects of Internet use, such as Internet addiction and increased social isolation and loneliness, although evidence for the latter association is both scant and equivocal (Berger 2005). An inherent

difficulty in examining such effects is establishing causal directions of influence: Do high levels of Internet use induce people to feel socially isolated and lonely, or do people who are already socially isolated and lonely, for reasons other than Internet use, gravitate to the Internet to help them alleviate or cope with these unpleasant feelings? Do people with “addictive personalities” simply find Internet use to be another activity to which to become addicted, or does use of the Internet itself induce addictive behavior? Yet another, and perhaps more realistic, possibility in each of these examples is that both causal directions occur and interact with each other in a complex, reciprocal fashion.

Some researchers have observed that when individuals engage in anonymous computer-mediated communication (CMC), as they might in an Internet chat room or on email, they are more likely to act in ways that they would not if they were interacting with others face to face (FtF) or if their identities were known to others in the CMC context. Researchers have postulated both positive and negative possibilities in this regard. On the positive side, anonymous individuals communicating with others by CMC might assume new identities, personalities, or both that could help them cope with personal problems. For example, highly introverted and shy people who wish to overcome their social inhibitions might “try on” a highly extraverted and outgoing persona whilst engaging in CMC. The effect of this experimentation might be to move such individuals in the desired direction of becoming less shy and introverted. However, on the negative side, others have noted that this same cloak of anonymity may serve to embolden individuals to insult and attack others or to “flame” them, behaviors they would not normally display in most FtF interactions or in CMC if their identities were known to their co-interlocutors.

Just as the advent of television prompted both considerable speculation and research aimed at comparing the then-new medium’s potential effects, especially with respect to its visual channel, with those of older media such as radio, so too the appearance of CMC has precipitated considerable research aimed at determining how CMC and FtF interaction differ with respect to various outcomes associated with their use (Walther & Parks 2002). Because text-based CMC, as currently used in electronic mail (email), news groups, and chat rooms, filters out many nonverbal cues typically available to people engaged in FtF interactions, it is presumed, e.g., that communication via text-based CMC is more task focused than is FtF communication. Moreover, while relatively cue-deprived, text-based CMC venues may be quite useful for initially encountering and screening potential friends and romantic partners, they apparently do not afford sufficient information for developing close relationships. Individuals who initially meet in the text-based CMC world usually elect to communicate with each other through other channels, e.g., phone and FtF encounters.

These alternative communication channels afford their users potentially more rich and comprehensive samples of each other’s behavior. Although the ability to send pictures and live video in the CMC context may overcome some of this cue loss in the visual realm, there are certain nonverbal communication channels such as touch, pheromones, body temperature, and smell that are at once both highly significant in most close romantic relationships and currently difficult or impossible to instantiate in CMC. The unavailability of these channels in current, commonly used incarnations of CMC raises questions about

this medium's ability to help sustain close, romantic relationships over long distances (→ Long-Distance Relationships).

Because text-based CMC may serve to filter out personal information that might be used to understand people as individuals rather than as group members, some researchers have suggested that when groups use CMC to communicate with each other, the lack of individuating information about group members may foster stronger ingroup identity. Increased ingroup loyalty may serve to "deindividuate" people to the point where they are willing to stereotype outgroup members and behave negatively toward them. Although research has supported this possibility (Postmes et al. 2000), some have observed that these findings are limited to the domain of group-based CMC and may not apply in situations in which people are using CMC to interact with others on an individual basis (Walther & Parks 2002). Beyond the realm of CMC, under the aegis of human-computer interaction (HCI), considerable research evidence has been adduced to support the idea that people tend to treat computers and other communication technologies as if they are human agents, even when users know that they are interacting with a machine (Reeves & Nass 1996). Apparently, technology users cannot help imputing human-like qualities to the communication technologies they encounter in their everyday lives.

Given the rapid rate at which new communication technologies that enable mediated social interaction between people are being made widely available to the public, understanding how the use of these technologies affects communication in these modes and how prolonged use of the technologies may alter the nature of FtF interaction represents a challenge to communication researchers.

### OTHER RESEARCH AREAS

The six areas just considered do not exhaust the entire domain of interpersonal communication research. In addition to these theoretically defined areas are specific concepts in which interpersonal communication researchers have had an enduring interest. A few of the more important of these are now considered.

Everyday experience suggests that some individuals are consistently better able than others to achieve their goals during their social interactions. Some people appear to be able to induce others to like them (→ Ingratiation and Affinity Seeking; Impression Management) and others seem to be very effective at persuading others and getting their way (→ Power, Dominance, and Social Interaction). The skills associated with success in these and other social interaction domains can be subsumed under the term *communication competence* (→ Interpersonal Communication Competence and Social Skills). Much has been written about the communication competence concept, but there remains considerable ambiguity concerning its meaning; moreover, there has yet to be a theory that elaborates the concept. Some have suggested that communication competence might profitably be viewed as a theoretical term or domain of study rather than a single theoretical concept (Wilson & Sabee 2003).

There appears to be some agreement that communication competence refers to the degree to which individuals are able to reach their goals (effectiveness) and the extent to which goal achievement is accomplished in an appropriate manner (social appropriateness). In addition, some have suggested that efficiency may be another component of

competence; i.e., how quickly individuals are able to achieve their goals. Another point of convergence is that communication competence is not a generalized skill but is specific to different kinds of communication goals and situations. Thus, a parent might be very persuasive when conducting high-level business negotiations on the job but, at the same time, be quite ineffective at inducing a resistant son or daughter to finish his or her homework. Similarly, an individual might be very effective at offering social support and comfort to others (→ Social Support in Interpersonal Communication) but very ineffective at gaining compliance from others. Although most interpersonal communication researchers acknowledge that communication competence is goal- and situation-specific, as yet there is no typology of goals and situations that enables us to determine specific skill sets that are associated with various classes of goals and situations. This typology development task is one in need of attention.

As noted previously, much of everyday social interaction is organized around recurring goals that arise in the course of everyday living. The routines associated with everyday family and work interactions, and with daily transactions in business and commerce, encourage the development of communication routines in order to reach these recurring goals effectively and efficiently. If people had to plan consciously how to reach each of these recurring goals every day, the pace of social life would slow to a crawl. Instead, communication is routinized and can be enacted automatically when the occasion arises. Routinization of language use is pervasive; it has been estimated that up to 70 percent of adult language is formulaic (Berger 2005). The notion of communication routines may be related in some ways to communication competence. Competent communicators may be those who, in a given situation, have rapid access to communication routines that generally eventuate in goal achievement. Of course, the relationship between the availability of communication routines and communication competence rests on the assumption that the routines accessed are both effective and socially appropriate. A given situation may be nonroutine and require conscious planning effort; thus, the discerning communicator must be able to differentiate between those social situations that are routine and those that are not. This requirement for astute social discernment suggests that competent communicative action involves more than the production of effective messages. Accurate perception of others' circumstances, moods, and emotional states is a vital prerequisite to competent social conduct.

## **Interpersonal Communication Competence and Social Skills**

*Brian H. Spitzberg*

*San Diego State University*

Every act and artifact of communication is open to evaluations of its quality, i.e., how well it was accomplished. Because such evaluations involve individual and social judgments of communicative performance, especially in interpersonal contexts, and because virtually all relevant achievements of interpersonal communication depend on performance and subsequent evaluations, a theory of interpersonal communication competence is tantamount to a theory of interpersonal communication itself. Interpersonal communication competence and social skills are concerned with both the performance of communication and the evaluation of its quality.

*Interpersonal communication competence* is typically defined either as the ability to enact message behavior that fulfills requirements of a given situation, or as the subjective evaluation of the quality of message behavior. The first conception views competence as a set of abilities that enable repeated, goal-directed behavior that fulfills task demands of a particular communication context. If the context is a job interview, competent communication consists of the ability to perform the various behaviors identified as essential to a good interview. The judgment of what constitutes a good interview, however, brings with it a perceptual dimension that necessarily connects the ability perspective to the subjective evaluation perspective. What distinguishes good from not so good performance will necessarily vary somewhat from interviewer to interviewer, organization to organization, and culture to culture. *Social skills* are similarly defined as either the ability to perform various requisite behaviors in everyday interpersonal encounters, or the evaluation of the quality of performance in such encounters. These terms have been used

as synonyms, and historically the choice of one over another label has been determined more by their disciplinary origin (social skills in psychology, interpersonal competence in communication) than by any substantive distinctions.

## **HISTORY AND SOCIAL CONTEXTS**

The study of interpersonal communication competence and social skills developed as relatively independent literatures until the 1980s, when their mutual relevance began to be recognized. Many related terms evolved, including grammatical competence, referential competence, linguistic competence, conversational competence, social competence, developmental competence, psychosocial competence, interactional competence, literacy, and relational competence.

Both interpersonal communicative competence and social skills reflect highly diverse intellectual origins and research methodologies. Although the rhetorical tradition dating back to Aristotle (384–322 BCE) was most concerned with public oratory, it was in this tradition that the assumption took root of systematically codifying, learning, and adapting communication strategies to specific contexts, tasks, and audiences to produce desired impressions of the communicator (→ Rhetoric, Greek; Ethos and Rhetoric). Some of the ancient rhetorical scholars after Aristotle explicitly took up concern with more interpersonal kinds of contexts. Cicero (106–43 BCE), e.g., emphasized the importance of tact in ordinary conversation, and Quintillian (35–95 CE) emphasized the general art of speaking well (→ Rhetoric, Roman).

By the time of the Renaissance and after, stratification in society led to an interest in establishing codes of social conduct. Manuals for instruction in polite society reinforced attention to everyday social behavior as well as social boundaries and the distances between bourgeois and working-class (→ Rhetoric, European Renaissance). Parallel to some of these developments, the rediscovery of the ancient rhetorics by scholars in the 1700s and 1800s and the rise of the modern university led to an interest in teaching the art of rhetoric. Around 1900, at the point at which a split occurred between teaching English through writing and teaching it through oral performance, the communication discipline rediscovered its emphasis on performance instruction and evaluation. By the 1960s, traditional interest in public speaking expanded to include the study of communication in other contexts, including interpersonal communication (→ Speech Communication, History of).

In the field of psychology, interest in the nature of personality and its disorders, particularly the nature of mental illness, led to an ongoing interest in the nature of normality (Wine 1981). By the late 1800s, interest in mental hygiene and competence had produced the concept of the intelligence quotient, or a measure of a person's mental competence. By the 1920s, the concept of social intelligence was introduced as an analog, and early measurement efforts sought to determine its value as an index of deficiencies in basic social functioning. By the 1960s deficit models of social competence began to give room to more positive models of self-actualization and optimum performance. In particular, the assertiveness movement spurred extensive research in the specific behaviors entailed by a model of confident interpersonal self-expression and achievement of personal goals through interaction (Phillips 1985).

Parallel with these twentieth-century intellectual developments, the discipline of anthropology was beginning to identify the nature of different cultural codes of expression, varying across and within tribes, societies, and cultures (→ Speech Codes Theory). In linguistics, an interest developed in identifying the factors that enable coherent construction of grammar and sentences across languages. This interest ultimately split into studies of the psycholinguistic abilities (mental faculties describing potential and actual utterances) and sociolinguistics (linguistic enactments in actual social contexts).

A host of other disciplines independently developed interest in the assessment, instruction, and enhancement of social skills. Child development scholars seek to understand the developmental trends in communicative competence (→ Communication Skills across the Life-Span). Education scholars seek better instructional methods for teaching the social skills of students (→ Student Communication Competence). Business schools seek to better understand the communicative competencies required for employees, and the relationship of such abilities to organizational outcomes.

These diverse disciplines share a common assumption that interpersonal communication competence is integral to desired social outcomes. Individuals, peer relationships, marriages, families, friendships, organizations, communities, societies, nations, and international relationships are all assumed to function more optimally to the extent people are more interpersonally competent. This assumption led scholars to posit social skills as a model not only of individual mental health, but of the transformation of societies into more rational and democratic institutions (→ Habermas, Jürgen). A wealth of evidence does indeed link interpersonal communication competence and social skills to manifold social outcomes, including higher intelligence, happiness, psychological adjustment, peer status, educational attainment, marital satisfaction, job satisfaction, socio-economic status, and lower likelihood of depression, drug abuse, delinquency, criminal activity, conflict, stress, morbidity, and mortality (Spitzberg & Cupach 1984, 2002).

## **DIMENSIONS AND COMPONENTS**

Most approaches to interpersonal communication competence vary in the extent to which they attend to affective (motivation), cognitive (knowledge), behavioral, outcomes, or evaluation aspects of competence, or some combination of these. *Motivational approaches* tend to focus on social anxiety (→ Communication Apprehension and Social Anxiety) or goals (→ Goals, Social Aspects of). Whereas anxiety tends to be a factor that leads to communication avoidance and incompetent performance, goals are the terminal objectives communicators approach through their behavior. These factors tend to lie on opposite ends of the approach/avoidance continuum, but both can coexist (e.g., a person can be anxious about a job interview, but approach it nonetheless).

*Knowledge approaches* tend to focus on the mental processes by which communicative action is produced (→ Action Assembly Theory; Message Design Logics). One of the early and influential distinctions in studying the knowledge underlying communication was articulated by Noam Chomsky (1965), who argued for a dichotomy between competence (i.e., knowledge of language) and performance (actual use of language in specific contexts). Performance is contingent upon many factors, including motivation, skills, and environment. A theoretical model of language knowledge, in contrast, would describe

how an ideal speaker-hearer knows what verbal constructions would make a coherent sentence (→ Schemas, Knowledge Structures, and Social Interaction).

*Skills approaches* tend to focus on the behavioral contents or abilities that represent quality performance. Two common tributaries of skills approaches have emerged. The coding approach involves quantifying specific behaviors (e.g., gestures, eye contact, questions, assertions, etc.) and examining the extent to which these relate to partner or third-party impressions of competence. The factor-analytic approach (→ Factor Analysis) analyzes perceptual groupings across behavioral items (e.g., “She or he makes eye contact when interacting with others,” “\_\_\_\_\_ is good at asking relevant questions during interactions,” “I can assert myself and my opinion when I want to,” etc.) that presumably represent underlying skills such as attentiveness, interaction management, expressiveness, or confidence.

Finally, *outcomes approaches* tend to focus on the extent to which communication fulfills or violates expectancies (→ Expectancy Violation), or the subjective dimensions by which communication quality is evaluated (→ Implicit Personality Theories). The study of communication outcomes highlights the importance of the criteria by which competent performance is evaluated.

Most of the debate about criteria of interpersonal communication competence and social skills has revolved around a relatively small number of *evaluative dimensions*. Among the candidates proffered are understanding (or clarity, accuracy, fidelity, co-orientation), attractiveness, credibility, and efficiency. The two criteria most commonly associated with interpersonal communication competence are appropriateness and effectiveness. Effectiveness refers to the extent to which relatively preferable outcomes are achieved through communication. Appropriateness generally refers to the extent to which communication is viewed as legitimate within a given context. Most scholars accept the importance of both criteria, under the rationale that communication that achieves preferable outcomes through simultaneously appropriate interaction is likely to be optimally competent.

## RESEARCH MODELS AND CONTEXTS

There is no consensus on a particular organizing theoretical model of interpersonal communication competence and social skills. Michael Argyle (1969) brought together some of the concepts operating in cybernetics and feedback process models of the time into a model of social skills. In this model, an interactant’s motivation or goal instigates a process of translating perceptions into behavioral (motor) responses that effect changes in the social world that provide feedback to the person, who can then incorporate such changes into ongoing behavioral adaptations. This model was later elaborated by McFall (1982) through the addition of decoding skills (reception, perception, interpretation), decision skills (response search, response time, repertoire search, utility evaluation), encoding skills (execution, self-monitoring), and an observer’s subjective evaluation of the resulting performance. This model is more elaborate in contemporary communication models of interpersonal strategic interaction and message production.

Two influential articles posited essential *sets of component skills*, including empathic communication, descriptiveness, owning feelings, self-disclosure, behavioral flexibility

(Bochner & Kelly 1974), and affiliation/support, social relaxation, empathy, behavioral flexibility, and interaction management (Wiemann 1977). Spitzberg & Cupach (1984) popularized a motivation, knowledge, skills, context, and outcomes model to organize the diverse traits and processes necessary to explain competent performance and evaluation.

Exemplary research on interpersonal communication competence examines its role in phenomena such as depression, loneliness, and drug abuse (e.g., Segrin 2001). Other research on interpersonal communication competence in particular contexts examines its role in the intercultural adaptation of sojourners (e.g., Bradford et al. 2000), adapting to interpersonal or group differences (→ Communication Accommodation Theory; Intergroup Accommodative Processes), or adapting face-to-face skills to a computer-mediated context (e.g., Spitzberg 2006).

*Measurement* work is ubiquitous, and illustrates that there is little consensus regarding the assessment of interpersonal communication competence. Over 100 measures have been identified, and depending on the particular purpose of research, there are approximately a dozen measures available with sufficient research traditions to recommend their use (Spitzberg 2003; Spitzberg & Cupach 1989). Examination of the measures of interpersonal communication competence and social skills produces a list of well over 100 distinct skills attributed to competence (Spitzberg & Cupach 1984, 1989, 2002). Efforts to reconfigure interpersonal skills suggest that there may be more parsimonious models (e.g., Benjamin 1996; Spitzberg & Cupach 2002; Wish et al. 1980). Other approaches hope to reduce the lists of skills through the application of factor analysis techniques to identify a set of underlying dimensions (Bubaš 2001).

For example, any list of behavioral skills could include any or all of the following: topic initiation, open-ended questions, sentence completions, use of verbal reinforcers, intonation, use of gestures, gaze, eye contact, response latency, head nods, interruptions, touching, body posture and orientation, paralanguage, speaking rate, vocal volume, vocal quality, verbal fluency, self-references, facial expression, emotional disclosure (→ Disclosure in Interpersonal Communication), expressing opinions, clarifications, seeking clarification, use of humor, laughing, ownership statements, relative talk time, agreement, disagreement, apologies (→ Apologies and Remedial Episodes), and compliments.

Clearly, however, these labels are a gloss on the microscopic details of the composition of such behaviors, and just as clearly, this is only a partial list of potentially relevant skills. Furthermore, these skills are often not the meaningful units people use to make sense of their social interaction. More meaningful units are likely to occur at more molar levels of abstraction, such as adaptability, empathy, disclosure, attentiveness, → listening, comforting (→ Comforting Communication), immediacy (→ Empathy Theory), assertiveness, confidence, aggressiveness (→ Verbal Aggressiveness), conflict (→ Conflict Resolution), and so forth. That the former molecular skills map in some systematic way onto the more molar categories or inferences about performances is one of the leading measurement concerns of research (see, e.g., Dillard & Spitzberg 1984; Pavitt 1989).

There are five persistent *challenges to assessment of interpersonal communication competence*. The first problem is identifying the appropriate domain of skills. If there are over 100 skills, there is no consensual basis to determine which to include and exclude. A second problem is that skills exist at different levels of abstraction, so it is not obvious whether assessment should occur at the level of molecular skills (e.g., eye contact) or

more molar skills (e.g., assertiveness). A third challenge to assessment is whether to measure competence as a trait or state. It is not obvious whether interpersonal communication competence is highly variable or relatively stable across different kinds of contexts and times. A fourth problem is identifying the most appropriate judge of interpersonal communication competence. The locus of judgment can be a person-evaluated self, a person judging a conversational partner (i.e., an involved interactant), a person being evaluated by an uninvolved third party (e.g., a trained rater evaluating an anonymous interactant), or a person being evaluated by an expert judge (e.g., a client being rated by a counselor or instructor). A fifth persistent challenge is the differentiation between objective and subjective evaluations. There is no consensus on whether to measure behaviors through a coding process for their frequency of occurrence, or to forgo such labor-intensive approaches and rely on interactant subjective reports of their competence.

Future research may show promise from advances in theory development, such as expectancy theories of competence inference or theories of message production, in which the content of competence may be more specifically articulated. Progress may also result from application of the analysis of experts. Individuals identified as expert communicators in certain targeted interpersonal contexts (e.g., managers, negotiators, etc.) could be systematically studied to determine the skills they master that differentiate them from those more novice communicators in such domains.

## Interpersonal Communication, Sex and Gender Differences in

*Daniel J. Canary*

*Arizona State University*

*Beth Babin-Gallagher*

*Arizona State University*

Few topics interest lay people and scholars more than how men and women might differ from each other. *Sex differences* refer to behavioral variations between men and women based on biological differences; *gender differences* refer to behavioral variations between people due to cultural, sociological, and/or psychological differences. This entry focuses on the manner in which *sex differences* affect interpersonal communication behavior (→ Gender and Discourse).

Opinions abound regarding sex differences. Some scholars assume that men and women differ until proven otherwise, whereas others assume that men and women are similar until proven otherwise. And reputable scholars represent each side of the coin.

One way of deciding which side of the debate is more accurate involves the use of statistical tests to determine whether or not differences between men and women for a given sample might be generalized to a larger population. In general, the likelihood of finding statistical differences is relatively low. However, scholars who are prone to think that there are substantial differences between men and women often use nonstatistical, anecdotal evidence and qualitative analyses (e.g., Tannen 1990). Scholars who are prone to view women and men as being similar often point to large sample statistical summaries that frequently report small and inconsistent sex differences (e.g., Dindia 2006).

One should not look for sex differences everywhere, nor should one be too skeptical about sex differences. The pivotal issue concerns which behaviors reflect sex differences and under what conditions they occur. As one can imagine, sex differences have been explored with respect to many behaviors. Five domains of behavior illustrate where sex differences have been profitably examined in interpersonal communication: self-disclosure, relational maintenance, conflict management, supportiveness, and nonverbal messages. We briefly review each and offer related theoretic explanations for the findings.

### **SEX DIFFERENCES IN SELF-DISCLOSURE**

Generally speaking, *self-disclosure* refers to information about oneself that is shared with others (→ Disclosure in Interpersonal Communication). Since Jourard's (1961) early work on self-disclosure, numerous scholars have shown interest in sex differences in self-disclosure. Much research suggests that women self-disclose more than do men to friends, parents, spouses, and strangers. For example, women self-disclose more intimately and discuss more topics than do men in their friendships, and men and women differ in their expectations for intimacy in romantic relationships.

Although sex differences in self-disclosure appear to be consistent, the significance of those differences is debatable since the effect sizes reported in studies are generally small. Dindia and Allen's (1992) meta-analysis revealed that women generally disclose more than men to same-sex and opposite-sex partners; however, the average effect size across all studies accounted for less than five percent of the variance in disclosure behavior. Furthermore, sex differences appear to be moderated by the measure of disclosure. For example, larger sex differences were found for perceptions of a partner's self-disclosure, as compared to self-reports and observational ratings of self-disclosure (Dindia 2000).

### **SEX DIFFERENCES IN RELATIONAL MAINTENANCE**

*Relational maintenance behaviors* refer to ongoing actions and activities undertaken to keep one's personal relationships as one wants them to be (→ Relational Maintenance). Various maintenance strategies have been examined, but five common strategies are *positivity* (being upbeat and spontaneous), *openness* (discussing one's goals and relational agreements), *assurances* (stressing one's love and commitment), *social networks* (involving friends and family), and *sharing tasks* (doing one's fair share of the work). Several studies have found that women report using more openness and sharing tasks to maintain their close involvements than do men, and some research indicates that men are more likely to rely on positivity and assurances (Canary & Wahba 2006). Overall, however, a slight tendency

exists for women to engage in maintenance actions more than do men. Moreover, women's maintenance behaviors appear to affect both partners' relational quality more powerfully than do men's maintenance behaviors.

Equity theory concerns how fairly people treat each other and offers one explanation for the use of maintenance behaviors. People who are fairly treated tend to engage in behaviors to sustain their personal relationships to a greater extent than do people who are under-benefited or over-benefited (→ Social Exchange). Importantly, women's assessments of fairness are more salient than men's when predicting whether either person will engage in maintenance behaviors; that is, women's reports of how fair the relationship is tend to offer a more robust predictor of whether both partners use maintenance behaviors (Canary & Wahba 2006).

### **SEX DIFFERENCES IN CONFLICT COMMUNICATION**

Research involving conflict in personal relationships does not support the widely held stereotype of men as assertive animals and women as passive caregivers (→ Interpersonal Conflict). Rather, in contexts where they have familiar footing, women appear to be equally or more assertive and confronting than are men. Assertive behaviors include such tactics as attempts to discuss the problem, identifying causes for the conflict, self-disclosure, and so forth. Confronting, assertive behaviors include showing anger, blaming the partner, and putting down the partner. Men tend to engage in more avoidance tactics, including withdrawing from the situation and denying the problem.

Various explanations have been offered as to why women are more confronting than men (Canary & Emmers-Sommer 1997). One explanation focuses on how boys and girls tend to segregate into groups in the playground, with boys involved in team sports that rely on clearly defined rules of the game and girls engaged in less structured games that focus on relational interaction in lieu of scoring points. Because, on this view, girls develop their conflict negotiation skills whereas boys do not, women tend to want to discuss relational issues and details and men prefer to avoid them. An alternative explanation is that because women are less benefited in conjugal relationships with men, women have more to complain about (e.g., the division of household labor is often unfair to women). Unfairly treated women attempt to change the status quo that men defend through avoidance. A third explanation resides in how men tend to be very sensitive to their own physiological reactions to conflict and withdraw as the result of trying to retain self-control. Women, however, tend to ignore physiological reactions in their focus on attempts to solve relational problems.

### **SEX DIFFERENCES IN SUPPORTIVE COMMUNICATION**

*Supportive behaviors* occur when people enact communication to provide or to seek help (→ Comforting Communication; Social Support in Interpersonal Communication). Research has revealed sex differences in men's and women's supportive behavior, although men and women are more similar than different regarding supportive communication (Burlison & Kunkel 2006). Generally speaking, women are more likely than men to seek and provide emotional support (e.g., expressions of sympathy), attend to the other's

feelings, and engage in more highly person-centered (HPC) comforting messages (Burlleson & Kunkel 2006). Person-centered messages reveal an awareness of the various forces that impact the other individual. HPC comforting messages legitimize the other's feelings, whereas low person-centered (LPC) comforting messages criticize and deny the legitimacy of the other's feelings. A message's level of person-centeredness is a common criterion for evaluating the effectiveness of comforting messages. Both sexes report that HPC comforting messages are more feminine, sensitive, and effective than LPC comforting messages; however, studies have consistently reported that women view HPC messages somewhat *more* favorably and LPC comforting messages somewhat *less* favorably than do men.

Regarding partners' communication skills, both sexes report that relational partners' expressive skills are more important than their instrumental skills (e.g., advice-giving). Women tend to value expressive skills and men tend to value instrumental skills. Moreover, women rate the importance of pursuing emotion-focused goals in supportive situations slightly higher than men do, and evidence clearly indicates that both sexes prefer to discuss problems with, and seek and receive support from, women.

Scholars have examined sex differences in supportive communication using several theoretical frameworks (e.g., evolutionary, social role, skill specialization). Perhaps most central and controversial to the study of supportive communication is the different cultures thesis (DCT), which argues that men and women value relational features differently (e.g., instrumental or relational goals), and have distinctive speech communities that engage in cross-cultural communication (Tannen 1990). Opponents of the DCT indict its failure to account for sex similarities and argue that other theories, including social role theory and the skill specialization model, can account for sex differences in supportive behavior that are predicted by the DCT (e.g., Burlleson & Kunkel 2006).

## **SEX DIFFERENCES IN NONVERBAL BEHAVIOR**

Performing a meta-analysis of nonverbal behavior, Hall (2006) found that women display more nonverbal sensitivity and smiling than do men. That is, women tend to be more capable than men at reading cognitive and affective meanings conveyed nonverbally. This effect is largely due to women's superior reading of facial expressions but not vocal or postural variations. In a related manner, Andersen's (2006) review of the literature also pointed to women's ability to decode nonverbal meaning. In addition, Andersen found that men can decipher spatial nonverbal behaviors and mapping better than can women. For instance, men appear to be more capable at navigation and rotating three-dimensional objects mentally. And men appear to be more dominant when it comes to defining interpersonal distances used during interaction.

Explanations for nonverbal differences between men and women have relied on social as well as biological theories (→ Gestures and Kinesics). Social role theory (Eagly 1987) proposes that the division of labor has led to differences in how men and women relate to other people. Being the primary caretakers of the home and family, women tend to adopt a less assertive role in society and become relationally adept. On the other hand, men focus more on instrumental gains and take a less communal approach to other people. An alternative theoretic explanation derives from evolutionary theory, which posits that

men's larger size required them to hunt and to battle competitors (Andersen 2006). Due to their ability to breast-feed and to their smaller size, women remained at home and took care of children as well as injured warriors, which involved learning how to ascertain the meaning of nonverbal messages. And a combination of social role theory and evolutionary theory has been offered (Wood & Eagly 2002).

Sex differences certainly exist, but where and when they occur needs to be theoretically explained and not simply presumed.

# Interpersonal Conflict

William R. Cupach

Illinois State University

Interpersonal conflict occurs when individuals perceive their own self-interest to be incompatible with another person's interest, and the other person's actions undermine the achievement of self-interest. Such incompatibilities are commonplace in all kinds of interpersonal relationships, including those among friends, romantic partners, family members, and co-workers. Ironically, the opportunities for conflict are greatest in relationships characterized by interdependency and intimate exchange, such as marriage. It is through communication that conflicts are recognized, expressed, and managed.

## ISSUES AND SOURCES OF INTERPERSONAL CONFLICT

Numerous *sources of perceived incompatibility* can trigger interpersonal conflict. Sometimes one person's goal clashes with another's (→ Goals, Social Aspects of). Other times parties disagree about the means to achieve a common goal, or they mistakenly perceive incompatibility due to miscommunication or lack of communication. Conflicts often emerge when behavior violates expectations (→ Expectancy Violation) or runs contrary to social or relational rules (→ Communication: Relationship Rules). Under such circumstances, one person perceives another's behavior as annoying, inappropriate, interfering, offensive, or otherwise dispreferred.

Conflict issues can be inferred and expressed at various *levels of abstraction* (Braiker & Kelley 1979). At the most concrete level, conflicts stem from particular behaviors. These can range in seriousness from a one-time trivial irritation, to a cumulatively annoying habit, to a serious relational transgression. Meta-conflict occurs when disagreement pertains to the manner in which conflict is enacted (e.g., "I don't like it when you yell at me when we discuss our differences"). More abstractly, conflicts can reflect broader relationship issues such as power, intimacy, privacy, respect, trust, and commitment. Conflicts can also be about disagreeable personality traits. Conflicts about relationship issues and personality tend to be more serious and more difficult to resolve than conflicts about particular behaviors. One study found, for example, that the frequency of conflict regarding issues of power and trust was associated with relational dissatisfaction (Kurdek 1994).

A particular episode of conflict can revolve around multiple and sometimes complex issues, although they may not all be expressed. One person's complaint about another's particular behavior (e.g., failing to do laundry) might reflect a *hidden agenda*; that is, an unexpressed dissatisfaction regarding a broader relationship issue such as power or intimacy (e.g., who has more control in the relationship). Occasionally the source of conflict is not about the incompatibility that is expressed. In such cases the confrontational person creates a conflict to vent latent (and perhaps subconscious) dissatisfaction unrelated to the expressed conflict. For instance, a friend may criticize a companion's behavior, but the real source of discontent is a bad mood due to a stressful day at work.

## DIMENSIONS OF INTERPERSONAL CONFLICT BEHAVIOR

One common distinction used to characterize conflict behavior is its constructive versus destructive nature (Deutsch 1973). *Constructive conflict* conveys neutral or positive affect, assumes a collaborative orientation, and tends to be relationship preserving. Constructive conflict is reflected in behaviors that focus on problem solving, show respect, save face, share information, and validate each person's worth. *Destructive conflict*, on the other hand, conveys negative affect, assumes a competitive orientation, and tends to be relationship undermining. Behaviors that demean, ridicule, attack, and coerce are typically destructive (→ Verbal Aggressiveness). For example, Gottman (1994) identified a common destructive pattern of behavior in marital conflicts (→ Marital Communication). He found that distressed marital couples, compared to nondistressed couples, engage in personal criticism, which elicits contempt, characterized by bitter scorn and disdain. Contempt, in turn, leads to defensiveness marked by a whining tone, making excuses, and denying responsibility for untoward behavior. This can lead to stonewalling, which conveys smugness, icy distance, and unwillingness to participate in the conflict. When these behaviors become habitual and reciprocated, they undermine relationship satisfaction and are highly predictive of eventual divorce (→ Relational Termination).

Although negative conflict behaviors undermine interpersonal relationships, particularly when they entail the reciprocation of negative affect, there is also evidence that positive behaviors play a role in preserving relationships. Nondistressed married couples, regardless of whether they exhibited a high or low frequency of disagreements, tended to enact five positive behaviors for every one negative behavior during conflict interactions. Among distressed couples the ratio of positive to negative behaviors was roughly one-to-one (Gottman 1994). Partners prevent conflict interactions from escalating into chains of reciprocating negative behavior through *accommodation* (Rusbult et al. 1991). When a negative pattern of behavior emerges, one partner accommodates by resisting the impulse to respond destructively and makes an effort to put the discussion back on a constructive course. In addition, the negative effects of recurring serial conflicts are mitigated when partners provide reassurance by conveying relationally confirming messages (Johnson & Roloff 2000). Aside from the satisfaction that positive behaviors engender, they also help nullify the adverse relational consequences of negative behaviors.

When individuals perceive a conflict, they can choose either to confront the issue or avoid it. Although confrontation is most commonly associated with the occurrence of conflict, it is also common for individuals to avoid the expression of disagreements. In particular, people withhold their dissatisfactions when the issue is relatively trivial, when they see little hope of resolving the conflict, or when they feel that confrontation will yield irreparable damage to the relationship. The manifestations of conflict avoidance are varied, and include withholding complaints, deflecting another's attempt to confront, giving in to another's demands, repeatedly dodging a sensitive subject, and withdrawing from interaction.

Neither confrontation nor avoidance of conflict is always constructive or destructive. Effective confrontation can yield a host of positive consequences. These include promoting desired change, finding fair and creative solutions to problems, creating opportunities for mutual gain, defusing negative arousal, attaining mutual understanding, and developing

solidarity and a mutual sense of accomplishment. When confrontation goes awry, it can lead to polarization, stalemate, relationship damage, enmity, and even physical violence. Thus, strategic avoidance of some conflicts is necessary for interpersonal relationships to develop and be maintained (→ Relational Maintenance; Relationship Development). However, systematically withholding complaints is damaging to relationships when the avoided issues are important, recurring, and foster growing feelings of resentment.

One commonly studied pattern of conflict behavior, the *demand–withdraw sequence*, involves a dyadic combination of both confrontation and avoidance behaviors. During episodes of demand–withdraw, one person issues criticism and pushes to gain compliance while the other person resists confrontation and attempts to avoid the issue. Either demanding or withdrawing can initiate the sequence; demanding can lead to withdrawing, but withdrawing can also lead to demanding. Research indicates that chronic demand–withdraw patterns are often, but not always, associated with relationship dissatisfaction and dissolution (e.g., Caughlin & Huston 2002).

### FACTORS THAT INFLUENCE HOW PEOPLE RESPOND TO CONFLICT

People's beliefs about conflict in general can influence their orientation toward it. Some individuals, for example, regard conflict as negative. They believe that disagreement is destructive and confrontation should be avoided. Individuals with such beliefs respond to interpersonal conflicts in ways that damage their relationships, and they experience lower relational satisfaction compared to those who do not endorse these beliefs.

Individuals possess *mental schemas* that shape their expectations for how different types of relationships ought to operate (→ Relational Schemas; Schemas, Knowledge Structures, and Social Interaction). These schemas guide how individuals behave in their relationships, including how they manage conflict. For example, Fitzpatrick (1988a) demonstrated that there are different types of marriages, and different couple types possess different expectations about how to manage conflict (→ Marital Typologies; Fitzpatrick 1988b). *Traditionals*, who possess a conventional ideology of marriage and value closeness and interdependence, engage in overt conflict on particularly important issues, and exhibit less negativity in confrontations compared to other couple types. *Independents* hold an unconventional ideology of marriage and value both autonomy and interdependence in their marriage. They prefer to resolve disagreements through overt confrontation. *Separates* hold a conventional ideology of marriage and value autonomy over interdependence in marriage. Consequently, they prefer to avoid confrontation. Research regarding the role of schemas in conflict has been largely confined to marital relationships. Future inquiry should reveal how schemas in other kinds of interpersonal relationships (e.g., between friends, co-workers) influence conflict tendencies.

Relationship climate tends to foster a self-fulfilling character to conflicts. Satisfying relationships are marked by constructive management of conflict, which perpetuates the stability of the relationship. This is partly attributable to the tendency to possess positive illusions about one's partner (Holmes & Murray 1996). When the overall relational frame is positive, individuals idealize characteristics of their partner and downplay their faults by interpreting them in optimistic and trusting ways. These perceptual tendencies naturally militate against destructive conflict tendencies. In similar fashion, relationships

that are troubled are more likely to exhibit destructive behaviors and reciprocity of negative acts and negative affect. Such relationships lack the benevolent and optimistic appraisals that preserve relationships by diminishing the likelihood and intensity of negative perceptions and behaviors.

The causal and responsibility attributions one makes about another's conflict behaviors exert a particularly potent influence on how one responds to that behavior (→ Attribution Processes; Bradbury & Fincham 1990). Compared to individuals in stable and satisfying relationships, individuals in distressed or troubled relationships are more likely to view their partner's conflict behavior as global rather than confined to a single issue, stable rather than fleeting, and personality-driven rather than context-driven. Moreover, they perceive their partner's conflict behavior as intentional, blameworthy, and selfishly motivated. These chronic interpretations foster defensive, hostile, and otherwise destructive responses, which in turn, further erode relationship satisfaction and stability.

*Personality* also exerts an influence on how one responds to conflict. Individuals can manifest a conflict *style* that transcends situations and relationships. Some people behave in ways that are dispositionally competitive, cooperative, or avoidant. Agreeable individuals tend to enact constructive conflict behaviors whereas neurotic individuals tend to enact destructive conflict behaviors. Individuals who are characterized as verbally aggressive tend to engage in personal attacks, teasing, ridicule, and insults more than their less aggressive counterparts (→ Verbal Aggressiveness). Some people are thin-skinned and predisposed to take conflict personally. Because they feel persecuted, threatened, and hurt by interpersonal conflict, they avoid it (Hample 1999).

## Interpretive Journalism

*Brant Houston*

*University of Missouri*

Interpretive (or interpretative) journalism goes beyond the basic facts of an event or topic to provide context, analysis, and possible consequences. Interpretive journalists must have unusual familiarity with and understanding of a subject, and their work involves looking for patterns, motives, and influences that explain what they are reporting (Keller 1997).

For 150 years, interpretive journalism has waxed and waned, but levels of interpretation have generally risen since the beginning of the twentieth century, at least in US journalism (Barnhurst & Mutz 1997; → Journalism, History of). In other countries where news work developed primarily as a literary occupation, interpretation began and remained at the forefront. In Latin America, southern Europe, Africa, and elsewhere, the main content occupying key positions in newspapers, for example, is always interpretive rather than straight → news, which journalists in these regions consider mere chronicles.

Interpretive journalism overlaps with other forms of reporting (→ Investigative Reporting; Advocacy Journalism), in which journalists themselves, after interviews and reviews of

documents and data, assert who committed wrong or what caused failure. As in explanatory or narrative journalism (→ Narrative News Story), reporters make judgments regarding the most reliable sources and most trustworthy information.

Newspapers in the nineteenth century engaged in an early form of interpretive journalism by explaining events according to the ideology of an affiliated political party (→ Partisan Press; Party-Press Parallelism). A modern form of interpretive journalism began once the press became industrialized and independent of party control. During the muckraker era in the United States, for instance, reporters exposed unethical government and business practices and assigned blame for corruption (→ Muckraking). At the same time, the push to report facts without comment advanced within some newspapers and through wire services (→ Objectivity in Reporting; News Agencies; News Agencies, History of).

Journalists challenged the ideal of → neutrality and argued that the informational model did not provide citizens with an understanding of events such as World War I. Day-to-day journalism especially gave descriptive accounts that lacked context. So newspaper journalists began to incorporate original research into stories and express a point of view about events. The journalist → Walter Lippmann in 1920 urged reporters in *Liberty and the news* (Lippmann 2007) to base their work on facts combined with analysis. Journalism professor Curtis D. MacDougall encapsulated those concepts in his 1937 textbook *Interpretative reporting* (1987). He proposed that journalists explain what events mean and approach reporting aware of their biases, while offering a balanced viewpoint.

Some politicians criticized journalism that provided interpretation, saying that trivia, entertainment, and → commentary were replacing substance in reporting. By the 1950s, objectivity had come back into fashion in the United States and left unchallenged political demagogues, such as Senator Joseph R. McCarthy, who made false allegations against citizens. The lack of substantial questioning by the press led, in turn, to greater resistance to journalists acting as mere stenographers who hold up a mirror to events.

By the 1960s, interpretive journalism had moved toward personal and literary styles (→ New Journalism), so that the ideal of the detached bystander gave way to acknowledging journalists as participants in events. Investigation and advocacy then re-energized in the United States and Europe through the late 1960s and the 1970s.

During the US civil rights movement and the Vietnam War, traditional reporting of official statements without background served to promulgate misinformation, and journalists adopted an independent model of interpreting news, conducting adversarial interviews to challenge authority. The trend culminated in the investigative reporting that brought down the Nixon administration (→ Civil Rights Movement and the Media; Watergate Scandal). In subsequent years, particularly the 1980s, investigative reporters became more assertive and bolstered their interpretations by analyzing large databases (→ Precision Journalism).

Critics say interpretive journalism permits baseless comment and bias (→ Bias in the News), but journalists internationally may bring a strong point of view and stated politics to their work. For example, journalists in Nigeria and other African countries intersperse commentary and opinion throughout news articles. In western Europe, objectivity was never a central professional value, and German journalists in particular have seen opinion as superior to news (Donsbach & Klett 1993). Award-winning British reporter Robert Fisk urged journalists not to hesitate about expressing opinions in writing or challenging

government officials' assertions. Yet, in some cases, overstatements and fabrications by reporters or literary journalists have undercut interpretive journalism (→ Journalists, Credibility of). The reluctance of corporate media to offend the public also pressures reporters to limit interpretation in regular coverage (→ Commercialization of the Media; Commercialization: Impact on Media Content).

Commentary in broadcast news increased significantly toward the end of the twentieth century, especially for politics (→ Americanization of the Media). Echoing earlier complaints, media critics say the trend and journalists' negativity have exacerbated public skepticism. Surveys show that broadcast journalists in commercial media systems worldwide may spend more airtime analyzing a politician's comments than on giving the comments themselves, and growing negative coverage of political candidates has made voters cynical (Patterson 2002; → Negativity).

Today, leading journalists say the public will need more interpretive journalism because the → Internet offers complex information and unsupported opinion (→ Internet News; Citizen Journalism). Journalists suggest they can best sift through, organize, and present information understandably by offering factually backed judgments. Questions about impartiality will continue to dog interpretive journalists. Some media observers suggest that objectivity and impartiality will become more important as journalism globalizes, but journalists should pursue impartial reporting while recognizing their own cultural biases (→ Globalization of the Media).

# Interview

*Wiebke Möhring*

*Hanover University of Music and Drama*

*Daniela Schluetz*

*Aserto GmbH*

The term “interview” allows for several definitions. In this entry, all forms of the socio-scientific interview – also called → survey – are dealt with. The interview – along with content analysis and observation – is one of the three basic empirical instruments of data collection. It is defined as a planned and systematic situation in which knowledge is gained by human subjects. The aim is to generate individual answers, which in their entirety lead to the clarification of a (scientific) question. This method has been in use since the end of the eighteenth century. Significant impulses for its establishment and development in the field of mass communication were set by several mainly sociological studies. These were conducted in both scientific (by a group around → Paul F. Lazarsfeld) and applied (by George Gallup; → Election Surveys) contexts. Socio-scientific interviews are conducted to elicit subjective evaluations, judgments, attitudes or interpretations of an issue. Interviews are also conducted to measure both cognitive contents and behavior that cannot be observed. In mass communication, interviews are central to measuring the process, evaluating, and studying the effects of mass media use (→ Media Effects), as well as to examine the state and trend of → public opinion.

The interview’s basic idea is to give respondents the opportunity to express their personal views. In principle, this method is comparable to everyday communication. In an interview, however, this communication follows certain defined rules. Using specific linguistic stimuli, the respondents are motivated to react in a specific way (stimulus–response approach) – either in their own words or by using multiple-choice answers. The ruling principle is to measure communication by communication. This is at the same time the great strength and the great weakness of the method: the interview’s strength lies in its ability to measure a person’s mental state; its weakness is the respondent’s reactivity, which is caused by the communicative situation and the interaction between interviewer and respondent. An interview has two prerequisites: first, respondents must be articulate; second, they must be able and willing to provide information on the subject in question. Thus, they have to be conscious of their answers, or at least become conscious of them during the interview.

## THE SITUATION OF THE INTERVIEW

It is the social situation of the interview that sets this method apart from other forms of data collection. Interviewer and interviewee meet – either in person or via the telephone – in a seemingly everyday situation. The interaction, however, is not the same as in a normal conversation, where social roles are usually not so clear-cut. As opposed to natural social situations, it is necessary to avoid establishing social standards that create conformity. This, however, is hardly possible because besides the actual question – which

is considered the stimulus – several other parameters of the situation (e.g., mood, atmosphere etc.) can exert significant side-effects. Every question initiates a cognitive process in the interviewee that leads to an answer. More often than not, this process is related to certain personal assessments or judgments. Thus, instead of simply recalling attributes (i.e., reacting to the stimulus), the respondent acts according to the situation. That means the respondent perceives the parameters of the situation, rates them according to perceived possible consequences and expectations, and finally chooses the reaction that – in his or her opinion – best serves the goals.

Depending on the subject in question, specific situational parameters can have a “distorting” effect. Such a bias may stem from the interviewer or the respondent. An answer is described as biased when it is influenced by such a parameter and not just by the respondent’s attitude. Biasing attributes – the so-called interviewer effect – can have various forms. They may be apparent: such as the age, gender, education and profession, and ethnic or religious affiliation of the interviewer. Psychosocial attributes, however, can be of influence as well – the expectations and attitudes of the interviewer, for instance. In addition, the conduct of the interview itself, including verbal conditioning, eye contact, body language, and gestures, may have influence. To minimize such effects interviewers must be thoroughly trained. Some authors suggest that interviewers should be matched closely to respondents in vital personal characteristics wherever possible. As far as the respondents are concerned, particularities of the real situation – such as the presence of a third person – have effects on the answering behavior. Another form of bias is due to so-called response sets that are independent of any content. Most important here are acquiescence (the respondents try to give the seemingly accommodating answer) or the tendency for evasion. Another important influencing factor is the phenomenon of social desirability, which can be both person-related and situation-related. Social desirability may distort answers because of a perceived but unspoken norm (→ Social Desirability). None of these three phenomena can be avoided completely. Intelligent wording of the questionnaire, however, can at least minimize the problem.

## STANDARDIZATION OF THE INTERVIEW

There are many types of interviews. They can be distinguished on several dimensions: the degree of standardization, the number of persons interviewed at the same time, the chosen method, and the frequency of administration. With regard to standardization, one can differentiate between completely standardized, semi-standardized, and nonstandardized interviews. Thus, the roles of both interviewer and interviewee are framed by the type of interview. In the case of a completely standardized interview, the course of the interview is precisely predetermined. Both the questions and the multiple-choice answers are accurately phrased. The interviewer is obliged to follow the instructions accurately. Thus, all respondents receive the same stimulus so that their responses are based on exactly the same conditions. Attempts are made to control or eliminate any factors that might influence the responses, such as unwanted additional stimuli from the interviewer, or changes during the communication situation caused by the presence of a third person or similar (→ Interview, Standardized).

Semi-standardized or semi-structured interviews are often called guided interviews or, because they are often conducted by experts, expert interviews. This type of interview is

less well defined. The course of the interview is planned, but the interviewer is not bound to follow it strictly. The basic questions are written down beforehand, but only to remind the interviewer to raise the topics. He or she can decide upon the question order and the wording – just as the situation and the interviewee demand. Thus, he or she is able to adapt to the situation whenever necessary. At the same time, the respondents have ample scope to develop their answers and to contribute to the interview situation – and the research question. The advantage is that such an interview leaves room for spontaneity, unforeseen notions, subjective wording, and the individual behavior of the respondents. Despite the increased scope they allow, semi-structured interviews are comparable to one another. Non-standardized interviews are not structured at all and more closely resemble a “normal conversation” than other types of interviews. Only the essential subject is defined beforehand. The course and content are dependent on the situation and on the persons participating in the interview (→ Interview, Qualitative).

These three basic forms of interview can be conducted in different situations and in different ways. In principle, all forms can be used for individual as well as for group interviews. The standardized group interview, however, is restricted to filling out a standardized questionnaire. It is important to note that the social situation is different when an interview is conducted in a group situation. In addition to the relationship between interviewer and interviewee, interactions among group members can influence the situation dramatically. In principle, the same interview can be conducted only once with each respondent (cf. the problem of reactance of the respondents and its effects on the → reliability). Therefore, most interviews are conducted as one-time cross-sectional surveys. Nevertheless, some issues, particularly those on development and diversification, require repeated measurement. There are two basic approaches: (1) repeated interview on the same subject with different respondents (trend or tracking study) and (2) repeated interview of the same respondents at different times, which is called a panel (→ Longitudinal Analysis).

## **INTERVIEW MODES**

The traditional form is the oral interview conducted personally face-to-face. Depending on the research goal and the interviewees, other forms of communication are possible: via telephone or in a written form. Within these types of interview, there are different alternatives, particularly because of the increasing use of computers and the Internet (online interview). The choice of method depends first and foremost on the kind of information required and on the subject. The degree of standardization also plays an important role. The higher the degree, the simpler is the use of supplementary media such as paper, telephone or computers. Whereas guided interviews can also be conducted via telephone, this channel does not apply to open qualitative interviews. The choice of method is also determined by the budget, the time schedule of the study, and the information relevant to choosing the sample. In a face-to-face interview, the interviewer and respondent face each other. The interviewer asks the questions and records the respondent's answers. Thus, in a personal interview the social situation has the strongest effect. Face-to-face interviews offer a wide range of possibilities. The social presence allows for complex questions and those requiring mutual trust. Apart from linguistic stimuli, the interviewer is able to present nonverbal, visual, and optical stimuli (e.g., lists, brands, logos,

products, objects or other supporting material). At the same time, however, the interviewer is particularly responsible for the correct conduct of the interview. It is difficult to control the interview situation from outside; this involves both the presentation of questions and the logging of answers. Measures to secure the quality of the sample – particularly relevant in quantitative surveys – are also highly dependent on the interviewer.

In recent years, the computer has become increasingly important for conducting surveys, mostly for quantitative interviews. If computers replace paper and pencil questionnaire in personal interviews, the technique is called Computer-Assisted Personal Interviewing (CAPI). Normally, in a CAPI interview the respondents do not sit in front of a computer monitor, but the interviewer enters the answers for them on a keyboard (usually a laptop or hand-held computer). Some answers, however, can be keyed in by the respondents themselves to ensure privacy. The use of computers in a face-to-face situation offers both advantages and disadvantages. The advantages are the technical processing of the questionnaire and the accurate presentation of the questions. The disadvantages are a consequence of the medium itself – the possibility of technical failure, and the presence of the technical device itself altering the communication situation. In telephone interviews, interviewer and respondent talk to each other on the phone. Interviewers can fill out paper questionnaires or the interview can be conducted as a “Computer-Assisted Telephone Interview” (CATI). As telephone interviews are conducted swiftly, they are mainly used to measure spontaneous reactions to current events, to represent a current public opinion or a trend in the population. The telephone can also be used for expert interviews, particularly to facilitate recruitment and appointment. Apart from these aspects, the main advantages of the telephone are the speed of data collection and the low costs. A disadvantage, however, is that it is not possible to use any stimuli other than linguistic ones. Complexity as well as questionnaire length has to be adapted to the interview situation. Thus, the range of application is somewhat limited. In the case of international comparative studies, it has to be considered that in many countries outside the western world, telephone penetration is far from 100 percent.

The self-administered questionnaire differs most from personal and telephone interviews by the absence of an interviewer. The social situation is thus completely different, defined only by the respondents and their social environment. That means that the use of written interviews depends on the literacy of the country in which the interview is conducted. The questionnaire, together with a cover letter, can either be sent via mail to a sample of respondents or it can be delivered to them in person. In the case of an audience survey at a public event, interviewers may also hand over questionnaires directly to potential respondents. It is also possible to insert a questionnaire in a journal (reader survey) or leave it in a public place for people to take away (e.g., for visitors’ surveys). If completion of the questionnaire has to be “controlled,” it can be distributed to individuals or groups in a “classroom survey,” and respondents complete the questionnaire in the presence of a supervisor. A special type of interview is the survey via the Internet, the so-called online survey. The questions are presented online – i.e., on the world wide web or via email. This demands, however, that the respondents are familiar with the technique and that they have easy access to it. Written presentation can only be used in standardized or semi-standardized surveys. In answering the questions, the respondents are left to their own devices. They decide on the time and order of completion. Questions measuring spontaneous

reactions cannot be used here whereas questions demanding longer contemplation or even research of cognitive contents or facts work quite well. At the same time, though, the respondents' high self-determination is a disadvantage of the written interview. Self-selection of the respondents, i.e., the decision to participate, happens without any further personal persuasion to cooperate. The high level of nonresponse threatens the sample quality.

Additionally, some specific types of interviews have been established in media and communication research. A → Delphi study is a specific form of group communication with experts to predict particular circumstances. With the help of a (usually standardized) Delphi questionnaire, selected experts interact with each other anonymously. The goal of a Delphi survey is to jointly develop answers to specific problems by a repeated exchange of the results achieved. Mostly the aims are prognoses about the future (of communication, for example). A central difficulty of surveys in communication and media research is that they are mostly conducted independently of the actual media use in question. Usually, the respondents are interviewed after watching television or reading a newspaper, which demands a high ability to remember and to generalize. This is a problem because media use often takes place in low-involvement situations. Therefore, respondents may have difficulty reproducing their attitudes, behavior, motives or even emotional states with validity. Diaries can be used to solve this problem. A diary study is a written form of survey, which records the daily (media) behavior. The advantage of this method is that the respondents are only dependent on their short-term memory. The comparatively high effort necessary for this time-consuming method – for both the researcher and the respondents – is problematic, however. To avoid problems of retrospective measurement, the “Experience Sampling Method” (ESM) can be applied. The ESM requires the repeated application of a written questionnaire. Respondents are reminded (via telephone or SMS). The times of measurement are predetermined and chosen at random. Unlike the diary method, ESM mostly analyzes the quality of media use and tries to relate this to personal characteristics and/or situations.

### **SAMPLING AND METHODOLOGICAL PROBLEMS**

Almost without exception, all quantitative (and to a lesser degree, qualitative) surveys are conducted with samples. Thus, the quality of a survey is also highly dependent on the sampling method. Determination of the → reliability and → validity of an interview are problematic in principle, due to the high reactivity of this survey method. That means that the instrument has influence on the measured object, which is in consequence modified. It is impossible to conduct the same interview with the same respondents without the first interview influencing the second. Also, processing and problems of comprehension of the respondents influence the validity of the measurement. These problems cannot be solved – but they can be addressed with the use of high-quality interviews or by conducting → meta-analyses.

## **Interview as Journalistic Form**

*Steven E. Clayman*

*University of California, Los Angeles*

Within journalism, the interview is traditionally known as a tool for gathering story material (→ News Sources), but it is also a finished news product in its own right, a basic form journalists use to package → news for public consumption. This mode of news presentation was marginal in the newspaper era, when verbatim interviews only occasionally appeared in print, but has become more prominent since the advent of broadcasting and the emergence of public affairs programs organized around live or taped interviews. In moving from the backstage to the frontstage of journalistic practice, the interview has become a key component of the public face that journalism presents to the world.

The journalistic or “news interview” is a familiar and readily recognizable genre of broadcast programming. Its basis in comparatively spontaneous interaction distinguishes it from the fully scripted narratives and stories characteristic of traditional news programs. The news interview also differs from other interaction-based genres of → broadcast talk (such as celebrity talk shows or panel discussions) in its distinctive mix of participants, subject matter, and interactional form (→ Interaction). In a prototypical news interview, the interviewer is known as a professional journalist rather than a partisan advocate or celebrity entertainer (→ Advocacy Journalism; Celebrity Journalists). Interviewees are public officials, experts, or others whose actions or opinions are newsworthy (→ News Values). The discussion normally focuses on current events, is relatively formal in character, and progresses primarily through questions and answers. Close relatives of the news interview include the partisan interview, the celebrity interview, and the news conference.

### **ORIGINS AND INSTITUTIONALIZATION**

The news interview brings together representatives from two important social institutions – journalism and politics – and the history of the news interview intertwines with the co-evolution of these institutions (→ Journalism, History of).

Although it now seems natural for journalists to interview elected officials, political candidates, and other public figures (→ Political Journalists), it has not always been so. Interviewing for the record was virtually nonexistent in most societies prior to the mid-nineteenth century. In the United States, for instance, institutions of national government only gradually became publicly accessible, and even as the House of Representatives and later the Senate granted journalists access, verbatim quotations were normally prohibited. The aloofness of government officials was matched by the disinterest of most journalists. Newspapers during this period were financed by political parties and were vehicles for editorial opinion rather than reportage (→ Partisan Press).

The practice of interviewing began with the rise of the American → penny press in the 1830s, the first papers to devote themselves primarily to “news rather than views” and to employ reporters devoted to the task of news gathering. But published interviews with public figures did not become common journalistic practice until the late nineteenth century. This new form of journalism first expanded rapidly in the United States, and then more slowly in England and other western European countries, in part at the prompting of American journalists in Europe. This expansion did not occur without controversy; interviewing was frequently attacked as an artificial and unduly intrusive journalistic practice (Schudson 1994).

Although these criticisms would not disappear entirely, the news interview became more accepted as a journalistic practice in the early decades of the twentieth century. This development roughly coincides with the growing stature of journalism (→ Professionalization of Journalism), and the shift within government from backstage intra-governmental negotiations to → public relations as tools of governance. Accordingly, the three US presidents most responsible for institutionalizing the presidential press conference – Theodore Roosevelt, Woodrow Wilson, and Franklin Roosevelt – were all progressive reformers with ambitious political agendas, aiming to build public support for their policies. The advent of television made news interviews more prominent, as regular news programs became devoted to the questioning of public figures. With the collapse of the Soviet Union, news interviews and news conferences expanded in the emerging democracies of eastern Europe.

In short, what was once considered extraordinary has become standard practice across a range of democratic societies. Just as journalists once faced criticism for questioning public officials, now public officials face criticism if they fail to make themselves sufficiently accessible to journalistic interrogation. This development has, in turn, displaced the traditional story form of news (→ News Story), yielded a new generation of reporters and politicians skilled at asking and answering – or at least responding to – questions, and made individual journalists into celebrities.

## CONTEMPORARY NORMS AND PRACTICES

The news interview is not merely a reflection of journalistic and political institutions; it is also a *social institution in its own right*. A complex matrix of norms and conventions govern conduct within the news interview (→ News Routines), largely organized around the roles of interviewer and interviewee (Clayman and Heritage 2002a).

The most fundamental and pervasive characteristic of news interview interaction is that it unfolds as a series of questions and answers. This empirical regularity typifies news interview talk and is also a social norm that participants are obliged to uphold. The question–answer framework may seem obvious, but its very obviousness constitutes the news interview as a recognizably distinct form of interaction. Underlying this normative framework is a far less obvious substrate of practices necessary to produce interaction in manifest compliance with the question–answer norm. These practices include the systematic avoidance of acknowledgment tokens and other responsive behaviors (such as “Uh huh,” “Yeah,” “Right,” “Oh,” or “Really”), which pervade ordinary conversation but become incongruous in a context where the parties are supposed to restrict themselves to questioning and answering. Interview participants usually take for granted both the question–answer norm and the practices that underlie it, but they may become more fully conscious of the ground rules at contentious moments, at times appealing to such rules as a means of complaint or self-defense.

In building questions, interviewers are sensitive to two further journalistic norms that are difficult to reconcile. On the one hand, they are supposed to remain formally neutral in their conduct (→ Objectivity in Reporting). Absolute neutrality is an unattainable ideal, but interviewers do strive to maintain a neutral posture by restricting themselves to the action of questioning, avoiding overt forms of agreement and disagreement, and avoiding flat assertions except as prefaces to a question or as attributed to a third party.

On the other hand, interviewers are supposed to be adversarial and should not allow public figures to use the interview as a personal soapbox (→ Fourth Estate). Interviewers pursue the adversarial ideal in part through the content of their questions, raising alternative viewpoints and subjecting interviewees’ previous responses to challenge. They also pursue this ideal through the underlying form of their questions – designing questions in ways that narrow the parameters of an acceptable response, tilting questions in favor of one particular response over others, and encoding presuppositions that are difficult for the interviewee to counter or refute. Interviewers can enhance these adversarial elements by including statements before a given question. Prefatory statements are accountable as providing background information necessary to render the question intelligible to the audience, but the interviewer can mobilize them in ways that enhance control over the discussion agenda and exert pressure on recalcitrant interviewees.

The balance struck between the neutral and adversarial ideals is a signature that distinguishes individual interviewers, the news programs where they appear, and historical periods in the evolution of journalism. These ideals also balance differently during panel interviews involving multiple interviewees with divergent or partisan perspectives. The panel interview creates a division of labor that helps to reconcile the ideals of being neutral and adversarial. Partisan interviewees can play the role of adversary with one another, leaving the interviewer free to act as an impartial catalyst.

Interviewees, in responding to questions, face a different set of cross-cutting pressures. Adversarial questions create an incentive for evasive responses, encouraging interviewees to be less than forthcoming or to shift the discussion in a more desirable direction. However, the normative question–answer framework obliges interviewees to answer straightforwardly, so that failure to do so can be costly. Interviewers may counter such maneuvers with probing follow-up questions and negative sanctions; audience members

may infer that the interviewee has some ulterior motive for avoiding the question; and subsequent news coverage often singles out acts of evasion. Interviewees almost always design their evasive responses so as to minimize these consequences. They may choose to sidestep the question in an overt or explicit manner, which allows for equally explicit forms of “damage control,” the justificatory accounts and displays of deference to the interviewer. Or, when sidestepping the question covertly, they may take steps to obscure what is transpiring and thus maintain a facade of responsiveness.

### EVOLVING STYLES OF QUESTIONING

Comparative research on the news interview demonstrates that styles of questioning have changed substantially since the advent of broadcasting (→ Broadcast Journalism; Questions and Questioning). Journalists’ questions to public figures have become *less deferential and more aggressive* during this period. In US presidential news conferences, this shift is apparent not only in the growth of adversarial question content but also in formal properties that exert pressure on recipients (Clayman et al. 2006). Simple one-sentence questions have given way to increasingly complex questions with extended prefatory remarks embodying greater initiative by the journalist. Questions have also become more blunt or direct, and more assertive in their propensity to favor a particular answer. If this pattern reflects a general trend in interviewing, then journalists have come to exert greater pressure on interviewees to address inconvenient, unflattering, or incriminating topics.

The rise of more vigorous questioning appears to have developed somewhat differently in America and Britain (Clayman and Heritage 2002a). In Britain, a robust tradition of government regulation of broadcast journalism combined with the absence of competition before 1958 to foster a highly deferential style of questioning in 1950s → BBC interviews. When the BBC monopoly ended, the competition from a second channel fueled a sudden and dramatic increase in aggressive questioning. In America, where government regulation of broadcasting has been minimal and competitive pressures have been present from the outset, aggressive questioning has grown more steadily from a higher baseline. But for the case of presidential news conferences, the growth in vigor has been discontinuous. Questioning since 1968 has been substantially and consistently more aggressive than questioning in previous years, suggesting a paradigm shift in the White House press corps in response to the socio-political upheavals of the late Vietnam and Watergate era that has endured for several decades (→ Watergate Scandal).

Whatever its causes, the rise of aggressive questioning has transformed the journalistic interview into a more formidable instrument of public accountability. It is now more difficult for politicians to make purely self-serving statements in the context of a news interview. This revolution has stimulated a counter-revolution among politicians in the form of increasingly sophisticated tactics of prevarication and evasion, as well as strategic use of alternative communicative forms and media outlets (Jones 1992).

## **Interview, Qualitative**

*Wiebke Möhring*

*Hanover University of Music and Drama*

*Daniela Schluetz*

*Aserto GmbH*

At first sight, a scientific → interview resembles a common conversation, a qualitative interview even more so than a standardized one. Unlike a day-to-day conversation, however, such an interview takes place in an artificial situation, follows specific rules, and is conducted to reach a predefined goal. An open-ended interview can be conducted for two different reasons. It may be *explorative*, which means that it is used to gather a first understanding of a topic, a deeper insight into the relevant dimensions in question, and an idea of the terms used in describing these dimensions. An explorative interview is only the first in a series of other, usually standardized, research steps. A *qualitative* interview, on the other hand, is a method of inquiry in its own right. It is theoretically rooted in symbolic interactionism and Max Weber’s *verstehender Soziologie* (→ Symbolic Interaction; Verstehen vs Erklären). The great value of open-ended interviews lies in the fact that

respondents are allowed to tell it “their way” with a minimum of direction, thus offering their understanding of the topic in question in the context of and from their social position.

## **THE INTERVIEW SITUATION**

In an interview both participants actively construct some version of the world. Hermanns (2005) describes the interview as a stand-up “interpersonal drama” consisting of three dilemmas: first, the dilemma of vagueness: the interview has to contribute to answering the research question although its structure is and has to be quite vague; second, the dilemma of fairness: the interviewer must try to find out as much about the interviewee as possible without becoming disrespectful; and third, the dilemma of self-presentation: the situation must be as natural as possible although the interviewer is enacting a specific naïve role without disclosing his or her own self. To enact a successful drama, the interviewer has to create a situational frame by briefing the interviewee about the purpose of the interview and its rules. Furthermore, he or she must establish a rapport, creating space for the interviewee to open up and let the “drama” develop itself. As the interview situation is hardly standardized, the interviewer has to be familiar with the study’s aims and research questions. Furthermore, he or she has to be trained in the field of interviewing.

## **TYPES OF INTERVIEWS**

The rules of interviewing, noted above, vary from one type of interview to another. A fundamental difference exists between individual and group interviews.

### **Individual Interviews**

*Individual interviews* can be differentiated in terms of standardization. A classical standardized interview imposes a certain structure on the situation as it selects the theme and the topics of conversation, question order, and question wording (→ Interview, Standardized). Although qualitative interviews never follow a strict question–answer scheme, there are semi-structured and unstructured types of interviews. The former select a theme and certain topics without a strict order and specific wording. The latter do nothing like that, which leads to a more interviewee-controlled situation. All forms, however, have one thing in common: the essence of a qualitative interview is that it seeks to discover what may account for certain kinds of behavior. It seeks deeper understanding of factors, sometimes covert, that influence behavior, media use or certain attitudes. It is an intrinsically subjective technique. It cannot and does not seek to produce statistical evidence but it is able to provide unique insights into the motives and aims of a certain kind of behavior or the foundation of a specific attitude. Qualitative interviews, especially individual ones, offer the possibility of retrieving unconscious motives, attitudes, and goals. In talking, the interviewee may give himself or herself certain cues that elicit comments or statements that would not have surfaced in a standardized interview. Types of semi-structured interview are the topic-guide interview and the problem-centered interview, a mix of topic-guide questions and narrative episodes. Interviews with experts usually use a topic guide as well and can thus be subsumed under this point. Merton and

Kendall's focus interview is semi-standardized as well. As it is used as a group technique more often today, it will be discussed under that heading, below. Unstructured, open-ended interviews aim at understanding the respondent's notions and attitudes. They are also called in-depth interviews, a term that derives from clinical interviewing. There are several types of in-depth interviews. Narrative interviews, for instance, reconstruct social events as first-hand experience via storytelling. The underlying notion is that stories are rather based on actions and plots and less influenced by ex post rationalizations. Biographic interviews aim at understanding people's lives, and ethnographic interviews are usually integrated into studies of participant observation to provide so called "thick descriptions" of the complexities of everyday life.

### Group Interviews

Lunt and Livingstone (1996, 80) describe the *group interview* method briefly as bringing together a group of subjects to discuss an issue in the presence of a moderator, who ensures that the topic of discussion stays in focus, while eliciting a wide range of opinions on that issue. It is important that he or she does not lead one-to-one conversations but stimulates a dialogue between the group members. The moderator's role varies depending on the research goals. He or she will intervene less if the discussion is more explorative. Usually group discussions are face-to-face-interviews. Due to technical developments, online discussions are possible as well (chats). It is important to note that a group interview is not an easy way to elicit a range of opinions from different people at the same time and, thus, a means of speeding up social research. Group dynamics will interfere with every single opinion. Group interviews should, therefore, only be conducted if the research topic in question has to do with social interaction (like notions of → public opinion). Interview groups can consist of existing social clusters that already share common experiences. Thus, the discussion is more authentic. Groups can be established specifically for the research situation. Such ad hoc groups are usually more flexible in terms of topic. They may be heterogeneous or homogeneous as regards relevant, usually socio-demographic, categories. The former may have different conversation styles, inhibiting the discussion. On the other hand, different perspectives are brought into the discussion. Interview groups usually comprise 6–10 persons and take place in a rather informal setting. The moderator has to monitor "a complex social situation, encourage contributions, and manage disruptions, diversion, and other problematic group dynamics" (Lunt & Livingstone 1996, 82). He or she usually uses a discussion schedule comparable to a topic guide in an individual interview.

Usually each group discussion is conducted once, although one can repeat meetings of the same group if necessary. One should run discussions to the point of theoretical saturation, i.e., until the last group has nothing new to add. The "right" number, therefore, depends on the topic at hand and the productiveness of the groups. The origin of group interviewing lies within the Frankfurt School and their concept of "group opinion." This opinion is said to be the product of collective interactions rather than the sum of individual beliefs. Group opinions can be made visible in a group interview situation. Two basic approaches can be distinguished. Merton (1987) coined the term "focus group" to describe a method of generating hypotheses and research questions in a

group situation. He used a focus, usually a short film or an ad, to concentrate the respondents' attention on a particular issue or topic. Focus groups, to him, offer the possibility of identifying the salient dimensions of a complex topic to complement further quantitative research (explorative approach). In the realm of the Centre for Contemporary Cultural Studies (CCCS; e.g., Morley, Willis), another understanding was established, that of "group discussions." This approach was based on the notion that meaning is created socially. The interactive nature of a group discussion makes this process both visible and understandable. The groups are representatives of real social entities such as classes, and thus share common interpretative codes that are represented within the discussions. Commonly, group discussions like this are very much open-ended and try to document the rise of certain theoretical aspects with limited interference by the moderator. The main difference between the focus group approach and the group discussion is that the latter enables the representation of results that can thus be generalized.

### **ANALYZING QUALITATIVE INTERVIEWS**

The interviews, be they individual or group discussions, should be audio- or video-taped in an unobtrusive way and later transcribed. The level of detail of the transcript depends on the aim of the study, as well as on the involvement of paralinguistic features like voice tone or pauses. The transcripts are analyzed manually or by using specific software. Two ways of analyzing can be distinguished, theoretical and thematic coding (→ Content Analysis, Qualitative). The latter uses a priori categories; the former works on the material to built categories (open coding; Glaser & Strauss 1967; → Grounded Theory). In both the guiding principle is the exchange between the material and the (emerging) theory in terms of a circle. The main focus varies between interpretative sensitivity and systematic coding (Lunt & Livingstone 1996). The aim is the reduction of complexity and the finding of structures. This method is rooted in Foucault's theories, and analyzes the dependence between conversational actions and social structures.

### **SAMPLING IN QUALITATIVE INTERVIEWING**

Qualitative studies usually search for the special rather than the general. Therefore sampling does not strive for representativity. As the population is usually not known beforehand, this would be a problem anyway. More relevant sampling criteria are accessibility and typicality, as the aim is not to generalize but to generate variance. Two sampling methods are used in qualitative studies: classic and theoretical sampling. The former uses an a priori matrix based on specific characteristics to choose the subjects. The latter evolves while the research is in progress based on the collected findings. A convenient and therefore frequently used way of sampling is the so-called snowball method, where one research subject gives the names of other possible participants. This method is convenient but often leads to clustered samples.

## **Interview, Standardized**

*Wiebke Möhring*

*Hanover University of Music and Drama*

*Daniela Schluetz*

*Aserto GmbH*

Quantitative surveys are usually comprised of standardized interviews that are conducted using a questionnaire. The term “standardization” describes the pre-determination of the course of the interviews. In a fully standardized questionnaire each respondent is presented with the same stimulus, i.e., an equal question. Therefore, the reaction (i.e., the answer) is comparable to that of another respondent. The aim of a standardized interview is to avoid disturbing factors as far as possible. Usually, however, not all bias can be eliminated, which is why one should at least try to keep it constant. In standardized quantitative surveys, this means that the wording of all questions and response items is identical for all respondents. Furthermore, the sequence of the questions is specified exactly and the social situation should be constant in every interview.

Standardization aims at comparability of results as an important prerequisite for generalization and representativity of the whole survey. Quantitative surveys are able to produce results that are considered representative for the part of the population that participated in the interview. Besides using a specific sampling technique, this is achieved by a high degree of standardization and by complying with specific criteria regarding selection, training, and control of the interviewers. In media and communication research, quantitative interviews are a central → survey instrument because representative results are often sought. Quantitative surveys are used for large samples and to make

(representative) statements about the population as a whole or specific parts of it. This, for instance, may be the case in the field of political communication (e.g., election research; → Election Polls and Forecasts; Election Surveys) as well as in reception and effects research (→ Media Effects).

### **MODE**

Several modes or methods of conduct are possible when implementing a quantitative interview. The main differentiation is the communication channel used. Quantitative interviews can be conducted orally, either in person (face-to-face interview) or via telephone. They can also be carried out in writing. All three forms may be supported by use of the computer (→ Interview). The interview situation will change significantly according to the use of the different modes.

### **INTERVIEW SITUATION**

In a standardized survey, researchers collect socio-scientific data using a highly formalized instrument. The resulting communication situation has a functional character that is strictly defined beforehand. This leads to an artificial social situation in this type of interview that differs distinctly from other kinds of everyday communication. As a rule, strangers meet in an asymmetrical communication relationship – one person asking questions, the other one providing answers. Moreover, both the situation itself and the respondent's answers are socially without consequences. Also, because of the required degree of standardization, the interviewer acts in a highly functional and formalized manner and, thus, quite unnaturally. The wording of the questions and response items is accurately defined, as is the question sequence, and the use of lists, card games (to support the answering process) and the like.

### **INTERVIEWER AND RESPONDENT**

Compared to qualitative interview forms (→ Interview, Qualitative), in a quantitative interview the interviewer has hardly any scope. This is necessary to make sure the standardization serves its purpose. To narrow the scope even more, researcher and interviewer are usually not one and the same person. Interviewers should scarcely know about the purpose of the survey so that they will not be able to influence the respondent (interviewer bias). Instead, they are restricted to the role of a professional interviewer who is able to motivate the respondents to participate and to handle the questionnaire technically well. Their purpose is to set the stimulus. The question then directly activates a multilevel cognitive process consisting of at least five steps (Schwarz & Oyserman 2001, 129). The interviewee has to (1) understand the question, (2) recall the relevant behavior, (3), make inferences and estimations concerning this behavior, (4) adapt his or her answer to fit the response format, and (5) edit the answer for reasons of social desirability. This process implies that “people know what they do and can report on their behavior with candor and accuracy, although they may not always be willing to do so” (Schwarz & Oyserman 2001, 129).

## **STEPS OF A STANDARDIZED SURVEY**

A quantitative survey is normally based on a particular research question and conducted according to a specific pattern. The question is divided into dimensions and those relevant for the study are selected. By using indicators, these dimensions are operationalized and transferred into the questionnaire. The final version of the questionnaire is subject to a pre-test and afterwards submitted to the selected sample. Subsequently, the data are transferred into a data processing program and statistically analyzed.

Each of these steps is prone to error and has to be conducted meticulously to guarantee methodological quality. The → operationalization of the research question, i.e., the wording of the questionnaire, is a particularly important step. In a quantitative interview, formalized questions are asked to collect information. It is important that all respondents should understand these questions in the same way. Normally, though, different parts of the population have a different understanding of the same term. Also, different frames of reference are possible. Additionally, in most cases one cannot directly ask what the researcher is interested in but one has to use the indicators defined beforehand.

Therefore, particular attention has to be paid to the question phrasing in a quantitative survey. The research question has to be properly “translated.” First, this requires the predefinition of the indicators that have to be collected. Second, they have to be phrased in a language comprehensible to all respondents. In a good questionnaire, the researcher’s frame of reference – i.e., the dimensions of the question that are to be considered – is transferred into questions that are adequate to the respondents’ frame of reference. In methodological research, this aspect is the subject of many studies because the survey’s → reliability and → validity depend on the quality of the questions and the respondents’ understanding of them.

## **UNWANTED EFFECTS IN QUANTITATIVE SURVEYS**

When wording questions, unwanted effects may arise. These effects can be the result of response order and so-called “non-opinions.” An order effect occurs when respondents choose an answer because of a formal reason instead of a content-related one. For instance, they tend to prefer either the first (primacy effect) or the last (recency effect) item in a long list. The unwanted effect called non- or pseudo-opinion occurs when respondents tend to answer questions although they do not have (or cannot have) an opinion about the subject. This problem can only present itself when using closed questions, of course, because multiple-choice answers enable the respondents to venture a guess. When they are asked to give evaluations with the help of a → scale, they often tick a medium position. If no middle position is given, new problems of pseudo-opinions may arise when respondents choose an answer at random.

Unwanted effects may also arise due to the sequence of the items because questions (and their answers) can influence the answering behavior in subsequent questions (context effects).

## **TYPES OF QUESTIONS**

Survey questions have to be clear and concrete, explicit, and nonsuggestive. Generally, there are two types of questions: open-ended (also “free answer”) and closed ones. In

open-ended questions, no alternative answers are offered; the question itself provides the frame of reference. Within this frame, respondents can express themselves freely. Such questions should be used sparingly in a standardized interview. They may be useful if the range of possible answers is too broad to be given (e.g., “year of birth”) or if the respondents’ exact choice of words is to be maintained, if the range of answers or spontaneity is important. One has to be aware that analyzing open questions in a standardized interview is very time-consuming. Also, open-ended questions are laborious for both respondents and interviewers, and the responses obtained are not always significant.

Therefore, mostly closed questions are used in standardized interviews. Unlike open-ended ones, all alternative answers are presented next to the question itself. Closed questions enable the researcher to compare respondents as the answers define the frame of reference. Thus, these categories guide the respondents more strongly and constrain them at the same time. Therefore they are regarded as more valid and reliable. Considering the cognitive process described above, the response items should be worded at least as meticulously as the questions. Respondents infer the respective significance from the questions and response items, and use them as a source of information on “usual” behavior (Schwarz & Hippler 1987).

There are various forms of closed questions. They may be simple alternative questions, multi-choice questions with a range of possible answers, ranking scales to measure order, or rating scales to measure intensity. The scale types can be classified as nominal, ordinal, or interval according to the data level they produce. Scales are used to measure attitudes, evaluations, and opinions but also activities. Using scaling techniques allows the measurement of non-observable states “within” a person, such as hypothetical constructs or emotions, preferences or evaluations. Rating scales may be presented as verbal scales, numeral scales, or visualized versions.

# Intimate Talk with Family and Friends

*Todd Sandel*

*University of Oklahoma*

Intimate talk with family and friends can be examined as a product, process, or resource. It is a product of a relationship that has become intimate over time. This is the focus of studies involving social penetration (Altman & Taylor 1973) or social exchange theories (Thibaut & Kelley 1959), which find that as one person self-discloses, the other may reciprocate and the relationship becomes closer or more intimate. A different understanding comes from seeing intimate talk as process: speakers co-construct meaning and through talk create the relationship. This is the focus of scholars interested in → conversation analysis. Standing between these two approaches is intimate talk as resource, whereby speakers are competent in the performance and interpretation of certain forms of talk, such as joking or greeting, and intentionally use these to create, index or point to, and sustain intimate relationships. This is the focus of studies in such fields as sociolinguistics and the → ethnography of communication.

## INTIMATE TALK AS PROCESS

In an oft-cited study, the prominent conversation analysts Jefferson, Sacks, and Schegloff (1987) studied laughter in everyday conversations (→ Voice, Prosody, and Laughter). They found laughter occurs at strategic points, e.g., at the completion of speaker turns. Laughter may occur as a component of “improper” talk, or talk that is marked as rude, obscene, or profane, and marks a move from non-intimate to intimate talk. That is, when one speaker utters such words as “orgasmic” or “diarrhea,” the other speaker may laugh at length and show appreciation, or laugh and show “affiliation” by carrying on and contributing to the talk. For example, when one person said “syphilitic,” the other laughed and then said, “I keep running tests onyuh I know yer not” (Jefferson et al. 1987, 167). This indicates topics considered “improper” are evaluated and marked through laughter, which may signal the process of moving to more intimate talk among friends.

A study by Kitzinger (2005) also looks at intimate talk as process. In a classic lecture, Sacks (1972) explained the sentences, “The baby cried. The mommy picked it up” as providing speakers with membership categories upon which they decide appropriate activities. That is, upon hearing these sentences, the reader assumes the baby belongs to the mother and thus it is appropriate for her to pick it up. Kitzinger (2005) applied this to an analysis of recorded telephone conversations between patients and “after hours” doctors in the United Kingdom. (“After hours” doctors are those with no specialization who work 24-hour shifts answering phone calls from unknown patients.) She found that when the caller utters a kinship term, such as daughter, wife, or husband, the doctor assumes the caller lives with the patient and has intimate knowledge of the sick person’s condition. However, when other kinship terms are used, such as grandson or boyfriend, or non-kinship terms such as friend or “the lady,” the doctor does not assume intimate knowledge of the condition. Thus, these terms play a role in how speakers make on-the-spot

evaluations of the degree of intimacy of relationships, demonstrating how talk is co-constructed as a process.

### INTIMATE TALK AS RESOURCE

Hymes (1974), who first articulated the ethnography of communication, helps us understand intimate talk as resource. As children mature into adulthood it is necessary that they develop “communicative competence.” They must learn not only the language of their community, but also the rules and norms which guide the performance and interpretation of speech. One important part of communicative competence is to know how to perform “speech acts,” a minimal unit of speech such as a joke or greeting. One well-known example of a speech act as a resource of intimate talk comes from Basso’s (1979) observations of talk among the Western Apache. Over several years he observed joking imitations of “the whiteman.” In each performance the speaker code switched from Apache to English and selected a status-role of Anglo American (e.g., doctor or tourist) and contrasted it with a Western Apache one (e.g., patient). The Anglo American role was exaggerated and marked by verbal and nonverbal behaviors that contrasted with proper Apache behavior: pointedly and loudly asking, “How are you?” while shaking the hand in an accentuated up-and-down fashion, speaking loudly, inquiring about the other person’s health. Each performance would end with the evaluative comment, “White men are stupid.” Basso found these joking performances were considered to be both funny and dangerous. They were dangerous because the joke could be taken in the wrong way and they functioned as a social commentary on proper Apache behavior. These jokes were performed among people who were family members or intimate friends. Such jokes were a resource of intimate talk, both indexing the nature of the relationship – because we are close I can joke with you – and building the relationship – by joking I make our friendship stronger.

Another example of a speech act (→ Linguistic Pragmatics) for intimate talk is found in a study by Sandel (2002). He looked at greetings involving the use of kinship terms in Taiwan. When visitors enter a home or place where adults and children are present, be they kinfolk or familiar others, children are instructed to “address” the visiting adult with an appropriate kinship term, such as *A-yi* (auntie) or *Shu-shu* (uncle). Following this greeting, the child may be praised – “You are so well-behaved!” – conversation among the adults may begin, and the child is then free to remain or leave. It is not required that the adult reciprocate and use a kinship term to address the child. Adults in Taiwan see this speech act as important because it demonstrates the child is polite and has been taught well; it shows the child understands what is proper behavior and is grasping moral teachings of right and wrong; and the child learns that he or she is a member of a world inhabited by family members related to one another, indexed through a complex system of kinship terms based on generation, birth order, and gender. For example, members of younger generations must use the appropriate kinship term to address their elders, while elders may address younger by name; the term for older brother (*gege*) is not the same as younger (*didi*); and the term for mother’s sister (*A-yi*) is not the same as brother’s sister (*Gu-gu*). Finally, when children do not use kinship terms to address family members, this is interpreted as indexing problems with the relationship. For example, one boy’s parents

moved to the city to work and he remained in the country where his grandmother cared for him. During holidays or weekends when his parents returned, the boy did not address his parents as “daddy” or “mommy.” His inability to utter these words was interpreted as his lacking an intimate relationship with his parents.

The above examples draw attention to cultural differences when looking at how intimate talk is performed and interpreted. Many other examples of culturally shaped talk can be found. Among the Beng of West Africa, young children, like those in Taiwan, are taught to properly greet others in the community using kinship terms (Gottlieb 2004). However, unlike children in Taiwan, they are also taught to tease and use “dirty names” with certain relatives. For example, a mother will call her son, “Shit prick!” and a young child is considered “cute” when shrieking “You red balls!” to his grandfather (Gottlieb 2000). These are utterances used as resources to create intimacy not only with kinfolk, but with anyone in the village who can be considered as kin. Likewise, Schieffelin (1990) found that among the Kaluli of Papua New Guinea, mothers instruct children how to interact with their siblings, using different methods according to sex. A mother will encourage same-sex siblings to ask for company and assistance. Boys, however, are taught to tease and provoke their sisters. Schieffelin explains that these ways of interacting are carried on into adult life as brothers who live in the same village cooperate on a number of tasks. Sisters cooperate in gardening and household tasks as they grow up, but upon marriage usually move to other villages, where they establish cooperative networks with other women. Thus, children’s knowledge of how to interact becomes a resource they use in adulthood to guide competent and cooperative communication.

### **CODE SWITCHING IN INTIMATE TALK**

A final way for understanding intimate talk with family and friends as resource is informed by studies of code switching. As a majority of people in the world speak more than one language, the ability to code switch, or shift from one language to another, is a common, everyday practice. Communication accommodation theory (Giles et al. 1973) finds that among bilinguals, the more effort a speaker makes to converge, the more favorably this is evaluated, and the greater the sense of social and individual integration. For example, if I am a Canadian bilingual, and I speak French with a Canadian who identifies as Québécois, our speech will converge and our sense of solidarity grow.

Taiwan is another context where most people are bilingual and code switching is used as a resource for creating intimacy (Sandel et al. 2006). While *Tai-gi* (also called *Hokkien*, Taiwanese) is the Chinese language spoken by the majority of the population, Mandarin Chinese (mutually unintelligible with *Tai-gi*) is Taiwan’s official language. Furthermore, from 1945, when control of Taiwan was handed over to the Chinese Nationalists, until 1987, when martial law was lifted, the government pursued a language policy actively promoting Mandarin and limiting and repressing “dialect speaking.” In recent years the political climate has changed and the government is now promoting the learning of “mother tongues” in addition to Mandarin, as many children grow up learning to speak Mandarin only. These language policies and practices affect people’s everyday interactions. For example, it is common for a bilingual adult to see an elderly person and speak to her

in Tai-gi, and a child in Mandarin. However, when talking to another middle-aged adult, the choice is not always clear. The conversation may begin in Mandarin; a switch to Tai-gi, however, may occur if the speakers discover they are both *benshengren*, or native-born Taiwanese. This then changes the nature of the relationship as the feeling becomes “more intimate” and the relationship is drawn closer. In sum, we find that intimate talk with family and friends can be understood as product, process, and resource.

# Intrinsic and Extrinsic Motivation and Volition

Tilo Hartmann

Free University Amsterdam

Intrinsic and extrinsic motivation and volition are important constructs in research on → selective exposure to media. Building on recent psychological theories of action (Gollwitzer 1990; Heckhausen & Kuhl 1985), media exposure results if a person develops an (intrinsically or extrinsically motivated) intention and invests sufficient volitional effort to carry out the intention.

A general aspiration to turn to a medium is developed in a *motivational* phase that precedes any action (sometimes termed the “deliberative phase”). In the motivational phase, a mere wish to acquire a certain psychological or material outcome is translated into an *intention* to acquire that outcome via media exposure (called a “behavioral intention”; Gollwitzer 1993; Vorderer 1993). Expectancy-value-based evaluations underlie the formation process (→ Expectancy Value Model; Uses and Gratifications; e.g., Babrow 1989). Knowledge derived from one’s own prior experiences (→ Habituation) and → information obtained by the observations of others feed the translation from a wish to a general behavioral intention. For example, a vague wish to feel socially engaged could result in the intention to go out to the movies, as prior knowledge exists that the movie characters and other movie-goers effectively provide a social atmosphere. Accordingly, the individual would both deem it very likely that he or she would feel socially integrated when watching a movie (expectancy) and evaluate this outcome very positively (value). Consequently, it is probable that the individual would develop an intention to watch a movie (Ajzen 1991; Rise et al. 2003).

In a subsequent phase, called the *volitional* phase (or the “implementation phase”), an individual picks the strongest or most convenient intention from the list of existing behavioral aspirations. Intentions to choose a → medium are likely to be implemented if the user has properly identified when, where, and how to carry out the exposure to the medium (for implementation intentions, see Gollwitzer 1993 and Rise et al. 2003; for instrumental media use, see Rubin 1984), and if the current situation does not allow for pursuing alternative goals (e.g., eating, accomplishing a job task, etc.). In addition, intentions that led to successful behavior in the past (e.g., a strong entertainment experience; → Enjoyment/Entertainment Seeking) are more likely to be implemented, as they build on stronger attitudes and can be automatically triggered by external cues (Bargh et al. 2001).

Users intentionally turn to the media because they strive either for intrinsic or extrinsic outcomes (Eccles & Wigfield 2002). *Intrinsically* motivating outcomes are achieved immediately in the course of the exposure to the medium through diverse pleasurable experiences (Vorderer et al. 2006; Sherry 2004). “Someone who is seeking entertainment usually does so for its own sake, i.e., in order to experience something positive, like enjoyment, suspense, amusement, serenity” (Vorderer et al. 2006, 6). Atkin (1985, 63)

addresses intrinsic media gratifications as “transitory mental or emotional responses providing momentary satisfaction at an intrinsic level.” According to self-determination theory (Deci & Ryan 1985 and 2000), intrinsic pleasure rests on experiences of autonomy, competence, and social relatedness; situations that effectively inform an individual about related capabilities (e.g., being competent or being socially related to others) are pleasurable. In a similar fashion, media can activate the pleasure pathways of the human user (Bryant & Miron 2002). Consequently, drawing on self-determination theory, it has been argued that media users frequently turn to the media following an intrinsic motivation to feel autonomous, competent, and socially included (Vorderer et al. 2006).

Users also turn to the media to achieve *extrinsic* outcomes, sometimes referred to as uses (Atkin 1985) or utilities (Sherry et al. 2006). Extrinsic behavior exists in two distinct situations: either “when people engage in an activity to comply with an externally pressuring demand” (e.g., a task) or when they try to “meet internally pressuring feelings of guilt, shame, and self-aggrandization” (Vansteenkiste et al. 2005, 484). Accordingly, extrinsically motivated media use is task-oriented (cf. instrumental media use; Rubin 1984 and Noble 1987) and driven by the struggle to meet external and/or internal pressures. For example, the intention to write an email at work might result from the expectation of receiving praise from the boss or avoiding a reproach. Or the intention to write a daily SMS in a romantic long-distance relationship might build on the extrinsic goal not to feel guilty.

## Invention and Rhetoric

James Jasinski

University of Puget Sound

In classical rhetorical theory, invention was one of the five essential canons and referred to the activity or process of creating a message (a speech, an essay, a poem, etc.). (On the other canons, see → Arrangement and Rhetoric; Delivery and Rhetoric; Memory and Rhetoric; Style and Rhetoric.) Over time, rhetoricians have explored some recurrent questions, such as whether or not invention can be described and systematized, what is the precise nature of the process of invention, and what exactly is the scope and function of inventional activity. Scholars have identified four dominant approaches to explaining and guiding this activity/process: romantic, systematic, imitative, and social (Kennedy 1963; Jasinski 2001).

Rhetoricians typically credit Plato with introducing a romantic approach to invention that emphasizes an individual's psychic interior as the appropriate source for ideas and inspiration (LeFevre 1987). With its emphasis on imagination, emotional spontaneity, and individual creative genius, late eighteenth- and early nineteenth-century romanticism represents a particularly strong version of this approach to rhetorical invention. But the romantic emphasis on psychic interiors, many scholars maintain, remained a fixture in twentieth-century speech and composition classrooms (Crowley 1990; Bawarshi 2003). Critics of modernist rhetorical and “current-traditional” composition theory argue that

the romantic focus on the individual is epistemologically suspect and effectively privatizes the process of invention. Various “social” approaches to invention attempt to rectify these perceived problems.

As Kennedy (1963) and others have noted, classical rhetorical theorists developed a number of systematic analytic procedures that could be used to generate persuasive messages (→ Persuasion). Stasis theory, Lauer (1984) suggests, was the earliest framework developed in classical thought, designed to help legal advocates generate persuasive arguments. Deliberative stock topics are a much more recent and very popular extension and adaptation of classical stasis doctrine to the realm of policy → discourse. By illuminating the recurrent points of dispute that organize and shape policy controversies, the stock topics identify the issues that policy advocates must address. But the most widely recognized systematic approach to the composition process is the *doctrine of topoi or topics*. The Greek terms *topos/topoi* (in Latin *locus/loci*) referred to a sense of place, space, or region. Message producers were taught to access various *topoi/loci* in order to investigate an issue or subject and discover things that might be said or arguments that might be made about this issue or subject. Composition and speech teachers discussed topical frameworks well into the twentieth century (Corbett 1971; Wallace 1972).

Imitation, the third approach to explaining how people generate messages, was central to the thought of numerous ancient teachers and theorists, including Isocrates, Longinus, Cicero, Quintilian, and Dionysius of Halicarnassus (Kennedy 1963). More recent scholarship extends classical scholarship to engage some perennial questions: Can imitation help message producers generate rather than replicate an original model? Can imitation engender novelty or creativity? (e.g., Copeland 1991; Leff 1997). These scholars argue that while it might seem paradoxical, imitating the structure, style, and/or argument and language strategies of precursor texts is often a complicated process that can help writers and speakers adjust old ideas and patterns to new and changing circumstances.

The *imitative model of invention* at least implicitly locates speakers and writers in a world of other texts and voices that help generate and shape discourse production. Recent scholarship in composition theory (LeFevre 1987; Bawarshi 2003) and → linguistics (Kamberelis & Scott 1992) emphasizes the centrality of other texts, genres, and voices to the process of inventing discourse. Scholars subscribing to a social approach insist that since language, the raw material of discourse practice, is a social (and not individual) phenomenon, rhetorical invention must be understood as similarly social in nature. Implicit in this social approach to rhetorical invention is the image of a “bricoleur”: a person who acts by making do or improvising with the materials that are available in a particular situation. Message producers are in effect language “tinkerers,” who stitch together bits of linguistic material and persuasive strategy to meet the demands of the specific occasions. Additional theoretical commitments frequently follow when a scholar adopts the social approach. For example, Bawarshi (2003) and Kamberelis and Scott (1992) argue that as people generate messages, they simultaneously create (or “co-articulate”) specific texts *and* self-identity.

## Investigative Reporting

James L. Aucoin

University of South Alabama

Investigative journalism is the product of independent work by reporters and editors, which reveals a public or social issue that would otherwise remain unknown. Reporters produce original investigations for → newspapers, → magazines, → books, broadcast outlets (→ Television; Radio), newsletters, and news websites (→ Internet). The process of investigation may take days, months, or years and include reviewing public documents, conducting multiple interviews, surveying public opinion, analyzing databases, or the like. Investigative reports are usually comprehensive and much longer than other → news stories.

Investigative reporting goes beyond official statements and meetings of government, business, and other institutions to reveal information these groups would keep secret from the public. The reports expose abuse of power, corruption, criminal activity, human rights violations, miscarriages of justice, or official neglect. Some investigations have an ideological perspective and aim to bring about the reform of government, business, or institutional policies and programs. Reporters have conducted these investigations in the United States, the United Kingdom, and western European democracies since the late nineteenth century, but the practice has spread elsewhere in the world since the 1990s. In 2002, more than 300 journalists from 44 countries attended a conference on investigative journalism.

In the United States, the public has generally shown strong, widespread support for investigative reporting since at least the early 1980s (Opt & Delaney 2000). Anecdotal evidence suggests similar support in other countries. In the former Soviet Union, when a little-noticed weekly magazine exposed government corruption in the late 1980s, its circulation jumped from 260,000 to 4.6 million. In Venezuela, a 1995 book exposing corruption in the judicial system became a national bestseller and sold so quickly that copies were difficult to find.

US journalists founded *Investigative Reporters and Editors, Inc.* (IRE), in 1974 to provide training and encouragement for investigative journalists. Since the late 1980s, IRE has helped reporters in other countries establish similar groups. By 2006, organizations modeled after IRE had formed in Bosnia-Herzegovina, Denmark, Finland, Germany, Mexico, the Philippines, Sweden, the United Kingdom, and other countries. In 2003, 50 investigative journalism organizations from more than 30 countries established an international network, Global Investigative Journalism, to share resources.

Investigative journalists may go undercover, employ hidden microphones and cameras, use the surveillance techniques of private detectives, stage sting operations, or hire accountants and scientists to conduct analyses. After computer analysis became common in the 1980s, journalists could investigate trends in government programs by probing tens of thousands of entries from electronic databases.

In Honduras, reporters searched a US General Accounting Office database to reveal US military aid to their country that government officials refused to acknowledge. In the United States, reporters from the *Philadelphia Inquirer* examined 1,200 court case files and talked to hundreds of individuals in 1973 to document harsher sentences for blacks and poor defendants as well as judges who were overly lenient. In Thailand, a TV journalist talked to more than 100 individuals to show that police had wrongly charged a man with murdering children on a school bus.

Investigative reporting may act as the *conscience of society* (Ettema & Glasser 1998). By naming the names of perpetrators and identifying victims, investigative reporters contribute to a dialogue about public virtue that can encourage a community or society to demand improvements. Investigations have revealed unfair tax laws and mismanaged school systems, exposed illegal pollution and police brutality, and documented unfair business practices and City Hall corruption. Investigative reporters have helped spur governments to free wrongly convicted inmates, topple corrupt politicians, enforce health and safety regulations, and pass new laws.

The traditional view of investigative journalism suggests what some researchers call the *mobilization* (or → *muckraking*) *model*: the media reveal a wrong, which stirs the public

to demand correction, which leads government to respond (Molotch et al. 1987). Other studies show that investigative reporting sometimes spurs public policy changes regardless of whether public opinion demands change. Reform sometimes takes place because investigative reporters discuss the problems with policymakers before publication of their stories (Protest et al. 1991).

The most famous episode of investigative reporting in the United States was the → Watergate scandal during the mid-1970s. Reporters from the *Washington Post* revealed crimes in the White House, ultimately resulting in the resignation of President Richard Nixon. Jose G. Burgos, Jr., writing in an underground Manila newspaper, exposed corruption within the ruling regime in the Philippines, leading to the ousting of dictator Ferdinand Marcos in late 1985. Investigative journalists in Belgium revealed inept police work that undermined public confidence in the country's justice system in the late 1990s.

Investigative reporting can have *undesirable consequences*. Even when done well, investigations can undermine public confidence in, and lead to cynicism about, social and political institutions. When done poorly, investigations can focus public attention on insignificant concerns. A 1997 study of prime-time TV newsmagazines found that only one in ten investigative stories dealt with traditional subjects of investigative reporting (Project for Excellence in Journalism 2006): economics, education, foreign affairs, the military, national security, politics, or social welfare. The other nine reported on behavior, celebrities, consumerism, health issues, or personal lifestyle.

Investigative reporting faces *many obstacles*. In open democracies, most government documents are available, because of laws such as the US Freedom of Information Act mandate public access. In less democratic countries, government and business secrecy impedes access to records. In some countries, targets of investigations can file lawsuits to take revenge on reporters for publishing stories. In authoritarian regimes, reporters have faced imprisonment or murder. Violence against investigative reporters remains relatively rare in Europe and North America but continues to be a threat elsewhere. Drug dealers and mobsters, as well as political extremists, have killed dozens of investigative reporters in the United States, Ireland, Colombia, Mexico, Russia, and Iran, among others (→ Violence against Journalists).

## Involvement with Media Content

Werner Wirth

University of Zurich

Involvement is included in numerous theories and empirical studies of → information processing, → persuasion, → advertising, knowledge acquisition, and other → media effects. It is mainly linked with or defined as more elaborative, self-determined, active, and in-depth acting with and processing of media content.

In origin, involvement is rooted in three major research traditions. In the work of Sherif and Cantrill (1947) concerning *social judgment theory*, ego-involvement plays a central role. If a topic activates central values of the self-concept, a person becomes personally involved in the situation. Ego-involvement is the relatedness of an issue to a person's self-picture and self-identity (Salmon 1986; → Social Identity Theory). According to social judgment theory, a belief change becomes less and less probable the more a person is ego-involved. Furthermore, these authors distinguished task-involvement from ego-involvement. Task-involvement results from the experimental manipulation performed by the researcher and is assumed to be rather volatile (→ Experimental Design). In short, involvement can be described in this context as activated relevance for an issue (Salmon 1986).

In the framework of the *dual process theories on persuasion*, highly involved recipients are motivated to process the arguments of the message (central route or systematic processing), whereas low-involved recipients use heuristics and select rather peripheral stimuli for a superficial judgment (Chaiken & Trope 1999; → Elaboration Likelihood Model). Finally, for Krugman (1965), involvement is the number of *conscious bridging experiences, connections, or personal references* that a viewer makes per minute between his or her own life and a stimulus.

Stimulated by these roots, audience and effects research began to pick up involvement. Specifically, media usage under low-involvement conditions seemed to be of particular interest. The usage of electronic media (radio, television; → Exposure to Radio;

Exposure to Television) often occurs only incidentally, in a way that is habitualized and without much → attention. Alternatively, within the → Uses-and-Gratifications approach, involvement is explicitly integrated as a part of the *concept of audience activity*. In the three-phases model of Levy and Windahl (1984), before media exposure, involvement is expressed as intent of usage. During media exposure, involvement is understood as the degree to which the individual interacts psychologically with a medium or its message (→ Exposure to Communication Content). After the person has been exposed to the medium, involvement can be conceptualized as a long-term identification or parasocial relationship (Levy & Windahl 1984; → Parasocial Interactions and Relationships).

In modern communication research, conceptualizations of involvement are multifaceted. Thus, a distinction should be made between different references or “targets of involvement” (for example, the message of the media, the advertised product, a protagonist of a film, a program, or an issue), the “persistence of involvement” (enduring, persistent versus situational, short-term, and volatile), the “components of involvement” (cognitive, affective, conative/motivational), the “valence of involvement” (negative or positive), and the “intensity of involvement” (Wirth 2006). For example Greenwald and Leavitt (1984) discern four intensity levels of involvement: pre-attention, focal attention, comprehension, and elaboration. At least in older conceptions of involvement, there is also a differentiation regarding the locus of involvement: according to this, involvement can be seen as an attribute of a medium, a topic, a situation, or the reception process. At least from the perspectives of reception research and media psychology, in most cases involvement is interpreted as an internal state or process.

Taking all these differentiations together, one can distinguish between a broader and a more confined concept of involvement. Involvement as a meta-concept encompasses a family of related though distinct concepts that inform us of how users are occupied with the media and their content in diverse ways, and how they engage with them in a cognitive, affective, conative, and motivational way (Salmon 1986). In this view, involvement is rather a framework or a research perspective; its multiple interactions with other concepts of media usage and effects can be studied and related to each other systematically.

On the other hand, a concept that includes cognitive responses, felt emotions, attention, recall, information seeking, *and* discussions about a topic seems to be not very useful and frequently results in contradicting empirical results. Therefore, a more confined sense of involvement would be advantageous. According to this, involvement is an attribute of the information processing itself (Cameron 1993; Greenwald & Leavitt 1984; Slater 2002; Wirth 2006). The process-oriented definition of involvement directly refers to the phase of media usage and encompasses the intensity of an individual’s cognitive, emotional, or conative engagement with the media message. In a similar way, some authors conceptualize involvement as a mode of reception as opposed to a distanced or analytical mode of media usage (e.g. Vorderer 1993).

## **Iran: Media System**

*Marcus Michaelsen*

*University of Erfurt*

The Islamic Republic of Iran (population approx. 67,500,000 in 2004; adult literacy rate 77.1 percent) was established as a result of Iran's revolution in 1979. The political system blends republican elements (i.e., regular parliamentary and presidential elections) with the idea of the "government of the Islamic jurist" (*velayat-e faqih*), developed during the 1960s and 1970s by Ayatollah Khomeini, the leader of the revolution and the founder of the Islamic Republic of Iran. Most political power thus lies in the hands of a Shiite cleric, the "Supreme Leader of the Islamic Revolution" (*rahbar-e moazam-e enqelab-e eslami*).

The history of Iran's *press* is determined by successive phases of authoritarian rule and rare episodes of political liberalization. The first → newspaper was published in 1837 under the Qajar dynasty. At the advent of the Constitutional Revolution in 1906, exile and clandestine periodicals gained considerable importance for the dissemination of modern political ideas. The subsequent years witnessed a flourishing of publications that ended when Reza Shah took power in 1925. The central state authority weakened again in 1942–1953, providing room for a dynamic and politicized press. The reinstated monarchy of Mohammad Reza Shah subjected the press once more to limitations.

*Radio* was introduced in 1940 by the government following experimentations with wireless transmissions throughout the 1920s (→ Radio). The first → *television* channel opened in 1958 on the initiative of a private entrepreneur. Its merger with a second state-owned station in 1971 created the National Iranian Radio and Television organization. By the mid-1970s, Iran had developed the second biggest broadcasting system in Asia after Japan, reaching more than half the total population.

In the Islamic Republic, the constitution grants freedom for the mass media within the framework of religious principles. The constitution further stipulates the media's educational mission for the propagation of Islamic culture. The press law requires all publications to be licensed and prohibits articles violating the fundamentals of the Islamic Republic or offending religious authorities. The principal institutions that shape culture and media politics are the Ministry of Culture and Islamic Guidance and the Supreme Council of the Cultural Revolution.

Ideological restrictions on the media were especially severe during the Iran–Iraq war between 1980 and 1988. From the mid-1990s on, a relaxation of governmental politics allowed for a growing number of press publications to express alternative views. However, the press became the target of a judicial campaign backed by conservative factions, leading to the closure of over 100 publications from 2000 to 2006.

The majority of the press as well as radio and television are based in Tehran. Newspapers are comparatively cheap due to governmental subsidies for paper and advertisement. About 1,700 periodicals were published in 2005, including 136 dailies and more than 700 specialist publications. The main news agency is the governmental *Islamic Republic News Agency* (IRNA).

The current national radio and television organization, the *Islamic Republic of Iran Broadcasting* (IRIB), has been under the direct control of the Supreme Leader since the revision of the constitution in 1989. The organization is funded by the state, though advertisement constitutes a growing share in its budget. IRIB has considerably expanded its structure and programming since 1994. A major factor in the rise of entertainment and foreign content in the programs was the attempt to counter the increasing influence of satellite television, perceived as a cultural onslaught by the regime.

Radio provided seven national channels in 2006, partly specializing in culture, youth, sports, and religion. IRIB offers extensive regional radio broadcasting and its world service transmits programs in 25 languages. There are two main national TV channels, while a third targets youth, providing sports and films. The fourth channel offers religious and instructive content; the fifth is a regional channel for the capital and other cities; and there are further educational and news channels. IRIB has also launched several satellite organizations. Since 1997, *Jam-e Jam* has been broadcasting three mainly Farsi channels for the Iranian diaspora. *Sahar* transmits two channels in different languages (English, Kurdish, and Urdu), and the Arabic *Al-'Alam* seeks its audience particularly in neighboring Iraq.

Attempts to create private television have failed so far. Receiving *foreign* → *satellite television* is officially forbidden though currently tolerated. Estimates of the number of Iranian households equipped with satellite dishes go from 3 million to 5 million. Governmental projects to provide centralized access to chosen satellite channels have not yet been realized. About 15 stations broadcasting in Farsi and mainly run by the US-based exile community opposed to the current regime can be received in Iran.

The → *Internet* was introduced in 1992. The estimated number of users increased noticeably between 2000 (200,000) and 2006 (7 million). Access is provided by over 500 ISPs working under the close supervision of the Ministry of Communications and Information Technology and of the national Telecommunications Company of Iran, owned by the state and working under the control of the ministry. Ambitious state programs seek to enhance Internet accessibility and connection quality. The government concurrently developed a sophisticated system of online censorship, controlling both the content and usage of the Internet, which had become an instrument for expressions of political and cultural discontent.

The evolution of Iran's media is, therefore, constantly affected by the politics of a strong state. Despite significant cultural assets and a long history of journalism, the country has not yet developed an appropriate and independent media system.

## **Israel: Media System**

*Dan Caspi*

*Ben-Gurion University of the Negev*

Israel, a young democracy, established in 1948, with a 120-member unicameral parliament elected officially every four years in universal, proportional, nationwide elections, is located in the Middle East, along the eastern coastline of the Mediterranean Sea, bordered by Lebanon, Syria, Jordan, and Egypt. It lies at the junction of three continents: Europe, Asia, and Africa.

From the outset, Israel's media system took shape in the shadow of an extended conflict with Arab states and the Palestinian people that culminated in several military clashes – 1948, 1956, 1967, 1973, 1982, 1989, 2000, and 2006. According to Israel's Central Bureau of Statistics, in 2005, the country's population exceeded seven million, consisting of 5,313,800 Jews (76.0 percent of the population); 1,140,600 Muslims (16.3 percent); 146,600 Christians

(2.1 percent), of whom 118,700 are Christian Arabs; 1,115,200 Druze (1.6 percent); and 272,200 with no religious affiliation (3.9 percent). The country's founders overtly aspired toward creation of a modern, western, democratic state. As such, the concept of social responsibility had a decisive influence on the development of mass media in the fledgling democracy.

During Israel's six decades of independence, its media institutions have undergone extensive structural change, shifting from a centralized, monolithic system to a decentralized one that integrates traditional and new media and boasts a well-developed telecommunications infrastructure. Besides the printed press – dailies, local papers, and magazines – and dozens of radio and cable and satellite television channels, a variety of online newspapers enriches the media map. Furthermore, four mobile telephony service providers offer a wide range of programs, while old broadcast media and new entrepreneurs are examining options for the Internet.

### THE PRE-STATE PERIOD (UNTIL 1948)

The media first struck roots in the British Mandatory period, before the establishment of the state of Israel in 1948. Cultural capital – and especially commitment to the press and books – was the chief resource borne by Jewish immigrants. Although only modestly endowed economically, the pre-state Jewish community (*Yishuv*) was blessed with an extensive supply and variety of publications, about half of them published regularly, including some 40 dailies of varying life-spans. These were generally unassuming publications of a few pages each, appearing at varying intervals and functioning as ideological organs of political movements and schools of thought.

On March 30, 1936, in the best colonial tradition, the Mandatory authorities in Palestine inaugurated radio broadcasts in three languages – English, Hebrew, and Arabic – on a station called the *Voice of Jerusalem*.

### THE TRANSITION PERIOD (1948–1967)

The second stage extends from the country's initial, formative years until the Six-Day War (1967). The political-party and foreign-language press flourished during the state of Israel's first decade, as mass immigration underscored the urgent need for newspapers in the languages of incoming immigrants: Yiddish, Polish, Romanian, Hungarian, French, and others. Moreover, the demographic processes engendered by immigration were conducive to the emergence of popular dailies eager to maximize circulation (→ Migration and Immigration). Leading papers *Maariv* and *Yedioth Ahronoth*, along with several morning papers, most of them party organs, challenged the population's traditional reading habits.

Initially, the professional infrastructure installed by the British was reorganized as the Voice of Israel. Experienced broadcasters staffed the state radio network that began operation as the Israel Broadcasting Service under the auspices of the Prime Minister's Office. In 1965, radio broadcasts were institutionalized as part of the Israel Broadcasting Authority (IBA).

The vision that guided Israel's state radio system, which bore just a soupçon of paternalism, also sought to promote educational goals among the young immigrants who

comprised the country's army. In 1950, the Israeli government decided to launch an additional radio station, under the auspices of its armed forces, called *Galei Zahal*. In 1966, Israel Educational Television, financed by the Rothschild Foundation, began broadcasting programs to strengthen education and enrichment for children, especially those living in development towns and frontier localities.

### **CONTROLLED PLURALISM (1967–1986)**

This period is characterized chiefly by the reinforcement of a moderate, liberal atmosphere, a controlled pluralistic structure, and varied regulatory arrangements concerning reciprocal relations between the media institution and its surroundings. Immediately after the Six-Day War, traditional opposition was lifted and Israel Television was given the green light (→ Television). Regulations declared that programming time would be divided between two languages, Hebrew and Arabic, on the same channel, which would be subject to public supervision within the framework of the IBA (Katz 1971; → Public Service Broadcasting: Law and Policy).

The postwar economic boom hastened decentralization of the printed press and yielded a flourishing local press industry (Caspi 1986). At the same time, the status of privately owned publications was enhanced at the expense of party organs and the foreign-language press, largely due to the accelerated integration of immigrants, most of whom switched to Hebrew-language media. Social growth processes were particularly kind to private → newspapers, which began to consolidate and take shape as → media conglomerates owned by three families: Mozes, Nimrodi, and Schocken. Each had a flagship daily (*Yedioth Ahronoth*, *Maariv*, and *Haaretz*, respectively) and produced numerous publications, including → magazines, local papers and → books.

In 1973, “peace pilot” Abie Nathan launched the *Voice of Peace* radio station, transmitting from a ship anchored, at least officially, outside the territorial waters of Israel (→ Radio).

### **OPEN SKIES (1987–)**

The fourth and current stage, which reflects the Israeli government's neo-liberal policies, features extensive regulation, particularly concerning broadcasting channels, as well as an open-skies policy, accelerated development of telecommunications infrastructures, and increasing signs of a decline in the status of the printed press.

August 1986 saw the completion of Amendment No. 4 to the Telecommunications Law, the legal device required for regulation of → cable television. At first, cable broadcasting was divided regionally among five franchisees. These five firms later merged into three and eventually became one company, HOT, as a result of competition with the sole satellite television service provider in the early 2000s. Cable television enhanced the supply of programming, primarily by providing dozens of foreign-content channels, including English-language news networks such as → CNN, SKY, and the → BBC, as well as sports, music, film, and entertainment channels.

In 1993, seven years after the start of experimental broadcasting and three years after Knesset ratification of the relevant law, a franchise for a commercial television channel,

*Channel 2*, was issued. At the same time, franchises were awarded to 14 regional radio stations, which were also supported by → advertising. In early 2000, the firm YES received a franchise for provision of satellite television service, which increased the supply of foreign channels in the same format as cable television. Two years later, in 2002, another commercial television channel, *Channel 10*, went on the air. By the start of the third millennium, Israel's broadcasting map had changed markedly, displaying an abundance of radio and television channels (Caspi et al. 2002).

The multiplicity of channels supported by advertising was the first palpable threat to the printed press. Small newspapers closed down and the three major dailies anxiously sought ways to persevere, consolidating themselves as media conglomerates and expanding → cross-ownership of other media. At first, each conglomerate intensified its hold on the local press through a network of local papers dispersed throughout the country, seeking to exhaust the financial potential of local advertising. Subsequently, the media barons joined forces with the country's economic powers. Three of them – Arnon Mozes, Ofer Nimrodi, and later Eliezer Fishman – secured shares in the Channel 2 franchise groups. The *Yedioth Ahronoth* conglomerate even has a hand in the vibrant Russian-language press, which has flourished because of mass immigration from the former Soviet Union since the late 1980s, as it owns the only Russian-language daily, *Vesty* (Caspi et al. 2002).

Over the past few years, increased → Internet access has given rise to online journalism in all its many shapes and forms, threatening the status quo once again. In 2006, about 3.7 million Israelis aged 13 and up browsed the web, and 86 percent of them were exposed to online newspapers. Three types of online newspapers can be differentiated. The first is online editions of printed newspapers, such as the *Globes* financial daily, which launched an English-language Internet version for foreign investors in 1996 and later added a Hebrew version as well. Immediately thereafter, *Haaretz* launched its own site, as did other newspapers. Second are separate online and printed newspapers: the two most outstanding sites are *Ynet*, launched in 2000, which belongs to Israel's most popular daily, *Yedioth Ahronoth*, and *nrg*, belonging to the daily *Maariv*. Third, there are independent online newspapers: *Zman Merkazi* is a pioneer in this category, to which *News First Class* belongs as well (→ Online Media).

Over the past few years, other media have also found the Internet to be a fertile field for experimentation. Broadcasting stations have learned to provide Internet broadcasts along with conventional transmission.

## THE ARAB MEDIA

The Arab media map in Israel, like its Jewish counterpart, took shape in the shadow of the bitter conflict between Israel and its neighbors. By one count, there are over 100 Arabic publications in Israel (Adoni et al. 2006), most of them suffering from low circulation and irregular publication. A majority of the regularly published Arabic periodicals are supported by political, public, or religious factors. In 2006, only two Arabic dailies were published in Israel: the Communist Party organ *al-Ittihad*, and the independent *al-Fajr al-Jadid*, first published in 2004.

The first original and successful initiative emulating the private newspaper model occurred in 1983, when local advertising agency owner Lutfi Masha'our decided to

publish a local newspaper in Nazareth, *al-Sanara (The Fishing Rod)*. Another venture, *Kul al-'Arab (All the Arabs)*, under Arab–Jewish joint ownership, was also economically dependent on an advertising agency.

Private weekly newspapers apparently succeeded in establishing and reinforcing reading habits, as three additional weeklies were subsequently published regularly: *Panorama* in Taibeh (since 1987), and *al-Midan (The Square)* and *al-A'ain (The Spring)* in Nazareth (since 1999 and 2000, respectively).

The new political and nationalistic spirit led to the emergence of nationalistic Arab political parties and their respective organs: *Al-Watan (The Homeland)* – Progressive Party for Peace, 1983; *Sawt al-Haq wal-Huriyya (The Voice of Truth and Freedom)* – weekly, Islamic Movement, Umm el Fahm, 1989; and *Fasl al-Maqal (Unequivocal Words)* – weekly, National Democratic Alliance, Nazareth, 1996 (→ Partisan Press; Party Political Communication; Party–Press Parallelism).

The broadcast media, by contrast, enjoyed significant prosperity and stability thanks to generous government support. Most Arab radio and television broadcasts remained under the auspices of the IBA, which also supervised their content. Technological developments challenged the Jewish majority's control of Arabic broadcasting channels. Pirate radio stations began operating in several Arab towns despite meager human, financial, and technological resources; their transmitters were weak but sufficed to cover concentrated Arabic-speaking areas, offering a refreshing alternative to partisan *radio-for* broadcasts. In October 2002, a new license was awarded to the *Radio al-Shams* group, which began as a Jewish–Arab group.

When a designated commercial Arabic television channel was approved, the concession was again granted to an ostensibly “mixed” group controlled by Jewish businessmen who guaranteed its *television-for* nature. As of summer 2006, however, this group has not succeeded in carrying out the project, which has apparently been hampered by a lack of serious investors.

Similarly, the advent of cheap satellite dishes enabled many citizens to watch television stations from elsewhere in the region rather than Israel Television's Arabic broadcasts. As of 2006, nearly 25 Israeli Arab reporters are employed by satellite stations in Arabic-speaking countries (Al Jazeera, Abu Dhabi, al-'Arabiyya, Egyptian satellite television, etc.), and most are also connected to leading newspapers in Arab countries (*al-Ahram*, *al-Mustaqbal*, *al-Khaleej*, and *al-Sapir*) and in the west (*al-Sharq al-Awsat*, *al-Hayat*, and *al-Quds al-'Arabi* in London).

## Issue Management

Ulrike Röttger

University of Münster

Issue management is a systematic procedure that helps organizations to identify, analyze, and respond to external or internal concerns that can significantly affect them. On this note, strategic issue management is a managerial function, which creates the information bases for a proactive examination of (potentially) critical themes that can limit strategic scope (→ Strategic Communication). It has to be accentuated that issue management does not solely relate to the effects of a crisis or a conflict. For a full understanding of this aspect of the discipline, we need to also consider the positive and negative repercussions concerning promotional themes in regard to a → brand or a company image.

Issues are debatable topics of → public interest that are connected with controversial opinions, expectations, or problem solutions by an organization and its stakeholders. Issues have actual or potential effects on the organization. An issue is an immediate problem requiring a solution (Heath 2006, 82–83). There is a wide variety of models for the issue management process. Most models differentiate between five or six key stages (see in particular Chase 1984; Dutton & Jackson 1987).

*Issue identification:* it is important to observe the environment systematically, continually, and comprehensively, in order to identify weak signals that point to a conflict topic as early as possible. Scanning is the inductive observation of the environment by using, e.g., media content analysis (→ Content Analysis, Qualitative; Content Analysis, Quantitative), → surveys, or expert → interviews. In a second step, potential issues as well as known issues are observed more closely (monitoring). Scanning and monitoring deliver a variety of kinds and quality of information about different stakeholders, their views on issues, and suggestions regarding the implications that their views could have for the status of an issue.

*Analysis and interpretation:* once issues have been identified, they must be prioritized with respect to their relevance, exigency, and consideration of the amount of resources dedicated to deal with the issues. Furthermore, the future trend of the issue will be forecast on the basis of its current and past development.

*Selection and prioritizing of key issues:* analysis and interpretation provide those key issues for which the organization must develop action decisions and issue positions. The key issues need to be further researched and observed. A research document identifying the history, status, potential development, and policy options open to the organization

needs to be compiled and circulated among decision-makers. The permanent compression of information obtained in this process makes an adjustment of the current scanning and monitoring possible.

*Development of the strategy:* the results of the analysis are the basis for the development of the strategy and tactics. There are five main strategic options: reactive, adaptive, proactive, initiative, and interactive strategies. Issue management aims at influencing public and media attention in regard to particular themes, including processes of not making something a subject of discussion as well as the attempt to keep themes out of media coverage (→ Agenda Building). Furthermore, framing is of great importance, e.g., the impact on interpreting themes via accentuation and attribution concerning single aspects of a theme (→ Strategic Framing). In addition, direct exchange and collaboration with stakeholders is denotative, contingent on the specific issue and the level of action potential of the affected stakeholders (→ Stakeholder Theory). In general, it is necessary to formulate a coherent position and a coordinated message. Usually for this purpose, a task force from the different departments and business units concerned with the issue is formed.

*Program implementation:* once a course of action has been decided upon, a program to achieve the desired objectives must be implemented. The program must effectively communicate the organization's position and messaging to key stakeholders.

*Program evaluation:* any program instituted must be evaluated after completion regarding its effectiveness and quality. The evaluation of the output and outcome of issue management is a great challenge, since successful issue management shows up finally in the fact that an issue is not escalated or has not become public. Successful issue management does not leave any measurable issues. For this reason, indicators and models that can measure and evaluate the results of the issues management in a valid way are absent (→ Public Relations Evaluation).

Issue management needs interdisciplinary cooperation within the whole organization and the issue task force. There is no standard denomination of the different *roles of issue management* in literature and in practice, but the role descriptions are similar: “networkers” are specialized experts from the different departments and business units of the organization. They observe their area of expertise with respect to critical themes. “Issue leaders” are persons who lead the task force and are responsible for the issue treatment regarding content. “Theme experts” are specialized experts from different departments. They analyze and execute specific aspects of the issue. Further experts complete the task force, e.g., lawyers and members of top management (→ Public Relations Roles).

However, issue management is no isolated procedure, and it is not simply an operational instrument for environmental monitoring. Its effectiveness and performance depend on whether and to what extent issue management is established as a process and a thinking attitude in the whole organization. The organizational structure and culture must foster trans-sectoral cooperation and internal information networks. They must sensitize all members of the organization to the relevance of environmental monitoring and the early identification of critical issues.

## **Issue Management in Politics**

*Spiro Kioulos*

*University of Florida*

Issue management in politics refers to the process by which politicians, campaigns, parties, and other political groups identify, prioritize, develop, and convey positions on key issues. A fundamental early step in effective political issue management involves formative research where groups investigate the perceptions, attitudes, and behaviors of target audiences concerning policy preferences and problems. Some of the major research techniques used to gather such information include → surveys, focus groups, content analysis, and in-depth → interviews (→ Research Methods; Content Analysis, Qualitative; Content Analysis, Quantitative; Interview, Standardized; Interview, Qualitative). These same approaches are also used to evaluate the success of communication efforts for issue management purposes.

From a theoretical standpoint, the concepts of agenda building and agenda setting are useful for understanding the process of political issue management. The core proposition of agenda-setting theory is that the issues made salient (or prominent) in news media often become the issues that are considered important in public opinion, though the effect is not universal (McCombs & Shaw 1972). For over three decades, extensive empirical support for agenda-setting influence has been collected in local, state, national, and international settings (→ Agenda-Setting Effects). While agenda setting concentrates on the relationship between news media and the public, the broader concept of agenda building suggests that issue salience is determined by several groups in addition to media and voters, such as politicians, organizations, and activists (→ Agenda Building). Thus, an integral part of successful issue management entails developing strategies for dealing with these diverse sets of stakeholders.

A vital factor impacting the issue-management process involves meaningfully classifying different types of issues. Research has offered several systems for categorizing issues. For example, the difference between obtrusive issues (those with which citizens have direct experience) and unobtrusive issues (those with which citizens have little direct experience) has proved critical with regard to media influence on public perceptions of issue importance (Zucker 1978). Research suggests that mass-media impact is greatest for unobtrusive issues. A similar distinction has been drawn between abstract and concrete issues, with empirical work documenting stronger media influence on perceptions for the latter issue type (Yagade & Dozier 1990). Beyond issue type, the tone and frames associated with issues are germane for issue-management purposes because they shape *how* issue portrayals are generated and their subsequent effects on various constituencies (→ Framing Effects).

The use of information subsidies by political groups or organizations to exert influence on news media, voters, and other audiences represents a pervasive approach for effective → issue management. Among the most commonly used information subsidies are news releases, interviews, news conferences, and “op-ed pieces” (i.e., opinion editorials by contributors who are not necessarily affiliated to the publication). Research has shown that these kinds of political communications are valuable for shaping the salience of issues. For example, multiple studies have demonstrated that the issues emphasized by political campaigns in news releases often become the political issues stressed in media content. One study of the 2002 Florida gubernatorial race found a close correspondence between the salience of issues in campaign news releases and media coverage of the election (Kioussis et al. 2006). This finding is noteworthy because it shows that campaigns can indirectly have an impact on public opinion by altering the salience of issues covered in news content. Although not typical, some studies have found strong correlations between issue importance in news releases and public opinion, as well as linkages among news releases from competing campaigns (Tedesco 2005).

Though often image oriented, political advertising also wields considerable influence on issue management in politics. Research has shown that → political advertising affects the perceived salience of issues among voters. Further, voters can become more knowledgeable about candidate positions on issues from exposure to political spots. Finally, news media issue agendas have been reported to closely correspond with those in political advertising, offering yet another indirect route for impacting voters and other political groups.

Much of the scholarly and applied interest in political issue management is based on the premise that issue perceptions and opinions sway elections (→ Election Campaign Communication; Issue Voting). The concept of priming provides some insight into how this influence transpires. According to this perspective, media affect attitudes and opinions toward political candidates by shifting the criteria by which politicians are judged, through the media’s emphasis on certain issues at the expense of others (→ Priming Theory). Thus, if news media stress the economy, then voters are likely to assess politicians on the basis of their performance on that issue as opposed to others. As a result, political campaigns and groups aim to influence the news media agenda by highlighting issues with which their organizations or candidates perform well. Issue-ownership theory indicates that certain political parties are thought to handle some issues more competently than other parties. For instance, research has suggested that Republicans in the US are seen as being better on

defense, while Democrats are viewed as handling education more competently. As such, priming is a paramount part of understanding political issue management.

Because political power in modern media democracies has become a function of public approval, political actors are now required to go public and influence public opinion (→ Media Democracy). This makes issue management a central element of the political process and a key aspect of → political communication.

## **Issue Voting**

*Rüdiger Schmitt-Beck*

*University of Duisburg-Essen*

The notion of issue voting refers to electoral choices that are based on the substance of politics – collective problems for which solutions are expected from governments. That responsibility for solving problems is ascribed to the political system is not self-evident. Political cultures differ with regard to the extent to which the state is commonly held responsible for dealing with citizens' grievances. Media reporting can stimulate the politicization of individually experienced problems by conveying the impression that they are not merely private concerns but shared by many people (Mutz 1994).

Although solving problems of political communities by means of binding decisions is the very essence of politics, most models of electoral behavior assign issues only a limited

role. The Michigan School's attitudinal model of voting behavior sees *voters' orientations toward issues* as one of three factors that determine vote choices (Campbell et al. 1960). Along with electors' *party identification* – a longstanding emotional tie to a party originating from early processes of political socialization – and *candidate assessments*, issue orientations can direct people's votes toward certain parties or candidates. Importantly, partisanship is seen as a deeply internalized, stable core of the political personality that colors perceptions and evaluations of both candidates and issues, so that these three components do not operate independently of one another. Empirically, issues appear as the least important of the model's components. Although the decline of partisanship over recent decades has made room for stronger independent effects of issues on vote choices, no such trend could be empirically confirmed so far.

To develop orientations toward issues that can be translated into electoral preferences is *a demanding task for voters* (→ Political Persuasion). For lack of motivation, knowledge, and/or cognitive capability, not many voters can be expected to manage this (→ Political Cognitions; Political Knowledge). Many issues concern complicated policy problems that are difficult to understand. It is far easier to form impressions about candidates. A precondition for an issue to gain significance at an election is some familiarity with it on the part of voters. Only members of specialized "issue publics" possess the necessary awareness of many issues (→ Publics: Situational Theory). To become relevant for voting, an issue has also to be ascribed some importance, and voters need to form opinions about it. Furthermore, electors need to identify links between this issue and the competing candidates or parties (→ Candidate Image). Even if all these preconditions are fulfilled, an issue can still become a meaningful point of reference for electoral choices only if voters additionally perceive parties or candidates to be somehow different with regard to it.

According to the Michigan model, it is crucial whether voters see differences in the *competence of parties* or candidates to deal with an issue. If they feel that one competitor is more able than another to solve a particular problem that they consider important, they may come to choose this party or candidate at the polls, even if it is not the one they identify with. However, selective exposure and perception often lead them to conclude that it is their own party or its candidate that is most competent on most if not all issues (→ Selective Exposure; → Selective Perception and Selective Retention). Hence, what looks like issue voting is sometimes ultimately guided by partisanship.

Although rooted in a different theoretical context, the notion of *priming* ties in well with this strand of research (→ Priming Theory). According to this hypothesis, by setting their audiences' issue agenda, the mass media influence the criteria for evaluating parties and candidates (→ Agenda-Setting Effects; Election Campaign Communication). An important implication of this mechanism is that the perceived relevance of issues is not idiosyncratic but systematic – it reflects the media's and other organized communicators' decisions about which themes to highlight and which to neglect (→ Agenda Building). If many voters believe that a particular issue is most pressing, a party that is widely seen as the one most able to deal with it will be advantaged at the polls. In fact, issues are often "owned" by certain parties, in the sense that voters have learned that this party is the one that will perform best with regard to this particular problem (→ Issue Management in Politics). For instance, Social Democratic parties typically "own" the issue of social

welfare. Parties usually profit from election campaigns during which “their” issues are most salient (Budge & Farlie 1983).

Originating from rational choice theory, the *spatial model* is another important conception of issue voting. According to Downs (1957), voters have distinct positions with regard to which policies they prefer to see enacted on issues. When casting a vote, they choose the party or candidate whom they perceive as being located closest to their own policy preference. This model is even more demanding with regard to voters’ cognitive and motivational capacity, as it requires them to develop very clear and detailed ideas about which political measures fit their interests best, and how well all the parties’ past or promised future policies match these policy ideals. Empirically, the proximity variant of the spatial model is only weakly supported, especially when compared to the competence model. A recent attempt to arrive at a more realistic understanding of spatial issue voting is the “directional” model, which requires voters only to have a rough idea of the general policy directions they prefer.

## **Italy: Media System**

*Gianpietro Mazzoleni*

*University of Milan*

Italy (population 58.4 million) is one of the founding members of the EU. It is a parliamentary republic; general elections are held every five years. The electoral system, formerly a mix of majoritarian rule and proportional representation, was changed to

purely proportional before the general election of 2006. Governments and political parties have always displayed an acute sensitivity over issues of communication and information, and have produced legislation and regulations that have allowed political power to exert tight control over the broadcasting media and to keep the press in check, mostly by means of the *lottizzazione*, a partitioning of the political parties' grasp on all sectors of communication. The "political parallelism" model (Hallin & Mancini 2004) explains such close connections between politics and news media in Italy.

## HISTORICAL OVERVIEW

Until the mid-1970s the country's media landscape was made up of the radio and television channels of the public broadcasting company *Radiotelevisione Italiana* (RAI; → Public Broadcasting Systems) and of a dozen publishing houses that printed hundreds of newspapers and weekly magazines. After a historic pronouncement by the Constitutional Court in 1976 that allowed private companies to enter into the formerly monopolized broadcasting market, the situation changed rapidly and radically. Between 1976 and 1990, more than 500 local television and about 2,500 radio stations were established. It is in those years, interestingly with an almost total lack of legislation, that an entrepreneur who had struck gold in real estate and construction, *Silvio Berlusconi*, entered into broadcasting and in a short time put up three nationwide television networks, which are still today the backbone of his multifaceted communication empire.

RAI gradually lost its central position, even though it grew hugely, stimulated by the competition of Berlusconi's commercial networks, but eventually contained by the thresholds to advertising imposed by the law. The 15 years of wild deregulation ended in 1990 when Parliament passed a broadcasting act that essentially legitimized the Darwinian evolution of the domestic broadcasting system. This meant the recognition of a duopoly between RAI and *Mediaset* (Berlusconi's company), each with three networks. The law failed to introduce measures to leave the door open to other players in the domestic market, and the situation remained the same until Berlusconi's government, in 2004, passed a controversial law that not only strengthened the existing duopoly but also extended it to the new digital television sector.

## NORMATIVE AND LEGAL FRAMEWORK

Reform is in prospect at the time of writing, but meanwhile, the media system is regulated by several laws and regulations, not always clear cut and easily applicable. It is worth noting that, in the context of the instability of legislatures and governments over the years, and the inconsistency and discontinuity in law-making on the part of the political world, the Constitutional Court played a key role in implementing some critical measures regarding the media system. Its ruling in 1976 that allowed commercial broadcasting showed the courage to start deregulating broadcasting despite RAI's strong position. Several other Court decisions, not always implemented by government and Parliament, deeply affected the development of the regulation of the media sectors.

The following laws have had a strong influence on the structure and development of the Italian media system. A law passed in 1975 reformed RAI, transferring control from

the government's hands to Parliament. The law created a bi-cameral commission representing all political parties, with significant power in appointing the governing body of RAI and in issuing guidance for public service programs. The *Press Law* passed in 1981 rescued the newspaper industry from financial crisis by providing public subsidies to publishers, and introduced legal barriers to concentration of ownership in the hands of industrial trusts. In 1990 Parliament passed a law that preserved the role of public service broadcasting, and entrusted it to a publicly owned company; it also recognized the rights of private enterprises to run broadcasting activities and allowed RAI and Berlusconi to own three television network licenses each.

In 1997 the *Authority for Communications* was established as an independent body with several tasks in the fields of telecommunications and electronic and printed media, a body whose president, however, is appointed by the prime minister. The law introduced restrictions on the number of licenses (down from three to two) for terrestrial television (never enforced, due to political stalemate). In 2000 the *Par condicio* (equal opportunity law) introduced strict regulation for political broadcasts particularly during campaigns and elections. Finally, in 2004 the *Gasparri Law* (named after the minister of communications) was passed. It inaugurated digital terrestrial television, reinstated the possibility of owning three licenses for television networks, and set out the various steps and conditions for a partial privatization of RAI.

The regulatory bodies of the broadcasting sector are the above-mentioned Authority for Communications (AGCOM), with a wide range of tasks from telecommunications to new media; the Authority for Competition (AGCM), with anti-trust functions; and the Parliamentary Commission of Vigilance on RAI, with authority only on matters concerning the public service. An interesting peculiarity of Italy's journalism is the regulation of the profession by a law (No. 69/1963). To be admitted into the official list of "professional journalists" one has to pass a public examination. Various attempts to reform the law, in light of the liberalization of professions, failed and the "Ordine dei giornalisti" continues to condition access.

## PRINTED PRESS

Overall there exist about 140 daily → newspapers in Italy, owned by a dozen publishing companies, the most important of which are Gruppo RCS (*Il Corriere della Sera* and *La Gazzetta dello Sport*), Gruppo L'Espresso (*La Repubblica*), Gruppo Caltagirone (*Il Messaggero*), Gruppo Monti (*Il Resto del Carlino*), Editoriale La Stampa (*La Stampa*), and *Il Sole 24 Ore*, some of which run also several regional and city newspapers.

Italy does not excel in newspaper circulation and readership rates. In addition there is no tradition of a popular or tabloid press. In 2004 the copies sold per 1,000 inhabitants were 149, in contrast to the 650 of Norway and the 67 of Greece (WAN 2005). The average daily circulation in 2005 was 5.9 million (FIEG 2005), whereas the number of readers in an average day is 20.9 million, i.e., 41 percent of the adult population. The free press (three major dailies) is a recent and successful phenomenon, which reached a circulation of 1.6 million copies in 2004. Experts have very diverse explanations for the low penetration rate of the daily press: from the too "literary" flavor (Hallin & Mancini 2004) of much Italian printed journalism, to an excess of political content in the news, to the competition of

other outlets, among which the new media like the → Internet play a considerable role. On the other hand, the market for the tabloid press is quite lively and achieves higher readership penetration rates, with 67.6 percent (33.9 million) readers.

## BROADCASTING

The RAI-Mediaset duopoly and the competition between the two is reflected very clearly in the picture and the figures of the domestic → television market. RAI runs three major channels: *Rai Uno*, *Rai Due*, and *Rai Tre*. Mediaset runs *Canale 5*, *rete 4*, and *Italia 1*. The public broadcasting company draws most of its revenues from the license fee (57.7 percent of the total returns in 2005) and from advertising (41 percent). Mediaset, being a commercial venture, lives only on advertising and on sale of rights. Beside the two giants other minor companies operate in the domestic market, the most important of which are Telecom Italia Media and Sky Italia (owned by Rupert Murdoch's News Corporation, and mostly in the business of pay-TV). Most of the channels offer generalist content, i.e., a mix of news, entertainment, and fiction. RAI channels carry significant quotas of educational and cultural programs, though, according to critics, not enough to live up to its peculiar public service mission. To compete with commercial channels, RAI has scheduled a large number of entertainment programs, often very similar to those of its commercial competitors.

The Italian → radio sector is more fragmented, with hundreds of local stations, mostly associated in different forms with fewer than 20 nationwide networks. The networks of the public radio have the lion's share, but a few commercial/all-music channels have very high audience rates as well (AGCOM 2006).

## NEW MEDIA

The Gasparri Law in 2004 launched terrestrial *digital television* and set the date for an end to analog television in 2008. To make this possible the Berlusconi government subsidized the buying of decoders. By the end of 2005, the number of decoders was 3.5 million. However, the new digital channels have rapidly turned into a sort of pay-TV, competing with satellite TV for premium contents (football, games, movies, TV series). The government elected in 2006 stated its intention to introduce major changes in the development of the digital television sector and to delay the switch-off of analog signals to 2012.

The use of the *Internet* and especially of broadband has registered significant increases since the early 2000s. In 2005 there were 9.2 million households with access to the net and 18.3 million web users. The diffusion of broadband (6.8 million more users 2004–2005) is associated with an increase in the demand and supply of innovative applications such as VoIP (Voice over Internet Protocol) and IPTV (Internet Protocol TV). In the latter sector, Telecom Italia is seeking joint ventures with information and content providers like Murdoch's News Corporation.

Italy's mobile telephone market is one of the largest and liveliest in Europe. The overall value of this sector was €19.6 billion in 2005. The UMTS (Universal Mobile Telecommunications System) services of the four mobile companies had been subscribed to by 10 million people at the end of 2005 with a forecast of 25 million by the end of 2007. The 2006 soccer World Cup opened the way to the new venture of mobile television

(with DVB-H [Digital Video Broadcasting – Handheld] technology). The enthusiastic acceptance by users of this new service has prompted analysts to issue optimistic forecasts for future development in this sector.

Overall, the Italian media system shares most of the features of other European media markets, while being sharply distinctive in what has been termed an “anomaly” in the European landscape, i.e., the unique concentration of television channels and other media in the hands of one single trust with strong interests also in the political arena. The “Berlusconi factor” deeply marked the development of both Italy’s media and political systems, bringing about a contamination that to a certain extent has always been typical of the national “parallelism” between politics and the media. This has raised a great deal of concern for the quality of the democratic process in Italy, even if it was an exaggeration to fear a “videocracy” when Berlusconi took power in 1994 and in 2001 (Mazzoleni 1995, 2004). Berlusconi lost the elections in 1996 and in 2006, notwithstanding his exceptional media power. Nevertheless, the weakness of the Italian media system lies in its strong connection with the political powers (no matter what coalition runs the country), which makes it dependent on the political system even in its industrial policies, in the ambiguous legislation that has left large margins for abuses, and in the limited power of the regulatory bodies.

## Japan: Media System

*Yasuhiro Inoue*

*Hiroshima City University*

*Youichi Ito*

*Keio University*

Japan is an advanced industrialized country whose GNP/GDP is the second largest in the world. Its population is 127 million, which is the ninth largest in the world. The political system is a parliamentary democracy with the emperor as the state figurehead. The literacy rate is nearly 100 percent, and the per-capita income is about the same as that of other advanced industrialized countries. The income disparity is small for a capitalist economy, leading most people to believe that they belong to the middle class.

The first general election was held in 1890, and the National Diet, Japan's parliament, opened soon afterwards. However, Japanese democracy from 1890 through 1945 was unstable and had many systemic problems. Due to these problems, the government was taken over by the military around 1937, and what was in effect a military dictatorship continued from then until the end of World War II in 1945. The new constitution, which was drawn up under the guidance of the American occupation forces, removed all those failures inherent in the prewar constitution. The new constitution guarantees complete freedom of expression and prohibits government censorship. The Japanese media system naturally reflects Japan's history as well as its social and cultural characteristics.

### **MEDIA OWNERSHIP STRUCTURE**

Most major newspaper companies in Japan hold their shares internally. Japan's corporate law allows this internal stock holding in order to prevent external editorial influence and acquisition. Partly because of this, no large media conglomerates are owned primarily by non-media corporations, unlike in other industrialized countries (→ Concentration in Media Systems; Cross-Ownership; Media Conglomerates). Another reason for the difficulty in "taking over" any Japanese media company is that there exist several media *keiretsu* or groups that are closely intertwined in terms of both stock holdings and personal relationships. In 1996, Rupert Murdoch attempted to purchase one of the major Japanese television networks but failed because of this complex "cultural barrier."

The key actors in the *keiretsu* are the five national newspapers, each of which has close financial and personal ties to one of the five commercial television networks. Regional and local newspapers also own one of the regional and local television stations in their circulation areas. Although this *keiretsu* structure may sound monopolistic or oligopolistic, there exist a large number of magazines, radio stations, and tabloid newspapers that are independent of this mainstream system.

## PRINTED PRESS

About 70 million copies are published each day by 108 newspaper companies in Japan, which is second to China (96 million, → China: Media System). In terms of per-capita circulation, Japan ranks the highest in the world (633 copies per thousand): more than twice that of the US and six times that of China. General newspapers in Japan can be categorized into three kinds: national, regional (called “block”), and local. There are five nationals (the *Yomiuri Shimbun*, the *Asahi Shimbun*, the *Mainichi Shimbun*, the *Nihon Keizai Shimbun*, and the *Sankei Shimbun*). Each has a circulation of more than 2 million and is regarded as a quality paper (→ Quality Press). The *Yomiuri* publishes 10 million morning and 4 million evening papers. The second largest, the *Asahi*, publishes a total of 12 million copies a day. The *Nihon Keizai (Nikkei)*, which publishes 4.5 million copies daily, has the largest circulation for an economics paper in the world.

Most newspapers, including blocks and local newspapers, publish morning and evening editions, which is one of the particular characteristics of Japanese newspapers. Another characteristic is a heavy reliance on a home-delivery system. In total, 94 percent of all general newspapers are delivered to homes every day by exclusive distributors.

Four national newspapers (all but *Nikkei*) and all three block newspapers publish sports newspapers, which are sports- and entertainment-oriented and fall into the category of → Tabloid Press. *Nikkei*, in turn, publishes three trade papers. All the nationals have publishing divisions and issue weekly or monthly magazines as well as books. In addition, the *Yomiuri* and the *Asahi* own two of the top ten advertising agencies in Japan.

## BROADCASTING

*Television* service is provided by a dual broadcasting system consisting of the public broadcasting corporation and commercial broadcasters. The public television service *Nihon Hoso Kyokai* (NHK) is the second largest broadcasting corporation in the world after the → BBC (→ Public Broadcasting Systems). Supported by viewers’ fees, NHK broadcasts two channels nationwide through a network of 54 stations. It also conducts satellite broadcasting with two channels. Although NHK is not state-run, its annual budget and executive personnel proposals must be approved by the Diet, the Japanese parliament.

The five commercial broadcasters based in Tokyo, who are all affiliated with major national newspapers, are *Nihon TV* (NTV, affiliated with the *Yomiuri*), *TV Asahi* (affiliated with the *Asahi*), *Tokyo Broadcasting Systems* (TBS, affiliated with the *Mainichi*), *Fuji TV* (affiliated with the *Sankei*), and *TV Tokyo* (affiliated with the *Nikkei*). These broadcasters are network stations (key stations) affiliated with regional and local stations (→ Television Networks). The key stations provide their affiliated stations not only with news, but also

with programs that account for 80 to 90 percent of local broadcasting time. Of the 127 commercial stations, only 13 are independent in the strictest sense. Digital satellite broadcasting began in 2000 with 10 channels, two of which are operated by NHK. All analog terrestrial broadcasting is to be completely digitalized by 2011. Another important actor in Japanese broadcasting is *Dentsu*, the largest advertising agency in the world. Dentsu actively participates in program creation. Its influence in the media system is incomparable with any western advertising firms. It accounted for 40 percent of all television advertising (and 20 percent of newspaper and magazine advertising) in 2005.

There are 110 commercial *radio stations* in Japan: 47 AM, 53 FM, one shortwave, and nine satellite (community radio stations are not included). Of the 47 AM stations, 34 are operated by television stations. FM stations are independently operated. Many radio stations, like television stations, are also affiliated with major newspaper companies. NHK provides two AM networks and one FM network for its domestic audience from its 54 stations. It also operates international shortwave broadcasting.

## THE INTERNET

As of 2005, the diffusion rate of the Internet is 67 percent. In terms of broadband diffusion rate, Japan is ranked eleventh in the world, with a diffusion of 17 percent in 2005. It is particularly worth noting that most mobile phones are equipped with Internet access in Japan. Mobile users are able to not only make a phone call and send emails but also access the sea of information on the web. In 2006, television service for mobiles was introduced.

In terms of online news media, Japan's mainstream media are reluctant to be fully committed to Internet service. Major newspapers and NHK have started and keep developing their own news sites. But the information provided on their websites is very limited, both in terms of amount and in terms of depth, because they are not sure whether they can maintain their existing business scale by switching from "paper" subscription to web subscription. They are also afraid that the web-subscription system will drive thousands of existing newspaper distributors all over Japan out of business.

## CONFORMITY AND DIVERSITY

Major national newspapers and television networks are relatively homogeneous in agendas, or news items (in straight news), but diverse in opinions (in editorials). The contents of major national newspapers and television networks tend to be similar because of the organizations' deep commitment to impartiality and neutrality stipulated in their code of ethics. Major newspapers and television networks do not endorse a specific candidate or political party in general elections.

One of the reasons for so much conformity in the news agenda has to do with the *kisha* (reporters) club system, which is unique to the Japanese news media industry. *Kisha* clubs are attached to nearly every government office and major organization all over Japan. Large *kisha* clubs in Tokyo were established more than 100 years ago. As there are many small and informal ones, especially in small cities, it is impossible to count the exact number. A rough estimation is 1,000 nationwide. There are no standard rules, but membership is usually limited to reporters from newspaper companies and television stations that belong to the *Nihon Shinbun Kyokai*, the Japanese association of newspaper publishers and

editors. Until the mid-1990s, foreign-media reporters were not allowed to join most major clubs, and Japanese magazine reporters and freelance journalists are still largely excluded.

Since most Japanese reporters belong to one or more clubs, 80 to 90 percent of news comes from *kisha* clubs. This fact contributes to conformity in the news agenda because (1) the reporters receive the same official announcements, press releases, and background briefings, and (2) regarding unimportant news, reporters at *kisha* clubs discuss when and how the news should be published. These practices, especially the second one, comprise a “news cartel” and have been severely criticized by journalism experts (→ Journalism: Group Dynamics). It has often been a point of discussion in how far the contents of the Japanese news media are determined by the government through the *kisha* club system. It should be noted, however, that *kisha* club reporters face competition from non-*kisha* club media such as the foreign media and tabloids, as well as weekly and monthly magazines. When the news is important, especially if it is scandalous, it is impossible for club reporters or the government to control it in any way. To compete with each other, newspaper and television companies mobilize large numbers of reporters not affiliated with any particular club. The small, cozy “club cocoon” thus easily crumbles. As a result, at least three prime ministers (since 1945) have had to resign in disgrace due to revelations of, and a continuous stream of news about, scandalous conduct.

Another stereotype concerns the homogeneity of Japan’s media content. However, although Japan is racially and culturally homogeneous, the same cannot be said with regard to ideological viewpoints. For example, in the National Diet, the Japan Communist Party, the Komei Party (Buddhist party), and the Japan Democratic Socialist Party (renamed from the Japan Socialist Party) are all represented. The *Asahi Shimbun* is also known for being sympathetic to socialist parties, including the Japan Communist Party, and the *Sankei Shimbun* often carries articles expressing the views of anti-democratic right-wing intellectuals, especially in its monthly magazine *Seiron*.

In Japan, there are intellectuals of any standing who overtly question the values of democracy, although the number of these is very small. They claim that democracy, especially “sengo minshushugi,” or postwar democracy, is too “American” and “alien,” and is therefore incompatible with Japanese culture and tradition.

# Journalism

*Kevin G. Barnhurst*

*University of Illinois at Chicago*

*James Owens*

*University of Illinois at Chicago*

Journalism is a constellation of practices that have acquired special status within the larger domain of communication through a long history that separated out news sharing from its origins in → interpersonal communication. Telling others about events in one's social and physical surroundings is a common everyday activity in human cultures, and news as a → genre of such interactions has the primary characteristic of being new to the listener. A main difficulty for sharing intelligence is ascertaining truth, or, put the other way round, distinguishing intelligence from gossip (Froissart 2002; → Rumor; Small Talk and Gossip; Truth and Media Content). Telling about events, supplying novelty, and, from the process, discerning factual truth are the main rudiments that came to define journalism as a cultural practice.

Journalism, however, is a modern-era phenomenon (→ Journalism, History of), which began its *separation from ordinary communication* first with correspondence, in the form of newsletters sent out in multiple copies to existing → social networks (→ Media Content and Social Networks), a custom available to those with literacy, leisure, and means to write (Zboray & Saracino Zboray 2006). Newsletter authors also required some facility to produce more than one copy and to distribute the result, as well as sufficient social status to make such activity appear to have value for recipients (→ Credibility of Content). This latter quality has been the source of constant attention in journalism (→ Journalists, Credibility of). From the beginning, journalism also depended upon the existence of a delivery means, such as a common courier, to convey news to readers (and in turn to auditors, when the recipients then read the news aloud; → Listening). With the advent of the printing press, some early newsheets imitated hand-made newsletters, but the primary model for all printing was the book as → printer-editors incorporated the sharing of new intelligences into their line of business. The precursors to journalism thus added writing, mechanisms of production, and a system of distribution to its definition, along with issues of status within an economic and social system.

The main claim to distinction for journalism has come through a *close alliance with political life* (Popkin 1989; Pasley 2001). Politics impinged on printing from the beginning in the form of government controls, and printing itself quickly became a political act, of either cooperation with or defiance against the powerful, or the state (→ Censorship;

Communication and Law). Journalism developed at the nexus of negotiating boundaries to demarcate private life, civil society (or the market), and the state from each other, and in some perspectives that zone became a special or sacred space (→ Privacy; Public Sphere). It was a short step, then, for the emerging press to become enmeshed in politics, an alliance of two initially (and perhaps continually) unsavory activities (an irony often lost on practitioners and scholars; → Partisan Press). The relationship began with partisan politics clearly having the upper hand (Weber 1958/1991), but eventually turned adversarial as journalism escaped state and party control, moving more firmly toward the ascendant and eventually vying for discursive dominance.

In the nineteenth century, the advance of literacy and growth of (often national) markets, along with government-created information systems (especially the post and the census), joined with industrialization to turn newspapers into the central mode of news as an economic activity (Ward 2005; → Newspaper Journalism). The term “journalism” proper emerged to refer to the resulting group of occupations involved in generating and preparing news content (→ News Workers). Publishers remained in control, but journalists became chief among workers involved in industrial news production and distribution (Hardt & Brennen 1995). A further development in news manufacture was the founding and growth of → news agencies to generate and distribute content across (often competing) outlets, which developed either among publishers (in commercial systems) or from central or government initiative (in noncommercial systems). Agencies replaced the informal exchange of news (printers merely copying content from other, distant printers) with a market exchange of a commodity specifically formulated to fit into the press regardless of partisan (or national) affiliations.

Owners and practitioners (and some scholars) normally claim technology – printing, the telegraph, radio and television broadcasting, and subsequent equipment (→ Broadcast Journalism; News Production and Technology; Online Journalism; Telegraphic News) – as a key impetus in the evolution of journalism, but studies find news organizations to be not leading but mainstream or late adopters of new techniques in most cases (Barnhurst & Nerone 2001). After resisting initially, they have so far found ways first to turn technical change to their economic advantage and then to trumpet themselves as innovators (although the outcome always remains in doubt midstream).

A more important component in the success of journalism, whether in commercial or public service media systems of the world, has been a willingness to engage with existing power relations, whether pandering to parties or markets, crusading for political stability or change, or doing some combination of these options (→ Advocacy Journalism; Muckraking; Yellow Journalism). One measure of the cultural power of journalism is the violent reaction against its practitioners throughout its history (Nerone 1994), especially in periods of social controversy and change (→ Violence against Journalists; Violence and the Media, History of).

## ASPECTS OF PRACTICE

Journalism emerged around the same time as the modern novel, and both forms share a basis in narrative (→ News Story; Narrative News Story). The two have borrowed liberally from each other in a long-running, usually tacit, dialogue, and the relationship

between news and fiction is thus antagonistic only at a superficial level. News storytelling involves more than employment, with actors performing their roles at a time and place or scene that reaches climax and resolution (White 1973; Ricoeur 1984), but also re-enacts deeper myths that express a society's view of good and evil, or of who deserves to win and who to lose (Lule 2001; → News Myths; Popular Mythology).

Separating the occupation of journalist from author is one marker of a project under way by the early twentieth century to make journalism into a particular kind of profession (→ Professionalization of Journalism). Other markers include the emergence of acceptable practices, training programs, associations, and codes of ethics (→ Ethics in Journalism; Journalists: Professional Associations). In many parts of the world, journalism remained part of and firmly aligned with literary work, and even in nations where the professional project predominated, such as the United States, movements of long-form and literary journalism arose (→ New Journalism).

Although fiction writing occasionally imitates news, journalism differs fundamentally in practice. Reporters turn to sources outside journalism for information and judgments (→ News Sources), even when writing opinion or analysis, although the practice may veil the journalist's perspective, at least partially (Schiller 1981; → Objectivity in Reporting; Instrumental Actualization). Journalists invented a particular kind of interview, which differs from ordinary interaction, especially in the case of broadcasting (→ Interview as Journalistic Form). Government and other leaders have developed specific presentational tools for getting and holding the attention of journalists (→ Press Conference; Public Relations). These activities, unlike the work of other authors, operate in predictable rounds growing out of news genres and processes of production, so that weekly news magazines, daily newspapers, multiple television newscasts, and hourly radio news updates set workflow into motion in → news cycles akin to the hours of medieval monastic orders. Journalists experience these cycles as *deadline pressures*, a central aspect distinguishing news practice.

From its birth in the industrialized newsroom, journalism developed customary patterns for all aspects of work (→ News Routines). The best-known example is the *beat*, which combines location and process so that a reporter goes through a set of routines to gather information from predictable and reliable places (Tuchman 1978). Because they share experiences, if not training, journalists within a mainstream (usually national or regional) system respond to each other and to the world in similar ways (→ Journalism: Group Dynamics). For example, the collective mentality that leads journalists to gather around certain public occurrences or figures has acquired the name "pack journalism." This pejorative term, along with others such as "paparazzi," the photographers who hound celebrities, forms a system of policing the boundaries between journalists and others who do similar work but lack the insider status that, in general, only institutions in the industry have the power to confer (→ Photojournalism; Celebrity Culture).

Other terms convey the *pattern of competition*, such as the "scoop" and the "exclusive," which reinforces standard practices and keeps practitioners in a state of perpetual anxiety. Unionization has been the principal force mediating between the power of news institutions and journalism workers, but all involved, even corporations and state bureaucracies, subscribe to a competitive discipline that defines practice (→ Standards of News). Journalism awards and prizes (operating primarily at the national level) formalize competition and

reify the abstract quality assumptions about news work (→ News Ideologies). A set of *news elements* (the five Ws – who, what, when, where, and why) underlies a broader set of → news values, which go by a plethora of terms in training manuals and in practice, but may correspond roughly with the elements: prominence (who), peculiarity (what), novelty (when), proximity (where), and significance (why). Like other practical ideals (such as *principles of design* among graphic designers; → Graphic Design), news values inherently come into conflict with each other, which keeps news work interesting. But the patterned responses to practical principles not only help national and regional news cultures define themselves but also help guide individual journalists in their self-assessment (→ Journalists' Role Perception).

News cultures have tended through the twentieth century toward consensus around two main ends, one supervisory at its core and the other advisory. As news managers, journalists operate as gatekeepers, handling what they perceive as a growing flow of information and providing an altruistic service for audience members (White 1950; → Gatekeeping). These news manager-supervisors apply the principles to select and reject potential content, although decisions about what the public needs tend to occur without much recourse to the people themselves (Dennis 1978). As news advisors, journalists operate as advocates, promoting particular understandings of the world, again as a public service. Journalism is promotional and managerial in a vocational rather than commercial sense, and news systems blend these tendencies, which act as poles pulling practice in apparently opposite directions, advisory versus supervisory. Both, however, may tend to enhance journalism by directing attention away from journalists and toward their expressed public service vocation.

In the broadest sense, the ends of journalism point toward more general theories, such as the possibility of democracy and realities of power and authority (McNair 2000; → Media Democracy; Power and Discourse). Journalism is thus a construction that embodies ideals about society and the world, and these theories provide pictures of social, political, economic, and cultural organization, through the lens of journalism and its view of itself (→ Journalism: Normative Theories).

### DIFFERENTIATION AMONG JOURNALISTS

As an occupational category, journalism in the nineteenth century merged several kinds of tasks: principally the *editor*, who managed some aspect of content from a central office, the *correspondent*, who ventured out as a worldly traveler and (perhaps imperial) observer of affairs, and various forms of *news hounds*, who did piecework as local scavengers to fill the editorial hole by the inch, often pursuing a particular topic or venue such as crime or the docks. As journalism emerged as a professional project, specialization produced new bundles of tasks. A foreign location, for example, allowed some journalists to build expertise through experience in a distant location (→ Foreign Correspondents). Government control remained one of the main difficulties for journalists crossing boundaries into media systems outside their own. Another specialty focused on wars and conflicts (→ War Correspondents), and although such a pattern of assignments might enhance the status of the journalists exposed to risk, the professional in these roles also faced the drudgery of frequent deadlines and routine coverage typical of scavenger work, which

earlier correspondents might have avoided. The tradeoffs between professional autonomy and state protection re-emerged as military authorities invented and elaborated on systems of control (→ Embedded Journalists).

Journalism has embodied and reinforced concepts of the mainstream and the other, another form of differentiation that plays out on two levels: in the structure of news businesses and in the agency at work within these organizations. Ethnic groups that share a heritage, language, location, and the like (Riggings 1992), especially when excluded from mainstream institutions, began forming their own newspapers early in press development (→ Ethnic Journalism). The minority press has likewise tended to emerge in the wake of geopolitical boundary formation and international migration (→ Minority Journalism). These journalisms at the margins may begin in advisory mode, promoting group solidarity in opposition to the mainstream, but here again joining the professional project of journalism can shift their emphasis toward a neutral form of information management. Although women have generated publications throughout news history, the level of agency has been especially evident in their fate in journalism (→ Gender and Journalism). Early feminist histories focused on remarkable women journalists, and recent work has shifted emphasis to the gendered division of labor and topics and then to gendered identity (De Bruin & Ross 2004).

The relationship of journalism to politics has also seen differentiation. Groupings of news workers covering national capitals and heads of state have acquired special status as a *press corps*, including their own organizations and rituals, and wield considerable influence but identify with and rely on official sources (→ Political Journalists), in contrast to the ethnic, minority, and women's, along with the underground and oppositional, groupings of journalists (→ Alternative Journalism). The latter groups represent alternative political ideologies, and they may espouse specific positions on issues (→ Peace Journalism), but in general they take an active, advisory stand with their audience members (Downing 2001). Mainstream journalists focused on information supervision have turned to investigating public officials since the nineteenth century (Ettema & Glasser 1998; Waisbord 2000), but their exposing of corruption and mismanagement tends to reinforce dominant ideologies by implying that small institutional changes and responsible individual behavior are sufficient to set things right (→ Investigative Reporting). A recent movement to make reporting more answerable to civic and community needs strikes closer to reform within the political culture of journalism (Rosen 1999; → Public Journalism).

Other kinds of differentiation have grown out of the main currents of a society. Examples include journalists focused on topics such as → science journalism and on modes of delivery such as visual journalism (→ Visual Communication). The growth of computer networks and increased accessibility of large databases about public issues have contributed to a corresponding specialization for journalists in countries rich in the necessary resources and skills (→ Precision Journalism).

These same currents may have contradictory outcomes for the professional project of journalism. The production of news content has become more portable across traditional print and broadcast media as the tasks journalists perform *converge on digital technology* (→ Cross-Media Production). The changes might point to multimedia journalism or instead to a de-skilling of practice, as the tools shift from professionals into other hands. In many countries, citizens can now tell each other their own news by writing and

distributing it electronically from home or from a community center or library (Rodríguez 2000; → Citizen Journalism). Despite hopes for broader democratic participation, online forms of journalism have so far reproduced existing alignments in politics and emerged along existing economic and cultural cleavages (→ Blogger).

Journalists, however, have accumulated considerable cultural capital in more than a century of existence. As a cultural practice, journalism has shed some of its unsavory past, but not all, as long as scandal and titillation continue (→ Sensationalism), and in fact practitioners themselves can acquire fame (Corner & Pels 2003; → Celebrity Journalists). Journalists have become central interpreters in public discourse, and even in the United States, where a denotative journalism of facts and events took early and deep root, the quantity and degree of interpretation within the mainstream news media have grown continually for more than a century (Barnhurst & Mutz 1997; → Interpretive Journalism).

### NEWS WORK AND THE ACADEMY

Scholarly inquiry on journalism emerged in the second half of the nineteenth century in Europe, where works of history, economics, and sociology identified the press as a force in the dynamics of public and political life (Dennis & Wartella 1996). German economist Karl Knieves wrote in 1857 on the relationship of the telegraph and the press, and Karl Bücher at Leipzig, in *Kultur und Presse*, expanded the idea that news moved between localities through complementary exchange relationships. Historians of the same period traced the liaison of literature and the press in France, and Tocqueville's *Democracy in America* examined newspapers in the making of associations. The German sociologist Emil Loeb applied systematic concepts to newspaper organization and content as well as journalism practices. Max Weber, in his well-known essay "Politics as a vocation," observed the roles and status of journalists. He tried to make journalism research a greater priority for German scholarship, proposing that the National Sociological Society conduct a large empirical study of the ideological determinants of news content, the relation of journalism to public life, and the impact of press ownership on the distribution of power, among other issues.

Alignments between industry and the academy for the purposes of job training helped shape journalism research (→ Journalism Education). The first *university journalism programs* grew from the organized efforts of publishers and press associations to harness academic work to the project of making journalism respectable. European programs combined sociological research on the press with training for journalism practice, oriented in relation to concepts of the public, but the practice of journalism remained aligned with humane letters, especially in the southern tier of Europe. In the United States, journalism programs grew from English departments (Dressel 1960), but industry demands for news production skills came into conflict with liberal arts (Hutchins Commission 1947), especially with existing curricula oriented to the study of literature. As a result, journalism programs became administratively independent and more vocational. Speech programs followed a similar route, becoming separate entities that eventually took a role in training for broadcasting work (Wallace 1954). The contest of job skills versus liberal arts was not peculiar to journalism but informed wider debates about academic specialization, pitting expertise (for journalists) against generalist training (for

citizens) in the early twentieth century. Because specialization could allow interested elites to corrupt the academy, Canadian scholar → Harold Innis (1946) suggested preserving the university tradition against particular vocational training and against narrow empiricism inherent in the rising new definitions of social science. For journalism as an academic field, professionalism especially seemed inappropriate for organizing university inquiry (Carey 1978; → Communication as a Field and Discipline).

Generally, the study of journalism remained *scattered among academic disciplines* and dependent upon the particular research projects of investigators. Journalism likely did not come into focus for research because the surrounding institutions focused on practice. In Asia, Africa, and Latin America (Deuze 2006), industry associations were instrumental in creating journalism schools as occupational centers, founded, for example, in China by 1918 (Lee 2000), Egypt by 1935 (Murphy & Scotten 1987), Argentina by 1934 (Knudson 1987), and Russia by 1947 (Morrison 1997). Researchers might use materials from newspaper offices, as did an early study in Poland (Thomas & Znaniecki 1927), or encounter journalism as an aspect of daily life, as did the mass observers in 1930s Britain (Madge & Harrison 1938), but the result did not place journalists in sharp focus. The famed Chicago School paid considerable attention to news in community life (e.g., Fenton 1911) and included at least one professor with practical journalism experience, Robert Park (Lindner 1996), but then Chicago sociology for many years disappeared from view in the academic study of journalism.

Professors' organizations growing out of university departments founded the first scholarly periodicals to focus on journalism research. The earliest was probably *Zeitschrift für Zeitungskunde*, which Bücher founded shortly after 1916 (Dennis & Wartella 1996). Elsewhere, the American Association of Teachers of Journalism in 1924 founded *Journalism Quarterly*, a publication that endured organizational changes and mergers. (The *Journal of Broadcasting*, which the University Association for Professional Radio Education founded, later followed a similar path.)

Following World War I, *propaganda analysis* became a leading academic and popular way to understand journalism (Sproule 1997; → Propaganda). Contributors included journalists such as → Walter Lippmann as well as academic researchers. Scholarly debate on propaganda and journalism in the interwar period eventually divided between those taking a propaganda practitioner approach (e.g., Lasswell 1927) and those taking a propaganda criticism approach (e.g., Lee & Lee 1939/1979; Lynd 1939/1964), based on normative ideas of journalism and its place in democracy. The work of propaganda analysis helped establish institutional foundations for studying journalism.

World War II disrupted organized academic activities in Europe and elsewhere, and some scholars whose work touched on journalism, including Herta Herzog and Herbert Marcuse, among others, moved to the United States. Government agencies involved in monitoring and analyzing enemy broadcasts and designing propaganda campaigns sometimes involved academic researchers in journalism topics. For example, → Harold Lasswell (1946) conducted content analyses that provided evidence for prosecuting German-American publishers (→ Content Analysis, Quantitative). Another strand of research influencing the understanding of journalism emerged from connections to industry through market studies (→ Marketing). Paul → Lazarsfeld applied the concept of *Handlung* (action) from German humanistic psychology to marketing research as an

inquiry into purchasing choices (Lazarsfeld & Kornhauser 1935; Lazarsfeld 1939; Czitrom 1982), seen as parallel to the decisions of voters and news audiences.

### SCHOLARLY STUDY AND PROSPECTS

By the late 1940s, empirical social science became the dominant paradigm for academic inquiry into journalism, organized generally around the concept of “mass communication.” Early PhD programs emphasizing journalism had emerged in the US midwest during the first half of the twentieth century, with the general tendency toward the social sciences (Weaver & McCombs 1980). Programs at the universities of Illinois, Iowa, Minnesota, and Wisconsin, as well as Stanford, eventually incorporated sociology from Lazarsfeld, political science from Lasswell, and social psychology from → Carl Hovland to treat journalism as a social object of study (Zelizer 2004). Journalism research thus acquired a growing emphasis on means of → observation, systematic documentation, and → generalizability of results (e.g., Hovland et al. 1949; Breed 1955). Humanities approaches to journalism fell behind as the status of social science grew, so that, for instance, studies employing quantitative methods went from 10 to 48 percent of the news media research in *Journalism Quarterly* in the decades from 1937 to 1957 (Schramm 1957; → Quantitative Methodology). Although earlier research had treated journalism as a powerful force in defining social problems and in propagating government ideas and fomenting public support, the dominant thinking among scholars by mid-century was more functionalist and had come to see journalism as limited in its effects (e.g., Berelson et al. 1954; → Functional Analysis; Media Effects).

By the 1960s, however, objections began to arise. Intellectual currents such as → semiotics began to influence thinking about journalism (Eco 1965/1972; Barthes 1967). Social scientists in the United Kingdom developed an interest in the study of journalism, led by Jeremy Tunstall (1971), who pursued inquiries into journalists’ autonomy from surrounding forces. By the 1970s, fault lines emerged in the dominant social scientific paradigm, after research found that greater effects could occur among distinct social groups as opposed to the masses and that journalism had influence in setting the public agenda among political elites especially (Greenberg & Dominick 1969; McCombs & Shaw 1972). In Britain once → cultural studies emerged, Stuart Hall (1973, 1974) and others analyzed journalism texts, and social critics such as Ralph Miliband (1969/1973) described how capitalist ownership and shared values among media professionals helped support class domination. US sociologists examined news and conducted fieldwork among journalists (e.g., Molotch & Lester 1974; Gans 1979), and communication scholars began incorporating cultural approaches, led by James W. Carey (1976, 1989; Allan 1999).

In the early 1980s, when the communication discipline underwent a period of ferment, a new vector also extended into journalism study. *Agenda-setting effects*, along with → *priming theory* and → *framing effects* (e.g., Iyengar & Kinder 1987), developed as a research approach to journalism, particularly related to political life (→ Agenda-Setting Effects; Framing of the News). Under the emerging conditions of postmodernism, attention to news was declining among youth (Bogart 1989; Barnhurst & Wartella 1991), and journalism as a professional project entered a conscious period of crisis (Hallin 1992;

→ Postmodernism and Communication). Journalists became aware of declining audiences related to the aging of the population and also faced industrial changes such as the liberalization of state-controlled media in some countries and the proliferation of cable, talk radio, and other alternatives to traditional news outlets in countries with commercial systems, accompanied by the rise of new populist media and spread of tabloid journalism globally.

As intellectuals debated the process of globalization, scholars of journalism engaged in *political and economic critiques* that examined the relationship of media organizations to centers of social control (Hess 1984; Manoff & Schudson 1987; → Globalization Theories; Globalization of the Media; Media Economics). US practitioners responded with the civic journalism movement and joined with their counterparts in industrialized countries and with some academics in adopting a view of news as a contributor to the public sphere (Habermas 1962/1989; Dahlgren 1995). The rise of political-economic criticism (e.g., Herman & Chomsky 1988/2002; → Political Economy of the Media), on top of the cultural criticism of the 1970s, prolonged the moment of crisis in journalism practice, which intensified after the Cold War ended in 1989. Among scholars, the crisis concentrated attention on journalism and exposed its underlying realist assumptions (Hartley 1982, 1996). Journalism studies, incorporating concepts of narrative and myth, ideology and hegemony, as well as approaches such as professional critique, political and economic analysis, and sociological observation, took institutional form in anthologies of canonic scholarship (O'Malley & Bromley 1997; Tumber 1999), in new scholarly journals such as *Journalism Theory, Practice and Criticism* and *Journalism Studies* (both founded in 1989), and in the creation and rapid growth of a Journalism Studies Division in the International Communication Association.

In a sense, then, the vectors of journalism study followed general intellectual movements of the latter twentieth and early twenty-first centuries and paralleled the increasing differentiation in journalism practice. At the beginning of the new century, critical scholars argued that → access to the media varies by social group (especially given the → digital divide), that capitalist ownership shapes news values, and that market-driven news practices benefit the already privileged (Curran 2002). Liberal pluralist scholars tended instead to align themselves with journalists' definition of a positive and realist social role for journalism as an extension of (or a means essential to) the public sphere, aligning these concepts with journalistic training (Bromley 2006). Although the definition of journalism itself varies across academic disciplines and across dominant and alternative forms of practice, the main issue facing journalism is power. While scholars debate the power relations of journalists in media and political systems, journalists see multiple threats to their powers to practice in safety, to retain political autonomy, and to resist losses in their tenuous professional status.

## Journalism Education

Lee B. Becker

University of Georgia

Journalism education is instruction for work in the news departments of media organizations, both print and electronic. The instruction can take place before journalists enter the workforce, during early employment, and at later career stages. It can involve practical training in the skills of the journalist and broader education about the context of that work (→ Professionalization of Journalism). The training can cover reporting (information gathering and evaluation), writing (language use and storytelling techniques, including photography and graphics), and editing (including story presentation and integration into the news format) skills. Education about the context of journalism can include topics such as the social setting and impact of news, journalism history and law, and news ethics.

### MAIN TRADITIONS

Education for entry-level journalism has followed three main traditions, which reflect not only the historical evolution of journalism education, but also the control from, and involvement of, media businesses themselves. The earliest journalists learned their skills *on the job*, usually beside a journeyman. That tradition has persisted until now, most notably in Great Britain. A tradition usually associated with the US centers on *university instruction* before entering the workforce. A tradition associated with continental Europe houses journalism instruction in *training institutions* other than the university and

separate from the industry. Variants of these traditions exist in nearly every country even today.

Most research on journalism education is descriptive, such as the → UNESCO project that mapped the field (Gaunt 1992). Variants in journalism education tend to reflect the history, traditions, political structure, and economics of each national press system.

Proponents view journalism education as important because it gives journalists skills and values that affect what they do, e.g., expertise to be better gatherers and interpreters of information, writing and video-shooting skills to fashion better reports, which audiences will more likely attend to and understand. The outcome should be a better-informed citizenry (→ Journalism: Normative Theories). Although the evidence for that assumption is largely anecdotal, news media companies support it in their habits. Larger organizations employ journalists specialized to cover medicine, transportation, legal affairs, defense, and the like, because they believe that specialized knowledge, acquired through training or on the job, makes for better reporters and editors, to the benefit of citizens.

The employing media organizations believe that journalism training supplies more productive members of the workforce. A journalist who knows which sources to approach, how to conduct an interview, how to write in news style (→ News), and how to work under deadlines will likely produce the news product quickly and cost-effectively. A journalist trained in libel and other legal constraints on news (→ Libel and Slander) will likely help the employing organization avoid legal problems. From education, the employer gets a type of certification of a journalist's basic skills.

Journalism education frequently has been a means of political control. In Eastern European countries under communism, for example, journalists generally could not hold the top news leadership positions unless one of a few university journalism programs had trained them. The training guaranteed that journalists followed the techniques and values of the state information system. The values of the host society always influence journalism, and journalism education is necessarily one means to exert social control over journalism practice.

## **JOURNALISM EDUCATION IN THE US**

University-based journalism education began in the US in the last quarter of the nineteenth century, when departments of English began offering courses in basic writing and reporting skills for print journalism. In 1908, the University of Missouri established the *first School of Journalism*, a distinct academic unit designed to educate students for careers. Enough journalism programs were in operation four years later to see the founding of the American Association of Teachers in Journalism, which developed into today's Association for Education in Journalism and Mass Communication, a largely US-based organization (Emery & McKerns 1987).

Journalism education fitted well into the US university, which, more than its European contemporaries, included instruction in entry-level skills for persons preparing to join the labor force (→ News Workers). American universities expected students to participate in courses across multiple fields – a type of liberal arts education that most European countries included in pre-university curricula – and American students could also study to be nurses, teachers, engineers, and even agricultural workers, as well as journalists.

Despite this integration of journalism education into the core of American universities, a division has always existed between programs fully integrated into, and those drawing on but separate from, that liberal arts core (Reese 1999). Proponents of the former position, called the *Wisconsin model* after the university where it originated, argue that journalism programs should be housed in the core of the university. Proponents of the latter model, associated with the University of Missouri, argue that journalism education should stand outside that core. Most US journalism programs follow the Wisconsin model, a minority follows the *Missouri model*, and some follow another variant.

Another persistent division in US journalism education is between instruction for entering newspapers and magazines, and instruction for entering radio and television. When US radio broadcasters began to need trained workers, they turned to universities with programs in oral communication. These units, mainly departments called Speech Communication (→ Speech Communication, History of), educated students in the techniques of argumentation and debate as well as voice and articulation. The close alliance of the newspaper industry with existing journalism programs and the competition between newspaper and radio made a separate source for radio talent an advantage. Television followed this same path until the 1960s, when news operations began to expand and needed workers trained in journalism. Existing print journalism programs then began to provide journalism instruction for broadcasters.

In the 1970s, journalism programs at US universities began to expand their curricular offerings to include instruction for careers in public relations and advertising (→ Advertising; Public Relations; Professionalization of Public Relations). Advertising had been a part of the University of Missouri journalism program from the beginning, and many students likely studied journalism to enter public relations either immediately or later as their careers unfolded. Today, advertising and public-relations instruction is common in US journalism programs.

The division between speech communication and journalism still exists at many US universities, although others have brought these programs together in an umbrella organization, a college or department of communication. About 1,200 US universities offer some form of instruction in communication, and roughly 450 of them include journalism in their curriculum.

Efforts to create standards for journalism education (→ Standards of News) in the US began as early as 1917 and culminated in 1945 with the founding of the American Council on Education for Journalism, today called the Association for Education in Journalism and Mass Communication (ACEJMC; Emery & McKerns 1987). The accreditation standards, a by-product of discussions between journalism educators and the media industries that employ their graduates, cover curriculum, faculty qualifications, facilities, governance, and the like. In 2006, ACEJMC accredited 109 programs in the US and one in Chile.

## **JOURNALISM EDUCATION IN OTHER AREAS**

In western Europe, few universities until recently offered curricula to train students in the practice of journalism. Usually instruction came from other institutions of higher education focused on specialized trades and occupations. The universities instead offered

courses to examine critically how journalism operates, often from the point of view of political science or sociology. The University of Leipzig taught such courses as early as 1762.

Despite similarities within Europe, countries have pursued different approaches to journalism education (Gaunt 1992). In *France*, a body representing the government, the journalism union, and the media industries accredits programs. Consistent with the French tradition in journalism itself, instruction focuses on a literary tradition. In the Netherlands, specialized institutions have training journalists as their sole mission. Many *German* media organizations run training internally. Graduates may seek employment outside the organization, but the organization can observe their work over time and offer contracts to the most promising students. Large German media organizations value specialized knowledge and hire journalists with doctoral degrees in their areas of specialization. The new democracies of *eastern Europe* have tended to follow the American models for journalism education, although several countries house journalism within political-science colleges.

Former British colonies in *Asia* and *Africa* followed the tradition of on-the-job training initially, but have moved more recently toward university-based education. Other countries have followed the traditions of their colonial masters as well. In the Philippines, for example, universities offer journalism curricula very similar to those of the US.

Beijing University in 1918 offered the first journalism courses in *China*. Other universities, many headed by American missionaries, began similar instruction. With the creation of the People's Republic of China in 1949, journalism education came under state control. As China became more open to the west at the turn of the twentieth century, journalism instruction also came less under central control and reflected the American trends more.

Journalism education in *Latin America* is an amalgam of US and European influences. The programs emerged in the 1950s and 1960s and followed American university-based models, but often included a political component. Practical skills training is less prominent than theoretical analysis of the role of journalism in society, reflecting the countries' strong literary and humanistic traditions.

### MID-CAREER TRAINING

Post-employment training for working journalists has become common in many countries. In Denmark, for example, union contracts guarantee training opportunities for journalists. In the US, approximately 130 such programs operate. As part of media assistance, donor countries around the world commonly include training for working journalists. The employer, an educational institution, or an independent organization may offer *mid-career* training.

The programs, running from a few hours to several months of intensive study, may take place at work or at another institution. Specialized journalism training organizations offer some programs, and universities offer others, as extensions of existing journalism curricula. Programs may focus on specific skills, such as software use or government databases, or on general knowledge, such as health research methods. Web resources increasingly supplement the programs, and some training takes place exclusively online.

Working journalists may know about and regard the programs highly, but little systematic information exists about the *effectiveness of the training*. Some research suggests that mid-career training can give journalists new ideas and sources for writing and producing stories (Becker et al. 2006). Promoters say that participants have more motivation and advance in their careers. Sharing experiences may improve individual performance and journalism in general. Research does suggest that long programs give journalists a respite, a time to gain new enthusiasm for work and for subsequent stages of their careers.

The competencies of journalists, acquired through education before and after employment, may affect the news construction process, but research has not yet documented to what extent. More important, research has not examined how variants in journalism education affect news work. Do university- and industry-based programs produce reporters with different value systems? Do journalists educated in the humanities produce a different version of news than those educated in the social-science tradition? Research needs to pursue these questions to understand journalism education.

## **Journalism: Group Dynamics**

*Carsten Reinemann*

*Johannes Gutenberg University of Mainz*

Several factors shape journalists' everyday news decisions, their general concepts of what is newsworthy (→ News Factors; News Values), and their understanding of quality

(→ Quality of the News), as well as long-term changes in reporting. One of the most important factors is the close interaction and frequent communication among journalists, or *co-orientation*. Co-orientation comprises several kinds of dynamic processes within journalism. In the era of 24-hour news channels, the Internet, and shortening production cycles (→ News Cycles), the dynamic processes within journalism are not only occurring faster but are also becoming more important.

### TYPES OF INTERACTION AMONG JOURNALISTS

The basis of journalist group dynamics is their close interaction and communication in professional and private contexts, their *ingroup orientation* (Reinemann 2004). Across different contexts, causes, functions, and effects, the types of interaction among journalists fall along two dimensions: the *modes of interaction* (interpersonal vs via mass media vs virtual or cognitive) and the *constellations of interaction* (journalists of the same organization vs those of different organizations).

First, among the *modes of interaction*, journalists can interact directly. Reporters have interpersonal interaction on their news beats, at → press conferences, in reporter pools for foreign and war correspondents, or during election campaigns with candidate tours (Crouse 1973; → Election Campaign Communication). Beat reporters develop a good rapport and solidarity among themselves, based on cooperative arrangements. Second, journalists also communicate indirectly via mass media, such as when they read each other's work in the morning newspaper. Finally, a purely cognitive or virtual form of interaction takes place when journalists anticipate their competitors' future news decisions and react to them in their own reporting. As a consequence, journalists may choose stories because they *expect* a competing medium to do so.

Among the *constellations of interaction*, interaction among journalists may occur within the same or across different media organizations. In the same organization, the interaction involves discussions among peers in the staff, among corporate supervisors and journalists, and among reporters and editors. The discussions serve to make new colleagues familiar with the professional norms of a medium (*professional socialization*), to establish and stabilize principles of news making, or to decide whether and how to cover a specific story (*editorial control*). The most important institutionalized form of communication in news organizations is the *editorial conference* (→ News Routines). Interaction among journalists working for different organizations also is intense. Using other news media is the most frequent form of journalistic interaction for newsroom journalists. Reporters of different media are more often interacting interpersonally at their news beats. Journalists may also be members of journalist unions or read professional journals (→ Journalists: Professional Associations).

All these forms of interaction might be means of news gathering, of observing competing news organizations, or of keeping up with the latest trends in the profession. Indirectly, the interactions also establish an intermedia consensus on the criteria of newsworthiness and reporting quality. The importance and implications of discourse and informal contacts among journalists are central to the concept of journalists as *interpretive communities* (Zelizer 1993; → News Ideologies; Political Media Content, Quality Criteria in).

Most types of journalistic interaction have undergone empirical study. Observational and survey studies have investigated professional socialization and structures of influence within newsrooms, journalists' media use, the direct interaction and networking among journalists of different news organizations, and the like. In observational studies, researchers have looked at, for example, how intense communication was in newsrooms, when and how other media were used, and the extent to which competing media served as points of reference in editorial conferences. Survey studies have asked journalists how often and for how long they use other news media; what influence their supervisors, colleagues, competing media, important newspapers, or wire services have on their concept of newsworthiness; what influence other media have on their post-publication evaluation of their own work; and the like. The studies have shown that journalists spend a lot of their time monitoring other media, which they regard as important for their everyday work (*routine reliance on other media*) (Shoemaker & Reese 1995). Some studies found differences among journalists of different ages and editorial positions, as well as differences among those working for different media (Reinemann 2004; Weaver et al. 2006).

### WHY JOURNALISTS INTERACT CLOSELY

Scholars studying co-orientation in journalism offer several reasons why colleagues and other media matter so much to journalists. Some of the rationales concern features of the news production process, but others concentrate on the characteristics that distinguish colleagues and media from other journalistic sources (→ News Sources).

Some authors argue that, because journalism lacks *rational* criteria for news decisions, journalists must make decisions under uncertainty. Journalists also face constant time pressure and must make decisions quickly. In these circumstances, colleagues and the coverage of other news media fulfill the journalists' need for a *social validation* of their news decisions (Donsbach 1999). Other authors argue that uncertainty itself can serve to explain only a strong need for information, but not why journalists rely so much on co-orientation. Among the variety of sources available, other journalists may become points of reference because of their special quality as journalistic sources (Reinemann 2004).

The importance of other media for journalists may result from a missing or disturbed relationship between journalists and their audiences. In other words, because journalists neglect their audiences, their colleagues remain their main point of reference. This view gains support from studies showing that journalists write primarily for themselves, for their editors, and for other journalists. On the other hand, the spread of → audience research has increased journalists' knowledge about their audiences, and economic concerns pressure journalists to take seriously what their audiences need (→ Competition in Media Systems; Readership Research). Co-orientation among journalists and orientation toward audiences are not mutually exclusive phenomena. Other media may be important for journalists because a previous publication on a topic indicates that it has audience appeal. Journalists may rely heavily on other media for story ideas not *for lack of* interest but instead *because of* that very interest in the audience. Another reason may be that the media must meet the expectations that come along with their position in the daily news cycle. For example, an evening newspaper can succeed only if it picks up the stories from morning papers and radio news, adding the latest information (McManus 1994).

Competition among media may be the main reason for the intense interactions among journalists. In this view, tracking the products of competitors is a way of controlling the environment of the news organization. From the journalists' perspective, the control is necessary because they think that success depends on providing more timely, comprehensive, or exclusive reporting than their competitors. In fact, some evidence suggests that journalists do follow only a limited number of media closely, mostly those that compete directly with them. The competition does not seem to be equally intense for all kinds of stories. For example, Herbert Gans (1979) found at the magazines he investigated that competition was most intense for cover stories. The processes of economic concentration, which lead, for example, to media monopolies in local markets (→ Concentration in Media Systems), also reduce the need to monitor competitors.

Other research stresses the qualities of journalists and media as information sources: perceived reliability, saturation with news factors, correspondence with journalistic styles of presentation, constant availability and low cost, as well as their usefulness in various stages of news production. These qualities make other media especially valuable sources. Other media can provide an overview about what is on the news map, can be an indicator of audience interest, and can provide background information or new angles for a story. Colleagues also play a central role, post-publication, in evaluating the quality of individual stories or the appropriateness of the placement and weight a topic receives. No other source is so *multifunctional* (McManus 1994; Reinemann 2004).

### EFFECTS OF JOURNALISTS' GROUP DYNAMICS

Close interaction and mutual observation in journalism lead to dynamic processes within and between news organizations. Most studies argue that these processes may lead to homogeneous concepts of newsworthiness and, as a consequence, of news content (→ Consonance of Media Content). There may be a → mainstreaming effect on the general attitudes of journalists. News organizations foster professional socialization and establish editorial control through interpersonal discourse, through editing each other's work, and through monitoring the reception of the medium. Interactions between journalists from *different* media can also lead to dynamic intermedia processes.

In processes of *intermedia agenda setting*, journalists pick up stories or issues covered in another medium (→ Agenda Building). A possible consequence of the processes is the *focusing* of the media agenda; that is, a consonance of the issues covered in the media. Warren Breed (1955a) was the first to describe this process. His seminal study led authors to look at several issues, such as the influence of scientific journals on media serving a general audience or the differences in agendas of national and regional media at specific points in time (Shaw & Sparrow 1999).

In *intermedia frame setting*, journalists adopt the perspective or story angle used in another medium in their reporting (→ Framing of the News). In periods of *routine coverage*, the repeated reception of certain news frames in other media reinforces their use by the recipient journalists. In phases of *orientation*, such as after surprising key events when no known news frame is easy to apply, intermedia frame setting can establish a perspective for reporters throughout the media system (Scheufele 2006).

In *intermedia opinion leading*, the reporting and commentary of one medium affects not only other journalists' agendas or frames, but also their opinions and evaluations of persons, issues, or events (→ Opinion Leader). A conformity of issues discussed in the media may be functional for democratic processes, but a consonance of opinions may instead be dysfunctional in pluralistic democratic societies, where the media should present a diversity of viewpoints on political issues (→ Plurality). Some authors argue that the socio-psychological processes that → Elisabeth Noelle-Neumann described in her theory of public opinion (→ Spiral of Silence) can help explain the processes of consonance building within the media system.

One special type of intermedia process is the *wave of coverage*, also called *media hype* or *feeding frenzy*, in which the media pick up an issue and respond to each other in a spiral of peeking coverage, before largely dismissing the issue. The amount of coverage often does not reflect the importance of the issue or the real development of the problem. Key events or scoops spark media hype, which differs from ordinary day-to-day intermedia agenda setting in intensity and dynamics. Similarly, in a *feeding frenzy*, a critical mass of reporters jumps on a prurient or shocking matter and pursues it with excessive intensity (Sabato 1991). This kind of reporting is also called *pack journalism*, a term referring to the crowds of journalists trying to get information from a source, who may act like hounds pursuing their prey.

## OPINION-LEADING MEDIA

Studies investigating intermedia processes try to identify the most influential media in a system or in the context of a specific issue or event. These media take the role of *opinion leaders* (Breed 1955b). Like interpersonal opinion leaders (→ Two-Step Flow of Communication), the so-called *prestige* or *quality media* (→ Quality Press) are trendsetters that present and interpret topics in ways that generate a chain reaction in other media (Noelle-Neumann & Mathes 1987). Because agenda setters do not necessarily set frames or opinions at the same time, no consensus exists about which media most influence a media system. The evidence from content analyses and surveys of journalists is mixed.

In the mid-twentieth century, Warren Breed (1955a) postulated a clear direction of influence in intermedia processes from larger to smaller newspapers. Since then, several studies have come to differing conclusions. Some authors found *spillover effects* from alternative to mainstream media (→ Alternative Journalism). Others found not only *top-down processes* from national to regional but also *bottom-up processes* from regional to national media. Still other studies observed top-down processes for some issues but not for others. Evidence regarding influences between TV and the press is also ambiguous. Some studies found a stronger impact from the press, but others found varying directions of influence, perhaps because the structure of influence differs among TV, daily newspapers, and news agencies for specific aspects of an issue. When media hype occurs, even the most influential journalists and media may fall in line with the mainstream.

Finally, countries seem to vary in the *types* of media regarded as most influential within the media system. National quality newspapers traditionally held that position, but changes in a society and its media system can alter the assessment of influence. In some countries, news magazines, TV newscasts, or even tabloids seem to have a strong impact

on journalists working in other venues. Famous individual journalists have emerged in recent years as media opinion leaders in some countries (→ Celebrity Journalists).

Although strong evidence supports the relevance of intra- and intermedia dynamic processes in journalism, several questions remain. Although journalistic co-orientation appears important for journalism around the globe, international comparative studies need to look for differences in factors such as the intensity of media use and the role of influential media organizations. Most studies restrict themselves to political or general news journalism, although different processes and influential news organizations may exist for different types of media or for different areas of reporting, such as the economy, sports, or culture. Because media content is far from consonant all the time, systematic studies need to explain under what circumstances consonance emerges or media hype develops. Current explanations for intermedia processes deserve reconsideration. Competition can prevent intermedia agenda setting when journalists either try to get exclusive stories or come to the conclusion that their audience has seen enough of an issue. The circumstances when journalists choose adoption or differentiation also deserve thorough investigation. Finally, 24-hour news channels, the Internet, and shortening news cycles likely have made dynamic processes within journalism change. Whether and to what extent those changes have occurred are important subjects for future studies of journalist group dynamics.

## Journalism, History of

John Nerone

University of Illinois at Urbana-Champaign

The history of journalism, inclusively defined, encompasses the history of news and news media, including, among other things, the history of print, broadcast, and computer technology; of news work, news routines, and news workers; and of news organizations, including newspapers and other media outlets as well as wire services and feature syndicates. Defined more narrowly, the history of journalism refers to the emergence of a set of values and explanations that discipline, regulate, and justify news practices (→ Journalism). Journalisms are socially constructed (→ Constructivism), and appear in different guises at different times in different national cultures in reference to different media. The history of journalism examines their construction in national and international settings, as well as anticipating their future prospects.

### JOURNALISM AS HISTORICAL CONSTRUCT

Commentators on political discourse began to apply the term "journalism" to some of the content of → newspapers in the early nineteenth century. By the end of the nineteenth century, journalism came to refer to a specific kind of reportage in the various national

cultures of the modern west. A form of the word “journalist” appears first describing the highly opinionated and politicized newspaper writers of post-revolutionary France. The word then appeared in English news reports but continued to refer to French essayists. It was subsequently applied to English and US essayists, but continued to refer to opinion writing until the second half of the century. Then it began to be applied to news-gathering practices, which were becoming increasingly routinized (→ News Routines).

This capsule history of the word underscores the fact that journalisms tend to exist within national systems, even though the history of journalism is really an international one. Printed newspapers first appeared in Europe at the beginning of the seventeenth century (→ Media History; Newspaper, History of). They were a late feature of the so-called printing revolution, the long set of transformations that scholars like Elizabeth Eisenstein (1980) argue the invention of the printing press inaugurated and intensified (→ Printing, History of). Among other things, these scholars assert that the ability of the printing press to mass produce ephemera helped standardize vernacular languages and create national publics. Benedict Anderson (1991) argues that a particular variant, print capitalism, was essential to the rise of modern nationalism.

Early newspapers responded to religious and economic concerns. Most governments, anxious to keep public affairs out of the hands of ordinary people, created systems of censorship and tried to suppress political news (→ Censorship; Censorship, History of). But practicalities made this difficult. Recurring periods of intra-elite conflict produced breakdowns in censorship systems, as when, for instance, the English Printing Act lapsed in 1695 because dueling parties in Parliament were unable to reach agreement on appropriate measures (Siebert 1952). The division of Europe into many warring jurisdictions meant that neighboring countries could host publications: the first English-language newspapers appeared in Amsterdam, and Swiss publishers readily served readers in France (Darnton 1979).

As censorship systems failed, the various nations of western Europe and North America developed what → Jürgen Habermas (1989) has described as a bourgeois → public sphere. In this formulation, such a public sphere appeared as a space between civil society and the state and worked both as a buffer zone, preventing state interference in private life, and as a steering mechanism, allowing citizens to deliberate in an uncoerced manner to form → public opinion, which would then guide the governing process. Scholars disagree on most aspects of Habermas’s formulation, but it seems clear that by the beginning of the nineteenth century in the modern west the major function of the press was its involvement in governance.

The newspaper became a key part of a system for representing public opinion. At first, opinion pieces in newspapers maintained a careful decorum, including the use of pseudonyms and the maintenance of an appearance of personal disinterest, meant to give the impression of *rational* deliberation. The most famous example of this was the publication of the Federalist Papers, co-authored by James Madison, Alexander Hamilton, and John Jay but published pseudonymously over the name of Publius, arguing in favor of the ratification of the US Constitution in an apparently neutral and dispassionate manner. This decorum was always somewhat deceptive, and in some political situations, including the factional politics of the early United States, wore thin quickly. Shortly into the nineteenth century, a frankly partisan model of newspaper politics (→ Partisan Press)

prevailed in western Europe and North America. It was this style of newspapering that occasioned the first use of the word *journalism*.

## INTERNATIONAL PATTERNS

Although it is hard to generalize across national media systems, journalism seems to have a shared history in gross terms in the modern west. In most national histories, there was first a transition from opinion to factual observation, followed by a split between correspondence and reporting, followed by the emergence of a professional journalism centered on objective expert reportage (→ Objectivity in Reporting). And, in most countries, this history was complicated by the emergence of pictorial journalism (→ Illustrated Newspapers; Photojournalism), followed by broadcasting (→ Broadcast Journalism). What distinguishes these national histories, however, is the different experiences with censorship and other forms of media regulation, as well as the differing states of political development. In the late nineteenth and the twentieth centuries, the west exported its models of journalism to other regions of the world.

The *shift in the meaning of journalism* from opinion to fact came about in the context of the emergence of a mass daily press. This shift centered on the British Isles and North America. The United States was an early leader in newspaper circulation because it avoided censorship and taxes on knowledge, as well as because of positive Federal postal policies and a national commitment to create a media system that would allow for the representation of a dispersed and diverse citizenry as a unified public. By the 1820s, the United States had a partisan press system with a high popular readership. In the 1830s, cheap daily newspapers, or *penny papers*, began to circulate in urban centers (→ Penny Press); at the same time, the content of all newspapers shifted toward the sorts of event-oriented news that one associates with the modern concept of journalism. In Great Britain the growth of a popular press was delayed by the various stamp taxes on newspapers, which were finally repealed in 1851. The adoption of new production and transmission technologies furthered the growth of news audiences. Beginning as early as the 1810s but taking off in the 1830s, printing presses adopted first steam power, then rotary cylinder plates, followed by stereotyping, and finally linotype typesetting in the 1880s. And, beginning in the late 1840s, the telegraph enhanced the commoditization of news and the growth of wire services and press agencies (→ Telegraph, History of; Commodification of the Media; News Agencies; News Agencies, History of). Jean Chalaby (2001) has argued that it was only at the moment of industrialization that the figure of the journalist emerged in something like its modern form.

In earlier newspaper systems, news gathering had been done by correspondents (→ Foreign Correspondents; War Correspondents), a term for letter-writers who dispatched reports from distant places. Correspondents were often amateurs, sometimes paid, sometimes under contract to a single news medium but often also contributing to many. Correspondents' reports had a personal voice to them, though they were often written over a pseudonym or a set of initials. Readers expected that a correspondent's observations would be inflected by strongly expressed attitudes.

As newspapers became more commoditized – that is, as they began to think of themselves and their content more as items sold to consumers than as interventions in

public life – they began to hire reporters (Baldasty 1991). Reporters were meant to faithfully record facts: to transcribe speeches, to present minutes of meetings, to compile shipping lists and current prices, to relate police court proceedings. Early penny papers, for instance, often emphasized crime news. In a typical late-nineteenth century newspaper, reporters worked for city editors whose aim was to make the flow of news copy rational and predictable – and often sensational. In most western countries, the late nineteenth century saw controversies over → yellow journalism (→ Muckraking). Journalism historians often trace this term to Richard Felton Outcault’s cartoon strip “The Yellow Kid,” which appeared in both Joseph Pulitzer’s *New York World* and William Randolph Hearst’s *New York Journal*, the two most famous of the US yellow dailies. A more international pedigree for the term may reside in the quick discoloration of the cheap pulp newsprint these papers were printed on, or might refer even further back to the color of the paper bindings of earlier sensational cheap books devoted to crime and adventure. In some languages, crime novels are still referred to as *yellow*s.

Industrialized news practices came into conflict with the established norms and values for public communication (→ Journalism: Normative Theories). Industrializing newspapers adopted a set of norms that distinguished between their high-value or sacred mission and their more profane work of earning success in a competitive marketplace (→ Markets of the Media; Supply and Demand in Media Markets; Cost and Revenue Structures in the Media). In most western nations, the sacred mission of the press was to create an informed public that could contribute to its own governance in a constitutional state – usually but not always democratic in some measure. But the profane work of the news seemed to produce a misinformed public whose tastes and intellect had been affected by → sensationalism. And the competitive marketplace seemed to favor greedy and increasingly monopolistic industrialists with a political agenda of their own.

## MODERN CONSTRUCTIONS

The modern notion of journalism mediates between the sacred and profane work of the press and applies to an occupational structure that merges the work of the correspondent and the reporter. In Anglo-American history, the key term in this journalism has been objectivity. Objective journalists are expert professionals, who are always aware of their own subjectivity – like the correspondent – but police it, separating their own values from impersonal reports. Michael Schudson (1978) has described this form of objectivity as arising from a dialectic of naïve empiricism and radical subjectivism. A similar dialectic is evident in the rise of pictorial journalism. Raw material for illustrations came from a variety of empiricist techniques, including photography and sketch artistry, which seemed to promise fidelity to an objective reality. Master engravers then turned these observations into lucid and often interpretive visual reports.

A tribe of indicators can trace the *rise of professional journalism* in the west. Canons of journalism ethics (→ Ethics in Journalism) began to appear at the beginning of the twentieth century, along with professional associations and schools of journalism (→ Journalists: Professional Associations; Journalism Education). The forms of professional journalism – the byline, the inverted pyramid form and summary lead (which counterintuitively tells stories from end to beginning rather than from beginning

to end), and the habit of balancing and sourcing (→ Balance; News Sources) – became familiar around the same time. The excesses of World War I intensified the drive for professionalization inside and outside of the news industry (→ Professionalization of Journalism).

Professionalization coincided with the invention of journalism history as a scholarly activity. There had been a tradition of anecdotal and autobiographical histories of printers and other newspaper entrepreneurs since the beginning of the nineteenth century, but professional journalism education called for histories that emphasized the progressive development of standards, tied in with a genealogy of press autonomy from public and private power (→ Standards of News).

By the 1920s an alternative model of professionalism had appeared, first in the Soviet Union, then in other anti-capitalist states. In the most important cases – the Soviet Union and the People's Republic of China – the creation of a *statist professional journalism* followed a long history of attempts by bourgeois journalism to overcome government censorship. When revolutions inspired by Marxist-Leninist philosophies overthrew authoritarian states in Russia and China, they adopted some notions of bourgeois professionalism, wedded them to vanguardism, and institutionalized the resulting construct in state monopoly institutions. Among the adopted elements were a claim of independence for journalists, a rhetorical commitment to serving ordinary people, and an adversarial mission mutated into the concept of self-criticism. A bright line separated journalists, trained and certified as professionals, from ordinary citizens.

Or at least this was the ideology or theory of communist journalism. In practice, the journalism of communist societies rarely achieved the professional autonomy called for in theory. At best, such journalism achieved some standing as an agency of independent but loyal criticism. At worst, it functioned as a fully dependent propaganda wing of the party and state, a role in no way justified by Marxist philosophy. Such practice led critics to compare communist journalism with fascist totalitarian media systems in Hitler's Germany or Mussolini's Italy, regimes that dictated advancing the interests of the state as the role for journalism, with only incidental regard to accuracy and completeness.

In the capitalist countries and elsewhere in the world, other alternative forms of journalism had appeared (→ Alternative Journalism; Minority Journalism; Advocacy Journalism). Usually alternative journalisms were tied to a group within the larger society, whether based on some aspect of identity (gender, race, ethnicity, class) or on the advocacy of a particular position. General interest news media tended to look down upon these alternative journalisms in the same way that they looked down upon sensationalism – as nonprofessional and potentially pernicious (→ Feminist Media; Grassroots Media; Activist Media; Citizens' Media; Community Media).

Globally, the twentieth century saw the rise of broadcast journalism. In some countries, particularly in North America, broadcast media, although state-licensed, were privately owned; in others, there were monopolistic national broadcast authorities (→ Ownership in the Media). In either case, broadcasting seemed to intensify the process of professionalization. The paradigm case might be the → BBC, with its high degree of independence and autonomy. But in other cases (such as Italy) state broadcasting was allotted along party lines (→ United States of America: Media System; United Kingdom: Media System; Italy: Media System).

By the end of World War II, the modern notion of journalism had taken root in most of the world. The United Nations Universal Declaration of Human Rights and the report of the MacBride Commission enshrined freedom of the press (→ Freedom of the Press, Concept of; Freedom of Communication; Freedom of Information) as an international value, though these formulations were subject to varying interpretations. Many observers questioned the relationship between journalism and the supposed free market that had become a staple of western and especially US formulations.

## PROSPECTIVE

Forms of news considered distinctive to the Anglo-American tradition continued to spread in the late twentieth century. Investigative journalism spread to Latin America, for instance (Waisbord 2000; → Investigative Reporting). The retreat of state-supported broadcast authorities in Europe brought the introduction of more commercial television news programming. The collapse of the Soviet bloc sparked a wave of commercial media ventures in eastern Europe, often alongside a revitalization of partisan journalism.

Meanwhile, within the west, the end of the twentieth century saw the erosion of what Dan Hallin (1994) has called the “*high modernism of journalism*.” The decline of the Cold War as a news frame (→ Framing of the News), the rise of ethnic and racial diversity within and among countries, the feminist movement (→ Feminist and Gender Studies), and the renewed philosophical questioning of the value of objectivity undermined the credibility of journalism as an institution. The same trends occurred in the media environment itself, with the rise of the 24-hour television news service (→ Newscast, 24-Hour), of new so-called personal media like talk radio and the blogosphere (→ Blogger), of the tabloid form (→ Tabloid Press; Tabloidization) and a hybrid journalism, especially in the Scandinavian countries, and of a new form of partisan media power associated with broadcast entrepreneurs like Silvio Berlusconi and Rupert Murdoch (→ Media Conglomerates). With the erosion of the high modern moment came calls to rethink the role of the press as an institution within the governing process, on the one hand, and calls for a new → citizen journalism or → public journalism on the other.

News practices are always in flux, and the journalisms that explain and govern them must therefore be continually reinvented. Journalisms come a beat after the news revolutions they regulate.

## **Journalism: Legal Situation**

*Sandra Davidson*

*University of Missouri-Columbia*

“Knowledge is power,” said English lawyer and philosopher Francis Bacon (1561–1626). But sometimes journalists have the knowledge while the government has the power. This can lead to clashes that, unfortunately for journalists, can sometimes lead to imprisonment and even death (→ Violence against Journalists). While civil libel suits against journalists remain the media’s biggest financial danger, that danger pales in comparison to loss of freedom or life (→ Libel and Slander).

### **JAILING JOURNALISTS FOR THEIR MESSAGES**

Traditions of press freedom are not universal (→ Freedom of the Press, Concept of). Stifling ideas by stifling those who wield pens has been common in closed societies but has also occurred in societies known for openness. Dissident writer Alexander Solzhenitsyn languished in prison in the Gulag Archipelago before the fall of the Soviet Union. But the United States has stifled expression of opinions as well. While the First Amendment of the US Constitution proclaims: “Congress shall make no law . . . abridging the freedom of speech, or of the press,” that freedom has not proved absolute.

When government believes that ideas threaten its existence, then government is tempted to wield its power. In February 2007, an Egyptian appeals court overturned the one-year jail sentence of Ibrahim Eissa, a newspaper editor convicted of libeling President Hosni Mubarak. He had to pay a fine instead. In April 2007, Azerbaijani newspaper editor Eynulla Fatullayev was sentenced to two and a half years in jail for criminal libel; Hong Kong journalist Ching Cheong passed the two-year mark in a Chinese prison, where he is serving a five-year sentence on charges of spying for Taiwan. Rwandan editor Agnes Nkusi-Uwimana received a one-year sentence for criticizing her government. Ecuadorian journalist Nelson Fualta received a 60-day jail sentence for insulting Pujili’s mayor. Paris-based Reporters without Borders said that Cuba’s jailing of Oscar Sanchez Madan raised the number of journalists in Cuban jails to 26.

Murder is also a problem for journalists. The New York-based Committee to Protect Journalists says that 13 reporters have been murdered in Russia since Vladimir Putin took power, while Reporters without Borders places the number at 21.

Historically, some governments acted much more brutally than they would today. England used to stifle dissent by shedding blood. One example is John Twyn, who in 1663 printed a book saying that the people had the right to revolt and even execute the king. Twyn did not write the book, but he refused to say who did write it and so was subjected to the standard treatment for treason. He was sentenced to be hanged, emasculated, disemboweled, quartered, and beheaded. Unfortunately, Twyn’s punishment was not unusual.

A lesser crime than treason was seditious libel – the crime of criticizing government or its officials. In England, seditious libel charges could land a person in front of the Star Chamber, a court that heard seditious libel cases from 1487 to 1641. Among its punishments for seditious libel were putting the convicted person in a pillory and ordering that prisoners’ ears be cut off and that their cheeks be branded with the letters “SL” for seditious libel.

### **US HISTORY OF FREEDOM OF SPEECH AND THE PRESS**

While the United States avoided most of the bloodier aspects of dealing with dissent, its history includes imprisonment for dissent well into the twentieth century. Congress passed the Espionage Act of 1917. Under the Act, people could be punished for such things as obstructing military recruitment or causing disloyalty or insubordination within the armed forces. Also, the law allowed the Postmaster General to exclude seditious material from the mail. The following year, 1918, Congress also made it a crime to urge reduction of production of necessary war materials, such as ammunition.

This set the scene for the confrontation that began the interpretation of the First Amendment by the US Supreme Court in 1919 in *Schenck v. United States*. Schenck was the general secretary of the Socialist Party of the United States. He and some other defendants mailed some leaflets out to draft-age young men, saying that the draft violated the 13th Amendment of the US Constitution, which prohibits slavery or involuntary servitude.

The US government said that these leaflets were illegal because they encouraged obstruction of the draft and that the defendants unlawfully used the mail to disseminate the leaflets. Found guilty of violating the Espionage Act, Schenck and his co-defendants appealed, claiming that their leaflets were protected by the First Amendment.

The US Supreme Court upheld the convictions. Justice Oliver Wendell Holmes, writing for the Court, articulated his “clear and present danger” test: “We admit that in many places and in ordinary times the defendants in saying all that was said . . . would have been within their constitutional rights. But the character of every act depends upon the circumstances in which it is done. The most stringent protection of free speech would not protect a man in falsely shouting fire in a theater and causing a panic.” Congress had the right to stamp out words that created a “clear and present danger,” Holmes concluded. “It is a question of proximity and degree. When a nation is at war many things that might be said in time of peace are such a hindrance to its effort that their utterance will not be endured so long as men fight.”

Later in 1919, Holmes dissented when the Supreme Court upheld Espionage Act convictions in *Abrams v. United States*. In the summer of 1918, the United States had sent marines to Siberia as a strategic move against the Germans on the eastern front. But Abrams and his friends thought that this was a US attempt to crush the Russian Revolution. So they put out pamphlets that verbally attacked the special American expeditionary force, which they mistakenly claimed was sent to Russia to defeat the new communist revolutionary government.

The majority opinion said of Abrams and his friends that “even if their primary purpose and intent was to aid the cause of the Russian Revolution, the plan of action which they adopted necessarily involved . . . defeat of the war program of the United States.”

In his dissent, Holmes said, “In this case sentences of twenty years imprisonment have been imposed for the publishing of two leaflets that I believe the defendants had as much right to publish as the Government has to publish the Constitution of the United States now vainly invoked by them.” Holmes added, “[W]hen men have realized that time has upset many fighting faiths, they may come to believe . . . that the ultimate good desired is better reached by free trade in ideas, – that the best test of truth is the power of the thought to get itself accepted in the competition of the market.”

In 1940 the US Congress passed the Alien Registration Act, also known as the “Smith Act,” which prohibited advocating violent overthrow of the government, printing anything that advocated violent overthrow of the government, or conspiring with others to do so.

In 1951, the US Supreme Court heard its first case arising under the Smith Act, *Dennis v. United States*. Eleven defendants were charged with conspiring to organize a Communist Party to advocate violent overthrow of the government. The Court considered both the “gravity of the evil” and the probability that evil would occur in order to decide how much invasion of free speech was warranted. The Court concluded that a highly organized conspiracy created a clear and present danger that justified the convictions.

Because *Dennis* upheld the convictions, the government continued to prosecute communists under the Smith Act, including lower echelon communists. But in 1969, the Court majority decided that the danger should indeed be “imminent,” that is, that the danger should be just on the verge of happening before speech could be prohibited. In *Brandenburg v. Ohio*, the Court said, “[C]onstitutional guarantees of free speech and free press do not permit a State to forbid or proscribe advocacy of the use of force or of law violation except where advocacy is directed to inciting or producing imminent lawless action and is likely to incite or produce such actions.” In short, mere advocacy may not be punished, the Supreme Court said. More is required. Advocacy must meet the subjective test of being directed to inciting or producing imminent lawless action, and advocacy must also meet the objective test of being “likely to incite or produce such actions.”

The *Brandenburg* test protects orators, distributors of leaflets, editorial writers, and anyone expressing ideas that might arguably “incite” others to commit harmful acts. The *Brandenburg* test protected the late Tupac Shakur when a widow claimed that his “gangsta rap” incited a teenager speeding down a Texas highway to shoot and kill her husband, a Texas trooper. *Brandenburg* protected Ozzy Osbourne and Judas Priest against claims that their suicide music incited teenagers to kill themselves. It has protected producers of TV shows, magazines, ads, and games. It protected Oliver Stone against claims that he incited copycat murders with his movie *Natural Born Killers*. News reports have also inspired copycat crimes, including murders, and the journalists involved would receive *Brandenburg* protection, if needed.

While journalists, like everyone else in the United States, receive protection from incitement charges under the *Brandenburg* case, this does not mean that they can advocate anything they want. The prohibitions under which Schenck and others were convicted in 1919, obstruction of military recruitment, is still a crime under federal law, with a possible 20-year imprisonment. And advocating overthrow of the government, under which Dennis and many other communists were convicted, is likewise still a federal crime with a possible 20-year sentence.

### **SHIELDING JOURNALISTS WHO PROTECT THEIR SOURCES**

While few journalists in the United States have been put in jail recently for what they say, they have been going to jail for what they refuse to say. When federal judges order journalists to appear before federal grand juries and to reveal confidential sources of information, journalists who refuse risk jail time as well as fines (→ Source Protection).

For example, Josh Wolf, a “videographer,” spent 226 days in captivity in California. Wolf refused to testify before a federal grand jury and hand over his raw video tape of a G8 Summit protest that resulted in injury to a police officer in San Francisco in July 2005. As part of an agreement for his own release, he released the video tape.

Broadcast journalist Jim Taricani spent four months under house arrest in 2004–2005. He refused a federal judge’s order to reveal the source of an FBI video tape showing a Providence official accepting an envelope full of cash from an undercover FBI agent.

*New York Times* reporter Judith Miller spent 85 days in jail in 2004–2005 after refusing to reveal the source of a leak of the name of a CIA undercover agent, Valerie Plame. The US Supreme Court refused to hear her case.

In 2001, Vanessa Leggett, a freelance, spent a record 168 days in jail for refusing a federal judge's order to hand over notes and tapes of interviews she had made while writing a book about the murder of a Houston socialite, Doris Angleton.

Why do journalists fight to protect their sources? Some object that compelling disclosure of sources is equivalent to turning journalists into investigators for the government or a party in a lawsuit. More importantly, some fear confidential sources will dry up, obstructing the → free flow of information to the public. Journalists' primary goal in promising confidentiality to a source is to gain information that the journalist could not gain in any other way. The source is either the only individual or part of a small group that knows the information. The source is divulging information to the journalist despite the fact that it would be adverse to the source's self-interest if he or she were known to be the source. The adversity that the source would experience if his or her identity became known could perhaps include criminal prosecution, loss of a job, loss of esteem in the community due to the source's participation in wrongdoing or the source's being viewed as disloyal, or, in the most egregious circumstances, even loss of life.

Not revealing the identity of a source is considered by responsible journalists to be a matter of fiduciary duty. This fiduciary duty to the source is an obligation of the highest order because of the enormous personal risks the source may be taking in furnishing information. The source is placing his or her trust in the journalist based on the journalist's promise of confidentiality. The source's confidence that the reporter will keep the promise is thus key to the source's divulging sensitive information. In short, confidence in confidentiality is imperative because a breakdown in confidence leads ultimately to a loss of information for society. A gap in information will occur, and the effect on society of that gap will depend on the importance of that lost information.

The problem for American journalists is that there is no federal law to shield reporters from being forced to divulge sources to grand juries. While Congress has considered such a law over the years, none has passed. But a majority of states (34 out of 50, along with the District of Columbia, as of mid-2007) do have shield laws. Some state shield laws give better protection than others, depending on how broad or narrow they are. For example, does a shield law only cover sources, or does it also cover confidential information? How broad is the definition of a journalist? When does the privilege apply? Does it apply when a journalist is compelled to appear before a grand jury, a court, or a legislative committee? Does it apply when a journalist is on trial for libel? Is the privilege absolute, or is it a qualified privilege where a judge balances interests?

In 1972, the US Supreme Court in *Branzburg v. Hayes* said in a 5–4 decision that the First Amendment does not give journalists shield protection. In balancing interests, the Court simply concluded that the obligation to appear in front of a grand jury and give testimony when ordered to do so outweighs First Amendment considerations. The Court held, "We cannot seriously entertain the notion that the First Amendment protects a newsman's agreement to conceal the criminal conduct of his source, or evidence thereof, on the theory that it is better to write about crime than to do something about it."

The *Branzburg* Court recognized that some sources may dry up, and there may be some constriction of news, but how much is "speculative," the Court said. Also, the Court mentioned a practical consideration: if it granted a "constitutional newsman's privilege,"

then sooner or later the Court was going to have to define who qualifies as a “newsman.” The Court did say, however, that the federal government and the states could fashion statutory privileges for journalists.

Federal judges have, indeed, granted journalists protection from revealing sources in cases not involving grand juries. But so long as the federal government does not pass a shield law, journalists subpoenaed to appear in front of grand juries will continue to go to jail in order to protect sources.

A problem remains concerning who should qualify as a journalist, especially in the Internet age of → bloggers. A narrow definition would only include persons working for newspaper, magazine, or broadcast companies. A broad definition would cover any person wishing to gather information for the purpose of disseminating it to the public through any means, including the → Internet.

Clearly, confidential sources can provide information that can make a big difference in the functioning of a government. Arguably, the most famous such confidential source from the United States was “Deep Throat.” Reporters Bob Woodward and Carl Bernstein published stories in the *Washington Post* linking aides of then-president Richard Nixon to a break-in at the Democratic National Headquarters in Washington, DC. No federal judge ordered the journalists to reveal their source. But in May 2005, Mark Felt, a former FBI deputy director, revealed himself as “Deep Throat.”

The threat of jail sentences for refusing to reveal sources is not a purely American phenomenon. In 2005, two Australian journalists from the *Herald Sun*, Michael Harvey and Gerard McManus, were threatened with imprisonment for refusing to reveal a source. This has helped prompt calls for passage of strong shield laws in Australia.

### **JOURNALIST’S PRIVILEGE: AN INTERNATIONAL AND FOREIGN LAW PERSPECTIVE**

Journalists in some other countries do receive protection from revealing confidential sources. For example, in October 2006, Japan’s Supreme Court protected a reporter from the Japan Broadcasting Company. Presiding Justice Toyozo Ueda ruled that a reporter’s protection of confidential sources is a form of protecting one’s occupation.

Sweden is another example. In Sweden, the journalist’s privilege is a constitutional right under the Freedom of the Press Act, which is one of the three parts of the Swedish Constitution. The Freedom of the Press Act, first adopted in 1766, established the right of anonymity of “authors” in 1812. When it was strengthened in 1949, it protected news sources, especially for the print media. Singularly significant is that the Swedish shield law, one of the strongest in Europe, empowers sources to take criminal prosecution against journalists if their confidential identity is revealed without their authorization. It further forbids public officials to inquire about the journalistic sources. If public officials violate the law, they face fines or up to one year in jail.

Most importantly, international law on the journalist’s privilege is far more media-friendly than US law. Two international courts have accepted claims that the confidentiality of journalistic sources is part of a right to freedom of expression. The → European Court of Human Rights (ECHR) declared in 1996 that journalists have a right not to disclose their sources unless an overriding countervailing interest outweighs the confidentiality of

news sources. The International Criminal Tribunal for the former Yugoslavia (ICTY) held in 2002 that war correspondents cannot be compelled to testify about their sources, except under extraordinary circumstances.

Still, going to jail seems to be an occupational hazard for journalists worldwide. Sometimes the offense is criticizing government or its policies. Sometimes the offense is refusing to reveal confidential sources. Sometimes, some journalists might say, the offense is merely speaking the truth. Truth sometimes has the power to set one free, as the adage goes, but sometimes it is government that has the power and it is the truth teller who loses freedom.

## **Journalism: Normative Theories**

*Rodney Benson*

*New York University*

Normative theories of journalism concern ideal functions of the press, what the press *should* do. These purposes are best understood in relation to larger claims about the *good*

*society*. In principle, there are as many normative theories of journalism as there are political systems, from Marxism–Leninism to diverse conceptions of democracy. Nonacademics as well as academics may express these theories, which are relatively coherent conceptions that cluster together specific ideals (such as representation, deliberation, accountability, and the like) in different combinations with varying emphasis (→ News Values; Standards of News; Journalists’ Role Perception). Such broad theories are, to a certain extent, artificial constructs, because no one, from politicians to ordinary citizens, is entirely consistent in adhering to only one of them. Journalistic practice likewise does not always accord with normative theories of journalism, but these theories remain an important component of professional training (→ Journalism Education). Institutions and the state draw upon theories of journalism, implicitly or explicitly, when shaping media policies that carry real incentives or penalties for deviant behavior.

Scholars attempting to classify normative theories (Siebert et al. 1956; McQuail 1983, 2005; Baker 2002; Ferree et al. 2002), as well as less systematic reflections about media and democracy, have identified nondemocratic theories, including authoritarian, totalitarian, Marxist–Leninist, and developmental, as well as democratic theories, including libertarian, social responsibility, democratic elite, democratic participatory, public sphere, and postmodern.

### NONDEMOCRATIC THEORIES

*Authoritarian theory* holds that journalism should always be subordinate to the interests of the state in maintaining social order or achieving political goals (Siebert et al. 1956). At a minimum, the press is expected to avoid any criticisms of government officials and to do nothing to challenge the established order. The press may remain free to publish without prior censorship, but the state retains the right to punish journalists or close media outlets that overstep explicit or implicit limits on reporting and commentary.

Under more extreme authoritarianism, or *totalitarianism*, a closely censored press proactively promotes and extends a totalizing state control over society. In the context of the Cold War, the Soviet communist theory stood out (Siebert et al. 1956), an approach perhaps best understood today as a variant of totalitarianism that includes Islamic and other forms of religious fundamentalism. Since the disintegration of the Soviet Union in 1991, versions of Marxist–Leninist, or *Soviet*, theory have survived in North Korea, Cuba, and Vietnam, and to a certain extent in China, as the most coherent, self-consciously elaborated examples. The Soviet normative theory of journalism posits that media should not be privately owned, should serve the interests of the working classes, and, most importantly, should provide a complete, objective view of the world following Marxist–Leninist principles, as defined by the communist-party-controlled state.

Another nondemocratic normative theory is partly a product of western communication scholarship and foreign development projects. *Development theory* is authoritarianism *for a good cause* (→ Development Journalism), supporting the economic development and nation-building efforts of impoverished societies (Schramm 1964; McQuail 1983). In the context of western dominance in international news gathering (→ News Agencies) and in cable news, the United Nations Educational, Scientific and Cultural Organization (→ UNESCO) has also framed development theory in cultural pluralist terms as the right

to communicate (MacBride Commission 1980) and, most recently, as the defense of global cultural diversity (→ Right to Communicate; New World Information and Communication Order [NWICO]; Rogers, Everett; Schramm, Wilbur).

The western press and communication research generally portray these nondemocratic theories negatively, as anti-democratic, whatever their potential merits. Outside of the west, however, purely anti-democratic justifications of journalism have grown more rare. The Chinese government, for instance, defends a *market socialist* approach to the media, which combines limited market freedoms with continuing state control (→ China: Media System). Certain ideals in nonwestern societies are not necessarily anti-democratic, such as the poetic or literary ideal of the Arabic press (Mellor 2005; → Iran: Media System; Egypt: Media System; Gulf States: Media Systems). Democratic normative theories have been motivating forces behind emerging nonwestern media outlets such as the Qatar-based Arabic-language cable news channel Al Jazeera (modeled after the BBC and CNN) (→ Arab Satellite TV News). Even in the most repressive authoritarian states, the language of democracy has become commonplace.

## DEMOCRATIC THEORIES

Where authoritarianism stresses the importance of maintaining social order, libertarianism aims to maximize individual human freedom. John Locke and other liberal philosophers of the eighteenth century conceived of the libertarian theory (Siebert et al. 1956), which relates closely with *laissez-faire* capitalism. In the oft-used metaphor, the press should offer a *marketplace of ideas*, pursuing profits in a natural process believed to support democracy. *Libertarian theory* sees the government as the primary if not the only threat to press freedom. Perhaps the best-known embodiment of the ideal is the First Amendment to the US Constitution, which specifies: “Congress shall make no law . . . abridging the freedom of speech, or of the press.” This formulation expresses the ideal only in negative terms, as a freedom *from* state intervention. Presumably the press, left to its own devices, will represent diverse voices and hold government accountable, but the only requirement for the press is to pursue its own economic interests. Far from a caricature, this pure form of libertarianism is alive and well in the public pronouncements of many news media owners and managers, as well as of some journalists (→ Freedom of the Press, Concept of).

Observers and activists who perceive that a pure market orientation does not necessarily support democracy have argued that the press must instead assume *social responsibility*. In the 1947 Hutchins report, the US Commission on a Free and Responsible Press conceived the chief responsibilities as factual accuracy, promotion of open debate, representation of diverse views, and protection of individual rights by serving as a watchdog that guards against government abuses of power.

Any theory that the press has a voluntary duty to perform positive functions could belong in this category, but social responsibility theory, as originally described (Siebert et al. 1956), clearly upheld the US journalistic ideal of *objectivity*, which stresses factual (especially investigative) reporting over commentary, the *balancing* of opposing viewpoints, and maintaining a neutral observer role for the journalist (Schudson 2001; → Objectivity in Reporting; Investigative Reporting). This ideal has become dominant globally, even among journalists in countries where highly polarized political cultures

make it difficult to put into practice (Hallin & Mancini 2004; → Party–Press Parallelism; Convergence of Media Systems).

Social responsibility theory lacks any systematic critique of capitalist media ownership and funding (Baker 2002; cf. McQuail 2005). Most journalistic professional exhortations about *ethics* are social responsibility theories in this sense (→ Ethics in Journalism), including not only traditional defenses of investigative journalism but also the recent US movement for civic journalism (→ Public Journalism). Armed with enough courage, individual journalists are assumed capable of performing their democratic responsibilities.

Other democratic normative theories also concern social responsibilities, but emphasize some more than others. Legal scholars, philosophers, and social scientists, rather than journalists, largely produced these theories, which may not share the assumption against state intervention as a legitimate means to orient journalism democratically.

Representative liberal theory (Ferree et al. 2002) or *democratic elite theory* (Baker 2002) proposes that democracy works best with highly educated elites and specialized technicians in charge. The primary duties of the press are to chronicle accurately the range of competing elite perspectives, to examine the character and behavior of elected officials, and to monitor closely their activities for corruption or incompetence (the *watchdog* function). In other words, the press should adopt a critical, serious tone in covering public affairs, defined as the activities primarily of government but also, in principle, of business or other powerful social institutions. Democratic elite theories tend to be skeptical, however, of whether the press can adequately report and analyze complex issues (e.g., Lippmann 1922; → Lippmann, Walter).

Pierre Bourdieu's (1998) critique of journalism argues for a democratic elite theory from a sociology of knowledge perspective. He values most highly those forms of intellectual and artistic production sheltered from external economic or political pressures. By analogy, his critique esteems the specialized forms of journalism that maintain the greatest *autonomy* from external pressures (→ Science Journalism). He would generally prefer that journalism loosen its *monopoly* over public communication so that non-journalist experts could directly transmit their knowledge as they see fit. However, Bourdieu's ideal of complete autonomy could lead journalists (as well as non-journalist experts) to pursue only their own narrow interests and ignore legitimate concerns of wider publics (Schudson 2005).

In *democratic participatory theory*, journalism is called upon to promote actively the political involvement of citizens. The theory emphasizes principles such as popular inclusion, empowerment, and full expression through a range of communicative styles (McQuail 1983; Ferree et al. 2002). Its theorists emphasize diverse viewpoints and active citizen involvement more than the quality of the discourse (whether reasoned, critical, serious, or the like). They disagree on the best means to achieve these goals. Tabloid forms of journalism (→ Tabloid Press; Tabloidization), for example, might provide a bridge leading formerly apathetic citizens to an interest in politics (McNair 2000), or the mainstream press might provide news from more perspectives (Gans 2003). In participatory theory, however, small-scale, *segmented* media, commercial as well as nonprofit, are best for promoting grassroots citizen involvement (e.g., Keane 1991; → Grassroots Media; Citizens' Media; Citizen Journalism).

With his ideal of the → public sphere, the German sociologist and philosopher → Jürgen Habermas (1989) combines concerns for the quality (reasoned, critical debate) with the quantity (broad representation and participation) of discourse that journalists mediate (Calhoun 1992). However, *public sphere theory*, also referred to as the *discursive* (Ferree et al. 2002) or *republican* (Baker 2002) ideal, places the greatest emphasis on quality, narrowly conceived: the press should create a domination-free environment where the better argument can prevail in a quest for social consensus (→ Deliberativeness in Political Communication). The public sphere should be free from the state as well as the market (→ Coffee Houses as Public Sphere). Societies seem most likely to achieve the ideal during periods of democratic revolutionary effervescence, as in France and the United States at the end of the eighteenth century or in the Soviet Union and east-central Europe during the late 1980s.

By adaptation (and perhaps taming), public sphere theory can fit the conditions in western democracies. Public television, for example, armed with legal guarantees of autonomy from political intervention (→ BBC; Public Service Broadcasting: Law and Policy), may be the best embodiment of the ideal (Garnham 1986). French and other continental European traditions of a journalism of ideas (→ France: Media System; Comparative Research), rather than of raw information, are also consistent (Albert 1998). The ideal inspired the US movement among journalists to redefine their role, from simply providing information to promoting reasoned and civil public debate among ordinary citizens (Glasser 1999).

Emerging in part as a critique of Habermas, postmodern or *constructionist theory* (Ferree et al. 2002), like democratic participatory theories, is more tolerant of diverse styles and forms of discourse that journalists mediate. Feminist scholars such as Nancy Fraser say that the ideal of reasoned critical debate may embody masculine domination and that the ideal of social consensus may suppress ineradicable identity differences (Calhoun 1992). Building on the motto, “the personal is political,” postmodern theory privileges personal narratives and emotion over abstract reason, celebrating grassroots media that facilitate the playful search for identity or the articulation of counter-hegemonic interests (→ Advocacy Journalism; Radical Media). A postmodernist ideal is also evident in Kevin Barnhurst and John Nerone’s (2001) critique of rationalized, modernist newspaper design form and the hegemonic aspiration of professionalized journalism to map the social world (→ Newspaper, Visual Design of). Postmodern theory insists on a journalism open to the widest range of narrative styles and perspectives, especially those emerging from the margins of society.

## THE NEED FOR NORMATIVE THEORIES

Are normative theories of journalism necessary, as Hallin and Mancini (2004) ask? The best-known texts in normative theory, such as *Four theories of the press* (Siebert et al. 1956), may promote ethnocentrism and justify the US model of market-oriented, ostensibly objective, journalism (→ News Ideologies). The assumption that other approaches are inferior has dampened intellectual curiosity about the practice of journalism in other parts of the world. The market model has also influenced international organizations such as the World Association of Newspapers and the Inter American Press Association.

Freedom House, for instance, rates national press systems as free, partly free, or not free, based primarily on political rather than economic criteria. US-centrism, however, is not inherent to normative reflection on and critiques of journalism.

One promising alternative approach, *complex democracy* (Baker 2002), acknowledges the shortcomings of any type of news media in the face of diverse democratic purposes and seeks to encourage the greatest variety of journalistic practices. A working model includes multiple sectors (Curran 2000): a core sector of public service television, a supplementary private enterprise sector, a professional sector under the control of journalists, a civic sector supported by social organizations, including political parties, and a closely related sector of ideologically or culturally marginal media that operate in the market with partial subsidies from the state.

Through broad reflection on the many strains of political theory, or through comparative research on media systems, normative theorizing can continue to play a key role in communication education and research (→ Professionalization of Journalism). Value judgments guide all research, and it is important to make implicit normative theories explicit. Plural normative *theories* rather than any singular *theory* can help clarify the range of policy and ethical choices available to guide the practice of journalism (→ Media Policy).

## Journalists, Credibility of

Yariv Tsfati

University of Haifa

Credibility is a central professional value for journalists. For audiences, perceived credibility of the media affects choices of and responses to the news. Scholars and journalists disagree about what constitutes credibility, but agree that it relates primarily to the truthfulness and accuracy of the facts journalists report. Credible journalism is reliable and believable. However, scholars, mostly in the United States, argue that credibility goes beyond believability (Metzger et al. 2003), and demonstrate that it encompasses fairness, lack of bias, → accuracy, completeness, and trustworthiness (Meyer 1988; → Bias in the News; Credibility of Content; Fairness Doctrine; Quality of the News).

The broader definitions of credibility describe a relationship between → audiences and journalists, under uncertain conditions, where audiences cannot fully verify the character and intentions of the journalists and the veracity of their reports. Audiences expect that credible journalists will act according to shared norms of honesty and fairness, and expect reading and watching the news to be worthwhile activities. These expectations depend on secular norms such as professionalism, which vary from one place to another. In the United States, for example, *credible* journalists who live up to the standards of their profession are expected to tell the whole story in a sincere, precise, fair, and truthful manner, reporting to serve the public good, not personal or partisan interests (→ Ethics in Journalism;

Standards of News). In Europe, by contrast, professional culture puts somewhat less emphasis on objectivity and neutrality (→ Neutrality; Objectivity in Reporting).

### **CREDIBILITY AS A JOURNALISTIC NORM**

Surveys of journalists worldwide have documented the importance of credibility as a norm for journalists and editors. All national US journalists surveyed by the Pew Research Center in 1999 said that “getting the facts right” was a “core principle” for journalism, and almost all (98 percent) said the same for “getting both sides of the story.” Large majorities of journalists in several other nations, including Chile, Hong Kong, Germany, Taiwan, and Mexico, rated credibility most important (Weaver 1998).

Journalists’ codes of ethics also make credibility a central tenet (Tsfati 2004). In these documents, credibility is the rationale for many journalistic dictates, even for not accepting gifts. The ethics codes mention audience trust as *an asset* that journalists may now enjoy, but could lose through misconduct. Journalistic discourse almost everywhere treats trust as the *raison d’être* for the profession.

Reactions of journalists to events that could damage trust in the profession also suggest that credibility is central. US journalists felt *assaulted*, *humiliated*, and *befouled* in the wake of the Janet Cooke scandal, involving a Pulitzer Prize winning series, because the author faked the existence of a specific source, in violation of the credibility norm (Eason 1986). A similar professional discourse followed in Germany after journalist Gerd Heidemann published the forged *Hitler Diaries* in *Stern* magazine in 1983, and in the United Kingdom after the James Forlong scandal, involving a faked Sky News report about a missile firing during the 2003 Iraq war.

### **CREDIBILITY AS SEEN FROM THE AUDIENCE PERSPECTIVE**

In the occupational culture of journalists, credibility plays a role as a goal, a tool, an asset, and a rationale behind most professional creeds. For journalists themselves, audience assessments of their credibility are associated with their adherence to professional norms.

However, US scholars have examined credibility mostly from the perspective of the audience, not of journalists. Findings demonstrate that audiences attend to more mainstream news if they consider the mainstream news media credible. Those who rate journalists low on credibility tend to diversify their news diets and attend to more alternative news. Perceived news credibility was found to moderate an array of media effects, including agenda setting, priming, and the perceived → climate of opinion (→ Agenda-Setting Effects; Credibility Effects; Media Effects; Priming Theory). In other words, the news media exert more influence on audiences who perceive them as credible and less influence on those who remain relatively skeptical about their credibility.

What factors underlie audience perceptions of media credibility? The perceptions may result when audiences take cues from elites (Watts et al. 1999), when the media pay more attention to the blunders of journalists, or when audiences are exposed to cynical or strategic media framing of politics (→ Framing of the News). The perceptions of media credibility may also result from psychological mechanisms, such as when involved partisans categorize and recall selectively (Vallone et al. 1985; → Hostile Media Phenomenon), from

political variables, such as the extent of political involvement, and from interpersonal factors, such as the prevalence of conversations with like-minded individuals (Eveland & Shah 2003).

## RESEARCH ON CREDIBILITY

### Dimensions of Credibility in Classic Research

Research on the concept of credibility takes place in three principal domains: the source, the message, and the medium. Hovland et al. (1953) initiated the first, *source credibility*, by focusing on the communicator – an individual, group, or organization. With his Yale colleagues, Hovland related credibility to the judgments perceivers make about whether the source is believable. Since the 1960s, scholars have emphasized *message credibility*, by focusing on what characteristics could make messages more or less believable. The third domain is the channel that delivers content, *media credibility*, focusing on which media are most believable and what makes them so (Kioussis 2001). In early research, respondents rated TV news more credible than newspapers. In subsequent studies, respondents rated Internet news more credible than other media.

The main dimensions of source credibility are expertise (a communicator's qualifications for knowing the truth in a certain area) and trustworthiness (a communicator's motivation to tell the truth about that topic). Later research found evidence that secondary dimensions, such as dynamism, composure, and sociability, support source credibility (Berlo et al. 1969). Liking, and perceiving oneself as similar to, a speaker tend to make him or her seem more trustworthy. The main dimensions of *message credibility* include structure (the organization of a message) and content (including language intensity and the fluency and speed of delivery).

### Recent Developments

Hovland and his colleagues thought of credibility as a static and objective characteristic of the source. Gradually, scholars began to shift attention to the audience and, by the 1980s, were measuring credibility as a dynamic and subjective experience that varies across individuals. The concept was relabeled *perceived news credibility*. Early persuasion research examined *any* communication sources, relying on experiments, but recent research deals with *mass media news sources*, using surveys. The main dimensions of media credibility include *credibility* and *social concerns*. Typically, respondents rate a media outlet on whether it is fair, unbiased, accurate, comprehensive, and trustworthy (Meyer 1988), for credibility. Social concerns include whether the outlet has the public interest at heart.

Some research asks news sources to locate factual errors in articles that mention them (Maier 2005). The findings were that the error rate in US newspapers had increased from almost half (46 percent) in 1936 to well over half (61 percent) in 2005 (although scholars used different newspapers throughout the years). Higher frequencies of errors accompanied lower perceptions of the credibility of the story and the newspaper. The trend overlaps longitudinal polls, which show declining confidence and trust in mainstream US news in recent decades (Moy & Pfau 2001). The share of those having

little confidence in the press grew from 14.6 percent in 1973 to 44 percent in 2004. Scholars, journalists, and media pundits interpret these poll results as a credibility crisis for mainstream journalism (Gaziano 1988).

The concept of credibility has sparked a large amount of research, much of it from → interpersonal communication and → persuasion and very little in the context of journalism. Future research should include the perspectives of journalists and of the audience, as well as examining the credibility of the message and the medium. Such integrated studies would broaden understanding of credibility and its consequences.

# Journalists: Professional Associations

Svennik Høyer

University of Oslo

Joining a professional journalist association usually requires gaining one's main livelihood by working fulltime in the editorial department of a media organization. News gathering may involve documentation, detective work, outright research, or combining findings from existing databases. Other specialists such as photographers, technicians, designers, and the like are central to producing content but are not responsible for the full journalistic text. Furthermore, media work involves observing events and images or fetching information from outside sources, transcribing or transforming the information, and finally editing and framing the information into a preset template (→ Magazine, Visual Design of; Newspaper; Photojournalism).

It is difficult to pursue → journalism outside editorial departments. Getting hired by a publisher is still one of the main criteria for entering journalism and for being admitted to a professional organization. "Professionalism" is often defined as the mastering of themes, forms, and routines, which regularly occur in journalism. As part of their stylebooks, media companies set the standards for their publications, but unlike medicine, journalism practice does not draw on scientific research for authority. Instead, journalism has depended, for long periods of its history, more on artistic effort than on professional routines (→ Professionalization of Journalism).

*Codes of ethics* serve as a combination of abstract principles and guidelines to professional values and conduct, which unite journalists working under different conditions. Codes began to appear in the 1920s, but most codes emerged after World War II (EthicNet; → Ethics in Journalism). The Society of Professional Journalists in the US revised its code of ethics in 1996 and did not mention, as in previous versions, *objectivity* of journalistic texts as the cornerstone for professionalism (→ Objectivity in Reporting). Instead the code now emphasizes journalists' active role in the mediating process: seeking truth, minimizing harm, acting independently, and being accountable (<http://spj.org>). The growing importance of professional standards helps journalists identify more with their job than with their media organization, but no wide agreements exist on how to staff a media organization and edit content, or on what minimum quality standards apply to journalistic products. The power to reorganize media organizations still rests with the publisher.

## HISTORICAL DEVELOPMENT

The formation of associations for journalists followed a sequence resulting from changes in the newspaper industry in each country and from the ensuing changes in journalists' position within the work organization of newspapers, as well as from changes in the social standing of journalists (→ Journalism, History of).

The first generation of associations was social in character and had no specific vocational purpose. The groups served mainly as a forum for mutual respect and gave the members an opportunity to discover who worked where. The American newspaper

industry, for example, had grown so complex by the end of the nineteenth century that even those with long experience in the press had lost the broader view (Dicken-Garcia 1989).

The next generation of organizations had more vocational ends: first, publishers seeking to regulate competition (→ Competition in Media Systems) and to produce relevant data about the industry and advertisers (→ Advertising), and, later, journalists negotiating for better wages and work conditions. Only recently have organizations been active in pursuing professional objectives beyond the codes of ethics.

Journalists started to organize in the late nineteenth century. Associations appeared on local, national, and international levels: in Germany in the 1860s and 1870s, in Scandinavia in the 1880s and 1890s. In Great Britain the pioneering Newspaper Society had already formed in 1836. The National Association of Journalists, with more professional aims, came into being in 1884 and formed the Institute of Journalists, which received a Royal Charter as a professional organization in 1886. In the US associations did not include publishers, editors, and journalists within one organization as early European associations sometimes did. The American Newspaper Publisher Association came into being in 1887. News workers began to organize in the 1890s and finally founded the Newspaper Guild in 1933, which eventually became effective for wage negotiations. In Scandinavia the multiparty press from the 1880s organized journalists, editors, and publishers in parallel organizations, which rarely cooperated across party lines, which delayed the formation of national or regional organizations and also prevented any real accord on professional standards.

### **SOCIAL STANDING AND TRAINING**

The social standing of journalists has been ambiguous throughout journalism history and still varies widely for at least three reasons: because journalism covers many different jobs, from manual to intellectual (→ Journalists' Role Perception), because their control of what gets published varies greatly, and because journalists' characteristics are hard to describe. These ambivalences, made acute by censorship in many systems, help explain the slow development of professional journalist associations.

At first the printer served in the capacity of editor and principal contributor. The printer's job was dirty, literally speaking, and also low in esteem (→ Printer-Editors). As democratic governance increased and rudimentary party systems followed, many printer-publishers used the growing importance of newspapers to gain social status and, sometimes, political office (Pasley 2001; → Media History; Printing, History of; Newspaper, History of). In many countries the early press also accommodated a *mix of vocations*. General literati, essayists, professors, and members of the free professions were among the forerunners of the journalist today (→ Literary Journalism). All worked part-time for newspapers, often as contributors but sometimes as editors. In countries where the press has not yet become a mass medium, much of journalism is still highbrow, literary, and intellectual.

In the early nineteenth century much of the news gathering and manuscript editing still occurred outside the printer's shop. The network of regular contributors included out-of-town correspondents as well as legmen roaming the streets in metropolitan cities, visiting courts, harbors, and the like, hunting for news. Editors and printers met in coffee houses or taverns (→ Coffee Houses as Public Sphere), and only with the advent of a mass press in the 1860s did newspapers regularly hire editors and journalists fulltime.

Beginning in the late 1850s production of books increasingly separated from newspapers, because the poor quality of pulp newsprint on rotary presses did not meet the standards of book publishing. Like journalism, book authorship appeared as a possible career. When the literati and intellectuals left newspapers, they also left the emerging journalistic profession in a social vacuum. The old profile of *haute bourgeoisie* could no longer characterize journalists, who instead became *proletarian professionals*, at least in the case of the US (Kaul 1986).

Around the end of the nineteenth century, when reporters moved to offices sheltered inside newspaper headquarters in metropolises around the world, their qualifications also changed. Newspapers came to emphasize a daily → news cycle that demanded continuous surveillance of sundry events. Efficiency in writing all sorts of copy became the main qualification of journalists, making journalism more a job for handymen and wordsmiths than for specialists or independent intellectuals. At the same time the editorial hierarchy grew, adding layers of subeditors, rewriters, reviewers, and special correspondents, threatening to de-skill journalism in an industrial environment (Hardt & Brennen 1995).

The unsettled question of *talent versus knowledge* has allowed publishers to recruit journalists from any educational background. The resulting difference in education among their members reduced the motivation of journalist associations to set professional standards. Mostly, outsiders took the initiative to establish regular courses in journalism, first in America at the University of Missouri in 1908 and then at Columbia University in 1912. The University of Leipzig established the first German chair in *Zeitungskunde* in 1916, and Finland introduced a two-year course in journalism at college level in 1925. Chinese universities also began teaching journalism in the 1920s. Colleges of journalism and university programs of media studies became common in Europe only in the 1950s and 1960s (→ Journalism Education).

## INTERNATIONAL PERSPECTIVES

What journalists, publishers, and editors could not fully agree on at the national level apparently became easier at the international level. The *International Union of Press Associations* worked between the 1890s and World War I with ideas of education for journalists and a code of professional ethics (Björk 1994), but first World War I and later the totalitarian regimes in the Soviet Union and Germany disrupted these international efforts. Today about 30 international associations for journalists and editors work mainly on questions of press freedom, codes of conduct, and the safety of journalists who work either on assignment in dangerous areas or on topics generating serious conflicts. The best known are the International Press Institute, World Association of Newspapers, International Federation of Journalists, Reporters without Frontiers, and World Association of Press Councils.

Studies of journalists' attitudes in two political systems in economic and political transition, China and Russia, reveal widespread uncertainty. Journalists in mainstream media are torn between professional autonomy and mandatory loyalty to politically and financially elite owners. No one believes that professional associations can change the state of affairs. The party used the old communist unions to control journalists and left a

legacy of distrust in professional associations. The lack of organized protection makes individual journalists vulnerable to external and internal pressures (→ Censorship).

Ownership of media in *China* still remains with the communist party. Rather than giving subsidies, the state allows media companies to compete for higher ratings or larger circulation and thus for more advertising. Censorship has become milder, but opposition to the party can still lead to an early retirement. Journalists may pursue popular journalism outside the realm of politics, but they still face restrictions in reporting public affairs (Lee 2005; → China: Media System).

In *Russia* the old guard among journalists from the Soviet era still considers the media an instrument of power to serve the state and the public or society, but the larger group of post-communist, often untrained, journalists, emphasize entertainment and sensationalism (Pasti 2005; → Russia: Media System).

Despite the comprehensive international network of professional associations, little or no agreement has yet emerged on the key characteristics of journalism (Weaver 1998). Comparisons between the Anglo-American traditions of *objectivity* in journalism and the German or Continental tradition of opinionated journalism emphasize a lack of accord on professional conduct. The two traditions have clearly different attitudes toward sources of information (Köcher 1986): British journalists are more aggressive toward authorities than are German journalists. The opinion editor and commentary are the height of the profession in Germany (Donsbach & Klett 1993).

A cross-national survey of journalists in 22 nations revealed their values and practices, but hardly any consensus either about the duties of journalists toward their sources or about the purpose of journalism. Transmitting news as soon as possible was the only value journalists accepted universally. The study concluded that no place has a monopoly on journalists' professionalism (Weaver 1998).

## Journalists' Role Perception

Wolfgang Donsbach

Dresden University of Technology

An important concept to apply in describing how journalists in different cultures and media systems understand their work and its social function is *role perceptions*. These can have a strong influence on journalists' professional behavior and thus can explain differences between news cultures. The term "role" originates from theater, and sociology adopted the term to designate the whole set of expectations that other people have of the holder of a certain social position. Those expectations then create the perceptions that the holders of the roles have in their social environment and accept as legitimate, and consequently their perceptions guide their attitudes and behaviors. Thus, journalists' role perceptions can be defined as generalized expectations which journalists believe exist in society and among different stakeholders, which they see as normatively acceptable, and which influence their behavior on the job.

Journalists' role perceptions have been studied primarily for news workers involved in covering politics and current affairs. The research assumes that the way journalists understand their role will influence considerably the way they interact with news sources and make decisions about news selection and presentation. In a causal model of factors influencing news decisions, role perceptions become an intervening variable that moderates the influence of primary variables such as the news value of people or topics in the news, or subjective beliefs. For instance, journalists who see themselves as a common

carrier of the news might try to suppress the influence of their own preferences on the coverage of a political figure. Conversely, journalists who see a role for themselves in political activism would allow such a subjective influence.

## THEORETICAL CONCEPTS

To describe journalists' role perceptions, communication researchers have developed a variety of concepts, some as *ideal types*, some as *normative standards*, and some as *empirical typologies*. According to sociologist Max Weber, ideal types develop from observing reality but do not exist in reality in their pure form. They usually occupy the end points of a given dimension and thus form helpful markers. Siebert et al. (1956) presented the first spectrum of this kind in their four theories of the press: the authoritarian, the Soviet, the liberal, and the socially responsible. Although used to distinguish between press systems, these four theories can also be regarded as ideal-type descriptions of different journalistic role perceptions.

One of the most widely recognized pairs of ideal types for role perceptions was identified by Morris Janowitz (1975), who distinguished between the *gatekeeper* and the *advocate*. These types differ particularly along two dimensions: their picture of the audience, and their patterns of news selection. Journalists adhering to the advocacy model may assume that many members of the audience cannot either recognize or pursue their own interests in society (→ Advocacy Journalism). These journalists therefore believe that their major task is to act on behalf of this part of the audience. Consequently, they select the news according to its instrumentality for the social groups they support. In contrast, the gatekeeper regards audience members as mature and able to pursue their own needs and thus selects the news exclusively according to professional criteria, such as the perceived news value. Similar but not identical is the distinction between the *neutral* and the *participant* journalist (Johnstone et al. 1976) in a survey of US journalists. The *active* versus the *passive* journalist, the *liberal* versus the *partisan* journalist, and the *mediator* versus the *communicator* are similar ideal types.

Several normative typologies highlight specific social tasks that the public can or should expect journalists to perform. The typologies serve a heuristic purpose in research. For instance, Patterson (1995) distinguished between the roles of *signaler*, *common carrier*, *watchdog*, and *public representative*. As signalers, journalists represent an early warning system for society. As common carriers, they channel information between the government and the people. As watchdogs, they monitor institutions and issue warnings to the actors in politics and commerce, and as public representatives, they become spokespersons on behalf of public opinion.

Several normative proposals for journalistic role models have triggered discussions in the academic as well as in the professional world. In the 1960s and 1970s, several authors suggested a different and more active role for journalists in developing countries, arguing that the state of social structures and of the media system in such countries would require that journalists become themselves agents of change and collaborate to a certain extent with the authorities (→ Development Journalism). In the USA a widely recognized debate about journalists' professional tasks began with the proposal of the new role: public journalism (→ Citizen Journalism). Although the term lacks a universally accepted definition, it

**Figure 1** Dimensions in journalists' role perceptions

usually assigns journalists the role of motivating or enhancing public deliberation and getting the public more engaged. Along a different dimension Philip Meyer (1991) suggested that journalists should see themselves more often in a role equivalent to that of the social scientist, applying research methods such as polls and statistical analyses of data sets to describe social reality (→ Precision Journalism).

Finally, different patterns of role perceptions have emerged from surveys of journalists and subsequent data analyses, usually by factor analysis (→ Statistics, Descriptive). In the first of a series of surveys of US journalists, Weaver and Wilhoit (1986) extracted from their data the roles of *information dissemination*, *interpretative-investigative*, and *“adversary.”* An international comparative survey of British and German reporters and editors (Köcher 1986) labeled the role perceptions of the German respondents as those of *missionaries* and the British as those of *bloodhounds*.

The common denominator of these typologies is that they ask what social goals journalists should pursue and how they should behave on the job when collecting and processing the news. For democratic countries, the existing theoretical role models differentiate three dimensions, all of them interrelated (see Fig. 1). On the first dimension (participant–observational), journalists can choose between actively seeking to influence the political process and trying to function as impartial conduits for political reporting. On the second dimension (advocacy–neutral), the alternatives are expressing subjective values and beliefs and maintaining strict neutrality and fairness to all sides. Finally, on the third (commercial–educational), journalists can strive either to reach the widest audience by serving its tastes and patterns of media exposure or to make news decisions based on what is good for democracy and public discourse. Journalists in all countries acquire elements of all these dimensions from the available role models. Scholars can usually explain the differences between journalistic cultures when comparing countries or between individual journalists in a single country by examining which of the alternatives prevails.

### EMERGENCE OF ROLE PERCEPTIONS

How journalists perceive their professional role depends on many factors, including the collective influence of the professional culture of a given country, the individual influence

of other journalists, or both. Historical development is one of the most decisive factors for differences in journalism between countries. For instance, economic and social changes in the US population in the first half of the nineteenth century, as well as the commercial motivation of publishers to reach the widest possible audience, together drove US newspapers to adopt a less partisan position, to become oriented more toward news and less toward opinion, and to develop basic professional standards such as the norm of objectivity (→ Objectivity in Reporting). It was “the triumph of the news over the editorial and facts over opinion, a change which was shaped by the expansion of democracy and the market, and which would lead, in time, to the journalist’s uneasy allegiance to objectivity” (Schudson 1978, 14). The role model of a neutral observer of ongoing social and political processes still permeates today the way most US journalists see and carry out their job.

Journalism in the United Kingdom showed similar patterns of historical development because of early press freedom and commercialization (→ Penny Press), but the professional role models in most of the continental European countries developed differently. In Germany, for instance, the absence of press freedom until the twentieth century led journalists to see themselves as individual freedom fighters and adversaries of authority. As a consequence, many journalists consider it more important to voice their opinion than merely to cover the news.

The development of professional standards also influenced journalists’ role perceptions, often as a consequence of media history and the emergence of professional organizations (→ Journalists: Professional Associations; Professionalization of Journalism), as did the training and socialization of journalists. While in some countries, such as the USA, a majority of journalists have studied a journalism or similar university program with standardized modules conveying specific professional norms, in most other countries news workers come from many different fields and lack a common basis of knowledge and norms. Aside from these intercultural differences, the role perception of journalists within a given media system can also differ according to their individual training, socialization, institutional demands, or personal job motivations.

## MEASUREMENT AND FINDINGS

Communication researchers have applied a variety of methods and empirical indicators to assess journalists’ role perceptions. Surveys in which the respondents answer questions about their norms and behaviors are the method used most frequently by far. Analyses of media content allow researchers to infer role perceptions from the work product. Participant observation in the newsroom allows researchers to witness the behavior of journalists on the job in day-to-day practice.

Most frequently researchers have asked explicitly how journalists define their roles or tasks, for example whether they see themselves as neutral reporters or as proponents of specific values and ideas. Questions about journalists’ general motivations in their work can reveal their ambitions, that is, which goals they want to pursue while working in journalism. Questions about qualifications and skills necessary to do the job well can indicate where journalists see the core competence of the profession. Questions about basic norms such as fairness, objectivity, or distance from sources can reveal the

normative basis of their practice. Questions on their picture of the audience can show whether they see themselves in a position elevated above or equal to the public, which in turn can indicate an educational role perception.

Comparative investigations are particularly valuable because they allow benchmarking with other professional cultures and can help interpret and evaluate the role perceptions measured in one country or in one professional sector. Although journalists in western democratic societies operate under similar legal, political, economic, and cultural conditions and share a professional orientation, their media systems, news organizations, political structures, and general cultures differ and thus affect their norms and behaviors. International comparative research on journalists' role perceptions began with the so-called professionalization studies that Jack McLeod and colleagues initiated in the 1960s. The researchers had developed a scale for measuring how the professional attitudes of US journalists compared to those of traditional professions such as medicine and law. Surveys later applied the scale to journalists from other countries, allowing international comparisons (Donsbach 1981). Several other research programs contributed to comparative evidence on role perceptions. A questionnaire first used for US journalists in the 1980s was later applied in 20 other countries (Weaver 1997). In the early 1990s a survey conducted almost simultaneously in five countries measured the role perceptions and professional norms of journalists involved in daily news decisions (Donsbach & Patterson 2004).

These international comparative studies show that professional cultures differ considerably even among countries otherwise similar in the structural patterns of their media and political organization. In the study of journalists mentioned previously, German and Italian respondents said far more often than their British, Swedish, and US colleagues that "championing values and ideas" was an important aspect of their work as journalists, thus indicating a role perception more open to advocacy. German and Italian respondents rated professional standards such as objectivity or neutrality as less important and readiness to influence the political process as more important. For Germany, a higher advocacy role perception also clearly correlated with the influence of subjective beliefs on actual news decisions in a quasi-experimental design that accompanied the survey. These cross-national differences describe news systems that also have much in common, including their primary task: gathering and disseminating the latest information about current events. Western news systems are more alike than different, although their differences are important and consequential. Besides differences based on mean values for these countries, role perceptions can differ considerably among individual journalists and media organizations.

Role perceptions within the countries have also changed over the years. In some cases the changes have occurred through crucial events, such as the Vietnam War or the Watergate scandal in the USA, which made US journalists more skeptical or even cynical toward politics and political leaders. Content analysis of Swedish news media over a period of 80 years showed a sharp increase in negative news (Westerstahl & Johansson 1986), leading to the conclusion that the general role model of journalism changed in the 1960s from the ideology of paternalism to the ideology of criticism, and surveys and content analyses in other countries (Lang et al. 1993; Patterson 1993) support that interpretation. Some evidence suggests that the increasing commercialization of the news media worldwide has started yet another, more global process of changing role models,

so that for many journalists the possibility of advocating specific goals and norms has become less important in the face of an increasing necessity to reach the widest audience. More evidence from empirical studies is needed, however, to verify this hypothesis.

## Katz, Elihu

Sonia Livingstone

London School of Economics and Political Science

Over the past five decades, Elihu Katz (born in New York in 1926) has made a major contribution to the analysis of mass communication. Best known for the concept of the “two-step flow of mass communication” (→ Two-Step Flow of Communication) and for the theory of → “uses and gratifications” obtained by media audiences, Katz’s work examines the relation between the individual and the group in the process of mass media influence, contributing to the understanding of the active television viewer, the diffusion of innovations (→ Diffusion of Information and Innovation), → media effects, → public opinion, and media imperialism. Professionally, Katz has divided his time between America (first the University of Chicago, later the Annenberg School for Communication at the University of Southern California, then the University of Pennsylvania) and Israel (where he founded the Communications Institute at the Hebrew University, headed the Institute of Applied Social Research, and directed the task force charged with introducing television to Israel in the 1960s; → Communication as an Academic Field: Middle East, Israel).

His work began with the publication of *Personal influence* in 1955 (with his mentor at Columbia, → Paul F. Lazarsfeld) and two books on the diffusion of innovation: *Medical innovation* (1966), with James Coleman and Herbert Menzel, and *The politics of community conflict* (1969), with Robert Crain and Donald Rosenthal. These were followed by the founding statement of uses and gratifications theory, *The uses of mass communications* (1974), edited with Jay Blumler, which stressed the active and selective nature of audiences’ responses to the media (→ Selective Exposure). His equally influential investigation into the cultural conditions of audience reception of the American soap opera *Dallas*, *The export of meaning* (1990), with Tamar Liebes, took him in a more cultural, interpretive direction (→ Intercultural Media Effects; Soap Operas). More recently, he published a groundbreaking analysis of media events, *Media events* (1992), with Daniel Dayan (→ Media Events and Pseudo-Events).

Other books include a reader on *Bureaucracy and the public* (1973), edited with Brenda Danet; *The secularization of leisure* (1976) with Michael Gurevitch; *Broadcasting in the third world* (1977) with George Wedell, a cross-national account of media and modernization; *Social research on broadcasting* (1977), a report on the role of research in understanding the audience for the BBC; *Almost midnight* (1980) with Itzak Roeh, Akiba

Cohen, and Barbie Zelizer, on the changing nature of television news; *Mass media and social change* (1981), edited with Tamas Szecsko; *Election studies* (2001) with Yael Warshel; and, most recently, *Canonic texts in media research* (2003), edited with John Durham Peters, Tamar Liebes, and Avril Orloff, which re-examined canonical (or “should be” canonical) figures in the history of media and communication research (→ Media Effects: Direct and Indirect Effects; Opinion Leader).

According to the two-step flow hypothesis, opinion leaders seek out mass media messages relevant to their expertise and disseminate these through vertical or horizontal flows in their local community, especially during periods of uncertainty, resulting in a selective transmission process, which either resists or facilitates social change, depending on interpersonal relations in primary groups. Looking more broadly at the question of media influence, Katz (1980, 119) argued that “the history of empirical work on the effects of mass communications can be written in terms of two concepts: selectivity and interpersonal relations.” Thus, “the ‘power’ of the media rises and falls, conceptually, as a function of the importance attributed to the intervening processes of selectivity and interpersonal relations” (Katz 1980, 120), an importance which he shows to oscillate over six decades of research on “effects.”

In a famous exchange, Todd Gitlin (1978) articulated the classic critique of media effects research, attacking its focus on measurement, quantification, and short-term effects, its marketing orientation, and its claim to scientific objectivity and political neutrality: in short, its grounding in functionalist sociology. Katz and Lazarsfeld, claimed Gitlin, drastically underplayed the power of the media as regards long-term ideological effects, particularly those that reinforce the status quo. Notwithstanding attempts from Katz and others to rebut these criticisms (Peters 1989; Simonson 2006), the debate between Katz and Gitlin became emblematic of the struggle between administrative and critical scholars during the 1970s and 1980s (→ Critical Theory).

Yet Katz has consistently advanced an agenda of convergence across often warring divisions in the research field – seeking to integrate methods, political positions, academic disciplines, and research traditions. Drawing on social psychology, sociology, and political science, his commitment to convergence is also evident in his various academic and practice-oriented collaborations, as expressed in a series of articles designed to build bridges across intellectual divides.

Katz’s work furthers the understanding of the complex relations between public opinion, media, and social interaction (→ Interpersonal Communication). Influenced by the social theorist Tarde, Katz points out that, insofar as Tarde argued for the rationality of public opinion as contrasted with the mindlessness of the masses, he may be seen as the originator of the active/passive viewer (or voter) debate in media and communications research, with the notion of the two-step flow (Katz & Lazarsfeld 1955), foreshadowed in Tarde’s social psychological essay of 1898, “La conversation” (Katz 1992). Last, Katz has always been committed to the usefulness of social science research in public policy terms, seeking ways to ensure that his research on media effects, media institutions, public opinion, and audiences benefits society, especially journalism, broadcasting, and public policy.

## **Knowledge Gap Effects**

*Cecilie Gaziano*

*Research Solutions, Inc.*

Building upon early research from rural sociology, diffusion of innovations, public opinion poll data, and information campaigns, Tichenor et al. (1970, 159–160) posed the hypothesis: “As the infusion of mass media information into a social system increases, segments of the population with higher socioeconomic status (SES) tend to acquire this information at a faster rate than the lower status segments, so that the gap in knowledge between these segments tends to increase rather than decrease.” The less advantaged were predicted to gain knowledge but at a slower rate than more advantaged groups. The gap can be studied at one time point or over time. Tichenor et al., also known as the Minnesota Team, focused on public affairs and scientific knowledge (→ Political Knowledge). They assumed that knowledge growth was irreversible (although forgetting can occur) and that ceiling effects occurred at varying rates for different SES groups or else had not been reached (→ Media Campaigns and Perception of Reality; Media Use by Social Variable).

The most frequent indicator of SES is level of formal education (→ Operationalization; Scales; Scales and Indices), although researchers also have used income and, less frequently, occupation (Viswanath & Finnegan 1996; Gaziano 1997). Missing data are a greater problem with income questions than education or occupation measures, and occupation

can be difficult to code. *Knowledge* is defined as information acquired and retained by people through learning processes. *Gap* means the relation between SES and knowledge. Knowledge has been measured as simple awareness or as in-depth knowledge, either in open-ended or closed-ended questions, or both. Incidentally, awareness knowledge gaps can be narrowing while in-depth knowledge gaps are increasing, and knowledge measured with open-ended questions does not necessarily decrease the relation to SES, compared with closed-ended questions with objectively defined answers. Additionally, media use, attention, or publicity should vary because the prediction concerns changing levels of media information diffusion.

*Operational definitions of knowledge gap* include differences in mean knowledge scores among SES groups, differences in proportions of SES groups possessing any knowledge, correlations between knowledge and SES (Viswanath & Finnegan 1996; Gaziano 1997), statistical interactions between education and news media use in hierarchical multiple regression analyses of cross-sectional data (Kwak 1999; Eveland & Scheufele 2000), and comparisons of communities that vary in structural characteristics (Tichenor et al. 1980; Donohue et al. 1986). Inaccurate information is seldom examined; it tends to circulate more often among lower SES groups than higher SES groups (Gaziano 1997).

### **CONDITIONS UNDER WHICH GAPS INCREASE OR DECREASE**

The Minnesota Team reported that *differentials decreased* when (1) conflict was associated with issues (bringing them to the attention of all social groups), (2) levels of media coverage were high and sustained over time, (3) levels of interpersonal discussion about topics were high, (4) community structures were relatively smaller and more homogeneous, as opposed to larger, heterogeneous structures (that tend to have more groups active on issues and greater complexity of communication channels), (5) issues had high levels of basic concern to communities, and (6) forgetting occurred over time among all groups (Tichenor et al. 1980; → Memory). Other work corroborated and extended these findings (Viswanath et al. 1995).

The majority of studies find knowledge inequalities (Viswanath & Finnegan 1996; Gaziano 1997). Conditions under which gaps tend to arise include those in which topics have differential appeal to SES groups or in which there are high levels of organized group activity, which tend to create greater interest in issues, although group ability to define issues or control information dissemination can lead to restriction of information (Tichenor et al. 1980; Holst 2000). Knowledge gaps can develop between small, homogeneous communities and larger, more heterogeneous communities as metropolitan newspapers pull back from regional coverage in order to maximize profits (Donohue et al. 1986). Smaller communities can be less attractive markets to metropolitan dailies because of rural location, agricultural orientation, and lower-income populations.

### **THEORETICAL MODELS**

Ettema and Kline (1977) and Dervin (1980) were early *critics* of the knowledge gap perspective; however, analysis of their critiques showed that their models, units of analysis, and assumptions were different from those of the Minnesota Team, leading to different kinds of hypotheses

and different explanations (Gaziano & Gaziano 1999). The Minnesota Team conducted a systematic program of research spanning nearly three decades that located cause in the social stratification of collectivities (especially communities) and that saw knowledge gaps resulting from social control processes, with knowledge control by elites and/or pressures for social change as potential outcomes (Tichenor et al. 1980; Viswanath & Finnegan 1996).

Ettema & Kline (1977) were concerned with social-psychological, individual-level causal factors, audience-related elements (skills, motivation, media behavior) and message-related elements (ceiling factors), in order to explain knowledge differentials as “communication effects gaps,” in terms of “differences” rather than “deficits.”

Dervin’s (1980) model was an intra-individual, cognitive-processing model with cybernetic and library science elements (→ Information Processing). She characterized data on gaps as “numeric myths” with a “blame the victim” perspective. Her unit of analysis was the “gap-bridging instance,” and she perceived the debate in terms of “information gaps” and “sense-making.”

A fourth model brought the concepts of culture, belief systems, community networks, and other networks to center on knowledge differentials among social groups (Gaziano & Gaziano 1999; → Culture: Definitions and Concepts).

## **FUTURE RESEARCH DIRECTIONS**

The relative contributions of print and broadcast media to knowledge inequities have been little studied, particularly → radio, → magazines, and the → Internet. Use of television and, to a lesser extent, → newspapers contributed to smaller knowledge gaps when campaign interest and key demographics were controlled in an analysis of national election data (Eveland & Scheufele 2000). After controlling for demographics, Kwak (1999) found that high exposure to television news was related to smaller knowledge differentials during the 1992 presidential campaign in Dane County, WI, a pattern for television corroborated by Liu and Eveland (2005) with national data (→ Television News). Kwak (1999) also found that close attention to news of the campaign in newspapers among those who were the most interested in the election diminished the education-based knowledge gap. Eveland and Scheufele (2000) expected that newspaper use would lead to larger knowledge gaps because newspaper access frequently depends on education, but they found the opposite result. In contrast, Liu and Eveland (2005) observed an influence of newspaper use and attention on increased knowledge disparities.

Since most knowledge gap work involves cross-sectional data, future research should include more panel or time-trend studies to better study change (Holst 2000; Holbrook 2002; → Survey). Also needed is more study of factors that reduce gaps, such as motivation, including the conditions under which motivation is related to SES and when it is not (Kwak 1999); new communication technologies, especially the Internet; childrearing patterns and family communication styles (Gaziano 2001); school curricula oriented toward enhancing adolescent-parent communication and political learning (McDevitt & Chaffee 2000); and different communication (Eveland & Scheufele 2000) and cultural (Gaziano & Gaziano 1999) contexts. In addition, more study is needed of measurement issues, such as improved knowledge measurement and increased number of indicators of key concepts (Viswanath & Finnegan 1996; Liu & Eveland 2005; → Measurement Theory).

# Knowledge Interests

Hartmut Wessler

University of Mannheim

The term “knowledge interests” (*Erkenntnisinteresse*) was coined by German philosopher and social theorist → Jürgen Habermas in his work *Knowledge and human interests* (Habermas 1968/1987). Habermas distinguished three kinds of knowledge interests constitutive for particular object domains and their scientific investigation. According to him, the interest of *control through prediction* is constitutive of the natural sciences, while the interest of *hermeneutical understanding* characterizes the humanities. The social sciences, in turn, follow the knowledge interest of *emancipation* in that they create awareness of the contingency and changeability of the social world and thus of societal alternatives (Jensen 1995, 93–95).

In his later writings, Habermas has replaced this threefold typology of knowledge interests with a theory of communication that distinguishes *four different types of action* and corresponding “relations to the world” (Habermas 1981/1984, 75–101; 2001, 15). Teleological (goal-directed) action presupposes an *objective* world (as the totality of all entities about which true statements are possible); normatively regulated action presupposes the objective world as well as a *social* world (as the totality of all legitimately regulated interpersonal relations); and dramaturgical action presupposes the objective world (including social facts) as well as a *subjective* world (as the totality of the experiences of the speaker, to which he or she has privileged access). Communicative action, finally, comprises all three types of relations to the world in a reflexive manner, i.e., acknowledging the possibility that truth claims concerning objective reality, claims of moral rightness concerning the social world, and claims to sincerity and truthfulness in relation to the subjective world can be contested by other speakers and must be rationally justified.

The earlier typology of knowledge interests constitutive of particular object domains has thus been transformed into a typology of actions with particular validity claims and pragmatic relations to the world, which, according to Habermas, implicitly lie at the heart of every act of communication. From this later perspective, the specificity of social–scientific inquiry can be seen in the fact that it makes truth claims as well as claims to moral rightness concerning social relations, or, in other words, that it is empirical–analytical and (at least implicitly) normative at the same time. The normative content of social–scientific knowledge does not derive from a more or less arbitrary political stance of individuals or groups of researchers, but must be rationally justifiable in the light of opposing claims to rightness in the scientific community.

In (mass) communication research, traces of such normative content can be found even in the most basic concepts of the field, namely the models of communication that (mass) communication researchers employ (McQuail 2000, 52–58; → Models of Communication). The dominant model of communication is the *transmission model*, according to which meaning is transmitted from a sender through a channel to one or many receivers. It follows the perspective of the sender and his or her intentions, and sees communication as goal-directed action aiming at some effect on the side of the receiver (e.g., issue

awareness, persuasion). In this sense the model aims at control through prediction of effects. The *ritual model*, by contrast, sees communication as the representation of shared beliefs (Carey 1989) and communicators as participants in a shared experience. This model involves dramaturgical as well as normatively regulated action. The *publicity model* aims at maximizing the attention in audiences by optimizing techniques of display. Like the transmission model, it is teleological and further corresponds to the logic of advertising and commercial media use research, where the contact with a medium or message constitutes the basic goal. Finally, the *reception model* of communication places particular emphasis on the preferences of audiences and the latitude they possess in interpreting media texts and developing their own readings. It involves all types of action and is in line with intentions found in cultural and media studies to value popular tastes and media perceptions (→ Cultural Studies), sometimes at the expense of a critical view on those tastes and perceptions. All of these basic models of communication are inevitably imbued with particular knowledge interests that are only rarely justified and discussed explicitly.

# **Knowledge Management**

*Lorna Heaton*

*University of Montreal*

Knowledge management (KM) is a key concept in today's business world. While there is an element of fashion in its appearance toward the end of the 1990s (Swan et al. 1999), many of the world's most successful corporations, businesses, and organizations are investing considerable resources in this enterprise (Alvesson & Karreman 2001). These knowledge projects include setting up intranets, using collaborative or workflow software, mentoring, and sharing information on best practices. Deeply rooted in practicality and typically tied to organizational objectives, these practices seek to identify, create, represent, and distribute knowledge throughout the organization (→ Organizational Communication).

A number of considerations motivate organizations to embark on a KM program. Perhaps first among these is to gain and maintain the competitive advantage that comes with improved or faster learning and new knowledge creation. In a business environment characterized by radical and discontinuous change, successful companies are those that anticipate changes, consistently create new knowledge, disseminate it widely throughout the organization, and quickly embody it in new processes and products. Potential benefits of KM programs include: managing the proliferation of data and information in complex environments; allowing employees rapid access to useful and relevant knowledge resources; greater innovation; shorter product development life cycles; leveraging the expertise of people across the organization and thus benefiting from “network effects” (as the number of productive connections between employees increases); facilitating organizational learning; and increasing the responsiveness or resilience of organizations to environmental change (→ Learning Organizations).

## DEFINING KNOWLEDGE MANAGEMENT

One aspect of KM, knowledge transfer, has always existed in one form or another. The actual study of KM is much more recent, however, and has its roots in areas such as business, management, sociology, and economics. Most working definitions suggest that KM is about identifying and harnessing intellectual assets, either in the form of explicit knowledge held in artifacts or as possessed by individuals or communities. A recurrent theme is that KM provides a framework that builds on past experiences and creates new mechanisms for exchanging and creating knowledge. Implicit is the recognition that knowledge, and not simply information, is the primary source of an organization’s innovative potential.

In considering KM, it is important to distinguish between *knowledge* and *information*. Generally, information becomes knowledge when it is seen in context or interpreted. A more process-oriented view of knowledge focuses on knowing and anchors it as a social accomplishment. Orlikowski (2002), for example, refers to knowledge as procuring the “capacity to act.” As the KM field has matured, there has been increasing academic debate on epistemological questions of this type and the emergence of a critical perspective on what began as a practical, management-based movement (e.g., Styhre 2003).

There are *three general perspectives on KM*: the cognitive perspective, the networking perspective, and the social, community-based perspective. The dominant perspective is the *cognitive perspective*, in which knowledge is a commodity and an asset, something that can be accounted for and managed. Typically, there are a number of processes involved: knowledge identification, capture or acquisition, generation, validation, diffusion, storage, retrieval, and use or reuse. Variations of the cognitive model of KM are practiced by most organizations with formal KM processes in place. Some prominent cognitive models of KM are the SECI model described later (Nonaka & Takeuchi 1995) and discussions of intellectual capital, the intangible assets that contribute to an organization’s value (Bontis 1999). Some scholars argue that the cognitive model of KM may be most applicable to the reutilization of knowledge. From this perspective, IT tools are used to codify, store, retrieve, and transfer knowledge.

*Networking perspectives* on KM emerge parallel with the theories of the network organization (→ Communication Networks). From this perspective, knowledge acquisition

and sharing is a primary lever for organizational learning, which enables organizations to choose and adopt new practices where relevant. The network perspective acknowledges that individuals have social as well as economic motives, and that their actions are influenced by networks of relationships in which they are embedded. Information technologies are extremely important as facilitating tools for maintaining and building knowledge sharing and transfer networks. In practice, network models of KM try to integrate collaboration patterns and IT networks in order to control the flow of information and forge strategic alliances both within and across organizations (Contractor & Monge 2002).

Both the cognitive and network perspectives on KM suppose a high degree of planning and formalization. An alternative strategy to encoding and retrieving knowledge from knowledge repositories such as databases is for individuals to ask their knowledgeable co-workers questions as needed. This *social, community-based perspective* to KM has much in common with → communities of practice and narrative or storytelling approaches in organizational communication (→ Storytelling and Narration). The community perspective builds on the notion that knowledge and practice are inseparable. Community members work together to re-create and apply transferred information in locally situated, appropriate ways. The response from the expert individual is highly contextualized to the particular problem being addressed and personalized to the questioner. Knowledge is generated locally and collectively, through the social construction of new meanings and understandings. In this perspective, IT-based solutions play a secondary role. The challenge for organizations approaching KM from this perspective is to encourage enabling organizational practices, such as providing spaces for exchange and a nurturing environment (Cook & Brown 1999; Iverson & McPhee 2002).

## KEY CONCEPTS IN KNOWLEDGE MANAGEMENT

Nonaka and Takeuchi's (1995) widely cited model of knowledge creation and dissemination distinguishes between *tacit* and *explicit knowledge*. If "tacit," knowledge is unarticulated, and thus indescribable. Polanyi's (1967) famous example of bicycle riding is a case in point: the ability to ride is demonstrated not through explanation, but through presentation. "Explicit" knowledge, on the other hand, can be expressed linguistically in artifacts (through writing, drawing, programming). In its explicit form, knowledge lends itself to recombination and thus becomes accessible to others. Only when it is externalized can tacit knowledge become useful to the group.

Nonaka's *model of knowledge creation and management* has served as a foundation for much of the research in KM (Nonaka 1994; Nonaka & Takeuchi 1995). Nonaka and Takeuchi (1995) argue that a successful KM program must, on the one hand, convert internalized tacit knowledge into explicit codified knowledge in order to share it, but also enable individuals and groups to internalize and make codified knowledge personally meaningful once it is retrieved from a KM system. The model describes a continuous process of dynamic interaction between tacit and explicit knowledge through a sequence of *four modes of knowledge conversion*. In the first mode, "socialization," tacit knowledge is shared through interaction between individuals. Because tacit knowledge cannot be articulated, the key to acquiring it is experience. Apprenticeships are one example. The second mode, "externalization," involves developing ways to embed this shared tacit

knowledge, and enable its communication. “Combination,” the third mode, involves reconfiguring different elements of externalized information through sorting, categorizing, adding, and recontextualizing it in new ways. Finally, “internalization” occurs when explicit knowledge is integrated into and becomes part of the individual’s knowledge base (a mental model). This sequence of steps from socialization, to externalization, to combination, to internalization is known as the *SECI process*.

According to the model, various triggers, such as interaction, dialogue, the use of metaphors, or experimentation, induce shifts between modes. The result is a *dynamic spiral*, which widens as it moves from individual to group to organization levels, explaining how individual knowledge is transformed into organizational knowledge and vice versa. The successful organization is one that best enables the knowledge creation spiral from socialization (tacit-to-tacit) to externalization (tacit-to-explicit) to combination (explicit-to-explicit) to internalization (explicit-to-tacit), thus capitalizing on the intellectual capital of individual employees (Bontis 1999).

## TECHNOLOGICAL ASPECTS OF KNOWLEDGE MANAGEMENT

Information technology is a key enabler of KM programs. The earliest KM technologies were online corporate yellow pages (expertise locators) and document management systems. With the development of collaborative technologies such as *Lotus Notes* in the mid-1990s, KM systems expanded rapidly. Workflow systems and status tracking tools also added impetus to the movement, as did semantic technologies for search and retrieval and content management.

Several issues cloud the application of technological tools to KM. IT tends to reduce the complexity or richness of knowledge in order to be able to code it. Organizations sometimes store large quantities of information or data and mistakenly think they are fostering the flow of knowledge. There is a tendency to focus on individuals as the source of knowledge. Finally, existing KM systems have difficulty dealing with tacit knowledge.

As technologies gain in sophistication, they are progressively more capable of providing meaningful support for knowledge sharing in organizations. For example, discussion forums and the scaffolding structures they provide can be seen as KM tools. Intelligent information filtering and extraction (such as recommender systems) have become commonplace in the past five years. Social computing tools such as blogs and wikis provide a more unstructured approach to knowledge transfer and knowledge creation (→ Blogger). Such tools are still primarily text based, however. Developments in visualization techniques such as concept mapping and image indexing provide new opportunities for distilling meaningful, reusable knowledge from their content.

As the KM field has matured, it has become apparent that advanced technologies cannot solve all KM problems, however. Database entries in knowledge repositories are only valuable if they correspond with users’ sense-giving processes. Constructing an information technology infrastructure for knowledge does not, in itself, guarantee that organization members will use the system. The literature on best practices in KM suggests that fostering an environment conducive to knowledge sharing and open communication is vital in any KM strategy. Other considerations are a shared vision, committed leadership, and a strong link to business priorities.

## **Korean Cultural Influence**

*Kwang-Suk Lee*

*University of Texas at Austin*

South Korea has emerged as a center of pop culture throughout Asia: its scope of cultural influence encompasses Eurasia (e.g., Uzbekistan, Mongolia, and Russia), East Asia (e.g., China, Hong Kong, Taiwan, Singapore, and Japan), Southeast Asia (e.g., Cambodia, Vietnam, the Philippines, Indonesia, and Malaysia), and even extends beyond Asia. Korea's cultural products – notably, its blockbuster movies, television programs, → fashion, and → popular music – have become favorites among Asians and even among Latin Americans. The so-called “Korean wave” (or *Halryu*, a term first coined by Chinese reporters in 1999) refers to the growing appeal of Korean → popular culture in other Asian countries (Koh et al. 2005), while the Korean government's rhetoric of the “digital

Korean wave” is an attempt to ride the wave of Korea’s cultural influence by simultaneously promoting Korea’s high-tech electronic companies such as Samsung Electronics (→ Samsung Corporation).

Korean → television programs and → cinema have gained a “pan-Asianist” value (Dator & Seo 2004; Kim 2007), and the scope of their cultural influence in the global market has become similar to the pan-Iberian/Latin American *telenovela* culture, which is relatively independent from the monolithic cultural dominance of the → Hollywood empire (→ Cultural Imperialism Theories). Korea’s pan-Asian appeal can be theoretically explained by “cultural proximity,” a phenomenon first identified by empirical studies of Latin American TV watching patterns, which verified the export success of channels such as Mexico’s Televisa and Brazil’s TV Globo and noted their function as a counter to worldwide cultural standardization by global media firms (Sinclair 1999). “Cultural proximity” is created by such factors as local culture, language similarity, local market strength, and other cultural variables (Straubhaar 1991).

The “Korean wave” in Asian regions bears some similarity to the cultural influence of the *telenovela* in Latin America, and the new pan-Asian culture signifies the “non-linear, fractured nature of cultural globalization” (Ang 1996, 154), the so-called “hybridity” of global culture (→ Hybridity Theories), as distinct from theories of the propagation of uniformity by the western-dominated media market. The cultural proximity among Asian countries lacks linguistic proximity, unlike Spanish and Portuguese, and hence the “Korean wave” in Asia is less firmly grounded than the influence of *telenovela* culture in Latin America. In an attempt to ensure that the “Korean wave” is not merely a passing fad, Korea moved beyond exporting its TV programs and films to invest in television and film production in China and Taiwan, and also to become involved in co-producing such entertainment with these countries. Moreover, to alleviate the antagonistic responses from some Asian regions to the dominant penetration of Korean popular culture, Korea has launched government-driven public relations programs which aim at promoting Korea’s image as harmless: the government has been establishing “Korea Plazas” in the major Asian regions, which are used for teaching the Korean language, previewing Korean TV programs, films, and other cultural commodities, and eventually promoting tourism. As another way to lessen some negative responses to Korean popular culture, over the past ten years the government has also invited and sponsored 1,000 Asian artists, entertainers, and cultural activists every year. The government expects these public leaders in Asian countries to promote Korea’s public image among their own peoples (Ministry of Culture and Tourism 2005).

Korea’s effort to *promote culture as a business* originated from government policies promoting the domestic cultural and → tourism industries. Under the pressure of the 1997 IMF-driven financial crisis, the government shifted to radical adoption of neo-liberal economic policies and to privileging the information and culture industries over labor-intensive heavy industries. Since that time, culture in Korea has been widely regarded both as a key dimension of economic globalization and as a creative industry for earning foreign dollars and creating a new job market. Under the administrations of Dae-jung Kim (1998–2003) and of Moo-hyun Noh (2003–the present), policy plans for the cultural or creative sector have been predominantly driven by reducing cultural products to pure commodities.

This has been addressed by encouraging foreign exports of Korean music, television, and film, promoting Korean entertainers in the Asian entertainment market, and establishing international trade fairs or film and leisure/sports festivals in major cities designated as international culture or tourism sites (→ Culture: Definitions and Concepts). The neo-liberal yet interventionist cultural policies initiated by the Ministry of Culture and Tourism plan to place Korean culture in the first tier of the pan-Asian cultural/creative industries, along with promoting the rapid incorporation of national and local development into the global economic system. Ironically, however, as of August 2006, Korea paid almost twice the amount of royalties to the Hollywood empire as it earned in entertainment dollars from Asian regions. The “Korean wave” thus signifies the Korean culture industry’s ambiguous position vis-à-vis the global Hollywood system.

## **Kurdish International Broadcasting**

*Zozan Akpınar*

*University of Paris II*

Med TV, the first Kurdish satellite TV channel, began its standard broadcasts in May 1995 from its head office in London and its main studios near Brussels. It was created by people close to the Kurdistan Workers Party (PKK), which had been conducting an armed struggle against the Turkish state since 1984. On the one hand, this channel was seen as an instrument in the struggle against Turkish media, which were used in the conflict by

the Turkish army according to “psychological warfare” requirements. On the other hand, it was seen as a means of opposing the homogenization policy of the Turkish nation-state, which banned the use of Kurdish in broadcasting. Europe, where a considerable Kurdish migrant population lived, constituted a human and material resource-base favorable to creating a satellite network in Kurdish (→ International Television).

Faced with cross-border television, the Turkish authorities began to operate a strategy whose first aspect consisted of interrupting broadcasts with the help of technical interventions. On 14 December 1995, Med TV broadcasts were stopped by a jamming transmission to the satellite hosting the signal (→ Satellite Television). The channel’s programs continued to be jammed in the years that followed, in order to prevent their reception.

A second aspect of the state’s strategy relied on diplomatic interventions with western countries to get the channel banned. Thus, in 1996 the Turkish government succeeded step by step in obtaining the cancellation of contracts of Med TV’s satellite broadcasts, thanks to its diplomatic efforts with the French and Polish governments. Between July and August 2006, the channel was forced to interrupt its broadcasts for 45 days until it was able to sign a new transmission contract with a satellite firm.

The countries that hosted Med TV’s head office and studios were further targets of Turkish diplomacy. Following multiple negotiations, on September 18, 1996 the Belgian, German, and British police began Operation “Sputnik” against the channel. Med TV’s head office and studios were searched simultaneously in all three countries. The trial of the TV station’s directors, which began in Belgium on September 19, 2003, seven years after Operation “Sputnik,” ended in an annulment.

The Turkish state’s diplomatic pressures were equally focused on the UK’s Independent Television Commission (ITC), which had authorized the satellite channel broadcasts (→ United Kingdom: Media System). On March 22, 1999, the British body suspended Med TV’s license for three weeks. Finally, on April 23, the ITC announced it was revoking the license for incitement to violence, following the Turkish authorities’ arrest of Abdullah Ocalan, the PKK leader, the previous February. British prime minister Tony Blair’s intervention with the ITC was pivotal to this decision.

From May 1999, Kurdish television continued, however, to transmit for several hours a day on the CTV frequency, a British-based channel. And on July 30, 1999, a new channel, *Medya TV*, saw the light of day from France. In February 2004 the Turkish state succeeded a second time in getting Kurdish television banned by France’s Supreme Broadcasting Council (Conseil Supérieur de l’Audiovisuel). For this body, *Medya TV* was a successor to Med TV and close to the PKK.

Nonetheless on March 1, 2004, *Roj TV* emerged in *Medya TV*’s stead. Although its main studios were near Brussels, its head office was in Copenhagen. The Turkish government immediately switched its pressure to the Danish authorities in order to obtain its closure. The US also intervened with the Danish government on its Turkish ally’s account, requesting the channel should be banned within the framework of anti-terrorism cooperation. Despite this, the Danish government, with the support of European Union leaders, refused this request and allowed transmissions to continue in the name of press and speech freedom (→ Freedom of the Press, Concept of).

*Roj TV* is a general-purpose channel, its programs angled to audiences of all ages. It broadcasts cartoons, documentaries, and news magazines in Kurdish and Turkish, along

with debates in which PKK – now Kongra-Gel – leaders participate by phone. Moreover MMC, a music channel created in 2006, continues to be broadcast from Copenhagen. Some of the videos on this channel are even produced by Kongra-Gel supporters.

Over and above these two channels, Rojhelat TV, Komala TV, and Tishk TV began broadcasting in 2006, together with Newroz TV in 2007. All these originated in Iranian Kurdish political movements. Finally, aside from these Europe-based satellite channels, Kurdistan TV, Kurdsat, and Zagros TV were transmitting from northern Iraq.

# Labor in the Media

*Christopher R. Martin*

*University of Northern Iowa*

When labor is in the news media, it reveals – perhaps more than any other subject – the economic, political, and professional conflicts between the practice of → journalism and the business of media. The problem of the news media’s coverage of organized labor is that the news media are both the social institutions designated to practice democratic communication, and capitalist entities designed to generate profits for their corporate executives and stockholders (→ Commercialization of the Media; Cost and Revenue Structures in the Media). As the literature reveals, all too often the news media fail to act as independent storytellers about labor, and instead align their journalism with the generally anti-labor interests of multinational corporations, which often include the news media themselves and their advertisers (→ Advertising).

But news media organizations that serve their own corporate interest risk undermining their greatest asset: people’s trust. Kovach and Rosenstiel (2001) argue normatively that the first loyalty of journalism is to citizens, not media owners. Because of the significant stakes for corporations, labor, and citizens, news organizations’ coverage of labor has long invited criticism of the media’s credibility and institutional loyalties.

## **CORPORATE MEDIA AND LABOR**

The corporate news media’s posture toward labor unions is often evident in their own labor practices. For example, in the US many of the most highly regarded multinational news media corporations – including the → News Corporation, → Time Warner Inc., → Disney, Gannett, the Tribune Company, the Washington Post Company, and the New York Times Company – have a long record of anti-labor activities, including efforts to break their labor unions and prevent new ones from forming (Martin 2004). Moreover, media workers are increasingly treated like disposable entities, subject to the same kinds of outsourcing and instabilities as other workers in the global economy (→ Labor Unions in the Media).

In the logic of capitalism, it follows that news businesses would not report – or would avoid reporting favorably – on issues such as labor that might damage their bottom line. Not only do the mass media work to help themselves in this manner, but they also serve to express and reinforce the dominant cultural, political, and economic system (Miliband

1969; → Political Economy of the Media). Thus, the pro-capitalist function of the mass media necessarily involves anti-labor sentiment because organized labor infringes on the decision-making power of capital and may inhibit capital's profit margins. Herman and Chomsky (1988) see the mass media as a system of → propaganda, but one that is disguised by a free market configuration of private ownership (→ Ownership in the Media) and periodic exposure of corporate and government malfeasance in the name of free speech and citizen interest. Of course, labor is sometimes covered, even in favorable terms, by the news media. The capitalist mass media require some level of credibility to draw their audience, gain the professional commitment of journalists, and maintain public support for a free press (Curran 1991).

### **NEWS MEDIA AND LABOR BIAS**

Some studies argue that the news media are biased against business, although none conversely concludes that the news media are biased in favor of labor. More common are complaints in the US from the political right that the news media represent the views of a liberal elite (→ Bias in the News). In the view of Lichter et al. (1986), an elite, liberal, east-coast media strongly influences the general tone of America's national news coverage. This elite group is generally in favor of liberal social positions, which are out of step with business leaders' opinions. The authors therefore conclude the media are biased against business. But the authors' conclusion of an anti-business bias is problematic, particularly in the case of labor, because they also find that the media elite are broadly in favor of policies and ideas that support the US capitalist system. Large majorities of the elite news workers responded that they believed "people with more ability should earn more," "private enterprise is fair to workers," and "less regulation of business is good for the U.S." (Lichter et al. 1986, 29). Thus, the elite media workers' liberalism does not seem to extend to the concerns of labor.

The news watchdog organization Fairness and Accuracy in Reporting (FAIR) came to a similar conclusion in 1998 when it found that on a wide variety of economic issues – including the expansion of NAFTA, taxing the wealthy, concern over corporate concentration of power, and government-guaranteed medical care – the press was to the right of the public's views (Croteau 1998). Media critic Eric Alterman's (2003) extensive study of bias in the news also found a clear slant against labor coverage, even on America's presumably left-leaning, nonprofit, government-supported National Public Radio (→ Public Broadcasting Systems), which offers a number of programs and features focusing on business and finance.

### **MEDIA REPRESENTATIONS**

A large area of emphasis in the study of labor in the media is representation. Observers of the US labor movement have been critical of news media coverage of strikes and labor activities for more than a century.

Anti-labor sentiment in the US press can be traced back at least as far as the 1870s, when English-language dailies in Chicago were generally hostile to picketing, strikes, and class-based movements (Bekken 1993). Accurate reports on labor and strikes were difficult to find; most press reports from this era marked unionists as violent radicals, regardless of any factual evidence. Most notably, Chicago's English-language daily newspapers

hailed the execution of the alleged Haymarket conspirators, four working-class radicals who were convicted on questionable evidence of bombing a Haymarket Square rally in 1886.

In his 1920 book *The brass check*, Progressive Era → muckraking journalist Upton Sinclair identified several decades of dishonest newspaper stories designed to discredit labor unionists and paint them as anarchists and terrorists. Sinclair reserved particular ire for the Associated Press (AP) wire service, which was a dominant force in the US press (and is now the largest news organization in the world). He observed that if strikers are violent, “Capitalist Journalism” puts the story on the wire services, and if they are not violent, the strike gets no wire coverage.

Stereotypical portrayals of striking laborers as violent thugs still persist, but as labor battles have become more legalistic, the language of media representation has adapted (→ Stereotyping and the Media). For example, three major studies by the Glasgow University Media Group (1976, 1980, 1982) on British television’s coverage of industrial news demonstrated poor coverage of labor issues. The Media Group found that events reflecting negatively on management, such as industrial accidents, were consistently underreported, whereas labor’s reasons for striking were reported irregularly or not at all. The British studies also showed that the credibility of labor’s position was always in question, compared to management, in the news discourse of industrial conflicts (→ News as Discourse). The news characterized management’s statements positively as *offers*, and conversely portrayed labor’s statements negatively as *demands*. Parenti (1986) catalogued similar representations of labor in the media. Puette (1992) also found negative representations of labor in the news media, as well as in films (→ Cinema), entertainment → television, and newspaper → cartoons (→ Popular Communication and Social Class).

More recent research has focused on the ways in which news organizations seek to *maintain credibility* while working within the political and economic confines of the corporate mass media (→ Objectivity in Reporting; Journalists, Credibility of; Credibility of Content). First, journalists can avoid appearing biased in favor of labor or management positions by framing reports on labor relations from a consumer perspective (→ Framing of the News). For example, stories about transit strikes typically focus on the problems of the people who are stranded, and dismiss labor–management concerns as secondary to the quick resumption of service to customers. This consumer point of view on labor stories functions as an “objective” position in that it appears to be dispassionate about labor and management positions, but it ultimately has the effect of helping capital, as it submerges issues of citizenship, political activity, and class relations and elevates issues of consumption and a mythology of class-free social relations (Martin 2004).

Second, news organizations can minimize labor news by simply excluding the labor beat from reporter assignments. Because *beat assignments* help the news-gathering bureaucracy define what becomes news, not staffing certain beats diminishes regular coverage of that topic. For example, in the United States and Canada, national commercial broadcast and cable news networks have no regular labor beats. In the print media, the labor beat has almost disappeared in recent decades as editors have cut labor reporting while increasing business coverage. Labor reporters, who generally cover unions and worker associations, the labor movement, and issues like job equity and discrimination, have been replaced in the US and Canada by workplace reporters and columnists, whose assignment focuses more on lifestyle issues – such as getting along with bosses, telecommuting, or the ethics of workplace romances.

The decline in the labor beat is connected to newspapers' general shift away from working-class news readers to a more affluent readership since the 1980s. This is a shift that moves journalism away from its loyalty to all citizens in order to appeal to a select group of consumers and increase advertiser interest and news organization profits (Martin in press). Directing journalism to "upscale" consumer audiences (to the detriment of labor) is evident around the globe. For example, European-based Metro International, the distributor of the free *Metro* commuter newspaper in major cities around the world, which has become the world's largest global newspaper, targets affluent young adults.

### THE LABOR NEWS MEDIA

Given the shortcomings of labor coverage in the mainstream media, it is no surprise that labor activists have often taken the matter into their own hands by publishing labor-oriented newspapers.

At the beginning of the twentieth century, the US labor movement circulated hundreds of local, regional, and national labor newspapers, in dozens of languages (Bekken 1993). Partisan publications with pro-union messages were as popular as commercial newspapers. For example, *Appeal to Reason*, a socialist newspaper, was the largest-circulation weekly in the US, reaching a peak circulation of more than 760,000 copies by 1913. During the Great Depression, the *Daily Worker*, the Communist Party newspaper, had a circulation of 100,000 (Pizzigati & Solowey 1992). The high circulation of these weeklies (significant even by today's standards) was difficult to sustain, especially with government-led anti-radical campaigns that included banning certain publications from the mail, destruction of presses, and deportation of editors. By the end of the twentieth century, local, independent working-class newspapers in the US had mostly faded away. The remaining union-sponsored publications typically have limited readership, and have most often served as undemocratic mouthpieces for union leaders. The International Labor Communications Association has called for the opening up of labor publications to dissent, and the International Association of Machinists has proposed a labor satellite/cable television channel.

Outside of unions, closer to the mainstream, but still on the margins, reside independent labor monthlies in the US like *Labor Notes*, websites like Workday Minnesota, public affairs magazines of the left (including the *Nation*, the *Progressive*, *In These Times*, and *Z Magazine*), radio news programs like *Democracy Now*, the syndicated radio service Workers Independent News, and satellite/cable channels like Free Speech TV and Link TV. London-based LabourStart.org offers the broadest global labor news on the Internet. These news organizations – not beholden to the commercial constraints of the corporate news media – provide the most consistent and accurate coverage of the labor movement.

To date, most of the focus of research on labor in the media has been on the US, UK, and Canada. There is a great deal of research to be done on labor in the media outside of these countries, especially as the labor movement grows around the globe.

## **Labor Unions in the Media**

*Catherine McKercher*

*Carleton University*

Labor unions have been a feature on the world's media landscape for close to two centuries. Depending on the era and the locale, they have certified the skills of content providers and production workers, bargained collectively for wages and benefits, trained and disciplined members of the craft, and fought with employers and the state over freedom of expression, workplace health and safety, protection of intellectual property,

and access to information. In general, they have attracted relatively little scholarly attention. Nonetheless, they have had a significant impact on media institutions and on the societies in which they operate.

Calculating the number of unionized media workers around the world is virtually impossible. In part, that is because the definition of what constitutes the media continues to evolve. Meanwhile, many unions have transformed themselves into sector-wide communications unions that include but are not limited to media workers. Finally, statistical agencies define and tally media work in different ways. Globally, an International Labour Organization (ILO) survey of 92 countries estimated that union density – the proportion of workers who were organized into trade unions – stood at just under 20 percent, though this varied widely from country to country (International Labour Organization 1997). In the media, union density also varies tremendously. In many areas of Europe and North America, it is higher than among other private-sector industrial workers. It also tends to be higher at national public broadcasters than at private broadcasting networks and stations. The International Federation of Journalists (IFJ), a confederation of national journalists' unions and professional associations in more than 100 countries, estimated that 1.5 million people were working as journalists in 2006. IFJ members accounted for 500,000 of them. The bulk of IFJ membership was in Europe, where the union represented more than 230,000 members.

Unionized media labor includes technical and production workers as well as journalists, performers, and other content providers. The activities of media unions have an impact well beyond their immediate membership. Wages and working conditions negotiated in unionized newspapers, for example, tend to set the pattern for nonunion shops. Similarly, the Screen Actors Guild (SAG) requires producers working outside the United States to be signatories to its contracts if they wish to use SAG members – a policy that has ripple effects among performers' unions in those countries. National media workers' unions are active members of national labor federations and many are active in international federations as well, including the International Federation of Musicians, the International Federation of Actors, the IFJ, and the Union Network International (UNI). The varied activities of media unions ensure that their influence in the workplace and in the policy realm is often far greater than union density would suggest.

## **DEVELOPMENT OF MEDIA UNIONS**

Trade unionism in the media originated with printers' organizations, which began to appear in Europe and North America in the eighteenth century. *Printers* were the earliest knowledge workers, manufacturing ideas and debate rather than simply material goods. They were highly skilled and literate at a time when most workers were not. Printers' unions, originally conceived as mutual support organizations, transformed themselves over the late-eighteenth and early-nineteenth centuries into locally based unions, and then into national unions. For much of the nineteenth century, these were the only national media workers' unions in most countries. That changed with the massive expansion of the periodical press in the second half of the nineteenth century. New unions formed, often by way of separation from the original printers' unions, to represent the various crafts in publishing (bookbinders, press operators, stereotypers, and so on).

By the middle of the twentieth century, as many as eight or nine unions might represent various groups of production workers in the same newspaper. In general, the printers' unions were the strongest (→ Printing, History of; Printer-Editors).

Some attempts to organize newspaper reporters occurred in the nineteenth century, but in most areas stable journalists' unions were a feature of the twentieth century. Britain's National Union of Journalists (NUJ) was founded in 1907, for example, while the American Newspaper Guild appeared in the 1930s. The *International Federation of Journalists* was founded in 1926 and relaunched in 1952 with a mandate of promoting press freedom, professional development, and recognition of trade unionism.

The combination of professionalism (→ Professionalization of Journalism) and trade unionism has been a feature of journalists' unions in many countries, where the unions fulfill a professional certification function by issuing national press cards, setting industry-wide codes of ethics, and contributing actively to the education of journalists (→ Ethics in Journalism). Freelances account for about one-quarter of the members of European journalists' unions and about one-half of those in Central and South America. In North America, by contrast, the unions operate mainly as collective bargaining agents for permanent employees. In authoritarian countries, journalists' unions have also served as a means to control the dissemination of information, and the journalists themselves (→ Censorship; Censorship, History of). Nonetheless, almost all journalists' unions, historically and in the present time, see part of their mandate as devoting attention to professional issues like freedom of expression, copyright, and training.

Unions representing *film and broadcast* workers developed in parallel with those technologies and industries, appearing in the 1920s, 1930s, and beyond. These included unions of technicians as well as unions representing performers and broadcast journalists (→ Broadcast Journalism). Broadcast unions often developed separately from print journalists' unions. In the United States, broadcast journalists were organized as part of a broader union of radio performers. Film performers, meanwhile, organized their own union. In many countries, including Canada, the United Kingdom, and Australia, union amalgamations or consolidations have resulted in unions representing both print and broadcast journalists.

In the 1960s, *digital technology* began to erode traditional union jurisdictions in all areas of the media. Very soon, it was apparent that technology would hollow out the production process, leading to significant job reductions among technical and production workers and threatening the existence of several unions. The unions responded in a number of ways, including confrontations with employers and other unions over jurisdiction, mergers with other trade unions, and attempts to trade lifetime job guarantees for going along with employers' plans for technological change. Lengthy newspaper strikes over new technology occurred in a number of countries in the 1960s, 1970s, and 1980s. Perhaps the definitive industrial dispute of the era began in 1986 when Rupert Murdoch (→ News Corporation) secretly moved his London newspaper business to a fortress-like plant in Wapping, precipitating a long, bitter, and ultimately unsuccessful printers' strike. The development of smaller, lighter video cameras and nonlinear editing systems led to similar reductions among broadcast production workers. Because broadcast technicians' unions were not, in general, as entrenched as printers' unions, technological change in broadcasting tended to result in fewer high-profile strikes than in newspapers (→ Commercialization of the Media).

*Concentration of media ownership*, an increasingly significant feature of media systems in many parts of the world, further challenged media unions in the 1990s (→ Concentration in Media Systems). Many corporations began pursuing strategies of convergence, using digital technology to integrate their various media holdings. Some unions responded with their own strategy of convergence, forming larger and broader unions that represent a range of communication workers. The 700,000-member Communications Workers of America is perhaps the foremost model of this kind of union. It began as a telephone workers' union but now includes newspaper editorial and production workers, broadcast journalists and technicians, telephone and telecommunications workers, and workers in the difficult-to-organize high-tech industries. In part, this reconfiguration is a defensive move, but it also represents an attempt by media workers' unions to take advantage of synergies brought about by growing convergence in their work. Because they represent workers who are increasingly involved in producing for a converging electronic information services or knowledge arena, these unions see improved opportunities for organizing and for bargaining. The ILO noted in 2004 that mergers among unions at the national level were common in the media, cultural, and graphics sector.

### ISSUES AND TRENDS

Structural changes in the media that gained momentum in the last quarter of the twentieth century continue to challenge unions in the twenty-first century. These include concentration of media ownership, which has an impact not just within national borders but also beyond them. Employers have accelerated the pace of shifting work from higher-paid areas to lower-cost locales, through a practice known as outsourcing. At the same time, many media employers have sought to replace permanent employees in their core holdings with a contingent workforce of freelance or contract workers, and to create a nonunion workforce in their new media holdings.

The unions have responded with a range of activities designed to maintain or perhaps even increase labor power. These include *inter-union cooperation*, the creation of new federations of unions, and attempts to extend organizing to new locales and to new types of workers. The Hollywood-based entertainment unions, for example, have worked in coalition to combat the phenomenon they call "runaway production," or filming stories intended for a domestic audience in lower-cost international locales. Much of their activity has focused on lobbying US federal and state governments for film subsidies. Significantly, however, they worked with film unions within those "runaway" locales to improve wages and working conditions.

While informal coalitions are common, there have been developments at the international and national federation level as well. In 2006, the *Union Network International* – created in 2000 by a merger among the Media and Entertainment International, the International Graphical Federation, the Communications International, and the white-collar and services federation FIET – represented 15.5 million members in 900 unions from more than 140 countries. Five of its twelve sectors covered workers in the converging media, communications, and information businesses, which together are becoming increasingly significant in the global economy. In 2005 North America's leading labor federation, the AFL-CIO, set up an industry coordinating committee covering 10 unions in the arts,

entertainment, media, and telecommunications. The committee's goal is to build more power for workers in these industries in the face of rapid media consolidation and massive technological shifts.

Media unions continue to work to assert their jurisdiction over the array of new media products and services that are characteristic of an information economy. They are also stepping up efforts to organize new groups of workers in the information industries. The twenty-first century has also seen a rise in social movement unionism among the knowledge worker occupations, particularly through the formation of worker associations. The Washington Alliance of Technology Workers (WashTech), originally created to organize temporary workers at Microsoft, has emerged as the leading voice in the US opposing outsourcing of information technology jobs to the developing world. Meanwhile, a French film workers strike in 2003 helped launch a movement that drew attention to issues surrounding intermittent or precarious labor not just in the media but in other sectors of the economy too.

Labor convergence and the rise of worker movements can be seen as encouraging developments for media unions. Nonetheless, these are perilous times for the unions as the very definition of media work comes increasingly into question. For example, the rise of so-called → citizen journalism has forced journalists' unions to ask questions about what journalism is, and what the unions' role should be in certifying credentials or negotiating pay rates. Production and content workers' unions, meanwhile, struggle with an ever-expanding array of digital products. At the same time, they continue to grapple with important traditional questions, such as how to promote freedom of expression, safety in the workplace (including, for journalists, in war zones), and independent trade unions.

# Language Acquisition in Childhood

*Kathryn Hirsh-Pasek*

*Temple University*

*Roberta Michnick Golinkoff*

*University of Delaware*

Language learning starts before babies utter their first words. Even in the womb, they jump in response to noises, such as fireworks and loud bands; they eavesdrop on their mother's conversations. Within just hours of birth, newborns recognize their mother's voice, along with stories and songs they've heard in the womb. They can even distinguish their native language from a foreign one (for example, French versus Russian). They enter our world prepared to learn any of the 7,000 languages spoken and signed around the globe.

Though language begins as a flowing melody of sounds and sights (for signers), babies quickly learn to find meaningful patterns in the speech they hear. Where does one word end and the next begin? How do building blocks like words come together to form sentences? Research suggests that by 4.5 months of age, they're on the way to finding words in the stream of speech that washes over them. They start by recognizing their own name ("IRVing" is different from "AnnETTE"); in very little time, they distinguish their name (e.g., "IRVing") from other names with the same stress pattern ("WILson"). Their names and other frequently occurring words – like "mama" – serve as anchors into the speech stream (Bortfeld et al. 2005).

Babies also *compute statistics on the sound stream* to find the words. In one classic study, 8-month-old babies heard a string of nonsense sounds ("bidogolabidomanelamebido") for just 2 minutes; surprisingly, they learned that the combination of sounds "bido" occurred together and more frequently than "gola". As tiny statisticians, they use these skills to find the sounds that together make up words (Saffran et al. 1996). Babies also use their keen detective abilities to find the beginnings and ends of sentences. For example, the word "book" is pronounced differently in the following two sentences: "He took the book off the shelf" and "Off the shelf, he took a book". Babies of just 4.5 months know that the vowel gets stretched in a word when it occurs at the end of the sentence (Jusczyk et al. 1992).

However, *attention to sounds* takes babies only so far. They next need to figure out what the sounds mean. By six months, infants attach the word "mama" to their own mother and not to just any woman. As their internal vocabularies expand, learning what words mean can be complicated. A classic example is what might happen if we were in a foreign country and saw a rabbit hop by. A native might say "gavagai" and we must determine what that means. "Rabbit" seems the obvious guess, but it might not be right. Among other possible candidates, "gavagai" could refer to "hopping" or "ears." Despite the daunting nature of this task, by 12 months of age, babies seem to interpret words as labels for whole objects (like rabbits) as opposed to parts (like ears) or actions (like hopping). And once they learn a cadre of object words, they then turn their attention to words for actions (verbs) and properties of objects (adjectives). Most babies say their first words

around 12 months. By 18 months, many have a vocabulary of 50 or more words in their repertoire and understand twice that number.

*Learning words* is a stunning achievement that starts out slowly and gains pace between 18 and 21 months when children seem to become what Pinker (1994) called “vacuum cleaners for words.” It is at this time that they also take the first step that marks true language acquisition: they begin to put words together to make sentences. They know more about their language than what they can say – just as you could understand more in a foreign language than you could speak. So while their first spoken words appear at around 12 months of age, they may already understand hundreds of words.

By 18 months, toddlers can understand five- and six-word sentences when they may be saying only one or two words at a time themselves. One example of their grammatical abilities comes from a study looking at whether toddlers pay attention to the order of words. English is very sensitive to order as a clue to meaning. History would be quite different if “Caesar killed Brutus” rather than “Brutus killed Caesar.” Picture an oversized TV screen, split between two moving images. The left image shows the Cookie Monster hugging Big Bird, the right image Big Bird hugging Cookie Monster. Babies watch the screen with rapt attention. When they hear “Where’s Big Bird hugging Cookie Monster?” they look more at the right side of the screen than at the left. This indicates that toddlers are *sensitive to grammar*. They use the order of the words in English to figure out who is doing what to whom.

Language learning progresses as children learn the rules of grammar, the ways in which words can be reassembled to make questions from statements (“You can go” versus “Can you go?”) and the ways in which markers are added to contradict a statement (“You can NOT go”). These facts about sentences take time to learn. Another example is learning to use *wh-words* in the English language. The word “what” requires a response about an object (Question: “What did you eat last night?” Answer: “Steak”), but words like “why” and “how” require entire explanations (Question: “Why did you eat a steak?” Answer: “I could have eaten a bear”). And *wh-words* can only appear in certain places within sentences. Children don’t use and understand these words until well into the third year of life.

Babies are sponges when it comes to learning languages. There is much more going on than what we see. And remarkably, they are as good at learning two or more languages as they are at learning one. Before they can tie their shoelaces or be left alone, children are solving one of the most complex tasks in human nature, acquiring an ability that distinguishes us from all other species on the planet: they are learning language.

## Language Attitudes in Intergroup Contexts

Aaron Castelan Cargile

California State University, Long Beach

Although there is no consensus as to what *precisely* an → attitude is, language attitudes may be defined as embodied dispositions toward various and wide-ranging language behaviors (e.g., intensity, politeness, rate, accent, dialect; → Language Varieties). Correspondingly, language attitude research represents a broad-scale, multidisciplinary effort to assess diverse reactions to language behaviors (Cargile & Bradac 2001). Within intergroup contexts, language attitudes often represent the indirect expression of prevailing intergroup attitudes and relational norms. Thus, both a response in Catalan to a query made in Spanish and the characterization of mainstream US English speakers as “intelligent” by African-American respondents epitomize the terrain of language attitudes in intergroup contexts.

Language is a human capacity that evolved to aid in the reduction of uncertainty (→ Linguistics). This *informational function* of language is critical and yet complemented by an equally important *communal function* – language plays a central role in both creating and maintaining community. A common language binds people together often more effectively than other markers of group identity (e.g., skin color, dress, artifacts, etc.) because language behaviors are attributed “internally” (as conscious decisions about how to self-project) rather than “externally” (as historical accident). For example, that is why, despite his Croatian ancestry, Spanish-speaking Joseph Morgan was allowed to reign as godfather of the Mexican mafia in Los Angeles.

At the same time that language helps draw pro-social group boundaries, it also erects barriers. Linguistic *shibboleths* help separate the ingroup from the outgroup, friend from foe. When the Soviet empire crumbled along nationalistic fissures marked by language, the central press reported that a young Russian was murdered in Kizil after failing to reply in Tuvian to the question, “Do you have a smoke?” Language can be used to gatekeep not only individuals, but also entire groups. Language policies (e.g., *NBC handbook of pronunciation*) can be set to exclude nondominant “others” from political or economic access in a practice termed *elite closure*. Because language is a malleable dividing line, outgroup members may find the high-prestige language or dialect an ever-shifting target to pursue (Chambers et al. 2002).

Since language is central to (inter)group life, attitudes toward its use typically function as a heuristic summary of intergroup relations. If two groups are antagonistic competitors,

the chances are that members will not be favorably disposed to the others' way of talking (e.g., Israelis and Palestinians). Conversely, if two groups share favorable relations (e.g., Australians and British), or if one group's subjugation is obscured by a dominant ideology (e.g., Mexican-Americans in the US; → Cultural Imperialism Theories), then ingroup members may be inclined to favor outgroup language behaviors, at least in certain circumstances (Preston 1989). Although the actual macro-context is complex and multifaceted (not to mention complicated by factors in the immediate social situation, e.g., the hearer's emotional state or formality), the study of intergroup language attitudes has normally relied on two relevant, interrelated socio-structural dimensions: standardization and ethnolinguistic vitality (Giles & Coupland 1991).

*Standardization* is a relatively static dimension, and it describes the extent to which norms for correct usage have been codified, adopted, and promoted for a particular language variety. *Ethnolinguistic vitality* is more dynamic, and reflects the range and importance of functions served by a given language variety and the social pressures toward shifts in language use. Although both dimensions are conceivably "objective," language attitudes are affected by the interlocutor's "subjective" or perceived assessment of such factors. Generally, the more standardized and vital a language variety is perceived to be, the more likely it is that speakers of that language will be judged favorably on traits related to competence, intelligence, and social status. Conversely, the less standardized and vital the language, the less likely these same judgments will follow. It is important to note, however, that speakers of such a subordinate language variety may be judged favorably on traits related to kindness, solidarity, and overall attractiveness if the dominant group's ideology includes the *tokenism* of nondominant groups. *Ethnolinguistic identity theory* explains how individuals respond to and negotiate this terrain of judgment depending on their group membership and perception of the macro-context.

If language attitudes represent a predisposition informed by the history and character of intergroup relations, what do they predispose us to? With its modern inception in the 1960s, language attitude research, like most intergroup research and theory, has been motivated by practical problems (e.g., strained relations between French and English Canadians). Consequently, using a variety of research techniques (→ Field Research; Experiment, Laboratory), studies have explored outcomes of judgment and a host of other pragmatic behaviors associated with these predispositions. Such behaviors include communication convergence/divergence, cooperative assistance, language policy planning, employment and housing decisions, and modes of classroom instruction. For example, De la Zerda and Hopper (1979) found employment interviewers in Texas less likely to hire Mexican-American applicants with nonstandard (Chicano English) accents as supervisors, but more likely to hire them as unskilled workers compared to applicants who spoke standard US English. Of course, the relationship between our language attitudes and our behaviors is never quite so simple or direct (→ Attitude–Behavior Consistency). Even so, the study of these predispositions reminds us that *how* we say something is equally if not sometimes more important than *what* we say.

## **Language and the Internet**

*Susan C. Herring*

*Indiana University*

Language and (or “on”) the → Internet refers to human language (or language intended to be human-like, such as the linguistic output of artificial intelligence agents) produced and displayed through computer-mediated communication (CMC) systems that are mostly text based and mostly reciprocally interactive, such as email, listserv lists, newsgroups, chat, instant messaging, text messaging via mobile phones (SMS), blogs, and wikis. The term “Internet language” is somewhat of a misnomer, in that some of this communication takes place on intranets and some is mediated by mobile technologies, rather than by the global networked infrastructure known as the Internet per se (→ Internet, Technology of). “Internet” is used here in an extended sense to include these related communication technologies. Variant terms for Internet language include computer-mediated language, computer-mediated discourse, online discourse, and electronic discourse (→ Technologically Mediated Discourse). All of these are intended to distinguish language- and discourse-related phenomena as a focus of interest from the broader phenomenon of computer-mediated communication, of which they form a part.

### **INTELLECTUAL AND SOCIAL CONTEXT**

Language in the form of typed text is one of the most pervasive and visible manifestations of Internet use. Internet language has attracted the interest of scholars, educators, and the general public, and has been at the center of controversies in each domain. Linguists have argued about how it should be classified; ethnographers and ethnomethodologists have grappled with how to apply the methods of their disciplines to it (→ Ethnography of Communication); and sociologists and communication scholars have debated the status

of linguistically performed online identities (→ Identities and Discourse) and of virtual communities whose group identity is constructed and maintained through online discourse (→ Virtual Communities). Educators and language purists have expressed concern about the nonstandard, informal nature of the language found in chat rooms and text messaging, and have wondered whether and how to teach the new mediated language varieties. And despite warnings in the mass media about deception in online dating sites (→ Deceptive Message Production) and the risks of revealing too much information about oneself in other online social contexts, people frequent such sites in large numbers, managing their self-presentation through language and images.

The concerns of scholars are mainly descriptive – they seek to describe, classify, and interpret language online as it is actually used – while those of educators, language purists, and the mass media are largely prescriptive – they seek to provide direction for how online language should (or should not) be used. As with traditional written and spoken language, tensions arise between these two approaches, especially as concerns the Internet and language change. From a *prescriptivist perspective*, the nonstandardness of much Internet language and its alleged effects on nonmediated language indicate a dangerous trend toward a decline in the overall quality of the language (which is usually English in these debates, although prescriptive concerns have also been raised about other languages, especially Greek). There is a tendency to attribute this trend to the medium itself, consistent with a belief in technological determinism (Baron 2000). *Descriptivists*, in contrast, are interested in documenting trends and understanding the factors that influence them, whether those factors are technical, social, or a combination of both, and they do not assume that nonstandard language is degenerate. On the contrary, they often characterize such language as playful, creative, and performing useful social functions (Cherny 1999).

Moreover, linguists, in particular, are cautious about assuming that variation in online language will necessarily lead to *long-term language change*. They distinguish between practices primarily restricted to online environments – including acronyms such as “ttyp (talk to you later) and “l33t speak” (from “leet,” a shortening of “elite”), which employs letters, numbers, and non-alphanumeric keyboard characters to represent words – and practices that have extended to offline language. In the latter case, they distinguish further between relatively superficial lexical changes – a shift in meaning of words such as “spam” and “lurk”; the addition of new vocabulary such as “email” and “emoticon”; new word formative elements such as the prefixes “e-” and “cyber-” – and deeper, syntactic change, of which there is little evidence as yet (Stein 2006).

## MAJOR AREAS OF RESEARCH

In addition to, and cross cutting, the issues identified above, research on language on the Internet may be grouped into the five major areas discussed below.

*Classification research* aims to characterize and label computer-mediated language. Much early research focused on the relationship of computer-mediated language to the modalities of speech and writing. Like the latter, it is produced and read as text, but like the former, Internet language tends to be informal and context-dependent, especially in

synchronous modes, and message exchanges can feel like conversation, leading some scholars to characterize Internet language as “written speech.” Others consider it to be a distinct, third modality (“Netspeak”, see below). Another level of classification differentiates among modes or genres of computer-mediated discourse, such as Instant Messaging, web boards, and blogs, noting that different language practices are characteristic of each (→ Genre). A more fine-grained approach classifies computer-mediated discourse samples according to a set of features, such as synchronicity, participant structure, and topic, that cut across modes (Herring 2007).

Historically and continuing to the present time, the most popular area of language and Internet research has been the *structural features* of Internet language, especially typography, orthography, and neologisms (new word formations). Crystal (2001) has popularized the term “Netspeak” to refer to the use of abbreviations, emoticons (combinations of keyboard symbols that represent, for example, a smiling face), and playful typography that is claimed to characterize Internet language as a unique language variety. Most structural analyses of Internet language catalogue lists of features or speculate about the reasons for their existence; as Androutsopoulos (2006) notes, there has been little systematic study as yet of language variation involving such features.

Internet language also manifests a rich variety of *discourse patterns* (Herring 2001). These include pragmatic phenomena such as politeness (and rudeness, including “flaming”; → Verbal Aggressiveness), violations of relevance, and the performance of various speech acts (→ Linguistic Pragmatics); interactional phenomena such as turn-taking, repairs, topic establishment, maintenance, and drift (→ Conversation Analysis); and register phenomena such as gender styles, regional dialects, and ingroup language practices characteristic of particular online communities (→ Language Varieties). These phenomena necessitate the analysis of language in context.

Internet language has also proven to be a useful *lens through which to study human behavior* more generally. Most online activity, whether information exchange, political debate, online learning, making friends, or flirting, is instantiated through typed text (→ Personal Communication by CMC). The discourse of each of these activities has characteristic properties and can be mined for patterns (→ Discourse). Internet language in this sense has attracted the interest of non-language scholars whose goals are not to describe language for its own sake but rather to use it to gain a purchase on otherwise elusive but theoretically rich concepts such as collaboration, community, democracy, identity, influence, performance, power, reputation, and trust (Herring 2004).

Finally, *languages and language ecologies* have increasingly attracted attention as the Internet expands its global scope. The Internet has been claimed to accelerate the ongoing spread of English and perhaps other large regional languages such as Chinese and Spanish, although commentators disagree as to whether this is at the expense of smaller languages. While the numerical domination of English-language users has decreased considerably over the past decade, the use of English as a *lingua franca* appears to be growing as speakers of different languages come into contact via the Internet and use English as a common language. At the same time, differences across languages and cultural contexts are increasingly being documented, ranging from structural features such as emoticons

and script-conditioned typography to gender patterns in online interaction (→ Gender and Discourse; Danet & Herring 2007).

## **CHANGES OVER TIME IN INTERNET LANGUAGE AND ITS TREATMENT**

The order of presentation of the five areas above corresponds approximately to the order in which each emerged as a strand of language and Internet research, since the time of the first studies in the mid-1980s, although all of these areas continue to attract attention. A general trend can be noted, from a fascination with the technologically conditioned features of Internet language in the early years, to a growing awareness that social and contextual factors shape online language use, much as they do offline language, and that culture and geographical setting may condition more variation than originally envisioned (Georgakopoulou 2003).

Simultaneously, from the two basic modes of email (asynchronous) and chat (synchronous) that were popular in the early 1990s (→ Electronic Mail), the types and capabilities of CMC systems that support linguistic communication have expanded to include web-based modes such as blogs, wikis, and social network sites; semi-synchronous modes such as instant messaging; graphical modes such as avatar-based virtual worlds; and Internet telephony (Voice over IP). Inevitably, Internet language research lags somewhat behind these developments. Audio communication, in particular, has been little researched to date.

## **METHODOLOGICAL ISSUES AND CHALLENGES ASSOCIATED WITH LANGUAGE AND THE INTERNET**

Internet language offers a number of advantages for research, including an abundance of naturally occurring (i.e., non-experimental) data that, unlike speech, does not require transcription and that can be readily analyzed using computational means (→ Log-File Analysis). The ability of researchers to “lurk” in online environments without their presence being visible or salient to participants is another advantage, especially for studies of social interaction, albeit one that raises ethical issues (→ Research Ethics: Internet Research).

From the *linguist's point of view*, text-based Internet language is lacking in sound, and therefore questions of phonetics and phonology, which are central to linguistics, can not be addressed directly (→ Linguistics). Variationist sociolinguists are challenged to apply their methods, because it is often difficult or impossible to ascertain the demographics of text producers, which typically constitute the independent variables in studies of linguistic variation. Researchers interested in online multilingualism (→ Bi- and Multilingualism) or in describing online discourse in other languages may encounter the confounding effect of English influence on those languages, especially as regards borrowed vocabulary and popular abbreviations.

An ongoing challenge associated with language and the Internet is the rate at which new technologies continue to be introduced. Since the affordances of media can affect language use through those media, it is necessary to consider each new CMC mode first on its own terms, a situation that has distracted attention somewhat from the development of theory about online language. At the same time, the ready availability of new modes provides a rich opportunity to study the emergence of language practices,

norms, and social behaviors as expressed through discourse, and to theorize about emergent language phenomena.

### **FUTURE DIRECTIONS IN RESEARCH, THEORY, AND METHODOLOGY**

There is a need to move beyond description to theorize CMC effects on language. Theories should also be tested empirically on large corpora of contextually classified (i.e., tagged) computer-mediated language samples that can be compared systematically across modes, contexts, and languages. Related to this is a need for Internet language preservation efforts, particularly in the case of synchronous data that are not automatically logged, and for longitudinal studies to investigate mediated language change. It is likely that computer-mediated language will be perceived as just plain language by future generations who have grown up with it; it will thus need to be studied to address broader questions of language change.

Future language research will almost certainly devote increased attention to spoken and visually enhanced modes of networked and mobile communication. At the same time, the ascendancy of multimedia CMC over text-based CMC has been predicted for nearly a decade, yet text remains the most popular format. Whatever else the future holds, it seems certain that people will continue to use new media to communicate and that they will do so using human languages, and thus that the study of language and digital media will be relevant for years to come.

## Language and Social Interaction

Karen Tracy

*University of Colorado at Boulder*

Language and social interaction (*LSI*) refers to the area of communication research that studies how language, gesture, voice, and other features of talk and written texts shape meaning-making. LSI includes a loosely bounded set of topics and intellectual commitments. In contrast to the domain-of-life approach (e.g., political, interpersonal, or organizational communication) that is the typical way of categorizing scholarly expertise areas in communication, LSI defines itself by *how* it investigates questions about communication. It is the commitment to qualitative study of social life in its culturally inflected, complex, and context-sensitive particularity that makes LSI work so distinctive and recognizable. To be sure, LSI has a space for other research approaches (e.g., laboratory studies, quantitative coding; → Experimental Design; Content Analysis, Quantitative), but these approaches are minority voices in the LSI community.

In the International Communication Association, one of the major academic organizations in communication, LSI is one of a small set of divisions responsible for selecting the papers, panels, and workshops that will be programmed at annual conferences. On a practical level, then, LSI is a group of people who form an institutionally recognizable academic community. Most LSI scholars are housed in departments of communication, but a goodly number come from sociology, psychology, anthropology, and linguistics, as well as a smattering of other fields. This multidisciplinary character of LSI is reflected in its scholarship, with particular LSI sub-areas making ties with one or another of these contributing disciplines. As is true with any institutional category, the LSI community shapes decisions about appropriate content for college courses in its area; how university-level faculty positions should be defined and who should be hired into them; and what research should be published in journals and books.

To understand LSI as an area of communication research, including both its dominant and its minority voices, its scholarly work needs to be considered proceeding from both bottom-up and top-down directions. Reviews and handbooks of LSI research (e.g., Fitch & Sanders 2005), of which there are many, usually adopt a top-down approach, dividing LSI into its major theoretical–methodological camps. A top-down view of LSI, provided in the next section, draws attention to key theoretical concepts, intellectual commitments, and important scholars. The distinctive character of LSI work, however, would be obscured if explication were restricted to prominent theoretical approaches. The particulars of social interaction and language use are the very heart of LSI work. In the second section

LSI research is examined from the bottom up. Scholarly activity is viewed from three complementary grounding points: (1) LSI research as focused on understanding the basic units of language and interaction; (2) LSI as committed to explicating functions that talk serves; and (3) LSI's interest in identifying the discourse strategies and structures of particularly important sites of interaction.

## APPROACHES TO LSI

### Sociologically Shaped Approaches

One particularly influential tradition in LSI is that of → conversation analysis (CA). Developed by sociologists Harvey Sacks (1992), Emanuel Schegloff, and others in the 1960s, CA was committed to building an observational science of social life. Departing radically from sociological research of the time, CA's first step was to go out and collect tapes of ordinary talk. Telephone calls between intimates or in institutions, dinner conversations, meetings of all kinds, courtroom interrogations, medical or business consultations: all became data for analysis. To study these taped exchanges, CA then creates a detailed transcript. Because it is impossible in advance to know which features of talk contribute to people's meaning-making, CA has seen it as important to capture as many features of talk as possible. Toward this end, Gail Jefferson, another key CA scholar, developed a transcription system that captured how people actually speak. Jefferson's system includes such features as whether a speaker breaks off mid-word; whether they utter uhs, ums, and interjections; the cadence of speech and whether it is markedly loud, soft, fast, or slow; and if one person's talk overlaps with other participants' (→ Transcribing and Transcription). Many different transcription systems have been developed; the CA transcription system (or a simplified version of it), however, has become the standard system used in most strands of LSI research.

In studying scenes of social interaction, CA works to describe the interactional machinery, identifying and naming sequences of action that cut across many social situations. An example of one influential CA idea is the notion of *conversational preference*. Conversational preference refers to a structural preference built into conversation for an utterance of one type to be followed by an utterance of a second type. For instance, a request ("Do you want to come to lunch?") prefers an acceptance (done quickly with a brief remark such as "sure," or "yep, where to?") over a decline as the second utterance. Dispreferred second utterances will be performed by speakers in a much more elaborate fashion than preferred ones. In response to a request, for instance, communicators are likely to pause, preface what they say with "uhs" or "well," and say "no," while offering an account. Because dispreferred utterances are performed differently than preferred ones, conversationalists are often able to project that their partner is going to decline a request in the short pause that precedes a person's response before a single word has been uttered.

An especially important commitment of CA research is to make visible people's sense-making practices. This commitment can be traced to the influence of Harold Garfinkel (1967), the father of ethnomethodology and one of Sacks's teachers. CA is the most visible strand of research emanating from what can be thought of as a larger ethnomethodological enterprise (→ Ethnomethodology). A second scholar who strongly influenced CA scholarship was another of Sacks's teachers – Erving Goffman. Goffman, a scholar responsible

for developing a large set of influential LSI concepts (e.g., face, footing, frame, interaction order, frontstage/backstage) (→ Goffman, Erving) contributed to CA by modeling and legitimating study of ordinary exchanges in their messy particularity. Until Goffman, ordinary interaction had been seen as an undeserving object for communication study.

As video-taping technology became widespread and accessible, more and more LSI scholars opted to video-tape interaction rather than just audio-tape. Related to this change, one school of LSI researchers extended CA work to address distinct research questions about social life that become apparent when one starts looking as well as listening. Video-taping makes visible the fact that social actions are not merely audible talk, but are embodied actions in material environments that contain particular artifacts. Understanding how meanings are made, where the contributions of gaze, gesture, and artifacts are given their due, is what → microethnography, the name for this new approach, is all about. Microethnography has been especially useful in studying interaction in classrooms and in a range of workplace settings.

### Anthropological–Linguistic Approaches

A second set of influential LSI approaches is composed of those approaches that draw upon and extend some combination of ideas from anthropology and linguistics. Ethnography of communication (EOC), the name for the most visible tradition, extends the anthropological work of Dell Hymes (1972), using his SPEAKING mnemonic (setting, participants, end, act, key, instrumentalities, norms, genre) as a central interpretive tool to guide inquiry (→ Ethnography of Communication). EOC studies work to show how a community of people speak, interpret others' actions, and, more broadly, understand what it means to be a person and have relationships. EOC studies combine analysis of transcripts of interaction with participant observation and informant interviews, and have primarily focused on studying ethnic and national communities (e.g., Colombian, Mexican, American).

A key figure in EOC scholarship is Gerry Philipsen (1975), whose study of Teamsterville, a white working-class American community, brought the EOC tradition into communication research. In the last decade and a half, Philipsen has extended EOC to develop the idea that sets of people have *speech codes* (→ Speech Codes Theory). Speech codes theory draws attention to the systematic nature of the symbols that communities use to talk with each other and to comment on the communicative conduct of self and others.

In addition to the EOC tradition, there are two other anthropologically inflected traditions influential in LSI work. The first, → interactional sociolinguistics, developed by John Gumperz (1982), is centrally interested in making sense of why miscommunication occurs between people from different cultures. His idea of contextualization cue – the notion that vocal intonation and other low-awareness features of talk cue important aspects of social meaning – has been especially useful in explaining interactional trouble. A second and more recent tradition is the idea of a → community of practice that has been developed by Jean Lave and Etienne Wenger (Wenger 1998). In contrast to the national/ethnic group focus in most EOC research, communities-of-practice studies focus on interaction among people sharing pursuit of an activity, such as is to be found in schools, workplaces, and recreational groups. The idea of community of practice is also shaped by cognitive theorizing.

### Psychologically Inflected Approaches

If one were to offer a generalization about LSI research, it would be fair to say that much of it is anti-cognitive. LSI work is interested in what happens in interaction among people – not what goes on in their minds. This anti-cognitive thread is particularly visible in a tradition developed by British psychologists Jonathan Potter and Derek Edwards (Edwards 2005). Discursive psychology explores how everyday psychological terms are used in discourse and how psychological matters are managed rhetorically (→ Discursive Psychology). A person’s remark that she can’t remember, for instance, is treated not as a straightforward account of a mental state, but rather, an utterance designed to manage an interactional sensitivity.

Although much LSI work eschews cognitive explanations of meaning, not all does. Recently the debate about cognition’s role in studying social interaction has become especially lively (→ Discourse, Cognitive Approaches to). One particularly novel idea, put forward by Stephen Levinson (2006), is that of the *interaction engine*, which is a “very special kind of cognition” underlying talk “on which discourse is built” (p. 86). The interaction engine explains universals, such as people’s ability to “mind-read” (i.e., interpret actions in terms of people’s intentions) and culture-spanning rituals such as greetings and leave-taking.

A longstanding tradition of LSI research, currently in the methodological minority because of its use of quantitative methods, is → Language and Social Psychology (LSP). LSP has worked to make language an important topic for social psychologists – something not typically so – and to bring issues of strategy and motivation to language research. Communication Accommodation Theory, developed by Howard Giles, accounts for the subtle, largely out-of-awareness ways communicators quickly adapt to each other (→ Communication Accommodation Theory). In a short conversation, for instance, communicators often become more similar to each other in speaking rate, pause length, and dialect features.

### Linguistically Flavored Hybrid Approaches

Unsurprisingly, the field of *language* and social interaction has been shaped by ideas about language and meaning-making from philosophy and linguistics, two academic disciplines in which language is a focus. Several enduring starting points come from work in the philosophy of language. Philosophy of language theories, while generally not foci of current communication scholarship, infuse LSI’s intellectual landscape, shaping contemporary research in a myriad of ways. Two particularly important ideas are that of the *cooperative principle* and of *speech acts* (→ Linguistic Pragmatics).

The philosopher H. P. Grice proposed that the purpose of talk is to share information efficiently. Conveying information, Grice argued, is facilitated by all parties orienting to a cooperative principle whose meaning rests on four accompanying maxims (quality, quantity, relevance, and manner). Importantly, the cooperative principle does not so much govern what people do, as speakers routinely say too much or too little or make off-topic remarks, as it explains how interpreters make sense of what speakers must mean by saying what they do.

A second family of ideas that has been influential, that of speech acts, was developed by language philosophers John Austin and his student John Searle. Reacting to other philosophers who treated the purpose of language as primarily geared to making representational statements about the world, Austin argued that speech always, and often centrally, is performing actions in social life. Searle went on to propose the main categories of action that speech can perform, with two speech act categories being directives (to direct others' actions) and expressives. Grice, Austin, and Searle's ideas have shaped thinking in LSI study. In addition, they form the backbone of the area in linguistics that studies language in use, which in turn shapes multiple strands of current LSI research (Arundale 2005).

Politeness theories, of which Brown and Levinson's (1987) is the most well known in the field of communication, begins with Grice's analysis of communication's purpose as being information exchange and Searle's speech act units (→ Politeness Theory). This theoretical framework is then integrated with Goffman's notion of face (the public image each person claims in interaction) to explain why communicators deviate from maximally efficient communication, frequently speaking indirectly, including small comments such as "I hate to ask you but," and "Wow, great haircut, could you give me a ride to . . ." Politeness theory, which claims to be universally applicable, has been strongly criticized by communication and linguistic scholars. The breadth of politeness theory's claims and the parts of the theory that have been strongly supported, however, maintain it as a much-used frame in communication research.

Action-Implicative Discourse Analysis (AIDA), an approach to discourse study developed by communication scholar Karen Tracy, reflects multiple intellectual influences, including politeness theory (→ Action-Implicative Discourse Analysis). Similar to other LSI traditions, AIDA foregrounds talk as its central data. What distinguishes it from other approaches is its rhetorical spirit. Centrally interested in describing discourse strategies that are used in identifiable communicative practices, AIDA research takes as a goal developing ideas about better and worse ways to talk in the practices it studies. AIDA studies typically focus on explicating the problems of a practice, the conversational strategies of key kinds of participants, and participants' normative beliefs about good conduct in that site. Practices studied have included emergency calls, public community meetings, and consultations between doctors and patients.

Another hybrid approach that brings a normative commitment to theorizing is that of → Design Theory. Developed by Mark Aakhus and Sally Jackson, Design Theory draws on linguistic pragmatic ideas in conjunction with ideas from argument theory to consider how participation and conduct in a range of communicative practices, for example mediation for divorcing couples or groups using decision-support systems, ought to be designed.

In the past decade or two, the ideas of the Russian literary scholar → Mikhail Bakhtin, who had been writing in the early years of the twentieth century but has only recently been translated, have gained attention. Bakhtin proposed that: (1) the *utterance* is the basic unit of social life; (2) *heteroglossic* (multiple, fragmented) meanings are part of all talk and texts; because (3) all words and utterances have a *dialogic* character, invariably carrying meaning traces from earlier uses, as well as generating in-the-moment, novel meanings. Bakhtin's ideas have been adopted in communication and blended with ideas from other traditions to understand particular discursive contexts.

A final linguistically inflected LSI approach that deserves mention – Critical Discourse Analysis (CDA) – is actually a family of approaches, with key scholars in the different schools (e.g., Deborah Cameron, Norman Fairclough, Teun van Dijk, Ruth Wodak) combining linguistic pragmatic traditions with a variety of other influences. Shared by all CDA programs are the practice of close study of social interaction or written texts, and a political commitment to expose how power gets naturalized. Because scholarship can never be politically neutral, CDA researchers work to show how language and discourse practices are marshaled to suggest objectivity while all the time systematically advantaging those who have power at the expense of parties who do not (→ Discourse Analysis). An example of CDA is Thurlow and Jaworski's (2006) analysis of how airlines create "elite" identities through frequent-flyer programs, and in so doing solidify notions of good taste and social class ideologies that further privilege moneyed, traveling people.

### **BASIC CONCEPTS AND FINDINGS**

LSI examines people talking with others in a range of social occasions to accomplish complementary and antagonistic purposes. LSI studies of people interacting generally accomplish three things: (1) they identify distinctive features of language and/or interaction; (2) they describe the interpersonal, organizational, or political functions that talk is serving; and (3) they show how the particulars of (1) and (2) come together to create interactional sites that are communicatively distinctive. Particular research studies often foreground one feature over the others, but it is important to keep in mind that the three are intertwined, not actually separable.

### **Basic Units of Language or Interaction**

When people speak a language, they always speak a particular dialect or variety of it (→ Language Varieties), whether the language be Spanish, Korean, or English. These varieties of a language differ in many ways and connect to speakers' social identities. Features of pronunciation ("going" vs "goin") and grammar ("she is attractive" vs "she be attractive"), for instance, are used differently by communicators of different social classes, geographic regions, and genders. In addition, all speakers vary how they talk based on the relative formality of a situation. A feature of talk that is especially sensitive to the relationship between parties, as well as the newness of a topic, is that of → discourse markers. These little tokens ("yeah," "wow," "anyway") are crucial devices for creating smooth, well-functioning stretches of interaction.

Another small bit of talk that is ubiquitous and especially likely to appear at interactionally sensitive moments is the meta-discursive comment (→ Meta-Discourse). Meta-discourse labels the communicative acts (e.g., "an argument," "gossip") or assessments (e.g., "He's just giving you constructive criticism") of oneself and others, and makes visible everyday speakers' beliefs about how communication is working.

If one were to tally what aspects of talk have been studied particularly extensively, the most researched talk unit would undoubtedly be the question. Questions, and the responses that follow them, are bread-and-butter actions of institutional encounters. Questioning is the central vehicle in health-care exchanges, policing and the courts, and

numerous other sites in which professionals work with clients (→ Questions and Questioning). Besides the rather obvious goal of gaining information, questions serve a range of other functions. How questions are designed and sequenced with other questions is part of how speakers claim status for self or give deference to the conversational partner. LSI research documents these particulars.

Another interesting, multipurpose unit of talk is the narrative or story (→ Storytelling and Narration). Narratives are extended units of talk in which a person recounts a memorable event. Stories can be told to entertain or they may be in the service of doing sensitive actions such as disagreeing. In a study of an organ transplant support group in a hospital, Hsieh (2004) found that support-group members told stories of their experiences with hospital personnel both as a way to endorse the views of others and as a way to disagree with other group members' assertions. Bamberg (1997) underscores that stories have multiple purposes: besides a story's "very referential and informative functioning it may entertain, be a piece of moral advice, extend an offer to become more intimate, seek audience alignment for the purpose of joint revenge, and serve as a claim as to 'who I really am' – and all that at the same time" (p. 341).

By and large communication researchers have been especially interested in understanding how people design and vary speech acts that are sensitive in some way (Tracy 2001). Studied acts have included: (1) → directives, where one person seeks to direct the actions of another, whether it be done forcefully, as in commanding, or gently, as in hinting; (2) apologies, in which a communicator admits to doing a wrong or hurtful act (→ Apologies and Remedial Episodes); and (3) accounts, in which a speaker seeks to make reasonable his or her choices, often to another who is questioning whether those choices are reasonable or not (→ Accounting Research).

In addition to language-based units of discourse that are relatively discrete and easy to name, talk always has a particular sound (→ Voice, Prosody, and Laughter), and is carried out in conjunction with eye gaze (→ Gaze in Interaction) and facial and bodily gestures (→ Gestures in Discourse). All of these aspects of language and interaction function together to create the particular situated meanings that participants actually arrive at. Mirivel (in press), for instance, examined how a cosmetic plastic surgeon used his gazing and aversion of gaze, along with a tape measure and very particular kinds of touches to persuade a woman during a physical examination that her entering assessment of her breasts being problematic and in need of (expensive) surgery was, in fact, an accurate judgment.

### Functions of Talk

Information-giving is recognized by ordinary speakers, as well as LSI scholars, as being an important function of talk. There is, however, a whole range of less immediately apparent functions. It is to these less visible functions that LSI scholars have given the lion's share of attention. One function of talk is to strengthen bonds of connection and affection between people. Originally described by the anthropologist Malinowski as *phatic communion*, it is now more often referred to as *small talk* (→ Small Talk and Gossip). Small talk occurs in hallways, at the beginning of meetings, and around coffee pots in workplaces. The content of small talk is weather, sports, and a whole host of other routine life topics.

In contrast to the largely below-the-radar status of small talk are conversations that occur when a person is experiencing significant trouble. Breakups, illness, negative evaluations at work: all of these are occasions when it is common to seek social support, either from friends and family or from crisis centers and helping professionals (→ Support Talk). Talk that gives a person support is ideally designed in ways to avoid offending the party to whom it is offered. LSI scholars have been interested in these design features. In addition, the role of talk in conveying what speakers are feeling about a topic, another person, or the situation is an ongoing function of talk that communicators regularly monitor. What features of talk and interaction people use to infer that an observed person is experiencing certain feelings is a question that LSI scholars have pursued (→ Emotion and Discourse).

Another function of talk is to enact who the conversing parties are (Tracy 2002). Talk does identity-work. Every time a person speaks, her talk presents the kind of person she is and altercasts the other (i.e., presents how the other is seen; → Identities and Discourse). For instance, the greeting “Wazup?” suggests that a speaker sees the other differently than if he had said, “Good morning, Ms Kim, how are you today?” The kinds of identities that talk implicates include personal, idiosyncratic ones (e.g., being serious, mean-spirited, funny, sharp-tongued, articulate), role- and performance-related ones (e.g., a fair referee or a disorganized meeting participant), and those related to what are assumed to be more enduring features of personhood (race, ethnicity, age, gender, nationality). A controversy about the link between identity and talk that has become especially heated in English-speaking countries, and the US in particular, concerns the language people speak (e.g., English or Spanish) and their national identity (→ English-Only Movements). To frame the issue as a question, we could ask: “What is or should be the link between speaking English and being American?”

Of all the kinds of identity that have been examined, none has received as much attention as what it means to talk like a woman or a man (→ Gender and Discourse). Gender is constructed through how people talk. LSI researchers have investigated the degree to which men and women talk similarly and in what ways they communicate differently. Much recent work has identified that the performance of gender is strongly shaped by a speaker’s social class, race, and national culture, as well as situation-specific factors. There is no single female or male communicative style. Gender differences, many scholars have argued, are more a result of the power relations among people than of a person’s gender (→ Power and Discourse). A female expert witness in a courtroom will talk more like her male counterpart than another female who is a lay witness. Similarly, male lay witnesses speak more like females of that status than male experts.

A claim that power affects how people talk is not particularly newsworthy because it is so self-evident, but how to observe the expression of power in interaction is not at all straightforward. It is difficult to know which differences, among the vast number of talk features that can be found to vary in situations, should actually be attributed to power differences. LSI scholars see it as important to problematize the many generalizations about power and talk that are taken for granted. Generalizations that people with more power speak more often and for longer time periods, that they interrupt, and that they change the topic frequently are sometimes true. But at other times they are not. LSI sees it as crucial to specify carefully the contextual boundaries of power’s working and identity-talk claims.

A function of talk that occurs frequently in decision-making groups as well as arenas of public life is that of argument. Argumentative talk is discourse in which people dispute each other's claims. These claims could be internationally consequential, as can be seen in disputes between Sunnis and Shiite Muslims in Iraq, or they could be relatively routine and minor, as is the case in many sibling spats (→ Argumentative Discourse).

A final function of talk worth mentioning, and one that is almost always presumed to be negative, is talk as a vehicle to purposefully deceive others (→ Deception in Discourse). Researchers have extensively studied where this happens and how it is done. Admittedly, deception is usually problematic, but a study by Mattson and Roberts (2001) found an interactional site in which deception became a desirable and promoted action. In counseling patients about safe-sex practices, health-care professionals suggested deception as a reasonable discourse strategy to certain clients. When clients were adamant about not revealing to their long-term partner a sexual encounter they had had with another – and hence why they needed to use condoms – the health-care professionals would suggest that clients lie to their partner about why they now needed to use condoms. Mattson and Roberts' study illustrates how looking carefully at talk can make visible places in social life where the usual generalizations about good and bad conduct need to be tempered with attention to situational particulars.

### **Discourse Sites: Their Strategies and Structures**

Interaction in health-care settings where nurses, doctors, or counselors are talking with each other or with patients, either face-to-face or on the telephone, is one institutional site to which LSI researchers have given a lot of attention (→ Doctor–Patient Talk). Advice about how patients should talk with their doctors or how doctors should communicate with patients is easy to find. LSI studies often lead to a more complicated picture about how talk happens and ways patients and doctors could try talking differently than one gets from advice guidebooks.

Although not every kind of interaction has been studied, many have. LSI studies reveal particulars of what is going on in consequential communicative contexts that would not have been noticed if the careful looking and listening that characterizes LSI work had not happened. One example of this is Tracy and Durfy's (2007) study of an American community's contentious school board meetings. In these public meetings, citizens used a variety of discourse strategies to convey negative sentiment. The strategies included describing community events limned with negative feeling, straightforward avowal of feelings, rhetorical questions, reported speech, and an argumentative discourse strategy (use of god terms) that implied that the proposal a speaker was advocating was concerned about "the children," whereas those who were against it had no concern about the district's children. In community school-board meetings, "children" functioned as a god term. Everyone agreed that the good of the children was what school districts should be all about; no one ever explicitly argued against "the children." In this context, then, speakers' appeals to the good of the children, or characterizing others as not having this concern, were how participants sought to advance the proposals they favored and hinder those they did not (→ Public Meetings).

Discourse sites that LSI scholars have most extensively studied include:

- 1 intimate exchanges among family members and friends from a variety of national cultures (→ Intimate Talk with Family and Friends);

- 2 courtroom interaction, including attorney–witness exchanges and judge communication (→ Discourse in the Law);
- 3 exchanges that occur in a range of alternative dispute-resolution practices, but especially mediation;
- 4 the talk that occurs in business, including meetings of all types and sales exchanges (→ Business Discourse);
- 5 conversations on the telephone between intimates and for institutional services such as emergency calls (→ Telephone Talk);
- 6 television chat shows and call-in radio (→ Broadcast Talk); and
- 7 old as well as new forms of → technologically mediated discourse.

Language and social interaction is a distinctive area of communication study. Its trademark is the use of excerpts of talk to make claims about important units of talk or interaction, the structure of social action, how identities and institutions are constructed through interactional moves, how culture is displayed discursively, and so on. As Tracy and Haspel (2004, 807) conclude in a journal review of LSI research:

Whatever the particular issues are that LSI scholars tackle, our main mission is to render the “small” or mundane features of talk (such as conversational routines) large, to make the invisible (such as background knowledge or expectancies) visible, to make abstract concepts (such as “agency” or “strategy”) observable, and to make what matters most to communicators (such as “respect”) understandable to those who study and teach communication.

## Language and Social Psychology

Kimberly A. Noels

University of Alberta

Social psychology is conventionally defined as the scientific study of how the actual or imagined presence of others influences an individual’s thoughts, feelings, and behavior. The social psychology of language (SPL) concentrates on the role of language in the dynamics between individuals and their social world; language use is argued to affect and be affected by both psychological and social variables. Scholarship in SPL has incorporated aspects of the broader discipline, including a theory- or variable-driven approach, along

with its preferred quantitative methods, particularly survey techniques and laboratory experiments (→ Survey; Experimental Design). Unlike mainstream social psychology, SPL has also welcomed contributions from other disciplines, including communication studies, sociolinguistics, anthropology, and other disciplines. Correspondingly, constructivist perspectives and qualitative methods, which are better recognized in these other disciplines, have found a receptive community in SPL (→ Qualitative Methodology; Constructivism). Furthermore, SPL scholars herald from around the world, and different “schools” of scholarly activity have developed in many regions, including Canada, the United Kingdom and Europe, Australasia, and the United States. Because of the range of perspectives that inform SPL, it cannot be said that any single paradigm characterizes this field of inquiry; indeed, a hallmark of research in this area is its variety of theoretical and methodological approaches.

Although language was an integral part of Wundt’s *Völkerpsychologie*, rather little systematic investigation of the role of language in social interaction was carried out by social psychologists in the first two-thirds of the twentieth century. Notable exceptions include the work of Mead, → Erving Goffman, and others whose work was more prominent in sociological social psychology. During the 1960s and 1970s, with the decline in behaviorism and the rise of cognitivism in psychology, the subdiscipline began to grow, although it generally remained on the margins of mainstream social psychology (→ Information Processing). Institutional support in the form of journals (e.g., *Journal of Language and Social Psychology*, established 1982), textbooks and handbooks (e.g., *Handbook of Language and Social Psychology*, 1990, 2001), regular specialist conferences (International Conference on Language and Social Psychology), and professional associations (e.g., the International Association of Language and Social Psychology, established in 1997) served to organize a community of scholars and to substantiate SPL’s legitimacy as an important area of scholarly concern.

### TENETS OF SPL

In the following, some general tenets of SPL are outlined, along with some examples of prominent research topics. Two themes are evident. First, consistent with the cognitive orientation of social psychology, a prominent theme in SPL is how the production and reception of language behaviors are associated with cognitive processes, including attitudes, attributions, self-concepts/identities, and so on (→ Discourse, Cognitive Approaches to). A second theme concerns the importance of social motivation for interpersonal interaction.

People enter social interactions with the *purpose of influencing another person* to achieve a goal. Sometimes this purpose can be determined from the literal content of an utterance, but often it is conveyed indirectly through nonverbal behaviors, the form of the utterance (e.g., question, command), and so on (→ Nonverbal Signals, Effects of). For instance, a speaker’s vocabulary choices can subtly lead a listener to particular inferences about the causes of an event. According to Semin (2004), more concrete terms indicate situational causes and tend to be used to describe less expected events (e.g., “Jamie touched the man”). More abstract forms tend to indicate that the person is the cause of the action and tend to be used for expected events (“Jamie is friendly”; “Jamie is intrusive”). Concrete terms are often used to describe negative events regarding oneself or a positively valued person or group to imply their irregularity, and abstract terms are used

for positive events to imply their ordinariness. The opposite is true for negatively valued persons or groups. Although both speakers and listeners may be unaware of this practice, such word choices shape how listeners understand an event and their reactions to it.

Speakers recognize that listeners come to the interaction with different understandings and feelings about the topic at hand, different perceptions of the context in which the interchange takes place, different experiences with the speaker, and so on. To achieve desired goals, the speaker must assume the perspective of the listener in order to formulate a message that the listener can readily comprehend. An intriguing effect of attuning a message to another's perspective is that it can have implications for the speaker's own understanding of that topic. For instance, by framing a positive message for an audience that is known to evaluate that person positively, the speaker may come to also evaluate that person more positively (i.e., the "saying-is-believing" effect; see Higgins 1992).

The listener is also an active participant in the communication process, who strives to *determine the speaker's goals and intentions*. To this end, listeners attend to utterances that are contrary to their expectations. According to Grice (1975), participants in a conversation expect that the interaction will be structured to promote the efficient exchange of information; a speaker will clearly and concisely convey all of the necessary, relevant information (→ Linguistic Pragmatics). Violations of this principle suggest to the listener that additional interpretation is necessary to determine the intended meaning of the utterance in that context, and he or she uses the contextual cues in the situation (e.g., the speaker's social status) and in the conversation (e.g., the sequence of conversational topics) to do so. These types of violations are often committed in the interest of politeness, to save the face of one or both of the interactants, and as such signal the nature of the relationship between interactants (see Holtgraves 2002, for review).

Listeners also use *paralinguistic features* to deduce the speaker's identity and his or her relationship to the listener. In his seminal research, Lambert and his colleagues (Lambert et al. 1960) developed the matched guise technique to investigate how listeners evaluated speakers of different languages. Participants in these studies listened to tape recordings of bilingual speakers using one or another language and were asked to evaluate each of the speaker's guises on several dimensions. By using the same speakers and the same message in all recordings, personality and message differences were controlled and only language was evaluated. The results showed that speakers using French were evaluated less positively than the same speaker using English, and this was true regardless of whether the listener was a native English or French speaker. Numerous variations of this technique have been carried out to look at a *range of speech characteristics*, including languages, dialects, and accents; speech rate; lexical diversity, etc. With some consistency, certain speech styles are regularly associated with impressions of status, solidarity, dynamism, and other dimensions. Importantly, the impressions that listeners form of speakers have implications for how they behave toward those speakers. For example, compared to their counterparts who use standard dialects, speakers of nonstandard dialects may be regarded by their teachers as having poorer educational prospects, by their employers as less suitable for higher-status occupations, and by jurors as more culpable of particular crimes.

Although communication has been portrayed thus far as an exchange between speaker and listener, communication is much better described in terms of interactants who continually adapt to one another. *Theories of adaptation* in interpersonal interaction

portray communication as a process of mutual influence in response to perceptions of the other and assessments of the goal of that interaction. As an example of theories of this type, → Communication Accommodation Theory suggests that individuals strategically use verbal and nonverbal characteristics to signal their identities and to create more or less social distance from their interlocutor, depending upon whether they evaluate that person positively or negatively (cf. Gallois et al. 2005). When language behavior becomes more similar, termed convergence, it generally reflects a more positive evaluation of that person, and when it becomes dissimilar, termed divergence, it tends to signify a negative evaluation of that person. These speech patterns indicate to the partner the identity claims of the speaker, eliciting in turn a psychological and behavioral response from the partner. Over time, these adaptation patterns establish and maintain a particular level of social distance between interactants.

Perspective-taking and mutual adaptation are crucial for the coordination of action between interactants, and coordination is essential for the achievement of communicative goals. In order to effectively coordinate their actions, participants must stand on “common ground” – that is, have a shared understanding of their mutual knowledge, beliefs, and suppositions. Clark’s (1996) *collaborative model* maintains that interactants ensure, through questions, back channeling, and other strategies, that they have comparable understandings of each utterance before they move on to the next utterance. Such a perspective of language use as joint, or social, action emphasizes that meaning lies not within the minds of individuals, but is created through the interaction between them.

### **LINKS AMONG THE INDIVIDUAL, SOCIETY, AND LANGUAGE**

SPL is a developing field that has been shaped by diverse influences. As a result, there are divergent opinions on how the interrelations between the individual, society, and language should be framed and examined. These discussions point to directions for future inquiry. Because of its emphasis on social cognition, SPL has been suggested to be overly focused on mental processes, with too little attention given to examining language behavior per se. Others suggest that SPL research has inappropriately adopted the individual as a unit of analysis, and that a more appropriate unit would be dyadic or group interactions. It has been argued that SPL research has been overly reliant on quantitative methods, such as self-report surveys and laboratory experiments, in which language use is abstracted from naturally occurring situations. Qualitative methodologies (→ Discursive Psychology; Conversation Analysis; Ethnography of Communication) could better investigate language use as it unfolds in uncontrived settings, complementing the more commonly used techniques. At times these discussions regarding the proper conceptual and methodological approach are heated and adversarial. Perhaps a more constructive approach to understanding language and its place in the social world would evolve from dialogue between disparate viewpoints. Although harmonious complementarity may be elusive, multiple perspectives are crucial for a field that is still defining itself. Moreover, through their dialectic, each perspective ensures that the others stay humble regarding their truth claims.

## **Language Varieties**

*Miriam Meyerhoff*

*University of Edinburgh*

The term “language varieties” covers “language” and “dialect.” A variety may be characteristic of a particular social group, or associated with a particular speaking style across groups of speakers in a community (→ Communities of Practice). “Variety” makes no direct or indirect assertions about the relative status of the linguistic system being described (“dialect” often refers with negative overtones to nonstandardized varieties).

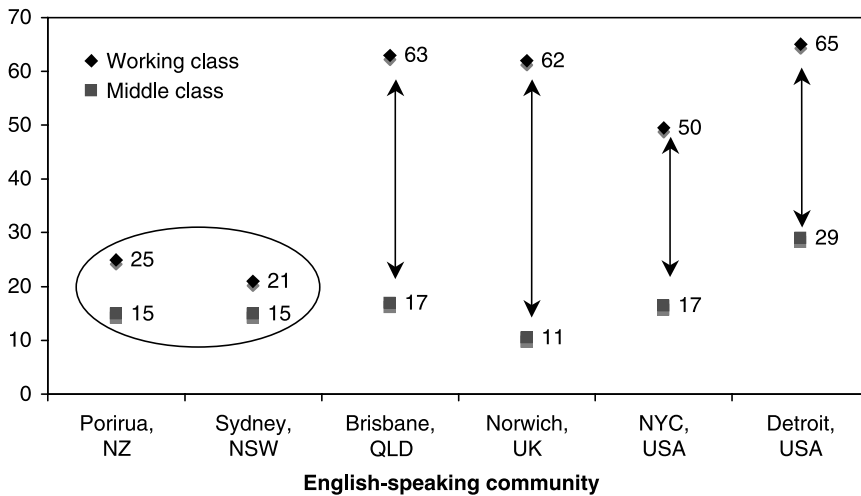

The relationship between language, social groups, and styles reflects present-day and historical factors that are unique to each community (→ *Ethnography of Communication*). Good variationists use qualitative research to decide which correspondences between language and society to examine quantitatively. Some social groupings are common across societies, presumably because such group distinctions are generally salient to people the world over. These include identities and networks based on age, gender, social class, or very local communities of practice. Speakers systematically, though often sub-consciously, differentiate members of different social groups by using a wide range of linguistic resources. These can be subtly different pronunciations of the same words, different patterns for organizing new and old information in sentences, or different pitch and intonation patterns. In earlier work on sociolinguistic variation, these correspondences were sometimes discussed as if the social categories with which speakers could be identified determined their use of particular linguistic variants. This is viewed critically now, and the relationship between linguistic forms and social identities is considered to be more complex, and mutually constitutive.

William Labov, considered the founder of variationist studies of language, demonstrated that variation of a feature of talk (e.g., *gonna* vs *going*) may not be categorical, but is systematically and probabilistically constrained by linguistic and social factors. (In most linguistic variables, the linguistic constraints account for more of the observed variation than social or individual factors do.) This means that synchronic variation, i.e., that which occurs at a particular moment in time, can be studied as a complement to historical linguistics.

Not all linguistic variation is the first step in language change. Some variables are stable over time. Stable variables and changes in progress have different profiles across different age groups of speakers. Variationists infer change from differences in the distribution of variants across different age groups (“apparent” or “generational” time as opposed to real/chronological time). The robustness of apparent time has been validated by real-time checks of some studies. For changes proceeding below speakers’ conscious awareness, apparent time seems to be reliable. However, apparent time data are not good indicators of the speed with which a change is taking place.

More conservative variants are often retained in formal or careful speech styles longer than they are retained in informal or casual speech. Sociolinguists differ in how they understand individual styles (→ *Interactional Sociolinguistics*). Labov argued for a model based on whether a speaker was giving more or less attention to the act of speaking. Howard Giles argued that style shifting reflected different (real or imagined) addressees, to whom the speaker was converging (accommodating) (→ *Communication Accommodation Theory*), and Allan Bell developed this further as “audience design.”

There are often striking parallels between the way variants are distributed across individuals’ styles of speaking and across different *social classes*. Typically, the variant that occurs most in more casual styles, or more ingroup speech, also occurs more often as one moves down the social spectrum. For example, the suffix “-ing” (“*walking~walkin*”) occurs as “-in” most in working class speech overall, and most in all classes’ casual ingroup style. The parallelism between class and style suggests that ideologies about class and style (whether operationalized as attention to speech or attention to others) are very deeply intertwined.

**Figure 1** Class stratification of *-ing* in six English-speaking communities: fine stratification in Porirua and Sydney; broad stratification in others  
*Source:* Meyerhoff (2006, 169)

It has been suggested that broad social class stratification (i.e., major differences in relative frequency of a variant in the speech of different social classes) reflects relatively rigid social class divisions at the societal level. However, evidence supporting this is limited (Fig. 1). The fine stratification observed in New Zealand and in Sydney might fit with Australasian ideologies of social mobility, but we find similar patterns of broad social class stratification in Brisbane as we do in Norwich (UK) and Detroit (USA).

## Lasswell, Harold D.

*Hanno Hardt*

*University of Iowa*

Harold Dwight Lasswell (1902–1978), American political scientist with a specific interest in the symbolic aspects of politics (→ Political Communication; Symbolic Politics), is considered one of the founders of mass communication research in the United States. Although his wide-ranging and prolific writings on theoretical and methodological issues regarding politics, personality, and culture remained rather peripheral to communication research, his approach to the effects of mass communication (→ Media Effects) helped define and strengthen a quantitative approach to questions concerning media and communication in the political arena (→ Quantitative Methodology). Lasswell studied at the University of Chicago with George Herbert Mead, Robert E. Park, and Charles Merriam, while being influenced by John Dewey and American → pragmatism. He also taught at Chicago (1922–1938) and served as chief of the Experimental Division for the Study of War Time Communications at the Library of Congress in Washington, DC, during World War II before joining the Yale law school (1946–1970).

Among early contributors to the field of communication studies, Lasswell was particularly knowledgeable about Freudian psychology and Marxist ideology. His insight into the structure of the latter provided a comparative perspective for the analysis of political behavior, long before many of his American colleagues acknowledged its relevance (→ Comparative Research). His efforts at integrating classical and empirical political science solidified the quantitative approach to different aspects of communication flows, ranging from psychiatric reports to propaganda campaigns. By denying the dualism of individual and society, and by applying Freudian analysis to society, he established the importance of considering the social totality as a symbolic context, thus anticipating later directions in social theory and analysis. Lasswell acknowledged the implications of culture and language for the study of political communication, aided especially by the interdisciplinary nature of his inquiries.

Lasswell's (1948) definition of communication was a powerful and influential contribution to conceptualizing communication as transmission (→ Models of Communication). In making it, he not only identified the major elements of the communication process – communicator, message, medium, receiver, and effects – but also labeled the corresponding areas of communication research – control, content, media, audience, and effect analysis. His descriptive model revealed a primary interest in persuasive communication, but also referred to broader functional equivalences between an organism and the body social within an approach dominated by the intent of the communicator and the effect of messages (→ Functional Analysis). As such, his definition of communication (who – says what – in which channel – to whom – with what effect?) harks back to the stimulus-response model, rooted in learning theory, which became a significant force in the rise of mass communication theory in the United States and in post-1945 Europe.

Emerging from Lasswell's work is the realization of a growing social and political need to study and understand mass communication phenomena, particularly in the realm of

politics, including the uses of → propaganda in the practice of democracy. His ideas about effects, his contributions to content analysis (→ Content Analysis, Quantitative), and his humanistic inflection of behaviorism, in particular, helped shape communication studies, even if the field was dominated at the time by the disciplinary interests of American sociology (→ Communication as a Field and Discipline).

## **Latina Feminist Media Studies**

*Angharad N. Valdivia*

*University of Illinois at Urbana-Champaign*

Latina feminist media studies addresses the intersectional themes of gender, ethnicity, nation, and media in relation to that recently constructed category of Latina/os, i.e., a segment of the US population of Latin American origin (→ Identity Politics). As such, this category both differs from, and overlaps with, “Latin American,” as many US Latinas experience transnational lives through personal travel and migration, enduring family and community connections, and media consumption of both US and Latin American cultural forms. In media studies, there is a strong corpus of research about this subject, with a range of scholarship from Chicano and Puerto Rican studies of film and performance. Falling between “black/Afro-American media studies” (→ Black Feminist Media Studies) and “media studies” (which tends to center on whiteness), Latina feminist media studies

explores the production, consumption, content, and effects of media from perspectives that foreground gender and ethnicity (→ Feminist Media Studies, Transnational).

Fregoso's (1993) and Valdivia's (2003, 2005) work on the production of media – at the individual, organizational, and institutional levels of analysis – demonstrates that most mainstream media production remains in the hands of white, male producers (→ Media Production and Content). The rules that govern the production of media, as well as the values and beliefs that shape both organizations and individuals, contribute to a media production that tends to marginalize the input and narratives of Latinas. Celebrities such as Salma Hayek, Jennifer Lopez, and Gloria Estefan stand out as examples of exceptional Latinas who are involved in the production of media. The highly acclaimed prime-time US television show *Ugly Betty* (→ Soap Operas) has won numerous awards for its portrayal of a non-normative young Latina in the fashion industry, and the pop singer Shakira's cross-over success echoes transnational flows of people, music, style, and culture across all continents.

The vast majority of research on Latinas focuses on *representations and content* (→ Media and Group Representations). Racialized and gendered media representations render feminized images less valuable and powerful than masculine ones (→ Feminization of Media Content; Gender: Representation in the Media). Feminist media scholars have studied all narratives, particular bodies, and types of media. As a signifier of difference and the arrival of the Latina body, Jennifer Lopez's butt has been a focus of research interest (Negrón-Muntaner 1997; Barrera 2000; Molina Guzmán & Valdivia 2004). Molina Guzmán and Valdivia (2004) find that “the female ethnic subject is othered through its categorization and marginalization in relation to dominant constructions of Whiteness and femininity . . . Latinas fall beyond the margins of socially acceptable femininity and beauty” (p. 206).

Mainstream popular culture creates and adheres to tropes in its representations of Latinas. Frances Aparicio and Susanna Chávez-Silverman (1997) identify “tropicalization” as a dominant trope used to signify Latinas. Tropicalization renders Latinas as hot, dynamic, nearly combustible, and hyperfertile. Most notable as a figure in this vein is the actress Carmen Miranda, whose representation endures in myriad advertising campaigns. María Victoria Ruiz (2002) has studied popular fears of the hyperfertile Latina in both medical literature and freeway signs. Ruby Tapia (2005) extends this analysis to a study of teenage-pregnancy campaigns wherein the implicit pregnant body is Latina.

Latina feminist media studies also includes research on popular music, magazines, children, and girl culture (→ Popular Culture). Jillian Báez (2006) explores individual performers such as Ivy Queen and hybrid cultural forms like “reggaetón” in terms of gender, ethnicity, and nation. Research on salsa by Frances Aparicio (1998) informs much of the contemporary study of Latina feminist popular music of other stars, such as Celia Cruz and La India, and Valdivia's (2003) work on salsa as a form to construct Latinidad in the midwest US. In magazine studies, both Katynka Martínez (2004) and Melissa Johnson (2003) explore the construction of femininity and masculinity in *Latina* magazine as well as the development of models of acculturation in Latina women's magazines. Research on *American Girl* dolls and products conducted by Acosta-Alzuru and Roushanzamir (2003) and the analysis, conducted by Harewood and Valdivia (2005), of the chat streams linked to the children's television show *Dora the explorer*, examine the

highly profitable commodification of girl-culture and its incorporation of Latinas. Much less studied is radio. Here Inés Casillas's (forthcoming) work on masculinity in talk radio in the Los Angeles area stands out.

Audience interpretation is underresearched (→ Audience Research). Little is known about what kind of media Latinas use, how they identify with characters and interpret themes and narratives, or how Latina characters are interpreted by wider audiences. Viviana Rojas's (2004) work on Spanish-language television found ambivalence and recognition on the part of a number of Latinas, and Mayer's (2003) work on San Antonio girls found that class limited their ability to engage with media and popular culture. Vargas (forthcoming), like Mayer, also finds that girls use transnational media to retain a connection to their recent or ancestral countries of origin.

## Latitude of Acceptance

Michael Kunczik

Johannes Gutenberg University of Mainz

Social-judgment theorists (Sherif & Hovland 1961) assume that → attitudes concerning important topics are bipolar. People have an internal reference scale. The initial attitude on an issue with high ego-involvement influences the reaction to a communication representing a different view (→ Involvement with Media Content). The discrepancy of a communication from one's own position is decisive for the amount of change achieved by a source because message discrepancy affects the perception of the quality of a message. More discrepant messages are perceived as being more unfair, more illogical, more boring, etc. In order to explain whether a person will change toward or away from a position advocated by a source, Sherif and Hovland (1961) segmented an attitude on a pro and contra issue into three parts (assimilation-contrast theory): latitude of acceptance, latitude of non-commitment (zone of indifference), and latitude of rejection (→ Attitudes, Values, and Beliefs, Media Effects on; Cumulative Media Effects; Hovland, Carl I.).

Within the *latitude of acceptance* (on an attitude scale the position most acceptable to a person on a given topic plus other positions which are considered acceptable), a source's opinion is distorted perceptually as being more similar to one's own opinion than it really is ("assimilation effect"). Attitude change is unlikely because the source's point of view is perceived as being similar to one's own. The reinforcement of one's already existing attitude will be the most likely effect (→ Media Effects, Strength of).

Within the *latitude of rejection* (the positions one finds objectionable), a source's opinion is perceived as further removed from one's own stand than it really is ("contrast effect"). The changing of attitudes in the direction of the source's position is extremely unlikely because the discrepant communication will be perceived as being more discrepant than it is. One's opinion is most likely to remain unchanged or even to change in a contrasting way ("boomerang effect"). While accepting and rejecting certain

positions concerning an issue, the *zone of indifference* (latitude of non-commitment) allows an individual to remain neutral (moderate) regarding certain positions. With opinions neither accepted nor rejected, perceptual distortions are least likely to happen. In this zone of indifference, attitudes are most likely to be changed in the direction advocated (→ Propaganda).

In a series of studies that addressed nontrivial topics (e.g., US presidential elections in 1956 and 1960, labor-management issues, or the Arab Unity issue; see Sherif & Sherif 1969, 357ff.), it was established that the size of the three latitudes varies according to the position an individual upholds. A study by Hovland et al. (1957) tried to answer the question of how a person's initial position on a certain issue influences reactions to a communication representing different views. The theme addressed was the question of lifting an alcohol ban, which was controversial in Oklahoma (then a "dry" state) at the time of the study. The subjects' positions ranged from "dry" via "moderate wet" to "wet." The subjects were confronted with messages that strongly or weakly contradicted their own views. It was found that where discrepancy was great, the credibility of the communicator was doubted (→ Credibility of Content). And with increasing distance, the communication was perceived as propagandistic and unfair. Moreover, communications with more deviant opinions were perceived as more distant from one's own views than they actually were ("contrast effect"). Communications with less deviant opinions were perceived as more similar than they actually were ("assimilation effect"). It was also found that moderate subjects changed more in the direction advocated. If the source's position is highly discrepant, one is less likely to be influenced and develops doubts about the credibility of a communicator. Bochner and Insko (1966) could demonstrate that greater credibility gives the chance to advocate more discrepant opinions successfully. Opinions of sources with low credibility are more likely to be rejected.

The (relative) *size of the latitude of non-commitment* is an indicator of the extent of ego-involvement: the smaller the indifference zone, the greater the ego-involvement. A large latitude of non-commitment is typical of an individual who is not deeply involved. The size of the latitude of non-commitment also proves to be an index of susceptibility to change (Sherif & Sherif 1969, 482, 491). The greater the importance of a topic (involvement), the greater the resistance to attitude change. The width of the latitude of acceptance, according to Hovland et al. (1957), is dependent on the importance of the issue: the more important an issue, the smaller the latitude of acceptance. When compared with a moderate person, an individual with high involvement had a narrower latitude of acceptance and a greater latitude of rejection. The latitude of acceptance of intensively involved persons is significantly smaller than the latitude of rejection and the latitude of non-commitment (Sherif & Sherif 1969, 297). On the other hand, non-partisan individuals with low involvement have a latitude of acceptance and a latitude of rejection of nearly the same size, and a relatively large latitude of non-commitment.

Concerning the discrepancy between communication content and recipient attitude, linear assumptions (that the greater the distance, the smaller the attitude change) are too simplistic (→ Linear and Nonlinear Models of Causal Analysis). With unimportant themes and with credible communicators, greater discrepancy can cause more change; greater importance, in other words, implies a greater resistance to change. The following *hypotheses* can be made:

- 1 No effect of persuasive communication intended by the communicator is expectable in the rejection zone, but rather a boomerang effect, especially since distorted perception is very likely because of the contrast effect.
- 2 Attitudes are most likely to be changed in the non-commitment zone.
- 3 In the acceptance zone, attitude change – even gradual – is unlikely because, within this zone, communications are perceived as similar to one’s own position.

## **Lazarsfeld, Paul F.**

*Hanno Hardt*

*University of Iowa*

Paul Felix Lazarsfeld (1901–1976), Vienna-born sociologist, influenced by Ernst Mach, Henri Poincaré, and Albert Einstein, and intellectually close to the Vienna Circle of logical positivism, called himself a “European positivist.” He was the founder of modern empirical sociology and a major figure in twentieth-century American sociology. His contributions to the study of communication grew out of his collaborative work at the *Bureau of Applied*

*Social Research*, which he had founded at New York's Columbia University in 1937. His position was firmly established with the publication of *The people's choice* (Lazarsfeld et al. 1944) and *Personal influence* (Katz & Lazarsfeld 1955), which set the stage for the social scientific exploration of communication in modern society. Lazarsfeld's work is also an example of the intellectual contributions made by emigré scholars to American scholarship during and after World War II.

Lazarsfeld's research on the social and political impact of radio as a new medium (→ Radio: Social History) reinforced his leading role in forging the direction of mass communication studies after World War II, and further illustrates his understanding of what he termed *administrative research*. His response to the spread of literacy and the rise of a centralized system of mass communication was a call for a philosophical grounding and a systematic approach to research techniques (→ Research Methods), suggesting a role for communication research as an important source of → media policy and social philosophy. Lazarsfeld saw the problem of media and society in technological terms, dealing with the inevitability of industrialization, the massification of audiences, and the effects of mass media on people (→ Media Effects). His understanding of the role of *critique* within the social sciences was grounded in a perceived need to provide a social scientific rationale for an adjustment to the dominant forces in society (→ Critical Theory). Thus, his own complex intellectual interests and his lifelong commitment to applied research kept him involved in assessing methodological and substantive contributions to the creation and transfer of knowledge. In Lazarsfeld's view of mass society, one challenge for social scientists was to help improve the standards of living for people under the conditions of industrialization. Yet his notion of critical research remained within a populist, reformist questioning of authority.

Lazarsfeld helped to fashion communication research into an important methodological specialization, leading to the legitimization of American communication research as a socially and politically relevant academic undertaking (→ Communication as a Field and Discipline). This position was premised on a widespread and commonsensical understanding of social problems as being related inescapably to media performance. Consequently, questions about communication or the role of media tended to be reduced to practical issues, while theoretical interests in the development of a communication-based theory of society surfaced outside the sociological mainstream. Lazarsfeld's influence extended after World War II to Europe, where his work played a role in the rise of media studies as a social scientific project.

## Le Monde Diplomatique

*Nicolas Harvey*

*University of Rennes 2*

*Le Monde Diplomatique* (LMD) is a French monthly → newspaper created in 1954 by Hubert Beuve-Méry, then editor of the Parisian newspaper of record, *Le Monde*. It is large format and typically runs to 32 pages, including color artistic photographs and art reproduction. It offers feature and political analysis articles, mostly of one to two pages in length. Sometimes a particular issue will contain a cluster of articles on the same issue or country, running to several pages. It also has short book review pages, mostly of nonfiction, but always including at least one or two novels, generally by global southern authors.

Today, LMD is one of the most important global anti-capitalist newspapers, with worldwide influence, especially in countries where people speak Romance languages or Arabic. The newspaper was translated into 26 languages, as of 2006, and had a total circulation of almost 2 million paper copies. Even though the newspaper has never taken sides in a French electoral campaign, the editorial line can be defined as to the left of the French Socialist party. However, LMD was never monolithic and three broad historical tendencies have been in play during its history: leftist Christians (some of them leading resistance fighters during World War II), internationalists (most of them former Communists), and leftist nationalists (some linked to the Eurosceptic political party *Mouvement Républicain et Citoyen*, led by former interior minister Jean-Pierre Chevènement). The leftist Christians had all retired by the time of writing, but the two latter tendencies were still present in the newsroom. However, notwithstanding these political dissensions, all the journalists were close to global justice movement (*altermondialiste*) perspectives and were unanimous in denouncing the European Constitutional Treaty proposal in 2005.

In the mid-2000s the newspaper worked with a small editorial staff of nine journalists. These editors had a remarkable level of cultural capital, with seven having doctoral degrees. The majority of the articles were written by outside contributors, mostly foreigners, and academics or independent journalists. The newspaper may be regarded as a strategic institutional location for leftist intellectuals writing on international issues.

As with other worldwide media such as the *International Herald Tribune* or the *Financial Times*, when we observe the sociological composition of its journalists and its readership, *LMD* has always belonged more to “class media” than “mass media” or “popular media” (→ Popular Culture and the News Media). A study done in 1998 showed that 75 percent of *LMD*'s subscribers had higher education and 40 percent of them were senior executives. Some articles resembled academic popularization rather than journalistic news, and readers needed a high degree of cultural capital to master the contents. It also had the peculiar feature of including both professional journalists and academics on its staff.

In its early beginnings, *LMD* did not have a radical leftist editorial line. The newspaper was only a supplement of the daily newspaper and it aimed particularly at a readership in the diplomatic arena. The newspaper had only one or two permanent journalists and most of the articles were written by *Le Monde*'s foreign correspondents. The two newspapers kept the same editorial line until 1973, adopting a neutralist position in the Cold War, and dominated by center-left Christian staffers. Nevertheless, *LMD* had the ambition to become a successful newspaper of record, with an austere image and the goal of objectivity.

In 1973, *LMD* changed its editor, its style, and its editorial line. The newspaper adopted a third-world position and a critical view of the western bloc during the Cold War. As academics and former communist journalists joined the editorial staff, the newspaper switched course and adopted an anti-capitalist editorial line. The content also changed enormously. Before 1973, *LMD* was overwhelmingly interested in international relations, diplomatic circles, and possibly the national politics of foreign countries. With its new editor, *LMD* began to be interested in cultural and social news. Also, in the early 1980s, Claude Julien, the editor of *LMD*, had been elected editor of *Le Monde*, but a subsequent vote reversed the election. Julien then returned as head of *LMD* with more legitimacy and greater autonomy, conceded by *Le Monde*'s new editor to smooth over the ousting.

The *degree of autonomy* increased and was institutionalized in the late 1990s by *LMD* becoming a subsidiary company, where *Le Monde* kept 51 percent of the newspaper, with the other 49 percent being shared by editorial staff and readers. *LMD* needed money and asked readers to become shareholders. The association Les Amis du Monde diplomatique (“*LMD*'s friends”) was created for this purpose, and many local associations started to organize conferences and debates with *LMD*'s journalists and external contributors. It is a top-down association with a charter that allows the editorial staff to control the election of its national executive committee. The nomination of local coordinators is done by this national executive committee and local committees are not allowed to take any public position.

Editorial autonomy had been respected since the beginning of the 1980s and the new subsidiary company was able to protect the newspaper against *Le Monde*'s future editorial interference. Readers and staff together held more than 33 percent of the shares, the threshold needed in French corporate law for protecting statutes that guaranteed autonomy of internal functioning and editorial line. Nevertheless, *LMD* is a capitalist firm that has to be profitable. In contrast to the alternative media sector's typical economic weaknesses, *LMD* uses similar marketing strategies, market research, administration, and financial planning to those used in mainstream media.

Until the late 1990s, *LMD* had a radical editorial line but was not literally activist. However, after the major 1995 wave of strikes in France, the newspaper decided to participate directly in the creation of some activist associations (→ Activist Media). Most of these associations were created in a similar way. The first was the *Association for the Taxation of Financial Transactions for the Aid of Citizens* (ATTAC, in French), one of the leading associations in the worldwide campaign against “rightist globalization.” The idea to create this association originated in 1997 in an editorial by *LMD*’s editor Ignacio Ramonet. The newspaper rapidly received a significant number of letters from readers who wanted to become members of an association of this kind. The inaugural assembly was held soon after the famous editorial. A similar strategy was adopted for the creation of two other *altermondialiste* organizations: the *World Social Forum* (WSF) and *Media Watch Global* ([www.mwglobal.org](http://www.mwglobal.org)). Some *LMD* journalists also became leaders of anti-globalization organizations.

## **Leadership in Organizations**

*David L. Collinson*

*Lancaster University*

Leadership dynamics significantly shape communication in organizations. By defining leadership primarily as a process of → persuasion, many scholars place communication at the very heart of leadership dynamics. The complex organizational relationships between leaders and followers can crucially influence the nature and extent of communication. Equally, the nature and extent of communication often reflects and reinforces the quality of the relationships between leaders and followers. Within organizations, leadership and communication frequently interact in complex, mutually reinforcing and sometimes contradictory ways.

Within the literature there is a growing recognition that leadership in organizations can occur at various hierarchical levels and is best understood as an inherently social, collaborative, and interdependent process. Leadership is the responsibility not only of

those who occupy senior positions such as entrepreneurs, owners, chief executives, and senior managers, but also of all those engaged in supervisory functions. These insights are suggestive of new forms of organizational communication. Rather than the traditional top-down model of command and control, there is a growing view that, especially in high performance organizations, communication is dispersed through team-based interdependencies and fluid, multidirectional social interactions and networks of influence (→ Organizational Communication; Organizational Structure).

## MAINSTREAM PERSPECTIVES

Over the past fifty years researchers have developed numerous theories about leadership dynamics, most of which concentrate on leaders themselves and the qualities and behaviors deemed necessary to be an “*effective leader*.” Situational leadership (e.g., Hersey and Blanchard 1996) holds that effective leaders should communicate by deploying a mix of directive and supportive behaviors compatible with followers’ “developmental levels.” Path-goal theory (e.g., House 1971) suggests that leaders must choose leadership styles best suited to followers’ experience, needs, and skills. Transformational studies (e.g. Lord and Brown 2003) argue that charismatic leaders can inspire followers to greater commitment by satisfying their needs, values, and motivations. Leader-member exchange theory (e.g., Graen and Uhl-Bien 1995) observes that leaders tend to be open and trusting with “ingroup” followers, but distant with “outgroup” members. Recent interest in “emotional intelligence” suggests that effective leaders need to develop greater awareness of the emotional dynamics of leadership processes.

Within the leadership communication literature there is growing interest in the *role of social identity* (e.g., Van Knippenberg & Hogg 2003). Informed by the idea that leadership is primarily a group process, social psychologists argue that leadership is contingent upon the degree to which leaders are perceived as “prototypical” of the group’s identity. They predict that followers will endorse leaders who quintessentially embody the values of the group (→ Group Communication). Relatedly, some researchers argue that when communicating with followers, leaders do and should manipulate their identities through → impression management strategies.

Researchers also suggest that by focusing on followers’ identity, *charismatic leaders* can profoundly transform subordinates’ commitment so that they perform above and beyond the call of duty. Arguing that people are motivated by concerns to express themselves and enhance self-esteem, these writers contend that charismatic leaders can validate followers’ identities by, for example, acting as role models and encouraging followers’ psychological identification and value internalization. From this perspective, leadership has been defined as a social process through which the leader changes the way followers envision themselves (e.g., by shifting the salience of different elements of subordinates’ identities or by creating new aspects of their self-concept) (→ Information Processing: Self-Concept).

The degree of leader “distance” is also a growing area of leadership research (e.g., Antonakis & Atwater 2002). Early writers argued that psychological leader distance was a precondition for sustaining charisma. More recent research reveals that distance between leaders and led can take many different forms. Distance may, for example, be social,

hierarchical, physical, and/or might be defined by interaction frequency. On the one hand, retaining a distance may be necessary for leaders to maintain a strategic overview, make “hard” decisions, and communicate “difficult” information. On the other hand, however, leaders can become so detached from the led that their “motivational” messages are no longer effective.

Although the foregoing leadership theories have produced useful insights, particularly about leaders’ behaviors, competencies, and skills, studies have sometimes been so concerned to produce law-like, universal generalizations about what constitutes effective leadership that they have undervalued the specificities and nuances of the contexts in which these processes occur. Some mainstream leadership perspectives have been criticized for relying on gendered, heroic images of the “great man.” Meindl et al. (1985) highlighted a tendency in the literature to “romanticize leaders” by developing overly heroic and exaggerated views of what they are able to achieve. Collins (2001) found that successful organizations tend to be led not by “larger-than-life” charismatic egoists, but rather by leaders who are quiet, modest, reserved, unpretentious, relatively humble, and self-effacing.

### CRITICAL PERSPECTIVES

Recently, more critical and “post-heroic” perspectives have questioned the tendency of mainstream studies to conflate leadership with leaders and to underestimate context. They argue that mainstream studies have sometimes underestimated the importance of followers and their relationships with leaders. In prioritizing leaders as the active agents, mainstream studies have viewed followers largely as passive recipients who will be susceptible to certain leader messages and behaviors. Critical approaches suggest that communication between leaders and followers is rarely neutral, usually embedded in asymmetrical power relations, and typically shaped by control practices that are historically specific (→ Organizational Communication: Critical Approaches; Organizational Communication: Postmodern Approaches).

Informed by various perspectives (from labor process theory to radical psychology, poststructuralism, and feminism; → Feminist and Gender Studies), critical leadership writers recognize that leaders’ power can take multiple economic, political, and ideological forms (Grint 2005). They show how control is not so much a “dependent variable” as a deeply embedded and inescapable feature of leadership structures, cultures, practices, and communication. Leaders in organizations can exercise control through, for example, constructing corporate visions, shaping structures and cultures, intensifying and monitoring work, and by making key strategic and HR decisions.

Critical writers reveal how leaders can also exercise control by “*managing meaning*” and defining situations in ways that suit their purposes. They contend that leaders’ hierarchical power enables them to provide rewards, apply sanctions, gain access to expertise, and secure followers’ consent. “Toxic leaders” (Lipmen-Blumen 2005) may exercise power in coercive, dictatorial, and narcissistic ways. The recent case of Enron revealed how the company’s leadership acted in highly self-interested and manipulative ways, suppressing dissent and promoting conformity with disastrous consequences for the organization and its employees (Tourish and Vatcha 2005).

Critical researchers also suggest that forms of control (particularly coercive practices) can produce *follower resistance* (→ Control and Authority in Organizations). Post-structuralist and feminist perspectives in particular highlight how followers may draw on strategic agencies and cultural resources to express disaffection in the workplace, exercise a degree of control over work processes, and/or construct alternative, more positive identities to those prescribed by the organization (Collinson 2005). They reveal how oppositional practices can take numerous forms, including strikes, “working to rule,” output restriction, “whistleblowing,” and sabotage. Even in the disciplinary context of the military, there is a long history of outright rebellion, mutiny, and spontaneous acts of follower dissent. In exceptional cases, subordinates may even successfully depose leaders.

Viewing control and resistance as discursive and contested, poststructuralist perspectives treat such dialectical practices as mutually reinforcing and simultaneously linked, often in contradictory ways. While not all follower dissent is aimed specifically at leaders, critical researchers suggest that employee resistance does frequently focus directly on the leaders of organizations, and particularly on the change programs they seek to instigate (→ Organizational Change Processes; Change Management and Communication). This is especially the case when followers believe they have not been consulted, perceive leaders to be “out of touch,” and when they detect discrepancies between leaders’ policies and practices. Research in a UK truck manufacturer, for example, demonstrated that a corporate-culture campaign introduced by the new US senior-management team to establish trust with the workforce had precisely the opposite effect (Collinson 2006). Further, while followers might be highly critical of leaders’ practices, they may decide, for fear of reprisals, to censor their views and camouflage their actions. Subtle subversions such as absenteeism, foot-dragging, disengagement, and even irony and satire can be disguised and ambiguous and thus difficult for leaders to address.

Feminist poststructuralist researchers argue that gender is a very important and frequently neglected feature of leadership dynamics. Observing that men tend to remain dominant in leadership positions, they reveal how masculinity continues to shape the styles, language, cultures, identities, and practices of leadership. A number of feminist researchers suggest that leaders themselves may engage in oppositional actions. Sinclair (2007) focuses on the “subversive leadership” of two Australian leaders, a woman chief commissioner of police and an aboriginal school principal, who achieved radical change in moribund systems. Meyerson (2001) shows how senior managers can attempt to effect (gender) change while working within the organization. “Tempered radicals” are frequently women in senior positions who are committed to their organization, but also to a cause that is fundamentally at odds with the dominant workplace culture. These feminist poststructuralist studies suggest that, within complex workplace power structures, leaders typically retain a degree of discretion that can, in certain circumstances, facilitate their own opposition to dominant organizational imperatives.

## FUTURE DIRECTIONS

It is likely that future research on leadership communication will extend the foregoing critical insights into the ambiguities, paradoxes, and dialectics of leadership. Recent poststructuralist and feminist interest in identity/identities is likely to inform more

research on the multiple, shifting, contradictory, and ambiguous identities of “leaders” and “followers.” Exploring how these subjectivities are negotiated in practice within complex organizational power relations will further enhance our understanding of leadership dynamics. *Research on followership* is also likely to become more prominent, with future studies building on the work of a small number of writers who highlight the importance of “exemplary” and “courageous” followers for “successful” organizations. This research is likely to enhance understanding about followers’ proactive agency as well as the potentially oppositional role of both followers and leaders themselves.

The *significance of context(s)* could also become much more deeply understood in future leadership studies, with greater awareness of the impact of specific settings on leadership and communication dynamics (e.g., leadership in the context of multinational corporations, new technologies, and the pressure to create sustainable environments). It is very likely that the foregoing emergent themes will facilitate new ways of thinking about the complex and paradoxical dynamics of leadership, raising a number of currently underexplored issues about what it may mean to be a “leader” and a “follower” within the organizations of the future.

# Learning and Communication

Ann Bainbridge Frymier

Miami University

The study of learning has been undertaken since the beginning of the twentieth century and has been heavily influenced by psychology. Although multiple definitions exist, learning has been generally defined as a persistent change in behavior or performance as a result of some stimulus. This definition encompasses both behavioral and cognitive aspects of learning. Behaviorism, which postulates that the environment has a direct impact on behavior, dominated roughly the first half of the twentieth century. In the latter half of the twentieth century, cognitive theories challenged behaviorism by asserting that learners process information obtained from the environment and that behavior is the result of how the information is processed. Learning theorists focused on understanding the process of learning, whereas other scholars sought to develop methods for measuring and assessing learning.

## THE CONCEPTUALIZATION OF LEARNING

One of the first efforts to assess learning systematically was led by Benjamin Bloom (1956), who put forth a *taxonomy of cognitive learning*. This taxonomy was intended to classify “the changes produced in individuals as a result of educational experiences” (Bloom 1956, 12), or in other words, *learning*. The taxonomy is hierarchical in nature, with each successive level subsuming the preceding one. The six major classes of learning are knowledge (lowest), comprehension, application, analysis, synthesis, and evaluation (highest). A primary purpose of the taxonomy was to facilitate the assessment of learning by creating common terminology and definitions for specific student behaviors.

In 1964, Krathwohl et al. extended the taxonomy of cognitive learning to include the *affective and psychomotor domains*. The affective domain emphasizes “a feeling, an emotion, or a degree of acceptance or rejection” (Krathwohl et al. 1964, 6) and includes receiving (attending), responding, valuing, organization, and characterization by a value or value complex. Similar to the taxonomy of cognitive learning, the taxonomy of affective learning is also hierarchical. Krathwohl et al. noted that affective objectives are

often assumed to have been accomplished if cognitive objectives have been obtained. However, they argued that, similar to higher levels of cognitive learning, affective learning develops when appropriate learning experiences are provided to students, and, therefore, affective learning – like cognitive learning – must be facilitated.

In 2001, Anderson and Krathwohl, with their colleagues, revised Bloom's taxonomy, creating a *two-dimensional taxonomy* consisting of the cognitive process and knowledge dimensions. They identified four organizing questions in education: (1) what is important for students to learn? (2) how should instruction be delivered? (3) how should learning be assessed? and (4) how can learning objectives, instruction, and assessment be aligned? The second question – how instruction should be delivered – has been the focus of the communication discipline.

### THE OPERATIONALIZATION OF LEARNING

Learning has been measured using performance and self-report methods. Performance methods usually involve some type of test of ability to recall information. A problem with this method is that students may score well on a test of knowledge not because they have learned the content, but because they already knew the information. Writing ability, anxiety, and other factors can also impact students' scores, reducing the validity of so-called *objective* tests. The self-report method involves asking individuals how much they think they have learned. Psychology and education scholars have favored performance methods because of their reliance on the experimental method, whereas communications scholars have relied more heavily on self-report methods.

Communication scholars have focused on how teacher communication behavior influences student learning, and have sought to make generalizations about teacher behavior across disciplines and age groups (→ Teacher Communication Style). In order to make generalizations, students' perceptions of their own learning have frequently been used. The use of self-reported learning is based on the assumption that adult students are aware of their learning and can self-report the general quantity they have learned from a class. The *measurement of learning* by self-report measures has been a contentious issue in the communication discipline, particularly the measurement of cognitive learning. However, at this point, the desire to generalize findings has overridden concerns about the self-report method. The two most commonly used self-report measures of cognitive learning are the cognitive learning measure (McCroskey et al. 1985) and the learning indicators scale (Frymier & Houser 1999). The McCroskey et al. measure consists of two questions. The first asks students to estimate how much they have learned on a scale from 0 to 9, and the second asks them to estimate how much they could have learned with an ideal teacher on the same scale. The answer to the first question is subtracted from that to the second to address students' lack of confidence in their ability to learn the content. The learning indicators scale consists of seven questions that ask how frequently students engage in behaviors believed to be a part of learning, such as relating content to other courses.

The *measurement of affective learning* also utilizes a self-report methodology. The construct of affective learning has been embraced in communication, and students' self-reported attitudes toward the content and the teacher have been the most common way

of measuring learning in communication. Affective learning was first measured in the late 1970s. In 1998, Mottet and Richmond examined both the conceptualization of affective learning and its measurement, and expanded the measurement of affective learning from six to eight constructs. Their instrument contains six constructs that measure affect toward the content and course and two that measure affect toward the teacher. The measurement of affective learning has been considered a reliable and valid measure and has been used in numerous studies.

## THE IMPACT OF COMMUNICATION ON LEARNING

A great deal of instructional communication research has focused on how teacher communication behavior impacts student learning. Learning is the most commonly used outcome variable in instructional communication research. However, other student outcomes, such as motivation and satisfaction, have also been studied. Because of the interest in generalizing across disciplines, instructional communication scholars have focused on general teacher communication behaviors rather than on discipline-specific teaching strategies. Six teacher communication behaviors (immediacy, affinity seeking, power, clarity, relevance, and humor) and one student characteristic (communication apprehension) have received significant research attention and are associated with student learning, particularly affective learning.

### Teacher Variables

Teacher *immediacy* has received the most research attention and has consistently been related to positive student outcomes (→ Teacher Immediacy). Immediacy is defined as a perception of physical and/or psychological closeness between people (Richmond et al. 1987). Jan Andersen (1979), the first communication scholar to examine teacher immediacy, found teacher use of nonverbal immediacy behaviors to be associated with affective (but not cognitive) learning, and this finding has been replicated consistently over time. The correlation between nonverbal immediacy and affective learning has typically been moderate to moderately large, indicating a consistent and substantial relationship between nonverbal immediacy and affective learning. The relationship between immediacy and cognitive learning has been less certain. Immediacy has consistently been positively related to self-reported cognitive learning, and has also been associated with a higher rate of recall in a handful of experimental studies, negating Andersen's (1979) finding to the contrary. Immediacy appears to impact primarily students' attitudes and motivation, which, in turn, has some impact on cognitive learning. For a thorough review of the construct of teacher immediacy, see Richmond et al. (2006).

A second teacher variable, *affinity seeking*, was first discussed by McCroskey and Wheelless (1976), who defined it as a positive attitude toward another person. Later, Bell and Daly (1984) expanded and refined the construct of affinity seeking and identified 25 affinity-seeking strategies. The affinity-seeking typology was applied to the education setting, both to see if teachers used affinity seeking in the classroom and to examine the impact of affinity seeking on student learning and motivation (→ Teacher Affinity Seeking). Although the body of research is not large, multiple studies have concluded that

both K-12 and college teachers use affinity seeking to gain student liking, and that some affinity-seeking strategies are associated with student affect and motivation. Although conclusions vary somewhat on which strategies are the most appropriate and effective in the classroom, some – facilitate enjoyment, optimism, assume equality, conversational rule-keeping, comfortable self, dynamism, elicit other's disclosure, altruism, listening, and sensitivity – have consistently been identified as useful for teachers. For a more thorough review of affinity seeking in the instructional context, see Frymier and Wanzer (2006).

How teachers go about influencing students to do specific tasks is referred to as *compliance gaining* in general, which is a concept that is rooted in the construct of power (→ Classroom Power). McCroskey and Richmond (1983) were the first to examine teachers' use of power in the classroom. Subsequent research has found that students' perceptions of teacher use of referent and expert power are positively associated, while those of teacher use of coercive and legitimate power are negatively associated, with affective learning. How teachers enact power in the classroom was examined by Kearney et al. (1985), who identified 22 compliance-gaining strategies used by teachers, which they refer to as behavioral alteration techniques (BATs; → Classroom Management Techniques). Most of the BATs can be classified as enacting one of the five power bases (reward, coercive, legitimate, referent, and expert). Consistent with the research on power, the BATs based in referent, expert, and reward power are associated with affective learning, and those based in coercive and legitimate power are negatively associated with affective learning. Plax et al. (1986) replicated these relationships and found that nonverbal immediacy moderated the effect of BAT use on students' affective learning. For a more thorough review of power and learning, see Roach et al. (2006) and Richmond & McCroskey (1992).

Immediacy, affinity seeking, and power are primarily relationship variables that influence the teacher–student relationship. How a teacher presents content and structures messages also influence student learning (→ Pedagogy, Communication in). One such variable is clarity (→ Teacher Clarity). Clarity refers to teacher behaviors that contribute to the fidelity of instructional messages (Chesebro & Wanzer 2006). When teachers are clear they do things such as use examples, stress important points, and use organizational cues to facilitate student note taking. Clarity can also include having a clear syllabus, clear assignments, checking for understanding, repeating important points, and using nonverbal behaviors to facilitate student understanding. Clarity has been operationalized in numerous ways, making it difficult to draw specific conclusions about its impact on learning. However, clarity, in its many operationalizations, has been consistently associated with positive outcomes for students and has been linked to both cognitive and affective learning.

Another aspect of how a teacher presents content is how *relevant the message* is to students. When students perceive the instructor's message as relevant, they see the content as satisfying personal needs, personal goals, and/or career goals (Keller 1983). There has been a limited amount of research on relevance as a communication phenomenon. Relevance strategies have been associated with on-task behavior, and perceived relevance has been associated with self-reported learning (affective and cognitive). However, research on relevance in communication has been stymied by difficulties in manipulating relevance. The existing research indicates that when students perceive a teacher's message as relevant

to their interests or needs, their learning is enhanced. However, the specific behaviors that lead students to perceive a teacher's message as relevant are not well understood. For a thorough review of the research on relevance, see Chesebro and Wanzer (2006).

*Humor* is a communication variable that teachers can use to enhance their relationship with students, as well as being a strategy for presenting content (→ Teacher Use of Humor). Humor has been studied extensively both in and out of the classroom. The first way in which humor has been studied is in experimental designs where humorous messages are manipulated. A problem with this approach is that there are so many different forms of humor and only one or two of them can be used in any one experiment, making generalizations difficult. A second method has focused on describing what types of humor messages are used by teachers. This line of research has been useful in describing how humor is used, and has provided an understanding of the vast array of humor messages used by teachers. A third method has been to focus on humor as a personality characteristic, or more specifically, humor orientation. Humor orientation refers to a predisposition to use humor in a variety of situations (Booth-Butterfield & Booth-Butterfield 1991).

The results of these different approaches have revealed that the use of humor is associated with learning, that teachers use a variety of humorous messages (some of which are inappropriate), and that students report learning more from teachers who are perceived as humor oriented. Research has just begun to compare the impact of a humorous message in relation to how the humor is delivered by a teacher. Humor is one of the more complex communication variables studied in the classroom because of the number of forms a humorous message can take, the role of delivery by the teacher, and individual student differences in perceiving the humorous message. At this point, research indicates that humor, when used appropriately, is a useful teaching tool. However, it should be used to enhance other teaching strategies such as immediacy, clarity, and pro-social use of power, and not as a standalone technique. For a thorough review of humor in relation to learning, see Chesebro and Wanzer (2006).

### **Communication Apprehension**

Although teachers have a major impact on the classroom environment and on how students behave in the classroom, students also impact the learning environment. How students impact the classroom and their own learning has received little attention, with the exception of the → communication apprehension (CA) construct. CA is the fear or anxiety associated with real or anticipated communication (McCroskey 1978). CA has consistently been negatively associated with student learning and other student outcomes (→ Communication Apprehension). Highly apprehensive students learn less, receive lower grades, and have lower ACT scores. Many teachers in the United States expect students to interact in the classroom, and they base grades and other evaluations on students' oral communication in class. While there are treatment options available to students with high levels of CA, skills training alone (e.g., requiring students to take communication-intensive courses) is not an effective treatment (→ Communication Apprehension: Intervention Techniques; Reticence). For a thorough review of the impact of CA on students, see McCroskey & Richmond (2006).

Beginning in the 1970s, communication scholars have examined the role of several communication variables in learning environments. This research has been based on the premise that teaching is communicating and to be an effective teacher, one must be an effective communicator. Scholars in this area have purposely avoided studying the presentation of specific content. Rather they have focused on identifying effective communication behaviors that go across disciplines. Verbal and nonverbal communication behaviors that communicate approach, liking, caring, and interest in students have consistently been found to be positively associated with affective learning and motivation, and to a lesser degree, cognitive learning.

## Learning Organizations

Joel O. Iverson

Texas A&M University

A learning organization is most simply described as an organization in which learning has become a part of the → organizational culture. As Lehr and Rice (2002, 1062) state, “organizational learning is most often treated as an extended process through which organizations grow, change, adapt, and improve to remain viable.” Interest in learning organizations can be tracked to the early interests in → organizational change processes, organizational culture, and organizational improvement.

The goals of learning organizations include maximizing the organization’s potential, adaptability to turbulent environments, and flexibility for change, increasing knowledge sharing among employees (→ Knowledge Management), and creating strong organizational cultures. Learning organizations are contrasted with stagnant, unyielding, and overly bureaucratic organizations. The organizational learning literature is significant and growing (see Daft & Huber 1987; Weick & Ashford 2001).

Learning goes beyond information sharing to include understanding and “know-how” (Yanow 2004), involves application, is situated (Raz & Fadlon 2005), and involves various levels and types. For example, Argyris and Schön (1978) differentiate between simple problem–solution thinking (single-loop learning) and a more reflexive learning where the underlying assumptions, thinking, and even organizational processes come into question (double-loop learning).

## ROLE OF COMMUNICATION IN ORGANIZATIONAL LEARNING

Some theorists emphasize that communication is an important instrument of learning. The role of communication is to share information by making it explicit (Lehr & Rice 2002), as a mechanism to build trust (Barker & Camarata 1998), and to provide a means to overcome barriers to organizational learning. Weick and Ashford (2001), for example, treat clear communication as critical for message differentiation, as in the case of a pilot asking for “takeoff power” (an increase in power) who is heard by the engineer as asking to “take off power” (a decrease in power), resulting in a crash. Communication is the way information and “learnings” are moved around the organization. Communication is examined from a linguistic perspective as a resource for examining mistakes to enhance future learning (Jones & Stubbe 2004). While the instrumental perspective provides insights into organizational learning and offers communication as a mechanism to increase organizational learning, this view risks restricting communication to a role as only the conduit of information and a variable reflected in word choice.

Another view grounds organizational learning as a socially constituted, communicative *process* rather than merely an instrument of learning, critiquing the instrumental view as “divert[ing] focus from relational development, community-building and cultivation of dialogic processes in favor of a more traditional emphasis on organizational knowledge products” (Bokeno & Gantt 2000, 240). The creation of open dialogue and empowerment that defines the organizations in terms of relationships characterizes the desired culture of learning organizations (→ Dialogic Perspectives). A learning organization looks to build relationships throughout the organization so that knowledge from workers on the front lines and outside the organization can be incorporated into decision-making (Yanow 2004). Styhre et al. (2006, 84) examine learning as “embedded in verbal and symbolic interaction.” The process view focuses on organizational learning as a result of communicative interactions and relationships such as storytelling, mentoring, and communities of practice.

Organizational learning from an *interactive perspective* focuses on the development of open relationships. One mechanism is dialogic mentoring, which meets the goal of learning organizations by letting the learners learn through relationships that enhance the processes of framing, support, modeling, argument, experimentation, and innovation (Bokeno & Gantt 2000). Dialogic mentoring emphasizes openness, welcoming, contradiction, and tension as healthy processes that energize learning. This relationship is primarily dyadic, with one mentor and one protégé. Mentoring can be productive, but is limited to organizations where those relationships can be developed.

*Communities of practice* offer another communicative approach that incorporates assumptions about empowerment, openness, and creating an organizational environment that cultivates learning in the organization (→ Communities of Practice), but shifts the focus from the dyadic to the group level of → interaction. Within communication literature, communities of practice are considered mechanisms of organizational learning that are primarily communicative. Zorn and Taylor (2004) indicate that communities of practice serve as models for the way organizational knowledge is communicated in the organization. Iverson and McPhee (2002) note three elements of a community of practice that exemplify an active process of learning. First, members must share a repertoire or set

of skills that are continually learned, rehearsed, and adjusted through the process of practice. Second, the members mutually engage with one another by communicating about their practices and by practicing together. Third, the members negotiate their joint enterprise through empowered interaction. Participation in decision-making about the nature of the practice is what allows the learning to become an organizational process. The negotiation of a joint enterprise encapsulates the ability to learn, give new directions, and even engage in double-loop learning that gives the reflexivity of organizational learning.

Learning organizations (including communities of practice) cannot be managed by command and control, but instead need to be cultivated by valuing their learning, providing resources and time for learning to occur, and encouraging participation. Learning organizations can be cultivated through communication practices of celebration by recognizing accomplishments, articulation through storytelling and putting knowledge into words, and collaboration by creating a collective, cooperative environment. Celebration, articulation, and collaboration provide conditions that nurture the learning culture through communication processes.

Organizational learning has been *explored* through measurement instruments as well as relational mechanisms to enact organizational learning. The *Organizational Learning Profile* is one representative instrument that considers the factors of information-sharing patterns, inquiry climate, learning practices, and an achievement mindset (Pace 2002). Information sharing examines the amount of information and the means of sharing, while inquiry climate focuses on the challenging, questioning, and experimenting behaviors that attempt to make improvements in the organization. The achievement mindset is “the perspective that organization members have regarding their desire to achieve in the organization” (Pace, 2002, 460).

## CRITICISM

Organizational learning can include so many different activities, processes, and goals that the construct can become *devoid of meaning*. Thus a learning organization becomes more of a stated goal than an achieved state.

Another criticism emerges from the tendency to treat learning as an *unquestioned good*, ignoring the risks of enacting large organizational learning schemes. Critics focus on the ideology of learning that serves management and its potential for abuse. Organizational learning asks for more effort and output from members, often with few extra rewards. Engaging in learning communities can lead to participatory surveillance (Driver 2002; → Control and Authority in Organizations), when a team pressures fellow employees. Thus, it is important to accept the limits of organizational learning and minimize the negative outcomes of transforming to a learning organization through transparency and reflection.

Overall, organizational learning emphasizes the need for organizations to cope with changing environments and new technologies, and to find ways to improve performance. Organizational learning either focuses on communication as an instrument of learning or recognizes that learning happens through communicative interactions and relationships. Research in communication has focused on measuring learning, creating learning systems,

and building relationships through mentoring and groups such as communities of practice. Whether organizational learning is genuine reform or creates new forms of managerial control depends on the context and enactment of these programs.

# Legitimacy Gap Theory

Roy Langer

Roskilde University

Sethi (1975) defined a “legitimacy gap” as an expectancy gap indicating a discrepancy between an organization’s actions and society’s expectations of this organization. Legitimacy gaps can threaten an organization’s image and reputation, and ultimately its existence as a legitimate member of the business community and society (Bridges 2004; → Corporate Reputation; Organizational Image). Hence, legitimacy theory asserts that organizations avoid conflicts and ensure that they operate within the boundaries and norms of their respective societies, so their activities are perceived as legitimate (Sethi 1977). While legitimacy has been frequently studied in sociology, organizational studies, and political science, Heath (2001) asserts that legitimacy gap theory will play a more important role in → organizational communication due to an increased focus on dialogue and relationship management between organizations and their stakeholders (→ Stakeholder Theory).

Legitimacy gap theory is tied to the broader concept of → issue management and social contract theory, which posits that organizations are bound by social contracts to conduct socially desired actions in return for approval of their objectives and other rewards. Most notably, legitimacy gap theory is closely related to the concept of → *corporate social responsibility*. Society’s expectations of an organization can address various issues and practices, such as an organization’s recruiting and employment policies, environmental impact, marketing and communication ethics, and accounting practices. Such expectations are grounded in social norms and values that are changing over time (Heath 1997). Organizations that are not able to honor these norms and values and adapt to new expectations from society at large or from specific stakeholder groups are at risk of losing their “license to operate” (→ Trust of Publics).

Recent prominent examples exemplifying this risk include the case of Shell, which wanted to dump its oil platform *Brent Spar* into the Atlantic (1995); the bankruptcy case of Enron – one of the world’s leading electricity, natural gas, pulp and paper, and communications companies – due to accounting fraud (2001); and the financial fraud scandal and bankruptcy of Europe’s biggest dairy and food company, Parmalat (2003).

Since the late 1960s, a growing amount of research addressed the ethical and philanthropic responsibilities of organizations, as companies should no longer just satisfy the needs of their shareholders, but should consider the social needs of other stakeholders (Carroll 1991). By proposing activities that facilitate awareness of potential legitimacy gaps, legitimacy gap theory has contributed to proactive research that seeks to analyze the organization’s perception by its stakeholders in order to prevent organizational crises (→ Crisis Communication). Several researchers emphasize that increased social performance can improve employee morale and community trust; and ultimately can have positive effects on the financial performance of organizations (Margolis & Walsh 2001).

Organizations can apply → strategic communication in order to establish, maintain, extend, or defend their legitimacy and reputation. Such *strategies include*: (1) continuous

and consistent reports about the organization's environmental, ethical, and social performance; (2) information from stakeholders about behavioral changes in attempts to adapt to changing social norms; (3) engagement in social causes that affect stakeholder perceptions positively (e.g., cause-related marketing and sponsorship of social causes); (4) engagement in dialogue about expectations and creation of alliances with stakeholder institutions and organizations that possess a strong positive reputation (e.g., NGOs); (5) alteration of existing social definitions of legitimacy without changing behavior; (6) modification of external expectations to concur with current organizational practices; and (7) application of rhetorical response strategies in legitimacy crises. From a communication ethics perspective, all of these strategies can be applied with the intention of either creating more transparency and legitimacy or manipulating stakeholder expectations toward a perception of the legitimacy of an organization.

As social expectations toward the legitimacy of organizations have constantly been increasing over recent decades, it can be expected that legitimacy gap theory will be developed further in the future. Such future development might well receive further inspiration from other disciplines, such as from gap analysis between intended and actual corporate images in corporate branding research or from research on social and environmental accounting.

# Lerner, Daniel

*Hemant Shah*

*University of Wisconsin-Madison*

Daniel Lerner (1917–1980) was the author of *The passing of traditional society: Modernizing the Middle East* (1958), a study of Egypt, Iran, Jordan, Lebanon, Syria, and Turkey that provided the first comprehensive statement of the role of mass communication in the process of modernization for postcolonial countries (→ Egypt: Media System; Iran: Media System; Postcolonial Theory). The general theory posited a model of societal transformation for poor countries made possible by embracing western manufacturing technology, political structures, values, and systems of mass communication. In Lerner's model, increasing urbanization led to the growth of mass media (as people demanded news and information) and literacy (as more and more schools were built), which in turn resulted in greater public participation in economic activity and politics. Lerner maintained that mass communication was the key factor in helping traditional societies to become modern (→ Media Effects; Modernization). Lerner theorized that radio, television, magazines, and newspapers were important catalysts of the modernization process (→ Development Communication; Development Communication: Middle East; Radio for Development; Television for Development). The mass media provided information about the modern west and vicarious experiences of modern lifestyles to audiences in the postcolonial world. Audience members with highly empathic personalities – those who could easily imagine themselves in different circumstances – would begin to think and behave in ways that helped transform their countries from traditional societies to modern ones modeled primarily on the United States. Empathy, a key psychosocial factor in the modernization, is perhaps Lerner's key contribution to the area of development communication (→ Empathy Theory).

Lerner was born in Brooklyn, New York, on October 30, 1917. After earning Bachelor's and Master's degrees from New York University, Lerner was inducted into the army. He was commissioned as a second lieutenant in November and took additional training in civil affairs and signal intelligence before shipping out to France where he worked with the French Forces of the Interior (FFI). Lerner was wounded in August 1942 and, after a period of recuperation, was transferred to the Psychological Warfare Division (PWD) in Paris. At PWD, he edited the daily compilation of intelligence field reports, working closely with Edward Shils and Morris Janowitz, leading American sociologists. Lerner's supervisor was Murray Gurfein, a lawyer who was to become well known as the judge who issued the injunction to prevent publication of a US government study of how the country became involved in the Vietnam war ("Pentagon Papers", 1971). Lerner was awarded the Purple Heart and the Bronze Star by the US military and the Croix de Guerre by the French military for his work with the FFI.

After the war, Lerner took a position at Stanford University's Hoover War Library (later renamed the Hoover Institution) on a research project called Revolution and the Development of International Relations (RADIR). The project analyzed journalism

in a large number of countries to determine their orientations toward the United States, the USSR, and other key players in postwar international relations. RADIR was supervised by → Harold D. Lasswell, who became Lerner's lifelong friend and mentor.

While at Stanford, Lerner completed a dissertation at New York University on the effects of Allied propaganda on the German people. He discovered that Allied propaganda had been most effective among a certain group of Germans, using a modified version of a categorization scheme developed in part by his former PWD colleague Shils to divide the German targets of propaganda into three types: the "hard-core Nazis," who were impervious to Allied propaganda; the "anti-Nazis," who were already converted to the Allied viewpoint; and the "nonpoliticals," who were ambivalent about the Allied perspective. He concluded that the best use of Allied propaganda had been to target the ambivalent group because they were the hearts and minds most likely to be won over (→ Propaganda in World War II; War Propaganda).

Lerner gained his doctorate in American civilization and social science in 1948. While in New York for his dissertation defense, Lerner met with → Paul F. Lazarsfeld at Columbia University to ask about recruiting scholars for the RADIR projects at Stanford. Lazarsfeld subsequently invited Lerner to Columbia's sociology department as a visiting professor in January 1951. During that semester, Lerner worked on a research project at Lazarsfeld's Bureau of Applied Social Research (BASR), examining the effectiveness of → Voice of America (VOA) broadcasts in several Middle East countries. In a report he wrote about Turkey, he divided the Turkish listeners into three categories, much as he had done in his dissertation on German targets of Allied propaganda: the "modern," who were already more or less pro-western; the "traditional," whose personalities were constricted by backwardness and a narrow range of experiences; and the "transitional," an ambivalent group who exhibited some traditional and some modern orientations. The ideal policy for VOA, Lerner concluded, would be to target the transitional group, for they were most ripe for conversion to western views. In his report Lerner also briefly introduced the idea of projection, the notion that mass media content could help certain listeners project themselves into unfamiliar roles and surroundings (Lerner et al. 1951, 20). This relationship was later elaborated more fully in *The passing of traditional society* as the concept of empathy.

In 1958, the year *The passing of traditional society* was published, Lerner was named the Ford Professor of International Communication at Massachusetts Institute of Technology. He wrote prolifically about propaganda and war, social science methods, and communication and development (Lerner 1963; Lerner & Schramm 1967). Lerner retired from MIT in 1977 at the age of 59. In 1978, he and his wife Jean moved to Santa Cruz, California, where he was an adjunct professor of sociology at University of California, Santa Cruz. Lerner died of bone cancer on May 1, 1980.

## **Libel and Slander**

*Edward L. Carter*

*Brigham Young University*

The law of defamation targets false communication, whether by words, pictures, gestures, or music, that causes one's reputation to be harmed among a respectable segment of society. The law, especially in Euro-American nations, traditionally distinguished between libel (written) and slander (spoken). Recovery for slander generally required proof of special damages, or monetary loss, because the mere spoken word was thought to carry less potential for harm than the written word.

In many jurisdictions, including the United States, the distinction between libel and slander has been blurred and no longer holds great importance. In jurisdictions that maintain the distinction between libel and slander, however, an important and unresolved question is whether defamatory → Internet communications constitute libel or slander.

The law of defamation in a society reflects, to a great extent, assumptions about the relative value of reputation versus freedom of expression (→ Freedom of Communication). For example, the US Supreme Court in *New York Times Co. v. Sullivan* takes a constitutional “actual malice” approach to protecting unknowing false and defamatory statements about public officials and public figures. Few nations follow the uniquely media-friendly approach of American libel law, but contemporary defamation laws around the world tend to protect freedom of expression more so than in the past.

Sanctions for libel and slander date to the *earliest recorded history*. For most contemporary common-law and civil-law systems, the roots of libel and slander may be traced to the Roman Empire. Roman law greatly influenced development of early European civil law systems. By about the twelfth century, Spanish municipal codes began to prohibit verbal insults, listing prohibited words.

Roman law likewise influenced development of common-law libel and slander. During the reign of Henry III (1216–1272) in England, libel was defined as “the use of abusive language addressed to a man publicly or the act of inciting a crowd to beset a man's house or to mob the man himself.” In the sixteenth century, the infamous Star Chamber of England determined to stamp out dueling by vigorously prosecuting the sending of challenges. The Star Chamber propagated both civil and criminal punishments for defamation.

## **CRIMINAL AND CIVIL SANCTIONS FOR DEFAMATION**

Under the Star Chamber, civil actions for defamation replaced physical confrontation. Meanwhile, the Star Chamber also punished defamation as a crime in order to prevent sedition. Under this criminal defamation law, truth was no defense. In fact, true statements were more likely than false ones to provoke breach of the peace.

Criminal libel fell into disuse in America in the twentieth century as most state legislatures and judges viewed the proper sanction for defamation to be monetary damages rather than incarceration. But criminal libel remains on the books in more than a dozen US states even into the twenty-first century. Significantly, however, Mexico decriminalized libel to protect freedom of the press in 2007.

A 1990 *global survey* concluded that more than 100 nations punished, as a crime, the “insult” of government and government officials. Insult laws differ from criminal libel laws in that insult laws do not require the information to be false and instead focus on protecting “honor and dignity” even in the face of true but reputationally harmful statements.

## **DEFAMATION IN DIVERSE JUDICIAL SYSTEMS**

### **Basic Elements of Defamation and Defenses under US Approach**

In US law, a plaintiff must prove that the statement in question was (1) false, (2) likely to cause reputational harm among right-thinking members of society, (3) factual in nature rather than mere opinion or incapable of objective verification, (4) made “of and concerning” the plaintiff, (5) communicated to a third party, and (6) made with the requisite degree of fault (→ Communication Law and Policy: North America). The United States, like many nations, allows not only individuals but also corporations to sue for libel; remedies may be available for product disparagement.

After US Supreme Court holdings in *New York Times Co. v. Sullivan* and subsequent cases, the First Amendment to the US Constitution prohibits liability for statements about public officials or public figures unless the plaintiff can prove “actual malice,” defined as knowledge of falsity or reckless disregard for the truth. Liability may be imposed for statements about private individuals with a showing of mere negligence, but the First Amendment prohibits strict liability.

Media defendants may invoke several common-law privileges. The fair report privilege prevents liability for fair and accurate descriptions of judicial, executive, and legislative proceedings, even if the original statements made in those settings turn out to be false. Opinion, or fair comment, is also privileged as long as statements are purely opinion and not factual in nature.

### **“Responsible Journalism” as a Libel Defense in England**

At English common law, certain statements – accusing someone of lying, committing a crime, or having a loathsome disease – were libelous *per se*, meaning they were not capable of innocent meaning and required no additional information for defamatory meaning to be evident (→ Communication Law and Policy: Europe). Libel *per quod*, on

the other hand, required extrinsic evidence: stating that a woman is pregnant would not harm her reputation unless additional information (that she is married but her husband has been out of the country for 10 months, for example) is known. Practically speaking, contemporary sanctions do not differ for libel *per se* and libel *per quod*.

With respect to falsity, English common law required only substantial truth, meaning minor inconsistencies were excused. The substantial truth doctrine is preserved today in the United States, but England and most nations other than the United States place the burden of proving truth on the communicator. A 2006 international libel and privacy handbook documented that truth is an absolute or qualified defense in 15 of 19 nations surveyed.

In 1999 the British House of Lords, in *Reynolds v. Times Newspapers Limited*, established “responsible journalism” criteria to measure whether media are entitled to a qualified privilege to report potentially defamatory information. The criteria include seriousness of the allegation, extent to which the matter is of public concern, source of information, steps taken to verify information, and presence of claimant comment, among others. English media defendants still must overcome the presumption of falsity and damage.

In the 2006 case *Jameel v. Wall Street Journal Europe*, the House of Lords wrote in *Sullivan*-like language that a newspaper’s story about US monitoring of a Saudi businessman’s bank accounts was not defamation because the matter was one of public interest, the defamation was justified, and reporting methods were responsible. *Jameel* strongly endorsed application of the *Reynolds* criteria to protect responsible → investigative reporting on matters of public concern notwithstanding reputational harm and falsity.

### **Communist China: Socialist Approach to Libel Law?**

While guaranteeing freedom of expression as a right, the Chinese Constitution of 1982 explicitly protects a right of personal dignity that includes liberty from insult and false incrimination (→ Communication Law and Policy: Asia). In China, where the media are part of the state power in a communist society, libel is a tort of strict liability (→ China: Media System). The law punishes as defamation not only false statements of fact but also malicious tarnishing of another’s image and insulting of another’s reputation. Significantly, however, no injury to reputation is presumed.

Chinese law does not require that an individual be identified by name or image in order to sue for libel. Accounts cloaked as fiction but based on reality are potentially defamatory if a specific person is readily identifiable by acquaintances. Group libel and libel of the deceased are recognized.

As in the common law countries, the fair report privilege, and fair comment have been accepted as libel defenses. But prominent individuals are not held to a higher standard in proving fault, and expression on matters of public interest are not afforded a greater degree of protection. Defamation is present if the communicator acted with negligence, in that he or she failed to live up to the standard of care that would have been expected from one in his or her position.

The one-party China strictly forbids seditious libel, as the 2002 Regulation on the Administration of Press and Publication states. Further, the media are required to follow

directives from the Chinese Communist Party on what should not be published, including criticism of the Party.

### **Japan: Confucianism in Libel Law**

As compared with the Anglo-American concept of reputation as a right of individuals, Japanese look at their reputational interests in relation to the groups to which they belong. Thus, Japanese view defamation as a loss of face to their familial group on the basis of Confucian tradition.

The present Japanese Constitution was modeled after the US Constitution. It guarantees freedom of expression, but that freedom can be qualified under the “public welfare” justification for its restriction. Truth is no defense to criminal defamation unless it relates to the public interest. The Civil Code makes defamation an unlawful act, i.e., tort. It provides for pecuniary compensation and other “suitable measures,” such as public apology and injunction. The US “actual malice” doctrine has not been accepted in Japan.

Compared with the United States and other western liberal democracies, libel litigation in Japan is relatively rare, although it has become an increasing concern to news media in recent years. One explanation for the relatively small number of libel cases in Japan is socio-cultural: many Japanese still feel they should not trouble the media, a powerful institution in society, with claims for reputational injury. Interestingly, criminal libel is often preferred to civil libel because criminal libel prosecution is less costly and more prompt.

### **International Law on the Sullivan Libel Rule**

International human rights tribunals, including the → European Court of Human Rights, long resisted the adoption of a *Sullivan* “actual malice” rule. But in the 1986 case *Lingens v. Austria*, the European Court found that the criminal libel conviction of an Austrian journalist for criticizing a government official was in violation of the free-expression provision of the European Convention on Human Rights. In 2004 the → Inter-American Court of Human Rights, based in Costa Rica, reached similar conclusions in two cases of criminal libel convictions. The Court applied the American Convention on Human Rights; although the Court stopped short of adopting the *Sullivan* “actual malice” standard, it applied a test that produced a similar result.

### **TECHNOLOGY’S EFFECT ON LIBEL AND SLANDER**

Contemporary problems of libel and slander include jurisdictional and other issues brought on by Internet communication. In the landmark 2002 case *Dow Jones and Co. v. Gutnick*, the High Court of Australia held that an Australian could sue an American publisher in Australia for defamation, based on the publication of online statements. In other words, the defamation occurred at the place of reception and not only at the place of publication.

Another thorny problem has involved the effect of the Internet on the common-law rule that a republisher of libel or slander was just as culpable as the originator. The US Congress in 1996 adopted a provision protecting Internet service providers from liability

for libels propagated by users in electronic mail messages or on electronic bulletin boards. But few countries have gone that far in immunizing providers altogether.

## **Licensing of Journalists**

*Toby Mendel*

*Article 19, Global Campaign for Free Expression*

For the purposes of this entry, licensing of journalists is understood to mean a system whereby individuals are required to apply to an external authority for permission to practice journalism, which permission may be refused or revoked. Closely related to licensing are regimes whereby journalists are required to belong to a certain professional association, such as a journalists’ syndicate, and where such associations may refuse or revoke membership (→ Journalism; Journalism: Legal Situation).

In some countries, the law places certain *minimum conditions* on who may practice journalism, such as minimum age or training criteria, or citizenship requirements.

Formally, this is not licensing as it does not involve the possibility of permission to practice journalism being refused or revoked. However, where the conditions go beyond the purely technical, for example by removing the right to practice journalism upon conviction for criminal defamation, this system starts to reflect some of the key problems associated with licensing.

*Accreditation*, on the other hand, is quite different from licensing, although the two are sometimes confused. Accreditation involves the granting of special privileges, most commonly access to restricted areas such as legislatures and courts, to journalists on the basis that they will inform the wider public about these proceedings. Where accreditation is abused on political grounds, for example to deny access to critical or independent journalists, it can take on some of the negative features of licensing. The general question of whether it is legitimate to ban someone from the practice of journalism was addressed early on by the European Commission of Human Rights in the case of *De Becker v. Belgium* (January 8, 1960, Application No. 214/56). De Becker had been convicted of collaborating with the German authorities during World War II in his role as editor of a Belgian daily. His death sentence was commuted and he was released from prison, but a ban on him exercising certain rights, including working as a journalist, remained in effect for life. De Becker challenged this ban on the basis that it breached his right to freedom of expression (→ Freedom of the Press, Concept of). The commission held that the ban on de Becker breached his right to freedom of expression because it was inflexible and permanent. Although the commission did not entirely rule out the possibility of a ban, the decision has to be understood in light of the extreme circumstances of the case, namely, that de Becker had committed treason while Belgium was at war and under enemy occupation. This suggests that prohibiting access to journalism through a mere licensing system could never be legitimate.

International standards support this view. The main issue in an advisory opinion of the Inter-American Court of Human Rights, *Compulsory Membership in an Association Prescribed by Law for the Practice of Journalism* (November 13, 1985, Series A. No. 5), was whether or not compulsory membership in a statutory journalists' association was legitimate. Three arguments were advanced in support of the system. First, public order required such regulation of the profession, which was also "normal" for all professions. Second, membership would promote high professional and ethical standards, supporting the right of the public to receive full and truthful information. Third, compulsory membership would help protect the independence of journalists in relation to their employers. The court accepted that mandatory membership could contribute to public order, understood broadly to include the idea that journalists should "act in good faith and in accordance with the ethical demands of the profession." However, public order in this broad sense was dependent upon strict respect for freedom of expression, as the court noted: "Freedom of expression constitutes the primary and basic element of the public order of a democratic society . . . It is also in the interest of the democratic public order . . . that the right of each individual to express himself freely and that of society as a whole to receive information be scrupulously respected." The court concluded that restricting access to the journalistic profession did more harm than good to public order.

In rejecting the argument that all professions are subject to licensing regimes, the court distinguished between journalism and, for example, the practice of law or medicine. In

contrast to those of lawyers and doctors, the activities of journalists are specifically protected as a fundamental human right (→ Professionalization of Journalism). The court also rejected the argument that the system would promote professional standards and protect the public's right to be informed. It held, rather, that the public welfare is best served by promoting the "greatest possible amount of information" and that conditioning freedom of expression on the truthfulness or quality of information was open to abuse and "violates the right to information." The court also found that the goal of protecting media workers against their employers could be accomplished through less intrusive means than restricting access to the profession and, as a result, the licensing scheme could not be justified.

Some national courts have taken a similar point of view. For example, in August 1997, the High Court of Zambia held that any attempt to establish a statutory body to regulate journalists would breach the right to freedom of expression, regardless of the form it took (*Kasoma v. Attorney General*, August 22, 1997, 95/HP/29/59). The three special mandates for protecting freedom of expression – the UN special rapporteur on freedom of opinion and expression, the OSCE representative on freedom of the media, and the OAS special rapporteur on freedom of expression – adopt a Joint Declaration each year setting out standards relating to important freedom of expression issues. In their Joint Declaration of December 18, 2003, they stated quite clearly: "Individual journalists should not be required to be licensed or to register."

## **Limited Capacity Model**

Annie Lang  
Indiana University

The limited capacity model of motivated mediated message processing (LC4MP) is the most recent version of a data-driven model (→ Models of Communication) that tries to

explain how human beings process all types of mediated messages (A. Lang 2000, 2006a, 2006b; → Information Processing). This model differs from the vast majority of communication theories in a number of ways.

First, it is *not an effects theory*. That is to say that it makes no effort to examine the relationship between some specific type of content in a media message and a later behavioral action. Second, it is not a theory about a specific type of media content (violence, politics, sex, advertising, health). Instead, its goal is to *generalize to all types of content* and to completely describe the realm of possible contents through psychologically relevant independent variables such as emotion, difficulty, relevance, redundancy, narrative strength, etc. Third, this theory is not *limited to a specific medium* but is meant to be relevant to all currently existing media and those not yet invented. Again, this means that media are described not by their names (radio, TV, computer, video game) but instead by a set of psychologically relevant variables (channel of information presentation, range of structural features, luminance, content forms, movement, etc.). Finally, the theory is *data-driven*. This means that it is constantly evolving so as to remain compatible with the state of knowledge in related disciplines and in the field of communication.

The broad outline of the theory is simple. It involves five assumptions, three sub-processes, two systems, and automatic and controlled resource allocation mechanisms. Each aspect of the theory has at least one validated operational definition. The complexity lies not in the overarching framework of the theory but rather in the task of explicating the specifics of the theory in the myriad of contexts to which it applies.

### THE FIVE ASSUMPTIONS

The five assumptions of LC4MP arise primarily from theories of information processing and theories of emotional processing (→ Emotion). The *first assumption*, a primary tenet in most cognitive psychological theorizing, is that humans are limited capacity information processors. This means that human beings have a fixed pool of resources with which to process their environment. If the demands of the tasks in which they are engaged exceed this limit then some of those tasks will be done less well. This assumption gives rise to the fundamental concept of *cognitive overload*. Cognitive overload is defined as a state that arises whenever the demands of an information-processing task exceed one's available processing capacity.

The *second assumption*, from emotion research, is that people have two motivational systems that produce fundamental drives to approach positive stimuli and avoid negative ones. These two systems, the *appetitive* and the *aversive motivational systems*, function automatically and independently to protect and maintain the individual. Together these first two assumptions lead to a second central concept in LC4MP, embodied motivated → cognition. This concept maintains that the brain is not just riding around on top of the body telling it what to do, but instead is one of many organs in the interconnected biological system that makes up a human being and functions as a primary influence on the cognitive system.

The *third assumption* in this theory is that all functioning in the system occurs over time. Each part of the system responds within its own characteristic time frame to specific types of inputs. At any one point in time, the functioning of any one aspect of the system

is multiply determined by the state of the system in the moment preceding the point of interest, the current psychologically relevant characteristics of the environment, and the limits of the system.

The *fourth assumption* is that mediated messages are made up of continuous streams of variably redundant information being presented in one or many perceptual channels using a variety of symbol systems. Messages are not defined by industry descriptions related to technology, content, or genre. Instead, they must be defined in terms of psychologically meaningful variables (e.g., rate of change, movement, luminance, etc.).

*Fifth*, communication is the interaction between the motivated cognitive system, the context in which the interaction occurs, the psychologically relevant aspects of the medium that carries the message, and the psychologically relevant aspects of the content of the message.

Taken together, these assumptions lay the groundwork for a theory that tries to explain the dynamic interaction of the motivated cognitive system with the psychologically relevant aspects of the medium's structure and the message's content to determine how a message is attended to, encoded, stored, and subsequently retrieved.

## THE SUB-PROCESSES

As previously noted, LC4MP is a limited capacity information-processing model. Information processing is thought to involve both automatic and controlled processes. Processes are conceived of as requiring cognitive resources. Automatic processes occur without conscious awareness, require few cognitive resources, and cannot be stopped. Controlled processes require a fair number of cognitive resources and can be consciously initiated and terminated.

Processing a mediated message is theorized to involve at least three cognitive sub-processes: encoding, storage, and retrieval. The theory maintains that resources are allocated independently to the three sub-processes through both controlled and automatic mechanisms. Thus, in the absence of a voluntary intention by a media user to pay attention to or remember a specific type of content, automatic processes allocate resources to encoding, storage, and retrieval as a function of the psychologically relevant aspects of the media message. However, media users can, through controlled resource allocation, improve or inhibit how these automatic processes function by intentionally altering their message processing behavior.

The *encoding* sub-process involves creating a mental representation of the information in the message. This process is not thought to be veridical. Messages are not encoded either exactly or completely. This is because at any given point in time most messages contain more information than can be completely encoded. As a result, a continuous process of selection and encoding occurs. The selection process is guided by both automatic and controlled processes. Some elements of messages are selected because they engage automatic resource allocation mechanisms through the manipulation of psychologically relevant variables. LC4MP theorizes two primary routes to automatic resource allocation. First, elements of messages that create novelty by introducing new information to the message (e.g., cuts, edits, video graphics, sound effects, etc.) or are signals that viewers have learned indicate important content (e.g., slow motion, words,

etc.) elicit orienting responses, which are automatic attention mechanisms resulting in the allocation of cognitive resources to encoding the message. Second, emotional, or motivationally relevant, content also results in the automatic allocation of resources to encoding (→ Selective Attention).

The second sub-process, *storage*, is conceptualized as the process of connecting new information to already stored information. LC4MP does not subscribe to a specific memory theory or architecture; it conceptualizes memory within the general framework of associative network spreading activation models. When one is aware of stored information, its representation is thought to be active. Links are formed when two representations are concurrently active. Activation spreads automatically through the links from active to related inactive information. Stored information can be partially activated through spreading activation making that information more accessible. Within this framework, storage is conceived of as the process of creating links between incoming information and previously stored information. When more resources are allocated to storage, more and stronger links are forged between old and new information. The allocation of resources to the storage process is also influenced by automatic and controlled resource allocation mechanisms. Motivationally relevant information is thought to result in the automatic allocation of resources to storage. Viewers can also increase the allocation of resources to storage through controlled processes and cognitive effort (→ Memory; Memory, Message).

The third sub-process is *retrieval*. Retrieval plays two roles in this theory, first as online or real-time retrieval and second as delayed retrieval of the information presented in a mediated message. In either case, retrieval is the process of fully activating a stored representation. Online retrieval is the process of activating previously stored information in order to make sense of an incoming message. Much of this retrieval occurs automatically through the process of spreading activation. As the media message is perceived, it activates relevant representations already stored in memory, and previously stored information relevant to the topic is fully activated or retrieved. Second, there is the process of retrieving the information being presented in a message at a later date. It is thought that the better the information in the message is stored the more likely it is to be retrievable at a later point in time.

## THE SYSTEMS

The two underlying motivational systems, appetitive and aversive, are integrated into the current version of LC4MP based on the theoretical conceptualizations found in John Cacioppo's dual system theory (Cacioppo & Gardner 1999) and P. J. Lang's dimensional emotional theory (Lang et al. 1997). Each system is theorized to have its own activation function. These functions are characterized by two variables called the positivity offset and the negativity bias.

Positivity offset is the tendency of the appetitive motivational system to be more active in a neutral environment, and the negativity bias is the tendency of the aversive system to activate more quickly than the appetitive system in response to moderately arousing stimuli. LC4MP theorizes that activation in the appetitive motivational system results in increased allocation of resources to encoding and storage, while increased activation in

the aversive motivational system elicits an increase in resources allocated to storage, and an increase followed by a decrease (at very high levels of activation) in resources allocated to encoding. Thus, LC4MP predicts that at very high levels of activation, positive stimuli should be encoded and stored well, whereas negative stimuli are thought to be stored extremely well but encoded less well.

## MEASUREMENT

Each process in LC4MP has at least one validated operational definition. The three memory processes are measured using three different *memory protocols* – encoding is indexed through recognition measures (including latency, accuracy, and signal detection measures); storage is assessed using cued recall protocols; and retrieval is measured using free recall measures. Resource allocation is measured using secondary task reaction time methodology or by measuring heart rate. Heart rate can be analyzed beat by beat to measure orienting responses to a specific aspect of a message, or its long term deceleratory or acceleratory trend can be assessed to index cognitive effort. Appetitive activation is indexed by inhibition of the startle response, increased activation in the zygomatic and orbicularis oculi muscles, and facilitation of the post-auricular response, and through self-report ratings of positive emotional experience. Aversive activation is indexed by startle facilitation, increased activation in the corrugator muscle, and increased self-reported ratings of negative emotional experience. The level of activation in the motivational systems is indexed by skin conductance and self-reported level of experiential arousal.

The use of this theory and measures allows one to analyze media and media messages in terms of the structural and content features they contain that lead to increased or decreased levels of resources allocated to encoding and to storage. By measuring the level of information introduced over time within messages in conjunction with automatic calls for resources, it is possible to identify – over time – the points at which the system is overloaded (and therefore encoding and storing less information) and when it is functioning optimally. This theory also provides a framework on which to investigate the extent to which motivational activation alters the message processing functions and ultimately influences later actions, attitudes, and behaviors.

# Linear and Nonlinear Models of Causal Analysis

*Vincent Price*

*University of Pennsylvania*

*Derek Freres*

*University of Pennsylvania*

Communication researchers often gather quantitative data – for example from surveys, content analyses, or experiments – and then generate mathematical models to represent or summarize those data (→ Survey; Content Analysis, Quantitative; Experimental Design). These models are used in two basic ways: first, to generate *predictions* about certain variables; and second, to study *relationships* among some number of variables (Allison 1999). In some cases, the goal is to obtain as accurate a prediction as possible, without much regard to the particular variables used to make the prediction. In most cases, at least in communication research, the focus is on the pattern of relationships among particular variables, and especially on *testing hypotheses* made in advance about how variables are expected to interrelate (→ Hypothesis; Statistics, Explanatory).

## MODELS

Models represent the relationship between a dependent or outcome variable and one or more independent or predictor variables, by stipulating the former as some mathematical function of the latter. Models contain parameters that express the function, usually a set of weights applied to independent variables.

The vast majority of the models used in communication research are *linear models*, which represent the functional relationship as a line (in two dimensions) or as a linear surface (in three or more dimensions). For example, a simple linear model explaining the number of times a child behaves aggressively (the dependent variable) by the hours of violent television watched (the independent variable) would be a line representing the predicted number of aggressive acts per each hour viewed (→ Violence as Media Content, Effects of).

In some cases, we may find that a straight line or linear surface is inadequate to represent the functional relationship. For instance, the outcome could grow exponentially with increases in a predictor variable, or the outcome could at first grow with increases in

a predictor up to some point, but thereafter stop increasing, or begin to decline with further increases in a predictor variable. In such instances, *curvilinear* or *nonlinear models* would better represent the data.

While both are commonly termed “nonlinear,” curvilinear and nonlinear models are distinguished mathematically. *Curvilinear* models, like polynomial functions (for instance, where aggressive behavior is modeled as an additive function of both hours viewed and the *square* of hours viewed), predict outcomes falling on a curved line, but the predictions are still actually a simple linear function of the weights (or parameters) assigned to each variable. These sorts of curvilinear models are “nonlinear in the variables, but linear in the parameters.” *Nonlinear* models, on the other hand, posit more complex functional relationships stipulating that variable weights of other parameters themselves depend on the values of predictor variables. These models are “nonlinear in the parameters” (Cohen et al. 2003).

## MODEL ESTIMATION

A model, then, specifies a particular functional relationship (e.g., linear, curvilinear, or nonlinear) between a dependent variable and some set of independent variables. These models are then fit to empirical data using some *estimation method*, that is, a particular algorithm used to estimate model parameters or coefficients (such as the slope of a prediction line). Estimation methods typically define some mathematical quantity that is to be minimized, which is known as a *loss function*. For instance, one of the most commonly used estimation methods, known as ordinary least squares (OLS), fits a predictive model to a set of observed data by minimizing squared deviations of each observed data point from the points predicted by the model.

The same model can be fit to data using different estimation methods. Whatever method is used, the process usually involves calculating *standard errors*, which are estimates of the degree of random variation one would expect in coefficient estimates for samples of a given size (→ Sampling, Random). These standard errors are critical in hypothesis testing, because they offer an estimate of the chances that certain hypothesized relationships, as reflected in calculated model coefficients, may have been generated by random processes alone. Evaluating these chances is known generally as *significance testing*.

To make sound interpretations of model estimates, researchers must also assess how well the stipulated model fits the data. Appraisal of fit is often based on the proportion of variance in the dependent variable predicted by the model, or on comparison of the model’s prediction errors to those generated by some baseline, such as a random model (Lewis-Beck 1980).

## THE LINEAR REGRESSION MODEL

Multiple-variable linear regression, using OLS estimation methods, is one of the most popular ways of fitting a linear model to observed data (→ Regression Analysis). It allows researchers to estimate how much variation in a dependent variable is uniquely predicted (or “accounted for”) by one out of a set of independent variables. For example, we may be

interested in the effect of viewing violent television on aggressive behavior, but recognize the possible influence of other factors, such as gender or socio-economic status, on both the amount of viewing and aggressive behavior. In generating the slope estimate for aggression on hours of viewing, linear regression removes from consideration the portions of the variance in aggression that can be attributed to other variables in the model. The effects of numerous variables can thus be disentangled, and if comparisons are desired, then standardized slopes or coefficients, which put change in standard deviation metric, are used. Each has an associated standard error, which can be used to conduct statistical tests of differences between slopes for different variables.

### **Curvilinear Regression Models**

Standard regression results can be misleading if a straight-line relationship does not properly characterize the data. Consider, for instance, two variables perfectly related in a U-shaped pattern. Fitting a straight line might lead one to conclude, quite incorrectly, that no relationship exists.

Researchers can adapt the standard linear regression model to account for such curvilinear relationships. One approach involves using *dummy variables* (Allison 1999); that is, variables that categorize observations according to where they fall along the distribution of a given independent variable (e.g., low or high). If we think, for example, that with increasing amounts of exposure to children's TV programming, young viewers gain verbal knowledge, but that this relationship reverses and becomes negative once viewing time passes a particular threshold, we might include dummies that identify the appropriate viewing ranges and capture the change in slope that occurs relative to verbal scores.

Another common approach is to specify a curved functional form, and then to apply *transformations* of the variables (e.g., by taking their logs, reciprocals, squares, or cubes), such that the model remains linear in its parameters, although it is nonlinear in the variables (Berry 1993). Such transformations allow the use of OLS linear estimation with a few complications that can be mitigated. Sometimes researchers will fit a variety of functional forms and test for improvements in overall model fit (Kleinbaum et al. 1998).

### **THE GENERALIZED LINEAR MODEL**

Variable transformations are an important feature of the *generalized linear model* (GLM), a generalization of the standard linear regression model to cover many different contexts, including curvilinear models and some, but not all, nonlinear models. There are two components of the GLM: a *link function* transforming variables so that the dependent variable becomes a linear function of the independent variables; and an *error distribution* reflecting the assumed behavior of a model's prediction errors (Dunteman & Ho 2006). The standard linear regression model is just a special case of the GLM, in which the link function is the identity, since there is no transformation of the dependent variable, and in which errors are assumed to be normal. Other GLMs rely on different link functions and error distributions, enabling researchers to capture a wide variety of functions.

### Analysis of Variance Models

Another special case of the GLM, which also assumes the identity link and the normal error distribution, is the analysis of variance (ANOVA). Commonly employed with planned experiments, ANOVA models group differences (Keppel & Wickens 2004). ANOVA is estimated with OLS and is very closely related to standard linear regression, to the point that almost any ANOVA design can be analyzed in a linear regression model (Allison 1999). Still, many find it easier to apply ANOVA to certain data, particularly those gathered in randomized experimental trials (→ Experiment, Laboratory).

### NONLINEAR MODELS

Although many communication processes and effects can be well described using linear or curvilinear models, others are inherently nonlinear. For instance, research on the ways in which ideas diffuse or gather strength through communication over time strongly suggests that these processes are nonlinear (→ Diffusion of Information and Innovation). In some cases, the appropriate nonlinear model can be transformed and analyzed within the GLM by way of appropriate link functions and error distributions, but many others cannot.

Methods for estimating nonlinear models differ from those used in linear regression and ANOVA, where the loss function can be solved analytically. Nonlinear estimation instead requires iterative estimation methods. The process involves choosing “start values” for model coefficients, running these through a maximization (or minimization) function to improve the coefficients, and then running these back through the function again until stable estimates are realized. There are a number of such iterative methods, such as *nonlinear least squares* or *maximum likelihood* (ML), which estimates model parameters that maximize the probability of generating the observed data (Dunteman & Ho 2006).

### Logit, Probit, and Poisson Models

Several widely used nonlinear models can be reformulated within the GLM and estimated using ML or other iterative methods. A number of these predict categorical or binary variables; for example, whether or not a person is able to recognize a particular news story. In such cases, OLS linear regression is problematic, since neither a linear relationship nor a normal distribution of prediction errors can be safely assumed (Hosmer & Lemeshow 2000). These issues can be solved in the GLM by using a *logit* link function, which describes an S-shaped growth in the dependent variable over the range of a predictor, rising monotonically to an asymptote. The logit transforms this function into one that is linear in its parameters and can be analyzed using a binomial distribution to model prediction errors. Closely related to the logit model are the *logistic regression model*, which predicts continuous outcomes ranging between a lower and an upper limit, *multinomial* or *polytomous* logits for nominal dependent variables with more than two categories, and *ordered* logit models for ordinal data. *Probit* models are a slight variation, which may be appropriate when the outcome represents a continuous latent construct

rather than a true binary. For count data, such as the number of times a particular event occurs, researchers might use a *Poisson regression*.

### **Nonlinear Regression**

Most communication researchers rely on linear or curvilinear models estimated through standard linear regression, ANOVA, or nonlinear models such as logistic regression that can be handled within GLM. Additional nonlinear models, including many that cannot be transformed so that they are linear in the parameters, can also be stipulated and estimated using iterative, nonlinear optimization techniques specifying an appropriate loss function. David Fan's ideodynamic model (1985) is one such model. It predicts opinion change in a particular population as a dynamic, nonlinear function of the amount of media information available, the "decay rate" of that information, the proportion of people already on different sides of an issue, and other factors (→ Cumulative Media Effects).

## **Linguistic Pragmatics**

*François Cooren*

*University of Montreal*

The origin of linguistic pragmatics as a discipline can be traced back to an article titled "How to make our ideas clear," written by Charles Sanders Peirce in 1878. In this essay,

the founder of semiotics, the science of signs, presented a general principle of inquiry, which was later identified by William James as the first formulation of “pragmatism.” Although Peirce did not use the term *per se* in his original piece, it is in this essay that he presented the thesis according to which the meaning of a concept or statement is to be found in all its possible *practical* bearings. Although this thesis had a tremendous influence on key philosophers such as William James or John Dewey, creating as a result the American philosophical movement called “pragmatism,” the influence that is of interest to us regarding its linguistic dimension is the one it exerted on Charles W. Morris (1901–1979).

### THE STUDY OF LANGUAGE

Morris proposed three ways of studying signs: syntactic studies, which analyze the relation between a sign and other signs; semantic studies, which investigate the relation between a sign and what it is supposed to refer to; and pragmatic studies, which examine the relation between a sign and its users/interpreters. While Morris’s reflection was devoted to the functioning of signs in general, Rudolf Carnap started to use this trichotomy to speak of the different manners of studying natural languages, pragmatics being for him a type of investigation focusing on language use in specific situations. The term “linguistic pragmatics” therefore refers to a sub-branch of linguistics that focuses on such usage. As it is often the case, there exist many different ways of defining linguistic pragmatics, but the most common way is to speak of it as “the study of language usage” (Levinson, 1983, 5). From this very broad definition, at least five phenomena tend to qualify as typical objects of linguistic pragmatics: speech acts, presuppositions, conversational implicatures, politeness, and indexical expressions.

Historically, it seems fair to say that pragmatics has not been a very hot topic in communication research *per se*. Communication scholars are, of course, often aware of Searle’s speech act theory, Grice’s cooperative principle, or Brown and Levinson’s politeness theory (see below), but the students typically interested in the detailed study of interaction tend to be more familiar with the research agendas put forward by ethnographers of communication, conversation analysts and ethnomethodologists. There are, however, some important exceptions, like the work of Mark Aakhus on the language–action perspective (LAP), Robert B. Arundale on conversational implicatures, Scott Jacobs and Sally Jackson on argumentation (→ Argumentative Discourse), Robert E. Sanders on the sequential dimensions of interaction, and Robert T. Craig, Karen Tracy, and Frances Spisak on → politeness theory. Since most of these communication studies stem from speech act theory and the model of conversational implicatures, it is these two specific theories that will now be briefly introduced.

### SPEECH ACT THEORY

Although John Austin (1911–1960) never spoke about pragmatics *per se* in his posthumously published William James Lectures titled *How to do things with words*, his reflection on the action dimension of language is one of the pillars of pragmatics research. Austin started his lectures by deploring philosophers’ tendency to exclusively focus on

statements and other descriptive sentences, which prevented them from accounting for other uses of language. This led him to create a first opposition between what he called constative and performative utterances. A typical constative utterance would be “This painting is beautiful,” which consists of noticing or reporting a specific state of affairs, while a typical performative utterance would be, “I name this ship the *Queen Elizabeth*,” which consists of performing a specific action, i.e., naming a ship the *Queen Elizabeth*, if these words are pronounced in the right circumstances by the right person.

As his reflection progressed throughout his lectures, Austin started to express much discomfort with this opposition, especially when he realized that even constative utterances could be considered as having performative dimensions. For instance, he noticed that utterances like “This painting is beautiful” also consist of “doing things with words” (e.g., *asserting* something). This led him to approach all utterances in terms of performance and to identify three types of action: locutionary, illocutionary, and perlocutionary acts. While a locutionary act simply consists of *saying something*, the illocutionary act is what is done *in* saying something. In saying, “This painting is beautiful,” A is asserting something about a painting. Depending upon the context, A could also be said to be performing other illocutionary acts simultaneously. For instance, if a friend is accompanying her in the museum and says, “I just don’t get it,” we could then say that in uttering “This painting is beautiful,” A is also retorting to or contradicting B. Finally, Austin proposes the notion of perlocutionary act to account for the consequences of a given illocutionary act. For instance, if, upon hearing A saying, “This painting is beautiful,” B starts to look more carefully at the Picasso, we could then say that A’s response *made B look* more carefully at the painting, which is the perlocutionary act.

Although Austin provided a very detailed classification of illocutionary acts, it is the one of his student John Searle that is the most renowned. Searle proposes a typology of five speech acts, which he calls assertives (i.e., holding something to be true, as in “This painting is beautiful”), commissives (i.e., committing oneself, as in “I will come”), directives (i.e., getting someone to do something, as in “Give me a hand!”; → Directives), expressives (i.e., expressing a psychological state vis-à-vis something previously performed, as in “I apologize for calling so late”), and declarations (i.e., transforming the world by making it conform to what is declared, as in “I hereby declare you husband and wife”). This classification, according to him, exhausts everything that can be done *in* saying something. Furthermore, Searle proposes a theory explaining the functioning of what he calls *indirect speech acts*, i.e., illocutionary acts by which one says more than what is literally said in the utterance produced. For instance, when A says to B “Do you know who is going to tomorrow’s meeting?” A might not only be literally asking B if he knows who is going to tomorrow’s meeting, but also asking him to tell her who is going to that meeting.

Interestingly enough, this theory can also elegantly explain how pre-sequences function (see Cooren 2005), i.e., sequences by which speakers prefigure another sequence for which they invite collaboration on the hearers’ part (Levinson 1983). For instance, “Do you know who is going to tomorrow’s meeting?” can be used not only to indirectly ask who is going to that meeting (indirect request), but also to literally check if the interlocutor indeed knows this piece of information. In this case, this question can then function either as a pre-announcement or a pre-request. This explains how the same utterance can end up accomplishing many different things depending on the situation.

## CONVERSATIONAL IMPLICATURES

It is also through the William James Lectures that H. Paul Grice first introduced the topic of conversational implicatures, a key phenomenon in linguistic pragmatics. Although his lecture was given in 1967, it was not until 1975 that it was published as an essay titled *Logic and conversation*. In this essay, Grice put forward what he called the cooperative principle, which is phrased as follows: “Make your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged.” There is a general presumption that when people interact with each other, they intend to abide by this principle. Thus, if the literal content of what an interlocutor says appears to deviate from this principle, there is then an inference that this person might mean something else; hence the idea of implicature.

Grice presented four specific maxims to specify the cooperative principle: *quantity* (“Make your contribution as informative as it is required”), *quality* (“Try to make your contribution one that is true”), *relation* (“Be relevant”), and *manner* (“Be perspicuous”). Each time an interactant appears to breach one of these maxims in communicating, this can be interpreted as implicating something else. For instance, if A says “That’s very clever!” to comment on a behavior that appears obviously stupid to the participants, it is then understood that A is willingly breaching the maxim of quality and is therefore implicating that this behavior is stupid. In other words, implicatures function because it is presupposed that people cooperate to convey meaning.

This model remains a great source of inspiration for many scholars, e.g., Brown and Levinson and their theory of politeness. For them, interactants are endowed with two properties – rationality and face – which explain why people tend to adopt politeness strategies when interacting with each other. While the idea of face is explicitly borrowed from Erving Goffman, the rationality ascribed to interactants derives from Grice’s cooperative principle. By face, Brown and Levinson (1987) mean that interactants are considered to be endowed with two specific wants: the wants to be unimpeded (negative face) and approved of (positive face). By rationality, they mean that interactants will reason from ends to the means that allow them to achieve these ends. In other words, linguistic strategies will be considered “means satisfying communicative and face-oriented ends.” Given that many speech acts can be considered face-threatening-acts (FTA) – e.g., asking something, advising, reminding – interactants will tend to develop politeness strategies, called “facework,” to minimize the face-threatening dimension of what they say (for further development, see Arundale 2005; Craig et al. 1986; Fitch & Sanders 1994).

## PRAGMATICS AND COMMUNICATION

Although communication studies and linguistic pragmatics have somewhat neglected dialogue with each other, a lot could be learned should their respective agendas converge more often. One interesting path of convergence is the parallel work of several communication scholars who have insisted on the constitutive aspect of communication in meaning production and interpretation. While the traditional literature in linguistic pragmatics tends to focus on the cognitive aspects of meaning production, scholars like

Arundale (2005), Cooren (2005), and Sanders (1987) have insisted on the limits inherent in any attempt to reduce the question of meaning to what speakers intend to mean in a specific interaction. These scholars thus propose, in their respective agendas, approaches that tend to focus on the dynamic that is at stake at any moment of given interaction. It is in the recognition of such a dynamic that communication scholars can indeed expect to productively contribute to the field of linguistic pragmatics.

## **Linguistics**

*Naomi S. Baron*

*American University*

Linguistics is the study of language. Because linguists disagree on the scope of “language,” definitions of linguistics have varied. Descriptively, the study of language has gone from a search for relationships between specific languages to current interest in the biological bases for language and in language use. Methodologically, linguistics has changed from an empirical discipline to one admitting a priori suppositions and personal introspection in model building.

Regardless of theoretical bent, students of language generally divide linguistic inquiry with respect to several conceptual parameters. Linguists distinguish between looking at language at a specific moment in time (synchronically) as opposed to tracing historical language change (diachronically). A second parameter decomposes language into multiple levels for analysis: phonology (sounds), morphology (units of meaning that combine to form words), and syntax (how words are combined to form sentences). In addition, linguistics entails semantics (word and sentence meaning), discourse analysis (connected speech), and pragmatics (language structure and meaning in nonlinguistic context).

## LANGUAGE, SEMIOTICS, AND COMMUNICATION

In defining “language,” it is useful to understand the relationship between language and other systems of signs in which material forms (such as a yawn or the Italian word *grazie*) are paired with meanings (here, “I’m tired” or “thank you”). The broadest domain for studying signs and their meanings is → semiotics (literally, “the study of signs”). Semiotics includes the analysis of human languages, but it also encompasses animal communication and inanimate signs (e.g., a cloudy sky portending rain). The other end of the spectrum of sign-based inquiry is linguistics, traditionally limited to human spoken languages.

Less clearly defined is the middle ground: communication. Conventionally, communication includes all meaningful behavior emitted and perceived by sentient beings, including animal communication and human languages. However, linguists disagree over which particular forms of communication also constitute language. One issue is whether only the speech stream counts as language or whether such paralinguistic features as kinesics (body language) and proxemics (physical distance between interlocutors) belong to linguistics proper. Another issue has been whether language includes writing and the sign languages of hearing-impaired communities.

## THE EVOLUTION OF LINGUISTIC THEORY

The roots of modern linguistics trace back to a lecture delivered in Calcutta in 1786. Sir William Jones, a British judge serving in India, hypothesized that Sanskrit, Greek, and Latin must all have sprung from a common source – what today we call Indo-European. In the mid-nineteenth century, Jacob Grimm explained how German phonology systematically differed from the sound systems of such languages as Latin and Sanskrit. Soon thereafter, the *Junggrammatiker* (neogrammarians) created a linguistic research agenda for comparing languages in the Indo-European family, predominantly focusing on phonology. By the early twentieth century, linguistics had largely become the diachronic study of Indo-European sound systems.

Ferdinand de Saussure, a Swiss neogrammarian, moved linguistics from a strictly historical enterprise to also *exploring modern language structure*. Saussure was heavily influenced by the growing movement of structural approaches to social phenomena, appearing, for example, in the work of the sociologist Émile Durkheim. Structuralism sought to discover how social systems work as wholes that are organizationally greater than the sum of their individual parts (→ Structuralism). Saussure used this model to analyze

language as a system of signs. Saussure's analysis of linguistic signs remains foundational in the field of semiotics and influential in social, literary, and cultural theory.

Contemporaneous with Saussure, the newly emerging field of *anthropology* found language to be an important tool for understanding nonwestern cultures. Bronislaw Malinowski's work on the construction of meaning among indigenous peoples of the western Pacific provided a framework for subsequent British anthropological linguistics such as the work of J. R. Firth. In America, Franz Boas used his analyses of Native American languages to argue that their speakers had sophisticated cultures and could not be dismissed as "primitive peoples." Building upon Boas' initiatives, a linguistic tradition grew up in the US during the first half of the twentieth century, alternatively known as American Structuralism or American Descriptivism. This tradition strove to create research methodologies for uncovering the structure of unwritten languages. Rooted in empiricism, American Structuralists admitted as data only those spoken utterances that had been observed. Practitioners included Leonard Bloomfield, Charles Hockett, and Zellig Harris – Noam Chomsky's friend and teacher.

In the mid-1950s, Chomsky proposed a new goal for linguistic theory. Rather than using empirical evidence to "discover" the structure of languages, Chomsky drew upon his background in philosophy to create a *rationalist approach* to linguistic theory. Chomsky's aim was to explain the intrinsic linguistic abilities of native speakers, using introspection in lieu of discovery methods and attempting to characterize the knowledge of "ideal speaker/hearers" rather than the empirical productions of real-world language users. Following René Descartes, Chomsky argued that language is uniquely human (thereby excluding animal communication from linguistics). He also maintained that human language is sufficiently complex that it cannot be learned by beginning with a blank mental slate. Rather, the core of linguistic abilities must be biologically innate. Given his interests and presuppositions, Chomsky took linguistics to be the study of abstract linguistic knowledge, especially of syntax. Chomsky did not deem language use part of linguistic inquiry.

Over the past half-century, Chomsky's original model (known alternatively as transformational grammar or generative-transformational grammar) has strongly shaped linguistic research internationally. Yet during this same period, a number of social scientists eschewed the Chomskian limitation of linguistics to abstract human linguistic ability. The field of *sociolinguistics* emerged in the 1970s, represented by such practitioners as Dell Hymes and William Labov, who argued that linguistics must include the study of language in social context (→ Language and Social Interaction). The field of child language acquisition was redefined in the 1970s and 1980s, as psychologists and linguists such as Jerome Bruner, M. A. K. Halliday, and Jean Berko-Gleason reasoned that children learn language not as a standalone system but in social context and for social reasons (→ Language Acquisition in Childhood).

A second major challenge to Chomskian linguistics came from psychologists and linguists, who argued that nonhuman primates possess many of the linguistic abilities Chomsky assumed unique to *Homo sapiens*. From the sign-language-based studies of the chimpanzee Washoe (by Allen and Beatrice Gardner) to Sue Savage-Rumbaugh's use of symbol boards and spoken language recognition with Kanzi (a bonobo chimpanzee), a cadre of researchers argued that linguistics should include the communicative behavior of at least the broader primate family.

## CURRENT DIRECTIONS IN LINGUISTICS

Today, ideological battles have largely been replaced by a proliferation of approaches to linguistics. The number of free-standing linguistics departments in universities has historically been small. Linguists are commonly housed in foreign language or English departments, in anthropology or sociology, in education or computer science, and often adopt the perspectives of their disciplinary homes. More importantly, since no individual has emerged with the visionary stature of Chomsky, linguists have little impetus to align themselves with a specific model of language or definition of linguistics.

That said, there is no shortage of scholars who employ linguistic theories and methodologies. The following three broad areas of inquiry illustrate the contemporary linguistic enterprise. *Social discourse*: continuing the anthropological tradition of studying language in social context, sociolinguistic research often centers on → discourse, specifically considering gender, age, ethnic, or class-based differences in language use. Sociolinguistic perspectives are also widely employed in such domains as first-language acquisition, second-language acquisition, bilingualism, and cross-cultural communication (→ Bi- and Multilingualism). *Writing and technology*: interest in writing as a linguistic process, distinct from speech, has grown in recent decades. Linguists such as Roy Harris, Deborah Tannen, Wallace Chafe, and Douglas Biber have examined written language both as a medium in its own right and in comparison to speech. Linguistics has also become a tool in the hands of researchers studying language conveyed via computer systems such as the Internet (known as computer-mediated communication, CMC). Linguistic analyses of chat, email, instant messaging, and text messaging on mobile phones complement sociological studies of how people use these messaging systems (→ Language and the Internet). *Artificial intelligence, cognition, and language*: with the unfolding of artificial intelligence research in the 1960s and 1970s, linguistics became a valuable instrument for processing natural language (i.e., using computers to analyze spoken or written sentences) and for performing machine translation between languages. Given the importance of global communication, along with the explosive growth of the Internet, both natural language processing and machine translation will continue to be important research issues for the foreseeable future.

The 1990s witnessed a surge of interest in the *neurological bases of language*. With the development of sophisticated imaging technology, it is possible to measure brain activity while subjects are performing linguistic tasks. This research has, for example, yielded neurological evidence for differences in the way speakers of English produce regular past-tense forms (e.g., *walked*) vs irregular forms (e.g., *went*), and has suggested gender variation in language processing, as well as neurological distinctions between bilinguals and monolinguals (→ Cognitive Science).

## LANGUAGE IN SOCIO-POLITICAL CONTEXT

While roughly 6,000 different languages are spoken today, the number continues to decline as new speakers born into minority-language communities eschew learning ancestral languages and remaining speakers die out. Linguists have begun partnering with social activists to document and support endangered languages. At the same time, others

are questioning the dominant role that former colonial languages, especially English, are playing on the global stage. Now that non-native speakers of English outnumber native speakers, a growing number of voices argue for replacing the notion of “world English” with that of “world Englishes.” Moreover, some argue that non-native speakers should have primary say in defining the linguistic make-up of those Englishes, rather than adhering to prevailing British or American English norms. These attitudes are increasingly reflected in the way that English is taught to speakers of other languages. In recent years, the emphasis has shifted from concentrating on correct grammar to nurturing communicative abilities. Similarly, there is a move away from accent reduction and toward teaching for phonological intelligibility.

Beyond its core function of enabling people to communicate with one another, language is always potentially a political tool. A century ago, the issue was imposition of colonial languages upon subjugated populations. Today the range of political concerns includes sexist or racist language, along with policies regarding bilingual education and the status of national languages. Regardless of one’s theoretical stance about the proper scope of the field, linguistics offers a powerful instrument for addressing these real-world problems.

# Link Analysis

Mike Thelwall

University of Wolverhampton

With the increasing migration of communication and information provision to the web, new research methods are emerging to cope with the challenge of understanding the implications of this change. Link analysis is the *study of hyperlinks* between websites in order to discover (1) why they were created and what they are used for, (2) online networks or patterns of behavior, or (3) insights into reflected patterns of offline behavior.

Hyperlink analyses have been conducted on themed collections of websites or web pages, such as those owned by a selected group of politicians, universities, or nongovernmental organizations campaigning around a specific issue. Link analysis is particularly suitable for gaining rapid initial insights into offline topics that have an online reflection (e.g., left-right political debates) and for analyzing how the web is used for communication in particular situations (e.g., elections). The strength of hyperlink analysis is the ease with which practitioners can gain fast insights into a topic of interest, especially with the new generation of free link analysis software. The main drawback is the casualness with which links are often created (or not created), which inhibits making strong inferences, forming generalizations, and making future predictions.

It is useful to distinguish between different *types of links*. A “site outlink” is a hyperlink that points to a page in a different website, whereas a “site self-link” points to a page within the same website. Site self-links are usually ignored because the connections between different sites are more interesting. Site outlinks may expose such things as the site owner’s collaborators and information sources. Similarly, the “site inlinks” of a website are the links pointing to it from other websites. Site inlinks may reveal the importance or uses of a website. Alternatively, the site inlinks may also give information about how important the organization owning the website is and the types of other organizations that link to it. The links within a collection of websites may reveal informative patterns of interconnectivity, such as which is the most central site in the network, and whether there are any clear sub-groups. Potential applications include revealing the interconnection structure of related pressure groups on the web, or exploring politicians’ websites for differences in online networks and uses of the web across the political spectrum.

For a hyperlink analysis, *relevant links* must first be identified. The most straightforward data collection methods are to browse websites to manually identify links or to use a link search command in a commercial search engine. For example, the query `linkdomain:wlv.ac.uk – site:wlv.ac.uk` in Yahoo! (→ Search Engines) returns a list of web pages that link to any page in the University of Wolverhampton website (`www.wlv.ac.uk`) and all other domains ending in `wlv.ac.uk`, such as `www.scit.wlv.ac.uk`), but excluding pages within the University of Wolverhampton website. Given a set of websites to study, as long as it is not too large, the links between all possible pairs of websites can be counted by entering a series of queries like the one above. A second way to get link data is to use software that automatically downloads the web pages from a list of URLs (uniform resource locators), or downloads all of the pages in one or more websites. Free online

software for this includes Issue Crawler, LexiURL, SocSciBot, and VOSON. It is also possible to automatically submit queries to search engines from LexiURL Searcher and VOSON, which is useful for counting links to or between a large set of websites.

Once the link data has been downloaded there are four main *alternative investigative methods*: visualizations, summary statistics, comparison with other data sources, and content analysis of link types. The above software typically produces visualizations such as network diagrams of the interlinking websites or pages, and forms of summary statistics, such as the total number of links to and from each website and the commonest sources and targets of links broken down by website, page, or top-level domain (e.g., .edu, .de). The data can also be imported into social network analysis software such as UCINET to obtain a wider range of statistics. Moreover, UCINET and standard statistical analysis software can compare the link count data with other sources of data (e.g., via correlation tests). For large-scale counting studies, particularly for academic websites, sophisticated link counting methods (Alternative Document Models) have been developed to prevent results being dominated by spurious or repeated links.

In contrast to the quantitative approaches described above, a descriptive or *comparative content analysis of links* may reveal why they have been created and what they are used for. This is particularly useful because the web and links are used for such a wide variety of purposes that it is easy for intuition to fail when hypothesizing about why hyperlinks are used in any given context, e.g., in politicians' websites. The content analysis typically takes the form of classifying link types through the page containing the link and perhaps also the page that is the target of the link. The categories are often inductively defined, partly on the basis of a pilot study and partly on that of the research question or theoretical perspective underpinning the research. One finding from this type of research is that surprisingly many links are created primarily to acknowledge a relationship, such as funding or collaboration, rather than to be used by visitors. In addition, while there is a degree of copying and uniformity between similar websites about the types of links used, there are still significant variations, indicating that in many cases website usage and creation strategies are continuing to evolve and innovate.

# Lippmann, Walter

Hanno Hardt

University of Iowa

Walter Lippmann (1889–1974), political columnist and confidant of several presidents, public intellectual and winner of two Pulitzer prizes, remains an important voice among critics of → public opinion and the role of the press. In early twentieth-century America, he was an essential contributor to American political thought and the American way of life, whose path he observed with authority. Lippmann also represents a rare intellectual tradition in American journalism; his weekly column, “Today and tomorrow,” became a powerful and effective response to the political scene in Washington.

*Public opinion* (1922) provides a pessimistic assessment of the idea of liberal democracy and the condition of public opinion. As such, it stands in contrast to John Dewey’s *The public and its problems* (1927) a few years later. Lippmann’s consideration of public opinion was influenced by political realities at home and abroad, including the rise of mass democracy in light of the advancements of science and technology and the rise of totalitarianism between two world wars. He understood the close relationship between democracy and media and regretted the political consequences of approaching mass communication as a form of mass consumption. His arguments concerning the failure of prevailing theories of democracy, and, implicitly at least, the failure of communication to initiate, support, and perpetuate the democratic experience, was advanced in a series of books, beginning with *Liberty and the news* (1920) and *The phantom public* (1925). His readings of Sigmund Freud and the influence of George Wallas, further, led him to reassert the importance of the irrational in politics and to argue for reconsidering bias, prejudice, and feelings as factors in how people attempt to grapple with notions of fact or reality (→ Emotion).

Lippmann engaged in a thoughtful and challenging critique of contemporary democracy, including the role of the media, and never abandoned his search for answers, finally calling for a return to the ideals of western civilization in the guise of a public philosophy. Here, he drew on a Platonic notion of people as followers of decisions that are made by a capable and informed intellectual elite, in order to offer an alternative to liberal democracy as a prophetic vision. Lippmann’s writings are central to understanding the dilemmas of communication in modern society in general and in politics in particular (→ Political Communication). They return research and public debate to the question of power in a democratic state, and address both the position of institutions and the role of individuals in the creation of knowledge, including the responsibility of the press to serve the truth, to inform and to educate, rather than to excite or amuse.

## Listening

*Paul E. King*

*Texas Christian University*

It was the Greek Stoic philosopher Epictetus who first observed that nature had provided two ears but one tongue that we might hear from others twice as much as we speak. While the wisdom and practical values of listening have been understood throughout history, attempts to study listening as a social science and to include listening instruction in curricula are relatively recent phenomena, gaining some popularity with the early work of Ralph Nichols, including his groundbreaking text *Are you listening?* (Nichols & Stevens 1957). Nichols and Stevens describe an early study conducted by Paul Rankin that divided the act of communication into four distinct behaviors: reading, writing, speaking, and listening. In this survey, listening was used more extensively than the other communicative modes. Similarly, Shannon and Weaver's (1949) model of communication included the receiver as an independent component in the communication process (→ Models of Communication). Possibly due to the focus of this early work, listening was reified as distinct and unique, functioning independently of other communicative behaviors.

### LISTENING AND INFORMATION PROCESSING

Over time, the view of communication as a linear process, neatly divisible into speaker, listener, and message components, gave way to the conceptualization of communication as a transaction in which meaning is constructed and message encoding and decoding occur simultaneously. Similarly, efforts to measure listening as a distinct behavior (as listening comprehension) were deemed invalid (Kelly 1967). Scholars began to describe listening in terms of multiple forms of → information processing, such as hearing, → attention, → memory, and various aspects of message interpretation and evaluation. Because listening was originally conceived as unitary and distinct, while our current understanding is that it involves a large number of information-processing skills, efforts to define listening have been numerous and agreement on a common definition does not exist. In an excellent review of these issues, Bostrom (1990, 7) concludes simply that “the term, ‘good listener’ has become a synonym for a caring, other-oriented person.”

Educators who teach and study listening have tended to engage in certain arbitrary short cuts: studying message reception in relative isolation from message encoding, or studying the auditory (hearing) aspects of message reception in relative isolation from the visual aspects of communication. However, there are practical benefits to be gained from this approach: it permits educators to focus on specific information-processing behaviors that can be improved, which has proven fruitful (Brownell 1990). Today, many listening texts continue to be more practical than theoretical: oriented toward improved relationships, improved message comprehension, and improved retention of information. The expectation is that this practical study will reap rewards in school, at work, and in one's circle of friends and family.

### MEASUREMENT

Early attempts were made to measure listening as a simple, unidimensional concept of message comprehension (actually, message retention). When the → validity of these tests came into question, several multidimensional tests of listening effectiveness were developed. Among these are the Kentucky Comprehensive Listening Test (Bostrom & Waldhart 1980), the Watson-Barker Listening Test (Watson & Barker 1983), and the Communication Competency Assessment Instrument (Rubin 1982).

Each of these approaches involves measuring several types, or aspects, of listening: for example, following instructions, remembering information presented in short talks, recognizing central ideas, correctly inferring the meaning of statements from both verbal context and nonverbal cues, resisting distractions, and differentiating facts from opinions. All three tests require participant responses to specific auditory and visual recorded stimuli. Thus, an objective test rather than simple self-assessment is utilized. Significant questions concerning the validity and the reliability of listening assessment remain and need to be addressed by future research. Doubtless, as previously discussed, many of the methodological issues trace back to the difficulty in defining and operationally conceptualizing a construct as expansive as listening.

### LISTENING AND EMPATHY

It would be remiss of any review of the term “listening” to not include a *humanistic perspective*. In common parlance, listening is often used synonymously with terms such as empathy, decentering, or human compassion. To listen is to attend, to care, and to value. An effective listener not only processes information effectively, but also and often more importantly demonstrates interest in the speaker. While this approach has frequently been the subject of scholarly inquiry and reflection (Weaver & Kirtley 1995), it is most often seen in clinical and instructional materials in areas such as counseling, interviewing, mentoring, mediation, and general → interpersonal communication. There have been efforts made to develop psychometric instruments useful in determining listening empathy and empathic styles (Drollinger et al. 2006).

An excellent example of this applied, humanistic approach to listening is Carl Rogers's *active listening* (Rogers & Farson 1973). This general approach to listening (Rogers strongly resisted terming it a “technique”) is also widely known as nondirective therapy

and has been cited in literally hundreds of books and articles in the fields of communication, psychology, education, and business. The approach stresses the elimination of any evaluation of the speaker or the speaker's comments, the importance of an appropriate level of empathy, and the avoidance by the listener of directive communication such as substantive comments and questions. Instead, the listener is encouraged to use mirror statements (repeating a few of the speaker's words) and to paraphrase the speaker's meanings and apparent feelings. Active listening has met with widespread acclaim for a variety of reasons, not the least of which is its sensitivity to the maxim "First, do no harm." Today, it has become pervasive in the field of clinical psychology (Bozarth et al. 2002).

### CURRENT TRENDS AND FUTURE DIRECTIONS

One of the most notable trends in the study of listening is its conceptual integration with the study of social cognition (→ Cognition; Social Perception). Research and instruction in listening can benefit dramatically from the theoretical sophistication found in social cognition research. In turn, social cognition scholarship tends to be composed primarily of pure, or conceptual, research, and may benefit by application in the practical, everyday contexts of listening. In short, social cognition research can provide the conceptual depth lacking in the field of listening, and listening can provide the real-world contexts sorely needed in social cognition research.

An example can be shown in the area of *information load*. Nichols's original assertion that there was a thought-speed/speech-speed differential that led to problems in listening was accepted without question for many years. In other words, since listeners' minds (presumably) were capable of processing information at much faster speeds than normal spoken communication rates, listeners tended to daydream. In addition, it was assumed that spoken material could be time-compressed to almost twice normal speed with little or no loss of comprehension (→ Individual Differences and Information Processing).

This "accepted fact" stood in stark contrast to capacity theory (Kahneman 1973) and other advances in information-processing theory. King and Behnke (1989) demonstrated that, while increases in communication load (information divided by time) did not affect listening tasks relying on short-term memory or interpretation of paralinguistics, load increases had a direct, linear relationship to listening tasks involving long-term memory. In other words, any increase in the speed of the stimulus led to a concomitant decrease in retention. The implications of this finding are very important in an academic discipline where debaters regularly speak at extremely high rates of speed, wrongly assuming that such delivery has no impact on audience listening.

Increases in communication load have also been shown to impact levels of affect and anxiety toward the information being presented. Finally, the effect of communication load on listening has been shown to vary during a specific listening assignment (probably due to the build-up of a cognitive backlog), with higher levels of anxiety and lower levels of affect being experienced the longer one listens (King & Behnke 2004). Interestingly, this pattern of listening behavior is a mirror opposite of the patterns of anxiety and affect normally experienced during public speaking. In a world where information overload has become a daily frustration, such research may prove valuable.

*Future research* should seek to integrate listening, or the cognitive processes typically associated with message reception, into research that simultaneously deals with social cognition and message encoding. In fact, scholars are now examining the nexus between message decoding and encoding, and have documented differing patterns of language when thinking for (the purpose of) speaking and thinking for listening (Dipper et al. 2005). And just as theories of message production and processing account for nonconscious message encoding (Greene 1997), understandings of message reception should account for largely automatic forms of listening behavior.

The topic of listening, however defined, has become enormously popular. Proficiency in listening is a major concern in business and industry (Wolvin & Coakley 1991). Formed in 1979, the *International Listening Association* supports the professional activities of members from 49 US states and 15 other countries. The association sponsors a scholarly journal, the *International Journal of Listening*, and holds an annual convention. Listening instruction, once neglected, has become increasingly common. So, in response to Ralph Nichols's original question, "Are you listening?" the answer today is a qualified "yes."

## Literary Journalism

*Bridget Bennett*

*University of Leeds*

Literary journalism is a form of writing characterized by a particular aesthetic self-consciousness more usually associated with literary creativity than with fact-driven journalism. While conventional descriptions of journalism stress objectivity and clarity (→ Objectivity in Reporting), descriptions of literary journalism often focus on qualities more usually associated with literary texts. Literary journalism aims to combine a desire to present information objectively with one to do it stylishly, therefore giving it a different kind of impact to the regular fare of newspapers. Some argue that one of its characteristics is that the quality of its craft means that it will be still read in years to come, whereas much journalism has, and is intended to have, a short shelf life.

As a term, “literary journalism” is both more, and less, than the sum of its parts. The first word of the term implies its proximity to kinds of writing conventionally thought of as literature: chiefly fiction, plays, poetry. Yet at the same time the second word seems to contradict, even rule out, the first. If it is → journalism, how can it also be literary? This may be one reason why the term “creative nonfiction” is also increasingly being used as a less burdened and more precise description. Such a synonym does not run the risk, as “literary journalism” does, of implying that such writing must concern itself with the literary in some way.

Other related terms include “new journalism.” This was originally coined in the late nineteenth century to describe developments in → newspaper writing within a newly technologized industry, produced for a reading public with different expectations from their daily reading than their predecessors had (→ Journalism, History of). It was made still more famous by Tom Wolfe’s groundbreaking book *The new journalism* (1973), which argued for a form of journalism that could be read like a novel. Wolfe cited many novelists who were also celebrated journalists, and was a pioneer in the kind of journalistic writing often cited as an example of the best kind of journalistic practice. Others whose work also crossed over in this way include Stephen Crane, Charles Dickens, and George Orwell.

Uglove (1998) has argued that the term “literary journalism” needs to be considered historically in order to understand its shifting and sometimes conflicted relationship to the larger sphere of cultural production. Certainly, thinking about it in this way allows for a broader consideration of the relation between literary journalism and the → public sphere more generally. Literary journalism, some proponents claim, helps to create and sustain debates about a range of subjects in a manner that commands a wide readership and is likely to do so for a long period. It does this by its adherence to the best qualities of both journalistic endeavor, such as truthfulness and objectivity, and literary texts. In short, it reads like the best kind of fiction, but it is not made up. Whether, finally, the term “literary journalism” or “creative nonfiction” is most appropriate, the qualities that characterize it remain the same.

## **Lobbying**

*Bruce K. Berger*

*University of Alabama*

*Lobbying* is a strategic process through which groups and organizations carry out activities intended to influence policymakers and the formation of laws and regulations. In the nineteenth century, the term described how agents of interest groups gathered in the lobbies and hallways of the US Capitol in Washington and US state capitols to

advocate with legislators during meeting breaks. This kind of face-to-face advocacy between representatives of interest groups and policymakers constituted the act of lobbying. Today, lobbying is often seen to include many other communication strategies and tactics, ranging from presentations of research reports and committee testimony, to media relations activities, issue advertisements, grassroots campaigns, and even litigation.

Groups that engage in lobbying represent diverse types of organizations, ideologies, and levels of political resources. They include businesses, labor unions, nongovernmental organizations, social movements, single interest groups, trade groups, think tanks, professional associations, religious groups, foreign governments, and specialized institutional agencies like health-care and education (→ Social Movements and Communication). Such political actors are collectively referred to here as *interest groups*, though they are often categorized somewhat differently in the literature as firms and economic organizations, membership groups, peak associations, and so forth. However, they are all interest groups in that they conduct strategic activities that aim to influence policymakers and thereby advance their own agendas and goals.

Lobbying occurs in local, state, regional, national, supranational, and international political decision-making arenas and forums, and communication activities may be carried out by registered lobbyists, interest group officials and representatives, public affairs personnel, coalition representatives, trade and association personnel, and highly specialized agencies. Professional lobbyists are viewed with skepticism in some countries, especially the US, given the enormous amounts of money that flow into lobbying activities and periodic ethical scandals involving lobbyists.

### **THEORETICAL FRAMEWORKS AND CONCEPTS**

Lobbying is most often practiced and studied in democratic-type nations and political forums in western Europe and North America, where professional lobbying has a long tradition. In democracies, interest groups are seen to play an important role in the political process, and political theory developed around the concept of interest groups in the US in the mid-twentieth century (Truman 1951). The theory suggested that governmental decisions and policies grow out of the public's identification and discussion of social issues and problems. The role of government is to listen to these multiple voices, arbitrate conflicts, encourage compromise, and act in the best interests of "the people." The voices of competing interest groups, expressed through lobbying activities, help shape policy decisions.

However, Mancur Olson's (1965) theory of collective action highlighted the difficulties groups faced in organizing members and engaging in concerted action, which prevented some groups from having an equal voice in policy debates. Statist and elitist perspectives also challenge pluralistic conceptions of interest groups and policymaking. Statist theories (Skocpol 1988, 1992) in the 1970s and 1980s posited that government policymakers, far from responding to pressure group voices and lobbying activities, are powerful actors in their own right and exert considerable influence on policy decisions and implementation. In the elitist view (Mills 1956), certain groups and organizations (e.g., corporations and the wealthy) exert a disproportionate influence on policymakers because they possess and use more political and economic resources, and are linked with policymakers through

common social circles, education, group memberships, and ideology. Comprehensive studies have found consistently that economic producers are heavily over-represented in Washington-based lobbying associations and groups (Herring 1929/1967; Schattschneider 1960; Schlozman & Tierney 1986).

Researchers have also conceptualized policymaking as a communicative process in which groups select and use lobbying tactics and approaches to compete for political action and attention. Social movement theorists (Benford & Snow 2000) and political communication researchers (Reese et al. 2001) have developed and used framing theory to help explain how collective action groups construct and frame their messages and advocacy efforts, how such frames change over time, and how they may be used to attract or mobilize group members (→ Framing Effects). Berger et al. (2002) contended that three interrelated communication processes bear heavily on policy decisions: (1) the framing of social problems, (2) the selection or identification of certain social issues to be addressed by policymakers (agenda setting), and (3) the use of → issue management approaches through which organizations engage in the public policy formation process (→ Issue Management in Politics). Collective action groups monitor their environments, identify issues for political action, set goals, and select and carry out various lobbying strategies and tactics.

## RESEARCH DIRECTIONS AND FINDINGS

Lobbying and the dynamics of political action communications overlap a number of disciplines, including political science, political communication, issue management and public affairs, economics, sociology, and organizational behavior. Political science researchers have long been interested in influence in the political process and have conducted many studies to ascertain whether lobbying and political action committee (PAC) contributions in the US influence policymaking. These variables are frequently used in studies because campaign finance reform laws in the 1970s in the US provided new databases of business lobbying and PAC expenditures. The findings in such studies are inconsistent: reviews of 23 lobbying and 68 PAC studies concluded that such influence attempts appeared to sometimes strongly affect policymaking, sometimes marginally, and sometimes not at all (Baumgartner & Leech 1998; Smith 1995).

Some inconsistencies are due to the use of different methodologies and statistical tests, as well as a lack of direct measures of lobbying and influence in the studies. In addition, many other variables come into play in the policymaking process, and these often go unexplored and uncontrolled in studies. Such variables include the public salience of issues, public opinion about issues, the type of issue up for discussion, the scope of issue conflict, the stage of issue development, the presence of other lobbying tactics, the nature and extent of opposition from contending interest groups, election factors, party affiliation, and various contextual, institutional, and cultural factors.

Communication, sociological, and political communication researchers have studied the particular lobbying strategies and tactics that interest groups use. These studies have yielded a greater consistency of findings, suggesting that most interest groups and organizations use a variety of similar tactics to attempt to influence policymakers. Berry (1977) developed a typology of four lobbying strategies, which are groups of tactics

selected for use in specific political contexts. *Information strategies* employ such tactics as public relations media campaigns, congressional testimony, and presentation of data and research results formally or informally to policymakers. *Confrontation strategies* include the tactics of demonstrations, protests, other staged events, and aggressive media activities. *Constituency strategies* include grassroots campaigns and political contributions, while *legal strategies* use litigation tactics and other forms of administrative actions. The selection of strategies appears to be based on the characteristics of the interest group, the amount and type of its resources, the scope of the issue conflict, and the political and institutional contexts of decision-making arenas.

According to the findings of six major surveys, face-to-face discussions with policy-makers and presentations of research and information at committee meetings were the two most common lobbying tactics used by interest groups in Washington, DC and US state capitals (Baumgartner & Leech 1998). Other frequently used tactics included informal contacts with officials, coalitions, → public relations and → advertising initiatives, drafting or advising on regulations or legislation, constituent or grassroots campaigns, and legal actions (→ Political Advertising). Protests, demonstrations, and election support activities, i.e., campaign contributions and candidate endorsements, were used least often.

## LOBBYING IN EUROPE

Practiced in some European nations for many years, lobbying activities, and research into them, accelerated sharply in the 1980s and 1990s due to the Single European Act and the emergence of Europeanization and corresponding EU policymaking. As the number of lobbying offices and lobbyists multiplied in Brussels, research focused on case studies of particular groups and issues, lobbying styles and tactics, policy networks, and the growing Europeanization of interest groups, trade associations, and nongovernmental organizations. More recent research has taken an institutional approach, examining how lobbying activities and practices are shaped by the political contexts and institutional frameworks in which they take place. These include the EU Commission and Parliament, political ministries, legislative committees in nation-states, civil services, party systems, supranational agencies, and rules of the game that affect law-making processes, protocols, and timetables (McGrath 2005). Such research focuses on relationships between institutional constraints and opportunities and the interest groups that operate within the institutions, the tactics and strategies they employ, and the extent to which they are successful.

European researchers are also interested in similarities and differences between the US and the EU regarding lobbying tactics, practices, and policy-formation processes. Woll (2006) found that lobbying on both sides of the Atlantic had increased sharply in the past several decades and that lobbyists everywhere seek to gain access to policymakers, influence policy decisions, and advance the goals of their groups. In addition, coalition approaches continue to increase, and both European and American lobbyists most often use research presentations and formal and informal consultation to attempt influence. However, the style, characteristics, and instruments of lobbying differ to some extent. Lobbying in the US is more aggressive and confrontational, whereas in Europe the approach is lower-key and more consensus-oriented. US lobbying is also more competitive and fragmented and seems less focused on developing long-term relationships with

policymakers. US lobbyists also use legal and financial instruments, which are limited tactical options in Europe, and employ public relations and advertising approaches to a far greater extent.

## FUTURE RESEARCH

Past research has provided a great deal of descriptive data about lobbying through interest group case studies, framing analyses, domain studies, examinations of group lobbying tactics and strategies, and quantitative studies of lobbying and campaign contributions. However, theory development has lagged, and future research is likely to be directed toward studies that better explain how, why, and when interest groups select particular lobbying strategies and tactics, and in what contexts and under what conditions they successfully influence policymakers. The most promising research approaches in Europe and the US appear to be international comparative studies and institutional and cultural studies that shed light on the many complex contextual variables that shape lobbying practices, influence strategic and tactical choices, and affect policy decisions.

## Local News

*Young Jae Choi*

*Hallym University*

The term “local news” is often used to refer to news with coverage of events in a local context, which would be contrasted with news of other localities, or of national or international scope (→ International News Reporting). The geographic characteristics of local news have been regarded as forces with influence on shaping local media markets, labor, and media technology, which in turn affect local → news values. The geographic local boundary assumed to be influential in the process of local news production is easily connected to the socially constructed “community” concept. Thus, local news is expected to play a role in networking the local community and serving local interests (→ Community Integration).

Local news has been studied both from the perspective of journalistic functions and roles for the local community and concerning changes in the local media market and technology (→ Journalists’ Role Perception). The former approach deals with the problem of local news conveying a “chamber of commerce attitude” (Breed 1958, 111), rather than representing civic opinions and interests. The latter covers the consolidation of local news ownership into a handful of regionally based monopolies, which leads to a separation of journalists from their local readers and community. Also, local news faces challenges by new digital technologies, which are viewed more often than not as depriving local media of “locality” (→ Digital Media, History of).

Within the local context, news embraces *two contradictory journalism models*: civic journalism vs booster journalism. The goals of “civic journalism,” or → “public journalism,” as a normative journalism model, include improving civic attitudes, reinvigorating public debate about issues of concern to citizens, and improving participation in civic activities, such as voting, belonging to community organizations, or participating in community problem solving (→ Political Discourse; Public Sphere). Local news is expected to play a role in creating avenues for people to connect with each other and their public institutions by bringing awareness of problems, issues, and potential solutions to people in a community. Local news may stimulate growth of knowledge, enhance civic attitudes, and increase participatory behaviors. Local news provided by community media has been termed “the thing that democracy has been made of” (Park 1925, 13).

But a different view of the local media portrays it as an instrument of social control within the local community. Within the geographic boundaries of community, local news is not produced independently of local political and economic interests, but is

interdependent with local power elite. Local media have interests in economic growth in terms of circulation and advertising revenues, and the success of local news, as products, depends on the interests and acceptance of community members (→ Cost and Revenue Structures in the Media; Media Economy). Thus, the local media are inclined to help boost the local economy, while they frequently omit “undemocratic power of business elites” (Breed 1958, 111). Logan and Molotch’s (1987) local growth coalition model explains how the local media become an active contributor to enhance economic value and growth potential in the local community rather than to seek to promote aesthetic and lifestyle values. While the growth coalition is constructed with property owners at the core, along with local government, developers, financiers, universities, various cultural institutions, and so on, the local media enter the growth coalition by selectively reinforcing, legitimizing, and endorsing the accepted views. Whereas communities within a region or landowners within a single community may compete directly with each other, the local news endorses only the overarching position common to all community elites: that growth is desirable. Local news preserves the objective reporting principle, yet underlies more boosterism than quality of life in local communities.

The *public’s expectations of local news* have changed from the traditional “watchdog” role toward “good neighbor”: caring about the community, reporting on interesting people and groups, understanding the local community, and offering solutions (Poindexter et al. 2006). The gap between the public’s expectations of local news as good neighbor and the public’s disaffection with the press’s watchdog role, however, should be investigated further. The good neighbor and the watchdog model do not appear to be contradictory but complementary.

Local news has been affected by overall reduced news consumption (→ Exposure to News). The number of local newspapers has declined, and readerships and circulations of local media have diminished. But paradoxically, the regional or local newspaper business is reported to be booming. The readership size and advertising revenue in individual local media entities in the UK, for example, have increased in recent years (Franklin 1998). This resulted from the consolidation of local newspaper ownership into a handful of monopolies.

The consolidation has led to a reduced number of local newspapers (→ Concentration in Media Systems; Consolidation of Media Markets). It sustains profitability by centralizing production in large regional centers, which, in turn, separate journalists from their readers and local community. The media group also has further minimized production costs by reducing the number of journalists employed, which increases local papers’ editorial reliance on news agencies and public relations sources based in local and central government, as well as other local interest groups. Whereas local media businesses survive and prosper to some degree, the journalistic value of “locality” is at risk.

*New digital technologies* create economic and journalistic challenges and opportunities for local news by increasing local communities’ access to news via the Internet and mobile telephony. The traditional local media, such as newspapers and broadcasting, face detrimental challenges by a significant and troubling migration of news users and advertising to new media sites. The traditional “spatial” localism may no longer provide a beneficial community sense for local news in the new media environment, where new communication technologies such as → Internet, satellite, and digital mobile broadcasting (DMB) defy geographic boundaries. On the other hand, the new digital technologies enable any news service, national or local, to adapt more easily to specific localities. The

technologies give the media the chance to provide news on demand in local communities. A variety of ways of commissioning user-generated content from individuals and organizations in more segmented local communities are being tested around the world.

The term “hyperlocal” has begun to be used to refer to news coverage of community-level events usually overlooked by mainstream media outlets (→ Community Media). The locality in hyperlocal news covers not only the hitherto geographic local area, but local cyberspace communities, such as newsgroups and Internet café blogs (Lindgren 2005). Hyperlocal news contents are more widely available not only to news users in the hyperlocal community but also to ones residing beyond the cyber-boundaries through the new digital network.

## **Log-File Analysis**

*Bernard J. Jansen*

*Pennsylvania State University*

*Amanda H. Spink*

*Queensland University of Technology*

Log-file analysis uses the records stored in the transaction logs of information retrieval systems, web → search engines, and websites to offer valuable understanding of the interactions between these systems and people. This understanding informs system design,

interface development, and information architecture. Log files (or transaction logs) are an unobtrusive and relatively easily method of recording significant amounts of usage data on a considerable number of users at low cost.

A log file or transaction log is a record of the interactions between a system and the users of that system. Rice and Borgman (1983) present transaction logs as a data collection method that automatically captures the type, content, or time of transactions made by a person from a terminal with that system. Peters (1993) views transaction logs as electronically recorded interactions between online information systems and the people who search for the information found in those systems.

### NATURE AND GOALS OF LOG-FILE ANALYSES

Once one has collected and recorded the data in a log, one must analyze this data in order to obtain useful information. The process of conducting this analysis is *transaction log analysis* (TLA) or log-file analysis. TLA can focus on many issues and questions, but it typically addresses issues of system performance, information structure, or measurements of user interactions. Peters (1993) describes TLA as the study of electronically recorded interactions between online information retrieval systems and the persons who search for information found in those systems. Blečić et al. (1998) define TLA as the detailed and systematic examination of each search command or query by a user and the following database result or output. Spink and Jansen (2004) also provide comparable definitions of TLA but with a web focus.

The goal of TLA is to gain a clearer understanding of the interactions among searcher, content, and system, or the interactions between two of these elements. The research questions are the drivers for the particular study. From this understanding, one achieves some stated objective, such as improved system design, advanced searching assistance, or identifying user information searching behavior.

TLA is conceptually based on a  $\rightarrow$  *grounded theory* approach (Glaser & Strauss 1967), although one could also view it from a purely quantitative approach. Grounded theory emphasizes a systematic discovery of theory from data using methods of comparison and sampling. The resulting theories or models are grounded in observations of the real world, rather than being abstractly generated. Therefore, grounded theory is an inductive approach to theory or model development, rather than the deductive alternative.

### COMPUTER–USER INTERACTION

Using TLA as a methodology, one examines the characteristics of searching episodes in order to isolate trends and identify typical *interactions* between searchers and the system. Interaction has several meanings in information searching, addressing a variety of transactions including query submission, query modification, results list viewing, and use of information objects (e.g., web page, pdf file, video). TLA addresses levels one and two (*move* and *tactic*) of Bates's (1990) four levels of interaction, which are move, tactic, stratagem, and strategy. Saracevic (1997) views interaction as the exchange of information between users and system. Increases in interaction result from increases in communication content. Hancock-Beaulieu (2000) identifies three aspects of interaction,

which are interaction within and across tasks, interaction as task sharing, and interaction as a discourse (→ Computer–User Interaction).

Interactions are the physical expressions of communication exchanges between the searcher and the system. For example, a searcher may submit a query (i.e., an interaction). The system may respond with a results page (i.e., a reaction). The searcher may click on a uniform resource locator (URL) in the results listing (i.e., an interaction). Therefore, for TLA, interaction is a mechanical expression of underlying information needs or motivations.

Discussing TLA as a methodological approach, Sandore and Kaske (1993) review methods of applying the results of TLA. Borgman et al. (1996) comprehensively review past literature from different methodologies employed in these studies. Several researchers have viewed TLA as a high-level designed process, including Cooper (1998). Other researchers, such as Hancock-Beaulieu et al. (1990), Griffiths et al. (2002), and Hargittai (2002), have advocated using TLA in conjunction with other research methodologies or data collection. These other methods include questionnaires, interviews, video analysis, and verbal protocol analysis.

In terms of strengths, log-file analysis provides a method of collecting data from a great number of users. Given the current nature of the web, transaction logs appear to be a reasonable and non-intrusive means of collecting user–system interaction data during the web information searching process from a large number of searchers. One can easily collect data on hundreds of thousands to millions of interactions, depending on the traffic of the website. One can also collect this data inexpensively. The costs are the software and storage. The data collection is unobtrusive, so the interactions represent the unaltered behavior of searchers. Finally, transaction logs are, at present, the only method for obtaining significant amounts of data within the complex environment that is the web.

### **LIMITATIONS TO LOG-FILE ANALYSIS**

Researchers have critiqued TLA as a research methodology (Blecic et al. 1998; Hancock-Beaulieu et al. 1990; Phippen et al. 2004). Kurth (1993) comments that transaction logs can only deal with the actions that the user takes, not their perceptions, emotions, or background skills, and further identifies three methodological issues with TLA: execution, conception, and communication. Kurth states that TLA can be difficult to execute due to collection, storage, and analysis issues associated with the hefty volume and complexity of the dataset (i.e., the significant number of variables). With complex datasets, it is sometimes difficult to develop a conceptual methodology for analyzing the dependent variables, from a positivist framework. Communication problems occur when researchers do not define terms and metrics in sufficient detail to allow other researchers to interpret and verify their results. This issue also occurs during the data collection period.

Certainly, any researcher who has utilized TLA would agree with these critiques. However, upon reflection, these are issues with many, if not all, empirical methodologies. Further, although Kurth's critique is still generally valid, advances in transaction logging software, standardized transaction log formats, and improved data analysis software and methods have addressed many of these shortcomings.

There are certainly limitations that do exist. Transaction logs are primarily a server-side data collection method; therefore, some interaction events are masked from these logging

mechanisms, such as when the user clicks on the back or print button on the browser software, or cuts or pastes information from one window to another on a client computer. Transaction logs also, as stated previously, do not record the underlying situational, cognitive, or affective elements of the searching process.

Another limitation is that there may be certain types of data not in the transaction log, individuals' identities being the most common example. An IP (Internet protocol) address typically represents the "user" in a transaction log. Since more than one person may use a computer, an IP address is an imprecise representation of the user. Search engines are overcoming this limitation somewhat by the use of cookies. In addition, there is no way to collect demographic data when using transaction logs in a naturalistic setting. This constraint is characteristic of many nonintrusive naturalistic studies. However, there are several sources for demographic data on the web population based on observational and survey data. From these data sources, one may obtain reasonable estimates of needed demographic data.

In addition, a transaction log does not record the reasons for the search, the searcher motivations, or other qualitative aspects of use. This is certainly a limitation. In the instances where one needs this data, transaction log analysis can be used in conjunction with other data collection methods. However, this invasiveness then intrudes on the unobtrusiveness that is an inherent advantage of transaction logs as a data collection method.

Finally, the logged data may not be complete due to caching of server data on the client machine or proxy servers. This is a relatively minor concern for web search engine research because of the method by which most search engines dynamically produce their results pages. For example, a user accesses the page of results from a search engine using the back button of a browser. This navigation accesses the results page via the cache on the client machine. The web server will not record this action. However, if the user clicks on any URL on that results page, functions coded on the results page redirect the click first to the web server, from which the web server records the visit to the website.

Overall, transaction logs are powerful tools for collecting data on the interactions between users and systems. Using this data, TLA can provide significant insights into user–system interactions, and it complements other methods of analysis by overcoming the limitations inherent in these methods. With respect to shortcomings, where feasible TLA can be combined with other data collection methods or other research results to improve the robustness of the analysis. Of course, although transaction logs many times "reside in the background" for most searchers, there are privacy concerns that the researcher must be aware of when using this method of data collection. Even with these shortcomings, TLA is a powerful tool for web searching research and the TLA process can be helpful in future web searching research endeavors.

## Logos and Rhetoric

Carol Poster

York University

*Logos* (plural *logoi*) is a polysemous Greek term, which generally has been used in rhetoric to refer to the component of persuasion grounded in logic or reason as opposed to that based on emotion or character, although these distinctions are not entirely unproblematic. The Greek noun *logos* derives from the verb *legô* (to speak), and has many derivatives and cognates in several Indo-European languages. *Logos* is found infrequently in Homer (eighth century BCE), coming into wide usage only in the prose writers of the sixth century, with the primary meaning of a “speech” or “tale.” It quickly became a common Greek term, with many meanings, including “word,” “story,” “speech,” “reputation,” “ratio,”

“book-keeping tally,” “rumor,” “rule,” “explanation,” “argument,” and “reason.” *Logos* tends to signify uttered thought, rather than specific words; barbarians and Greeks are described as using different types of sound (*phônê*) or word (*rhêma*) to express the same *logos*. In its senses as both reason and speech, *logos* was used in ancient Greek to refer to that which distinguished humans from beasts. In much of Greek thought, rationality and speech were considered interdependent.

As long prose compositions were termed *logoi*, prose writers, including historians and those employed in the lucrative, if moderately disreputable, profession of ghost-writing speeches for law courts, were referred to as “logographers” (*logographoi*). A related compound, *logopoiios* (derived from *logopoiêô*, to write, invent, or compose stories or speeches), found in Herodotus (c. 484–425 BCE), Thucydides (c. 460/455–c. 399 BCE), Plato (427–347 BCE), and Theophrastus (c. 371–287 BCE), is used, inter alia, neutrally to signify a composer of prose stories or tales or pejoratively to indicate a spinner of tall tales.

Particularly significant for rhetoricians is Gorgias’ (c. 483–c. 375 BCE) paradoxical “Encomium of Helen,” which argues that Helen was not culpable because she did not leave her husband voluntarily, but was compelled by a superior force, being either abducted forcibly by Paris or overcome by the powers of love, fate, or persuasive speech. Gorgias emphasizes the power of *logos* (in the sense of language in general, speeches, or verbal persuasion) as deriving from its magical effect, which acts like a drug, on its hearers, and thus has the force of a compulsion (→ Rhetoric, Pre-Socratic).

The term *logos* takes on distinct technical senses in fourth-century BCE rhetorical theory. Plato uses *logos* for a speech or account as a whole, a sentence, and a supporting reason or argument, as well as for reason in general, and opposes *logos* to *muthos*. For Alcidas (fourth century BCE), *logos* refers to a speech, and *enthymeme* to an argument (of any sort). In *On Sophists*, Alcidas distinguishes those who produce written speeches (*logographoi*) from true orators, who speak *ex tempore*.

Aristotle (384–322 BCE) defines *logos* as “meaningful speech (or sound) [*phônê sêmantikê*]” (*On Interpretation* 16b), and in his *Prior Analytics* calls a syllogism a type of *logos*. Often cited by rhetoricians is Aristotle’s tripartite division of intrinsic proofs: “The proofs provided from the *logos* [either “speech” or “argument”] are of three types; they are those from the moral character [*êthos*] of the speaker, those from disposing the hearer in a certain manner [*en tô ton akroatên diatheinai pôs*], and those from the *logos* itself [*en autô tô logô*], in so far as it demonstrates or appears to demonstrate something” (*Rhetoric* 1356a1). In contemporary rhetorical theory, this is often described as proof from “*êthos*, *pathos*, and *logos*” with “*logos*” being defined as abstract reasoning, although such an interpretation depends on reading back Aristotle’s subsequent explanatory material into this passage. For Aristotle, intrinsic rhetorical proof appears based on abstract and universal reason (e.g., the relationship of lesser to greater or part to whole) rather than fact, the latter being antecedent to the activity of the orator and thus extrinsic to the speech (→ Rhetoric, Greek).

The *Rhetorica ad Alexandrum*, usually attributed to Anaximenes of Lampsacus (fl. 380–320 BCE), specifies: “There are two types of proof: there are those drawn from the deeds and persons and words [*logôn*] themselves, and those supplementary to the things said and things done” (1428a17), a distinction similar to the one Aristotle makes between intrinsic (*entechnos*) and extrinsic (*atechnos*) proof.

In Hellenistic and later rhetoric, the derivative terms *logismos* (rare in the sixth century, but widely used in the fifth and subsequently) and *logikos* (only becoming common in the fourth century) are used to indicate reasoned argument, with *logos* most often referring to either a speech as a whole or a distinct unit of speech, e.g., an enthymeme being defined as a type of *logos* (*Anonymous Seguerianus* 157–159).

Another important use of the term *logos* found throughout antiquity is the antithesis between words (*logoi*) and deeds (*erga*). The best known Homeric instance of this contrast does not actually use the term *logos*; Phoenix describes himself as having taught Achilles to be a speaker of words [*muthôn*] and doer of deeds [*ergôn*]” (*Iliad* 9.442–443). From the classical period through late antiquity and beyond, this distinction appears in rhetorical theory (and often in oratorical practice) as the *logoi-erga topos*, which contrasts (mere) words (*logoi*) with deeds (*erga*).

*Logos* as a rhetorical term was not carried over into Latin or vernacular rhetorics to any great degree until the revival of Aristotelian rhetoric and logic in the nineteenth century. It became increasingly important with the separation of Communication departments from English in the United States in the early twentieth century, with the concomitant self-definition of Communication Studies as a field rooted in the classical traditions of oral communication and argument. Argument from “*logos*”, in the sense of logic or reason, is clearly distinguished from that from “*ethos*” (the character of the speaker), and “*pathos*” (the emotions of the audience) in twentieth- and twenty-first-century American neo-Aristotelian speech and writing pedagogy, and the three Greek terms are routinely used in Anglophone rhetorical theory and instruction.

## **Long-Distance Relationships**

*Laura Stafford*

*Ohio State University*

Relationships are considered long-distance when opportunities for communication are restricted due to geographic constraints. Long-distance relationships (LDRs) are of interest given the implicit assumption in much interpersonal scholarship that relationships

without frequent face-to-face contact are not as “close” as those with such contact (Stafford & Merolla 2007). LDRs exist in opposition to norms for shared residences and/or proximity among romantic partners, family members, and close friends. LDR participants hold expectations for continued close involvements and usually anticipate residing in geographic proximity at some future time (Stafford 2005).

LDRs occur due to educational or career pursuits, employment demands, military deployment, incarceration, divorce, or nonmarital parent-child arrangements. The number of LDRs is unknown. Outside of the military, long-distance families are not officially recognized. Estimates indicate that approximately 50 percent of college students may be involved in long-distance dating relationships (LDDRs). When considering friendships, sibships, and adult-child-parent relationships as forms of LDRs, most people in the US are likely involved in at least one LDR (Stafford 2005).

The idea that LDRs are relationships with restricted contact has been used to expand the conception to include “cross-residential” relationships (Stafford 2005). These occur when families span households (e.g., bi-nuclear or some multigenerational families) although distance between households might be minimal. Proximity or shared residences are not goals for these and many other LDR forms such as friendships (→ Friendship and Peer Interaction), and some romantic couples prefer a continued LDR status (Levin & Trost 1999).

In western research, study of LDR family interactions began with deployed military personnel (Hill 1949). Hill reported roller-coaster-like cycles of separation and reunion, and identified family coping patterns. Though couples have long been apart due to traditionally male-dominated occupations, the 1970s saw the rise of “dual-residence dual-career” marriages, prompting research into “commuter” couples. Such couples choose to live apart, maintaining two residences, so both can pursue career opportunities that would be limited otherwise (Gerstel & Gross 1984). Although long-distance friendships and kinships have received some attention, most research in the fields of communication and relational studies has focused on heterosexual LDDRs, beginning with Stephen (1986).

The main focus of western research on LDRs is maintenance during separation (→ Relational Maintenance). Among family and romantic relationships, attention has been given to adjustment and coping during separation, the effects of parental absence (with recent emphasis on maternal absence), the use of new communication technologies during separation, and issues encountered with reunions. Among extended family and friendships, research has addressed the strength of ties or the ability of the relationship to meet needs. Stress and coping difficulties have been presumed to be inherent in romantic LDRs, though this has been questioned in regard to civilian dual-residence and LDDRs. These couples have reported benefits of LDRs alongside difficulties. Despite an emphasis on maintenance during separation, recent research indicates that LDDRs are at risk for dissolution upon reunion. Findings indicate that LDDRs are as satisfying and stable as geographically close relationships; LDR friendships are as strong as proximal ones; and extended family networks meet numerous emotional support needs. Geographic distance has generally been considered the defining feature of LDRs. However, there is difficulty in operationalizing LDRs. Long-distance status has been considered a given for some populations (deployed military personnel). For other romantic relationships, long-distance status has been based on participants’ reports of the distance between them, of

their residence in different cities, of the number of nights a week they spend apart, their inability to see each other every day, or simply their own self-classification as long-distance. Parameters for defining other types of LDRs are more ambiguous.

Most research has been atheoretical (however, see Sahlstein 2006). Focus has been on the frequency and mode of interaction, including computer-mediated communication (→ Mediated Social Interaction). Little work has examined the content, nature, and substance of communication (→ Intimate Talk with Family and Friends). Consideration of the means of connection aside from communication (e.g., rituals and cognitions; → Imagined Interactions), additional influences in the lives of the LDR participants (e.g., proximal networks; Stafford 2004; → Social Networks), and markers of success aside from relationship stability is warranted. Study of the maintenance of relationships and issues faced by individuals separated by incarceration, national borders, and foster care arrangements, and populations beyond military personal or middle-class commuter couples and college students is also needed.

# Longitudinal Analysis

*Helmut Scherer*

*Hanover University of Music and Drama*

For many inquiries in the field of communication research, the analysis of change is of great value. Classic diffusion research in the communication sciences deals with the diffusion of information in society, and it is important to know the dynamics of the diffusion process, as well as the factors that influence it (→ Diffusion of Information and Innovation). Media research considers media effects mostly as individual changes caused by media content. Therefore, methods that allow the analysis of these changes are of particular importance in communication research.

There is a fundamental distinction between cross-sectional studies and longitudinal studies. In the case of cross-sectional studies, a → survey is conducted only once. Longitudinal studies, on the other hand, are those studies in which the same survey is conducted several times at certain intervals. Only this second type of study allows for a dynamic approach, a longitudinal analysis. There are two distinct types of longitudinal analysis: trend studies and panel studies. The difference between these two types of surveys is that a trend study employs different respondents with each survey, while a panel study implies the use of the same respondents each time for a multiple survey. In other words, a trend study employs a new sample for each measuring time, while a panel study employs the same sample over a series of measuring times. The two different types of longitudinal studies have a variety of advantages and disadvantages, and accordingly call for, as well as permit, different analytical techniques.

## TREND STUDIES

Trend studies can be conducted in relatively quick succession. This helps establish with relative accuracy the point in time when changes of specific variables occur. It is also possible to conduct an analysis according to sub-groups, and to examine in which social groups the development shows a greater dynamic. A larger number of data measured at regularly spaced intervals allows for the application of → time-series analysis.

However, trend studies have certain limitations. Trend studies draw new independent samples at different points in time, which, nevertheless, have to come from the same population. This does not permit the study of changes at an individual level, but only at an aggregate level. It is therefore impossible to assess which people have changed their opinion over time. Moreover, there may be differences between the samples drawn at different survey times that have nothing to do with changes in the population, but rather stem from time-related variations in the effect of the sampling error. Fluctuations between different survey times may therefore be coincidental. Pertinent statistical analysis may, however, help establish the likelihood of these coincidental differences, and the degree of certainty with which one may interpret the differences found.

## PANEL STUDIES

Panel studies have traditionally played an important role in communication research. This probably has to do in part with the fact that some of the pioneering communication studies are panel studies, the first among them being *The people's choice* (Lazarsfeld et al. 1948, 1st pub. 1944; → Lazarsfeld, Paul F.). Their importance, however, is due particularly to the considerable strategic advantages this survey method offers for communication research (Lazarsfeld & Fiske 1938; Lazarsfeld 1940).

The repeated questioning of the same respondents allows for the collection of more data about them. It also permits the building of trust between surveyor and respondent, which in turn may make the posing of more intimate questions possible (→ Interview). There is greater reliability in the assessment of changes, since in the comparison of two independent samples the selection error, which can have a different effect on each of the samples, always has to be taken into account. Panels are an especially useful method to help answer central questions in the communication sciences. Measuring data at certain intervals facilitates the analysis of changes at the individual level as well as the statistical analysis of the conditions under which such changes are most or least likely to occur. This is particularly important for media effects research.

### Advantages of Panel Studies

Panel studies have an important analytical advantage in that they can uncover gross changes. As a rule, social situations are subject to opposing forces. The actual dynamic of social changes can therefore be grossly underestimated. A marketing campaign, for example, may lead to a better assessment of the product in question by a sector of the population while causing negative reactions in another sector. If in this case we compare two independent samples, we will underestimate the actual change caused by the marketing campaign. Only a panel that measures individual changes will provide a clear picture. The example given here shows this clearly (Tables 1 and 2). Table 1 shows the net change in a similar way to a trend study. The picture is one of relative stability. If we consider the sum of all changes, the net change amounts to no more than 5 percent.

An analysis based on individual changes as provided by a panel study provides a more dynamic picture (Table 2). The diagonal thereby represents stability, i.e., here we find the respondents whose position has not changed. This shows that only 62 percent of respondents did not change their opinion. The respondents in the other categories have all changed their opinion. This shows clearly that substantial fluctuations can occur in a seemingly very stable situation. Only in the sum do these fluctuations cancel each other out almost completely. These analyses stress the ways in which panel studies can improve the description of social dynamics.

Panels are generally considered to be a useful method for the analysis of causal relationships. In this context we have to distinguish between two different types of questions. On the one hand, there are the quasi-experimental inquiries (→ Experimental Design). These are analyses that evaluate hypotheses about the influence of one variable on another. Typical questions in media research, for instance, are concerned with assumptions regarding the influence of television on particular cognitive patterns. In this

**Table 1** Analysis of trends in attitudes toward the census  
 Question: "In general: are you in favor of or against the census?"

	Panel wave 1	Panel wave 2	Net change wave 2 and wave 1
In favor	25	26	1
Against	35	33	2
Undecided/no answer	39	41	2
Total	100	100	5

N = 1062, German Census Panel, 1986 to 1987, wave 1 = Jan/86, wave 2 = Apr/86.

**Table 2** Analysis of the actual change in the panel  
 Question: "In general: are you in favor of or against the census?"

	Wave 1		
	In favor (%)	Against (%)	Undecided/no answer (%)
Wave 2	16	3	7
	2	22	9
	7	10	24

N = 1062, German Census Panel, 1986 to 1987, wave 1 = Jan/86, wave 2 = Apr/86.

case the analysis follows experimental research models, in that one differentiates two groups, one of which has, for example, watched relevant television programs while the other one has not. The research focus here is on potential differences in the development of these two groups. This type of process is of course only quasi-experimental, since first of all these groups are self-selected and, moreover, the researcher has not manipulated the experimental stimulus.

On the other hand, the panel study is useful in deciding between conflicting hypotheses about the causal relationship between two correlated variables. In this context the panel study essentially follows the logic that causal relationships can be transferred over into time-related ones, and that cause precedes effect. This means that from the occurrence of the cause, predictions can be made regarding the future effect, while occurrence of the effect does not allow a prognosis regarding a future occurrence of the cause. Thus, if the condition of the variable *Y* at the point in time  $t + 1$  can be more easily predicted from the condition of the variable *X* at the point in time  $t$  than the other way around, then *X* is considered the cause and *Y* the effect. Pertinent analytical procedures based on this logic are, for example, Lazarsfeld's 16-fold table (1972), Coleman's calculation of transition probabilities (1964), and the cross-lagged panel-correlation analysis (CLPC; see Campbell 1963; Campbell & Stanley 1963). This last one can be considered to be the standard method in causal analysis in panel studies (McCullough 1978).

CLPC analysis compares the time-lagged correlations of the variables. Its purpose is to find out whether the relationship between variable  $X$  at time  $t$  and variable  $Y$  at time  $t + 1$  is stronger than the relationship between  $Y(t)$  and  $X(t + 1)$ . If it is true that  $X(t)Y(t + 1) > Y(t)X(t + 1)$ , then  $X$  is considered to be the causative variable. However, it is important to calculate only cross-correlations that have been adjusted for the autocorrelation of the respective dependent variable. Otherwise the stationary correlation at time  $t$  influences the result.

### **Problems with Panel Studies**

A problem with panel studies is that the method requires a greater willingness to cooperate on the part of the respondents. They have to be available for repeated questioning and give their permission for their private address information to be collected. It is often the case that respondents do not take part in all surveys, so that the sample size progressively decreases. This phenomenon is called panel mortality. Panel mortality presents a problem for two reasons. On the one hand, the first sample has to be substantial to ensure it is still large enough at the end of the study. On the other hand, panel mortality presents a serious problem if dropouts are not coincidental but systematic. In such cases panel mortality distorts the sample results.

The terms “panel effect” and “conditioning effect” describe the phenomenon that respondents change their answers due to repeated questioning in the panel. We distinguish two types of panel effects: those in which respondents actually change their position and those in which they merely change their answering behavior. In the first case we have to assume that respondents may have become more critically aware or sensitive regarding the topic of the survey or that they may have become more stable in their opinion. There are very few studies concerning these effects. As a rule, these “conditioning effects” are considered to be very small (Holt 1989). In the second case, it is assumed that the quality of the answers has improved (Waterton & Lievesley 1989). The respondents learn the requirements of the survey interview procedure and build up trust in the surveyors. This can be seen on the whole as a positive effect, but it can also have negative consequences. If the quality of answers improves, this also means that change cannot be assessed with precision. If change occurs we do not know whether it is due to an actual change or merely to the fact that answers have become more precise.

# M

## Magazine

*Carol B. Schwalbe*

*Arizona State University*

No other popular mass medium rivals magazines for timelessness, permanence, and scope. Magazines reflect and mold the issues, opinions, and trends of the present; they also interpret and shape society's collective memory of the past (→ Collective Memory and the Media). Although critics fret about celebrity journalism and advertising pressure on editorial content, the diversity of magazines makes them a voice for the old and young, men and women, liberals and conservatives, the mighty and the marginalized.

Consumer magazines cover a broad array of topics of interest to the general public. They can be divided into general-interest magazines, which appeal to broad readerships, and special-interest magazines, which target niche → audiences. Trade magazines, also known as specialized business magazines or business-to-business magazines, serve specific industries and professions. Uses-and-gratifications studies indicate that readers of trade magazines and news weeklies prefer insight and information, while readers of consumer magazines seek diversion (→ Uses and Gratifications). For many readers, magazines play a social role, constructing a community or affinity group in which they consider themselves members. Magazine editors, in turn, stay attuned to their readers. Major publishers conduct extensive research so they can tailor content to readers' needs and interests (→ Markets of the Media).

Histories of the American magazine by Frank Luther Mott (1930) and Theodore Peterson (1964) established periodicals as a legitimate field of scholarly inquiry (→ Magazine, History of). More recently, Norberto Angeletti and Alberto Oliva (2004) offered a detailed analysis of eight history-making magazines: *Time*, *Life*, *People*, *Reader's Digest*, *National Geographic*, *Der Spiegel*, *Paris Match*, and ¡*Hola!* David Abrahamson's (1995) benchmark anthology of *The American magazine* sets forth theoretical and methodological issues. Content analysis, the most popular approach to this area, provides insights into the characteristics and meaning of magazine articles and advertisements (→ Content Analysis, Quantitative). Historical, feminist, visual culture, and other perspectives seek to understand different dynamics, such as the decline of a magazine or the relationship between an editor's opinions and a magazine's content.

Magazines mirror the social, political, and economic values of their time and place. By positioning their subjects in a specific time period, scholars draw connections among

a publication's producers, content, and environment. Intellectual historians have traced successful magazines to dynamic visionaries, such as Time Inc. co-founder Henry Luce and *Cosmopolitan* editor Helen Gurley Brown. Social historians have examined the interaction of economics and society (→ News Magazine, History of). The decline of many popular general-interest magazines in post-World War II America, for example, has been attributed to competition from television, poor management, and failure to adapt to a changing readership (Abrahamson 1996). Research on the economic forces that shape the magazine industry focus on the business aspects of publishing, such as emerging technologies, revenue streams from advertising, subscriptions, and newsstand sales, and gender as a factor in → marketing and readership (→ Gender and Journalism; Gender: Representation in the Media). Joan Barrell and Brian Braithwaite (1988) view women's magazines in the United Kingdom from a business perspective, while Ann Gough-Yates (2002) traces changes in production, advertising, and marketing practices, and analyzes how a variety of titles have fared in the global marketplace.

Historians first explored the role that gender plays in the positioning of editorial content and advertising, especially during the nineteenth century. Although scholars have begun to examine the relationships between gender and quantitative measures of magazine publishing, such as circulation, publication frequency, and advertising costs, much research about current trends appears in industry reports and trade journals. Most studies of *gender role portrayals in magazine* advertising have focused on US publications, thus limiting generalizations about their effects (→ Advertising). Traditionally, women appeared as entertainers, as decorative objects, or in stereotypical roles, for example as mothers, homemakers, and teachers. Although females today are also shown in occupational roles, they are still often depicted in sexually explicit ways (→ Women in the Media, Images of; Sex Role Stereotypes in the Media). Portrayals of males have shifted from stereotypical businessmen and servicemen to more varied roles – as decorative objects, as entertainers and sports figures, and in family-oriented roles, such as washing dishes or doing laundry.

Gender role portrayals in international magazine advertisements also reveal cultural values, biases, and → stereotypes. In some countries, men and women are more likely to be portrayed in decorative roles, while in others they appear in recreational and family roles. Stereotypes cut across national borders. Women are generally portrayed as more concerned with appearance than men and are not depicted as product authorities. Advertisements rarely feature older models, even in magazines targeted at older readers or in Asian countries where the elderly command respect.

Academics debate whether international advertisers should adapt their messages to *reflect cultural differences* in their target markets or standardize their → brand for a more homogeneous global market. US advertisers generally tailor messages to the magazine's editorial mission and target audience. In the tug-of-war between advertising pressure and editorial neutrality, for example, magazines that advertise cigarettes tend to shy away from articles about health issues associated with smoking (→ Advertising, Cross-Cultural).

Scholars pay a great deal of attention to the *depiction of young women*, especially in terms of socialization, body image, and ideal body shape (→ Body Images in the Media). Janet Cramer's (2002) bibliographic essay describes how a lot of research about US women's magazines concentrates on representations of identity. Several studies of sports

photographs reinforce the sexual differences between female and male athletes, with an emphasis on the body aesthetic (→ Photojournalism). Magazine articles tend to reinforce stereotypes of older women by portraying them more often in a negative light (as slow or helpless) than in a positive one (as trustworthy or wise).

Analyzing non-US magazines can enhance the potential for cross-cultural comparisons. Studies of images of Soviet women, Japanese women, and British women illustrate how a particular socio-political environment might affect meaning and content for readers (Cramer 2002). Other potential topics for cross-cultural comparisons include censorship issues, political posturing of the press, and social issues like AIDS.

While newspapers practice daily, fact-based, deadline-driven journalism generally rooted in a geographic area, international licensing and joint ventures have fostered the spread of magazine brands around the globe. Their diverse subject matter, thoughtful analysis, depth of coverage, breadth of information, and engaging presentation make magazines more complex than newspapers – and harder to throw away. In today's rapidly changing media world, these enduring qualities will help insure their survival.

# Magazine, History of

Andrew King

Canterbury Christ Church University

A “magazine” is a type of periodical characterized by entertaining and miscellaneous matter written by more than one author, often with illustrations. It is usually distinguished from a newspaper by containing less news coverage and by a lower frequency (weekly, monthly, or less). In the nineteenth century magazines were distinguished from reviews or quarterlies by an emphasis on light entertainment, and by the inclusion of → fiction. From around 1910 the term “little magazines” came to denote low-circulation periodicals produced by and for the avant-garde. Since the twentieth century, “magazine” has been used above all to denote entertainment periodicals with a high visual content.

## TYPES OF MAGAZINES

There are various ways of classifying magazines. The closest to the core meaning of “magazine” for most people today comprise the expensive “glossies” on high-quality, glossy paper. These promote consumer culture, sometimes with global reach and national variations (*Cosmopolitan* [1886–], *Vogue* [1892–], *GQ* [1958–], *Time Out* [1968–], *NME* [1952–]). Related but usually less glamorous are the highly specialized or local publications such as *Book and Magazine Collector* (1984–), *Kent Life* (UK, 1962–), and *Metropolis* (Tokyo, 1994–). They mainly derive profits from advertising revenue.

Glossies are often differentiated from “pulp,” printed on low-quality wood-pulp paper. These latter comprise mainly cheap mass-market fiction magazines, and derive profit from high circulation. They vary between themselves as much as the glossies, from the story papers aimed at older people, such as the various national versions of *Reader’s Digest* (1922–) or the Scottish *People’s Friend* (1869–), to the energetically illustrated Filipino *Liwayway* (1922–) aimed at the general public or the youth-targeting British *Boy’s Own Paper* (1879–1967), *Magnet* (1908–1940), and *Peg’s Paper* (1919–1940). Such magazines often elicit readers’ contributions to keep down costs. The term “pulp,” however, mainly refers to 1920s–1950s periodicals such as the American science fiction *Amazing Stories* (1926–2005) or the “hard-boiled” fiction *Black Mask* (1920–1951).

Other categorizations of magazine may be made based on the demographic of the target audience (“lads,” “girl teens,” “computing,” “football,” and so on) and/or on the genre of material covered (e.g., *Argosy* [1882–1978], an American “sweat” which ran men’s adventure stories). “Trade” magazines (e.g., the *Builder* [1842–], the *Grocer* [1862–1978]) and, more recently, those associated with specific retail outlets can be thought of as further sub-categories of the demographic model. Comics and Japanese manga, although strictly a subset of magazine, are usually dealt with separately (→ Comics).

These categorizations evolved historically and are culturally specific, depending on printing and paper-production technologies, distribution capacities, work and leisure practices, and high standards of living and literacy rates. For this reason, magazines are principally read and produced in the industrially developed world, with the USA, UK, Germany, and Japan among the highest consumers.

## HISTORY

There is no exact equivalent for “magazine” in other languages unless the word and meaning are directly imported from English, such as in German or French. While related words may be used to translate it, they almost always have different associations (e.g., *rivista* in Italian and *zasshi* in Japanese indicate both “magazines” and academic journals).

“Magazine” derives from an Arabic word denoting a storehouse and came to have its common meaning from being used metaphorically. Book titles had used “magazine” before (e.g., Robert Ward, *Animadversions of Warre; or, a Militarie Magazine . . .* [1639]), but the *Gentleman’s Magazine* was the first periodical to claim the word for itself. In the advertisement for its first issue (January 1731) it justified its title by claiming that it “treasured up, as in a Magazine, the most remarkable Pieces” copied or abridged from texts then being printed in Britain.

While the *Gentleman’s Magazine* is often stated to be the first magazine as regards format, it imitated previous periodicals, most notably the *Gentleman’s Journal* (1692–1694) and the *Mercure galant* (1672–1724). Other predecessors include key periodicals of the Enlightenment: the German *Erbäuliche Monats-Unterredungen* (1663–1668), the British *Philosophical Transactions* (1665–), and the French *Journal des Sçavants* (1665–1753), which all provided abstracts of books for learned readers. The *Gentleman’s Magazine* did not take over the practices of what is erroneously called the first magazine, Richard Steele’s *Tatler* (1709–1711). This latter originally comprised an original single-author essay on a topic of the day (and so resembles a blog more than a magazine; → Blogger).

Despite its predecessors, the *Gentleman’s Magazine* may still usefully be regarded as the first magazine since it spawned many imitations, both within and outside London, including the *Scots Magazine* (1739), the *American Magazine* (1741), and Benjamin Franklin’s *General Magazine* (1741). Other colonies were slower in producing their own. The weekly *Gazette de commerce et littéraire* (1778–1779) has been called Canada’s first, succeeded a decade later by the English-language *Nova Scotia Magazine* (1789–1792). Colonial India already had its *Oriental Magazine or Calcutta Amusement* (1785) and Australia produced its *Australian Magazine* in 1821.

*Blackwood’s* (1817–1980) was a notable six-shilling British monthly that sought to differentiate itself from the then culturally dominant quarterly “reviews.” Running fiction and scurrilous series on topics of the day, it sustained a circulation of only a few thousand, its importance stemming from the social positions of its readers and contributors.

More influential in terms of → design and price was the *Penny Magazine* (1832–1845), the flagship publication of the Society for the Diffusion of Useful Knowledge. It contained no fiction, but, making use of stereotype technology, graced its articles with high-quality woodcuts. It inspired many imitators, including the *Pfennig-magazin* (1833–1842) and *Le Magazin pittoresque* (1833–1914). In the 1840s newer, less didactic, rivals appeared – the fiction weeklies *Family Herald* (1842–1940), *London Journal* (1845–1928), and *Reynolds’s Miscellany* (1846–1868). These sustained circulations of 200,000–500,000 in the 1850s, enabled by the new railway distribution networks. Analogs included the American *New York Ledger* (1847–1903) and the Philadelphia *Saturday Night* (1865–1901); in New Zealand the *Colonists’ Family Herald* (1864–1865), the *Penny Auckland Journal* (1867), and *Saturday Night* (1874–1850); and in Australia the *Australian Journal* (1865–1965).

These magazines often ran the same serials, sometimes at the same time, indicative of the beginnings of a global Anglophone entertainment culture from the 1850s (→ Globalization of the Media).

Most of these proto-pulps used stereotype to combine images and words on the same page. More up-market British fiction magazines, such as the shilling *Cornhill* (1860–1975), favored full pages of text with separate high-quality prints. This was not the case in the US, where *Harper's New Monthly Magazine* (1850–) and later *Scribner's Monthly* (1870–1930) integrated word and image by exploiting the new process of half-tone illustration. By 1880 *Scribner's* was pioneering a fluid layout whose influence spread across the Atlantic to the *English Illustrated Magazine* (1883–1913) and the famous *Strand* (1891–1950). By the 1880s photographs appeared regularly in the press, and celebrity in a modern form was established. The new formats were glamorous, and magazines that adopted them derived larger proportions of their income from adverts, providing clear precedent for modern glossies in their financial organization as well as their layout, and helping establish national markets for brand-name products (→ Brands).

Through their emphasis on conspicuous consumption, women's magazines were key in the evolution of the glossy. Originating in the eighteenth century, they were aimed at tiny elite groups until the Beeton's *Englishwoman's Domestic Magazine* (1852–1881), which appeared when living standards for the first time allowed large numbers of women to spend money on leisure, fashion, and the home. The oppositional feminist magazine began almost simultaneously, the American Amelia Bloomer having launched the *Lily* in 1849 (–1855). In Britain the most significant examples were the *Englishwoman's Journal* (1858–1864) and the *Englishwoman's Review* (1866–1910) (→ Women's Movement and the Media). In the 1880s long-lasting women's consumer periodicals were born, including, in the US, *McCall's* (1880–2002), *Good Housekeeping* (1885–), and the *Ladies' Home Journal* (1883–).

“Little magazines,” although they can be traced back to the American *Dial* (1840–1844) and the *Germ* (1850) of the British Pre-Raphaelites, are a phenomenon particularly of the early twentieth century. Promoting what the editors perceive as artistic quality over commercial expediency, and often “sponsors of innovation, the gathering places of . . . ‘irreconcilables’” (Hoffman et al. 1946, v), they rarely achieve a circulation of more than a few hundred. Wyndham Lewis's *BLAST: A review of the great English vortex* (1914) is a typical instance, with work by Ezra Pound and others set in a revolutionary modernist design. Although descendents survive (*Poetry Review* was begun in 1912), few have the potency of these early shockers. Japanese *dojinshi*, which took inspiration from little magazines, are issued by groups united by interest in minority arts, but they are not necessarily avant-garde. *Dojinshi* in turn inspired magazines such as *Blithe Spirit* (1991–), the organ of the British Haiku Society, which has a circulation of less than 300. Mutants of “little magazines” are the self-published fanzines of the late twentieth century (→ Zines).

The early twentieth century saw an intensification of trends already established in the nineteenth, with technological innovations such as color printing (established by 1914) and offset lithography enabling ever greater variety of layout. This in turn allowed the revitalizing of the notion of the “digest” for the busy citizen in the form of photojournals, e.g., *Time* (1923–), *Newsweek* (1933–), *Life* (1936–), and *Picture Post* (1938–1957).

While high national circulation remained important, reflected in the publishing industry's responses to new media (e.g., the British *Radio Times* [1923–] and the American *TV Guide* [1953–]), new kinds of niche magazine emerged, enabling more specific targeting of consumers by advertisers. Whereas hitherto technology had helped expand the magazine industry, television began to rival it. As a result, several of the major photojournals went under or specialized in in-depth reporting. Others, such as *Paris-Match* (1949–) and the German *Bunte* (1948–), became celebrity magazines relying on paparazzi photographs.

Advertising became ever more the bedrock of magazine finance. New techniques enabled the production of small print runs as cheaply as large, in turn rendering profitable the targeting of specialized audiences. The fragmentation of the market was counterpointed by the dominance of global publishing empires such as EMAP, IPC, and Hachette Filipacchi Medias. The size of these companies meant that experiments targeting new demographics could be made, e.g., *Computer and Video Games* (1981–2004), *Loaded* (1994–), and *Nuts* (2004–). However, privately owned and independent publishers remain strong. Some target specific audiences (e.g., *Gay News* [1962–] and *MS* [1972–]), whereas others, such as *Hello!* (1988–, an outgrowth of Spanish *¡Hola!* [1944–]) or those magazines owned by the German firms Bauer and Hubert Burda Medias, aim for mass-market profit.

Trade magazines (e.g., *PRWeek* [1984–], *Campaign* [1978–]) continue to occupy a major slice of the industry worldwide. Significant new developments in the late twentieth century lock magazines into consumerism ever more tightly. They include magazines aimed at customers of particular retail chains or services (e.g., the supermarket *Sainsbury's Magazine* [1993–]). These are glossy developments of nineteenth-century catalogues and publishers' "house magazines," such as *Macmillan's* (1860–1907). Magazines that form supplements to newspapers, the first of which was the *Sunday Times Magazine* in 1962, were introduced both to extend advertising space and to compete with glossies.

## Magazine, Visual Design of

Jacqueline Naismith

Massey University

Magazines use the aesthetic and rhetorical strategies of graphic design to produce style codes, which define the identity of the magazine as a recognizable title, and establish relationships with their audiences. The → magazine combines text and image to publish → news, information, editorial content, and → advertising. The structural components of the printed magazine include the cover (composed of masthead or title, and image), editorial and contents pages, single pages, and double-page spreads. Magazine design employs the underlying structure of the grid (including columns and modules) to order arrangements of typographic, photographic, and illustrative elements on the page. The formal strategies of → graphic design, including proportion, balance, symmetry, color, rhythm, sequence, scale, and movement, are employed to produce visually persuasive texts (Frost 2003; Hurlburt 1978). As historical documents, magazines provide a record of relationships between → visual representation, identity, and consumption, across a vast spectrum of lifestyles, societies, and cultures (→ Magazine, History of).

*Early magazine design*, the domain of printers, was aligned to the production and design of newspapers and ordered through column and grid structures (→ Newspaper, Visual Design of; Printer-Editors). Framed images, text columns, and framed advertising were some characteristic features. Specific typefaces and visual systems determined the distinct identity of the publication, an early feature that remains a priority in magazine design (→ Typography). Mid-nineteenth-century advances in *mass imaging technologies* opened the way for the inclusion of images in magazines and intaglio methods of reproduction were replaced by lithographic and photographic methods, reducing production time (→ Printing, History of). The pictorial news magazine emerged in the mid-nineteenth century as a result of these advances. The subsequent rise of the picture magazine in the twentieth century strengthened the relationship between photography and magazine design and secured the place of the photo essay as an influential mode of storytelling (→ Picture Magazines; Photojournalism).

The *Bauhaus* and successive schools of design formalized and disseminated an understanding of page design organized by the grid and constructed from units of typographic and other elements. The combination of photography and typography in the Bauhaus curriculum taught by Moholy Nagy, Beyer, and others, in the form of the

“typophoto,” influenced applied magazine design. The understanding of proportion, balance, symmetry, and scale drew on both experimental and classical principles explored by modernist avant-garde artists, designers, photographers, and filmmakers.

These visual languages and aesthetic strategies evolved into powerful modes of visual rhetoric used by magazine designers and art directors after World War I. The use of the *double-page layout* created opportunities for compositional and typographic experimentation with photomontage, collage, cropping, scale, asymmetry, color, and repetition. The sequential nature of the pages and the influence of the film sequence prompted magazine designers to explore visual movement, dynamism, and rhythm to generate fresh visual strategies.

European émigré designers in the United States applied this design knowledge in the rapidly growing areas of commercial magazine design and photography. The 1930s saw the rise of the *profession of the magazine art director*. Magazine design also flourished in postwar Holland and Switzerland, and distinct regional stylistic approaches evolved. Some of the iconic publishing houses and magazine titles were established in this period. Magazine production and circulation grew rapidly post-World War II, and innovative design flourished in this period. European approaches at this time were characterized by clarity and order, while the New York school advanced graphic communication through visual metaphor (Heller 2002; Moser 2003b; Owen 1991; Remington & Hodik 1989).

*Digital technologies*, including hardware, digital image and typographic software, and digital printing processes, have had a significant impact on both design production processes and aesthetics in the later twentieth and early twenty-first centuries (→ Digital Media, History of). Aesthetic strategies have included the postmodern critique of the grid and rationalist approaches to design, closely followed by a neo-modernist reclaiming of the grid, order, and clarity (Leslie 2000; Moser 2003a; White 2003). Visual semiotic theory, now an integrated component of many design education programs, has highlighted the importance of specific style coding in identifying and communicating with magazine readerships (→ Semiotics). As graphic languages have multiplied and expanded to fill almost every possible identity niche, the magazine has proliferated as a commodity in its own right, its appeal linked to its design, production, and paper-based material qualities. As a pleasurable form of visual consumption, it represents and reproduces a wide spectrum of consumption-based lifestyles and identities, through targeted form, content, and advertising strategies. Magazines provide a symbolic link between the world of consumer aspiration and imagination and that of actual consumption. The advent of the web → zine and magazine design in networked and time-based environments enables new, multimedia delivery modes, which coexist with and supplement print media (→ Digitization and Media Convergence). The place of design in building reader communities remains central.

## **Mainstreaming**

*Michael Morgan*

*University of Massachusetts Amherst*

A corollary of cultivation theory, the concept of “mainstreaming” implies that heavy television viewing contributes to an erosion of differences in people’s perspectives that stem from other factors and influences. It is based on the argument that television serves as the primary common storyteller for an otherwise heterogeneous population. As the source of the most broadly shared images and messages in history, television represents the mainstream of the common symbolic environment into which children are born and in which we all live out our lives. From the perspective of cultivation analysis (→ Cultivation Effects; Cultivation Theory), television provides a relatively restricted set of choices for a virtually unrestricted variety of interests and → publics; programs designed for broad and diverse groups are watched across social and demographic boundaries. People who otherwise have little in common besides television are brought into the same dominant mainstream by cumulative heavy viewing (→ Audience).

Cultivation analysis, developed by → George Gerbner and his colleagues, is the study of the contribution of long-term, heavy television exposure to viewers’ conceptions of social reality. The *basic hypothesis* guiding cultivation analysis is that people who spend more time watching television are more likely than lighter viewers to see the real world in terms of television’s dominant and repetitive images and representations of life and society (→ Reality and Media Reality; Exposure to Television). In the late 1970s and 1980s, cultivation researchers and critics found that associations between amount of television viewing and people’s assumptions and perspectives were not uniform across demographic sub-groups. Associations were stronger in some groups and weaker or nonexistent in others. It was further observed that these variations could very often be explained by the concept of mainstreaming.

Among light viewers, people who differ in terms of background factors such as age, education, social class, political orientations, and region of residence tend to have sharply different conceptions of social reality regarding violence, interpersonal mistrust, gender-role stereotypes, and a broad range of political and social outlooks. Yet, among heavy viewers across those same groups, those differences tend to be much smaller or even to disappear entirely (→ Media Use by Social Variable).

For example, Gerbner et al. (1980) found that low-income respondents were more likely than those with higher incomes to say that “fear of crime is a very serious personal problem.” Among low-income respondents, the amount of television viewing was not related at all to perceptions of crime (→ Fear Induction through Media Content). In contrast, higher-income respondents as a group were less likely to think of crime as a serious personal problem, yet the heavy viewers among those with higher incomes were much more likely than the light viewers to be especially worried about crime. In other words, heavy viewers with higher incomes had the same perception as all of those with lower incomes; among heavy viewers, the difference stemming from income was sharply diminished. Similarly, among lighter viewers, those with more education were found to express more “progressive” attitudes about gender roles, but this difference disappeared among heavy viewers; more educated heavy viewers expressed the same “traditional” beliefs as did those with less education.

Subsequent studies have explored the *political implications of mainstreaming*. As television seeks to attract large and heterogeneous audiences, its messages are intended to disturb as few as possible. Therefore, television programs tend to “balance” opposing perspectives, and to steer a “middle course” along the supposedly non-ideological mainstream. In studies done over 20 years, it has been consistently found that heavy viewers are substantially more likely to call themselves “moderate” and to avoid labeling themselves as either “liberal” or “conservative.” The mainstream is not “the middle of the road,” however, in terms of the specific political attitudes that people take. Looking at such topics as racial segregation, homosexuality, abortion, minority rights, and other issues, the expected differences between liberals and conservatives are mainly evident among those who watch little television. Among heavy viewers, liberals and conservatives are much closer to each other than they are among light viewers. While mainstreaming bends toward more conservative positions on many political and social questions, it leans toward more liberal stances on economic issues (e.g., demanding more government spending on social services and programs), reflecting the influence of a marketing orientation and setting up potential conflicts of demands and expectations (→ Political Communication; Political Cognitions).

These patterns imply that cultivation is like a *gravitational process*, in which the angle and direction of the “pull” depend on where groups of viewers and their styles of life are with reference to the line of gravity, the mainstream of the world of television. Mainstreaming thus represents a relative homogenization and absorption of divergent views and a convergence of disparate viewers. Cultivation researchers contend that television contributes to a blurring of cultural, political, social, regional, and class-based distinctions, the blending of attitudes into the television mainstream, and the bending of the direction of that mainstream to serve the political and economic tasks of the medium and the institutions that subsidize it (→ Political Socialization through the Media).

## **Malaysia: Media System**

*Mohd Safar Hasim*

*National University of Malaysia*

Malaysia is a federation of 13 states covering an area of 329,750 square km. A parliamentary democracy with a constitutional monarchy, Malaysia shares a border in common with five of the 10 ASEAN countries, namely Thailand, Singapore, Indonesia, Brunei Darussalam, and the Philippines. It has a population of 26.6 million, comprising the three major ethnic groups, Malay, Chinese, and Indian, and smaller ethnic minorities. The literacy rate is 93.5 percent, and newspapers are published in the Malay, English, Chinese, and Tamil languages. Radio and television programs are also broadcast in these languages.

The British had a great influence on the development of print and broadcasting in Malaysia, as well as the laws related to its press. It was the third European power to colonize Malaya after the Portuguese (1511) and the Dutch (1641). While the Portuguese and the Dutch confined their interests largely to Malacca (present-day Melaka), the British acquired the island of Penang in 1786, and expanded their influence to Singapore (1819), Malacca (1824), and from 1874 the Malay states. British interests introduced the press to Malaysia 200 years ago, and created a press system based on laws and regulations. The first newspaper, the *Government Gazette*, was published on March 1, 1806. Following the practice in the three East India Company presidencies in India, the editor had to submit proof sheets of his newspaper before publication to the government for censorship (Mohd Safar 1996).

The Printing Presses and Publication Act 1984, the law governing the press, can be traced to the Indian Act No. 11 of 1835, a law to repeal all laws and regulations pertaining to censorship of the press in Bengal, Bombay, and Madras which was extended to Singapore, Penang, and Malacca. The law required owners of *printing presses* to register their equipment, in effect creating press freedom in the colony (→ Freedom of the Press, Concept of). It was in force until 1920 when, following “lawlessness” involving vernacular newspapers, the Straits Settlements government in Singapore reintroduced licensing of the printing presses by turning it into Printing Presses Ordinance. A similar law was enacted in the Federated Malay States in 1924. Later, in 1939, the government further amended the ordinance to include the requirement of a publishing permit to counter Japanese → propaganda. These two landmark provisions continue to this day in Malaysia (Mohd Safar 1996).

In February 2006, some 67 publishing permits of newspapers were issued by the Ministry of Internal Security, a requirement under the Printing Presses and Publication Act 1984. Of these, 58 newspapers are in publication, five are still pending, three have ceased publication, and one was suspended indefinitely by the government for reprinting → caricatures of the prophet Muhammad previously published by a Danish newspaper (the owners themselves also decided to cease publication following the incident). There are 26 newspapers in Chinese, 14 in English, 14 in Malay, and 4 in Tamil. Most of the 34 newspapers are based in peninsular Malaysia, while nine are based in Sabah and 15 in Sarawak. Leading newspapers are the *Star*, the *Sun* (free newspaper), *New Straits Times* (in English); *Utusan Malaysia*, *Berita Harian*, and *Harian Metro* (in Malay); *Sin Chew Daily* and *Nanyang Siang Pau* (in Chinese); and *Tamil Nesan* and *Malaysian Nanban* (in Tamil). Political parties publish party newsletters using special permits. Such newspapers include the *Rocket* of the Democratic Action Party, the *Harakah* of the Pan Malaysian Islamic Party, and *Suara Sosialis* of the Parti Rakyat. The Keadilan Party also publishes a newsletter, *Suara Keadilan*, without a permit, as its application for one has not to date been approved by the government (→ Party Political Communication).

*Broadcasting* in Malaysia began in 1921 as an amateur effort by nearly a dozen wireless societies in Malaya. This early experiment led to the formation of the Radio Service Company of Malaya (RSCM) in 1933, and two years later the British Malaya Broadcasting Company (BMBC) was set up. After the Japanese occupation, the British set up Radio Malaya in 1946. Following the unsuccessful communist revolt in 1948, radio became an important source of communication with the people. *Radio* broadcasting has come a long way since then, with government and commercial radio stations operating side by side. In 2006, the Malaysian government operated 30 radio stations at national, regional, and local levels in various languages and dialects. There are also 26 commercial radio stations, including Astro's eight channels (Media Guide 2006).

Initially, *television* was owned and operated by the government through Radio and Television Malaysia (RTM). It started with black and white broadcast on December 28, 1963 which was followed by a second channel six years later in November 1969. With the introduction of an international standard satellite earth station in Kuantan, Pahang in 1970, a television link was established to Sabah and Sarawak (→ Satellite Television). Color television arrived on December 28, 1978. The private commercial station TV3 started in 1984, ending the government monopoly. Ten years later, in 1995, the government licensed

two more private TV stations: Metrovision and Mega TV. The first was a terrestrial UHF channel in the Klang Valley. The second was a 10-channel (initially five-channel) cable TV station. Astro, Malaysia's first satellite broadcasting station, with 23 TV channels and eight radio channels, joined the competition after Malaysia launched its first satellite, Measat 1, in January 1996, followed by Measat 2 a little later. Another commercial TV station with nationwide coverage, NTV7, began operation in 1998. Another station, Channel 9, was also approved but its operation was delayed. Metrovision (Channel 8) went through a hard time and was eventually bought over by Media Prima, but Mega TV closed down.

Broadcasting is now concentrated in *three major entities*, the government, the Media Prima group, and the Astro group. The government operates RTM1 and RTM2. Media Prima is the only group to own print publications as well as radio and television stations, i.e., TV3, Channel 8, Channel 9, and NTV7, while Astro owns the satellite channels. Astro doubled its number of channels in 2007 with the launch of the Measat-3 satellite on December 12, 2006, and its full commissioning on January 26, 2007. The new satellite not only increased the capacity of its key orbital location, but expanded the three Measats' "footprint" to over 70 percent of the world's population across three continents. Two newcomers in the broadcasting scene are MiTV (interactive TV) and Fine TV. MiTV is the second pay, or subscription, television channel in Malaysia, using digital terrestrial broadcast and IP or UHF technology, while Fine TV is an interactive on-demand pay television channel, the third in Malaysia, which went on air on December 26, 2006.

Most newspapers also have an online version but *Malaysiakini* is the only online newspaper apart from news portals and blogging sites. Malaysia's Multimedia Bill of Guarantee provides for no censorship of the Internet.

# Marginality, Stigma, and Communication

Dale Brashers

University of Illinois at Urbana-Champaign

Goffman (1963) popularized the concept of *stigma* through his well-cited book, *Stigma: Notes on the management of spoiled identity*. He defined it as “an attribute that is deeply discrediting,” which reduces the bearer “in our minds from a whole and usual person to a tainted, discounted one” (Goffman 1963, 3). Stigmatizing attributes include “abominations of the body,” “blemishes of individual character,” and “tribal stigmas of race, nation, or religion” (Goffman 1963, 4). Current research supports the theory that people are stigmatized, and ultimately marginalized, because of mental and physical illnesses; behavior that is considered deviant, immoral, or illegal; and personal characteristics such as race, class, gender, and sexual orientation. Alonzo and Reynolds (1995), for example, noted that stigma associated with HIV or AIDS comes about because moral judgments often are made about personal responsibility and deviant behavior (e.g., gay sex or drug use) and because the disease is associated with contagion and death (→ Intercultural Communication in Health-Care).

Although Goffman referred to stigma in terms of attributes, he recognized that it was a *relational or social concept*; that is, stigma comes about through interactions with others. Several theoretical perspectives reinforce the idea that stigma has a social or group basis. In social identity theory, stigma is considered a function of the “widespread knowledge of negative stereotypes and devaluation of some social identities within the culture” (Crocker et al. 1998, 511). Based on intergroup perspectives (→ Intergroup Accommodative Processes), ingroup–outgroup categorization is the basis of the problem: people who are stigmatized are considered outgroup members because they are different from the ingroup or “normals” (Tajfel & Turner 1986). Stigmatized attributes often lead to individuals being excluded from the dominant group, or being *marginalized* (→ Prejudiced and Discriminatory Communication). Marginalization can lead to less access to society’s resources and “normal” channels of communication (e.g., Dutta-Bergman 2004).

*Fear of stigmatization* can interfere with the daily lives of people when these judgments are salient. For example, research has shown that people avoid health-care settings if they have an illness that might result in stigma. They also may avoid self-care behaviors that could reveal their illness to others. Rintamaki et al. (2006) found that perceptions of stigma were associated with treatment adherence problems for people living with HIV, which can lead to strains of the virus that are resistant to further treatment. They speculated that the association between nonadherence and stigma resulted because those individuals for whom stigma was salient were less likely to disclose their illness, which made them more likely to skip doses when they felt they needed to hide their medications.

Stigma can be the basis of *dysfunctional communication patterns*. Communication about outgroups may help strengthen the “us–them” thinking that reinforces stereotypes and stigma (→ Social Stereotyping and Communication). Pittam and Gallois (2000) reported that framing of HIV and AIDS among young adults in Australia involved language strategies that maximized intergroup differences, so that their ingroup was less

to blame for HIV transmission and their own risk was deemed less salient. Similarly, the use of racist or sexist speech can establish outgroup difference and ingroup preference. Communication with outgroups also may be perceived as problematic. Giles et al. (2003) found that young adults across a variety of cultures rated interactions with same-age peers (ingroup) more positively than those with family and nonfamily elders (outgroup). Intergenerational communication, therefore, can be problematic, even in cultures in which respect for elders is a commonly espoused value. Even within a traditionally marginalized group, ingroup/outgroup status can emerge (e.g., young gay men versus older gay men; see Hajek & Giles 2002).

Future research should focus on how individuals who are stigmatized or marginalized resist those processes. For example, as Rintamaki et al. (2006) suggested, strategies are needed to help patients overcome fear of stigma about their illnesses. Activist or self-advocacy behaviors may help people fight the effects of stigmatization (e.g., Brashers et al. 2004), and providing avenues for dialogue with marginalized communities may enhance opportunities for distributive justice (e.g., Dutta-Bergman 2004). Communication, therefore, can be a vector for stigmatizing behavior, but it also may hold solutions for managing stigma and discrimination. Continued research is needed to understand the complex connections between communication and stigma.

# Marital Communication

Chris Segrin

University of Arizona

Marital communication refers to the communication and social interaction that transpire between spouses. However, the study of marital communication is often informed by and extended to a range of couples in a “marriage-like” setting such as cohabiting and same-sex couples. In most industrialized societies as many as 90 percent of the population marry, and in many of these societies, up to 50 percent divorce. Many people feel that communication is the key to marital success, and therefore interest in marital communication is often undertaken to discover why some marriages fail and how to help couples maintain a happy and successful marriage.

## THEORIES ON MARITAL COMMUNICATION

There are several prominent theoretical viewpoints that guide the study of marital communication. *Behavioral* theories tend to focus on communication behaviors emitted by husbands and wives that are either rewarding or aversive. Behavioral theorists are also interested in how spouses might reward or punish each other for enacting certain communication behaviors. For example, if one spouse becomes verbally aggressive and the other responds by being conciliatory and compliant, a behavioral theorist would observe that the aggressive spouse’s aversive behavior was rewarded by the other and this in turn should prompt more verbal aggression in the future. Behavioral theorists will thus often rely on behavioral observation (also known as behavioral assessment or interaction analysis) as their primary methodological tool. Most behavioral observation is done in a laboratory setting where couples are instructed to engage in a conversation that is recorded and later analyzed.

*Cognitive* theories of marital interaction hypothesize that people hold certain beliefs and exhibit distinguishing perceptual and interpretive patterns that have a strong impact on the couple’s communication patterns and ultimately on the quality of their marriage. A robust finding from this research tradition is that distressed couples often exhibit maladaptive attributional patterns in response to each other’s behavior. That is, distressed couples tend to dismiss their partner’s positive behaviors to situational and transitory factors (e.g., “you just told me that you loved me because you want something from me”) and make stable and internal attributions for their partner’s negative behaviors (e.g., “you won’t agree with me on this point because you are a stubborn jerk”). Research guided by cognitive models of marital interaction often uses self-report measures to assess partners’ attributions for each other’s behaviors in real or imagined social interactions.

*Family systems* theorists believe that marital communication behavior can only be understood by analyzing the larger interpersonal and social context in which it occurs. Systems theorists assume that the communication behavior of spouses is *interdependent* and affected by *mutual influence* processes. They also assume that the whole of a marital relationship is more than just the sum of its parts. This is the basis for the concept of *emergent properties*. This implies that the quality of a marital relationship emerges from

the nature of the couple's communications, which amount to something more than the mere sum of all their messages. In research settings, systems theorists tend to rely on a combination of self-report and behavioral observation techniques, sometimes in the home setting and with other family members such as children present.

### TYPES OF COMMUNICATION BEHAVIORS

Researchers have been able to identify distinct types of marriages on the basis of couples' communication behaviors, and these different marital types all have comparable success rates. Fitzpatrick's (1988) couple typology describes three distinct types of marriages. *Traditional* couples hold conventional values toward their marriage, are interdependent, and are willing to engage in conflict when serious issues emerge. In contrast, *independent* couples are unconventional in their marital ideology, somewhat interdependent, and generally unrestrained in their conflict engagement. Finally, *separate* couples are the most autonomous and least likely to engage in conflict, while also holding somewhat conventional values. Of the three, separates are the least expressive. Gottman (1994) presented findings on a comparable typology of marriages, based largely on the nature of couples' conflicts. *Validators* tend to be mostly positive during their conflicts, showing mutual respect and validation of their partner's emotions and perspective. *Volatile* couples tend to be more explosive and argumentative, as they pursue marital conflicts with vigor while also expressing substantial positivity. In sharp contrast, *avoiders* prefer to minimize their disagreements and avoid discussing them altogether. Gottman observed obvious connections between his marital typology and that of Fitzpatrick (i.e., traditionals = validators, independents = volatiles, and separates = avoiders).

Like all other forms of interpersonal communication, marital communication is multidimensional. Perhaps the most obvious dimension of marital communication is the content of the talk exchanged between spouses. There are a number of *verbal* behaviors, such as complaining, validation, and criticizing, that have proven to be remarkably consequential for spouses' satisfaction with their marriage.

Another important dimension of marital communication is the couple's nonverbal behaviors (→ Nonverbal Signals, Effects of; Nonverbal Communication and Culture). How something is said is often more consequential for spouses than exactly what is said. *Nonverbal* behaviors such as eye contact, vocal tone, and facial expression can be powerful indicators of sarcasm, warmth, concern, or anger. These expressions appear to be a better indicator of couples' adjustment than the actual content of their speech.

The expression of *affect* or emotion between spouses also plays a vital role in marital communication. Communications that have a negative emotional tone reflective of anger, sadness, or anxiety are particularly common among distressed couples. Sentiment override occurs when a spouse has a particularly dominant emotional reaction to his or her partner's behavior, regardless of the actual content of that behavior. For example, distressed spouses will often respond negatively to virtually any communication from their partner, even those that appear to have an objectively positive tone.

The *cognitive* dimension of marital communication refers to how couples plan their own messages as well as how they interpret and explain the behavior of their partner. The

attributions that spouses make for each other's communication can exert a strong influence on marital satisfaction, particularly when spouses make maladaptive attributions for their partner's negative communication behaviors (Johnson et al. 2001).

Finally, researchers are beginning to document important *physiological* phenomena that occur during marital communication that are predictive of positive and negative marital outcomes. During marital conflict, some people become overwhelmed by arousal and emotion and are unable to effectively cope with this uncontrolled acceleration of arousal. This phenomenon is known as flooding and it portends a troubled future for the marriage. Conversely, if spouses are able to sooth their own or their partner's arousal during heated conflicts, they are more likely to experience positive marital outcomes. Chronic arguing with a spouse or feeling misunderstood by a spouse appears to put a great deal of wear and tear on the nervous system. This stress on the nervous system, known as allostatic load, appears to predispose people to a number of serious health conditions such as lowered immunological fitness and poor cardiac functioning.

### CONFLICT IN MARITAL COMMUNICATION

The study of *conflict* has a privileged status among many marital communication researchers because of the general belief that effective conflict management is vital to marital success and that excessive conflict is destructive to marriage. For this reason, much of what is known about marital communication comes from studies of conflict and problem-solving interactions. However, in many marriages conflict is not a very frequent occurrence. Furthermore, many marriages (e.g., volatile or independent) seem to function quite well despite relatively high levels of conflict. It is not conflict per se that is harmful to marital satisfaction, but how conflict is handled.

One particularly damaging pattern of marital communication is known as *demand-withdrawal*. This occurs when one spouse (the demander) presents a complaint or criticism to the other (the withdrawer) who becomes defensive and avoids discussion of the topic. The demand-withdrawal pattern of marital communication is reliably associated with marital dissatisfaction. Naturally, this pattern of communication makes it difficult for spouses to truly resolve their differences.

In distressed marriages, the expression of negative affect in one spouse often prompts a comparable expression of negative affect from the other. This phenomenon is known as *negative affect reciprocity*. One example of this is when couples engage in cross-complaining, whereby one spouse presents a complaint (e.g., "You don't ever take me out to dinner anymore") and the other spouse responds with a complaint of his or her own (e.g., "Well you can't ever save up enough money so we can afford to go out"). As spouses exchange criticism after criticism, negative emotions escalate and the content of the behavior associated with the criticism is never actually addressed. Instead, the spouses essentially move on to another topic. Satisfied spouses are able to calm their partner and to deflect negative affect by showing support, agreement, and validation, and sometimes even injecting humor into their problem-solving discussions.

Extensive research on married couples' conflict interactions has revealed an important *cascade of communication behaviors* that are highly predictive of later divorce. A

cascade is a sequence of events in which enactment of one stage of the cascade is associated with a very high probability of progressing to the next stage with little possibility of altering the sequence. Couples headed for divorce tend to exhibit a cascade of noxious communication behaviors that Gottman (1994) characterizes as “the Four Horsemen of the Apocalypse.”

The cascade starts with a behavior Gottman calls *complain/criticize*. This is the commingling of a complaint or expression of dissatisfaction with criticism of the partner. This criticism often takes the form of blaming statements with character attacks expressed in terms such as “you always” and “you never.” The next step in the behavioral cascade is *defensiveness*. When people get defensive in marital interactions they try to protect themselves from criticism and avoid blame by denying any responsibility for wrongdoing. When spouses refuse to accept responsibility for any wrongdoing, conflicts remain unresolved. The third link in this chain of corrosive communication behaviors is *contempt*. When people express contempt, they mock or insult their partner. Their communication sends the message “you are stupid” or “you are incompetent.” Contempt is also communicated nonverbally through a particular facial expression that involves pulling back one corner of the mouth and perhaps rolling the eyes. The last of the Four Horsemen of the Apocalypse is *stonewalling*. When people engage in stonewalling, they show no signs of receiving messages from their partner. Their facial expressions are often blank and they may not even make eye contact with their spouse. Often, stonewalling is a manifestation of emotional divestment from the marriage. People stonewall when they no longer care enough about the relationship to put forth the effort to engage in conflict.

Although marital communication research has identified a number of negative communication behaviors that are deleterious to marriage, certain positively toned behaviors can contribute to marital success. One is *spousal support*. Happily married couples will often exchange messages that show support, acceptance, and validation toward their partner – even during conflicts. Such expressions make partners feel valued and cared for, which has obvious benefits for marriage. Also, well-adjusted spouses tend to make *repair attempts* during their conflict interactions. Repair attempts involve efforts to tone down negativity during heated discussions by accepting responsibility, agreeing with a partner’s appraisal (e.g., “OK, you’ve got a point there”), and even using humor, or making statements that provide a temporary diversion from the conflict.

## Marital Typologies

Mary Anne Fitzpatrick

University of South Carolina

Marital typologies are classifications of marriages based on systematic differences among them. An assumption underlying the study of marital typologies is that within any given sample of marriages, a few discrete, meaningful types can be discerned. Marriages are categorized into types in order to understand the communication that occurs between husbands and wives (→ Interpersonal Communication; Marital Communication). Typologies of marriage range from vague, non-theoretical formulations to elaborate conceptual models that include empirically testable statements. Researchers have adopted logical, intuitive, and empirical approaches to classify marriages to explain changing family forms over time, to help therapists working in clinical settings with troubled couples, and to aid researchers reflecting post hoc on data collected for other purposes. The resulting typologies, which focus on qualitative dimensions of relationships, have been theoretically interesting and heuristically valuable in sorting marriages.

One of the early distinctions made in the literature, for example, is between *institutional and equalitarian marriages* (Adams 1971). Institutional marriages emphasize the value of law, conventional morality, and authority structures, whereas equalitarian marriages emphasize the values of mutual affection, common interests, and consensus. These two types differ fundamentally in the source of social control that regulates the marital relationship (→ Power, Dominance, and Social Interaction). Levinger (1965) categorized marriages into one of four types based on placement of the *marriage as high or low on stability and satisfaction*. That is, the first dimension focused on the boundaries of a relationship or the strong or weak external stability forces holding a couple together. The second dimension involved marital satisfaction, happiness, or the attractions of a relationship. The resulting four types of marriages represented the first indication in the literature that marital stability and marital satisfaction might be independent of one another. Using clinical interviews collected for other purposes, Ryder (1971) developed a typology of marriage that included 21 marital types involving various combinations of 5 conceptual dimensions. One was the Competent Husband–Incapable Wife pattern. The husbands in this couple were viewed as effective whereas the wives were evaluated as unable to cope with the demands of life.

The scientific model for formatting typologies, however, involves both the rules for classifying cases as well as the actual assignment of empirical cases to particular types. Marital typologies follow the conventional logic of classification in that the categories on which the system is based must be mutually exclusive and comprehensive. In other words, the typology must permit every marriage to be assigned unambiguously to one and only one type. Furthermore, to advance the understanding of interpersonal dynamics of marriage, the attributes on which the discriminations are based need to include significant dimensions of marriage or those capable of explaining marital behavior and communication (→ Reciprocity and Compensation in Interaction).

*Monothetic classification schemes* for marriage are a yes/no affair. That is, a marriage is happy or unhappy; stable or unstable; traditional or nontraditional. Although this approach was appealing in the early stages of the work on marriage, it became clear that many characteristics of a marriage, however, are not simply present or absent but are those that the marriage possesses to a greater or lesser degree. Furthermore, simple discriminations along one or two dimensions did not capture the range and variety of marital styles. In contrast, *polythetic classification schemes* place individuals in the same type when they share a large number of characteristics. *Polythetic schemes* propose a series of important dimensions of marriage and subsequently allow the empirical clustering of dimensions to define the types of marriages. Fitzpatrick (1988) classified marriages according to three basic dimensions: ideology, interdependence, and philosophy of communication. These dimensions interact to form three different types of marriages: traditional, independent, and separate. Traditionals value sharing and companionship in the marriage and are capable of handling their disagreements. Independents engage in conflict, open expressions of positive and negative feelings, and bargaining. Separates maintain psychological distance in the marriage and avoid open conflict (→ Interaction; Relational Control).

Two key *methodological issues* emerge consistently in this research. The first issue concerns the aggregation of data from the individual to the couple level. That is, in describing marital types or systems, the unit of analysis is *the marriage*, which is not simply the sum of the individual behaviors or perceptions. The second issue is one of data structures and analysis. In dealing with data collected from the self-reported responses or the interaction of husbands and wives, the correlation/dependency in the data can affect the validity of the statistical tests, and must be taken into account in the model.

Typologies are of interest only if they can be associated in a predictive and explanatory way with a wide variety of communication behaviors and outcomes, aside from those that define the categories. This is the key direction for future research and theory.

## Marketing

*Franz-Rudolf Esch*

*Justus Liebig University*

*Kristina Strödter*

*Justus Liebig University*

Commonly, people associate selling and → advertising with marketing. In the old interpretation, this understanding of marketing was quite right, as marketing primarily comprised making a sale. But today, there is more to marketing than selling, promoting, advertising, and publicizing. Selling and advertising are only two of the many tasks of marketing management. Briefly, marketing is about “meeting needs profitably” (Kotler & Keller 2006). But although marketing can be summarized in such simple terms, there are many tasks behind it.

Today, marketing can be defined in the sense of market-oriented business leadership. This market orientation is characterized by all relevant activities and processes of the company that focus on consumers’ needs and wants (Esch et al. 2006). To focus on consumers and the market, it is one of the basic tasks of marketing to actually find out about relevant consumers’ needs and wants (Kotler 1967). Therefore, it is important to thoroughly analyze consumers. If marketers know consumers’ needs, the next step is to develop products and services that satisfy them (Drucker 1954).

### THE SCOPE OF MARKETING IN THE TWENTY-FIRST CENTURY

Marketers have to be very flexible, since markets are very dynamic. The management guru Peter Drucker (1954) once stated that a company’s winning formula for the last decade will probably be its undoing in the next decade. To be able to react to changes in the environment rapidly, it is important to permanently scan and monitor for signals of upcoming changes. In the twenty-first century, companies face changing customer values, which are observably getting more diverse. Even one and the same person can have different needs in different situations. The phenomenon of “*hybrid consumption*” is rapidly emerging. Firms try to react to specific needs by offering customized products. Obviously, this customization and segmentation leads to higher marketing costs and lower profit contributions of each brand and product.

Another challenge is *increased global competition*. In the wake of globalization and liberal markets, new competitors are penetrating the market (→ Globalization Theories). In particular, the liberalization of the Chinese market led to many new brands popping up. Also, western companies are trying to establish their products in new, attractive markets like China, with annual growth rates of about 10 percent (Pitsilis et al. 2004). This trend is intensified by new information and communication technologies like the → Internet, which make it easier to sell products worldwide (→ E-Commerce).

Along with a growing number of companies competing for customers, *communicating activities have soared*. Worldwide, there are more than 47,000 → radio stations and 21,000 → television stations (Lyman & Varian 2003). In addition, the Internet, events, sponsoring activities, product placement, and other types of below-the-line marketing are used to communicate with consumers.

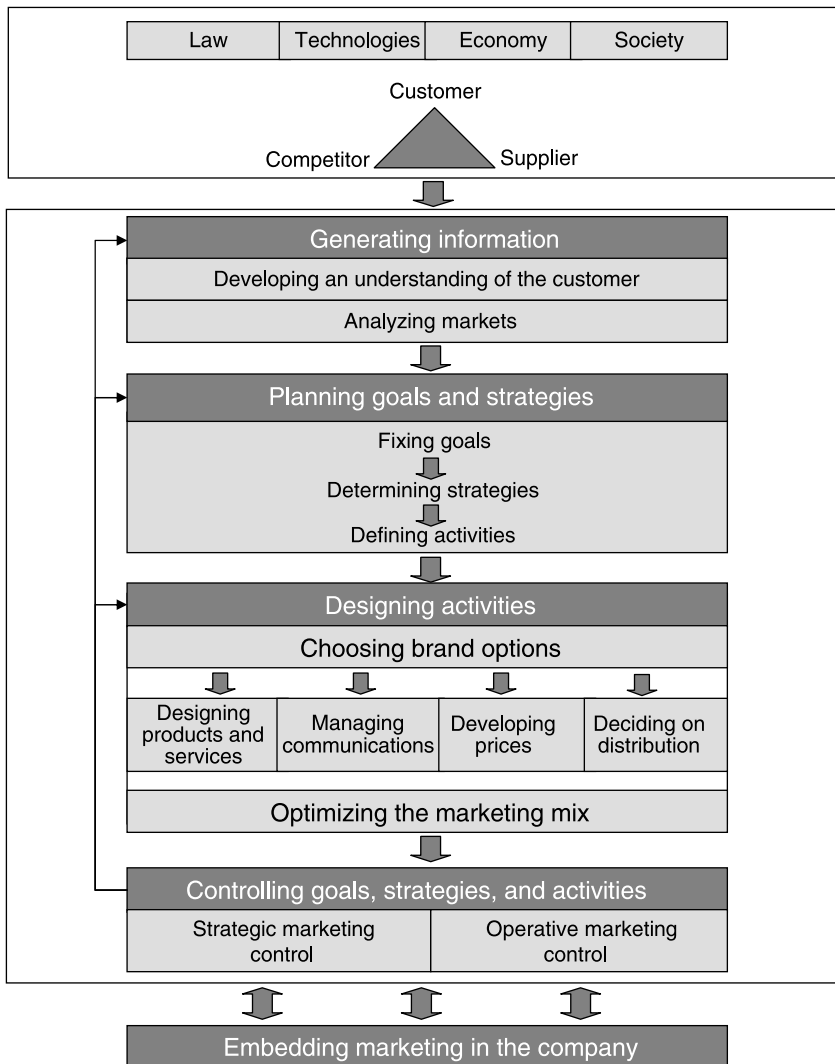

For consumers, the world has become more complex, because of too much information pelting down on them. Due to limited capacities to process information, considering all alternative products would lead to an → *information overload* (→ Information Processing). This trend is accompanied by products being outdated sooner (Lim & Tang 2006). In this environment, launching new products successfully is a real challenge. In 2002, around 27,000 new products were listed in food retailing stores in the USA. But after one year had passed, only half of those products were still on the market (Lim & Tang 2006).

## **DESIGNING MARKETING STRATEGIES**

As markets become more complex and dynamic, *systematic strategic planning* is more critical than ever and marketing management becomes even more important (Ansoff 1965). A marketing plan, as the core of marketing management, is the central instrument for directing, synchronizing, and coordinating all marketing activities. Figure 1 gives an overview of the marketing management process, which can be defined as planning, coordinating, and controlling all market-directed activities of a company (Esch et al. 2006).

First, it is important for marketers to develop an understanding of their customers. Without a deeper understanding of consumers' needs and wants, it is not possible to manage marketing successfully. Psychological processes in consumers' minds and social processes between consumers and their environment need to be analyzed and understood. This analysis is the basis for influencing consumers' decisions effectively. In a second step, information about the market needs to be generated, which means the general conditions of the market, the development of the market, and the company's current and potential competitors. These market conditions are best detected, described, and explained by market research. Based on this information, marketing activities can be specifically designed and the success of activities taken can be controlled by gathering relevant data.

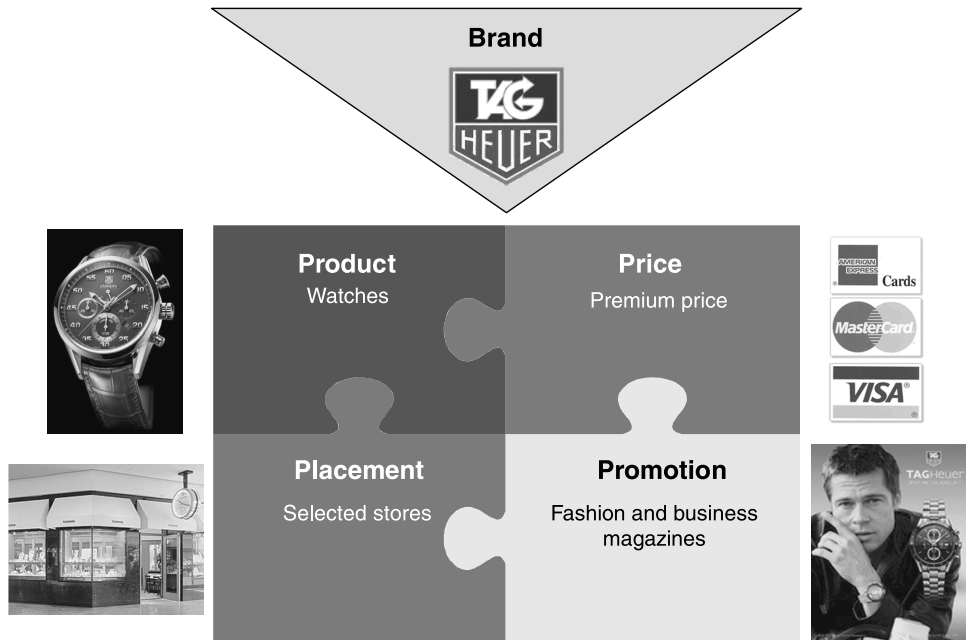

Based on this knowledge, goals and strategies must be determined. In this context, there are three levels that need to be planned systematically: (1) the marketing goal, which represents the situation strived for, (2) marketing strategies, i.e., the roads leading to that goal, and (3) marketing instruments necessary to "walk the road" (Esch et al. 2006). In a different determination, the first two levels are called "strategic marketing planning," since they lay out long-term goals, and target markets and value propositions on the basis of the markets' opportunities and threats. The lowest level represents the tactical side.

**Figure 1** An overview of the marketing management process

Here, marketing tactics, like product features, communication strategy, or pricing, are specified. Therefore, it is important to synchronize different instruments to meet the challenges of the market in an optimal way (Kotler & Keller 2006). After defining the goals and strategy, activities must be designed that enable the company to reach its goals. The classic set of marketing activities is summarized by the *4Ps* (*product, price, placement, promotion*), which are described in more detail below (McCarthy 1960).

In our understanding, the *4Ps* are the pillars of marketing, while → branding is its base, on which all marketing activities are built. Therefore, it is crucial to base marketing strategies on a thoroughly planned branding strategy (Esch et al. 2006; see Fig. 2). These activities need to be thoroughly designed and synchronized, for the whole is more than

**Figure 2** Integrated branding strategy

the sum of its parts (Esch et al. 2006). To meet consumers' needs, marketers need to adjust all instruments of the marketing mix to their target group (Borden 1964). They have to decide on what to sell, through which channels, at what price, and how they will give consumers information about the product and evoke a need for it.

To ensure that the activities taken help the company to achieve its goals, it is important to control activities, strategies, and goals regularly. Without monitoring their effectiveness, it is pointless to define goals. In this context, progress in the achievement of the company's objectives has to be measured. Besides controlling the effectiveness of strategies and activities, marketers should revise whether the marketing goals are still worth striving for or whether they are outdated (Esch et al. 2006).

To manage marketing efficiently, marketing should be embedded in the company. This embedment in the company comprises the operational as well as the organizational structure of the company. The organizational structure must be designed in such a manner that it supports an optimal allocation of work, competencies, and responsibilities. The crucial point of this organizational structure is its orientation toward the products and brands of the company, the customers, and the relevant regions. In a complementary manner, the operational structure should be organized in a way that forwards processes to reach the marketing goals.

## THE BRAND AS THE BASE FOR MARKETING ACTIVITIES

Brands are central creators of value in companies, with which companies obtain extra price and quantity (→ Brands). Additionally, strong brands have a positive impact on all

metrics of economic success. According to Interbrand (2007), Coca-Cola's brand value amounts to 65.3 billion US dollars. Therefore, strong brands have notably high brand values (Esch 2007). About 67.0 percent of the corporate value is ascribable to the *brand value* (PricewaterhouseCoopers & Sattler 2006). In this respect, it is no wonder that brands are used to create value, e.g., by conquering new markets or groups of customers, by brand extensions, or by brand alliances. The aim of brand management is to build and sustain strong brands with high brand values (Esch 2007). Brand value can be defined from two points of view. First, the *financial perspective* defines brand value as the net present value of future discounted cash flows that can be obtained by the brand. This financial perspective refers to the economic success of the brand. Second, the *consumer-based perspective* describes brand value as the result of consumers' reactions to marketing and branding activities in relation to identical activities taken by a fictitious brand due to consumers' brand associations (Keller 2003). This view on brand value captures the reasons for a brand's success.

A brand can be defined as a mental → image in the minds of the target group that leads to identification and differentiation and affects people's choices (Esch 2007). An example of a brand's image affecting people's behavior is Coca-Cola. Whereas in blind tasting, participants have a bias toward Pepsi, Coca-Cola is favored when the brand name is shown (de Chernatony 2001). Feelings like soulfulness or the "American way of life" that are commonly associated with Coca-Cola have an impact on consumers' perception of taste. But creating a successful brand takes time and must be thoroughly planned.

*Brand identity and brand positioning* are the pivotal points for all brand decisions. In contrast to brand image, which refers to the perception of the brand, brand identity and positioning are in the company's sphere of action. As the positioning of a brand is based on its identity, it is important to first determine a brand's identity. Only exact knowledge of the brand's central characteristics enables marketers to manage and design all marketing activities in conformity with the brand (Esch 2007). Brand identity expresses what the brand stands for. It captures those attributes that are essential and characteristic for the brand. These attributes of the brand comprise hard facts as well as soft facts like feelings and emotions. Moreover, attributes can be both verbal and nonverbal, e.g., consumers associate the "swoosh" with Nike, the "drum bones" with Intel, and the "contour bottle" with Coca-Cola. The aim of capturing a brand's identity is to get a complete and holistic picture of the brand.

To create unique mental images in consumers' minds, it is important to concentrate on only a few *differentiating characteristics of the brand*, which are captured by brand positioning. Positioning aims to create brands that are attractive to consumers and differentiate themselves from competitive brands in such a way that consumers are biased toward these brands (Esch 2007). Positioning therefore aims at clearly differentiating a company's product from its competitors by linking the product with unique associations in consumers' minds (Esch 2007). To successfully position a brand, it is important to focus on only a few attributes that differentiate the brand from its competitors (points of difference). Other attributes need not be better than those of competitors (points of parity).

*Strategic brand decisions* are on the agenda when companies consider branding new or newly acquired products and when existing brand systems need to be restructured (Esch

2007). Principally, companies face three basic options to lead their brands: (1) product brands, (2) family brands, and (3) corporate brands. Using a *product brand* strategy, every product of a company forms an own-brand; this means “one brand = one product = one brand promise” (e.g., Procter and Gamble, with brands like Pringles, Ariel, and Pampers). This strategy is favorable if the array of products is heterogeneous and aims at diverse target groups. By using different brands, each product brand can be tailor-made for its target group. But this obviously leads to high costs, as there are no synergies between the brands.

A *family brand* comprises several products under one brand, e.g., Maggi or Nivea. The advantage of this strategy is that all offerings of a brand profit from its existing brand image. As the range of products offered under one brand is relatively homogeneous, it is still possible to pointedly position a brand. Additionally, synergies can be exploited as marketing costs are born by several products. One of the major disadvantages of this strategy is the risk of distending the brand too much, when new products offered under the same brand no longer go with the identity of the brand.

*Corporate brands* are used for all products of a company. The prior aim of this strategy is to profile the company and its competencies. Corporate brands are advantageous if the range of products and services is too wide to employ product brands (e.g., General Electric), if the target groups and positioning of the offerings are relatively homogeneous (e.g., Allianz), and if the array of products undergoes fluctuations in short cycles (e.g., Armani).

The advantages of a corporate brand strategy are similar to those of family brands. Its disadvantages must be seen in the limited possibility to position the brand precisely and to fit it perfectly to its customers.

In practice, one scarcely finds these basic brand strategies in their classic form. Brand architecture describes the arrangement of a company’s brands for the determination of their positioning, and the relationships between brands and products from a strategic point of view (Aaker & Joachimsthaler 2000; Esch 2007). Brand architecture focuses mainly on the arrangement and the roles of two or more brands on different hierarchical levels to realize synergies by employing the corporate brand, while family and product brands still preserve a necessary degree of uniqueness. In this context, it is important to logically arrange brands and their relationships. The advantage of this strategy is the possibility to seize spillover effects. Brands on all hierarchical levels can benefit from the other brand’s image, if consumers perceive a relationship between these brands. The realization of the positioning idea requires integration of the various marketing instruments to build unique images in consumers’ minds (Esch 1998). Each instrument of the marketing mix leaves the consumer with a certain impression and influences the image of the brand (Lindquist 1974).

### **RAISING CONSUMERS’ BRAND AWARENESS AND BRAND IMAGE WITH COMMUNICATION**

To catch consumers’ → attention for a brand and make them need it, its level of awareness must be raised. With communication activities, consumers’ attention can be revived and demand created. Additionally, communication is an effective instrument to build unique brand images in consumers’ minds. To communicate a brand’s image and to heighten its

awareness, several instruments can be used, e.g., commercials and advertising, personal communication, promotion and publicizing, direct marketing, sponsoring, events and exhibitions, product placement, and guerilla and viral marketing. These instruments can be brought in line with the means of integrated communication (→ Integrated Marketing Communications; Marketing: Communication Tools).

Integrated communication is understood as the integration of form and content of all communication activities, which unifies and reinforces the impressions made. Through repetition of more or less identical impressions and information, the brand message is not only processed faster by the consumer, but the targeted image is imprinted in consumers' minds. Communicating alternating and diverging impressions decelerates or even hinders learning processes. The perceived positioning of the brand is then far from its ideal. Finally, integrated communication saves costs, as the intended goals can be reached more effectively (Esch 2006).

In integrated communication, verbal as well as nonverbal elements can be used. These either transfer distinctive image associations (BMW is sporty and dynamic) or form an anchor to enhance brand awareness, for example, by using a particular color code (Orange uses orange dominantly in its communication) or symbols (Marlboro continually presents the cowboy). The first case is an example of semantic integration, the second of formal integration. Additionally, integrated marketing communication consists of integration over time and integration between different kinds of communication. In the first case, positioning contents of the brand need to be conveyed to continually realize learning effects and construct brand knowledge. If there is to be integration between different kinds of communication, it is necessary to translate the message and the means of integration into another kind of media.

To insure that the messages communicated are perceived, processed, and understood by consumers, communication must follow socio-technical principles. First of all, communication must succeed in contacting consumers to insure that the advertising message is perceived. Following that, emotions must be imparted and consumers' understanding should be obtained. Finally, the advertising message is to be embedded in consumers' minds.

Catching consumers' attention is getting increasingly harder due to barriers of contact. Every day, consumers are confronted with an overload of information, which cannot be processed. Therefore, communication activities must be designed in such a way that they attract attention. This is possible by using *activating stimuli* that are physically intensive (e.g., loud colors and sounds), surprising (e.g., a person with the head of an animal), or emotional (e.g., the face of a child, a woman's body). The use of these techniques depends on the recipient's involvement, which can be defined as the degree of attention a person turns to a stimulus or an activity (Kroeber-Riel & Esch 2004). Especially in mass communication, recipients mostly have low involvement. Only consumers who are about to buy new goods and are actively searching for information are highly involved (Zaichowsky 1985). Generally, it must be stated that the lower the involvement of a person, the more activating the marketing communication should be (Kroeber-Riel & Esch 2004).

*Frequency techniques* aim at a frequent repetition of the communication message in one and the same communication medium as well as in different kinds of media. By this

repetition, the likelihood that consumers have contact with the advertising message is raised (→ Advertising Frequency and Timing).

Furthermore, marketers need to ensure that consumers process the advertising message. This includes factual as well as emotional information. Due to low involvement, consumers often interrupt contact with an ad after only a few seconds. A one-page ad in a → magazine is looked at for approximately two seconds. To succeed in communicating the message, it is important to communicate information hierarchically as well as use pictures, as these are perceived, processed, and remembered easier and faster than verbal information.

Understanding a brand's message is important for the success of the campaign, but should not be overestimated, as it only refers to direct processing of information. Moreover, consumers also process their own reactions and thoughts provoked by the ad. Emotions especially play a major role, as the emotional impression precedes understanding. *Emotional communication* can have two effects on consumers: (1) atmospheric effects, which influence the general ambience, and (2) emotional consumption experiences, through which a brand differentiates itself from its competitors. The aim of either effect is to generate acceptance of the product (Kroeber-Riel & Esch 2004; → Advertising, Emotions in; Emotion).

As a basic principle, communication instruments can be divided into *personal and mass communication*. Personal communication refers to those communication instruments that allow interaction between two people. Due to this interaction, people can respond to their communication partner's needs. In contrast to mass communication, personal communication is not only verbal through spoken and written language, but also nonverbal. People additionally get information from their communication partner's *mimics, gestures, tones of voice, or symbols* used in the conversation (→ Nonverbal Communication and Culture; Rhetoric, Nonverbal). Mass communication addresses a large crowd of people. To diffuse information, mass media are used. Latterly, developments in mass media, such as the Internet, enable people to converse directly and respond to each other.

Regarding its impact on a single person, personal communication has an edge over mass communication. Personal communication distinguishes itself by greater credibility of the communicator, the possibility to respond to the listener's needs, and the information conveyed by nonverbal communication (→ Credibility of Content; Credibility Effects). Moreover, personal communication offers higher flexibility. As the communicator can respond to the recipient's queries, the recipient gets information that is tailor-made for his or her needs. In spite of these advantages, mass communication is prevalent. Because of its reach, mass communication can address more people in different places at the same time. Therefore, the costs per person addressed are as a rule lower than those of personal communication.

Regarding the *buying cycle concept*, neither of these two alternatives supersedes the other. The best strategy is to combine both kinds of communication. A customer's buying cycle can be broken down into four different stages. The buying cycle starts when a consumer gets in touch with a product. This first contact happens through mass communication, e.g., through commercials on TV. These commercials often create demand for a certain product. Hence, in the second stage of the buying cycle, the consumer starts gathering

more information. In this stage, personal communication is very important. Due to higher credibility, potential customers are more easily convinced to buy the product. Additionally, mass media can be used to offer detailed information in special-interest magazines. When a customer is finally buying a product, personal communication is essential. The assistant should give advice about special features and different models of the product. After the customer has bought the product, many companies are of the opinion that their business is finished. But quite the contrary, while the customer is using the product, a company should stay in touch with the customer. Brochures, events, or telephone calls by the company help the company to get feedback about its product and services. Moreover, the company knows in time if the customer is planning to replace the product. By providing him or her with information about new versions, companies can succeed in creating demand for a new product. If the customer is appropriately accompanied in this stage of using the product, it is very likely that he or she will also buy the new version from this company. If the company succeeds in satisfying its customer, the buying cycle starts anew (→ Advertising Effectiveness).

### **OFFERING BENEFITS THAT MEET CONSUMERS' NEEDS**

A company's array of products complies with consumers' actual and potential needs. Activities taken in this array can take four major forms. The aim of product variation is to deliberately change a product's attributes or benefits, whereas its main benefits remain unchanged (Esch et al. 2006). Principally, product variation aims at modifying symbolic or aesthetic features, like design, color, or shape. By varying products, companies can meet changes in consumers' needs and wants as well as adapt to changes in legal policies.
